***Patients who are incapacitated and unable to provide informed consent may be enrolled if an appropriate patient representative (e.g., family member) is present, willing, and able to provide consent on the patient's behalf. If, in the course of study operations, such a patient become capable of providing informed consent, the patient will be directly consented.*

Section 5.4.5. Determining the Number of Patients to Enroll in Clinical Settings

Estimated sample sizes of patients approved in the Master IRB is a maximum of 1,620 in each country for syndromic surveillance activities over the course of the project. Any deviations from this total estimate will need to be reviewed and authorized by the UCD IRB (See Section 5.8.1b).

Patients meeting targeted case definitions should be enrolled systematically across the year so that the patient population is sampled across all relevant seasons. Monthly sample sizes throughout the year should reflect a consistent proportion of patients meeting targeted case definitions.

In general, patients should be enrolled using a quota system until approximately 20% of the participants are children < 18 years of age and 80% are adult. For larger hospitals and clinics, interval sampling will be implemented by selecting every N^{th} case at the site among those individuals who meet enrollment criteria. The interval should be determined by country teams based on an evaluation of the expected number of cases presenting at the site within a given year in order to best meet study design and sample size criteria. For example, in a large hospital with many patients meeting enrollment criteria, the first patient meeting criteria would be selected for study participation followed by selection of every 3^{rd} or 5^{th} individual (depending on the appropriate interval) until the maximum sample size is obtained.

Procedures for Patients in Hospitals and Clinics

Section 5.4.6. Overview of Procedures in Hospitals and Clinics

PREDICT and hospital/clinic staff should consider and make arrangements to conduct the following steps. These steps may need to be adjusted depending on the circumstances of each enrolled health facility. An overview is summarized below for ease of use in training PREDICT staff. Details for each procedure are described further below and in the IRB protocol.

Outline of Activities Involving Patients:

1. **Patient Triage and Intake**: Patients arrive at health facilities and present to patient triage and/or intake units. Clinic or hospital POC(S) will assess patient etiology as part of their normal routine. Following patient triage and intake, patients with presenting syndromes of interest will need to be actively referred to PREDICT POC(s). This active referral will deviate from the health facility staff's normal routine. Country coordinators will need to establish a protocol with the health facility staff prior to beginning recruitment and *ensure that this process does not negatively impact patient access to health services, or health facility workflow*.

2. **Administer Informed Consent**: Patients determined eligible via the Screening Form will be offered participation in PREDICT. Study staff will administer the informed consent form to interested patients. *No study procedures can be conducted without having first obtained informed consent.* Informed consent must happen in a private space and should not involve anyone other than research staff, the patient, a representative if the patient is incapacitated, an impartial witness if the participant is illiterate, and a

parent/guardian if the patient is a child. Once consented, the patient is considered an enrolled participant.

Note: The presence of clinical staff directly involved in patients' care during the consenting process should be construed as coercive. Patients may think they need to consent in order to continue receiving care. PARTICIPATION MUST BE STRICTLY VOLUNTARY.

3. **Collect PREDICT Specimens**: Once enrolled, PREDICT POC(s) will coordinate human biologic specimen collection. Samples may be taken concurrently when collecting samples for normative diagnostics or independently.

4. **Administer Human Questionnaire**: Study staff will administer the **standardized IRB approved human questionnaire to all enrolled participants** at a point in time that ensures patient privacy and is not disruptive to patient care. The human questionnaire must be administered to all patients from which a biologic specimen is collected.

   In clinical settings with critically ill patients, the full human questionnaire may not be possible or appropriate to administer. At a minimum, the "**Core Human Questionnaire" (pages 1-6 of Human Questionnaire)** and the **Human Hospital & Clinic Module** for Patients should be completed.

5. **Normative Diagnostics**: Throughout a patient's inpatient stay, a variety of normative diagnostics, if available, might be run by the health facility staff to determine patient etiology. If additional sampling procedures are conducted as part of normative diagnotics that do not overlap with PREDICT specimen types already collected, PREDICT may request that any unused or remaining diagnostic specimen types be saved from patients enrolled in the PREDICT study (such as cerebral spinal fluid, pleural fluid, etc) to expand the sample set for PREDICT testing.

   Once health facility staff obtain diagnostic results, patients' etiologies will be updated. This information can be used to prioritize samples for testing with PREDICT viral family protocols. If an etiology for fever or clinical syndromes is identified, samples from this patient are of lower priority, unless a novel viral infection is still suspected because the objective of PREDICT's testing strategy is to detect novel viruses that are causing disease in patients. PREDICT POC(s) will need to follow the inpatient progress of enrolled participants to know when etiologies are updated.

6. **Second PREDICT Serum Specimen Collected**: 7 days after the first sample collection or later, an additional serum sample (the discharge serum) should be obtained from participants when possible.

Section 5.4.7. Administering Informed Consent

Participation of human subjects in the study will be strictly voluntary and will require signed, informed consent. All consent discussions and procedures will be conducted in a private room or location with a trained staff member fluent in the local language. Only the PREDICT staff person/POC and the patient will be present during the consent process. Additionally, the patient's representative if the participant is incapacitated, an impartial witness if the participant is illiterate, and/or the patient's parent or guardian if the patient is a child, can be present during the consent process. CITI-trained PREDICT staff may occasionally observe consent procedures to ensure they are appropriately and thoroughly conducted.

All participants will be given an information sheet and consent form prior to being asked to participate in this study. Potential participants will review the information sheet and consent form with the PREDICT POC(s) and will be given time to ask questions. During the review, POC(s) will explain details of the study, including:

- Purpose of the study,
- Why they were selected,
- What will happen if they enroll in the study,
- Potential risks due to their participation,
- How their participation is beneficial to understanding viral pathogens in the community,
- That their participation is completely voluntary,
- How they can withdraw their participation at any time,
- How participation in the study will not interfere with, nor affect, their routine medical care in the health facility,
- How PREDICT testing is exploratory research, and not diagnostic, and this will not inform on patient diagnosis or treatment.
- Test results, these will not be directly communicated back to the participant

PREDICT Study staff POC(s) will review the consent form with participants, answering any questions participants have. It should be made clear to all participants that any data or information collected will be kept strictly confidential. Measures will be taken to ensure the respect, dignity, freedom, and privacy of each participant. PREDICT POC(s) involved in the enrollment and recruitment of participants must avoid coercion of any kind. The PREDICT representative conducting informed consent procedures will not enroll the participant in the study unless confident that the participant or his or her representative fully understands the study and all potential associated risks and benefits.

After reviewing the forms and discussing the study, individuals who agree to participate will sign and date two copies of the consent form, and the staff member conducting the consent discussion will also sign and date the consent forms. If the participant is a child, he or she will

be asked to provide assent to participate in the study and the patient's parent or guardian will sign and date the consent forms. If the patient is illiterate, the witness will sign and date two consent forms. If the patient is incapacitated, his or her representative will sign and date the consent forms. The patient will be given a copy of all consent documents.

Section 5.4.8. Brief Overview of PPE

Minimum PPE Required for Safe Human Specimen Collection
The minimum PPE used by healthcare professionals for human sampling should follow the CDC and other international guidelines for best practices and precautions.

The following are the minimum PPE requirements:

- Gloves
- Designated clothing (which may include gown, apron, long sleeve lab coat)
- Closed-toed shoes
- Eye protection (glasses or goggles), face mask or shield

(See the PREDICT ***Biosafety and PPE Guide (Section 4.1)*** for detailed instructions regarding PPE Use.)

Section 5.4.9. Collecting Clinical Specimens

Enrolled patients who satisfy inclusion criteria as described above (with signed consent form) will be asked to provide clinically relevant biological specimens based on clinical symptoms. To ensure patient privacy, no identifying information from patients will be stored with, or paired with, biological specimens or test results.

Patients should be enrolled with specimens and data collected within 3-5 days of onset of symptoms if possible, and not longer than 10 days after onset becase we are targeting viral etiologies. Critically, patients must have specimens collected as soon as possible after admission in order to ensure they are captured in the viremic phase and/or while they are still shedding the virus, if the illness turns out to be of viral origin. If feasible, hospitalized patients may have repeated serum samples collected at seven days after enrollment, or later before discharge.

Biological samples may only be collected by trained personnel certified by the country's authority for certification of medical professionals. All personnel collecting or handling PREDICT biological specimens must wear appropriate PPE and practice Universal Precaution procedures.

Study representatives should conduct activities in a secure location and a confidential

manner to ensure participant privacy. A barrier or private room should be utilized so that participants cannot be seen by outside observers while they are being sampled. During and immediately after sample collection, trained medical professionals and/or clinic staff will monitor specimen collection site(s) and treat any complications according to existing health facility protocols.

Summary of Clinical Specimen Types

The decisions about which specimens to collect should be based on the patient's clinical symptoms (eg. blood and oral/nasal swabs for respiratory patients;):

- 2 x Oral or Nasal or Oropharyngeal swabs - one in 500 µL VTM and one in 500 µL Trizol
- 2 x Whole blood samples - one with max of 500 µL of whole blood in 500 µL VTM and one with max of 500 µL of whole blood in 500 µL Trizol
- 2 x Serum samples - 2 x 500 µL aliquots, frozen without media
- 2 x Urogenital swab samples – one swab each in 500 µl VTM and 500 µl Trizol
  OR
  2 x Urine samples - one 500 µL urine sample each in 500 µL VTM and in 500 µL Trizol
- 2 x Rectal swabs - one swab in 500 µL VTM and one in 500 µL Trizol
  OR
  2 x Fecal samples - 0.5cc (pea size) feces in 500 µL VTM and 0.5cc (pea size) feces in 1 mL Trizol
- Additional samples or aliquots of specimens collected for standard normative diagnostic purposes by hospital staff may be requested, as appropriate and based on clinical symptoms (see below).

Whole Blood and Serum

Trained phlebotomists, doctors, or nurses will collect venous blood samples by standard venipuncture from the right or left antebrachium.

A minimum of two blood samples will be collected from each participant. Collect one sample into a vacutainer tube containing serum separator and the other into a vacutainer tube containing EDTA. For children aged 12 years or younger, collect a maximum of 6mL in each tube. From individuals aged 13 years and older, collect a maximum of 12mL per tube.

Ensure adherence to appropriate PPE while handling biological specimens.
Allow blood in the red top or serum separator tube to clot, then centrifuge. After clotting and centrifugation, aliquot a minimum of two (and up to four) 0.5 mL aliquots of serum into individual cryovials without Trizol or VTM.

From the EDTA lavender top tube, place up to 500 µL whole blood directly into 2 vials, one containing 500 µL VTM and one containing 500 µL Trizol. Mix each vial well.

Samples will be frozen immediately in liquid nitrogen and then transferred to an ultralow (-80°C) freezer as soon as possible for storage until analysis.

Note that two blood sampling events are warranted if feasible in a hospital or clinic setting, one on the day of enrollment and one seven days after enrollment or later (before discharge), to collect a serum sample only. If serologic assays are available for use for targeted viruses, a rise in IgM with convalescence might assist in establishing causality with disease syndromes.

Oral, Nasal, or Oropharyngeal Swabs

Each patient may have duplicate oral, nasal, or oropharyngeal swabs collected on the day of enrollment to the study.

Oral and nasal swabs will be collected by applying a sterile, flexible, nylon-tipped swab to the appropriate tissue and gently rubbing for 2-5 seconds. Oropharyngeal swabs will be collected by medically trained personnel by gently inserting sterile, flexible, nylon-tipped swabs into the pharyngeal cavity for 2-5 seconds and rotating while removing, as is done for diagnostic procedures.

Place each swab into its own vial, one containing 500 µL VTM and one containing 500 µL of Trizol, mix each tube well, and freeze immediately.

Rectal Swab or Feces

Rectal swabs will be collected by gently inserting 2 sterile, flexible, nylon-tipped swabs into the anal canal, moving them from side to side, and rotating while removing. Place each swab into a vial, one containing 500 µL VTM and one containing 500 µL of Trizol. Mix each tube well and freeze immediately.

If patients are to provide a stool sample instead, they will be provided containers labeled with their individual ID number and instructions on how to collect an uncontaminated fecal sample, including appropriate guidelines for hand washing after sample collection.

Add 500 µL (a pea-sized piece) of feces directly into each of two vials, one containing 500 µL VTM and one containing 1ml Trizol. Mix each tube well and freeze immediately.

Urogenital Swab or Urine

A urine sample will be collected in a sterile universal container. Patients will be provided containers labeled with their unique ID numbers and instructions on how to collect an uncontaminated urine sample, including appropriate guidelines for hand washing after

sample collection.

Add up to 500 µL of urine directly into each of two vials, one containing 500 µL VTM and one containing 500 µL Trizol. Mix each tube well and freeze immediately.

If urine can't be obtained, collect two urogenital swabs and place into two vials, one containing 500 µL VTM and one containing 500 µL of Trizol. Mix each tube well and freeze immediately.

Additional Samples

For hospitalized patients, PREDICT also may receive remnants or aliquots of appropriate clinical specimens that have already been collected for diagnostic purposes. PREDICT testing should be conducted on remaining sample aliquots only after standard diagnostic procedures have been completed to ensure PREDICT activities do not interfere with patient care. These samples may include urogenital swabs, cerebral spinal fluid (CSF), pericardial fluid, pleural fluid, ocular swabs, or others. PREDICT should collect these remnants or aliquots in keeping with the respective participant's clinical symptoms, for instance, pleural fluid would be sourced from participants with respiratory distress, CSF from participants with encephalitis, etc. These samples can be frozen at −80 °C without Trizol or VTM. If additional PREDICT analyses are done on hospital diagnostic screening samples, results will not be communicated to patients or participating health facilities.

Section 5.4.10. Medical History and Behavioral Risk Data Collection in Clinical Setting

All enrolled patients will complete the required elements of the ***Human Questionnaire*** and the ***Human Hospital and Clinic Module for Patients***. If appropriate given the clinical setting and patient condition, the full PREDICT Human Questionnaire with all relevant modules can be completed.[1]

Questionnaire data will be collected by trained staff in a strictly confidential manner. Individual interviews will be conducted in private with no other individuals within a 10-foot distance, ensuring that others cannot hear the interviews. A barrier will be created so that no other individuals can view the participant while they are in their interview. Staff will take care to pair interviewers and respondents by sex to ensure protection of women and children and privacy

[1] To access the Human Questionnaire and desired module bubble forms, log in to EIDITH at https://connect.eidith.org/. Click the "Download Bubble Forms" button and select "Human Questionnaire" under the Choose Type drop-down menu. Select the Questionnaire or module you wish to download, indicate the number of forms you would like, and press "Submit." When prompted to do so, click on the word "here" to download your form/s. Additional instructions for completing and uploading the forms may be found in the Videos and Instructions menus on the connect.EIDITH.org dashboard.

and confidentiality of responses. Children will not be interviewed in the absence of a parent or guardian.

As many questions are sensitive in nature, the presence of support persons may make it difficult for participants to feel comfortable answering questions honestly. PREDICT POC(s) should liaise with clinical staff and family members for critically ill participants, as appropriate, to determine the most patient-centered means of collecting sensitive data, while still maintaining the accuracy of the data collection methods.

Where participants are intubated and unable to communicate verbally, but alert and appropriately communicative, POC(s) may administer the human questionnaire using paper and pencil with participants, if possible. Where patients are sedated and/or comatose, a shortened version of the questionnaire may be completed with a family member or substitute decision maker, if deemed appropriate by all parties. The human questionnaire must be completed if a biologic specimen is drawn; therefore, if the POC(s) is unable to complete the questionnaire for any reason with a participant, they will be excluded from the study. In all instances, the decision to complete the human questionnaire with critically ill individuals must weigh the benefits and downsides with family/friends, clinical staff, and the research team. The POC(s) must also consider patient privacy in immobile or critically ill participants and deem if there is appropriate space in which to conduct the questionnaire to ensure privacy and confidentiality.

Participants may be given a small token of appreciation for participation in the study that is appropriate with local culture and customs and valued at no more than $10 USD. Local research teams will determine the most appropriate item to give as a token of gratitude to research participants. This item should be given to participants after consent and baseline sampling and interviews are complete.

Section 5.4.11. Record Maintenance and Ensuring Participant Privacy

A study participant log should be maintained at each site to track participant enrollment. Information on new participant enrollments should be added to the log in a timely fashion after their consent; the enrollment of pregnant women and children, in particular, should be noted. If, after signing a consent form, a participant decides that they wish to withdraw from study activities, this information must be recorded in the participant log. In addition, each site may wish to maintain a confidential linking log that links participant names to their unique identification number; this log should also be maintained in an up-to-date manner, with information on study enrollees added shortly after their consent. An example participant log is attached in Appendix III.

No identifying information from patients will be stored with or paired with questionnaire data, biological specimens, or analytical test results. Further, identifying information must not be stored electronically and must be stored securely in locked drawers or cabinets in areas accessible only by PREDICT staff. When questionnaires are moved to the country headquarters,

they will contain only coded data to ensure the safety and confidentiality of participants and will be maintained in a secure database. The only document that will link the participant with a unique ID number is the consent form, which will be stored in a locked file separately from participant data in the offices of the Country Coordinator.

Section 5.4.12. Reporting Results

The PREDICT team will inform collaborating partners of the aggregate patient test and behavioral risk findings as well as provide information about viral detection and zoonotic diseases detected, as appropriate. One key benefit of this study to participating clinics and hospitals is to enhance understanding of viruses that could be causing syndromes in local people but that have previously gone undiagnosed. This information will inform participating clinics and hospitals about viruses common in target patient communities and may lead to practices that could reduce exposure and health risks.

Report summaries of interpreted data generated from the project will be provided to the Ministry of Health for approval for release. Following approval for release, report summaries from the project can be shared with other in-country collaborating investigators and hospitals. Adverse events or serious adverse events will be included in report summaries provided to Ministries of Health upon request.

Section 5.4.13. Protocol Deviations, Unanticipated Problems, and Adverse Events

For complete information on protocol deviations, unanticipated problems, and adverse events, see the PREDICT Compliance and Monitoring Guide.

Protocol Deviations
Country teams and hospital and clinic POCs responsible for conducting PREDICT surveillance activities must be familiar with PREDICT's IRB protocols and knowledgeable about expected human surveillance operations. If, during the course of study activities, a team member becomes aware that any human surveillance activities have not been conducted in accordance with protocols or training guides, the team member should promptly inform the country field coordinator/human surveillance officer (if one is active in the country) or Country Coordinator about the deviation. The Country Coordinator should promptly contact the regional lead and complete any documentation, including developing any Corrective and Protective Action plans.

Unanticipated Problems
Unanticipated problems are events that are **unexpected** and **related to the research study** and that put one or more study participants at **greater risk of harm**. Unanticipated problems can include events or issues arising during standard research operations that may not cause detectable harm or adverse effects to research participants, but nonetheless raise the level of

risk associated with research participation (e.g., stolen consent forms or linking logs; breaches of privacy during research interviews). All problems meeting the three criteria above must be reported to the Operations Officer (predict@ucdavis.edu) within 24 hours (if the unanticipated problem is serious) or 72 hours (if the problem is not serious) using the form in Appendix IV.

Adverse Events and Serious Adverse Events

It is possible that during the course of study activities, a participant may experience discomfort or distress. Certain discomforts, such as pain at the site of blood collection and discomfort answering sensitive questions, are expected and detailed in the study protocol. Additional possible risks to study participation may be identified for a given site upon consultation with a local risk expert.

If, during the course of study operations, a participant reports or exhibits one of these anticipated adverse reactions to study participation (be it physical, mental, emotional, or social), that adverse reaction, or "adverse event," should be documented and reported to the human surveillance/field coordinator (if one is active in the country) and Country Coordinator promptly, but no later than within five working days (see the Reportable Information, Unanticipated Problem, and Adverse Event Reporting Form, Appendix IV). Once the Country Coordinator learns of the Adverse Event, he or she should report it to the Lead PREDICT PI (Dr. Mazet) and Operations Officer (predict@ucdavis.edu) within **72 hours**.

In the event a participant reports or exhibits a ***serious*** adverse event that is ***unexpected,*** that is likely ***related*** to study activities, and that implies the ***level of risk to all study participants may be higher than previously expected***, that serious adverse event should be reported to the human surveillance/field coordinator (if one is active in the country) or Country Coordinator within five working days. The human surveillance/field coordinator should report the event to the Country Coordinator, and the Country Coordinator should report the event to the Lead PREDICT PI (Dr. Mazet) and Operations Officer (predict@ucdavis.edu) **within 24 hours**.

The Lead PREDICT PI and Operations Officer are responsible for notifying the UCD IRB within the same time frame (72 hours for adverse events; 24 hours for serious adverse events). The Country Coordinator should report these adverse events to the in-country IRB or ethical committee if and as required to do so.

After becoming aware of any adverse event, the Country Coordinator should confer with their regional lead, the PREDICT global team, and relevant IRBs/ethical boards to determine what steps, if any, should be taken to address the adverse event and prevent similar future events.

Section 5.4.14. Site Monitoring

Each in-country team should work together in the first year to implement key procedures from the PREDICT IRB Compliance and Monitoring Guide on site monitoring and reporting (summarized in Appendix 5). Country Coordinators will be expected to work with PREDICT POCs at hospital and clinic sites to develop a regular system for transferring key study documents, reviewing records for completion, and addressing issues or concerns that arise during study activities.

As part of monitoring and reporting plans, at the completion of each surveillance period, generally on a calendar year schedule, a data and safety review will be conducted by a representative of the PREDICT global or regional management team. At this review, safety information and adverse events collected during the performance period will be discussed and addressed. Data may include case report forms, notes from study visits, and or any telephone calls to the PI from participants.

Section 5.4.16. Appendix I. PREDICT IRB Checklist for UC Davis Submission

Before initiating human surveillance activities described in the Master Protocol, the following items must be submitted to the PREDICT Global Team via predict@ucdavis.edu prior to submission to local IRBs or ethical committees. The Global Team will conduct a rapid internal review of these documents to ensure plans comply with project objectives and global IRB approvals.

Following local IRB or ethics committee approval, additional materials must also be shared with the Global Team to forward onto the UC Davis IRB for final review and approval of country activities.

The most current drafts of global IRB-approved documents, including the currently approved protocols, consent forms, and questionnaires, are available at: http://eidith.org/Resources/PREDICTIRBProtocols.aspx (EIDITH login required).

Submission Checklist:

☐ 1. Submitted a bulleted list of changes made to all global document(s) to predict@ucdavis.edu.

☐ 2. Shared the country plan developed on the PREDICT global protocol template (using Track Changes as descried in the instructions) with predict@ucdavis.edu.

☐ 3. Used the most recent version of the Master Protocol documents (available at http://eidith.org/Resources/PREDICTIRBProtocols.aspx) to develop in-country materials.

☐ 4. Submitted English language versions of the country protocol, written consent form, verbal consent form, introductory script, and human questionnaire (Word.doc preferred) to predict@ucdavis.edu. Provided English language versions of any printed advertising materials to predict@ucdavis.edu.

☐ 5. Provided in-country IRB submission requirements (in copy or by web link, or if not in English via a document explaining the requirements) to predict@ucdavis.edu.

☐ 6. Clearly listed all Country Coordinators, Human Surveillance Coordinators, Global Leads, and key US-based staff involved in the study in the country protocol personnel list. These individuals will require CITI training.

Following Country-Level Approval – The Post-Submission Checklist:

☐ 1. Submitted all documentation of local IRB/ethical approvals to predict@ucdavis.edu. *All countries to submit this documentation.*

☐ 2. Provided all translated documents to predict@ucdavis.edu. For countries using town hall recruitment methods, this includes (a) translated study introduction letter(s) and recruitment script(s).

☐ 3. Submitted CITI training certificates for all personnel listed in the country protocol to predict@ucdavis.edu and entered all CITI training events to the EIDITH training app for monitoring (EIDITH app: http://training.eidith.org).

☐ 4. Trained all members of the human subject research team (training conducted by CITI-certified personnel) in human research ethics, and entered documentation of training events into the EIDITH training app (http://training.eidith.org). *Please maintain a record of all personnel involved in the study to allow monitoring of training status via the EIDITH Training Dashboard.*

☐ 5. Trained all relevant staff in PREDICT biological specimen safety protocols and entered documentation of all training events into the EIDITH training app (http://training.eidith.org). In addition, identified all local requirements for biological specimen safety (if any) and communicated requirements with study staff.

☐ 6. Identified and addressed local IBC requirements (if any) and shared a document outlining these requirements with predict@ucdavis.edu.

☐ 7. Conducted a consultation with a local expert on risks of human subject research in the study area; communicated these risks to the global and human surveillance teams for consideration.

☐ 8. Submitted a signed attestation form to predict@ucdavis.edu (see instructions) indicating that all personnel will adhere to all US federal and state regulations related to the protection of human research subjects.

Section 5.4.18. Appendix III Sample PREDICT Participant Enrollment Log

Participant ID Number	Consent / Enrollment Date	Pregnant Woman? (Y/N)*	Child / Minor? (Y/N)*	Date Human Questionnaire Completed	Biological Samples Provided? (Y/N)	Ethnographic Interview? (If Yes, date)	Focus Group? (if Yes, date)	Withdrawn consent? (Y/N)	Withdrawn due to AE?** (Y/N)

*If a participant is **both** pregnant **and** a minor, they should be marked in the child/minor category **ONLY**
**AE – Adverse Event

Enrollment Log Page Number _____

Section 5.4.19. Appendix IV PREDICT Reportable Information, Unanticipated Problem, and Adverse Event Reporting Form

Form is embedded in PDF document (pp. 26a and 26b, below) and available as a standalone document in the PREDICT EIDITH online Operating Procedures EBook.

USAID | PREDICT
FROM THE AMERICAN PEOPLE

PREDICT Reportable Information, Unanticipated Problem, & Adverse Event Reporting Form

Reportable information (RI), unanticipated problems (UPs), adverse events (AEs), and serious adverse events (SAEs) arising in the course of PREDICT operations must be documented and reported to PREDICT Global staff at UC Davis. These reports help PREDICT and ethical review boards ensure that study participation does not pose unacceptable levels of risk to participants. This form should be used to report one instance of reportable information, one unanticipated problem, or one adverse event. The form may also be used to provide new, additional information on an existing report.

If providing new information on an existing report, please reference the date and provide a brief description of the previous report.

Please report all RI, UPs, AEs, and SAEs to your c ountry coordinator within THREE (3) business days if the event is not serious and ONE (1) day if the event is serious (see reverse for definitions).

Country coordinators should report RI, UPs, AEs, and SAEs to within THREE (3) days (if not serious) or ONE (1) day (if serious).

1. The report following describes (please check all that apply)

☐ Reportable Information ☐ an Unanticipated Problem ☐ an Adverse Event

☐ New information from a previous report.

Original report date: _____

2. Date of report: _____

3. Date(s) of event: _____

4. Date of event discovery: _____

5. Please provide a brief description of the event:

6. Did any of the following occur? (Check all that apply)

- ☐ Non-compliance with IRB requirements or determinations, or allegations of such non-compliance*
- ☐ Protocol deviation due to the action or inaction of the investigator or research staff*
- ☐ Breach of confidentiality*
- ☐ Death of participant
- ☐ Event is life threatening/places the subject at immediate risk of death
- ☐ Inpatient hospitalization or prolongation of existing hospitalization
- ☐ Persistent or significant disability/incapacity
- ☐ Congenital anomaly/birth defect
- ☐ Subject's health in jeopardy; may require medical, counseling, or surgical intervention to prevent one of the other outcomes listed above
- ☐ Criminal or civil liability or damage to the subject's financial standing, employability, or reputation.

7. Relatedness to study procedures, by principal investigator (PI) determination (Please select one)

- ☐ Unrelated: cause of problem is known; problem is not related to study procedures
- ☐ Possibly related: Less than likely (≤ 50%) chance of relatedness to study procedures; relation to study procedures is unclear but cannot be ruled out.
- ☐ Probably related: More than likely (≥ 50%) chance of relatedness to study procedures;
- ☐ Definitely related to study procedures: clear association in time with study procedures; no likely alternative cause

8. Outcome

- ☐ Resolved with no further problem/complaint
- ☐ Resolved with additional problem/complaint
- ☐ Hospitalization
- ☐ Death
- ☐ Unresolved at time of study close-out

Definitions:

Reportable Information includes **any new information that indicates the rights, safety, or welfare of participants or others has been or may be compromised** by something that occurred or did not occur in relation to study activities. Reportable information may include (but is not limited to) protocol deviations, participant complaints, safety monitoring reports, and changes to research conditions that pose safety risks.

Unanticipated problems are problems that are **unexpected**, that are **related or probably related** to the study, and that suggest research participation involves a **higher level of risk than was previously anticipated.**

Unexpected means that the **nature**, **severity**, and/or **frequency of the problem was not anticipated** given the study population and the nature of the IRB-approved study procedures. In reference to an AE, "unexpected" means that the nature, severity, or frequency of the problem is inconsistent with the natural progression of any underlying disease, disorder, or condition that the subject may have or with the participant's predisposing risk factor profile for the AE.

Adverse events are any **unfavorable occurrences** (including physical, mental, emotional, and social) that the participant experiences during or as a result of study activities.

*Requires additional completion and submission of a Corrective and Preventive Action (CAPA) Plan.

Signature_____ Date _____

(PENDING)

- Sample of a human survey questionnaire: Camel Exposure Module – English (see next page)

Camel Exposure Module – English

STUDY ID: _____

Q1. Have you taken this questionnaire in the past?

◯ NEVER

◯ YES – IN 2018 AT THIS LOCATION

◯ YES – IN 2018 AT A DIFFERENT LOCATION

◯ YES – IN 2017 AT THIS LOCATION

◯ YES – IN 2017 AT A DIFFERENT LOCATION

INTERVIEWER SCRIPT
We will now ask you about recent illnesses you may have had, any hospitals you may have visited recently, different interactions you may have had with camels, and what you think about camels and health.

Q2: Do you feel sick today?

◯ YES ◯ NO

Q3: Do you have a cough today?

◯ YES ◯ NO

Q4: Do you feel like you have a fever today?

◯ YES ◯ NO

↳ IF Q2 OR Q3 OR Q4 = "YES" SKIP TO Q6.

⇨ **Q5: Have you felt sick, had a cough, or had a fever recently?**

◯ NO

◯ IN THE LAST 3 DAYS

◯ IN THE LAST 7 DAYS

◯ IN THE LAST 14 DAYS

◯ IN THE LAST MONTH

↳ IF Q2 & Q3 & Q4 & Q5 = "NO" SKIP TO Q11.
↳ IF Q2 & Q3 & Q4 = "NO" & Q5 ≠ "NO" SKIP TO Q7.

⇨ **Q6. For how many days have you felt sick or had a cough or fever?**

_____ FILL IN NUMBER OF DAYS

↳ IF Q6 IS ANSWERED SKIP TO Q8.

⇨ **Q7. How many days in total did you feel sick or have a cough or fever?**

_____ FILL IN NUMBER OF DAYS

⇨ **Q8. Have you been seen by a doctor or nurse for this condition?**

◯ YES ◯ NO

↳ IF Q8 = "YES" SKIP TO Q10.

⇨ **Q9. Do you plan to be seen by a doctor or nurse for this condition?**

◯ YES ◯ NO

↳ IF Q8 & Q9 = "NO" SKIP TO Q11.

⇨ **Q10. Where did you go or where will you go to see a doctor or nurse for this condition?**

◯ FRIEND OR FAMILY MEMBER WHO IS A DOCTOR OR NURSE
◯ PRIVATE DOCTOR OR NURSE
◯ CLINIC ◯ HOSPITAL ◯ OTHER_____

Q11. When was your most recent illness involving a fever or cough:

◯ NEVER
◯ IN THE PAST MONTH ◯ IN THE PAST 3 MONTHS
◯ IN THE PAST 6 MONTHS ◯ IN THE PAST YEAR
◯ IN THE PAST 2 YEARS ◯ MORE THAN 2 YEARS AGO

↳ IF Q11 = "IN THE PAST MONTH" CHECK THAT Q5 DOES NOT SAY "NO".

Q12. When is the most recent time you have been in a hospital?

◯ I HAVE NEVER BEEN IN A HOSPITAL
◯ IN THE PAST 14 DAYS ◯ IN THE PAST MONTH
◯ IN THE PAST 3 MONTHS ◯ IN THE PAST 6 MONTHS
◯ IN THE PAST YEAR ◯ IN THE PAST 2 YEARS
◯ MORE THAN 2 YEARS AGO

↳ IF Q12 = "I HAVE NEVER BEEN IN A HOSPITAL" SKIP TO Q14.

⇨ **Q13. During your most recent visit to a hospital, what was the main purpose of your visit?**

◯ I WAS A PATIENT ◯ I WAS VISITING A PATIENT
◯ I WORK AT THE HOSPITAL ◯ I WAS VISITING A HOSPITAL WORKER
◯ OTHER_____

INTERVIEWER SCRIPT
Camels are an important part of Jordanian culture, and many people use camels or camel products such as milk in their daily life. We will now ask you about a number of different ways in which you might interact with camels or use camel products in Jordan.

Q14. In a typical week for you, how many camels do you see?

◯ 0 ◯ 1 ◯ 2-5 ◯ 6-10 ◯ 11-20 ◯ 21-50
◯ 51-100 ◯ 101-500 ◯ MORE THAN 500

Q15. In a typical week for you, how many camels are ever within a distance of 1 meter from you? *Interviewer should point to someone or something approximately 1 meter away from the participant to indicate the distance.*

◯ 0 ◯ 1 ◯ 2-5 ◯ 6-10 ◯ 11-20 ◯ 21-50
◯ 51-100 ◯ 101-500 ◯ MORE THAN 500

Q16. Do you drink camel milk?

◯ NEVER
◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q16 = "NEVER" SKIP TO Q19.

⇨ **Q17. Thinking about the last time you drank camel milk; did you or someone else boil the camel milk before you started drinking it?**

◯ YES ◯ NO

IF Q17 = "YES" SKIP TO Q19.

⇨ **Q18. Have you or someone else ever boiled camel milk before you started drinking it?**

◯ YES ◯ NO

Q19. Do you drink camel urine?

◯ NEVER
◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q19 = "NEVER" SKIP TO Q22.

⇨ **Q20. Thinking about the last time you drank camel urine; did you or someone else boil the camel urine before you started drinking it?**

◯ YES ◯ NO

IF Q20 = "YES" SKIP TO Q22.

⇨ **Q21. Have you or someone else ever boiled camel urine before you started drinking it?**

◯ YES ◯ NO

Q22. Do you apply camel urine topically onto your skin?

◯ NEVER
◯ ONCE A DAY OR MORE
◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE
◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q22 = "NEVER" SKIP TO Q25.

⇨ **Q23. Have you ever put camel urine on your skin and it came into contact with any scratches, cuts, abrasions, or open wounds on your skin?**

◯ YES ◯ NO

⇨ **Q24. Have you ever put camel urine on your face?**

◯ YES ◯ NO

Q25. Do you eat camel meat?

◯ NEVER
◯ ONCE A DAY OR MORE
◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE
◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q25 = "NEVER" SKIP TO Q28.

⇨ **Q26. Thinking about the last time you ate camel meat; was it uncooked/raw?**

◯ YES ◯ NO

IF Q26 = "YES" SKIP TO Q28.

⇨ **Q27. Have you ever consumed uncooked/raw camel meat?**

◯ YES ◯ NO

Q28. Have you ever been inside an area where camels are raised, held, quarantined, slaughtered, or butchered?

◯ YES ◯ NO

IF Q28 = "NO" SKIP TO Q30.

⇨ **Q29. How often are you inside an area where camels are raised, held, quarantined, slaughtered, or butchered?**

◯ ONCE A DAY OR MORE
◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE
◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q30. Have you ever touched an adult camel with your hands?

◯ YES ◯ NO

IF Q30 = "NO" SKIP TO Q32.

⇨ **Q31. How often do you touch an adult camel with your hands?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q32. Have you ever touched a camel calf (baby or young camel) with your hands?

◯ YES ◯ NO

IF Q32 = "NO" SKIP TO Q34.

⇨ **Q33. How often do you touch a camel calf (baby or young camel) with your hands?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q34. Have you ever kissed a camel on its face?

◯ YES ◯ NO

IF Q34 = "NO" SKIP TO Q36.

⇨ **Q35. How often do you kiss a camel on its face?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q36. Have you ever milked a camel?

◯ YES ◯ NO

IF Q36 = "NO" SKIP TO Q38.

⇨ **Q37. How often do you milk a camel?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q38. Have you ever slaughtered or butchered a camel?

◯ YES ◯ NO

IF Q38 = "NO" SKIP TO Q40.

⇨ **Q39. How often do you slaughter or butcher a camel?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q40. Have you ever touched a camel's blood?

◯ YES ◯ NO

IF Q40 = "NO" SKIP TO Q42.

⇨ **Q41. How often do you touch a camel's blood?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q42. Has a camel ever sneezed or spit on you?

◯ YES ◯ NO

IF Q42 = "NO" SKIP TO Q44.

⇨ **Q43. How often does a camel sneeze or spit on you?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q44. Have you ever cleaned a pen, holding area, stable, farm grounds, living area, or quarantine for camels?

◯ YES ◯ NO

IF Q44 = "NO" SKIP TO Q47.

⇨ **Q45. How often do you clean a pen, holding area, stable, farm grounds, living area, or quarantine for camels?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

⇨ **Q46. Thinking about the last time you were cleaning a pen, holding area, stable, farm grounds, living area, or quarantine for camels, were camels physically present during your work?**

◯ YES ◯ NO

Q47. Have you ever been bitten or scratched by a camel?

◯ YES ◯ NO

IF Q47 = "NO" SKIP TO Q49.

⇨ **Q48. How often are you bit or scratched by a camel?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q49. Have you ever been within 1 meter of a camel that has nasal discharge? *Interviewer should show an image of nasal discharge in a camel and point to someone or something approximately 1 meter away from the participant to indicate the distance.*

◯ YES ◯ NO

IF Q49 = "NO" SKIP TO Q51.

⇨ **Q50. How often are you within 1 meter of a camel that has nasal discharge?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q51. Have you ever stepped on, sat on, or touched a surface where fresh camel feces are frequently present?

◯ YES ◯ NO

IF Q51 = "NO" SKIP TO Q53.

⇨ **Q52. How often do you step on, sit on, or touch a surface where fresh camel feces are frequently present?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q53. Have you ever stepped on, sat on, or touched a surface where fresh camel urine is frequently present?

◯ YES ◯ NO

IF Q53 = "NO" SKIP TO Q55.

⇨ **Q54. How often do you step on, sit on, or touch a surface where fresh camel urine is frequently present?**

○ ONCE A DAY OR MORE
○ ONCE A WEEK OR MORE
○ ONCE A MONTH OR MORE
○ ONCE A YEAR OR MORE
○ LESS THAN ONCE A YEAR

Q55. Have you ever stepped on, sat on, or touched a surface where fresh camel blood is frequently present?

○ YES ○ NO

IF Q55 = "NO" SKIP TO Q57.

⇨ **Q56. How often do you step on, sit on, or touch a surface where fresh camel blood is frequently present?**

○ ONCE A DAY OR MORE
○ ONCE A WEEK OR MORE
○ ONCE A MONTH OR MORE
○ ONCE A YEAR OR MORE
○ LESS THAN ONCE A YEAR

Q57. Have you ever been in an area where <u>camel calves (babies and young camels)</u> are raised, kept, or present?

○ YES ○ NO

INTERVIEWER SCRIPT
Please listen to the following claims and state whether you agree, disagree, or neither.

Q58. Camels <u>cannot</u> cause me to get sick.

STRONGLY DISAGREE — SOMEWHAT DISAGREE — NEITHER — SOMEWHAT AGREE — STRONGLY AGREE

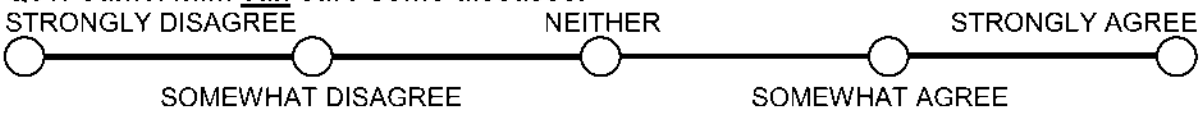
Q59. After touching a camel, wiping my hands with a towel or cloth is enough to fully clean my hands.

STRONGLY DISAGREE — SOMEWHAT DISAGREE — NEITHER — SOMEWHAT AGREE — STRONGLY AGREE

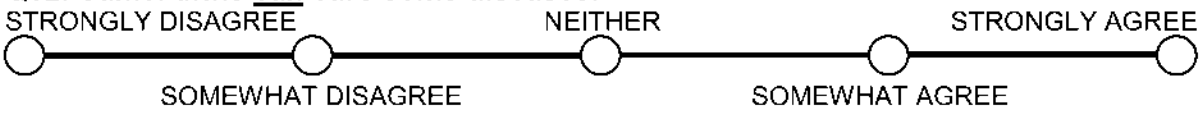
Q60. After touching a camel, it is important to me to wash my hands with soap and water before coming home to my family.

STRONGLY DISAGREE — SOMEWHAT DISAGREE — NEITHER — SOMEWHAT AGREE — STRONGLY AGREE

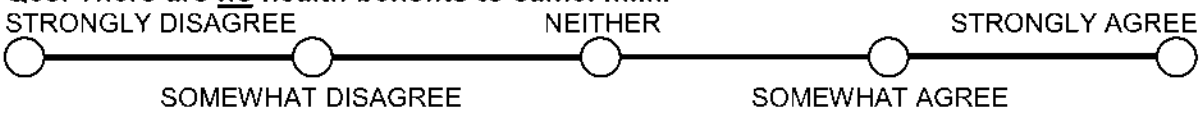
Q61. Camel milk <u>can</u> cure some diseases.



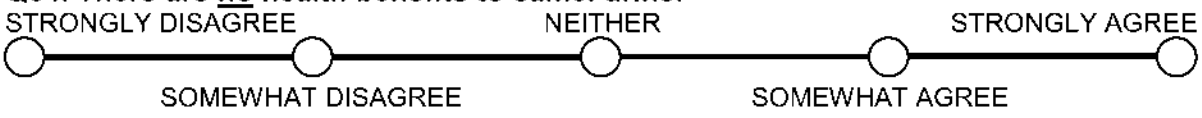
Q62. Camel urine <u>can</u> cure some diseases.



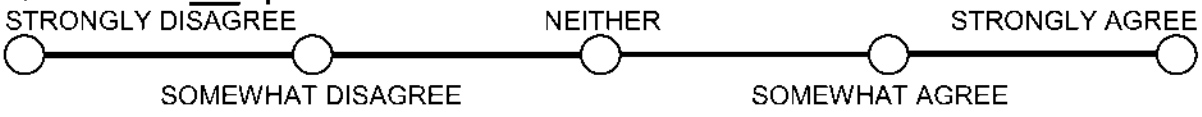
Q63. There are <u>no</u> health benefits to camel milk.



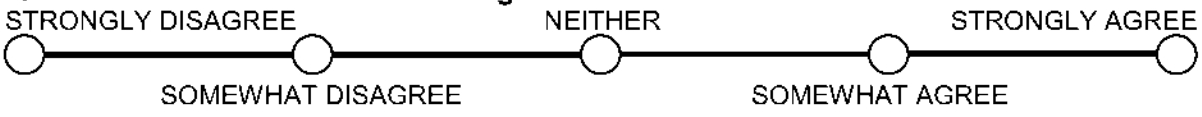
Q64. There are <u>no</u> health benefits to camel urine.



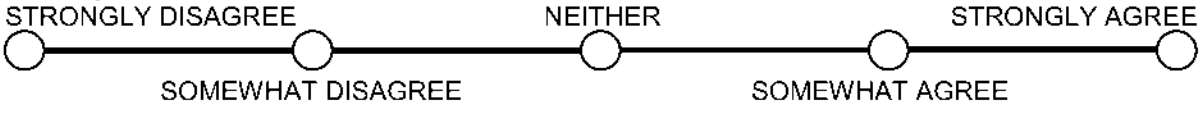
Q65. Camels <u>can</u> spread diseases to humans.



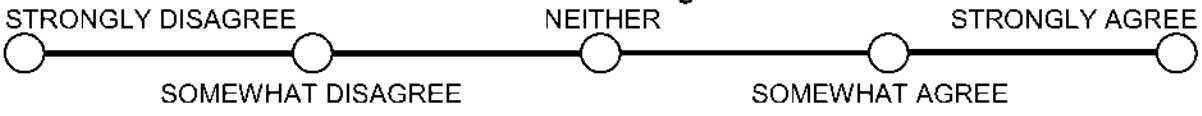
Q66. I believe someone I know has gotten sick from a camel.



Q67. I prefer the taste of raw/non-boiled camel milk over boiled camel milk.

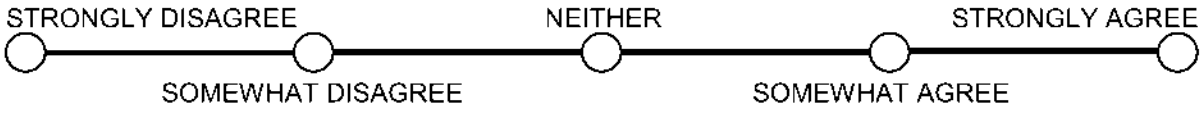


Q68. Camel milk should be boiled before drinking it.

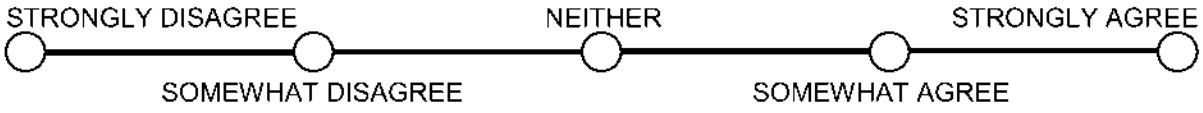


Q69. I believe someone I know has gotten sick from drinking raw/non-boiled camel milk, and would not have if it had been boiled first.

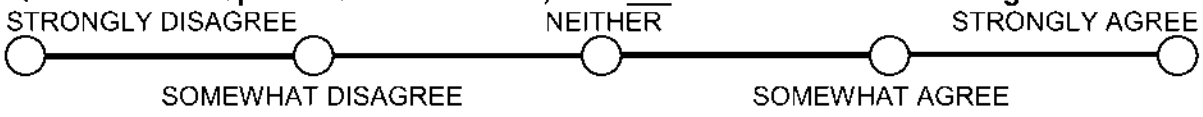
Q70. I believe someone I know has gotten sick from eating raw/uncooked camel meat, and would not have if it had been cooked.



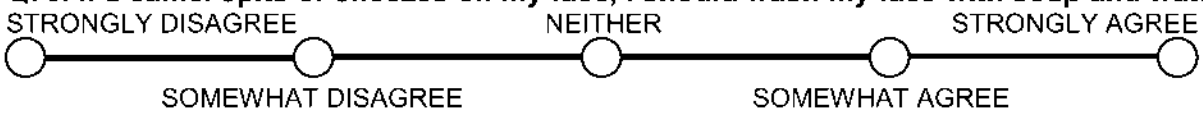
Q71. If I am cooking camel meat, there is no need to clean any surfaces that have come in contact with raw/uncooked camel meat.



Q72. If a camel spits or sneezes on me, I am not worried about becoming sick.



Q73. If a camel spits or sneezes on my face, I should wash my face with soap and water.



Q74. Do any of your jobs or livelihoods involve the ownership, buying, selling, trading, farming, management, care, or production of camels, camel meat, camel milk, camel urine, camel hair, or any other camel product?

○ YES ○ NO

⇨ IF Q74 = "YES" COMPLETE THE CAMEL WORK MODULE.

X

For animal subjects research, our protocols will align with PREDICT protocols, with which our in-country teams have been complying for three years. These protocols are listed below and, as they are very extensive, a link to access them is provided. They will be modified to reference the specifics of this project's IACUC (as opposed to PREDICT's IACUC):

- 5.2.11 Livestock Sampling Methods (see next page)

Available at: https://ohi.vetmed.ucdavis.edu/programs-projects/predict-project/publications under "Field Sampling Guides."

USAID | PREDICT

Section 5.2.11 Livestock Sampling Methods: Cattle, Sheep, Goats, Camels, and Swine

Prepared by
Marcela Uhart, University of California, Davis
Christopher Kilonzo, University of California, Davis
Kali Holder, Smithsonian
Jonathan Epstein, EcoHealth Alliance
and the PREDICT One Health Consortium

Objectives: To safely collect biological samples from livestock.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

The authors assert that animal capture and sampling should always occur in compliance with all applicable laws and regulations and should only be undertaken after securing all necessary permits and approvals, including ethical approvals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Livestock Sampling Methods.

Table of Contents: Livestock Sampling Methods: Cattle, Sheep, Goats, Camels, and Swine

Section 5.2.11.a. Brief Overview of PPE

Minimum PPE Required for Livestock Sampling

The minimum PPE for livestock (including camels, cattle, sheep, goats, and swine) sampling includes:

1. Dedicated clothing
2. Nitrile (recommended) exam gloves
3. Safety glasses or other eye protection

(See the PREDICT ***Biosafety and PPE Guide (Section 4.1)*** for detailed instructions regarding PPE Use)

Standard disinfection procedures for equipment and clothing should be followed when moving between animal enclosures or properties.

Section 5.2.11.b. Livestock Handling and Welfare

Performance standards during handling include careful, considerate, respectful, calm, human interactions with animals in as positive a manner as is possible. Animals handled in a respectful manner will be calmer and easier to handle than animals handled in a rough or disrespectful manner. PREDICT field staff should be familiar with the correct techniques and the anatomy of each livestock species before attempting sampling procedures. At all times, observe animals for signs of excessive distress. If animals are unwell, stop all procedures, provide adequate support care, and release upon recovery.

While most veterinarians are familiar with handling livestock, we recommend that PREDICT staff visit the following guidelines as a refresher.

Section 5.2.11.c. Sample Data Collection

Introductions and informed consent
Upon arriving to a household or farm, introduce yourselves (team members, purpose of the visit) to the acting head of household responsible for the livestock. Explain the purpose of the study, allow time for questions, and clarify any issues that may arise. If local regulations require it, obtain informed consent per project guidelines and protocols.

Animal Handling and Sampling Procedures
Note: For all food animals, manual restraint will be used. If drugs are used for sedation in a food animal, that animal will not be allowed to return the human food chain unless it is specifically labeled for use in that species and withdrawal periods are observed

The following basic set of samples should be collected from each animal where possible (If only one sample can be collected, then place into VTM):

1. **Two nasal swabs** - one in 500 µL VTM and one in 500 µL Trizol
2. **Two fecal samples** - one with max of 500 µL/0.5cc feces in 500 µL VTM and one with max of 500 µL/0.5cc feces in 1 mL Trizol
   Or
   Two rectal swabs - one in 500 µL VTM and one in 500 µL Trizol
3. **Two whole blood samples** - one with max of 500 µL of whole blood in 500 µL VTM and one with max of 500 µL of whole blood in 500 µL Trizol
4. **Two serum samples** - 2 x 1.0 ml aliquots frozen without media
5. **Two urogenital swabs or urine samples** - one with max of 500 µL of urine in 500 µL VTM and one with max of 500 µL of urine in 500 µL Trizol

Freeze all samples (except tissue in formalin) in liquid nitrogen immediately in the field and transfer to -80°C freezer once back in the lab.

If there is no **short-term** access (i.e. within 24 hours) to cold chain such as in an emergency situation, then samples can be collected in 500 µL of RNAlater instead of Trizol and VTM. Storage times and temperatures for samples in RNAlater are as follows:

- 1 day at 37 °C (i.e. ambient temp)
- 1 week in the refrigerator
- Within one week freeze at -80 °C for storage until analysis

Collecting Nasal Swabs

Using sterile, polyester-tipped swabs with a plastic shaft, rub the swab tip gently but thoroughly against the walls of the animal's nares, about 1-2" from the opening, saturating the swab with mucus. **Place 1 swab in a cryovial filled with 500 µl of VTM and the other swab into 500 µL of Trizol in another cryovial**. Mix each tube well. Store both cryovials in a liquid nitrogen dry shipper or dewar & transfer to -80˚C freezer when possible.

Bleeding Collection Techniques

1. Cattle

Blood can be collected from the jugular vein in cattle of all ages or from the tail (coccygeal) vein of older cattle.

A variety of collection devices may be used - vacutainers, bleeding tubes, syringe and needle. Restraint should ensure quick, easy and safe collection of the sample causing minimal distress. This may involve use of a bail, race, or crush for tail bleeding. For jugular bleeding the animal may require minimal restraint (e.g. halter) or may need to be restrained in a crush with head bail and the employment of a halter or nose grips. Use of nose grips should be avoided wherever possible.

Operators should use gloves and disinfect or replace them between animals to prevent the transmission of blood-borne diseases. Equipment such as vacutainer holders should also be cleaned between animals. An antiseptic must be applied to clean skin surface prior to venipuncture.

For a visual guide see the following online tutorials:

Cattle
https://www.youtube.com/watch?v=IuNbsTMrIuI (tail and jugular)
https://www.youtube.com/watch?v=ZEsHMwKFbKg (tail)
https://www.youtube.com/watch?v=812CskWCqGQ (jugular)

Procedure for Jugular Venipuncture Using Vacutainer Needle and Tubes:

1. Identify and georeference the study site and document the signalment of the animal on the data collection sheet.
2. Before sample collection, ensure that the animal is effectively and humanely restrained to avoid injury to the animal and/or study personnel.

3. Using the halter, position the animal's head so that it is slightly elevated and drawn to the side opposite the jugular vein to be sampled.
4. Disinfect venipuncture area with alcohol
5. Occlude the vein by applying digital pressure in the jugular groove located in the lower neck.
6. Place a vacutainer needle attached to a vacutainer holder into the distended jugular vein at a 45° angle cranial to the jugular groove.
7. Once needle is positioned in the vein, insert a vacutainer into the needle to collect the blood.
8. When the desired volume has been collected (5 ml minimum suggested) remove the occluding pressure from the vein.
9. Detach the tube from the needle and withdraw the needle from the jugular vein.
10. You can collect more than 1 tube by repeating steps 7 and 8.
11. Label the vacutainer tubes with the sample ID.

Procedure for Jugular and Coccygeal Venipuncture Using Syringe and Needle

Jugular bleeding

1. Restrain cow with the head elevated and the jugular groove exposed.
2. Raise the jugular vein by placing pressure at the base of the jugular groove.
3. Pass the needle through the skin and into the vein by a firm thrust directed at an angle of 20° to the skin surface.
4. Withdraw the blood sample.

Tail Bleeding

1. Restraint should prevent the cow from moving away during the procedure.
2. Raise the tail vertically with one hand until it is horizontal with the ground.
3. Approximately 150 mm from the base of the tail, locate the groove lying in the ventral midline of the tail.
4. Midway along the body of a coccygeal vertebra, insert the needle perpendicularly to the surface of the skin to a depth of a few millimeters.
5. Withdraw blood sample.
6. Apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.

Once blood is collected, place the needle into a sharps container. Open red-top and purple top vacutainer tubes. Place approximately 2.5cc in each tube, then discard the syringe into a biohazard container. Invert each tube several times to mix.

2. Sheep/Goats

Blood should be collected from the jugular vein. The procedures for blood collection are identical to those described for cattle, with the exception of the amount of restraint needed and the possibility of shearing the bleeding area on the neck for easier viewing of the vein and minimizing the chance of introducing dirt or bacteria into the vein with the needle.

In sheep and goats, blood sampling can be done with assistance or alone. If you are not proficient at drawing blood alone, work with an assistant. The assistant should restrain the sheep/goat's body and turn the head to the side, at a 30-degree angle, by holding the animal under its jaw to allow for easy access to the jugular vein.

Restraining a sheep or goat without assistance is better for those who have become proficient at drawing blood. The handler should straddle the sheep/goat, place his or her knees behind the animal's shoulders, and back the sheep/goat into a corner or against a wall to help control their hindquarters. The sheep/goat's head should be turned opposite to the side of collection, once again at a 30-degree angle. Restraint of the head is accomplished by using the elbow and the upper arm to keep it held off to the side. This leaves both hands available for the blood collection.

