1	WARREN G. FOSTER, Ph.D., first	1	communications between Dr. Foster and whoever
2	having been duly sworn, testified as follows:	2	may have retained him.
3	· ·	3	Q. You can answer.
4	MR. GOODALE: Please begin.	4	A. In one case, I was asked by an attorney
5	Ç	5	whether or not pesticide might be involved in a
6	EXAMINATION	6	person's child's neurodevelopmental effects. And
7	BY MS. ROBERTSON:	7	after a brief telephone conversation and discussion of
8		8	issues, it didn't go any further.
9	Q. Good morning, Dr. Foster. Have you ever	9	(Discussion held off the record.)
10	given a deposition before?	10	Q. And what was the name of the pesticide?
11	A. Yes.	11	MR. DHINDSA: Same objection.
12	Q. And when did you give a what how many	12	A. I believe the pesticide's name was Dursban.
13	prior depositions have you given?	13	Q. Prior to being retained by Hollingsworth,
14	A. One.	14	have you ever looked at the carcinogenic effects of
15	Q. When was that?	15	glyphosate?
16	A. 2011, 2012, somewhere thereabouts.	16	A. No.
17	Q. And did you give this deposition as an	17	Q. Prior to being retained by Hollingsworth, did
18	expert?	18	you have any opinion as to whether glyphosate could
19	A. Yes.	19	cause cancer in humans?
20	Q. And what was the litigation?	20	A. I hadn't looked at it, so, no, I had no
21	A. The litigation was Merck. Marderosian v.	21	opinion on it.
22	Merck.	22	Q. And your expertise is toxicology, with a
23	Q. And what was your expert opinion about?	23	special focus on reproductive toxicology. Isn't that
24	A. The trial or the case was about health	24	correct?
25	effects of hexavalent chromium, and I provided an	25	A. I trained in reproductive biology and pursued

Have you had any involvement with EPA during these meetings related to EPA guidelines? A. Sorry. Have I had any interaction with EPA in the past year or two on EPA guidelines? Q. When you've when you've been when EPA has sought your opinion related to meetings or grant programs and the like, have any of has any of this work been related to EPA guidelines? A. I would say so, yes, in the respect of developing endocrine-disrupting testing guidelines. Q. What about carcinogenicity guidelines? A. No, I have not participated in that area. Q. You state in your expert report that regulatory studies favor the detection of false positives false positive adverse outcomes in preference to false negatives. Do you recall that? A. Do you have a copy of my report?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	at the animal data related to the detection of false positives, as compared to false negatives? MR. DHINDSA: Objection. A. The approach that I use is one that I've used throughout my career; is to look at the conduct of the study, details of the methodology, as well as the interpretation of the data that's been generated, and to explore all the all the data that's available in relation to the outcomes of interest. So I would look where where I have the data, body weight, behavior of animals, if there's any adverse affects, atypical behaviors that might be present, and then take a look at the the the outcomes that we see. Q. Dr. Foster, does the quality of the study or observed effects during a study relate to whether a false negative is observed? A. Does the quality of the study relate to whether or not a false negative is detected? Q. Yes. I asked my previous question, some two questions ago, was about false positives and false negatives. A. Right.

Page 20 Page 18 1 cetera. 1 claim that they saw -- the chemical that they're --2 So I'm wondering if that's responsive to my 2 that they're interested in was associated with an 3 question regarding -- related to false negatives and 3 adverse health effect, when in the study they had not 4 4 actually measured any health effects. false positives. 5 A. It would be responsive to both. 5 So an example of this is a recent thesis I 6 6 Q. So the quality -just examined, where the student examined exposure 7 7 A. Because you're looking at the quality of the to -- to Bisphenol A in the study, and in their 8 study and how reliable the results are, regardless of 8 conclusions, they were commenting on health effects 9 the direction in which they go. 9 that were not -- not examined in their -- anywhere in 10 10 Q. So does your report approach the studies with their thesis. 11 an eye toward finding a false negative or a false 11 Q. Is the inverse also true? Can study authors 12 12 positive? underinterpret their original data when conducting an 13 13 A. I don't approach the study a priori with the experiment in animal bioassays? 14 goal of finding false positives or false negatives. My 14 A. That can also happen, yes. So somebody 15 approach is to -- is to take an objective assessment of 15 may -- the example here might be somebody may not fully 16 16 appreciate the complexity of the assays they're looking the study and determine whether or not the outcomes 17 17 that were presented in the data are compound-related or at and may not understand -- say they're measuring a 18 18 thyroid-stimulating hormone, and they've also noted 19 that as thyroid-stimulating hormone fell, they saw a 19 Q. Dr. Foster --20 20 A. So -corresponding rise in thyroxine, and they've -- they've 21 21 Q. Oh, sorry. Please finish. not interpreted that as showing that there's -- they've 2.2 A. -- you know, I might look at a study and --22 got internal consistency in corroborating evidence from 23 23 so I'm reviewing a paper, and in reviewing a paper, I two different assays. 24 24 am going to be asking the -- the author of that paper Q. And, Dr. Foster, when you looked at the 25 animal carcinogenicity in this case, did you consider 25 whether or not they have interpreted their results Page 19 Page 21 1 fully, just as well as I might look at the paper and 1 what the study authors submitted as in relation to 2 2 say, well, you've overinterpreted your data as well. overinterpretation or underinterpretation of their data 3 So I'm looking at -- in both directions. 3 4 Q. What would an overinterpretation of data be? 4 A. Did I interpret the studies to determine 5 A. An overinterpretation in a -- in a study 5 whether or not they were over- or underinterpreted? Is 6 6 that's been submitted for publication might be where that your question? 7 7 they're making conclusions that are not supported by 8 8 A. That was something that I would consider, the data that's presented in the paper. 9 Q. What about for a study that is not submitted 9 yes. 10 for publication? 10 Q. And how did you go about this consideration? 11 MR. DHINDSA: Objection. 11 A. Can you give me an example of what you mean 12 12 here. There could be many things like that. Q. Did you have access to all of the studies? 13 13 Q. Well, what I'm trying to understand is what A. I had access to study data in three studies, 14 an example of an overinterpretation of data would be. 14 and I also had a review paper in which I had the data. 15 And your answer relates to submitted publications. So 15 But I don't typically rely upon reviewed data -- review 16 is there overinterpretation of data from original study 16 studies. I might read them from the perspective of 17 authors? Is that possible? 17 giving me a place to start. But in this particular 18 18 A. Original study authors may overinterpret case, they actually had the study data appended that I 19 19 their data, yes. was able to -- to review. 20 20 Q. In what way? Q. And so for the appended study data, did that 21 21 A. They may make conclusions that are not study data include the original authors of the animal

6 (Pages 18 to 21)

carcinogenicity study's overinterpretation or

MR. DHINDSA: Objection.

A. To my knowledge, I only had the -- the

underinterpretation of results?

22

23

24

their report.

supported by the data that they -- that they present in

So that -- I'm trying to think of an example

that I've seen recently. But somebody might make the

Page 24 Page 22 tabulated data. In the text of the paper, on occasion, 1 Q. What type of rodents are used for rodent 2 there was some text discussion of the conduct of the 2 carcinogenicity studies as it relates to this case? 3 3 A. Mice and rats. 4 4 Q. And which review paper are you referring to, Q. Does it matter which type of rodent is used 5 5 Dr. Foster? in an animal bioassay? 6 A. I'm referring to the Greim, et al. study. 6 A. The -- the decision to use mice and rats has 7 7 O. In your expertise, and listed on your CV, been something that has been arrived at through 8 what do you mean by "environmental carcinogenesis"? 8 international harmonization of test guidelines through 9 A. I'm looking at chemicals that are 9 the OECD, as well as other test guideline groups. 10 10 commercial -- commercial chemicals that have been shown So these are guidelines that have been 11 11 to be environmental contaminants. So -thoroughly vetted, they've been reviewed by each 12 12 Q. And is this -- I'm sorry. participating country's expert delegate, as well as 13 13 A. So they're -- they're in the environment, and peer-reviewed by experts within each country. 14 14 there's potential for human exposure. So, in essence, the guideline is a 15 peer-reviewed guideline that advises which -- what is 15 Q. And is this in the context as it relates to 16 16 reproductive toxicology? the most appropriate animal model to use, and mice and 17 17 A. Not always, no. In occasion -- for instance, rats have been chosen. 18 18 in Dieldrin, we were interested in looking at the Q. And you applied these OECD guidelines in your 19 19 carcinogenicity of that pesticide outside the analysis to -- as to whether these -- as -- your 20 reproductive tract. 20 analysis related to the quality of these studies, 21 Q. And that was the Merck case; is that right? 21 correct, in your expert report? 22 Did I get the name right? 22 A. My knowledge is limited to the guidelines? A. No. That was -- the Merck -- the trial, you 23 2.3 Is that what you're asking me? 24 24 Q. I'm asking if you applied the guidelines mean? 25 25 Q. I can -- let me rephrase. And when you say in -- in reviewing whether these reports were of Page 23 Page 25 1 "when we were looking at Dieldrin," what do you mean? 1 sufficient quality for you to include in your expert 2 A. I mean that my students and I had written a 2 opinion. 3 grant for which we had obtained funding to examine the 3 A. Well, I wouldn't have applied the 4 impact of Dieldrin as a carcinogen. 4 guidelines -- if I understand you correctly, the 5 Q. What is Dieldrin? 5 studies were conducted in other labs, according to the 6 6 guidelines that were established at that point in time. A. Dieldrin is a pesticide. 7 7 Q. Do you know who manufactures Dieldrin? I would have reviewed the studies that were conducted 8 A. I do -- I do not know. My understanding is 8 to see, to the extent possible, that they followed the 9 it's banned from production, and so I don't know who 9 guidelines and that the data was of good quality. 10 manufactured it historically. 10 Q. All right. And you found that these studies 11 Q. Okay. Let's take a look --11 all followed the guidelines. Correct? 12 12 MR. DHINDSA: Objection. (Discussion held off the record.) 13 Q. Dr. Foster, what is an animal bioassay? 13 A. I think that in looking at the individual 14 A. An animal bioassay is a study involving 14 studies, that largely they followed the guidelines --15 animals in which you would dose the animals with known 15 in general, they did. 16 concentrations of your test substance, vehicle control, 16 So, for example, a study -- the OECD 17 plus at least three additional dose groups, and assess 17 guidelines advises that you -- your top dose is 18 18 outcomes of interest decided before the initiation of 1,000 milligrams per kilogram or thereabouts, the 19 19 maximum tolerated dose. And some studies approached it 20 20 Q. What is a null hypothesis? and got near it, but didn't quite achieve it. 21 A. A null hypothesis would be -- Chemical X will 21 Q. Yes. And that's the Lankas study you're 22 22 not cause an increase in body weight would be a null referring to. 23 hypothesis. It's a -- it's stated in a way that you 23 A. The Lankas study is one that did not achieve 24 24 can -- the outcome of your study will either support or

Q. All right. So I'd like to direct your

25

25

disprove that -- that hypothesis.

Page 28 Page 26 you're reading. I'm on Page 11. But where are you? 1 attention to Page 27 of your expert report, if we 1 2 2 Q. If you go into the first -- the main 3 A. (Witness complies.) 3 paragraph, the one that stands alone on this page, and 4 Q. It's a rather lengthy paragraph carried over 4 it's in your discussion of -- and the paragraph begins 5 5 from Page 26. I'll give you a moment to find it. with, "In assessing rodent bioassay data..." 6 But in the middle of that paragraph, you 6 A. Yes. I'm in that paragraph. 7 7 state, "Therefore, as designed, the regulatory studies Q. Okay. If you read down maybe six lines, 8 favor the detection of false positive adverse outcomes, 8 "Finally, bioassays are carried out with the goal of 9 finding non-treatment-related tumors in preference to 9 identifying adverse outcomes for hazard 10 10 false negatives, missing detection of treatment-induced identification." 11 tumors." 11 A. Yes. 12 12 Do you see where I'm reading? Q. As you sit here today, do you agree with that 13 13 A. Yes, I see where you're reading. statement? Q. And as you sit here today, do you agree with 14 A. I agree with that statement, yes. 14 15 that statement? 15 Q. Can you explain for us what you mean by this 16 A. Yes, I do. 16 statement, "Outcomes for hazard identification." 17 17 Q. And is your -- is your expert opinion A. The bioassay is conducted because you don't 18 following this notion to detect false positive adverse 18 really have any idea what the toxicological profile of 19 outcomes? 19 your chemical is. So you're administering a vehicle, 20 A. Can you say that again, please? 20 plus at least three additional doses, one up to the 21 Q. Sure. 21 maximal tolerated dose, in assessing a broad range of 22 THE WITNESS: Sorry, Ran. 22 outcomes, in the effort to determine whether or not 23 Q. Is your expert analysis, as described in your 23 there are adverse outcomes. 24 24 expert report following the statement, meaning are you So an adverse outcome in this particular case 25 likewise -- are you likewise favoring the detection of 25 would be to see whether or not there are statistically Page 27 Page 29 1 false positive adverse outcomes as compared to false 1 significant differences in treatments versus controls. 2 2 negative adverse outcomes? (Discussion held the record.) 3 MR. DHINDSA: Objection. 3 MR. GOODALE: Off the record at 9:45 a.m.) 4 A. I would say no to that question [sic]. My 4 (Recess held.) 5 goal in reviewing the -- the individual studies was to 5 MR. GOODALE: We're back on the record at 6 6 try and determine what, if any, outcomes were 9:57 a.m. 7 7 compound-related. BY MS. ROBERTSON: 8 8 Q. All right, Dr. Foster, I'd like to show you Q. Dr. Foster, do you know what the 9 precautionary principle is? 9 an exhibit we'll mark as 18-2. 10 A. I've heard of it. It's been used widely in 10 (Foster Deposition Exhibit 18-2 - Notice to 11 the lay press and elsewhere. I'm not sure I really 11 take Oral and Videotaped Deposition of Dr. 12 understand it. 12 Warren G. Foster - marked for 13 Q. Do you know whether EPA follows the 13 identification.) 14 precautionary principle? 14 Q. This is a Notice of Deposition of Dr. Warren 15 A. Well, since I really don't understand what it 15 Foster. 16 is and how it would be put into practice, I can't 16 Dr. Foster, have you seen this document 17 answer that question. I don't know whether they do or 17 before? 18 don't. 18 A. I've seen an email version of it, yes. 19 Q. Let's look at Page 11 of your expert report. 19 Q. And if you could please go back to the fourth 20 A. (Witness complies.) 20 page. It's titled Schedule A. 21 21 Q. You state here that, "The goal of a bioassay A. I'm sorry. 22 is to identify adverse outcomes for hazard 22 Q. It's got a -- it's a number 1. It's 4 on the 23 identification." 23 document, but it should be -- my apologies. I'm 24 Do you still agree with that statement today? 24 double-sided. 25 A. I don't know, because I don't know where 25 A. Yes. I'm on Page 4. Or the last page.

Page 32 Page 30 1 Q. The last page. And it says Request No. 7? 1 A. Yep. Last page before References. 2 2 Q. So the last page of the memo. 3 Q. And, Dr. Foster, were you asked to provide A. Yes. Q. And here the EPA is articulating that they 4 any of these communications in response to this 4 5 5 request? disagree with the registrant's position. The 6 6 A. I was. And I didn't have any to provide. registrant in this context would be Monsanto, correct? 7 7 Q. Okay. Thank you, Dr. Foster. A. The registrant would be Monsanto, yes. 8 I'm going to go ahead and hand you what we're 8 Q. And the last -- the last two sentences of the 9 going to call Exhibit 18-3. 9 first paragraph on Exhibit 18-3 read, "The registrant 10 10 (Foster Deposition Exhibit 18-3 - USEPA wishes to avoid false positives while those concerned 11 Lacayo Memorandum - marked for 11 with public health wish to avoid false negatives. 12 12 identification.) Hence, for this reason alone, Monsanto's argument is 13 13 Q. Dr. Foster, for the record, if we could unacceptable." please just consult your expert report quickly and look 14 14 Do you see where I'm reading? 15 A. I see where you're reading, yes. 15 at Citation 47. I would ask, please, whether you can 16 confirm the document I handed you as Exhibit 18-3 is 16 Q. So, Dr. Foster, you would agree that at least 17 17 your referenced Exhibit 47 -- or, sorry, Citation 47. at the time of this memo, that the regulatory studies 18 should favor the detection of false negatives. 18 A. I believe it is. 19 Q. Thank you. So, Dr. Foster, it's fair to say 19 Correct? 20 that you've reviewed this memo before, correct? 20 MR. DHINDSA: Objection. 21 A. Yes, I believe I've reviewed this document 21 A. Regulatory -- as I understand your question, 22 22 before. regulatory studies should favor the detection of false 23 Q. And this document is an EPA memorandum, 23 negatives? 24 24 correct? Q. Correct. 25 25 A. Yes. A. I think that the more appropriate way of Page 31 Page 33 1 O. And this document relates to the glyphosate 1 stating that is that regulatory studies should favor 2 feeding study, which is EPA Registration No. 524-308. 2 the detection of effects over not seeing something. 3 Correct? 3 In other words, what you're trying to do is 4 A. Correct. 4 screen, and you want to make sure that the -- you're 5 5 Q. And what do you appreciate this -- which using a sensitive assay so that if there is something 6 study do you appreciate this document as discussing? 6 worth looking at, you're not missing it by being too 7 7 A. I believe this would be referring to the 8 8 Knezevich and Hogan study. Q. So, Dr. Foster, do you agree or disagree that 9 Q. And who sponsored that study? Do you know? 9 regulatory studies should favor the detection of false 10 A. The Knezevich and Hogan study? 10 negatives? 11 Q. Yes. 11 MR. DHINDSA: Objection. 12 12 A. I would have to look at my expert report to A. I can't --13 13 see if I noted that. MR. DHINDSA: Objection. 14 In my expert report, I indicate that this 14 A. I can't speak to the author of this report 15 study was conducted by Monsanto. 15 and what's in their mind at the time, what's happening 16 Q. And, Dr. Foster, was this one of the three 16 before this email or this memo exchange is taking 17 studies you mentioned earlier that you reviewed the 17 18 full data for? 18 But the point that I'm making -- and I think 19 19 A. I believe that is the -- correct. it's the valid point -- is that when you're a 20 20 Q. So, Dr. Foster, if we can go to the last full government agency, you're trying to protect the health 21 21 page of content of Exhibit 18-3, the page right before of the -- of the overall population. You want to 22 References. 22 design an assay, a screening assay that's sensitive 23 A. I'm sorry; which document do you want me to 23 enough in order to detect an effect over missing things 24 24 that may -- may be there. So you don't want your assay 25 25

9 (Pages 30 to 33)

to be too conservative.

Q. Document 18-3.

	Page 34		Page 36
1	Q. Dr. Foster, I think potentially you misspoke	1	and we'll do the second-to-last paragraph that begins
2	there. You were talking about if you're a government	2	with, "Viewpoint is a key issue," and continues with,
3	agency and you're trying to protect the health of	3	"Our viewpoint is one of protecting the public health
4	overall population, you want to design an assay or a	4	when we see suspicious data. It is not our job to
5	screening assay that's sensitive enough. You don't	5	protect registrants from false positives. We
6	mean the government agency wants to design an assay,	6	sympathize with the registrant's problem, but they will
7	correct?	7	have to demonstrate that this positive result is
8	A. The reason I stated it that way is that the	8	false."
9	governments globally have come together and developed	9	Do you see where I'm reading?
10	the guidelines that companies then follow. So the	10	A. I see where you've read that, yes.
11	company didn't develop the guideline. The company had	11	Q. And so would you agree, Dr. Foster, that it
12	no say in it.	12	is, in fact, true that the EPA is concerned with
13	Q. Um-hum.	13	seeing with a false negative, as compared to a false
14	A. So you're yeah, they're following a	14	positive?
15	prescribed guideline for for regulatory purposes.	15	MR. DHINDSA: Objection. Asked and answered.
16	Q. And one of the goals of a government agency	16	A. I can see that the author of this is stating
17	in this context is to protect human health. Correct?	17	that as his view his/her viewpoint.
18	A. Governments in the United States and Canada	18	Q. Dr. Foster, let's look at the first page of
19	and elsewhere have participated in the development of	19	substance of Exhibit 18-3. And we'll see here that the
20	these guidelines in an effort to develop data that	20	author is Mr. Herbert Lacayo, statistician.
21	would be useful in protecting the health of their	21	A. Yes.
22	populations.	22	O. Tox/HED/OPP.
23	Q. But, Dr. Foster, the government isn't	23	A. Correct.
24	developing the data. Aren't the study authors	24	Q. And would you agree that Dr. Herbert Lacayo
25	developing the data? Knezevich and Hogan in this	25	is an employee of the EPA?
	Page 35		Page 37
1	_	1	
1 2	instance?	1 2	A. Correct.
2	instance? A. Knezevich and Hogan conducted the study that	2	A. Correct.Q. So this is an EPA memo, and it is the EPA's

I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your
2 3 4 5 6 7 8 9 10 11	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in	2 3 4 5 6 7 8 9 10 11	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you
2 3 4 5 6 7 8 9 10 11 12	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that	2 3 4 5 6 7 8 9 10 11 12 13	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does
2 3 4 5 6 7 8 9 10 11 12 13 14	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a	2 3 4 5 6 7 8 9 10 11 12 13 14	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert
2 3 4 5 6 7 8 9 10 11 12 13 14 15	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they	2 3 4 5 6 7 8 9 10 11 12 13 14 15	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion?
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further. Q. And would it be fair to say that	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was provided to me. I did not cite it, because I did not
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further. Q. And would it be fair to say that investigating further is the result of finding study	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was provided to me. I did not cite it, because I did not see it as being relevant in my expert report.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order — is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further. Q. And would it be fair to say that investigating further is the result of finding study results that have some sort of suspicious finding?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was provided to me. I did not cite it, because I did not see it as being relevant in my expert report. Q. Well, if we look at Page 21 and 22 of your
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order — is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further. Q. And would it be fair to say that investigating further is the result of finding study results that have some sort of suspicious finding? Meaning that it appears there is a dose relationship	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was provided to me. I did not cite it, because I did not see it as being relevant in my expert report. Q. Well, if we look at Page 21 and 22 of your expert report with respect to the Knezevich and Hogan
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further. Q. And would it be fair to say that investigating further is the result of finding study results that have some sort of suspicious finding? Meaning that it appears there is a dose relationship within the animal bioassay?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was provided to me. I did not cite it, because I did not see it as being relevant in my expert report. Q. Well, if we look at Page 21 and 22 of your expert report with respect to the Knezevich and Hogan study, the only citation I see is Greim, et al., 2015.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further. Q. And would it be fair to say that investigating further is the result of finding study results that have some sort of suspicious finding? Meaning that it appears there is a dose relationship within the animal bioassay? MR. DHINDSA: Objection.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was provided to me. I did not cite it, because I did not see it as being relevant in my expert report. Q. Well, if we look at Page 21 and 22 of your expert report with respect to the Knezevich and Hogan study, the only citation I see is Greim, et al., 2015. So my question, Dr. Foster, is what you
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	instance? A. Knezevich and Hogan conducted the study that generated data using a guideline that was approved by governments. So in this case, an OECD-style-type guideline. Q. Understood. And in evaluating the data that Knezevich and Hogan gathered when they conducted the study, the EPA, from a public health perspective, has a concern with protecting against false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. The public health agency is interested in order is interested in the results of studies that would provide them information on whether or not a compound has any potential hazard to health that they could then investigate further. Q. And would it be fair to say that investigating further is the result of finding study results that have some sort of suspicious finding? Meaning that it appears there is a dose relationship within the animal bioassay?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	A. Correct. Q. So this is an EPA memo, and it is the EPA's position that there is a concern with false negatives. Isn't that correct? MR. DHINDSA: Objection. Asked and answered. A. I can't I can't say what the EPA position is. I see that an EPA employee, writing to another EPA employee, is stating this as their opinion. But I don't know that this person, a statistician, speaks for the entire EPA and states EPA policy. Q. Dr. Foster, you listed this document in your Materials Consulted of your expert report, but you don't cite to it anywhere in your expert report. Does that mean you didn't rely on it to form your expert opinion? A. I read the report as information that was provided to me. I did not cite it, because I did not see it as being relevant in my expert report. Q. Well, if we look at Page 21 and 22 of your expert report with respect to the Knezevich and Hogan study, the only citation I see is Greim, et al., 2015.

in order to conduct my review of the Knezevich and

25

Q. We'll just go ahead and look at Exhibit 18-3,

25

	Page 38		Page 40
1	Hogan study. So I looked at the Greim table. I also	1	within the Knezevich and Hogan study.
2	looked at the memo that you had shared. I also looked	2	A. Yes, there was.
3	at the information from the Pathology Working Group and	3	Q. What do you mean by "tissue blocks"?
4	additional memos going back and forth between the	4	A. Okay. At the end of a study in this case,
5	group.	5	since we're talking about kidneys, we'll focus on
6	Q. Can you identify me for me in your	6	kidneys. The kidneys would be embedded into paraffin,
7	materials consulted which citation relates to the	7	and the paraffin is referred to as a tissue block. And
8	(PWG), which I assume is your citation to the Pathology	8	that tissue then would be used to that paraffin
9	Working Group?	9	tissue block would be cut on a microtome, and thin
10	A. Can I identify the reference that refers to	10	paraffin sections would be added to a glass slide which
11	that?	11	would then be stained with routine hematoxylin and
12	Q. Yes, please.	12	eosin, mounted with a cover slip for analysis by the
13	A. I believe Reference No. 49 might be one that	13	pathologist.
14	refers to that.	14	Typically, in these studies, because you're
15	Q. Okay, well, let's go ahead and look at	15	dealing with large numbers of animals, one section
16	Reference No. 49, then, Dr. Foster.	16	is is prepared per animal.
17	I'm going to hand you what we'll go ahead and	17	Q. And so a tissue block is different from a
18	mark as Exhibit 18-4.	18	slide. Is that correct; my understanding?
19	(Foster Deposition Exhibit 18-4 - USEPA Kasza	19	A. A tissue block is different from a slide,
20	Memorandum - marked for identification.)	20	yes.
21	Q. Can you identify this document for the	21	Q. Do you know who made the decision to
22	record, Dr. Foster.	22	reanalyze the kidney sections of the Knezevich and
23	A. This is a memo to William Dykstra, Reviewer,	23	Hogan study?
24	Toxicology Branch, from Lou Kasza, D.V.M., Ph.D.,	24	A. I do not know who made that decision, no.
25	pathologist of the toxicology branch.	25	Q. Do you know why the decision was made?
	Page 39		Page 41
1	Q. So this is not the PWG?	1	A. I believe the decision well, no, I
2	Q. So this is not the PWG?A. No. This is relating to that issue, but no.	2	A. I believe the decision well, no, I don't I don't know why the decision was made. I
2	Q. So this is not the PWG?A. No. This is relating to that issue, but no.Q. And did you consider this document when	2 3	A. I believe the decision well, no, I don't I don't know why the decision was made. I wasn't part of the process.
2 3 4	Q. So this is not the PWG?A. No. This is relating to that issue, but no.Q. And did you consider this document when analyzing Knezevich and Hogan?	2 3 4	 A. I believe the decision well, no, I don't I don't know why the decision was made. I wasn't part of the process. Q. Is it after a after study authors
2 3 4 5	Q. So this is not the PWG?A. No. This is relating to that issue, but no.Q. And did you consider this document when analyzing Knezevich and Hogan?A. I did review this article, yes.	2 3 4 5	 A. I believe the decision well, no, I don't I don't know why the decision was made. I wasn't part of the process. Q. Is it after a after study authors provide final pathology reports of the study conducted,
2 3 4 5 6	 Q. So this is not the PWG? A. No. This is relating to that issue, but no. Q. And did you consider this document when analyzing Knezevich and Hogan? A. I did review this article, yes. Q. This document states that the purpose was to 	2 3 4 5 6	A. I believe the decision well, no, I don't I don't know why the decision was made. I wasn't part of the process. Q. the addendum to the Bio/Dynamics, Rozezvich and Hogan study? A. If you have a copy of it, could I look at it, and then I'll be able to answer that? Q. I might — I might be able to so we'll start on this. Don't want you to answer any further. I don't know if I brought it. Bo you know if the Patheo PWG report is publicly available? A. I don't know. 10 Q. Do you know whether the original pathology conducted by Knozevich and Hogan is publicly available? A. Tarta, again, I would not know. Q. Your materials consulted cite to a number of EFPA documents, most owhich deal with the Knozevich and Hogan study; Is there a reason you chose to focus the Knozevich and Hogan study; Is there a reason you chose to focus by the Monsanto lavyers. A. Those were documents that were provided to me by Monsanto lavyers and the search. I did not find anything additional related to it. In my recollection. Page 47 Q. Let's go ahead and look at Page 6 of your expert report, Dr. Foster. A. Page? Q. Let's go ahead and look at Page 6 of your expert report, Dr. Foster. A. Page? Q. Sory. In the Literature Reviewed section. A. Yes. Q. Hastras with, "A critical review of the literature woul. Who carried this review out. A. Larried the review out. Monaried the review out. A. Larried the review out. Monaried the review out. A. Correct. A. Again, that would be the materials that were provided to me op the page. Who carried this particular recited in the literature cited in the literature resided in the literature review out? A. Thouse were documents that were provided to me op the page. Page 47 Page 47 Page 47 Page 49 Secientific ment of the submitted article. Q. So Sory. In the Literature Reviewed section. A. Yes. Q. It starts with, "A critical review of the literature recited in the liter		Page 46		Page 48
2 A. If you have a copy of it, could I look at it, 4 and then I'll be able to answer that? 5 Q. I might – I might be able to, so well start 6 on this. Do low tany out on asswer any further. I 7 don't know if I brought it. 8 Do you know if the Pathco PWG report is 9 publicly available? 10 A. I don't know. 11 Q. Doy ou know if the Pathco PWG report is 9 publicly available? 12 conducted by Knezevich and Hogan is publicly available? 13 A. Tata, again, I would not know. 14 Q. Your materials consulted cite to a number of 15 EPA documents, most of which deal with the Knezevich 16 and Hogan study. I shere a reason you chose to focus 17 your research on EPA documents for this particular 18 study analysis? 19 A. Those were documents that were provided to me 19 by the Moassanto lawyers. 20 Q. Did you conduct any independent research on 10 the Knezevich and Hogan study? 21 Q. Did you conduct any independent research on 22 the Knezevich and Hogan study? 23 A. I did my own independent PubMed electronic 24 search. I did not find anything additional related to 25 it. In my recollection. Page 47 2 Q. Let's go ahead and look at Page 6 of your 24 expert report? 25 A. Carn's and the publication? 26 A. Sadly, no. It was all mine. 27 (O. Did you list all of these case materials you 28 conducted by Knezevich and Hogan study? 29 (D. Foster, you have a lot of experience, and the study and the fine experience, and the self-wave file elicities benefit and the publication of the submitted article. 29 (D. Did you conduct any independent research on the Knezevich and Hogan study? 29 (D. Proster, you have a lot of experience, and the self-wave published over 150 times. 29 (D. Proster, you have a lot of experience, and the self-wave published over 150 times. 29 (D. Did you conduct any independent research on the Knezevich and Hogan study? 20 (D. Carn you explain to me what a journal referce in elicitations and have the published over 150 times. 21 (D. Carn you explain to me what a journal referce in elicitations and the self-wave published o	1	_	1	
A. If you have a copy of it, could I look at it, and then II be able to answer that? Q. Implied 1 might be able to, so well start on this. Don't want you to answer any further. I don't know if I brought it. Do you know if the Pathco PWG report is peblicly available? A. I don't know. Q. Do you know whether the original pathology conducted by Knezzwich and Hogan is publicly available? A. That, again, I would not know. Q. Vour materials consulted eite to a number of FPA documents, most of which field with the Knezzwich and Hogan study. Is there a reason you chose to focus your research on FPA documents for this particular study analysis? A. Those were documents that were provided to me by the Monsanto lawyers. Q. Did you conduct any independent research on the Knezwich and Hogan is publicly available? A. I did my own independent pubMed electronic the Knezwich and Hogan is publicly available? A. I did my own independent PubMed electronic search. I did not find anything additional related to the Knezwich and Hogan is publicly available? A. Page? A. I did my own independent research on FPA G. G. Let's go ahead and look at Page 6 of your expert report, Dr. Foster. A. A Yes. Q. D. Let's go ahead and look at Page 6 of your expert report, Dr. Foster. A. A Yes. Q. D. It starts with, "A critical review of the literature was carried out in which I reviewed all of the available case materials." A. Yes. Q. D. So what do you mean — A. So — I starts with, "A critical review of the literature was carried out in which I reviewed all of the available case materials." A. So — I made and that would include. A. A So — Jee Page 47 Q. So so does this mean you receive a submitted and the editor anonymously when the manuscript from title through to the later and would look at the manuscript from title through to the later and would look at the manuscript of the preview of the literature was carried to me by Mensantol hayers. And then I go on and — and talk about the — the hierature cited in the Destruction of the submitte		•		
4 expert report? 5 Q. I might – I might be able to, so we'll start on this. Don't want you to answer any further. I don't know if I brought it. 8 Do you know if the Patheo PWG report is publicly available? 10 A. I don't know. 11 Q. Do you know whether the original pathology conducted by Knezevich and Hogan is publicly available? 13 A. That, again, I would not know. 14 Q. Your materials consulted ite to a number of EEPA documents, most of which deal with the Knezevich and Hogan study. Is there a reason you chose to focus your research on EPA documents that were provided to me by the Monasnot lawyers. 14 A. Thuse were documents that were provided to me by the Monasnot lawyers. 15 Q. Did you conduct any independent research on the Knezevich and Hogan study. Is there are ason you chose to focus by the Monasnot lawyers. 16 Q. Did you conduct any independent research on the Knezevich it. In my recollection. 17 Page 47 1 Q. And where does the journal referee come in? A. Please help me. What are you asking? Q. I'm trying to figure out what your role is in the process as a journal referee to the peer-reviewed literature process. A. Okay. The peer reviewer would read the submitted manuscript and would look at the manuscript from title through to the last page, asking questions about does the title accurately reflect the the subject of the paper. We would look at the introduction to determine whether or not that the rationale for the paper has been adequately described, has it been thorough, has it has it omitted information that could be important to include, have they provided an adequate justification for the study and the doses that

Page 52 Page 50 1 to determine whether or not they're complete. You 1 Q. In your experience as a peer reviewer, how 2 might also look at the methods that have been employed 2 long does the revision process normally take? 3 to determine whether or not they're the state of the 3 A. I can't answer that. It's --4 4 art and whether they're comprehensive. Q. More than a day? 5 5 You would look at the statistical methods A. The -- the revision process? 6 6 that have been applied and determine whether or not Q. Correct. 7 7 A. You know, I've had papers come back and say they've been adequately described and they're complete. 8 You would review the results and determine 8 "accept as is". 9 whether or not the results have been accurately 9 Q. Um-hum. 10 10 A. So no revision needed. Lovely to receive a presented. Are they presented in the best format 11 possible. Are they publication quality. 11 letter like that. 12 12 So, I mean, there's many, many issues that, Q. Okay. 13 13 as a reviewer, you're looking at. And what you're A. Extremely rare. 14 14 trying to do is provide the editor with feedback on Q. Okay. 15 terms of whether or not the paper makes a substantial 15 A. Most often you get something that requires 16 contribution to the scientific literature that's worthy 16 comment and revision. And the revision process is 17 17 of publication. You try and give them some context in something that could be done quickly, depending upon 18 18 terms of priority for publishing; whether it's what are the things the submitting author has on their 19 19 appropriate for that journal. And if there are issues desk at the time. It might take a couple months. 20 that might be useful in guiding the authors to improve 20 So I think -- you know, I think outside 21 21 the quality of the paper. sometimes it might be three months, and editors might 22 Q. So is journal referee just another name for 22 give more time, depending upon the issues. 23 23 peer reviewer? Q. Okay. So let's go ahead and look back at 24 24 A. If you would have asked that earlier, we Exhibit 18-4. 25 25 could have got there quicker, but, yes. A. (Witness complies.) Yes. Page 51 Page 53 1 1 Q. And it's the EPA memo we discussed earlier Q. And the process for peer review takes 2 2 significant time, correct? that you have on your Materials Consulted list as 3 3 Citation 49. 4 Q. And in the process of peer review, after 4 This is a representation of the review of the 5 5 you've engaged in the first submitted draft, are kidney section slides of the Knezevich and Hogan by Dr. 6 critiques or comments ever sent back to the study 6 Kasza, branch pathologist at EPA. Correct? 7 7 author articulating we can't publish this; please look A. That's correct. 8 8 at these concerns we have? Q. And the interpretation in the Results section 9 9 A. Every submitted -- every submitted article, states that, "The lesion may be a proliferative change, 10 the peer reviewer submits their comments back to the 10 having the potential to lead to the development of a 11 11 editor. The editor then reviews them to determine frank tumor. But as the tissue can be seen under the 12 12 whether or not they've been -- they're fair. microscope as a small, well-demarcated focal cell 13 13 aggregate morphologically different --" Sometimes you might get a reviewer that takes 14 advantage of the anonymity of the process and provides 14 (Attorney Robertson interrupted by the 15 15 comments that are not appropriate. reporter.) 16 O. Um-hum. 16 Q. "-- tissue can be seen under the microscope 17 A. In any case, all of the comments are sent 17 as a small, well-demarcated focal cell aggregate 18 back to the -- to the submitting author, the 18 morphologically different from the healthy-looking 19 19 corresponding author. surrounding kidney tissue. The morphological 20 Q. And then the submitting author likely makes 20 alteration does not represent a pathophysiological 21 21 the determination as to whether they are going to significant change." revise and resubmit, or maybe they need to go back to 22 22 Do you see what I'm reading? 23 the drawing board. Correct? 23 A. (No response.)

Q. That's what it says, right, Dr. Foster?

A. That is what it says, yes.

24

25

24

25

A. It would be up to the submitting author to

make a decision what they're going to do at that point.

1	Page 54		Page 56
	Q. And do you know whether EPA's analysis of the	1	tumor in the control group included there are no
2	kidney tissue slides occurred before or after the PWG	2	statistically significant differences?
3	working group's review of the kidney slides?	3	A. That's what I interpreted from his report,
4	A. I can't state with certainty, but I believe	4	yes.
5	it happened before the Pathology Working Group.	5	Q. Okay. Well, let's look at his report.
6	Q. Is this the type of incidence that you noted	6	(Discussion held off the record.)
7	earlier that would have encouraged a full tissue block	7	Q. I'm sorry, Dr. Foster, I need that real quick
8	reanalysis of slides?	8	to mark it as Exhibit 18-5. Apologies.
9	MR. DHINDSA: Objection.	9	A. I was going to ask.
10	A. I'm sorry; I got lost there. Is this the	10	(Foster Deposition Exhibit 18-5 - Christopher
11	type of finding?	11	J. Portier, Ph.D. Expert Report - marked for
12	Q. Earlier you had described that sometimes	12	identification.)
13	years after a study is completed, tissue slides may be	13	Q. So Dr. Portier discusses the Knezevich and
14	recut. Is given the language in this EPA memo, is	14	Hogan study on Page 36. I guess that's not really
15	this one of those instances that would support	15	he starts on Page 36, and he goes through 39.
16	recutting kidney tissue slides?	16	Now, Dr. Foster, on Page 37, within the first
17	MR. DHINDSA: Objection.	17	paragraph carried over, Dr. Portier explains that,
18	A. I can't say what were the driving factors	18	"Adenomas no longer have a significant trend, but
19	there. I do know from my interaction with	19	carcinomas have a marginally significant trend against
20	pathologists, that it is not uncommon for them to see	20	concurrent controls and clearly significant trend using
21	something and for them to seek the input of other	21	historic controls."
22	pathologists and to cut additional slides.	22	Do you see where I'm reading?
23	Q. But in this EPA memo, there's no indication	23	A. Yes.
24	that EPA is asking for recut slides. Correct?	24	Q. So, in fact, on Page 22 of your expert
25	A. There's no indication in this memo that that	25	report, it's not true that Dr. Portier included in his
	Page 55		Page 57
1	took place or that this pathologist consulted with any	1	expert report a finding that stated no statistically
2	other pathologist at EPA.	2	significant differences even with the tumor in the

2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	 Q. Are the two related? A. Don't know that they are. Q. Okay. I'm going to go ahead and hand you now what is going to be marked as Exhibit 18-7. (Foster Deposition Exhibit 18-7 - Article in Biometrics Journal - marked for identification.) Q. And, Dr. Foster, this is an article that's written by two department heads in biostatistical science. Would you agree? A. Correct. Well, it's written by four people. I don't know that they're department heads. They are from the department of biostats. Q. At the Harvard School of Public Health and at the Dana-Farber Cancer Institute in Boston. Correct? A. That is correct. Q. And if we can flip to Page 220 of this article. A. (Witness complies.) Q. In the paragraph above No. 7, Discussion. 	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	A. I'm not saying that. I'm saying that you can do statistics and people can assign those words to them, but they don't carry a lot of weight in the interpretation of the analysis. Q. Dr. Foster, do you know whether statisticians use the phrase "marginally significant"? A. I have seen it used, yes. Q. And you're not a statistician yourself. Correct? A. No, I am not. Q. Let's talk about your ultimate conclusion in the Knezevich and Hogan study. You state that there is no evidence of tumor progression in the Knezevich and Hogan study. Isn't that correct? MR. DHINDSA: Objection. A. There are several reasons in this study why I determine that the results are not compound-related. Q. Can you, please, direct me in your citation Materials Consulted as to which citation you rely upon to make those decisions and conclusions.

Dr. Foster, where did you find the 11 percent loss in body weight? Where did you find that information? A. This would have been found during the conduct of my reading. Whether this was reported in the the either the the I'm trying to come up with
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	use the concurrent control or historic controls? A. I believe in my analysis, in looking at the Knezevich and Hogan study, I looked at the concurrent controls, in addition to looking at the additional analyses that were conducted, together with the other outcomes that were seen in the study. Q. What do you mean by "additional analyses conducted"? A. I'm referring to the Pathology Working Group there. Q. And did the Pathology Working Group at all address historical controls? A. No, they did not. Q. All right. And so you looked at the concurrent controls as — A. I believe that's correct. Q. So if we looked at Dr. Portier's expert report on Page 38, Table 9, he offers the data for tumor incidences observed in the Knezevich and Hogan	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A. I see that, yes. Q. Yet, Dr. Foster, you conclude that there is no dose response relationship shown in the Knezevich and Hogan study. A. Again, I think you have to look at the study in its totality. So when we looked at the well, when I looked at the Knezevich and Hogan study, in the high dose group, we're looking at an 11 percent loss in body weight in the highest dose group. This is a concern to me. That's suggesting that there's something going on in this study at that high dose group that's potentially confounding the data. Q. Dr. Foster, where did you find the 11 percent loss in body weight? Where did you find that information? A. This would have been found during the conduct of my reading. Whether this was reported in the the either the the I'm trying to come up with the word the text of the Greim study or in the EPA
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	use the concurrent control or historic controls? A. I believe in my analysis, in looking at the Knezevich and Hogan study, I looked at the concurrent controls, in addition to looking at the additional analyses that were conducted, together with the other outcomes that were seen in the study. Q. What do you mean by "additional analyses conducted"? A. I'm referring to the Pathology Working Group there. Q. And did the Pathology Working Group at all address historical controls? A. No, they did not. Q. All right. And so you looked at the concurrent controls as A. I believe that's correct. Q. So if we looked at Dr. Portier's expert report on Page 38, Table 9, he offers the data for tumor incidences observed in the Knezevich and Hogan study. Do you see where I'm at?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	A. I see that, yes. Q. Yet, Dr. Foster, you conclude that there is no dose response relationship shown in the Knezevich and Hogan study. A. Again, I think you have to look at the study in its totality. So when we looked at the well, when I looked at the Knezevich and Hogan study, in the high dose group, we're looking at an 11 percent loss in body weight in the highest dose group. This is a concern to me. That's suggesting that there's something going on in this study at that high dose group that's potentially confounding the data. Q. I just want to make the record clear. A. I'm sorry; I got lost. Q. I just want to make the record clear that as you sit here today, you are offering an opinion as an animal toxicologist expert in animal toxicology. A. Okay. To be full in my answer, I am a have expertise as a toxicologist, and I've been asked to provide my expert opinion on the animal literature in this in this litigation. Q. Okay. MR. DHINDSA: Is now a good time for a break? MS. ROBERTSON: Yes. I understand we only have a little bit of time left on the tape, so we can go ahead and take a break, Dr. Foster.	4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Q. Okay. So, again, this memo is still talking about the Knezevich and Hogan study, as indicated by, "Review pathology report on additional kidney sections." Correct? A. Okay. I've read the article the memo. Q. And we see on Page 2 in the conclusion that the EPA determined that additional tumor in the control group which had been re diagnosed from the re-evaluation of the original slides was not present in the recut kidney sections. Correct? A. So in additional sections, no, there were no additional tumors. Q. Well, it actually says "was not present". A. I see that sentence, and this is I don't know the training of the individual, so they're reporting the EPA pathologist Dr. Kasza's statement. Q. Do you know the training of the individuals who made up the Pathology Working Group? A. I believe all of the five members were Board-certified pathologists. Q. But you don't have any knowledge as to
5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	distinction, because semantics are important. Are you an expert in animal toxicology? A. I Q. You stated that earlier. I just want to make the record clear. A. I'm sorry; I got lost. Q. I just want to make the record clear that as you sit here today, you are offering an opinion as an animal toxicologist expert in animal toxicology. A. Okay. To be full in my answer, I am a have expertise as a toxicologist, and I've been asked to provide my expert opinion on the animal literature in this in this litigation. Q. Okay. MR. 	Page 74		Page 76
1	today?	1	Pathology Working Group. Isn't that correct?
2	A. That's not what I said. I said, looking at	2	A. I don't know when Dr. Kasza reviewed the
3	the front page of this document, I do not know the	3	slides.
4	training of these people; Robert Taylor, Robert	4	Q. I direct your attention to Exhibit 18-4. Is
5	Zendzian, William Dykstra. I don't know if any of	5	this the memo you've been referred to, Dr. Foster, that
6	those three are pathologists.	6	is Dr. Kasza's opinion?
7	When I read the sentence, it's not stating	7	A. December 4 of 1985, yes.
8	that they have examined them. They're stating	8	Q. And so it's true that Dr. Kasza reviewed the
9	they're restating Dr. Kasza's statement. That's the	9	recut kidney slides and did not find a tumor after the
10	way I'm interpreting this.	10	Pathology Working Group had stated there was a tumor.
11	Q. So do you disagree with the EPA that the EPA	11	Is that correct?
12	did not find a do you disagree with the statement	12	A. What I have here is a memo dated December 4
13	that the EPA concluded that an additional tumor in the	13	of 1985. The memo was written December of 19
14	control group was not present in the recut slides?	14	December 4th of 1985. That does not tell me that he
15	MR. DHINDSA: Objection. Objection.	15	did the analysis on December 3rd. I have no idea when
16	A. What I'm saying is that this the way I	16	the analysis was done.
17	read this memo is that they're restating Dr. Kasza's	17	Q. Okay. Well, let's look at the last page in
18	statement, the EPA pathologist.	18	this exhibit and the test for significances of
19	Q. And so the restatement of Dr. Kasza's	19	differences between proportions dated 11/13/1985.
20	statement is that an additional tumor in the control	20	Dr. Foster, does this look like some study
21	group was not present in the recut kidney slides. Is	21	results from a pathologist?
22	that correct?	22	A. This looks like statistics done December 11,
23	A. Again, I'm state what I'm saying is I	23	1985.
24	stand by my original statement. They are parroting the	24	Q. And is December no. It is dated
25	statement that was made by Dr. Kasza. We've already	25	11/13/1985.

Dr. Foster, do you know which version you used when you cited to Citation 49? A. Sitting here today, I could not tell you the date that was on the document. Q. Dr. Foster, when you reviewed these memos supplied to you by Monsanto's counsel, did these memos

	Page 78		Page 80
1	A. I I cannot answer that. I don't know.	1	controls, the historical controls, and the whole body
2	Q. Do you know whether	2	of data, not just whether or not there was statistics
3	A. I have no recollection.	3	involved or not.
4	Q. Do you know whether these documents had	4	Q. Not talking about the concurrent controls,
5	"USEPA Archive Document" cover page that these exhibits	5	not talking about the whole of the data, which set of
6	have? Do you recall?	6	historical controls did you apply to your analysis of
7	A. Yes, the I'm pretty sure that what I	7	Knezevich and Hogan?
8	looked at looks like this (indicating).	8	A. I believe I relied upon the concurrent
9	Q. And they had the USEPA Archive Document cover	9	controls.
10	page that you see on the front of 18-8, 18-4, and 18-7?	10	Q. Dr. Foster, you just stated that you relied
11	A. Yes.	11	on concurrent controls, historical controls, and whole
12	Q. Dr. Foster, why didn't you apply concurrent	12	body data. Did you not rely on historical controls for
13	controls in your analysis of Knezevich and Hogan?	13	your analysis?
14	A. I looked at all the data, not just the	14	A. What I am stating is that I had looked at
15	concurrent controls.	15	them, but I relied upon the concurrent controls.
16	Q. What other historic controls did you look at?	16	Q. Which historic controls did you look at?
17	A. If we go to my report, I state in my report	17	A. Sitting here, I can't tell you which ones I
18	that I looked at the information provided from the	18	looked at.
19	Knezevich and Hogan, the recut, the Pathology Working	19	Q. So even in the instance of a rare tumor, such
20	Group, and then I also looked at the results from other	20	as a renal tubule adenoma seen in the Knezevich and
21	endpoints, including the body weight.	21	Hogan study, you applied concurrent controls. Is that
22	Q. Okay.	22	correct?
23	A. So it wasn't just control groups and how	23	A. I gave them more weight in this review.
24	control groups I'm looking at all the data.	24	Q. Let's look at the article that you cited to
25	Q. Dr. Foster, you do agree that in order to	25	by Joseph Haseman. It was handed to you earlier.
	Page 79		Page 81
1	analyze a dose response, you need to look at the	1	A. (Witness complies.)
2	treatment groups compared to the control group,	2	Q. I think it's 18 Exhibit 18-6.
3	correct?	3	A. It is.
4	A. I do.	4	Q. Okay. And that first paragraph in the
5	Q. And in this study, you chose the concurrent	5	abstract agrees that concurrent controls are an
6	control. Isn't that correct?	6	appropriate control group for interpretive purposes,
7	A. I believe that is correct. But, again, I	7	just as you state on Page 6 of your report. Correct?
8	looked at all the data. I may have relied on the	8	A. That's correct.
9	concurrent controls in this case, but I looked at all	9	Q. And, again, the last sentence in that
10	the data.	10	paragraph applies to the discussion of the use of
11	Q. Dr. Foster, do you know whether the	11	historical controls when you have a rare tumor.
12	regulatory bodies of EPA and ESLA looked at the current	12	Correct?
13	controls or the historic controls?	13	A. Sorry. Can you state your question again. I
14	A. I cannot comment on what other regulatory	14	was reading.
15	bodies did or didn't do.	15	Q. Sure. The last sentence in the paragraph
16	Q. Dr. Foster, would you agree that a renal	16	the last sentence of the first paragraph in the
17	tubule adenoma is a rare tumor?	17	abstract applies to the discussion of the use of
18	A. I can agree that renal adenomas in mice are	18	historical controls when you have a rare tumor.
19	rare, yes.	19	Correct?
20	Q. And in the instances of rare tumors, is it	20	A. Correct.
0.7	appropriate to look at the historical controls?	21 22	Q. Okay. What methodology did you use to omit
21	A It13 t f -1 1 1	_ 44	the evaluation of historical controls in arriving at
22	A. It would not be out of the question to look	1	
22 23	at historical controls.	23	your conclusion that there was no dose response
22		1	

Page 82 Page 84 1 MR. DHINDSA: Objection. 1 carcinogenicity studies, isn't one of the purpose to 2 A. Again, coming back to my point, I looked at 2 administer a high dose so you can show the potential 3 the entire data set that was available to me. And when 3 toxic effect in humans? 4 4 I see that we've got an increase -- or, sorry, a A. The purposes of going up to the high dose is 5 5 to have a dose that's sufficiently high that you don't decrease in body weight in the highest dose group, that 6 6 leads me to concern that there's something happening in miss an effect if one is present. 7 7 that group of animals that calls into the question the Q. And don't we use these animal bioassays and 8 8 interpretation of the data. gauging whether there is a present effect to apply to 9 Q. And so because you saw a loss in body weight, 9 whether a chemical can be a human carcinogen? 10 10 you made the expert opinion to use concurrent controls A. Again, I come back to the point I've made 11 11 as compared to historical data controls, even though -previously, is that in your high dose group, if you see 12 12 A. It wasn't -adverse outcomes on different endpoints that calls in 13 13 Q. -- it was a rare tumor. question and makes it difficult to interpret the --14 14 A. I wasn't making the decision based on that to whether or not those results are compound-related, then 15 15 you assign less weight to them. which control group to look at; whether it was 16 16 Q. Dr. Foster, did you assign less weight to concurrent controls or historical. At this point, I'm 17 17 looking at the quality of the study and interpretation this study? 18 18 of the overall information; what this study is telling A. I don't know what you mean by "did I assign 19 19 me, as is standard practice within the field. less weight to this study". 2.0 Q. Isn't it also standard practice in the field 20 Q. In your introduction of your expert report 21 21 to apply historical control data sets to rare tumors? and in your recent testimony, you talk about the weight 22 A. Again, I didn't say that I did not look at 22 of studies, and you would assign less weight to studies 23 23 them. What I am saying is that in looking at the data, that have high doses in the high dose group. Did you 24 24 when I saw an 11 percent loss in body weight in my high assign less weight to this study? 25 25 dose group, I became concerned that interpreting the A. In this particular study, I did not find Page 85 Page 83 1 results from the study was going to be difficult. So 1 evidence of compound-related effects. 2 2 at that point, that became more important. Q. That's not the question. 3 Q. Your conclusion is that there's an absence of 3 A. I think that's the bottom line. 4 4 Q. That's not the question. Did you assign less dose response together with lack of evidence of tumor 5 progression, supporting your conclusion that the tumors 5 weight to this study because of the high dose 6 6 are spontaneously occurring and unrelated to treatment. administered to the high dose animal group? 7 7 It's the second full paragraph on Page 22 of your MR. DHINDSA: Objection. Asked and answered. 8 8 expert report. A. I looked at the study and asked the question, 9 A. I see that. I'm just going to read it again. 9 did -- in this study, were there compound-related 10 (Witness read.) So in the body of that paragraph, I 10 effects. I did not see compound-related effects, so 11 lay out my reasons for determining that these were not 11 there was no need to assign a weight to it. 12 12 compound-related effects. Q. So you only assign a weight to a study that 13 I come back to my point that in the high dose 13 shows a compound-related effect. 14 14 group, you're almost five times the maximum dose A. No. What I'm saying here is that this -- in 15 recommended by OECD, and you've got an effect on body 15 looking at compound-related effects, I found it to be a 16 weight that leads me to question the -- the relevance 16 negative study. 17 of the effects seen in those animals. You take that 17 Q. Isn't loss in body weight the result of a 18 18 out, there is no dose response. One, zero, one. dose response? 19 Then you add in that that there were step 19 A. Sorry. Say that again. Isn't loss of body 20 20 sectionals done. No additional tumors on any dose weight --21 group were found. 21 Q. Isn't loss in body weight the result of a 22 22 Q. Dr. Foster, do you know what the mathematical dose response? 23 23 equivalent is to 1,000 ppm? A. In this particular case, I don't know what's 24 24 A. Not off the top of my head, no. causing the loss in body weight.

Q. But it contributes to your overall conclusion

25

25

Q. In administering high doses in animal

	Page 86		Page 88
1	that this is a negative study, even though you don't	1	This will be Foster Exhibit 18-9.
2	know what caused the lower body weight.	2	(Foster Deposition Exhibit 18-9 - Curriculum
3	A. I'm saying that the loss in body weight,	3	Vitae of Warren G. Foster, Ph.D marked
4	11 percent loss in body weight, leads me to question	4	for identification.)
5	the relevance of the findings.	5	Q. Dr. Foster, your CV mentions that you've done
6	Q. So if there's	6	work for other industry. Isn't that correct?
7	A. It's not reliable.	7	A. Can you tell me where you're referring to.
8	Q no loss in body weight, the results of	8	Q. Well, do you recall, as you sit here today,
9	these findings would be relevant?	9	as to whether you've done any industry work?
10	A. Again, I come back to my point. When I see a	10	A. Can you tell me what you mean by "industry
11	loss in body weight, it causes me to question the	11	work".
12	relevance of the findings. There and whether or not	12	Q. Have you ever done any work for the a company
13	they're reliable. I don't believe they're reliable,	13	Exponent?
14	and I don't believe they're reliable, because, again,	14	A. I have participated with Exponent in the

	Page 94		Page 96
1	Q. You are aware that IARC classified glyphosate	1	that.
2	as a 2A, right?	2	Q. Well, prior to receiving IARC Monograph 112,
3	A. I am aware of that, yes.	3	you don't know today whether you knew if the
4	Q. Were you aware at the time Monsanto	4	classification was a 2A?
5	approached you to serve as an expert in this case?	5	MR. DHINDSA: Objection. Asked and answered.
6	A. I may have been aware of it. I I can't	6	A. Again, I don't recall one way or the other
7	say one way or the other.	7	what I did or didn't know at that time.
8	Q. We have a letter here from your counsel dated	8	Q. So Monograph 112 could have been the first
9	August 18, 2016. That's the initial correspondence	9	time that you learned that glyphosate was a 2A. Is
10	between you and the attorney. And I'll show it to you,	10	that correct?
11	just to refresh your recollection, and we'll mark this	11	A. Again, at the time, I I can't say what I
12	as Exhibit 18-10.	12	knew on August 18th. I may have known that.
13	(Foster Deposition Exhibit 18-10 - Dhindsa	13	Q. When you entered into the expert consulting
14	Letter Dated August 18, 2016 to Dr. Foster -	14	agreement with Hollingsworth on behalf of Monsanto, you
15	marked for identification.)	15	were aware that Monsanto did not agree with IARC's
16	Q. Does this letter look familiar to you?	16	assessment. Correct?
17	A. So far. Yes.	17	A. Sorry, but I at the time I entered into
18	Q. Okay. So, Dr. Foster, this letter shows that	18	the agreement with Hollingsworth, I may have been able
19	you entered into an agreement to provide expert	19	to assume that, but I had no idea what Monsanto did or
20	consulting services with Hollingsworth, LLP on behalf	20	didn't agree with.
21	of Monsanto Company on August 18, 2016. Isn't that	21	Q. Well, your expert consulting expert
22	correct?	22	consulting letter marked as Exhibit 18-10 describes
23	A. That's correct.	23	that you are to provide expert consulting services for
24	Q. And on August 18, 2016, sitting here today,	24	the purpose of assisting Hollingsworth in representing
25	you can't recall whether you knew IARC had classified	25	Monsanto in connection with potential or actual

And, again, that's just days after you served on an IARC monograph; isn't that correct? A. That would be correct. Q. Did you use info you gained at Meeting 117 in your review for the IARC guidelines?

