Lauren

I had a few TDS samples sent to Narong and he tested for glyphosate for me (see attached). Very low levels but both glyphosate and its metabolite are present-even for processed commodities (way below tolerance). I think this data supports the regulatory program in that there is not need to test processed commodities, and micro-chem assignment will help with the Raw Ag commodities.

You have to provide an update each year to the GAO audit. For 2015, you can say you had a method for glyphosate and 2,4-D developed and you have some preliminary data with a bigger assignment planned for 2016. Chris developed the acid herbicide method and tested a bunch of TDS samples for acid herbicides (2,4-D is an acid herbicide).