The easiest way to locate the vein is to draw an imaginary line from the middle of the sheep/goat's eye down the side of the neck. The vein can be located by applying pressure with the thumb or fingers in the groove on either side of the trachea. The pressure will cause the vein to pop up and be easy to feel or see if the area has been shaved. Proceed as with cattle, using a vacutainer collection system or syringe and needle.

For a visual guide see the following online tutorials:

Sheep/goats (small ruminants) **https://www.youtube.com/watch?v=47tlmqXX3eE**

Blood sample processing and storage:

Whole Blood

- Collect whole blood into 1 lavender top tube containing EDTA, and allow another tube to clot for collection of serum.
- Add up to 500 µL of whole blood (from EDTA tube) directly into 2 vials, one containing 500 µL Trizol and one containing 500 µL VTM (= maximum final ratio of 1:1) and mix each vial well.

Serum

- After clotting is complete, use a plastic pipette to take 1 ml of serum and transfer into 2 cryovial tubes, 0.5 ml each.
- If a centrifuge is available, centrifuge samples for 15 minutes and then collect 1 ml serum and transfer into 2 cryovial tubes, 0.5 ml each.
- Label the cryovial tubes with the same label information used on vacutainer tube.
- You can harvest additional serum for serum bank as appropriate.
- Freeze all samples in liquid nitrogen immediately in the field and transfer to -80°C freezer once back in the lab.

3. Camels

Because of the risk of MERS CoV exposure, sample collectors should wear gloves, a respirator, and eye protection when handling camels.

Blood can be collected from the jugular vein in camels of all ages, though it is recommended that this be undertaken on animals while they are in sternal recumbency (kush position), well-restrained, or sedated. The lateral thoracic vein or caudal epigastric ("milk") vein may be used but should only be targeted in animals where physical or chemical restraint prevents kicking.

A vacutainer needle (18G or 19G) with purple top (EDTA) tubes and red-top (with serum clot activator) tubes may be used, or a 5cc syringe and 18G or 19G needle. Restraint should ensure quick, easy and safe collection of the sample causing minimal distress.

Equipment such as vacutainer holders should be cleaned between animals.

Procedure for Jugular Venipuncture Using Vacutainer Needle and Tubes

1. Identify and georeference the study site and document the signalment of the animal on the data collection sheet.
2. Before sample collection, ensure that the animal is effectively and humanely restrained to avoid injury to the animal and/or study personnel.
3. Using the halter, elevate the animal's head and draw it to the side opposite the jugular vein to be sampled.
4. Disinfect venipuncture area with alcohol
5. Occlude the vein by applying digital pressure in the jugular groove located in the lower neck. Alternatively, a rolled towel affixed with a rope over the withers can be applied at the same level to act as a temporary incomplete tourniquet.
6. Place a vacutainer needle, attached to a vacutainer holder, into the distended jugular vein at a 45° angle cranial to the jugular groove.
7. Once the needle is positioned in the vein, insert a vacutainer into the needle and collect the blood.
8. When the desired volume has been collected (5 ml minimum suggested), remove the occluding pressure.
9. Detach the tube from the needle.
10. Detach the needle from the jugular vein and apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.
11. If more than one tube of blood is required, repeat steps 7 through 9 with occluding pressure.
12. Label the vacutainer tubes with sample ID.

Note: If vacutainer needles are unavailable, a 5cc syringe and 18G or 19G needle can be used. Once blood is collected, place the needle into a sharps container. Open red-top and purple top vacutainer tubes. Place approximately 2.5cc in each tube, then discard the syringe into a biohazard container. Invert each tube several times to mix.

Whole blood can be aliquoted into cryotubes with VTM and Trizol using a pipette gun. Serum tubes can either be centrifuged (if available) or placed vertically in a cooler with ice bricks and allowed to stand undisturbed overnight (~12 hours) for clean serum separation. Serum can then be aliquoted into cryotubes.

Procedure for Jugular Venipuncture Using Syringe and Needle

Jugular bleeding

1. Restrain camel with the head elevated and the jugular groove exposed.
2. Disinfect venipuncture area with alcohol
3. Raise the jugular vein by pressure at the base of the jugular groove.
4. Pass the needle through the skin and into the vein by a firm thrust directed an angle of 20° to the skin surface.
5. Withdraw blood sample.
6. Apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.

Lateral Thoracic/Caudal Epigastric Vein Bleeding

1. Restraint should prevent the camel from moving away or kicking during the procedure.
2. Identify the lateral thoracic vein, caudal to the point of the elbow's olecranon process.
3. Pass the needle through the skin and into the vein by a firm thrust directed an angle of 20° to the skin surface.
4. Withdraw blood sample.
5. Apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.

4. Swine

All personnel handling or sampling pigs should wear appropriate PPE and practice appropriate biosafety practices to avoid spreading infection from one animal to another and from one herd, farm or property to another. This includes wearing dedicated clothing (e.g. coveralls and rubber boots) that can be removed and disinfected once work at a site has been completed. Recommended PPE includes nitrile gloves, a respirator and safety glasses.

Restraint: Manual restraint is recommended, without the use of anesthesia. Pigs to be sampled should be constrained to a separate pen, if possible. The use of a snout snare (see appendix) by the animal restrainer is recommended for pigs over 20 kg, but should only be used by experienced personnel and for short term restraint to avoid injury to the pig's snout. Pigs will be restrained for a maximum of three minutes and then released. If blood collection is unsuccessful, then the pig will be allowed to calm down for five minutes before a second attempt is made.

Blood can be collected from the external jugular vein, or the cranial vena cava, using a 1", 20G needle and a 5cc syringe. This technique requires the head to be restrained and elevated parallel to the ground, typically using a snout snare. In pigs weighing less than ~50 kg, blood can be collected further caudally (and more medially) in the jugular groove, nearer the manubrium from anastomose of internal and external jugular vein. For pigs weighing less than ~20 kg, a technician will manually restrain the pig on his lap, holding the forelegs in one hand, and the animal's head in the other. Then a max of 5.0 to 10 ml may be collected from the jugular vein. Venipuncture should only be performed by experienced personnel.

The marginal ear veins are the only veins that are easily visible on pigs of any size. Usually there are three prominent veins. The lateral or central vein is usually the largest of these. These veins may also be punctured for blood collection. An alternative venipuncture site is the caudal auricular ("marginal ear") vein, though this typically yields low (<1 mL) blood volumes. A smaller, 22G or 23G needle should be used for this vein.

See also http://oslovet.norecopa.no/teaching/pig/pigbleed/ for more details on blood collection from pigs.

Collecting Fecal Samples

Ensure the animal is properly restrained prior to sampling. Fresh fecal samples should be collected, preferably from the rectum. If freshly passed, feces can be collected off the ground. Only the top part of a freshly passed fecal pat should be collected using a disposable spoon or scooped up in a gloved hand, plastic bag or plastic vial.

For Collection from the Rectum in Cattle and Camels

- The operator places an obstetrical sleeve on one arm
- The arm is formed into a cone and the animal's tail held to one side with the opposite gloved hand.
- Gentle pressure is applied to the anal sphincter until penetration into the rectum is obtained.
- A fecal aliquot of sufficient size for the intended laboratory procedure is scooped with the sleeved hand and removed from the animal.
- The fecal sample is placed in a separate container or the obstetrical sleeve is inverted off the arm such that the fecal sample is trapped inside.

Small calves, sheep, goats, and swine: restrain manually. Gently pass a gloved, lubricated finger through the anus and massage the rectal wall to stimulate rectal evacuation. If feces are not produced, collect feces with finger.

Place two ~200 mg (pea size) samples of fresh feces into 2 vials, one containing 500 µL VTM (= maximum final ratio of 1:1) and one containing 1 mL Trizol (= maximum final ratio of 1:2). Homogenize by shaking. Freeze in dry shipper or dewar with liquid nitrogen and transfer to -80˚C freezer when possible.

If feces are not available, collect 2 rectal swabs- 1 in VTM and 1 in Trizol: Gently insert one sterile swab tip at a time into the animal's rectum. [Note: DO NOT USE TRIZOL AS A LUBRICANT – IT IS HIGHLY IRRITATING TO TISSUE.] Place 1 swab in a cryovial filled with 500 µL of VTM. Place the other swab into a tube with 500 µL of Trizol. Store in a dewar or dry shipper with liquid nitrogen dry shipper and transfer to -80˚C freezer when possible.

Collecting Urine/Urogenital Swabs

Many animals will urinate as a fear reaction while they are handled. Urine can be collected free catch in plastic vials. Add up to 500 µL of urine directly into 2 vials, one containing 500 µL VTM and one containing 500 µL Trizol (= maximum final ratio of 1:1) and mix each tube well. Store in dry shipper or dewar with liquid nitrogen and transfer to -80˚C freezer when possible.

If urine is not available, collect 2 urogenital swabs: 1 in VTM and 1 in Trizol. Place 1 swab in a cryovial filled with 500 µL of VTM. Place the other swab into a tube with 500 µL of Trizol. Store in a dewar or dry shipper with liquid nitrogen dry shipper and transfer to -80˚C freezer when possible.

Section 5.2.11.d. Sample Collection from Dead or Euthanized Livestock

PREDICT's primary approach to sample collection in livestock is to collect specimens from living animals. In the event that an animal has died of natural causes or been euthanized due to humane or veterinary care reasons, the guidelines below for necropsy sampling may be followed. If bodies are relatively whole and fairly fresh, then sample as described above. The *American Veterinary Medical Association guidelines (Section 8.5.2.)* in the PREDICT Operating Procedures ebook provides information on animal euthanasia that may be useful to PREDICT veterinarians called upon to euthanize an animal.

As discussed throughout this protocol, all animals should be considered potentially infectious for a wide variety of dangerous pathogens, and dead animals in particular should be sampled only following all safety measures, including proper PPE use, proper work station decontamination, and proper carcass disposal, as outlined here and in other PREDICT documents.

Though not required for PREDICT sampling, thorough necropsy procedures can be very beneficial and relevant for some animals (e.g., suspicious deaths). Time and skill permitting, when full necropsies are performed, following any Association of Zoos and Aquariums/AZA (or similar) necropsy protocol is recommended and most can be adjusted for application to livestock species. Necropsy protocols are also addressed in the Non-Human Primate Sampling protocol, Appendix V.: AAZV's Occupational Primate Disease Safety Guidelines for Zoological Institutions: Standardized Necropsy Report for Non-Human Primates Work Sheet (ebook Section 5.2.6j.); most of the information and worksheets in this document can be utilized for sampling of

livestock. (*Note that properly following extensive necropsy procedures and collecting and measuring all samples can require 4-6 hours for a single animal.*)

Duplicate blood samples are to be collected from each animal; one sample must be collected into Trizol and one into viral transport media (VTM). If only one sample can be collected, then place the sample into VTM.

Tissue specimens should be collected in triplicate. One specimen should be frozen in 500 µL VTM in a cryovial, one should be frozen in 1 mL Trizol in a cryovial, and one should be stored at room temperature in a small vial or jar in 10% buffered formalin at a volume of fixative 10 times the volume of the tissue (once fixed, the tissue may be transferred to a smaller volume for shipment).

Post-Mortem Blood Collection

From recently dead animals, it may be possible to collect whole blood (often clotted) from the right side of the heart where the largest volume of blood is available. Collect all available blood into an appropriate size container (typically one or more blood tubes). Allow the tubes to sit undisturbed for at least 30 minutes, and then centrifuge at high speed (2000 x G for 20 minutes). Transfer the serum (clear, yellow or red-tinged fluid at the top), preferably via pipetting, to appropriately labeled cryovials. Transfer the remaining blood clots to separate cryovials. Refrigerate or freeze both the serum and blood clots.

If a centrifuge is not available, allow the clots and cells to settle as much as possible, and then collect the serum and clots as described above. If the animal's death is recent enough that the blood has not yet clotted and a centrifuge is not available, invert the blood tubes after the blood has been collected to allow the clot to form on the rubber stopper. After the blood has clotted, turn the tube right side up and carefully remove the stopper with the adhered clot, thereby leaving a clean serum sample in the tube.

At a minimum, as many of the following blood samples as possible should be collected:

- 2 samples of 500 µL (**whole blood**) placed in 2 vials, one containing 500 µL **Trizol** and one containing 500 µL **VTM** (= maximum final ratio of 1:1). Mix each vial well.
- 2 or more aliquots (0.5 ml) of **separated serum**, frozen

Tissue Collection

Collect three, adjacent, approximately 200mg (pea-sized) samples of the following tissues:

- Adrenal
- Colon
- Heart
- Liver
- Lymph node
- Ovary
- Testes
- Cecum
- Duodenum
- Kidney
- Lung
- Spleen
- Pancreas
- Other, if required*

*It will usually require experience to identify abnormal tissues, but potentially recognizable gross lesions include masses, discolored areas, ulcerations, etc. Samples for histopathology (i.e., in formalin) should be collected at the abnormal margins to include both normal and abnormal sections in the same piece of tissue. Collection of any obvious internal parasites in ethanol is also recommended.

Figure 1: A commercial snout snare (left) and use of a modified snout snare, made from local materials, to restrain a pig during sampling in Bangladesh (right).

Section 5.2.11.h. Appendix III. Checklist for Supplies

General equipment and supplies

- ☐ Animal handling equipment – Halters and animal restraining ropes
- ☐ Data Collection forms
- ☐ Rubber stamp ink and pad
- ☐ GPS
- ☐ Camera
- ☐ Field Notebook
- ☐ Pen/Pencil
- ☐ Permanent markers
- ☐ Cryomarkers
- ☐ Protective clothing – Waterproof rubber boots, overalls, facemask, and nitrile gloves
- ☐ First aid kit
- ☐ Ice box containing ice packs (for short term storage and transport)
- ☐ Sharps bin
- ☐ Sturdy garbage bags
- ☐ Field centrifuge (portable 12vt)
- ☐ Liquid nitrogen dewar

Blood sample collection equipment and supplies

- ☐ EDTA vacutainer tubes – 9ml (lavender top)
- ☐ Serum separator vacutainer tubes – 9ml (red/gray top)
- ☐ Vacutainer needle holders
- ☐ Vacutainer needle: Cattle and Camels, 1½" 18 or 19 gauge; Sheep, Goats, and Swine, 1" 20G
- ☐ Syringes: 20, 10 and 5 ml
- ☐ Needles: Cattle and Camels, 1½" 18 or 19 gauge; Sheep, Goats, and Swine, 1" 20 guage for jugular or 22 or 23 gauge for auricular vein
- ☐ Alcohol (squirt bottle or vaporizer)
- ☐ Gauze
- ☐ Vacutainer tube rack
- ☐ Cryovial tubes
- ☐ Cryovial rack
- ☐ Centrifuge
- ☐ VTM
- ☐ Trizol

Fecal Sample Collection Equipment and Supplies

- ☐ Obstetrical Sleeve
- ☐ Disposable Spoons
- ☐ Plastic bags or vials
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol

Urine Sample Collection Equipment and Supplies

- ☐ Plastic vials
- ☐ Plastic pipettes
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol

Swab Collection Equipment and Supplies

- ☐ Plastic handle, polyester tip swabs
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol

Tissue Collection Equipment and Supplies (in case of animal necropsy)

- ☐ 21 Gauge needles for cardiocentesis
- ☐ 1 mL Syringe for cardiocentesis
- ☐ Scalpel and surgical blades
- ☐ Forceps
- ☐ Sharp and blunt tip scissors
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol
- ☐ Small Vials or Jars
- ☐ 10% Buffered Formalin

Section 5.2.11.i. Appendix IV. Additional Permit Requirements for Livestock Samples Imported into the United States

In addition to all other permits, livestock samples require special import permits from the USDA.

7. GUIDELINES FOR SAMPLE TRANSPORT

Sample transport from the human and animal field sites will follow established protocols from the PREDICT project, which JUST has been implementing for three years. We will adhere to these cold chain protocols except where necessary to modify to meet the project's specific requirements:

- 6.1 Implementing Cold Chain for Safe Sample Transport and Storage (see next page)

Available at: https://ohi.vetmed.ucdavis.edu/programs-projects/predict-project/publications under "General Information."

Section 6.1. Implementing Cold Chain for Safe Sample Transport and Storage

Prepared by
David Wolking, University of California, Davis,
and the PREDICT One Health Consortium

Objective: To provide principles and general considerations for cold chain maintenance, the safe transport and storage of samples collected during PREDICT surveillance activities, and the safety of personnel.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Implementing Cold Chain for Safe Sample Transport and Storage.

Table of Contents: Implementing Cold Chain for Safe Sample Transport and Storage

Section 6.1.1. Introduction to Cold Chain

This guide focuses on implementing an efficient cold chain and sample transport/storage plan appropriate for PREDICT disease surveillance activities. The guidance provided is to ensure that all PREDICT materials arrive at their end laboratories in suitable condition for PREDICT diagnostics and pathogen testing. When you are familiar with the information in this Guide, take the PREDICT quiz on ***Implementing a Cold Chain for Safe Sample Transport (Section 8.4.14.)***.

A cold chain is a monitored temperature-controlled supply chain. The goal of the cold chain is to keep a sample or material within a certain temperature range during all stages of delivery, processing and storage (Figure 1). Cold chains are widely used to ensure the viability of products in the pharmaceutical and agricultural sectors, and are critical components of vaccination programs and bio-medical surveillance activities.

Many biological samples deteriorate when exposed to heat, sunlight, or fluorescent light. When transporting and storing such biological substances, it is imperative that field and laboratory teams control environmental conditions, ensuring that exposure to potentially damaging environmental factors is minimized.

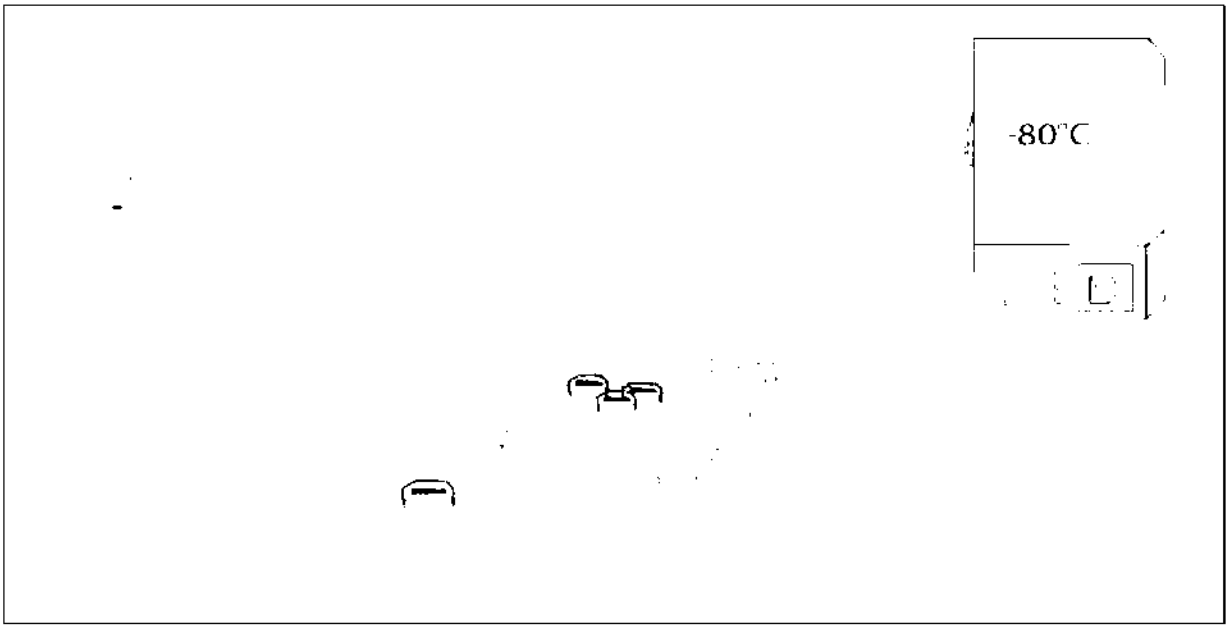

Figure 1: Illustration of a typical cold chain from field to lab storage for PREDICT biological samples. Field teams sample an animal and place specimens in liquid nitrogen dewar for storage. The dewar with specimens is transported in the back of a project vehicle to long-term storage at a PREDICT laboratory or field station, inventoried, and archived until testing in an ultra-low temperature freezer (<-80°C).

Freezing is the simplest way to ensure that the biological samples remain viable for laboratory analysis. The cold chain for PREDICT samples can be maintained through the use of ice packs, coolers and dry ice (for a very brief period immediately following collection), liquid nitrogen (LN2) containers and freezers, and the use of ultra-low temperature (-80°C and colder) freezers. It is recommended that PREDICT samples be placed in LN2 or ultra-low temperature freezers as soon as possible to optimize sample viability for diagnostics and pathogen testing.

Repeated exposure to heat leads to a cumulative and irreversible loss of sample viability and may render a sample useless for laboratory analysis.

PREDICT Sample Cold Chain Requirements: All biological samples from PREDICT surveillance activities should be stored and transported at temperatures colder than -80ºC suitable for the preservation of targeted PREDICT pathogens and viral detection.

Section 6.1.2. Implementing the Cold Chain

This section introduces recommended steps for cold chain planning and implementation.

Section 6.1.2a. Planning

The first step in implementing the cold chain is planning. Your team must identify the cold storage needs for your sampling activities, then identify and procure all necessary materials and resources. In addition, it is critical to train your team to understand the logistics of the cold chain, how to monitor cold chain temperature, and how to maintain system records.

Considerations for Cold Chain Planning:

1. What is your surveillance plan and what type of cold chain is appropriate for that plan? What types of samples are you collecting? What are the temperature requirements for safely storing these samples?
2. Assess local context and conditions. Do you have access to long-term sample storage facilities? Are your sampling activities located in remote rural locations several days or weeks from the project infrastructure or laboratory?
3. Determine where the cold chain ends. If your field team delivers samples to a laboratory with an ultra low temperature freezer, then initiating your cold chain may require simply extending it from laboratory to sampling site through the use of LN2 dry-shippers or dewars. If you are developing a cold chain without any pre-existing infrastructure, mapping out an appropriate cold chain from sample collection to endpoint is essential (Figure 2).
4. Determine the maximum amount of time samples will be located outside of long-term cold storage. If your field activities are 5 days away from long-term storage, then you will need a minimum of 5 days mobile cold storage in LN2. If you plan to export samples, how long will it take to ship from origin to destination?
5. Determine the minimum amount of time samples will stay in long-term storage. Planning for long-term storage requires assessing the space necessities of your cold chain. Are you

maintaining a sample bank or archive? If so, you will need to plan for sufficient storage space for the life of the project to preserve sample viability.

6. Establish procedures for monitoring the cold chain and tracking the samples moving through the cold chain. Confirm all team members have been trained in cold chain maintenance and record keeping. Prepare forms for data logging and recording. Prepare a schedule for re-filling LN2 containers and contingency plans for equipment failure.

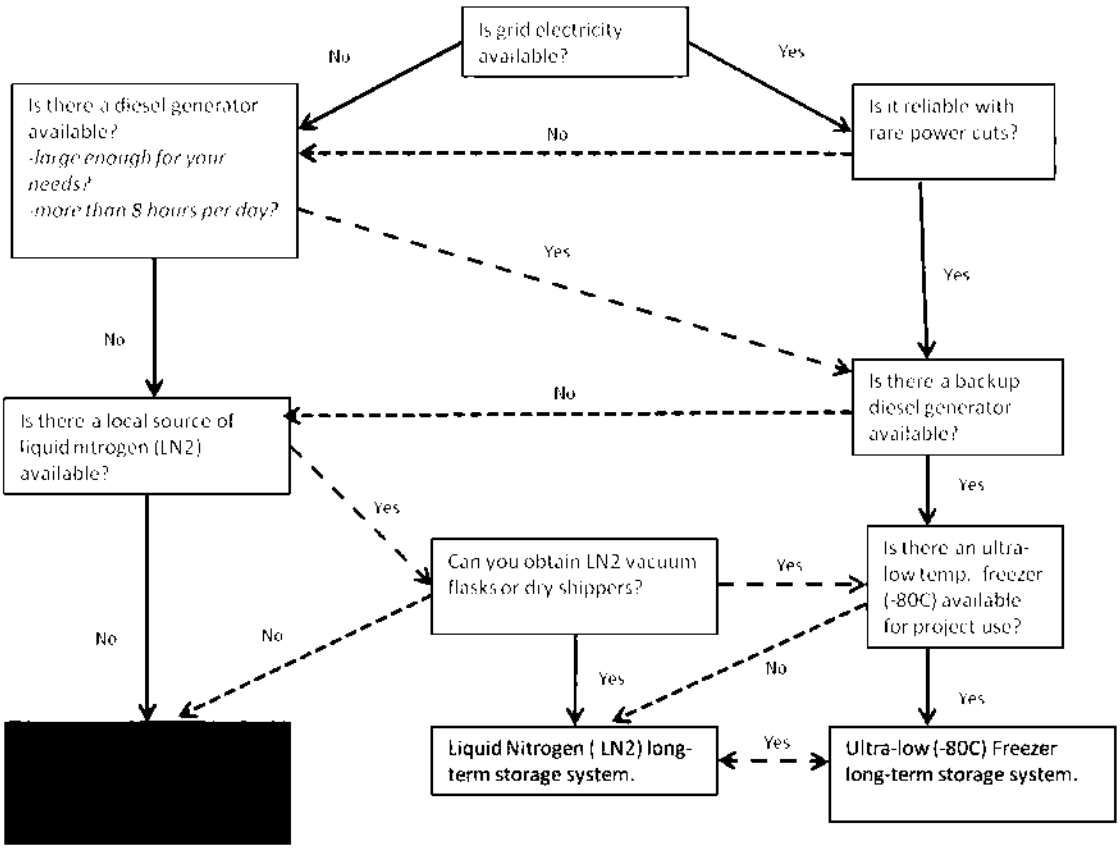

Figure 2: A decision tree for cold chain planning. Based on United Nations World Food Program Logistics Cluster "Logistics Operational Guide".

Developing a Cold Chain System

To develop and maintain a cold chain, a series of simple and routine processes must be established. These processes should be designed to function efficiently in each team's environmental and local conditions, and should be easy to maintain with available materials and resources.

1. Assess the opportunities and constraints to developing a cold chain in your area. These may include:
    a. Access to a pre-existing cold chain
    b. Access to LN2, and LN2 transport and storage supplies
    c. Access to an ultra-low temperature (sub -80°C) freezer available for use
        i. If freezer available, does it have a backup generator and alarm system?

2. Identify the appropriate materials and resources needed to implement and maintain the cold chain. Required materials and resources may include:
    a. Personal Protective Equipment (PPE) for working with LN2 and -80ºC freezers
    b. Coolers
    c. Ice/gel freezer packs
    d. Liquid Nitrogen (LN2) dewars and/or LN2 vapor-phase dry shippers (see distinctions below in Table 2)
    e. Source of LN2
    f. Large capacity LN2 storage dewars or ultra-low temperature (<-80°C) freezers for longer-term sample storage
    g. Temperature gauges, thermometers, data loggers (as needed), alarm systems, and an alert network for staff when facilities are unoccupied
    h. Appropriate sample storage containers and racks for sample organization
3. Identify local suppliers or other sources for procurement of materials and resources. (Note: Carefully assess the reliability/sustainability, and costs of any suppliers to assure procurement of reliable supplies and ability to service equipment.)
4. Establish a written protocol for monitoring the cold chain and stored samples. The protocol should cover:
    a. Temperature regulation and record
    b. Sample storage and tracking system
    c. Equipment maintenance schedules
    d. Response procedures in event of container/freezer failure or power outage
    e. Training programs to ensure continued and safe operation of cold chain system
    f. Annual review of cold chain operation and sample storage procedures

Cold Chain Materials and Resources

A cold chain can consist of any combination of materials and resources that serve to maintain samples at a desired temperature. **For all PREDICT samples, that temperature is -80°C or lower.** This temperature range requires the use of specialized cooling technologies and specially designed freezers. Gas-based coolants (LN2) do not require electricity, and can be deployed to remote and rural areas. In contrast, ultra low temperature (< -80°C) commercial freezers are dependent upon an electrical grid and emergency generators in the event of blackouts or grid failure.

Safety Considerations for Coolants

Working with cold chain coolants can be dangerous if appropriate precautions are not taken. The recommended PREDICT cold chain requires samples to be stored in temperatures well below freezing. Exposure to these temperatures can cause severe burns and damage to living tissue. There are three coolants commonly used in implementing a cold chain: 1) ice/gel packs, 2) dry ice, and 3) liquid nitrogen (LN2). Dry ice and LN2 give off gases that can cause asphyxiation and should only be handled by trained personnel in ventilated areas. In addition, dry ice and LN2 containers must be able to vent evaporated gas to avoid the risk of explosion. Characteristics and safety considerations for working with cold chain coolants are listed in Table

1. For more information on human safety when working with PREDICT field and laboratory activities, please review the *PREDICT guide to* ***Biosafety and PPE Use (Section 4.)***.

Table 1: Characteristics and safety considerations for PREDICT cold chain coolants.

Coolant	Characteristics	Use and Maintenance	Safety Considerations
Ice Packs	Ice packs are water filled packs that obtain the temperature of a standard freezer (approx.-18°C). **Ice packs DO NOT achieve temperatures sufficient for the preservation of PREDICT biological samples.**	Ice packs must be kept in a freezer for 12-24 hours to achieve maximum coldness. Keep at a temperature colder than the freezing point of the ice pack, to ensure longer cold life.	None (water-based product). Do not chill ice packs used for samples in refrigerators or freezers used for food and beverages.
Gel Packs	Gel packs consist of a liquid blend of chemicals that depress the melting point of a cold pack allowing the gel pack to remain colder than 0°C for longer time intervals than an ice pack. **Gel packs DO NOT achieve temperatures sufficient for the preservation of PREDICT biological samples.**	Before purchase, request documentation from the manufacturer to validate manufacturer claims on the product's cold life, and to obtain instructions on appropriate use of the product, including packaging a cooler with biological samples and the gel packs. Gel packs take at least 24 hours to reach their lowest temperature and can take even longer if chilled in a domestic refrigerator.	Though most gel packs are non-toxic, be careful to not ingest gel from ruptured gel packs. Consult manufacturer guidelines for product use on safety.
Dry Ice	Dry ice is the solid form of carbon dioxide (CO_2), and is approximately -78.5ºC. In ambient conditions, dry ice is unstable and evaporates quickly. Therefore, samples packed in dry ice should be transferred to a <-80º container within 24 hours. **Dry ice is recommended as a SHORT-TERM COOLANT ONLY**, to be used for transporting samples from the field to more reliable temperature controlled storage containers.	Dry ice is easily manufactured, often as a byproduct of other processes, and is widely used in the food industry for preservation. Dry ice can frequently be sourced from breweries, importers of frozen products like ice cream, and meat processing facilities. Any specimens transported on dry ice must be placed in specially insulated containers capable of venting gaseous CO_2. Note: sealing seams of containers like Styrofoam cold boxes prevents ventilation of the gas and can lead to unsafe pressure build-up.	Wear insulated gloves. Always work in well-ventilated areas. Always transport dry ice in containers approved for transport, ensuring that the CO_2 can diffuse minimizing pressure build-up.

Liquid Nitrogen (LN2)	LN2 is a readily transportable and highly effective compound used for the cryopreservation of blood, reproductive cells, and other biological samples and materials. LN2 is produced through the distillation of liquid air, and is stored and transported in vacuum flasks insulated from ambient heat.	LN2 can often be locally obtained through international airports (urban areas), and services that work with artificial insemination (beef/dairy industry located primarily in rural areas). LN2 boils at -196°C, and can cause rapid freezing on contact with living tissue, and severe damage to materials if spilt.	Wear insulated gloves, a thermal apron and a face shield. Always work in well-ventilated areas. LN2 tanks feature pressure relief devices, which if not routinely checked and properly maintained can fail resulting in tank explosion and considerable damage. Consult the manufacturer's recommendations for tank maintenance to ensure compliance. Transporting LN2 tanks or dewars inside project vehicles can be dangerous: there is a risk of rupture or tank failure, and the tanks can potentially explode. When possible, transport LN2 in dry shippers or vacuum flasks approved for transport. If using LN2 tanks or dewars, be sure to secure these containers on the exterior of the vehicle to maximize safety in transport. LN2 tanks should only be placed in an upright position.

Containers for Cold Chain Transport and Shipping

There are two main types of LN2 containers: dry shippers (vapor shippers) and vacuum flasks (dewar flasks). The insulating capacity of LN2 containers varies considerably from a few hours to weeks, requiring constant vigilance for signs of leakage, and routine assessment of container temperature.

Dry shippers (vapor shippers)

Dry shippers are large vacuum containers that contain an absorbent material to hold LN2. A properly prepared dry shipper does not contain any free LN2, and can safely store samples at the optimal temperature range for a period of 24 hours to several weeks depending on the type. Dry shippers are highly recommended for sample storage when samples need to be transported or shipped (bicycle, car, airplane, etc.). Because of their transport utility, dry shippers are often smaller and more compact, and well suited to more short-term storage applications.

Vacuum (dewar) flasks

Vacuum flasks are non-pressurized LN2 containers lacking absorbent material, in which biological samples or specimens are suspended in LN2 within the container. Vacuum flasks should not be used to transport or ship biological specimens. Rather, vacuum flasks are suited

for longer-term storage application (storage time dependent on size of the flask – consult the manufacturers guidelines) in laboratories, field offices, or other locations where samples are expected to reside for longer period of time. Vacuum flasks come in a range of sizes from small to very large capacity containers.

Recommended steps for using dry shippers/vacuum flasks:

- Always consult and follow the manufacturer's instructions for filling, as procedures for each type of container can vary.
- Always wear a face shield and insulated gloves made for handling liquid nitrogen.
- Always work in well-ventilated areas, as a significant amount of nitrogen gas will be generated as the cold liquid contacts the warm surfaces inside the shipper.

Refrigerators and Freezers

Domestic (e.g., household/home) refrigerators and freezers are designed and built for food and drink storage; they do not meet the requirements for sample storage, and do not reach the temperature levels needed for preservation of PREDICT biological material (e.g., specimens for viral screening). **DO NOT STORE SAMPLES IN REFRIGERATORS OR FREEZERS THAT CONTAIN FOOD OR BEVERAGES FOR CONSUMPTION.** In addition, temperature in domestic refrigerators varies significantly with door opening, defrosting, and variable ambient temperatures; they should not be used in a cold-chain for storage of PREDICT samples. Additionally, freezers designated as "frost free" should not be used for sample storage; because the temperature cycling mechanisms they utilize to avoid ice accumulation can damage samples.

Only specially designed ultra-low temperature (< -80°C) commercial freezers are recommended for use with samples when viral isolation is an objective.

Ultra-low temperature (< -80°C) commercial freezers

Commercial freezers come in a variety of temperature settings (-20, -40, -50, -85, and cryogenic freezers at -150°C), and in a variety of configurations (upright, chest, and bench top freezers). It is important to be sure any commercial freezers utilized for biological sample and specimen storage are able to consistently maintain a sub 80°C environment.

Operating a commercial freezer requires a constant source of electricity to maintain temperatures colder than -80°C temperatures and ensure the viability of the cold chain. In many places where PREDICT projects are being conducted, electricity is intermittent and blackouts are common. **It is imperative that the electrical source for a commercial freezer be supported by a back-up generator to ensure continued power for the freezer and viability of the samples.** It is equally imperative that each team has a contingency plan for power outages, to ensure that the back-up generator is functioning and that the freezer remains operational. Teams should clearly mark the power source to the freezer to prevent accidental disconnection, which can cause heat damage if unnoticed over long periods of time. The power source can also be protected by placing a sticker above the power plug or switch, or by installing a lockable

switch. Additional steps on maintaining the cold chain during blackouts are included in Section 3 below.

The location of the freezer in the laboratory or field office impacts performance. Avoid placing a freezer in direct sunlight or near heat sources (hot water or a warm external wall), because that makes the freezer work harder to maintain cool temperatures. In addition, -80°C freezers often require a certain amount of airspace in their immediate surroundings for ventilation and to function efficiently; -80°C freezers should not be located in close proximity to other freezers, equipment, counters, etc. When possible, leave at least 1 meter of space between the -80°C freezer and other freezers or equipment.

Temperature Gauging Equipment

Continual temperature monitoring of the cold chain assures that all samples remain in an optimal environment for preservation. There are a number of methods to monitor cold chain temperatures, from simple thermometers to more complex temperature gauges, cold chain monitors, and data loggers. When combined with an appropriate record keeping system, temperature monitoring provides an ideal method to evaluate the viability of the cold chain and to respond accordingly to any interruptions.

Table 2: Temperature gauging equipment used in the cold chain.

Type	Description	Guidelines for use
Thermometers	Minimum/maximum thermometers are essential equipment for temperature monitoring, and come in two main types: dial and digital.	All thermometers used for temperature monitoring should be set to Celsius, must be reset on a daily basis, and require annual checks to ensure accuracy, as battery failure or damages temperature probes can impact readings. In addition, a temperature-monitoring chart should be maintained to provide a record of variation in temperature that may indicate problems with the freezer or thermometer.
Temperature Chart Recording Systems	Temperature Chart Recording Systems are automated systems that record temperature and provide visual or audio alarms at signs of malfunction.	These systems are fully automated and provide digital output of temperature variations over time. These are typically after-market modifications to freezers, and if installed, should be verified to function with the freezer manufacturer as they may void product warranty.
Data loggers	Data loggers are used to record temperature patterns over time by recording temperature data electronically, and providing an electronic and downloadable record.	Data loggers are not a replacement for manual monitoring, and daily minimum and maximum temperatures should still be recorded to ensure the maintenance of the cold chain. When used for routine temperature monitoring, a data logger must be equipped with a visual min/max temperature display to allow for daily real-time recordings.

Cold chain monitors	Cold chain monitors generally consist of dual-time temperature indicators (WarmMark™ and MonitorMark™) and function by displaying changes in temperature through color change on an indicator strip. Other types of cold chain monitors include freeze indicators (Freeze Watch™, ColdMark™) consisting of color bulbs that release a dye at a threshold temperature. There are also combined indicators featuring dual time-temperature indicators and freeze indicators.	Cold chain monitor color change allows for an estimation of the amount of time a temperature exceeds a pre-determined threshold. No color change means the cold chain was not interrupted and temperature remained safe for sample transport. Note: these monitors are often for temperatures warmer than -80°C (e.g. cold boxes/coolers, refrigerators, -20°C freezers) and are often not designed for samples kept at or colder than -80°C.

Management of Cold Chain Equipment.

Procuring the needed equipment is only one aspect of keeping a functional cold chain. Equipment management and maintenance is equally important, and requires:

- Maintaining an equipment inventory
- Planning and budgeting for equipment operation (e.g., electricity), maintenance, and repair
- Planning and budgeting for equipment replacement
- Emergency response or contingency planning in the event of cold chain breach or equipment failure

Equipment Inventory

An inventory should be developed to track all equipment, tools, and parts that are used as part of the cold chain. A good inventory will allow team members to track the location of all materials used in the cold chain, schedule maintenance and repair, arrange for replacement and evaluate the project supplies. Table 3 includes some information recommended for a sample storage equipment inventory.

Table 3: Sample storage equipment inventory database example.

Item	Specifications (brand, model, SN, date of acquisition)	Current Location	Current Condition (Working, Under repair, Out of commission)	Date of purchase – warranty number	Estimated Replacement Date	Notes
Ultra-low freezer	TS Revco ElitePlus, S/N 007054568, Oct. 2010	Morogoro	Working	September 2010	October 2013 (MFR warranty expiration)	Recently purchased and installed
Dryshipper	MVE Cryomoover, S/N 9989900745, Oct. 2010	Serengeti, PREDICT Mobile team	Working	September 2010	October 2013 (MFR warranty expiration)	Field sampling with TAWIRI team
LN2 Generator	StirLITE, S/N 356777456, Oct. 2010	Iringa, PREDICT office	Out of Commission	September 2010	October 2013 (MFR warranty expiration)	Installation issues: working with support services to resolve; sourcing LN2 from supplier in Dar es Salaam currently.

Equipment Operation, Maintenance, and Repair

All equipment requires maintenance to protect against failure and degradation. Maintenance planning involves identifying procedures and plans to keep equipment functioning properly, as well as planning for emergency repair in the event of equipment failure. Some equipment requires routine maintenance (daily, weekly, or monthly), while others may require maintenance following use (dry shippers, vacuum flasks, cold boxes, etc.). Maintenance instructions are usually included with the equipment, and can often be obtained from the manufacturer. It is important that team members receive training in routine maintenance and repair within reason, while skilled technicians should be identified for complex maintenance and repair procedures.

In addition, it is important to estimate the costs of installing, operating, and maintaining the equipment. Ultra-low temperature freezers utilize significant quantities of electricity, though newer models are designed to minimize power consumption. It is possible that the installation of new equipment will drastically increase power consumption requiring a re-budget of operational costs.

You may use the following equation to estimate the cost of your electrical equipment using the manufactures specifications to obtain the value for kilowatt hours (kWh). [kWh / 24 h] x [kWh costs in your location] x [365 days] = Operational Cost / Year

Maintenance of equipment over time will also require a budget, and should be included in operational cost planning.

Equipment Replacement

Equipment will eventually wear out, and if plans are not in place to address equipment failure, a significant cold chain breach may occur (See Section 6.1.3.). It is important that teams understand the lifecycle of all cold chain materials and equipment, and that plans are in place to address equipment failure when it occurs. Most manufacturers provide estimates of equipment life expectancy. When developing the equipment inventory, estimated replacement dates should be included in documentation to assist in replacement planning. As equipment can often take months for order and delivery, temporary cold chain storage plans should be considered to ensure no breach or interruption.

Emergency Planning

Cold chains are fragile, material dependent, and subject to interruption through breakdowns of background infrastructure (electricity failure) and equipment failure (leakages of cold storage containers or freezer malfunction). Team members must set up emergency planning for identifying equipment failure early, along with arrangements for maintaining the cold chain during repairs or replacement. Equipment outages caused by shortages of spare parts or materials should not occur.

Power surges and "brown-outs" are often frequent occurrences in areas where PREDICT teams are active. A brown-out is a drop in voltage in an electrical power supply, most commonly observed by the dimming of lights. Black outs are covered below in the Section 6.1.3.. To prevent adverse impacts to cold chain equipment during power surges, it is imperative to have stand-by generators, back-up power sources, and other mechanisms in place (surge protectors, CO2 backup systems, etc.). Often electrical equipment is sensitive to undercurrent (for example a 220V system running at 205V temporarily), and equipment failure and destruction is possible.

Section 6.1.2b. Recommended Temperature Requirements for Sample Transport and Storage

An essential component of cold chain planning is knowing the optimal temperature requirements for different diagnostic methods, sample types and storage media.

For PREDICT purposes all samples (stored in VTM and Trizol) must be frozen in liquid nitrogen immediately in the field and transferred to a -80°C freezer once back in the lab. If the location of the field site allows, you may use short term (maximum 48 hrs.) refrigeration (i.e., ice/gel packs) prior to transfer to -80°C freezer or LN2 dewar.

ONLY if there is no **short term** access (i.e., within 24 hours) to cold chain such as in an emergency situation samples can be collected in 200 µL of RNAlater instead of Trizol and VTM. Storage times and temperatures for samples in RNAlater are as follows: 1 day at 37°C (i.e., room temperature), 1 week in the refrigerator, and transfer to -80°C for long term storage as soon as possible and within 1 week until analysis.

Do not collect samples onto dried blot spot cards.

Section 6.1.2c. Cold Chain Initiation at the Sampling Sites

Following collection in the field, samples must be immediately introduced to the optimum temperature range. When possible, collected samples should be initially stored in cryotubes allowing for immediate introduction to the cold chain and minimizing any freeze/thaw issues involved in sample transfer at a later time.

Table 4 provides an overview of temperature ranges used in PREDICT activities, along with procedures for optimizing these ranges for short-term storage. This table is followed by recommendations on the use of referenced equipment.

Table 4: Maintenance of transit temperature by optimum temperature range.

4°C *Commercial Refrigerator or "on-ice"*	**-70°C** *Dry ice*	**-80°C or colder** *LN2*
Time interval: 1-2 days (chilled). Limit to a minimum	Time interval: 1-2 days (frozen).	Time Interval: Indefinite (as long as LN2 quantities are maintained)
*Procedure: The sample transport container (cold box or cooler) should be fitted with as many ice/gel packs as possible. Temperature should not exceed 4°C. If available, a cold chain monitor should also be inserted.	*Procedure: Place a minimum 1 kg of dry ice per 1 kg of samples (but double or triple dry ice amount if possible) for every 24 hours in transit. Place in a sturdy Styrofoam container, allowing for release of carbon dioxide gas to prevent explosion. Use solid dry ice cubes when possible as their duration greatly exceeds that of chips or snow.	*Procedure: Place samples into special cryotubes with screw-down lids (no snap-tops). Cryotubes are then inserted into a LN2 "charged" dry shipper or vacuum flask.

**Maintain at least 4 frozen gel packs and an additional transport container as a contingency plan in case of package or container failure with dry ice or LN2.*

Using temporary cold boxes or coolers

Insulated cold boxes or coolers may be used for sample transport of less than 48 hours duration for all samples requiring storage at -80° C or if no LN2/dry ice supplies are available, or during equipment failure or emergency maintenance periods.

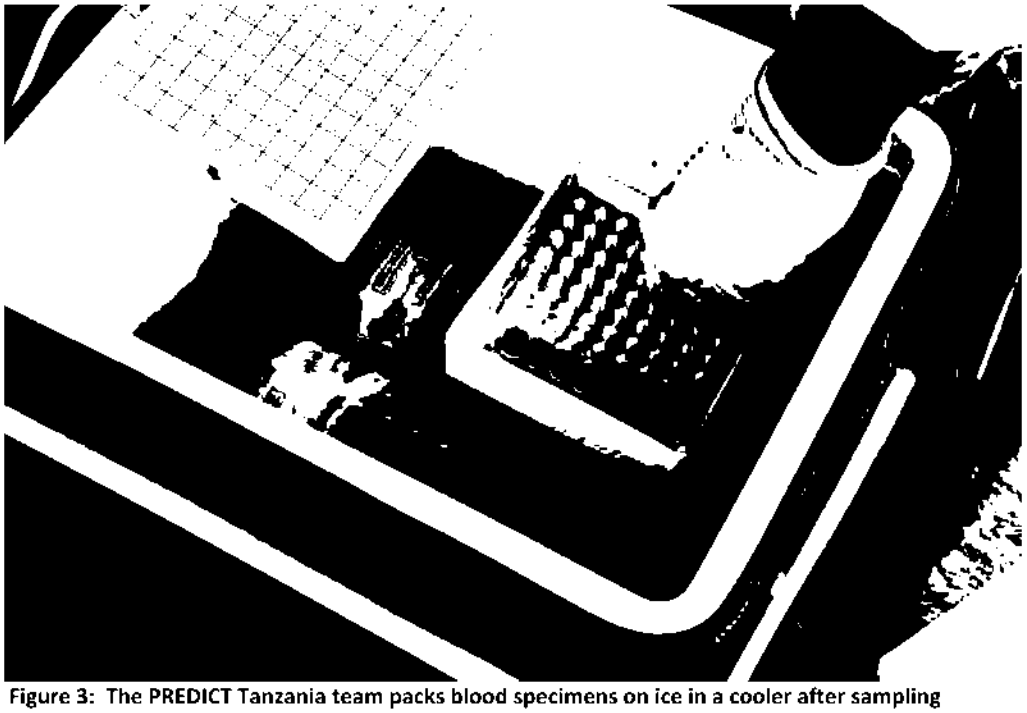

Figure 3: The PREDICT Tanzania team packs blood specimens on ice in a cooler after sampling rodents. Other specimens from field collection were stored in LN2 consistent with sample storage guidelines (Table 6). Photo by Liz Vanwormer.

Recommended steps when using cold boxes or coolers:

- Samples must be protected from heat, sunlight and fluorescent light at all times.
- Check the temperature in the cold box using a mercury or digital thermometer every 3 hours. Note: repeated opening and closing of the cold box will cause temperatures inside the box to elevate more rapidly. Teams must use good judgment when deciding to monitor the cold box temperatures.
- Rotate ice/gel packs to maintain maximum coldness within the container. If possible have extra ice gels to replace thawing or thawed ones.
- Do not transport samples in the trunks of vehicles (or the floors of some vehicles) due to the risk of exposure to temperature extremes. Be familiar with the coolest part of the vehicles.
- Do not remove samples from cold box or cooler until ready to transfer to recommended vacuum flask, dry shipper, or commercial freezer.
- When transferring samples, do not leave them out on the counter or the floor subjected to room temperature and light.
- Keep records of amount of time samples were stored at temperatures warmer than -80°C, and record the date and time when samples were introduced to the -80°C cold chain.

Using containers with dry ice

Dry ice (-78.5°C) is colder than ice and gel packs and allows for maintenance of samples frozen in transit. Any specimens transported in dry ice must be placed in specially insulated containers capable of venting gaseous CO2.

Recommended steps when using dry ice:

- Pack samples in a good insulated container. Thick polystyrene/styrofoam boxes work well with dry ice as they allow for the necessary off gassing of CO_2 (release of CO_2 gas) and are durable enough to last through transport.
- Sufficient dry ice is needed for maintaining samples consistently frozen. If dry ice quantities are insufficient samples will thaw and rendered useless.
- Use a minimum 1 kg of dry ice for each **1** kg of samples for every 24-hour transit period. Keep in mind however that depending on the quality of your shipping container and environmental conditions you will need to adjust these quantities to ensure constant temperatures. In hot conditions and whenever possible use double or triple the recommended dry ice quantity (i.e., 2 or 3 kg dry ice per kg of samples). For longer than 24 storage/transit times, double the amount of dry ice.
- When packaging items, place dry ice and sample containers as close together as possible and cover with additional dry ice. Fill any empty space with newspaper (ideal) or cloth, bubble packs, or Styrofoam peanuts. Empty space allows the dry ice to sublimate (change from liquid to gas) more quickly.
- Dry ice blocks take longer to evaporate and are better at maintaining samples frozen for longer storage/transit periods. However, samples must be close to dry ice (or surrounded by it) for adequate preservation. Solid blocks of 2-3 kg are ideal, yet not always available. Avoid using "snow" or chip dry ice whenever possible as they evaporate very quickly.

Using dry shipper or vacuum flask storage (LN2)

Dry shippers and vacuum flasks when properly charged provide ideal low temperatures for preservation of PREDICT samples both in the short-term following sample collection, in transport, and in the long-term as samples await analysis and/or shipping for diagnostics.

Recommended steps for filling dry shippers/vacuum flasks for sample transport:

1. Use appropriate PPE!
2. Add the LN2 slowly into the container.
3. Stop filling the container when the liquid reaches the neck of the dry shipper. (**DO NOT OVERFILL**)
4. Then, attach the cap and set the container aside to saturate the absorbent for the period specified by the manufacturer. This is called "charging" the container.
5. Repeat the steps above until the liquid level no longer drops on standing (e.g. the container is "charged"). Some manufacturers provide empty and full weights for their containers. If the dry shipper will not reach the expected full weight specified by the manufacturer, there may be a problem with the absorbent's ability to hold the LN2, and could indicate the container is compromised, and that samples transported or stored in the container may be at risk of degradation. In this case, contact the manufacturer or supplier of the equipment to assess whether the container is fit for use with biological samples.
6. Remove all free liquid nitrogen from the container prior to transport.
7. Empty the container by pouring the excess liquid nitrogen back into a large LN2 vacuum flask.
8. If the LN2 cannot be poured back into the flask, pour the LN2 into an appropriate area.
9. Do not pour LN2 onto the floor or onto hard surfaces. LN2 can crack and destroy concrete and other hard surfaces, and the liquid could splash onto your shoes or legs and cause severe burns.
10. Ensure that any area where LN2 is poured away is well ventilated. Remember that handling or spilling LN2 in a small, confined space has been known to cause fatalities via asphyxiation /displacement of oxygen. Appropriate safety precautions outlined in the Protocol above must be considered.
11. After pouring out excess LN2, hold the dry shipper or vacuum flask upside down to be sure that all liquid has stopped flowing.
12. Stand the dry shipper upright for the period specified by the manufacturer.
13. Repeat the LN2 removal steps as many times as necessary to make sure there is no excess LN2 in the container.
14. Put the samples into the dry shipper/container and replace the cap.
15. Record the date, time, and ID of the samples for when they were placed into the container to initiate the cold chain data log.
16. Ready the dry shipper/container for transport by securing the container in the vehicle. If using a protective bin for the container, then secure the container in the bin first, before securing the bin in the vehicle.

Recommended steps for using dry shippers or vacuum flasks for sample storage:

- Make sure containers are fully charged prior to deployment in the field or removal from dry ice/LN2 source (See steps on filling shippers/flasks above).
- Make sure containers are not leaking.
- Make sure to have sufficient quantities of LN2 on hand for sample storage and emergencies.
- Develop a plan for obtaining additional dry ice/LN2 supplies in the event of emergency or container failure.
- When in the field, always keep additional cold boxes with conditioned (e.g., properly prepared) ice/gel packs as back up in event of container failure.
- Following sample collection, organize samples in the containers according to animal or sample ID consistent with PREDICT sample tracking recommendations for rapid retrieval.
- Remove samples from containers only when ready to prepare for analysis or shipping.
- Record the length-of-time samples were kept in containers and document the number of times and duration containers were opened.

Figure 1: The PREDICT Tanzania team packs up equipment after collecting specimens from rodents. The mushroom shaped container in the background is a specially designed transport container for LN2 dryshippers, ensuring the dryshipper container is well protected during overland or air travel, and that all stored specimens are well within the temperature range required for viral isolation. Photo by Liz Vanwormer.

Section 6.1.2d. Sample Transport

Following sample collection, it is imperative that the field teams coordinate with the receiving laboratories or PREDICT Country Coordinators on all details involving sample transport and storage planning. In many cases, samples will be delivered from the field/collection site to a temporary storage facility prior to shipment to end-use processing laboratories, and may involve multiple phases of the cold chain. In the event of international transport of samples to a processing laboratory, all PREDICT personnel must follow the guidelines specified in ***Section 6.2 Packing and Shipping Biological Samples*.**

All sample transport containers must be secured (e.g., tied down) in the transport vehicle. If possible, LN2 dryshippers should be secured in a separate compartment space from the passengers (e.g., rooftop bin or a covered canopy of a flatbed truck), and equipped with a spill kit containing absorbent materials to protect personnel from any accidents involving spillage. Non-LN2 containers with unprocessed samples may be secured in the project vehicle with proper secondary containment to minimize sample jostling during transport. There is a risk that containers may leak during transport, so it is imperative that teams understand the risk of asphyxiation in a closed vehicle and be prepared to address any spills and leakages with appropriate equipment. **PREDICT vehicles should be equipped with cold chain PPE (e.g., disinfectant, heavy reusable gloves, disposable gloves, mask, apron, goggles, and a sealable and leak proof disposal container) to respond to any incidents involving sample spillage**. To ensure maintenance of the cold chain, additional ice/gel packs, dry ice and appropriate containers, or an additional LN2 dry shipper should be available to prepare for travel delays or primary container failure.

Section 6.1.2e. Safe Storage of Samples

Upon delivery of samples from the field, it is the responsibility of the receiving party to ensure that cold chain is continued and samples are appropriately stored, documentation transferred (See Section 6.1.3.. Records below), and Country Coordinator or other supervisor notified. **For PREDICT purposes ALL SAMPLES must be stored frozen at -80°C or lower temperatures.**

Additional Sample Storage Guidelines

- Samples should be divided or aliquoted into the smallest useful units during initial processing in order to avoid excessive freeze-thaw cycles, and to avoid damage leading to a loss of infectivity.
- When samples are removed from cold storage and shipped to a laboratory facility for analysis, teams should follow the PREDICT training guidelines on ***Packing and Shipping Biological Samples (Section 6.2)***.

Long-term Sample Storage

It is strongly recommended that all samples kept for long-term storage be maintained at temperatures at or below -80°C. This can be achieved either through the use of large capacity LN2 dewars or through ultra-low temperature freezers.