Page 114 Page 116 O. I'm sorry. Did you use any of the knowledge 1 obligated to inform IARC that you had been retained by 2 2 you gained from serving on Monograph 117 for reviewing Hollingsworth on behalf of Monsanto for Roundup and 3 the IARC guidelines in connection with your work for 3 glyphosate litigation? 4 4 Hollingsworth on behalf of Monsanto? MR. DHINDSA: Objection. 5 5 MR. DHINDSA: Objection. A. I have no knowledge that Monsanto is involved 6 6 in such activity. But hypothetically speaking, if I A. I don't know how to answer that. 7 7 O. Did Monograph 117 include review of was involved in a meeting with IARC, and Company X is 8 8 guidelines for conducting an IARC review? acting in a manner to defund or -- I would have to 9 A. Did -- did the 117 panel meeting involve 9 understand and know what the reasons were, to 10 10 looking at the -re-evaluate my position in either direction. 11 11 Q. Apologies. I'll rephrase. Q. And what if your research showed that the 12 12 Company X sought to defund IARC for an adverse opinion, When you worked on the IARC Monograph 117, 13 13 in their respect, to a chemical classified as a 2A? did you review IARC guidelines for conducting review? 14 14 A. On the first day, I believe it was something MR. DHINDSA: Objection. 15 that would have been presented. 15 A. If the Company X is taking a position because 16 16 Q. But you didn't do it before. Is that they had an opinion that was contrary to what they 17 wanted, what would I do? I think, again, that I would 17 correct? 18 need a lot more information around the situation of why A. Before going to the meeting? 18 19 19 Q. Correct. they've adopted that position. 20 2.0 A. I may have read them before going to the Q. So Company X -- IARC reviewed a chemical 21 that's manufactured by Company X. IARC determines the 21 meeting. 22 Q. Okay. And as part of these guidelines, 22 chemical manufactured by Company X is a carcinogen. 23 23 doesn't IARC ask invited panelists to honestly disclose You subsequently sit on an IARC panel unrelated to 2.4 24 any conflict or perceived conflict of interest, so that Company X, but in your unrelated work, you are retained 25 IARC can decide whether its panelists should serve in 25 as an expert for Company X. When Company X engages in Page 117 Page 115 1 the subgroups? 1 a campaign to defund IARC, should you not tell IARC, 2 2 MR. DHINDSA: Objection. even if your work with IARC is unrelated to Company X? 3 A. I believe that's in the guidelines, yes. 3 MR. DHINDSA: Objection. 4 Q. But you didn't give IARC the opportunity to 4 A. I think I need a lot more information on 5 5 make the decision, because you failed to disclose your that. The -- the situation -- you know, there -- there 6 work on behalf of Monsanto. Isn't that correct? 6 might by many reasons why. There -- there might be 7 7 MR. DHINDSA: Objection. legitimate reasons why they might adopt that position 8 8 A. Again, coming back to the issue of looking at that I -- that I have no knowledge of. 9 Aldrin, Dieldrin, and pentachlorophenol, I did not see 9 Q. So as you sit here today, just association 10 a conflict of interest. 10 between consulting work with -- as you sit here today, 11 (Discussion held off the record.) 11 your interpretation of what you must disclose on a 12 12 Q. Hypothetically, had you known that Monsanto declaration of interest is subjective, in your view. 13 was engaged in a campaign to defund IARC before the 13 MR. DHINDSA: Objection. 14 Lyon meeting for Monograph 117, do you think you would 14 A. No, I'm saying that there's -- it's a complex 15 have been obligated to inform IARC that you were 15 issue. And you're asking me to -- to adopt a 16 retained by Hollingsworth on behalf of Monsanto related 16 hypothetical situation where I have very limited 17 to Roundup and glyphosate litigation? 17 information, that I can't make a decision about. 18 MR. DHINDSA: Objection. 18 I would need to know what the -- why Company 19 A. Hypothetically speaking, if I knew that 19 X has adopted the position, what the issues are. Are 20 20 Hollingsworth -- or, sorry, that Monsanto was involved they -- are they meritus, are they not meritus. I 21 in a campaign to defund --21 would need to know what the IARC process was and what 22 Q. Correct. 22 their -- their conclusions and what they were -- why 23 A. -- would I then have disclosed a conflict of 23 they came to their conclusion. And I would also have 24 24 to take a look at what I was consulting the company

30 (Pages 114 to 117)

for. It might be minimal. Trivial.

25

25

Q. Would you have felt you would have been

Page 118		Page 120
Q. Okay. So you filled out the declaration of	1	A. Yeah.
	2	Q. Okay.
	3	A. 64, 65.
	4	Q. Do either 64 or 65 deal with a pesticide or a
MR. DHINDSA: Objection.	5	chemical?
A. Again, I believe that I did it accurately.	6	A. 64 is dealing with dieldrin, which is a
MS. ROBERTSON: Okay, thank you. Let's break	7	pesticide. 65 is dealing with a dietary supplement.
for lunch.	8	Q. And so with 64 and 65, the research is
MR. GOODALE: This marks the end of Media	9	related to transgenic mice?
No. 2 in the deposition of Dr. Warren G.	10	A. It's involving transgenic mice, yes.
Foster, Ph.D. Going off the record at	11	Q. And are transgenic mice used in the data set
12:35 p.m.	12	that you reviewed for glyphosate?
(Recess held.)	13	A. Transgenic mice were not used in the data set
MR. GOODALE: Here begins Media No. 3 in the	14	that I'm looking at.
deposition of Dr. Warren G. Foster, Ph.D.	15	Q. And were the transgenic mice used in your
We're back on the record at 1:26 p.m.	16	Study 64 and 65 because you were looking for a specific

I start by describing the study, and then I one of the tumors here that I discuss is hemangiosarcomas, where I note that a significant trend was found.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Isn't that correct? A. Sorry. Say that again. The majority Q. Of these articles are not looking at the chemical effect and the potential to cause cancer. Is that correct? A. The majority of these studies are looking at are conducted in animal studies using environmental contaminants to look at effects on target organs, mostly of which are in the reproductive tract. Q. Okay. Dr. Foster, if we could look at Page 59 of your CV. And you offer Areas of Research Interest. A. Yes. Q. Okay. And is this still are these three categories No. 1, reproductive epidemiology in biomonitoring; No. 2, reproductive and development toxicity and carcinogenicity of environmental and dietary chemicals; and, No. 3, the cellular and molecular mechanisms of endometriosis still your top three research interests, as you sit here today?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	determination. Do you mean important? Q. The significant trend seen that's noted in your expert report, does that factor into your conclusion that the tumors are not treatment-related? A. What I see is there was a statistically significant trend for hemangiosarcomas. That's not the end of the interpretation of the study, but, rather, the beginning. So I looked at that. Q. Okay. But for your analysis on the Atkinson study, it does begin with a discussion of hemangiosarcomas only. Correct? A. I don't know what you mean by "only". Q. You start with you're right. You start with hemangiosarcomas in looking at the Atkinson data, correct? A. I start by describing the study, and then I one of the tumors here that I discuss is hemangiosarcomas, where I note that a significant trend was found. Q. Okay. And do you recall, as you sit here
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Isn't that correct? A. Sorry. Say that again. The majority Q. Of these articles are not looking at the chemical effect and the potential to cause cancer. Is that correct? A. The majority of these studies are looking at are conducted in animal studies using environmental contaminants to look at effects on target organs, mostly of which are in the reproductive tract. Q. Okay. Dr. Foster, if we could look at Page 59 of your CV. And you offer Areas of Research Interest. A. Yes. Q. Okay. And is this still are these three categories No. 1, reproductive epidemiology in biomonitoring; No. 2, reproductive and development toxicity and carcinogenicity of environmental and dietary chemicals; and, No. 3, the cellular and molecular mechanisms of endometriosis still your top three research interests, as you sit here today? A. Yes.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	determination. Do you mean important? Q. The significant trend seen that's noted in your expert report, does that factor into your conclusion that the tumors are not treatment-related? A. What I see is there was a statistically significant trend for hemangiosarcomas. That's not the end of the interpretation of the study, but, rather, the beginning. So I looked at that. Q. Okay. But for your analysis on the Atkinson study, it does begin with a discussion of hemangiosarcomas only. Correct? A. I don't know what you mean by "only". Q. You start with you're right. You start with hemangiosarcomas in looking at the Atkinson data, correct? A. I start by describing the study, and then I one of the tumors here that I discuss is hemangiosarcomas, where I note that a significant trend was found. Q. Okay. And do you recall, as you sit here today, what the numbers are that support that
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Isn't that correct? A. Sorry. Say that again. The majority Q. Of these articles are not looking at the chemical effect and the potential to cause cancer. Is that correct? A. The majority of these studies are looking at are conducted in animal studies using environmental contaminants to look at effects on target organs, mostly of which are in the reproductive tract. Q. Okay. Dr. Foster, if we could look at Page 59 of your CV. And you offer Areas of Research Interest. A. Yes. Q. Okay. And do you recall, as you sit here today, what the numbers are that support that significant trend? You note that there are four of

			1
	Page 126		Page 128
1	A. Sorry, I do not have the numbers before me.	1	reported by Dr. Portier on Page 39?
2	Q. Okay. Well, let's take a a compare here	2	A. I see no reason to agree, nor disagree with
3	and look at Dr. Portier's report on Page 39, Table 10.	3	it.
4	Do you see Dr. Portier's table, Dr. Foster?	4	Q. Dr. Foster, your report is unclear as to
5	A. I see his table, yes.	5	whether there were any hemangiosarcomas reported in the
6	Q. Do you have any reason to dispute the	6	male control group. So in explaining your analysis,
7	accuracy of the numbers in Table 10 of Dr. Portier's	7	isn't it important to report on the hemangiosarcomas in
8	report?	8	the control group?
9	A. I have no reason to either agree, nor	9	A. I'm not sure what it is you're asking there.
10	disagree with them.	10	Q. Isn't it true that the hemangiosarcomas seen
11	Q. Your expert report is consistent to show four	11	in the Atkinson study in the male mice should be
12	of 45 lesions in the high dose group.	12	controlled compared against the concurrent controls;
13	A. Sorry, I see four of 50. On Page 10?	13	thus it should be included in your report?
14	Q. Yes.	14	A. By citing the paper, I'm citing what they
15	A. Or, sorry, Page 39, Table 10.	15	found. I didn't did I write out zero of 50, zero of
16	Q. Yes.	16	50, zero of 50, four of 50 four of 50 or four of 45?
17	A. Hemangiosarcomas in the high dose group?	17	No, I did not write that out.
18	Q. Yes.	18	Q. When you conducted your analysis, did you
19	A. Males only.	19	consider the control group?
20	Q. Yes.	20	A. Yes.
21	A. He's got it reported as four of 50, not 45.	21	Q. And you explain on Page 23 that the tumors
22	Q. And where does your number 45 come from?	22	were not detected in a statistically significant trend
23	A. I thought that's what you just finished	23	in male mice and other appropriately conducted
24	saying.	24	bioassays.
25	Q. It's on Page 22 of your expert report. You	25	So what I'm trying to understand here is what
	Page 127		Page 129
1	Page 127	1	Page 129
1 2	observe a significant trend of hemangiosarcomas with	1 2	your statistically significant trend is and whether
2	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of	2	your statistically significant trend is and whether you've used the concurrent controls to calculate a
2	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males.	2 3	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies.
2 3 4	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely	2 3 4	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on
2	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table.	2 3 4 5	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23?
2 3 4 5	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning	2 3 4	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole,
2 3 4 5 6	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you	2 3 4 5 6	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to
2 3 4 5 6 7	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose	2 3 4 5 6 7	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole,
2 3 4 5 6 7 8	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you	2 3 4 5 6 7 8	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study.
2 3 4 5 6 7 8	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct?	2 3 4 5 6 7 8	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question.
2 3 4 5 6 7 8 9	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes.	2 3 4 5 6 7 8 9	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male
2 3 4 5 6 7 8 9 10	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the	2 3 4 5 6 7 8 9 10	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related?
2 3 4 5 6 7 8 9 10 11	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order to be able to to answer that question properly.	2 3 4 5 6 7 8 9 10 11	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related? A. I am saying that according to the analysis
2 3 4 5 6 7 8 9 10 11 12	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order	2 3 4 5 6 7 8 9 10 11 12	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related? A. I am saying that according to the analysis conducted, whether it was the four of 45 or four of
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order to be able to to answer that question properly. Q. Is it fair to say that you think you got the information from the Greim table?	2 3 4 5 6 7 8 9 10 11 12 13 14	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related? A. I am saying that according to the analysis conducted, whether it was the four of 45 or four of 50, there was a statistically significant trend. Q. And is that the result of a dose relationship?
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order to be able to to answer that question properly. Q. Is it fair to say that you think you got the information from the Greim table? A. As I've just finished stating previously, I	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related? A. I am saying that according to the analysis conducted, whether it was the four of 45 or four of 50, there was a statistically significant trend. Q. And is that the result of a dose relationship? A. It's the result of the high the number in
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order to be able to to answer that question properly. Q. Is it fair to say that you think you got the information from the Greim table? A. As I've just finished stating previously, I believe I relied upon the Greim table for that	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related? A. I am saying that according to the analysis conducted, whether it was the four of 45 or four of 50, there was a statistically significant trend. Q. And is that the result of a dose relationship? A. It's the result of the high the number in the high dose group only. But is that a dose-related
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order to be able to to answer that question properly. Q. Is it fair to say that you think you got the information from the Greim table? A. As I've just finished stating previously, I believe I relied upon the Greim table for that information.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related? A. I am saying that according to the analysis conducted, whether it was the four of 45 or four of 50, there was a statistically significant trend. Q. And is that the result of a dose relationship? A. It's the result of the high the number in the high dose group only. But is that a dose-related trend?
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order to be able to to answer that question properly. Q. Is it fair to say that you think you got the information from the Greim table? A. As I've just finished stating previously, I believe I relied upon the Greim table for that information. Q. Okay. Do you know whether there were any	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. A. So you're reading the top sentence on Page 23? Q. I'm actually trying to figure out as a whole, Dr. Foster, how what your conclusion was, related to the significant trend you noted in the Atkinson study. A. Sorry. I don't understand your question. Q. Are the hemangiosarcomas seen in the male mice in the Atkinson study dose-related? A. I am saying that according to the analysis conducted, whether it was the four of 45 or four of 50, there was a statistically significant trend. Q. And is that the result of a dose relationship? A. It's the result of the high the number in the high dose group only. But is that a dose-related trend? Q. Correct.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	observe a significant trend of hemangiosarcomas with four of 45 lesions found in the high dose group of males. A. Okay. If that's there, I most likely obtained that from the Greim summary table. Q. But you do acknowledge that at the beginning of the your analysis here in Atkinson, when you describe the study, there were 50 animals in each dose group. Correct? A. I as I reported, yes. Q. Okay. So why have you used only 45 as the denominator for the high dose group? A. I would have to see the Greim table in order to be able to to answer that question properly. Q. Is it fair to say that you think you got the information from the Greim table? A. As I've just finished stating previously, I believe I relied upon the Greim table for that information. Q. Okay. Do you know whether there were any hemangiosarcomas found in the male control group for	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	your statistically significant trend is and whether you've used the concurrent controls to calculate a significant trend to compare against other studies. It's the result of the high the number in the high dose group only. But is that a dose-related trend? Q. Correct. A. Yeah, I guess you could call that a dose-related trend. It's a a significant effect at

Page 130 Page 132 1 it as a trend, because you're not getting an increasing 1 know where that paper is at present. And given the 2 line, but you're getting dose-significant effect. 2 short time frame that I had, I did not have the 3 Q. Okay. So you call it a dose-significant 3 opportunity to scour all my -- my file -- files to 4 effect, but because we can't apply a linear model, 4 provide that. 5 5 it -- it isn't a positive linear trend? Is that what Q. And so you don't have a copy of the article 6 6 you're saying? electronically. 7 A. I stand by my report, where I say there was a 7 A. I did not have access to one electronically. 8 significant trend in hemangiosarcomas. 8 Q. Did you make a copy of the article for your 9 Q. But you also --9 own personal use? 10 10 A. That was only found in the high dose group. A. I cannot recall whether I made a copy or just 11 Q. But you ultimately find that this is a 11 made notes. 12 12 negative study. So I'm trying to under --Q. So you actually don't know if you have the 13 13 A. Ultimately, yes. article. Is that what you're saying? Q. I'm trying to understand how you dismiss or 14 A. What I'm saying is this is a publicly 14 15 how you go about dismissing the significant trend you 15 available article that has been published. I don't --16 noted in the hemangiosarcomas in the male mice. 16 I can't say with a hundred percent certainty that I 17 17 A. I don't dismiss. I look at the entire study, have a copy of the article. I may have read the 18 18 and I evaluate the overall study. And in this article and simply made notes from it. particular case, you've got tumors that are --19 19 Q. Okay. So, previously, you misspoke when you 20 hemangiosarcomas in mice. 20 said you had a copy, but you had left the office on 21 21 Now, I know that these are rare in humans. your way here, and so you couldn't give it to your 22 22 lawyers. You actually don't know if you have a copy; They're also relatively rare in rats. But in mice 23 these are not an uncommon tumor. 23 is that right? 24 24 Q. And you cite to the Elwell 2004 article for MR. DHINDSA: Objection. Mischaracterizes. 25 25 A. With a hundred percent certainty, without that? Page 131 Page 133 1 A. I do. 1 going through my files and sitting down, I can't say, a 2 Q. And when did you review the Elwell 2004 2 hundred percent certainty, I do or don't. I know I 3 3 have read the paper. 4 A. During the conduct of my background reading 4 (Discussion held off the record.) 5 5 Q. Okay. So, yeah, you did, Dr. Foster, 6 6 identify that this paper is publicly available. So did Q. And did you -- have you reviewed the -- have 7 7 you reviewed the Elwell 2004 article recently in you access it through PubMed? 8 preparation for your deposition? 8 A. It's listed in PubMed. 9 A. I have not reviewed any -- I have not 9 O. Um-hum. 10 reviewed most of the papers that are on my Materials 10 A. But did -- what do you mean by "did I access 11 Cited list recently. 11 it in PubMed"? 12 Q. Do you have a copy of the Elwell article? 12 Q. Did you obtain it from having a subscription 13 A. I'm sure I have a copy somewhere in my 13 to PubMed and being able to pull the article 14 14 electronically after you ran your search on the records, yes. Q. Did your lawyers ask you to provide a copy of 15 15 computer? 16 that article? 16 A. No, I did not. 17 A. Yes, they did. 17 Q. So you had to go and find the article. Is Q. And did you provide a copy of that article? 18 18 that correct? A. When I got asked for the article, I had 19 19 A. That's correct. 20 already left the office and was on my way here. 20 Q. Okay. So it's publicly available in published form; hard copy only. Is that correct? 21 Now, I have prepared my expert report, 21 22 reviewed the literature in my home office here, in my 22 A. I don't know if that's true or not. I know 23 university office, as well as my -- my residence in 23 that I didn't get it off the net. 24 Florida, as well, as well as going into libraries and 24 Q. Okay. So in your instance, your PubMed 25 so forth. I know I have accessed the paper. I don't 25 search led you to the article, and you then sought to

1 2	Page 134		Page 136
	find the hard copy, because you couldn't find it	1	and Clifford 2000. Correct?
<i>Z.</i>	online. Is that right?	2	A. I note that, yes.
3	A. I believe that's correct.	3	Q. Why did you choose to apply historical
4	Q. And do you remember where you found the hard	4	control data when you had current controls you could
5	copy of this article?	5	have discussed?
6	A. The hard copy? The textbook is available at	6	A. Because when I'm looking at the concurrent
7	the University of Guelph in the main library.	7	controls, I see zero out of 50, and I have data here
8	Q. Okay. So is it a textbook or is it an	8	that says that hemangiosarcomas in the CD-1 mice are
9	article?	9	not uncommon. They're not rare. And so I'm asking the
10	A. It's a book chapter, I believe.	10	question, is not finding them at all in the in the
11	Q. Do you remember how long the article was?	11	low dose or the control group, I'm asking whether or
12	A. Not off the top of my head, no. I don't	12	not the study is a reliable study.
13	remember how long any of the articles were.	13	Q. But isn't it true, Dr. Foster, that the
14	Q. Do you	14	concurrent control group is the first choice when
15	(Discussion held off the record.)	15	comparing studies?
16	Q. Do you recall the mice that were the subject	16	A. I agree. It's one that I would weigh or
17	of the Elwell article?	17	look at in my assessment.
18	A. Not right off the top of my head, but I think	18	Q. But you don't assess the concurrent controls
19	they were the CD-1, but I'm not sure.	19	in this study.
20	Q. Well, it would be pretty important that	20	A. I didn't say that. I look at concurrent
21	they're CD-1, wouldn't it be, Dr. Foster?	21	controls, I look at historical controls.
22	A. Probably, yeah.	22	Again, it's not where you'd look at just one
23	Q. The Atkinson study was done with CD-1 mice,	23	thing. You look at it in balance.
24	correct?	24	Q. Okay. You don't evaluate the
25	A. Yes, I believe that is correct	25	hemangiosarcomas in the male mice against the
	Page 135		Page 137
1	Q. And it's true that common neoplasms in mice	1	concurrent controls in the Atkinson study, at least
2	different or differ based on strain. Isn't that	2	within the Pages 22 and 23 of your expert report.
3	correct?	3	Isn't that correct?
4	A. They can, yes.	4	A. I don't know what you mean by I didn't I
5	Q. So Elwell, in order to be an appropriate cite	5	don't evaluate or I don't consider it.
6	here, needs to be discussing CD-1 mice. Isn't that	6	Q. Dr. Foster, do you discuss the concurrent
7	correct?	7	controls related to hemangiosarcomas in Pages 22 and 23
_	A. The Elwell paper would. However, it's not	8	in your expert report related to Atkinson?
8	the only paper that I I have on my Materials Cited		y 1 1
8 9	• • •	9	A. I don't explicitly state that the concurrent

I believe it does, yes. Q. The title says "Hemangiosarcoma in Rodents". A. Correct. Q. For your discussion on the hemangiosarcomas,	10 11 12 13 14 15 16 17 18 19 20 21 22	A. I don't explicitly state that the concurrent controls were zero of 50. That doesn't mean I didn't consider it in coming to my conclusions. Q. But your conclusion is that the hemangiosarcomas reported in the Atkinson study fall within the historical ranges reported by Giknis and Clifford 2000. A. I do state that, yes. Q. And because the incidence is well within the range of historical controls, this makes these hemangiosarcomas not treatment-related. A. I suggest that is one reason why it calls that into question. Q. Now, you have a footnote, Footnote 3 on

	Page 138		Page 140
1	capturing all hemangiosarcomas.	1	A. The title is Neoplasm in Male [sic]. And
2	A. I see that, yes.	2	what was your other point?
3	Q. And is that still your opinion today?	3	Q. And that it appears to be the beginning of
4	A. Yes.	4	Table 3; hence Table, comma colon 3.
5	Q. All right. Now, Dr. Foster, did you look at	5	A. I can't tell if it is the beginning or not.
6	the Giknis and Clifford data to make the determination	6	Q. The beginning of the table identifies columns
7	related to your criticism of Dr. Portier and the whole	7	by location and tumor, number of studies total, number
8	body hemangiosarcomas, or did you just take the range	8	of studies. Do you see that, Dr. Foster?
9	point?	9	A. I do.
10	A. Sorry. Did I refer to the Giknis	10	Q. And you can see that location and tumor
11	Q. Did you look at it? Did you look at it to	11	included in that column is liver?
12	see that Dr. Portier, as you state, is confused related	12	A. I see it.
13	to the reporting of the hemangiosarcomas as whole body?	13	Q. And hemangiosarcoma is listed within the
14	A. I looked at the report, yes.	14	liver category, correct?
15	MS. ROBERTSON: This will be Foster	15	A. I see it.
16	Exhibit 18-12.	16	Q. And in the columns, reading across the line,
17	(Foster Deposition Exhibit 18-12 - Giknis and	17	we see that there's data entry observed from 29 lesions in 15 studies. Correct?
18 19	Clifford 2000 Report - marked for identification.)	19	in 15 studies. Correct? A. Yes.
20	Q. So if we look at Page 9, Table 3 of the	20	A. 1 es. Q. For an overall incident range of 1.11 through
21	Giknis and Clifford control data set	21	5 percent. Correct?
22	MR. KALAS: Counsel, can I note that the copy	22	A. Yes.
23	you gave us appears to be missing the	23	Q. And your expert report on Page 22 reports an
24	even-numbered pages.	24	incident range for hemangiosarcomas of 12 percent.
25	MS. ROBERTSON: It's not double-sided?	25	Correct?
	Page 139		Page 141
1	Page 139 MR. KALAS: It is double-sided, but it's	1	Page 141 MR. DHINDSA: Objection.
1 2	MR. KALAS: It is double-sided, but it's missing the even-numbered pages.	1 2	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis
	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages?	2 3	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000
2 3 4	MR. KALAS: It is double-sided, but it's missing the even-numbered pages.Q. Dr. Foster, do you have all the pages?A. No, I do not.	2 3 4	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes.
2 3 4 5	MR. KALAS: It is double-sided, but it's missing the even-numbered pages.Q. Dr. Foster, do you have all the pages?A. No, I do not.MS. ROBERTSON: This was an exhibit that was	2 3 4 5	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma
2 3 4 5 6	MR. KALAS: It is double-sided, but it's missing the even-numbered pages.Q. Dr. Foster, do you have all the pages?A. No, I do not.MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier	2 3 4 5 6	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma incident rate reported in historical controls up to
2 3 4 5 6 7	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages? A. No, I do not. MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier by the Hollingsworth firm, and this is the	2 3 4 5 6 7	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma incident rate reported in historical controls up to 12 percent. That would be whole body hemangiosarcomas,
2 3 4 5 6 7 8	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages? A. No, I do not. MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier by the Hollingsworth firm, and this is the complete exhibit entered into in that	2 3 4 5 6 7 8	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma incident rate reported in historical controls up to 12 percent. That would be whole body hemangiosarcomas, I believe.
2 3 4 5 6 7 8	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages? A. No, I do not. MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier by the Hollingsworth firm, and this is the complete exhibit entered into in that deposition.	2 3 4 5 6 7 8	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma incident rate reported in historical controls up to 12 percent. That would be whole body hemangiosarcomas, I believe. Q. Okay. So do you know whether the Atkinson
2 3 4 5 6 7 8 9	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages? A. No, I do not. MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier by the Hollingsworth firm, and this is the complete exhibit entered into in that deposition. MR. KALAS: I understand you're making that	2 3 4 5 6 7 8 9	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma incident rate reported in historical controls up to 12 percent. That would be whole body hemangiosarcomas, I believe. Q. Okay. So do you know whether the Atkinson study looked at the whole body hemangiosarcomas in
2 3 4 5 6 7 8 9 10	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages? A. No, I do not. MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier by the Hollingsworth firm, and this is the complete exhibit entered into in that deposition. MR. KALAS: I understand you're making that representation. I don't have those exhibits	2 3 4 5 6 7 8 9 10	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma incident rate reported in historical controls up to 12 percent. That would be whole body hemangiosarcomas, I believe. Q. Okay. So do you know whether the Atkinson study looked at the whole body hemangiosarcomas in reporting on hemangiosarcomas?
2 3 4 5 6 7 8 9 10 11	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages? A. No, I do not. MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier by the Hollingsworth firm, and this is the complete exhibit entered into in that deposition. MR. KALAS: I understand you're making that representation. I don't have those exhibits in front of me. But this does not appear to	2 3 4 5 6 7 8 9 10 11	MR. DHINDSA: Objection. A. Yes. I see that in the citation to Giknis 2000 Q. Yes. A that reports hemangioma hemangiosarcoma incident rate reported in historical controls up to 12 percent. That would be whole body hemangiosarcomas, I believe. Q. Okay. So do you know whether the Atkinson study looked at the whole body hemangiosarcomas in reporting on hemangiosarcomas? A. My recollection is that was whole body
2 3 4 5 6 7 8 9 10 11 12	MR. KALAS: It is double-sided, but it's missing the even-numbered pages. Q. Dr. Foster, do you have all the pages? A. No, I do not. MS. ROBERTSON: This was an exhibit that was entered into by the deposition of Dr. Portier by the Hollingsworth firm, and this is the complete exhibit entered into in that deposition. MR. Page 142 Page 144 of 50, zero of 50, 2 of 50, for a P trend of 0.062. 1 vascular system. 1 2 Q. Would you agree that hemangiosarcomas are 2 Q. And that would be a significant statistically 3 vascular tumors? 3 trend, correct? 4 4 A. I believe that hemangiosarcomas are vascular A. No, that would not be a statistically 5 5 tumors that occur throughout the body. significant trend. That is greater than .05. 6 6 Q. So the data you cited to in Giknis and Hogan Q. Is it important to look at the fact that the 7 7 [sic] is looking at the body, multiple organ. Is that hemangiosarcomas are seen in the high dose group and no 8 8 correct? The 12 percent range. other groups related to the Sugimoto study in the male 9 A. I believe that's accurate. 9 high dose group? 10 10 Q. Are you aware, Dr. Foster, that EPA cites to A. Sorry. Say that again. 11 11 the hemangiosarcoma range, as Dr. Portier does in his Q. Is it important to look at the fact that the 12 12 expert report, with 1.1 to 11 percent? Citing also to hemangiosarcomas are in the high dose group and no 13 13 the Giknis and Clifford paper. other groups in the Sugimoto study? 14 14 MR. DHINDSA: Objection. I don't recall that. Q. Do you know what rates EFSA used in their 15 15 A. In the high dose group -- first off, there's 16 16 recent reevaluation of the animal carcinogenicity data no statistically significant difference here. However, 17 for completeness, we see two of 50 in the high dose 17 for the range of hemangiosarcomas from Giknis and 18 Clifford 2000? 18 group, in the Sugimoto study. 19 19 A. No, I don't. And then if you look at the Sugimoto study, 20 Q. You do agree, Dr. Foster, that the tumor 20 we note that this is a study that in the high dose 21 21 trend in CD-1 mice is different in other strains of group, where they're being dosed in males with 4,348 22 mg's per kilogram per day, that these animals were 22 mice for that same tumor, correct? 23 23 MR. DHINDSA: Objection. noted to have liquid stool. Liquid stool in an animal 24 24 is also considered to be sign of a potential systemic A. Can be, yes. 25 25 Q. So it's entirely practical that the dose toxic effect. Page 143 Page 145 1 response among rodent strains will differ, correct? 1 So although I see something going on, two of 2 2 MR. DHINDSA: Objection. 50, that's not statistically significant. I would 3 A. You're asking me to speculate on whether or 3 again begin to question this study. 4 not it might -- a dose response may differ by different 4 Q. Did this study report any body weight loss in 5 strains? I would need to see more information on it, 5 the high dose groups? 6 6 A. I don't recall whether it reported body but I think it's possible. 7 7 Q. Okay. And on Page 23, Dr. Foster, you -- you weight loss. Let me look at my report, please. 8 8 note that you didn't see any hemangiosarcomas and other So they reported it as retarded growth and reduced food consumption. 9 bioassays. Is that correct? Apologies. Let me 9 10 correct. That's not right. 10 Q. Who reported? 11 You note that hemangiosarcomas did not show 11 A. In this case, it was in the Greim text. 12 12 statistically significant trends in male mice and other Q. So the Greim review article report of this 13 13 cancer bioassays, correct? finding. 14 A. Yes, I note that. In other well-conducted 14 A. In the Greim review article, again, I 15 cancer bioassays in mice -- in male mice, there was no 15 reviewed -- I relied primarily on the data that was 16 statistically significant trend noted. 16 provided. However, I note that there was also some 17 Q. So if we look at Page 42 of Dr. Portier's 17 text that was provided in terms of how the study was 18 expert report, Table 12 in the Sugimoto study. 18 conducted and what was seen. And that was useful. 19 19 A. What page? Q. Okay. Now, in the paragraph above in the 20 Q. 42. Are you there, Dr. Foster? 20 Sugimoto study, we have a discussion here on malignant 21 21 A. I'm on Page 42. lymphomas. Correct?

37 (Pages 142 to 145)

A. Sorry; I don't know where you're referring.

Q. And, here, you provide the control, low, mid,

Q. The first paragraph of Sugimoto.

A. First paragraph? Okay. Yes.

22

23

24

25

Q. And you see in Table 12 that hemangiosarcomas

in male mice, there were two hemangiosarcomas noted in

A. Hemangiosarcomas in male was zero of 50, zero

the Sugimoto study in the high dose group. Correct?

22

23

24

25

Page 146 Page 148 important when you're interpreting the study results 1 and high dose numbers reported as two of 50, two of 50, 1 2 zero of 50, six of 50. Correct? 2 that you evaluate all the information that you have 3 A. That's what's written here, yes. 3 before you. 4 4 Q. Okay. And if you look on Dr. Portier's Q. And in this --5 5 expert report, Table 12, Page 42, that gives us a A. I'm trying to determine whether or not we 6 6 statistically significant trend. Correct? have a compound-related effect. And when I see 7 7 A. Yes, that gives a statistically significant evidence that there is systemic toxicity, that makes it 8 8 very difficult for me, if not impossible, to conclude trend. 9 Q. However, your conclusion for this study is 9 that that's a compound-related effect. 10 10 that it's strongly negative. How do you reach that Q. Do you know whether there was a survival 11 11 conclusion? difference between the controls in the high dose group 12 12 A. In the -- sorry. In the Sugimoto? in the study? 13 13 Q. Correct. A. Sitting here at this moment, without having 14 14 the information before me, I can't say one way or A. In looking at this, again, I come back to the 15 15 point that these animals in the high dose group were another whether there was a difference in survival. 16 16 noted to have liquid stool, retarded growth, reduced Q. Do you have any reason to think that the 17 17 food consumption, calling into question the effects in other observed effects led to a higher tumor rate? 18 18 the high dose group. A. The other observed effects. What are you 19 19 If we look at that, that would then go two, referring to? 20 two, zero, suggesting that somehow or another 20 Q. Do you have any reason to believe that the 21 21 glyphosate is potentially protective. liquid stool, retarded growth, and reduced food 22 22 consumption led to the tumors seen in the highest dose Q. How would glyphosate be potentially 23 protective when you have an incidence of six out of 50 23 group? 24 24 in the Sugimoto study in the high dose group? A. It's possible that the same mechanisms that 25 25 A. As I just indicated, when you've got retarded are leading to these metabolic effects. Or liquid Page 147 Page 149 1 growth, reduced food consumption, liquid stool in the 1 stool, retarded growth, reduced food consumption could 2 2 high dose group, that calls into question the relevance be the consequence of something in these animals or in 3 of findings in that dose group. 3 that the -- the feed or in the dosing material that is 4 Q. So do you not include the high dose group --4 creating systemic toxicity, irritation of the gut 5 5 oh. So the high dose group, then, is not included in lining, or something like that, that could, indeed, 6 6 your analysis of whether this is a statistically contribute to the -- the tumors. 7 7 significant trend for malignant lymphomas. Correct? Q. And you saw those potential contributions to 8 8 tumors in -- in the Sugimoto study when you did your A. No. What I am saying is that in this study, 9 where we see evidence of potential systemic toxic 9 literature review? 10 effects as shown by liquid stool, retarded growth, 10 MR. DHINDSA: Objection. 11 decreased food consumption, that's -- the 11 A. I -- I stand by what I've said, in that when 12 12 interpretation of the -- of findings in the high dose I see evidence of systemic toxicity, it makes it very 13 13 group is difficult, if not impossible, to relate to a difficult to evaluate the quality or the 14 compound-related effect. 14 compound-related effect of -- of the test chemical. 15 Q. Did EPA accept the Sugimoto study as -- as 15 This -- and this is not my decision. This is something 16 acceptable study? 16 that is routinely done in evaluating toxicological 17 A. They -- I didn't say it was an unacceptable 17 18 Q. So when I have a high dose group that shows 18 study, and I don't know what EPA -- EPA did or didn't 19 19 do. I'm conducting my own assessment of the tumors, I don't consider the cause of those tumors. I 20 20 literature. first consider the quantity of the dose given to see 21 21 Q. Dr. Foster, isn't it important to ward whether the tumor should even be evaluated? 22 against false negatives? And by excluding the high 22 A. What I'm saying is that -- let's forget the 23 dose group, based on your analysis, you are, in fact, 23 outcome measure, whether it's tumors, whether it's

38 (Pages 146 to 149)

decreased follicle loss, whether it's behavioral

effects. You have animals in which you're getting

24

25

24

25

encouraging false negatives?

A. I don't agree with that. I think it's

			1
	Page 150		Page 152
1	systemic toxicity. That now makes it very difficult to	1	A. It's also possible that these events started
2	determine whether the outcome you're looking at,	2	before, too. I don't know.
3	regardless of what it is, is being driven by the test	3	Q. So you don't know whether the malignant

Q. As you sit here today, do you believe glyphosate's a promoter? A. No, I do not believe it's a promoter. Q. So in this instance, the malignant lymphomas
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	MR. DHINDSA: Objection. A. I'm saying because these effects were seen in the high dose group, I cannot state with certainty that these are compound-related effects. The tumors, that is. Q. Do you have any indication from this study or the literature you reviewed that there's evidence that anything other than glyphosate caused these malignant lymphomas in the CD-1 mice in Sugimoto? A. Again, I stand by my report and what I've already testified; that at the high dose group, we've got liquid stool, retarded growth, and reduced food consumption. Q. And A. The consequence of that is I cannot conclude that there's a compound-related effect there. Q. Do you know when these observations were made? A. What do you mean, when they were made? Q. In the study. At what point in time in this 18-month study were these observations made?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	involves initiation and promotion Q. So cancer doesn't develop, does it, Doctor MR. DHINDSA: Were you finished with your answer? THE WITNESS: Sorry? MR. DHINDSA: Were you finished with that answer? THE WITNESS: No, I was going to go on, but A. It's it's a multi-step process involving initiation, mutation in the in the in the DNA, and promotion, proliferation. There's also repair mechanisms that might take place to prevent tumors from from developing. Tumors may be present spontaneously in the animal and only show up later when a promotional event happens. Q. As you sit here today, do you believe glyphosate's a promoter? A. No, I do not believe it's a promoter. Q. So in this instance, the malignant lymphomas would need to develop over time, not upon some
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	MR. DHINDSA: Objection. A. I'm saying because these effects were seen in the high dose group, I cannot state with certainty that these are compound-related effects. The tumors, that is. Q. Do you have any indication from this study or the literature you reviewed that there's evidence that anything other than glyphosate caused these malignant lymphomas in the CD-1 mice in Sugimoto? A. Again, I stand by my report and what I've already testified; that at the high dose group, we've got liquid stool, retarded growth, and reduced food consumption. Q. And A. The consequence of that is I cannot conclude that there's a compound-related effect there. Q. Do you know when these observations were made? A. What do you mean, when they were made? Q. In the study. At what point in time in this 18-month study were these observations made? A. At this point in time, I believe they were	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	involves initiation and promotion Q. So cancer doesn't develop, does it, Doctor MR. DHINDSA: Were you finished with your answer? THE WITNESS: Sorry? MR. DHINDSA: Were you finished with that answer? THE WITNESS: No, I was going to go on, but A. It's it's a multi-step process involving initiation, mutation in the in the in the DNA, and promotion, proliferation. There's also repair mechanisms that might take place to prevent tumors from from developing. Tumors may be present spontaneously in the animal and only show up later when a promotional event happens. Q. As you sit here today, do you believe glyphosate's a promoter? A. No, I do not believe it's a promoter. Q. So in this instance, the malignant lymphomas would need to develop over time, not upon some spontaneous event such as glyphosate-administered dose.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	MR. DHINDSA: Objection. A. Is there any other method for assessing carcinogenicity besides initiation and promotion? A. Can you help me out with that question? I don't know what you're asking. It's it's too broad. Q. Initiation promotion is not the only methodology to use that can be used to assess carcinogenicity. MR. DHINDSA: Objection. A. They're not methods. Q. Approaches? A. Nor are they approaches. Q. Is there can I have an agent that causes	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Q. My so I was asked to provide an assessment of the animal literature, which I've done. My although I've looked at cancer carcinogenesis and I've looked at different mechanisms in cancer development, my understanding is that a chemical must be an initiator or must act through tumor promotion in order to produce carcinogenicity. Q. I understand that. And I understand you're not a pathologist. Correct? A. No, I am not. Q. Do you have knowledge on epigenetics effects on tumor suppressor genes? MR. DHINDSA: Objection. (Attorney Robertson asked for clarification by the reporter.) Q. Any knowledge on epigenetic effects on tumor suppressor genes. A. Okay. So epigenetic modification of the DNA is something that's becoming increasingly important in transgenerational effects. It's something that I have studied in our work, although I'm not a a molecular biologist or and certainly not focused entirely on epigenetics.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	sacrifice do interim sacrifices to see if something's going on there. Q. But, otherwise, it's only at death that terminal sacrifice A. Otherwise, it's at terminal sacrifice, yes. Q. And these malignant lymphomas were observed at terminal sacrifice, correct? A. That's my understanding, yes. Q. So the malignancies found were only looked at one time. Correct? A. That's my understanding in this case, yes. Q. Is there any other method for assessing carcinogenicity besides initiation and promotion? A. Can you help me out with that question? I don't know what you're asking. It's it's too broad. Q. Initiation promotion is not the only methodology to use that can be used to assess carcinogenicity. MR. DHINDSA: Objection. A. They're not methods. Q. Approaches? A. Nor are they approaches.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Q. My so I was asked to provide an assessment of the animal literature, which I've done. 41 (Pages 158 to 161)

	Page 162		Page 164
1	MR. DHINDSA: Objection to the extent it	1	A. Correct.
2	calls for anything confidential.	2	Q. Now that you have seen this article, how much
3	A. I can't say with certainty who it was that	3	time did you spend in total on this project, would you
4	actually approach approached me. It might have been	4	estimate?
5	Lorenz Rhomberg.	5	A. Again, I couldn't say with certainty.
6	Q. Is that somebody who works at Exponent?	6	Q. Okay. And which section did you draft?
7	A. I believe it is.	7	A. It was contents of different sections. Let
8	Q. How much time would you say you spent on	8	me take a look. So right off the bat, I had read the
9	drafting this letter for Exponent?	9	updated 2012 assessment, so I read that over. Provided
10	A. I really couldn't say.	10	my own notes and critical comments on what I thought
11	Q. Do you know what Exponent did with your	11	were strengths, weaknesses of the the 2012 update,
12	letter?	12	which I shared with my co-authors. I certainly
13	A. No, I don't.	13	provided comment in the written sections of the state
14	Q. Dr. Foster, I'm going to hand you an article	14	of the science. And then the majority of my work
15	that was published in Regulatory Toxicology and	15	related to the human health issues. So sperm, semen
16	Pharmacology. We'll mark that as 18-13.	16	quality would be one area in which I drafted sections.
17	(Foster Deposition Exhibit 18-13 - Regulatory	17	Endometriosis would have been another.
18	Toxicology and Pharmacology Article - marked	18	Q. And when you say "drafted sections", you
19	for identification.)	19	you started from scratch and then submitted your
20	Q. Dr. Foster, have you ever seen this article	20	sections to the various other co-authors for review.
21	before?	21	Is that correct?
22	A. Yes, I have.	22	A. Correct.
23	Q. And you're listed on this article. Isn't	23	Q. And what was your criticism to WHO-UNEP State
24	that correct?	24	of the Science of Endocrine Disrupting Chemicals
25	A. That's correct.	25	following the assessment?

1	A. Yeah.	1	document that was produced in this litigation by
2	Q. Article	2	Monsanto. This document is going to be Exhibit 18-14,
3	A. I see, yeah.	3	and it begins with the Bates number MONGLY01947702, and
4	Q. So does that mean that these critical	4	it ends with 7704.
5	comments underwent peer review?	5	(Foster Deposition Exhibit 18-14 - Monsanto
6	A. My understanding is that, yes, this paper	6	Document - MONGLY01947720 through 7704 -
7	underwent peer review.	7	marked for identification.)
8	Q. Do you recall whether or were you part of	8	Q. I'd give you a moment to review, Dr. Foster,
9	the process after the peer reviewers revised or had	9	unless you can tell me that you've seen this before.
10	comments or any notations? Did you, again, then look	10	A. I don't recall seeing it before, so I'd like
11	at this article prior to it being resubmitted for	11	to read it over.
12	publication?	12	Q. Please.
13	A. If I remember correctly I mean, this is	13	A. (Witness reads.) Okay.
14	going back some time, so I've published quite a few	14	Q. Okay, Dr. Foster. On the second page of this
15	papers since that time. But if I remember correctly,	15	exhibit, MONGLY01947703, we see that part of Phase 2 is
16	we got reviewers' comments, and that there was a	16	that Exponent and Gradient staff will draft a detailed
17	teleconference amongst us and emails about how we	17	critical review in response to the WHO-UNEP endocrine
18	should respond to the comments.	18	report. Correct?
19	Q. Had you ever previously worked with any of	19	A. I see that that's what they're proposing,
20	your other co-authors on this report, aside from	20	yes.
21	Mr. Glen Van Der Kraak, who we already identified?	21	Q. And we see that after this draft is
22	A. I believe it's Dr. Van Der Kraak.	22	completed, select experts will review and comment as
23	Q. Yes. I'm so sorry. You're right; Doctor.	23	co-authors on the draft document. Correct?
24	Apologies	24	A. I see this. This reads a response to a
25	A. I hold him in very high regard.	25	request for application and a proposal for work to be
	Page 167		Page 169
1	Jim Lamb, I've met at SOT; a highly regarded	1	done. So it's it's what they're proposing to do.
2	toxicologist. Julie Goodman is somebody I know. And	2	Q. Okay. Now
3	Lorenz Rhomberg I met. I don't I can't state with a	3	A. Not necessarily what was done.
4	hundred percent certainty that we have not communicated	4	Q. Okay. And they're proposing that the draft
5	or done something together in the past, but.	5	be completed by Exponent and Gradient staff, and the
6	Q. Okay. Did you ever have an in-person meeting	6	draft will then be shared with select experts who will
7	in order to work with your co-authors on this critical	7	become co-authors after they review and comment on the
8	comment article?	8	draft document. Correct?
9	A. Meeting? Meeting	9	A. That's what this says, yes.
10	Q. Face-to-face.	10	Q. And you are listed as being considered for
11	A face-to-face?	11	inclusion in this critical review. Correct?
12	Q. Yes, correct.	12	A. That is correct.
13	A. I didn't feel that was necessary in this	13	Q. And the very next paragraph, there's the
14	case.	14	preliminary cost estimates for the labor by Exponent
1 -	······		
15	Q. And you're listed as the third author on this	15	and Gradient, as well as a 4- to \$5,000 honorarium or
16		15 16	and Gradient, as well as a 4- to \$5,000 honorarium or fee which will be appropriate for each of the experts.
	Q. And you're listed as the third author on this		
16	Q. And you're listed as the third author on this article. Was there any was there any dispute as to	16	fee which will be appropriate for each of the experts.
16 17	Q. And you're listed as the third author on this article. Was there any was there any dispute as to the order of author articles article authors.	16 17	fee which will be appropriate for each of the experts. Correct?
16 17 18	Q. And you're listed as the third author on this article. Was there any was there any dispute as to the order of author articles article authors. Sorry. Dyslexic.	16 17 18	fee which will be appropriate for each of the experts. Correct? A. That's correct.
16 17 18 19	 Q. And you're listed as the third author on this article. Was there any was there any dispute as to the order of author articles article authors. Sorry. Dyslexic. A. I don't recall any dispute. And I believe, 	16 17 18 19	fee which will be appropriate for each of the experts. Correct? A. That's correct. Q. Dr. Foster, isn't it true that this critical
16 17 18 19 20	 Q. And you're listed as the third author on this article. Was there any was there any dispute as to the order of author articles article authors. Sorry. Dyslexic. A. I don't recall any dispute. And I believe, outside of James Lamb, we're all listed alphabetically. 	16 17 18 19 20	fee which will be appropriate for each of the experts. Correct? A. That's correct. Q. Dr. Foster, isn't it true that this critical review article was in part funded by the American

43 (Pages 166 to 169)

before me, I don't see that that's where the money came

Q. Isn't it true that the American Chemical

23

24

25

author. Is that correct?

A. That would be correct.

Q. Now, Dr. Foster, I'm going to hand you know a

23

24

25

	Page 170		Page 172
1	Council collaborated with CropLife America to fund this	1	to the same disease in humans?
2	article?	2	A. I can't comment on what many others state or
3	A. I don't know that to be the case. I can't	3	don't state. I'm referring in I'm citing the the
4	I can't comment one way or another. I don't have that	4	Morse study that has reviewed in the peer-reviewed
5	information.	5	literature.
6	Q. Let's go back to your expert report on	6	Q. Okay. So Morse 2003 represents that B cell
7	Page 24.	7	lymphomas in mice are not consistent with the same
8	A. (Witness complies.)	8	cells seen in humans.
9	Q. And Page 24 talks about the Wood study, which	9	A. Morse is saying that there are clear
10	is listed as Study 14 in Greim. Correct?	10	differences and in the biological development of
11	A. Yes.	11	lymphomas in rodents and humans. The immune system in
		12	mice and humans are well-known to be different.
12	Q. And this is, again, a CD-1 mouse study.		
13	Correct?	13	Q. Do you know whether Morse offers an opinion
14	A. That is what I have written here, yes.	14	on B cell lymphoma?
15	Q. And do you recall, as you sit here today,	15	A. I believe Morse does, yes.
16	whether this was 18-month or 100 or a 24-month	16	Q. And is it your testimony today that Morse
17	study?	17	states that B cell lymphoma seen in mice is not similar
18	A. This was an 80-week study.	18	to that seen in humans?
19	Q. It's close to 18 months. Correct?	19	MR. DHINDSA: Objection.
20	A. That's correct.	20	A. I go back to the what I've already
21	Q. And you have a a criticism here of	21	testified to; that Morse points out that there are
22	Dr. Portier with regard to biological development of	22	clear differences in the biological development of
23	lymphomas in rodents and humans, and you cite to the	23	lymphomas in rodents and humans, and, thus, he's
24	Morse 2003 article. Correct?	24	questioning and leading me to question whether there's
25	A. Yes.	25	a connection between lymphomas in mice and humans.
	Page 171		Page 173

And does he do this specifically for B cell lymphomas in mice? MR. DHINDSA: You're asking him that question without showing him the article? MS. ROBERTSON: He cited to it. He relied on it. It's his expert opinion. He should be able to testify what he relied on to make his expert opinion. A. And I'm relying upon the point made by Morse that there are clear differences in the development of lymphomas in rodents and humans and that the immune systems in mice and humans are are different in important ways. Q. Did Morse 2003 report on whether there were any similarities between lymphomas found in mice and those found in humans, or did he only describe the differences? A. To my knowledge, he was emphasizing the differences. Q. When you say "emphasizing", does that mean to say that he didn't discuss the similarities? A. I don't recall one way or the other. Q. Is it your testimony today that some that
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Q. Is that your position, as you sit here today; that there are clear differences in the biological development of lymphomas in rodents and humans, as described by Morse? A. It's my testimony that Morse has made this point that there are clear differences, and I cite that here. Q. Are you familiar with the data from Jackson Laboratory Mouse Tumor Biology Database? A. What do you mean by am I familiar with it? Q. Do you know it exists? A. Do I know that Jackson Laboratory has such data? Q. Correct. A. I believe I do know that. Q. And isn't it true that Morse 2003 and Morse 2010, both listed on your Materials Consulted, use information from the Jackson Laboratory Mouse Tumor Biology database in writing their articles on lymphomas? Isn't that correct? A. I can't state with certainly one way or the other.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	 Q. And does he do this specifically for B cell lymphomas in mice? MR. DHINDSA: You're asking him that question without showing him the article? MS. ROBERTSON: He cited to it. He relied on it. It's his expert opinion. Page 174 Page 176 1 testified and what my expert report states, is that in subsets? 2 2 A. Say that again, please. looking at the individual studies and then looking at 3 Q. Is it your testimony today that based on your 3 the studies in aggregate, I saw no evidence of a 4 4 compound-related effect. literature review, mouse lymphomas do not have strong 5 5 Q. And that's different of biological histo -- histologic similarities to human NHL subsets? 6 6 A. Histologic similarities is a point in time. plausibility. Is that what you're telling me? 7 7 A. Biological plausibility becomes an issue once It's a snapshot. It doesn't give me any insight into 8 8 the development of the tumor. And so although there one has seen a compound-related effect in a bioassay. 9 may be histologic similarities, it doesn't get to the 9 Now, I've looked at each of the individual 10 10 studies, and I've looked across the studies in point of whether or not they have similarities in 11 aggregate to reach the conclusion there was no 11 development between mice and humans. They have same 12 12 cellular components. They both contain ribosomes, they compound-related effect. 13 13 Q. Still didn't answer the question. both both contain nuclei. 14 14 Q. Do you have whether mice and humans have the A. Yes, it does --15 same -- have similar histologic -- have histologic 15 MR. DHINDSA: Objection. 16 16 similarities for B cell lymphoblastic cells? A. -- answer the question. It states quite 17 clearly that I did not see evidence of compound-related 17 A. Okay. I think where you're going with this 18 18 information is really outside my scope of expertise. 19 19 You're now starting to enter into the realm of a So I'm -- you're asking me on biological 20 pathologist. And the expert opinion that I was asked 20 plausibility to explain something that didn't occur. I 21 21 to provide was on the conduct of the animal studies, can't do that. 22 22 Q. Well, in this section of the Wood, you have not to histopathology. 23 23 talked about clear differences in the biological So for the purposes of looking at this 24 24 information, I can't comment as an expert on the development. You cite to Morse. And you then question 25 25 whether a connection between NHL in mice and humans can histopathology. Page 175 Page 177 1 O. Okay. But as an expert, you do comment on 1 be definitively established. 2 2 the idea that your -- well, your opinion holds that A. I see that section of my report, yes. 3 it's not biologically plausible for glyphosate to cause 3 Q. And that's what you cite to -- Morse to. To 4 NHL in humans. Isn't that correct? 4 the best of your ability, as you sit here today, you 5 5 A. My opinion is that glyphosate in the Wood believe that's what that Morse citation stands for, 6 6 study did not induce a compound-related increase. correct? 7 7 Q. What about your overall conclusion for the A. To the best of my knowledge, Morse is 8 8 entirety of your expert report? Don't you conclude pointing out that there are clear differences between 9 that it's not biologically plausible for glyphosate to 9 the development of lymphomas in rodents and humans and 10 cause NHL in humans? 10 that there are important differences in the immune 11 A. My overall conclusion from the seven rat 11 system. Only one issue that I looked at. 12 studies and the five mouse studies is that glyphosate 12 Q. All right. So for the data for the Wood 13 did not induce compound-related effects that would lead 13 study, is this another one of the reports that you 14 me to conclude that there is no evidence of glyphosate 14 relied on the Greim summary tables in forming your 15 acting as a human carcinogen. 15 expert opinion, or did you have the raw data? 16 Q. So you don't offer an opinion as to 16 A. This report was in -- cited in Greim, so it 17 biological plausibility? 17 was in the Greim data tables. And I looked at the 18 MR. DHINDSA: Objection. 18 Giknis and Clifford data for historical controls as 19 A. In my report, would you like to point to my 19 well. And there -- if I remember correctly in this

report where we're talking about that?

MR. DHINDSA: Objection.

biological plausibility.