Using Liquid Nitrogen

There are generally two types of sample storage systems available for LN2 dewars: box/rack (or canister systems) and cane/straw systems. While cane/straw systems are acceptable for short-term storage, it is highly recommended that samples for long-term storage be kept in box/rack systems, which allow for quick retrieval and identification with minimal temperature reduction upon retrieval. Cane/straw systems have less storage capacity and often increase the amount of time required to locate samples for pathogen testing.

Recommended steps for using LN2 in long-term sample storage:

- Make sure containers are filled to capacity, functioning properly, and are not leaking.
- Develop a plan for obtaining additional LN2 supplies in the event of emergency or container failure.
- Maintain a supply of ice/gel packs to maintain temperature in the container in the event of container failure, or for use in emergency storage or transport.
- Organize samples in box/rack systems according to animal or specimen ID consistent with PREDICT sample tracking recommendations for rapid retrieval.
- Remove samples from containers only when ready for testing or shipping.
- Record the length-of-time samples were kept in containers and document the number of times and duration containers were opened.

Using Ultra-low Temperature Freezers

Like samples in LN2, samples stored in ultra-low temperature freezers (-70/80°C and colder) must also be easily identifiable and organized in a way to minimize the time required for sample location and access. Freezers must be well managed, and staff must be prepared for disruption of electricity, blackout, or other event where the freezer malfunctions.

Recommended steps for using ultra-low temperature freezers:

- Store material in the freezer leaving space between boxes/containers to allow for air to circulate.
- Organize samples according to animal or sample ID consistent with PREDICT sample tracking recommendations for rapid retrieval.
- Remove samples from freezer only when ready to prepare for testing or shipping.
- Minimize the number of times the freezer is opened, and make sure the freezer door is closed tightly.
- Secure the electrical outlet and freezer plug to prevent accidental disconnection and freezer failure.
- Post a highly visible sign or sticker by the electrical outlet to ensure the freezer is not unplugged, or cover the electrical outlet with a cage to prevent disconnection.
- Maintain a supply of ice/gel packs in the freezer to maintain temperature in the event of freezer failure, and for use in emergency storage or transport.
- Employ a temperature monitoring system.
- Train all staff members in monitoring and documenting temperatures.

Section 6.1.2f. Cold Chain Maintenance

Checking, Recording and Monitoring Cold Chain Temperature

Implementing a temperature-monitoring plan through consistent and regular thermometer readings is essential to maintaining a secure and reliable cold chain.

Recommended Steps for Cold Chain Temperature Monitoring:

- Check LN2 levels and container temperature (if using gauge), and ensure that the container is not leaking twice per day in the mornings and evenings.
- Check and record freezer temperature twice per day in the mornings and evenings (Figure X) as follows: (Note: these readings must be done more frequently if samples are temporarily stored in cold boxes or coolers).
    - Check and record the current freezer temperature.
    - Check and record the maximum freezer temperature.
    - Clear the maximum reading after it is documented.
    - Check and record the minimum freezer temperature.
    - Clear the minimum reading after it is documented.
    - Reset the thermometer.
- Do not open the freezer door to take the temperature readings; an external temperature gauge should be used for commercial freezers.
- Change the thermometer or temperature gauge battery every 6 months (i.e., seasonally with the time change) or as recommended by the manufacturer, as a low functioning battery may give false temperature readings.
- Keep a supply of spare batteries in case of device failure.

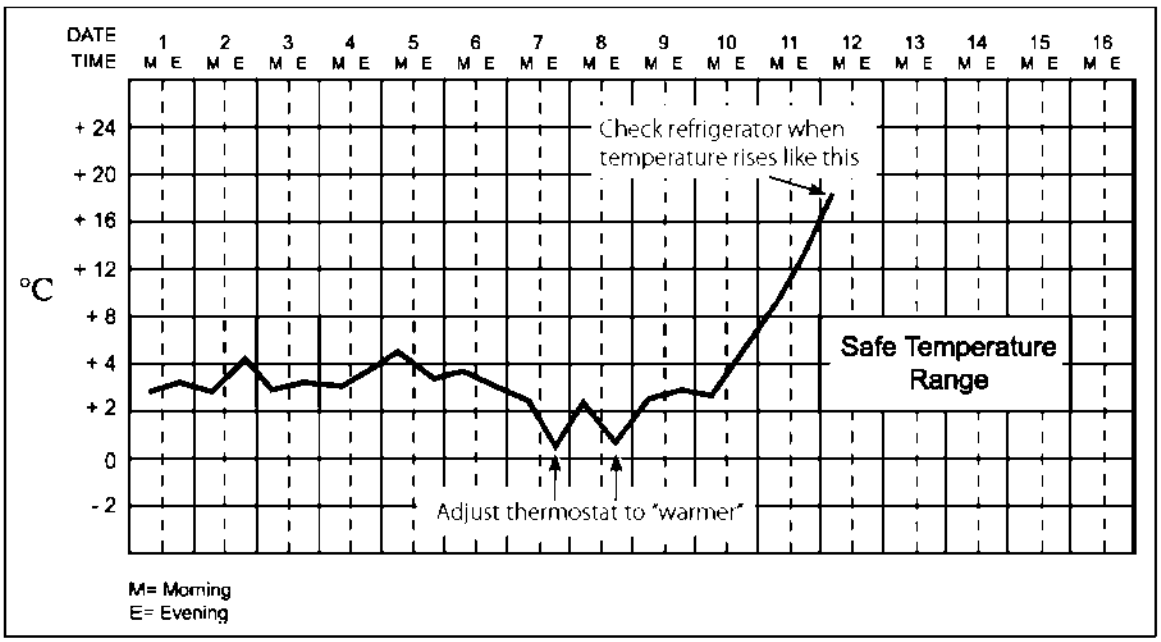

Figure 5. An example of a cold chain temperature monitoring chart. Source: WHO, 2004.
Note: this chart is for a cold chain optimized for vaccines at 2-8ºC. Use the chart included in the Appendix for the PREDICT cold chain at lower storage temperatures optimal for viral isolation.

Section 6.1.3. Contingency Planning and Responding to a Cold Chain Breach

Preserving and maintaining below freezing temperatures in tropical conditions requires attention to detail and intensive logistical planning, linking equipment, people, policies, and procedures into an integrated system. Country coordinators, laboratory technicians, and field personnel all have a role to play in ensuring that PREDICT samples are collected, transported, stored, and shipped (if necessary) without breaks in the cold chain. In addition, team members must be trained and prepared to address incidents in which there is a cold chain breach, to enact response measures for rapid cold chain rehabilitation.

Contingency Planning

It is imperative that all PREDICT teams have a pre-determined contingency plan for maintaining the cold chain in the event of freezer or container malfunction or electricity disruption. It is highly recommended that all facilities using commercial -80°C freezers be linked with a back-up generator for continued electrical operation (see box below). However, it is the team's responsibility to make sure that the back-up generator is of sufficient capacity to operate the freezer, is functioning and has sufficient fuel to maintain electricity, or that alternative measures for maintaining the cold chain are necessary. Arrangements with other facilities for temporary sample storage (if necessary) should be made in advance, along with plans for rapid sample transfer with minimal cold chain disruption.

Essential Steps in Setting-up your Back-up Generator System

Generators should be connected to freezers before a power failure to determine:

a) If the generator can effectively operate the freezer
b) The temperature at which the freezer operates when connected to the generator, and whether an appropriate temperature is maintained for samples over an extended period of time
c) How long the generator can be used in the event of a power outage

If these three conditions are met, then the generator is sufficient to act as a back-up system in the event of a breach. If these conditions are not met, please see "Recommended Steps for Contingency Planning" below.

Recommended Steps for Contingency Planning:

- Identify possible sources of cold chain interruption or breach (e.g., equipment failure, supply shortages, power outages, etc.).
- Identify preparations and solutions for possible chain interruptions
- Prepare back-up infrastructure for sample storage.
- Identify alternate storage facilities for samples and initiate communication to facilitate emergency use.
- Monitor and evaluate equipment regularly and maintain records to assist in understanding potential weaknesses in the cold chain.
- Ensure staff are trained on cold chain maintenance and monitoring for prevention of a breach.

Recommendations for a Power Failure Contingency Plan

Power Failure Contingency Plan (Example)

Start-up the Generator! If Generator is not working, or is insufficient to provide adequate backup (See Box above), then proceed with these steps below:

Samples stored in refrigerator

Monitor the temperature of refrigerator (temperature gauges should be battery powered).

During a power failure of 4 hours or less, the refrigerator door should be kept closed at all times.

If samples are at risk of warming, implement alternative storage arrangements. All samples must be transferred to cold boxes/coolers with prepared ice/gel packs. Monitor sample temperature through the use of a thermometer probe placed near the samples inside the cold box or cooler.

Samples stored in commercial freezer

Monitor the temperature of freezer (temperature gauges should be battery powered).

If samples are at risk of thawing, implement alternative storage arrangements (either in dry ice or LN2, or in cold boxes and coolers with prepared ice/gel packs).

Responding to a Cold Chain Breach

A cold chain breach is an interruption in the cold chain exposing samples to temperatures above the required range for viral preservation (for prolonged periods – opening and closing a freezer door will often cause temperature fluctuation, but does not qualify as a "breach"). If not quickly rehabilitated, such an interruption can destroy sample viability and render samples useless for PREDICT pathogen testing activities. It is imperative that all teams have documented plans for addressing a breach in the cold chain, and that all team members have received training on appropriate response and cold chain rehabilitation.

Recommended steps in responding to a cold chain breach:

1. Contact your PREDICT Country Coordinator (or supervisor) as soon as possible for advice on emergency response measures, and consult your contingency plans.
2. Define the incident: check all temperature monitoring records, equipment, and discuss with staff possible explanations for the breach.
3. Confirm accuracy of equipment by referencing manufacturer specifications to ensure that the breach is not simply equipment malfunction (data loggers, cold chain monitors and temperature gauges may have operational failure. It is important that emergency measures are not implemented until staff is certain the failure is with the freezer or storage container).
4. Assess the condition of the freezer/storage container. Can the cause be identified (e.g., leaky dewar, freezer door no longer closing completely)?
5. Record:
    a. When the cold chain was last guaranteed?
    b. What monitoring has been recorded prior to breach?
    c. What is the time interval of breach?
    d. What is the temperature range of the breach period?
    e. What samples were involved in incident? Enter record in sample database.

6. Continuously monitor temperatures of the containers/freezers and record the duration of time samples are exposed to temperatures warmer than -80°C.
7. If temperatures approach -30°C, begin planning for sample transfer to temporary cold boxes or coolers, or other laboratory facilities.
8. If temperatures climb to warmer than -20°C, transfer samples to temporary storage containers and continue monitoring temperature. If there is no -20°C capacity, actively pursue an alternative storage facility and prepare insulated boxes for sample transport.
9. DO NOT discard any samples until advice has been sought from PREDICT Country Coordinators and laboratory personnel.
10. Label all samples exposed to elevated temperatures in the PREDICT sample tracking information database.

Take active steps to correct and prevent the problem from recurring.
In the event of a cold chain breach, it is important to keep records to guide in response implementation, to help prevent future breaches, and to inform PREDICT team members of any potentially affected samples. The following table includes an example data sheet for a cold chain breach. A blank data sheet is included in the Appendix.

Example data sheet for cold chain breach

Date and suspected time of the breach	Date: Aug. 13, 2010	Time: 5:14 PM
Do you store your samples in a commercial freezer or vacuum flask container?	Commercial Freezer	LN2 vacuum flask
Minimum and maximum temperature readings	Minimum: -88°C	Maximum: -57°C
When was the thermometer last reset	Dave of reset: July 12, 2010	Time of reset: 11:12 AM

Section 6.1.5. Appendix I. Datasheets and Checklists for Cold Chain Planning and Implementation

Equipment Inventory Template

Item	Specifications (brand, model, SN, date of acquisition)	Current Location	Current Condition (working, in repair, out of commission)	Date of Purchase	Estimated Replacement Date	Notes

Equipment Maintenance Record Template

Model No.	Serial No.	Purchase Date	Last Service Date	Work (Maintenance) Performed

**Note: It is also recommended that teams catalog recommended maintenance forms, registries, and schedules that accompany equipment to help plan for equipment maintenance and minimize interruptions in the cold chain. It may also be helpful to keep a record of responsible team members so staff are aware of equipment maintenance duties.*

Data Sheet Template for Cold Chain Breach

Date and suspected time of the breach	Date:	Time:
Do you store your samples in a commercial freezer of vacuum flask container?	Yes	No
Minimum and maximum temperature readings?	Minimum	Maximum
Are Cold Chain Monitors (CCMs) stored with the samples? If 'yes', be ready to report the reading when breach was noticed.	Yes	No
When was the thermometer last reset?	Date of reset:	Time of reset:
When was the thermometer battery last changed?	Date of battery change:	Time of batter change:
When was the last check on the accuracy of the thermometer done?	Date:	Time:
How long do you think the temperature was above -80°C?	Minimum Estimate	Maximum Estimate:
How long do you think these problems have been occurring?	First breach	Recurring (state number):
Where is the temperature probe situated?	Location:	Notes:
What type and number of samples were exposed to the breach?	Type of samples:	Number of samples:
Are all samples labeled and accessible?	Yes	No
Are there ice/gel packs in the freezer to use if transfer is necessary?	Yes	No
What do you think was the cause of the cold chain breach?	Suspected cause:	Notes:
Has the cause of the cold chain breach been rectified?	Yes	No

USAID | PREDICT

Section 6.3. Basic Laboratory Safety

Prepared by
Tracey Goldstein, University of California Davis,
Simon Anthony, Columbia University,
Carlos Sanchez, Smithsonian Institution,
and the PREDICT One Health Consortium

Objective: To provide a safe and healthy environment for staff, volunteers and all personnel involved in PREDICT activities. This Guide is to provide basic information to ensure a safe laboratory environment and to comply with environmental standards. The recommendations in this Guide are consistent with the requirements of the U.S. Occupational Safety and Health (OSHA) Act of 1970, Executive Order 12196.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Basic Laboratory Safety.

Table of Contents: Basic Laboratory Operations

Section 6.3.1. Learning Objectives

If you understand the material in this Guide, you should be able to:

- Work safely in a basic laboratory environment.
- Recognize laboratory hazards and take the appropriate measures to reduce those hazards.
- Obtain a Material Data Safety Sheet (MSDS) for a hazardous material and explain the kinds of information in an MSDS.
- Explain important precautions to avoid needlestick injuries.
- Explain how to avoid exposure to pathogens in the laboratory.
- Describe the safety measures for a BSL 2 laboratory.
- Explain why medical monitoring of laboratory personnel is important.
- Describe the proper disposal of sharps and medical waste.
- Describe safety procedures for handling chemicals in the laboratory.

Confirm you understand the material of this Guide:
When you are familiar with the information in this Guide, take the PREDICT quiz on ***Basic Laboratory Safety (Section 8.4.16.)***.

This training module is mandatory for all laboratory and field staff.
Once you have passed the quiz please supply proof of training and completion to your supervisor.

Section 6.3.2. Principles

Guiding principles for PREDICT laboratory operations:

1. Prevent loss of life, personal injury or illness, property loss or damage, or environmental harm.
2. Comply with the ***PREDICT Environmental Compliance Protocol*** and local and national safety and health requirements.
3. Comply with applicable local building safety codes.
4. Ensure all PREDICT personnel understand relevant safe and healthy work practices.
5. Identify and assess hazards in the laboratory environment.
6. Establish overall safety and health guidelines that ensure employee safety and health at all times during PREDICT activities.
7. Periodically review and evaluate PREDICT plans, facilities, equipment, and activities to ensure that safety and health objectives are achieved.

Section 6.3.3. General Guidance for Laboratory Safety

This Laboratory Safety Guide describes safe work practices, personal protective equipment, and other control measures necessary for the safe use of chemicals and other hazardous materials

and procedures in the basic laboratory environment. PREDICT personnel involved in laboratory activities must review and follow this Guide. Staff, interns, visiting scientists, and volunteers are to receive this Guide prior to conducting laboratory activities for the PREDICT Program. This Guide will be updated as needed to improve safety procedures.

Ensure Safe Working Conditions

- Inspect your personal protective equipment (PPE), such as goggles and gloves, to ensure that each component fits well and works properly. Examine your gloves for cracks. Nitrile and latex gloves are disposable and a new pair should be used for each task.
- If you are working with PPE kits, ensure that the kit is complete (a list with the contents of the PPE kit should be available).
- Dispose of broken glass and biohazard materials in designated sharps and hazardous waste containers in the laboratory.
- Help provide a safe work environment by keeping the workspace neat and uncluttered.
- Sinks and eye wash stations should be kept clear.
- Wash your hands and forearms after you have removed and disposed of your PPE.

Hazard Identification and Assessment

Personnel should be able to recognize the possible hazards and inherent risks associated with laboratory procedures and equipment.

Table 1: Hazards associated with laboratory procedures

Procedure	Possible hazards	Likelihood of illness or injury	Risk
Using autoclave or hotplate	High temperature	Moderate	Burns
Handling animal and human samples including body fluids, tissues, swabs	Infectious organisms	Low to moderate	Pathogen exposure zoonotic diseases
Reagent preparation	Acids or alkalines Solvents (alcohols, acetone)	Low Low	Burns Inhalation irritant
Disposal of needles and slides	Sharp objects Infectious organisms	Low to moderate	Needlesticks, cuts, zoonotic disease, pathogen exposure
Dry ice, liquid nitrogen or ultra-low freezers	Extreme cold (~-100F)	Low	Burns
Media preparation	Extreme heat	Low	Burns
Formaldehyde	Inhalation of vapors, ingestion of liquid or direct contact with the liquid or vapor (skin, eye contact)	Moderate	Cancer, skin, eye and respiratory tract irritation
TRIzol Reagent (or Tri reagent; phenol solution)	Toxic if inhaled, absorbed through skin or ingested; reacts with bleach	Moderate	Contact burns, systemic poisoning; creates toxic gas if mixed with bleach

Safe Laboratory and Operating Procedures

Personnel must understand and follow the safe operating procedures of laboratory equipment and PPE to minimize health and safety risks. **The use of the PPE for specific laboratory tasks, listed in Table 2, is mandatory** and all PREDICT personnel must follow the special precautions listed for handling highly hazardous materials.

Table 2: PPE required for laboratory tasks

Lab Task	Health or Safety Hazards	Required PPE	Precautions for Highly Hazardous Materials*
Handling all samples from animals and humans (body fluids, tissues, swabs)	Zoonotic disease potential	Lab coat, closed shoes, disposable nitrile gloves, eye protection and respirator (N95 minimum)	Use of Biosafety Cabinet Class II and eye protection for samples known to be highly infectious or use PPE kits.
Handling acids or chemicals that are irritants (i.e. formaldehyde)	Respiratory irritation, acid or alkaline burns	Lab coat, laboratory gloves, face mask, closed toe shoes.	Chemical fume hood
Operation of autoclaves	Burns	Appropriate gloves, eye protection, closed toe shoes.	Care in opening the door to avoid burns from escaping steam.
Dry ice, liquid nitrogen	Burns, asphyxiation risk	Appropriate gloves, eye protection, closed toe shoes, and use in well-ventilated room.	Dispose of any unused dry ice or liquid nitrogen in ventilated fume hood.
Centrifuges	Aerosolized fluids, zoonotic disease	Lab coat, facemask, appropriate gloves when handling samples or cleaning centrifuge.	Ensure proper balancing of centrifuge and contents. Do not open until rotor has stopped. Use closed-top swinger rotors to spin biological materials.
Hot plate	Possible burns	Appropriate gloves, closed toe shoes.	Do not leave unattended for extended periods.
Use of bleach to disinfect	Possible burns, respiratory irritation	Lab coat, gloves, closed toe shoes, and eye protection.	Use of chemical fume hood recommended when preparing bleach.
Disposing of needles, glass slides	Cuts, zoonotic disease	Gloves, sharps container, closed toe shoes.	Follow sharps safety procedures in this guide.
TRIzol Reagent (or Tri reagent; phenol solution)	Contact burns, systemic poisoning	In lab: Gloves, lab coat, close toe-shoes, eye goggles In field: Gloves, close toed-shoes, appropriate field PPE (e.g. coveralls, N95 mask, goggles per the task being performed – See Biosafety Guide)	Aliquot TRIzol for sampling in the field in a ducted biosafety cabinet or fume hood; Perform RNA extraction of samples collected into TRIzol in a biosafety cabinet

Definitions

***Highly hazardous materials** are chemicals, toxics and reactives that have the potential to cause immediate and permanent harm at feasible exposure levels. Chemicals that are highly toxic, are known to cause cancer or birth defects, have very low "permissible exposure limits," are highly reactive, or that react vigorously with common materials (such as water or air) should all be considered "highly hazardous materials." Chemicals that are under pressure, that can build up pressure, that can auto-ignite at possible temperatures, that burn vigorously and energetically, or that when burning cannot be extinguished with conventional methods, should be considered highly hazardous.

For a complete and updated list of Highly Hazardous Materials, visit the following OSHA link:
http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_id=9761&p_table=standards

****Personal Protective Equipment (PPE)** is specialized clothing or equipment worn by an employee for protection against infectious and other hazardous materials. The warranted components of PPE vary according to the tasks being performed by personnel. A basic PPE kit may include: gloves, gowns or other protective clothing (e.g., plastic apron), shoe and head covers, mask or respirator, and face or eye protection (e.g., goggles).

Review of Material Safety Data Sheets

PREDICT personnel must verify that a Material Safety Data Sheet (MSDS) for each product to be used during PREDICT activities is readily available, complete and updated (less than three years old).

Coordinators must ensure that personnel have read and understand the MSDS BEFORE using a chemical product.

Personnel must be familiar with the name of the chemical and understand the hazards, safe handling and storage, and specific emergency procedures BEFORE using a chemical product.

Copies of MSDSs for all chemicals used in the laboratory should be kept together in a binder and placed in an accessible location known to all laboratory personnel.

What is a Material Safety Data Sheet?

A MSDS is prepared by the supplier or manufacturer of the material and contains information on the potential hazards (health, fire, reactivity and environmental) and safe use of the chemical product. It is an essential information resource for all health and safety programs. The MSDS also contains information on the safe use, storage, handling and emergency procedures for all hazardous materials. The MSDS contains much more information about the material than found on the product label including what to do if accidents occur, and how to recognize and treat overexposure to the chemical product.

What information is on the MSDS?

The information of greatest concern to workers is featured at the beginning of the data sheet, including information on chemical composition and first aid measures. More technical information that addresses topics regarding the physical and chemical properties of the material and toxicological data appears later in the document. The 16-section MSDS is now recognized internationally. Each MSDS must include:

1. Identification (name, manufacturer and supplier names, address and emergency phone numbers)
2. Hazard(s) identification
3. Composition/information on ingredients
4. First-aid measures
5. Fire-fighting measures
6. Accidental release measures
7. Handling and storage
8. Exposure controls/personal protection
9. Physical and chemical properties
10. Stability and reactivity
11. Toxicological information
12. Ecological information
13. Disposal considerations
14. Transport information
15. Regulatory information
16. Other information

Emergency Overview

Harmful or fatal if swallowed. May be corrosive. This product contains a material which causes skin burns. This product contains a material which causes irreversable eye damage. May be harmful if absorbed through the skin. Vapor and/or spray must harmful if inhaled. Vapor irritates eyes, nose, and throat. Vapor generated at elevated temperatures irritates eyes, nose, and throat.

Route(s) of Entry: Inhalation? No Skin? No Eyes? No Ingestion? No

Potential Health Effects (Acute and Chronic)

INGESTION: Harmful or fatal if swallowed.

EYE CONTACT: This product contains a material which causes irreversible eye damage.

SKIN CONTACT: May be corrosive. This product contains a material which causes skin burns. May be harmful if absorbed through the skin.

INHALATION: Vapor and/or spray must harmful if inhaled. Vapor irritants eyes, nose, and throat. Vapor generated at elevated temperatures irritates the eyes, nose, and throat. Repeated exposure to high vapor concentrations may cause irritation of the respiratory system and permanent brain and nervous system damage.

CHRONIC OVEREXPOSURE: Avoid long-term and repeated contact. This product contains an ethylene series glycol ether and/or acetate which has been shown to cause adverse effects on the kidneys, liver, blood and/or blood-forming tissue. This product contains diethylene glycol monobutyl ether (DEGBE). DEGBE consumed in drinking water at low levels by rats for 30 days caused injury to either the liver, kidney, spleen, or testes.

Licensed to A V Systems, Inc. MSDS MSDS, (c) A V Systems, Inc. ANSI Format

Different jurisdictions have different content requirements for Material Safety Data Sheets. Despite the internationally recognized standard, a MSDS prepared in accordance with the United States OSHA Hazard Communication Standard is not necessarily acceptable in other countries. Check with local health authorities to ensure that your MSDSs are in compliance with local regulations.

Where to obtain MSDSs for chemical products?

A MSDS can be requested from the manufacturer or supplier of the product; in addition several MSDS databases exist online including:

SIRI MSDS index: **http://siri.org/msds/index.php**
MSDS online: **http://www.msdsonline.com** or **http://www.msdsonfile.com/mctx/msds/msdsonfile.jsp**
MSDS Hazard Communication Library: **http://www.setonresourcecenter.com/MSDSs/comply1.htm**

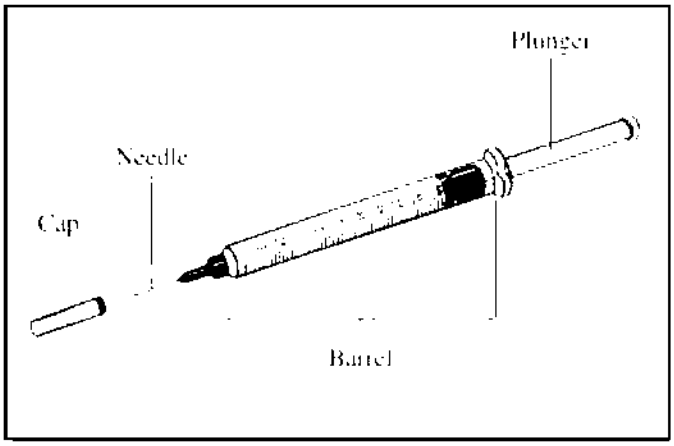
Needlestick Injury Prevention

Needlestick injuries are of concern in basic laboratory settings because they can result in the inoculation of personnel with infected materials. Additionally, skin breaks from needlesticks can act as portal of entry for environmental pathogens.

Most needlestick injuries occur during the following activities

- Recapping, bending, or breaking needles.
- Inserting a needle into a test tube or specimen container and missing the target.
- Carrying unprotected sharps.
- Leaving sharps in unexpected places, such as clothing.
- Handling or disposing of waste that contains used sharps.

Parts of a Syringe and Needle



Procedures to Prevent Needlestick Injuries

- Follow proper techniques when using needles and syringes.
- Be familiar with the different types and components of syringes and needles.
- When **uncapping a syringe needle**, pull the cap straight off to remove it and expose the needle.
- **Never leave an uncapped needle lying around.** A used syringe with the attached needle should be placed in a sharp disposal container immediately after use (a sharps disposal

container is designed for safe containment of medical articles that may cause punctures or cuts to those handling them – see below).

- **Removal of the syringe needle** may be necessary for transfer of the sample to another container, or for disposal of only the needle in the sharp container. When removal of the needle is necessary:
- Make sure not to remove the cap--twist the entire needle to take it off the syringe along with the cap. Alternatively, the needle may be removed from the syringe by use of forceps.
- Uncapped needles should never be removed from the syringe by hand.
- **Syringes and needles** used on humans should never be recapped. However, when working with animals and in the field, it may be necessary to carefully recap a needle to avoid accidental sticks if a sharps container is not immediately available.

If you recap a needle, use the *ONE HAND METHOD*

1. Lay the cap on a table or on a flat surface.
2. Hold the syringe by the end.
3. Tilt the end of the syringe up, so that the needle inside the cap is point down onto the surface.
4. Insert the needle on the syringe into the cap.
5. "Fish" up the cap with the needle.
6. Use the same hand to recap the needle.
7. Apply enough pressure to set the cap onto the needle.

If a needlestick occurs, it must be reported to your local PREDICT Supervisor and a medical professional immediately.

Section 6.3.4. Biohazards of Zoonotic Pathogens

Investigators working with domestic and wild animals and humans or with animal and human samples are at risk of disease due to exposure to zoonotic pathogens (pathogens transmitted between animals to humans). The zoonotic disease risk varies depending on the animal species being handled, but is generally caused by direct contact (e.g., contaminated/dirty hands), through open cuts, contact with blood and other body fluids, or inhalation of contaminated materials.

When performing tasks with risk of exposure to zoonotic pathogens (such as handling live or dead animals or samples from humans, collecting, testing, or packaging samples), PREDICT personnel should always wear the appropriate PPE as warranted by the assessed risk. It is the responsibility of the supervising veterinarian or medical specialist to determine the required PPE components for specific activities, based on an established PREDICT protocol or based on a risk assessment. (*See **Section 4. Biosafety and PPE Use** for more information about determining the appropriate PPE.)*

In the event that any personnel believe they have been exposed to material from a person or animal, they should immediately report the exposure to their supervisor, and if warranted seek the appropriate medical attention and follow-up.

Species-Specific Biosafety Precautions

The PREDICT Program will conduct surveillance and sampling among several groups of species. This section discusses special biosafety considerations for some of the key groups of species (bats, rodents, and non-human primates) likely to be handled as part of PREDICT activities.

Rodents, bats, non-human primates and other wild species may harbor pathogens that are transmittable to, and highly pathogenic in, humans. When handling these rodents, bats or non-human primates, careful consideration needs to be given to conscientious use of PPE, good personal hygiene (i.e., hand washing), safety training, and application of good animal handling and sampling techniques to minimize exposure to infection or injury.

In the event of an injury while handling animals that pose risk of zoonotic pathogen exposure, appropriate first aid must be applied. The risk of infection can be significantly reduced with immediate and thorough scrubbing of the wound with soap or antiseptic.

Vaccination to prevent rabies infection: Personnel who are handling animals that are known reservoirs for rabies (e.g., bats and dogs) should be immunized against rabies virus according to World Health Organization and CDC recommendations.

Investigators should familiarize themselves with known biohazards specific to species under study and with the procedures for the isolation and control of zoonotic pathogens.
Specific considerations with regard to working with rodents, bats and non-human primates are discussed below:

Rodents

Wild rodents have the potential to carry a variety of zoonotic bacteria and viruses that can be passed on to those handling them. Because of the serious consequences of becoming infected, personnel must always follow good personal hygiene and animal handling procedures and use the provided PPE to protect against exposure.

Special Precautions:

- Wear the minimum PPE for handling rodents as specified in the PREDICT PPE Use Guide, this includes an N95 mask, eye-protection, gloves and coveralls, or clean dedicated clothing.
- Personnel who are handling animals should be immunized against rabies virus according to the World Health Organization and CDC recommendations.

Bats

Exposure to wild bat roosts (in caves or trees), handling of bats in the field or handling bat excreta (urine or feces) presents a potential for exposure to zoonotic pathogens. Rabies, Nipah virus, Ebola virus, and the fungal disease histoplasmosis are examples of zoonotic pathogens carried by some bat species. Bat bites, scratches and wound and mucous membrane exposure to bat saliva are the ways in which rabies can be transmitted. Spores of histoplasmosis can be present in soil and debris enriched with bird and bat droppings. When this dry soil is disturbed, spores can become airborne and cause infection by inhalation.

Special Precautions:

- When working around bats in enclosed spaces, such as in a cave, wear at a minimum an N95 respirator, goggles, gloves and Tyvek coveralls (or dedicated long-sleeved clothing).
- Personnel who are handling animals such as bats should be immunized against rabies virus and be aware of appropriate post exposure prophylaxis in the case of bites according to World Health Organization and CDC recommendations.

Non-Human Primates

Non-human primates may be infected with a number of potentially serious zoonoses. For example, all macaque monkeys and their fluids should be considered to be infected with **Herpes Simian B virus**. Marmosets, although they do not carry the herpes B virus, can carry other disease agents that affect humans such as lymphocytic choriomeningitis virus and *Trypanosoma cruzii*, the cause of Chagas' disease. It is critical that work with non-human primates be done while wearing the appropriate personal protective equipment and with the well-established safe protocols and procedures.

Special Precautions:

- Personnel must follow strict hygiene procedures. Frequent and thorough hand washing, although too often overlooked by the staff, is critical to physically remove bacterial contamination and prevent ingestion exposure.
- PREDICT personnel must wear the minimum PPE for handling non-human primates as specified in the PREDICT PPE Use Guide. This includes an N95 mask, eye-protection, gloves and coveralls or clean dedicated clothing.

Biosafety Levels and Practices

General

All laboratories handling biological agents must post signage indicating that the site is a potential biological hazard area, and identifying all agents in use. Supervisors shall ensure that employees are informed of biological hazards and that suitable biosafety controls are in place. Country Coordinators and lab and field supervisors managing surveillance and other field and laboratory activities should ensure that appropriate biosafety practices are implemented by personnel. Biological safety cabinets are to be certified annually.

It is important to know the biosafety level of the disease that you are working with before beginning work, so that the correct precautions can be taken.

Note: All samples collected for the PREDICT project are to be handled in a Class II Biosafety Laboratory.

Basics of Biosafety Level 1

Biosafety Level 1 (BSL1) practices represent a basic level of containment that relies on standard microbiological practices and basic safety equipment and lab design for laboratories that work with defined and characterized strains of viable microorganisms not known to consistently cause disease in healthy adult humans. However, many agents not ordinarily associated with disease processes in humans are opportunistic pathogens and may cause infection in the young, the aged, and immuno-deficient or immunosuppressed individuals.

BSL-1 Standard Microbiological Practices

1. Access to work areas is limited at the discretion of the supervisor.
2. Hands must be washed after handling biological materials, removing gloves, or before leaving the laboratory.
3. No eating or drinking is allowed in the laboratory.
4. Only mechanical devices are used for pipetting.
5. Safety devices such as self-protected injection syringe or non-sharps should be used as an alternative to sharps. Sharps used should be handled and disposed of properly.
6. Activities that are likely to create splashes, sprays, or aerosols should be minimized.
7. Work surfaces should be decontaminated with 10% bleach (70% ethanol for metal surfaces) at least daily (before and after work with infectious samples) and after any spills.
8. Waste materials should be disposed of properly.
9. Secondary containment should be used when transporting bio-hazardous materials outside of the laboratory. Avoid public areas during transport.

BSL-1 Safety Equipment (Primary Barriers)

1. BUTTONED lab coats should be worn to protect street clothes.
2. Barrier (preferably non-latex) gloves should be worn, particularly if hands have broken skin or a rash.
3. Appropriate eye/face protection (safety goggles as a minimum) should be worn if splashes or sprays are anticipated, or if wearing contact lenses during lab work.

BSL-1 Laboratory Facilities (Secondary Barriers)

1. The lab should have a sink for hand washing.
2. The lab should have an eye wash station.
3. The lab should have a door for access control.
4. The lab fixtures and floors should be easily cleaned and disinfected (no carpets or rugs); bench tops are to be impervious to water and resistant to both moderate heat and the chemicals used to decontaminate the work surface and equipment.

Note: BSL-1 is NOT APROPRIATE for PREDICT samples.

Basics of Biosafety Level 2

Biosafety Level 2 is more restrictive than BSL-1 and is suitable for work involving agents of moderate potential hazard to personnel and the environment. All PREDICT samples are to be handled in a Biosafety level 2 laboratory. It differs in that (a) laboratory personnel have specific training in handling pathogenic agents and are directed by trained technologists, (b) access to the laboratory is limited when work is being conducted, (c) extreme precautions are taken with contaminated sharp items, and (d) certain procedures in which infectious aerosols or splashes may be created are conducted in biological safety cabinets or other physical containment equipment. **All PREDICT samples are to be handled in Class II biological safety cabinets, in Biosafety level 2 laboratory.**

BSL-2 Standard Microbiological Practices

1. Personnel must wash their hands after they handle viable materials, after removing gloves, and before leaving the laboratory.
2. Eating, chewing gum, drinking, smoking, handling contact lenses, and applying cosmetics should not be permitted in the laboratory. Persons who wear contact lenses in laboratories should also wear goggles or a face shield. Food should be stored outside the work area in cabinets or refrigerators designated for this purpose only.
3. Only mechanical pipetting devices are used for pipetting.
4. Policies for safe handling of sharps (when non-sharps are not available) should be instituted.
5. All procedures should be performed carefully to minimize the creation of splashes or aerosols.
6. Work surfaces should be decontaminated with 10% bleach (70% ethanol for metal surfaces) at least once a day (before and after working with infectious samples) and after any spill of viable material.

7. All cultures, stocks, and other regulated wastes are disposed of in the biohazard trash by placing them in a durable, leak-proof container, closed for transport from the laboratory, and transferred to the designated receptacle for disposal. Materials to be decontaminated at off-site locations from the laboratory should be packaged in accordance with applicable local, state, and federal regulations, before removal from the facility.

BSL-2 Special Practices

1. Access to the laboratory is limited or restricted by the laboratory supervisor when work with infectious agents is in progress. In general, persons who are at increased risk of acquiring infection, or for whom infection may be unusually hazardous are not allowed in the laboratory. Persons who are immuno-compromised, immunosuppressed, pregnant or at higher risk of acquiring infections, should not be permitted in the laboratory.
2. The laboratory director establishes policies and procedures whereby only persons who have been advised of the potential hazard and meet specific entry requirements (e.g., immunization) enter the laboratory.
3. Laboratory personnel receive appropriate immunizations or tests for the agents handled or potentially present in the laboratory (e.g., hepatitis B vaccine or TB skin testing).
4. A high degree of precaution must always be taken with any contaminated sharp items, including needles and syringes, slides, pipettes, capillary tubes, and scalpels.
    - Only needle-locking syringes or disposable syringe-needle units (i.e., needle is integral to the syringe) are used for injection or aspiration of infectious materials. Used disposable needles must not be bent, sheared, broken, recapped, removed from disposable syringes, or otherwise manipulated by hand before disposal; rather, they must be carefully placed in conveniently located puncture-resistant containers used for sharps disposal. Non-disposable sharps must be placed in a hard-walled container for transport to a disposal area.
    - Broken glassware must not be handled directly by hand, but must be removed by mechanical means such as a brush and dustpan, tongs, or forceps. Containers of contaminated needles, sharp equipment, and broken glass should be decontaminated with 10% bleach before disposal, according to any local, state, or federal regulations.
5. Cultures, tissues, or specimens of body fluids are placed in a container that prevents leakage during collection, handling, processing, storage, transport, or shipping.
6. Laboratory equipment and work surfaces should be decontaminated with an appropriate disinfectant (such as 10% bleach) on a routine basis, before and after work with infectious materials is finished, and especially after overt spills, splashes, or other contamination by infectious materials. Contaminated equipment must be decontaminated according to any local, state, or federal regulations before it is sent for repair or maintenance or packaged for transport in accordance with applicable local, state, or federal regulations, before removal from the facility. Bleach (10%) can be used on all non-steel surfaces; however, 70% ethanol or other recommended disinfectant should be used when those chemicals are not available.

7. Spills and accidents that result in overt exposures to infectious materials should be reported immediately to the laboratory director. Medical evaluation, surveillance, and treatment should be provided as appropriate and written records should be maintained.

BSL-2 Safety Equipment (Primary Barriers)

1. **Properly maintained biological safety cabinets, Class II,** and other appropriate personal protective equipment or physical containment devices **should be used**.

Procedures with a potential for creating infectious aerosols or splashes are a hazard. These may include centrifuging, grinding, blending, vigorous shaking or mixing, sonic disruption, opening containers of infectious materials whose internal pressures may be different from ambient pressures, inoculating animals, and harvesting infected tissues from animals, eggs or cell cultures.

2. Face protection (goggles, mask, face-shield or other splatter guards) should be used for anticipated splashes or sprays of infectious or other hazardous materials to the face, when the microorganisms must be manipulated outside of the biosafety cabinet.
3. Protective laboratory coats, gowns, smocks, or uniforms designated for lab use should be worn while in the laboratory. This protective clothing should be removed and left in the laboratory before leaving for non-laboratory areas (e.g., cafeteria, library, administrative offices). All protective clothing should be disposed of either in the laboratory or laundered by the institution; it should never be taken home by personnel.
4. Gloves (nitrile or latex) should be worn when hands may contact infectious materials, contaminated surfaces or equipment. Wearing two pairs of gloves may be appropriate, if a spill or splatter occurs; the hand will be protected after the contaminated glove is removed. Gloves should be removed and disposed of when contaminated, removed when work with infectious materials is completed, and should not be worn outside the laboratory. Disposable gloves are not washed or reused.

BSL-2 Laboratory Facilities (Secondary Barriers)

1. Each laboratory should contain a sink for hand washing.
2. The laboratory is designed so that it can be easily cleaned and disinfected. Rugs in laboratories are not appropriate, and should not be used because proper decontamination following a spill is extremely difficult to achieve.
3. Bench tops are impervious to water and resistant to acids, alkalis, organic solvents, and moderate heat.
4. Laboratory furniture is sturdy, and spaces between benches, cabinets, and equipment are accessible for cleaning.
5. An eyewash facility is readily available.
6. The laboratory should be at negative pressure with respect to areas outside the lab. Hoods and biosafety cabinets should be positioned away from doors, supply vents and air conditioner airflow.

Biosafety Level 3

Biosafety Level 3 is applicable to working with indigenous or exotic agents, such as brucella and tuberculosis, that may cause serious or potentially lethal disease through the inhalation route of exposure. Laboratory personnel must receive specific training in handling pathogenic and potentially lethal agents, and must be supervised by scientists competent in handling infectious agents and associated procedures. All procedures involving the manipulation of infectious materials must be conducted within a BSC (preferably Class II or Class III), or other physical containment devices. A BSL-3 laboratory has special engineering and design features.

Biosafety Level 4

Biosafety Level 4 is required for work with dangerous and exotic agents, such as Ebola, that pose a high individual risk of aerosol-transmitted laboratory infections and life-threatening disease that is frequently fatal, for which there are no vaccines or treatments, or a related agent with unknown risk of transmission. Agents with a close or identical antigenic relationship to agents requiring BSL-4 containment must be handled at this level until sufficient data are obtained either to confirm continued work at this level, or re-designate the level. Laboratory staff must have specific and thorough training in handling extremely hazardous infectious agents. Laboratory staff must understand the primary and secondary containment functions of standard and special practices, containment equipment, and laboratory design characteristics. All laboratory staff and supervisors must be competent in handling agents and procedures requiring BSL-4 containment. The laboratory supervisor in accordance with institutional policies controls access to the laboratory.

Section 6.3.5. Medical Monitoring

The major purpose of medical monitoring is the early detection of disease or conditions for which treatment can prevent further illness. Medical monitoring is conducted to evaluate exposure to human and zoonotic diseases and unanticipated adverse health effects of exposure. It can also be a valuable tool for hazard control to monitor if initially effective control or work practice has lost effectiveness, or by detecting previously unknown exposures.

Medical consultations should take place:

- Whenever an injury occurs, such as a needlestick, or splash with contaminated material.
- Whenever an employee develops symptoms of exposure to a hazardous chemical or biological agent to which the employee may have been exposed in the laboratory.
- Whenever a spill, leak, explosion, or other occurrence results in the likelihood of an overexposure to a hazardous chemical or biological agent.
- When an employee requests a medical consultation due to health concerns related to assigned tasks and/or change in personal medical history, such as pregnancy, special medications, diagnosed hypersensitivities or other illnesses.
- When exposure monitoring results trigger medical surveillance requirements or when other regulations mandate medical consultations, such as for the use of respiratory protection.

Section 6.3.6. Medical Waste Management

Safe Sharps Disposal

The term "sharps" refers to any object that can cut or puncture the skin including, but not limited to, needles (hypodermic and suture), scalpels, lancets, broken vials or glass, broken capillary tubes, slides and coverslips, and exposed ends of contaminated wires. The primary cause of occupational exposure to blood-borne pathogens in field and laboratory personnel is injury from needlesticks or other sharp objects. At least 20 pathogens are known to have been transmitted following percutaneous exposure to blood. Infections with each of these pathogens are potentially life threatening – and preventable.

How to prevent sharp injuries:

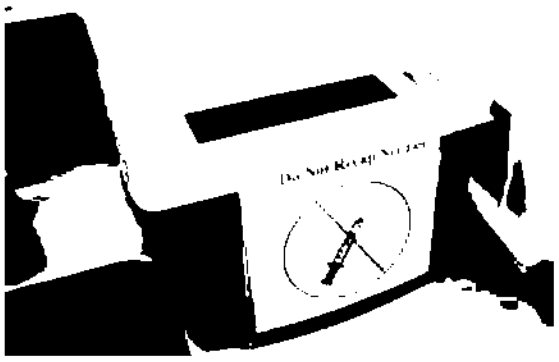
- Do not bend, break, or cut sharps. Shearing or breaking of needles is prohibited.
- Concentrate on what you are doing and do not get distracted.
- Dispose of all sharps in an approved puncture-resistant container as soon after use as possible.
- Ensure this container is placed in the area where sharps are used.
- Ideally, needle and syringe should be disposed as one unit if possible. If a needle must be removed follow the directions on the **Removal of the syringe needle** section above.
- Do not recap needles unless absolutely necessary. If recapped, never use two hands, instead use the one-hand "scoop" technique (see **Removal of the syringe needle** section above).
- Do not overfill sharps disposal container. Seal the container and replace when it is ¾ full.
- Do not empty sharps containers. Dispose of whole container as one unit.
- Wear utility gloves when disposing of medical waste including sharps containers.
- To prevent sharp injuries during transport of medical waste, use a puncture-proof container that remain closed.

Sharps Disposal Containers

Never discard needles and sharps in waste bags, as personnel might be injured when they handle the bags.

Sharp containers are available commercially or can be adapted from some containers that comply with minimal safety standards.

Commercial sharp disposal container boxes)



Non-commercial sharp disposal containers (safety

There are four major criteria for sharps disposal container safety performance, functionality, accessibility, visibility, and accommodation:

Functionality: Containers should remain in a good state during their entire usage. They should be leak-resistant on their sides and bottoms and puncture-resistant until final disposal. Individual containers should have adequate volume and safe access to the opening.

Accessibility: Containers should be accessible to all workers who use, maintain, or dispose of sharp devices. Containers should be placed in all areas where sharps are used and, if necessary, be portable within the workplace or for fieldwork. Portable containers must have a lid to prevent spills and injuries during transport or while working in the field.

Visibility: Containers should be plainly visible to the workers who use them. Workers should be able to see the warning labels and the degree to which the container is full.

Accommodation: Container designs should be convenient, environmentally sound, and easy to store.

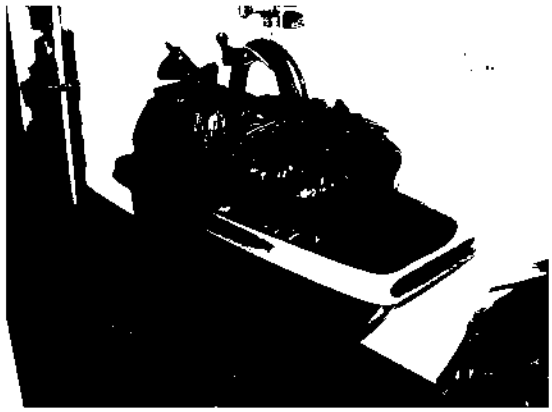
Medical Waste Disposal

Biological waste includes human and animal tissues, fluids and animal carcasses. These are generated along with the sharps and other biologically contaminated equipment that typically need to be discarded in all laboratories (e.g. pipette tips, gloves).

Animal carcasses should be bagged, sealed, and stored in freezers located in the facility until pick up for incineration.

All other biologically contaminated material should be placed in a red bag-lined medical waste box. When the medical waste box is full, it is the responsibility of the field and laboratory personnel to seal the bag, seal the box, and apply a label that contains information about the generating lab.

Medical waste container appropriate for storing and transporting biological waste



Inappropriate container and method for storing and transporting biological waste

Section 6.3.7. Special Chemical Storage and Handling Practices

Laboratory chemical storage and handling hazards can be effectively managed if you:

- Maintain good inventory control and purchase/use the least amount possible.
- Label all stored and in-process chemicals clearly and completely.
- Adopt safe handling practices.
- Use secondary containment and practice your spill response plan.
- Segregate incompatible chemicals and store them in separate appropriate cabinets or cold-storage.
- Develop special controls for highly hazardous materials.

Inventory Control

- Purchase chemicals only in the quantities needed and in containers of the smallest practical size. Although the cost may be higher, significant savings will be gained by reduced hazardous waste disposal or clean-up costs.

- Inventory your chemical supplies at least annually and actively share or distribute excess stocks with other departments to minimize waste. Dispose of all unused and outdated chemicals through appropriate hazardous waste programs.
- Products that could also be purchased for home use, such as soap, oil, or cleaning sprays, should be part of your chemical inventory and have an MSDS on file if the product will be used in an occupational setting and could cause a health exposure in the workplace.
- Before laboratory personnel leave the laboratory, all leftover chemicals should be inventoried and distributed or disposed of.

Labeling

Personnel should ensure that labels on containers of hazardous chemicals are not removed or altered, particularly the manufacturer's original label. Empty chemical containers must never be reused for another purpose, even if the labeling is changed as reactions with new liquid and residual chemical could be extremely dangerous. All bottles, containers, and other apparatus containing chemicals should be accurately and clearly labeled as to contents, hazards, and where practical, the appropriate precautions required when handling the chemical.

Avoid the use of grease pencils or other markers that will wear off.

There are three levels of complexity to labeling: original container, secondary transfer containers, and small container (vials, flask, beakers) for immediate, same-day use.

1. The manufacturer's original labels must contain the following information:
    - Name of chemical or solution
    - Manufacturer name and emergency telephone number
    - Hazard warning (health effect or target organs)

    When opening you must add:
    - Date received and opened
    - Initials

2. For laboratory-prepared solutions and when chemicals are transferred to secondary containers not intended for immediate use, labels should include:
    - Name (no abbreviations) of the chemical and its concentration.
    - For prepared solutions or any secondary containers: initial and date prepared.
    - Hazard warning on the most serious health or safety hazard posed (consult MSDS). Stickers can be applied indicating "corrosive," "carcinogen," "water-reactive," "flammable," etc.
    - If special precautions are critical, expand the hazard warning to include the target organ and the required protection (e.g., "Corrosive, esp. to skin and eyes. Use gloves and goggles").

3. Containers for immediate (same-day) use should have:
    - Chemical name and its concentration
    - Date
    - Initials

Safe Handling and Transfer

Hand-carried chemicals should be placed in unbreakable secondary containers such as bottle carriers or acid-carrying buckets. Wheeled carts used to transport chemicals should have side guards and lipped surfaces capable of containing a break, and sturdy wheels that move easily over uneven surfaces.

Staff should wear protective aprons, gloves, goggles and closed-toed shoes when transporting chemicals.

Class I flammable liquids (any liquid having a flash point below 37.7°C should not be stored or transferred from one vessel to another in an exit access corridor, open plan building, or in an ancillary space unprotected from the exit access corridor.

Transfer of Class I liquids to smaller containers from bulk stock containers not exceeding 5 gallons in capacity should be performed in a laboratory hood, in an area provided with ventilation adequate to prevent accumulations of flammable vapor exceeding 25% of the lower flammable limit, or within an inside liquid storage area approved for dispensing.

Class I liquids should not be transferred between conductive containers of greater than 1.1 gallons, unless the containers are bonded and grounded (the process of providing an electrically conductive pathway - usually by clipping connecting wires - between a dispensing container and a receiving container [bonding], and the receiving container and an earth ground).

Secondary Containment and Spill Control

Liquid chemicals should be stored in corrosion-resistant trays or on spill pallets or other secondary containment to contain a break or leak.

Concentrated acids and bases should be stored in acid or caustic storage cabinets. If possible, keep corrosives stored in their original (e.g. Styrofoam cubes) shipment containers.

In the event of a chemical spill, try to turn off all reaction apparatus, especially heat sources, notify supervision immediately and follow the response steps in your facility.

Cabinet and Shelf Storage – General Precautions

Cabinets and other storage areas should be marked with the general class of chemical stored, and any other pertinent warnings.

Storage areas should have good general ventilation and be well lighted.

On shelves, containers should be staggered for easy access, with labels facing out. DO NOT ALPHABETIZE STORED CHEMICALS; SEPARATE BY COMPATIBILITY (see next section).

Heavy and large containers are to be placed on bottom shelves. Chemicals, especially liquids, should be stored below eye level. Larger containers should be stored on lower shelves. Exposure to heat or direct sunlight should be avoided. Avoid storing chemicals on the floor unless in approved shipping containers. Minimize open shelf or bench top storage, except for those chemicals currently being used, to prevent accidental spills and reduce the risk of fires.

Cabinets specifically for corrosives (either acids or bases) should have corrosion-resistant paint. Flammable storage cabinets should provide an airtight seal; vent holes should be kept covered and flame-arrestor kept in place.

Oxidizers MUST be stored in separate cabinets from flammables and combustibles. Oxidizers, explosives, and organic peroxides must be separated from combustibles and placed in a metal cabinet, or in an approved dry, cool, and well-ventilated location.

If acids and bases must be stored together in the same cabinet, place each in separate secondary containers (non-reactive trays) on opposite sides of the cabinet to minimize intermingling in case of a spill or drip (in other words, do not store all the acids on one shelf, and all the bases on the shelf below).

Initially assign each chemical to broad hazard classes, for example: flammable, corrosive (acids and bases), reactive oxidizer or reducer, special hazard (air/water reactive, peroxide forming chemical, store at reduced temperature or under an inert atmosphere, highly toxic).

Chemicals that possess more than one hazard (i.e., oxidizer and corrosive) are assigned to the class that represents the greater hazard for that laboratory.

Post incompatibility lists (from your MSDSs) for reference.

Hazardous chemicals should be disposed of in clearly labeled containers, and as with storage, separated by class. For example, acids should not be disposed of with bases but should be separated. The same is true for corrosives and flammables.

Refrigerators and Freezers – Flammable Storage

All refrigerators or freezers should be distinctly marked as to whether they are suitable for the storage of flammable liquids.

Standard household-variety refrigerators should not be used to store flammable liquids.

Flammable liquids stored in refrigerated equipment should be in closed containers.

Storage of Chemicals by Class

Flammables and Combustibles

Flammables are chemicals that have a flash point less than 37°C (100°F). Combustible chemicals have flash points that are 37-93°C. If stored or used improperly, flammables and combustibles can be a fire hazard.

Examples of flammable liquids include benzene, alcohols, acetone, ethers, organic acids (i.e., glacial acetic acid).

The quantity of flammable/combustible hazardous chemicals within a laboratory unit or in a laboratory work area, that is stored in the open, shall be limited to the minimum necessary to perform required tasks.

Bulk supplies of alcohol (such as 95% EtOH in drums) should be stored in an approved flammable liquids storage room.

To the greatest degree possible, the storage of flammable liquids in a laboratory work area, outside of an approved flammable liquids cabinet, or storage room should be limited to what is needed for a single day's use. Otherwise, flammable liquids should be stored within an approved flammable liquids cabinet when not in use.

Corrosives: Acids

Acids are corrosive and react violently with bases. There are two main groups of acids: organic acids, and inorganic (mineral) acids. Some inorganic (mineral) acids are oxidizers and will react with organics, increase burning rate of combustibles and contribute an oxygen source to a combustion reaction. Therefore, inorganic (mineral) acids should be stored separately from organic acids.

Examples of inorganic OXIDIZING acids: perchloric acid (particularly dangerous at elevated temperature), chromic acid, nitric acid, sulfuric acid (particularly dangerous at elevated temperature).

Examples of inorganic MINERAL acids: hydrochloric acid, hydrofluoric acid, phosphoric acid.

Examples of organic acids: acetic acid, formic acid, butyric acid, propionic acid, picric acid, acrylic acid.

Oxidizing inorganic acids should be segregated from organic acids, flammable and combustible materials. Most mineral acids can be stored together, except perchloric acid (see below):

Nitric acid shall be stored separate from other acids.

Segregate acids from bases and active metals such as potassium and magnesium.

Segregate acids from chemicals that could generate toxic gases upon contact, such as sodium cyanide.

Segregate acids from solvents such as toluene and xylene.

Organic acids (e.g., glacial acetic acid) are combustible and should be stored separately or with flammables rather than with inorganic acids. Several inorganic acids are oxidizers and are therefore incompatible with organics.

Corrosives: Bases
Bases are corrosive and react violently with acids.

Examples: ammonium hydroxide, sodium hydroxide, calcium hydroxide, organic amines.

Segregate bases from acids. Bases are also corrosive to skin and tissue. Pay meticulous attention to PPE when using bases.

Reactive: Oxidizers
Oxidizers react vigorously with reducing materials. The reaction can lead to fires or explosions. Oxidizers will increase the burning rate of combustible materials and contribute oxygen to a combustion reaction.

Examples: halogens, ammonium persulfate, hydrogen peroxide, sodium dichromate, potassium permanganate, perchloric acid; at elevated temperature, ammonium nitrate (and other nitrate salts).

Keep oxidizers away from flammables, combustibles (such as paper, wood) and other reducing agents.

Reactive: Reducers
Reducing materials react vigorously with oxidizers. The reaction can lead to fires or explosions.

Examples: ammonia, carbon, metals, metal hydrides, phosphorus, silicon, sulfur.

Store reducing materials away from oxidizers.

Water-reactive Chemicals
Water reactive materials react with water, water solutions, moisture, or humidity in the air to produce heat and/or flammable gases, which can ignite.

Examples: sodium (elemental), potassium (elemental), calcium carbide, phosphorous pentachloride.

Store water reactives away from any sources of water or moisture. Review manufacturer's recommendations for special storage conditions, such as under an inert atmosphere or, as in the case of elemental sodium, under mineral oil.

Peroxide Forming Chemicals

Potentially explosive peroxides are formed by a free-radical reaction of hydrocarbons with molecular oxygen. Distillation, evaporation or other concentration of the peroxide can cause an explosion in contaminated hydrocarbons.

Examples: diethyl ether, tetrahydrofuran, acetaldehyde, isopropyl ether.

Store peroxide-forming chemicals away from light and heat. Carefully label all containers with the date received and the date opened. Monitor container dates and avoid keeping peroxide-forming chemicals on hand for more than a year after receipt and 6 months after opening.

Highly Hazardous Chemicals

Highly hazardous chemicals are defined as chemical carcinogens, reproductive toxins, acutely toxic substances, and highly reactive materials (ex. Ethidium bromide used in molecular laboratories).

Designate a Restricted Work Area. Conduct all transfers and work with these substances in a "controlled area" (i.e., a restricted access hood, glove box, or portion of a lab designated for use of highly-toxic substances) for which all personnel with access are aware of the substances being used and the necessary precautions that must be taken. Only trained and authorized personnel should work in or have access to controlled areas.

Signs and labels. Assure that the controlled area is conspicuously marked with restricted access and warning signs, such as, "WARNING: Highly-Toxic Substance in Use: Authorized Personnel Only" or "WARNING: Cancer-Suspect Agent: Authorized Personnel Only." All containers of these substances must be appropriately labeled with identity and warning such as, "Warning: High Chronic Toxicity or Cancer Suspect Agent."

Storage. Store containers of these chemicals in a ventilated, limited access area in appropriately labeled, unbreakable, chemically resistant, secondary containers.

Establish Decontamination Procedures. The need for routine decontamination of designated work area, equipment, or personnel depends on the laboratory circumstances.

Medical surveillance. When using a highly toxic substance on a regular basis (e.g., 3 times per week), consult with your supervisor concerning medical surveillance or other health concerns you may have.

Cleanup and Waste Disposal. Use chemical decontamination whenever possible. Use a vacuum cleaner equipped with a High Efficiency Particulate Air (HEPA) filter, instead of dry sweeping

when the toxic substance is a dry powder. A wet mop may also be used when the chemical is not water reactive or otherwise incompatible with water. Ensure that all vacuum filters, bag debris, mop heads or cleaning rags, as well as waste chemicals are transferred from the designated control according to a hazardous waste disposal container. Ensure that contingency plans, equipment, and materials are available to minimize exposures to personnel and property in the event of an accident. Do not ask/expect custodial staff to clean hazardous materials spills, unless they are already members of the facility's trained response team.

Hazardous Waste Disposal and Spill Control

Each container of hazardous waste is to be labeled with the following legends:

"HAZARDOUS WASTE"
Contents (be specific as to chemical):
Accumulation start date:

If a reagent container label has been removed or becomes illegible, and the identity of the contents is unknown, the container must be disposed of as soon as possible by arrangement with the facility hazardous waste coordinator.

Prior to the departure of staff, chemicals for which that person was responsible should be inventoried and discarded or returned to storage.

Pouring hazardous waste chemicals down the drain, adding them to regular trash, or evaporating them in a local exhaust hood could be illegal actions!

Section 6.3.8. Training in Basic Laboratory Procedures and Protocols

Training and education in laboratory safety need to be an ongoing process, not just an annual presentation. The most effective way to reinforce good work practices is to involve all personnel from principal researchers to volunteers in regular, periodic reviews and updates of this Basic Laboratory Safety Guide. Documentation of all forms of training is to be maintained in the laboratory as well as reported to the facility safety coordinator.

INITIAL BASIC LAB HAZARD AWARENESS TRAINING **is mandatory for all staff** and must be provided to all employees doing field and laboratory work prior to actual lab and field work, and prior to assignments involving new potential exposures. Information provided during trainings should include:

The location and availability of the Laboratory Safety Plan, chemical inventory, Material Safety Data Sheets (MSDSs), applicable regulatory exposure limits, and other reference material regarding the safe handling, storage, and disposal of hazardous chemicals (or hazardous collections) in the lab.

Signs and symptoms associated with exposures to hazardous chemicals and biological agents used in the laboratory, as well as the health hazards themselves.

Methods that may be used to detect the presence or release of a hazardous chemical. This could include industrial hygiene monitoring, the use of continuous monitoring devices, visual appearance, or odors of chemicals.

Methods employees can take to protect themselves from hazards, including work practices, personal protective equipment and emergency procedures listed in the LSP. This should include a discussion of the proper use and limitations of engineering controls and safety devices, including chemical and biological hoods.

Emergency response plans established by each facility's Emergency/Disaster Response Plan, any medical or first aid response specifically recommended, extinguishment of clothing fires (Stop, Drop, and Roll), and Chemical Spill Response Plans established by each facility.

Section 6.3.9. Basic Standards and Guide Checklists

- ☐ Coordinators should provide a "Useful Contacts" list with address and numbers of local medical and emergency response services.
- ☐ Personnel should know the locations of the emergency supplies (fire extinguishers, first aid kits, spill kits, safety showers and eye wash stations), phone numbers of supervisor and exits.
- ☐ Coordinators must verify that a Material Safety Data Sheet (MSDS) for each product to be used during PREDICT activities is readily available, complete and updated.
- ☐ Personnel should know where the MSDSs are located.
- ☐ Coordinators must ensure that personnel have read and understood the MSDS before using a chemical product
- ☐ Coordinators must have MSDS data available for emergency responders.
- ☐ Individuals that have been exposed to any hazardous chemical or biological agent should immediately report the exposure to medical authorities and supervisor.
- ☐ A complete list with the contents of the PPE kit should be available to the personnel.
- ☐ Personnel should wear appropriate PPE (lab-coat, protective glasses, gloves, closed toed shoes) for laboratory procedures.
- ☐ Inspect your PPE to ensure that it is in proper working condition before use (goggles, gloves, etc.).
- ☐ If you are working with PPE kits, ensure that the kit is stocked and material has not expired.
- ☐ Personnel must use a chemical, fume or laminar flow hood when indicated.
- ☐ All needles, scalpel blades and any other sharp instruments should be used and disposed of in a manner that prevents accidental human injury.
- ☐ All stored and in-process chemicals should be labeled clearly and completely.
- ☐ Segregate incompatible chemicals and store in appropriate cabinets or special cold-storage.
- ☐ Develop special controls for highly hazardous materials.
- ☐ Purchase chemicals only in the quantities needed and in containers of the smallest practical size.
- ☐ Inventory your chemical supplies at least annually and actively share or distribute excess stocks with other departments.
- ☐ Dispose of all unused and outdated chemicals through appropriate hazardous waste programs and NOT down the drain or by adding them to regular trash.
- ☐ Sinks and eye wash stations should be kept clear and in proper working condition.
- ☐ Staff should wash their hands and forearms after they have removed and disposed their PPE or after removing gloves.
- ☐ Food and beverages are NOT allowed in any of the labs.
- ☐ Report any lab failure (equipment, facilities, etc.) to the supervisor.
- ☐ Staff should keep BUTTONED lab coats at all times when working in the laboratory.
- ☐ All human and animal tissues, fluids and excrement should be handled in a Class II Biosafety Cabinet so that the potential for human exposure is minimized.
- ☐ Specific Biosafety levels 1 and 2 practices should be followed by personnel as warranted.
- ☐ Personnel must be familiar with hazard controls and safe operating procedures.

Section 6.3.10. List of Equipment and Supplies

- [ ] Lab-coat
- [ ] Nitrile gloves ideal, latex if not available
- [ ] Face-mask
- [ ] Goggles
- [ ] Face-shield
- [ ] Closed toed shoes
- [ ] Disposable (Tyvek) suit
- [ ] Sharp-container
- [ ] Medical waste box
- [ ] Respirator
- [ ] PPE Kits or Supplies
- [ ] Eyewash station
- [ ] Liquid nitrogen gloves

Section 4. Biosafety and Personal Protective Equipment (PPE) Use

Prepared by
Terra Kelly, UC Davis
Matthew LeBreton, Metabiota
and the PREDICT One Health Consortium.

Objective: To provide principles and general guidelines for the use of Personal Protective Equipment (PPE) to prevent exposure to and transmission of infectious pathogens during PREDICT activities.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Biosafety and Personal Protective Equipment (PPE) Use.

Table of Contents: Biosafety and Personal Protective Equipment (PPE) Use

*Adapted from the *USAID STOP-AI Training Module: Introduction to PPE*

Section 4.1. Learning Objectives and Confirmation

After studying this guide, you will be able to:

- Implement basic biosafety precautions.
- Describe the factors to consider when assessing the biological risk of handling animals and collecting human and animal samples, and other field and laboratory activities that may have potential risk for zoonotic disease exposure.
- Understand factors to consider when choosing appropriate PPE based on identified risks.
- Identify and describe the functions of each component of PPE.
- Correctly put on and take off appropriate PPE for PREDICT sample collection and handling activities in a non-outbreak setting. For collecting samples from hospital and clinic patients and during disease outbreaks, specific PPE components and procedures to put on and take off PPE should be adapted based on the determined risk level.
- Describe the importance of respirator fit and fit testing.

Confirm you understand the material of this guide:
When you are familiar with the information in this guide, take the PREDICT quiz in ***Section 8.4.3. Biosafety and PPE Use***.

Section 4.2. Biosafety Overview

Personal Safety Responsibilities

- Individuals have the primary responsibility for their own health and safety. Nothing substitutes for good training and vigilance.
- Follow safety procedures outlined in PREDICT protocols regarding each activity that involves potential exposure to infectious pathogens.
- Use appropriate safety equipment.
- Report unsafe or hazardous situations, injuries, and accidents immediately to your supervisor or instructor.
- Report any illness to your PREDICT supervisor.
- Participate in required safety training.

Follow PREDICT waste disposal procedures (see ***Basic Laboratory Safety (Section 6.3.)*** *and* ***Safe Disposal of Carcasses and Infectious Waste Guide (Section 2.5.)***) consistent with the ***PREDICT Environmental Mitigation and Monitoring Plan (Section 2.4.)***.

Responsibilities of the Country Coordinator and Field Supervisors

- Provide and document training for all personnel who will participate in PREDICT project activities.
- Ensure compliance with relevant PREDICT or organizational task protocols.
- Ensure compliance with the PREDICT Environmental Mitigation and Monitoring Plan.
- Ensure compliance with local permit requirements and regulations.
- Report injuries/accidents and ensure compliance with associated mitigation.
- Ensure that all field personnel are trained on the safe use of field equipment.

General Zoonoses Biosafety Precautions

There is a risk of exposure to pathogens, including zoonotic pathogens, when handling animals, and human and animal samples in the field. Therefore, it is important to implement measures to minimize the risk of pathogen transmission.

The following list of general precautions applies to most situations:

- Inform all who enter potential zoonotic pathogen risk areas of their potential for exposure and the associated risks.
- Review information regarding the zoonotic agents likely to be found in the samples or animals to which you or others may be exposed.
- Wear the appropriate PPE based on protocols for the activity and species and as directed by the Country Coordinator or Field Supervisor.
- Use disposable supplies whenever possible.
- Wash hands and wrists after removing your gloves.
- Don't wear field or lab clothing or shoes outside of work areas where there may be zoonotic pathogen exposure. Change clothing and shoes before getting into your vehicle.
- Launder contaminated protective clothing at work. Don't take your protective clothing home with you.
- Never eat or drink in areas where human sampling, animals, their wastes, or their products (e.g., blood) are present.
- Wash your hands frequently and practice good hygiene. Avoid touching your face while working with animals, human and animal samples, or other sources of pathogens. Although a normal, healthy adult person may have only mild symptoms of a zoonotic disease, that person may unknowingly spread the disease to others. Unfortunately, animal handlers have "carried home" zoonotic pathogens to their infants with fatal consequences. Therefore, good hygiene is not only to protect the person working directly with human and animal samples; but it is also for all persons and animals with whom they have contact.
- When seeking medical advice for any illness, inform your physician of your work with humans and animals.
- Make sure a first aid kit is immediately available during all field and laboratory activities.
- Refer to established procedures for how to respond to a bite, cut, scratch, puncture or other injury that results in possible zoonosis exposure.

- Refer to established procedures for disinfecting all equipment, samples, cages, and traps according to guidance provided below.

Hand Washing - Teach and Practice Good Hand Washing Technique

The importance of hand washing in preventing infection and the spread of infectious pathogens cannot be over emphasized.

Always wash your hands before:

- Putting on PPE for handling animals or collecting or handling human and animal samples
- Contact with a sick or injured person or animal
- Treating wounds or administering medications
- Preparing food
- Eating
- Inserting or removing contact lenses

Always wash your hands after:

- Taking off PPE
- Touching an animal, human and animal samples, waste, products or animal equipment
- Collecting and handling diagnostic samples
- Visiting field sampling sites or clinics/hospitals
- Preparing foods, especially raw meat or poultry
- Using a toilet
- Changing a diaper
- Blowing your nose, coughing or sneezing into your hands
- Treating wounds
- Touching a sick or injured person
- Touching garbage or other potentially contaminated materials
- Finishing work in the laboratory

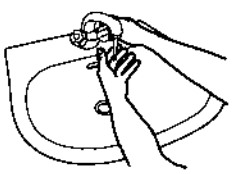
Plan for hand washing:

- Plan for hand washing in the field by identifying any locations with running water near the site and bringing supplies (i.e., water, soap, bucket, paper towels, hand sanitizing gels and germicidal wipes that contain at least 60% alcohol)
- Plan when you will need to wash to ensure supplies are ready and available

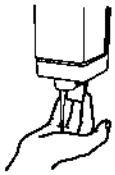
See the WHO guidelines below for proper hand washing technique. If soap and water are not available, use an alcohol-based hand sanitizing gel that contains at least 60% alcohol. These products significantly reduce the number of microbes on the skin and are fast acting. However, they are not effective if hands are visibly dirty. Organic matter and natural oils on hands create a barrier that blocks the effectiveness of the sanitizer. See http://www.cdc.gov/handwashing/show-me-the-science-hand-sanitizer.html for more information.

How to Hand

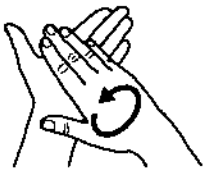
☐ **Duration of the entire procedure:**



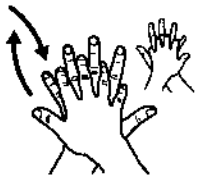
Wet hands with water;



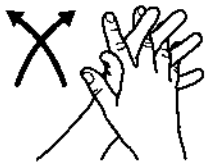
Apply enough soap to cover all hand surfaces;



Rub hands palm to palm;



Right palm over left dorsum with interlaced fingers and vice versa;

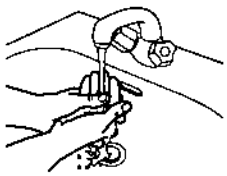


Palm to palm with fingers interlaced;

Backs of fingers to opposing palms with fingers interlocked;

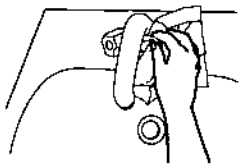
Rotational rubbing of left thumb clasped in right palm and vice versa;

Rotational rubbing, backwards and forwards with clasped fingers of right hand in left palm and vice versa;

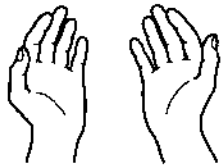


Rinse hands with water;

Dry hands thoroughly with a single use towel;



Use towel to turn off faucet;



Your hands are now safe.

Disinfection of Surfaces and Materials

Dirt and organic matter can protect microbes from decontaminants (antiseptics, chemical germicides and disinfectants). Therefore, precleaning contaminated surfaces as well as reusable supplies, equipment and PPE is important to achieve proper disinfection. Precleaning should be carried out cautiously to avoid exposure to pathogens.

Contact times for disinfectants are specific to the type of solution and the manufacturer. Therefore, it is important to follow the manufacturers' specifications. Further, solutions used for precleaning and disinfection should be the same or chemically compatible.

There are several types of disinfectants on the market and formulations should be selected for specific needs. High temperatures can degrade chemical disinfectants, so shelf-life may be decreased in areas with high ambient temperatures.

Chlorine bleach or Virkon disinfectant solution are commonly used as general-purpose disinfectants. See the WHO Laboratory Biosafety Manual (http://www.who.int/csr/resources/publications/biosafety/en/Biosafety7.pdf) for frequently used classes of disinfectants, with general information on their applications and safety profiles, as well as recommended dilutions for chlorine-releasing compounds, such as chlorine bleach.

Section 4.3. Assessing Biosafety Risk of Zoonotic Pathogens and Selecting PPE

Key to the practice of biosafety is assessing the risk of infection associated with a specific procedure under specific environmental conditions. There are many considerations in the assessment of risk and it is the job of the supervisor to weigh these considerations to determine the appropriate measures to protect humans and animals from infection.

Factors to Consider when Assessing Biological Risk of Procedures to Determine Necessary PPE

1. Species to be handled and sampled.
2. Pathogens likely to be present in these species/samples.
3. Pathogenicity of these pathogens (see WHO classification of infective microorganisms by risk group below).
4. Potential exposure opportunities and routes of infection for the pathogens given the planned activity.
5. Potential result of exposure to the pathogens.
6. Estimated infectious dose and stability of the pathogens in the environment.
7. Information available in the literature, including animal studies and clinical reports that would help inform on risk.
8. Measures to reduce the risk of exposure, such as sanitary measures (e.g., food and water hygiene) and control of animal reservoirs or arthropod vectors, the movement of people or animals, and the importation of infected animals or animal products.
9. Local availability of effective prophylaxis and treatment. Prophylaxis may include vaccination or antisera. Treatment options may include passive immunization and post-

exposure vaccination, antibiotics, and chemotherapeutic agents, taking into consideration the possibility of the emergence of resistant strains.

Based on the risk assessment considering the factors listed above, the following should be determined by the PREDICT activity supervisor (often Country Coordinators):

1. Hazards and risk of exposure.
2. Appropriate PPE required to implement the activity safely and to prevent transmission of infectious pathogens. (Components of PPE to consider are discussed later in this document).
3. Special procedures, such as disinfection procedures between handling individual animals and people or between site visits, that may be required to reduce risk of transmission and provide adequate protection for humans and animals.
4. Vaccinations or prophylaxis required for PREDICT personnel before the activity.

World Health Organization (WHO) Classification of Infective Microorganisms by Risk Group (2004)

WHO provides the guidelines below for classifying biological risk categories, based on pathogenicity of the organism and modes of transmission and host range of the organism. These primary factors are affected by existing levels of immunity, density and movement of host population (human or animal), presence of appropriate vectors and environmental conditions, and availability of effective preventive measures and treatment. Countries usually adopt a similar set of risk categories. The WHO risk group classification was developed for laboratory work. See **http://www.absa.org/riskgroups/** for more information and a link to the Risk Group Database where information on risk can be obtained for specific microbes and/or microbe families.

The WHO risk categories are:

WHO Risk Group 1 (no or low individual and community risk) -- A microorganism that is unlikely to cause human disease or animal disease.

WHO Risk Group 2 (moderate individual risk, low community risk) -- A pathogen that can cause human or animal disease but is unlikely to be a serious hazard to laboratory workers, the community, livestock or the environment. Laboratory exposures may cause serious infection, but effective treatment and preventative measures are available and the risk of spread of infection is limited.

WHO Risk Group 3 (high individual risk, low community risk) -- A pathogen that usually causes serious human or animal disease but does not ordinarily spread from one infected individual to another. Effective treatment and preventive measures are available.

WHO Risk Group 4 (high individual and community risk) -- A pathogen that usually causes serious human or animal disease and that can be readily transmitted from one individual to another, directly or indirectly. Effective treatment and preventive measures are not usually available.

Appropriate PPE for PREDICT Activities

While PREDICT field staff will be working in very different environments with varying levels of biological risk, there are some tasks for which **minimum PPE requirements** have been established and detailed in Table 1.

Table 1. Minimum PPE to wear for some PREDICT Tasks:

Taxa/Task	Respirator (N95 or respirator with comparable filtering rating	Goggles, Face shield or protective glasses	Gloves*	PPE Coveralls or Dedicated Clothing with washable shoes
Handling human and animal specimens	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Handling primates (live or carcass)	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Handling rodents or bats (live or carcass)	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Sampling in bat caves	Yes	Yes	Yes	PPE coveralls
Sampling or necropsy of sick/dead animals	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing) with apron
Sampling bushmeat	Yes	Yes	Yes	Yes (either PPE coveralls or dedicated clothing) with apron
Handling poultry or waterfowl	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Handling livestock	Depends**	Depends**	Yes	Yes (either PPE or coveralls or dedicated clothing)
Sampling apparently healthy humans	Depends***	Depends***	Yes	Depends***
Collection of animal feces or urine from the environment	Depends****	Depends****	Yes	Depends****
Sampling an animal once it has been anesthetized	Recommended if in close contact with the animal during sampling activity	Recommended for those in close contact with the animal during sampling activity	Yes	Yes (either PPE or coveralls or dedicated clothing)

Table Definitions

* When handling live animals that pose a bite or scratch risk, it is recommended that leather gloves be worn above nitrile gloves for added protection. Nitrile gloves are more puncture resistant than latex and may reduce the risk of exposure from a bite or scratch. In many cases chemical restraint (anesthesia) is recommended to prevent injury to either the handler or the animal during sample collection.

** It is recommended to use a respirator, full protective clothing and eye protection when in contact with livestock suspected of harboring a biohazardous agent and pregnant livestock or livestock recently giving birth, and upon entering and/or working in abattoir settings or other settings where livestock are being slaughtered and/or butchered.

*** For routine sample collection from apparently healthy people, gloves are recommended. For collecting samples from hospital and clinic patients and during outbreaks, PPE should be adapted based on the determined risk level.

**** In some cases, such as during the collection of urine underneath a colony of fruit bats roosting in trees where there is a high risk of aerosolizing of excreta and microbial agents, then it is recommended to use a respirator (N95 respirator is recommended as the minimum level of protection), full protective clothing and eye protection.

Higher Risk Taxa

Below is a summary of special biosafety considerations for some of the key groups of species (bats, rodents, and non-human primates) to be handled as part of PREDICT activities.

Rodents, bats, non-human primates and other wild species may harbor pathogens that are transmittable to, and highly pathogenic in, humans. When handling these rodents, bats or non-human primates, careful consideration needs to be given to conscientious use of PPE, good personal hygiene (i.e., hand washing), safety training, and application of good animal handling and sampling techniques to minimize exposure to infection or injury.

In the event of an injury while handling animals that pose risk of zoonotic pathogen exposure, appropriate first aid must be applied. The risk of infection can be significantly reduced with immediate and thorough scrubbing of the wound with soap or antiseptic.

Vaccination to prevent rabies infection: Personnel who are handling animals that are known reservoirs for rabies (i.e., bats and dogs) should be immunized against rabies virus according to World Health Organization and CDC recommendations.

Investigators should familiarize themselves with known biohazards specific to species under study and with the procedures for the isolation and control of zoonotic pathogens.

Specific considerations with regard to working with rodents, bats and non-human primates are discussed below:

Rodents

Wild rodents have the potential to carry a variety of zoonotic bacteria and viruses that can be passed on to those handling them. Because of the serious consequences of becoming infected, personnel must always follow good personal hygiene and animal handling procedures and use the provided PPE to protect against exposure.

Special Precautions:

- Wear the minimum PPE for handling rodents including an N95 mask, eye-protection, gloves and coveralls, or clean dedicated clothing.
- Personnel who are handling animals should be immunized against rabies virus according to the World Health Organization and CDC recommendations.

Bats

Exposure to wild bat roosts (in caves or trees), handling of bats in the field or handling bat excreta (urine or feces) presents a potential for exposure to zoonotic pathogens. Rabies, Nipah virus, Ebola virus, and the fungal disease histoplasmosis are examples of zoonotic pathogens carried by some bat species. Bat bites, scratches and wound and mucous membrane exposure to bat saliva are the ways in which rabies can be transmitted. Spores of histoplasmosis can be present in soil and debris enriched with bird and bat droppings. When this dry soil is disturbed, spores can become airborne and cause infection by inhalation.

Special Precautions:

- When working around bats in enclosed spaces, such as in a cave, wear at a minimum an N95 respirator, goggles, gloves and Tyvek coveralls (or dedicated long-sleeved clothing).
- Personnel who are handling animals such as bats should be immunized against rabies virus and be aware of appropriate post exposure prophylaxis in the case of bites according to World Health Organization and CDC recommendations.

Non-Human Primates

Non-human primates may be infected with a number of potentially serious zoonoses. For example, all macaque monkeys and their fluids should be considered to be infected with **Herpes Simian B virus**. Marmosets, although they do not carry the herpes B virus, can carry other disease agents that affect humans such as lymphocytic choriomeningitis virus and *Trypanosoma cruzii,* the cause of Chagas' disease. It is critical that work with non-human primates be done while wearing the appropriate personal protective equipment and with the well-established safe protocols and procedures.

Special Precautions:

- Personnel must follow strict hygiene procedures. Frequent and thorough hand washing, although too often overlooked by the staff, is critical to physically remove bacterial contamination and prevent ingestion exposure.
- PREDICT personnel must wear the minimum PPE for handling non-human primates including an N95 mask, eye-protection, gloves and coveralls or clean dedicated clothing.

Section 4.4. Use and Disposal of PPE

Considerations When Using PPE

Personnel wearing PPE may experience heat stress and general discomfort in hot or humid environments. It is important to remain hydrated by drinking adequate water before and after wearing PPE. Length of time wearing full PPE should be limited, based on environmental conditions, to avoid the risk of heat exhaustion or heat stroke. Personnel should inform their supervisor(s) if they experience severe discomfort during animal capture or sampling activities, so that they may take a break.

When workers are heat-stressed, uncomfortable, or unable to see out of their fogged goggles, they are more likely to remove their goggles or mask in risky environments, exposing themselves to potential pathogens.

Most PPE items to be worn during PREDICT activities are disposable and designed to be used only once, and should be properly disposed of as medical waste after each use. Plastic goggles and rubber boots may be re-used, but must be disinfected between each use.

Designate a clean area for putting on PPE. It should ideally be a clean area away from any potentially contaminated animal equipment, such as cages, crates, or farm tools. All personnel should use this area to put on their PPE. Also, designate a decontamination and PPE removal site.

Always wear the respirator properly when you are working. Ensure that there is a tight seal formed around the mask and never hang it around your neck.

When wearing coveralls, ensure there is no exposed skin between your sleeves and gloves. If any piece of PPE is torn, it should be changed at the PPE decontamination site as soon as possible following the steps outlined in the section on how to take off PPE.

It is beneficial to have a colleague confirm that PPE is properly worn. Working in teams when putting on and removing PPE can help avoid mistakes and react immediately if accidents occur.

Planning and Preparations for PPE Use

1. Prior to going to the field, the level of risk for the field tasks and the appropriate PPE needed to safely perform the field tasks should be determined.
2. PPE kits should be assembled for each person who will be involved in the field tasks. Multiple kits per person may be required, based on the number of animals to be handled, the number of breaks that personnel may take, and to account for potential tears in gloves and coveralls, etc.
3. Prior to going to the field, PPE supplies should be organized. Along with required sets of PPE, supplies should include disinfectants, alcohol-based hand sanitizing gel and germicidal wipes, large color coded bags for infectious waste disposal according to national codification, and collection bags for equipment (such as plastic goggles, face shields and rubber boots) that will be disinfected for re-use.
4. Bottled water should be available for consumption before and after use of PPE. PPE can be very hot, and personnel are more likely to suffer heat stress if they do not consume adequate amounts of water.
5. Bring additional tape and extra collection and disposal bags. Tape can be used to secure shoe covers and protective clothing and seal bags.
6. Plan for disposing of PPE:
    a. An area for removing PPE should be identified. This area should be away from the contaminated area and away from animals. All personnel should use this area to remove their PPE.
    b. Remove all of your PPE carefully, following the recommended steps for PPE removal (below) and discard them (or put reusable items in bags for disinfection) before taking a break. Put on a new set after the break.
    c. Immediately after removing PPE, place it directly into the color coded infectious waste bag (or marked biohazard waste bag).
    d. Color coded infectious waste bags should be sealed and properly disposed. Follow the instructions of the local officials or person supervising the work on where to dispose infectious waste bags when they are full.
    e. Disposal methods (such as burning or burial) may differ by situation or location. Local officials and/or those supervising the work will likely decide on how best to dispose of used PPE and other disposable items that are potentially contaminated. For guidelines, see PREDICT Safety Guide: Laboratory Operations, Environmental Guidelines for Small-Scale Activities in Africa (EGSSAA) Ch. 8: Healthcare Waste: Generation, Handling, Treatment and Disposal (http://www.encapafrica.org/egssaa/medwaste.pdf); and WHO Safe Management of Wastes from Health-Care Activities (**http://www.who.int/water_sanitation_health/medicalwaste/wastemanag/en/).**

Components of PPE Kits

1. Coveralls, dedicated clothing and shoes, and aprons – for high-risk tasks, full coverage may be warranted. In that case, Tyvek or Tychem coveralls, shoe covers or boots, and an apron may be used. For lower-risk tasks, just an apron and/or dedicated clothing and shoes may be appropriate. An apron should be a disposable type that is properly disposed of together with

gloves and masks after each use. Dedicated clothing (e.g., cotton coveralls) at the work site should be removed and laundered after each use.

Regarding the use of Tyvek or Tychem coveralls:

- Wear these coveralls to protect your skin and/or clothing against contamination when in contact with human samples, animal droppings, dust, animal urine or droppings, or animal fluids such as blood, saliva, and mucous.
- The synthetic material Tyvek is water resistant and Tychem is water proof, so even if the coveralls get dirty or wet, they will offer protection. Tychem offers more protection from liquids and should be considered in situations with high risk of exposure to blood-borne pathogens (e.g., hemorrhagic disease, EVD outbreak investigations).
- You can wear your dedicated shoes and clothing under the coveralls.

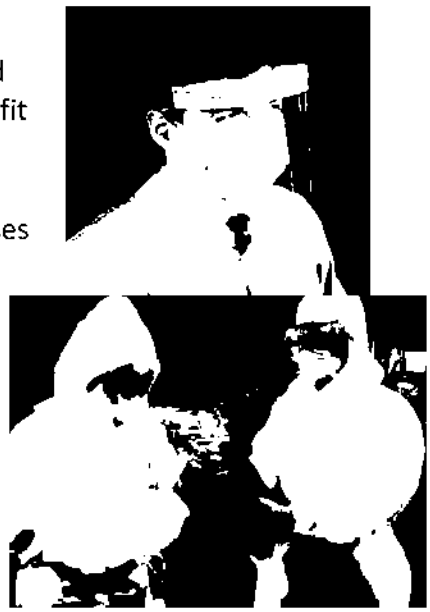
2. Shoe Covers or Washable Rubber Boots

- Because pathogens in human and animal samples including feces, secretions, or blood can easily contaminate your footwear, it is important to have disposable shoe covers or rubber boots that can be disinfected.
- The shoe covers provided in some PPE kits fit over your coverall feet, or over your shoes.
- Rubber boots may be worn with dedicated pants pulled over the top of them. If using PPE coveralls with rubber boots, purchase the coveralls without feet (or cut the feet off) and pull the pant legs of the coveralls over the top of the boots.
    - A footbath should be prepared with either chlorine bleach or Virkon disinfectant. This can be used to disinfect boots and other footwear upon leaving the field site. A boot brush should be available for scrubbing surfaces of footwear prior to using the footbath. It is critical to remove all organic material from footwear prior to disinfection to ensure effectiveness of disinfectants.

3. N95 Respirator

- N95 respirators (masks) protect you from inhaling droplet or aerosolized pathogens into your nose and lungs. Surgical masks are not respirators. They do not protect against aerosol and small droplets. They filter out large-size particles in the air and offer protection from large droplets and direct contact.
- There are several different models, styles, and sizes of N95 and comparable respirators that fit a variety of face shapes and sizes. Each person requiring a respirator for PREDICT activities should be individually fit tested to identify a respirator that appropriately and comfortably fits her or his face.
- Respirators with exhalation valves are generally more comfortable as the exhalation valve prevents resistance to exhalation when the filters load with dust.
- See ***Section 4.5*** on respirator use to learn more about respirators and fit testing.

4. Goggles and Face Shields



- Goggles protect your eyes from splashes and liquids.
- They are adjustable to ensure the best fit. Adjust the head strap before putting on all of the PPE. The goggles should fit snuggly over and around your eyes.
- Personal glasses are not a substitute for goggles or safety glasses; if you wear eyeglasses, the goggles or safety glasses should be placed over them.
- If ordering goggles, be sure to order fog-free goggles. If they are not fog-free, they are likely to fog up in a few minutes, rendering them useless. If all you have are non-fog-free (regular) goggles, you may rub a little soapy water on the inside of the lens prior to use to reduce fogging.
- Goggles (and rubber boots) are one of the few components that may be re-used if disinfected properly after each use.

5. Gloves

- Nitrile gloves are best for use for infectious agent exposure protection. **Gloves are a component of minimum PPE required for sample collection and handling tasks conducted under PREDICT.**
- Two pairs of nitrile gloves are recommended when using sharps.
- Heavy rubber gloves or leather gloves may be required when handling animals and can be worn over the nitrile gloves. PREDICT teams have good success with Hexarmor Hercules 400R6E gloves.

6. Disinfecting Wipes and Alcohol-based Hand Sanitizing Gel (at least 60% alcohol) -- for disinfecting gloves and hands.

- Disinfecting wipes that contain at least 60% alcohol should be used to clean your gloves and other PPE before removing them.
- Alcohol-based wipes or hand sanitizing gel can be used to clean areas of skin that may have been contaminated. It is critical to remove organic material before using sanitizers to ensure effectiveness of disinfectant.
- It is recommended that you ALWAYS disinfect and wash your hands after removing gloves, regardless of contamination.

7. Infectious Waste Bag—for the safe disposal of PPE and other medical waste.

- A color coded infectious waste bag (or otherwise labeled biohazard bag) should be available at the field site for containing and disposing of used PPE items.
- As soon as you remove a contaminated item, place it in the infectious waste bag.
- Do not over fill bags and ensure they can be closed and tied.
- Tie the bag at the top and spray the outside of the bag with disinfectant once it is closed and tied. Wet waste should be double-bagged to prevent leakage.
- Leave it at the designated collection site or place it in in a secure container for transport to a proper disposal site.
- Containers should be constructed to contain all contents and prevent leakage of fluids during handling, storage, and transport.
- It is strongly recommended that field teams do not burn or bury medical waste at the field site. Incomplete burning may leave infectious or dangerous materials, and animals or children may dig up buried waste. All bio-hazardous waste should be contained and returned to a medical center for autoclaving or incineration. **See *Section 2.5 Safe Disposal of Carcasses and Infectious Waste Guide* for information regarding guidelines for waste disposal.**

Procedure for Putting on PPE

All of the components of PPE discussed below are not necessary or appropriate for all PREDICT tasks. For instance, Tyvek or Tychem coveralls and aprons are not necessary for many PREDICT tasks. However, when investigating disease outbreaks or other potentially high-risk situations, the PPE and donning and doffing procedures may be substantially enhanced to reduce risk of exposure. See http://www.cdc.gov/vhf/ebola/hcp/ppe-training/index.html for CDC Guidelines for Personal Protective Equipment (PPE) Donning and Doffing Procedures during management of Ebola virus disease cases.

1. Wash your hands and/or disinfect them with alcohol-based hand sanitizing gel prior to putting on PPE.

2. Coveralls or dedicated clothing go on FIRST. Always start with the coveralls (which should be big and loose to fit over clothing and not restrict movement) or dedicated clothing. Be certain to zip up coveralls or button up clothing.

3. **Shoe covers or boots go on SECOND.** Shoe covers fit over the coverall feet. Pant legs of dedicated clothing and coveralls should fit over the boots.

4. **Respirator or surgical mask goes on THIRD.** Of the equipment to be worn around the head and face, the mask or respirator is always first on and last off. On a mask with a metal nose clip, be sure to form the clip around the nose for a nice fit. Any time you put on a respirator, perform a seal check by inhaling sharply. If there is air leakage around the edges of the mask, readjust to ensure a proper seal.

5. **Goggles go on after the respirator.** Goggles should fit snuggly over and around your eyes. Goggle straps should be adjusted to fit your head.

Once the respirator and goggles are in place, pull the hood on your coveralls over your head (or put on the separate head cover if the coveralls do not have a hood).

6. **Tie on the apron over the coveralls or your dedicated clothing.** Place the apron over your head and then tie it in the back.

7. **Put on two pairs of gloves.** The inner glove should go under the sleeve of the coverall to prevent exposed skin between the coverall and the glove. Coveralls with finger loops that secure the sleeve over the first pair of gloves are ideal to avoid exposure of the wrist area (or you can make a small cut in the coverall sleeve and introduce your thumb). Otherwise, tape the coverall sleeve to the inner glove. Put the second pair of gloves on over the first pair and extend the gloves over the coverall cuffs.

Procedure for Removing PPE

After completing your work, assume the exterior of the PPE is contaminated. The goal of correct removal of PPE is to minimize contact between your clothes and skin and the contaminated outer surfaces of the PPE.

1. **Wipe off any visible contamination of the PPE** using germicidal or alcohol-based wipes and dispose of the used wipe in the infectious waste bag.

2. **Remove and dispose of the apron** in the infectious waste bag.

3. **Wipe off outer gloves with a germicidal wipe and dispose of the used wipe** in the infectious waste bag.

4. **Remove boots or remove shoe covers** by holding the top and rolling them off of your feet. Place the shoe covers in the infectious waste bag. Place the boots in the equipment collection bag for disinfection and re-use.

5. **Remove the outer gloves** and place them in the infectious waste bag. Using one gloved hand, grasp the outside of the opposite glove near the wrist. Pull and peel the glove inside-out and away from the hand. Hold the removed glove in the opposite gloved hand. Then, slide one or two fingers of the ungloved hand under the wrist of the remaining glove. Peel glove off from the inside, creating a bag for both gloves. Dispose of the gloves in the infectious waste bag.

6. **Disinfect your inner gloves with alcohol-based hand sanitizing gel.**

7. Unzip and roll down the coveralls until they are inside out and place them in the infectious waste bag.

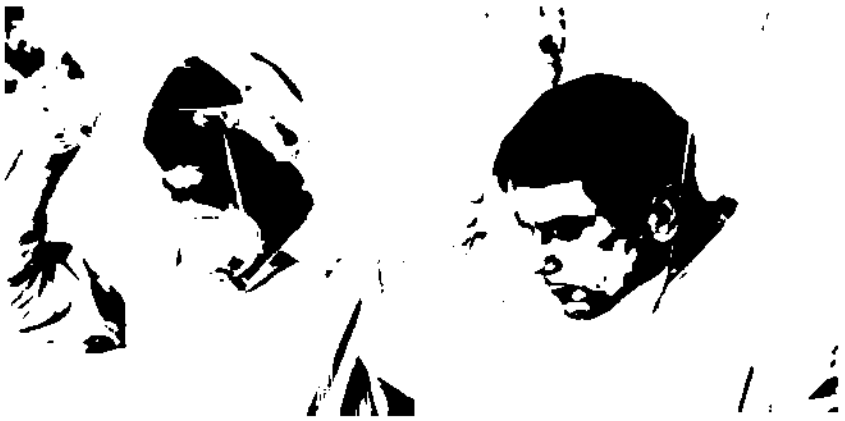
8. Disinfect gloves with alcohol-based hand sanitizing gel.

9. Remove the goggles by the strap and place them in the infectious waste bag or equipment collection bag for disinfection and re-use if re-usable. Re-suable goggles can be disinfected using a chlorine bleach solution.

10. Disinfect gloves with alcohol-based hand sanitizing gel.

11. Close the biohazard bag by tying the corners of the top of the bag together.

12. Remove the respirator by grabbing the top and then the bottom elastic bands, and pulling the bands up over your head or by grabbing the nose and pulling forward and then off. Place the respirator **in a second clean red infectious waste bag**.



13. Disinfect gloves with alcohol-based hand sanitizing gel.

14. Remove the inside gloves using the procedures listed in #5 above and place them in the second infectious waste bag. Dispose of infectious waste bags according to guidelines in Section 4, #6 e above.

15. Disinfect your hands with alcohol-based hand sanitizing gel.

16. Wash your hands and wrists using soap and running water (from a tap or poured) following the guidelines presented in Section 2.

If PPE is compromised, falls off, rips or is removed while you are handling or are exposed to biological hazardous materials, stop your current activity, remove PPE in the designated area, and wash or disinfect the exposed skin/surfaces. In addition, immediately inform your supervisor to determine if prophylaxis is indicated.

Section 4.5. Respirator Use

- Using respirators alone will not fully protect you from acquiring an infection – the respirator must be used in combination with all of the other PPE components.
- Each person using respirators must be fit tested to identify a respirator that he or she can comfortably and securely wear. Fit testing is a process that takes approximately 15-20 minutes to complete and should be performed for each member of the field team before he or she uses any respirators in the field. Qualitative fit test kits are available for purchase through 3M. A video on fit testing is available online at **https://www.youtube.com/watch?v=7IAsoU6h-8g**. After passing a fit test with a respirator, you should always use the same make, model, style, and size of respirator that was found during the fit test process to create an effective seal around your face. If you have facial hair, it is unlikely that you can properly fit a disposable particulate respirator. Workers who cannot ensure a proper fit because of facial hair or other fit limitations should consider a loose-fitting (i.e., helmeted or hooded) powered air purifying respirator equipped with high-efficiency filters. More information on respirators and respiratory protection can be found at: **https://www.osha.gov/SLTC/etools/respiratory/index.html**.
- Do not use or provide others with respirators without instruction on the health risks associated with them. For example, workers with respiratory problems may not be able to wear these respirators. Anytime someone indicates they are having trouble breathing while wearing a respirator, they should go to the PPE removal site and remove their respirator.

- When disposable particulate respirators become wet from saliva, sweat, or respiratory secretions, they lose their protective properties and must be changed.
- If a respirator is splashed and becomes wet, it should be changed using gloves and the gloves disinfected or washed following hand washing procedures.
- Respirators should be discarded and replaced after 4-6 hours of use.
- Respirators should not be hung around your neck when working. Always wear them when working.

Response to debrief comments and requests for clarification

Date of response: March 17, 2020

Thank you for the feedback and requests for additional detail. Please find our responses below (in italics), referring to additions or updates to the Technical Proposal and other project proposal sections in accordance with the recommendations.

Recommend the applicants consider approaches in which a greater proportion of the work is conducted in-country (to the extent practical).

Thank you for the recommendation. We have made some adjustments to the allocation of work accordingly, now reflected in the budget and budget justification. The main changes are:
We have shifted activities for training and laboratory work in Egypt to the Princess Haya Laboratory at the Jordan University of Science and Technology (JUST). Except for one initial training in Egypt at the National Research Center, the Human Link consultant will provide training in Jordan to the Jordanian team and no samples will be transported outside of Jordan. Funds have been allocated now for equipment needed to conduct MERS virus neutralization at the Princess Haya Biotechnology Center at JUST. This is a unique opportunity to operationalize this capacity in Jordan for the first time, leveraging the operational partnership with Human Link to build in-country capacity.
We have also reduced staff time and travel on the part of the US-based team to the amount that we are certain we can still provide the rigor of collaboration necessary to support the overall team, capacity strengthening, and scientific exchange and dissemination. We will rely on frequent remote communications (e.g. via Zoom or Skype) for pre-training and preparation to maximize time between EHA, JUST and Human Link.

Recommended applicants provide greater detail on a "culturally- and financially-appropriate token of appreciation" for patients enrolled in the study. Recommend applicants establish a regimen for this "appreciation token" approach in order to reduce attrition rate of participants following the initial enrollment phase of the study.

Please find additional detail now added (page 6). Participants will be given a cell phone calling card at each visit. This token has utility for participants and acknowledges their time without introducing undue influence to participate.
For sites with animal sampling, we will distribute veterinary medicines and supplies for common animal diseases (e.g. anti-parasitics) as needed up to a reasonable amount at every other visit. This approach has been successful in past field projects undertaken in Jordan, leveraging the existing veterinary expertise of our team and promoting overall disease awareness. This is based on the last five years of work that our JUST animal health investigators have been using in outreach to herders and producers. We have budgeted for these at $100 per site visit twice a year.

Recommend applicants provide a more detailed description of the methods for obtaining

human samples. For example, will samples be obtained in the field at time of recruitment or will participants be referred to a local healthcare facility?

Thank you. Please find additional detail now included (page 7 under "human sampling"). The teams will have a nurse when working with herders or farmers in remote locations and conduct sampling in a safe, semi-private and shaded area (e.g. a field tent or shelter). If sampling at a community near to a clinic, we will set up appointments with participants to have samples collected at a clinic. This approach seeks to minimize time burden and maximize comfort while ensuring consistent safety for all participants.

Recommend applicants clarify whether abattoirs will be included as a sampling "site" and the strategy for such an approach. Abattoirs are briefly mentioned in the abstract; however, not repeated elsewhere in the proposal.

We have eliminated abattoirs as a sampling site (page 1 (abstract)). We had originally considered abattoirs when first developing the concept but as we refined the project design it became clear it was not necessary for the research and to answer our hypotheses. Our apologies for inadvertently leaving it in the abstract.

Recommend applicants provide an overview/flowchart for the integration of all diagnostic procedures; human and animal.

Please find the process flowchart now provided in Attachment 3 reflecting the diagnostic procedures and the treatment of human and animal samples. While we recognize the strategy is complex to present, the implementation on the ground is seamless (as tested by our PREDICT field and laboratory activities when rolled out for a more limited diagnostic panel) and will leverage the proximity between the laboratories for high efficiency (in both time and resources) and effective coordination.

Recommend applicants include greater detail about students and personnel who will be trained in support of research activities.

Additional details have now been added to the Technical Proposal to emphasize the extent and value of the training of students and ministry colleagues (page 9).
We estimate four students per year will be trained over the course of the project. To reach professional students who can directly integrate their skills and capacity into their work in the future to promote sustainable uptake in the country, we anticipate training of:

- *8 veterinary students, including 4 undergraduate and 4 graduate, students to work in the field or the lab;*
- *4 students from the school of Public Health for the field epidemiology and socioeconomic analyses;*
- *4 students from the biomedical sciences for laboratory training; and*
- *4 undergraduate or graduate students from the nursing school to observe informed consent, sampling, and transport protocols.*

All students (as well as all other personnel) participating in the project field, laboratory or analysis activities will be CITI-trained and receive full training to ensure

safety and ethics practices are constantly observed. Co-I Abu-Basha and his team have extensive experience overseeing training and student research from the schools above at JUST, and the opportunity for the students to collaborate their project work with their peers from other disciplines is expected to also generate valuable collaboration and appreciation for One Health approaches as they enter their careers.
In addition, in-service training will be provided to Ministry of Health and Ministry of Agriculture laboratory scientists and epidemiologists during the workshops as described in Table 4 (page 9). We estimate a minimum of 20 ministry staff will participate in all of the training workshops. Co-I Abu-Basha has existing collaboration with these ministries through the One Health platform that will facilitate interest in the trainings and awareness about how the trainings can be applied in their work to advance implementation and sustainability of improved surveillance and detection capacity and risk reduction approaches.

Recommend applicants discuss sustainability following completion of the project.

The project design builds in several pathways to sustainability (please see additions on page 8, 9, and 11). In particular, we have now discussed sustainability under section "relevance" (page 11) regarding three major areas: strengthening capacity of laboratories in the south of Jordan, new technology at Princess Haya Biotechnology Center via MERS-CoV virus neutralization capacity that will appeal to government for its high quality and modernization of the country's disease detection system, and overall awareness and leadership about One Health strategies as part of biological threat reduction. The growing poultry industry also offers a potential source of long-term disease screening support as in other countries with poultry production incentivized to demonstrate risk reduction.

Recommend applicants modify the Human Link serology training. The serology training at Human Link in Egypt is not sustainable nor the best use of project funds. Currently, six personnel per year are travelling to and hand-carrying samples to Egypt to be trained on serology. It would increase Jordanian sustainability and be more fiscally responsible for the one Human Link trainer to fly to Jordan so the Jordanians can learn the technique in their own laboratory as well as reduce the overall costs and risks associated with hand-carrying biological materials.

We have shifted activities for training and laboratory work in Egypt to the Princess Haya Biotechnology Center in Jordan (please see pages 7-9 of the Technical Proposal). Except for initial training in Egypt, which will be useful for showcasing and training on operational equipment and building confidence for successful capacity transfer to Jordan, the Human Link consultant (Co-I Kayali) will provide training in Jordan to the Jordanian team via visits each year and via regular communication for quality control. No samples will be moved outside of Jordan now. This approach leverages the operational and trusted partnership with Human Link to build in-country capacity and promote successful capacity transfer and support that is valuable for long-term capacity development and maintenance. As well noted by reviewers, this will help shift to the

fiscal buy-in from Jordan and also allow for close collaboration between the human and animal laboratory experts for coordinated interpretation of findings.

Recommend applicants consider the workload of the EHA Senior P.I. and make appropriate adjustments, as necessary. Per the current and pending support document, the EHA Senior P.I. is already overcommitted with 15.74 calendar months of work each year. If funded, this project would add an additional 2 calendar months of work each year. This is not a sustainable workload and there is concern the P.I. will not be able to contribute the stated amount to this project.

Thank you for your concern. The current and pending support document listed a range of current and prospective opportunities. All staff at EHA are continually submitting proposals for new projects that include our time. Only a few are awarded and our time commitments are thus allocated to the ones that are awarded and are not utilized for the proposals not awarded. PI Karesh's form has now been updated with the latest information and time allocations. Given the specialized work and capacity required for DTRA projects, all DTRA proposals take priority for our time allocation; for other pending proposals (non-DTRA), if indeed successfully awarded, additional staff would be hired by EHA to work on those projects to ensure we are not committed beyond 12 calendar months per staff member.

Recommend updating the below PRAT concerns and submitting revised PRATs:

We have included revised PRATs in our submission addressing these questions and recommendations (detailed briefly below as well). We appreciate these important details. (Separately, we note that these and other biosafety and biosecurity practices will be reinforced at the workshops as well for greater awareness and safeguards across the national system too).

Rational and justification for using an aerosol chamber.
Thank you – this was selected in error and is not needed. We have updated it accordingly.

Provide information for type, number, and certification dates for biosafety cabinets on biosafety supplemental page.
Please see the requested information now attached (in Attachment 3), via six certificates for the two biosafety cabinets in Facility 2 and two certificates for the biosafety cabinet in Facility 4.
Recommend maintaining facility records for certification of biosafety cabinets for Facility 1. Recommend a facility biorisk assessment occurs at Facility 2 by a biosafety professional prior to full project approval.

This will be done by Eng. Radi Hamasha, Head of quality assurance in Princess Haya Biotechnology Center. We have added his name as the biosafety officer and we will begin the process to complete both prior to full project approval.

Also, recommend using a facility specific biorisk management manual at Facility 2 to document how biohazards are mitigated at this laboratory (Section 3c).

This will be implemented through the help of Eng. Radi Hamasha, Head of quality assurance in Princess Haya Biotechnology Center.

Recommend having emergency eyewash bottles available if a hard-plumbed eyewash is not present.

Excellent suggestion. We have now budgeted for these and will make sure they are maintained throughout the project.

Recommend ensuring staff wash hands prior to leaving laboratory spaces despite not having a sink near laboratory exits at Facility 1.

Thank you; we will ensure a protocol is formally put into place and reinforced visually and in training and enforcement. This is already a generally utilized practice in our laboratories, but we agree about the value of formalizing it.

Recommend instituting limited access practices such that personnel only enter labs necessary for completing their tasks. Recommend having emergency eyewash bottles available if a hard-plumbed eyewash is not present at Facility 2 (section 4b).

Restriction access is implemented (for example, keys are only in the hands of approved personnel who are participating in this study). Per the university approval, we are adding safeguards (including a security fingerprint door lock, which we have now budgeted for). Regarding the eyewash bottles, we will purchase them and ensure our laboratory members are trained on their proper use.

This proposal conveys an approach by the relevant implementers to achieve biological threat reduction mission requirements in collaboration with partners from Jordan, Iraq and Lebanon. Despite this, additional information, in a revised proposal, for the items as noted above, is needed to better appreciate the full implications, implementation plans, costs, and expected results of the proposed study.

Thank you for the feedback and for the opportunity to submit a revised proposal.

Dear (b)(6)

Please find our excel file with a breakdown of EcoHealth Alliance costs and with separate tabs for our subcontracts.

Call me anytime, if you have additional questions or need other documents.

Many thanks!

-Aleksei

Good morning,

Thank you for documents as they will come in handy. Would you be able to provide an excel breakdown of EHA and subs?

Much appreciated.(b)(6)

I cannot imagine how you get through all these documents. We only have a few proposals/awards to justify and it seems like an enormous task for us!

If I may help you quickly locate certain documents in our forms and files, please call or text my handphone anytime day or night.

Many thanks again!

-Aleksei

Dear (b)(6)

Please find attached seven files:

1) FRBAA14-6-2-0471_Clarifications_FINAL.xlsx
2) EHA Budget Justification_FINAL.docx
3) EHA Documentation_FINAL.pdf
4) Human Link Budget Justification_FINAL.docx
5) Human Link Documentation_FINAL.pdf
6) JUST Budget Justification_FINAL.docx
7) JUST Documentation_FINAL.pdf

There are three sets of paired files with the requested documentation (PDFs) and track-change budget justifications (MS Word) for EcoHealth Alliance and our two subcontracts under this proposal. We have also included the clarifications (MS Excel) with responses to the specific questions in each tab.

Please let me know, if there are additional questions or any other documentation is required.

Many thanks!

-Aleksei

Dear (b)(6)

Please find our excel file with a breakdown of EcoHealth Alliance costs and with separate tabs for our subcontracts.

Call me anytime, if you have additional questions or need other documents.

Many thanks!

Good morning,

Thank you for documents as they will come in handy. Would you be able to provide an excel breakdown of EHA and subs?

Much appreciated.(b)(6)

I cannot imagine how you get through all these documents. We only have a few proposals/awards to justify and it seems like an enormous task for us!

If I may help you quickly locate certain documents in our forms and files, please call or text my handphone anytime day or night.

Many thanks again!