Q. I'm just asking you if you reached a

conclusion, based on your review, as it relates to

A. Again, I'm going to come back to what I've

	Page 178		Page 180
1	study. There were historical controls from other	1	Safepharm data here, when this is just one study, not a
2	studies in the same lab at the same time frame.	2	historical control data set?
3	Q. How did you get that data?	3	A. When I looked at the historical control data
4	A. It's in the Tier 2 summary data.	4	cited in Giknis and Clifford, it indicated that it's
5	Q. What's the Tier 2 summary data?	5	unusual to have zero lymphomas in a control group.
6	A. Tier 2 summary data is the data from the	6	I then looked at this group, as well, to see
7	the lab.	7	in another study conducted at the same lab what their
8	Q. Is the Tier 2 summary data from the lab	8	rates were.
9	publicly available?	9	Q. And is that appropriate methodology to
10	A. I don't believe that's publicly available.	10	follow?
11	Q. So who gave it to you?	11	A. In trying to evaluate the overall value of
12	A. That would have been provided to me by the	12	the study and the quality of the data, yes, it wouldn't
13	attorneys.	13	be inappropriate to do that.
14	Q. Okay. And then can you point to me in your	14	Q. Why not use a historical-controlled data set,
15	Materials Consulted where you cite to Safepharm?	15	as compared to one study to compare? Isn't there a
16	A. Where I cite to Safepharm?	16	fear of skewing numbers?
17	Q. Right. You have it in parentheses here, so I	17	A. Again, I'm looking at historical controls
18	assume it's listed in your Materials Consulted?	18	I'm sorry controls that were conducted by the same
19	A. I believe it's No. 185.	19	investigators, at the same lab and the same time, and
20	Q. Okay. Wood, et al., 185?	20	by same pathologists, I assume. Same lab, so I would
21	A. I believe that's the one, yes.	21	assume the same pathologists.
22	Q. Does that citation say Safepharm in there	22	Q. And so the Safepharm data set is used in your
23	anywhere?	23	expert report as the better data set, as compared to
24	A. No, it does not.	24	the concurrent controls? Is that correct?
25	Q. Okay. So how is a reader intended to follow	25	A. No. It's it is another piece of

And so your expert report identifies a historical background incidence of 12 percent in the 18-month study from Safepharm. And that's what this	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	information that I can look at and help me in arriving at my conclusion as to whether or not this study performed as one would expect. Are the differences there compound or potentially compound-related or not. Q. Can you identify another instance in where it would be appropriate to apply a control group set from one study, as compared to a historical-controlled database study? Have you ever done this before? A. Have I ever done Q. Have you ever chose to use one historical control study, as compared to a data set of historical controls in analyzing data? A. Well, the way the way you're phrasing your question is is difficult for me, because it sounds like I do something at the exclusion of something else; that I just ignore it, and I and I don't. It's I weigh all the information before me and evaluate it. Have I had the opportunity to do this previously? I don't recall having the opportunity to do it, because it's rare that you have control data
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	to your citation here with Safepharm to Citation 185? It would be a little confusing, wouldn't it? A. It would be a little confusing, yes. MS. ROBERTSON: I'd like to mark Exhibit Foster 18-15. (Foster Deposition Exhibit 18-15 - Eric Wood Document, MONGLY07070096 through 0099 - marked for identification.) Q. I'll represent for the record this was produced by Monsanto, and it starts with Bates number MONGLY07070096 and ends with 0099. Dr. Foster, have you seen this document before? A. Yes, I believe. I believe just let me look through it, please. Yes. Q. And is this document what you refer to in your materials consulted as 185? A. I believe that's correct. Q. Okay. And so your expert report identifies a historical background incidence of 12 percent in the 18-month study from Safepharm. And that's what this document, Exhibit 18-15, is what you're citing to	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	information that I can look at and help me in arriving at my conclusion as to whether or not this study performed as one would expect. 1	exhibit, in fact, the author is Brooks. Is that	1	A. I see that, yes.
2	correct?	2	Q. And do you know whether Greim identifies what
3	A. Sorry. The second page?	3	the animals are fed?
4	Q. Wood is listed as the third author, but	4	A. Greim provided me with the data tables and
5	the the first author there is Brooks. Correct?	5	summary of the studies. I don't believe that they
6	A. I see that, yes.	6	stated the diet.
7	Q. Okay. And this article is titled CD-1 in	7	Q. Okay. So you're not aware today whether or
8	part, CD-1, in parens, (ICR) BR Strain Mice, correct?	8	not Wood was fed the same as Safepharm. Is that
9	A. It is, yes.	9	correct?
10	Q. And your expert report indicates CR strain	10	A. I cannot state whether they were or were not.
11	mice. Is that a typo in your expert report, or is	11	Q. Doctor, you testified that this Safepharm
12	there another data set we should be concerned with?	12	data came from a Tier 2 summary. Can you explain that
13	I'm looking at Document I'm looking at No. 185 on	13	a little further, for what you mean by Tier 2 summary.
14	your Materials Consulted list.	14	A. Tier 2 summary, in my mind, is a second look
15	A. It's possibly that that's a typo.	15	at the overall data; the pooling of the data.
16	Q. And Citation 185, right? That's what we're	16	Q. And who conducted the Tier 2 summary that
17	talking about? Not the study?	17	you're talking about?
18	A. Well, it's possibly a typo somewhere.	18	A. Well, I believe this is Brooks.
19	Q. Okay.	19	Q. When you received this document, was it
20	A. I can't state where the typo came from.	20	received as produced and used as an exhibit here today?
21	Q. Well, if you can't state where the typo came	21	A. I don't understand.
22	-	22	Q. Did it have any accompanying pages, or is
23	from, is there some other data you relied on here that would match this title for the CR strain of mice?	23	this the complete document you used when you referenced
		24	Safepharm in cite to 185?
24	A. No, I don't no, I do not believe so.	25	_
25	Q. So it is this document that is 185?	25	A. My recollection is that this is how I
		i e

In the context of this document, I believe this is a report that was prepared by these authors for internal use. Q. And these authors also conducted the Wood 2009 study. Do you know who sponsored the Wood 2009 study? A. I do not know that for sure at this point in
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A. That's I would agree with that. Q. Would it have made a difference in your analysis if you were aware that the animals in the Safepharm data set, which is Exhibit 18-15, were fed a different diet than those in the Wood 2009 study? A. So in 18-15, they were fed a different diet? Q. Would it make a difference of your analysis if 18-15 animals were fed a different diet than those in the Wood 2009 study that you compare? A. It would be something that I would want to look at and I would want to know about. I did not note that as a difference in my analysis. Q. Sitting here today, do you know whether the Wood animals were fed the same as the Safepharm animals? A. I cannot state one way or another without that information. However, again, coming back to the comment that I made, that this was work that was conducted by the same group, the same lab, at the same	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	received the information. Q. And on the second page of the exhibit, you do see that it says "internal publication", correct, underneath the title and the author name? A. I see that, yes. Q. Okay. So what do you take "internal publication" to mean? MR. DHINDSA: Objection. Q. In this context with this document. MR. DHINDSA: Objection. A. In the context of this document, I believe this is a report that was prepared by these authors for internal use. Q. And these authors also conducted the Wood 2009 study? A. I do not know that for sure at this point in time. MS. ROBERTSON: I'd go ahead and enter
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	A. That's I would agree with that. Q. Would it have made a difference in your analysis if you were aware that the animals in the Safepharm data set, which is Exhibit 18-15, were fed a different diet than those in the Wood 2009 study? A. 	Page 186		Page 188
1	without the supplementary material.	1	A. I don't know who Nufarm is, so they either
2	BY MS. ROBERTSON:	2	paid for it or they are the ones that conducted it
3	Q. Dr. Foster, this is the review article that	3	themselves. I don't know I'm not in the industry,
4	we've been discussing today, correct?	4	so I don't know if this is a contract lab or or what
5	A. (No response.)	5	they are.
6	Q. Is this what you appreciate to be the review	6	Q. Okay. Well, we can look at the Table of
7	article that you	7	Contents here in Greim, and we see that Greim
8	A. This is yes, that this is the what I	8	identifies Monsanto, Cheminova, Feinchemie Schwebda
9	appreciate to be the review article that I've used the	9	MS. ROBERTSON: I'm sorry, Court Reporter.
10	summary tables from.	10	A Excel, Arysta Life Sciences, Syngenta,
11	Q. Okay. And Greim doesn't use the study	11	Nufarm.
12	authors. They number the studies and then put in	12	A. Yes.
13	parens the sponsor of those studies. Correct? On	13	Q. And these appear to be industry-sponsored
14	Table 1, first page.	14	studies and that's listed here, not the lab.
15	A. Yes, they do.	15	Correct?
16	Q. Okay. And so if we look for your expert	16	A. Sure. I can go with that.
17	report has Wood 2009b. We see that that's Study No. 8	17	Q. Okay. And so the Safepharm data that you
18	sponsored by Nufarm. Correct?	18	used that was for internal use only must be a Nufarm
19	A. Sorry? Say that again.	19	document. Correct?
20	Q. So your expert report identifies Wood 2009b.	20	A. Sorry. You're asking me in this Safepharm
21	A. Yes.	21	document here is a Nufarm document?
22	Q. And Greim identifies Nufarm 2009b as Study 8.	22	Q. Correct.
23	Your report says 14. I just want to make sure that we	23	A. I would say that's possible, yes.
24	can be accurate here on the record as to whether this	24	Q. Okay. And if it's for internal publication
25	discussion here in your report is a or b.	25	only, how did you come to receive Nufarm unpublished

And as a consequence, I'm not sure that it's appropriate to use in this context. I think it's an interesting research proposal. Q. Has science developed over time? A. Science continues to develop over time. Q. And do methodologies change over time? A. Methodologies always are changing, yes.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Q. And then you offer a counter to that, saying that you're not aware of any data that demonstrates a 26-month study would detect tumors at any different rate. Correct? A. No, that's not what I said. I said that I'm not aware sorry. I'm not "However, no evidence is offered that I am and I am not aware of any evidence demonstrating that a 26-month study would detect interstitial tumors at any different rate than a 24-month study." Q. Okay. Well, let's look at what I believe is responsive to your criticism here of Dr. Portier, which would be Page 34 of Dr. Portier's report. A. Okay. Page 34? Q. Um-hum. I am trying to understand, Dr. Foster, if this matches your criticism to Dr. Portier that you identify on Page 15 of your expert
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	certainly took into account comparing CD-1 mouse, 24 month with other CD-1 mouse, 24 month, in part. A. In part, yes. Q. And you identify on Page 11 that Dr. Portier employs a novel statistical approach, as you already stated, that is not generally accepted by regulatory toxicology. Isn't that correct? A. What I'm stating there is that in my knowledge, that it's an interesting proposal that has not stood the test of time. It hasn't been evaluated in the literature. And as a consequence, I'm not sure that it's appropriate to use in this context. I think it's an interesting research proposal. Q. Has science developed over time? A. Science continues to develop over time. Q. And do methodologies change over time? A. Methodologies always are changing, yes. Q. Is it your expert opinion that scientific	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Q. And then you offer a counter to that, saying that you're not aware of any data that demonstrates a 26-month study would detect tumors at any different rate. Correct? A. No, that's not what I said. I said that I'm not aware sorry. I'm not "However, no evidence is offered that I am and I am not aware of any evidence demonstrating that a 26-month study would detect interstitial tumors at any different rate than a 24-month study." Q. Okay. Well, let's look at what I believe is responsive to your criticism here of Dr. Portier, which would be Page 34 of Dr. Portier's report. A. Okay. Page 34? Q. Um-hum. I am trying to understand, Dr. Foster, if this matches your criticism to Dr. Portier that you identify on Page 15 of your expert report.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	certainly took into account comparing CD-1 mouse, 24 month with other CD-1 mouse, 24 month, in part. A. In part, yes. Q. And you identify on Page 11 that Dr. Portier employs a novel statistical approach, as you already stated, that is not generally accepted by regulatory toxicology. Isn't that correct? A. 	Page 194		Page 196
1	Q. Okay. Understood.	1	go into whether there is a dose response.
2	A to get my context here. Okay.	2	A. It's something that goes into my overall
3	Q. And is this what you're is this paragraph	3	assessment of the study and whether or not the
4	what you're referring to on Page 15 of your expert	4	compound there are compound-related effects or not.
5	report, when you say, "Dr. Portier speculates"?	5	Q. Okay. And on Page 14, you give us, again,
6	A. Yes, I believe that's what I'm referring to.	6	some percentages for historical control data in the
7	Q. And as you sit here today, do you still	7	second paragraph. I'll give you a moment to locate it.
8	believe that this portion from Dr. Portier's report is	8	A. Yes.
9	speculation?	9	Q. Why not use the concurrent controls?
10	MR. DHINDSA: Objection. I don't know which	10	A. In this particular study, if I remember
11	portion you're referring to.	11	correctly, there were a number of things that were at
12	A. What he's saying is that thyroid C cell	12	issue.
13	carcinomas could be a result of the longer exposure	13	In particular, the survival rate in the
14	period, even though the dose is substantially lower in	14	control group was lower than in the higher dose group.
15	the study compared to the other two. So he's saying	15	And for some reason in this study, the higher dose
16	"could". He's qualifying it as well. So it's it's	16	group survived longer and did better.
17	speculative.	17	Q. And that's why you used historic controls
18	Q. I'm just asking if you're if as you sit	18	instead of the concurrent controls?
19	here today, you still agree that Dr. Portier speculated	19	A. It is one of the things that I considered,
20	there.	20	yes.
21	A. I believe he speculated there, yes.	21	Q. And where did you find information related to
22	Q. It's important to consider study length and	22	the survival rates of the animals? It's uncited in
23	the incidence of any adverse effect, isn't it,	23	your report here.
24	Dr. Foster?	24	A. Again, this is one in which I believe,
25	A. It's important to evaluate the entire study,	25	because I didn't have the original data, I would have
	Page 195		Page 197
-1	Page 195	1	Page 197
1	not just the study length.	1	relied upon the Greim study, summary tables, and the
2	not just the study length. Q. You're right. In part, study length is	2	relied upon the Greim study, summary tables, and the write-up in the in the Greim paper, if I remember
2	not just the study length. Q. You're right. In part, study length is important to consider when evaluating the entirety of a	2 3	relied upon the Greim study, summary tables, and the write-up in the in the Greim paper, if I remember correctly.
2 3 4	not just the study length. Q. You're right. In part, study length is important to consider when evaluating the entirety of a study. Correct?	2 3 4	relied upon the Greim study, summary tables, and the write-up in the in the Greim paper, if I remember correctly. Q. So maybe we should have cited to Greim there,
2 3 4 5	not just the study length. Q. You're right. In part, study length is important to consider when evaluating the entirety of a study. Correct? A. It would be one thing that I would look at,	2 3 4 5	relied upon the Greim study, summary tables, and the write-up in the in the Greim paper, if I remember correctly. Q. So maybe we should have cited to Greim there, correct?
2 3 4 5 6	not just the study length. Q. You're right. In part, study length is important to consider when evaluating the entirety of a study. Correct? A. Everything that I consulted is on my Materials Consulted list. And in my review of this study, if I remember correctly, I looked at the Greim summary tables and the text. Q. Which historical controls did you look at for

	Page 198		Page 200
1	can figure it out here.	1	one, and six. Correct?
2	If I remember correctly in this particular	2	A. Correct.
3	case, I may be referring to the Greim paper.	3	Q. And because of the 16 in the high dose group,
4	Q. The Greim paper is a review summary, correct,	4	that's why you include as the last sentence in the
5	not a historical control database.	5	second paragraph, "The neoplastic changes in the testis
6	A. No, it's not a a historical control	6	of the high dose group were evaluated to better
7	database.	7	elucidate their importance," is that your analysis you
8	MR. DHINDSA: Is this an appropriate time for	8	were talking about or Greim's?
9	a break?	9	A. No, this is my evaluation.
10	MS. ROBERTSON: The question is pending.	10	Q. Okay. And so here you note that it's
11	He's looking.	11	important to look at the high dose group survival rate,
12	MR. DHINDSA: Okay.	12	compared to the controlled group survival rate, because
13	A. Okay. This is Study 1 under the Greim, so	13	these neoplasms may develop spontaneously. Correct?
14	this would have been material that I had from it's a	14	A. I think it's well-documented that neoplastic
15	Monsanto-funded study, so I believe I actually had the	15	changes can occur spontaneously. And in this
16	original data to look at.	16	particular study, we had a much higher survival rate in
17	Q. Right. But we're talking about historical	17	the the higher dose group than in the control group.
18	controls, and Monsanto doesn't have	18	Q. And as a result, you conclude that this can't
19	historical-controlled data sets, do they?	19	be the six interstitial testicular tumors are not
20	A. I don't know what Monsanto does or doesn't	20	compound-related tumors. Correct?
21	have.	21	A. Not solely on that basis.
22	Q. Well, in this instance, you said that you had	22	Q. Okay. What's the other basis?
23	the original Monsanto study, but we're talking about	23	A. So I'm looking at this. I see the
24	historical controls. So I just want to make sure that	24	pathology pathologist in their evaluation notes that
25	we're not we're not crossing hairs here.	25	there was absence of compound-related hyperplasia.
23	we to not we're not crossing mans here.		ancre was assence of compound related hyperplasta.
	Page 199		Page 201
1	Page 199 A. No, I get that. So as I read the Greim	1	
1 2		1 2	Page 201 Hyperplastic changes would be expected to be present. In if these were compound-related changes. I looked
	A. No, I get that. So as I read the Greim		Hyperplastic changes would be expected to be present.
2	A. No, I get that. So as I read the Greim paper, investigators noted that a terminal sacrifice in	2	Hyperplastic changes would be expected to be present. In if these were compound-related changes. I looked
2	A. No, I get that. 	Page 202		Page 204
1	males, that equivalent the equivalent of that is 34,	1	per kilograms per day. So you're going to take a study
2	roughly, mg's per kg per day.	2	from 1981 in males, that from a high dose group
3	Q. And 31, almost 31 and a half for the males.	3	observation, and compare that to a study that has a low
4	A. That I'm sorry. I thought that 31.5	4	dose group administration, that has a similar to same
5	let me be clear is for the males. Sorry. 34 for	5	milligram per kilogram per day? Am I understanding
6	the females.	6	correct?
7	Q. And we can agree that that's a relatively, if	7	MR. DHINDSA: Objection.
8	not greatly, low dose for the high dose group.	8	A. What I stated was that there was no
9	Correct?	9	replication of the testicular tumors in other studies
10	A. That would be a low dose, yes.	10	that used similars doses through to much higher doses.
11	Q. And it was such a low dose did that come	11	You asked me was there another study that used any dose
12	into your consideration with result to six tumors seen	12	that was similar.
13	in the high dose group?	13	Q. Um-hum.
14	A. What do you mean, did it come into my	14	A. I gave you a study in which they used one of
15	consideration?	15	their doses that was similar and consistent with what I
16	Q. With six tumors in the high dose group,	16	had testified.
17	higher than any other group, doesn't this suggest that	17	Q. And that's the Atkinson study.
18	the tumors are compound-related, as compared to the	18	A. I believe that was the Atkinson study, yes.
19	controls, because the doses are so low?	19	Q. And which dose group are you referring to
20	A. No. I mean, it in your control group, you	20	A. Sorry. Sorry. Let me
21	don't have them surviving. And we know that the longer	21	Q. Sorry.
22	the animal lives, that spontaneous tumors occur, and	22	A. Let's just make sure we're talking the right
23	that the longer the animals live, the greater the	23	one here. Atkinson, et al., 1993. This is Greim, et
24	chance you're going to see tumors.	24	al., Study No. 3, Page 19 of my report.
25	Q. And so	25	Q. And which dose group are you referring to
	- 000		
	Page 203		Page 205
1	A. Spontaneously occurring.	1	that's similar
1 2	A. Spontaneously occurring.Q. Sorry. Are you finished? I don't want to	2	that's similar A. So they have one dose group that's using 11
2	A. Spontaneously occurring.Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry.	2 3	that's similar A. So they have one dose group that's using 11 mg's per kilogram.
2 3 4	A. Spontaneously occurring.Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry.A. You can cut me off now.	2 3 4	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct?
2 3 4 5	 A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree 	2 3 4 5	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group.
2 3 4 5 6	 A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood 	2 3 4 5 6	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the
2 3 4 5 6 7	 A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? 	2 3 4 5 6 7	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for
2 3 4 5 6 7 8	 A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even 	2 3 4 5 6 7 8	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors
2 3 4 5 6 7 8	 A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the 	2 3 4 5 6 7 8	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct.
2 3 4 5 6 7 8 9	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias,	2 3 4 5 6 7 8 9	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors.
2 3 4 5 6 7 8 9 10	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication	2 3 4 5 6 7 8 9 10	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh,
2 3 4 5 6 7 8 9 10 11	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted	2 3 4 5 6 7 8 9 10 11	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's.
2 3 4 5 6 7 8 9 10 11 12 13	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses.	2 3 4 5 6 7 8 9 10 11 12 13	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same
2 3 4 5 6 7 8 9 10 11 12 13 14	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose	2 3 4 5 6 7 8 9 10 11 12 13 14	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592.
2 3 4 5 6 7 8 9 10 11 12 13 14 15	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study?	2 3 4 5 6 7 8 9 10 11 12 13 14 15	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram,	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.)
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark. Q. For the high dose group?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So they're overlapping that dose range.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark. Q. For the high dose group? A. Sorry. You asked me if they used any any	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So they're overlapping that dose range. Q. Now, Dr. Foster, did the Atkinson study
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark. Q. For the high dose group? A. Sorry. You asked me if they used any any dose that was in that range, not the high dose. Any	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So they're overlapping that dose range. Q. Now, Dr. Foster, did the Atkinson study authors report on all 50 animals in the low dose group
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark. Q. For the high dose group? A. Sorry. You asked me if they used any any dose that was in that range, not the high dose. Any dose.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So they're overlapping that dose range. Q. Now, Dr. Foster, did the Atkinson study authors report on all 50 animals in the low dose group when they did their final analysis, as it relates to
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark. Q. For the high dose group? A. Sorry. You asked me if they used any any dose that was in that range, not the high dose. Any dose. Q. Well, would you compare a high dose group	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So they're overlapping that dose range. Q. Now, Dr. Foster, did the Atkinson study authors report on all 50 animals in the low dose group when they did their final analysis, as it relates to testicular tumors?
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark. Q. For the high dose group? A. Sorry. You asked me if they used any any dose that was in that range, not the high dose group result to a low dose group result?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So they're overlapping that dose range. Q. Now, Dr. Foster, did the Atkinson study authors report on all 50 animals in the low dose group when they did their final analysis, as it relates to testicular tumors? A. The Atkinson study is the study in which they
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	A. Spontaneously occurring. Q. Sorry. Are you finished? I don't want to cut you off. I'm sorry. A. You can cut me off now. Q. Okay. Sorry. So so, yeah, we can agree that the longer the animal lives, the more likelihood there is for a spontaneous tumor to occur. Correct? A. Correct. So in this particular study, even though the doses are lower, I've got a problem with the study on the basis that the low dose, survival bias, the histopathology report, and the lack of replication of the diet of the outcome in other well-conducted studies that use this dose and much higher doses. Q. Can you identify a study that uses a dose that's even within 500 ppm of the Lankas study? A. Atkinson used a dose of 11 mg's per kilogram, so that would be in the same ballpark. Q. For the high dose group? A. Sorry. You asked me if they used any any dose that was in that range, not the high dose. Any dose. Q. Well, would you compare a high dose group	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	that's similar A. So they have one dose group that's using 11 mg's per kilogram. Q. And that's the low dose group, correct? A. That's the low dose in that group. Q. And you didn't see a replication with the with tumor incidents in the Atkinson low dose group for these testis interstitial cell tumors A. That's correct. Q or testicular tumors. A. That's correct. And if you look at Suresh, Greim study, they use the males a dose of 6.3 mg's. So it's a little bit lower, covering the same range, going 6.3 for 59.4 to 592. (Witness asked for clarification by the reporter.) A. 59.4 to 595.5 mg's per kilogram per day. So they're overlapping that dose range. Q. Now, Dr. Foster, did the Atkinson study authors report on all 50 animals in the low dose group when they did their final analysis, as it relates to testicular tumors?

Page 206 Page 208 1 Q. So, Dr. Foster, how did you compare the 1 did not find them. So they were not reported. 2 Lankas study high dose group with the Atkinson study 2 Q. And is your testimony today that Suresh 3 low dose group for testicular tumors? 3 conducted a different analysis than Atkinson 1993? Is 4 A. If you're seeing something that's 4 that my -- is that correct? 5 5 A. What do you mean by a "different analysis"? compound-related, you would expect to see a dose 6 6 response with higher -- as you got higher. They did Q. Well, Atkinson did not report on tumors --7 7 not see that in that study. all the tumor incidences seen, unless it 8 8 In the high dose group, there was no report showed positive -- unless there was a positive finding 9 of a testicular tumor. 9 or compound-related finding between the control group 10 10 Then you look at the Suresh, another study and the high dose group. Correct? 11 11 covering the same dose range. They don't see it A. They -- the way I understand the Atkinson 12 study to have been conducted is they looked at the 12 either. 13 13 Q. Okay. But my question wasn't that. My control versus the high dose group and -- to determine 14 question was whether Atkinson looked at the 50 animals 14 whether or not there were tumors being seen there that 15 15 in the low dose group receiving the like -- the similar were different than the control, to decide whether or 16 16 dose that Lankas high dose group received. Did the not they were going to invest the money to go back and 17 17 study authors look for testicular tumors? look at the intermediate doses. 18 18 A. Not in the low dose group, because they Q. Okay. 19 19 didn't see them in the high dose. A. That would be my interpretation of their 20 Q. So how did you compare the Atkinson low dose 20 thinking in that study. 21 21 Q. And is that the same or different from the group to the Lankas study? 22 A. I didn't say I did. The way I -- I stated my 22 study analysis of Suresh? 23 23 testimony was that in studies that looked at similar A. That is different -- different than what 24 24 doses through to higher, they did not see a replication Suresh did. 25 in testicular tumors. 25 Q. So when you conclude that the interstitial Page 207 Page 209 1 Atkinson -- you asked me which studies 1 testicular tumors have not been replicated, that's by 2 2 covered similar doses. Atkinson is one that did. They looking at the Suresh report. Is that correct? 3 only looked at the high dose versus the control. 3 A. Looking across all the studies, I see no 4 If one is seeing a compound-related effect, 4 replication of testicular tumors in any study. 5 5 one would expect to see that if there were Q. Now, your first full paragraph on Page 15, 6 6 compound-related effects, as you increase dose, you still talking about the Lankas study, observes that the 7 7 would see an increase in the number of tumors. That statistical significant disappears once thyroid C cell 8 wasn't seen in control versus the high dose group. 8 adenomas and carcinomas are combined. Do you see where 9 Then you go on to Suresh, that did look at 9 10 the animals from all the dose groups, and they don't 10 A. I'm reading that paragraph now. Yes. 11 see an increase in testicular tumors. 11 Q. Okay. And so once you combine the carcinoma 12 12

Q. Is it --

Q. Do you know what animals McConnell 1986 used when they published this article that you cite?

A. I cannot recall at this point in time which animals they were looking at.

Q. Would it make a difference to combining adenomas or carcinomas as to what animals McConnell is talking about?

A. It depends on the context in which this is being written. If he's talking as a pathologist and stating that this is the appropriate thing to do in evaluating rodent carcinogenicity assays, then, no, I

53 (Pages 206 to 209)

	Page 210		Page 212
1	don't think it does.	1	pursuant to OECD guidelines should not be part of the
2	Q. Let's take a glance at Stout and Ruecker 1990	2	final statistical analysis from a main study?
3	test on Page 16 and 17 of your expert report.	3	A. They would be normally would be omitted.
4	A. Yes.	4	Q. Now, in this same discussion, you again note
5	Q. Stout and Ruecker is a Monsanto study,	5	historical controls and a range of zero to 17 percent
6	correct?	6	for these pancreatic islet carcinomas. Correct?
7	A. This was a study conducted by Monsanto in	7	A. I don't see where you are.
8	Sprague-Dawley rats.	8	Q. The third paragraph. I apologize. Please
9	Q. And is this one of the studies that you	9	take your time.
10	received the full data set for?	10	And here in Footnote 2, you give you offer
11	A. Yes.	11	your methodology behind using the range of historical
12	Q. And here you discuss the results of the Stout	12	controls, as as opposed to the mean. Correct?
13	and Ruecker using 60 animals in each group. Is that	13	A. This is where I'm talking about that issue,
14	correct?	14	yes.
15	A. Those are the numbers that they had, yes.	15	Q. Okay. And sitting here today, you believe
16	Q. Okay. If I could direct you to the Greim	16	it's most appropriate to use the range of historical
17	paper, Study 2, that you have in front of you.	17	controls as compared to the mean? Is that correct?
18	A. Sure. Somewhere.	18	A. I do.
19	Q. Exhibit 18-16. Isn't it true, Dr. Foster,	19	Q. And for support of this, you cite to Baldrick
20	that Greim uses 50 animals when discussing the Stout	20	2005 and Baldrick 2007.
21	and Ruecker study?	21	A. That's correct.
22	A. This is Table No. 5? Where are we looking?	22	(Discussion held off the record.)
23	Q. I'm looking at	23	Q. Dr. Foster, we we'll mark both Baldrick
24	A. I'm sorry. In the text?	24	2005 and Baldrick 2007 Baldrick 2005 will be Foster
25	Q. Yeah, 191 of the Greim article, Study 2,	25	Exhibit 18-17.

1	Monsanto 1990.	1	(Foster Deposition Exhibit 18-17 - Baldrick
2	Monsanto 1990. A. He's reporting 50 animals per dose group.	2	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.)
2	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where	2	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18.
2 3 4	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60?	2 3 4	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick
2 3 4 5	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I	2 3 4 5	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.)
2 3 4 5 6	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study	2 3 4 5 6	 (Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18.
2 3 4 5 6 7	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go	2 3 4 5 6 7	 (Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.)
2 3 4 5 6 7 8	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion.	2 3 4 5 6 7 8	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to.
2 3 4 5 6 7 8	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study	2 3 4 5 6 7 8	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles?
2 3 4 5 6 7 8 9	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking	2 3 4 5 6 7 8 9	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please.
2 3 4 5 6 7 8 9 10	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from	2 3 4 5 6 7 8 9 10	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes.
2 3 4 5 6 7 8 9 10 11 12	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from which ten were used for intermin sacrifice.	2 3 4 5 6 7 8 9 10 11	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes. Q. Okay. And we see that 18-17 deals with
2 3 4 5 6 7 8 9 10 11 12	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from which ten were used for intermin sacrifice. Q. Okay. In the second paragraph of your expert	2 3 4 5 6 7 8 9 10 11 12 13	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes. Q. Okay. And we see that 18-17 deals with Sprague-Dawley rats, and 18-18 is CD-1 mice. Right?
2 3 4 5 6 7 8 9 10 11 12 13 14	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from which ten were used for intermin sacrifice. Q. Okay. In the second paragraph of your expert report on Page 16, under the Stout and Ruecker study,	2 3 4 5 6 7 8 9 10 11 12 13 14	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes. Q. Okay. And we see that 18-17 deals with Sprague-Dawley rats, and 18-18 is CD-1 mice. Right? A. Correct.
2 3 4 5 6 7 8 9 10 11 12 13 14 15	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from which ten were used for intermin sacrifice. Q. Okay. In the second paragraph of your expert report on Page 16, under the Stout and Ruecker study, when you provide the numbers for pancreatic islet cell	2 3 4 5 6 7 8 9 10 11 12 13 14 15	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes. Q. Okay. And we see that 18-17 deals with Sprague-Dawley rats, and 18-18 is CD-1 mice. Right? A. Correct. Q. Now, this the subject of this article is
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from which ten were used for intermin sacrifice. Q. Okay. In the second paragraph of your expert report on Page 16, under the Stout and Ruecker study, when you provide the numbers for pancreatic islet cell adenomas, you do use the denominator using presumably	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes. Q. Okay. And we see that 18-17 deals with Sprague-Dawley rats, and 18-18 is CD-1 mice. Right? A. Correct. Q. Now, this the subject of this article is for comparison of tumor data with dual control groups.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from which ten were used for intermin sacrifice. Q. Okay. In the second paragraph of your expert report on Page 16, under the Stout and Ruecker study, when you provide the numbers for pancreatic islet cell adenomas, you do use the denominator using presumably the number 60. Correct?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes. Q. Okay. And we see that 18-17 deals with Sprague-Dawley rats, and 18-18 is CD-1 mice. Right? A. Correct. Q. Now, this the subject of this article is for comparison of tumor data with dual control groups. Correct?
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm just reading through my report now. If I remember correctly, they used 10 animals in this study as an interim sacrifice, leaving the 50 animals to go through to the study conclusion. So I believe Greim is talking about the study conclusion. I think at the start here, I'm talking about the 60 that entered per each dose group, from which ten were used for intermin sacrifice. Q. Okay. In the second paragraph of your expert report on Page 16, under the Stout and Ruecker study, when you provide the numbers for pancreatic islet cell adenomas, you do use the denominator using presumably the number 60. Correct? A. I have here, yes.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	(Foster Deposition Exhibit 18-17 - Baldrick 2005 Study - marked for identification.) Q. And Baldrick 2007 will be Foster 18-18. (Foster Deposition Exhibit 18-18 - Baldrick 2007 Study - marked for identification.) Q. Here is 18-18. (Discussion held off the record.) Q. And these are the articles you refer to. Correct, Dr. Foster? I pulled the correct articles? I'd like your confirmation, please. A. I believe these are the articles, yes. Q. Okay. And we see that 18-17 deals with Sprague-Dawley rats, and 18-18 is CD-1 mice. Right? A. Correct. Q. Now, this the subject of this article is for comparison of tumor data with dual control groups. Correct? A. Yes.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Monsanto 1990. A. He's reporting 50 animals per dose group. Q. As you sit here today, do you recall where you got the number 60? A. I'm not talking about the mean, the standard deviation. Q. You're talking about the interquartile range? A. I'm talking simply about the range, not the interquartile range. The range, period. Q. Okay. So historical control considerations as outlined by OECD don't talk about using the range, do they? A. They don't exclude using it, no.

Page 220 Page 218 1 A. Almost 30 years' experience working in the 1 A. In this particular case, that's in reference 2 field. And, again, it wasn't the only thing that I 2 just to the males. 3 relied upon. 3 Sorry. Are we --4 4 Q. What else did you rely upon? Q. I was trying to figure out why you choose to 5 5 A. I looked at whether or not these were use historical controls as opposed to concurrent 6 6 compound-related effects based on the conduct of the controls here. 7 7 study. A. Okay. I'm -- again, I'm looking at the 8 So my methodology throughout all was 8 overall conduct of the study. I'm seeing differences 9 assessing survival of the animals. Was there systemic 9 in survival rate. And then I go on and I also note 10 10 toxicity -- signs of systemic toxicity seen. Were that the USEPA requested that additional data on 11 11 there histopathological evidence of tumor progression. historical controls be looked at as well. 12 12 So it was not just me. USEPA is asking that Things like that. 13 13 Q. Okay, yeah, I didn't ask a proper question. they look at historical controls as well. 14 14 I thought you were saying that you relied on And this is in the context of the thyroid C 15 15 other things beyond your experience to use the range of cell adenomas and hyperplasia. The hepatocellular --(Witness interrupted by the reporter.) 16 historical controls, and I was asking what else you 16 17 17 relied on that supports your use of ranges. A. Thyroid C cell adenomas, carcinomas, and 18 18 A. Again, this is common throughout toxicology. hyperplasia; hepatocellular adenomas, carcinomas, and 19 Q. Do you find the range to be more relevant 19 hyperplasia; and, three, the keratoacanthomas. 20 than the mean when applying historical control data to 20 Q. Okay. But the EPA didn't ask for historical 21 21 rare tumors? control data related to the pancreatic islet cell 22 MR. DHINDSA: Objection. 22 adenomas. Isn't that correct? 23 23 A. Again, I don't rely upon it to the exclusion A. Not in this case, no. 24 24 of other factors. It's something that I look at. Q. But you consulted historical control data 25 Q. So you can't answer that question because you 25 Page 219 Page 221 1 don't isolate that particular analysis when deciding 1 A. In order to conduct a fulsome analysis of the 2 2 whether to use historical controls. Is that correct? study, yes, I did look at historical controls. 3 MR. DHINDSA: Objection. 3 Q. Was this use of historical controls based on 4 A. I look at the data, I look at what's -- the 4 using the study results from the 60 total animals, as 5 5 controls are doing. If there's reason for me to look reported in your report, including the interim 6 6 at historical controls, then I will do so. But I'd sacrificed? 7 7 look at it in the context of the overall study. A. I believe that's correct. 8 8 Q. And what was your purpose in using historical Q. Let's take a look at the Brammer study, which 9 controls in the Stout and Ruecker analysis? 9 is the very next page in your expert report on Page 17. 10 A. In this particular study, we see differences 10 11 in survival with higher survival in the high dose 11 Q. And, here again, we're -- we have a 12 discussion on historical control data, this time using 12 groups. So 29, 38, 34, 34. 13 13 Giknis and Clifford 2011. Correct? In males, you're look -- sorry. That was 14 males. 14 A. Correct. 15 Now, in this study, I also note that there 15 Q. And in your analysis, what did you -- what led you to use the Giknis and Clifford 2011 historical 16 was a number of issues going on as well. There's no 16 17 change in food consumption, but there's also a change 17 control data set? 18 in increased liver weight found in the males. Seeing a 18 A. In my analysis of the data, I believe that I 19 19 sign of increased liver weight tells me that I've got looked at Dr. Portier's report and noted that he used 20 liver induction, and that is potentially confounding 20 it, so I went and looked at it as well. 21 21 effects at higher dose. Q. And did you find it sufficient for the 22 Q. But, Dr. Foster, you state on Page 16 that 22 purposes of this study? 23 the data taken together suggests that the dose 23 A. Did I find what sufficient for the purposes

	Page 226		Page 228
1	mentioned earlier today, I had already left my office	1	report?
2	and was not able to locate it in my home office, and so	2	A. Part of the reason. And then I also cited
3	I asked one of my colleagues if they could look for it	3	or I didn't cite in the text, but I also have Cohen in
4	for me.	4	my Materials Considered list, which also looked at the
5	Q. And that's how you located the document	5	same issue.
6	today.	6	Q. And in the Elwell article, can you please
7	A. They were able to provide me with the	7	point me to where Elwell is stating that in CD-1 mice
8	photocopy, yes.	8	hemangiosarcomas are common neoplasms?
9	Q. Not had time to study the document or review	9	A. So in the introduction, they talk about it.
10	the document, given the density, but you have reviewed	10	And then when you go to Page 5, they are talking about
11	this document in connection with forming your expert	11	Figures 2 22 to 23, where they talk about it.
12	opinion. Correct?	12	Q. Okay. And in the introduction, can you
13	A. I have reviewed this document, yes.	13	please direct me because I must be missing it
14	Q. I'd like to direct your attention to Page 5,	14	where they are talking about CD-1 mice.
15	which is shown in the upper right-hand corner.	15	A. They are talking about mice in general.
16	A. The number 5 is, yes.	16	Q. Isn't it true that tumor incidences in mice
17	Q. Yes. And, also, on that page in the	17	occurred differently among different strains?
18	right-hand column we see hemangiosarcomas. Correct?	18	MR. DHINDSA: Objection. Vague.
19	A. Correct.	19	A. Yes. Do you have a are you are you
20	Q. Is it not it's true, isn't it, that this	20	suggesting that CD-1 mice might be different than other
21	is the only place that mentions hemangiosarcomas with	21	mice?
22	discussion?	22	Q. Well, isn't it true that CD-1 mice are
23	A. What do you mean, "with discussion"?	23	different than other mice?
24	Q. Let me ask it another way, Dr. Foster.	24	A. I'm not sure that the the information
25	Does Page 5, the paragraph on	25	that's providing [sic] in this report is suggesting
	Page 227		Page 229
1	Page 227 hemangiosarcomas, support your statement in your expert	1

2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	hemangiosarcomas, support your statement in your expert report wherein you cite to Elwell for the premise that hemangiosarcomas are common in CD-1 mice? A. This is one area in the report in which they talk about it. Q. And is this the area that supports your statement on Page 22 that tumors are rare in human, but they are common neoplasms of mice, citing to Elwell 2004? A. This is one area where I saw it. And then the other, I note in the introduction they also point out. The given the relatively common occurrence of spontaneous background lesions and the potential for treatment of disk lesions in the cardiovascular system (Witness asked for clarification by the reporter.) A. Sorry. So in the introduction, they point out, "Proliferative and non-proliferative lesions of	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	that it's different for CD-1 mice. They are talking about mice in general. These people, I believe, are pathologists, so I'm going to rely upon them. Q. Okay. And in the section from this article on Page 2, first column, Amyloidosis, we get a specific reference to B6C3F1 strains and CD-1 strains. Correct? A. Yes. Q. But we don't get any specific such reference in the hemangiosarcoma section, correct? A. To a specific strain being different? No. Q. Okay. Doctor, if I could direct your attention to Page 18 of your expert report. A. (Witness complies.) Q. We talked a lot today about comparing studies, quality of studies, considering studies. Correct? A. Yes. Q. And as part of your consideration for the studies and the material, you note the publication year
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	hemangiosarcomas, support your statement in your expert report wherein you cite to Elwell for the premise that hemangiosarcomas are common in CD-1 mice? A. A. Yes. Q. And as part of your consideration for the studies and the material, you note the publication year as relevant to study publications, for example, in the context of applying historic controls. Correct? A. I've I'm sorry. Are you referring to when

	Page 230		Page 232
1	matches or is within the similar time frame as the	1	(Discussion held off the record.)
2	study you're discussing. Correct?	2	Q. Yeah, Environmental Health Perspectives.
3	A. I'm trying to do that, yes.	3	A. I
4	Q. Okay.	4	Q. Are you familiar with that journal?
5	A. And, also, just trying to make it possible so	5	A. I I am familiar with that journal. I've
6	that we can refer to the right study. This is a a	6	published it in the past, and I have reviewed for them.
7	voluminous amount of of literature to look at. And	7	Q. And you find it to be a reputable journal?
8	as we've both noted, looking at the individual studies	8	A. I don't know what you mean by "reputable".
9	and looking at Greim, there is some difficulty in	9	Q. Well-respected?
10	matching them up, so.	10	A. It is one of many scientific journals that we
11	Q. Right. And just so the record's clear, we're	11	publish in.
12	talking this time about Wood and the Wistar rat study.	12	Q. Yeah. Standing alone. But it's not, for
13	Not the mouse. We previously talked about the mouse.	13	example, a journal that's supported by lobbyists or
14	A. This is excuse me Greim Study 8, and	14	
	it's in the Wistar rats, that's correct.		anything like that. It's a scientific journal.
15	,	15	A. Environmental Health Perspectives is a
16	Q. Okay. And you have a reference here related	16	journal that is published by the Environmental
17	to mammary gland tumors and that they are common in	17	Health sorry Environmental Protection Agency. I
18	rats with a prevalence of 57 percent in female	18	believe they own and operate it.
19	Sprague-Dawley rats that are allowed to live out their	19	Q. Okay. By chance, have you read the articles
20	naturally lifespan. Correct?	20	by Lauren Zeise, Z-E-I-S-E, et al., on dose response
21	A. Correct.	21	relationships for carcinogens?
22	Q. Are animals were animals in the Wood 2009	22	A. It's not ringing a bell for me at the moment.
23	rat study allowed to live out their natural lifespan?	23	Q. Dr. Portier I'm sorry. My apologies.
24	A. No. They were this was a rat study, so it	24	Dr. Foster, isn't it true that animal
25	was a two-year carcinogenicity study.	25	bioassays can be looked at using non-linearity and
	Page 231		Page 233
1	Page 231 Q. Is it true that mammary gland tumor incidence	1	Page 233 linear trends?
1 2		1 2	
	Q. Is it true that mammary gland tumor incidence		linear trends?
2	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives?	2	linear trends? A. I would have to look at the paper in order to
2	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes.	2 3	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to.
2 3 4	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives?A. Yes.Q. And isn't it true that the Wood 2009 rat	2 3 4	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when
2 3 4 5	 Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? 	2 3 4 5	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report?
2 3 4 5 6	 Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now 	2 3 4 5 6	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that.
2 3 4 5 6 7	 Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. 	2 3 4 5 6 7	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't
2 3 4 5 6 7 8	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats?	2 3 4 5 6 7 8	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined
2 3 4 5 6 7 8	 Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study 	2 3 4 5 6 7 8	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related?
2 3 4 5 6 7 8 9	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So	2 3 4 5 6 7 8 9	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no.
2 3 4 5 6 7 8 9 10	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8.	2 3 4 5 6 7 8 9 10	linear trends? A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part.
2 3 4 5 6 7 8 9 10 11	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8. Q. Yes. A. And this is a duration of two years.	2 3 4 5 6 7 8 9 10 11	A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part. A. It is a factor that I look at, yes.
2 3 4 5 6 7 8 9 10 11 12 13	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8. Q. Yes.	2 3 4 5 6 7 8 9 10 11 12 13	A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part. A. It is a factor that I look at, yes. Q. Isn't it true that a rare tumor will likely
2 3 4 5 6 7 8 9 10 11 12 13 14	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8. Q. Yes. A. And this is a duration of two years. Q. And you relied on Greim to get this data, not	2 3 4 5 6 7 8 9 10 11 12 13 14	A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part. A. It is a factor that I look at, yes. Q. Isn't it true that a rare tumor will likely result in a sublinear trend?
2 3 4 5 6 7 8 9 10 11 12 13 14 15	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8. Q. Yes. A. And this is a duration of two years. Q. And you relied on Greim to get this data, not the actual study report. Correct? The study data.	2 3 4 5 6 7 8 9 10 11 12 13 14 15	A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part. A. It is a factor that I look at, yes. Q. Isn't it true that a rare tumor will likely result in a sublinear trend? A. It is possible, yes.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8. Q. Yes. A. And this is a duration of two years. Q. And you relied on Greim to get this data, not the actual study report. Correct? The study data. Sorry.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part. A. It is a factor that I look at, yes. Q. Isn't it true that a rare tumor will likely result in a sublinear trend? A. It is possible, yes. Q. And under your analysis, rare tumors would be
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8. Q. Yes. A. And this is a duration of two years. Q. And you relied on Greim to get this data, not the actual study report. Correct? The study data. Sorry. A. In this case, I believe I looked at Greim for	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part. A. It is a factor that I look at, yes. Q. Isn't it true that a rare tumor will likely result in a sublinear trend? A. It is possible, yes. Q. And under your analysis, rare tumors would be dismissed or speculated, at least, because further
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Q. Is it true that mammary gland tumor incidence is likely to increase the longer the rat lives? A. Yes. Q. And isn't it true that the Wood 2009 rat study was only an 18-month study? A. I believe it was a two-year cancer bioassay. Q. Doctor, does your review in Greim just now refresh your recollection that this is a 18-month study in rats? A. I'm just looking for the right place. So there is the Nufarm 2009b. This is Wood Study No. 8. Q. Yes. A. And this is a duration of two years. Q. And you relied on Greim to get this data, not the actual study report. Correct? The study data. Sorry. A. In this case, I believe I looked at Greim for the data tables, and then I also if I remember	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A. I would have to look at the paper in order to get some context about where this is being referred to. Q. Dr. Foster, do you use linear trends when analyzing the data for your expert report? A. I have as one one factor looked at that. Q. And when you see a dose response that doesn't offer a linear trend, isn't it true that you determined the dose response is not compound-related? A. Not based solely on that issue, no. Q. But in part. A. It is a factor that I look at, yes. Q. Isn't it true that a rare tumor will likely result in a sublinear trend? A. It is possible, yes. Q. And under your analysis, rare tumors would be dismissed or speculated, at least, because further evaluation would need be needed, even though a dose

I don't understand the question. Can you restate that, please.

	Page 234		Page 236
1	MR. DHINDSA: Objection.	1	variance, as to when a resubmission may be reviewed
2	A. I don't determine that it is a positive or	2	again and published?
3	negative study based on that factor alone.	3	MR. DHINDSA: Objection.
4	Q. Now, you see the list. Many publications	4	Q. Like, is there a such a thing as a rush
5	or yeah, publications, journals where you're a	5	review?
6	journal referee. We discussed that a little bit	6	A. (No response.)
7	earlier this morning. Correct?	7	Q. On a resubmitted paper.
8	A. Yes, we did.	8	A. I am not familiar with that.
9	Q. And can I use journal referee to be	9	Q. Okay. Have you ever, in your experience as a
10	synonymous with peer reviewer in this context? Is that	10	peer reviewer for any journal, experienced a situation
11	fair?	11	where peer reviewers have sent substantive edits back
12	A. That would be fair.	12	to the study author, and the study author resubmits the
13	Q. And on your CV you list that you're a peer	13	paper in less than a day, and the paper is published
14	reviewer for the journal article Critical Reviews in	14	the very next day?
15	Toxicology. Correct?	15	A. In my experience, I have as a journal
16	A. I have reviewed on occasion, ad hoc basis,	16	editor, I have been on occasion surprised by how quick
17	for Critical Reviews in Toxicology, yes.	17	some authors have turned around their their
18	Q. So you're not a permanent peer reviewer for	18	revisions. And I have seen quick within a day or
19	Critical Reviews in Toxicology. Is that what you're	19	a day or two.
20	telling me?	20	Q. And what about within a day or two and then
21	A. To my knowledge, there is no journal that has	21	the journal accepts it? Have you seen that as well?
22	such a thing as a permanent reviewer.	22	A. I think I've done it.
23	Q. So it's more that you are contacted by the	23	Q. You've accepted same day?
24	journal when they think that your expertise could be	24	A. If I'm in the office, and I'm getting I
25	utilized as a peer reviewer because a paper is going to	25	get an email from the the journal that says, one of
	Page 235		Page 237
1	Page 235 be submitted. Is that correct?	1	Page 237 the papers that has been assigned to you as by an
1 2	be submitted. Is that correct? A. Not because a paper is going to be submitted,	1 2	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look
	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted.	2 3	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email
2	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies.	2 3 4	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal
2	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might	2 3 4 5	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly.
2 3 4 5 6	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right.	2 3 4 5 6	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer,
2 3 4 5 6 7	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely	2 3 4 5 6 7	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article
2 3 4 5 6 7 8	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for.	2 3 4 5 6 7 8	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the
2 3 4 5 6 7 8	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get	2 3 4 5 6 7 8	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's
2 3 4 5 6 7 8 9	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been	2 3 4 5 6 7 8 9	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission.
2 3 4 5 6 7 8 9 10	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps	2 3 4 5 6 7 8 9 10	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three
2 3 4 5 6 7 8 9 10 11	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer,	2 3 4 5 6 7 8 9 10 11	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it
2 3 4 5 6 7 8 9 10 11 12	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want	2 3 4 5 6 7 8 9 10 11 12	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it is comes back into the journal, it's automatically
2 3 4 5 6 7 8 9 10 11 12 13 14	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want to accept that accept the offer from the journal to	2 3 4 5 6 7 8 9 10 11 12 13	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it is comes back into the journal, it's automatically sent to the two or three peer reviewers to reassess.
2 3 4 5 6 7 8 9 10 11 12 13 14 15	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want to accept that accept the offer from the journal to become a peer reviewer for a submitted article.	2 3 4 5 6 7 8 9 10 11 12 13 14	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it is comes back into the journal, it's automatically sent to the two or three peer reviewers to reassess. Q. And do each of the peer reviewers need to
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want to accept that accept the offer from the journal to become a peer reviewer for a submitted article. A. For that article, yes.	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If — if there has been two or three expert peer reviewers assigned to it, then when it is — comes back into the journal, it's automatically sent to the two or three peer reviewers to reassess. Q. And do each of the peer reviewers need to accept the changes from the resubmitted article before
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want to accept that accept the offer from the journal to become a peer reviewer for a submitted article. A. For that article, yes. Q. Okay. We talked about when the after an	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it is comes back into the journal, it's automatically sent to the two or three peer reviewers to reassess. Q. And do each of the peer reviewers need to accept the changes from the resubmitted article before it's published?
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want to accept that accept the offer from the journal to become a peer reviewer for a submitted article. A. For that article, yes. Q. Okay. We talked about when the after an article is peer-reviewed, it often has revisions sent	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it is comes back into the journal, it's automatically sent to the two or three peer reviewers to reassess. Q. And do each of the peer reviewers need to accept the changes from the resubmitted article before it's published? A. They need to respond one way or the other.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want to accept that accept the offer from the journal to become a peer reviewer for a submitted article. A. For that article, yes. Q. Okay. We talked about when the after an article is peer-reviewed, it often has revisions sent back to the article author. Do you recall that	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it is comes back into the journal, it's automatically sent to the two or three peer reviewers to reassess. Q. And do each of the peer reviewers need to accept the changes from the resubmitted article before it's published? A. They need to respond one way or the other. Q. How important is it to you in your practice,
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. That they think I might Q. Right. A be able to provide them with a timely review for. Q. Okay. So I'll clear that up. So you get contacted by the journal after a paper has been submitted, and that journal determines that perhaps your expertise would make you a valuable peer reviewer, and you're given the opportunity as to whether you want to accept that accept the offer from the journal to become a peer reviewer for a submitted article. A. For that article, yes. Q. Okay. We talked about when the after an article is peer-reviewed, it often has revisions sent back to the article author. Do you recall that testimony?	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	the papers that has been assigned to you as by an editor is in your dashboard to look at, I try and look at them as quickly as I can in order to keep my email from getting plugged up. And, so, yeah, I try and deal with them quickly. Q. And so you deal with them as a peer reviewer, and the other peer reviewers assigned to this article are, likewise, reviewing the resubmission by the author, correct? You're not the only person that's looking at a resubmission. A. No. If if there has been two or three expert peer reviewers assigned to it, then when it is comes back into the journal, it's automatically sent to the two or three peer reviewers to reassess. Q. And do each of the peer reviewers need to accept the changes from the resubmitted article before it's published? A. They need to respond one way or the other. Q. How important is it to you in your practice, your many years of experience, to have access to data
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	be submitted. Is that correct? A. Not because a paper is going to be submitted, but because a paper has been submitted. Q. Apologies. A. 	Page 238		Page 240
1	study and then publishing on it. How important is it	1	Greim on Page 199, Study 11, Cheminova 1 1993b.
2	to you is it to you to have the underlying data	2	A. Sorry. P age 199.
3	before you publish an article?	3	Q. Yep, the Cheminova study.
4	MR. DHINDSA: Objection.	4	A. Table 15. I'm sorry?
5	A. I don't I'm not following your question.	5	Q. No, just the Cheminova study. I just want to
6	I in my typical practice, I am reviewing I I	6	get your attention there. That's where that's where
7	run the the study in my lab or together with my	7	I want to look at.
8	collaborators. We generate the data, we review it, and	8	Now, Table 16 on the next page relates to the
9	write the paper. So I have the data.	9	Atkinson findings as reported by Greim in the summary
10	Q. So the data is all your own. You don't	10	article. Correct?
11	have you don't ever publish or author anything on	11	A. This refers to Cheminova study, yes; 1993b.
12	someone else's data. You use your own data.	12	Q. Okay. And in Table 16, Study 11, do we see
13	Q. If I'm doing a systematic or critical review	13	any reporting of hemangiosarcomas?
14	of the literature, then I would do a computerized data	14	A. They are not listing them here as being
15	search in order to obtain all the published literature	15	included in this table.
16	in both the peer-reviewed press and the gray	16	Q. Okay. Yet you discuss hemangiosarcomas on
17	literature, to the extent possible, for my review.	17	Page 22 Pages 22 and 23 of your expert report.
18	Q. And that would be a review article, though.	18	Correct?
19	Correct?	19	A. Yes.
20	A. That would be a review article.	20	Q. Okay. So in the in the context of
21	Q. Okay. When you were reviewing the Greim	21	reviewing data to form an expert opinion or even to
22	review article and the supplemental tables, did did	22	publish an article, there is a true value in receiving
23	it ever cross your mind as to whether Greim might	23	underlying data. Correct?
24	underreport any tumor incidences seen in the data sets?	24	MR. DHINDSA: Objection.
25	A. Did it cross my mind that he would	25	Q. A review article would not be enough.
	Page 239		Page 241
1	underreport it?	1	MR. DHINDSA: Objection.
2	Q. That underreporting could happen?	2	A. In this case, I'm responding to Dr. Portier,
3	A. That's not something that crossed my mind. I	3	and I would have gone back to Dr. Portier's report to
4	don't have any reason to believe that did or did not	4	look at that information.
5	occur.	5	Q. Okay. So the hemangiosarcoma discussion in
6	Q. Okay. Well, let's look at	6	your report is using some of Dr. Portier's data that he
7	(Discussion held off the record.)	7	reports on.
8	Q. So if we look at Greim, the review article,	8	A. Correct.
9	Exhibit 18-16	9	(Discussion held off the record.)

1.0 Introduction:

Glyphosate (N-(phosphonomethyl)glycine) is a broad spectrum post emergent herbicide that has been registered for use globally. Though it has been confused with organophosphate pesticides, glyphosate is not an organophosphate but rather an aminophosphonic analogue of the natural amino acid glycine (Greim et al. 2015). Briefly, glyphosate is a highly water soluble (hydrophilic) chemical that is poorly absorbed from the skin (Wester et al., 1991). Oral exposure to glyphosate is considered to be the primary route of exposure (EPA, 2016). Absorption from the gut is estimated to be less than 30% of the oral exposure with negligible tissue accumulation and the majority excreted unchanged in the urine. Inhalation exposure is minimal and dermal penetration is low. The glyphosate that is absorbed from the skin is rapidly excreted mainly via the urine within 24 hrs. (Wester et al., 1991; Chan, 1992). Maximal human exposures of 0.47 mg/kg/day were estimated for children (1-2 years) and up to 0.03-7 mg/kg/day for mixer/loaders assuming that personal protective equipment was not employed (EPA, 2016). Regulatory agencies worldwide have independently assessed the human health risk for glyphosate, consistently reaching the conclusion that glyphosate is not a carcinogen. In contrast, in March 2015 the International Agency for Research on Cancer (IARC) finalized its health hazard assessment of glyphosate, a less stringent process than risk assessment, concluding that glyphosate is a probable carcinogen (classification 2A).

I have been retained as an expert to render opinions concerning the experimental rodent carcinogenicity bioassay literature including, but not limited to, those described by IARC and plaintiffs' experts purporting to link glyphosate exposure in rodents and carcinogenicity. Following a review of the available data I have concluded that glyphosate is not a rodent carcinogen. If glyphosate were carcinogenic in rodents, one would expect to see replication of carcinogenic findings of a particular tumor type across multiple studies. Such evidence is absent from this comprehensive and rich data set.

The following sections outline my background and expertise, approach taken in conducting my objective review of the data, assessment of the evidence, and my scientific opinions of the data. The opinions I plan to offer in this matter will include opinions set forth in this report, opinions that may be elicited from me in discussing or elaborating on those areas and/or responding to the testimony of plaintiffs' experts and any opinions formed based upon further literature review and review of any additional materials. My opinions are based on my review of the relevant scientific literature; materials specifically related to this case and related proceedings; and my education, training, research, and experience. A list of materials I have considered in forming my opinions is included in Section 6.0 below.

2.0 Background and Qualifications:

My expertise is in toxicology with a special focus on reproductive toxicology and environmental carcinogenesis. I have continuously carried out research in the field since 1991 conducting primarily animal studies according to established internationally accepted test guidelines

designed to provide data for government regulatory needs. I have also carried out numerous studies designed to assess human exposure and define mechanistic pathways to explain toxic phenomena including cancer. Over the course of my career, my expertise in the field has been recognized as shown by numerous invitations to provide expert technical advice to non-government organizations, government, and industry since 1991. Further detail of my background and expertise are summarized below:

- (i) I obtained my undergraduate training (Hon. B.Sc.) in Human Biology from the University of Guelph, Guelph, Ontario, Canada (1979) and a M.Sc. from the University of Guelph in medical sciences (1986). I completed my doctoral training in medical sciences in 1991 at McMaster University.
- (ii) I joined the staff of the Environmental Health Directorate at Health Canada in 1990 where I worked as a reproductive toxicologist. I was promoted to Head, Reproductive Toxicology Section and subsequently served as the Acting Division Chief, Environmental Health Directorate. As a Health Canada scientist, I oversaw an active research program consisting of four Sections focused on general, inhalation, reproductive/developmental toxicology and mutagenicity. During my career, I have designed and carried out animal studies to provide data necessary for regulatory assessment of chemicals under the Canadian Environmental Protection Act. Specifically, I designed, executed, and performed relevant data analyses, interpreted the study findings, and published the results of numerous animal studies for the assessment of the general, endocrine, reproductive and developmental toxicity as well as carcinogenesis of a broad range of chemicals including pesticides. I have also designed and executed numerous animal and tissue culture studies designed to elucidate mechanisms underlying the pathophysiology of observed adverse outcomes. I also participated in several epidemiological studies designed to assess human exposure to metals and persistent organic compounds to evaluate the potential impact of these exposures on human health. I have continuously carried out research and am recognized for my expertise in animal models and working at the intersection between animal research and clinical research (translational science). My productivity in the field and impact of my work has led to numerous invitations to present my findings at major international medical and scientific conferences and provide expert advice to government, non-government organizations, and industry since 1991 as detailed in my attached CV.
- (iii) I am currently a Professor in the Department of Obstetrics and Gynecology at McMaster University where I lead a productive and well-funded research program designed to assess human exposure and the effect of environmental chemicals on adverse outcome pathways including oxidative stress, inflammation, autophagy, apoptosis, and cell proliferation; all of which are normal physiological processes that have also been associated with the pathogenesis of human disease including cancer. A separate line of inquiry in my laboratory is focused on the identification of clinical markers of endometriosis and novel therapeutic interventions. I am also a voluntary clinical professor in the Department of Reproductive Medicine at the University of California, San Diego where I conduct collaborative research in women's health.

- (iv) McMaster University is a leading Canadian research intensive university that trains medical, undergraduate and graduate students in the medical sciences. I am involved in the teaching of undergraduate Bachelor of Health Sciences and Medical Students (Ovarian regulation and physiology of selective estrogen receptor modulators and selective progesterone receptor modulators). I teach several graduate courses (Reproductive Endocrinology and Environmental Toxicology) and directly supervise the training of graduate students and postdoctoral fellows. I mentor residents on their research projects and have served as the resident research coordinator and a member of the resident postgraduate education program as well as the postgraduate evaluation committee. I am also a member of the animal advisory committee and the animal research ethics board in the Faculty of Health Sciences at McMaster University.
- (v) I have been continuously supported by the Canadian Institutes of Health Research (CIHR) since 2001. My research has also been supported by grants and contracts from the Natural Sciences and Engineering Research Council, The New York Community Trust, the American Chemistry Council, and Health Canada. I have published greater than 180 total career peer reviewed scientific publications. In addition, I have been invited to give over 92 invited scientific presentations and more than 137 presentations at scientific and medical conferences over the course of my career. My work is frequently cited with over 5,820 citations and an H-Index=45 (Measure of impact on the field).
- (vi) I have served on numerous local, national and international expert panels including: National coordinator for the Organization for Economic Cooperation and Development (OECD) Test Chemical Guideline Program (bioassays for toxicology and carcinogenesis); WHO/IPCS Steering Group on Endocrine Disruptors, and Member, Council of Canadian Academies Panel, Integrating Emerging Technologies into Chemical Safety Assessment, and Expert Panel on the Integrated Testing of Pesticides. Recently, I also served as a member of an IARC expert monograph working group. I have also served on numerous, Local, National, and International grant review committees (e.g. Canadian Cancer Society, CIHR, NIH, and EPA-STAR), editorial boards, and have been elected by my peers to serve on the board of several prestigious scientific societies (e.g. Society of Toxicology Canada and the Canadian Fertility and Andrology Society) and recently was elected as a Fellow of the Canadian Academy of Health Sciences (CAHS).
- (vii) I am currently an editor of the Journal of Applied Toxicology and a member of the editorial boards of the Journal of Toxicology and Environmental Health: B Critical Reviews, Reproductive Toxicology, Immunology, Endocrine & Metabolic Agents in Medicinal Chemistry, and the Faculty of 1000. Further details of my training and contributions to science are provided in my curriculum vitae included in section 7.0 of this report.

3.0 Statement of Opinions and rationale:

Unless otherwise stated, all the opinions expressed in this report are to a reasonable degree of scientific certainty including my opinion that glyphosate is not a rodent carcinogen. My opinion is based on my interpretation of the experimental animal studies and the following points:

- (1) The animal studies have been conducted in accordance with recognized animal test protocols for carcinogenicity;
- Appropriate routes of test agent administration and dose ranges were used in these studies;
- (3) The dose ranges used cover low concentrations through, and in some studies, well above the limit dose of 1,000 mg/kg/day;
- (4) The methods of tissue analysis and data interpretation were appropriate;
- (5) There is insufficient reliable scientific evidence of a dose-response relationship;
- (6) Tumor incidences are generally within historical control ranges with the order of priority as follows:
 - a. concurrent controls;
 - b. historical controls from the same lab within 2-3 years; and
 - c. historical controls from other labs or the same lab beyond 2-3 years.
- (7) In all studies reviewed the data fails to show evidence of tumor progression;
- (8) There is a lack of consistency of findings of tumor types across the animal studies (mice and rat) including within the same strain of rodent model; and
- (9) Additional factors that further call into question the biological plausibility of putative compound-related changes.

Thus, taken together, these data demonstrate that tumors identified in the animal studies are most likely spontaneously occurring and unrelated to glyphosate exposure. Therefore, there is no scientifically reliable basis to justify a conclusion that glyphosate is a rodent carcinogen. Furthermore, I am not aware of any reliable scientific evidence available that Roundup formulations are a rodent carcinogen. I will use the following paragraphs to provide a detailed description of the literature reviewed, the methods of analysis employed to arrive at my conclusions, and highlight in each case how the study contributed to the above conclusions.

Literature reviewed: A critical review of the literature was carried out in which I reviewed all available case materials, which are summarized in the literature-cited section of this report. I reviewed detailed data reports arising from industry sponsored animal carcinogenicity studies, the IARC report on Glyphosate (IARC 2015), EPA evaluations and correspondence, and other regulatory documents (e.g. EFSA, BFR, and the Science Advisory Panel report). In addition, I also carried out an independent literature search using PubMed on August 18th, 2016 and updated on October 3rd, 2016, May 17th, 2017, and July 7th, 2017 to ensure that all relevant literature was included in my assessment. Bibliographies of each paper were also searched for additional relevant papers. To assess the literature, I assigned greater weight to studies conducted according to internationally accepted test guidelines for carcinogenicity for the following reasons:

- (1) Greater weight was assigned to studies using at least three dose levels (low, medium, and high) allowing for assessment of dose-response characteristics. Dose levels that covered broad ranges of concentrations including a high dose that approached or included the limit dose (1,000 mg/Kg/day) were also given greater weight. Studies that exceeded the limit dose with concentrations that fell below 5% of the overall diet were also highly valued in my assessment. It is essential to include in the study a high dose group represented by the limit dose or 5% diet concentration to assure that animals have been exposed to a concentration of the test agent that will markedly exceed human exposure. If the dose is in the 5% range it should be below the maximally tolerated dose (MTD) to mitigate potential frank toxicity that would confound the results. Thus, evidence of adverse health effects was also considered in my assessment in reaching my final conclusions.
- (2) It is essential that cancer studies use an adequate number of animals in each treatment group to detect statistically significant increases in neoplastic lesions. For this reason, studies that used at least 50 animals/treatment group were viewed as compliant with regulatory test guidelines. Studies that failed to use an adequate number of animals/groups were assigned lower weight in my analysis.
- (3) Study duration for cancer studies typically should be at least two years in length (24 months) in rats or 18 months for certain strains of mice. This is done to capture the majority of life expectancy of the animals. Unless justified by evidence of increased mortality or neoplastic lesions of sufficient size or number to induce unreasonable pain or suffering, experimental animal studies of shorter duration were given less weight.
- (4) Tumor progression was considered important in my assessment owing to current understanding of the mechanisms of chemical carcinogenesis. Consequently, if present, I would assign greater weight to studies in which evidence of chemical-induced tumor promotion was demonstrable. Additionally, factors contributing to biological plausibility were evaluated.

4.0 Assessment of Carcinogenicity:

Introduction and definitions - To understand how exposure to a chemical can lead to cancer, it is necessary to introduce some definitions and briefly discuss how cancer bioassays are conducted. Cancer refers to a malignant neoplasm (an abnormal growth of tissue that forms a swelling or mass), a lesion resulting from the new or autonomous growth of a tissue. Neoplastic lesions may be either benign (non-cancerous growth of cell mass that does not possess the ability to invade neighboring tissues) or malignant (cell growth that tends to worsen and has the properties of cells that have reverted to a less differentiated form, uncontrolled cell growth, invasiveness, and metastasis). Benign lesions are characterized by slow growth of the tissue that fails to invade surrounding tissues. Examples of benign growths include moles, fibroids in the uterus and endometriosis. In contrast, a malignant neoplasm is characterized by rapid growth,

invasions of surrounding tissue, and metastases (growth of cancer cells in distant tissues). When cancer develops it typically follows the progression from benign to malignant growth.

A chemical carcinogen is any chemical or its metabolite that can induce neoplasia (abnormal growth). Throughout the animal literature I reviewed and the studies cited by plaintiffs' experts (Drs. Jameson, Portier, Neugut, Weisenburger, and Nabhan), reference is made to several different types of tumors. Plaintiffs' experts have noted the different tumors in relevant studies but have failed to carry out a critical appraisal of these studies and the data generated. The evaluation and interpretation of data from such rodent studies is paramount in determining their significance. Plaintiffs' experts merely count several tumors and generate statistical comparisons, often novel and untested, absent further analysis. Critical analyses largely absent from plaintiffs' expert reports include, but are not limited to, biological relevance (e.g. dose response, mechanism, relevant human exposure, and translation from rodents to humans), neoplastic continuum or progression, expected tumor incidences, and replication of tumor types across multiple studies. Therefore, I will describe the different types of tumors here and provide a detailed assessment of each study considered in rebutting the plaintiffs' experts and arriving at my conclusions.

Several different tumor types are discussed in the literature reviewed and therefore definitions are provided. Adenomas are benign tumors in which epithelial cells cluster together and form recognizable glandular structures. Also discussed in one study is an interstitial tumor of the testes. These tumors are also known as Leydig cell tumors (the cells that produce testosterone) a type of tumor that is typically benign although some may progress to malignancy. Another tumor type mentioned in the reports that I reviewed was a hemangioma. A hemangioma is a congenital malformation consisting of a benign tumor made up of newly formed blood vessels. The cause of these benign tumors is unknown and they can appear throughout the body, including the skin, liver, and bones. In contrast, a hemangiosarcoma is a malignant tumor of the blood vessels that has its origin in the vascular endothelium (the cells that line the blood vessel). Finally, also discussed in the animal studies are lymphomas. Lymphoma refers to a group of over a dozen tumors that arise from lymphocytes which are a type of white blood cell.

Multistep pathway to cancer - Cancerous growths are thought to arise through activation of the carcinogenic cascade that involves initiation, promotion, and ultimately neoplastic progression (Cohen and Ellwein 1991). A carcinogen is a physical (e.g. radiation) or chemical agent (or one or more of its metabolites) whose interaction with DNA typically induces a mutation in the genetic code and thus acts as an initiator of cancer. Mutations do not always lead to cancer since cells possess DNA repair mechanisms or the damage occurs in a non-coding region of the DNA. In contrast, clonal expansion of the mutated cell can occur if repair of the damaged DNA is unsuccessful.

Tumor growth occurs through the influence of growth factors or hormones that induce cell proliferation and thus tumor promotion. Substances that are only tumor promoters are typically not mutagenic and are unable to induce neoplastic lesions on their own.

Cancer progression refers to the irreversible conversion of a benign pre-neoplastic lesion to a neoplastic lesion. Chemicals that induce tumor progression are usually genotoxic. Tumor progression can occur spontaneously from the accumulation of chromosomal aberrations or instability of the chromosomes.

Hallmarks of carcinogens - The impact of chemical agents on gene expression, cell signaling pathways, receptor binding and signaling, inflammation, immune surveillance, cell proliferation and nutrient supply has been recognized and are potentially important in the pathogenesis of cancer (Hanahan and Weinberg 2011). Ten key characteristics of chemical carcinogens have been described and summarized (Smith et al. 2016) and cited by Dr. Portier in his expert report. Although chemical carcinogens are reported to induce one or more of the 10 key characteristics, use of these hallmarks as a "rule in" test for carcinogenicity is unfounded. The concentrations and the experimental conditions needed to induce changes in any of the hallmark pathways must be carefully evaluated for their relevance to human health. Indeed, numerous chemicals have one or more hallmarks of carcinogens but the effects can only be produced at concentrations that far exceed potential human exposure.

While rodent carcinogenicity assays are used for identification of potential hazards, it is important to note that not all chemicals that have been shown to be rodent carcinogens have been found to be human carcinogens. Potential reasons for this lack of relationship include: different mechanisms of action in rodents compared to humans; differences in absorption, distribution, metabolism, and excretion; and the concentration of test chemical needed to induce cancer in rodents exceeds concentrations that can effectively be achieved in humans. The assessment of carcinogenic potential and health risk is a complex task involving more than simply counting lesion types and assigning a label. Critical to the process is assessment of the biological relevance of all adverse outcomes enumerated in a study and ultimately evaluation of human exposure relative to doses needed to induce an adverse outcome in the most sensitive animal model accounting for uncertainties in translation of results from animals to humans.

Overview of cancer bioassays - In recognition of the long-term serious health consequences represented by chemical carcinogens, chemicals are routinely screened for their potential to induce cancer. Beginning in the early 1960's the National Cancer Institute began to develop animal test methods for the assessment of potential chemical carcinogenicity. Within a decade the two rodent species, two sex, and two year cancer bioassay was in wide use. Regulatory agencies from multiple countries subsequently standardized, validated, and harmonized rodent carcinogenicity test protocols. Standardized cancer bioassays are regulatory requirements for chemical registration. The World Health Organization (WHO) under the leadership of the Organization for Economic Cooperation and Development (OECD) oversees the International Program on Chemical Safety that is mandated with the development and validation of test guidelines for the assessment of chemical hazards. The OECD Test Guideline Program is responsible for a collection of the most relevant internationally agreed upon testing methods used by governments, industry and independent laboratories to assess the safety of chemical products. Test Guidelines are updated on a regular basis to keep pace with progress in science and countries' regulatory needs. The objectives of OECD carcinogenicity studies (OECD-TG-

451/452) and the combined chronic toxicity and carcinogenicity study (OECD-TG-453) are designed to observe test animals for a major portion of their life span for the development of neoplastic lesions with exposure to at least three doses of a test substance and a vehicle control using an appropriate route of administration (typically oral). Carcinogenicity bioassays are conducted over a period of 24 months for rodents; however, for specific strains of mice a duration of 18 months may be more appropriate, to account for the shorter life-span for these strains (e.g. CD-1 mice). A tumor incidence of 57% was found in Sprague Dawley (SD) rats allowed to live out their entire life-span (Davis et al. 1956). The average life-span of SD rats in this laboratory was approximately 760 ± 21 days and 87% of all tumors appeared after the animals were 540 days of age. Consequently, the study duration of 24 months (730 days) in cancer bioassays has been selected to account for the recognized long latency between initiation of cancer and the detection of tumors that follows tumor promotion and progression. This study design also accounts for compensatory mechanisms (e.g. DNA repair) as well as tissue repair providing an adequate time for tumors to appear. Note that a study may be terminated early should the number of survivors in the lower dose groups or the control group fall below 25 per cent. The study may also be terminated early if the tumor volume attains a size or number of tumors that seriously compromises the health of the animals. It is important to note that twospecies, two-sex, rodent cancer bioassays conducted according to test guidelines usually generate reproducible results (Gold et al. 1987; Gold et al. 1989; Haseman and Huff 1987) that are valuable for human risk assessment. It is expected that studies adhering to standard operating procedures and following regulatory study guidelines would produce reproducible findings. Failure of studies to generate replicable data causes concern and calls into question the relevance of the data because of the probability the finding might be due to random chance, normal variation of the outcome, or methodological issues. Scientists faced with divergent results are compelled to explore the reasons for the lack of consistency in the data. Common reasons for lack of reproducible findings include: differences in study methodology; animal model used; duration or amount of test chemical exposure; analytical methods employed; time frame of the study; and normal variation in the outcome being observed.

Interpretation of bioassay results – Evaluation of bioassay results and determination of their importance involves several steps, including assessment of adherence to study protocol, statistical methods, data analysis, and interpretation. When reviewing any study, the first step involves understanding the question being addressed and the appropriateness of the animal model employed. For cancer bioassays, the main points to be addressed are the use of an appropriate rat or mouse strain, randomization to treatment groups, appropriate route of test chemical administration, dose levels that cover a broad range up to and including the limit dose, duration of study that allows for development of tumors, assessment of systemic toxicity, and accepted histopathological methods. In reviewing study reports it is important to consider the statistical methods employed to ensure that prescribed methods have been followed or if alternative methods have been employed, their use has been adequately justified.

Detection of statistically significant differences among and between treatment groups is important to note but their biological relevance must also be determined. Specifically, it is possible to have statistical significance in the absence of biological relevance and thus the investigator must evaluate whether the changes detected are internally consistent based on the totality of the animal data collected and current understanding of underlying biological mechanism(s). This may involve consideration of the normal range for a given outcome. To do this it is best to make comparisons with concurrent controls or alternatively appropriate historical controls. I agree with Dr. Portier that it is best to compare data with contemporary controls. However, historical controls generated in the same lab within 2-3 years of the study may also provide useful information. If such historical control data is not available then it may be necessary to compare with data outside the preferred time period. However, that data should be used with extreme caution for quantitative analysis due to differences in the genetic makeup of animals of the same species/sex/strain over time and between laboratories.

In assessing rodent bioassay data, evidence that could indicate systemic toxic effects as shown by changes in body weight, stereotypical behaviors, abnormal vocalizations, porphyria, lacrimation, ruffled coat, barbering of the hair or changes in clinical chemistry and hematology should also be considered. The interpretation of bioassay outcome is based on the integration of what is known of study conduct, data produced, statistical analysis, and understanding of the underlying biology for each outcome. Finally, bioassays are carried out with the goal of identifying adverse outcomes for hazard identification. A properly conducted hazard identification, taking into account all of the available relevant evidence, is but one step in the process of determining risk. Risk assessment is a protective process used in regulatory toxicology that is the product of hazard, human exposure, and recognition of translational differences between rodents and humans. Furthermore, the determination of a risk does not necessarily mean causation has been established. Evidence of scientific causation involves the integration of additional issues such as demonstration that human relevant concentrations of the test chemical can reproducibly induce the adverse effects, evidence of human exposure, knowledge of internal dose, target tissue exposure, understanding of mechanism of action, and its applicability to humans. Consequently, these rodent bioassays on their own do not generate data that can establish causal relationships between external exposure and human health. However, these bioassays may generate data that suggests a compound is unlikely to be carcinogenic in humans.

The case of glyphosate is unusual in that there are multiple rodent (mouse and rat) study results from cancer bioassays. As a result, there are individual study results to evaluate. Additionally, results of the data generated can be assessed across studies. Dr. Portier uses a novel statistical approach for generating a test statistic for comparing current results with those of historical controls. I have not seen this approach applied elsewhere in the toxicology literature or in my profession, and thus I am not aware that this is a validated method that has been assessed by scientific peers or achieved general acceptance by the scientific community. In addition, Dr. Portier employs pooling of data across studies which again is a novel statistical approach that has not been peer reviewed, validated, and to my knowledge has not been tested to reach the level of a generally accepted approach in regulatory toxicology. Indeed, Dr. Portier admits that his methodology utilized in his report is novel and untested (Portier report, pg. 21). While pooling

such data has not yet been evaluated, validated, and thus is not generally accepted in the scientific community or ever even done to my knowledge, comparing data from rodent studies is a standard practice and paramount in assessing carcinogenicity.

Further, Dr. Portier acknowledges that "simple evaluation of the positive versus negative findings fails to resolve the issue of which findings are driving the overall responses in these data." (Portier report, p.47). A central concept of science is reproducibility of data both within a laboratory, across laboratories, and over time. The lack of reproducible effects, as revealed by the glyphosate data set, indicates that these effects are not compound-related.

Where statistically significant results are lacking, Dr. Portier repeatedly relies upon so-called "marginal trends" to ascribe significance to statistically insignificant data. In my field of expertise, typical research activity outcomes are either statistically significant at the p<0.05 level or they are not. The concept of "marginally significant trends" is not typically used in the biomedical literature.

In contrast to the approach of Dr. Portier I, like other scientists in the field, compare the results from multiple studies mindful of differences in animal strain, doses of test chemical employed, experimental conditions, analytical methods employed, data analysis, and interpretation of the study results. This comparison is undertaken utilizing a qualitative evaluation, with statistical significance forming just one piece of the overall evaluation. The generally accepted scientific methodology, which I employed, involves careful consideration of study design, conduct, analytical methodology, data analysis and interpretation to ensure that the results are not over or under interpreted. Moreover, to fully appreciate the data, a critical and qualitative appraisal of the data is necessary and this cannot be achieved through statistical analysis alone.

5.0 Assessment of experimental animal literature:

Animal studies are essential in regulatory toxicology, particularly in the absence of evidence of human exposure and epidemiological data. Animal studies allow scientists to address important questions that are either unethical or cannot be carried out in human studies. For example, in human studies, exposure to test chemicals and developmental life-stage of exposure are often unknown. Moreover, many target tissues (e.g. brain, liver, and kidney) are not easily accessible and thus cannot be examined in human studies. Thus, surrogate markers are frequently used to detect effects in these tissues. In contrast, experimental animal studies allow for the administration of known quantities of a test chemical of known purity under carefully controlled environmental conditions (temperature, humidity, time of day, lighting conditions, and unlimited access to water and food of controlled nutritional composition) in genetically similar animals of known age, developmental stage and health. Experimental animals are monitored over the course of the study for changes in biochemistry and hematology, allowing for the early detection of changes in health status. At study conclusion, a full necropsy is performed and all organ and

tissue samples undergo careful gross and histopathological assessment by board certified veterinary pathologists. Thus, these studies provide robust data for the detection of potential adverse outcomes for regulatory purposes that cannot be achieved through alternative means. Of additional importance, the concept of multiple comparisons increases the probability of finding differences through chance alone (Squire 1989). Dr. Portier also recognizes the problems multiple comparisons pose with a data set of this magnitude (Portier report, p. 40), though we disagree on the remedy for that problem (see pp. 21 and 47). Dr. Portier further acknowledges that one expects a certain number of positive findings due to chance alone (Portier report, p. 50). Thus, the finding of a statistically significant difference cannot be interpreted by itself to indicate a compound-related effect. Therefore, results of animal studies may elucidate statistically significant effects of treatments that must be evaluated further for their biological relevance.

Glyphosate has been assessed using regulatory toxicology studies in mice and rats. Sufficiently high doses of glyphosate were used in most studies, approaching or exceeding the limit dose as described in regulatory cancer test guidelines (e.g. OECD TG 451). Results from over a dozen regulatory studies revealed spontaneous tumors in several different tissues but all unrelated to glyphosate treatment. In view of the relatively large number of studies that have been carried out, it is remarkable that although incidental tumors unrelated to glyphosate exposure were found in individual studies, there is a consistent absence of evidence via replicated results for carcinogenicity across studies. The lack of reproducible tumor findings in animal studies designed specifically to produce reliable and reproducible results is compelling evidence for a lack of association between glyphosate and carcinogenicity. One should be mindful that rodent bioassays are not hypothesis driven, and require both gross and histopathological evaluation of all tissues thus increasing the probability of false positive results. Indeed, these studies are designed to maximize the potential of detecting compound-related effects at the expense of detecting false positive results. Detection of a statistically significant positive result is not the end of the study analysis but rather only the beginning of the scientific assessment as it is necessary to determine if the findings are spurious or represent biologically important findings. Consequently, I will describe each study in detail in the following sections.

Rat studies

Studies judged as inadequate

In combination, Drs. Neugut, Portier, and Jameson excluded six studies (Reyna, Chruscieleska, Excel, Seralini, Burnett; Pavkov and Wyland), all of which were reported to be negative studies with the exception of one (Seralini et al. 2014). While in total, plaintiffs' experts excluded six studies, they were not in complete agreement. However, given the methodological concerns and the lack of reliance of plaintiffs' experts, I give the six studies referenced above and the plaintiffs' expert opinions based on those same studies minimal weight in my causation analysis and will not discuss these studies further.

Studies judged as adequate

Of the studies judged as adequate, Dr. Portier provides a statistical assessment of the data only whereas Dr. Jameson provides a summary of the results analogous to the listing of data in the IARC report for glyphosate. The entirety of Dr. Neugut's discussion of the animal data is comprised of two paragraphs and an accompanying table. Similarly, Dr. Weisenburger, though acknowledging the existence of numerous negative glyphosate rodent studies, concludes without engaging in generally accepted toxicological analysis that "positive studies listed above cannot be dismissed, and provide sufficient evidence for the carcinogenicity of glyphosate in experimental animals" (Weisenburger Report at p. 8). Plaintiffs' experts fail to provide a critical appraisal of the studies or interpretation of the data. Further they fail to discuss potential explanations for lack of consistency of study findings. Hence, the rationale for their conclusions is in my view unsupported. The results of each study and its' biological relevance are described in detail below.

Bio/Dynamics Inc. 1981 Study BDN-77-2062 (Lankas et al., 1981 discussed in Greim et al., 2015 - Study 1): In 1981 Bio/Dynamics Inc. conducted a combined chronic toxicity and carcinogenicity study of glyphosate for the sponsor. Sprague-Dawley rats were exposed to 30, 100 and 300 ppm glyphosate in the diet over the course of their lifetime (26 months). The dose was adjusted according to changes in body weight such that the rats were exposed to 3.05, 10.30, and 31.49 mg/Kg/day for males and 3.37, 11.22, and 34.02 mg/kg/day for females. Body weight, food consumption and clinical laboratory studies were conducted over the course of the study.

Neoplastic lesions were documented in the pituitary and pheochromocytomas in males and females and mammary tumors in females; however, the incidence was similar across all treatment groups and thus is not considered to be treatment related. Interstitial tumors of the testis (Leydig cell tumors) were detected in this study with an incidence of 0, 3, 1, and 6 in the controls, low, medium, and high dose groups, respectively. While the incidence of testicular tumors in the low and medium dose groups was within the highest incidence found for historical control (7%), the incidence of these tumors in the highest dose group (12%) was greater than that for the historical control group examined for this research laboratory. Consequently, neoplastic changes in the testis of the high dose group were evaluated to better elucidate their importance.

The testes received thorough histopathological evaluation. The study pathologists did not report any evidence of any dose related changes but did report a notable absence of compound-related hyperplasia. Hyperplastic changes would be expected to be present in the case of compound-related tumors and indeed to be coincident with the development of lesions. Moreover, there are several additional issues noted in the conduct of the study that impact the relevance of the testicular tumors. Specifically, the number of animals surviving to the end of the study was greater in the highest dose group compared to the control group. This is an important point because it creates the scenario where there were more animals in this group that had the opportunity to develop spontaneous neoplasms and thus could artificially increase the likelihood

of detecting a neoplastic change in this group compared to the control group. Had animals in the control group lived for the same length of time as those in the highest dose group (this is referred to as survival bias), it is possible that no effect may have been found. Furthermore, the absence of testicular tumors in the control group is below the historical range noted for this strain of rat and studies conducted by this laboratory. A lower response rate than expected in the control group could therefore increase the likelihood of detecting a false positive increase in testicular neoplasms. Finally, interstitial testicular tumors have not been replicated in any other study including those in which much higher doses of glyphosate were employed. Moreover, it is relevant to note that, in the studies considered acceptable by plaintiffs' experts, doses similar to Lankas et al., along with much higher doses were employed, and no relationship between glyphosate and interstitial testicular tumors was found.

This study also revealed the presence of spontaneous occurrence of thyroid C cell tumors in females. A statistically significant trend for thyroid C cell carcinomas in the female animals only was observed (1/47, 0/49, 2/50, and 6/47). However, after combining thyroid C cell adenomas and carcinomas, which is appropriate (McConnell 1986), the statistical significance disappears. Although Dr. Portier agrees that combining these tumors is appropriate, he raises concern about these tumors in female rats even though none of the other studies revealed a statistically significant increased incidence of these tumors. I therefore conclude that the presence of thyroid C cell tumors in female rats in this study is not compound-related.

Although pairwise comparisons revealed a statistically significant increase in the number of pancreatic islet cell tumors for the lowest dose group (3.05 mg/kg/day) in male animals only, there was no evidence of a dose response (0/50, 5/50, 2/50, and 3/50). The low incidence of tumors, lack of evidence for tumor progression, absence of a dose response, and consistency with historical controls all support the conclusion that these tumors are not compound-related.

In summary, both the decreased survival in the control group compared to the highest dose group of rats together with the lower incidence of testicular tumors in the control group compared to historical controls increases the likelihood of finding a statistically significant increase in tumors amongst the other dose groups whose biological relevance is questionable. Dr. Portier speculates that the 26-month duration of the study offers unique insights that may be missed in a study lasting only 24 months. However, no evidence is offered and I am not aware of any data demonstrating that a 26-month study would detect interstitial tumors at any different rate than in a 24-month study in dose groups compared to control groups. I therefore conclude that the absence of a dose related increase in incidence of interstitial tumors, the absence of changes that

An example might be illustrative here. If one expects a background rate of 6% for a given tumor in a study with four arms of 50 rats each, one would expect 3 out of 50 rats in each group to have that tumor (or 12 out of 200 overall). However, if the control group has 0% by chance, then one would expect 4 out of 50 rats in the remaining groups to have that tumor by chance because one would still expect 12 rats out of 200 to have that tumor.

would be indicative of tumor progression, and statistical limitations suggests that these tumors are incidental findings unrelated to glyphosate exposure.

Strengths of this study include an appropriate study design, adequate number of animals/dose group, use of three dose groups plus a negative control, appropriate methodology for tissue assessment and statistical analyses of the data. The study was conducted prior to the introduction of standardized and internationally accepted OECD test guidelines for carcinogenicity although much of the methodology is consistent with those guidelines. However, the use of a high dose that was substantially below the limit dose is a weakness of the present study.

MSL-10495 (Stout and Ruecker, 1990; discussed in Greim et al., 2015 - Study 2): This was a chronic study conducted by Monsanto in albino Sprague-Dawley rats (n=60/group) following a two-year cancer bioassay (consistent with the current OECD carcinogenicity TG-453). Rats were fed glyphosate (96.5% pure) in the diet for 24 months. Target doses were 2,000, 8,000, and 20,000 ppm. Using food consumption data, the authors calculated that the rats were exposed to 89, 362, 940 mg/Kg/day for the males and 113, 457, and 1,183 mg/Kg/day for the females of the low, medium, and high dose groups.

There was a treatment-related significant decrease in body weight among the female rats in the highest dose group in the absence of any change in food consumption. Significantly increased liver weight was also found for males in the highest dose group. The number of animals surviving to the conclusion of the study was 29, 38, 34, and 34 for males and 44, 44, 34, and 36 for females. Taken together, these data suggest that the dose selection was considered adequate for a carcinogenicity study. However, signs of toxicity in the highest dose group could confound interpretation of neoplastic changes. Regardless, non-statistically significant neoplastic changes were noted in pancreatic islet cells. Specifically, pancreatic islet cell adenomas (benign lesion) were found in 1/58 (2%), 8/57 (14%), 5/60 (8%), and 7/59 (12%) in the control, low, medium, and high dose group males. In females the incidence was 5/60 (8.33%), 1/60 (1.67%), 4/60 (6.67%), and 0/59 in the control, low, medium and high dose group females, respectively.

I conclude that the pancreatic islet cell adenomas are not treatment-related for several reasons. First, a dose related increase in the incidence of these lesions was not demonstrated in the males and the incidence of these tumors was higher in the control females compared to those treated with glyphosate. Furthermore, while pancreatic islet cell tumors are more common in male than female rats (Majeed 1997), these tumors are known to occur spontaneously in aged Sprague-Dawley rats (Chandra et al. 1992) and the incidence of these lesions in the current study was within the range of historical controls $(0-17\%)^2$. Moreover, there was no evidence of neoplastic

²I have used the range of historical controls as opposed to the mean, which is the common and standard practice in interpreting toxicological data. The range is more relevant compared to the mean because it provides the reviewer with a better appreciation for the spread of the data, which can be variable for many tumors and is thus important to take into consideration (Baldrick 2005; 2007).

progression noted in any of the pancreatic specimens examined and the only carcinoma that was found occurred in a male animal from the control group. Hence, the neoplastic changes documented in this study are in my opinion spontaneously occurring pancreatic islet cell tumors and unrelated to glyphosate treatment.

To complete its review, the United States Environmental Protection Agency (US-EPA) requested additional data on the historical controls for the following lesions: (1) thyroid C-cell adenomas, carcinomas, and hyperplasia; (2) hepatocellular adenomas, carcinomas, and hyperplasia; and (3) keratoacanthomas. A review of the data submitted on incidence of historical controls led to a conclusion that, for all three neoplasms, the incidences for all lesions fell within the range of historical controls and therefore, I conclude that these lesions were spontaneously occurring and unrelated to glyphosate treatment. Dr. Portier reports that there was a statistically significant trend for liver adenomas; however, this disappears when these lesions are combined with hepatocellular adenocarcinomas. I further noted that there was no compound-related replication of these tumors across multiple studies, there was no progression to carcinoma, no evidence of a dose response, and finally no significance when combining adenomas/carcinomas. Accordingly, I conclude within a reasonable degree of scientific certainty that glyphosate was not carcinogenic in this study.

Strengths of this study include use of an appropriate study design, number of animals/dose group, three dose groups and a negative control, appropriate route of exposure, use of a high dose that reached the limit dose, and adequate study duration.

MRID (Brammer, 2001 – discussed in Greim et al., 2015 - Study 7): This study was conducted by Syngenta and included Wistar rats of both sexes (52/group) treated with vehicle or glyphosate (121, 361, and 1214 mg/kg/day for males and 145, 437, 1498 mg/kg/day for females) in the diet for 24 months in a standard cancer bioassay. Strengths of this study include use of an appropriate study design, number of animals/dose group, three dose groups and a negative control, appropriate route of exposure, use of a high dose that exceeded the limit dose, and adequate study duration.

Results of this study revealed the presence of liver adenomas with an incidence of 0/52, 2/52, 0/52, and 5/52 in the control, low, medium, and high dose animals, respectively. It is important to note that in this study, males of the highest dose group were more robust as reflected in a better survival compared to the control group (26/52 vs. 16/52, respectively). Increased survival to the end of the study is relevant because it allows the animals longer exposure time for tumors to spontaneously emerge and thus increases the likelihood of detecting tumors in the high dose group compared to the control group. Furthermore, according to the historical control data cited by Dr. Portier, it is relevant to note that the range of liver adenomas in Wistar rats is 0 to 17.5% (Giknis and Clifford, 2011). Results of the present study are within the range of these historical controls. Thus, the findings of a 10% incidence in adenomas in rats of the highest dose group in

the present study are not in my opinion treatment related. Beyond just a statistical comparison of the numbers, there was no evidence of a dose response and evidence of progression from adenomas to adenocarcinomas was also lacking. Hence, for multiple reasons this is considered a negative carcinogenicity study.

MRID 49987401 (Wood et al., 2009a – discussed in Greim et al., 2015 - Study 8): Adult male and female Wistar rats were treated with vehicle of 95.7% pure glyphosate (95, 317, and 1230 mg/kg/day) in the diet. This was a combined chronic toxicity and carcinogenicity study and conducted according to regulatory guidelines. Strengths of this study include use of an appropriate number of animals/dose group, three dose groups and a negative control, appropriate route of exposure, use of a high dose that exceeded the limit dose, and adequate study duration. Combining a chronic toxicity study with a two-year cancer bioassay is seen as an additional strength of the study owing to the incorporation of additional outcome measures of general toxicity.

Results of this study failed to reveal a statistically significant increase in the incidence of mammary gland adenomas whilst there was a significant trend for increased incidence of mammary gland adenocarcinomas (2/51, 3/51, 1/51, and 6/51). Combination of adenomas and adenocarcinomas was significant using a pair wise test for the highest dose group only (2/51, 3/51, 1/51, and 8/51) and trend analysis was also significant. However, it is noted that there was no evidence of a dose response. Moreover, I note that in the Brammer study discussed above there was no evidence of a statistically significant trend for an increase in the number of mammary gland adenomas and adenocarcinomas. Furthermore, the incidence of adenomas and adenocarcinomas was higher in the controls of the Brammer study than in the treated animals. The same results were found in the Suresh study discussed in detail below.

Taken together these considerations lead me to conclude that mammary gland tumors in this study were not compound-related. In the summary of the study, there was no mention of proliferative changes. Dr. Portier asserts without reference that mammary adenocarcinomas can arise without the presence of adenomas. It is unclear where this comment derives from and it is inconsistent with the generally accepted view of cancer pathobiology. Mammary gland tumors are common in rats with a prevalence of 57% in female Sprague-Dawley rats allowed to live out their natural life-span (Davis et al. 1956) and within the historical control range for these tumors in Wistar rats (Giknis and Clifford, 2011). I note that there were no statistically significant mammary tumors detected in other well conducted studies in Wistar (Brammer, 2001; and Suresh, 1996) or any Sprague Dawley (Lankas, 1981; Enemoto, 1997; Atkinson et al., 1993; Stout and Ruecker, 1990) rats as summarized in Table 8 from Dr. Portier's report (p. 33).

A non-significant increase in skin keratoacanthomas (2/51/3/51/0/51, and 6/51) was noted but trend analysis was significant in the males. The dose response was not detected and the lack of pair-wise statistical significance suggests that this pattern of tumors is not compound-related. Furthermore, the lack of reproducibility of these findings - in other well conducted studies - further indicates that these findings were not compound-related.

In summary, this was a well-designed carcinogenicity bioassay that employed an appropriate route of exposure, number of animals, dose groups, and study duration. The maximal dose exceeded the regulatory requirement for a limit dose. Absence of evidence of a significant dose response for the mammary tumors, a common spontaneously occurring tumor, and lack of findings of tumor progression lead me to conclude that the mammary tumors were unrelated to glyphosate treatment. Therefore, it is my assessment that this is a well-conducted negative study.

Atkinson et al. 1993 (discussed in Greim et al., 2015 - Study 3): A combined chronic toxicity and carcinogenicity study was carried out using dietary exposure of glyphosate (98.9% pure) administered to 50 Sprague Dawley rats of both sexes/dose group. Five dose groups including a vehicle control were used. The males received 0, 11, 112, 320, and 1,147 mg/Kg BW/day while the females received 0, 12, 109, 347, and 1,134 mg/Kg BW/day for 104 weeks. Interim sacrifices were carried out at one-year in an additional 35 rats from each sex and dose group.

There were no adverse effects of treatments and histopathological assessment of tissues failed to reveal any morphological abnormalities in this study. Furthermore, there was no increase in the incidence of neoplasia in any tissue studied. Although there were no significant glyphosate effects on thyroid tumor incidence, Dr. Portier notes a statistically significant trend for follicular thyroid tumors based on the assumption that the unexamined mid-dose groups would not have any tumors. Thyroid follicular tumors are relatively common in rats with an average incidence of 3.79% and a range of 0-14% in control animals studied over 24 months (Giknis and Clifford, 2004). Thus, the high dose tumor incidence falls within the range of historical controls suggesting that these tumors are not compound-related. Moreover, the lack of reproducibility of these tumors in other studies further suggests that these are incidental findings that are not related to glyphosate exposure.

This study has a number of strengths including the study design employed, use of an appropriate route of administration, inclusion of four dose groups in addition to a vehicle control, use of an appropriate high dose, appropriate number of animals/dose group, two-year duration of the study, and inclusion of interim analysis of animals for signs of toxicity. No weaknesses were detected with the study design, execution or interpretation of the study results. Dr. Portier considers this a weak study because it failed to examine the pathology of all animals in mid dose groups. However, Dr. Portier's own report (p. 27) showed that adding in additional animals to the mid-dose groups did not produce a meaningful change in the p-trend unless one assumes that all animals in the mid dose groups would not have had tumors. However, as noted above, these are common tumors and thus this maybe an unreasonable assumption. Therefore, I assign little

weight to Dr. Portier's criticism especially because this study was consistent with the state of the art of the time that it was conducted. Accordingly, this study was considered a strong negative study that lends strength to the view that glyphosate is not a carcinogen.

<u>Suresh</u>, 1996 (discussed by Greim et al., 2015 – Study 4): In this study, 50 Sprague Dawley rats of each sex were assigned to one of three dose groups or a control. The animals were administered glyphosate (96-96.8% pure) at doses of 0, 6.3, 59.4, and 595.2 mg/Kg BW/day (males) and 0, 8.6, 88.5, and 886 mg/Kg BW/day (females) in the diet for 24 months. Results of this study did not elicit any evidence of adverse health effects and no morphological abnormalities were demonstrated in the histopathological assessment of the animal tissues studied. Furthermore, there was no evidence of a statistically significant increase the trend in tumor incidence in any of the tissues studied.

Overall, this is a well-designed study with numerous strengths including an appropriate study design for the assessment of carcinogenicity, use of three dose groups plus a control, route of glyphosate administration, and appropriate study length. A weakness of this study is the highest dose group falls below the limit dose.

Enemoto, 1997 (discussed in Greim et al., 2015 – Study 6): This was a combined chronic toxicity and carcinogenicity study carried out by Arysta Life Sciences in 50 Sprague Dawley rats for each sex and dose group. Rats were administered glyphosate in the diet at dose levels of 0, 104, 354, and 1127 mg/kg BW/day (males) and 0, 115, 393, and 1247 mg/kg BW/day (females) for two-years. Interim sacrifices were carried out at 26, 52, and 78 weeks in 10 rats of each sex/dose group. This study did not reveal any signs of adverse effects and histopathological assessment of the tissues did not demonstrate any evidence of any morphological abnormalities. However, although pair wise comparisons failed to reveal a statistically significant effect of treatments, Dr. Portier reports that there was a statistically significant trend for kidney adenomas (p. 30). Histopathological assessment of the tissues failed to reveal any evidence of hyperplasia and thus there was no evidence of tumor progression. The lack of evidence of morphological abnormalities (hyperplasia), absence of significant differences by pair wise comparisons, absence of dose response, and failure to replicate these findings in other well-conducted studies leads me to conclude that this observed trend is not glyphosate related.

This study has a number of strengths including the study design employed, use of an appropriate route of administration, inclusion of three dose groups in addition to a vehicle control, use of an appropriate high dose, appropriate number of animals/dose group, two-year duration of the study, and inclusion of interim analysis of animals for signs of toxicity. No weaknesses were detected with the study design, execution or interpretation of the study results. Accordingly, this negative study lends strength to the view that glyphosate is not a carcinogen.

Synthesis of rat studies

In summary, while potential neoplastic changes were documented in these studies, the totality of the evidence leads me to conclude that these tumors were not glyphosate related. This is especially because, as Dr. Portier readily admits, statistically significant results are to be expected given the high number of tests performed across these studies. These studies all failed to demonstrate any evidence of statistically significant compound-related increased incidence of tumors. These studies are highly relevant and were generally conducted according to well-established and internationally harmonized regulatory carcinogenicity test guidelines. The conclusions in the current report diverge from those of Dr. Portier. Reasons for our divergent conclusions can in part be explained by differences in the methodology and analyses carried out. Specifically, in the current assessment of the data, I have assessed the overall scientific quality of the studies in addition to evaluating neoplastic changes in the context of the totality of scientific knowledge rather than limiting discussion to just a statistical analysis of the data. The absence of compound-related tumor findings in each of these individual negative studies indicates that in total glyphosate is not carcinogenic in rats. Therefore, I conclude that there is no scientifically reliable evidence of glyphosate carcinogenicity in rats.

Mouse studies

Studies judged as inadequate

The doses of glyphosate used in the Reyna and Gordon (1974) and Pavkov and Turner (1987) studies were inadequate and thus were excluded from my analysis. Dr. Portier similarly considered these studies and excluded them from his analysis. These studies were all negative; however, in view of their limitations and consistency of opinions on these studies they will not be discussed further here.

Studies judged as adequate

Knezevich and Hogan, 1983 (discussed by Greim et al., 2015 - Study 10): The results of this mouse study conducted by Monsanto have received considerable attention owing to the pattern of kidney tubule lesions. Briefly, CD-1 mice (50/dose group for both sexes) were administered 99.8% pure glyphosate (161, 835, and 4,945 mg/Kg/day for male mice and 195, 968, and 6,069 mg/Kg/day for female mice) in the diet for 24 months. Results of this study revealed an 11% loss in body weight of the male animals in the highest dose group compared to controls. In addition, this study revealed that glyphosate treatment had no statistically significant effect on survival; however, kidney adenomas were found in 0/49, 0/49, 1/50, and 3/50 male mice. A reanalysis of

the tissue blocks identified one additional adenoma in the control group changing the dose response to 1/49, 0/49, 1/50 and 3/50.

Since it is typical of large cancer bioassays to only grossly examine the whole organ and to cut a single paraffin section for histopathological analysis, it is possible that even more tumors could be identified and further insight gained from examination of additional tissue sections in all four dose groups. Therefore, additional sections were cut for histopathological assessment and further insight was sought. Subsequently, a Pathology Working Group (PWG) met to review the kidney adenoma and carcinoma data. It is noteworthy that the PWG unanimously agreed that the control mouse tumor was present and should be considered. As Dr. Portier notes, with the tumor in the control mouse included there are no statistically significant differences. Moreover, I note Dr. Portier's statistical analysis indicated that none of the other mouse cancer bioassays to assess the carcinogenicity of glyphosate generated statistically significant incidences of compound-related kidney tumors using the guideline Fisher test or Cochran-Armitage trend analysis. The high dose of glyphosate used gives me confidence that that the absence of significant changes in kidney tumors is a genuine negative finding.

From my review of the data and subsequent analyses together with a review of the relevant correspondence, I conclude that the absence of a dose response together with lack of evidence of tumor progression supports the conclusion that these tumors are spontaneously occurring and unrelated to treatment. Drs. Neugut and Jameson use the *p* trend from the IARC assessment to justify their conclusions of a statistically significant trend yet Dr. Portier disagrees with this conclusion. Moreover, the dose levels employed were at or near the limit dose for the medium dose group whereas in the highest dose group they are 5 times above the limit dose for the male high dose group. While an 11% loss in body weight in the highest dose group of males was detected no compound-related tumors were demonstrated. Finally, the step sectioning employed makes it even more unlikely that the tumors were a compound-related effect, as extra sections failed to identify any new tumors in any dose group.

Atkinson, 1993b – (discussed in Greim et al., 2015 - Study 11): In this carcinogenicity study, 50 mice/dose group of each sex were administered 97% pure glyphosate (98, 297, and 988 mg/Kg/day for males and 102, 298, and 1,000 mg/Kg/day for females) in the diet for 24 months. No pre-neoplastic or related neoplastic lesions were detected. Incidental pituitary adenomas were noted and there was a non-significant increase in bronchioalveolar adenomas of the males only. Dr. Portier suggests that some of these tumors are marginally significant. However, as previously noted in my report, the concept of marginal significance would not typically be accepted in any credible scientific publication. There was a significant trend in hemangiosarcomas with 4/45 (8.9%) lesions found in the high dose group of males only. While these tumors are rare in humans (Weiss 2008) they are common neoplasms of mice (Elwell 2004), suggesting a potential different underlying mechanism for their development in mice compared to humans. Also note that the two-year hemangiosarcoma incidence data reported for historical controls in CD-1 mice ranges up to 12% (Giknis 2000). This incidence is well within the range of the historical controls

cited by Dr. Portier³. Moreover, since these tumors were not detected in a statistically significant trend in male mice in other appropriately conducted cancer bioassays, the lack of replication weighs against considering these tumors to be treatment related. Finally, I note that kidney adenomas in this study were found in a dose pattern of 2, 2, 0, and 0. This pattern contrasts with that reported previously in mice (Knezevich and Hogan, 1983) with a pattern of 1, 0, 1, and 3. These conflicting data further illustrate the lack of consistency of data across studies and further indicate the lack of compound-related effects. This is a strong study owing to the study design, and the dose levels used, including a dose representative of the limit dose, and absence of confounding systemic toxicity. Hence, this study is considered a negative study.

Sugimoto, 1997 (discussed by Greim et al., 2015 - Study 12): A chronic study in ICR-CD-1 mice (50/dose group) treated with 97.6% pure Glyphosate (165, 838, and 4,438 in mg/kg/day in males and 153, 787, and 4,116 mg/Kg/day for female animals) in the diet for 18 months was performed consistent with an OECD carcinogenicity TG. In this study, malignant lymphomas were reported 2/50, 2/50, 0/50, and 6/50. The absence of a dose response, lack of statistical significance by Fisher pair wise comparison, and absence of compound-related effects on lymphomas in other well conducted mouse cancer bioassays lead me to conclude that these tumors are not compound-related. Furthermore, the incidence of these tumors falls within the range of historical controls in the Giknis (2000) report (0-14%) cited by Dr. Portier and the range of historical controls (3-19%) from contemporaneous studies conducted at the same laboratory (BFR, 2015).

A statistically significant increased incidence of hemangiomas (a non-malignant tumor) was found in the female mice only with a pattern of 0/50, 0/50, 2/50, and 5/50. However, effects seen at the high dose are potentially confounded by signs of systemic toxicity as revealed by liquid stool, retarded growth, and reduced food consumption (Greim et al. 2015). These are non-malignant lesions of unknown cause that generally appear early in life. The absence of evidence of tumor progression in an 18-month study is reassuring that glyphosate is not carcinogenic. In addition, I note that there were no compound-related hemangiomas found in other well designed carcinogenicity bioassays. Thus, potential compound-related effects in the high dose group of this study are considered less reliable.

In summary, this study has numerous strengths including study design including multiple dose groups, dose range and duration of the study and is therefore regarded as a strongly negative study.

³Dr. Portier appears to confuse historical control data for "whole body" hemangiosarcomas as capturing all hemangiosarcomas. Thus, he does not count hemangiosarcomas reported in the Giknis data at other sites, like the liver. In fact, hemangiosarcomas are a vascular tumor that appears throughout the body and thus it may be best to report these tumors as the number of mice with these tumors regardless of site.

Wood et al., 2009b – (discussed in Greim et al., 2015 - Study 14): In this chronic toxicity study, CD-1 mice (50/sex/treatment group) were given free access to food containing 95.7% pure glyphosate (71, 234, and 810 mg/kg/day for male mice and 97.9, 300, and 1,081 mg/kg/day for female mice) for 80 weeks. Lung tumors and malignant lymphomas were detected in the male mice. While Dr. Portier argues that rodent and human NHLs are similar, it is unclear what he means. Specifically, are they similar in the biological processes of their origin, their pathobiology, incidence, progression, or ultimate impact on health? Contrary to Dr. Portier's suggestion, clear differences in the biological development of lymphomas in rodents and humans have been described (Morse, 2003) leading me to question whether the connection between lymphoma in mice and NHL in humans can be definitively established. Consequently, the published evidence, along with the known difficulty of directly extrapolating animal findings to humans, suggests that these tumors cannot be considered similar as suggested by Dr. Portier.

In this study, there was a statistically significant increase in the trend for the incidence of malignant lymphomas in the male mice. Historical controls from the same lab were available. The historical background incidence was 12% in an 18-month study (SafePharm) and thus the incidence in the high dose group in the current study is consistent with historical controls. Furthermore, lymphomas are common tumors in mice (Haseman et al. 1998; Ward 2006). The historical control data cited by Dr. Portier (Giknis and Clifford, 2005) indicate that it is unusual to have zero lymphomas in a control group. This observation, together with the absence of malignant lymphomas reported for the control group of the current study and considering the historical control rate of 12% in the same laboratory, suggests that the finding of statistically significant differences is most likely a statistical artifact. Therefore, I conclude that there were no treatment-related tumors in this study.

Treatment had no effect on lung adenomas but a trend towards an increase in lung adenocarcinomas was detected although statistical significance could not be demonstrated for the high dose group. The lack of agreement between the Fisher's comparison test and assessment of a trend is less convincing than if both are significant and prompts further analysis. Furthermore, the combined incidence of lung tumors (14/51, 12/51, 16/51, and 15/51) in this study lacks any evidence of a dose response and statistically significant changes could not be demonstrated. Moreover, absence of evidence of preneoplastic changes and tumor progression was noted indicating lack of compound-related effects. Dr. Portier speculates that tumors could arise by alternative mechanisms that do not involve pre-neoplastic lesions but fails to provide any citation to support his opinion. This notion runs contrary to widely accepted understanding of tumor pathobiology and thus is speculative at best. Therefore, I conclude that these are spontaneously occurring lesions unrelated to treatment.

This study has numerous strengths including study design including multiple dose groups, dose range, and number of animals/dose group. The 80-week duration of the study is shorter than the 24 months used for rat studies but is consistent with regulatory requirements for this strain of mice. Consequently, this study is regarded as a negative study.

<u>Kumar et al., 2001 – (discussed in Greim et al., 2015 - Study 13):</u> This study was conducted in Swiss Albino mice and failed to show evidence of morphological abnormalities although there was a statistically significant pairwise increase in the number of malignant lymphomas seen in the highest dose group; however, a statistically significant trend was not detected.

This study was noted to be of questionable value in a prior review (Greim et al., 2015) owing to a possible viral infection amongst the study animals. I note that this study was excluded from consideration by EPA and Dr. Jameson but that Dr. Portier considered this study. Furthermore, in Dr. Portier's revised report (p. 43), he cites a recent memo from Martens (2017) asserting that the incidences for malignant lymphomas and kidney adenomas described in Greim et al., (2015) and BFR (2013) are incorrect. I am troubled by the potential existence of multiple data sets for the same study and the lack of explanation or evidence of data verification. Consequently, the existence of two different data sets and lack of data validation together with the questionable value of this study owing to the potential viral infection leads me to conclude that this study is unreliable and thus was excluded from my analysis.

Synthesis of mouse studies

In summary, a statistically significant trend towards an increase in incidental tumors in varying tissues was reported in four studies (Knezevich and Hogan, 1983; Atkinson, 1993b; Wood et al., 2009b; and Sugimoto, 1997). However, looking beyond a simple statistical analysis of the data to include a comparison of incidence with concurrent controls, historical controls or the relevant literature suggests that these tumors did not depart from normal variation for the individual tumor types. The lack of consistent evidence of dose response further indicates that glyphosate is not carcinogenic. Furthermore, the lack of evidence for tumor progression and absence of statistically significant effects when benign and malignant tumors were combined adds further strength to the conclusion that any effects were not compound-related. I also found that there was no replication of potential compound-related effects across these studies.

I note that these studies are highly relevant and were conducted consistent with well-established test guidelines. The conclusions in the current report diverge from those of Dr. Portier, Reasons for our divergent conclusions can in part be explained by differences in the methodology and analyses carried out. Specifically, in the current assessment of the data, I assessed the overall scientific quality of the study in addition to evaluating neoplastic changes in the context of the totality of scientific knowledge. My analysis extends beyond that of Dr. Portier who limits discussion to a statistical analysis of the data only, utilizing novel statistical procedures without

scientific validation supported only by unreferenced speculation about potential causes. The absence of compound-related tumor findings in each of these individual negative studies indicates that in total glyphosate is not carcinogenic. Therefore, I conclude that there is no scientifically reliable evidence of glyphosate carcinogenicity in mice.

Synthesis of animal data

My review of the animal literature on the potential carcinogenicity of glyphosate revealed a robust data set. These studies were conducted over a wide span of time including introduction of regulatory test guidelines for carcinogenicity testing. I note that the majority of the studies reviewed followed regulatory guidelines for or were consistent with carcinogenicity testing guideline requirements.

Dr. Portier in his report argues (p. 52) that you cannot compare data across animal studies if you also argue that the data cannot be combined in a pooled analysis of the kind he carries out. However, it is a very different thing to look at results across studies you know are similar but have some important differences as opposed to treating them as if they are one big study suitable for combining in an unvalidated pooled analysis. Specifically, important differences between studies include a) different time periods, b) different labs, c) different doses, d) different rodent stocks, and e) known genetic drift. Animal studies are designed to control for or minimize the effect of other sources of variation that would confound the detection of a compound-related effect within the study. However, if you combine the data from multiple animal studies then you cannot exclude the influence of the above noted variables on the outcomes of interest (e.g. tumors). If you have a bias in time going one way (i.e. an increase in stomach tumors in that particular strain from 1970 - 2000), then that might produce significance when in fact there is no compound-related effect. Similarly, if there is a trend towards a decrease in incidence for a particular tumor over time, then combining data would increase the odds of not detecting tumors when they were in fact present. It is routine for toxicologists to compare the results of studies whereas combining studies in a single statistical analysis is not the current scientific standard. Although all studies detected tumors and some detected statistically significant increases of tumors, it is my opinion that the occurrences of these tumors were, within a reasonable degree of scientific certainty, incidental findings unrelated to glyphosate treatment. Glyphosate does not induce rodent tumors and thus, animal carcinogenicity experiments do not support the hypothesis that glyphosate poses a health risk to humans. The basis for my conclusions arise from multiple lines of consideration including the lack of consistency of the data across studies, weakness of the reported associations, lack of dose response characteristics, and absence of biological plausibility. Details of my considerations are described in the following paragraphs.

The animal studies reviewed were conducted according to or consistent with standardized and internationally recognized carcinogenicity test guidelines. Test guidelines are designed to produce robust and reproducible data. However, in the studies that I reviewed, I found no

consistency of tumor findings across the studies and tumors identified in the individual studies are, in my opinion, nothing more than statistical anomalies arising from multiple comparisons, unusually low prevalence of tumors in the control groups for common tumor types, decreased survival of control animals relative to treated animals, or evidence of systemic toxicity in the high dose group. Thus, there is a lack of consistency for any association of glyphosate exposure and tumor development. It was noted that a statistically significant trend was detected for hemangiosarcomas, a relatively common neoplasm in mice (Elwell 2004), in one mouse study (Atkinson, 1993) and was not replicated in other mouse studies. If glyphosate was acting as a carcinogen then I would expect the data to be reproducible with neoplastic changes in one study being replicated by other carefully conducted studies as previously described (Gold et al. 1987; Gold et al. 1989). Although there may be small variations between animals and studies, the mechanism of compound action is expected to remain constant and thus tumors in a given target tissue should be reproducible across animal studies. Indeed, I agree with Dr. Portier when he states that replication of studies "is critical in most scientific debates." (p. 5), Furthermore, I note that these regulatory studies typically assessed a broad spectrum of outcome measures including histopathological assessment of major organs. Therefore, as designed the regulatory studies favor the detection of false positive adverse outcomes (finding non-treatment related tumors) in preference to false negatives (missing detection of a treatment-induced tumor). In view of the lack of reproducibility of the tumor data between studies I conclude that these tumors are not compound-related. This view is further supported by similarity of incidence with concurrent and historical controls. While I appreciate that it is best to compare results with contemporaneous historical controls, this is not always possible especially with retrospective data. However, I note that the incidence of the tumors is generally in agreement with the published literature on tumor incidence in rats and mice (Chandra et al., 1992; Davis et al., 1956; Haseman et al., 1998; Majeed 1997; Prejean et al., 1973; Ward 2006; Giknis 2000; and Giknis and Clifford, 2011) providing further assurance that the observed tumor findings are spontaneously occurring and not attributable to glyphosate treatment. Thus, I conclude that the observed tumors are false positives and cannot be attributed to glyphosate treatment.

In addition to the lack of consistency across the studies, I further note that there is a general lack of a dose response for the tumor data. The dose response patterns reported in the reviewed studies can be characterized as inconsistent and in most cases statistically non-significant. Thus, the statistically significant dose-response curves when observed were of questionable biological relevance. It is important to acknowledge that, in almost all the cases, when tumor incidence became an observation of interest, it was almost exclusively a result of increased incidence in the highest dose group. Several studies used doses that were slightly to well above the limit dose (Brammer, 2001; Wood et al., 2009a; Knezevich and Hogan, 1983; Sugimoto, 1997). While this is acceptable when dosing through the diet, it remains important to ensure that the dose used is not inducing systemic toxicity that could confound interpretation of the study results. Moreover, the translational importance of potential adverse findings in these studies to humans is questionable. Therefore, I conclude that there is no scientifically reliable evidence from the studies reviewed that glyphosate treatment, under the conditions of these animal studies, can be considered carcinogenic.

In the context of assessing the animal carcinogenicity of glyphosate, I also assessed the biological plausibility that glyphosate is carcinogenic. Specifically, carcinogenesis is widely acknowledged to be a multistep process involving tumor initiation, promotion, and progression. Central to the process of carcinogenesis is the process of tumor initiation and tumor progression arising from genotoxic effects of a test chemical or its metabolites. While my task was to assess the animal literature, I note that the genotoxicity studies with glyphosate were both numerous and almost all (98%) were negative (Greim et al., 2015).

I further searched the literature for any evidence that glyphosate could act as a tumor promoter. One study suggested that glyphosate could act as a tumor promoter in a skin carcinogenicity test (George et al. 2010); however, any such mechanism remains elusive. While plaintiffs' expert Dr. Portier cites the preceding study as evidence of glyphosate's potential to act as a tumor promoter, this study has numerous shortcomings including but not limited to: no positive vehicle control, no defined source of substances or purity, low numbers of animals, and lack of pathological analysis. Therefore, I conclude that this poorly defined study does not provide convincing (or reliable) support for the notion that glyphosate acts as a tumor promoter.

From my review of the literature, I conclude that the carcinogenicity of glyphosate has been thoroughly evaluated according to validated and internationally recognized carcinogenicity test guidelines. Dr. Portier is correct when he notes, "it is clear that not every tumor shows a positive trend with glyphosate exposure." (pg. 46). In fact, the vast majority do not. Multiple well designed and executed studies conducted in rats and mice reveal that tumors are not more common in glyphosate treated animals than in the concurrent control groups. When perceived differences in tumor incidence were detected, careful evaluation of animal survival, body weight, historical control incidence, dose-response, and assessment for signs of tumor progression showed that tumors did not occur with higher incidence in the treatment groups compared to controls and thus glyphosate was not carcinogenic. Assessment of animal survival and body weight, as well as comparison with historical controls and histopathological assessment of proliferation and tumor progression are standard and expected procedures carried out routinely by scientists in regulatory, government, and academic laboratories worldwide. Thus, as an endpoint, carcinogenesis does not meet the standard required for the establishment of a no effect level in the hazard identification step of the risk assessment process. Moreover, the lack of consistency of effects across well designed regulatory carcinogenicity studies, weakness of the evidence for any association in the animal studies, flat or non-linear dose-response, and absence of credible or reproducible evidence for biological plausibility further add confidence to the conclusion that glyphosate is not a carcinogen, a conclusion that is consistent with independent reviews from multiple expert government regulatory panels from around the globe (EFSA, US-EPA, BFR etc.).

In summary, I conclude that, on the basis of multiple carcinogenicity studies conducted in rats and mice, there is no scientifically reliable evidence of glyphosate-induced increased tumor incidence. I disagree with the conclusions of Drs. Portier, Jameson, Weisenburger, Neugut, and Nabhan that any of the individual glyphosate rodent studies discussed in their reports demonstrates that glyphosate is a rodent carcinogen, let alone that there are any replicated findings of tumor-related effects. Accordingly, I disagree with Dr. Portier's statement that in the rodent carcinogenicity studies "there is clear evidence of a biological gradient" (Portier report at p. 75). Moreover, any extrapolation of the incidental tumors found (all of which are unrelated to glyphosate) to humans is scientifically implausible given the differences in relevant dosing, as well as the translational challenges in extrapolating from animals to humans. Additionally, pooling of these studies is an unproven approach that makes no toxicological sense. The hallmark signs of carcinogenicity are absent from the robust glyphosate data set. The glyphosate data does not demonstrate: a dose-response relationship between glyphosate exposure and tumors; tumor progression (neoplastic continuum); or a biologically plausible mechanism of action. Moreover tumor incidences are generally what one would expect when considering pairwise and historical controls, and the expected number of positive findings due to chance alone. The absence of glyphosate-induced tumor incidence in any one study, given the large number of studies, is compelling evidence that glyphosate is not carcinogenic. With such a robust data set, if glyphosate were carcinogenic, one would expect to see evidence of carcinogenicity not only in an individual study, but replication of carcinogenic findings in a particular tumor type across multiple studies. Accordingly, I conclude that, within a reasonable degree of scientific certainty, glyphosate is not a rodent carcinogen.

UNITED STATES DISTRICT COURT NORTHERN DISTRICT OF CALIFORNIA

IN RE: ROUNDUP PRODUCTS
LIABILITY LITIGATION

MDL No. 2741

Case No. 16-md-02741-VC

This document relates to: ALL ACTIONS PLAINTIFFS' NOTICE TO TAKE ORAL AND VIDEOTAPED DEPOSITION OF DR. WARREN G. FOSTER

To: Monsanto Company, by and through their counsel, Hollingsworth, LLP.

Please take notice that, pursuant to Rule 30 and Rule 45 of the Federal Rules of Civil Procedure, Plaintiffs' Counsel shall take the videotaped deposition upon oral examination of **Dr.**Warren G. Foster on September 15, 2017 before a person duly authorized to administer oaths. The deposition shall commence at 9:00 a.m. ET at Sheraton Gateway Hotel, Terminal 3,

Toronto AMF, Toronto, ON, L5P 1C4, Canada. The conduct of the deposition, including its continuation if necessary, shall be governed by Pretrial Order No. 7: Deposition Protocol (ECF No. 103) and Rule 30 of the Federal Rules of Civil Procedure. Dr. Foster shall produce any documents identified in Schedule A attached to his Document Subpoena, at least 10 days prior to the deposition.