Dear (b)(6)

Please find attached seven files:

1) FRBAA14-6-2-0471_Clarifications_FINAL.xlsx
2) EHA Budget Justification_FINAL.docx
3) EHA Documentation_FINAL.pdf
4) Human Link Budget Justification_FINAL.docx
5) Human Link Documentation_FINAL.pdf
6) JUST Budget Justification_FINAL.docx
7) JUST Documentation_FINAL.pdf

There are three sets of paired files with the requested documentation (PDFs) and track-change budget justifications (MS Word) for EcoHealth Alliance and our two subcontracts under this proposal. We have also included the clarifications (MS Excel) with responses to the specific questions in each tab.

Please let me know, if there are additional questions or any other documentation is required.

Many thanks!

HDTRA1-14-24-FRCWMD-BAA
CBEP = Thrust Area 6 - Cooperative Counter WMD Research
with Global Partners FRCWMD

"Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity"

Abstract: In line with Thrust Area 6 - Cooperative Counter WMD Research with Global Partners FRCWMD, we propose a multi-disciplinary One Health research project to identify causal factors in the transmission of Middle East Respiratory Syndrome Coronavirus (MERS), avian influenza (AI), and other zoonoses from animals to humans in Jordan, while simultaneously strengthening local capacity for prevention, detection, and reporting of these zoonoses in Jordan, Iraq, and Lebanon. Little is known about the transmission routes of MERS, AI, and other key zoonoses at human-livestock/poultry interfaces in Jordan. To fill this gap and contribute to biological threat reduction, we propose a hypothesis-driven One Health research project to characterize exposure risks for MERS and AI in Jordan using epidemiological causal inference techniques and improving serological technology. This prospective cohort study involves interviews and longitudinal sampling of humans and opportunistic non-lethal sampling of livestock and poultry at animal markets, farms, and abattoirs for MERS, *Brucella* spp., and *Leptospira* spp. (humans/livestock) and for AI subtypes (humans/poultry). Partner laboratories in Jordan will screen and characterize these zoonotic pathogens, and capacity-building cross-trainings will be conducted with visiting laboratory scientists from Iraq and Lebanon. This multifaceted One Health approach will advance scientific knowledge on the risk of MERS, AI, and other zoonoses in Jordan, strengthen local zoonotic disease surveillance capabilities, and enhance scientific partnerships in Jordan, Iraq and Lebanon to prevent, detect, and report MERS, AI, and other zoonotic threats.

Background: There have been over 2,200 cases and 790 deaths across 27 countries from MERS since 2012. Although most cases occurred in the Kingdom of Saudi Arabia (KSA), the first known human infections occurred in Jordan. Most KSA cases have been healthcare-associated, stemming from secondary generations of transmission. Identification of factors involved in *primary* transmission may inform interventions to prevent future primary cases and therefore prevent them from seeding healthcare or community outbreaks. Camels are the presumptive source of primary human MERS infections; however, the exact mechanisms of transmission and the possible role of other livestock species are unclear. These uncertainties highlight the need to better understand the causal factors of primary human infection with MERS at human-livestock interfaces. **Understanding modifiable risk factors may lead to development of public health interventions that can prevent animal-to-human transmission of zoonoses.**

Avian influenza viruses circulate worldwide among migratory bird populations and occasionally spill into poultry at mass production sites, farms, or backyard coops. Although not every AI subtype is capable of infecting humans or causing severe illness, there have been worrisome outbreaks. AI A/H5N1 has been detected in humans in 16 countries since 2003, resulting in 860 cases and 454 deaths by July 2018. Of these, nearly 42% were in neighboring Egypt. Due to antigenic shifts typical of the influenza viral genome, there is always a possibility of new AI subtypes emerging capable of infecting humans. **In Jordan, the rapidly expanding poultry industry driven by ever-increasing demand poses a distinct global health security risk.**

Identification and characterization of AI subtypes circulating among poultry across Jordan will provide critical information needed to understand baseline activity and risks. If human AI infections are detected, the project could identify causal factors in poultry-to-human influenza transmission, and therefore inform interventions to prevent future primary cases. **Given the human AI infections in neighboring countries, this is a critical gap to be filled in Jordan.**

Other zoonoses, such as *Brucella* spp. and *Leptospira* spp., also cause morbidity in Jordan, and surveillance for them can be easily integrated into the research study as secondary outcomes. All samples may be made available to other DTRA- or USG-funded researchers.

Scientific Impact for C-WMD Science: Given that transmission of high-consequence zoonotic pathogens such as MERS and AI, whether by nature or ill intent, poses a significant threat to global security, existing gaps in biosurveillance/detection capabilities, prevention/response activities, and reporting weakens our ability to counter biological WMD threats. Over 60% of emerging infectious diseases originate in animals, so it is imperative to strengthen local capacity to conduct biosurveillance for zoonotic disease threats to understand existing baselines of transmission, characterize risk factors to inform prevention activities that can interrupt transmission, and preempt and/or rapidly respond to emerging disease threats.

Our primary objectives are to characterize causal factors in animal-to-human transmission of MERS, AI, and other zoonoses in Jordan and to strengthen regional capacity for detection of these pathogens in order to reduce the threat of infectious diseases. Our proposed project will rigorously test the following initial hypotheses:

H_1. Livestock species and poultry in Jordan show evidence of infection with MERS, AI, and/or other assayed zoonoses. (*Output: Geospatial maps of naturally-occurring zoonotic viruses and bacteria capable of infecting humans developed with and shared with government authorities*)

H_2. Humans occupationally exposed to livestock and/or poultry have a greater risk of infection with MERS, AI, and/or other assayed zoonoses compared to other community members in Jordan. (*Output: Geospatial risk maps developed with and shared with government authorities*)

H_3. Some specific occupational practices that promote exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) pose a greater risk of infection with MERS, AI, and other assayed zoonoses compared to others. (*Output: Enhanced understanding of modifiable risk factors to inform government authorities on prevention activities*)

Knowledge generated from this project will confirm the presence of MERS, AI, and other zoonoses at human-livestock/poultry interfaces in Jordan, characterize specific occupational practices as causal factors in human infection with these zoonoses, and identify modifiable risk factors that may be used to inform prevention activities. The project will build and boost local capacity for prevention, detection, and reporting of zoonotic disease threats in Jordan, Iraq and Lebanon through regional cross-training workshops held in Jordan, all of which have substantial camel and poultry production (**Fig. 1**). This will fill capacity gaps, strengthen collaborative relationships, and foster goodwill in a politically fragile region, enhancing our ability to combat biological threats.

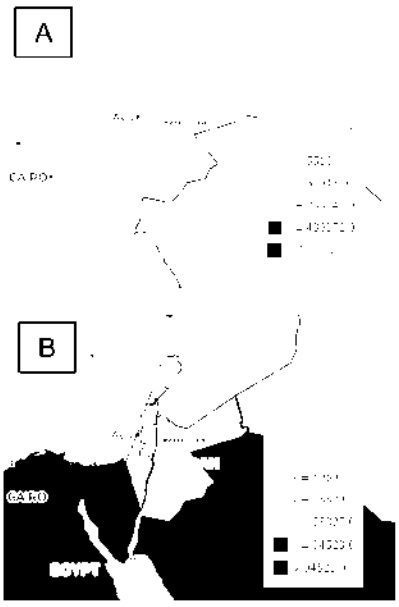

Figure 1: Regional map of live camel (A) and poultry (B) production, 2015.

Methodology: We propose to conduct a prospective cohort study with repeated surveys at various human-livestock/poultry interfaces across Northern, Middle, and Southern Jordan. Each interface will be visited thrice a year for 3 years (9 total visits per site) or 4 and 12 respectively if option years are exercised.

During each human-livestock interface visit, livestock (e.g., camels, goats, sheep, cattle) will be opportunistically tested for evidence of active infection with MERS using nasal swabs. During the first, fifth, and final visits, livestock will be opportunistically tested for past infection with MERS, *Brucella* spp., and *Leptospira* spp. using sera. Swab samples will be pooled by species + site + visit date and tested via real-time PCR. Serum samples will be tested via Luminex. During each human-poultry interface visit, poultry will be sampled for AI using oropharyngeal swabs. During the first, fifth, and final visits, poultry will be opportunistically tested for past infection with AI using sera.

Individuals at each site and its surrounding community will be approached for enrollment at the first visit. Those providing informed consent will complete a standardized questionnaire (the previously Jordan-approved and tested PREDICT-2 questionnaire augmented with study-specific items) during the first visit and complete a shorter questionnaire at each subsequent visit to account for time-varying factors. Participants will provide oropharyngeal and nasopharyngeal swabs at each visit and sera at the first, fifth, and final visits. These samples will be tested using PCR for the swab samples (MERS and AI) and Luminex serology for the serum samples (all 4 zoonoses).

Data will be analyzed to generate geospatial maps of livestock and poultry zoonoses, geospatial maps of human zoonotic disease risk (including static and seasonal versions), exposure risk models using causal inference techniques, and prediction models for transmission that can account for seasonal variations and wide-scale livestock/poultry practice trends.
Implementation of Luminex Serological Technology: Luminex technology for serology and associated equipment will be acquired for participating laboratories in Jordan. Training workshops will be held in Jordan for regional scientists, with refresher trainings held annually.

Regional Capacity Building: Iraqi and Lebanese scientists from their Ministries of Health and Agriculture will be invited to participate in capacity-building workshops in Jordan. Workshops will cover topics including implementing/using Luminex technology, animal and human sampling fieldwork, ethical human subjects research, biosafety and biosecurity best practices, data management and storage, and reporting procedures pursuant to OIE, WHO, IHR, and GHSA obligations. Advance technical training for key individuals is proposed for option years.

Our research project will serve multiple goals and objectives of the CBEP mission, by: 1) engaging partner country scientists in hypothesis-driven research; 2) supporting biosurveillance capacity building by enhancing partner capability to detect and report select agents; 3) enhancing

understanding of zoonotic diseases to allow differentiation of natural versus nefarious emergence events; 4) employing responsible bio-risk management best practices; 5) training partner country researchers to think critically about ethical research and be competitive in soliciting international funding; and 6) promoting a One Health concept.

Core Team and Project Organization:

- EcoHealth Alliance (EHA, prime), led by Dr. William Karesh (PI) and Dr. Patrick Dawson (co-PI), will design, implement, and oversee the research project; lead all contractual obligations with DTRA and project sub-awardees; coordinate travel and organize workshops; manage the information database; ensure coordination between partners; and collaborate with our partners in analyzing the data and publishing it.
- Jordan University of Science and Technology (JUST), led by Dr. Ehab Abu-Basha (co-PI), will conduct fieldwork and laboratory work on the research study. EHA has worked extensively with JUST and Dr. Abu-Basha on the USAID PREDICT-2 project, conducting viral surveillance among humans and animals and risk characterization since 2016.
- Partner Laboratories: JUST (Irbid, Jordan) and Jordan Ministry of Agriculture (Amman, Jordan). These institutions have demonstrated capacities for all required laboratory work, training workshops, and specimen storage. Additional laboratory partners may be added following consultation with national partners and DTRA.

Potential Challenges, Solutions, and Statistical Considerations: The main potential challenge will be a low detection rate of MERS, AI, and other zoonoses among human participants. However, power calculations to determine an appropriate sample size will be informed using recent, credible findings from the PREDICT-2 project. Another potential challenge is addressing cultural sensitivities while conducting work, such as avoiding stigmatization of livestock workers or working with various Bedouin communities. EHA and JUST have extensive experience in this domain through PREDICT-2, and have fostered positive relationships with community leaders and liaisons throughout Jordan. To reduce regional instability risk, we will be work in Jordan, a stable bedrock in the region, and will invite regional scientists to workshops inside Jordan rather than traveling to them.

Major Goals and Milestones: 1) Determine the presence of MERS, AI, and other zoonoses among livestock and/or poultry in Jordan. 2) Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses. 3) Characterize causal factors in animal-to-human transmission of these zoonoses. 4) Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk. 5) Identify specific modifiable risk factors for human infection with these zoonoses. 6) Implement Luminex serological technology in Jordan for enhanced diagnostic and detection capabilities. 7) Strengthen local capacity for detection and reporting of MERS, AI, and other zoonoses in Jordan, Iraq, and Lebanon through workshops.

Technical Abstract (Limit your abstract to 200 words with no classified or proprietary information)

This publicly releasable abstract is provided to DTRA for use in fulfillment of Section 8123 of the Defense Appropriations act and future versions of the same. Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity In line with Thrust Area 6 - Cooperative Counter WMD Research with Global Partners FRCWMD, we propose the first multi-disciplinary One Health research project to identify factors which allow or facilitate the transmission of Middle East Respiratory Syndrome Coronavirus (MERS-CoV), avian influenza (AI), and other infectious agents which spread from animals to humans in Jordan, while simultaneously strengthening local capabilities for prevention, detection, and reporting of these diseases in Jordan, Iraq, and Lebanon. Little is known about the transmission routes of MERS-CoV, AI, and other key diseases at humanlivestock/poultry interfaces in Jordan. To fill this gap and contribute to biological threat reduction, we have designed a hypothesis-driven One Health research project to characterize exposure risks for high consequence zoonotic diseases in Jordan using advanced epidemiological inference techniques and improve diagnostic testing using methods that do not require manipulation or

culturing of live viruses, further reducing the risk of accidental laboratory outbreaks and access to pathogens that could be used as biological weapons. This prospective cohort study involves interviews and longitudinal sampling of humans and opportunistic nonlethal sampling of livestock and poultry at animal markets, farms, and abattoirs for MERS-CoV, Brucella spp., and Leptospira spp. (humans/livestock) and for the full range of Influenza A found in humans and animals. Under close supervision, partner laboratories in Jordan and Egypt will screen for and characterize these pathogens. Capacity-building cross-trainings on diagnostics, epidemiology and risk reduction strategies will be conducted with visiting laboratory scientists and government authorities from Iraq and Lebanon. This multifaceted One Health approach will advance scientific knowledge on the risk of MERS-CoV, AI, and other zoonoses in Jordan, strengthen local zoonotic disease surveillance capabilities, and enhance scientific partnerships in Jordan, Iraq and Lebanon to prevent, detect, and report MERS-CoV, AI, and other zoonotic threats.

Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity

Phase II Technical Proposal

I. ABSTRACT

In line with Thrust Area 6 - Cooperative Counter WMD Research with Global Partners FRCWMD, we propose a multi-disciplinary One Health research project to identify causal factors in the transmission of Middle East Respiratory Syndrome Coronavirus (MERS-CoV), avian influenza (AI), and other zoonoses from animals to humans in Jordan, while simultaneously strengthening local capacity for prevention, detection, and reporting of these zoonoses in Jordan, Iraq, and Lebanon. Little is known about the transmission routes of MERS-CoV, AI, and other key zoonoses at human-livestock/poultry interfaces in Jordan. To fill this gap and contribute to biological threat reduction, we propose a hypothesis-driven One Health research project to characterize exposure risks for high consequence zoonotic diseases in Jordan using epidemiological causal inference techniques and improving serological testing using methods that do not require manipulation or culturing of live viruses. This prospective cohort study involves interviews and longitudinal sampling of humans and opportunistic non-lethal sampling of livestock and poultry at animal markets, farms, and abattoirs for MERS-CoV, *Brucella* spp., and *Leptospira* spp. (humans/livestock) and for AI subtypes (humans/poultry). Partner laboratories in Jordan will screen and characterize these zoonotic pathogens, and capacity-building cross-trainings will be conducted with visiting laboratory scientists from Iraq and Lebanon. This multifaceted One Health approach will advance scientific knowledge on the risk of MERS-CoV, AI, and other zoonoses in Jordan, strengthen local zoonotic disease surveillance capabilities, and enhance scientific partnerships in Jordan, Iraq and Lebanon to prevent, detect, and report MERS-CoV, AI, and other zoonotic threats.

II. SCOPE

A. Objective

Our primary research objectives are to characterize causal factors in animal-to-human transmission of MERS-CoV, AI, and other zoonoses in Jordan and to strengthen regional capacity for detection of these pathogens in order to reduce the threat of infectious diseases. Our proposed project will rigorously test the following initial hypotheses:

- **H_1.** Livestock species and poultry in Jordan show evidence of infection with MERS-CoV, AI, and/or other assayed zoonoses.
- **H_2.** Humans regularly exposed to livestock and/or poultry or their living areas have a greater risk of infection with MERS-CoV, AI, and/or other assayed zoonoses compared to other community members in Jordan.
- **H_3.** Some specific occupational practices that promote exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) pose a greater risk of infection with MERS-CoV, AI, and other assayed zoonoses compared to others.

Together, this research will generate critical advances in detecting the presence of and exposure risk to high-consequence zoonotic viruses and bacteria across geographic regions and interfaces, contributing to enhanced understanding of modifiable risk factors to inform government authorities on prevention activities to reduce disease threats.

B. Background

Jordan is an upper middle-income country with a total population of 9.7 million. Jordan has experienced several important zoonotic diseases in the few past years including Influenza A

(H1N1) pdm09 and MERS-CoV. Furthermore, an outbreak of H5N1 was reported in Jordan in 2006. A pandemic influenza surveillance plan that includes Severe Acute Respiratory Infection and other influenza-like illnesses has been in written[1] but needs capacity building to implement.

High-consequence zoonotic pathogens in the Middle East have resulted in disease epidemics of international importance, raising the need for health security enhancements to strengthen the region's ability to prevent, detect and respond to multiple zoonotic disease threats. In Jordan, MERS-CoV, AI and brucellosis are major public health concerns, with limited multisectoral preparedness capacity.[2] MERS-CoV is recognized as a threat to global health security, with designation as a priority disease under the World Health Organization (WHO) Research and Development Blueprint.[3] Since its initial emergence in 2012, there have been over 2,400 cases and 830 deaths across 27 countries from MERS. Although most cases have been reported in the Kingdom of Saudi Arabia (KSA), the first known human infections occurred in Jordan.[4,5] Most cases in KSA have been healthcare-associated, stemming from secondary generations of transmission.[6,7] Identification of factors involved in *primary* transmission may inform interventions to prevent future primary cases and therefore prevent them from seeding healthcare or community outbreaks. Camels are the presumptive source of primary human MERS-CoV infections; however, the exact mechanisms of transmission and the possible role of other livestock species are unclear.[8] These uncertainties highlight the need to better understand the causal factors of primary human infection with MERS-CoV at human-livestock interfaces given the high livestock-human contact in camel production systems in Jordan.[9] **Understanding modifiable risk factors may lead to development of public health interventions that can prevent animal-to-human transmission of zoonoses.**

Avian influenza viruses circulate worldwide among migratory bird populations and occasionally spill into poultry at mass production sites, farms, or backyard coops. Although not every AI subtype is capable of infecting humans or causing severe illness, highly pathogenic strains present risk to both animal and humans and are associated with major socio-economic losses. **In Jordan, the rapidly expanding poultry industry driven by ever-increasing demand poses a distinct global health security risk.** Identification and characterization of AI subtypes circulating among poultry across Jordan will provide critical information needed to understand baseline activity and risks. If human AI infections are detected, the project could identify causal factors in poultry-to-human influenza transmission, and therefore inform interventions to prevent future primary cases. **Given the human AI infections in neighboring countries, this is a critical gap to be filled in Jordan.**

To understand and reduce the threat of major zoonotic diseases in Jordan, we propose a One Health study in animals and humans to characterize exposure risks for priority pathogens that may potentially be associated with specific interfaces, behavioral practices, and environmental determinants (i.e., seasonality). To maximize potential for sustainability of zoonotic disease capacity in the country, the project is built around an all-hazards approach to detect pathogens and identify risk factors. Therefore, in addition to MERS-CoV and AI, *Brucella* spp. and *Leptospira* spp., which also cause morbidity in Jordan, will be integrated into the research study as secondary outcomes. Preliminary studies indicate associations between poor biosecurity and elevated seroprevalence of these bacterial diseases in animals in Jordan, as well as poor disease management practices when disease is suspected.[10-12] Therefore, this study will build on exiting capacity and provide an entry point for integrated prevention and control strategies for priority emerging and endemic zoonoses in the country and region.

Scientific Impact for C-WMD Science: Given that transmission of high-consequence zoonotic pathogens such as MERS-CoV and AI, whether by nature or ill intent, poses a significant threat to global security, existing gaps in biosurveillance/detection capabilities, prevention/response activities, and reporting weakens our ability to counter biological WMD threats. Over 60% of emerging infectious diseases originate in animals, so it is imperative to strengthen local capacity to conduct biosurveillance for zoonotic disease threats to understand existing baselines of transmission, characterize risk factors to inform prevention activities that can interrupt transmission, and preempt and/or rapidly respond to emerging disease threats. As a key area of stability in the region, enhancing Jordan's capacity for threat reduction for these diseases that pose serious potential human health, economic, and food production and security consequences is critical to protect U.S. warfighters as well as our regional allies (e.g. Jordan, Israel). Based on our analysis of risk drivers, the study regions are identified as elevated risk for disease emergence; ground-truthing is imperative to detect circulation trends and mitigate threats.[13] **Knowledge generated from this project will confirm the presence of MERS-CoV, AI, and other zoonoses at human-livestock/poultry interfaces in Jordan, characterize specific occupational practices as causal factors in human infection with these zoonoses, and identify modifiable risk factors that may be used to inform prevention activities.**

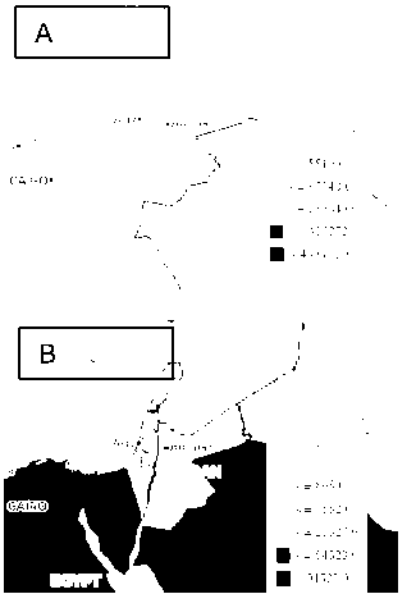

Figure 1. Regional map of live camel (A) and poultry (B) production, 2015

Through regional cross-training workshops held in Jordan, the project will also build upon and boost local capacity for prevention, detection, and reporting of zoonotic disease threats in Jordan, Iraq and Lebanon, all of which have substantial camel and poultry production (**Figure 1**). This will fill capacity gaps, strengthen collaborative relationships, and foster goodwill in a politically fragile region, enhancing our ability to combat biological threats.

Data will be analyzed to generate geospatial maps of livestock and poultry zoonoses, geospatial maps of human zoonotic disease risk (including static and temporal versions), exposure risk models using causal inference techniques, and prediction models for transmission that can account for seasonal variations and wide-scale livestock/poultry practice trends.

Regional Capacity Building: Iraqi and Lebanese scientists from their Ministries of Health and Agriculture will be invited to participate in capacity-building workshops in Jordan. Workshops will cover topics including implementing/using technology, animal and human sampling fieldwork, ethical human subjects research, biosafety and biosecurity best practices, data management and storage, and reporting procedures pursuant to OIE and WHO obligations. Advanced training for key individuals from Iraq and Lebanon is proposed for Year 3 and Option Years.

Our research project will serve multiple goals and objectives of the BTRP mission, by: 1) engaging partner country scientists in hypothesis-driven research; 2) supporting biosurveillance capacity building by enhancing partner capability to detect and report select agents; 3) enhancing understanding of zoonotic diseases to allow differentiation of natural versus nefarious emergence events; 4) employing responsible bio-risk management best practices; 5) training partner country

researchers to think critically about ethical research and be competitive in soliciting international funding; and 6) promoting the One Health concept.

Major Goals and Milestones (details in Section VI): 1) Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan: *Implement animal study; Conduct PCR and serology testing.* **2)** Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses: *Implement human cohort study; Conduct PCR and serology testing.* **3)** Characterize causal factors in animal-to-human transmission of these zoonoses: *Implement behavioral risk survey; Conduct epidemiological analyses.* **4)** Produce geospatial maps of zoonoses in livestock/poultry and human zoonotic transmission risk: *Generate geospatial distribution and risk maps.* **5)** Strengthen capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon: *Host workshops; Submit reports and publications; Attend presentations/meetings.* **6)** Identify specific modifiable risk factors for human infection with these zoonoses: *conduct causal interference analyses; provide policy recommendations.*

Methodology

Ethical Considerations: The study team will obtain required ethical approvals for both humans and animals prior to study initiation. For human subjects research, the informed consent documents (English and Arabic), study protocol (English), and questionnaires (English and Arabic) will be submitted to the Jordan University of Science and Technology (**JUST**) Institutional Review Board (IRB) in Irbid, Jordan and HummingbirdIRB in Needham, Massachusetts, USA (via EcoHealth Alliance (**EHA**)). For animal subjects research, the study protocol (English) will be submitted to the JUST Institutional Animal Care and Use Committee (IACUC) and a U.S. institution. All study team members will be trained on Collaborative Institutional Training Initiative (CITI) human subjects research (social/behavioral and biomedical), ethical research with animals ("Working with the IACUC"), and the USAID funded PREDICT-2 project training modules (basic laboratory safety, biosafety and biosecurity, safe animal sampling, cold chain implementation, and various other preparatory trainings). To maintain privacy, results will be presented in aggregate; no individual data will be shared.

Study Design: The proposed study is a prospective cohort study to evaluate behavioral and occupational risk factors for zoonotic infectious diseases (MERS-CoV, avian influenza, brucellosis, and leptospirosis) among persons living in Jordan in any of the five study regions. The exposure of interest is regularly (once a month or more) working with any livestock animal or poultry or sharing their living areas with these animals. Key sub-exposures will be evaluated to determine whether specific behavioral or occupational interactions with specific animal taxa or their living areas increase the risk of acquiring one of the four zoonotic infections being studied. The key sub-exposures, such as "milking camels" or "cleaning poultry cages," which may be identified as risk factors in this study, will be identified as modifiable risk factors behaviors or interactions that can be targeted during future disease prevention activities (e.g., using gloves, wearing a face mask, vaccinations, hand washing, pasteurization, etc.).

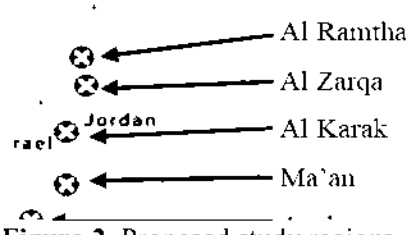

Figure 2. Proposed study regions.

Study Sites: Sites will be selected in five geographically-representative regions across Jordan (**Figure 2**): Northern Jordan (Al Ramtha), Middle Jordan (Al Zarqa), and Southern Jordan (Al Karak, Ma'an, and Aqaba). These regions were selected based on preliminary findings by our team and the presence of livestock production activities where we theorize pathogen transmission is likely to occur. Al Ramtha and Al

Zarqa were included as part of the PREDICT-2 study on MERS-CoV in people, camels, and bats. Two individuals having a confirmed MERS-CoV seropositive test result were previously identified in Al Ramtha by our PREDICT-2 project. Al Zarqa is the location of the first ever known human cases of MERS-CoV reported to the WHO. In 2016, the Food and Agriculture Organization of the United Nations (FAO) detected MERS-CoV virus-positive camels in both Al Ramtha and Al Zarqa. Little is known about the current circulation of MERS-CoV among human or camel populations in Southern Jordan, but Southern Jordan has a greater density of camel livestock than Northern and Middle Jordan. There are numerous poultry farms in all five study regions; while avian influenza in poultry has been detected previously in Jordan, regional or national estimates of avian influenza incidence or prevalence are lacking and this study will therefore better elucidate distribution trends.

Within each of the five study regions, sampling sites will be selected to ensure interfaces with poultry, camels, and other livestock animals are represented (e.g. farms or markets). Each region will include one or more of the following three types of sampling sites: poultry farm or production interface, camel farm or production interface, and "other" livestock farm or production interface where a least one other non-poultry/non-camel livestock animal is present, such as cattle or sheep. Sites with two or more of the interface types present may be included.

Potential sampling sites within each of the five regions will be identified and assessed prior to the beginning of the study and will be categorized by interface type (i.e., poultry, camels, "other," or a combination of multiple interface types) and expected number of persons in and around the site (<20, 21-50, 51-100, or 101+ persons). In each region, the study team will randomly select one site at a time until each of the three animal interface types are evenly represented, then continue to select additional sites until the combined expected number of persons in and around the selected sites exceeds 600 so the region enrollment goal (60) will remain less than 10% of the available population in the region. If it is not possible to reach this number, then all identified sites will be visited for that region. Selected sites will be visited in a random order during each region's first enrollment visit until all three interface types have been visited at least once and the site enrollment goal has been reached.

Study Population: The study will enroll persons regularly working with livestock or poultry or sharing their living areas with these animals as well as persons unexposed to these factors. Based on site selection, people living or working in the five regions will be eligible for recruitment in the study. Inclusion criteria are adults (18 years or older) providing informed consent and children (12 years or older) providing verbal assent and having a parent or guardian able to provide informed consent. Informed consent or assent may be withdrawn by the participant or their parent or guardian at any time during the study procedures or at any future study visit. Exclusion criteria are children less than 12 years old, adults unwilling or unable to provide informed consent, children aged 12-17 years old unwilling or unable to provide assent, and children aged 12-17 years old without a parent or guardian willing or able to provide informed consent. Those approached for recruitment who provide informed consent (and assent if a child) and complete a brief pre-screening questionnaire will be enrolled if they are selected based on their exposure status and the study recruitment quota for the exposed or the unexposed.

Sample Size Calculations: Using an acceptable Type I error rate of 5% and power of 80%, the minimum sample size was computed to detect a difference where 1% (1 out of 100) of unexposed persons (those who do not regularly work with livestock animals or poultry or share their living areas) will have at least one positive test result for at least one of the four zoonotic infections during the study and 12.5% (1 out of 8) of exposed persons (those who regularly work

with livestock animals or poultry or share their living areas) will have at least one positive test result for at least one of the four zoonotic infections during the study. Given these parameters while using the Fleiss method with a continuity correction applied, the minimum sample size needed for the study is 73 unexposed and 145 exposed individuals.

It is estimated that up to 20% of study participants may be lost to follow-up over the course of the study. To maintain the minimum sample size needed to detect the statistical associations of interest, a correction factor of 1.25 (division of 80%) was applied to the minimum sample size. This results in 91 unexposed and 181 exposed individuals needed at the beginning of the study. To account for the marginal possibility that some participants already have evidence of infection with at least one of the four zoonotic infections at the beginning of the study (and therefore must be excluded from the prospective cohort study), these enrollment goals will be rounded up to 100 unexposed and 200 exposed persons, for a total of 300 participants. This results in enrollment goals of 20 unexposed and 40 exposed persons in each of the five regions.

Study Procedures: All written and verbal interactions with potential study participants will be conducted in Arabic by native Arabic-speaking study team members. Individuals present at each study site will be approached for possible recruitment into the study through systematic random sampling until the site's exposed and unexposed enrollment goals are met. A culturally- and financially-appropriate token of appreciation (as deemed by local Jordanian stakeholders and community leaders) will be offered to enrolled participants at each study site visit to encourage retention in the study but not to unduly influence a participant's willingness to participate. Participants providing informed consent first will be asked to complete a pre-screening checklist to determine their enrollment into the study. This checklist will rapidly assess whether the participant would be categorized as "exposed" or "unexposed" in the study based on their interactions with livestock and poultry or their living areas. Participants will be enrolled at each site until the maximum enrollment for the exposure category for the site has been reached.

Enrolled participants will be asked to have two nasopharyngeal and oropharyngeal (NP/OP) swabs taken and serum collected by a trained nurse. Participants will be assigned a unique identifier to track their future participation over the course of the study. They will also be asked to provide contact information so they may be reached during future study visits. Study site visits will be made every three months for a total of 13 study visits per site. Although it is expected that not all participants will be available at every study site visit, every effort will be made to provide ample opportunities for continued participation.

Upon initial enrollment, participants will be verbally administered a standardized questionnaire by a trained member of the field team based on the PREDICT-2 Human Behavioral Risk Questionnaire (example provided in Attachment 3) augmented with animal-specific exposure frequency questions to collect demographic data, symptom and medical history data, social history data, and specific animal-related behaviors and practices that are possible risk factors for infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. During all future visits, enrolled participants will be administered a brief follow-up questionnaire designed primarily to capture time-varying exposure and covariate data. Participants will be asked to have NP/OP swabs taken at all visits. Serum will be collected on the 1st, 7th, and 13th visit.
Beginning with the first visit, the study team will also conduct opportunistic sampling of livestock taxa and poultry at each site as described in the following section. To detect potential pathogen shedding, animal and human sampling will occur within the same week (ideally the same days) at each site. Since animals are not the subject of the cohort study design (and instead will be sampled to provide covariate data for statistical modeling), there is no minimum sample

size required at a given site or sampling visit. The livestock or poultry present at each site may differ from sampling visit to sampling visit, and therefore individual animals will not be sampled longitudinally. Animal sampling parameters are provided below.

Sampling Schedule and Laboratory Assays: Sampling will begin during the third quarter of Year 1. Each site will be visited every 3 months until the final visit during the third quarter of Option Year 1 for a total of 13 sampling visits (**Table 1**). Sites will be visited sequentially during each sampling period, with several days allotted for sampling at each site.

Table 1. Sampling schedule for proposed study.

Year 1	Q1		**Year 2**	Q1	S_3	**Year 3**	Q1	S_7	**OY1**	Q1	S_{11}
	Q2			Q2	S_4		Q2	S_8		Q2	S_{12}
	Q3	S_1		Q3	S_5		Q3	S_9		Q3	S_{13}
	Q4	S_2		Q4	S_6		Q4	S_{10}		Q4	-

*OY=Option Year; Q=Quarter; S_n=Sampling visit number

Human Sampling: Individuals enrolled in the study will be asked to have two NP/OP swabs taken at each visit (**Table 2**). Each participant's swabs will be tested for MERS-CoV and influenza via RT-PCR after each sampling visit. At the 1st, 7th, and 13th (or final) sampling visit, serum will be collected for serology testing for MERS-CoV, AI, brucellosis, and leptospirosis antibodies (**Table 2**).

Table 2. Specimen type, assay, and sampling frequency for humans.

Specimen Type	**Assay**	**Infection**	**Frequency**
NP/OP swabs (2x each)	RT-PCR	MERS-CoV	Each visit (3 mos.)
		Influenza	Each visit (3 mos.)
Serum	Serology	MERS-CoV	1st, 7th, and 13th visit
		Influenza	1st, 7th, and 13th visit
		Brucellosis	1st, 7th, and 13th visit
		Leptospirosis	1st, 7th, and 13th visit

*NP/OP=Nasopharyngeal and oropharyngeal

Livestock and Poultry Sampling: During each site visit, livestock and poultry will be opportunistically sampled to assess infectious activity among animals present as well as to provide covariate data for the human study (i.e., "MERS-CoV-positive camels present at site"). Nasal swabs will be collected from up to 20 livestock animals per animal taxa at each site per visit, and oropharyngeal (OP) swabs will be collected from up to 20 poultry at each site per visit. Sampled animals will be temporarily marked with an adhesive colored band to avoid redundant sampling during the duration of the study site visit, which may last several days. Animal sampling schedule is provided in **Table 3**.

Laboratory testing: Nasal swabs will be tested for MERS-CoV by RT-PCR at the Molecular Biology and Virology lab in the Faculty of Veterinary Medicine/Jordan University of Science and Technology (MBVL/JUST) to detect whether at least one MERS-CoV-positive livestock animal was present at the site when humans were being sampled. MERS-CoV real time PCR are based on targeting upE and ORF 1a as proposed by Corman, 2012.[14] OP swabs will be tested for Influenza A by RT-PCR at the MBVL/JUST to detect whether at least one influenza-positive bird was present at the site when humans were being sampled. Real Time PCR assay will be classified into general real time PCR targeting the matrix gene for identification of influenza A, and then specific real time PCR assays for identification of influenza A subtypes H5,H7 and H9. The general real time PCR for influenza A will be done according to Spackman and Suarez, 2008,[15] and for H5,H7 and H9 the protocol will be based on Monne et al, 2008.[16]

On the 1st, 7th, and 13th (final) sampling visit blood for serum testing will be collected from humans, livestock and poultry to be tested for MERS-CoV, influenza, brucellosis, and leptospirosis antibodies using serology (**Table 3**). Human serum will be tested for MERS-CoV antibodies by Co-I Kayali (**Human Link**) at the Human Link lab at the National Research Centre in Egypt using a pseudoparticle neutralization (ppNT) assay where the spike protein of MERS-CoV is expressed by a replication-incompetent human immunodeficiency virus (HIV) thus avoiding the use of live MERS-CoV in the assay as described by Co-I Kayali.[17] Sera will be screened at a dilution of 1:10 and positive sera will be tested for end-point titers.

Animal serum will be tested for MERS-CoV antibodies at the Diagnostic Laboratory-Faculty of Veterinary Medicine/JUST using a S1-based ELISA kit from EUROIMMUN.[18] Human and animal serology for avian influenza will be performed at MBVL/JUST using Hemagglutination inhibition and serology according to the published protocol by Kayali et al, 2008.[19] Human and animal serology for brucellosis will be conducted at the Diagnostic Laboratory/JUST using the rose Bengal test for screening and a brucellosis complement fixation test (from Jordan Bio Industries Center (JOVAC), Amman, Jordan) for confirmation. Human and animal serology for Leptospirosis will be conducted at the Diagnostic Laboratory/JUST using a commercially available ELISA test. **All samples will be made available to other DTRA- or USG-funded researchers. All collected materials will be will be transported from field to labs on wet or dry ice by project personnel and stored in approved facilities indicated in the PRAT forms and destroyed at the conclusion of the study.**

Positive tests results for reportable diseases will be provided to relevant Jordanian authorities immediately for action as done by our group under USAID PREDICT-2.

Table 3. Specimen type, assay, and sampling frequency for livestock and poultry.

Specimen Type	Assay	Infection	Frequency
Nasal swabs (by taxa + site) - livestock	RT-PCR	MERS-CoV	Each visit (3 mos.)
Oropharyngeal swabs (by site) - poultry	RT-PCR	Influenza	Each visit (3 mos.)
Serum livestock	Serology	MERS-CoV	1st, 7th, and 13th visit
		Brucellosis	1st, 7th, and 13th visit
		Leptospirosis	1st, 7th, and 13th visit
Serum – poultry	Serology	Influenza	1st, 7th, and 13th visit

Analysis Plans

Geospatial Risk Mapping: Following completion of each quarter's sampling visits and testing, geospatial maps of human and animal infections with MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and updated. These will be shared with USG/ DTRA and Jordanian Ministry partners quarterly. Once human behavioral risk data become available, preliminary statistical models will be constructed to generate geospatial risk maps directly linking human-animal interactions with risk of human infection with the four zoonoses.

Temporal Assessment: At the completion of the third year's sampling visits, human and animal zoonotic infections with MERS-CoV, avian influenza, brucellosis, and leptospirosis will be assessed for potential temporal effects in Jordan. This will be updated should the option years be exercised. This will provide critical information on expected background activity of each zoonosis geographically by time of year, which will be essential in determining whether future zoonotic infection activity is exceeding baseline activity due to either a life course (e.g. birthing) or seasonal factor or other unintended outbreak or nefarious activity.

Epidemiologic Causal Inference to Identify Modifiable Risk Factors: Specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine,

feces, and/or nasal secretions) will be assessed for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. These potential modifiable risk factors will be determined through epidemiologic analysis of the questionnaire data (including time-varying data) paired with individual laboratory results (e.g., detection of viral RNA, bacterial DNA, or antibodies). Causal inference techniques within the potential outcomes framework will be employed to solidify statistical associations as concretized biological/ clinical/environmental pathways by operationalizing exposures as well-defined interventions and ensuring exchangeability is maintained through confounder control informed by directed acyclic graphs of the conceptual exposure-disease pathways. While the study may detect associations specific to each of the four diseases, the intent of the study is designed to examine multiple zoonotic pathogens to inform general threat reduction guidelines and identify areas for future study. Identification of modifiable risk factors will inform intervention development that may interrupt future zoonotic transmission of the four pathogens in this study, which will be shared with USG/DTRA and the Jordanian Ministry partners at the annual stakeholders meeting in Year 3 and Option Year 2 as well as during in-person meetings with ministry officials and the threat reduction workshop as potential policy guidance for Jordanian authorities.

Training and Workshops: Training workshops will be held in Jordan throughout the project and will be open to scientists from the Ministries of Health and Agriculture from Jordan, Iraq, and Lebanon (**Table 4 and Attachment 3**) based on recommendations from existing partnerships. The workshops will be delivered by scientists from EHA and JUST. Project staff will be trained to collect biological samples, to promote animal welfare and ethics, and on human subjects research ethics, obtaining valid, informed consent and administering questionnaires (**Attachment 3**). Staff will be cross-trained so that members of the animal health team will be trained to give questionnaires and members of the human health team will be trained to record animal data to promote efficient collaboration in field activities and the One Health concept. We will invite additional stakeholders to select workshops via Jordan's One Health platform to encourage multisectoral buy-in, interpretation and understanding of study findings, and novel collaborations on solutions for threat reduction. We anticipate including 4 professional students per year (20 total) in field, laboratory and analytical components of the project. Three Jordanian scientists and three students will also be trained in laboratory techniques at the Human Link laboratory in Egypt during the course of the project.

Table 4. Proposed training and regional capacity-building workshops (see Attachment 3 for more details).

Date	Workshop Topic(s)	Audience
Year 1 Q2	• Basic Laboratory Safety, Biosafety and Biosecurity, Cold Chain Implementation, Ethical Human Subjects Research, Ethical Animal Subjects Research, Safe Human Sampling, Safe Animal Sampling, Questionnaire Administration, Data Management and Storage	Study team
Year 2 Q3	• All Topics Covered by First Workshop • Disease Reporting Procedures (OIE, WHO IHR)	Regional MOH/ MOA scientists
OY 1 Q3	• Influenza Subtyping, Genomic Analysis of MERS-CoV • Biosafety and Biosecurity Refresher Training	Study Team, Regional MOH/ MOA scientists
OY 2 Q3	• Workshop 1: Geospatial Analysis, Advanced Epidemiology, One Health Disease Surveillance; Workshop 2: Risk Reduction • Biosafety and Biosecurity Refresher Training	Regional MOH/ MOA scientists; OH Platform

III: PROGRAMMATICS

In the past three years, EHA and JUST have co-led implementation of the USAID Emerging Pandemic Threats PREDICT-2 project in Jordan, developing critical surveillance and laboratory capacity for MERS-CoV detection in the country. Through regional partnerships under PREDICT-2 the organizations also collaborated with Human Link on MERS-CoV and broader CoV and Influenza sampling and diagnostics in Jordan and Egypt. **Data collected from these studies in coordination with Ministries of Health and Agriculture represent some of the leading multi-year studies of viral circulation in wildlife in the region and generation of some the first evidence of camel-human transmission dynamics, which form the basis of the proposed study.** EHA also leads a bat CoV pathogen research network in Western and Central Asia (WAB-Net), with Co-Investigators from Jordan (RSS). The proposed study builds on these strong partnerships to generate complementary, fundamental research about risk factors for circulation of MERS and other important zoonotic diseases in people and livestock. Through their expertise and commitment to One Health approaches to support threat reduction, project partners also facilitated the establishment of the national One Health platform, which brings together focal points from Ministries of Agriculture, Environment and Health, WHO, FAO, OIE, JUST, and the Royal Scientific Society of Jordan, which the country has committed to supporting, demonstrating successful transition of ownership and giving us confidence in the high potential impact of the proposed project. This One Health Platform provides a foundation for our multisectoral project to disseminate results and develop practical, country-relevant policy recommendations and promote long-term capacity sustainment.

Table 5. Project partners and roles.

Institution	Study design	Human cohort recruitment	Human sampling, & training	Animal sampling, & training	Lab testing & training	Analysis & dissemination
EHA	✓(Lead)	✓ (Co-Lead)	✓	✓ (Co-Lead)		✓ (Lead)
Overall project oversight; weekly phone calls with partners; study design development and refinement field sampling; human subjects research & training; data analysis; and information dissemination through workshops, conferences, and papers; Tasks 1-6				*William B. Karesh*, DVM (PI); *Catherine Machalaba*, MPH, (CoI) Epidemiologist, Project Coordinator; *Emily Hagan*, MPH, Behavioral Risk Scientist; *Whitney Bagge, PhD, Data Analyst/Mapping/Modeling*		
JUST	✓	✓ (Lead)	✓ (Lead)	✓ (Lead)	✓ (Lead)	✓ (Co-Lead)
Overall project oversight for Jordan-based activities; study design; field and lab oversight and personnel decisions; Jordan staff management; laboratory training, staffing, & testing; liaison with MOH on human studies; liaison with MOA for animal studies; data analysis & dissemination; Tasks 1-6				*Ehab Abu-Basha*, MSc, DVM, PhD (Co-I) *Zaidoun Saleh Hijazeen*, MSVet Med, Infectious Diseases, Veterinarian *Moh'd Borhan Al-Zghoul*, MS, PhD, Immunologist, Molecular Biologist *Mustafa Ababneh*, BSVetMed, PhD, Laboratory Diagnostics, Virologist *Saad Gharaibeh*, BSVetMed, PhD, Avian Diseases, Virologist *Zuhair Bani Ismail*, BSVetMed, Clinical Med, Camels, Leptospirosis *Hani A. M. Talafha*, MS, Field Coordinator		
Human Link	✓		✓		✓ (Co-Lead)	✓

Conduct and oversee human testing for MERS-CoV; Training of Jordanian scientists, study design, data analysis & dissemination; Tasks 2,5				*Ghazi Kayali*, MPH, PhD, (CoI) Virologist, Epidemiologist		
US CDC	✓					✓
Project advisor on zoonotic diseases; data dissemination planning and implementation support; Tasks 1-6				*Patrick Dawson*, MPH, PhD, (CoI) Epidemiologist		
Jordan MoA	✓			✓	✓	✓
Project advisor on zoonotic diseases; data dissemination planning and implementation support; Tasks 1,3,5,6				Mahmoud Alhanatleh, BSVetMed, Chief Veterinary Officer, Jordan		
Jordan FDA	✓					✓
Project advisor on zoonotic diseases; data analyses; implementation support; Tasks 2-6				*Wail Hayajneh*, MBBS (MD), Chairman, Infectious Diseases Comm., Jordan FDA		

IV: RELEVANCE

The USAID PREDICT-2 Jordan team in collaboration with FAO, Kansas State University, and the National Institute of Health (NIH)'s Rocky Mountain Laboratories conducted a nationwide study where blood samples from camels in Ramtha and Azrak were collected and tested against MERS-Cov. Out of 120 samples, 36 were positive. This was the first-ever report of this disease to OIE in camels in Jordan. To date, only few countries have reported virus-positive MERS-CoV test results to the OIE so this is a significant and important step in improving both MERS-CoV detection and reporting in the Middle East. Furthermore, MOH sampled humans from two sites to screen for MERS-CoV where 2 samples were confirmed positive. This demonstrates One Health in action in Jordan led by the JUST/EHA PREDICT-2 team. These results were published under the title "High Prevalence of Middle East Respiratory Coronavirus in Young Dromedary Camels in Jordan".[20] There are no reports of human leptospirosis in Jordan. However, a recently published article showed that approximately 27% and 53% of apparently healthy dairy cows and recently aborted cows are seropositive to Leptospira Hardo and Pomona.[10] Therefore, a serious outbreak of human leptospirosis could occur due to close contact between humans and dairy cows in the country. Regarding brucellosis, a study revealed that people who milk sheep and goats, consume raw feta cheese made from sheep and goat milk, consume raw cows' milk, and boiled feta cheese are more likely to be treated for brucellosis.[21]

V. CREDENTIALS

PI: Dr. William Karesh is the Executive Vice President for Health and Policy at EHA. He serves as the President of the OIE Working Group on Wildlife Diseases and on the WHO IHR Roster of Experts. Dr. Karesh has served as PI on several large-scale, multi-partner projects, including two DTRA-funded projects on RVF in South Africa, and as Technical Director and EPT Partners Liaison for the USAID Emerging Pandemic Threats PREDICT and PREDICT-2 projects, together a $200+ million effort focused on predicting and preventing pandemic diseases. Dr. Karesh coined the term One Health in 2004 and has pioneered initiatives focusing attention and resources on solving problems using the One Health approach linking public health, agriculture and environmental health agencies and organizations around the world. He has created, directed and managed projects and programs in 56 countries, including efforts to minimize the impact of diseases such as RVF, Ebola, avian influenza, and anthrax as well as supporting global surveillance systems for emerging diseases. He is a leading global expert on MERS, recently serving on the OIE *ad hoc* group on MERS-CoV, and assisted the Kingdom of Saudi Arabia in implementing MERS investigations in animals. He is currently Co-PI of the DTRA BTRP West Asia Bat Research Network, which will promote project synergies in the region.

Prime Organization: EcoHealth Alliance (EHA) is a science-based organization incorporated over 45 years ago, currently working with local partners in over 20 countries at the nexus of human, animal, and environmental health. EHA's staff in New York includes leading scientists from a wide range of disciplines (veterinarians, epidemiologists, diagnostic experts, modelers, economists, social scientists, ecologists, analysts and IT researchers), and administrative and communications staff. EHA has an extensive record of publishing high-quality, peer-reviewed papers, journals, and briefing documents. Our team led development of a human behavioral risk surveillance protocol and questionnaire that has now been implemented in 28 hotspot countries for disease emergence.

JUST: Co-I Dr. Abu-Basha has led several projects related to emerging zoonotic infectious diseases including "Enhanced Surveillance of Trans-boundary Animal Diseases in Rural Areas of Jordan Affected by the Crisis in Syria" and "Cross-sectional surveillance of MERS-CoV and related coronaviruses in camels in Jordan". He was also country project lead and country coordinator of the USAID PREDICT-2 Project, which was concerned with developing a global early warning system to detect, track, and predict the emergence of new zoonotic pathogens from wildlife that could pose a threat to human health. The MBVL/JUST laboratory is an important hub for training and preparing future scientists to perform techniques from sample handling to DNA extraction, cDNA synthesis, performing PCR protocols, cloning, plasmid purification, and sequencing analysis.

Human Link: Co-I Dr. Kayali has extensive experience on both MERS and Avian Influenza in the Middle East and Africa, conducting surveillance for avian influenza and MERS-CoV in humans and different animal species in several countries in the Middle East and Africa. He oversees two virology laboratories, one in Egypt at the National Research Centre in Egypt to be used in this project and one in Lebanon. Dr. Kayali is a world-renowned SME for influenza and coronaviruses. He is part of the NIAID CEIRS network and DTRA/GCRF CANARIES network and served as USAID PREDICT-2 lead for Egypt.

US CDC: Co-Investigator Dr. Patrick Dawson worked for EHA for 3 years overseeing the Jordan PREDICT-2 project work on viral zoonoses. As an EIS officer at CDC, he will be serving as project advisor on zoonotic diseases, and after Year 2, providing data analyses and dissemination. **Jordanian Ministry of Agriculture**'s Chief Veterinary Officer Dr. Mahmoud Alhanatleh served as an advisor on the USAID EPT PREDICT-2 project for the animal studies components. He will continue in this role for the proposed project. **Jordanian Food and Drug Administration** Chairman of the Infectious Diseases Committee Dr. Wail Hayajneh is a subject matter expert on zoonotic diseases, former dean of the JUST School of Medicine, and served as an advisor on the USAID EPT PREDICT-2 project. He will continue as a project advisor for the proposed project and serve as a liaison with the Jordanian government.

VI: WORK TO BE PERFORMED

Year 1:

Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and poultry in Jordan. *Subtasks*: (Format: Year #. Task #. Subtask #)

1.1.1 Identify sites for project study. **1.1.2** Obtain local permissions and approvals to work with animals. **1.1.3** Conduct biological sampling of animals in the study areas. **1.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

Description and execution: **1) Study sites:** Within each of the five study regions, sites will be selected as described in the methods section. **2) Local permissions:** Once U.S. ethical approval is finalized, we will submit protocols for local ethical clearance and permits to conduct research

with animals. As part of obtaining local permissions we will also meet with community leaders, owners of animals, and poultry production facility managers. **3) Conduct biological sampling of animals:** Nasopharyngeal and oropharyngeal swabs will be collected from 300 camels, poultry and other livestock quarterly in Y1, Q3-Q4 as described above. Blood samples will be collected from 300 animals in Y1, Q3 as described above. **4) Conduct laboratory testing** for pathogens in Y1, Q3 and Q4 as described above. Laboratory security details are indicated in the PRAT form.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 7 laboratory scientists and veterinarians (conduct field and laboratory work, coordinate field and laboratory activities); **HL:** 1 research scientist, (laboratory technical advisor, laboratory training, data analysis); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Selection of study sites; Permits and ethical clearance obtained for animal studies; Project staff trained; Animal sampling implemented; Sample testing implemented.
Deliverable: animal test results report produced and shared.

Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection.

Subtasks: **1.2.1** Identify sites and conduct enrollment for human study component. **1.2.2** Obtain approvals to work with human subjects. **1.2.3** Conduct biological sampling. **1.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description and execution: **1) Study sites and enrollment:** Based on site selection, people living or working in one of the 5 regions during the first, second, or third visits (until sample targets are reached) will be eligible for recruitment in the study as described above. **2) Local permissions:** Once U.S. ethical approval is finalized, we will submit protocols for local ethical clearance and permits to conduct research with human subjects. As part of obtaining local permissions we will also meet with community leaders and poultry production facility managers. **3) Human biological sampling:** Nasopharyngeal and oropharyngeal swabs will be collected from 300 people quarterly in Y1, Q3 and Q4 as described above. Blood samples will be collected from 300 people in Y1, Q3 as described above. **4) Conduct laboratory testing** for pathogens in Y1, Q3 and Q4 as described above. Laboratory security details are indicated in the PRAT form.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 7 laboratory scientists and medical doctor (conduct and coordinate field and laboratory work, organize partner and stakeholder meetings, coordinate field and laboratory activities); **HL:** 1 research scientist, 1 laboratory technician (human serology, laboratory training, data analysis); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Local permissions obtained to conduct human study; Project staff trained; Human sampling implemented; Sample testing implemented.
Deliverable: Human test results report produced and shared.

Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.

Subtasks: **1.3.1** Obtain local permissions and approvals to work with human subjects. **1.3.2** Conduct behavioral risk factor surveys in people. **1.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description and execution: **1) Local permissions:** Develop owner/worker questionnaire for the behavioral survey. Once U.S. ethical approval is finalized, submit protocols for local ethical clearance and permits to conduct research as described in methods section and obtain concurrence from local community leaders. **2) Conduct behavioral surveys:** Conduct

behavioral survey on 300 people in Y1, Q3 and brief follow-up survey in Q4 as described in the Methods. **3) Data analysis:** Preliminary data analysis will begin in Y1, Q3 and continue in Q4.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 5 research scientists and medical doctor (conduct behavioral work, coordinate field activities); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Obtain local permissions to conduct behavioral risk study; Questionnaire app developed; Project staff trained; behavioral study implemented.
Deliverable: Behavioral risk factor study initiated.

Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk.

Subtasks: **1.4.1** Generate geospatial maps of laboratory results. **1.4.2** Generate geospatial risk maps by addition of human behavioral risk data.
Description and execution: **1) Geospatial maps**: Lab results of human and animal testing for MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and updated quarterly beginning Y1, Q3 and shared with USG/DTRA and Jordanian project partners. **2) Risk maps:** Use statistical models to link human behavioral data to laboratory findings beginning in Y1, Q4 and share with USG/DTRA and Jordanian project partners.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 5 research scientists (design methodology, conduct data collection and analyses); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Compile data; Develop models and conduct analyses; Develop and update geospatial maps and risk maps.
Deliverable: Initial geospatial maps and risk maps produced and shared.

Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.