Dated: September 5, 2017

Respectfully submitted,

AO 88B (Rev. 02/14) Subpoena to Produce Documents, Information, or Objects or to Permit Inspection of Premises in a Civil Action(Page 3)

Federal Rule of Civil Procedure 45 (c), (d), (e), and (g) (Effective 12/1/13)

(c) Place of Compliance.

(1) For a Trial, Hearing, or Deposition. A subpoena may command a person to attend a trial, hearing, or deposition only as follows:

(A) within 100 miles of where the person resides, is employed, or regularly transacts business in person; or

(B) within the state where the person resides, is employed, or regularly transacts business in person, if the person

(i) is a party or a party's officer; or

 (ii) is commanded to attend a trial and would not incur substantial expense.

(2) For Other Discovery. A subpoena may command:

(A) production of documents, electronically stored information, or tangible things at a place within 100 miles of where the person resides, is employed, or regularly transacts business in person; and

(B) inspection of premises at the premises to be inspected.

(d) Protecting a Person Subject to a Subpoena; Enforcement.

(1) Avoiding Undue Burden or Expense; Sanctions. A party or attorney responsible for issuing and serving a subpoena must take reasonable steps to avoid imposing undue burden or expense on a person subject to the subpoena. The court for the district where compliance is required must enforce this duty and impose an appropriate sanction—which may include lost earnings and reasonable attorney's fees—on a party or attorney who fails to comply.

(2) Command to Produce Materials or Permit Inspection.

(A) Appearance Not Required. A person commanded to produce documents, electronically stored information, or tangible things, or to permit the inspection of premises, need not appear in person at the place of production or inspection unless also commanded to appear for a deposition, hearing, or trial.

(B) Objections. A person commanded to produce documents or tangible things or to permit inspection may serve on the party or attorney designated in the subpoena a written objection to inspecting, copying, testing, or sampling any or all of the materials or to inspecting the premises—or to producing electronically stored information in the form or forms requested. The objection must be served before the earlier of the time specified for compliance or 14 days after the subpoena is served. If an objection is made, the following rules apply:

(i) At any time, on notice to the commanded person, the serving party may move the court for the district where compliance is required for an

order compelling production or inspection.

(ii) These acts may be required only as directed in the order, and the order must protect a person who is neither a party nor a party's officer from significant expense resulting from compliance.

(3) Quashing or Modifying a Subpoenu.

(A) When Required. On timely motion, the court for the district where compliance is required must quash or modify a subpoena that:

(i) fails to allow a reasonable time to comply;

 (ii) requires a person to comply beyond the geographical limits specified in Rule 45(c);

(iii) requires disclosure of privileged or other protected matter, if no exception or waiver applies; or

(iv) subjects a person to undue burden-

(B) When Permitted. To protect a person subject to or affected by a subpoena, the court for the district where compliance is required may, on motion, quash or modify the subpoena if it requires:

 (i) disclosing a trade secret or other confidential research, development, or commercial information; or (ii) disclosing an unretained expert's opinion or information that does not describe specific occurrences in dispute and results from the expert's study that was not requested by a party.

(C) Specifying Conditions as an Aliernative. In the circumstances described in Rule 45(d)(3)(B), the court may, instead of quashing or modifying a subpoena, order appearance or production under specified conditions if the serving party:

 (f) shows a substantial need for the testimony or material that cannot be otherwise met without undue hardship; and

(ii) ensures that the subpoenaed person will be reasonably compensated.

(e) Duties in Responding to a Subpoena.

(1) Producing Documents or Electronically Stored Information. These procedures apply to producing documents or electronically stored information:

(A) Documents. A person responding to a subpoena to produce documents must produce them as they are kept in the ordinary course of business or must organize and label them to correspond to the categories in the demand.

(B) Form for Producing Electronically Stored Information Not Specified. If a subpoena does not specify a form for producing electronically stored information, the person responding must produce it in a form or forms in which it is ordinarily maintained or in a reasonably usable form or forms.

(C) Electronically Stored Information Produced in Only One Form. The person responding need not produce the same electronically stored

information in more than one form.

(D) Inaccessible Electronically Stored Information. The person responding need not provide discovery of electronically stored information from sources that the person identifies as not reasonably accessible because of undue burden or cost. On motion to compel discovery or for a protective order, the person responding must show that the information is not reasonably accessible because of undue burden or cost. If that showing is made, the court may nonetheless order discovery from such sources if the requesting party shows good cause, considering the limitations of Rule 26(b)(2)(C). The court may specify conditions for the discovery.

(2) Claiming Privilege or Protection.

(A) Information Withheld. A person withholding subpoenaed information under a claim that it is privileged or subject to protection as trial-preparation material must:

(i) expressly make the claim; and

(ii) describe the nature of the withheld documents, communications, or tangible things in a manner that, without revealing information itself privileged or protected, will enable the parties to assess the claim.

(B) Information Produced. If information produced in response to a subpoena is subject to a claim of privilege or of protection as trial-preparation material, the person making the claim may notify any party that received the information of the claim and the basis for it. After being notified, a party must promptly return, sequester, or destroy the specified information and any copies it has, must not use or disclose the information until the claim is resolved; must take reasonable steps to retrieve the information if the party disclosed it before being notified, and may promptly present the information under seal to the court for the district where compliance is required for a determination of the claim. The person who produced the information must preserve the information until the claim is resolved.

(g) Contempt.

The court for the district where compliance is required—and also, after a motion is transferred, the issuing court—may hold in contempt a person who, having been served, fails without adequate excuse to obey the subpoena or an order related to it.

SCHEDLUE A

DEFINITIONS

- 1. The term "Communication," as used in Schedule A shall include, but not be limited to, any contact or act by which information or knowledge is transmitted or conveyed between two or more persons and includes, without limitation: (1) written contact, including but not limited to letters, memoranda, PowerPoint presentations, email, text message, facsimile, internet-based meetings, or other written or electronic documents or files; (2) oral contact, whether by face-to-face meetings, internet-based meetings, video conferences, telephonic conversations, or otherwise; and (3) nonverbal acts intended to communicate or convey any meaning, understanding or other message.
- 2. "Documents" shall include, but not be limited to, the original and/or any nonconforming copies of any and all written, printed, typed, graphic, photographic, visual or
 otherwise recorded material, and all microfilm, or electronic sound recording or transcripts
 thereof however produced or reproduced, including non-identical copies, whether different
 from the original by reason of any notation made on such copies or otherwise, writings,
 drawings, records and recordings of every kind and description, whether inscribed by hand or
 by mechanical, electronic, microfilm, photographic or other means, as well as audio or visual
 reproduction of all statements, conversations or events including, but not limited to,
 agreements, bids, bonds, bulletins, calendars and appointment books, checks, circulars,
 communications, contracts, correspondence, statements, telegrams, receipts, returns,
 summaries, data books, accounting records, including ledgers, vouchers and books of account,
 computer printouts, information storage, media diaries and diary entries, drawings and charts,

including additions and revisions, estimates, evaluations, financial statements and records, instructions, inter- and intra-office communications, invoices, job site reports, investigative reports, audits, logs, memoranda of any type, minutes of all meetings, notes of all types, orders, including change, proceed and purchase orders questionnaires and surveys, photographs, price sheets, records, results of investigations, schedules including additions and revisions, statistical records, reports, analyses and studies of any kind, tape recordings, including any form of any recording of any telephone or other conversation, interview, conference, or meeting, and all contract and working papers as well as drawings, papers and files. A reference herein to any one or more of these types of documents shall be construed to include all other types of documents without limitations.

- 3. Words used in the singular shall, where the context permits, include the plural, and words used in the plural shall, where the context permits, include the singular.
- "You" and "your" refers to the person served with and responding to these requests.
- 5. "Roundup[®] litigation" refers to the multidistrict litigation captioned, *In re Roundup Products Liability Litigation*, Case No. 3:16-md-02741-CV (N.D. Cal.), in which individuals have asserted or will assert a claim against Monsanto Company ("Monsanto") asserting that the use of Monsanto's Roundup[®]-branded products has caused their non-Hodgkin's lymphoma ("NHL").

REQUESTS FOR PRODUCTION

As stated in the foregoing Notice, you are required to produce the following documents:

- All documents provided to you, or that you have, related to the Roundup[®] and/or glyphosate and cancer including, but not limited to, NHL, that are not publicly available.
- 2. All studies, literature, materials, research files, publications, treatises or any other documents that are not publicly available that you have reviewed and upon which you rely and/or intend to rely upon as a basis for, or in any other way support, the opinions that you intend to offer in general causation phase of the Roundup[®] litigation, MDL 2741, or that were reviewed and/or considered by you in the course of formulating your opinions.
 - 3. Your most recent curriculum vitae.
- 4. All billing records, invoices, or other documents reflecting time spent and/or fees and expenses charged by you (either directly or through your employer or other entity) in connection with the general causation phase of the Roundup[®] litigation, MDL 2741, and/or other consulting work regarding glyphosate, IARC Monograph 112, Roundup[®], Intertek Scientific & Regulatory Consultancy, other glyphosate- based products.
- 5. Any retainer letter, contract, agreement, or other document setting forth the retention of you to work in the Roundup[®] litigation, MDL 2741.
- 6. A copy of all abstracts, articles, draft articles, books or book excerpts, presentations, power points of which you are an author, co-author, drafter or editor which has as all or part of its subject matter NHL, glyphosate, Roundup[®], other glyphosate-based products

and/or IARC that are not publicly available. With respect to documents in this request relating to IARC, the time frame for the request is limited to 2014 to the present.

7. All documents and communications regarding glyphosate, NHL, Roundup[®], and/or other glyphosate-based products with any of the following people, agencies and/or entities: Exponent, Failure Analysis Associates, CropLife America, Reuters, Glyphosate Task Force, Glyphosate Expert Advisory Panel, Food and Chemical Toxicology Journal, Critical Reviews in Toxicology, Joint Glyphosate Task Force, Toxicology Technical Working Group, Environmental Protection Agency (EPA), European Union (EU), European Food Safety Administration (EFSA), Intertek Scientific and Regulatory Consultancy, Intertek Expert Panel, International Agency for Research on Cancer (IARC), Dr. Christopher Corcoran, Dr. William Fleming, Dr. Jay Goodman, Dr. Lorelei Mucci, Dr. Jennifer Rider, and Dr. Thomas Rosol.

MEMORANDUM

PESTICIDES AND TOXIC SUBSTANCES

SUBJECT: Use of historical data in determining the weight

> of evidence from kidney tumor incidence in the Glyphosate two-year feeding study; and some

remarks on false positives

Reto Engler, Chief

Scientific Mission Support Staff

TOX/HED/OPP (TS-769C)

Herbert Lacayo, Statistician FROM:

Herbert I acays Scientific Mission Support Staff

TOX/HED/OPP (TS-769C)

Bertram Litt, Statistics Team Leader THRU:

Scientific Mission Support Staff

TOX/HED/OPP (TS-769C)

BACKGROUND

The Glyphosate feeding study (EPA Reg. #: 524-308, Caswell #: 661A, Accession #: 251007-014) on Charles River CD-1 mice generated renal tubular adenomas in male mice at the 5000 and 30000 ppm dose levels. The registrant (Monsanto) claims that such tumors are "unrelated to treatment." (ref.1). In support of that they provide historical data from Bio/dynamics and two other laboratories (ref.2).

With respect to historical data we note the large number and variety of factors which influence the life history of rodents in chronic studies. Hence, it is generally agreed that the most relevant historical controls are experiments from the subject laboratory studied within a 3 to 4 year "window" (ref.3).

SUMMARY

The main purpose of this memo is to show one way historical data may be used to evaluate the significance of tumors in the glyphosate feeding study. When these data are so used we can conclude that Glyphosate dosing has a statistically significant effect (at the p = .006 level) in the production of kidney tumors in male mice. The appropriate procedure is outlined in the next section entitled Use of Historical Data. The last Section, Remarks on False Positives, addresses some comments by Monsanto (Ref.1) on this subject. That section outlines some of the weaknesses in Monsanto's position.

USE OF HISTORICAL DATA

The following information was derived from Reference 2.

Data Source*) p	Sigma		
The state of the s	(est.of tumor rate)	(est.of standard deviation)		
Bio/dynamics	.00368	.00212		
IRD Corp.	.00437	.00109		
	•			
Combined	.00399	.00094		

The value p = .00368, derived from Bio/dynamics data is a reasonable choice to use as a historical control. The data are from the same laboratory that performed the Glyphosate study and are within the appropriate 3-4 year time "window" (ref.3). Further, the standard deviation of the estimate is reasonably small.

We will now examine the Monsanto contention that the kidney tumors are unrelated to treatment. (i.e. Glyphosate has no effect on kidney tumors). First, consider the tumor rate in the Glyphosate Study: 4/198 = .0202 ---

In contrast, Bio/dynamics has the lower historical rate:

$$3/815 = .00368$$

The relevant question is: What is the probability that the 198 CD-1 mice in the Glyphosate study will produce by pure chance 4 or more mice with kidney tumors? Another way of stating this is - How likely are we to have a tumor rate of .0202 --- for the Glyphosate study given that the historical rata is .00368?

Questions of this type may be answered from manipulation of the relevant distribution which, in this case is the Binomial:

P(r out of n mice have tumors) = (r)prqn-r

Where: n = the # of male mice in the study

r = the # of male mice with kidney tumors

p = .00368, the historical probability that an individual male mouse will develop kidney tumors.

q = 1 - p

^{*}This does not include Hazleton Laboratories America, Inc. due to the small sample size of that data set

Using the above distribution and elementary but tedious calculations, we generate the following table:

# of mice with tumor	Probability that r or more min a study with 198 male mice	ce will have tumors
r = 0	1.	
1	.518177	4
. 2	.165711	
3	.037443	
4	.006481	

This last table indicates that based on a historical rate of p= .00368 that the probability of seeing 3 or more mice with kidney tumors is about .037; and the probability of seeing 4 or more such mice (i.e. seeing what in fact happened) is about .0064. We note that even considering data from I.R.D., the p value is about .01.

Under such circumstances a prudent person would reject the Monsanto assumption that Glyphosate dosing has no effect on kidney tumor production. Another way of saying this is that if Glyphosate were truly unrelated to kidney production we would expect to see 4 or more tumors in less than 1 out of 100 experiments of the type sponsored by Monsanto. Thus, Glyphosate is suspect.

REMARKS ON FALSE POSITIVES

In ref. 1 Monsanto notes that "...if 20 types of lesions were evaluated at a probability level of .05, the number expected to be positive would not be one in 20, but rather the probability would be 64 in 100, an unacceptably high value..." Monsanto is referring to the well-known fact that by examining enough data it is dikely that one will find an excess of some tumor type by chance alone; thus generating a false positive.

The Monsanto argument required the following assumptions:

- A mouse may develop 20 distinct and independent (in the statistical sense) types of tumors.
- The probability of each tumor type in a typical mouse is .05.

It follows from the above that:

P(a mouse has at least one tumor) = 1 -.9520

= .6415

Hence in 100 mice one would on the average see 64 with tumors. Monsanto proposes to avoid this "problem" of false positives by analyzing the study" ...at the .01 probability level."

We disagree with the Registrants position. First, even if one did analyze the study at the .01 level as they suggest it would still result (using the same mathematics as before) in seeing 18 mice out of 100 with tumors. And hence one still has the problem of false positives from the registrant's viewpoint. But this causes something worse from a regulatory viewpoint. We have decreased the false positive rate (i.e., the probability of saying that a chemical causes tumors when in fact it does not) at the cost of increasing the false negative rate (i.e., the probability of saying that a chemical doesn't cause tumors when in fact it does). The Registrant wishes to avoid false positives while those concerned with the public health wish to avoid false negatives. Hence, for this reason alone Monsanto's argument is unacceptable.

We further disagree as follows:

- The two assumptions needed to support the Monsanto argument are themselves in need of support (especially the requirement for statistical independence).
- False positive results are less likely to occur with rare tumors (ref. 5). And the tumors in question are rare.

Viewpoint is a key issue. Our viewpoint is one of protecting the public health when we see suspicious data. it is not our job to protect registrants from false positives. We sympathyze with the Registrants problem; but they will have to demonstrate that this positive result is false.

Finally, we mention that none of the tumors occurred in the control or low dose groups. Instead there was one at 5000 ppm and 3 at the 30000 ppm dose level. This together with the previous comments make it likely that there is a dose-tumor relationship for Glyphosate.

MEMORANDUM

TO:

William Dykstra, Ph.D.

OFFICE OF PESTICIDES AND TOXIC SUBSTANCES

Reviewer, Toxicology Branch, TS-769

FROM:

Louis Kasza, D.V.M., Ph.D.

Pathologist, Toxicology Branch, TS-769

SUBJECT:

Glyphosphate -- Evaluation of Kidney Tumors in Male Mice.

Chronic Feeding Study.

INTRODUCTION:

Tumors (0 (1)*; 0; 1; 3) were found in the kidneys of male mice at different dose levels. There were differences in the pathologists' opinions as to whether the small localized change in one kidney of the control group (#1028) represented a tumor or not. In order to provide more information, the Agency recommended the preparation of three (3) additional sections from each kidney in the male groups. "The lesion was not present in the recut specimens from that animal" in the control group (#1028). In the final reevaluation of the questionable control kidney slides (#1028), the conclusion was formulated that "The pathology staff at Bio/dynamics and I (Dr. McConnell) reviewed the lesion and concur that it may be representative of a developing tumor".

MATERIALS AND METHODS:

I (Dr. Kasza, Branch Pathologist) requested all kidney sections from male mice. After selection of slides from all animals in which kidney tumors were diagnosed, I studied them under the microscope.

RESULTS:

There was no difference in diagnoses between my and other pathologists' diagnoses with respect to kidney tumors in mid- (#3023) and high dose (#4029, 4023, 4041) groups. With regard to the questionable male control kidney (#1028), it is my opinion that the presence of a tumor can not definitely be established. My interpretation is similar to the conclusion of Bio/dynamics' pathology staff and Dr. McConnell, that the lesion "may be" a proliferative change having the potential to lead to the development of a frank tumor. But as the tissue can be seen under the microscope as a small well-demarcated focal cell aggregate morphologically different from the healthy looking surrounding kidney tissue, this morphological alteration does not represent a pathophysiologically significant change.

Expert Report Christopher J. Portier, Ph.D.

Charge

Glyphosate acid is a colorless, odorless, crystalline solid. Glyphosate is the term used to describe the salt that is formulated by combining the deprotonated glyphosate acid and a cation (isopropylamine, ammonium, or sodium). This expert report is intended to review the available scientific evidence relating to the potential of glyphosate and glyphosate-based formulations (GBFs), including Roundup®, to cause Non-Hodgkin's Lymphoma (NHL) in humans.

Qualifications

I received an undergraduate degree in mathematics in 1977 from Nicholls State University and a Master's degree and Ph.D. in biostatistics from the University of North Carolina School of Public Health in 1979 and 1981 respectively. My Ph.D. thesis addressed the optimal way to design a two-year rodent carcinogenicity study to assess the ability of a chemical to cause cancer^[1, 2]; the optimal dosing pattern from my thesis is still used by most researchers. My first employment following my doctoral degree was a joint appointment at the National Institute of Environmental Health Sciences (NIEHS) and the National Toxicology Program (NTP) to conduct research on the design and analysis of experiments generally employed in toxicology. After 5 years with NIEHS/NTP, I developed my own research group which eventually became the Laboratory of Quantitative and Computational Biology and then the Laboratory of Computational Biology and Risk Assessment (LCBRA). One highlight during this period was the development of the Poly-3 Test for survival adjustment of data from two-year carcinogenicity studies in rodents^[3, 4]; this test is used as the main method of analysis of these studies by the NTP and many others. We also did a complete analysis of the historical controls animals from the NTP studies [5, 6]. The LCBRA focused on the application of computational tools to identify chemicals that are toxic to humans, to develop tools for understanding the mechanisms underlying those toxicities and to quantify the risks to humans associated with these toxicities. The main toxicological focus of the LCBRA was cancer and my laboratory developed many methods for applying multistage models to animal cancer data and implemented the use of these models in several experimental settings^[7-19]. In my last few years at the NIEHS/NTP, my research focus expanded to the development of tools for evaluating the response of complex experimental and human systems to chemicals [20-24] and the name of the laboratory shifted to Environmental Systems Biology.

Over my 32 years with the NIEHS/NTP, I was involved in numerous national priority issues that went beyond my individual research activities. After Congress asked NIEHS to work with the Vietnamese government to address the hazards associated with Agent Orange use during the Vietnamese War, I was given the responsibility of working with

my counterparts in Vietnam to build a research program in this area^[25]. Congress also tasked NIEHS with developing a research program (EMF-RAPID) to address concerns about the risks to humans from exposure to power lines and to report back to Congress on what we found. I was in charge of evaluating all research developed under this program and was responsible for the final recommendations to Congress on this issue^[26-28]

While at the NIEHS/NTP, I also had administrative positions that relate to my qualifications. From 2000 to 2006 I was the Director of the Environmental Toxicology Program (ETP) at NIEHS. The ETP included all of the toxicology research laboratories within the NIEHS Intramural Research Program. It was my responsibility to ensure the research being done was pertinent to the mission of the NIEHS, addressing high priority concerns about toxic substances and human health and that the NIEHS had adequate resources to complete this research.

During this time I was also Associate Director of the NTP, a position in which I was the scientific and administrative director of the NTP (The Director of the NTP was also the NIEHS Director and gave me complete autonomy in the management and science of the NTP). These two positions were historically always combined at the NIEHS and the NTP so that one person was in charge of all toxicological research at the NIEHS/NTP. The NTP is the world's largest toxicology program, routinely having 15 to 25 active two-year carcinogenicity studies, numerous genetic toxicology studies and many other toxicological studies being conducted at any given time. The NTP two-year carcinogenicity studies and their technical reports are also considered the "gold standard" of cancer studies due to their extreme high quality, their tremendous utility in evaluating human health hazards and the rigor and transparency they bring to the evaluation of the data. All data from NTP two-year cancer studies are publicly available including data on individual animals and images from the pathology review of each animal. The NTP is also home to the Report on Carcinogens, the US Department of Health and Human Services official list of what is known or reasonably anticipated to be carcinogenic to humans. It was my responsibility to decide what items eventually went onto this list while I was Associate Director of the NTP. In 2006, I became an Associate Director of the NIEHS, a senior advisor to the director and the director of the Office of Risk Assessment Research (ORAR). ORAR focused on stimulating new research areas on the evaluation of health risks from the environment and addressed major risk assessment issues on behalf of the NIEHS/NTP. For example, in this capacity, I lead a multiagency effort to understand the health risks to humans from climate change and to develop a research program in this area [29].

I left the NIEHS/NTP in 2010 to become the Director of the National Center for Environmental Health (NCEH) at the Centers for Disease Control and Prevention and simultaneously Director of the Agency for Toxic Substances and Disease Registry (ATSDR). NCEH does research and supports activities aimed at reducing the impact of environmental hazards on public health. One well-respected research effort of the NCEH is the National Biomonitoring Program. This program tests for the presence of hundreds of chemicals in human blood and urine in a national sample of people in the

United States. ATSDR advices the Environmental Protection Agency (EPA) and communities on the potential health impacts from toxic waste dump sites (superfund sites). ATSDR is required by law to produce ToxProfiles. These are comprehensive reviews of the scientific literature for specific chemicals generally found at superfund sites. They also provide an assessment of the safety of these chemicals. As part of my activities at ATSDR, I began a modernization of the ToxProfiles to use systematic review methods in their assessments; this effort was linked to a similar effort that I had helped to implement at the NIEHS/NTP.

Aside from my official duties in my various federal jobs, I also served on numerous national and international science advisory panels. Most notable, for my qualifications for this statement, are my serving as Chair from 2005 to 2010 of the Subcommittee on Toxics and Risk of the President's National Science and Technology Council, member and chair of EPA'S Science Advisory Panel from 1998 to 2003 (focused specifically on advising their pesticides program) and chair of the International Agency for Research on Cancer (IARC) advisory group that updated and improved its rules for reviewing scientific data to ensure that conclusions on the carcinogenicity of human exposures are the best possible (Preamble)[30]. As part of my work on science advisory panels, I have served on EPA's Science Advisory Board, as an advisor to the Australian Health Council on risk assessment methods, as an advisor to the Korean Food and Drug Administration on toxicological methods, and served on several World Health Organization (WHO) International Program on Chemical Safety scientific panels dealing with risk assessment. Besides the guidelines for evaluating cancer hazards used by the IARC, I have either chaired or served as a member of scientific panels developing guidance documents for other organizations including the EPA.

I have received numerous awards, most notably the Outstanding Practitioner Award from the International Society for Risk Analysis and the Paper of the Year Award (twice) from the Society of Toxicology Risk Assessment Specialty Section. I am a fellow of the American Statistical Association, the International Statistical Institute, the World Innovation Foundation and the Ramazinni Institute. I have published over 250 peer-reviewed scientific papers, book chapters and technical documents on topics in toxicology and risk assessment.

Finally, I have served on numerous national and international committees tasked with evaluating the risk and/or hazard of specific environmental chemicals, including glyphosate. For example, I have contributed to risk assessments for EPA, the Food and Drug Administration, the Centers for Disease Control and Prevention, the National Institutes of Health, the WHO and IARC.

Reliance List

During the course of my preparation for this report, I have reviewed the following materials:

 All epidemiological data relating to the ability of glyphosate formulations to cause NHL in humans.

- b. Scientific papers on the cellular origins of NHL
- c. Peer-reviewed scientific data relating to the carcinogenicity, genotoxicity and oxidative stress caused by glyphosate
- d. Technical reports relating to the carcinogenicity of glyphosate provided by the defendant to the lawyers for the plaintiff
- e. The USEPA, the European Food Safety Authority (EFSA), the German Federal Institute for Risk Assessment, the European Chemical Agency, the IARC and the WHO/Food and Agriculture Organization Joint Meeting on Pesticide Residues reviews of the scientific literature relating to the potential for glyphosate to cause cancer.
- f. Technical documents available from EFSA regarding animal carcinogenicity data on glyphosate prepared by organizations other than the defendant
- g. Various other documents produced in the litigation

A complete list of my reliance materials is at the end of this report.

Methodology for Causality Evaluation

The evaluation of whether glyphosate and/or GBFs can cause NHL in humans requires the review and synthesis of scientific evidence from studies of human populations (epidemiology), animal cancer studies, and studies investigating the mechanisms through which chemicals cause cancer. Many different approaches^[31, 32] are used to synthesize these three areas of science to answer the question "Does this chemical cause cancer in humans?" In any of these three science areas, the quality of the individual studies has to be assessed and summarized to make certain the studies included in the overall assessment are done appropriately. Once the quality of the individual studies has been assessed, a judgment needs to be made concerning the degree to which the studies support a finding of cancer in humans. To do this, the EPA, IARC, the European Chemical Agency (EChA), the US Report on Carcinogens, and many others use guidelines^[30, 33-35] that rely upon aspects of the criteria for causality developed by Hill (1965)^[36].

Hill listed nine (9) aspects of epidemiological studies and the related science that one should consider in assessing causality. The presence or absence of any of these aspects is neither sufficient nor necessary for drawing inferences of causality. Instead, the nine aspects serve as means to answer the question of whether other explanations are more credible than a causal inference. As noted by Hill:

"None of my nine viewpoints can bring indisputable evidence for or against the cause-and-effect hypothesis and none can be required as a sine qua non. What they can do, with greater or less strength, is to help us to make up our minds on the fundamental question — is there any other way of explaining the set of facts before us, is there any other answer equally, or more, likely than cause and effect?"

The nine aspects cited by Hill include consistency of the observed association, strength

of the observed association, biological plausibility, biological gradient, temporal relationship of the observed association, specificity of the observed association, coherence, evidence from human experimentation and analogy. These are briefly described below.

An inference of causality is strengthened when several of the studies show a **consistent positive association** between cancer and the exposure. This addresses the key issue of replication of studies which is critical in most scientific debates. If studies are discordant, differences in study quality, potential confounding, potential bias and statistical power are considered to better understand that discordance.

An inference of causality is strengthened when the **strength of the observed association** in several studies are large and precise. These large, precise associations lessen the possibility that the observed associations are due to chance or bias. A small increase in risk of getting cancer does not preclude a causal inference since issues such as potency and exposure level may reduce the ability of a study to identify larger risks. Meta-analyses provide an objective evaluation of the strength of the observed association across several studies with modest risks to help clarify strength of the observed associations.

An inference of causality is strengthened when there is data supporting **biological plausibility** demonstrated through experimental evidence. Animal carcinogenicity studies, in which tumor incidence is evaluated in experimental animals exposed to pure glyphosate, play a major role in establishing biological plausibility. There are numerous types of mechanisms that can lead to cancer^[37], most of which can be demonstrated through experimental studies in animals, human cells, animal cells, and/or other experimental systems. Occasionally, occupational, accidental or unintended exposures to humans allow researchers to evaluate mechanisms using direct human evidence.

An inference of causality is strengthened when there is a **biological gradient** showing a reasonable pattern of changing risk with changes in exposure (e.g. risk increases with increasing exposure or with longer exposure). In many epidemiological studies, this aspect cannot be examined due to limitations in the study design or due to a lack of clarity in the presentation of the results. When a study does address an exposure-response relationship, failure to find a relationship can be due to a small range of exposures, insufficient sample size or a changing exposure magnitude over time that has not been accounted for.

An inference of causality is strengthened when there is a **temporal relationship** in which the exposure comes before the cancer. This aspect is necessary to show causality; if it is not present, a causal inference is not plausible. Because the latency period for cancers can be long (years), evaluation of studies should consider whether the exposure occurred sufficiently long ago to be associated with cancer development.

An inference of causality is strengthened when the exposure is **specific** for a given cancer. This would mean that the disease endpoint being studied is only due to the cause being assessed. This issue is seldom applicable and, since NHL has other causes, specificity is not applicable to the determination of causality for glyphosate.

An inference of causality is strengthened when other lines of experimental evidence are **coherent** with a causal interpretation of the association seen in the epidemiological evidence. To evaluate coherence, information from animal carcinogenicity studies, mechanistic investigations and information on the metabolism of the chemical being studied would be considered.

An inference of causality is strengthened when there is **experimental evidence in humans** supporting a causal interpretation. Seldom is this type of information available when addressing the toxicity of chemicals. However, experiments in which an individual reduces or limits exposures and the risk of cancer is reduced would carry considerable weight in the evaluation (e.g. studies evaluating the cancer risks of people who stop cigarette smoking compared with continuing smoking have demonstrated reduced lung cancer risks). No such data are available for glyphosate.

Finally, an inference of causality is strengthened when there are other chemical agents with **analogous** structures showing similar effects in humans and/or animals and/or showing similar biological impacts in mechanistic studies. No such data are available for glyphosate.

The most logical approach to developing an inference of causality is to step through each of the aspects of causality developed **by Hill (1965)**^[36] and apply them to the available data for glyphosate and for glyphosate formulations. This is done in the sections that follow.

Consistency of the Associations seen in Human Epidemiological Studies

Relevant Epidemiology Studies

In their meta-analysis, **Chang and Delzell (2016)**^[38] performed a systematic literature search of all scientific literature up to June, 2015, to identify all epidemiological studies that were pertinent to evaluating an association between glyphosate and NHL. They identified 12 relevant epidemiology studies^[39-50], Their search agrees with all current reviews of glyphosate and I will use their findings from the literature up until 2015. To cover from June 2015 to the present (April 1, 2017), I used their searching algorithm and identified 117 additional published studies, none of which were new epidemiology studies. These same 12 studies will be considered for use in this evaluation. Other experts will be discussing the studies as well as their strengths and their weaknesses; I will focus on using the results of these studies in evaluating causality so I will only briefly describe each study.

Cantor et al. (1992)^[39] did an in-person interview study comparing 622 white men, newly diagnosed with NHL, to 1245 population-based controls in Iowa and Minnesota. They originally identified 780 cases, of which 694 (89%) were interviewed. After pathology review, only 622 were found to have NHL, the remaining cases having leukemia or other diseases. Three different sources of controls were used, random digit dialing (76.7% response rate), Health Care Financing Administration rolls (79% response

rate) and deceased controls with eligible proxies (77% response rate). Both cases and controls were questioned regarding their use of agricultural products including Roundup® and any other glyphosate-based formulations. For deceased or incompetent controls (184) and cases (number not given), proxy interviews were done with a close relative. When cases in farmers were compared to cases in non-farmer controls, 26 cases (out of 266) and 49 controls (out of 547) had handled herbicides containing glyphosate yielding an odds ratio (OR) of 1.1 (95% confidence interval 0.7-1.9). This analysis controlled for vital status, age, state, cigarette smoking status, family history of lymphopoietic cancer, high-risk occupations and high-risk exposures in a logistic analysis. The authors noted there was "minimal evidence for confounding of results for any single pesticide by exposure to pesticides belonging to other chemical families." Because the exposure is determined based on interviews in cases and controls, this study has the potential for recall bias². However, the authors note that the bias could both increase or decrease the OR because of non-differential exposure misclassification because of difficulties in accurate recall of past pesticide exposures for both controls and treated individuals. This study will not be included separately into the evaluation since it overlaps with De Roos et al. (2003)[43]

Two additional studies conducted by Zahm et al. (1990)^[51] in Nebraska and Hoar et al. (1986)^[52] in Kansas collected information on pesticide and herbicide use, but did not report specifically on the effects of glyphosate. De Roos et al. (2003)^[43] pooled the data from these two studies with the data from Cantor et al. (1992)^[39] to examine pesticide exposure to glyphosate in farming as risk factors for NHL. The three case-control studies^[39, 51, 52] had slightly different designs. The design for the Minnesota study^[39] is

¹ The odds ratio (OR) is calculated as the proportion of exposed cases with disease to exposed controls divided by the proportion of non-exposed cases to non-exposed controls. For rare diseases, this value approximates the population risk ratio (PRR) which is the probability of having the disease in exposed individuals divided by the probability of having the disease in non-exposed individuals. If the PRR is 1, then there is no difference in the probability of having the disease regardless of your exposure. Values of PRR greater than 1 imply the risk is higher in the exposed population. Because the OR is an estimate of the PRR for rare diseases, it is usually accompanied by a 95% confidence interval that describes the probable range of the estimate. If the OR is greater than 1, then the exposure is associated with the disease. If the lower 95% confidence bound for the OR is greater than 1, this is typically used to say the association is statistically significant.

² Recall bias occurs when cases are more likely to say they are exposed to glyphosate than controls or when controls are more likely to say they are exposed to glyphosate than cases. The recall must be different for the cases than the controls for this to cause a bias; errors in recalling past exposures that happen for both cases and controls would not be recall bias.

³ Non-differential exposure misclassification occurs when the probability of an error in determining whether an individual is exposed or not is the same for both cases and controls.

provided directly above. In Nebraska [51], the cases were identified through the Nebraska Lymphoma Study Group and area hospitals for 66 counties and included all white men and women diagnosed with NHL between July 1, 1983 and June 30, 1986. Controls were obtained by random-digit dialing, Medicare records or state mortality files depending upon age and vital status. All study participants were over age 21 and even though this study included a few women, they were excluded from the De Roos et al. (2003) analysis. The response rates for cases and controls were 91% and 87% respectively. In Kansas [52], cases were randomly sampled from a registry at the University of Kansas of white men, over age 21, diagnosed between 1979 and 1981. The response rates for cases and controls were 96% and 94% respectively. Controls were population-based matched on age and vital status. As for the Nebraska study, controls for live cases were obtained from Medicare records for cases 65+ and by random-digit dialing for cases <65 years; controls for deceased patients came from state mortality records. The resulting pooled case-control study had 870 cases and 2569 controls (for analyzing the relationship between glyphosate and NHL, there were only 650 cases and 1933 controls following exclusion of subjects with missing data). For any glyphosate exposure, there were 36 exposed cases and 61 exposed controls with an OR (95% confidence interval) of 2.1 (1.1-4.0) in a logistic regression analysis controlling for all other pesticides reported, age and study site. The authors also analyzed the data using a Bayesian hierarchical regression analysis yielding an OR (95% confidence interval) of 1.6 (0.9-2.8) controlling for the same parameters as the logistic regression. They also conducted an analysis of "potentially carcinogenic" pesticides which included glyphosate. When just one of these pesticides was used by subjects, the logistic regression OR was 1.6 (0.8-3.1), two to four pesticides yielded an OR of 2.7 (0.7 to 10.8) and when more than five were used, the OR was 25.9 (1.5-450.2) in the logistic regression analysis and 1.1 (0.8-1.7), 1.3 (0.7-2.3) and 2.0 (0.8-5.2) respectively for the Bayesian analysis. Removing glyphosate from the list of "potentially carcinogenic" pesticides yielded equivalent ORs of 1.2 for one pesticide, 1.2 for two to four pesticides and 1.1 for five or more pesticides. The authors note that the positive results seen in their study are not likely due to recall bias since there were few associations seen over the 47 pesticides they studied. Also, although some of the positive results could be due to chance, the use of the hierarchical regression analysis theoretically decreases the chance of false positive findings. In the Kansas study^[52] suppliers for 110 subjects with farming experience were identified and provided information on the subjects' crops and pesticide purchases. In general, the suppliers reported less pesticide use than the subjects of the study with no consistent differences in agreement rates between cases and controls. The agreement between suppliers and subjects improved when pesticide use during the last 10 years was considered. This supports a reduced role of recall bias in these studies and a possible role of nondifferential exposure misclassification. The reduced ORs when using the Bayesian analysis as compared to the logistic regression is not surprising because the authors used a non-informative prior rather than a less conservative prior. In addition, adjustment for 47 pesticides is also likely to reduce the significance of the observed ORs for pesticides that are associated with NHL as demonstrated by the analysis of "potentially carcinogenic" pesticides (this model is possibly over-parameterized since it

includes over 47 dependent variables for only 36 exposed cases; this can significantly reduce the ORs and increase the confidence bounds). This pooled case-control study is the strongest study with sufficient power (3.8% of subjects exposed) and will be included in the evaluation of causation.

Lee et al. (2004)^[44] pooled data from Zahm et al. (1990)^[51] and Cantor et al. (1992)^[39] (previously described) to evaluate whether asthma acts as an effect modifier of the association between glyphosate exposure and NHL. Women were included in this analysis whereas De Roos et al. (2003)^[43] excluded women. The final study published by Lee included 872 cases and 2336 controls of which 45 cases and 132 controls had been told by their doctors they had asthma. The OR of association between glyphosate and NHL in non-asthmatics was 1.4 (0.98-2.1) and 1.2 (0.4-3.3) in asthmatics when controlling for age, vital status and state (geographical location). This study completely overlaps with the study by De Roos et al. (2003)^[43] with the exception of the inclusion of the few women in the study by Zahm et al. (1990)^[51]. Since this study only looks at effect modification due to asthma, it does not contribute to the overall evaluation of causality and it will be excluded from further evaluations.

Nordstrom et al. (1998)⁽⁴⁰⁾ conducted a population-based case-control study of hairy cell leukemia (HCL); a subtype of B-cell NHL) in Sweden that included an evaluation of exposures to glyphosate. The study included 111 men with NHL reported to the Swedish Cancer Registry between 1987 and 1992 (with one patient from 1993 accidentally included). Controls (400 in total) were drawn from the National Population Registry matched for age and county with the cases. The response rates were 91% for cases (10 refused to participate out of the original 121) and 83% (84 controls refused to participate out of 484 selected). Almost all questionnaires were answered by the subject of the study (4 cases and 5 controls were answered by proxies). The study reported an OR for glyphosate exposure and HCL of 3.1 (0.8-12) controlling only for age. This study had very limited power for detecting an association because there were only four cases and five controls with glyphosate exposure (1,8% of the total study population). In addition, because they failed to adjust for other exposures, the potential for confounding in this study is greater than those presented previously. The authors noted that they attempted to minimize recall bias by only using living cases in the analysis. Also, even though matching was performed to identify the controls, this matching was not used in the final analysis. This study was later used in a pooled analysis of HCL and NHL[42] and will not be considered independently in the evaluation for causation but will be used in the context of the pooled analysis.

Hardell and Eriksson (1999)^[41] conducted a population-based case-control study of all male patients older than 25 years diagnosed with NHL between 1987 and 1990 in the four most northern counties of Sweden. After excluding misdiagnosed cases, they included 442 cases of which 404 answered their questionnaire (most by proxy) for a response rate of 91%; 192 of these cases were deceased. For each living case, two male matched controls were chosen from the National Population Registry and matched on age and county. For each deceased case, two male controls were chosen from the National Registry for Causes of Death, matched for age and year of death. The response

rate for the controls was 84% (741 out of 884 identified). Study subjects were sent a detailed questionnaire and, in most cases, this was supplemented with a phone interview. A complete working history was obtained with questions regarding exposure to numerous chemicals to avoid a focus on pesticides and organic solvents, the focus of the study. Exposure was defined as at least one full day of exposure more than one year before diagnosis. For glyphosate exposure, the authors identified four cases and three controls with exposures and a univariate OR of 2.3 (0.4-13). A multivariate analysis of both glyphosate and phenoxy herbicides produced an OR of 5.8 (0.6-54). The study has limited power for detecting an effect because the exposure frequency is very low (0.6% exposed). This study was later used in a pooled analysis of HCL and NHL^[42] and will not be considered independently in the evaluation for causation but will be used in the context of the pooled analysis.

Hardell et al. (2002)^[42] conducted a pooled analysis of NHL and HCL by combining the studies of Nordstrom et al. (1998)^[40] and Hardell and Eriksson (1999)^[41]. This study fully overlaps with the previous two studies. The analysis controlling for age, study, county and vital status yielded an OR of 3.04 (1.08-8.52) based on eight exposed cases and eight exposed controls. A more extensive analysis additionally controlled for other pesticides and yielded a smaller OR of 1.85 (0.55-6.20). As for the study by De Roos et al. (2003), the analysis may be over-parameterized (more than eight dependent variables with only eight exposed cases) which could lead to a reduction in the ORs and larger confidence bounds. Even with the pooled data, Hardell et al. (2002) had limited power to detect an effect because the exposure frequency for cases and controls was very low (1% exposed). This study is a valid case-control study and will be used in the evaluation of causality.

In a later study, Eriksson et al. (2008)^[46] conducted a population-based case-control study where cases were identified as NHL patients aged 18-74 years diagnosed in four major hospitals in Sweden from December 1, 1999 until April 30, 2002. In total, 995 cases were identified as matching the study parameters with 910 (91%) answering the questionnaire shortly after diagnosis. All cases were classified into subgroups with 810 B-cell, 53 T-cell, and 38 unspecified lymphomas. Controls (1,108) were randomly selected from the population registry and matched on health service, region, sex and age and interviewed in several periods during the conduct of the study; 1,016 controls responded to the questionnaire (92% response rate). Study subjects were sent a detailed questionnaire and, in many cases, a phone interview followed. Exposure was defined as at least one full day of exposure more than one year before diagnosis. The univariate analysis, adjusting for age, sex and year of diagnosis (cases) or enrollment (control) yielded an OR of 2.02 (1.10-3.71) based on 29 exposed cases and 18 exposed controls. When cases and controls were divided into those with ≤10 days per year exposure and those with >10 days per year exposure, the ORs were 1.69 (0.70-4.07) and 2.36 (1.04-5.37) respectively. When diagnoses were grouped into various subtypes of NHL, the results did not change dramatically except for small lymphocytic lymphoma and chronic lymphocytic lymphoma which showed an increased OR of 3.35 (1.42-7.89), A multivariate analysis of glyphosate controlling for other agents with statistically

increased odds ratios and/or odds ratios greater than 1.5 yielded an OR of 1.51 (0.77-2.94). In a similar analysis to the multivariate analysis, latency periods of one to ten years showed an OR of 1.11 (0.24-5.08) and >10 years had an OR of 2.26 (1.16-4.40). This study was much larger than the previous Swedish studies (2.3% exposed) and, although there may have been confounding from other pesticides, this was addressed in the multivariate analysis and the latency analysis. This study is a valid case-control study and will be used in the evaluation of causality.

McDuffie et al. (2001)^[50] recruited incidence cases of NHL in men 19 years or older from six Canadian provinces with a first diagnosis between September 1, 1991 and December 31, 1994. Each provincial Cancer Registry or, in the case of Quebec, hospital, had a target number of cases and ended recruitment when the case number was reached. Controls were men 19 years or older selected at random from provincial health insurance records, computerized telephone listings or voter registration lists, depending upon the province. Cases and controls were sent questionnaires with surrogates ineligible to answer the questionnaires for deceased cases or controls. Each subject who reported 10 hours per year or more of pesticide exposure and a random sample of 15% who reported less exposure were interviewed by telephone to obtain details on pesticide use. A pilot study was conducted to obtain an improved version of the telephone interview questionnaire used by Hoar et al. (1986)[52] and Zahm et al. (1990)[51] that would provide accurate pesticide exposure assessment in the form of a screening questionnaire and a telephone interview questionnaire. This was followed by a validation study (27 farmers) where the final questionnaires used to screen and include potential cases and controls were administered and the answers regarding pesticide usage showed excellent concordance with purchases through their local agrochemical supplier. The screening questionnaire was returned by 517 cases of NHL (67.1% response rate) and 1506 controls (48% response rate). Following analysis of the screening questionnaire, the telephone interview was administered to 179 cases and 456 controls to obtain more detailed exposure information. The OR for glyphosate exposure and NHL was 1.26 (0.87-1.80) stratified by age group and province of residence and the OR was 1.20 (0.83-1.74) when the analysis also controlled for significant medical variables (51 exposed cases and 133 exposed controls). An exposure-response evaluation was performed where the OR for exposure between zero to two days per year was 1.0 (0.63-1.57) and for greater than two days per year was 2.12 (1.20-3.73) with the latter group having 23 exposed cases and 36 exposed controls. This study had excellent sample size and power (8.1% of subjects exposed), but a low response rate to the screening questionnaire. Also, by adjusting for significant medical variables, this study ruled out many confounders but did not adjust for other pesticide exposures. The effort to validate the recall of pesticide usage for farmers supports a lack of recall bias in the study. This study is a valid case-control study and will be used in the evaluation of causality.

Hohenadel et al. (2011)^[48] re-analyzed the data of **McDuffie et al. (2001)**^[50] to specifically investigate the impact of exposure to multiple pesticides on NHL. Four cases of NHL were excluded from this evaluation following a pathology review. They reported associations with the use of glyphosate with and without malathion but not with

glyphosate overall. The OR for glyphosate (ever used) without malathion (ever used) was 0.92 (0.54-1.55) and the OR for glyphosate (ever used) with malathion (ever used) was 2.1 (1.31-3.37). Chang and Delzell (2016)^[38] combined the ORs from the glyphosate only analysis with the glyphosate and malathion analyses using random-effects meta-analysis to get a combined OR for glyphosate of 1.4 (0.62-3.15). This study was specifically targeted to interactions of various pesticides and does not substantively contribute to an evaluation of glyphosate. Since it is a refined analysis of McDuffie et al. (2001)^[50], it will be included in the evaluation of causation only in the context of the combined analysis provided by Chang and Delzell (2016).

Orsi et al. (2009)[47] conducted a hospital-based case-control study of men and women diagnosed with lymphoid neoplasms in five hospitals in France between 2000 and 2004 who were aged 20-75 years (the abstract gives the age range as 18-75 years). All diagnoses were cytologically or histologically confirmed. The evaluation only included men and questionnaires/interviews were completed by 491 cases (95.7% response rate) which included 244 cases with NHL. Controls were patients in the same hospital (mostly orthopedic or rheumatological patients) with no prior history of lymphoid neoplasms and excluding patients admitted to the hospital for cancer or a disease directly related to occupation, smoking or alcohol abuse. The controls were matched to cases by hospital and age. Of the 501 candidate controls, 456 participated (91% response). Exposure was evaluated differently for subjects who had non-occupational exposures from those who had occupational exposures. For both, the subjects had to fill out a questionnaire/interview on occupations and home gardening pesticide exposures. For those who had worked professionally as farmers or gardeners for at least 6 months, a specific agricultural occupational questionnaire/interview was administered and exposure was determined on the basis of this extra data. The OR for occupational use of glyphosate and NHL was 1.0 (0.5-2.2) with 12 exposed cases and 24 exposed controls stratified by age and center category. A further analysis was done by individual subtypes of NHL with an OR of 1.0 (0.3-2.7) for diffuse large cell lymphoma, 1.4 (0.4-5.2) for follicular lymphoma, 0.4 (0.1-1.8) for chronic lymphocytic leukemia (CLL) and 1.8 (0.3-9.3) for HCL. No separate analysis of non-occupational use of glyphosate was provided, nor does it seem specific data on glyphosate usage was ascertained for subjects who were not professional farmers or gardeners. This could lead to nondifferential misclassification of exposure which could reduce the ORs of the study. Barring this, the sample size was sufficient to detect an effect (5.3% with occupational exposure) and this study will be included in the evaluation of causality.

Cocco et al. (2013)^[49] evaluated data from a multi-center case-control study of lymphoid neoplasms in six European countries from 1998 to 2004. Cases included only adult patients diagnosed with lymphoma during the study period drawn from participating centers. Controls were either selected by sampling from the general population on sex, age group, and residence area (Germany, Italy), or from hospital controls matched to the patient excluding patients with cancer, infectious diseases, and immunodeficiency diseases (Czech Republic, France, Ireland, Spain). The study included 2348 lymphoma cases (88% participation) and 2462 controls (81% response rate in hospital-based controls and 52% in population-based controls). Exposures were derived using an

occupational exposure matrix developed by industrial hygienists and occupational experts from the research centers. Only 35 individuals (cases and controls not broken out) in the study were exposed to carbamates (glyphosate was grouped with the carbamates). No results were provided for NHL and the only OR provided for glyphosate was for B-cell lymphoma where the OR was 3.1 (0.6-17.1) based on four exposed cases and two exposed controls. No information was provided on the total number of cases for each type of lymphoma evaluated. This study has very limited power to evaluate an association between NHL and glyphosate and provides only information on B-cell lymphomas with very few exposed cases and controls. As has been done by most researchers evaluating these data, this study will receive very little weight in the evaluation of causality.

De Roos et al. (2005)^[45] reported results on the association of glyphosate and cancer incidence from the Agricultural Health Study (AHS), a prospective cohort study in Iowa and North Carolina, which included 57,311 private and commercial applicators who were licensed to apply restricted-use pesticides at the time of enrollment. Recruitment occurred between 1993 and 1997 and cohort members were matched to cancer registry files to identify cases and the National Death Index (1999) to ascertain vital status. Incident cancers were identified from the date on enrollment until 31 December, 2001, with the average follow-up time being 6.7 years. Comprehensive use data was obtained by self-administered questionnaire for 22 pesticides, ever/never use for 28 additional pesticides, and general information on work practices. Applicators were given a second self-administered questionnaire on occupational exposures and lifestyle factors. They used three exposure metrics in their analyses: a) ever personally mixed or applied pesticides containing glyphosate; b) cumulative exposure days of use of glyphosate (years of use times days per year); and c) intensity weighted cumulative exposure days (years of use times days per year times intensity of use). Persons whose first primary tumor occurred before the time of enrollment (1074) were excluded from the analysis as were those who were lost to follow-up (298), did not provide age information (7) or information on glyphosate use (1678) leaving 54,315 subjects for inclusion. There were 92 cohort members with a diagnosis of NHL during the study period of which 77.2% had ever used glyphosate resulting in a rate ratio (RR) of 1.2 (0.7-1.9) when controlling for age and an RR of 1.1 (0.7-1.9) when controlling for age, lifestyle factors, demographics and five other pesticides for which cumulative-exposure-day variables were most highly associated with glyphosate cumulative-exposure-days (2,4-D, alachlor, atrazine, metalochlor, and trifluralin) or, for chemicals with only ever/never exposure information that were most highly associated with glyphosate ever/never use (benomyl, maneb, paraguat, carbaryl and diazinon). When cumulative exposure days in exposed individuals are divided into tertiles and RRs examined using the lowest exposed tertile as

⁴ The rate ratio (RR) is estimated as the incidence in the exposed population divided by the incidence in the unexposed population. Incidence is calculated as the number of events in a fixed period of time divided by the person years at risk. Unlike the OR, the RR does not require the assumption of a rare disease to serve as a good estimate of the population risk ratio (PRR).

the reference group, the RRs drop with values of 0.7 (0.4-1.4) and 0.9 (0.5-1.6) for tertiles 2 and 3 respectively controlling for demographic and lifestyle factors and other pesticides (30,699 subjects). When intensity-weighted exposure days are examined again using exposed tertile 1 as the reference group, the RRs drop with values of 0.6 (0.3-1.1) and 0.8 (0.5-1.4) for tertiles 2 and 3 intensity-weighted exposure days respectively controlling for demographic and lifestyle factors and other pesticides (30,699 subjects). Analyses are not shown for the evaluation of the exposed tertiles against never exposed because the authors felt that never exposed and exposed subjects differed in terms of socio-economic factors and other exposures like smoking [45].

This is a typical cohort study, but has some limitations in terms of its interpretation. The majority (75.5%) of subjects in the cohort reported having ever personally mixed or applied products containing glyphosate and was composed primarily of male, middleaged, private applicators. For glyphosate, reliability of the answers by subjects on the use of glyphosate between the first and second questionnaire were evaluated in the AHS^[53]: 82% agreement for whether they had ever mixed or applied glyphosate, 53% agreement on years mixed or applied, and 62% agreement on days per year mixed or applied and 62% agreement on decade first applied. They saw no differences in over versus under reporting between the two questionnaires suggesting this could lead to non-differential exposure bias and reduce the RRs in this study. Another weakness, noted by the authors, is that the small number of incident cases during follow-up period hindered precise effect estimates. Also, the high frequency of exposure to many pesticides (e.g. 73.8% were exposed to 2,4-D) means subjects unexposed to glyphosate were likely to be exposed to other agents that may also induce NHL, reducing the RRs. Also, as noted by the EPA's FIFRA Science Advisory Panel (SAP)[54] in their review of the EPA's issue paper on the carcinogenicity of glyphosate and as noted in a critique^[55] of the European Food Safety Agency's risk assessment for glyphosate, the follow-up time in this cohort study may not be long enough to produce a sufficient sample size for evaluation of the association between NHL and glyphosate. Like other studies, this study has few exposed cases and controls, but the authors adjust their analysis for many other pesticides which could reduce ORs and increase confidence bounds limiting the ability of the study to show positive results. This study could also suffer from a survival bias because pesticide applicators were recruited as case participants after their exposure had begun and those with a cancer prior to enrollment were excluded.

This study will be included in the evaluation of causality.

Consistency of Associations

Hill (1965)^[36] defines consistency as the answer "yes" to the question "Has it repeatedly been observed by different persons, in different places, circumstances and times?" For these studies, the answer is indeed yes.

If the population relative risk (PRR) for an association of glyphosate with NHL were equal to 1 (no effect), then one would expect very few statistically significant results in multiple studies and that about half of the studies would have ORs or RRs below one

and half above one. As noted by both the IARC Monograph 112 (2015)^[56] and by Chang and Delzell (2016)^[38], when comparing studies, the most reasonable comparison is to use the most-fully-adjusted risk estimates. I will mostly limit my comments to these most-fully-adjusted risk estimates.

Consistency of the associations across several epidemiology studies is not simply a matter of seeing how many were statistically significant and how many were not but must also address the consistency of the direction of the responses. Figure 1 shows a forest plot of all ORs and RRs from the epidemiology studies discussed previously. Each horizontal line in the forest plot shows the mean estimate of the OR/RR as a black square and the 95% confidence interval around this estimate as whiskers extending left and right from the black square.

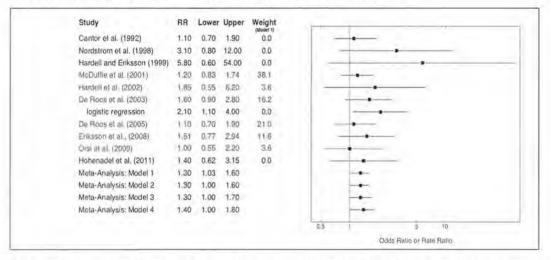

The first obvious conclusion to be drawn from Figure 1 is that all of the mean OR/RR estimates (black squares) are consistently ≥ 1 . This implies that all of the studies are pointing in the same direction toward a positive effect. In their meta-analyses, Schinasi and Leon (2014)^[57], IARC (2015)^[56] and Chang and Delzell (2016)^[38] all identified 6 papers (highlighted in red in Figure 1) as being the most reliable for evaluation of the ability for glyphosate to induce NHL in people: McDuffie et al. (2001)^[50], Hardell et al. (2002)^[42], De Roos et al. (2003)^[43] and (2005)^[45], Eriksson et al. (2008)^[46] and Orsi et al. (2009)^[47]. I will refer to these papers as the six core epidemiology studies. As noted above, if the true underlying risk ratio was 1 (no effect), you would expect about half of the findings to be below 1 and half to be equal to 1 or greater. Using only the results from the 6 core studies, you can see that all are ≥ 1 ; the probability of this happening is $(0.5)^6$ or 0.016, strongly suggesting the studies do not agree with an underlying PRR=1 and that they consistently support a positive effect.

A second way in which consistency can be evaluated is to combine the individual studies using meta-analysis to obtain a combined analysis using both the ORs and the RR (CRR) and test for heterogeneity in the studies. The meta-analysis done by Chang and Delzell (2016) includes the same analysis as that done by the IARC (2015) and is an improvement over Schinasi and Leon (2014), so I will focus my comments on using the Chang and Delzell (2016) meta-analysis. Chang and Delzell (2016) did four separate meta-analyses on the glyphosate epidemiology studies using two different methods (random-effects and fixed-effects models). In their first analysis (model 1)⁵, they combined the most-fully-adjusted risk estimates from the six core studies to yield a CRR of 1.27 (1.01-1.59) for both random-effects and fixed-effects models supporting an association between NHL and glyphosate exposure in these studies. In a second analysis (model 2), they replace the results of the Bayesian analysis in De Roos et al. (2003) with the results of the logistic regression analysis and get the same CRR of 1.30 (1.03-1.64) for both random-effects and fixed-effects models. In a third analysis (model 3), they replace from model 1 the McDuffie et al. (2001) results in with a combined meta-

⁵ Chang and Delzell (2016) provided only one significant digit to the right of the decimal point in their confidence bounds; the EPA SAP (2017) re-calculated models 1-4 of Chang and Delzell (2016) to provide two significant digits – these are presented here.

analytic result they derived from analyses by Hohenadel et al. (2011) (this study reanalyzed the same data as McDuffie et al. (2001), splitting results between asthmatics and non-asthmatics) resulting in a CRR of 1.32 (1.00-1.73) for both random-effects and fixed-effects models. Finally, in a fourth analysis (model 4), they use model 3 but replaced the Bayesian analysis in De Roos et al. (2003) with the logistic regression analysis yielding a CRR of 1.37 (1.04-1.82) for both random-effects and fixed-effects models. In essence, none of the different meta-analyses rejected the notion of a combined, statistically significant positive effect.

Figure 1: Odds Ratios and Rate Ratios from the most-fully-adjusted risk estimates from selected epidemiology studies and from the meta-analyses of Chang and Delzell (2016)^[38]. "RR" refers to the OR or RR from the study, "Lower" refers to the 95% lower bound, "Upper" to the 95% upper bound and "Weight" refers to the weight applied to that specific study in Model 1 of the meta-analysis (Table 3 in Chang and Delzell). For De Roos et al. (2003), the first row is for the Bayesian model analysis and the second row, labelled "logistic regression" is from the logistic model analysis.