Subtasks: **1.5.1** Conduct project kick-off meeting in Amman with local stakeholders. **1.5.2** Train local project staff in proper techniques. **1.5.3** Host annual partners and stakeholders meeting. **1.5.4** Complete annual report and share with project partners and local stakeholders. **1.5.5** Conduct training workshops. **1.5.6** Data management. **1.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description and execution: **1) Project kick-off meeting:** Government partners and stakeholders will be invited to a project launch meeting to be held in Amman in Y1, Q1. **2) Train local project staff in proper techniques:** Before the field studies we will train (Y1)/retrain (OY1) our One Health field team as described above and in Attachment 3. **3) Annual partners and stakeholders meeting:** We will host an annual Stakeholders and Partners Meeting to inform stakeholders of our progress and receive feedback and input on the project. For this meeting we will invite local and national representatives of public health, veterinary health, environmental health/sciences, medical and laboratory officers as well as community leaders. To be held in Amman Y1, Q4. **4) Annual Report:** compiled and delivered at the end of Y1, Q4. **5) Training Workshops:** To be held as described in Technical Narrative and Attachment 3 in Y1, Q2. **6) Data management:** A database will be developed, used for epidemiological analyses and shared among implementing partners (including government partners). While sensitive human data will remain protected, we will work with government partners and stakeholders to provide aggregated data as requested. Biobank sample repository information will be maintained in a DTRA-

specified format and all samples and data generated during the course of the project will be available for at least 12 months after the project end date. Scientific and general reports will be generated. **7) Presentations and Meetings:** Project participants will attend DTRA Annual Technical Review as requested and other national or international meetings such as the International Meeting on Emerging Diseases or ASM Biothreats.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, support workshops, ensure the curation and analysis of data); **JUST:** 9 scientists and technicians (organize and support training workshops, organize partner and stakeholder meetings); **HL:** 1 research scientist (training in laboratory techniques and analyses); **CDC:** 1 research scientist (training in methods and data analyses).
Metrics of success: Training workshops completed; Hosting of project meetings; Completion of annual report with sample repository data to DTRA Thrust Area 6; Participation in DTRA and scientific meetings.
Deliverable: Trained project personnel, communication via reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.
Year 2:
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan.
Subtasks: **2.1.3** Conduct biological sampling in animals within the study area. **2.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in Year 1 except: **3) Biological sampling of animals:** Swabs will be collected from 300 camels, poultry and other livestock quarterly in Y2. No blood samples collected in Y2. **4) Laboratory testing:** performed quarterly in Y2 (PCR testing only).
Metrics of success: Animal sampling conducted; Sample testing conducted.
Deliverable: Animal sampling and testing conducted; Test results report produced and shared.
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection.
Subtasks: **2.2.3** Conduct biological sampling of people within the study area. **2.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in Year 1 except: **3) Human biological sampling:** Swabs will be collected from 300 people quarterly. No blood samples will be collected from people in Y2. **4) Conduct laboratory testing:** performed quarterly in Y2 (PCR testing only).
Metrics of success: Participants re-enrolled; Human sampling conducted; Sample testing conducted.
Deliverable: Human sampling and testing conducted; Test results report produced and shared.
Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.
Subtasks: **2.3.2** Conduct behavioral risk factor surveys in people. **2.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description, execution and resources: as in Year 1 except: **2) Conduct behavioral surveys:** Conduct brief follow-up behavioral survey (subset of larger survey with ethical clearance obtained) on 300 people in Y2, Q3. **3) Data analysis:** Data analysis will be conducted quarterly.
Metrics of success: Develop app for follow-up behavioral survey; Project staff re-trained; behavioral study conducted.
Deliverable: Behavioral risk factor study results report produced and shared.
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human

zoonotic transmission risk.

Subtasks: **2.4.1** Generate geospatial maps of laboratory results. **2.4.2** Generate geospatial risk maps by addition of human behavioral risk data.

Description, execution and resources: as in Year 1 except: **1) Geospatial maps:** Lab results of human and animal testing for MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and updated quarterly and shared with USG/DTRA and Jordanian project partners. **2) Generate geospatial risk maps:** Use statistical models to link human behavioral data to laboratory findings quarterly and share with USG/DTRA and Jordanian project partners.

Metrics of success: Update geospatial maps and risk maps; Share with project partners.

Deliverable: Updated geospatial maps and risk maps produced and shared.

Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.

Subtasks: **2.5.3** Host annual partners and stakeholders meeting. **2.5.4** Complete annual report and share with partners and stakeholders. **2.5.5** Conduct training workshops. **2.5.6** Data management. **2.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.

Description, execution and resources: as in Year 1 except: **3) Annual partners and stakeholders meeting:** to be held in Amman Y2, Q4. **4) Annual Report:** compiled and delivered at the end of Y2, Q4. **5) Training Workshops:** To be held as described in the Technical Narrative and Attachment 3 in Y2, Q3 as a regional workshop.

Metrics of success: Hosting of project meetings; Completion of annual report with sample repository data to DTRA Thrust Area 6; Completed report to local stakeholders; Hosting of training workshops; Participation in DTRA and scientific meetings.

Deliverable: Training workshop conducted, communication via reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.

Year 3:

Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan.

Subtasks: **3.1.3** Conduct biological sampling in animals within the study area. **3.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

Description, execution and resources: as in Year 2 except: **3) Biological Sampling:** Blood samples will be collected in Y3, Q1. **4) Conduct laboratory testing:** Serology will be tested in Y3, Q1.

Metrics of success: Animal sampling conducted; Sample testing conducted.

Deliverable: Animal sampling and testing conducted; Test results report produced and shared.

Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses. *Subtasks*: **3.2.3** Conduct biological sampling of in people within the study area. **3.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

Description, execution and resources: as in Year 2 except: **3) Human biological sampling:** Blood samples will be collected from people in Y3, Q1. **4) Conduct laboratory testing:** Serology will be tested in Y3, Q1.

Metrics of success: Participants re-enrolled; Human sampling conducted; Sample testing conducted.

Deliverable: Human sampling and testing conducted; Test results report produced and shared.

Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.
Subtasks: **3.3.2** Conduct behavioral risk factor surveys in people. **3.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description, execution and resources as in Year 2.
Metrics of success: Project staff re-trained; behavioral study conducted.
Deliverable: Behavioral risk factor study results report produced and shared.
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk. *Subtasks*: **3.4.1** Generate geospatial maps of laboratory results. **3.4.2** Generate geospatial risk maps with addition of human behavioral risk data.
Description, execution and resources as in Year 2.
Metrics of success: Update geospatial maps and risk maps; Share with project partners.
Deliverable: Updated geospatial maps and risk maps produced and shared.
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.
Subtasks: **3.5.3** Host annual partners and stakeholders meeting. **3.5.4** Complete annual report and share with project partners and local stakeholders. **3.5.6** Data management. **3.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description, execution and resources: as in Year 2 except: **3) Annual partners and stakeholders meeting:** to be held in Amman Y3, Q4. **4) Annual Report:** compiled and delivered the end of Y3, Q4. **5) Training Workshops:** no training workshops to be held in Y3.
Metrics of success: Hosting of project meetings; annual report with sample repository data to DTRA Thrust Area 6; reports to stakeholders; Participation in DTRA and scientific meetings.
Deliverable: Communication via reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.
Task 6: Identify specific modifiable risk factors for human infection with these zoonoses.
Subtasks: **3.6.1** Conduct causal inference analyses based on data from Task 1, 2, 3. **3.6.2** Share results of analyses at annual partners and stakeholders meeting. **3.6.3** Submit written report to DTRA, local partners and stakeholders.
Description and execution: **1) Causal inference analyses:** as described in technical narrative. **2) Share Results:** at annual partners and stakeholder meeting Y3, Q4. **3) Written Report:** Results of analyses with identification and recommendations on modifiable risk factors delivered Y3,Q4.
Resources: **EHA:** 3 research scientists (design methodology, support JUST scientists, support workshops, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 4 research scientists (conduct data collection and analyses, support training workshops, organize partner meetings); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Initiate causal inference analyses; Deliver report to project partners and stakeholders on modifiable risk factors.
Deliverable: Causal inference analysis report produced and shared.
Option Year 1
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan. *Subtasks*: **O1.1.3** Conduct biological sampling of animals within the study area. **O1.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in Year 3 except: **3) Biological Sampling:** Swabs will be collected in Q1, Q2, Q3 and blood samples will be collected from 300 animals in OY1, Q3.
Metrics of success: Project staff re-trained; Animal sampling and testing conducted.

Deliverable: Animal sampling completed; Test results report produced and shared.

Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses. *Subtasks*: **O1.2.3** Conduct biological sampling within the study area. **O1.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

Description, execution and resources: as in Year 3 except: **3) Human biological sampling:** Swabs will be collected in OY1 Q1, Q2, Q3 and blood samples will be collected from 300 people in OY1, Q3.

Metrics of success: Project staff re-trained; Participants re-enrolled; Human sampling conducted; Sample testing conducted.

Deliverable: Human sampling and testing conducted; Test results report produced and shared.

Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses. *Subtasks*: **O1.3.2** Conduct behavioral risk factor surveys in people. **O1.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.

Description, execution and resources: as in Year 3 except: **1) Behavioral surveys**: will be conducted in OY1 Q1, Q2, Q3.

Metrics of success: Project staff re-trained; Behavioral study conducted.

Deliverable: Behavioral risk factor study surveys completed; Results report shared.

Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk. *Subtasks*: **O1.4.1** Generate geospatial maps of laboratory results. **O1.4.2** Generate geospatial risk maps by addition of human behavioral risk data.

Description, execution and resources as in Year 3.

Metrics of success: Update geospatial maps and risk maps; shared with project partners.

Deliverable: Geospatial maps and risk maps produced and shared with partners.

Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops. *Subtasks*: **O1.5.2** Train local project staff in proper techniques. **O1.5.3** Host annual partners and stakeholders meeting. **O1.5.4** Complete annual report and share with project partners and local stakeholders. **O1.5.5** Conduct local/regional training workshops. **O1.5.6** Data management. **O1.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.

Description, execution and resources: as in Y1 except: **2) Train local project staff:** retraining. **3) Annual partners and stakeholders meeting:** to be held in Amman OY1, Q4. **4) Annual Report:** compiled and delivered at the end of OY1, Q4. **5) Training Workshops:** To be held as described in the Technical Narrative and Attachment 3 in OY1, Q3 as a regional workshop.

Metrics of success: Hosting of project meetings; Completion of annual report with sample repository data to DTRA Thrust Area 6; Completed report to local stakeholders; Hosting of training workshops; Participation in DTRA and scientific meetings.

Deliverable: Communication via reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.

Task 6: Identify specific modifiable risk factors for human infection with these zoonoses. *Subtasks*: **O1.6.1** Conduct causal inference analyses based on Task 1, 2, 3. **O1.6.2** Share results of analyses at annual partners and stakeholders meeting.

Description, execution and resources: as in Y3 except: **1) Conduct causal inference analyses:** continue as described in the Technical Narrative. **2) Share Results:** updated results at annual partners and stakeholder meeting OY1, Q4.

Metrics of success: Conduct causal inference analyses; Deliver report to project partners and stakeholders on modifiable risk factors.
Deliverable: Causal inference analysis report produced and shared.

Option Year 2

Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan. *Subtasks*: **O2.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in OY1 except: **4) PCR and Serology testing:** to be completed by end of OY2, Q2.
Metrics of success: Animal sample testing conducted and completed.
Deliverable: Animal testing results report produced and shared.

Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses. *Subtasks*: **O2.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in OY1 except: **4) PCR and Serology testing:** to be completed by end of OY2, Q2.
Metrics of success: Human sample testing conducted and completed.
Deliverable: Human sample testing final test results report produced and shared.

Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.
Subtasks: **O2.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description, execution and resources: as in OY1 except: analysis of survey results be completed by end of OY2, Q4.
Metrics of success: Conduct analysis of epidemiologic causal inference.
Deliverable: Behavioral risk factor study analyses completed; Final results report generated with identified modifiable risk factors and delivered to partners and stakeholders.

Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk. *Subtasks*: **O2.4.1** Generate geospatial maps of laboratory results. **O2.4.2** Generate risk maps by addition of human behavioral risk data.
Description, execution and resources: as in OY1 except: to be completed by end of OY2, Q4. Geo-spatial analysis technology will be transferred in the regional workshop on geospatial analysis (Task 5).
Metrics of success: Update geospatial maps and risk maps; shared with project partners.
Deliverable: Completed final geospatial maps and risk maps.

Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.
Subtasks: **O2.5.3** Host annual partners and stakeholders meeting. **O2.5.4** Complete annual report and share with project partners and local stakeholders. **O2.5.5** Conduct local/regional training workshops. **O2.5.6** Data management. **O2.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description, execution and resources: as in Y3 except: **3) Annual partners and stakeholders meeting:** to be held in Amman OY2, Q4. **4) Annual Report:** compiled and delivered at the end of OY2, Q4. **5) Training Workshops:** To be held as described in Technical Narrative and Attachment 3 in OY2, Q3 as a regional workshop.
Metrics of success: Hosting of project meetings; Completion of annual report with sample repository data to DTRA Thrust Area 6; Completed report to local stakeholders; Hosting of training workshops; Participation in DTRA and scientific meetings.

Deliverable: Biobank sample repository information maintained in a DTRA-specified format. Final project reports delivered to partners, stakeholders and DTRA.

Task 6: Identify specific modifiable risk factors for human infection with these zoonoses.

Subtasks: **O2.6.1** Conduct causal inference analyses based on Task 1, 2, 3. **O2.6.2** Share results of analyses at annual partners and stakeholders meeting. **O2.6.3** Submit written report to DTRA and local partners and stakeholders.

Description, execution and resources: as in OY1 except: **1) Final causal inference analyses:** continue and complete as described in technical narrative by end of OY2, Q4. **2) Final Results:** final results provided at annual partners and stakeholder meeting OY2, Q4. **3) Final Written Report:** Final analyses results with identification and recommendations on modifiable risk factors delivered at end of OY2, Q4.

Metrics of success: Complete causal inference analyses; Deliver final report to project partners and stakeholders on modifiable risk factors.

Deliverable: Generate and deliver written report of analyses with identification and recommendations on modifiable risk factors.

VII: PERFORMANCE SCHEDULE

Task	Year 1	Year 2	Year 3	OY 1	OY 2
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan					
1.1. Identify sites for project study					
1.2 Obtain local permissions and approvals to work with animals					
1.3 Conduct biological sampling in animals within the study area					
1.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection					
2.1 Identify sites and conduct enrollment for human study component					
2.2 Obtain local permissions and approvals to work with human subjects					
2.3 Conduct biological sampling					
2.4 Conduct testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses					
3.1 Obtain local permissions and approvals to work with human subjects					
3.2 Conduct behavioral risk factor surveys in people					
3.3 Analyze epi causal inference to identify modifiable risk factors					
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk					
4.1 Generate maps of laboratory results					
4.2 Generate risk maps with human beh. risk data					
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon					
5.1 Conduct project kick-off meeting in Amman with local stakeholders					
5.2 Train local project staff in proper techniques					
5.3 Host annual partners and stakeholders meeting					
5.4 Complete annual report and share with partners and stakeholders					
5.5 Conduct local/regional training workshops					
5.6 Data management					
5.7 Conduct presentations/meetings at times and places specified					
Task 6: Identify specific modifiable risk factors for human infection with these zoonoses					
6.1 Conduct causal inference analyses based on Task 1, 2, 3					
6.2 Share results of analyses at annual partners and stakeholders meeting					
6.3 Submit written report to DTRA and local partners and stakeholders					

Confirmed Proposal Expiration Date. "EHA holds the proposal, to include proposed costs, firm for 180 days after the submission due date, as included in the invitation to submit a full proposal."

BUDGET JUSTIFICATION FOR ECOHEALTH ALLIANCE

EcoHealth Alliance requests a total of $4,975,681 over all-years of the proposed project to support personnel, travel, equipment, consortium agreements, and applicable indirect costs.

A. Key Personnel

William B. Karesh, D.V.M., Principal Investigator (2.0 calendar months for all years). Dr. Karesh will be responsible for the overall coordination of this project. He will provide overall project oversight, study design development and refinement, data analysis, publication support, annual stakeholder meeting participation and visits to oversee field work. We request S47,352 in Y1 due to the high cost of living in New York City we request a a 5% cost of living increase each subsequent year.

Catherine Machalaba, M.P.H., Co-Investigator (6.0 calendar months Y1-OY1, 7.0 calendar months OY2). Ms. Machalaba will be a technical advisor to the project, advising on study design and risk reduction. She to provide day-to-day project development and strategic management, including through regular in-person meetings and weekly phone and other direct communications with partners. She will also supervise field sampling, data analysis, and data and information dissemination through workshops, conferences, and papers. In OY2 she will conduct a risk reduction workshop as well as conduct a One Health economic analysis. We request S41,895 in Y1 with a 5% cost of living increase each subsequent year.

Emily Hagan, M.P.H., Behavioral Risk Scientist (3.0 calendar months in all years). Ms. Hagan will provide medical anthropology expertise for the questionnaires and analysis, supervise and conduct the IRB processes and trainings on the human subject work for local partners, and assist with data organization and analysis. We request S17,000 in Y1 with a 5% cost of living increase each subsequent year.

Whitney Bagge, Ph.D., Modeler (2.5 calendar months Y1, 1.2 calendar months in Y2, OY2). Dr. Bagge will be a technical advisor to the project, advising on data organization, analysis, and writing with a focus on statistical analytics and assist with study design in Y1, for which we request S19,113 in OY1.

B. Other Personnel

Amanda Andre, LMSW, Operations Assistant (6.0 calendar months in all years). Ms. Andre will be the administrative lead handling project management responsibilities related to budgeting, expenses, managing of subcontracts, and meeting scheduling and logistics. She will coordinate all meetings and travel and ensure compliance with funding and contractual requirements. We request S27,853 in Y1 with a 5% cost of living increase each subsequent year.

Research Assistant (12.0 calendar months in all years). A Research Assistant will be hired to assist in the development of reports, coordination of collaborators, and data cleaning, maintenance and analysis. We request $61,000 in Y1 with a 5% cost of living increase each subsequent year.

Fringe Benefits

Fringe benefits are calculated as 35.4% of base salary p.a. with $75,831 requested in Y1 calculated from the base salary for all Personnel. In Y2 OY2, we budget for a 5% per year cost of living allowance increase in all salaries.

C. Equipment
No funds are requested for equipment.

D. Travel
Domestic Travel
Domestic travel is requested for three trips per year for program staff to travel from New York City to Washington, DC for broader engagement of relevant partners and deliver presentations. EcoHealth Alliance has close relationships to the World Bank including a technical collaboration to optimize investments in health security and the application of the One Health approach. As requires, trips from New York City to Northern Virginia for two personnel to attend the CBEP meeting as included as well. Transportation is estimated at $400 per trip along with the government GSA per diem rates for Washington, DC ($251 for accommodation and $94 for meals and incidentals) and Northern Virginia ($161 for accommodation and $71 for meals and incidentals). Additional domestic travel support will facilitate EcoHealth Alliance staff presenting at a total of four domestic conferences annually. Two of these will be ASTMH in Maryland with transportation costs of $400, $157 for accommodation and $71 for meals and incidentals, along with two trips to APHA in San Diego with flights estimated at $500, $174 for accommodation and $71 for meals and incidentals. For each trip, $25 per day is estimated in taxi costs and for those that require transport to the airport $150 RT is included. In total, we are requesting $11,852 in each year of our proposed work.

International Travel
Foreign travel is requested for partner meetings, in-country trainings, and field research. Five or six EHA employees will attend annual meetings each year, depending on the year and the subjects that will be discussed at the meeting. Three EHA staff will make a second trip each year for trainings and field research. Flights for each of these trips is estimated at $1,500 and the federal per diem rates of $246 for lodging and $138 for meals in Amman, Jordan and $146 for lodging and $105 for meals while conducting field work outside of Amman, Jordan are requested. Additionally, we are requesting travel for staff to present on project findings at international conferences each year with flights estimated at $1,500 and hotels and meals at the government GSA per diem rates for Vienna, Austria for International Meeting on Emerging Diseases and Surveillance (IMED). The total requested for international travel in Y1 is $60,786.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
Co-Investigator Catherine Machalaba and the Research Assistant to be hired will both need a new computer, equipped with Microsoft and Adobe software for which we request a total of $6,000, in Y1. In order to analyze, manage, and produce graphical visualizations of data

a Stata license will be needed for which we request S600 p.a. Thus, we request a total of S9,000 over the full five years.

Publication Costs
To facilitate the dissemination of project findings, S6,000 per year in only Y2-OY2 is requested for open access publication costs in international peer-reviewed journals. This amounts to a request for $24,000 over the 5 years.

Consultant Services
For the human behavioral risk part of the project, $1,000 is requested p.a Y1-OY2 for Hummingbird IRB and $3,500 in Y1 for required Collaborative Institutional Training Initiative training for personnel handling human and non-human animals and samples as per IRB and IACUC requirements. Thus, we request a total of S8,500 over the five year project.

Subawards/Consortium/Contractual Costs
Subcontracts for the Jordan University of Science and Technology (JUST) and Human Link are outlined in their individual budget justifications.

H. Indirect Costs
We are requesting the EcoHealth Alliance federally approved indirect cost rate of 32.91% on all applicable direct costs. The USA Department of Defense's Department of the Navy has approved this rate on 17 July 2019. We have applied our indirect cost rate to the first $25,000 of the subcontracts. We request $132,086 in Y1 and S623,572 over the five years of the project.

BUDGET JUSTIFICATION FOR HUMAN LINK, LEBANON

Human Link requests a total of $53,661 over all years of the proposed project to support testing and indirect costs.

A. Key Personnel
Ghazi Kayali, Ph.D., Co-Investigator (1 week for OY1-2). Dr. Kayali will assist in conducting a three day didactic training on biosafety and security, including real-time PCR testing and analysis, influenza subtyping, genomic analysis of MER-CoVs and serology testing and analysis. For this he will be compensated one week salary, in addition to one week in OY2 to advise on data analysis, interpretation, and publications related to the laboratory work to promote scientific sharing of the laboratory methods to enhance detection capacity, for which we are requesting a total of $7,700.

B. Other Personnel
No funds are requested for other personnel costs.

C. Equipment
No funds are requested for equipment costs.

D. Travel
In order to conduct the biosafety, security and laboratory technique training in OY1, we are requesting $2,387 in international travel to cover the flight from Cairo to Amman (estimated at $400) as well as the federal per diem rates of $246 for lodging in Amman, Jordan and $138 for meals in Amman, Jordan.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Laboratory Testing
The Human Link lab at the National Research Centre in Egypt will be utilized to test human for MERS-CoV antibodies, supervised by Co-I Kayali. This will be conducted using a pseudoparticle neutralization (ppNT) assay where the spike protein of MERS-CoV is expressed by a replication-incompetent human immunodeficiency virus (HIV) thus avoiding the use of live MERS-CoV in the assay. Sera will be screened at a dilution of 1:10 and positive sera will be tested for end-point titers. Additionally, three Jordanian scientists and three students will also be trained in laboratory techniques at the Human Link laboratory in Egypt during the course of the project. The testing costs $40 per test, for a total of $14,256 p.a in Y1, Y3 and OY1.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 8% on all direct costs.

BUDGET JUSTIFICATION FOR JORDAN UNIVERSITY OF SCIENCE AND TECHNOLOGY, JORDAN

The Jordan University of Science and Technology (JUST) requests a total of $2,399,786 over all years of the proposed project to support personnel, travel, equipment, other direct costs and indirect costs.

A. Key Personnel

Ehab Abu-Basha, Ph.D., Co-Investigator (12.0 calendar month for all years). Dr. Abu-Basha will provide overall project oversight for Jordan-based activities. Dr. Abu-Basha will be leading all elements on the human and animal subjects research side of the project as well as the laboratory diagnostics elements. Dr. Abu-Basha will ensure JUST meets project tasks and milestones, will oversee JUST's budget, and will assist with dissemination of findings through publications and conference presentations. We request $128,400 p.a. in salary for Dr. Abu-Basha.

Hani Talafha, M.S., Biologist (8.0 calendar month for all years). As Director of Research Services at JUST, Mr. Talafha will co-oversee field work and assist in Jordan staff management, for which $32,000 is requested p.a.

Zaidoun Hijazeen, M.S, Veterinarian (2.0 calendar month for Y1, 12.0 calendar month Y2-OY2) Dr. Hijazeen will co-oversee field work, assist in study design and train and manage Jordan staff for which $8,000 is requested starting in Y1.

Mustafa Ababneh, Ph.D., Virologist (2.5 calendar month for Y1-OY2). As Lab Director, Dr. Ababneh will provide oversight of laboratory staff and activities, conduct laboratory analyses, provide interpretation of test results, supervise and train students, for which $15,000 is requested p.a.

Zuhair Bani Ismail, B.S., Livestock Expert (2.5 calendar month for Y1-OY2). Mr. Ismail will be responsible for the livestock sampling compliance and interpretation of test results for which $12,500 is requested p.a.

Borhan Al-Zoghoul, Ph.D., Molecular Biologist (3.0 calendar month for Y1-OY2). As Lab Director, Dr. Al-Zoghoul will provide oversight of laboratory staff and activities, conduct laboratory analyses, provide interpretation of test results, supervise and train students, for which $15,000 is requested p.a.

Bilal Al-Omari, BSc, Lab Supervisor (3.0 calendar month for Y1-OY2). As Lab Supervisor, Mr. Al-Omari will conduct laboratory analyses, provide interpretation of test results, supervise and train students for which $9,000 is requested p.a.

Wail Hayajneh, MBBS, Human Idntification Expert (1.0 calendar month for Y1-OY2). Mr. Hayajneh will assist with study design for the human components of the study and serve as government liaison, for which $5,000 is requested p.a.

B. Other Personnel

Saad Gharaibeh, Ph.D., Avian Pathologist (1.0 calendar month for Y1-3, 2.0 calendar months for OY1-OY2). Dr. Gharaibeh will assist with study design and implementation for the poultry components, provide interpretation of test results, and provide guidance on recommendations for which $5,000 is requested starting in Y1.

Administrative Assistant (3.5 calendar months for Y1-OY2). The administrative assistant will be handling project management responsibilities related to expenses, managing of the subcontract, scheduling and logistics, for which we request S6,300 p.a.

Nurses (2.0 calendar months for Y1, 4.0 calendar months for Y2-3, 3.0 calendar months for OY1). Two Jordanian nurses will be responsible for assisting with the human sampling at the field study sites. We request $78,800 over the proposed five years of the project for these two positions.

C. Equipment

A field vehicle for field sampling and sample transport is estimated at S35,000. The current agreement with DTRA and the US Embassy in Jordan will allow the vehicle to be imported without having to pay VAT.

D. Travel

Domestic Travel

In order to conduct field sampling, teams of five, including two nurses, will be visiting five sites (Al Ramtha, Al Zarqa, Al Karak, Ma'an, Aqaba) for five days each twice in Y1, four times in Y2-Y3 and three times in OY1. Field staff will be provided with a per diem for food and lodging of $60 per person per day. In order to cover meals, lodging, fuel for both field work and meetings around Irbid and Amman (an estimated 30,000 km Y1-OY1 and 10,000 miles in OY2), vehicle maintenance and refreshments for those participating in human work we request S22,330 in Y1.

International Travel

We are requesting travel for Jordanian project participants to attend aa average of five regional conferences and five international conferences each year to present on project findings. For the regional conference flights are estimated at $600 and hotels and meals at the government GSA per diem rates for Istanbul, Turkey of $299 and S131, respectively. For the international conference flights are estimated at S800 and hotels and meals at the government GSA per diem rates for Vienna, Austria of S221 and $122, respectively. We are requesting travel for Dr. Abu-Basha to the DTRA meeting in Northern Virginia, with the flight estimated at S1,000 and hotels and meals at the government GSA per diem rates of S251 and S76. For the MERS Serology, a neutralization test will be performed in Cairo. The samples will be hand carried once in Y1, Y3 and OY1 and accompanied by three project staff and three students for training in the lab in Cairo. For this travel, flights estimated at $400 and hotels and meals at the government GSA per diem rates for Cairo, Egypt of S175 for lodging and S98 for meals and incidentals for a seven day trip. We are requesting S3,000 p.a. to cover conference fees along with $500 p.a. for visa fees. For each trip, RT taxi to the airport are estimated at $75 along with $25 per day for in-country taxis.

In total over the course of the project, we are requesting $162,302 in for International Travel.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
We will supply the field team with all consumables required to collect samples, including serum tubes, vacutainer holder, needles, syringes, nitrile gloves, cotton swabs, Tyvek suits, goggles, biohazard bags, and sharps containers as well as five tablets ($200 ea.) for data collection at field sites. To ensure cold chain, for field visits outside Amman dry ice is required at a cost of $150 per week. We request $71,866 over all years of the project for field supplies.

Laboratory Testing
Our laboratory cost request covers PCR for MERS-CoV and avian influenza as well as serology for MERS-CoV, avian influenza, brucellosis and leptospirosis. Pricing is based on in-house costs on a per test basis. Details on numbers of each test and unit price are provided here for each year that laboratory testing will be conducted, Year 1 Option Year 1.

TESTS	YEAR 1

Meetings and Conferences

We request support for an annual meeting each year for 45 people including personnel from partner institutions (EHA and JUST) as well as local stakeholders. Travel costs for United States-based participants to attend the annual meeting are covered in the EcoHealth Alliance budget. We estimate that for the one-day meeting, ten Jordanian partners traveling from outside Amman will require transportation (estimated at S60 per person), meals and accommodation to be covered (S246 for lodging and $138 for meals and incidentals). Lunch will be provided for all participants and there will be costs associated with room rental (S1,000 per day), translation and sound equipment to facilitate translation ($2,000 per day) and printing and supplies. Overall costs for the annual meetings are estimated at $12,605 p.a.

In addition to the annual meeting, there will be a Kick Off meeting in Y1 only for 20 participants, five of which will be from outside of Amman. All cost estimates remain the same from the annual meeting, with the Kick Off Meeting estimated at $7,740.

There will be three regional meetings held in Amman in Y2, OY1 and OY2, for which regional transport will be required for two people each from Egypt (S200), Lebanon (S300) and Iraq

($500) as well as meals and accommodation to be covered (S246 for lodging and S138 for meals and incidentals). We will have the same printing, supplies, room rental and translation fees as above and lunch included for 24 participants. For the regional meetings, we request S19,865 each.

A threat reduction workshop in planned for OY2 with transportation and accommodation for ten participants from Jordan and international travel and accommodation for four participants each from Lebanon and Iraq; the workshop will consist of 45 total participants. The costs for flights, accommodation, meals and incidentals, lunch, room rental, and translation services remain the same as mentioned above. The printing and supplies is estimated for this meeting at S1,500 for the printing of booklets and reports. The total cost of this workshop is $45,743.

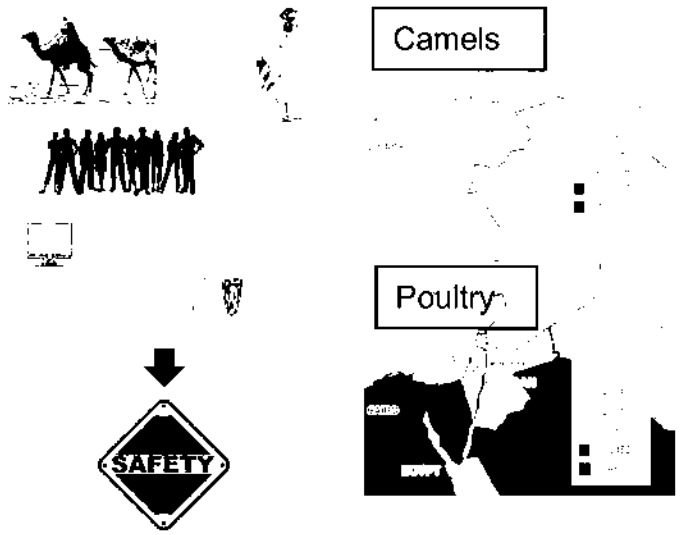
H. Indirect Costs

We are requesting the federally agreed indirect cost of 8% on all direct costs.

Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan, PI: William B. Karesh, BTRP-TA.6 CC WMD GRANT # 12862917

Objective: Work with government and private sector partners to characterize causal factors in animal-to-human transmission of MERS, AI, and other zoonoses in Jordan, implement serological technology for enhanced diagnostic and detection capabilities, and strengthen regional detection and reporting capacity to reduce biological threats.

Method: Conduct a prospective cohort study at various human-livestock/poultry interfaces across Northern, Middle, and Southern Jordan. Conduct regional collaboration and capacity building workshops in Jordan for Iraqi and Lebanese scientists from Health, Agriculture, and related Ministries and agencies.



Status of effort: Collaborative team working on infectious diseases in humans and animals in place. Established relationships with Ministries, labs, university scientists, poultry industry, camel owners and Bedouin community.

Personnel Supported: 7 University Faculty, 6 Other Scientists, 2 Scientific Advisors, 20 professional students, >24 government workshop participants.

Publications & Meetings: 10 stakeholder/partner meetings and training workshops, 8 scientific publications, >40 conference presentations

Major Goals and Milestones:

- Determine evidence of MERS, AI, and other zoonoses in humans, livestock and poultry in Jordan (Y1-OY2)
- Identify risk factors and modifiable behaviors for threat reduction (Y1-OY2)
- Improve knowledge and diagnostic capacity (Y1-OY2)

Funding Profile Yr 1:$994,909, Yr 2:$993,790 Yr 3:$999,490, OYr 1: $999,995, OYr 2: $987,497

Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity/PI Karesh
Thrust Area 6 - CCWMD Research with Global Partners FRCWMD
Statement of Work

Project Title: Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity.

Document Date: 28 August 2019.

Objective: The objective of this grant is to reduce the threat of high-consequence zoonotic pathogens in Jordan and improve regional disease surveillance capacity. Jordan faces risk of several zoonoses of concern to human and animal health, including Middle East Respiratory Syndrome (MERS-CoV) and Avian Influenza (AI), with fundamental knowledge and capacity gaps around the distribution and determinants of zoonoses. Recent work by our team detected MERS-CoV in camels and people in Jordan, suggesting ongoing and unmitigated transmission risk of a priority pathogen. The proposed study will generate critical advances in determining the presence of zoonotic pathogens in the country and opportunities for public health intervention. Through a prospective human cohort study coordinated with animal sampling, we will conduct biological and behavioral surveillance in five regions of Jordan with livestock production interfaces to determine the presence and risk factors for MERS-CoV, AI, brucellosis, and leptospirosis to identify modifiable risk factors. By testing three core policy-relevant hypotheses and providing multi-disciplinary training opportunities, the awardee shall enhance scientific capacity in Jordan and support disease detection and reporting in Jordan, Iraq and Lebanon. Taking a coordinated, multi-hazard approach to threat reduction, the proposed study will add critical understanding of presence and risk factors for zoonotic diseases in Jordan and advance scientific capacity and application of the One Health concept to counter biothreats in the region.

Scope: The awardee proposes a five-year One Health study of zoonotic diseases in Jordan. The awardee team shall focus on the following major goals and milestones:

1) Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and poultry in Jordan: *Implement animal study (Y1-OY1); Conduct PCR and serology testing (Y1-OY2)*

2) Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses: *Implement human cohort study (Y1-OY1); Conduct PCR and serology testing (Y1-OY2)*

3) Characterize causal factors in animal-to-human transmission of these zoonoses: *Implement behavioral risk survey (Y1-OY1); Conduct epidemiological analyses (Y1-OY2)*

4) Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk: *Generate geospatial distribution and risk maps (Y1-OY2)*

5) Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon: *Host workshops (Y1-2, OY1-2); Submit reports and publications (Y1-OY2); Attend presentations/meetings (Y1-OY2)*

6) Identify specific modifiable risk factors for human infection with these zoonoses: *Conduct causal interference analyses (Y3-OY2); Policy recommendations on modifiable risk factors (Y3-OY2)*

This research will generate critical advances in detecting the presence of and exposure risk to high-consequence zoonotic viruses and bacteria across geographic regions and interfaces in Jordan, contributing to enhanced understanding of modifiable risk factors to inform government authorities on prevention activities to reduce disease threats.

Background: Jordan has experienced outbreaks of several high-consequence zoonotic diseases, including MERS-CoV and AI. Since its emergence in 2012, MERS-CoV has resulted in over 2,400 human cases globally and is recognized as a priority disease under the WHO R&D Blueprint. While the first human cases of MERS-CoV were traced back to Jordan, little is known about its underlying and ongoing risk of zoonotic disease in animal populations, particularly around primary transmission risk factors and pathways that precede spread in healthcare settings. MERS-CoV is one of several zoonoses posing threat to animal and human populations in the country. Highly Pathogenic Avian Influenza outbreaks, including subtype H5N1, have been reported, and brucellosis is considered endemic in Jordan, with recurring spillover but inadequate understanding of specific modes of transmission and poor vaccination coverage. While human cases of leptospirosis have not been reported in Jordan to date, high rates of certain Leptospira serovars have been detected in animals. Key questions and capacity gaps hinder understanding of the presence, distribution and risk factors in the country, leaving the country vulnerable to zoonotic biothreats, as well as wider regional gaps in detection and reporting. The threat of zoonotic disease is especially pertinent given the rapidly-growing poultry production industry in Jordan and camel, livestock, and poultry rearing in the region.

Jordan has recently made recent several notable scientific advances in detection of MERS-CoV, generating preliminary data that the proposed project will build on. While camels are the presumptive source of primary human MERS-CoV infections, the exact mechanisms of transmission and the possible role of other livestock species are unclear. Blood samples collected from camels and humans in the northern region of Jordan were positive for MERS-CoV, leading to the first-ever report of this disease to OIE in camels in Jordan in 2016. To date, only few countries have reported virus-positive MERS-CoV test results to the OIE so this is a significant and important step toward improving both MERS-CoV detection and reporting in the Middle East. Studies of zoonotic pathogens in the region to date have largely focused on single sites or interfaces, cross-sectional sampling events, or select taxonomic groups, limiting understanding of causal factors. Research is needed to monitor presence and transmission of zoonotic pathogens spatially, temporally, and by biohazard exposure (e.g. blood, urine, feces, and/or nasal secretions) and practices and conduct epidemiological analyses to identify modifiable risk factors for public health intervention. As a key area of stability in the region, it is crucial to support Jordan's biosurveillance capacity, enable understanding of baseline disease risk to allow differentiation of natural versus nefarious emergence events, and ensure responsible bio-risk management to ethically monitor and reduce disease threats. The country has also recently established a One Health platform that indicates the country's commitment to countering zoonotic disease threats. Given the volume of migration between Jordan and its neighbors, including in animal trade, regional coordination in disease monitoring and threat reduction is a critical component in effectively characterizing and addressing disease risk. This project seeks to fill current capacity gaps to advance Jordan as a leader in scientific research and zoonotic disease management and creating new capacity and scientific collaboration pathways for hypothesis-driven research and zoonotic disease monitoring and threat reduction in the region.

Middle East respiratory syndrome coronavirus infection in dromedary camels in Saudi Arabia. *MBio*. 2014 Feb 25;5(2):e00884-14.

World Health Organization. Joint External Evaluation of IHR Core Capacities of the Hashemite Kingdom of Jordan. Geneva. 2016.

Tasks/Scientific Goals: **(Format: Year #(s). Task #. Subtask#).**

TASK 1: Y1.1-O2.1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan.

The awardee shall study presence of MERS-CoV, AI, Brucellosis and Leptospirosis in animals. Sites will be selected in five geographically-representative regions across Jordan: Northern Jordan (Al Ramtha), Middle Jordan (Al Zarqa), and Southern Jordan (Al Karak, Ma'an, and Aqaba). These regions were selected based on preliminary findings by our team and the presence of livestock production activities. Sites in each region shall reflect interfaces with poultry, camels, and other livestock animals are represented (e.g. farms or markets). The awardee shall receive permissions and approvals to work with animals prior to initiating sampling. Nasopharyngeal and oropharyngeal swabs will be collected from 300 camels, poultry and other livestock quarterly in Year 1, Q3 through Option Year 1, Q3 (a total of 13 sampling visits). At three points during the project (in Y1, Y3, and OY1 during the 1st, 7th, and 13th sampling visits, respectively), blood samples (serum) will be collected from 300 animals. Nasopharyngeal and oropharyngeal swabs will be tested for MERS-CoV and AI using real time PCR. Serum samples will be tested using serology for MERS-CoV, AI, Brucellosis, and Leptospirosis. Staff training on proper study techniques (e.g. sampling, transport, and laboratory) will occur as detailed in Task 5. This task will contribute to testing the hypothesis that livestock species and poultry in Jordan show evidence of infection with MERS-CoV, AI, and/or other assayed zoonoses, as well as inform type of transmission pathways.

Y1.2.1 Identify sites for project study.

Y1.2.2 Obtain local permissions and approvals to work with animals.

Y1.2.3-O1.2.3 Conduct biological sampling in animals within the study area.

Y1.2.4-O2.2.4 Conduct PCR and/or serology testing for AI, MERS-CoV, brucellosis and leptospirosis.

TASK 2: Y1.2- OY2.1: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses.

The awardee shall conduct a prospective cohort study of humans to evaluate behavioral and occupational risk factors for zoonotic infectious diseases (MERS-CoV, avian influenza, brucellosis, and leptospirosis) among persons living in Jordan in any of the five study regions. The study will enroll persons regularly working with livestock or poultry or sharing their living areas with these animals as well as persons unexposed to these factors. Sites will be selected as in Task 1 and in surrounding communities to enroll both exposed and unexposed populations. In Year 1, the awardee will receive local permissions and approvals to work with human subjects prior to initiating enrollment and sampling. Nasopharyngeal and oropharyngeal swabs will be collected from 300 enrolled humans quarterly in Year 1, Q3 through Option Year 1, Q3 (a total of 13 sampling visits). At three points during the project (in Year 1, Year 3, and Option Year 1

during the 1st, 7th, and 13th sampling visits, respectively), blood samples (serum) will be collected from 300 humans. Nasopharyngeal and oropharyngeal swabs will be tested for MERS-CoV and AI using real time PCR. Serum samples will be tested using serology for MERS-CoV, AI, brucellosis, and leptospirosis (Years 1-4). Biological sampling will be paired with behavioral surveillance data as in Task 3.

Y1.2.1 Identify sites and conduct enrollment for human study component.

Y1.2.2 Obtain local permissions and approvals to work with human subjects.

Y1.2.3-O1.2.3 Conduct biological sampling (nasopharyngeal and oropharyngeal swabs, and/or blood) of in people within the study area.

Y1.2.4-O2.2.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

TASK 3: Y1.3-OY2.3: Characterize causal factors in animal-to-human transmission of these zoonoses.

The awardee shall monitor behaviors of persons enrolled in the prospective cohort study (as in Task 2) to identify and characterize causal factors for animal-to-human transmission of MERS-CoV, AI, brucellosis and leptospirosis. The PREDICT-2 Human Behavioral Risk Questionnaire will be augmented with animal-specific exposure frequency questions to collect demographic data, symptom and medical history data, social history data, and specific animal-related behaviors and practices that are possible risk factors for infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. The project team will administer the survey to enrolled participants at the first sampling visit (Year 1). During all future visits (Year 1- Option Year 1), enrolled participants will be administered a brief follow-up questionnaire designed primarily to capture time-varying exposure and covariate data. This longitudinal information will provide critical information about the context of exposures and pathways to link biological sampling and provide the wider context of practices and risk factors. Epidemiologic analysis of the questionnaire data (including time-varying data) in this Task will identify current practices and exposure pathways and initial modifiable risk factors. Specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) will be assessed under Task 6 for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. Results will be shared via annual reports and stakeholder meetings as in Task 5.

Y1.3.1 Obtain local permissions and approvals to work with human subjects.

Y1.3.2-O1.3.2 Conduct behavioral risk factor surveys in people.

Y1.3.3-O2.3.3 Analyze epidemiologic causal inference to identify modifiable risk factors.

TASK 4: Y1.4-OY2.4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk.

The awardee shall map findings from Tasks 1-2 to show the distribution of detected pathogens across the regions and sampling sites. Geospatial mapping is a highly relevant visual tool to assist authorities in targeting surveillance and risk management activities. Using QGIS, laboratory results of human and animal testing for MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and mapped to show the distribution of detected pathogens. Maps will be generated beginning Y1, Q3 when laboratory findings are available. Geospatial risk maps will be generated using statistical models to link human behavioral data to laboratory findings beginning in Y1, Q4. Geospatial maps will be updated quarterly and shared with USG/DTRA and Jordanian project partners. Training on geospatial analysis will be provided to project team

members and will be covered under a regional workshop to promote broader uptake of geospatial mapping as a low-cost tool to enhance disease monitoring programs in the region (Task 5).

Y1.4.1-O2.4.1 Generate maps of laboratory results

Y2.4.2-O2.4.2 Generate risk maps of human behavioral risk data

TASK 5: Y1.5-OY2.5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.

Strengthening disease detection and reporting capacity is a key contributor to health security and the ability to target risk factors for threat reduction. The project team is committed to improving this capacity in Jordan as well as more widely in the region through involvement of scientists and government officials in Iraq and Lebanon. We will train local staff in proper techniques for all project activities (Year 1 and Option Year 1). Each year we will support four students from medical and veterinary disciplines in Jordan to participate in training, field activities, project analyses and workshops to provide scientific mentorship and promote the One Health concept. Jordanian scientists and students will also be trained in laboratory techniques at the Human Link laboratory in Egypt during the course of the project. The awardee shall organize workshops in Jordan open to scientists from the Ministries of Health and Agriculture from Jordan, Iraq, and Lebanon (Years 1-2, Option Years 1-2). A secure project database will be developed for use in the epidemiological analyses. The awardee shall provide submission of annual sample repository information using a DTRA-specified format and shall grant access to all samples collected and data generated during the course of the project, up to and including at least 12 months after the project end date. The awardee shall conduct presentations/meetings at times and places specified in the grant schedule (Year 1 Task 5), including the DTRA Annual Technical Review. In Year 1 the awardee shall hold a kick-off meeting to introduce the project objectives and promote buy-in in study findings and capacity sustainment. Annual reports and stakeholder meetings and scientific presentations and publications will be used to disseminate results. The project will reinforce Jordan's national One Health platform, promoting the One Health concept for multiple diseases of concern for public and animal health and advancing capacity for hypothesis-driven research with direct application for policy decisions for threat reduction.

Y1.5.1 Conduct project kick-off meeting in Amman with local stakeholders.

Y1.5.2 & O1.5.2 Train local project staff in proper techniques.

Y1.5.3-O2.5.3 Host annual partners and stakeholders meeting.

Y1.5.4-O2.5.4 Complete annual report and share with project partners and local stakeholders.

Y1.5.5-Y2.5.5 & O1.5.5-O2.5.5 Conduct local/regional training workshops.

Y1.5.6- O2.5.6 Data management.

Y1.5.7- O2.5.7 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.

TASK 6: Y3.6-OY2.6: Identify specific modifiable risk factors for human infection with these zoonoses.

The awardee shall integrate the findings of the biological testing (animal and human) and behavioral surveys in Tasks 1-3, assessing specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis,

or leptospirosis. These potential modifiable risk factors will be determined through epidemiologic analysis of the questionnaire data (including time-varying data) paired with individual laboratory results (e.g., detection of viral RNA, bacterial DNA, or antibodies). Using quarterly, longitudinal data collected in Tasks 1-3, we will examine any major temporal dynamics that may be associated with elevated transmission risk (e.g. seasonality, animal birthing periods). Causal inference techniques within the potential outcomes framework will be employed to solidify statistical associations as concretized biological/clinical/environmental pathways by operationalizing exposures as well-defined interventions and ensuring exchangeability is maintained through confounder control informed by directed acyclic graphs of the conceptual exposure-disease pathways. The awardee will examine multiple zoonotic pathogens (as above) to inform general threat reduction guidelines. Identification of modifiable risk factors will inform intervention development that may interrupt future zoonotic transmission of the four pathogens in this study. Findings will be shared with USG/DTRA and the Jordanian Ministry partners at the annual stakeholders meetings, the threat reduction workshop, scientific presentations and publications as specified in Task 5. This information will provide a strong basis for potential policy guidance and the generation of solutions at the threat reduction workshop in OY2.

Y3.6.1-O2.6.1 Conduct causal inference analyses bases on Tasks 1, 2, 3.

Y3.6.2-O2.6.2 Share results of analyses at annual partners and stakeholders meeting.

Y3.6.3 & O2.6.3 Submit written report to DTRA and local partners and stakeholders.

Performance Schedule:

Task	Year 1	Year 2	Year 3	OY 1	OY 2
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan					
1.1. Identify sites for project study					
1.2 Obtain local permissions and approvals to work with animals					
1.3 Conduct biological sampling in animals within the study area					
1.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection					
2.1 Identify sites and conduct enrollment for human study component					
2.2 Obtain local permissions and approvals to work with human subjects					
2.3 Conduct biological sampling					
2.4 Conduct testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses					
3.1 Obtain local permissions and approvals to work with human subjects					
3.2 Conduct behavioral risk factor surveys in people					
3.3 Analyze epi causal inference to identify modifiable risk factors					
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk					
4.1 Generate maps of laboratory results					
4.2 Generate risk maps with human beh. risk data					
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon					
5.1 Conduct project kick-off meeting in Amman with local stakeholders					
5.2 Train local project staff in proper techniques					
5.3 Host annual partners and stakeholders meeting					
5.4 Complete annual report and share with partners and stakeholders					
5.5 Conduct local/regional training workshops					
5.6 Data management					
5.7 Conduct presentations/meetings at times and places specified					
Task 6: Identify specific modifiable risk factors for human infection with these zoonoses					
6.1 Conduct causal inference analyses based on Task 1, 2, 3					
6.2 Share results of analyses at annual partners and stakeholders meeting					
6.3 Submit written report to DTRA and local partners and stakeholders

Current and Pending Support

(See GPG Section II.D.8 for guidance on information to include on this form.)

The following information should be provided for each investigator and other senior personnel. Failure to provide this information may delay consideration of this proposal.

Investigator: William Karesh	Other agencies (including NSF) to which this proposal has

Support: ☐ Current ☒ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity (current proposal)

Source of Support: DTRA

Total Award Amount: $4,975,681.29 Total Award Period Covered: 01/01/2020 - 12/31/2024

Location of Project: USA, Jordan

Person-Months Per Year Committed to the Cal: 2 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Understanding the Risk of Bat-Bourne Zoonotic Disease Emergence in Western Asia

Source of Support: DTRA

Total Award Amount: $4,391,443.65 Total Award Period Covered: 10/02/2017 - 10/01/2022

Location of Project: Global

Person-Months Per Year Committed to the Cal: 1.56 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Ground Truth Network

Source of Support: DHS

Total Award Amount: $2,231,114.13 Total Award Period Covered: 09/30/2016 - 09/29/2021

Location of Project: USA

Person-Months Per Year Committed to the Cal: 1.56 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

READY: Augmenting Capacity for Humanitarian Emergencies of Infectious Diseases with Epidemic or Pandemic Potential

Source of Support: USAID

Total Award Amount: $143,605 Total Award Period Covered: 09/25/2018 - 09/30/2021

Location of Project: Global

Person-Months Per Year Committed to the Cal: 1.56 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Emerging Pandemic Threats PREDICT-2

Source of Support: USAID

Total Award Amount: $100,000,000.00 Total Award Period Covered: 10/01/2014 - 09/30/2019

Location of Project: Global

Person-Months Per Year Committed to the Cal: 4.56 Acad: Sumr:

Northwestern University	Biological Sciences	BA	2010
Columbia University	Epidemiology	MPH	2012
Columbia University	Epidemiology	PhD	2019

Appointments

Epidemic Intelligence Service Officer, CDC	2019 - present
Research Scientist, EcoHealth Alliance, New York, NY	2016 - 2019
Teaching Assistant, Columbia University Mailman School of Public Health	2014 - 2019
Regional Epidemiologist, U.S. CDC, Egypt	2012 - 2014
Epi Scholar, New York City Department of Health and Mental Hygiene	2011 - 2012
Research Assistant, Columbia University Mailman School of Public Health	2010 - 2012
Intern, EdgeAlliance AIDScare Progressive Services	2009 - 2010
Intern, Bayshore Hospital, Holmdel, NJ	2007 - 2009

Publications and Presentations

Kandeil A, Gomaa MR, Shehata MM, El Taweel AN, Mahmoud SH, Bagato O, Moatasim Y, Kutkat O, Kayed AS, Dawson P, Qui X, Bahl J, Webby RJ, *Karesh WB*, *Kayali G*, Ali MA (2018) Isolation and characterization of a distinct influenza A virus from Egyptian bats. **Journal of Virology** 93(2):e01059-18.

Dawson P, *Abu-Basha E*, *Amarneh B*, Fahmawi A, Alshammari A, Alzaqa E, *Hijazeen Z*, *Talafha H, Omari B, Al-Zghoul B, Ababneh M, Ismail ZB, Karesh WB* (2018). Knowledge, attitudes, beliefs, and practices pertaining to camel-to-human hisease risks in Jordan. **International Meeting on Emerging Diseases and Surveillance (IMED)**, Vienna, Austria (poster).

Dawson P, *Karesh WB*, Kandeil A, Sayed A, Ali MA, *Kayali G.* (2018) Identifying behavioral risk intervention points to prevent zoonotic spillover at animal markets, farms, and abattoirs in Egypt. **18th International Congress on Infectious Diseases**, Buenos Aires, Argentina (oral presentation, Zoonoses & One Health).

Abdallat M, Dawson P, Haddadin AJ, El-Shoubary W, Dueger E, Sanouri T, Said MM, Talaat M. (2016) Influenza hospitalization epidemiology from a Severe Acute Respiratory Infection surveillance system in Jordan, January 2008 February 2014. **Influenza and Other Respiratory Viruses** 10(2):91-7.

Dawson P, Perri BR, Ahuja SD. (2016) High tuberculosis strain diversity among New York City public housing residents. **American Journal of Public Health** 106(3):563-8.

Kandeel A, Dawson P, Labib M, Said M, Refaey S, Naguib A, Talaat M. (2016) Morbidity, mortality, and seasonality of influenza hospitalizations in Egypt, November 2007-November 2014. **PLOS ONE** 11(9):e0161301.

FACILITIES, EQUIPMENT, AND OTHER RESOURCES

EcoHealth Alliance, New York, United States

EcoHealth Alliance is an US-based NGO that specializes in scientific research on the causes, origins and spread of zoonotic emerging diseases. EcoHealth Alliance scientists have been conducting field research on infectious zoonotic diseases for over three decades. EcoHealth Alliance is based in New York City with 10,000 square feet of office space including a meeting room and basic laboratory – freezer storage and light microscopy. The scientific staff (15 core scientists, 100+ field staff) is supported by a core admin staff of 11, which is available for work on this project and is also funded through private individual and foundation support.

EcoHealth Alliance is equipped with 25 networked computers (PCs and Macs) including ARRA funded International LifeSize Video Conferencing facilities, and high-speed video conferencing facilities have been installed with key international collaborators. EcoHealth Alliance has access to a 24-7 server, server support, and all required software including ArcGIS, MatLab, SPSS, Microsoft Office, and Adobe CS3 running on both Apple and Windows Operating Systems. Additionally, we have a four-processor, public IP addressed Linux server which can be used for intensive computational modeling and database processing by all the grantees.

EcoHealth Alliance is the headquarters of two networks that provide exceptional leverage for the core scientists: 1) The EcoHealth Alliance Local Conservation Partners: A global partnership of 15 NGOs in Asia (including Bangladesh, India, and China), Africa and Latin America (including Argentina and Brazil). This network provides access to fieldwork in countries (such as India) that are often difficult to work in, and obtain samples from; 2) The Consortium for Conservation Medicine: A unique collaborative institution linking Johns Hopkins Bloomberg School of Public Health, Tufts University School of Veterinary Medicine Center for Conservation Medicine, The University of Pittsburgh Graduate School of Public Health, The University of Wisconsin-Madison Nelson Institute for Environmental Studies, The USGS National Wildlife Health Center, and EcoHealth Alliance. The CCM provides access to hundreds of high caliber scientists, their facilities, and their students at 6 leading institutes of public health, veterinary medicine, and environmental science in the USA.