As stated above, another way to evaluate consistency in the epidemiological data would be to evaluate the heterogeneity in the studies. Heterogeneity may be due to differences in participants, outcomes, exposure metrics, methods for questioning study subjects, sex of the subjects, etc. **Chang and Delzell (2016)** formally tested for heterogeneity of the responses from the six core studies using Cochran's Q statistic and the I² statistic [58]. For models 1 to 4, the p-values from Cochran's Q test are 0.84, 0.59, 0.85, and 0.63 respectively (typically you reject the concept of homogenous studies in favor of heterogeneous studies if p<0.10). The I² statistic for all four models are 0.0% (values for I² can range from 0-100% with concern for heterogeneity above 50%). The fact that the fixed-effects models and random-effects models gave the same results also supports a lack of heterogeneity in the data. There is no indication of heterogeneity in these six core studies. Lack of heterogeneity supports the interpretation of the metanalyses as showing a positive association and strong consistency of the findings across the six core studies.

Chang and Delzell (2016) also evaluated the association between subtypes of NHL and glyphosate exposure where possible. For B-cell lymphomas, they combined the results of Eriksson et al. (2008)[46] with those of Cocco et al. (2013)[49] and saw a CRR (randomeffects and fixed-effects) of 2.0 (1.1-3.6) with an I² of 0 and a Cochran's Q test p-value of 0.58. For diffuse large B-cell lymphomas, they combined the results of Eriksson et al. (2008)^[46] with those of Orsi et al. (2009)^[47] and saw a CRR (random-effects and fixedeffects) of 1.1 (0.5-2.3) with an I² of 0 and a Cochran's Q test p-value of 0.79. For combined chronic lymphocytic leukemia and small lymphocytic lymphoma, they combined the results of Eriksson et al. (2008)^[46] with those of Orsi et al. (2009)^[47] and saw a CRR using the random-effects model of 1.3 (0.2-10) and for the fixed effects model 1.9 (0.9-4.0) with an I2 of 83.7% and a Cochran's Q test p-value of 0.01. For follicular lymphomas, they combined the results of Eriksson et al. (2008) 46 with those of Orsi et al. (2009)^[47] and saw a CRR (random-effects and fixed-effects) of 1.7 (0.7-3.9) with an I² of 0 and a Cochran's Q test p-value of 0.73. And finally, for HCL, they combined the results of Nordstrom et al. (1998)[40] with those of Orsi et al. (2009)[47] and saw a CRR (random-effects and fixed-effects) of 2.5 (0.9-7.3) with an 12 of 0 and a Cochran's Q test p-value of 0.63. These subtype analyses are based upon small numbers of cases and only two studies making them unreliable, when considered individually, to address the question of consistency in the data. However, when they are combined with the results for the meta-analyses of the core studies of NHL, these studies add support to the conclusion that these data are consistent.

Chang and Delzell (2016) also performed a sensitivity analysis by only doing meta-analyses on studies with similar characteristics. Using only the five case-control studies, the CRR was 1.3 (1.0-1.7). Breaking them into the type of control used, there were four studies using population controls with a CRR of 1.4 (1.0-1.8). There were four studies with males only with a CRR of 1.3 (1.0-1.7) and two studies with males and females with a CRR of 1.2 (0.8-1.8). Three studies were done in North America with a CRR of 1.2 (1.0-1.6), three in Europe with a CRR of 1.3 (0.8-2.1); two of the three studies were in Sweden with a CRR of 1.6 (0.9-2.8). All of the resulting meta CRRs were the same for the fixed-effects model and the random-effects model. This sensitivity analysis shows that the results do not differ significantly from the main CRR for the six core studies combined adding support to the findings being consistent across the different studies.

In case-control studies, selection bias arises when the reasons cases and controls choose to participate in the study could lead to systematic biases that might result in a positive or negative finding independent of the exposure being studied. For example, if cases with exposure are more likely to participate than controls with exposure, the result would be higher OR values; however, this difference has to be differential and not simply a difference in participation rates. It is possible that in a few of these studies, the method by which controls were selected could contribute to selection bias that might lead to increased ORs. However, given the diverse types of cases and controls used in the five core case-control studies, this is unlikely to explain the consistent findings seen from these studies. It is also possible that the lack of complete data on cases versus controls could result in selection bias if the reasons for not completing the questionnaire/interview are different between cases and controls and relates to

exposure. There is no indication of this type of selection bias in these reports, and this is unlikely to explain the consistency seen in these data.

Exposure misclassification can lead to increases or decreases in the OR or RR values seen in both case-control and cohort studies. For example, in case-control studies, if cases are more likely to say they were exposed to glyphosate than controls, this would inflate the OR values; this is one type of recall bias. This type of bias is less likely in cohort studies. In all six of the core studies, this issue was discussed by the authors. In every case, they concluded there was bound to be some exposure misclassification, but that it was most likely non-differential, meaning that the misclassification was random; this would likely reduce the OR/RRs seen in the studies rather than increase them.

Confounding occurs when there is an exposure or some other factor that is tightly associated with both glyphosate exposure and NHL diagnosis that, if controlled for, could explain the results. The most likely source of confounding in these studies would be exposures to other pesticides. Four [42, 43, 45, 46] of the six core studies controlled for exposure to other pesticides and saw basically the same findings as the other two studies. Another concern for confounding would be if the cases had immune deficiencies that could be linked to NHL; in all of the case-control studies, such cases were excluded. Finally, other agricultural exposures (e.g. animals, other chemicals, infectious agents) could be correlated with glyphosate exposure and may be linked to NHL; none of the studies controlled for these factors. However, not all exposed cases were farmers; if confounding via other agricultural exposures is occurring, it is not possible to determine the magnitude or direction of such an effect from these data.

In conclusion, we have six core epidemiology studies done on two different continents by four different research groups using different designs, questionnaires and study populations that are highly consistent with no obvious bias or confounding that would explain the results. There is a consistency of associations across the six core studies.

Strength of the Association seen in Human Epidemiological Studies

To explain strength of association, Hill (1965) gives the classic example of John Snow and the cholera epidemic of 1855 where the risk ratio of dying if you drank water from the Southwark and Vauxhall Company (polluted by sewage) compared to drinking from the Lambeth Company water (sewage free) was 14. Yet, for the six core studies, the OR/RR ranges from 1.0 to 1.85 for the most-fully-adjusted risk estimates and to 2.1 if you include the fully adjusted risk estimate from De Roos et al. (2003)^[45] using logistic regression. These are moderate OR/RR estimates making it conceivable they are individually due to either chance or bias. Thus, with the exception of the logistic regression analysis in De Roos et al. (2003)^[45], none of the core studies demonstrate large, precise risks as envisioned by Hill (2016)^[36]. However, Hill (1965) was not expressing himself in statistical terms where the significance of an association is dependent upon the precision of the observations. If the statistical variation around an OR/RR estimate is large relative to the estimate itself, the estimate is not very precise

and generally would not be statistically significant. The result from the study by **Hardell** and Eriksson (1999) shown in Figure 1 is an example of an estimate with very large statistical variation. On the other hand, a very small (in value), precise OR or RR estimate could be statistically significant and prove important in deciding causation. The meta-analyses shown in Figure 1 all demonstrate estimates of OR/RR that are significantly different from 1 rejecting the concept that the overall association is due to chance. The statistically significant estimate of the OR/RR for B-cell lymphomas in the meta-analysis support this finding as well.

In summary, we have six core epidemiology studies that all show approximately the same, modest increase in OR/RR that, when combined, demonstrate a significant strength of association. There is a strong association across the six core studies

Biological Plausibility

The range of data one can use to determine biological plausibility is quite diverse and can be exceptionally complicated. For simplicity, it can be divided into the types of assays that can be used in this evaluation: animal cancer bioassays, toxicokinetic studies, studies from accidental exposures in humans, and studies of specific biological mechanisms in animals or cells derived from humans or animals. Animal cancer bioassays are intended to test whether glyphosate can cause cancers in mammals, thus supporting the concept that the chemical could cause cancer in humans. Toxicokinetic studies provide insight into the degree to which glyphosate is absorbed by humans, distributed to various organs in the body, what happens to the chemical once it is in the body (metabolism), and, finally, how it is eliminated from the body. Studies from accidental exposures in humans can provide some information on the effects of glyphosate through changes in the chemistry and cellular structure of human blood. Studies of biological mechanisms are generally addressing what effects the chemical may have on human and animal cells under controlled, laboratory conditions. Some of the studies in this section were done with technical grade (virtually pure) glyphosate and some with the glyphosate formulations that humans encounter in occupational and environmental settings. I will summarize the literature in each of these areas and offer an opinion to their support of biological plausibility of NHL in humans.

Animal Cancer Bioassays

Typical animal cancer bioassays will expose animals (generally rats or mice) to a chemical for a substantial proportion of the animal's life (generally 2 years) then kill the animal and examine its organs and tissues for tumors. There are guidelines on how to conduct and analyze these studies. Typically, chemical registrants conduct cancer bioassays for pesticide approval pursuant to guidelines developed under the guidance of the Organization for Economic Cooperation and Development (OECD^[59]). Other groups^[30, 33, 34] provide guidance on how to analyze these studies based upon methodology papers from the published literature. These studies are conducted in a way that controls for everything in the animal's environment (e.g., food type, water quality, how often the animals are handled) leaving only the exposure to explain

differences in tumor formation between control and exposed animals. Even then, noncancer endpoints can also be modified by the chemical and these may have an impact on tumor rates in the animals (e.g., survival, death from some other toxic effect of the chemical); these must be accounted for when reaching conclusions from the study.

Studies generally use four groups of animals, one group receiving no exposure (control) and the remaining three groups are test animals, with each group receiving different dose exposures to the chemical [60]. Doses generally above human experience are used in animal carcinogenicity studies because only relatively small numbers of animals are being used to evaluate risk for a large human population and because even the best known human carcinogens do not cause cancer in large fractions (say 20%) of the human population. The basic underlying premise of this design consideration is that, as the dose increases, so does the risk of getting a tumor. By exposing animals to the highest dose possible, you increase the ability of the study to identify a risk if one is present. However, one must be careful not to use a dose that is so high it will cause cancers by processes that would never work at lower doses. To avoid this, studies are designed around a maximum tolerated dose (MTD) or limit dose. This dose is generally determined based upon a subchronic study (90 days) in the same animals and is usually the maximum dose that can be tolerated by the animals without any signs of significant toxicity in the exposed animals (e.g., weight loss, tissue damage). The OECD and EPA provide guidelines [33, 59] on how to choose this top dose. These guidelines are in general agreement with the scientific literature [60].

The guidelines also address the methods by which the data should be analyzed. For example, the EPA guidelines^[61] state that:

"A trend test such as the Cochran-Armitage test (Snedecor and Cochran, 1967) asks whether the results in all dose groups together increase as dose increases. A pairwise comparison test such as the Fisher exact test (Fisher, 1950) asks whether an incidence in one dose group is increased over that of the control group. By convention, for both tests a statistically significant comparison is one for which p is less than 0.05 that the increased incidence is due to chance. Significance in either kind of test is sufficient to reject the hypothesis that chance accounts for the result."

In fact, most guidelines and peer-reviewed publications come to the same conclusion $^{130,59,60,62]}$ on what tests to use, as did EPA's FIFRA Scientific Advisory Panel (SAP) in their review of the EPA's issue paper of the carcinogenicity of glyphosate $^{[54]}$. The US National Toxicology Program (NTP) uses both a trend test $^{[3,4,63]}$ and Fisher's exact test for analyzing carcinogenicity data. Unless otherwise noted in this document, all p-values presented in this section on animal cancer studies were recalculated on my computer and are the exact one-sided p-values for the Fisher test (p_{Fisher}) and/or the Cochran-Armitage linear trend test (p_{Trend}) where appropriate. In cases where the data is pooled and the numbers of tumors are large, the approximate p-value based upon the normal distribution is used for the trend test to avoid excessive computation time; these are noted as p_{TrendA} . The approximation (p_{TrendA}) is generally equivalent to the exact p-value (p_{Trend}) when there are more than 10 animals with tumors $^{[64]}$.

To avoid doing large numbers of tests and over-analyzing the data, my comments will generally rely upon the use of the trend test with the results from Fisher's exact test serving as a descriptive discussion of the findings. This is in agreement with SAP comments^[54] and is generally accepted in the evaluation of animal cancer studies.

Even with the high doses used in these studies, it is sometimes necessary to use "historical controls" to evaluate a given response. Historical controls are generally the historical collection of tumor responses from untreated control groups from studies in the same laboratory within two to three years of the study being evaluated [30, 34, 59, 65, 66]. Evaluation of the data using the historical controls should be done rigorously to correctly evaluate the responses seen in a given study. Where a valid historical control dataset was available. I used the mean tumor response in the controls to calculate the probability of observing the trend seen in the study or a more significant trend if the true probability of response is the historical control average; this is labeled p_{hist}. In all cases, the guidelines and literature support the use of the control in the current study as the most appropriate control group to use unless there is a specific need to address historical responses. Many guidelines [30, 33, 34, 67] suggest historical controls be used for evaluating rare tumors and findings in assays that appear to be unusual. It is explicitly noted that significant increases in tumors over what is seen in the concurrent control should not be rejected simply because the tumors are in the range of the historical controls^[30]. Nor is it recommended to reject significant increases in tumor responses because the control response is on the low end of the historical range. Animals are randomly assigned to control and exposure groups and any low response in controls is likely to also reflect similar response patterns in treated animals. This is in agreement with SAP comments [54] on the EPA issue paper on glyphosate [61] and with all guidelines for analyzing animal carcinogenicity data.

There are 13 animal carcinogenicity studies in rats^[68-80] and eight in mice^[81-88]. Only two studies^[71,77] appear in the peer-reviewed literature; the remaining studies are partially available through several sources. For three of the rat studies^[70,74,78] and two mouse studies^[83,86], technical reports from the performing laboratory are available from documents provided by the registrant. For the remaining unpublished studies, data was obtained from the EPA review of glyphosate^[61], the European Food Safety Authority review of glyphosate^[89,90] and supplemental material from a review of the carcinogenicity of glyphosate by a panel of scientists on behalf of Monsanto^[91].

Many additional endpoints, other than cancer incidence and related toxicities, were evaluated in these studies; I will only provide comments on the tumor incidence data and related data where relevant to the cancer findings.

It is unusual to have multiple carcinogenicity studies in the same experimental animal model arising from different laboratories. Methods for the combined analysis of multiple animal cancer bioassays are not available in the scientific literature. However, pooled analyses, as conducted in epidemiology^[92,93] are applicable for combining animal carcinogenicity studies. The basic concept is to pool all data from the same sex/species/strain into one study and analyze it appropriately. The basic steps are: 1) select the studies to be pooled; 2) merge the data for analysis; 3) estimate study specific

effects; 4) estimate pooled effects; 5) explain the differences between the pooled effects and the individual study effects; 6) do a sensitivity analysis if possible. These steps will be used to analyze pooled data from animal carcinogenicity studies where pooling is done by sex, species, strain and duration of exposure to limit heterogeneity across pooled studies. In their recommendations to the EPA regarding EPA's issue paper on the carcinogenicity of glyphosate^[54], the FIFRA Science Advisory panel strongly supported the use of a pooled analysis to address the question of consistency citing my comments to the EPA^[94].

Rat Studies

Reyna and Gordon (1974)^[76] exposed Albino rats (probably Sprague-Dawley) to ammonium salt of glyphosate (13.85% purity) in a two-year chronic feeding study. Only EPA^[61] reported on this study and provided no details other than to report there were approximately 70 animals per group and there was insufficient reporting on the histopathology findings. Insufficient detail is available on this study.

This study is inadequate for use in deciding on causality.

Burnett et al. (1979)^[70] exposed male and female albino rats to an aqueous monosodium salt solution of glyphosate by oral intubation (purity not given). There were 90 animals per group and doses were 0, 3, 10 and 30 mg/kg/day for 24 months. EPA^[61] reported that no histopathological alterations were observed; no additional information was available on this study. This study had severely reduced sensitivity to observe any cancer findings because the highest dose used in this study is very low compared to the MTDs in the other rat studies. This study does not contribute to the evaluation of cancer causation in laboratory animals and will be excluded from any further discussion.

Lankas et al. (1981)^[74] exposed groups of 50 male and 50 female Sprague-Dawley rats to glyphosate (98.7% purity) in feed (see Table 1 for doses) for 26 months. This study is not in concordance with OECD guidelines (they were not available at the time of this study), but as noted by EFSA^[89], it was in general accordance with the 1981 OECD guidelines. Information on this study was available from EPA^[61], EFSA^[89], Greim et al.^[91], the original study report from Bio/dynamics Inc.^[95] and memos from Monsanto to EPA provided by Monsanto.

There were no survival differences in this study and there was no indication that the highest dose used exceeded the maximum-tolerated dose.

Table 1 shows the statistically significant trend in testicular interstitial cell tumors that was observed (p_{Trend} =0.009). Historical controls were provided in the study report for five studies with response rates of 4/116, 5/75, 4/113, 6/113 and 5/118 for a mean response of 4.5% (24/535). Comparing this historical control mean to the observed response yields p_{Hist} =0.006, showing that this result is significant, even when comparing it to the historical control dataset. **Lankas et al. (1981)** argued that the tumor rates at sacrifice were not statistically significant from control suggesting this finding is not related to glyphosate. However, by reducing the numbers of animals to only those at

terminal sacrifice, the power to find an effect was significantly reduced. Also, if the tumor increases the animal's chances of dying, then some animals with tumors will die early, which could bias results only seen at terminal sacrifice. This type of analysis is simply never done; it appears to have been developed for this case to dismiss the effects seen in the study. Lankas et al. (1981) also suggested the control response was low compared to the historical rates, but the concurrent control is always the best control group to use unless it is clearly flawed [33, 34, 59]; in this case, there was no apparent problem with the controls because the probability of seeing 0/50 if the true background response is 4.5% is about 10% and this control group is not significantly different than the historical controls. EFSA^[89] noted rates for interstitial cell hyperplasia (a potential precursor for the interstitial cell tumors) and saw no dose-response trend (Table 1). However, these very low rates would suggest that the tumors arising in the 10 animals that did get interstitial cell tumors are independent of a mechanism involving interstitial cell hyperplasia. The tumor response for interstitial cell tumors was not monotonic (tumor rates increasing as dose increases), but was still within statistical variation. The EPA SAP agrees, concluding that "requiring visual confirmation of a monotonic trend in scatter plots of data ... is known to be a poor way of assessing trend"[54]

An increase in Thyroid C-cell carcinomas (Table 1) was observed in female rats (p_{Trend} =0.003) but combining adenomas and carcinomas was only marginally significant (p_{Trend} =0.072). Independent pathologists brought in by Monsanto argued these tumors were not treatment related. The authors provided historical control data for both carcinomas and carcinomas combined with adenomas from nine control groups with mean responses of 4/453=0.9% for carcinomas and 46/453=10.2% for the combined tumors. The significance of both results was unchanged using the historical control data.

The authors also mentioned that the incidence of lymphocytic hyperplasia in the thymus and lymph nodes were slightly elevated above controls (p_{Trend} =0.143). The middle dose group was significantly different from controls (p_{Fisher} =0.018).

This study also had a statistically significant increase in pancreatic islet cell tumors in the lowest dose (p_{Fisher} =0.028) in males (Table 1), but not any of the other doses; the trend test was not significant (p_{Trend} =0.312).

The highest dose used in this study in Sprague-Dawley rats is far below the MTD. Even though EFSA^[89] noted that this study was in general accordance with the 1981 OECD guidelines, they dismissed it for not meeting current guidelines due to the low-doses used. EPA^[61] also excluded this study from consideration. However, the study saw an increase in testicular tumors in males and Thyroid C-cell carcinomas in females that should be carefully evaluated in determining causality. Also, this is the study with the longest exposure (26 months) and provides unique information to the overall evaluation.

Additional tumors seen to have significant increases in other studies using Sprague-Dawley Rats are also included in Table 1.

Table 1: Tumors of interest in male and female Sprague-Dawley rats the 26-month feeding study of **Lankas (1981)**^[74]

Tumor	Sex	Doses (mg/kg/d	ay)		p-values
	Male	0	3.05	10.30	31.49	
	Female	0	3.37	11.22	34.02	
Testicular interstitial cell tumors	Male	0/50	3/50	1/50	6/50**	P _{Trend} =0.009 P _{Hist} =0.006
Interstitial cell hyperplasia	Male	1/50	1/50	1/50	0/50	P _{Trend} =0.830
Thyroid C-cell Carcinomas	Female	1/47	0/49	2/50	6/47	P _{Trend} =0.003 P _{Hist} =<0.001
Thyroid C-cell Adenomas and Carcinomas	Female	6/47	3/49	8/50	9/47	P _{Trend} =0.072 P _{Hist} =0.072
Pancreas Islet Cell Tumors	Male	0/50	5/50*	2/50	3/50	P _{Trend} =0.312
lymphocytic hyperplasia, thymus and lymph nodes	Female	27/50	35/50	38/50*	35/50	P _{Trend} =0.143
Thyroid C-cell Adenomas and Carcinomas	Male	1/47	2/49	4/49	4/49	P _{Trend} =0.122
Thyroid Follicular-cell Adenoma	Male	5/47	1/49	2/49	2/49	P _{Trend} =0.748
Liver Neoplastic Nodule	Male	3/50	5/50	1/50	3/10	P _{Trend} =0.630
Kidney Adenoma	Male	1/50	5/50	0/50	0/50	P _{Trend} =0.979

^{*-} pFisher<0.05, **- pFisher<0.01

In conclusion, this study shows positive result for testes interstitial cell tumors and hepatocellular adenomas in male Sprague-Dawley rats and a positive response for thyroid c-cell carcinomas in female Sprague-Dawley rats and will be included in the overall evaluation of causation.

Stout and Ruecker (1990)^[78] exposed groups of 50 male and 50 female Sprague-Dawley rats to glyphosate (98.7% purity) in feed (see Table 2 for doses) for 24 months. This study was done under OECD guidelines.

There were no survival differences in this study and there was no indication that the highest dose used exceeded the maximum-tolerated dose.

Pancreatic islet cell tumors were increased in all dose groups relative to the controls in male rats and statistically significant for the lowest (p_{Fisher} =0.015) and highest (p_{Fisher} =0.032) dose groups (Table 2). However, these rates include the 10 animals that were sacrificed at one year. Due to the short duration of exposure, the rats terminated at one year were likely not at risk of developing this tumor; it is very unusual to include these animals in the final tumor counts (EPA^[61] also excluded these animals). In the pathology tables for this study, there were no tumors in any of the 10 animals at the interim sacrifice. Removing these 10 animals does not alter the p-values for trend or

Fisher's exact test. Historical control data for this tumor in this laboratory was reported as 23/432 or 5.3%^[96] and a trend comparison against this control rate was not significant (p_{hist}=0.15). The lack of a trend is driven by the up and down nature of the response. Assuming the historical rate of 5.3% is correct, the chances of seeing eight or more tumors in 47 animals is 0.003. Similarly, for the mid- and high-doses, this probability is 0.124 and 0.014, respectively. Females did not show an increase in this tumor. The authors provided a table with the combined results for pancreatic islet-cell adenomas and carcinomas from this study with the tumor counts from the Lankas et al. (1981)^[74] study arguing the results do not show a dose-related increase. Animals studied for 26 months versus 24 months can have very different responses to the same chemical and very different control incidence.

In male rats, there was a statistically significant trend (p_{Trend} =0.015) after removal of interim-sacrificed animals for hepatocellular adenomas but a significant increase for adenomas and carcinomas combined (p_{Trend} = 0.05, Table 2) and not in females (not shown). Liver carcinomas are generally also provided in a separate analysis, but these data were not provided by the authors (the data would suggest the hepatocellular carcinomas would have a negative trend).

There was also a significant increase in thyroid C-cell adenomas in the female rats (p_{Trend} =0.049) and a marginal increase in adenomas and carcinomas combined (p_{Trend} =0.052) regardless of whether interim sacrificed animals are included (Table 2). In males, the trend for adenomas was p_{Trend} =0.084 and for adenomas and carcinomas was p_{Trend} =0.091. Adenomas were seen in male rats at the interim sacrifice demonstrating that male rats at the interim sacrifice were at risk for this tumor. If these animals are added back into the analysis, the trend test in males has p_{Trend} =0.063 for adenomas and p_{Trend} =0.068 for adenomas and carcinomas combined.

Several other tumors demonstrating significant findings in other studies of Sprague-Dawley rats are included in Table 2 and do not show significant effects.

In conclusion, the finding of an increased incidence of pancreatic islet-cell tumors in this study cannot easily be ruled out as a chance finding. Findings of significant increases in liver adenomas in male rats with no increases in carcinomas could be due to chance. The findings of significant increases in thyroid c-cell tumors in males and females should be compared with other studies. This study will be included in the overall evaluation of causation.

25

⁶ In statistics, it is common to refer to p-values in the range of 0.10>p-value>0.05 as marginal when the target p-value is ≤0.05; this is done to avoid missing trends in data reflected by almost significant findings

Table 2: Tumors of interest in male and female Sprague-Dawley rats from the 24-month feeding study of Stout and Ruecker (1990)^[78]

Tumor	Sex	Doses	(mg/kg/d	ay)		p-values	
	Male	0	89	362	940		
	Female	0	113	457	1183

Atkinson et al. (1993)^[68] conducted a combined chronic toxicity/carcinogenicity study of glyphosate (98.9% pure). They used 50 Sprague-Dawley rats in each group for both sexes with dietary exposures given in Table 3. An additional 35 rats/sex/dose were included for interim sacrifices.

There were no survival differences in this study and there was no indication that the highest dose used exceeded the maximum-tolerated dose.

Table 3: Tumors of interest in male and female Sprague-Dawley rats from the 24-month feeding study of Atkinson et al. (1993)^[68]

Tumor	Sex	Doses (mg/kg/da	γ)			p-values
	Male	0	11	112	320	1147	
	Female	0	12	109	347	1134	
Thyroid Follicular Adenomas and Carcinomas	Male	0/50	0/21	0/17	2/21	2/49	P _{Trend} =0.099
Thyroid Follicular Adenomas and Carcinomas (adding terminal sacrifice animals to denominator)	Male	0/50	0/50	0/50	2/50	2/49	P _{Trend} =0.034
Thyroid C-cell Adenomas and Carcinomas	Female	8/50	1/27	1/29	1/29	7/49	P _{Trend} =0.197

^{*-} pFisher<0.05, **- pFisher<0.01

The authors reported no significant effects, as do EPA^[61] and EFSA^[89]. The study did not do detailed histopathological examination on all animals in all groups for every tumor type, but did examine all control and high dose animals, all animals that died before study termination and animals showing macroscopic tumors at study termination; liver, kidney and lungs were examined for all animals. This severely weakens the study for addressing dose-response trends. However, in reviewing the pathology tables provided in Greim et al. (2015)^[91], thyroid follicular adenomas and carcinomas were found to be marginally significant (p_{Trend}=0.099) by the trend test. If the three middle exposure groups had seen no other tumors and the denominators were the entire 50 animals on study, the trend analysis becomes significant (p_{Trend}=0.034).

Without examination of the animals free of gross tumors at terminal sacrifice, the findings from this study will be given less weight in the overall evaluation of causation.

Brammer (2001)^[69] conducted a two-year carcinogenicity study in Wistar rats in which groups of 52 animals were exposed to glyphosate (97.6% pure) at doses provided in

Table 4. An additional 12 animals were sacrificed at one-year.

A significant positive trend in survival was noted by the EPA (p=0.03), however this trend was not accomplished using a Kaplan-Meir test⁽⁹⁷⁾ (the appropriate test), but simply a test relating to the percent surviving to terminal sacrifice. There was no indication that the highest dose used exceeded the maximum-tolerated dose.

EPA[61], but not EFSA[89], noted there was a statistically significant trend of hepatocellular adenomas in male rats with the highest dose also being statistically significant from the control. Trend analysis gives p_{Trend}=0.008 and the Fisher's exact test comparison of high dose to control is prisher=0.027. EPA dismissed this finding as potentially due to a slight difference in the number of animals at the terminal sacrifice in this study versus controls. However, no formal statistical evaluation of survival is provided and it cannot be assumed from these numbers that survival was significantly impacted in these animals. Greim et al. (2015)[91] used slightly different numbers for this tumor because three animals (one in the control group, one in the low-dose group and one in the mid-dose group) in the interim sacrifice group died before their sacrifice time and, from the pathology tables provided in their paper, these could not be separated from others. These numbers have been included in Table 4, but it does not change the significance of the findings. Greim et al. (2015)[91] dismissed these findings, partly because of the same survival argument used by the EPA and partly because they had a historical control dataset where the range of historical response was from 0-11.5%; they did not provide the mean response or the individual tumor responses for these historical controls. As mentioned earlier, dismissing results because they are in the range of the historical controls is an unacceptable method for using historical controls to evaluate a study, and in this case, there is no reason to question the concurrent controls.

Table 4: Tumors of interest in male and female Wistar rats from the 24-month feeding study of Brammer (2001)^[69]

Tumor	Sex	Doses	p-values			
	Male Female	0	121	361 437	1214	
		0	145		1498	
Hepatocellular Adenoma	Male	0/52	2/52	0/52	5/52*	P _{Trend} =0.008
Hepatocellular Adenoma (from Greim et al., 2015 ^[91])	Male	0/53	2/53	0/53	5/52*	P _{Trend} =0.008 P _{Hist} =0.006
Mammary Gland Adenomas and Adenocarcinomas	Female	3/51	2/51	0/51	2/51	P _{Trend} =0.575
Skin Keratocanthoma	Male	1/51	0/51	1/51	1/51	P _{Trend} =0.392

^{*-} pFisher<0.05, **- pFisher<0.01

I obtained historical control data from 16 control groups in Wistar rats from Charles River Laboratories for the years 2003 to 2011^[98]. Although these are outside of the optimal time range for the animals used in the **Brammer (2001)** study, they can serve as an illustration of why using a range can be misleading. There were 52 liver adenomas

seen in 1217 control animals for a mean response of 4.27% with a range of 0% to 17.5% (individual study findings of 6/100, 0/60, 1/60,1/50,1/80, 14/112, 1/65, 0/60, 21/120, 0/50, 1/50, 2/60, 0/50, 1/100, 1/150, 2/50; 13 studies with \leq 2% response). Assuming the underlying probability of having a tumor in controls is 4.27%, p_{Hist} =0.006 (Table 4). Thus, even though the responses seen in **Brammer (2001)** are in the range of the historical controls, the trend is highly significant when historical controls are used appropriately. **Greim et al. (2015)** also mentioned findings of increased toxicity at the high dose for which they provided numbers for only hepatocyte fat vacuolation and hepatitis; none of these findings were statistically significant by any test.

In conclusion, this study shows a positive result for hepatocellular adenomas in male Wistar rats and will be included in the overall evaluation of causation.

Pavkov and Wyand (1987)^[75] exposed Sprague-Dawley rats to glyphosate trimesium salt (sulfosate, 56.2% pure) in feed for two years. Eighty animals/sex were tested in the control, low-dose and mid-dose groups, and 90/sex were tested in the high dose group. Doses of 0, 4.2, 21.2 and 41.8 mg/kg/day were used in males and 0, 5.4, 27, and 55.7 mg/kg/day in females. This study showed no significant findings according to EPA^[61]. No details were given beyond that simple statement and no others reported on this study. The doses in this study are far below the MTD so this study would have reduced sensitivity to detect an effect if one existed. This study also used a different chemical than the other Sprague-Dawley rat studies and is not comparable on that basis.

This study is not acceptable for use in the evaluation of causality due to the lack of details about the study.

Suresh, (1996)^[79] exposed Wistar rats to glyphosate (96.8% pure) in feed for two years. Fifty animals/sex were tested in four exposure groups shown in Table 5.

There were no survival differences in this study and there was no indication that the highest dose used exceeded the maximum-tolerated dose.

EPA^[61] concluded there were no tumors increased due to glyphosate exposure in this study and EFSA[89] concluded that, "[n]one of the significant microscopic changes, increased and decreased incidences (in liver, spleen, lymph nodes, adrenals, thymus, gonads, uterus, mammary gland) observed have shown dose relationship, hence appeared to be incidental and not related to the treatment with the test compound." (page 491). Greim et al. (2015)[91] provided data on hepatocellular adenomas and carcinomas in both sexes but none of these showed significant trends or pairwise tests (Table 5). However, there was another study with a strong significant trend in hepatocellular adenomas in Wistar rats [69] so these are also included in Table 5 for comparison. No other tumors were mentioned by any other group and an examination of the grouped pathology tables provided by Greim et al. (2015) show an increase in mammary gland adenomas at the mid-dose (p_{Fisher}=0.017) but no significant trend. However, there was another study with a strong significant trend in mammary gland adenomas and adenocarcinomas combined in Wistar rats[80] so these are also included in Table 5 for comparison. Like the Atkinson et al. (1993)[68] study, Suresh (1996) did not do full pathology on all of the animals in the interim exposure groups making

interpretation of this study problematic.

This study will be included in the overall evaluation of causation.

Table 5: Tumors of interest in male and female Wistar rats from the 24-month feeding study of Suresh(1996)^[79]

Tumor	Sex	Doses (p-values			
	Male	0	6.3	59.4	595.2	
	Female	0	8.6	88.5	886	
Mammary Gland Adenoma and Carcinoma	Female	5/40	3/28	8/33	2/48	P _{Trend} =0.970
Hepatocellular Adenoma	Male	24/50	22/50	10/50	21/50	P _{Trend} =0.374
Skin Keratocanthoma	Male	0/50	0/50	0/50	0/50	P _{Trend} =1

^{*-} pFisher<0.05, **- pFisher<0.01

Enemoto (1997)^[72] exposed Sprague-Dawley rats to glyphosate (95.7% pure) in feed for two years. Fifty animals/sex were tested in four exposure groups (see Table 6). In addition, 10 animals per exposure group were exposed for 1 year and another 10 for 18 months at which point they were sacrificed and examined. These interim sacrifice animals (1 year and 18 months) are included in the analysis if tumors were seen in these groups.

There were no survival differences in this study and there was no indication that the highest dose exceeded the maximum-tolerated dose.

EPA and EFSA both found no significant changes in tumors in any group. **Greim et al.** (2015) again provide tables for a number of tumors, none of which show significant effects except for the incidence of kidney adenomas in male rats (p_{Trend}=0.004, Table 6). Examining the pathology tables provided in **Greim et al.** (2015) reveals no additional tumors showing an increase in tumor incidence with dose. A different study ^[74] in Sprague-Dawley rats demonstrated a strong significant trend in mammary gland adenomas, thyroid C-cell carcinomas, skin Keratocanthomas and testicular interstitial cell tumors so these are also included in Table 6 for comparison.

This study showed a significant increase in kidney adenomas and will be included in the overall evaluation of causation.

Table 6: Tumors of interest in male and female Sprague-Dawley rats from the 24-month feeding study of Enemoto (1997)^[72]

Tumor	Sex	Doses (mg/kg/d	ay)		p-values
	Male	0	104	354	1127	
	Female	0	115	393	1247	
Mammary Gland Adenoma	Female	23/50	27/50	24/50	30/50	P _{Trend} =0.106
Kidney Adenoma	Male	0/50	0/50	0/50	4/50	P _{Trend} =0.004
Thyroid C-cell Adenomas/Carcinomas	Female	4/60	7/60	8/60	4/60	P _{Trend} =0.692
Thyroid C-cell Adenomas/Carcinomas	Male	8/70	10/70	6/70	7/70	P _{Trend} =0.697
Thyroid Follicular-cell Adenomas/Carcinomas	Male	4/70	2/70	1/70	0/70	P _{Trend} =0.990
Testes Interstitial Cell Tumors	Male	3/49	2/50	0/50	2/50	P _{Trend} =0.594

Pancreas Islet-Cell Adenoma	Male	4/50	1/50	2/50	1/50	P _{Trend} =0.844

^{*-} pFisher<0.05, **- pFisher<0.01

Wood et al. (2009)^[80] exposed Wistar rats to glyphosate (94.7% to 97.6% pure) in feed for two years. Fifty-one animals/sex were tested in four exposure groups at doses shown in Table 7.

No survival differences were seen in this study.

EFSA^[89] found no dose-related tumor increases while EPA^[61] noted an increase in mammary gland adenomas and adenocarcinomas combined with p_{Trend}=0.062 for adenomas, p_{Trend}=0.042 for adenocarcinomas and p_{Trend}=0.007 for the combined tumors (Table 7). EPA concluded there was no progression from adenoma to adenocarcinoma and argued the increase was not glyphosate related. This conclusion is contradicted by the fact that 6 animals in control and the lower dose groups got carcinomas with no adenomas in any of the animals in these groups. It seems likely that, in this case, mammary gland adenocarcinomas can arise without the presence of any adenomas. Greim et al (2015)^[91] also noted an increase in skin keratoacanthoma in males (p_{Trend}=0.030). Review of the pathology tables identified no other tumors with increased tumor rates as a function of dose. There was another study with a strong significant trend in hepatocellular adenomas in Wistar rats^[69] so this tumor is also included in Table 7 for comparison.

This study showed an increase in mammary tumors in females and skin keratoacanthomas in males and will be used in the evaluation of causality.

Table 7: Tumors of interest in male and female Wistar rats from the 24-month feeding study of Wood et al. (2009)^[80]

Tumor	Sex	Doses		p-values		
	Male	0	85.5	285.2	1077.4	
	Female	0	104.5	348.6	1381.9	
Mammary Gland Adenomas	Female	0/51	0/51	0/51	2/51	P _{Trend} =0.062
Mammary Gland Adenocarcinomas	Female	2/51	3/51	1/51	6/51	P _{Trend} =0.042
Mammary Gland Adenomas and Adenocarcinomas	Female	2/51	3/51	1/51	8/51*	P _{Trend} =0.007
Skin Keratocanthoma	Male	2/51	3/51	0/51	6/51	P _{Trend} =0.030
Hepatocellular Adenoma	Male	0/51	2/51	1/51	1/51	P _{Trend} =0.418

^{*-} pFisher<0.05, **- pFisher<0.01

Excel (1997)^[73] exposed Sprague-Dawley rats to glyphosate (purity not given) in feed for two years. Fifty-one animals/sex were tested in four exposure groups at doses of 0, 150, 780 and 1290 mg/kg/day in males and 0, 210, 1060 and 1740 mg/kg/day in females. EPA^[61], EFSA^[89] and Greim et al. (2015)^[91] had concerns with the quality of this study, the characterization of the chemical being used and with tumor rates in this strain of animals being too low. The Supplemental Material from Greim et al. (2015) on this study shows no significant increase in any tumor and virtually all animals having no tumors in controls and treated animals.

This study is inadequate for use in deciding on causality for the same reasons given by the EPA, EFSA and Greim et al. (2015).

Chruscielska, K. (2000)^[71] exposed Wistar rats to glyphosate as a 13.8% solution (purity not given) in drinking water for two years. According to Greim et al. (2015)^[91], this appears to be the glyphosate formulation Perzocyd. Eighty-five animals/sex were tested in four exposure groups. The authors listed the doses as control, 300 mg/L, 900 mg/L and 2700 mg/L in drinking water. Greim et al. (2015)^[91] estimated the intake of glyphosate to be 0, 1.9, 5.7 and 17 mg/kg/day for females and 0, 2.2, 6.5, and 19 mg/kg/day in males. There was a slight increase in malignant adenomas of the pituitary gland and an opposite decrease in pituitary adenomas suggesting no effect or potentially a promotional effect in which adenomas are promoted to carcinomas by glyphosate. No other increased tumor responses were reported in the manuscript. Because of the low exposures, this study is an inadequate challenge to the animals (the highest dose is far below the MTD). The reporting of this study is very limited and it the overall quality of the work cannot be evaluated.

This study is inadequate for use in deciding on causality.

Seralini, G. E., et al. (2014)^[77] exposed Sprague-Dawley rats to the glyphosate formulation Roundup in drinking water for two years as part of a broader experiment on

Roundup-Ready Corn. Ten animals/sex were tested in four exposure groups at doses of 0, 0.00005, 400 and 22500 mg/L in females. The authors reported an increase in the incidence of mammary gland tumors (mainly fibroadenomas and adenocarcinomas) in female rats with incidences of 5/10 for control and 9/10, 10/10, 9/10 (p_{Fisher}=0.016) in the low-, mid- and high-doses groups respectively. It is difficult to assess the quality of this study due to limited reporting on the histopathological descriptions of the tumors and the very small sample size.

This study will not be used in the evaluation of causality.

Joint Analysis - Rats

Table 8 summarizes the significance for all tumors of interest in rats.

Brammer (2001)^[69] saw a significant increase in hepatocellular adenomas in male Wistar rats with increasing dose (p_{Trend}=0.008, Table 4). The other two acceptable studies in Wistar rats (Wood et al. (2009)[80] and Suresh (1996)[79] did not see significant increases (Tables 5 and 7). On the basis of statistical significance, these studies are inconsistent. To reject these findings based upon only 1/3 being positive is the same as rejecting a coin as being fair if, in three flips of the coin, the result is one head and two tails; it simply is not possible and there is a better way to address these findings, Given different doses and different sample sizes, we need to formally test for consistency in these studies. Suresh (1996) saw 48% response for hepatocellular adenomas in controls whereas the other two studies saw no tumors in the control animals. Thus, although all three studies are in Wistar rats, Suresh (1996) has a significantly different control response from the other two. Suresh (1996) did not give a substrain for the Wistar rats used, but Brammer (2001) and Wood et al. (2009) used different substrains. All three studies used different diets and were conducted in different facilities. Thus, there is no obvious explanation for the dramatically different rates in Suresh (1996). It is known that the same strain of rats from different laboratories can have markedly different control tumor responses. Because they have similar control response, Brammer (2001) and Wood et al. (2009) can be pooled into a single study to ask the question "Does the significant trend for Brammer (2001) disappear when it is pooled with the negative study of Wood et al. (2009)?" The analysis of the pooled studies yields p_{Trend}=0.013 supporting the conclusion that glyphosate causes hepatocellular adenomas in Wistar rats with similar background responses.

Wood et al. (2009)^[80] saw a significant increase in mammary gland adenomas and adenocarcinomas (p_{Trend}=0.007, Table 7) in females that was not seen in the other two studies (Tables 4 and 6). The background rates in these studies differ only slightly and a pooled analysis of all three studies yields p_{TrendA}=0.459, suggesting that combining the data eliminates the dose-response trend seen in Wood et al. (2009). However, if the Wistar rats used in Suresh (1996) differed in their response for hepatocellular adenomas, they may differ for this tumor as well. Combining only Wood et al. (2009) with Brammer (2001) results in p_{Trend}=0.037. Given the mixed results from the pooling for this tumor I conclude there is limited support for the notion that glyphosate can cause mammary gland adenomas and adenocarcinomas in Wistar rats.

Wood et al. (2009)^[80] saw a significant increase in skin keratocanthomas (p_{Trend}=0.030, Table 7) in males that was not seen in the other two studies (Tables 4 and 6). The background rates in these studies differ only slightly and a pooled analysis of all three studies yields p_{TrendA}=0.010, suggesting that combining the data does not eliminate the dose-response trend seen in Wood et al. (2009). Combining only Wood et al. (2009) with Brammer (2001) results in p_{Trend}=0.053. Given the results from the pooling for this tumor I conclude there is support for the notion that glyphosate can cause skin keratocanthomas in Wistar rats.

In Sprague-Dawley rats, there were four studies that were acceptable for inclusion in the evaluation of causality with one^[74] yielding strong positive responses for thyroid C-cell carcinomas in females and testicular interstitial tumors and hepatocellular adenomas in males and another^[72] yielding a strong result for kidney adenomas in males. Lankas (1981)^[74] saw a significant increase in thyroid C-cell carcinomas in female rats exposed to glyphosate (p_{Trend}=0.003, Table 1) and a marginal increase in C-cell adenomas and carcinomas combined (p_{Trend}=0.072, p_{hist}=0.072, Table 1; two of the other three studies also saw marginal results for thyroid C-cell adenomas and carcinomas in females (Tables 2 and 3). A pooled analysis using all four studies yields p_{TrendA}=0.390. This pooled analysis does not support the results seen in Lankas (1981). However, the Lankas (1981) study was for 26 months and the other three were for 24 months; the C-cell carcinomas could be a result of the longer exposure period even though the dose is substantially lower in this study compared to the other two. From these data, I conclude that the evidence is weak that glyphosate causes thyroid C-cell tumors in female Sprague-Dawley rats.

Thyroid C-cell adenomas and carcinomas combined, in males, show marginally significant dose-response trends in **Stout and Ruecker (1990**, Table 2) but not in the remaining three studies. Pooling all four studies yields a significant trend of p_{TrendA} =0.041. From these data, I conclude that there is evidence is that glyphosate causes thyroid C-cell tumors in male Sprague-Dawley rats.

Thyroid follicular-cell adenomas and carcinomas combined, in males, show a significant dose-response trend in **Atkinson et al. (1993**, Table 3) but not in the remaining three studies;. Pooling all four studies yields no significant trend with p_{TrendA} =0.618. From these data, I conclude that there is no evidence that glyphosate causes thyroid follicular-cell tumors in male Sprague-Dawley rats.

Hepatocellular adenomas, in males, show a significant dose-response trend in **Stout and Ruecker (1990**, Table 2) but not in the remaining three studies. Pooling all four studies yields a marginally significant trend with p_{Trend} =0.073. From these data, I conclude that there is limited evidence that glyphosate causes thyroid follicular-cell tumors in male Sprague-Dawley rats.

Table 8: Summary of significance tests for 5 tumors from 7 studies in Rats

Study	Strain				N	eoplasm			
	Hepato- cellular Adenomas (males)	Mammary Gland Tumors (females)	Skin Kerato- canthoma (males)	Thyroid C-Cell Tumors (females)	Thyroid C-Cell Tumors (males)	Thyroid Follicular Cell Tumors (males)	Testis Inter- stitial Cell Tumors (male)	Kidney Adenomas (males)	
Brammer (2001) ^[69]	Wistar	+++1	1-1-						
Wood (2009) ^[80]		2	+++	++					
Suresh (1996) ^[79]		1-1-2	- 3						
Pooled W	istar Rats	++2	++2	+++					
Lankas (1981) ^[74]	Sprague Dawley	_3				-	*	+++	-
Enemoto (1997) ^[72]					**	(*)			+++
Atkinson et al. (1993) ^[68]					•	-	++	1	
Stout and Ruecker (1990)		**			•	+	•	3	7
Pooled S Dawle		+			-	++	- 6		++4

¹entries are p_{Trend}/p_{Hist} with values: -p>0.1, $+0.1 \ge p>0.05$, $++0.05 \ge p>0.01$, $+++p\le 0.01$; ²pooling results from **Brammer (2001)** and **Wood (2009)** only; ³liver neoplastic nodules; ⁴excluding **Lankas (1981)**

Another significant trend seen in Sprague-Dawley rats is the finding of testes interstitial cell tumors from Lankas (1981)^[74] (P_{Trend}=0.009, Table 1); the other three studies were negative for this tumor (Tables 2, 3 and 6). Combining the other three studies with that of Lankas (1981) for testes interstitial tumors results in a p-value for trend that is clearly non-significant (p_{TrendA}=0.608). However, as noted above, the Lankas (1981) study was for 26 months and the other two were for 24 months; the tumors could be a result of the longer exposure period even though the dose is substantially lower in this study compared to Stout and Ruecker (1990), Atkinson et al.(1993) and Enemoto (1997).

The final tumor in Sprague-Dawley rats showing a strong significant trend is kidney

adenomas in males from the study by Enemoto (1997)^[72] (P_{Trend}=0.004, Table 6). The kidney tumor data is not significant for the studies by Lankas (1981)^[74] (Table 1), Atkinson et al. (1993)^[99] (Table 3) and Stout and Ruecker (1990)^[78] (Table 2). Pooling the Enemoto (1997) study with that of Lankas (1981)^[74], Stout and Ruecker (1990) and Atkinson et al. (1993) yields p_{TrendA}=0.201. Removing the 26-month study by Lankas (1981)^[74] yields a p-value for the three combined 24-month studies of p_{Trend}=0.031; thus, the association between glyphosate and kidney adenomas in male Sprague-Dawley rats is supported by these data, even with the difficulty associated with interpreting the results in the low- and mid-doses in the Atkinson et al. (1993) study. There is evidence to support an increase in kidney tumors in male Sprague-Dawley rats exposed to glyphosate.

In summary, there is evidence that glyphosate causes hepatocellular adenomas and skin keratocanthomas in male Wistar rats, mammary gland adenomas and adenocarcinomas in female Wistar rats and kidney adenomas and thyroid C-cell adenomas and carcinomas in male Sprague-Dawley rats. There is limited evidence glyphosate causes hepatocellular adenomas in male Sprague-Dawley rats.

Mouse Studies

Reyna and Gordon (1974)^[86] exposed Swiss White mice to glyphosate (>97% purity) in feed for 16 months in males and 18 months in females. Fifty animals/group/sex were tested in three exposure groups; control, 17 mg/kg and 50 mg/kg. Only 10 animals per group were examined for histopathological changes.

There was no impact on survival of administration of glyphosate and no indication that the high dose exceeded the MTD.

No significant increases were seen in any tumor from this study. However, given the small sample size for histopathological evaluation and the low doses used for this study, this study is inadequate.

This study will not be used in the evaluation of causality.

Knezevich and Hogan, (1983)^[83] exposed CD-1 mice to glyphosate (99.8% pure) in feed for two years. Fifty animals/group/sex were tested in four exposure groups (see Table 9).

There were no survival differences in this study and there was no indication that the highest dose used exceeded the MTD.

EPA^[100] found a significant increase in kidney tubular cell adenomas in male mice based upon the original pathology done from the study and this analysis is shown in Table 9 (p_{Trend}=0.019). Kidney tubular cell adenomas are very rare tumors in CD-1 mice so it is important to compare these results with the historical controls. No historical controls were available from the laboratory that conducted **Knezevich and Hogan**, (1983) so IARC, EPA and EFSA all used historical control databases from published studies in the

literature [101-103]. These studies have virtually identical rates for the important tumors seen in CD-1 mice; I will use the study by Giknis and Clifford (2000)[102] since it best covers the range of studies we have for CD-1 mice. For studies of approximately two years, the mean historical tumor response in controls is 0.27%. Applying this control response rate to the kidney adenomas yields p_{Hist}=0.005, strengthening the significance of the evaluation against the concurrent control. EPA originally used a similar analysis and reached the same conclusions. However, in 1985, the registrant had a group of pathologists review the kidney slides. Using additional kidney sections from this study, the pathologists identified an additional adenoma in the control animals and changed the classification for three adenomas to carcinomas (Table 9). With these changes, the adenomas no longer have a significant trend (P_{Trend}=0.442, P_{Hist}=0.121) but carcinomas have a marginally significant trend against concurrent controls and a clearly significant trend using historical controls (p_{Trend}=0.063, p_{Hist}=0.002, historical control rate of 0.15%). These historical control rates may not apply to this analysis because the reevaluation of the kidney tumors considered additional sections and no information is available on how additional sections affect historical control rates in this strain of mice; differences have been seen in other settings[104]. The incidence of combined carcinomas and adenomas has the same marginal significance against the concurrent control and significance against the historical controls (p_{Trend}=0.065, p_{Hist}=0.011, historical control rate of 0.44%). However, there was considerable disagreement on whether the one adenoma in the control group was correctly diagnosed[105]. Removing this one adenoma from the control group results in p_{Trend}=0.019 and p_{Hist}=0.005.

Other CD-1 mouse studies have seen increases in malignant lymphomas, hemangiosarcomas and lung adenocarcinomas (males) and hemangiomas (females). Evaluations of those tumors for this study yields results that are not significant; for malignant lymphoma, $p_{Trend}=0.754$, $p_{Hist}=0.767$, with the historical control rate equal 6.2%, for hemangiosarcomas $p_{Trend}=0.503$, $p_{Hist}=0.591$, with the historical control rate equal to 2.5%, for lung adenocarcinomas $p_{Trend}=0.918$, $p_{Hist}=0.899$, with the historical control rate equal to 9.2% and for hemangiomas $p_{Trend}=0.631$. No other tumors were found in this study.

The EPA^[61] has produced many different arguments to dismiss the findings of renal tumors from this study. One argument is that the pathology working group requested by the EPA in 1986 concluded these lesions were not glyphosate related because "1) renal tubular cell tumors are spontaneous lesions for which there is a paucity of historical control data for this mouse stock; 2) there was no statistical significance in a pairwise comparison of treated groups with the concurrent controls and there was no evidence of a statistically significant linear trend; 3) multiple renal tumors were not found in any animal; and 4) compound-related nephrotoxic lesions, including preneoplastic changes, were not present in male mice in this study." Reason number one no longer exists as there are two very good historical control databases for CD-1 mice^[101, 102]. The second reason, while technically correct, is not supportable since the Agency's own guidelines for evaluating carcinogenicity studies state that "Significance in

either kind of test [trend or pair-wise] is sufficient to reject the hypothesis that chance accounts for the result." The third reason is also weak since one would not expect (nor require) multiple tumors to appear when dealing with a rare tumor. For the fourth point, EPA provides data on the rate of bilateral chronic interstitial nephritis in the study which it considers to show no statistically significant results although the trend test is highly significant (p_{Trend}=0.006, Table 9). EPA then states, without reference, that "chronic interstitial nephritis is not considered to be a precursor lesion for tubular neoplasms". I could find no published research to either support or refute this statement. However, chronic interstitial nephritis is an inflammation of the interstitial tissue surrounding the glomeruli and tubules in the kidney. Inflammation is well known

Table 9: Tumors of interest in male and female CD-1 mice from the 24-month feeding study of Knezevich and Hogan (1983)^[83]

Tumor	Sex	Doses (mg	g/kg/day)			p-values

to play an important role in kidney cancer^[106] and many other cancers so this argument also fails to support rejection of these findings.

In summary, this study shows a positive result for kidney tumors in male CD-1 mice and will be included in the overall evaluation of causation.

Atkinson, et al., (1993)^[81] exposed CD-1 mice to glyphosate (>97% purity) in feed for two years. Fifty animals/group/sex were tested in four exposure groups (see Table 10).

There was no impact on survival of administration of glyphosate and no indication that the high dose exceeded the MTD.

Table 10: Tumors of interest in male and female CD-1 mice from the 24-month feeding study of Atkinson et al. (1993)[81]

Tumor	Sex	Doses (p-values

^{*-} p_{Fisher}<0.05, **- p_{Fisher}<0.01, ¹historical rate=0.44%, ²historical rate=6.2%, ³historical rate=2.5%, ⁴No historical control rate, ⁵Historical rate=9.2%

Hemangiosarcomas were the only tumors showing a significant trend in this study (P_{Trend} =0.004, P_{Hist} =0.001, Table 10). Also shown in Table 10 are the results for malignant lymphomas, kidney tumors and lung adenocarcinomas (males) and hemangioma (females); there is a marginal trend for malignant lymphomas (P_{Trend} =0.087, P_{Hist} =0.085) and no trend for kidney tumors.

The **EPA**^[61] concluded the findings in this study were not treatment related based upon the tumors appearing only in the high dose group, a lack of statistical significance between the response in this group and control response and that these tumors are commonly observed in mice as both spontaneous and treatment related effects. There is no scientific support for excluding positive findings in the highest dose group, a view also held by the **SAP**^[54]. I have already commented on how EPA's guidelines treat trend tests and Fisher's Exact test results, although in this case, the value of the comparison of the highest exposure group to controls, p_{Fisher}=0.059, is marginally significant. The argument regarding the frequency of this tumor in controls is addressed directly by the evaluation against the historical control rates; if these rates were high enough to exclude this finding, P_{Hist} would have be above 0.05 instead of 0.001. The mean

historical control incidence of hemangiosarcomas in controls from two-year cancer bioassays in CD-1 mice is 2.5% and the response seen in the high-dose group is 8.9%. The SAP^[54] stated very clearly that the practice, being used by the EPA, of negating a positive finding because of historical control data was not acceptable^[54]. (page 63). The EPA Cancer Guidelines^[33] state this very clearly "…statistically significant increases in tumors should not be discounted simply because incidence rates in the treated groups are within the range of historical controls or because incidence rates in the concurrent controls are somewhat lower than average."

In summary, this study shows a positive result for hemangiosarcomas in male CD-1 mice and will be included in the overall evaluation of causation.

Wood et al., (2009)^[88] exposed CD-1 mice to glyphosate (95.7% pure) in feed for 80 weeks. Fifty-one animals/groups/sex were tested in four exposure groups (see Table 11).

There was no effect on survival and no information suggesting the study exceeded the MTD.

No increase in kidney tumors or hemangiosarcomas (males) or hemangiomas (females) were seen in this study. There was a monotonic increase in lung adenocarcinomas (p_{Trend}=0.028, p_{Hist}=0.031) in males and a monotonic increase in malignant lymphomas (p_{Trend}=0.007, p_{Hist}=0.007) in males. The historical control incidence for this study is different from the earlier studies because this study is only for 80 weeks instead of 104 weeks (two years); the historical control rate for malignant lymphomas in CD-1 mice after 80 weeks is 2.6% instead of 6.2%, the historical control rate at two years^[102].

For lung adenocarcinomas, the $EPA^{[61]}$ again argued a lack of significance for pairwise comparisons (in violation of its guidelines) and that there was no evidence of progression from adenomas to carcinomas. Even though there was no increase in lung adenomas as a function of exposure, it is possible to have an increase in lung adenocarcinomas without an associated increase in adenomas^[107]. For malignant lymphomas, EPA notes that there was a statistically significant response and that the high dose was significantly different from control (p_{Fisher} =0.028), but then uses an argument based upon the number of analyses done in this study to adjust the Fisher Exact test p-value to 0.082 (an adjustment for multiple comparisons is indeed warranted in evaluating the outcomes of these animal cancer studies, this will be addressed later in my report in the evaluation of all of the studies combined).

The EPA^[61] uses historical control data^[103, 108] to exclude the malignant lymphomas and cite a mean response of 4.5% and a range of 1.5% to 21.7%. Son and Gopinath (2004)^[108] saw 21 animals out of 1453 examined prior to 80 weeks with lung adenocarcinomas (1.4%). Giknis and Clifford (2005)^[103] saw a mean rate of 4.5% with a range of 0% to 21.7% in 52 studies which included mostly 78 week controls (26 studies) and 104 week controls (21 studies). Including only studies of 80 weeks or less, the rate in Giknis and Clifford (2005) is 37/1372=2.7% with a range of 0% to 14%. Giknis and Clifford (2000)^[102] (the reference I have been citing) did a similar evaluation, using mostly the same data as their 2005 paper and saw an average tumor incidence before

80 weeks of 2.6% with a range of 0% to 14%. Based upon its flawed interpretation of the **Giknis and Clifford (2005)** historical controls, EPA argues that the incidence of concurrent controls in the study was low (it was 0%) and rejected the positive finding. In fact, of the 26 studies in the 18-month control groups evaluated by **Giknis and Clifford (2005)**, eight (31%) had response of 0% and eight (31%) had only one tumor. The evaluation used by the EPA is incorrect. In addition, as noted earlier, the use of historical control data to negate a positive finding is not supported by **EPA's guidelines** [33, 54] or its **SAP** [54].

There was an increase in the number of animals with multiple malignant tumors $(P_{Trend}=0.046)$

In summary, this study shows a positive result for malignant lymphomas and lung adenocarcinomas in male CD-1 mice and will be included in the overall evaluation of causation.

Table 11: Tumors of interest in male and female CD-1 mice from the 18-month feeding study of <u>Wood et al. (2009)</u> [88]

Tumor	Sex	Doses (mg/kg/d	ay)		p-values
	Male	0	71.4	234.2	810	
	Female	0	97.9	299.5	1081.2

^{*-} p_{Fisher}<0.05, **- p_{Fisher}<0.01, ¹historical rate=0.44%, ²historical rate=2.6%, ³Historical rate=2.5%, ⁴No Historical Control Rate

Sugimoto (1997)^[87] exposed CD-1 mice to glyphosate (94.61-95.67% pure) in feed for two years. Fifty animals/group/sex were tested in four exposure groups (see Table 12).

There were no effects of treatment on survival and no indication the highest dose had exceeded the MTD.

Kidney adenomas (p_{Trend}=0.062, p_{Hist}=0.005), malignant lymphomas (p_{Trend}=0.016,

 p_{Hist} =0.017) and hemangiosarcomas (p_{Trend} =0.062, p_{Hist} =0.004) in male mice and hemangiomas (p_{Trend} =0.002) in female mice all showed increased tumor incidence with increasing dose. The evaluation of lung adenocarcinomas in males showed no significant dose-related trend (p_{Trend} =0.148, p_{Hist} =0.140). This study also had an increase in animals with any malignancy in males (p_{Trend} =0.001) but not in females (p_{Trend} =0.362). Note that no hemangiosarcomas were seen in the 26 control groups evaluated by **Giknis and Clifford (2000)** so the development of an estimate of the historical control response is difficult (if the historical control rate is 0, then any observed response other than 0 has a p-value of 0). The fact that this tumor was never seen in the historical controls should strongly support any positive finding as being significant. However, to still allow for a test using historical control data, I used the historical control estimate of the mean response that would result in a 5% chance of seeing no tumors in 1149 animals. This estimated historical control response value was 0.0026. This value was used in the analysis for hemangiosarcomas in male CD-1 mice exposed for 18 months (p_{Hist} <0.001).

Table 12: Tumors of interest in male and female CD-1 mice from the 18-month feeding study of Sugimoto (1997)^[87]

Tumor	Sex	Doses	(mg/kg/d	ay)		p-values
	Male	0	165	838.1	4348	
	Female	0	153.2	786.8	4116	
Kidney Adenoma ¹	Male	0/50	0/50	0/50	2/50	P _{Trend} =0.062 P _{Hist} =0.005
Malignant Lymphoma ²	Male	2/50	2/50	0/50	6/50	P _{Trend} =0.016 P _{Hist} =0.017
Hemangiosarcoma ³	Male	0/50	0/50	0/50	2/50	P _{Trend} =0.062 P _{Hist} =0.004
Hemangioma ⁴	Female	0/50	0/50	2/50	5/50*	P _{Trend} =0.002
Lung Adenocarcinoma ⁵	Male	1/50	1/50	6/50	4/50	P _{Trend} =0.148 P _{Hist} =0.140
Number of animals with Malignant Neoplasms	Male	5/50	5/50	11/50	16/50**	P _{Trend} =0.001
Number of animals with Malignant Neoplasms	Female	9/50	13/50	16/50	13/50	P _{Trend} =0,362

^{*-} p_{Fisher}<0.05, **- p_{Fisher}<0.01, ¹historical rate=0.44%, ²historical rate=2.6%, ³historical rate=0/1424 (0.26% - 95% confidence limit), ⁴No Historical Control Rate, ⁵Historical rate=2.5%

EPA^[61] only addressed the hemangiomas in the female mice and did not note any other significant effects. For the females, EPA argued that the high dose was approximately four times higher than the current recommended high dose from the OECD guidelines^[109]. This study was correctly designed under the previous guidelines (the limit was <5% in feed) and there is no indication that this dose exceeded the MTD. The EPA also argued that when the p-value for Fisher's Exact test was adjusted for multiple comparisons, the new p-value for the high-dose group for hemangiomas was 0.055.

For the hemangiosarcomas in males, none of the 26 historical control groups examined by **Giknis and Clifford (2000)** had hemangiosarcomas, making this a very rare tumor in males prior to 80 weeks on study. The malignant lymphomas in males are statistically significant against both the concurrent controls and the historical controls. Finally, there is clearly an overall increase of malignancies in the males.

In summary, this study shows a positive result for kidney adenomas, malignant lymphomas and hemangiosarcomas in male CD-1 mice, hemangiomas in female CD-1 mice and an overall increase in malignancies as a function of exposure in male CD-1 mice. This study will be included in the overall evaluation of causation.

Kumar (2001)^[84] exposed Swiss Albino mice to glyphosate (>95% purity) in feed for two years. Fifty animals/group/sex were tested in four exposure groups (see Table 13).

The survival was decreased in the highest exposure group but this was not statistically significant and there was no other data indicating the MTD was exceeded for this study.

Kidney adenomas (p_{Trend} =0.062) and malignant lymphomas (p_{Trend} =0.064, p_{Hist} =0.070) in male mice demonstrated marginal statistical significance and hemangiosarcomas (p_{Trend} =0.500) in male mice demonstrated no statistical significance. In this study, not all animals in the low- and mid- dose groups were evaluated for kidney tumors, so a second analysis was done based on only the animals examined in these two groups (p_{Trend} =0.088). No historical control data was available for hemangiosarcomas and kidney adenomas in Swiss Albino mice. For the malignant lymphomas, EFSA provided a historical control data set showing a mean response of 46/250=0.184 (18.4%) with a range of 6% to 30%. Using this historical control data, the trend is only marginally significant (p_{Hist} =0.070). I have some concern that the responses at two of the doses are outside of the historical control range and the third dose is at the upper limit of the historical control range. However, this is a small historical control dataset for a tumor with a relatively high background tumor rate, thus placing too much emphasis on this historical control population is not warranted.

In a recent memo, Martens (2017) ^[110] asserts that the incidence counts for malignant lymphomas and kidney adenomas appearing in Greim et al. (2015) ^[91] and EFSA (2013) ^[89] are incorrect and provides different rates (shown in Table 13). The p-values for both of these tumors are reduced using the incidence counts from the Martens memo. However, it should be noted that if the counts for malignant lymphomas in the Martens (2017) memo are correct, then all three exposure groups have responses outside of the range of the historical controls. It is unclear from Greim et al. (2015), EFSA or Martens (2017) which tumor incidence counts are correct.

There was a significant increase in hemangiomas (any tissue) in female mice (p_{Trend}=0.004).

In summary, this study shows support for an increase for malignant lymphomas and kidney adenomas as a function of exposure in male Swiss Albino mice and an increase in hemangiomas in female Swiss Albino mice. This study will be included in the overall

Table 13: Tumors of interest in male and female Swiss Albino mice from the 18-month feeding study of Kumar (2001)^[84]

evaluation of causation.

Pavkov and Turner (1987)^[85] exposed CD-1 mice to glyphosate trimesium salt (56.2%) and 1% propylene glycol (wet weight vehicle) in feed for two years. Eighty animals/sex/group were tested in control, low- and mid-dose groups and 90 animals/sex were tested at the high dose. Exposure levels were 0, 11.7, 118 and 991 mg/kg/day in males and 0, 16, 159 and 1341 mg/kg/day in females. EPA^[61] lists this study as completely negative for any cancer findings. No details on this study are provided by the EPA nor is it listed in the Greim et al. (2015)^[91] manuscript. There was limited information on this study in a Data Evaluation Report from EPA (accession number 4021 40-06) that discussed findings from this study. EPA noted that body weight and food consumption were reduced in the highest exposure group, but the actual amounts of these reductions were not available. They also noted that the authors failed to make it clear that the tumors reported in the study had been histopathologically validated. Data was presented for tumors in the livers and lungs of male mice and the lungs of female mice. No other data is provided.

This study is not acceptable for inclusion in the evaluation of causation due to the lack of information on the tumor incidence in tissues other than liver and lung.

George et al. (2010)^[82] exposed groups of 20 male Swiss Albino mice to a glyphosate

formulation (Roundup Original, 36g/L glyphosate) at a dose of 25 mg/kg (glyphosate equivalent dose) topically three times per week, topically once followed one week later by 12-o-tetradecanoylphorbol-13-acetate (TPA) three times per week, topically three times per week for three weeks followed one week later by TPA three times per week, or a single topical application of 7,12-dimethyl-benz[a]anthracene (DMBA) followed one week later by topical application of glyphosate three times per week for a total period of 32 weeks. Appropriate untreated, DMBA-treated, and TPA-treated controls were included. The group exposed to DMBA followed by glyphosate demonstrated a significant increase (p<0.05) in the number of animals with tumors (40% of the treated animals versus no tumors in the controls) indicating glyphosate has a promotional effect on carcinogenesis in the two-stage model in skin. This study addresses the question of whether glyphosate is more likely to cause skin tumors through initiation (starting the cancer process) or promotion (moving the process along after it starts). This study supports the overall concept that glyphosate can have an impact on tumor incidence.

EPA^[61] discounted this study because it included only 20 animals per group, tested only males and did not conduct a histopathological analysis. It is hard to understand how EPA could reject a positive finding using 20 mice; typically one would ignore a negative study that had too few animals as not having sufficient statistical power to see an effect but never reject positive findings for this reason. Also, 20 animals per group is common for skin-painting initiation-promotion studies like the one presented here. Doing a study in only males is not a reason to ignore the positive findings in a study. Finally, in initiation-promotion studies of mouse skin, histopathological evaluation would be done if one were interested in separating papillomas from carcinomas. It is highly unlikely that the lesions seen in 40% of the DMBA/glyphosate treated mice were not papillomas or carcinomas.

Some members of the EPA SAP noted^[54] that the rodent data were consistent with glyphosate acting as a tumor promoter but, because "[t]here has been no direct test of this hypothesis (such as in a standard initiation-promotion bioassay)...," this "conclusion was speculative." (page #). Because the EPA dismissed this study without any discussion, the SAP did not recognize there was an initiation-promotion supporting a promotional effect of glyphosate.

This study is included in the evaluation of causality as support for a promotional effect of glyphosate on some tumors.

Joint Analysis - Mouse

In their evaluation of the mouse studies, EPA^[61] and EFSA^[89] chose to challenge the results in each study separately, dismiss the studies as showing no effect, and never compared results across the various studies. In response to the evaluation done by the IARC^[30], EFSA^[90] extracted the original data and did trend tests on kidney tumors, malignant lymphomas and hemangiosarcomas in male mice in five of the mouse studies, the same five studies I consider acceptable for a causation analysis. Rather than formally evaluate these cancer responses for consistency by pooling the data where appropriate, EPA and EFSA simply produced a table with the responses for each dose

group in each study and concluded (subjectively) they were inconsistent. In addition, EPA and EFSA argued that doses above 1000 mg/kg/day (there are only two of these) were outside the range of what would be tested today under OECD guidelines and should be excluded. I will now address both points.

In CD-1 mice, there are four useful animal carcinogenicity studies and one study in Swiss Albino mice. As with the rats, consistency across studies can be addressed in two ways. The first is by simply looking at the overall findings to evaluate where they agree or disagree in terms of statistical significance. Table 14 summarizes the positive and negative findings for all five cancers in which at least one study in CD-1 mice showed a significant trend. It is clear that not every tumor shows a positive trend with glyphosate exposure in every study. For hemangiosarcomas in males, there are clear positive findings in the studies by Sugimoto (1997) and Atkinson et al. (1993) and nonsignificant responses in Wood et al. (2009) and Knezevich and Hogan (1983). In females, hemangiosarcomas are only present in the study by Sugimoto (1997). Malignant lymphomas in males are clearly positive in two studies [87, 88] and marginally positive in a third^[81] but negative in the fourth^[83]. Both of the strong positive studies exposed animals for 18 months. Kidney tumors in males are positive in two studies [83, 87] and negative in the remaining two [81, 88]. Lung adenocarcinomas in males are only positive in the study by Wood et al. (2009). Sugimoto (1997) had four clearly positive associations between tumors and glyphosate while the others had two or less.

Table 14: Summary of significance tests for 5 tumors from 4 studies in CD-1 Mice

Study	Months on Study	Neoplasm						
		Hemangio- sarcoma (male)	Hemangioma (female)	Malignant Lymphoma (male)	Kidney Tumor (male)	Lung Adeno- carcinoma (male)		
Sugimoto 1997 ^[87]	18	+/+++1	+++	++/++	+/+++	-/-		
Wood 2009 ^[88]	18	-/-	(4)	+++/+++ -/-		++/++		
Sugimoto & Wood Pooled		++/+++	+++	+++/+++	++/+++	-/-		
Atkinson 1993 ^[81]	24	+++/+++		+/+	-/-	-/-		
Knezevich 1983 ^[83]	24	-/-	74	-/-	+/++	-/-		
Atkinson & Knezevich Pooled		-/-	(-)	-/-	+/+	-/-		
All CD-1 Studies Pooled		++/++	++/++	+/+	+++/+++	-/-		

¹entries are p_{Trend}/p_{Hist} with values: – p>0.1, + 0.1≥p>0.05, ++ 0.05≥p>0.01, +++ p≤0.01

As seen for the rat studies, this simple evaluation of the positive versus negative findings fails to resolve the issue of which findings are driving the overall responses in these data. To do this, I will again pool the studies. Table 14 summarizes the pooled analyses.

For kidney tumors in males, pooling the two 18-month studies yields significant increases in incidence (p_{Trend}=0.015, p_{Hist}=0.003) and pooling of the two year studies shows marginal significance (p_{Trend}=0.081, p_{Hist}=0.054). Pooling all four studies results in (ptrend=0.005, phist=0.007), thus the positive trend remains. Knezevich and Hogan (1983) saw a 4% response for kidney carcinomas in their highest exposure group. The largest response seen for kidney carcinomas in controls in 48 studies by Giknis and Clifford (2000) and in 52 studies by Giknis and Clifford (2005) was 2% and in the control groups from 11 two-year cancer studies, Chandra and Frith (1992)[101] saw only one animal out of 725 with a kidney carcinoma. In 46 control datasets, Giknis and Clifford (2000) saw 39 control groups with no adenomas, five with one adenoma and two with two adenomas; both 24-month studies saw two adenomas in the highest exposure group, a very rare finding. To better illustrate, there are 16 groups of animals in the four studies. For any one group, there is a 2/44 or 4.3% chance of getting a response 4% or larger. The chances of randomly getting 3 or more such responses in 16 groups is 2.9% and the chances of two of these being in any two of the four highest exposure groups is 0.01. In summary, the strong finding in two of the four studies, the positive finding when all four studies are pooled and the very low probability that this is due to chance when compared to historical controls support the conclusion that glyphosate causes kidney tumors in male mice.

For malignant lymphomas in males, pooling the two 18-month studies, Sugimoto (1997) and Wood et al. (2009), results in a significant trend (ptrend=0.005, phist=0.006). Pooling the two 24-month studies, Knezevich and Hogan (1983) and Atkinson et al. (1993), yields (p_{Trend}=0.653, p_{Hist}=0.649). The main differences between these two findings is in the control response; the pooled control response at 24 months is 6/99 (6%) versus 2/101 at 18 months (2%). This is expected since, in the absence of any exposure, tumor rates increase as a function of age^[5]. Giknis and Clifford (2000) show a control response at 18 months of 4% and a control response at 24 months of 6% (matching the value for the pooled studies). Pooling all four studies results in (p_{TrendA}=0.073, p_{Hist}=0.080). However, the responses seen for malignant lymphomas in controls by Giknis and Clifford (2000) show only one historical control group in twenty-six 18-month groups with 10% or higher response. The responses at the high doses (10% and 12%) in the two 18-month studies are very unlikely to have arisen by chance. There are eight groups of animals in the two studies. For any one group, there is a 1/26 or 3.8% chance of getting a response of at least 10% based on the 26 control groups from Giknis and Clifford (2000). The chances of getting two or more such responses in eight groups is 0.035 and the chances of these being in three of the four highest exposure groups is 0.004. For the 24-month studies, the higher background rate makes it difficult to identify a small change in incidence, thus the findings in the 24-month studies and the 18-month studies are not inconsistent. In summary, the very strong findings in the 18-month studies, the very strong positive findings when the two 18-month studies are pooled, the low probability that the responses seen in the 18-month studies are due to chance, and the

marginal increase in malignant lymphomas in the 18-month study in Swiss Albino mice^[84] support the conclusion that glyphosate causes malignant lymphoma in male mice.

For hemangiosarcomas in males, pooling the two 18-month studies results in a significant trend (p_{Trend}=0.015, p_{Hist}=0.002). Pooling the two 24-month studies yields (p_{Trend}=0.490, p_{Hist}=0.429). The main difference between these two findings is the 0/50 response in animals exposed at 4841 mg/kg/day in the study by **Knezevich and Hogan** (1983). Removing this one exposure group in the pooled 24-month analysis yields (p_{Trend}<0.001, p_{Hist}<0.001). Pooling all four studies results in (p_{Trend}=0.045, p_{Hist}=0.043). No hemangiomas were seen in controls groups from twenty-six 18-month studies by **Giknis and Clifford (2000)** so the two hemangiosarcomas seen in the high dose group in the study by **Sugimoto (1997)** are biologically very significant. For the 24-month historical controls, only two out of 20 control groups had a response greater than 8%. In summary, the very strong findings in the 18-month studies, the positive finding when all four studies are pooled and the low probability that the responses seen in the 18-month studies are due to chance support the conclusion that glyphosate causes hemangiosarcomas in male CD-1 mice.

For hemangiomas in females, pooling the two 18-month studies results in a significant trend (p_{Trend} =0.001). Pooling the two-year studies results in p_{Trend} =0.424. Pooling all four studies results in p_{Trend} =0.018. In summary, the very strong findings in one 18-month study, the positive finding when all four studies are pooled and the low probability that the responses seen in the **Sugimoto (1997)** study are due to chance, support the conclusion that glyphosate causes hemangiomas in female CD-1 mice.

For lung adenocarcinomas in male CD-1 mice, pooling the two 18-month studies results shows no significant trend (p_{Trend} =0.417, p_{Hist} 0.126). Pooling the two 24 month studies yields (p_{TrendA} =0.985, p_{Hist} =0.993). Pooling all four studies results in (p_{TrendA} =0.937, p_{Hist} =0.744). In summary, the moderate findings in one 24 month study, and the negative finding when any studies are pooled suggest that the linkage between glyphosate and lung adenocarcinomas in male CD-1 mice is due to chance.

The one study in Swiss Albino mice^[84] was effectively negative for all endpoints except malignant lymphomas and kidney adenomas where marginally significant tumor responses were seen. Considering the findings for kidney adenomas in CD-1 mice, glyphosate may also cause kidney adenomas in male Swiss Albino mice from the study of **Kumar (2001)**.

To summarize the findings in mice, glyphosate causes hemangiosarcomas, kidney tumors and malignant lymphomas in male CD-1 mice and hemangiomas in female CD-1 mice after 18 months of exposure, kidney tumors in male CD-1 mice after 24 months exposure and possibly kidney adenomas in male Swiss albino mice. When 18-month and 24-month studies are pooled, there is a significant increase in hemangiosarcomas in male mice, hemangiomas in female mice and kidney tumors in male mice.

Discussion and Summary Animal Carcinogenicity Studies

As noted earlier, there has been a suggestion that using doses substantially larger than 1000 mg/kg/day exceeds the current limit dose set by the OECD. The only place in the OECD guidance^[67] that addresses a dose of 1000 mg/kg/day is in paragraph 23 which reads:

"For the chronic toxicity phase of the study, a full study using three dose levels may not be considered necessary, if it can be anticipated that a test at one dose level, equivalent to at least 1000 mg/kg body weight/day, is unlikely to produce adverse effects. This should be based on information from preliminary studies and a consideration that toxicity would not be expected, based upon data from structurally related substances. A limit of 1000 mg/kg body weight/day may apply except when human exposure indicates the need for a higher dose level to be used."

This language does not preclude the use of a dose exceeding 1000 mg/kg/day nor does it advocate ignoring such doses when evaluating the results of an animal carcinogenicity study. In fact, the reasons for excluding a dose in an animal carcinogenicity study are clearly outlined in paragraph 90 within **OECD guidance**^[59] and reads:

"If the main objective of the study is to identify a cancer hazard, there is broad acceptance that the top dose should ideally provide some signs of toxicity such as slight depression of body weight gain (not more than 10%), without causing e.g., tissue necrosis or metabolic saturation and without substantially altering normal life span due to effects other than tumours. Excessive toxicity at the top dose level (or any other dose level) may compromise the usefulness of the study and/or quality of data generated. Criteria that have evolved for the selection of an adequate top dose level include: (in particular) toxicokinetics; saturation of absorption; results of previous repeated dose toxicity studies; the MOA and the MTD."

While one study has a slight decrease in body-weight gain, there are no indications in any other studies of an exceedance in dose that would support ignoring the findings from any exposure group.

EPA^[33] uses a slightly different criteria to determine which dose to include or exclude based on an earlier OECD document. These are spelled out in EPA's guideline document for carcinogenicity risk assessment^[33]

"Other signs of treatment-related toxicity associated with an excessive high dose may include (a) significant reduction of body weight gain (e.g., greater than 10%), (b) significant increases in abnormal behavioral and clinical signs, (c) significant changes in hematology or clinical chemistry, (d) saturation of absorption and detoxification mechanisms, or (e) marked changes in organ weight, morphology, and histopathology. It should be noted that practical upper limits have been established to avoid the use of excessively high doses in long-term carcinogenicity studies of environmental chemicals (e.g., 5% of the test substance in the feed for dietary studies or 1 g/kg body weight for oral gavage studies [OECD, 1981])." As before, this applies to only one study presented in this review.

Both of these guidelines make good scientific sense. In the 12 acceptable rodent carcinogenicity studies included in this evaluation, no study had sufficient toxicity at the highest dose to justify removing the highest dose from the analysis. Hence, the analyses presented here did not drop the doses >1000 mg/kg/day. This is also supported by one member of the EPA's SAP^[54].

Twenty chronic rodent carcinogenicity studies have been done using glyphosate as the test compound. Eight of these studies are unacceptable for use in an evaluation of causality leaving seven studies in rats and five studies in mice. Because of the large number of evaluations done in an individual animal carcinogenicity study, there is concern that the false-positive rates could be exaggerated. For example, if 20 evaluations are done and a finding is deemed significant if $p_{Trend} < 0.05$, then you would expect that 20*0.05=1 evaluation would be positive simply due to chance.

Table 15: Observed versus expected tumor sites with significant trends in the 12 acceptable rodent

carcinogenicity studies using glyphosate.

Species	Strain	Sex	Total Sites ¹	Exp. <0.05	Obs. <0.05	Tumors ² p<0.05	Exp. <0.01	Obs. <0.01	Tumors p<0.01

¹Number of sites examined is based upon suggestions by Dr. J. Haseman in his written testimony to the EPA; male mice – 10.5 sites; female mice – 15 sites; male rats – 21.5 sites; female rats – 25.5 sites

²Tumor abbreviations are: KA – kidney adenoma; KC – kidney carcinoma; KAC – kidney adenoma or carcinoma; HS – hemangiosarcoma; H – hemangioma; HA – hepatocellular adenoma; LAC – lung adenoma or adenocarcinoma; ML – malignant lymphoma; MC – mammary gland carcinoma; MAC – mammary gland adenoma or carcinoma; TCCC – thyroid C-cell carcinoma; TFAC

The EPA asked the SAP to comment on its evaluation of glyphosate [61] at a meeting in Washington, DC in December 2016^[54]. Many comments were received from outside experts at this meeting; one such set of comments came from Dr. J. K. Haseman (2016)[111]. Haseman (2016) directly addressed the false-positive error rate and concluded that the results seen in these studies were due to chance. He did this by deciding how many evaluations were likely for each study (broken into sex-by-species groups) and then aggregating the findings. He concluded that the effective number of analyses were 10.5 in male mice, 15 for female mice, 21.5 for male rats, and 25.5 for female rats. Haseman (2016) made two assumptions in his analysis that are not valid. The first was that all of the possible trend tests had been done on all of the sites he considered reasonable for such an evaluation. He identified eight positive findings. However, EPA had not evaluated all of the sites nor had they considered doing a formal analysis using historical control data. EPA identified eight sex/species groups that had at most one positive tumor finding using the trend test with p_{Trend}≤0.05. In Tables 1-14 above, I have identified 19 tumors with p_{Trend}≤0.05 or p_{Hist}≤0.05 and 12 with p_{Trend}≤0.01 or p_{Hist}≤0.01 (Table 15). Secondly, Dr. Haseman assumed one could aggregate all the studies into one large analysis of Type-1 error. However, inference in these studies is always made by sex/species/strain (e.g. glyphosate causes hemangiosarcomas in male CD-1 mice; not glyphosate causes cancer in rodents), and the analysis should have been done by grouping each separately. Table 15 shows these analyses as well as the aggregated analysis for all of the acceptable studies.

With the exception of male Sprague-Dawley rats, the observed number of tumors are at or near the expected number for the different sex/strain groups in rats (Table 15). For male Sprague-Dawley rats, 0.8 cases with $p_{Trend} \le 0.01$ or $p_{Hist} \le 0.01$ are expected and two were observed (p=0.21). In female CD-1 mice and Swiss Albino mice, the expected and observed numbers are approximately equal. However, in male CD-1 mice, there were 2.1 tumors expected for $p_{Trend} \le 0.05$ or $p_{Hist} \le 0.05$ and eight were observed (p<0.001) and there were 0.4 expected for $p_{Trend} \le 0.01$ or $p_{Hist} \le 0.01$ and five were observed (p<0.001). This clearly could not have occurred by chance alone. Even if one incorrectly groups all sexes and species together, there are 4.6 expected responses for $p_{Trend} \le 0.01$ or $p_{Hist} \le 0.01$ and 12 observed (p<0.001). Thus, chance does not explain the positive results seen in these studies.

Conclusion for Animal Carcinogenicity Studies

There are several general issues that pertain to all animal carcinogenicity studies. There is considerable genetic variability across animal strains both over time and space. It is difficult to compare experiments done in different laboratories even when using the same strain of animal. This is obvious when you examine the rates for hepatocellular adenomas in Wistar rats across the three studies using this strain. Thus, each study

thyroid follicular cell adenoma or carcinoma; TICT – testes interstitial cell tumor; SK – skin keratocanthoma
 (x): x studies with this result

should be considered separately with regard to the findings in that study before being compared across studies.

The use of a p-value of 0.05 as the cut off for increasing tumor incidence does not account for trends in the data across multiple studies. Three studies with marginal responses of 6-8% in a given tumor could, when pooled for analysis, lead to highly significant findings. This issue is well-recognized in epidemiology but not usually considered in toxicology because of a lack of replicate studies. This case is fairly unique because of the larger number of studies available for analysis and requires a more rigorous evaluation of the data such as the pooled analysis presented in this report.

Pooling of the data for the evaluation of replicate studies makes sense as it addresses the question "Does the data as a whole support a finding of increased cancer incidence in these studies?" Some toxicologists may argue that the studies are not replicates and hence cannot be pooled. But if they are not replicates, then they cannot be compared to see if there is consistency across the studies. This is because there may be some subtle change from one study to another that leads to a positive finding in one study but a negative finding in other studies. Thus, either the studies are not good replicates so you cannot compare across studies and you cannot pool them, or they are good replicates so you can compare across studies and you can pool them. There is no argument that would support a comparison across studies that is appropriate when pooling is inappropriate.

There were seven rat studies and five mouse studies that were of sufficient quality and with sufficient details available for inclusion in this evaluation.

Glyphosate has been demonstrated to cause cancer in two strains of rats and one strain of mice. Glyphosate causes hepatocellular adenomas in male Wistar rats and, to a lesser degree, in male Sprague-Dawley rats, mammary gland adenomas and adenocarcinomas in female Wistar rats, skin keratocanthomas in male Wistar rats, and kidney adenomas and thyroid C-cell adenomas and carcinomas in male Sprague-Dawley rats. Glyphosate causes hemangiosarcomas, kidney tumors and malignant lymphomas in male CD-1 mice and hemangiomas in female CD-1 mice and possibly causes malignant lymphomas, kidney adenomas in male Swiss albino mice and hemangiomas in female Swiss albino mice. Thus, glyphosate causes cancer in mammals.

Mechanisms Relating to Carcinogenicity

Many human carcinogens act via a variety of mechanisms causing various biological changes, taking cells through multiple stages from functioning normally to becoming invasive with little or no growth control (carcinogenic). Hanahan and Weinberg (2011)^[112] identified morphological changes in cells as they progress though this multistage process and correlated these with genetic alterations to develop what they refer to as the "hallmarks of cancer." These hallmarks deal with the entire process of carcinogenesis and not necessarily with the reasons that cells begin this process or the early stages in the process where normal protective systems within the cells remove

potentially cancerous cells from the body. While tumors that arise from a chemical insult to the cell may be distinct from other tumors by mutational analysis, they all exhibit the hallmarks as described by **Hanahan and Weinberg (2011)**.

Systematic review of all data on the mechanisms by which a chemical causes cancer is complicated by the absence of widely accepted methods for evaluating mechanistic data to arrive at an objective conclusion on human hazards associated with carcinogenesis. Such systematic methods exist in other contexts^[113], but are only now being accepted as a means of evaluating literature in toxicological evaluations^[114-117].

In this portion of the report, I am focusing on the mechanisms that can cause cancer. Smith et al. (2015)^[37] discussed the use of systematic review methods in identifying and using key information from the literature to characterize the mechanisms by which a chemical causes cancer. They identified 10 "Key Characteristics of Cancer" useful in facilitating a systematic and uniform approach to evaluating mechanistic data relevant to carcinogens. These 10 characteristics are presented in Table 16 (copied from Table 1 of Smith et al. (2015)^[37]). While there is limited evidence on glyphosate for most of the key characteristics, genotoxicity (characteristic two) and oxidative stress (characteristic five) have sufficient evidence to warrant a full review.

Genotoxicity

Genotoxicity refers to the ability of an agent (chemical or otherwise) to damage the genetic material within a cell, thus increasing the risks for a mutation. Genotoxic substances interact with the genetic material, including DNA sequence and structure, to damage cells. DNA damage can occur in several different ways, including single- and double-strand breaks, cross-links between DNA bases and proteins, formation of micronuclei and chemical additions to the DNA.

Just because a chemical can damage DNA does not mean it will cause mutations. So, while all chemicals that cause mutations are genotoxic, all genotoxic chemicals are not necessarily mutagens. Does that mean that the genotoxicity of a chemical can be ignored if all assays used for identifying mutations in cells following exposure to a chemical are negative? The answer to that question is no and is tied to the limitations in tests for mutagenicity (the ability of a chemical to cause mutations in a cell). It is unusual to see an evaluation of the sequence of the entire genome before exposure with the same sequence after exposure to determine if the genome has been altered (mutation). There are assays that can evaluate a critical set of genes that have previously been associated with cancer outcomes (e.g. cancer oncogenes), but these are seldom applied. In general, mutagenicity tests are limited in the numbers of genes they actually screen and the manner in which these screens work.

Because screening for mutagenicity is limited in scope, any genetic damage caused by chemicals should raise concerns because of the possibility of a mutation arising from that genetic damage. In what follows, I will systematically review the scientific findings available for evaluating the genotoxic potential of glyphosate. This will be divided into six separate sources of data based on the biological source of that data: (1) data from exposed humans, (2) data from exposed human cells in a laboratory setting, (3) data

from exposed mammals (non-human), (4) data from exposed cells of mammals (non-human) in the laboratory, (5) data from non-mammalian animals and others, and (5) data from cells from non-mammalian animals and others. These six areas are based upon the priorities one would apply to the data in terms of impacts. Seeing genotoxicity in humans is more important than seeing genotoxicity in other mammals, which is more important than seeing genotoxicity in non-mammalian systems. In addition, seeing genotoxicity in whole, living organisms (*in vivo*) carries greater weight than seeing responses in cells in the laboratory (*in vitro*). Basically, the closer the findings are to real, living human beings, the more weight they should be given.

Table 16: Key characteristics of carcinogens, Smith et al. (2016)[37]

Characteristic	Examples of relevant evidence				
Is electrophilic or can be metabolically activated	Parent compound or metabolite with an electrophilic structure (e.g., epoxide, quinone), formation of DNA and protein adducts				
2. Is genotoxic	DNA damage (DNA strand breaks, DNA-protein cross- links, unscheduled DNA synthesis), intercalation, gene mutations, cytogenetic changes (e.g., chromosome aberrations, micronuclei)				
3. Alters DNA repair or causes genomic instability	Alterations of DNA replication or repair (e.g., topoisomerase II, base-excision or double-strand break repair)				
4. Induces epigenetic alterations	DNA methylation, histone modification, microRNA expression				
5. Induces oxidative stress	Oxygen radicals, oxidative stress, oxidative damage to macromolecules (e.g., DNA, lipids)				
6. Induces chronic inflammation	Elevated white blood cells, myeloperoxidase activity, altered cytokine and/or chemokine production				
7. Is immunosuppressive	Decreased immunosurveillance, immune system dysfunction				
8. Modulates receptor- mediated effects	Receptor in/activation (e.g., ER, PPAR, AhR) or modulation of endogenous ligands (including hormones)				
9. Causes immortalization	Inhibition of senescence, cell transformation				
10. Alters cell proliferation, cell death or nutrient supply	Increased proliferation, decreased apoptosis, changes in growth factors, energetics and signaling pathways related to cellular replication or cell cycle control, angiogenesis				

Abbreviations: AhR, aryl hydrocarbon receptor; ER, estrogen receptor; PPAR, peroxisome proliferator—activated receptor. Any of the 10 characteristics in this table could interact with any other (e.g., oxidative stress, DNA damage, and chronic inflammation), which when combined provides stronger evidence for a cancer mechanism than would oxidative stress alone.

The data being included in this review come from the peer-reviewed scientific literature, the summaries of reports in regulatory documents that are proprietary and for which I have limited access to the original work, and reports from industry that are proprietary to which I have been given greater access. All of these studies are included in the overall evaluation of causation.

Genotoxicity in Humans in-vivo

Three studies have evaluated the potential genotoxicity of glyphosate formulations in exposed humans. Paz-y-Miño et al. (2007) analyzed the blood of 24 exposed individuals (living within 3 kilometers of spraying) and 21 unexposed individuals (living 80 kilometers away from the spraying area) for DNA damage using the comet assay. All study subjects were from Ecuador and none of the controls or exposed individuals smoked, drank alcohol, took non-prescription drugs or had been exposed to pesticides during the course of their normal daily lives. Exposed and control individuals did some cultivating and harvesting but without pesticides or herbicides. Exposed individuals were analyzed within two months of spraying for the eradication of plants associated with illegal narcotics. An average of 200 cells per person were ranked between 0-400 depending on the amount of DNA in the comet's tail in order to calculate the mean amount of DNA damage. There was a significant difference between the mean total migration level of exposed individuals to controls (p<0.001). Data was given for each individual classified into five groups based upon the amount of DNA in the comet's tail. There was clearly a shift in the distribution of DNA in cells with the controls never seeing scores in the top two categories while all but three exposed had some scores in the top two categories. In essence, some of the DNA had been fragmented by the exposure.

In a second study by the same group, Paz-y-Miño et al. (2011)^[119] evaluated the karyotypes (the chromosome count of the individuals and any alterations to the chromosomes as seen under a microscope) of 92 people living in 10 communities in northern Ecuador. Controls were from areas without spraying and both controls and exposed subjects had no history of exposure to smoking or other genotoxic compounds. This study saw no changes between controls and exposed subjects for 182 karyotypes evaluated.

Bolognesi et al. (2009)^[120] studied women of reproductive age and their spouses in five areas of Colombia, four of which are subject to spraying for either narcotics control or sugar cane growing. There were 60 subjects from the Santa Marta area (organic coffee is grown without the use of pesticides), 52 from Boyaca (manual spraying for illicit drugs), 58 from Putumayo (aerial spraying for illicit drugs using a glyphosate formulation), 63 from Nariño (same exposure as Putumayo) and 28 from Valle del Cauca (aerial spraying of Roundup 747 (74.7% glyphosate) without additional adjuvant for sugar cane maturation). All subjects were interviewed with a standardized questionnaire designed to obtain information about current health status, health history, lifestyle and potential exposure to possible confounding factors (smoking, use of medicinal products, severe infections or viral diseases during the last six months, recent vaccinations, presence of known indoor/outdoor pollutants, exposure to diagnostic x-rays, and previous radio- or chemotherapy). In Santa Marta, blood samples were taken

once, during the initial interview. In Boyaca, blood samples were taken at the initial interview and 1 month later. In Nariño, Putumayo and Valle del Cauca, blood samples were taken at the initial interview, within five days after spraying and 4 months later. In lymphocytes, binucleated cells with micronuclei (BNMN) were lowest in Santa Marta and similar in the four exposed regions prior to exposure. Statistically significant increases in BMNM in Nariño, Putumayo and Valle del Cauca were seen between first and second sampling. The mean BNMN in Nariño and Putumayo was greater in respondents who self-reported direct contact with sprayed fields, but differences were not statistically significant. Multiple linear regression demonstrated statistically significant increases in BMNM in all four exposed regions post exposure when compared to pre-exposure and controlling for all other variables (p<0.001). The largest total change in mean BMNM values pre-exposure compared to immediate post exposure occurred in Valle del Cauca where spraying is done using Roundup with no additional adjuvant.

Kier (2015)^[121] identified 16 additional studies of pesticide use that included some exposure to glyphosate. Eleven of the 16 studies demonstrated some degree of genotoxicity in the human populations studied but did not adequately attribute the exposure primarily to glyphosate so they are not included in this review.

In summary, two of the three studies in which genotoxicity endpoints were evaluated in humans in areas with exposure to glyphosate spraying showed statistically increased changes in DNA damage in blood. In the strongest study, in three areas where chromosomal damage (micronuclei) was examined in individuals pre- and post-spraying (<5 days) showed statistically significant increases. In one other area where post-exposure damage was measured one month after exposure, there was little change.

Genotoxicity in Human Cells (in vitro)

Studies have explored the *in vitro* genotoxicity of glyphosate using a variety of different cell types (lymphocytes, fibroblasts, and immortalized cells from cancers of the larynx, mouth, blood and liver) using several different assays for markers of genotoxicity with or without metabolic activation.

Mladinic et al. $(2009)^{[122]}$ induced DNA strand breaks (comet assay) from exposure to glyphosate (purity not given) in lymphocytes from three healthy human donors (questionnaire used to exclude genotoxic exposures) at concentrations of 3.5, 92.8 and 580 µg/ml with S9 activation and saw effects at only the highest doses for cells without S9 activation.

Alvarez-Moya et al. (2014) $^{[123]}$ conducted a similar study using lymphocytes from human volunteers (questionnaire used to exclude genotoxic exposures) and exposure to glyphosate (96% purity) at concentrations of 0.12, 1.2, 12 and 120 μ g/ml. A significant increase in DNA strand breaks (comet assay) was seen for all exposure groups with a clear dose-response relationship without metabolic activation (metabolic activation was not tested).

Using human HEP-2 cells, Manas et al. (2009)[124] induced DNA damage (comet assay) by

glyphosate (96% pure) at all concentrations ranging from 676 μ g/ml to 1270 μ g/ml (no S9 activation tested). Cell viability at the highest concentration was below 80% and values at the other concentrations were not given.

Monroy et al. $(2005)^{[125]}$ induced significant DNA damage (comet assay) in fibroblast GM 38 cells at concentrations of glyphosate (technical grade, purity not given) ranging from 676 µg/ml to $1000 \,\mu$ g/ml with a clear dose-response pattern. Over this same concentration range, they also saw concentration-dependent decreases in cell viability at all doses making the comet assay results difficult to interpret. In a similar analysis in the same paper, using fibrosarcoma HT1080 cells, they also saw concentration-dependent DNA damage and loss of cell viability. Activation by S9 was not used in either experiment.

Lueken et al. (2004)^[126] induced DNA damage (comet assay) in fibroblasts GM 5757 at a concentration of glyphosate (98.4% purity) of 12,680 μ g/ml in combination with exposure to 40 or 50 mM H_2O_2 . Activation by S9 was not used in this experiment. According to the authors, cell viability at this exposure level was above 80%.

Koller et al. (2012)[127] significantly induced DNA damage (comet assay) in human TR146 cells (buccal carcinoma cells) from exposure to glyphosate (>95% purity) in a dosedependent fashion at concentrations of 20 and 40 µg/ml. Above 40 µg/ml, there was a significant increase in tail intensity relative to controls, but the actual amount increased did not change as the dose increased (plateau). Using Roundup (Ultra Max) the authors saw virtually the same level of DNA damage at 20 and 40 µg/ml, but the concentration response continued to increase above that exposure. These experiments did not use S9 activation. They also used the CBMN assay in the same system to evaluate the total number of micronuclei in binucleated cells (MNI), the number of binucleated cells with micronuclei (BN-MNI), the number of nuclear buds (NB) and the number of nucleoplasmic bridges (NPB) caused by glyphosate and Roundup exposure. Two endpoints (NB, NPB) had significant increases at concentrations of 10, 15 and 20 μg/ml and two (MNi, BN-MNi) were significantly elevated for concentrations of 15 and 20 μg/ml. Equivalent Roundup exposures resulted in significant increases in all four measures of DNA damage at 10, 15 and 20 μg/ml. The results for the Roundup were greater than for glyphosate alone.

Gasnier at al. (2009) exposed cells from the hepatoma cell line HepG2 to glyphosate (purity not given) and four glyphosate formulations. Only one glyphosate formulation was tested for DNA damage (comet assay) and they saw significant effects at equivalent concentrations of 0.05 μ/ml to 4 μ g/ml of glyphosate (p-values not given). No p-values are provided and presentation of the results does not provide a clear means to compare these results with other studies. This study will not be used in the evaluation.

Manas et al. $(2009)^{[124]}$ obtained human blood samples from three healthy, non-smoking women and three healthy men with no history of pesticide exposure. Lymphocytes were cultured with glyphosate (96% purity) at concentrations of 34, 203, and 1015 µg/ml with no statistically significant changes in chromatid breaks,

chromosome breaks, chromatid gaps, chromosome gaps, dicentrics, acentric fragments, or endoreduplication.

Mladinic et al. (2009) [129] used blood from three non-smoking, healthy volunteers to evaluate the formation of micronuclei, nuclear buds and nucleoplasmic bridges as a function of exposure to glyphosate (98% purity). Significant changes in micronuclei were seen following exposure to glyphosate at 92.8 and 580 μ g/ml in S9 activated cells, but not those without metabolic activation. Changes in nuclear buds were seen at 580 μ g/ml for both S9 activated and non-activated cells while significant changes in nucleoplasmic bridges were seen only at 580 μ g/ml in S9 activated cells. This study contained a positive control (ethyl methanesulfonate at 200 μ g/ml) which was also negative in all assays, many times showing effects below that seen for glyphosate.

Bolognesi et al. (1997) obtained blood from two healthy female donors and exposed it to glyphosate (99.9% purity) or a Roundup formulation (30.4% glyphosate). At concentrations of 1000, 3000 and 6000 μ g/ml of glyphosate and at 100 and 330 μ g/ml of glyphosate formulation, significant changes in sister chromatid exchanges (SCEs) were seen. At 330 μ g/ml, a non-significant increase in SCEs was seen for glyphosate alone that was approximately 20% below that seen for an equivalent glyphosate exposure from the Roundup formulation. This study did not consider S9 activation.

Lioi et al. (1998)^[124, 131] obtained blood from three healthy donors and exposed it to glyphosate (>98% purity). At concentrations of 1.4, 2.9, and 8.7 μ g/ml of glyphosate, significant changes in sister chromatid exchanges (SCEs) and chromosomal aberrations were seen. This study did not consider S9 activation.

Vigfusson and Vyse (1980)^[132] exposed cultured human lymphocytes from two people to Roundup (% glyphosate unknown) at concentrations of 250, 2500 and 25000 µg/ml. Results for the highest concentration were not provided due to lack of cell growth in culture. SCEs were shown to be significantly increased for the remaining two concentrations in one donor and only for the lowest concentration in the other. While the relative SCE counts seen in this paper are similar to those from Bolognesi et al. (1997), the absolute counts in the controls are roughly three times higher in this study. This study did not consider S9 activation.

Genotoxicity in Non-Human Mammals (in vivo)

Bolognesi et al. (1997)^[130] exposed groups of three Swiss CD-1 male mice by Intraperitoneal (IP) injection with a single dose of glyphosate (99.9% purity, 300 mg/kg) or Roundup (900 mg/kg, equivalent to 270 mg/kg glyphosate). Animals were sacrificed at four and 24 hours after injection and livers and kidney were removed to obtain crude nuclei from the adhering tissues. Both tissues demonstrated significant increases in DNA single-strand breaks (p<0.05) at four hours for both glyphosate and Roundup with no discernable difference between the responses. At 24 hours, the presence of strand breaks was reduced and no longer statistically significant from controls.

Peluso et al. (1998)^[133] exposed groups of six (controls, lowest doses of glyphosate-salt and Roundup) or three Swiss CD-1 mice (males and females, specific numbers not

specified, liver and kidney tissues combined for analysis) to the isopropylammonium salt of glyphosate or Roundup (30.4% isopropylammonium salt of glyphosate) for 24 hours. DNA adducts (³²P-DNA post labeling) were not evident in mice exposed to the glyphosate-salt alone in either liver or kidney, but were present in liver and kidney at all tested doses of Roundup showing a dose-response pattern.

Rank et al. (1993)^[134] exposed male and female NMRI mice (three to five per sex) to glyphosate isopropylamine salt (purity not specified) and Roundup (480 g glyphosate isopropylamine salt per liter) by intraperitoneal injection. After 24 or 48 hours (only 24 hours for Roundup), polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 1000 cells. No significant increases were seen for any concentration in glyphosate-exposed animals (100, 150 and 200 mg/kg) or Roundup-exposed animals (133 and 200 mg/kg glyphosate equivalent dose). The positive controls, while not statistically significant, showed an increase in micronuclei.

Bolognesi et al (1997)^[130] exposed groups of three, four or six male Swiss CD-1 mice to glyphosate (99.9% purity) and Roundup (30.4% glyphosate) by intraperitoneal injection in two equal doses given 24 hours apart. After six or 24 hours following the last exposure, polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 1000 cells. Mice given two doses of 150 mg/kg of glyphosate showed a non-significant increase in micronuclei at 6 hours and a significant increase at 24 hours. In contrast, mice given two doses of 225 mg/kg glyphosate equivalent of Roundup showed a significant increase in micronuclei at both six and 24 hours. The relative differences in mean absolute increase (subtract mean response in controls) in micronucleii between glyphosate and Roundup at 24 hours was 3.6 whereas the relative difference in glyphosate equivalent dose was 1.5 indicating a greater effect of the glyphosate formulation.

Manas et al. (2009)^[124] exposed groups of male and female Balb C mice (group size not given, tissues combined for analysis) to glyphosate (96% purity) by intraperitoneal injection in two equal doses given 24 hours apart. Twenty-four hours post exposure, polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 1000 cells. No significant increases were seen at doses of 50 mg/kg and 100 mg/kg in glyphosate-exposed animals but a significant increase was seen at 400 mg/kg. The positive controls showed a statistically significant increase in micronuclei (roughly three times the control rate).

Dimitrov et al. (2006)^[135] exposed groups of eight male C57BL mice (tissues combined for analysis) to Roundup (41% glyphosate) via gavage at a dose of 1080 mg/kg. At 6, 24, 72, 96, or 120 hours post exposure, polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 4000 cells (500 per animal). No significant increases were seen. They also looked for chromosomal damage in these animals and saw no significant increases. The positive controls showed a statistically significant increase in micronuclei.

Prasad et al. (2009)^[136] exposed groups of 15 male Swiss CD-1 mice to Roundup (30.4% glyphosate) by IP injection at doses of 25 and 50 mg/kg. At 24, 48 or 72 hours post

exposure, polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 2000 cells per animal, five animals per sacrifice. Micronucleii counts were significantly increased (p<0.05) at all doses at all times relative to controls. In addition, the number of cells with chromosomal aberrations was significantly increased for all doses at all times. The control rate of micronuclei was similar to that of **Bolognesi et al. (1997)**, but about 50% greater response for a dose that was approximately 10 times smaller.

Grisolia et al. (2002)^[137] exposed groups of Swiss mice (sex and sample size not given) to Roundup (480 g glyphosate isopropylamine salt per liter) by IP injection at doses of 50, 100 and 200 mg/kg Roundup in two doses separated by 24 hours. At 24 hours post exposure, polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 2000 cells per animal. Micronuclei counts were not increased at any dose. This exposure appears to be the same formulation of Roundup used in the study by Rank et al. (1993) which was also negative.

Coutinho do Nascimento and Grisolia (2000)^[138] exposed groups of six male mice (strain not given) to Roundup (% glyphosate not given) by IP injection at doses of 50, 100 and 200 mg/kg in two doses separated by 24 hours. At 24 hours post exposure, polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 1000 cells per animal. A significant increase in micronuclei were seen at a dose of 85 mg/kg. No increase was seen at 42 or 170 mg/kg.

Cavusoglu et al. (2011)^[139] exposed groups of six Swiss albino mice by IP injection with a single dose of glyphosate formulation (RoundupUltra Max, 450 g/l glyphosate, 50 mg/kg glyphosate equivalent dose). Animals were sacrificed at three days after injection. Micronuclei in normochromatic erythrocytes were counted from a sample of 1000 cells per animal. There was a significant increase in micronuclei in erythrocytes (p<0.05). G. bilboa eliminated these effects.

Chan and Mahler (1992)^[140] exposed groups of 10 male and female $B6C3F_1$ mice to glyphosate (98.6% purity) in feed at doses of 0, 507, 1065, 2273, 4776, and 10780 mg/kg in males and 0, 753, 1411, 2707, 5846, and 11977 mg/kg in females for 13 weeks. At sacrifice, polychromatic erythrocytes from peripheral blood were extracted and micronuclei counted from a sample of 10,000 cells. No significant increases were seen at any of the tested doses.

Li and Long (1988)^[141] exposed groups of 18 male and female Sprague-Dawley rats to glyphosate (98% purity) by IP injection at a dose of 1000 mg/kg. At 6, 12 and 24 hours post treatment, 6 animals of each sex were sacrificed and polychromatic erythrocytes from bone marrow were extracted and micronuclei counted from a sample of 50 cells per animal. The percentage of cells with chromosomal aberrations was not increased at any time point following exposure.

Genotoxicity in Non-Human Mammalian Cells (in vitro)

Li and Long (1988)^[141] incubated Chinese hamster ovary cells (CHO-K1BH4) with glyphosate (98% purity) for three hours at concentrations of 5, 10, 50 and 100 mg/ml.

Cells were then plated using 200 cells per sample in triplicate and incubated for 8-12 days. Colonies were then counted and results expressed as mutant frequency. No positive results were seen in any experimental group with or without S9 activation. It is not clear why there is such a large difference in the incubation times in the various groups in this experiment, nor is it clear which groups incubated longer. In a second study in the same publication, non-induced primary rat hepatocytes (Fischer 344) were incubated with seven concentrations of glyphosate (12.5 ng/ml to 125 µg/ml) for 18-20 hours. No significant increases were seen for net grains per nucleus at any exposure concentration. There was a four-fold increase in the lowest exposure groups relative to controls and then every other treated group was below the control response. This is a very unusual finding and could be due to the way in which the data is adjusted for net grains in cytoplasm. The authors calculated net grains per nucleus by subtracting the highest cytoplasmic count from the nuclear count; if cytoplasmic count is increased by glyphosate this could bias the findings making any increase in nuclear count disappear. No data is provided to resolve this issue.

Roustan et al. (2014)^[142] incubated Chinese hamster ovary cells (CHO-K1) with glyphosate (purity not provided) for three hours at concentrations of 2, 5, 10, 15, 17.5, 20, and 22.5 mg/ml. Cells were then plated using 200 cells per sample in triplicate and incubated for 24 hours. For each exposure concentration, 2000 bi-nucleated cells were examined for micronuclei. No positive results were seen in any experimental group without S9 activation but the four highest exposure groups were significant with a clear concentration-response pattern when S9 activation was present.

Lioi et al. (1998)^[131] exposed lymphocytes from three unrelated healthy cows to glyphosate (>98% purity) for 72 hours to concentrations of 3, 14.4 and 28.7 μ g/ml without S9 activation. Chromosomal aberrations scored from 150 cells were significantly increased (P<0.05) for all exposure concentrations of glyphosate with a clear concentration-response pattern. Similarly, SCEs per cell were increased at all concentrations (p<0.05) but no concentration response pattern was evident.

Sivikova and Dianovsky (2006) [143] exposed lymphocytes from two healthy young bovine bulls to glyphosate formulation (62% glyphosate) for 2, 24 and 48 hours using concentrations of 4.7, 9.5, 23.6, 47.3, 94.6 and 190 μ g/ml without S9 activation. Chromosomal aberrations scored from 100 cells were not significantly increased (P<0.05) without S9 activation for any 24-hour exposure concentration of glyphosate (2-and 48-hours exposures were not done). SCEs per cell were increased at all 24-hour exposure concentrations (p<0.05) except the lowest concentration. At 48-hours, significant increases of SCEs per cell were seen at concentrations at or above 47.3 μ g/ml (2-hour exposures were not done). Finally, after two hours of exposure with S9 activation, significant effects were seen at 5 and 10 μ g/ml but not at 15 μ g/ml (24- and 48-hour exposures were not done for S9 activation).

Holeckova (2006)^[144] exposed lymphocytes from two healthy young bovine bulls to glyphosate formulation (62% glyphosate) for 24 hours to concentrations ranging from 28 to 1120 μmol/L without S9 activation. A significant increase in polyploidy was observed at 56 μmol/L, all other comparisons were without significance. However, this

one finding cannot be easily dismissed because all exposure groups above this concentration had too few cells for evaluation. This study did not consider S9 activation.

Genotoxicity in Non-Human Systems (in vivo and in vitro)

Four studies^[123, 145-147] in fish have seen positive results for genotoxicity (DNA strand breaks, different assays) following exposure to glyphosate. In addition, one study^[148] in oyster sperm and embryos exposed to glyphosate saw no increase in DNA damage (comet assay) and one study^[149] in two strains of Drosophila melanogaster showed an increase in mutations (wing spot test) at the higher doses of exposure.

Fourteen studies [137, 145, 147, 150-160] in multiple fish species evaluated the relationship between various glyphosate formulations and genotoxicity with all studies showing positive results for various endpoints (DNA strand breaks, micronucleus formation, and chromosomal aberrations). Two of the studies [150, 152] were negative for micronucleus formation after exposure to glyphosate formulations and one of these [150] was also negative for chromosomal aberrations but both were positive in other markers of genotoxicity. Two studies [161, 162] demonstrated genotoxicity (DNA strand breaks, micronuclei) in caiman from in-vivo exposure to a glyphosate formulation. Three studies^[163-165] demonstrated genotoxicity (DNA strand breaks, micronucleus formation) in frogs or tadpoles from exposure to glyphosate formulations. One study[148] in oyster sperm and embryos, one study[166] in clams and one study[167] in mussels exposed to a glyphosate formulation saw no increase in DNA damage (comet assay). One study[168] in snails saw increased DNA damage (comet assay) following exposure to a glyphosate formulation. Two studies [169, 170] in worms saw mixed results for DNA damage (comet assay) with one of these studies^[169] showing a positive result for micronucleus formation. One study^[171] in Drosophila melanogaster showed an increase in sex-linked recessive lethal mutations.

In the published literature, five studies evaluated the impact of glyphosate in *in vitro* systems. Two of these studies^[172, 173] looked at genotoxicity of glyphosate in combination with UVB radiation and saw significant increases in DNA strand breaks (FADU assay) in bacteria without metabolic activation. One study^[174] in eukaryote fish saw a significant increase in DNA strand breaks (comet assay) without S9 activation. Another study^[141] showed no increase in reverse mutations in two strains of bacteria with and without S9 activation.

Williams et al. (2000)^[175] summarized the literature regarding the use of reverse mutation assays in *S. typhimurium* (Ames Test). Four studies using glyphosate and five studies of glyphosate formulations were all negative. They cited one study^[134] of a glyphosate formulation that was positive with S9 activation and negative without S9 activation. However, this study was positive with S9 activation in TA100 cells, negative with S9 activation in TA98 cells, negative without S9 activation for TA100 cells and positive without activation for TA98 cells. They also summarized two studies of glyphosate in *e. coli* that were negative with and without activation.

Two additional studies $^{[141,\ 176]}$ of glyphosate using reverse mutation assays are available

from the scientific literature, both of which are negative.

Regulatory Studies

EFSA^[89] cited 14 reverse mutation assays in *S. typhimurium* (Ames Test), most of which were tested in strains TA 98, 100, 1535, 1537 (Table B.6.4-1). All 14 studies are listed as negative by EFSA. Actual data is provided for only one of the 14 studies and this study is clearly negative. EPA^[61] cited 27 reverse mutation assays in *S. typhimurium* (Ames Test), most of which were tested in strains TA 98, 100, 1535, 1537 (EPA Table 5.1). All 27 studies are listed as negative. No data is provided for any of the studies. Kier and Kirkland (2013)^[177] cited results from 18 bacterial reverse mutation assays of glyphosate and 16 of glyphosate formulations. Tabulated results and background information were provided for all 34 studies. Six studies of glyphosate alone demonstrated positive findings in one or more groups.

EFSA^[89] cites three studies of gene mutations in mammalian cells, all of which are listed as negative (EFSA Table B.6.4-5), two use the mouse lymphoma assay, and one uses the Chinese hamster ovary cell/hypoxanthine-guanine phosphoribosyl transferase (CHO/HGPRT) mutation assay. EPA^[61] cites four studies, three of which appear to be the same as those cited by EFSA (EPA Table 5.2) and the fourth is another mouse lymphoma assay. All four are listed as negative. Kier and Kirkland (2013)^[177] cite two of the mouse lymphoma studies and provide tabulated data. Neither study shows any indication of a statistically significant increase in mutation frequency at the thymidine kinase locus of L5178 mouse lymphoma tk(+/-) cells.

EFSA^[89] cites one in vitro study of DNA damage and repair in mammalian cells which is listed as negative (EFSA Table B.6.4-6). This study is of unscheduled DNA synthesis (UDS assay) in primary rat lymphocytes. They also list five studies of chromosome aberrations (EFSA Table B.6.4-8), which are characterized as negative. Two studies are in human lymphocytes and two are in Chinese hamster lung (CHL) cells. Data for one of the studies in CHL is provided in tabular form and is clearly negative. EPA[61] cites eight in vitro studies of chromosome aberrations in mammalian cells (EPA Table 5.3); two of these studies match studies in the EFSA report. Four of the studies are from the literature [124, 131, 143, 178] and are reviewed above. Surprisingly, EPA refers to the study by Manas et al. (2009)[124] as negative although it was clearly positive in the comet assay., Additionally, EPA refers to the study by Sivikova and Dainovsky (2006)[143] as negative even though they saw clear effects of glyphosate on SCEs. Basically, all four of the literature studies cited by EPA are positive yet EPA lists only two of the four as positive. The remaining four studies are noted as negative; however, no data is supplied for these studies. Kier and Kirkland (2013)[177] cites eight literature studies (all reviewed above) and three regulatory studies with glyphosate exposure. The three regulatory studies are listed as negative, and the data are available as a table in the supplement material to Kier and Kirkland (2013); these studies are negative at all tested concentrations in CHL cells; one matches the study data provided by EFSA^[89].

EFSA^[89] cites nine micronucleus assays, three in Swiss Albino mice, two in NMRI mice, two in CD-1 mice, one in Sprague-Dawley rats, and one in CD rats (EFSA Table B.6.4-12). They list one study in Swiss Albino mice as weakly positive in males, one study in CD-1 mice as positive at the highest dose (data for this study is provided) and all other studies as negative. They discard one study with low doses in male Swiss mice, but the tables provided for this study show a clearly significant result at the highest dose used (30 mg/kg) and clear dose-response. They provide data for two of the negative studies which indicate these studies were indeed negative. EPA^[61] (EPA Table 5.5) cites 20 micronucleus assays, four are available in the scientific literature and three are reviewed above (the fourth reference [179] was unavailable to me at the time of preparation of this report). The remaining 16 studies include six studies in Swiss Albino mice, four studies in CD-1 mice, three studies in NMRI mice, two studies in Sprague-Dawley rats and one study in Wistar rats. Since EFSA does not provide names associated with their micronucleus studies, I cannot determine if any of the studies cited by the EPA are the same as those cited by EFSA. EPA lists two of the literature studies as positive and two as negative (matching my reviews for the three studies I have access to) and all but one of the regulatory studies as negative (the one positive study was in Swiss-Albino mice). Kier and Kirkland (2013)[177] cite 12 regulatory micronucleus assays of glyphosate and provide data tables for all 12. All 12 of these studies are cited by EPA. Kier and Kirkland (2013) list 11 studies as negative and one as inconclusive. However, four of the studies show positive effects in at least one sex-by-treatment group. One of these four studies they list as inconclusive and the remaining three studies are determined to be negative because the response is within the range of the historical controls. As was discussed for the animal carcinogenicity studies, the correct group to use is the concurrent control. Kier and Kirkland (2013)[177] also cite 12 regulatory studies and three literature studies where animals are exposed to a glyphosate formulation. Two of the literature studies are reviewed above and the remaining study^[179] was unavailable. Data for the 12 regulatory studies are all provided in tables by Kier and Kirkland (2013) and show two positive studies in CD-1 mice and negative studies for the remaining 10.