Jordan University of Science and Technology, Irbid, Jordan

The Faculty of Veterinary Medicine at JUST is the only veterinary school in Jordan. It was established in1998 by Royal Decree. The Faculty consists of 3 different departments; Clinical sciences, basic sciences, and pathology and public health. There are several teaching and research laboratories in the Faculty. The Faculty is the home of several PhD holders and board-certified clinicians. The Basic Science Department is the home of a state-of-the-art Molecular Biology and Virology Laboratory which is the only laboratory of its kind in Jordan. The laboratory is well equipped and implements many molecular and diagnostic assays by a group of well-trained national scientists, young graduate students and technicians according to the latest scientific standards. Highly advanced molecular diagnostic assays such as cloning into TOPO vector, preparing PCR products for sequencing, and sequence analysis are performed routinely in this laboratory. In Jordan, the JUST Molecular Biology and Virology Laboratory is now considered an important hub for training and preparing future scientists with many graduate

students now being trained in the lab to perform techniques from sample handling to DNA extraction, cDNA synthesis, performing PCR protocols, cloning, plasmid purification, and genetic sequencing analysis.

The Faculty is also the home of the Veterinary Health Center (VHC). It is the only veterinary teaching clinic in Jordan. At the VHC, the veterinary Diagnostic Laboratory is equipped with various state of the art tools that enable it to perform all needed diagnostic and research tests. The laboratory is equipped with hematology, clinical chemistry analyzers, PCR machines, ELISA readers. The laboratory is also able to perform basic bacteriology tests such as bacterial culture, identification and sensitivity tests.

Human Link, Hazmieh, Lebanon
Human Link is a Lebanese-based non-governmental organization, founded in 2014 by a multidisciplinary team of scientists and experts in the fields of human development, engineering, and public health, with a common goal of "research advancing knowledge." Human Link's mission is to design and conduct scientific research and projects in the fields of bio-medicine, public health, environment, economy, and human development aimed at improving global knowledge and enhancing local population livelihoods. Human Link adopts the One-Health philosophy that links human, animal, and environmental health. At the heart of this philosophy is the notion that a healthy environment leads to healthier humans and healthier animals. It aims at reducing the burden of diseases affecting humans through unhealthy animals and unhealthy environment. At the same time, it aims at reducing the burden on the environment exerted by humans and animals.

Dr. Ghazi Kayali, CEO of Human Link, oversees two virology laboratories, one in Egypt and one in Lebanon. Human Link has exclusive use of 2160 sq. ft. of contiguous laboratory and office space in the newly completed Advanced Science building at the National Research Centre in Egypt and 2000 sq. ft. in contiguous laboratory and office space in Lebanon. A 120 sq. ft. office adjoins the laboratory, used exclusively by Dr. Kayali, and a 120 Sq. ft. office for a Secretarial Assistant.

The team includes 1 lab director, 1 postdoc, 1 research assistant, 9 graduate students, 7 field veterinarians, 4 zoologists, 4 field clinicians, and 19 field nurses working on various surveillance, cohort, and laboratory studies. All personnel have institutional laptops connected to shared cloud-based work space. PCR stations, gel documentation systems, and a DNA quantification machine, etc. are operated by connected laptops.

The laboratory in Egypt includes a dedicated tissue culture facility with 2 laminar flow hoods. The main laboratory contains benches for 12 workers, 1 fume hood, 1 fluorescence microscope, 1 inverted light microscope, 3 sinks, a de-ionized water system, a class 3 glove box, a laminar flow hood, 3 -80 freezers, 6 -20 freezers, 5 refrigerators, 5 thermal cyclers, 2 real-time PCR machines, 1 nano-drop, 2 gel documentation systems, and all necessary small laboratory equipment. The laboratory also has access to shared Ion torrent and Illumina MiSeq sequencers.

The laboratory in Lebanon includes a dedicated tissue culture facility, dedicated dark room, and dedicated PCR preparation room. The main laboratory contains benches for 24 workers and

trainees, 1 fume hood, 3 sinks, 1 -80 freezer, 1 -20 freezer, 1 refrigerator, 1 thermal cycler, 1 real-time PCR machine, 1 gel documentation system, and all necessary small laboratory equipment.

Dr. Kayali is part of the NIAID CEIRS network, USAID PREDICT network, and DTRA/GCRF CANARIES network. This enhances the work environment and provides access to additional expertise in virology, epidemiology, modeling, and genomics. Dr. Kayali also holds an adjunct assistant professor position at the department of Epidemiology, Genetics, and Environmental Sciences at the University of Texas School of Public Health.

2. DESCRIPTION OF RELATIONSHIP BETWEEN PROJECT AND CURRENT RESEARCH EFFORTS OF FOREIGN RESEARCH TEAM

Foreign Co-Investigator Dr. Ehab Abu-Basha is a professor at the Jordan University of Science and Technology (JUST) and former Dean of the School of Veterinary Medicine. He and the additional collaborators from JUST were the first to identify MERS-CoV in camels in Jordan during work with the USAID Emerging Pandemic Threats (EPT) program in coordination with PI Karesh and EcoHealth Alliance (EHA). Co-I Abu-Basha served as the Country Coordinator over the previous 3 years for the EHA/JUST implemented USAID EPT PREDICT project lead by PI Karesh and managed by Co-I Dawson from EHA and now at US CDC but participating in this proposed project. The staff included in this proposal at the two JUST laboratories identified for this project (Diagnostic Laboratory-Faculty of Veterinary Medicine and the Molecular Biology and Virology lab - Faculty of Veterinary Medicine) performed PCR and serology diagnostics for influenza and coronaviruses for the USAID EPT PREDICT-2 project. JUST field teams included in this proposal performed the human and animal sampling for the USAID EPT PREDICT project and conducted the behavioral interviews required for the project. Dr. Wail Hayajneh, MBBS, is Chairman of the Jordanian Food and Drug Administration and a professor at the JUST Medical University. He served as an advisor on the USAID EPT PREDICT-2 project for the human studies components and will continue in this role for the proposed project.

Foreign Co-Investigator Dr. Ghazi Kayali, CEO of Human Link, oversees two virology laboratories, one in Egypt to be used in this project and one in Lebanon. He has exclusive use of 2160 sq. ft. of contiguous laboratory and office space in the newly completed Advanced Science building at the National Research Centre in Egypt. The Human Link team includes 1 lab director, 1 postdoc, 1 research assistant, 9 graduate students, 7 field veterinarians, 4 zoologists, 4 field clinicians, and 19 field nurses working on various surveillance, cohort, and laboratory studies. Dr. Kayali is a world-renowned subject matter expert for influenza and coronaviruses. He is part of the NIAID CEIRS network and the DTRA/GCRF CANARIES network and served as USAID PREDICT-2 project leader for Egypt over the previous 3 years for the EHA/Human Link implemented USAID EPT PREDICT project lead by PI Karesh and managed by Co-I Dawson from EHA and now at US CDC but participating in this proposed project.

Dr. Mahmoud Alhanatleh is the Chief Veterinary Officer for the Jordanian Ministry of Agriculture. He served as an advisor on the USAID EPT PREDICT-2 project for the animal studies components, hosted partner and stakeholder meetings, and oversaw the project interface with government animal health care workers in all regions of Jordan. He will continue in this role for the proposed project and serve as a liaison with the Jordanian government (see letter of support).

Dr. Wail Hayajneh is the Chairman of the Infectious Diseases Committee of the Jordanian Food and Drug Administration. He was formerly the Dean of the School of Medicine at Jordan University of Science and Technology. He is a subject matter expert on zoonotic diseases and served as an advisor on the USAID EPT PREDICT-2 project in humans. He will continue as a project advisor for the proposed project and serve as a liaison with the Jordanian government.

3. FACILITIES, EQUIPMENT, AND OTHER RESOURCES

EcoHealth Alliance, New York, United States
EcoHealth Alliance is an US-based NGO that specializes in scientific research on the causes, origins and spread of zoonotic emerging diseases. EcoHealth Alliance scientists have been conducting field research on infectious zoonotic diseases for over three decades. EcoHealth Alliance is based in New York City with 10,000 square feet of office space including a meeting room and basic laboratory – freezer storage and light microscopy. The scientific staff (15 core scientists, 100+ field staff) is supported by a core admin staff of 11, which is available for work on this project and is also funded through private individual and foundation support.

EcoHealth Alliance is equipped with 25 networked computers (PCs and Macs) including ARRA funded International LifeSize Video Conferencing facilities, and high-speed video conferencing facilities have been installed with key international collaborators. EcoHealth Alliance has access to a 24-7 server, server support, and all required software including ArcGIS, MatLab, SPSS, Microsoft Office, and Adobe CS3 running on both Apple and Windows Operating Systems. Additionally, we have a four-processor, public IP addressed Linux server which can be used for intensive computational modeling and database processing by all the grantees.

EcoHealth Alliance is the headquarters of two networks that provide exceptional leverage for the core scientists: 1) The EcoHealth Alliance Local Conservation Partners: A global partnership of 15 NGOs in Asia (including Bangladesh, India, and China), Africa and Latin America (including Argentina and Brazil). This network provides access to fieldwork in countries (such as India) that are often difficult to work in, and obtain samples from; 2) The Consortium for Conservation Medicine: A unique collaborative institution linking Johns Hopkins Bloomberg School of Public Health, Tufts University School of Veterinary Medicine Center for Conservation Medicine, The University of Pittsburgh Graduate School of Public Health, The University of Wisconsin-Madison Nelson Institute for Environmental Studies, The USGS National Wildlife Health Center, and EcoHealth Alliance. The CCM provides access to hundreds of high caliber scientists, their facilities, and their students at 6 leading institutes of public health, veterinary medicine, and environmental science in the USA.

Jordan University of Science and Technology, Irbid, Jordan
The Faculty of Veterinary Medicine at JUST is the only veterinary school in Jordan. It was established in1998 by Royal Decree. The Faculty consists of 3 different departments; Clinical sciences, basic sciences, and pathology and public health. There are several teaching and research laboratories in the Faculty. The Faculty is the home of several PhD holders and board-certified clinicians. The Basic Science Department is the home of a state-of-the-art Molecular Biology and Virology Laboratory which is the only laboratory of its kind in Jordan. The laboratory is well equipped and implements many molecular and diagnostic assays by a group of well-trained national scientists, young graduate students and technicians according to the latest scientific standards. Highly advanced molecular diagnostic assays such as cloning into TOPO vector, preparing PCR products for sequencing, and sequence analysis are performed routinely in this laboratory. In Jordan, the JUST Molecular Biology and Virology Laboratory is now considered an important hub for training and preparing future scientists with many graduate students now being trained in the lab to perform techniques from sample handling to DNA extraction, cDNA synthesis, performing PCR protocols, cloning, plasmid purification, and genetic sequencing analysis.

The Faculty is also the home of the Veterinary Health Center (VHC). It is the only veterinary teaching clinic in Jordan. At the VHC, the veterinary Diagnostic Laboratory is equipped with various state of the art tools that enable it to perform all needed diagnostic and research tests. The laboratory is equipped with hematology, clinical chemistry analyzers, PCR machines, ELISA readers. The laboratory is also able to perform basic bacteriology tests such as bacterial culture, identification and sensitivity tests.

Human Link, Hazmieh, Lebanon
Human Link is a Lebanese-based non-governmental organization, founded in 2014 by a multidisciplinary team of scientists and experts in the fields of human development, engineering, and public health, with a common goal of "research advancing knowledge." Human Link's mission is to design and conduct scientific research and projects in the fields of bio-medicine, public health, environment, economy, and human development aimed at improving global knowledge and enhancing local population livelihoods. Human Link adopts the One-Health philosophy that links human, animal, and environmental health. At the heart of this philosophy is the notion that a healthy environment leads to healthier humans and healthier animals. It aims at reducing the burden of diseases affecting humans through unhealthy animals and unhealthy environment. At the same time, it aims at reducing the burden on the environment exerted by humans and animals.

Dr. Ghazi Kayali, CEO of Human Link, oversees two virology laboratories, one in Egypt and one in Lebanon. Human Link has exclusive use of 2160 sq. ft. of contiguous laboratory and office space in the newly completed Advanced Science building at the National Research Centre in Egypt and 2000 sq. ft. in contiguous laboratory and office space in

Lebanon. A 120 sq. ft. office adjoins the laboratory, used exclusively by Dr. Kayali, and a 120 Sq. ft. office for a Secretarial Assistant.

The team includes 1 lab director, 1 postdoc, 1 research assistant, 9 graduate students, 7 field veterinarians, 4 zoologists, 4 field clinicians, and 19 field nurses working on various surveillance, cohort, and laboratory studies. All personnel have institutional laptops connected to shared cloud-based work space. PCR stations, gel documentation systems, and a DNA quantification machine, etc. are operated by connected laptops.

The laboratory in Egypt includes a dedicated tissue culture facility with 2 laminar flow hoods. The main laboratory contains benches for 12 workers, 1 fume hood, 1 fluorescence microscope, 1 inverted light microscope, 3 sinks, a de-ionized water system, a class 3 glove box, a laminar flow hood, 3 -80 freezers, 6 -20 freezers, 5 refrigerators, 5 thermal cyclers, 2 real-time PCR machines, 1 nano-drop, 2 gel documentation systems, and all necessary small laboratory equipment. The laboratory also has access to shared Ion torrent and Illumina MiSeq sequencers.

The laboratory in Lebanon includes a dedicated tissue culture facility, dedicated dark room, and dedicated PCR preparation room. The main laboratory contains benches for 24 workers and trainees, 1 fume hood, 3 sinks, 1 -80 freezer, 1 -20 freezer, 1 refrigerator, 1 thermal cycler, 1 real-time PCR machine, 1 gel documentation system, and all necessary small laboratory equipment.

Dr. Kayali is part of the NIAID CEIRS network, USAID PREDICT network, and DTRA/GCRF CANARIES network. This enhances the work environment and provides access to additional expertise in virology, epidemiology, modeling, and genomics. Dr. Kayali also holds an adjunct assistant professor position at the department of Epidemiology, Genetics, and Environmental Sciences at the University of Texas School of Public Health.

4. FOREIGN PI AND KEY PERSONNEL LETTERS OF COLLABORATION

See next page.

Jordan University of Science & Technology

جامعة العلوم والتكنولوجيا الأردنية

August 18th, 2019

To: DTRA C-WMD Thrust Area 6 Program
From: Professor Ghassan Tashtoush, Dean of research, JUST

This letter signifies the Deanship of Research at Jordan University of Science and Technology (JUST) commitment to support the proposal "*Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity*".

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

JUST is a leading center of excellence in MERS-CoV research in Jordan and the wider region, with a strong regional influence and a proven track record in delivering high quality scientific research of a global standard. Prof. Ehab Abu-Basha has become a regional expert in MERS-CoV research, policy and control. Over the past two years he has been coordinating monthly Focal Point Meetings among all relevant emerging infectious diseases stakeholders in Jordan (governmental, WHO, FAO and others) to promote synergy of effort, prevent unnecessary duplication of resources or activities and to advise on policy. Prof. Wail Hayajneh, is Professor of Infectious Diseases at Medical school and he is also coordinating the Infectious Diseases group of Jordan and as such is at the forefront of MERS-CoV diagnosis, treatment, surveillance and control in Jordan. In addition to a highly qualified team of experts in the field of Virology, Avian diseases, Livestock infectious diseases that will add great value to the outcomes of this project.

This project will also build upon the considerable research and training capacity already developed at JUST. We whole heartedly endorse this proposal and the research value that it will add to Jordan and to the region.

Sincerely,

Ghassan Tashtoush, Professor and Dean of research

From: Ghazi Kayali PhD MPH

This letter signifies my commitment to support the proposal, *Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity.*

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

My own experience with studying Avian Influenza and MERS CoV at the human-animal interface is directly relevant to the project objectives. I have been conducting surveillance for influenza and MERS in poultry, wild birds, swine, camels, bats, humans, cattle, and ruminants in several countries in the Middle East and Africa since 2013. Furthermore, in my capacity as a WHO EMRO consultant, I am familiar with the needs of Jordan and believe that this project will enhance the country's One Health and disease surveillance capacities.

Sincerely,

Ghazi Kayali PhD MPH

To: DTRA C-WMD Thrust Area 6 Program
From: Patrick Dawson

This letter signifies my commitment to support the proposal, *Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity*.

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

My own experience has been with working in Jordan and Egypt over the last seven years on research relating to MERS-CoV and Avian Influenza in animals and humans. Through this work I have partnered with the Jordan University of Science and Technology in Jordan and Human Link in Lebanon. Over the past four years we've developed a positive working relationship through EcoHealth Alliance that I hope to see continue. In my new role, I'll be able to stay to on in an advisory capacity at the start of the project, and assist with data analysis in Year 3.

Sincerely,

Patrick D. Dawson

To: DTRA C-WMD Thrust Area 6 Program
From: Dr. Mahmoud Alhanatleh, CVO, MOA- JORDAN

This letter signifies the Ministry of Agriculture commitment to support the proposal, *Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity.*

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

Our previous experience with one health initiatives is directly relevant to the project objectives. The projects "Cross-sectional surveillance of MERS-CoV and related coronaviruses in camels in Jordan", "Enhanced Surveillance of Trans-boundary Animal Diseases in Rural Areas of Jordan Affected by the Crisis in Syria" and "PREDICT-2 Jordan" has successfully achieved there's research objectives, including developing capacity within Jordan for research, training, surveillance and control. This new collaboration will serve to further build capacity in these areas, equipping Jordan to grow as a regional hub for interdisciplinary, one health approaches to the challenges posed by emerging infectious diseases such as MERS-CoV and Avian Influenza.

We whole heartedly endorse this proposal and the added capacity it will bring to the Ministry of Agriculture in Jordan forMERS-CoV and AI research, training, surveillance, and control.

Sincerely,

Director Of
Veterinary & Animal Health
Dr. Mahmoud Al Hanatleh

Dr. Mahmoud Alhanatleh
Director of Veterinary Directorate (CVO)

5. PLANNED WORKSHOPS: TOPIC, IMPLEMENTER, AND TIMELINE

All trainings to be conducted in Amman or Irbid, Jordan except where noted.

Description	Participants	Timeline
Project Inception Workshop *One-day review of entire research design and anticipated outputs during kick-off meeting* • Overall research study protocol • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. FDA Min of Environ. Poultry Industry Camel "industry"	Y1 Q1
Jordan Training Workshop 1 *Three-day didactic workshop targeted to all personnel engaged with human subjects and animals at field study sites, laboratory staff and others who will handle human and animal data* • Basic Laboratory Safety Biosafety and Biosecurity • Cold Chain Implementation • Ethical Human Subjects Research • Ethical Animal Subjects Research • Safe Human Sampling • Safe Animal Sampling • Questionnaire Administration • Data Management and Storage	*Required attendance:* Project Personnel *Invited attendees:* Min. of Health Min. of Agric. FDA Min of Environ. Poultry Industry Camel "industry" Students	Y1 Q2
Training at Human Link lab at the National Research Centre, Egypt *Three-day hands on training in MERS-CoV diagnostics and advance avian influenza diagnostics with Co-I Kayali when human samples are brought from Jordan for MERS-CoV testing.*	One Jordanian project personnel and one Jordanian student	Y1 Q4
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Review of research study design • Presentation of Results from Year 1 • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	Y2 Q1
Regional Training Workshop 1 *Three-day didactic workshop in adherence to core principles and requirements for safe and secure sample handling and management (based on written DTRA requirements and BMBL 5th Edition Sections III-VI and current best practice standards)* • Review of research study design • Presentation of Results from Year 1 • Basic Laboratory Safety Biosafety and Biosecurity	Project Personnel *Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric. Jordan FDA	Y2 Q3

• Cold Chain Implementation • Ethical Human Subjects Research • Ethical Animal Subjects Research • Safe Human Sampling • Safe Animal Sampling • Questionnaire Administration • Data Management and Storage • Disease Reporting Procedures for OIE and WHO IHR	Min of Environ. Poultry Industry Camel "industry"	
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Review of research to date • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	Y3 Q1
Training at Human Link lab at the National Research Centre, Egypt *Three-day hands on training in MERS-CoV diagnostics and advance avian influenza diagnostics with Co-I Kayali when human samples are brought from Jordan for MERS-CoV testing.*	One Jordanian project personnel and one Jordanian student	Y3 Q1
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Presentation of Results from Years 1-3 • Policy recommendations • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	Y3 Q4 *Or* OY1 Q1 If option is exercised
Regional Training Workshop 2 **Laboratory techniques, Biosafety and Biosecurity** *Three-day didactic and hands-on intensive training and refresher training on Biosafety and Biosecurity* • Real-time PCR testing and analysis • Influenza Subtyping, Genomic Analysis of MERS-CoVs • Serology testing and analysis • Biosafety and Biosecurity Refresher Training	Project Personnel *Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	OY1 Q3
Training at Human Link lab at the National Research Centre, Egypt *Three-day hands on training in MERS-CoV diagnostics and advance avian influenza diagnostics with Co-I Kayali when human samples are brought from Jordan for MERS-CoV testing.*	One Jordanian project personnel and one Jordanian student	OY1 Q4
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities*	Project Personnel Min. of Health	OY2 Q1

• Review of research to date • Discussion and input from partners and stakeholders	Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	
Regional Training Workshop 2 **Analyses and Surveillance, Biosafety and Biosecurity** *Three-day didactic and hands-on intensive training and refresher training on Biosafety and Biosecurity* • Geospatial Analysis • Advanced Epidemiology • One Health Disease Surveillance • Biosafety and Biosecurity Refresher Training	Project Personnel *Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	OY2 Q3
Threat Reduction Workshop *This three-day focused, Jordan country-level workshop will be developed and facilitated by the project team in consultation with partners and frameworks pertinent to zoonotic disease risk and impact mitigation (e.g. through World Bank, FAO, OIE, WHO, GHSA, UNDRR) to promote broader alignment and uptake.* • Targeting risk factors in production systems • Disease prevention and control strategies • Economic analysis • Multi-sectoral action plans and roadmaps	*Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric. Jordan FDA Min of Environ. and representatives from other key sectors (e.g. disaster management, finance, industry)	OY2 Q3
Final Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Presentation of all project results • Policy recommendations • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	OY2 Q4

6. GUIDELINES AND PROTCOLS FOR HUMAN AND ANIMAL SUBJECTS RESEARCH

For human subjects research, our protocols will align with PREDICT protocols with which our in-country teams have been complying for three years. They will be modified to reference the specifics of this project's IRB (as opposed to PREDICT's IRB).

- 5.4 Human Syndromic Surveillance (see next page)

USAID | PREDICT

Section 5.4. Human Syndromic Surveillance

Prepared by
Christine K Johnson, PREDICT Biological and Ecological Surveillance Lead, UC Davis
Karen Saylors, PREDICT Behavioral Surveillance Co-Lead, Metabiota
Corina Monagin, Metabiota

With contributions from:
Maureen Miller PREDICT Behavioral Surveillance Lead
Jason Euren, Metabiota
Ashley Lucas, Metabiota
Nicole Ureda, UC Davis
Kim Dodd, Metabiota
Brian Bird, UC Davis
David Wolking, PREDICT Operations Officer
Tracey Goldstein, PREDICT Pathogen Discovery Lead
and the PREDICT One Health Consortium

Objectives: To safely and ethically collect biological samples and data from humans in clinical settings.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

The authors assert that human surveillance and sampling should always occur in compliance with all applicable laws and regulations and should only be undertaken after securing all necessary permits and approvals, including ethical approvals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Planning Syndromic Surveillance

Procedures for Patients in Hospitals and Clinics

References and Appendices

Planning Syndromic Surveillance

Section 5.4.1. Confirmation of Knowledge

When you are familiar with the information in this guide, take the PREDICT quiz ***Section 8.4.12. Human Syndromic Surveillance***.

PREDICT team members involved in the human surveillance activities described in this guide must be familiar with PREDICT's Institutional Review Board (IRB)-approved Master Protocol and related IRB obligations and should take and pass the quiz ***Section 8.4.18. PREDICT IRB Compliance and Monitoring***.

Section 5.4.2. Ethical and Training Considerations

All PREDICT activities involving human subjects must adhere to the most up-to-date version of the Master Protocol that has been approved by the UC Davis Institutional Review Board (IRB). The Master Protocol is available online through the PREDICT Operating Procedures e-Book under "Section 5.3" (https://eidith.org/Resources/PREDICTOperatingProcedureseBook.aspx). In addition, PREDICT activities involving human subjects may only be initiated after obtaining ethical approval from country institutional review boards.

Before implementing human subjects research related activities, documentation of all necessary country approvals along with attestations of trainings and adherence to ethical standards must be provided for review to UCD, and the UCD IRB as appropriate. These include

1) documentation of local IRB/ethical approvals and all approved documents (including the consent form and human questionnaire translated into the local language and any additional introduction letters and recruitment scripts planned for use);
2) completion of CITI training for all personnel listed on the country protocol (with training events documented in EIDITH);
3) training of project staff in procedures outlined in this SOP (with training events documented in EIDITH);
4) identification and documentation of local institutional biosafety committee (IBC) requirements (if any);
5) a consultation from a local expert summarizing risks to the area; and
6) an attestation that all personnel will adhere to USA and local government federal and state regulations regarding protection of human subjects research.

A checklist with both country IRB preparation guidance and post country IRB approval procedures relating to UC Davis IRB authorization has been created to assist country teams with this process (Appendix 1). Please review this checklist when preparing your application for

country IRB submission and to guide the final UCD IRB authorization process following local IRB approval. **The UC Davis IRB must approve each country's protocol before local activities are initiated.**

Effort will be made in all recruitment, consent, sampling, and interview activities to assure potential participants that their **participation in the study is completely voluntary** and that all information shared with researchers will be kept confidential. Every effort will be made to avoid coercion and ensure the privacy, respect, dignity, and freedom of each participant.

PREDICT staff named on the country protocol must complete Collaborative Institutional Training Initiative (CITI) training in human research ethics for biomedical researchers. In addition, PREDICT staff listed in the country protocol will need to ensure proper training of hospital/clinic POC(s) in study procedures, including recruitment, enrollment, informed consent, and sample collection, to ensure compliance with our Master IRB protocol and PREDICT practices.

When the staffing and implementation plans have been established, a plan should be developed to train clinic and hospital staff on protocol procedures to ensure implementation of agreed upon study design. Consideration should be given to how information will be presented, as not every facility staff member will need to know every detail of the PREDICT plan.

Section 5.4.3. Partnerships with Participating Health Facilities

Symptomatic patients will be recruited for syndromic surveillance in collaborating health facilities that have a catchment area that includes high-risk communities and PREDICT field sites where linked animal and human samples are being collected concurrently.

Syndromic surveillance of patients presenting to health facilities is necessary to identify symptomatic individuals. In order to optimize the chances of accessing the most relevant acute symptomatic individuals presenting at health facilities, appropriate selection and engagement of health facilities is key. While each individual site will require a slightly different approach, teams can be guided by the following methodology when looking to engage and maintain relationships with their sites in each country.

Assessment of the Health Facility

After initial engagement with key personnel, teams will need to work collaboratively with health facility personnel to consider the most optimal way to engage with clinical, laboratory and professional staff. A short form to assist with initial assessment of potential partners for syndromic surveillance is attached in Appendix 2 (Health Facility Screening Form).

Understanding Patient Flow

A thorough review of patient flow from arrival at the facility to discharge should be done by country teams through scoping site visits including:

- Where do patients normally present upon arrival to the facility and who would they first come into contact with for initial screening and assessment?
- What health professionals would potentially be involved in the assessment, diagnosis and treatment of individuals presenting with syndromes of interest throughout their stay at the health facility?
- If patients are not admitted to a health facility but might require follow-up care, what are the normal follow-up and discharge procedures?
- If patients are admitted to the health facility, what service units/departments might be involved in their care and treatment?

Understanding Staffing Needs

Understanding normal daily routine of staff and diagnostic practices, and identifying point of contact(s) (POC), will ensure that PREDICT procedures fit in as seamlessly as possible into the normal clinic routine.

- What is staff workload like?
- Who is your POC(s) to help identify symptomatic individuals?
- Who is your POC(s) for recruitment of appropriate individuals?
- Who may be best suited for assisting with study procedures, including sample collection and administration of questionnaire?
- Are these POC(s) likely to be the same person or different?
- What will be the best way to engage and train staff about study procedures and protocol?
- Are clinical staff skilled in proposed sampling procedures?
- How will costs for staff time at hospitals be covered and implemented?

The team should identify how PREDICT activities will fit into hospital workflow and develop an implementation plan that will need to be agreed upon with the hospital team. Decisions will need to be made about whether current hospital staff will be assigned additional duties or whether a new staff person(s) will be hired.

A detailed implementation plan, taking into consideration the following issues, should be developed with participating hospital staff:

- What are some potential barriers to implementation?
- What level of visibility and follow-up will be appropriate to keep sites engaged for the duration of the study?
- How will you maintain clear and open communication with health facility staff?
- What is the plan if key personnel involved in implementation leave the health facility?
- How will you take into consideration any known or observed differences religious/ethnic/immigration status in targeting individuals for recruitment?
- How will you monitor for adverse events?

Section 5.4.4. Patient Recruitment in Hospitals and Clinics

PREDICT targets patients that have been recently admitted to clinics and hospitals with acute conditions that match the case definitions for undiagnosed febrile syndromes of likely viral origin. **The objective of PREDICT's testing strategy is to detect novel viruses that are causing diseases in patients without a known etiology.** PREDICT testing should not overlap or duplicate diagnostic testing already being conducted at the hospital.
In communications with clinic medical staff, clinic administration and patients who might be enrolled, it is critical to note that **PREDICT's testing strategy will not directly inform on patient diagnoses or treatment. Our testing strategy is exploratory at the community level and not designed as a point of care diagnostic platform for normative (known) diseases.**
Case definitions should be reviewed closely with hospital POC(s) in advance of study implementation to identify patients for enrollment. Patients for enrollment may be identified in the emergency room, in the ward, or in the intensive care unit of each participating clinic and hospital. The POC(s) at each location should use the **clinical case definitions below** to target potential participants. Case definitions for syndromes have been standardized with those commonly used by WHO and CDC to allow national health authorities to interpret data in an international context.

Syndromic Category Clinical Case Definitions

Surveillance should be designed to target specific syndromes as appropriate in each clinical setting. Identification of relevant syndromes for each facility should be done on a facility-by-facility basis with participating partners and facility staff. Selected syndromes should reflect 1) high priority undiagnosed syndromes with likely animal origins, and 2) the clinical caseload of the hospital or clinic so that a large number of patients with targeted syndromes can be enrolled. Additionally, targeted syndromes should take into account local needs and seek to not duplicate ongoing syndromic surveillance programs by other partners at the clinic or hospital.

In larger referral hospitals with high caseloads, enrollment of patients in the PREDICT study will most likely want to focus on the following three severe syndromes and clinical case definitions to better target individuals with potentially unknown viral pathogens of concern:

1. **Severe Acute Respiratory Illness (SARI) of unknown origin:**
Acute onset of a fever greater than or equal to 38°C (100.4 °F) within the last 5 days
AND cough
AND requires hospitalization (or referral to a hospital)
AND absence of a more likely clinical explanation.

2. **Acute Encephalitis Syndrome (AES) of unknown origin:**
Acute onset of a fever (greater than or equal to 38°C or 100.4 °F) within the last 5 days
AND clinical signs consistent with meningitis, encephalitis, acute flaccid paralysis, or other

acute signs of central or peripheral neurologic dysfunction, as documented by a physician or a health-care provider
AND absence of a more likely clinical explanation.

3. **Hemorrhagic fever of unknown origin:**
Acute onset illness with a fever greater than or equal to 38°C (100.4 °F) within the last 5 days in a severely ill patient
AND clinical findings of bleeding or hemorrhage with no apparent cause
AND one or more of the following clinical findings: 1) severe headache, 2) muscle pain, 3) rash on the trunk within 3–4 days after rash onset, 4) vomiting, 5) diarrhea, 6) abdominal pain, or 7) pharyngitis, as documented by a physician or a health-care provider
AND absence of a more likely clinical explanation.

See also http://wwwn.cdc.gov/nndss/script/casedef.aspx?CondYrID=893&DatePub=2010-01-01

In smaller rural clinics, with limited diagnostic capabilities and lower patient caseloads, it may be appropriate to enroll a broader range of patients with suspected illness of unknown origin. In these circumstances, the following 2 clinical case definitions, for less severe and less specific syndromes, may be appropriate to target in addition to the severe syndromes targeted above.

4. **Fever of Unknown Origin (FUO):**
A temperature greater than or equal to 38°C (100.4 °F) for more than 24 hours as reported or measured by the patient or a health-care provider
AND absence of a more likely clinical explanation or failure to reach a diagnosis.

5. **Influenza-like Illness (ILI) of unknown origin**:
Acute onset of a fever greater than or equal to 38°C (100.4 °F) within the last 5 days.
AND cough
AND absence of a more likely clinical explanation.

Be sure to follow the most up-to-date version of the PREDICT Master IRB protocol with respect to all procedures, including recruitment, enrollment, inclusion, and exclusion criteria, and sample sizes.

Additional Enrollment Criteria and Considerations

PREDICT and hospital/clinic staff must take special care to ensure that patient recruitment and enrollment is not adversely impacting patients seeking medical care, or hindering patients' ability or willingness to seek medical care in any way. Recruitment and enrollment of patients should only occur after patients have established access to health services. Patient recruitment for this study should not be linked to patient intake or admission. Enrollment must be completely voluntary.

Eligible individuals should be recruited as soon as safely possible after presentation to the health facility, and after initial screening to ascertain whether patients meet the above clinical case definition, in order to maximize the utility of the biologic specimen collected. Successful recruitment of syndromic individuals will require monitoring of incoming patients to health facilities. Recruitment from health facilities involves many coordinated steps, involving coordination between PREDICT and health facility staff.

In addition to the clinical case syndromes identified above, inclusion and exclusion criteria outlined in the approved Master IRB protocol that must be applied to all PREDICT studies is reiterated below:

Additional Inclusion Criteria	***Exclusion Criteria***
1. Adults (18 years of age or greater) who provide informed consent	1. Individuals aged 18 years or older who refuse to provide informed consent, a parent or guardian of a child who refuses to provide consent on behalf of their child, or a child 12 years or older unable or unwilling to provide assent
2. Children (2 -17 years of age) * with an accompanying parent or guardian who is able to provide informed consent. Assent of children 12 years or older also required.	2. Adults unable to provide informed consent, including individuals with physiologically or medically induced cognitive impairments. **
3. Pregnant women	3. Children without an accompanying parent or guardian who is able to provide informed consent
	4. Children < 2 year of age
	5. Prisoners

**Children defined as 2-17 years unless the age of majority in a participating country differs. In these cases, the age range for children will be listed in the country specific IRB protocols.*

***Patients who are incapacitated and unable to provide informed consent may be enrolled if an appropriate patient representative (e.g., family member) is present, willing, and able to provide consent on the patient's behalf. If, in the course of study operations, such a patient become capable of providing informed consent, the patient will be directly consented.*

Section 5.4.5. Determining the Number of Patients to Enroll in Clinical Settings

Estimated sample sizes of patients approved in the Master IRB is a maximum of 1,620 in each country for syndromic surveillance activities over the course of the project. Any deviations from this total estimate will need to be reviewed and authorized by the UCD IRB (See Section 5.8.1b).

Patients meeting targeted case definitions should be enrolled systematically across the year so that the patient population is sampled across all relevant seasons. Monthly sample sizes throughout the year should reflect a consistent proportion of patients meeting targeted case definitions.

In general, patients should be enrolled using a quota system until approximately 20% of the participants are children < 18 years of age and 80% are adult. For larger hospitals and clinics, interval sampling will be implemented by selecting every N^{th} case at the site among those individuals who meet enrollment criteria. The interval should be determined by country teams based on an evaluation of the expected number of cases presenting at the site within a given year in order to best meet study design and sample size criteria. For example, in a large hospital with many patients meeting enrollment criteria, the first patient meeting criteria would be selected for study participation followed by selection of every 3^{rd} or 5^{th} individual (depending on the appropriate interval) until the maximum sample size is obtained.

Procedures for Patients in Hospitals and Clinics

Section 5.4.6. Overview of Procedures in Hospitals and Clinics

PREDICT and hospital/clinic staff should consider and make arrangements to conduct the following steps. These steps may need to be adjusted depending on the circumstances of each enrolled health facility. An overview is summarized below for ease of use in training PREDICT staff. Details for each procedure are described further below and in the IRB protocol.

Outline of Activities Involving Patients:

1. **Patient Triage and Intake**: Patients arrive at health facilities and present to patient triage and/or intake units. Clinic or hospital POC(S) will assess patient etiology as part of their normal routine. Following patient triage and intake, patients with presenting syndromes of interest will need to be actively referred to PREDICT POC(s). This active referral will deviate from the health facility staff's normal routine. Country coordinators will need to establish a protocol with the health facility staff prior to beginning recruitment and *ensure that this process does not negatively impact patient access to health services, or health facility workflow.*

2. **Administer Informed Consent**: Patients determined eligible via the Screening Form will be offered participation in PREDICT. Study staff will administer the informed consent form to interested patients. *No study procedures can be conducted without having first obtained informed consent.* Informed consent must happen in a private space and should not involve anyone other than research staff, the patient, a representative if the patient is incapacitated, an impartial witness if the participant is illiterate, and a

parent/guardian if the patient is a child. Once consented, the patient is considered an enrolled participant.

Note: The presence of clinical staff directly involved in patients' care during the consenting process should be construed as coercive. Patients may think they need to consent in order to continue receiving care. PARTICIPATION MUST BE STRICTLY VOLUNTARY.

3. **Collect PREDICT Specimens**: Once enrolled, PREDICT POC(s) will coordinate human biologic specimen collection. Samples may be taken concurrently when collecting samples for normative diagnostics or independently.

4. **Administer Human Questionnaire**: Study staff will administer the **standardized IRB approved human questionnaire to all enrolled participants** at a point in time that ensures patient privacy and is not disruptive to patient care. The human questionnaire must be administered to all patients from which a biologic specimen is collected.

   In clinical settings with critically ill patients, the full human questionnaire may not be possible or appropriate to administer. At a minimum, the "**Core Human Questionnaire" (pages 1-6 of Human Questionnaire)** and the **Human Hospital & Clinic Module** for Patients should be completed.

5. **Normative Diagnostics**: Throughout a patient's inpatient stay, a variety of normative diagnostics, if available, might be run by the health facility staff to determine patient etiology. If additional sampling procedures are conducted as part of normative diagnotics that do not overlap with PREDICT specimen types already collected, PREDICT may request that any unused or remaining diagnostic specimen types be saved from patients enrolled in the PREDICT study (such as cerebral spinal fluid, pleural fluid, etc) to expand the sample set for PREDICT testing.

   Once health facility staff obtain diagnostic results, patients' etiologies will be updated. This information can be used to prioritize samples for testing with PREDICT viral family protocols. If an etiology for fever or clinical syndromes is identified, samples from this patient are of lower priority, unless a novel viral infection is still suspected because the objective of PREDICT's testing strategy is to detect novel viruses that are causing disease in patients. PREDICT POC(s) will need to follow the inpatient progress of enrolled participants to know when etiologies are updated.

6. **Second PREDICT Serum Specimen Collected**: 7 days after the first sample collection or later, an additional serum sample (the discharge serum) should be obtained from participants when possible.

Section 5.4.7. Administering Informed Consent

Participation of human subjects in the study will be strictly voluntary and will require signed, informed consent. All consent discussions and procedures will be conducted in a private room or location with a trained staff member fluent in the local language. Only the PREDICT staff person/POC and the patient will be present during the consent process. Additionally, the patient's representative if the participant is incapacitated, an impartial witness if the participant is illiterate, and/or the patient's parent or guardian if the patient is a child, can be present during the consent process. CITI-trained PREDICT staff may occasionally observe consent procedures to ensure they are appropriately and thoroughly conducted.

All participants will be given an information sheet and consent form prior to being asked to participate in this study. Potential participants will review the information sheet and consent form with the PREDICT POC(s) and will be given time to ask questions. During the review, POC(s) will explain details of the study, including:

- Purpose of the study,
- Why they were selected,
- What will happen if they enroll in the study,
- Potential risks due to their participation,
- How their participation is beneficial to understanding viral pathogens in the community,
- That their participation is completely voluntary,
- How they can withdraw their participation at any time,
- How participation in the study will not interfere with, nor affect, their routine medical care in the health facility,
- How PREDICT testing is exploratory research, and not diagnostic, and this will not inform on patient diagnosis or treatment.
- Test results, these will not be directly communicated back to the participant

PREDICT Study staff POC(s) will review the consent form with participants, answering any questions participants have. It should be made clear to all participants that any data or information collected will be kept strictly confidential. Measures will be taken to ensure the respect, dignity, freedom, and privacy of each participant. PREDICT POC(s) involved in the enrollment and recruitment of participants must avoid coercion of any kind. The PREDICT representative conducting informed consent procedures will not enroll the participant in the study unless confident that the participant or his or her representative fully understands the study and all potential associated risks and benefits.

After reviewing the forms and discussing the study, individuals who agree to participate will sign and date two copies of the consent form, and the staff member conducting the consent discussion will also sign and date the consent forms. If the participant is a child, he or she will

be asked to provide assent to participate in the study and the patient's parent or guardian will sign and date the consent forms. If the patient is illiterate, the witness will sign and date two consent forms. If the patient is incapacitated, his or her representative will sign and date the consent forms. The patient will be given a copy of all consent documents.

Section 5.4.8. Brief Overview of PPE

Minimum PPE Required for Safe Human Specimen Collection
The minimum PPE used by healthcare professionals for human sampling should follow the CDC and other international guidelines for best practices and precautions.

The following are the minimum PPE requirements:

- Gloves
- Designated clothing (which may include gown, apron, long sleeve lab coat)
- Closed-toed shoes
- Eye protection (glasses or goggles), face mask or shield

(See the PREDICT ***Biosafety and PPE Guide (Section 4.1)*** for detailed instructions regarding PPE Use.)

Section 5.4.9. Collecting Clinical Specimens

Enrolled patients who satisfy inclusion criteria as described above (with signed consent form) will be asked to provide clinically relevant biological specimens based on clinical symptoms. To ensure patient privacy, no identifying information from patients will be stored with, or paired with, biological specimens or test results.

Patients should be enrolled with specimens and data collected within 3-5 days of onset of symptoms if possible, and not longer than 10 days after onset becase we are targeting viral etiologies. Critically, patients must have specimens collected as soon as possible after admission in order to ensure they are captured in the viremic phase and/or while they are still shedding the virus, if the illness turns out to be of viral origin. If feasible, hospitalized patients may have repeated serum samples collected at seven days after enrollment, or later before discharge.

Biological samples may only be collected by trained personnel certified by the country's authority for certification of medical professionals. All personnel collecting or handling PREDICT biological specimens must wear appropriate PPE and practice Universal Precaution procedures.

Study representatives should conduct activities in a secure location and a confidential

manner to ensure participant privacy. A barrier or private room should be utilized so that participants cannot be seen by outside observers while they are being sampled. During and immediately after sample collection, trained medical professionals and/or clinic staff will monitor specimen collection site(s) and treat any complications according to existing health facility protocols.

Summary of Clinical Specimen Types

The decisions about which specimens to collect should be based on the patient's clinical symptoms (eg. blood and oral/nasal swabs for respiratory patients;):

- 2 x Oral or Nasal or Oropharyngeal swabs - one in 500 µL VTM and one in 500 µL Trizol
- 2 x Whole blood samples - one with max of 500 µL of whole blood in 500 µL VTM and one with max of 500 µL of whole blood in 500 µL Trizol
- 2 x Serum samples - 2 x 500 µL aliquots, frozen without media
- 2 x Urogenital swab samples – one swab each in 500 µl VTM and 500 µl Trizol
  OR
  2 x Urine samples - one 500 µL urine sample each in 500 µL VTM and in 500 µL Trizol
- 2 x Rectal swabs - one swab in 500 µL VTM and one in 500 µL Trizol
  OR
  2 x Fecal samples - 0.5cc (pea size) feces in 500 µL VTM and 0.5cc (pea size) feces in 1 mL Trizol
- Additional samples or aliquots of specimens collected for standard normative diagnostic purposes by hospital staff may be requested, as appropriate and based on clinical symptoms (see below).

Whole Blood and Serum

Trained phlebotomists, doctors, or nurses will collect venous blood samples by standard venipuncture from the right or left antebrachium.

A minimum of two blood samples will be collected from each participant. Collect one sample into a vacutainer tube containing serum separator and the other into a vacutainer tube containing EDTA. For children aged 12 years or younger, collect a maximum of 6mL in each tube. From individuals aged 13 years and older, collect a maximum of 12mL per tube.

Ensure adherence to appropriate PPE while handling biological specimens.
Allow blood in the red top or serum separator tube to clot, then centrifuge. After clotting and centrifugation, aliquot a minimum of two (and up to four) 0.5 mL aliquots of serum into individual cryovials without Trizol or VTM.

From the EDTA lavender top tube, place up to 500 µL whole blood directly into 2 vials, one containing 500 µL VTM and one containing 500 µL Trizol. Mix each vial well.

Samples will be frozen immediately in liquid nitrogen and then transferred to an ultralow (-80°C) freezer as soon as possible for storage until analysis.

Note that two blood sampling events are warranted if feasible in a hospital or clinic setting, one on the day of enrollment and one seven days after enrollment or later (before discharge), to collect a serum sample only. If serologic assays are available for use for targeted viruses, a rise in IgM with convalescence might assist in establishing causality with disease syndromes.

Oral, Nasal, or Oropharyngeal Swabs

Each patient may have duplicate oral, nasal, or oropharyngeal swabs collected on the day of enrollment to the study.

Oral and nasal swabs will be collected by applying a sterile, flexible, nylon-tipped swab to the appropriate tissue and gently rubbing for 2-5 seconds. Oropharyngeal swabs will be collected by medically trained personnel by gently inserting sterile, flexible, nylon-tipped swabs into the pharyngeal cavity for 2-5 seconds and rotating while removing, as is done for diagnostic procedures.

Place each swab into its own vial, one containing 500 µL VTM and one containing 500 µL of Trizol, mix each tube well, and freeze immediately.

Rectal Swab or Feces

Rectal swabs will be collected by gently inserting 2 sterile, flexible, nylon-tipped swabs into the anal canal, moving them from side to side, and rotating while removing. Place each swab into a vial, one containing 500 µL VTM and one containing 500 µL of Trizol. Mix each tube well and freeze immediately.

If patients are to provide a stool sample instead, they will be provided containers labeled with their individual ID number and instructions on how to collect an uncontaminated fecal sample, including appropriate guidelines for hand washing after sample collection.

Add 500 µL (a pea-sized piece) of feces directly into each of two vials, one containing 500 µL VTM and one containing 1ml Trizol. Mix each tube well and freeze immediately.

Urogenital Swab or Urine

A urine sample will be collected in a sterile universal container. Patients will be provided containers labeled with their unique ID numbers and instructions on how to collect an uncontaminated urine sample, including appropriate guidelines for hand washing after

sample collection.

Add up to 500 µL of urine directly into each of two vials, one containing 500 µL VTM and one containing 500 µL Trizol. Mix each tube well and freeze immediately.

If urine can't be obtained, collect two urogenital swabs and place into two vials, one containing 500 µL VTM and one containing 500 µL of Trizol. Mix each tube well and freeze immediately.

Additional Samples

For hospitalized patients, PREDICT also may receive remnants or aliquots of appropriate clinical specimens that have already been collected for diagnostic purposes. PREDICT testing should be conducted on remaining sample aliquots only after standard diagnostic procedures have been completed to ensure PREDICT activities do not interfere with patient care. These samples may include urogenital swabs, cerebral spinal fluid (CSF), pericardial fluid, pleural fluid, ocular swabs, or others. PREDICT should collect these remnants or aliquots in keeping with the respective participant's clinical symptoms, for instance, pleural fluid would be sourced from participants with respiratory distress, CSF from participants with encephalitis, etc. These samples can be frozen at −80 °C without Trizol or VTM. If additional PREDICT analyses are done on hospital diagnostic screening samples, results will not be communicated to patients or participating health facilities.

Section 5.4.10. Medical History and Behavioral Risk Data Collection in Clinical Setting

All enrolled patients will complete the required elements of the ***Human Questionnaire*** and the ***Human Hospital and Clinic Module for Patients***. If appropriate given the clinical setting and patient condition, the full PREDICT Human Questionnaire with all relevant modules can be completed.[1]

Questionnaire data will be collected by trained staff in a strictly confidential manner. Individual interviews will be conducted in private with no other individuals within a 10-foot distance, ensuring that others cannot hear the interviews. A barrier will be created so that no other individuals can view the participant while they are in their interview. Staff will take care to pair interviewers and respondents by sex to ensure protection of women and children and privacy

[1] To access the Human Questionnaire and desired module bubble forms, log in to EIDITH at https://connect.eidith.org/. Click the "Download Bubble Forms" button and select "Human Questionnaire" under the Choose Type drop-down menu. Select the Questionnaire or module you wish to download, indicate the number of forms you would like, and press "Submit." When prompted to do so, click on the word "here" to download your form/s. Additional instructions for completing and uploading the forms may be found in the Videos and Instructions menus on the connect.EIDITH.org dashboard.

and confidentiality of responses. Children will not be interviewed in the absence of a parent or guardian.

As many questions are sensitive in nature, the presence of support persons may make it difficult for participants to feel comfortable answering questions honestly. PREDICT POC(s) should liaise with clinical staff and family members for critically ill participants, as appropriate, to determine the most patient-centered means of collecting sensitive data, while still maintaining the accuracy of the data collection methods.

Where participants are intubated and unable to communicate verbally, but alert and appropriately communicative, POC(s) may administer the human questionnaire using paper and pencil with participants, if possible. Where patients are sedated and/or comatose, a shortened version of the questionnaire may be completed with a family member or substitute decision maker, if deemed appropriate by all parties. The human questionnaire must be completed if a biologic specimen is drawn; therefore, if the POC(s) is unable to complete the questionnaire for any reason with a participant, they will be excluded from the study. In all instances, the decision to complete the human questionnaire with critically ill individuals must weigh the benefits and downsides with family/friends, clinical staff, and the research team. The POC(s) must also consider patient privacy in immobile or critically ill participants and deem if there is appropriate space in which to conduct the questionnaire to ensure privacy and confidentiality.

Participants may be given a small token of appreciation for participation in the study that is appropriate with local culture and customs and valued at no more than $10 USD. Local research teams will determine the most appropriate item to give as a token of gratitude to research participants. This item should be given to participants after consent and baseline sampling and interviews are complete.

Section 5.4.11. Record Maintenance and Ensuring Participant Privacy

A study participant log should be maintained at each site to track participant enrollment. Information on new participant enrollments should be added to the log in a timely fashion after their consent; the enrollment of pregnant women and children, in particular, should be noted. If, after signing a consent form, a participant decides that they wish to withdraw from study activities, this information must be recorded in the participant log. In addition, each site may wish to maintain a confidential linking log that links participant names to their unique identification number; this log should also be maintained in an up-to-date manner, with information on study enrollees added shortly after their consent. An example participant log is attached in Appendix III.

No identifying information from patients will be stored with or paired with questionnaire data, biological specimens, or analytical test results. Further, identifying information must not be stored electronically and must be stored securely in locked drawers or cabinets in areas accessible only by PREDICT staff. When questionnaires are moved to the country headquarters,

they will contain only coded data to ensure the safety and confidentiality of participants and will be maintained in a secure database. The only document that will link the participant with a unique ID number is the consent form, which will be stored in a locked file separately from participant data in the offices of the Country Coordinator.

Section 5.4.12. Reporting Results

The PREDICT team will inform collaborating partners of the aggregate patient test and behavioral risk findings as well as provide information about viral detection and zoonotic diseases detected, as appropriate. One key benefit of this study to participating clinics and hospitals is to enhance understanding of viruses that could be causing syndromes in local people but that have previously gone undiagnosed. This information will inform participating clinics and hospitals about viruses common in target patient communities and may lead to practices that could reduce exposure and health risks.

Report summaries of interpreted data generated from the project will be provided to the Ministry of Health for approval for release. Following approval for release, report summaries from the project can be shared with other in-country collaborating investigators and hospitals. Adverse events or serious adverse events will be included in report summaries provided to Ministries of Health upon request.

Section 5.4.13. Protocol Deviations, Unanticipated Problems, and Adverse Events

For complete information on protocol deviations, unanticipated problems, and adverse events, see the PREDICT Compliance and Monitoring Guide.

Protocol Deviations
Country teams and hospital and clinic POCs responsible for conducting PREDICT surveillance activities must be familiar with PREDICT's IRB protocols and knowledgeable about expected human surveillance operations. If, during the course of study activities, a team member becomes aware that any human surveillance activities have not been conducted in accordance with protocols or training guides, the team member should promptly inform the country field coordinator/human surveillance officer (if one is active in the country) or Country Coordinator about the deviation. The Country Coordinator should promptly contact the regional lead and complete any documentation, including developing any Corrective and Protective Action plans.

Unanticipated Problems
Unanticipated problems are events that are **unexpected** and **related to the research study** and that put one or more study participants at **greater risk of harm**. Unanticipated problems can include events or issues arising during standard research operations that may not cause detectable harm or adverse effects to research participants, but nonetheless raise the level of

risk associated with research participation (e.g., stolen consent forms or linking logs; breaches of privacy during research interviews). All problems meeting the three criteria above must be reported to the Operations Officer (predict@ucdavis.edu) within 24 hours (if the unanticipated problem is serious) or 72 hours (if the problem is not serious) using the form in Appendix IV.

Adverse Events and Serious Adverse Events

It is possible that during the course of study activities, a participant may experience discomfort or distress. Certain discomforts, such as pain at the site of blood collection and discomfort answering sensitive questions, are expected and detailed in the study protocol. Additional possible risks to study participation may be identified for a given site upon consultation with a local risk expert.

If, during the course of study operations, a participant reports or exhibits one of these anticipated adverse reactions to study participation (be it physical, mental, emotional, or social), that adverse reaction, or "adverse event," should be documented and reported to the human surveillance/field coordinator (if one is active in the country) and Country Coordinator promptly, but no later than within five working days (see the Reportable Information, Unanticipated Problem, and Adverse Event Reporting Form, Appendix IV). Once the Country Coordinator learns of the Adverse Event, he or she should report it to the Lead PREDICT PI (Dr. Mazet) and Operations Officer (predict@ucdavis.edu) within **72 hours**.

In the event a participant reports or exhibits a ***serious*** adverse event that is ***unexpected,*** that is likely ***related*** to study activities, and that implies the ***level of risk to all study participants may be higher than previously expected***, that serious adverse event should be reported to the human surveillance/field coordinator (if one is active in the country) or Country Coordinator within five working days. The human surveillance/field coordinator should report the event to the Country Coordinator, and the Country Coordinator should report the event to the Lead PREDICT PI (Dr. Mazet) and Operations Officer (predict@ucdavis.edu) **within 24 hours**.

The Lead PREDICT PI and Operations Officer are responsible for notifying the UCD IRB within the same time frame (72 hours for adverse events; 24 hours for serious adverse events). The Country Coordinator should report these adverse events to the in-country IRB or ethical committee if and as required to do so.

After becoming aware of any adverse event, the Country Coordinator should confer with their regional lead, the PREDICT global team, and relevant IRBs/ethical boards to determine what steps, if any, should be taken to address the adverse event and prevent similar future events.

Section 5.4.14. Site Monitoring

Each in-country team should work together in the first year to implement key procedures from the PREDICT IRB Compliance and Monitoring Guide on site monitoring and reporting (summarized in Appendix 5). Country Coordinators will be expected to work with PREDICT POCs at hospital and clinic sites to develop a regular system for transferring key study documents, reviewing records for completion, and addressing issues or concerns that arise during study activities.

As part of monitoring and reporting plans, at the completion of each surveillance period, generally on a calendar year schedule, a data and safety review will be conducted by a representative of the PREDICT global or regional management team. At this review, safety information and adverse events collected during the performance period will be discussed and addressed. Data may include case report forms, notes from study visits, and or any telephone calls to the PI from participants.