Summary for Genotoxicity

This is a complicated area from which to draw a conclusion due to the diversity of the studies available (there are multiple species, multiple strains within a species, multiple cell types from multiple species, differing lengths of exposure, differing times of evaluation after exposure, differing exposures, numerous markers of genotoxicity, and finally both glyphosate and multiple different glyphosate formulations). There are three studies that evaluate the genotoxicity of glyphosate in humans directly, 36 experiments in eight strains of mice, three studies in rats, nine studies in human lymphocytes and four studies in other human cells, 12 studies in non-human mammalian cell lines (two using mouse cells, five using hamster cells, two using rat cells and three using cells from cows), a large number of studies in a wide variety of non-mammalian species, and a plethora of studies, mostly identical, in bacteria.

Some conclusions are straightforward"; glyphosate does not appear to cause reverse mutations for histidine synthesis in Salmonella typhimurium, regardless of whether

these reverse mutations are due to frameshift mutations or point mutations. I am cautious in this determination because there were several studies with positive results, but no clear pattern is evident. There is ample evidence supporting the conclusion that glyphosate formulations and glyphosate can cause genotoxicity in non-mammalian animal species. This clearly indicates that both glyphosate and the formulations are able to cause injury to DNA. So while findings of genotoxicity in these species do not speak directly to the hazard potential in humans, they do support a cause for concern.

The more important studies are those that have been done using mammalian systems, human cells and direct human contact. Table 16 summarizes these studies in a simple framework that allows all of the experimental data to be seen in one glance. This table does not address the subtlety needed to interpret any one study, but simply demonstrates when a study produced positive versus negative results.

Clearly, for *in vitro* evaluations in human cells, the majority of the studies have produced positive results. There was only one regulatory study evaluating glyphosate genotoxicity in human lymphocytes from healthy volunteers and that study was negative. The study was not significantly different from the other six studies in this category, five of which produced positive results. The majority of these studies used either the comet assay (a simple way for measuring any type of DNA strand break) or methods that counted specific types of strand breaks in the cells (e.g. SCEs, micronuclei, nuclear buds and nucleoplasmic bridges). From these assays, we can conclude there is DNA damage. For glyphosate formulations, there are only three studies in humans *in vivo*, two of which were positive.

The magnitude of the concentrations used in these studies could potentially lead to false positives if the glyphosate is causing cytotoxicity in the cells. All six studies using the comet assay were positive with no study showing a negative response below 10 μ g/ml and mixed results below that with positive results at 0.12 and 3.5 μ g/ml and negative results at 2.91 and 10 μ g/ml. In general, the comet assays provide strong support for genotoxicity.

The four studies that directly addressed specific types of strand breaks in cells following exposure to glyphosate showed markedly different responses across the various concentrations used. Manas et al. (2009) saw no changes in chromatid breaks, chromosome breaks, chromatid gaps, chromosome gaps, dicentrics, acentric fragments or endoreduplication over the range of concentrations 3.4-1015 μ g/ml. In contrast, Lioi et al. (1998) saw changes in SCEs over concentrations ranging from 1.4 to 8.7 μ g/ml. Both studies were done in lymphocytes from volunteers. Mladinic et al. (2009) saw significant changes in micronuclei above 92.8 μ g/ml and Bolognesi et al. (1997) saw positive changes in SCEs above 1000 μ g/ml but not at 330 μ g/ml. While changes have been seen in three of the four studies, the actual concentrations in which the changes are seen is not consistent across studies. I conclude that glyphosate causes DNA strand breaks, which is indicative of genotoxicity.

The micronucleus assays in rodents examining glyphosate genotoxicity are either all positive in one strain or all negative in one strain with the exception of the three studies

in CD-1 mice and four studies in Swiss Albino mice. For the positive studies, we can ask the question of whether, in this strain, the actual number of micronuclei are consistent.

Table 17: Summary of *in vivo* and *in vitro* genotoxicity studies of glyphosate and glyphosate formulations in mammals¹

In vivo or in vitro	Species	Cell type or tissue	Glyphosate ²		Glyphosate Formulations	
			Number Positive	Number Negative	Number Positive	Number Negative
In vivo	Humans	Peripheral blood			2	1
in vitro	Humans	lymphocytes	5	2(1)	2	
		Hep 2	1			
		GM 38 HT1080	1			
	.03	GM 5757	1			
		TR146	1		1	
In vivo	Swiss CD-1 Mouse	Liver/Kidney	1	1	2	
In vivo	NMRI mouse	Erythrocytes		4(3)		2(1)
(micro- nucleus assay)	Swiss CD-1 mouse		1		2	
	Balb C mouse		1

	Chinese hamster	ovary	1	1		
	Fischer rat	liver		1		

Rat	Lymphocytes		1(1)		
Bovine	Lymphocytes	1		2	

¹each entry in the table corresponds to a single study where a study is positive if at least one valid positive finding emerged from the study p<0.05; entries in the table are only for studies where data was available to review including data from EFSA^[89] and Kier and Kirkland (2000)^{(177]}; ²numbers are the total number of studies in this category, numbers in parentheses are the subset of studies that are regulatory studies

In Swiss Albino mice, all four studies were done with males and females. Exposures were by oral gavage for the positive study (in female mice) and IP injection by the negative studies. The positive study was at 5000 mg/kg and the highest dose in any of the negative studies was 3024 mg/kg. Finally, the control response in the positive study was 6.7 micronucleated PCE per 1000 PCE whereas the controls in the three negative studies were between 0 and 0.6 micronucleated PCE per 1000 PCE. Any of these differences could easily explain the differences in response so the positive result in Swiss Albino mice should be accepted.

For CD-1 mice, the one negative micronucleus study was by oral gavage in males and females at a single dose of 5000 mg/kg. One of the positive studies was also by oral gavage in males at a single dose of 2000 mg/kg. Because of the nature of statistical noise, these two studies could both occur whether there is a true effect or not. For the other positive study, the dose was by IP injection in male mice with a positive response at 600 mg/kg that was more than double the response of the controls. These data support the finding that glyphosate can cause micronuclei in male CD-1 mice, which is indicative of genotoxicity.

The remaining *in vitro* assays in mammalian cells exposed to glyphosate show mixed results. The mouse lymphoma assay and the Chinese hamster ovary assays are looking for specific mutations that will allow these cells to grow in culture. The Chinese hamster lung, the two rat assays and the assay in bovine lymphocytes are measuring DNA damage and provide mixed results. In general, these responses appear to be negative with the exception of those seen in bovine lymphocytes that appear to show a positive increase in SCEs following exposure to glyphosate.

For glyphosate formulations, the main difference between the findings for glyphosate and those for the glyphosate formulations is the direct evidence for genotoxicity in humans and the micronucleus assays in Swiss mice. The observation of genotoxicity in humans following exposure to glyphosate formulations must carry the greatest weight in the overall analysis and two of the three studies were positive with the strongest study by **Bolognesi et al. (2009)**^[120] showing the strongest response.

For the Swiss mouse studies of micronuclei, the fact that all three studies are negative for glyphosate formulations while one study is positive for glyphosate creates a clear disagreement. The positive study is an oral gavage study with an effect seen in male mice at 30 mg/kg/day. The two negative regulatory studies for glyphosate formulations were done at 2000 mg/kg (about 500 mg/kg glyphosate equivalent), were also oral

gavage studies and were replicates done in the same laboratory at different times. The remaining negative study used glyphosate formulation doses of 50-200 mg/kg (25-100 mg/kg glyphosate equivalent) but was done by intraperitoneal injection. With the exception of the different routes of exposure, the differences between these studies cannot be resolved.

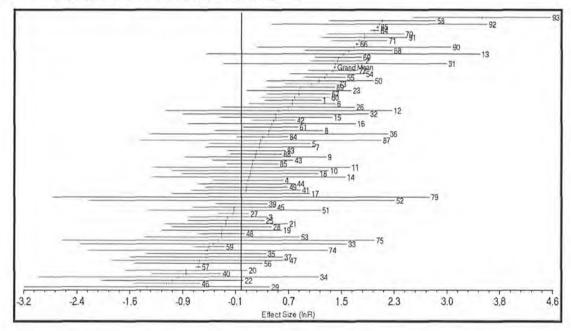

In this case, a pooled analysis of the data is not possible because in almost every case, no one study is a clear replicate of another. Instead, the appropriate approach would be to do a meta-analysis and evaluate which aspects of the experimental designs are important to producing positive findings of genotoxicity. The studies with the most data for this type of analysis are the various in vivo assays of micronucleus formation. Ghisi et al. (2016)[180] did a systematic search to identify all published studies evaluating the ability of glyphosate or glyphosate formulations to induce micronuclei in vivo. The authors also used the data from Kier and Kirkland (2013)[177] summarized above. An experiment, in their evaluation, was defined by sex/species/route/form of glyphosate so that some studies doing both sexes using glyphosate and a glyphosate formulation will enter multiple times into the analysis. They identified 93 experiments from which it was possible to do a meta-analysis. Data were extracted for each study and the log ratio of the mean of each experimental group to the mean control response (E+) was used to evaluate effect sizes in the meta-analysis. For this meta-analytic mean, a value below zero suggests no genotoxicity while a value above zero suggests increased genotoxicity. A test of heterogeneity (Cochran's Q statistic discussed earlier for the epidemiological data) was also evaluated.

Figure 2 is a reprint of Figure 1 from the study by **Ghisi et al.** $(2016)^{[180]}$ and is a forest plot from all studies they evaluated for glyphosate and glyphosate formulations. It is clear from this plot that the predominant response is positive in these data with an overall grand mean response across all studies of E+=1.37 and a 95% confidence interval of (1.356-1.381) (this is highly statistically significant with a p<0.0001). The Qt value for the grand mean was also statistically significant suggesting there are other explanatory variables in the data that would help to explain the overall variance.

Categorical variables were then used to make comparisons across the various strata in the data to identify which experimental conditions show the largest impacts on the mean response. Mammalian species presented a higher mean effect (E+=1.379; 1.366-1.391) than non-mammalian species (E+=0.740; 0.641-0.840). Glyphosate formulations showed a greater mean response (E+=1.388; 1.375-1.400) than did glyphosate (E+=0.121; 0.021-0.221), but both were significantly greater than zero. The mean response in studies using only male animals (E+=1.833; 1.819-1.847) was significantly different from zero as were studies using both males and females (E+=0.674;0.523-0.825) whereas the mean response in studies using only females (E+0.088; -0.153-0.328) was not. Peer-reviewed studies had higher mean response (E+=1.394; 1.381-1.407) compared to regulatory studies (E+=0.114; 0.027-0.202), but both means were significantly greater than zero, indicating an overall genotoxic effect. Other variables were examined such as length of exposure and magnitude of exposure that had very little impact on the overall findings.

The meta-analysis by **Ghisi et al.** (2016)^[180] provides strong support for the hypothesis that exposure to glyphosate and glyphosate formulations increases the formation of micronuclei *in vivo*. This means that glyphosate and glyphosate formulations are damaging DNA in living, functioning organisms with intact DNA repair capacity strengthening the finding that glyphosate is genotoxic to humans.

Figure 2: Forest plot of studies evaluating micronucleus frequency in glyphosate exposure, arranged by effects size. The plot shows the estimate of the response ratio and 95% confidence interval (CI) of each experiment included in the meta-analysis. The number beside the bars represents the reference number of each experiment as in Table 1 of Ghisi et al. (2016)^[180]. Grand Mean is the overall mean effects size of all studies. [Reprinted from Ghisi et al. (2016)^[180]]

From a simply statistical perspective, there is another way in which one can decide if the positive findings in the micronucleus assays in the mice are due to chance. For the glyphosate studies, if one adds up all of the individual experimental groups, there are 79 total groups which correspond to 79 statistical tests. Assuming the critical testing level is 0.05 for all of the tests, one would expect to see just under four positive findings, yet six are observed. For the glyphosate formulations, there were 70 experimental groups so one expects 3.5 positive findings yet 12 are observed (p<0.01). Overall, there were a total of 149 experimental groups examined in mice for micronucleus formation and we observed 18 (7.5 expected, p<0.01). Repeating this analysis on the basis of studies instead of experimental groups, there were 15 studies for glyphosate (expected number is 0.75 positive) yet six positive were observed (p<0.01). For the glyphosate formulations, there were 18 studies (expected number is 0.9 positive) yet six positive

are observed (p<0.01). Now expanding to all 69 studies presented in Table 17, there were 33 positive studies, but the expectation is a mere 3.5 (p<0.01).

It is clear that both glyphosate and glyphosate formulations have genotoxic potential. But which is worse? Of the 69 experiments in Table 17, there were eight experiments from five research publications that addressed both glyphosate and a glyphosate formulation in the same laboratory. Of these, two were negative for both glyphosate and the formulation and do not contribute to a discussion of relative potency. The remaining six can provide some guidance on the relative potency of glyphosate to glyphosate formulations. In Koller et al. (2007)[127], tail intensity for the comet assay were virtually identical when the amount of glyphosate in the formulation was compared to the results using glyphosate alone. In the same paper, micronuclei and related biomarkers were consistently higher in the glyphosate formulation by 10-20%. In Bolognesi et al. (1997), DNA strand breaks in liver and kidney in Swiss CD-1 mice were virtually identical under equivalent doses of glyphosate and glyphosate formulations. In their micronucleus assay, the glyphosate formulation was approximately 50% more potent. Finally, Bolognesi et al. (1997), in their analysis of SCEs in human lymphocytes, the glyphosate formulation was approximately twice as effective as glyphosate alone. In Peluso et al. (1988)[133], DNA adducts in livers and kidneys were only seen in mice treated with the glyphosate formulation, so these findings are not likely to be due to glyphosate. The data suggest a small increase in the potential for genotoxicity for glyphosate formulations relative to the genotoxicity one would see with glyphosate alone.

In summary, the data support a conclusion that both glyphosate and glyphosate formulations are genotoxic. Thus, there is a reasonable mechanism supporting the increases in tumors caused by glyphosate and glyphosate formulations in humans and animals.

Oxidative Stress

Oxidative stress refers to an imbalance between the production of reactive oxygen species (free radicals) in a cell and the antioxidant defenses the cell has in place to prevent this. Oxidative stress has been linked to both the causes and consequences of several diseases [181-186] including cancer [37, 187-191]. Multiple biomarkers exist for oxidative stress; the most common being the increased antioxidant enzyme activity, depletion of glutathione or increases in lipid peroxidation. In addition, many studies evaluating oxidative stress used antioxidants following exposure to glyphosate to demonstrate that the effect of the oxidative stress can be diminished.

Oxidative Stress in Human Cells (in vitro)

Mladinic et al. (2009) $^{[122]}$ examined the induction of oxidative stress from exposure to glyphosate (98% purity) in lymphocytes from three healthy human donors (questionnaires were used to exclude other genotoxic exposures) at concentrations of 0.5, 2.91, 3.5, 92.8 and 580 µg/ml. Cells with and without S9 activation saw increases in total antioxidant capacity at only the highest dose for cells without S9 activation although a clear concentration response pattern was seen with S9 activation.

Kwiatkowska et al. (2014) [192] examined the induction of oxidative stress from exposure to glyphosate (purity not given) in erythrocytes obtained from healthy donors in the Blood Bank of Lodz, Poland. Erythrocytes were exposed to concentrations of 1.7, 8.4, 17, 42.3, 85 and 845 μ g/ml and incubated for 1 hour. Oxidative stress (oxidation of dihydrorhodamine 123) was significantly increased at 42.3, 85 and 845 μ g/l with a clear concentration-response pattern.

Chaufan et al. (2014) [193] examined the induction of oxidative stress from exposure to glyphosate (95% purity) and Roundup UltraMax (74.7% glyphosate) in HepG2 cells (human hepatoma cell line). Exposure concentrations were 900 μ g/ml for glyphosate and 40 μ g/ml for the glyphosate formulation. After incubation for 24 hours, oxidative stress (expressed as the activity of superoxide dismutase (SOD), catalase (CAT), glutathione (GSH) and glutathione-S-transferase (GST)) was significantly increased (p<0.0-5) for the glyphosate formulation (increased SOD activity) but not for glyphosate alone.

Coalova et al. (2014) examined the induction of oxidative stress from exposure to a glyphosate formulation (Atanor, 48% glyphosate) or with a surfactant (Impacto) in Hep-2 cells (human epithelial cell line). Exposure concentrations were 376.4 μ g/ml for Atanor, 12.1 μ g/ml for Impacto and 180.2 μ g/ml for a mixture of the two. After incubation for 24 hours, oxidative stress (measured as activity of SOD, CAT, GSH, and GST) was significantly increased for Impacto, Atanor and the mixture (CAT and GSH only, p<0.05 or p<0.01).

Gehin et al. (2005)^[195] examined the induction of oxidative stress from exposure to glyphosate (purity unknown) and a glyphosate formulation (Roundup 3 plus, 21% glyphosate) in HaCaT cells (human keratinocyte cell line). Glyphosate induced cytotoxicity in the cells which was reduced or eliminated by antioxidants. The authors attributed the cytotoxicity to oxidative stress.

Elie-Caille et al. (2010) [196] examined the induction of oxidative stress from exposure to glyphosate (purity unknown) in HaCaT cells (human keratinocyte cell line). Exposure concentrations ranged from 1700 µg/l to almost 12,000 µg/ml. Glyphosate induced cytotoxicity in the cells and increased hydrogen peroxide $\rm H_2O_2$ (dichlorodihydrofluorescein diacetate assay). This study used exceptionally high concentrations that may be inducing cytotoxicity by means that are independent of the oxidative stress observed. Measuring oxidative stress using the dichlorodihydrofluorescein diacetate assay has limitations [197, 198].

George and Shukla (2013) [199] examined the induction of oxidative stress from exposure to a glyphosate formulation (Roundup Original, 41% glyphosate) in HaCaT cells (human keratinocyte cell line). Exposure concentration ranged from 1.7 μ g/ml to 17,000 μ g/ml and exposure was for 24 hours. Glyphosate significantly induced the formation of reactive oxygen species (dichlorodihydrofluorescein diacetate assay) at all exposures in a concentration-dependent fashion. Prior treatment of the cells with N-Acetylcysteine reduced the impact of glyphosate, but did not eliminate it. Measuring oxidative stress using dichlorodihydrofluorescein diacetate has limitations [197, 198] that affect the clear

interpretation of these results.

Oxidative Stress in Non-Human Mammals (in vivo)

Bolognesi et al. (1997)^[130] exposed groups of three Swiss CD-1 male mice by IP injection with a single dose of glyphosate (99.9% purity, 300 mg/kg) or Roundup (900 mg/kg, equivalent to 270 mg/kg glyphosate). Animals were sacrificed at eight and 24 hours after injection and livers and kidney were removed to obtain crude nuclei from the adhering tissues. Samples of liver and kidneys from these mice were evaluated for levels of 8-hydroxy-2'-deoxyguanosine (8-OHdG) which is a biomarker of oxidative stress^[200]. There was a significant increase in the liver of 8-OHdG at 24 hours following glyphosate exposure, but not at eight hours and not in the kidney. At both eight hours and 24 hours, Roundup increased 8-OHdG in the kidneys, but the mild increase seen in the liver at 24 hours was not significant.

Cavusoglu et al. (2011)^[139] exposed groups of six Swiss albino mice by IP injection of a glyphosate formulation (RoundupUltra Max, 450 g/l glyphosate, 50 mg/kg formulation). At the end of dosing, animals were fasted overnight then sacrificed. There was a significant increase in malondialdehyde in both liver and kidney and a significant decrease in GSH in liver and kidney from exposure to the glyphosate formulation. *G. bilboa* eliminated these effects.

Jasper et al. (2012)^[201] exposed groups of 10 male and 10 female Swiss albino mice via oral gavage for 15 days to a glyphosate formulation (Roundup Original, 41% glyphosate, 50 mg/kg glyphosate equivalent dose). Animals were sacrificed at three days after injection. There was a significant increase in thiobarbituric acid-reactive substances (TBARS) in the liver for both male and female mice at both doses (p<0.05). The concentration of non-protein thiols was elevated in both dose groups for males and for the high dose only in females (no dose-response was seen for this endpoint).

Astiz et al. (2009)^[202] exposed groups of four male Wistar rats by IP injection to a single dose of glyphosate (purity unknown, 10 mg/kg). Animals were injected three times per week for five weeks and then sacrificed. Thiobarbituric acid-reactive substances (TBARS assay), protein carbonyls (PCOSs), total glutathione levels, individual glutathione levels, SOD and CAT were all measured as biomarkers for oxidative stress in plasma, brain, liver and kidney. Glyphosate significantly increased TBARS in all tissues (p<0.01), total glutathione in brain (p<0.01), SOD in liver and brain (p<0.01) and CAT in brain. In a follow-up report^[203], they demonstrate that lipoic acid eliminates or severely reduces the impacts of glyphosate on the brain.

Cattani et al. (2014)^[204] exposed groups of four pregnant Wistar rats to glyphosate formulation (Roundup Original, 360 g/L glyphosate) in drinking water from gestational days 5-15 at a dose of 71.4mg/kg. Fifteen day-old pups (2 per dam) were examined for oxidative stress markers in the hippocampus. Pups had a significant increase in TBARS (p<0.05) and a significant decrease in GSH (p<0.01).

George et al. (2010)^[82] exposed groups of four Swiss albino mice to a glyphosate formulation (Roundup Original, 36g/L glyphosate) at a dose of 50 mg/kg (glyphosate

equivalent dose) via a single topical application. Proteomic analysis of skin from the treated animals saw alterations in SOD1, CA III and PRX II, proteins known to play a role in the management of oxidative stress.

Oxidative Stress in Non-Mammalian Systems

As for genotoxicity, oxidative stress from exposure to glyphosate and glyphosate formulations have been studied in various aquatic organisms; reviewed in Slaninova et al. (2009)^[205]. Many of the studies reviewed by Slaninova et al. (2009) showed associations with glyphosate and oxidative stress in various organs. Since that review, additional studies have been completed that also demonstrate a positive association between glyphosate and oxidative stress^[147, 156-159, 206-217].

Summary for Oxidative Stress

Seven studies addressed oxidative stress in human cells and another six studies addressed it in mammalian systems. In lymphocytes and erythrocytes from healthy donors, oxidative stress was detected as low as 580 μ g/ml in lymphocytes and at 42.3 μ g/ml in erythrocytes. In Hep-G2 cells, no increased oxidative stress was seen for a single concentration of 900 μ g/l. In two studies in HaCat cells, glyphosate induced oxidative stress in a continuous model fit to the results in one study and at the lowest concentration (1700 μ g/ml) in the other. The most convincing studies in human cells for oxidative stress are the two studies in human blood.

In Swiss CD-1 male mice, increased oxidative stress was seen in the liver at 24 hours, but not at four hours after injection of 300 mg/kg glyphosate. No increase was seen in the kidney. In Wistar rats, repeated IP dosing with glyphosate lead to increased oxidative stress in multiple organs using multiple biomarkers. Thus, all of the laboratory studies demonstrated oxidative stress with a significant finding in the rat study.

In Hep-G2 cells, a glyphosate formulation demonstrated a robust increase in oxidative stress at 40 μ g/ml. Given the negative response in this cell line for glyphosate alone, it must be concluded that this response is not due to glyphosate. In HEP-2 cells, a glyphosate formulation demonstrated a robust increase in oxidative stress via multiple biomarkers at 376 μ g/ml and when a surfactant is added, at 180.2 μ g/ml. In HaCaT cells, a glyphosate formulation demonstrated significant increases in oxidative stress from doses starting as low as 1.7 μ g/ml in a concentration-dependent fashion. No studies were available in human lymphocytes.

In Swiss CD-1 mice, a glyphosate formulation significantly increased oxidative stress in the kidney but only demonstrated a mild (non-significant) increase in the liver. This study evaluated oxidative stress at two different time points following exposure and saw responses that differed over time. The strong increase in the liver for glyphosate but not glyphosate formulation, suggests a complicated response pattern for pure glyphosate versus the formulation that could be linked to the time since exposure. In Swiss Albino mice, a glyphosate formulation demonstrated increased oxidative stress by two separate biomarkers in both the liver and the kidney. In a second study in Swiss albino mice using a different biomarker but a similar dose, increased oxidative stress

was seen in both the liver and the kidney. In Wistar rat pups exposed in utero, an increase in oxidative stress was seen in the hippocampus. In Swiss albino mice, topical application of a glyphosate formulation to the skin resulted in a proteomic fingerprint suggesting oxidative stress was increased.

Though there are fewer studies for oxidative stress than there are for genotoxicity, the robust response seen here in human cells and in rodent studies clearly supports a role for both glyphosate and glyphosate formulations in inducing oxidative stress. Thus, there is a second reasonable mechanism through which the tumors seen in humans and those seen in animals can be caused by glyphosate and glyphosate formulations.

Summary for Biological Plausibility

In the evaluation of causality, the evidence for biological plausibility is overwhelming. Glyphosate clearly causes multiple cancers in mice, two cancers in the hematopoietic system similar to what is seen in humans, causes cancer in rats, is genotoxic and induces oxidative stress. The findings are clear for both glyphosate alone and for glyphosate formulations. There is strong support for biological plausibility in support of a causal association of glyphosate and glyphosate formulations with NHL.

Biological Gradient

Only three of the epidemiological studies provided information on biological gradients in their publications.

Eriksson et al. $(2008)^{[46]}$ divided their cases and controls into those with ≤ 10 days per year of exposure and those with > 10 days per year of exposure. The ORs were calculated using a multivariate analysis that included agents with statistically significant increased OR, or with an OR > 1.50 and at least 10 exposed subjects. ORs for glyphosate were 1.69 (0.70-4.07) for ≤ 10 days per year and 2.36 (1.04-5.37) for > 10 days per year. In their multivariate analysis, latency periods of 1-10 years showed an OR of 1.11 (0.24-5.08) and > 10 years had an OR of 2.26 (1.16-4.40). Thus, they show an increase with intensity of exposure and with latency.

McDuffie et al. $(2001)^{[50]}$, using a conditional logistic regression analysis controlling for major chemical classes of pesticides and all other covariates with p<0.05, the OR for \leq 2 days per year of exposure was 1.0 (0.63-1.57) and for \geq 2 days per year, the OR was 2.12 (1.20-3.73). Thus, they show an increase with intensity of exposure.

De Roos et al. (2005)^[45] used three exposure metrics in their analyses: a) ever personally mixed or applied pesticides containing glyphosate; b) cumulative exposure days of use of glyphosate (years of use times days per year); and c) intensity weighted cumulative exposure days (years of use times days per year times intensity of use). For exposure measurements b and c, they divided the respondents into tertiles chosen a priori to avoid having sparse data when dealing with rare tumors. For cumulative exposure days and using the lowest exposed tertile as the reference group, the RRs drop with values of 0.7 (0.4-1.4) and 0.9 (0.5-1.6) for tertiles 2 and 3 respectively adjusted for demographic and lifestyle factors and other pesticides (30,699 subjects). When

intensity-weighted exposure days are examined, the RRs drop with values of 0.6 (0.3-1.1) and 0.8 (0.5-1.4) for tertiles 2 and 3, respectively adjusted for demographic and lifestyle factors and other pesticides (30,699 subjects). Thus, they do not see a biological gradient in their responses. However, the high frequency of exposure to many pesticides (e.g. 73.8% were exposed to 2,4-D) means subjects with low exposure to glyphosate were likely to be exposed to other agents that may also induce NHL; this could reduce the RRs in the higher exposure classes because it would inflate the RR in the low-exposure referent group.

Eriksson et al. (2008)^[46] and McDuffie et al. (2001)^[50] had consistent results for intensity of exposure per year (≤2 days per year, OR=1.0; ≤10 days per year, OR=1.69; >2 days per year, OR=2.12; >10 days per year, OR=2.26). It is not possible to resolve the remaining differences between these three studies nor is it easy to argue that one study has more weight on this question than any other. The studies use different measures of exposure or time since exposure, are done on different populations and have different statistical power to detect a trend.

In rodent carcinogenicity studies, there is clear evidence of a biological gradient.

In general, there is support that a biological gradient exists for the epidemiological data and thus support from this aspect of the Bradford-Hill evaluation.

Temporal Relationship

Exposure must come before the cancers occur otherwise the epidemiology studies are useless. In this case, it is clear that exposure came before the onset of NHL. The need for a temporal relationship in the data supporting a causal association between glyphosate and NHL is satisfied.

Specificity

There are other causes of NHL^[218-221] so this group of cancers is not specific to glyphosate. **There is little support for specificity**.

Coherence

Humans, coming into contact with glyphosate, can absorb the compound into their bodies where it has been measured in blood and in urine^[56, 222-226]. In laboratory animals, absorption, distribution and elimination of glyphosate and glyphosate compounds have been studied^[140, 227] and show that glyphosate gets into the animal's bodies, distributes to numerous organs and is eliminated in urine. The animal cancer studies clearly demonstrate that glyphosate in mammals can have toxic effects.

Mouse models have long served as surrogates for humans in understanding and developing treatments for many diseases. The same holds true for lymphoid tumors seen in humans. For over 30 years, mouse models have been studied and evaluated as surrogates for NHL^[228-232]. These publications and the associated classification systems for humans and mice indicate a close linkage between the diseases in humans and mice.

Thus, coherence is supported by the increased risk of malignant lymphomas in CD-1 mice, the marginal increase in these tumors in Swiss mice and the strong similarity between malignant lymphomas in mice and NHL in humans.

There is strong support for coherence in the data supporting a causal association of glyphosate and glyphosate formulations with NHL.

Experimental Evidence in Humans

There is no experimental evidence in humans since purposely exposing humans to a pesticide, especially one that is probably carcinogenic, is not ethical and would never pass review by a human subject's advisory board.

Analogy

I am unaware of any analogous compounds from the scientific literature. This, however, is not an area where I have sufficient background to express an opinion.

Summary

Table 18 summarizes the information for each of Hill's aspects of causality. For these data, causality is strengthened because the available epidemiological studies show a consistent positive association between cancer and the exposure. The studies do not show different responses with some studies being positive and others negative, nor do they show any heterogeneity when analyzed together. And, in answer to Hill's question, the relationship between NHL and glyphosate exposure has been observed by different persons, in different places, circumstances, and times.

Causality is strengthened for these data because the strength of the observed associations, when evaluated simultaneously, are statistically significant, the findings are uni-directional and the results are unlikely to be due to chance. Even though none of the individual studies provide relative risks or odds ratios that are large and precise, the meta-analysis has objectively shown that the observed association across these studies is significant and supports a positive association between NHL and glyphosate.

Biological plausibility is strongly supported by the animal carcinogenicity data and the mechanistic data on genotoxicity and oxidative stress. When addressing biological plausibility, the first question generally asked is "Can you show that glyphosate causes cancers in experimental animals?" In this case, the answer to that question is clearly yes. Glyphosate has been demonstrated to cause cancer in two strains of rats and one strain of mice. Glyphosate has been demonstrated to cause cancer in two strains of rats and one strain of mice. Glyphosate causes hepatocellular adenomas in male Wistar rats and, to a lesser degree, in male Sprague-Dawley rats, mammary gland adenomas and adenocarcinomas in female Wistar rats, skin keratocanthomas in male Wistar rats, and kidney adenomas and thyroid C-cell adenomas and carcinomas in male Sprague-Dawley rats. Glyphosate causes hemangiosarcomas, kidney tumors and malignant lymphomas in male CD-1 mice and hemangiomas in female CD-1 mice and possibly

causes malignant lymphomas, kidney adenomas in male Swiss albino mice and hemangiomas in female Swiss albino mice. Thus, glyphosate causes cancer in mammals. Thus, it is biologically plausible that glyphosate alone can cause cancer in mammals.

The next question generally asked is "Does the mechanism by which glyphosate causes cancer in experimental animals also work in humans?" The best understood mechanism by which chemicals cause cancer in both humans and animals is through damaging DNA that leads to mutations in cells that then leads to uncontrolled cellular replication and eventually cancer. It is absolutely clear from the available scientific data that both glyphosate and glyphosate formulations are genotoxic. This has been amply demonstrated in humans that were exposed to glyphosate, in human cells *in vitro*, in experimental animal models and their cells *in vitro* and *in vivo*, and in wildlife. One way in which DNA can be damaged is through the presence of free oxygen radicals that overwhelm a cell's antioxidant defenses. Glyphosate induces this type of oxidative stress, providing additional support for a biological mechanism that works in humans.

Table 18: Summary conclusions for Hill's nine aspects of epidemiological data and related science

Aspect	Conclusion	Reason Multiple studies, all are positive, meta-analysis shows little heterogeneity, different research teams, different continents, different questionnaires, no obvious bias or confounding			
Consistency of the observed association	Strong				
Strength of the observed association	Strong	Six core epidemiology studies all show the same modest increase, significant meta-analyses			
Biological plausibility	Very Strong	Multiple cancers in multiple species, not due to chance, increased risk of rare tumors, convincing evidence for genotoxicity and oxidative stress			
Biological gradient	Moderate	Clearly seen in the two case-control studies that evaluated it, not seen in the cohort stu			
Temporal relationship of the observed association	Satisfied	Exposure clearly came before cancers			
Specificity of the observed association	Not needed	NHL has other causes, this does not subtract from the causal argument			
Coherence	Strong	Glyphosate is absorbed, distributed and excreted from the body, cancers seen in the mice have strong similarity to human NHL			
Evidence from human experimentation	No data	No studies are available			
Analogy	No data	No studies available in the literature			

In general, there is support that a biological gradient exists for the epidemiological data and thus support from this aspect of the Bradford-Hill evaluation. Glyphosate ORs increased with time since first exposure and with intensity of use per year in the two case-control studies that evaluated at least one of these issues.

There is clearly the proper temporal relationship with the exposure coming before the cancers.

The human evidence is coherent. The basic findings in humans agree with the animal evidence for absorption, distribution and elimination of glyphosate. Also, one of the tumors seen in mice has almost the same etiology as NHL.

NHL is not specific to glyphosate exposure. There is no experimental evidence in humans and I did not find any references where researchers looked for analogous compounds with similar toxicity.

Hill (1965)^[36] asks "is there any other way of explaining the set of facts before us, is there any other answer equally, or more, likely than cause and effect?" There is no better way of explaining the scientific evidence relating glyphosate to an increase in NHL in humans than cause and effect.

In my opinion, glyphosate probably causes NHL and, given the human, animal and experimental evidence, I assert that, to a reasonable degree of scientific certainty, the probability that glyphosate causes NHL is high.

The IARC Assessment of Glyphosate

In March 2015, the International Agency for Research on Cancer (an agency of the World Health Organization) brought together seventeen scientists (the Working Group) to evaluate the scientific evidence on whether glyphosate can cause cancer in humans. This group also contained one invited specialist (myself) to aid the Working Group (WG) in going through the science but who was not allowed to join discussions on the final conclusion or write any part of the document. The Working Group concluded that glyphosate falls in the category "probably carcinogenic to humans (Group 2A)" [56].

The IARC preamble^[30] guides Working Groups on how to evaluate scientific literature to determine if something is a hazard. All Working Groups follow these guidelines and this process is accepted worldwide as a proper way to evaluate the literature for a hazard (e.g., the European Chemical Agency cites the IARC review process as guidance and then uses the exact same wording as IARC does to guide their own hazard evaluation process^[34]).

The WG examined the epidemiological data and classified it as "limited evidence of carcinogenicity," which is defined to mean "a positive association has been observed between exposure to the agent and cancer for which a causal interpretation is considered to be credible, but chance, bias or confounding could not be ruled out with

reasonable confidence." This is a precise and clear description of the strength of the evidence from the epidemiological studies.

The WG examined the evidence from animal carcinogenicity studies and classified it as "sufficient evidence of carcinogenicity," which IARC defines as: "a causal relationship has been established between the agent and an increased incidence of malignant neoplasms or of an appropriate combination of benign and malignant neoplasms in (a) two or more species of animals or (b) two or more independent studies in one species carried out at different times or in different laboratories or under different protocols. A single study in one species and sex might be considered to provide sufficient evidence of carcinogenicity when malignant neoplasms occur to an unusual degree with regard to incidence, site, type of tumour or age at onset, or when there are strong findings of tumours at multiple sites." Based on the data available to IARC at the time of their review and the restrictions placed on the studies they can review by the Preamble, this conclusion is justified and correct.

One of the major criticisms of the WG review was that the WG did not review all of the animal carcinogenicity data that was available to the regulatory bodies and thus came to the wrong conclusions on the animal cancer data. In this review, I evaluated all 19 animal carcinogenicity experiments that have been collectively mentioned by any agency that reviews glyphosate. Where possible, I have analyzed the original data and used sound statistical methods to test for significant increases in cancer incidence in animals exposed to glyphosate. My conclusion is that the WG would have called this data "sufficient evidence" to support their findings despite not reviewing the additional studies analyzed herein. Despite the fact the industry kept these studies confidential, nothing contained in the withheld studies would have changed the WG conclusion.

On the mechanistic data, the IARC Working Group reviewed the same data that I reviewed, but I also evaluated, where possible, the proprietary data supporting the regulatory decisions. Where possible, I reanalyzed that data to be certain the results being presented were accurate. The IARC Working Group, using the guidelines set forth in their Preamble, declared strong support for the biological mechanisms of genotoxicity and oxidative stress. As I have shown here, there is strong support for these two mechanisms, even with the proprietary evidence from the industry studies. Thus, the IARC Working Group reached the correct conclusion.

To decide on a final classification for a compound, the IARC Preamble provides guidance on how the classification of the three areas are to be used. If the data in humans is "limited" and the data from animal carcinogenicity studies is "sufficient," the discussions should begin with Class 2A, "the agent is probably carcinogenic to humans." Then, given the overall quality of the data set, the strength of the evidence from the mechanistic studies and any additional scientific issues that need to be considered, the Working Group will determine whether the data justifies a different category. In this case, the Working Group concluded 2A was the right category and I still believe the evidence supports that finding.

The EPA Assessment of Glyphosate

Like IARC, the EPA has guidelines that are to be followed when evaluating scientific literature and making a determination about the carcinogenic potential of a chemical. Those guidelines have been developed over many years and are based on sound scientific guidance that myself and many other scientists have provided to the Agency. For their evaluation of glyphosate, the Agency did not follow their own guidelines, nor did they follow sound scientific practice. This opinion is consistent with the review done by the EPA FIFRA Scientific Advisory Panel^[54]. In addition, the Agency failed to find all of the relevant animal cancer studies and misinterpreted several of them. The major problems with the Agency evaluation are:

- Misinterpretation of the epidemiological evidence, confusing the potential for bias and potential for confounding with real bias and real confounding, allowing them to give almost no weight to the case-control studies in favor of the one cohort study;
- · Misinterpretation of the findings in the meta-analysis;
- Failure to properly use historical controls in the analysis of the animal carcinogenicity studies; declaring a significant finding as not due to the compound if it is in the range of the historical controls;
- Failure to analyze all tumors in all studies relying upon the industry submissions to have done this correctly;
- Failure to follow their guidelines on what constitutes a positive finding, disregarding significant trend tests when no corresponding pairwise comparisons are also significant;
- Disregarding positive findings in doses that are clearly not above the maximum dose the animals could be given with compromising the integrity of the study;
- Using unreasonable arguments about the overall false positive rates in the study without actually doing an analysis of this issue;
- Failing to recognize the similar findings in similar studies and to do a pooled analysis to determine if the negative effects in one study cancel out the positive effects in another;
- Giving very little weight to studies from the literature and relying almost entirely
 on studies provided by industry that have not undergone peer review for both
 quality and, more importantly in some cases, interpretation of the findings; and
- Comparing results across different species and strains for the animal cancer studies and the mechanistic studies with little regard for unique findings in any one study and consistent findings across multiple studies.

Similar comments apply to the evaluation done by the European Food Safety Authority^[89] and the European Chemical Agency^[233]. My detailed comments to these

agencies on their risk assessments are attached. There were comments to my comments to EPA by other scientists and I also responded to those comments in the EPA docket for glyphosate. These are also included in the attached Appendices.

Use of Historical Control Data in Carcinogenicity Studies in Rodents*

JOSEPH K. HASEMAN, JAMES HUFF AND GARY A. BOORMAN

Biometry and Risk Assessment Program and Toxicology Research and Testing Program, National Institute of Environmental Health Sciences, Research Triangle Park, NC 27709

ABSTRACT

This paper considers the use of historical control data in the evaluation of tumor incidences from carcinogenicity studies in rodents. Although the most appropriate control group for interpretative purposes is always the concurrent control, there are instances in which the use of historical control information can aid an investigator in the overall evaluation of tumor incidence data. One example is rare tumors; another is a tumor that shows a marginally significant result relative to concurrent controls.

However, before historical control data can be used in a formal testing framework, a number of important issues must first be considered. The nomenclature conventions and diagnostic criteria for each study should be identical to insure unambiguous identification of all relevant tumors in the historical control database. Criteria should be established that will aid in determining whether a particular study should be included in the database. This will assure a homogeneous set of studies upon which to base statistical comparisons. Since study-to-study variability in tumor rates may exceed what would be expected by chance alone, these sources of variability should be identified and controlled. Finally, statistical procedures should be employed that adjust for extra-binomial variability.

This paper also summarizes tumor incidence data from untreated Fischer 344 rats and B6C3F₁ mice in the National Toxicology Program (NTP) historical control database. All studies in the database are of two years duration, and all neoplasms occurring with a frequency of 0.5% or more are reported.

INTRODUCTION

The National Cancer Institute (NCI) Carcinogenesis Testing Program began in the 1960's. In 1978, the National Toxicology Program (NTP) was established, and in July 1981, the responsibility for the NCI carcinogenicity studies was transferred formally to NTP. To date, NCI and NTP have generated nearly 300 Technical Reports summarizing the results of laboratory animal carcinogenicity studies for a wide variety of chemicals [1, 2]. The majority of these investigations are two-year feeding or gavage studies involving male and female Fischer 344 rats and B6C3F,

mice. For each of these studies detailed histopathology data—information on neoplastic and non-neoplastic lesions for individual animals—have been computerized and stored on the Carcinogenesis Bioassay Data System (CBDS)

Although the concurrent control group is always the first and most appropriate control group used for decision making [3, 4], there are certain instances in which the use of historical control information can aid an investigator in the overall evaluation of tumor incidence data. One example is rare tumors (which may require somewhat less stringent statistical evidence in a given study if the low spontaneous rate of the tumor can be demonstrated from historical control data); another is a tumor which shows a borderline

increase relative to concurrent controls (which may be discounted or considered to be biologically meaningful when historical control data are considered). Historical control data are also useful for quality control aspects of the study to determine if concurrent control tumor incidences are consistent with previously reported tumor rates [5].

There is currently no consensus regarding how and when historical control data should be used in the decision making process. The National Cancer Institute made limited use of historical control data to supplement the statistical analyses in certain Technical Reports [6]. In these instances the tumor incidences in chemically-exposed animals were often compared with the historical control range. If this tumor rate was within the historical control range, the effect was frequently regarded as being unrelated to chemical administration. Conversely, a tumor incidence outside the historical control range was often regarded as a chemically-induced effect.

Statistical issues related to the use of historical control data have been considered by a number of investigators [3, 4, 7, 8]. One goal of the National Toxicology Program is to investigate further the use of historical control information in the evaluation of tumor incidence data. This paper describes that research effort.

METHODS

A systematic examination of historical control tumor incidence data from NCI/NTP carcinogenicity studies was carried out. These data were taken primarily from two year experiments involving Fischer 344 rats and B6C3F, mice. Modification of existing CBDS programs were made to facilitate detailed comparisons of tumor incidences within and among contract laboratories. One objective of this investigation was to define an NTP historical control database and to compare tumor incidences in this database with previously reported rates from earlier NCI studies [9, 10]. This new database could then be utilized as a reference point in the evaluation of tumor incidence from current NTP studies. A second objective was to identify major sources of study-to-study variability in tumor rates, using an approach similar to that employed by Tarone, Chu and Ward [4].

Within each laboratory the binomial variance test for homogeneity [11] was employed to assess the presence or absence of extrabinomial study-to-study variability. Analysis of variance procedures [12] were employed to quantify the potential sources of variability in tumor incidence (e.g., laboratory; pathologist within laboratory; animal supplier). The variance stabilizing arc sine transformation was employed in these analyses.

RESULTS AND DISCUSSION

As the historical control tumor incidence data from NCI/NTP studies were reviewed. four issues became evident: (1) Different nomenclatures were used to describe the same lesion, (2) standardized criteria had not been defined for the inclusion of a study in the historical control database, (3) extra-binomial variability (i.e., variability among studies in excess of what would be expected by chance alone) was evident for certain tumors, and (4) appropriate statistical methodology for taking extrabinomial variability into account had not been adequately studied. These issues must all be addressed before historical control data can be used in a formal testing framework.

Resolving Nomenclature Differences. An examination of NCI/NTP historical data revealed that different terminologies were often being employed to describe the same tumor even for studies at the same laboratory carried out at approximately the same time. As an Illustration, consider the data in Table If historical control data from this laboratory on pituitary chromophobe adenoma were to be used in a formal testing framework, one must be aware that the Adenoma NOS (NOS = not otherwise specified) diagnosis is almost certainly chromophobe adenoma, notwithstanding the different nomenclature. Thus, in this instance a statistical analysis should be based on the combined incidence of all pituitary adenomas including chromophobe adenomas.

TABLE I—Example of Differences in Pathology Nomenclature: Pituitary Tumors in Female F344 Rats

Study ⁴	Adenoma, NOS	Chromophobe Adenoma	Combined
A	22/49	0/49	22/49
B	25/48	0/48	25/48
C	1/50	21/50	22/50
D	21/48	0/48	21/48
E	1/50	20/50	21/50

[&]quot;Studies A-E are all recently completed studies from the same laboratory. NOS: not otherwise specified

^{*} Includes all tumors occurring with a frequency of 0.5% or greater, as of March 1983.

* Number of animals examined histopathologically (or, for certain lesions, the number of animals necropsied).

Number of animals examined histopathologically (or, for certain lesions, the number of animals necropsied).
This combination is included because certain early studies in the data base tended to use these terms interchangeably.

Although this particular example is fairly straightforward, others are less obvious. For example, the following terms for leukemia have been used in NCI/NTP studies: leukemia NOS, mast-cell leukemia, monocytic leuthyroid of

kemia, myelomonocytic leukemia, mononuclear cell leukemia, granulocytic leukemia, lymphocytic leukemia, erythrocytic leukemia, and undifferentiated leukemia. To those unfamiliar with tumor pathology, it may not be clear which of these diagnoses represent synonymous terms for the same lesion and which represent histologically distinct leukemias, and therefore require separate anal-

issue is that the most meaningful analysis is for all leukemia, rather than for any one particular type.

yses. The NTP position on this particular

Another issue is the use of different sets of criteria for diagnosing a lesion. For example, some pathologists diagnose all thyroid C-cell proliferative lesions extending beyond the boundary of one follicle as C-cell carcinoma. Others diagnose all C-cell lesions located within the thyroid lobe as C-cell adenoma, regarding only lesions that extend beyond the thyroid capsule or having distant metastases as carcinomas.

Thus, the nomenclature conventions and diagnostic criteria for each study should be identical to insure unambiguous identification of all relevant tumors in the historical control database. As an initial step toward achieving this objective, the NTP has held workshops on kidney, liver, and pancreas pathology; each of the testing laboratories as well as leading diagnostic pathologists in the particular organ system have participated. During these workshops, examples of specific lesions were illustrated, discussed, and standardized diagnostic criteria formulated. These criteria have been incorporated into NTP's quality assurance and review procedures. Any diagnoses that do not conform to

these standards are returned to the testing laboratory pathologist for reconsideration.

Another issue involves combining benign and malignant tumors (e.g., hepatocellular adenoma and carcinoma) for biological and statistical interpretation. For example, in their study of the variability of tumor rates in F344 rats and B6C3F, mice, Tarone, Chu and Ward [4] combined certain benign and malignant neoplasms, since "these combined types represent the histogenetic development of the tumors, and the groupings should minimize the effect of various pathologists in the program using different terms for the same stage in the development of a given tumor type." Ward [8] presents data illustrating different diagnostic criteria employed by four pathologists in the evaluation of liver lesions. The issue of tumor combinations should be carefully studied in advance, so that the historical control database can summarize the incidences of appropriate tumor combinations.

Defining the Historical Control Database.

Criteria should be established that will aid in determining whether or not a particular study should be included in the database. This will assure a homogeneous set of studies upon which to base statistical comparisons. Previous investigators [3, 7] have recognized this need and have emphasized that historical control databases should contain studies that are similar with respect to experimental factors known or suspected to affect the magnitude of tumor rates.

Certainly species, strain, sex, study duration, pathology protocols, nomenclature conventions, quality assurance and review procedures should be the same for each study in a particular historical control database. Ideally, diets, caging regimens, and various environmental parameters should also be comparable. Different types of control groups (e.g., untreated, corn oil gavage) should be dealt with separately. Other potential sources of variability (calendar year, laboratory, pathologist, supplier) should also be investigated, identified and controlled.

In June, 1982, a meeting of NTP pathologists and statisticians was held to establish an "updated" historical control database for tumor incidences. After considering the factors mentioned above, the group decided that this database should consist of all chemicals whose technical report drafts were peer reviewed in 1980 or later. This corresponds to those chemicals whose Technical Reports begin with number 193. Thus, many early NCI studies were excluded from the database. This action was not meant to indicate that these studies were flawed or that the pathology diagnoses were unreliable. These studies were excluded primarily because the pathology protocols, nomenclature conventions, quality assurance and review procedures, and other experimental factors noted above were different in some respects from those currently employed.

A further decision had to be made: when in the overall pathology evaluation process were diagnoses to be regarded as final and the study formally included in the database. It was decided that approval of the laboratory's pathology diagnoses by the NTP Pathology Working Group (PWG) should be the point in time in which a study becomes part of the database (The PWG consists of NTP pathologists and other experts in rodent pathology from academia and industry; their primary function is to review the pathology data and resolve any discrepancies in pathology diagnoses).

Table II summarizes the incidences of the more frequently-occurring tumors in the NTP historical control database; included are tumor incidences from untreated control male and female F344 rats (47 studies) and B6C3F, mice (51 studies). Most control groups had 50 animals/species/sex and all were from two year carcinogenicity studies. All neoplasms occurring with a frequency of 0.5% or more are listed. The current database contains information beginning with those studies reported in Technical Report 193 through those studies whose pathology diagnoses were finalized in CBDS as of March, 1983.

Comparing these rates with previous tabulations of control tumor incidences for F344 rats and B6C3F, mice [1, 4, 8-10, 13-17] showed that the incidence of several neoplasms are significantly higher in the current database. For F344 rats, the most notable increases as compared to Goodman et al. [9] are mononuclear cell leukemia (males: 28% vs. 12%; females: 17% vs. 10%), pituitary adenoma (males: 22% vs. 11%; females: 44% vs. 29%) and adrenal pheochromocytoma (males: 18% vs. 9%). Similarly, for B6C3F₁ mice benign and malignant liver neoplasms (males: 31% vs. 21%; females: 8% vs. 4%) and pituitary adenoma (males: 0.6% vs. 0.1%; females: 8% vs. 3%) showed an increased incidence in the current data base compared to those reported by Ward et al. [10]. These differences in tumor rates are all significantly (P < 0.01) greater than what would be expected by chance alone.

These time-related trends are similar to those found by other investigators. When considering data from the early NCI studies, Ward [8] noted that "there is real evidence that tumor incidence at several sites in 2year-old F344 rats has increased significantly over the past 8 years. The cause(s) is not known." One possible explanation is that over time more uniform criteria have been established for the diagnosis of these neoplasms. In addition, an in depth three-phase review of the pathology data has been developed and implemented by the NTP [18]. These time-related differences in tumor incidence are probably also affected by increased survival in the more recent studies due to improved animal husbandry, diets and environmental conditions. Moreover, not all studies summarized by Ward et al. [10] were of two year duration. One should not exclude the possibility that the incidence of these neoplasms is increasing due to one or more factors such as genetic drift or the presence of low level carcinogens in the diet (especially nitrosamines), water, bodding, etc.

Identifying Sources of Variability. Study-tostudy variability in tumor rates may exceed what would be expected by chance alone. These sources of extra-binomial variability should be identified and controlled before attempting to use the database.

Time (calendar year) appears to be an important source of variability. Certain tumors show increased incidences in recent studies relative to earlier experiments. This variable can be controlled to some extent by limiting the historical control data to the more recent studies, as has been done by NTP. An additional strategy would be to employ a 3-4 year "window" for historical control data, i.e., to include in the database only those studies conducted within 3-4 years of the study being evaluated.

The laboratory is also an important source of variability for certain tumors. When all

contract laboratories with five or more studies in the NTP historical control database were considered, the following tumors showed significant (P < 0.05) interlaboratory variability (see Tables III-VI): pancreatic islet cell and testis interstitial cell tumors (male rats); liver nodules, thyroid C-cell tumors, mammary gland fibroadenomas, and uterine endometrial stromal polyps (female rats); lymphomas and pituitary tumors (mice); and lung tumors (male mice). No one laboratory appeared to report consistently high (or low)

tumor incidences relative to the others, with the possible exception of Laboratory C, which tended to diagnose more tumors for mice than did the other four laboratories (Tables V and VI).

131

A specific example of inter-laboratory variability is given in Table VII. For male B6C3F₁ mice, the incidence of lung alveolar/bronchiolar adenoma or carcinoma is nearly three times as great in Lab C as in Lab D; and there is essentially no overlap of reported tumor rates between these laboratories (Table VII).

^b Significant (P < 0.05) interlaboratory variability.

¹ Significant (P < 0.05) interlaboratory variability.

While this is admittedly a "worst case" example, differences of this magnitude may be important, and NTP is currently studying this issue in an effort to determine the underlying causes of laboratory-to-laboratory variability in tumor incidences.

A certain amount of interlaboratory variability is attributable to different diagnoses of a given neoplasm at different laboratories. Even though much effort is devoted to uniformity of diagnosis, histopathology is a judgmental science, with subsequent differential interpretation. Differentiations between hyperplasia and adenoma or between adenoma and carcinoma are sometimes not clear, and

subjective differences in interpretation of these diagnoses can result in significant interlaboratory variability. Secondly, differences in laboratory geography with concommitant differences in the environment of the test animals may have an effect on the frequency of certain neoplasms. Tarone, Chu and Ward [4] hypothesize that "... unknówn factors involving the diet, air, water, or bedding may play a role.... The unknown natural causes of certain tumors may allow slight modifications of ambient factors to greatly alter tumor incidence." Interlaboratory variability in tumor incidences in the NTP historical control database could not be attrib-

^{*} All NTP laboratories with five or more studies included.

uted to differences in survival, since this variable showed no significant differences among laboratories for any of the four sex-species

groups (Tables III-VI).

The finding of significant laboratory-to-laboratory variability is consistent with the results of Tarone, Chu and Ward [4] who carried out a similar investigation with earlier NCI data. They found significant interlaboratory variability for several tumor types in both the F344 rat and B6C3F, mouse. An obvious solution to the problem of inter-laboratory variability in tumor incidence would be to limit historical control comparisons to the laboratory that carried out the particular study in question. The one possible exception might be rare tumors, which occur so infrequently that laboratory-to-laboratory variability will generally not be a problem.

For certain tumors pathologist-within-laboratories was a significant source of variability. Thus, one could argue that historical control comparisons should be limited to those diagnoses generated by the same pathologist as well as being restricted to the same laboratory at the same time period. However, the differences among pathologists were not as striking or as frequent as the laboratory-to-laboratory variability, due perhaps in part to the quality assurance and the PWG review procedures which minimize this source of variability (as noted earlier, the original pathologist is asked to reconsider any diagnosis that does not conform to the standard diagnostic criteria established by the NTP). Thus, it may be somewhat too restrictive as a general rule to require that both laboratory and pathologist be identical for

historical control comparisons. Animal supplier did not seem to be a major source of variability in NTP studies. This may be due to animals from all sources being derived from a single genotype and reared under standardized conditions.

Although further evaluation is in progress, when NTP utilizes historical control data, it generally limits comparisons to relatively recent (e.g., past 3-4 years) studies at the laboratory that conducted the study in question. This eliminates much (but not all) of the extra-binomial variability and is consistent with the recommendations of other investigators who have considered the historical control issue [3, 4].

Developing Appropriate Statistical Methodology. As indicated earlier, one simple strategy for utilizing historical control data is to examine the historical control range and determine whether or not the interval includes the tumor incidence observed in a particular group. Although there are situations in which the range may be helpful, there are problems associated with its use as a formal statistical analysis in the evaluation

of tumor incidence data.

The range is sample-size-dependent, and tends to broaden as more studies are completed. If the range is based on only a few studies, then it is frequently narrow and a tumor rate in a test group could easily fall outside the range by chance alone. Conversely, if the historical control range is based on many studies, and hence potentially quite wide, a tumor rate in a test group may well be a chemically related effect even though the incidence is inside the upper bound of the historical control range.

Since the historical control range gets wider and wider as additional data are generated, it becomes progressively more difficult to obtain significant treatment-related effects (i.e., a tumor incidence outside the range) as more information is accumulated regarding control tumor rates. Intuitively, the opposite phenomenon seems more logical. Thus, a more appropriate statistical procedure is necessary before historical control data can be used in a formal testing framework.

Recently, three procedures were derived for the utilization of historical control data. The first was proposed by Tarone [7], who assumed a logistic model for dose response and an underlying beta distribution for the probability of tumor in the control population. Thus, a beta-binomial model was assumed, with parameters estimated from historical control data. Setting up the likelihood function, an asymptotic (large sample) test based on a modified Cochran-Armitage statistic was obtained for the existence of a dose response. The control tumor rate used in the test procedure was in essence a weighted average of the historical and concurrent control group rates, with the relative weights determined in part by the magnitude of the extra-binomial variability in the historical

A second method used a Bayesian approach [19]. The authors assumed that logits of the historical control rates were normally distributed and integrated out nuisance parameters to obtain a distribution for the slope of the linear effect. The slope was then tested by computing a Bayesian p-value, defined as the posterior probability of a positive or negative slope (whichever is smaller). Dempster et al. [19] stated that their Bayesian Z score principle and the asymptotic chi square sampling theory principle of Tarone yielded equivalent results in large samples.

The third method [5] was an exact conditional test rather than an asymptotic procedure, and like the Tarone procedure, it assumed an underlying beta-binomial model. An exact conditional test was derived by calculating the tail of the beta-binomial distribution, assuming the beta-binomial parameter values were known. This test was derived for pairwise comparisons rather than dose-response trends, but the method can be extended to include this more general case as well.

Hoel and Yanagawa [20] derived a locally most powerful test of trend for binomial response data using a beta prior distribution for the historical control information. This test provided a generalization of both the Tarone and Hoel procedures. The gain in asymptotic efficiency by incorporating historical control information was calculated and small sample methods were given. One major conclusion of their research was that a conditional exact test was preferred over an asymptotic test because of the poor operating characteristics of the asymptotic procedure for tumors having low background rates. A possible area of future research would be the extension of the methods described above to adjust for survival differences (and time-to-death-with-tumor). Considerations should also be given to possible time-related trends.

Finally, if the tumor rates observed in concurrent controls are inconsistent with past historical experience at that laboratory, then utilizing historical control data becomes more difficult. In this situation Cox and McCullagh [21] stated "it is far from clear how the historical controls could be used, or indeed whether they should be used, in for-

mal comparisons."

In summary, when the biological significance of an observed increase in tumor incidence relative to concurrent controls is uncertain, historical control rates can aid in the overall evaluation. Current NTP philosophy is that the most appropriate comparisons are with concurrent controls. Supplemental comparisons with historical control rates may occasionally be made and should generally be limited to data from the same laboratory. For certain uncommon or rare tumors use of Program-wide rates may be appropriate. If, however, historical control data are to be used in a formal testing framework, several issues must be resolved: (1) defining the historical control database; (2) standardizing pathology nomenclature and diagnostic criteria; (3) identifying major sources of variability; and (4) developing and utilizing statistical procedures that adjust for extrabinomial variability and survival differences.