Section 5.4.16. Appendix I. PREDICT IRB Checklist for UC Davis Submission

Before initiating human surveillance activities described in the Master Protocol, the following items must be submitted to the PREDICT Global Team via predict@ucdavis.edu prior to submission to local IRBs or ethical committees. The Global Team will conduct a rapid internal review of these documents to ensure plans comply with project objectives and global IRB approvals.

Following local IRB or ethics committee approval, additional materials must also be shared with the Global Team to forward onto the UC Davis IRB for final review and approval of country activities.

The most current drafts of global IRB-approved documents, including the currently approved protocols, consent forms, and questionnaires, are available at: http://eidith.org/Resources/PREDICTIRBProtocols.aspx (EIDITH login required).

Submission Checklist:

☐ 1. Submitted a bulleted list of changes made to all global document(s) to predict@ucdavis.edu.

☐ 2. Shared the country plan developed on the PREDICT global protocol template (using Track Changes as descried in the instructions) with predict@ucdavis.edu.

☐ 3. Used the most recent version of the Master Protocol documents (available at http://eidith.org/Resources/PREDICTIRBProtocols.aspx) to develop in-country materials.

☐ 4. Submitted English language versions of the country protocol, written consent form, verbal consent form, introductory script, and human questionnaire (Word.doc preferred) to predict@ucdavis.edu. Provided English language versions of any printed advertising materials to predict@ucdavis.edu.

☐ 5. Provided in-country IRB submission requirements (in copy or by web link, or if not in English via a document explaining the requirements) to predict@ucdavis.edu.

☐ 6. Clearly listed all Country Coordinators, Human Surveillance Coordinators, Global Leads, and key US-based staff involved in the study in the country protocol personnel list. These individuals will require CITI training.

Following Country-Level Approval – The Post-Submission Checklist:

☐ 1. Submitted all documentation of local IRB/ethical approvals to predict@ucdavis.edu. *All countries to submit this documentation.*

☐ 2. Provided all translated documents to predict@ucdavis.edu. For countries using town hall recruitment methods, this includes (a) translated study introduction letter(s) and recruitment script(s).

☐ 3. Submitted CITI training certificates for all personnel listed in the country protocol to predict@ucdavis.edu and entered all CITI training events to the EIDITH training app for monitoring (EIDITH app: http://training.eidith.org).

☐ 4. Trained all members of the human subject research team (training conducted by CITI-certified personnel) in human research ethics, and entered documentation of training events into the EIDITH training app (http://training.eidith.org). *Please maintain a record of all personnel involved in the study to allow monitoring of training status via the EIDITH Training Dashboard.*

☐ 5. Trained all relevant staff in PREDICT biological specimen safety protocols and entered documentation of all training events into the EIDITH training app (http://training.eidith.org). In addition, identified all local requirements for biological specimen safety (if any) and communicated requirements with study staff.

☐ 6. Identified and addressed local IBC requirements (if any) and shared a document outlining these requirements with predict@ucdavis.edu.

☐ 7. Conducted a consultation with a local expert on risks of human subject research in the study area; communicated these risks to the global and human surveillance teams for consideration.

☐ 8. Submitted a signed attestation form to predict@ucdavis.edu (see instructions) indicating that all personnel will adhere to all US federal and state regulations related to the protection of human research subjects.

Section 5.4.17. Appendix II. Health Facility Screening Form

Health Facility Screening Form

Facility Description

Type of Facility:
- ☐ Clinic
- ☐ Hospital
- ☐ Other_____

On-Site Facilities:
- ☐ Inpatient Unit (_____ beds)
- ☐ Emergency Department (_____ beds)
- ☐ Intensive Care Unit (_____ beds)

Facility Operating Hours:

Sunday	☐ Closed	☐ 24-Hrs	☐ ____ Hrs
Monday	☐ Closed	☐ 24-Hrs	☐ ____ Hrs
Tuesday	☐ Closed	☐ 24-Hrs	☐ ____ Hrs
Wednesday	☐ Closed	☐ 24-Hrs	☐ ____ Hrs
Thursday	☐ Closed	☐ 24-Hrs	☐ ____ Hrs
Friday	☐ Closed	☐ 24-Hrs	☐ ____ Hrs
Saturday	☐ Closed	☐ 24-Hrs	☐ ____ Hrs

Facility Departments:
- ☐ Chemistry Lab
- ☐ Microbiology Lab
- ☐ Radiology Department
  - ☐ CT Scanner
  - ☐ MRI Machine
  - ☐ Ultrasound Machine
  - ☐ X-ray Machine
- ☐ Transfusion Medicine Department

Direct Disease Reporting:
- ☐ Regional Reporting
- ☐ Country Reporting
- ☐ International Reporting

On-Site Personnel:
- ☐ Physicians (_____ staff)
- ☐ Nurses (_____ staff)
- ☐ Infectious Disease (_____ staff)
- ☐ Phlebotomy Team (_____ staff)

Health Care System

Coverage of Care:
- ☐ Fixed-Cost for Patients
- ☐ Sliding-Scale for Patients
- ☐ Free for Patients
- ☐ Supplemented Only if Patient has Private Insurance
- ☐ Location-Specific

Patients Served

Geographic Areas Served by Medical Facility:
- ☐ _____
- ☐ _____
- ☐ _____
- ☐ _____
- ☐ _____
- ☐ _____

Presentation of Syndromes of Interest (Last Month):
- ☐ Fever of Unknown Origin (_____ patients)
- ☐ Fever with Rash (_____patients)
- ☐ Fever with Diarrhea (_____patients)
- ☐ ILI/SARI (_____patients)
- ☐ Encephalitis (_____patients)
- ☐ Hemorrhage (_____patients)

Diagnostics

Health Facility Screening Form

Normative Diagnostics:

Chikungunya	☐ On-Site Rapid	☐ Serology Testing	☐ Off-Site	☐ None
Cholera	☐ On-Site Rapid	☐ Stool Culture	☐ Off-Site	☐ None
Dengue	☐ On-Site Rapid	☐ Serology Testing	☐ Off-Site	☐ None
Hantavirus	☐ On-Site Rapid	☐ Serology Testing	☐ Off-Site	☐ None
Influenza	☐ On-Site Rapid	☐ Culture	☐ Off-Site	☐ None
Japanese Encephalitis	☐ On-Site Rapid	☐ Cerebrospinal ELISA Test	☐ Off-Site	☐ None
Malaria	☐ On-Site Rapid	☐ Microscopic Examination	☐ Off-Site	☐ None
Tuberculosis	☐ On-Site Rapid	☐ Culture	☐ Off-Site	☐ None
Typhoid	☐ On-Site Rapid	☐ Culture	☐ Off-Site	☐ None
Yellow Fever	☐ On-Site Rapid	☐ PRNT Test	☐ Off-Site	☐ None

If Off-Site, Where?_____

Specimen Collection Capability

Fluid Collection
- ☐ Blood Sample
- ☐ Fecal Sample
- ☐ Urine Sample

Mucosal Collection
- ☐ Nasal Swab
- ☐ Nasopharyngeal Swab
- ☐ Oropharyngeal Swab
- ☐ Anal Swab

Other Samples
- ☐ Ocular Swab
- ☐ Sputum Sample
- ☐ Cerebrospinal Fluid
- ☐ Pericardial Fluid
- ☐ Pleural Fluid

Patient Care

Referral Process:

Are Patients Ever Referred Out for Care?
☐ No ☐ Yes (where: _____)

If Yes, Is There Active Patient Follow-Up?
☐ No ☐ Yes

Patient Health Records:
- ☐ Paper
- ☐ Electronic

Research Capacity

Experience with Research:

Facility Actively Conducts Research
☐ No ☐ Yes

Facility Collaborates with External Researchers
☐ No ☐ Yes

On-Site Cold Storage:
- ☐ Refrigerator (4C)
- ☐ Freezer (-20C)
- ☐ Deep Freezer (-80C)

Section 5.4.18. Appendix III Sample PREDICT Participant Enrollment Log

Participant ID Number	Consent / Enrollment Date	Pregnant Woman? (Y/N)*	Child / Minor? (Y/N)*	Date Human Questionnaire Completed	Biological Samples Provided? (Y/N)	Ethnographic Interview? (If Yes, date)	Focus Group? (if Yes, date)	Withdrawn consent? (Y/N)	Withdrawn due to AE?** (Y/N)

*If a participant is **both** pregnant **and** a minor, they should be marked in the child/minor category **ONLY**
**AE – Adverse Event

Enrollment Log Page Number _____

Section 5.4.19. Appendix IV PREDICT Reportable Information, Unanticipated Problem, and Adverse Event Reporting Form

Form is embedded in PDF document (pp. 26a and 26b, below) and available as a standalone document in the PREDICT EIDITH online Operating Procedures EBook.

USAID | PREDICT
FROM THE AMERICAN PEOPLE

PREDICT Reportable Information, Unanticipated Problem, & Adverse Event Reporting Form

Reportable information (RI), unanticipated problems (UPs), adverse events (AEs), and serious adverse events (SAEs) arising in the course of PREDICT operations must be documented and reported to PREDICT Global staff at UC Davis. These reports help PREDICT and ethical review boards ensure that study participation does not pose unacceptable levels of risk to participants. This form should be used to report one instance of reportable information, one unanticipated problem, or one adverse event. The form may also be used to provide new, additional information on an existing report.

If providing new information on an existing report, please reference the date and provide a brief description of the previous report.

Please report all RI, UPs, AEs, and SAEs to your c ountry coordinator within THREE (3) business days if the event is not serious and ONE (1) day if the event is serious (see reverse for definitions).

Country coordinators should report RI, UPs, AEs, and SAEs to within THREE (3) days (if not serious) or ONE (1) day (if serious).

1. The report following describes (please check all that apply)

☐ Reportable Information ☐ an Unanticipated Problem ☐ an Adverse Event

☐ New information from a previous report.

Original report date: _____

2. Date of report: _____

3. Date(s) of event: _____

4. Date of event discovery: _____

5. Please provide a brief description of the event:

6. Did any of the following occur? (Check all that apply)

- ☐ Non-compliance with IRB requirements or determinations, or allegations of such non-compliance*
- ☐ Protocol deviation due to the action or inaction of the investigator or research staff*
- ☐ Breach of confidentiality*
- ☐ Death of participant
- ☐ Event is life threatening/places the subject at immediate risk of death
- ☐ Inpatient hospitalization or prolongation of existing hospitalization
- ☐ Persistent or significant disability/incapacity
- ☐ Congenital anomaly/birth defect
- ☐ Subject's health in jeopardy; may require medical, counseling, or surgical intervention to prevent one of the other outcomes listed above
- ☐ Criminal or civil liability or damage to the subject's financial standing, employability, or reputation.

7. Relatedness to study procedures, by principal investigator (PI) determination (Please select one)

- ☐ Unrelated: cause of problem is known; problem is not related to study procedures
- ☐ Possibly related: Less than likely (≤ 50%) chance of relatedness to study procedures; relation to study procedures is unclear but cannot be ruled out.
- ☐ Probably related: More than likely (≥ 50%) chance of relatedness to study procedures;
- ☐ Definitely related to study procedures: clear association in time with study procedures; no likely alternative cause

8. Outcome

- ☐ Resolved with no further problem/complaint
- ☐ Resolved with additional problem/complaint
- ☐ Hospitalization
- ☐ Death
- ☐ Unresolved at time of study close-out

Definitions:

Reportable Information includes **any new information that indicates the rights, safety, or welfare of participants or others has been or may be compromised** by something that occurred or did not occur in relation to study activities. Reportable information may include (but is not limited to) protocol deviations, participant complaints, safety monitoring reports, and changes to research conditions that pose safety risks.

Unanticipated problems are problems that are **unexpected**, that are **related or probably related** to the study, and that suggest research participation involves a **higher level of risk than was previously anticipated.**

Unexpected means that the **nature**, **severity**, and/or **frequency of the problem was not anticipated** given the study population and the nature of the IRB-approved study procedures. In reference to an AE, "unexpected" means that the nature, severity, or frequency of the problem is inconsistent with the natural progression of any underlying disease, disorder, or condition that the subject may have or with the participant's predisposing risk factor profile for the AE.

Adverse events are any **unfavorable occurrences** (including physical, mental, emotional, and social) that the participant experiences during or as a result of study activities.

*Requires additional completion and submission of a Corrective and Preventive Action (CAPA) Plan.

Signature_____ Date _____

Section 5.4.20. Appendix V. IRB Compliance Responsibilities and Expectations

(PENDING)

- Sample of a human survey questionnaire: Camel Exposure Module – English (see next page)

Camel Exposure Module – English

STUDY ID: _____

Q1. Have you taken this questionnaire in the past?

◯ NEVER
◯ YES – IN 2018 AT THIS LOCATION
◯ YES – IN 2018 AT A DIFFERENT LOCATION
◯ YES – IN 2017 AT THIS LOCATION
◯ YES – IN 2017 AT A DIFFERENT LOCATION

INTERVIEWER SCRIPT
We will now ask you about recent illnesses you may have had, any hospitals you may have visited recently, different interactions you may have had with camels, and what you think about camels and health.

Q2: Do you feel sick today?

◯ YES ◯ NO

Q3: Do you have a cough today?

◯ YES ◯ NO

Q4: Do you feel like you have a fever today?

◯ YES ◯ NO

IF Q2 OR Q3 OR Q4 = "YES" SKIP TO Q6.

⇨ **Q5: Have you felt sick, had a cough, or had a fever recently?**

◯ NO
◯ IN THE LAST 3 DAYS
◯ IN THE LAST 7 DAYS
◯ IN THE LAST 14 DAYS
◯ IN THE LAST MONTH

IF Q2 & Q3 & Q4 & Q5 = "NO" SKIP TO Q11.
IF Q2 & Q3 & Q4 = "NO" & Q5 ≠ "NO" SKIP TO Q7.

⇨ **Q6. For how many days have you felt sick or had a cough or fever?**

_____ FILL IN NUMBER OF DAYS

IF Q6 IS ANSWERED SKIP TO Q8.

⇨ **Q7. How many days in total did you feel sick or have a cough or fever?**

_____ FILL IN NUMBER OF DAYS

⇨ **Q8. Have you been seen by a doctor or nurse for this condition?**

◯ YES ◯ NO

IF Q8 = "YES" SKIP TO Q10.

⇨ **Q9. Do you plan to be seen by a doctor or nurse for this condition?**

◯ YES ◯ NO

↳ IF Q8 & Q9 = "NO" SKIP TO Q11.

⇨ **Q10. Where did you go or where will you go to see a doctor or nurse for this condition?**

◯ FRIEND OR FAMILY MEMBER WHO IS A DOCTOR OR NURSE
◯ PRIVATE DOCTOR OR NURSE
◯ CLINIC ◯ HOSPITAL ◯ OTHER_____

Q11. When was your most recent illness involving a fever or cough:

◯ NEVER
◯ IN THE PAST MONTH ◯ IN THE PAST 3 MONTHS
◯ IN THE PAST 6 MONTHS ◯ IN THE PAST YEAR
◯ IN THE PAST 2 YEARS ◯ MORE THAN 2 YEARS AGO

↳ IF Q11 = "IN THE PAST MONTH" CHECK THAT Q5 DOES NOT SAY "NO".

Q12. When is the most recent time you have been in a hospital?

◯ I HAVE NEVER BEEN IN A HOSPITAL
◯ IN THE PAST 14 DAYS ◯ IN THE PAST MONTH
◯ IN THE PAST 3 MONTHS ◯ IN THE PAST 6 MONTHS
◯ IN THE PAST YEAR ◯ IN THE PAST 2 YEARS
◯ MORE THAN 2 YEARS AGO

↳ IF Q12 = "I HAVE NEVER BEEN IN A HOSPITAL" SKIP TO Q14.

⇨ **Q13. During your most recent visit to a hospital, what was the main purpose of your visit?**

◯ I WAS A PATIENT ◯ I WAS VISITING A PATIENT
◯ I WORK AT THE HOSPITAL ◯ I WAS VISITING A HOSPITAL WORKER
◯ OTHER_____

INTERVIEWER SCRIPT
Camels are an important part of Jordanian culture, and many people use camels or camel products such as milk in their daily life. We will now ask you about a number of different ways in which you might interact with camels or use camel products in Jordan.

Q14. In a typical week for you, how many camels do you see?

◯ 0 ◯ 1 ◯ 2-5 ◯ 6-10 ◯ 11-20 ◯ 21-50
◯ 51-100 ◯ 101-500 ◯ MORE THAN 500

Q15. In a typical week for you, how many camels are ever within a distance of 1 meter from you? *Interviewer should point to someone or something approximately 1 meter away from the participant to indicate the distance.*

◯ 0 ◯ 1 ◯ 2-5 ◯ 6-10 ◯ 11-20 ◯ 21-50
◯ 51-100 ◯ 101-500 ◯ MORE THAN 500

Q16. Do you drink camel milk?

◯ NEVER
◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q16 = "NEVER" SKIP TO Q19.

⇨ **Q17. Thinking about the last time you drank camel milk; did you or someone else boil the camel milk before you started drinking it?**

◯ YES ◯ NO

IF Q17 = "YES" SKIP TO Q19.

⇨ **Q18. Have you or someone else ever boiled camel milk before you started drinking it?**

◯ YES ◯ NO

Q19. Do you drink camel urine?

◯ NEVER
◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q19 = "NEVER" SKIP TO Q22.

⇨ **Q20. Thinking about the last time you drank camel urine; did you or someone else boil the camel urine before you started drinking it?**

◯ YES ◯ NO

IF Q20 = "YES" SKIP TO Q22.

⇨ **Q21. Have you or someone else ever boiled camel urine before you started drinking it?**

◯ YES ◯ NO

Q22. Do you apply camel urine topically onto your skin?

◯ NEVER
◯ ONCE A DAY OR MORE
◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE
◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q22 = "NEVER" SKIP TO Q25.

⇨ **Q23. Have you ever put camel urine on your skin and it came into contact with any scratches, cuts, abrasions, or open wounds on your skin?**

◯ YES ◯ NO

⇨ **Q24. Have you ever put camel urine on your face?**

◯ YES ◯ NO

Q25. Do you eat camel meat?

◯ NEVER
◯ ONCE A DAY OR MORE
◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE
◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

IF Q25 = "NEVER" SKIP TO Q28.

⇨ **Q26. Thinking about the last time you ate camel meat; was it uncooked/raw?**

◯ YES ◯ NO

IF Q26 = "YES" SKIP TO Q28.

⇨ **Q27. Have you ever consumed uncooked/raw camel meat?**

◯ YES ◯ NO

Q28. Have you ever been inside an area where camels are raised, held, quarantined, slaughtered, or butchered?

◯ YES ◯ NO

IF Q28 = "NO" SKIP TO Q30.

⇨ **Q29. How often are you inside an area where camels are raised, held, quarantined, slaughtered, or butchered?**

◯ ONCE A DAY OR MORE
◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE
◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q30. Have you ever touched an adult camel with your hands?

◯ YES ◯ NO

IF Q30 = "NO" SKIP TO Q32.

⇨ **Q31. How often do you touch an adult camel with your hands?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q32. Have you ever touched a camel calf (baby or young camel) with your hands?

◯ YES ◯ NO

IF Q32 = "NO" SKIP TO Q34.

⇨ **Q33. How often do you touch a camel calf (baby or young camel) with your hands?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q34. Have you ever kissed a camel on its face?

◯ YES ◯ NO

IF Q34 = "NO" SKIP TO Q36.

⇨ **Q35. How often do you kiss a camel on its face?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q36. Have you ever milked a camel?

◯ YES ◯ NO

IF Q36 = "NO" SKIP TO Q38.

⇨ **Q37. How often do you milk a camel?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q38. Have you ever slaughtered or butchered a camel?

◯ YES ◯ NO

IF Q38 = "NO" SKIP TO Q40.

⇨ **Q39. How often do you slaughter or butcher a camel?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q40. Have you ever touched a camel's blood?

◯ YES ◯ NO

IF Q40 = "NO" SKIP TO Q42.

⇨ **Q41. How often do you touch a camel's blood?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q42. Has a camel ever sneezed or spit on you?

◯ YES ◯ NO

IF Q42 = "NO" SKIP TO Q44.

⇨ **Q43. How often does a camel sneeze or spit on you?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q44. Have you ever cleaned a pen, holding area, stable, farm grounds, living area, or quarantine for camels?

◯ YES ◯ NO

IF Q44 = "NO" SKIP TO Q47.

⇨ **Q45. How often do you clean a pen, holding area, stable, farm grounds, living area, or quarantine for camels?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

⇨ **Q46. Thinking about the last time you were cleaning a pen, holding area, stable, farm grounds, living area, or quarantine for camels, were camels physically present during your work?**

◯ YES ◯ NO

Q47. Have you ever been bitten or scratched by a camel?

◯ YES ◯ NO

IF Q47 = "NO" SKIP TO Q49.

⇨ **Q48. How often are you bit or scratched by a camel?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q49. Have you ever been within 1 meter of a camel that has nasal discharge? *Interviewer should show an image of nasal discharge in a camel and point to someone or something approximately 1 meter away from the participant to indicate the distance.*

◯ YES ◯ NO

IF Q49 = "NO" SKIP TO Q51.

⇨ **Q50. How often are you within 1 meter of a camel that has nasal discharge?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q51. Have you ever stepped on, sat on, or touched a surface where fresh camel feces are frequently present?

◯ YES ◯ NO

IF Q51 = "NO" SKIP TO Q53.

⇨ **Q52. How often do you step on, sit on, or touch a surface where fresh camel feces are frequently present?**

◯ ONCE A DAY OR MORE ◯ ONCE A WEEK OR MORE
◯ ONCE A MONTH OR MORE ◯ ONCE A YEAR OR MORE
◯ LESS THAN ONCE A YEAR

Q53. Have you ever stepped on, sat on, or touched a surface where fresh camel urine is frequently present?

◯ YES ◯ NO

IF Q53 = "NO" SKIP TO Q55.

⇨ **Q54. How often do you step on, sit on, or touch a surface where fresh camel urine is frequently present?**

- ○ ONCE A DAY OR MORE
- ○ ONCE A WEEK OR MORE
- ○ ONCE A MONTH OR MORE
- ○ ONCE A YEAR OR MORE
- ○ LESS THAN ONCE A YEAR

Q55. Have you ever stepped on, sat on, or touched a surface where fresh camel blood is frequently present?

○ YES ○ NO

IF Q55 = "NO" SKIP TO Q57.

⇨ **Q56. How often do you step on, sit on, or touch a surface where fresh camel blood is frequently present?**

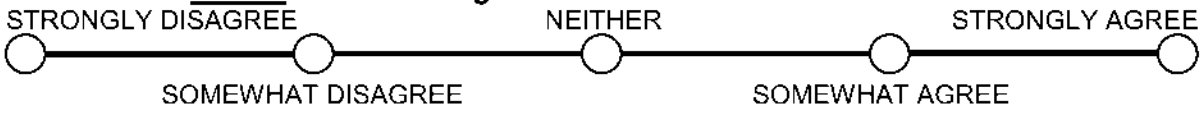
- ○ ONCE A DAY OR MORE
- ○ ONCE A WEEK OR MORE
- ○ ONCE A MONTH OR MORE
- ○ ONCE A YEAR OR MORE
- ○ LESS THAN ONCE A YEAR

Q57. Have you ever been in an area where <u>camel calves (babies and young camels)</u> are raised, kept, or present?

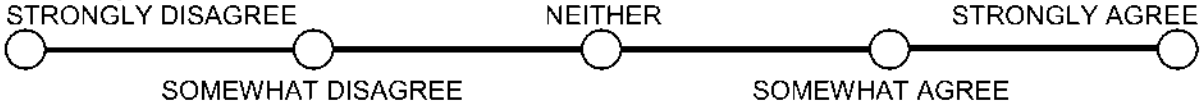
○ YES ○ NO

INTERVIEWER SCRIPT
Please listen to the following claims and state whether you agree, disagree, or neither.

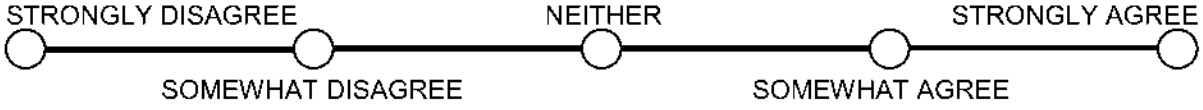
Q58. Camels <u>cannot</u> cause me to get sick.



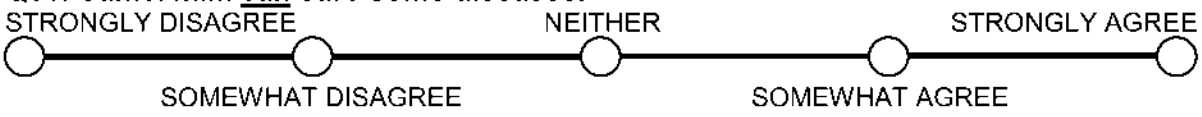
Q59. After touching a camel, wiping my hands with a towel or cloth is enough to fully clean my hands.



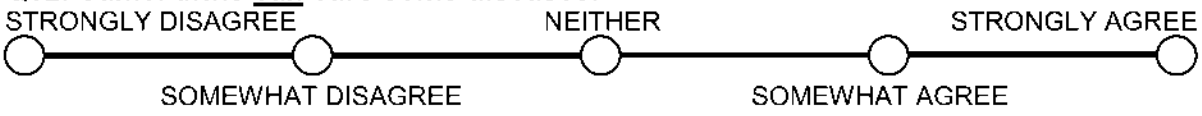
Q60. After touching a camel, it is important to me to wash my hands with soap and water before coming home to my family.



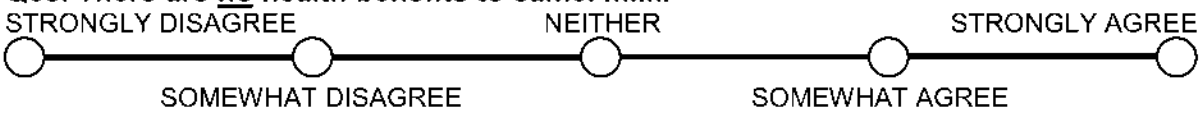
Q61. Camel milk <u>can</u> cure some diseases.



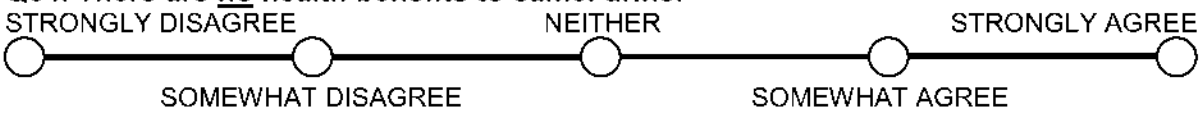
Q62. Camel urine <u>can</u> cure some diseases.



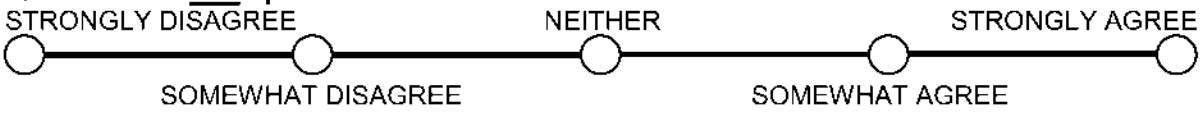
Q63. There are <u>no</u> health benefits to camel milk.



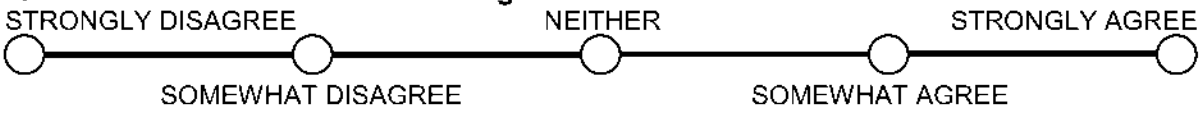
Q64. There are <u>no</u> health benefits to camel urine.



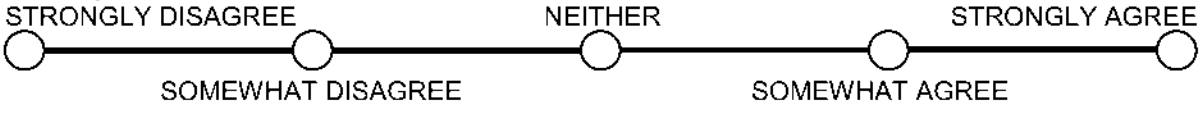
Q65. Camels <u>can</u> spread diseases to humans.



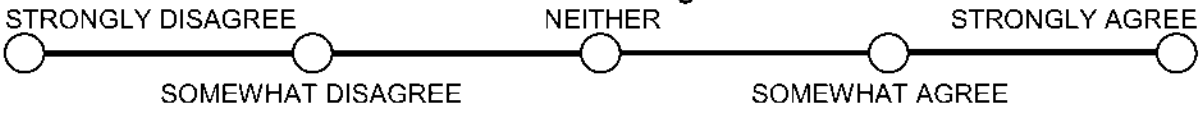
Q66. I believe someone I know has gotten sick from a camel.



Q67. I prefer the taste of raw/non-boiled camel milk over boiled camel milk.



Q68. Camel milk should be boiled before drinking it.



Q69. I believe someone I know has gotten sick from drinking raw/non-boiled camel milk, and would not have if it had been boiled first.

Q70. I believe someone I know has gotten sick from eating raw/uncooked camel meat, and would not have if it had been cooked.

STRONGLY DISAGREE — SOMEWHAT DISAGREE — NEITHER — SOMEWHAT AGREE — STRONGLY AGREE

Q71. If I am cooking camel meat, there is <u>no</u> need to clean any surfaces that have come in contact with raw/uncooked camel meat.

STRONGLY DISAGREE — SOMEWHAT DISAGREE — NEITHER — SOMEWHAT AGREE — STRONGLY AGREE

Q72. If a camel spits or sneezes on me, I am <u>not</u> worried about becoming sick.

STRONGLY DISAGREE — SOMEWHAT DISAGREE — NEITHER — SOMEWHAT AGREE — STRONGLY AGREE

Q73. If a camel spits or sneezes on my face, I should wash my face with soap and water.

STRONGLY DISAGREE — SOMEWHAT DISAGREE — NEITHER — SOMEWHAT AGREE — STRONGLY AGREE

Q74. Do any of your jobs or livelihoods involve the ownership, buying, selling, trading, farming, management, care, or production of camels, camel meat, camel milk, camel urine, camel hair, or any other camel product?

○ YES ○ NO

⇨ IF Q74 = "YES" COMPLETE THE CAMEL WORK MODULE.

X

For animal subjects research, our protocols will align with PREDICT protocols, with which our in-country teams have been complying for three years. These protocols are listed below and, as they are very extensive, a link to access them is provided. They will be modified to reference the specifics of this project's IACUC (as opposed to PREDICT's IACUC):

- 5.2.11 Livestock Sampling Methods (see next page)

Available at: https://ohi.vetmed.ucdavis.edu/programs-projects/predict-project/publications under "Field Sampling Guides."

USAID | PREDICT

Section 5.2.11 Livestock Sampling Methods: Cattle, Sheep, Goats, Camels, and Swine

Prepared by
Marcela Uhart, University of California, Davis
Christopher Kilonzo, University of California, Davis
Kali Holder, Smithsonian
Jonathan Epstein, EcoHealth Alliance
and the PREDICT One Health Consortium

Objectives: To safely collect biological samples from livestock.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

The authors assert that animal capture and sampling should always occur in compliance with all applicable laws and regulations and should only be undertaken after securing all necessary permits and approvals, including ethical approvals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Livestock Sampling Methods.

Table of Contents: Livestock Sampling Methods: Cattle, Sheep, Goats, Camels, and Swine

Section 5.2.11.a. Brief Overview of PPE

Minimum PPE Required for Livestock Sampling

The minimum PPE for livestock (including camels, cattle, sheep, goats, and swine) sampling includes:

1. Dedicated clothing
2. Nitrile (recommended) exam gloves
3. Safety glasses or other eye protection

(See the PREDICT ***Biosafety and PPE Guide (Section 4.1)*** for detailed instructions regarding PPE Use)

Standard disinfection procedures for equipment and clothing should be followed when moving between animal enclosures or properties.

Section 5.2.11.b. Livestock Handling and Welfare

Performance standards during handling include careful, considerate, respectful, calm, human interactions with animals in as positive a manner as is possible. Animals handled in a respectful manner will be calmer and easier to handle than animals handled in a rough or disrespectful manner. PREDICT field staff should be familiar with the correct techniques and the anatomy of each livestock species before attempting sampling procedures. At all times, observe animals for signs of excessive distress. If animals are unwell, stop all procedures, provide adequate support care, and release upon recovery.

While most veterinarians are familiar with handling livestock, we recommend that PREDICT staff visit the following guidelines as a refresher.

Section 5.2.11.c. Sample Data Collection

Introductions and informed consent
Upon arriving to a household or farm, introduce yourselves (team members, purpose of the visit) to the acting head of household responsible for the livestock. Explain the purpose of the study, allow time for questions, and clarify any issues that may arise. If local regulations require it, obtain informed consent per project guidelines and protocols.

Animal Handling and Sampling Procedures
Note: For all food animals, manual restraint will be used. If drugs are used for sedation in a food animal, that animal will not be allowed to return the human food chain unless it is specifically labeled for use in that species and withdrawal periods are observed

The following basic set of samples should be collected from each animal where possible (If only one sample can be collected, then place into VTM):

1. **Two nasal swabs** - one in 500 µL VTM and one in 500 µL Trizol
2. **Two fecal samples** - one with max of 500 µL/0.5cc feces in 500 µL VTM and one with max of 500 µL/0.5cc feces in 1 mL Trizol
   Or
   Two rectal swabs - one in 500 µL VTM and one in 500 µL Trizol
3. **Two whole blood samples** - one with max of 500 µL of whole blood in 500 µL VTM and one with max of 500 µL of whole blood in 500 µL Trizol
4. **Two serum samples** - 2 x 1.0 ml aliquots frozen without media
5. **Two urogenital swabs or urine samples** - one with max of 500 µL of urine in 500 µL VTM and one with max of 500 µL of urine in 500 µL Trizol

Freeze all samples (except tissue in formalin) in liquid nitrogen immediately in the field and transfer to -80°C freezer once back in the lab.

If there is no **short-term** access (i.e. within 24 hours) to cold chain such as in an emergency situation, then samples can be collected in 500 µL of RNAlater instead of Trizol and VTM. Storage times and temperatures for samples in RNAlater are as follows:

- 1 day at 37 °C (i.e. ambient temp)
- 1 week in the refrigerator
- Within one week freeze at -80 °C for storage until analysis

Collecting Nasal Swabs

Using sterile, polyester-tipped swabs with a plastic shaft, rub the swab tip gently but thoroughly against the walls of the animal's nares, about 1-2" from the opening, saturating the swab with mucus. **Place 1 swab in a cryovial filled with 500 µl of VTM and the other swab into 500 µL of Trizol in another cryovial**. Mix each tube well. Store both cryovials in a liquid nitrogen dry shipper or dewar & transfer to -80˚C freezer when possible.

Bleeding Collection Techniques

1. Cattle

Blood can be collected from the jugular vein in cattle of all ages or from the tail (coccygeal) vein of older cattle.

A variety of collection devices may be used - vacutainers, bleeding tubes, syringe and needle. Restraint should ensure quick, easy and safe collection of the sample causing minimal distress. This may involve use of a bail, race, or crush for tail bleeding. For jugular bleeding the animal may require minimal restraint (e.g. halter) or may need to be restrained in a crush with head bail and the employment of a halter or nose grips. Use of nose grips should be avoided wherever possible.

Operators should use gloves and disinfect or replace them between animals to prevent the transmission of blood-borne diseases. Equipment such as vacutainer holders should also be cleaned between animals. An antiseptic must be applied to clean skin surface prior to venipuncture.

For a visual guide see the following online tutorials:

Cattle
https://www.youtube.com/watch?v=IuNbsTMrIuI (tail and jugular)
https://www.youtube.com/watch?v=ZEsHMwKFbKg (tail)
https://www.youtube.com/watch?v=812CskWCqGQ (jugular)

Procedure for Jugular Venipuncture Using Vacutainer Needle and Tubes:

1. Identify and georeference the study site and document the signalment of the animal on the data collection sheet.
2. Before sample collection, ensure that the animal is effectively and humanely restrained to avoid injury to the animal and/or study personnel.

3. Using the halter, position the animal's head so that it is slightly elevated and drawn to the side opposite the jugular vein to be sampled.
4. Disinfect venipuncture area with alcohol
5. Occlude the vein by applying digital pressure in the jugular groove located in the lower neck.
6. Place a vacutainer needle attached to a vacutainer holder into the distended jugular vein at a 45° angle cranial to the jugular groove.
7. Once needle is positioned in the vein, insert a vacutainer into the needle to collect the blood.
8. When the desired volume has been collected (5 ml minimum suggested) remove the occluding pressure from the vein.
9. Detach the tube from the needle and withdraw the needle from the jugular vein.
10. You can collect more than 1 tube by repeating steps 7 and 8.
11. Label the vacutainer tubes with the sample ID.

Procedure for Jugular and Coccygeal Venipuncture Using Syringe and Needle

Jugular bleeding

1. Restrain cow with the head elevated and the jugular groove exposed.
2. Raise the jugular vein by placing pressure at the base of the jugular groove.
3. Pass the needle through the skin and into the vein by a firm thrust directed at an angle of 20° to the skin surface.
4. Withdraw the blood sample.

Tail Bleeding

1. Restraint should prevent the cow from moving away during the procedure.
2. Raise the tail vertically with one hand until it is horizontal with the ground.
3. Approximately 150 mm from the base of the tail, locate the groove lying in the ventral midline of the tail.
4. Midway along the body of a coccygeal vertebra, insert the needle perpendicularly to the surface of the skin to a depth of a few millimeters.
5. Withdraw blood sample.
6. Apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.

Once blood is collected, place the needle into a sharps container. Open red-top and purple top vacutainer tubes. Place approximately 2.5cc in each tube, then discard the syringe into a biohazard container. Invert each tube several times to mix.

2. Sheep/Goats

Blood should be collected from the jugular vein. The procedures for blood collection are identical to those described for cattle, with the exception of the amount of restraint needed and the possibility of shearing the bleeding area on the neck for easier viewing of the vein and minimizing the chance of introducing dirt or bacteria into the vein with the needle.

In sheep and goats, blood sampling can be done with assistance or alone. If you are not proficient at drawing blood alone, work with an assistant. The assistant should restrain the sheep/goat's body and turn the head to the side, at a 30-degree angle, by holding the animal under its jaw to allow for easy access to the jugular vein.

Restraining a sheep or goat without assistance is better for those who have become proficient at drawing blood. The handler should straddle the sheep/goat, place his or her knees behind the animal's shoulders, and back the sheep/goat into a corner or against a wall to help control their hindquarters. The sheep/goat's head should be turned opposite to the side of collection, once again at a 30-degree angle. Restraint of the head is accomplished by using the elbow and the upper arm to keep it held off to the side. This leaves both hands available for the blood collection.

The easiest way to locate the vein is to draw an imaginary line from the middle of the sheep/goat's eye down the side of the neck. The vein can be located by applying pressure with the thumb or fingers in the groove on either side of the trachea. The pressure will cause the vein to pop up and be easy to feel or see if the area has been shaved. Proceed as with cattle, using a vacutainer collection system or syringe and needle.

For a visual guide see the following online tutorials:

Sheep/goats (small ruminants) **https://www.youtube.com/watch?v=47tlmqXX3eE**

Blood sample processing and storage:

Whole Blood

- Collect whole blood into 1 lavender top tube containing EDTA, and allow another tube to clot for collection of serum.
- Add up to 500 µL of whole blood (from EDTA tube) directly into 2 vials, one containing 500 µL Trizol and one containing 500 µL VTM (= maximum final ratio of 1:1) and mix each vial well.

Serum

- After clotting is complete, use a plastic pipette to take 1 ml of serum and transfer into 2 cryovial tubes, 0.5 ml each.
- If a centrifuge is available, centrifuge samples for 15 minutes and then collect 1 ml serum and transfer into 2 cryovial tubes, 0.5 ml each.
- Label the cryovial tubes with the same label information used on vacutainer tube.
- You can harvest additional serum for serum bank as appropriate.
- Freeze all samples in liquid nitrogen immediately in the field and transfer to -80°C freezer once back in the lab.

3. Camels

Because of the risk of MERS CoV exposure, sample collectors should wear gloves, a respirator, and eye protection when handling camels.

Blood can be collected from the jugular vein in camels of all ages, though it is recommended that this be undertaken on animals while they are in sternal recumbency (kush position), well-restrained, or sedated. The lateral thoracic vein or caudal epigastric ("milk") vein may be used but should only be targeted in animals where physical or chemical restraint prevents kicking.

A vacutainer needle (18G or 19G) with purple top (EDTA) tubes and red-top (with serum clot activator) tubes may be used, or a 5cc syringe and 18G or 19G needle. Restraint should ensure quick, easy and safe collection of the sample causing minimal distress.

Equipment such as vacutainer holders should be cleaned between animals.

Procedure for Jugular Venipuncture Using Vacutainer Needle and Tubes

1. Identify and georeference the study site and document the signalment of the animal on the data collection sheet.
2. Before sample collection, ensure that the animal is effectively and humanely restrained to avoid injury to the animal and/or study personnel.
3. Using the halter, elevate the animal's head and draw it to the side opposite the jugular vein to be sampled.
4. Disinfect venipuncture area with alcohol
5. Occlude the vein by applying digital pressure in the jugular groove located in the lower neck. Alternatively, a rolled towel affixed with a rope over the withers can be applied at the same level to act as a temporary incomplete tourniquet.
6. Place a vacutainer needle, attached to a vacutainer holder, into the distended jugular vein at a 45° angle cranial to the jugular groove.
7. Once the needle is positioned in the vein, insert a vacutainer into the needle and collect the blood.
8. When the desired volume has been collected (5 ml minimum suggested), remove the occluding pressure.
9. Detach the tube from the needle.
10. Detach the needle from the jugular vein and apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.
11. If more than one tube of blood is required, repeat steps 7 through 9 with occluding pressure.
12. Label the vacutainer tubes with sample ID.

Note: If vacutainer needles are unavailable, a 5cc syringe and 18G or 19G needle can be used. Once blood is collected, place the needle into a sharps container. Open red-top and purple top vacutainer tubes. Place approximately 2.5cc in each tube, then discard the syringe into a biohazard container. Invert each tube several times to mix.

Whole blood can be aliquoted into cryotubes with VTM and Trizol using a pipette gun. Serum tubes can either be centrifuged (if available) or placed vertically in a cooler with ice bricks and allowed to stand undisturbed overnight (~12 hours) for clean serum separation. Serum can then be aliquoted into cryotubes.

Procedure for Jugular Venipuncture Using Syringe and Needle

Jugular bleeding

1. Restrain camel with the head elevated and the jugular groove exposed.
2. Disinfect venipuncture area with alcohol
3. Raise the jugular vein by pressure at the base of the jugular groove.
4. Pass the needle through the skin and into the vein by a firm thrust directed an angle of 20° to the skin surface.
5. Withdraw blood sample.
6. Apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.

Lateral Thoracic/Caudal Epigastric Vein Bleeding

1. Restraint should prevent the camel from moving away or kicking during the procedure.
2. Identify the lateral thoracic vein, caudal to the point of the elbow's olecranon process.
3. Pass the needle through the skin and into the vein by a firm thrust directed an angle of 20° to the skin surface.
4. Withdraw blood sample.
5. Apply pressure to the venipuncture site after withdrawal of the needle until the bleeding stops.

4. Swine

All personnel handling or sampling pigs should wear appropriate PPE and practice appropriate biosafety practices to avoid spreading infection from one animal to another and from one herd, farm or property to another. This includes wearing dedicated clothing (e.g. coveralls and rubber boots) that can be removed and disinfected once work at a site has been completed. Recommended PPE includes nitrile gloves, a respirator and safety glasses.

Restraint: Manual restraint is recommended, without the use of anesthesia. Pigs to be sampled should be constrained to a separate pen, if possible. The use of a snout snare (see appendix) by the animal restrainer is recommended for pigs over 20 kg, but should only be used by experienced personnel and for short term restraint to avoid injury to the pig's snout. Pigs will be restrained for a maximum of three minutes and then released. If blood collection is unsuccessful, then the pig will be allowed to calm down for five minutes before a second attempt is made.

Blood can be collected from the external jugular vein, or the cranial vena cava, using a 1", 20G needle and a 5cc syringe. This technique requires the head to be restrained and elevated parallel to the ground, typically using a snout snare. In pigs weighing less than ~50 kg, blood can be collected further caudally (and more medially) in the jugular groove, nearer the manubrium from anastomose of internal and external jugular vein. For pigs weighing less than ~20 kg, a technician will manually restrain the pig on his lap, holding the forelegs in one hand, and the animal's head in the other. Then a max of 5.0 to 10 ml may be collected from the jugular vein. Venipuncture should only be performed by experienced personnel.

The marginal ear veins are the only veins that are easily visible on pigs of any size. Usually there are three prominent veins. The lateral or central vein is usually the largest of these. These veins may also be punctured for blood collection. An alternative venipuncture site is the caudal auricular ("marginal ear") vein, though this typically yields low (<1 mL) blood volumes. A smaller, 22G or 23G needle should be used for this vein.

See also http://oslovet.norecopa.no/teaching/pig/pigbleed/ for more details on blood collection from pigs.

Collecting Fecal Samples

Ensure the animal is properly restrained prior to sampling. Fresh fecal samples should be collected, preferably from the rectum. If freshly passed, feces can be collected off the ground. Only the top part of a freshly passed fecal pat should be collected using a disposable spoon or scooped up in a gloved hand, plastic bag or plastic vial.

For Collection from the Rectum in Cattle and Camels

- The operator places an obstetrical sleeve on one arm
- The arm is formed into a cone and the animal's tail held to one side with the opposite gloved hand.
- Gentle pressure is applied to the anal sphincter until penetration into the rectum is obtained.
- A fecal aliquot of sufficient size for the intended laboratory procedure is scooped with the sleeved hand and removed from the animal.
- The fecal sample is placed in a separate container or the obstetrical sleeve is inverted off the arm such that the fecal sample is trapped inside.

Small calves, sheep, goats, and swine: restrain manually. Gently pass a gloved, lubricated finger through the anus and massage the rectal wall to stimulate rectal evacuation. If feces are not produced, collect feces with finger.

Place two ~200 mg (pea size) samples of fresh feces into 2 vials, one containing 500 µL VTM (= maximum final ratio of 1:1) and one containing 1 mL Trizol (= maximum final ratio of 1:2). Homogenize by shaking. Freeze in dry shipper or dewar with liquid nitrogen and transfer to -80˚C freezer when possible.

If feces are not available, collect 2 rectal swabs- 1 in VTM and 1 in Trizol: Gently insert one sterile swab tip at a time into the animal's rectum. [Note: DO NOT USE TRIZOL AS A LUBRICANT – IT IS HIGHLY IRRITATING TO TISSUE.] Place 1 swab in a cryovial filled with 500 µL of VTM. Place the other swab into a tube with 500 µL of Trizol. Store in a dewar or dry shipper with liquid nitrogen dry shipper and transfer to -80˚C freezer when possible.

Collecting Urine/Urogenital Swabs

Many animals will urinate as a fear reaction while they are handled. Urine can be collected free catch in plastic vials. Add up to 500 µL of urine directly into 2 vials, one containing 500 µL VTM and one containing 500 µL Trizol (= maximum final ratio of 1:1) and mix each tube well. Store in dry shipper or dewar with liquid nitrogen and transfer to -80˚C freezer when possible.

If urine is not available, collect 2 urogenital swabs: 1 in VTM and 1 in Trizol. Place 1 swab in a cryovial filled with 500 µL of VTM. Place the other swab into a tube with 500 µL of Trizol. Store in a dewar or dry shipper with liquid nitrogen dry shipper and transfer to -80˚C freezer when possible.

Section 5.2.11.d. Sample Collection from Dead or Euthanized Livestock

PREDICT's primary approach to sample collection in livestock is to collect specimens from living animals. In the event that an animal has died of natural causes or been euthanized due to humane or veterinary care reasons, the guidelines below for necropsy sampling may be followed. If bodies are relatively whole and fairly fresh, then sample as described above. The *American Veterinary Medical Association guidelines (Section 8.5.2.)* in the PREDICT Operating Procedures ebook provides information on animal euthanasia that may be useful to PREDICT veterinarians called upon to euthanize an animal.

As discussed throughout this protocol, all animals should be considered potentially infectious for a wide variety of dangerous pathogens, and dead animals in particular should be sampled only following all safety measures, including proper PPE use, proper work station decontamination, and proper carcass disposal, as outlined here and in other PREDICT documents.

Though not required for PREDICT sampling, thorough necropsy procedures can be very beneficial and relevant for some animals (e.g., suspicious deaths). Time and skill permitting, when full necropsies are performed, following any Association of Zoos and Aquariums/AZA (or similar) necropsy protocol is recommended and most can be adjusted for application to livestock species. Necropsy protocols are also addressed in the Non-Human Primate Sampling protocol, Appendix V.: AAZV's Occupational Primate Disease Safety Guidelines for Zoological Institutions: Standardized Necropsy Report for Non-Human Primates Work Sheet (ebook Section 5.2.6j.); most of the information and worksheets in this document can be utilized for sampling of

livestock. (*Note that properly following extensive necropsy procedures and collecting and measuring all samples can require 4-6 hours for a single animal.*)

Duplicate blood samples are to be collected from each animal; one sample must be collected into Trizol and one into viral transport media (VTM). If only one sample can be collected, then place the sample into VTM.

Tissue specimens should be collected in triplicate. One specimen should be frozen in 500 µL VTM in a cryovial, one should be frozen in 1 mL Trizol in a cryovial, and one should be stored at room temperature in a small vial or jar in 10% buffered formalin at a volume of fixative 10 times the volume of the tissue (once fixed, the tissue may be transferred to a smaller volume for shipment).

Post-Mortem Blood Collection

From recently dead animals, it may be possible to collect whole blood (often clotted) from the right side of the heart where the largest volume of blood is available. Collect all available blood into an appropriate size container (typically one or more blood tubes). Allow the tubes to sit undisturbed for at least 30 minutes, and then centrifuge at high speed (2000 x G for 20 minutes). Transfer the serum (clear, yellow or red-tinged fluid at the top), preferably via pipetting, to appropriately labeled cryovials. Transfer the remaining blood clots to separate cryovials. Refrigerate or freeze both the serum and blood clots.

If a centrifuge is not available, allow the clots and cells to settle as much as possible, and then collect the serum and clots as described above. If the animal's death is recent enough that the blood has not yet clotted and a centrifuge is not available, invert the blood tubes after the blood has been collected to allow the clot to form on the rubber stopper. After the blood has clotted, turn the tube right side up and carefully remove the stopper with the adhered clot, thereby leaving a clean serum sample in the tube.

At a minimum, as many of the following blood samples as possible should be collected:

- 2 samples of 500 µL (**whole blood**) placed in 2 vials, one containing 500 µL **Trizol** and one containing 500 µL **VTM** (= maximum final ratio of 1:1). Mix each vial well.
- 2 or more aliquots (0.5 ml) of **separated serum**, frozen

Tissue Collection

Collect three, adjacent, approximately 200mg (pea-sized) samples of the following tissues:

- Adrenal
- Colon
- Heart
- Liver
- Lymph node
- Ovary
- Testes
- Cecum
- Duodenum
- Kidney
- Lung
- Spleen
- Pancreas
- Other, if required*

*It will usually require experience to identify abnormal tissues, but potentially recognizable gross lesions include masses, discolored areas, ulcerations, etc. Samples for histopathology (i.e., in formalin) should be collected at the abnormal margins to include both normal and abnormal sections in the same piece of tissue. Collection of any obvious internal parasites in ethanol is also recommended.

Figure 1: A commercial snout snare (left) and use of a modified snout snare, made from local materials, to restrain a pig during sampling in Bangladesh (right).

Section 5.2.11.h. Appendix III. Checklist for Supplies

General equipment and supplies

- ☐ Animal handling equipment – Halters and animal restraining ropes
- ☐ Data Collection forms
- ☐ Rubber stamp ink and pad
- ☐ GPS
- ☐ Camera
- ☐ Field Notebook
- ☐ Pen/Pencil
- ☐ Permanent markers
- ☐ Cryomarkers
- ☐ Protective clothing – Waterproof rubber boots, overalls, facemask, and nitrile gloves
- ☐ First aid kit
- ☐ Ice box containing ice packs (for short term storage and transport)
- ☐ Sharps bin
- ☐ Sturdy garbage bags
- ☐ Field centrifuge (portable 12vt)
- ☐ Liquid nitrogen dewar

Blood sample collection equipment and supplies

- ☐ EDTA vacutainer tubes – 9ml (lavender top)
- ☐ Serum separator vacutainer tubes – 9ml (red/gray top)
- ☐ Vacutainer needle holders
- ☐ Vacutainer needle: Cattle and Camels, 1½" 18 or 19 gauge; Sheep, Goats, and Swine, 1" 20G
- ☐ Syringes: 20, 10 and 5 ml
- ☐ Needles: Cattle and Camels, 1½" 18 or 19 gauge; Sheep, Goats, and Swine, 1" 20 guage for jugular or 22 or 23 gauge for auricular vein
- ☐ Alcohol (squirt bottle or vaporizer)
- ☐ Gauze
- ☐ Vacutainer tube rack
- ☐ Cryovial tubes
- ☐ Cryovial rack
- ☐ Centrifuge
- ☐ VTM
- ☐ Trizol

Fecal Sample Collection Equipment and Supplies

- ☐ Obstetrical Sleeve
- ☐ Disposable Spoons
- ☐ Plastic bags or vials
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol

Urine Sample Collection Equipment and Supplies

- ☐ Plastic vials
- ☐ Plastic pipettes
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol

Swab Collection Equipment and Supplies

- ☐ Plastic handle, polyester tip swabs
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol

Tissue Collection Equipment and Supplies (in case of animal necropsy)

- ☐ 21 Gauge needles for cardiocentesis
- ☐ 1 mL Syringe for cardiocentesis
- ☐ Scalpel and surgical blades
- ☐ Forceps
- ☐ Sharp and blunt tip scissors
- ☐ Cryovial Rack
- ☐ Cryovials with VTM and Trizol
- ☐ Small Vials or Jars
- ☐ 10% Buffered Formalin

Section 5.2.11.i. Appendix IV. Additional Permit Requirements for Livestock Samples Imported into the United States

In addition to all other permits, livestock samples require special import permits from the USDA.

7. GUIDELINES FOR SAMPLE TRANSPORT

Sample transport from the human and animal field sites will follow established protocols from the PREDICT project, which JUST has been implementing for three years. We will adhere to these cold chain protocols except where necessary to modify to meet the project's specific requirements:

- 6.1 Implementing Cold Chain for Safe Sample Transport and Storage (see next page)

Available at: https://ohi.vetmed.ucdavis.edu/programs-projects/predict-project/publications under "General Information."

Section 6.1. Implementing Cold Chain for Safe Sample Transport and Storage

Prepared by
David Wolking, University of California, Davis,
and the PREDICT One Health Consortium

Objective: To provide principles and general considerations for cold chain maintenance, the safe transport and storage of samples collected during PREDICT surveillance activities, and the safety of personnel.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Implementing Cold Chain for Safe Sample Transport and Storage.

Table of Contents: Implementing Cold Chain for Safe Sample Transport and Storage

Section 6.1.1. Introduction to Cold Chain

This guide focuses on implementing an efficient cold chain and sample transport/storage plan appropriate for PREDICT disease surveillance activities. The guidance provided is to ensure that all PREDICT materials arrive at their end laboratories in suitable condition for PREDICT diagnostics and pathogen testing. When you are familiar with the information in this Guide, take the PREDICT quiz on ***Implementing a Cold Chain for Safe Sample Transport (Section 8.4.14.)***.

A cold chain is a monitored temperature-controlled supply chain. The goal of the cold chain is to keep a sample or material within a certain temperature range during all stages of delivery, processing and storage (Figure 1). Cold chains are widely used to ensure the viability of products in the pharmaceutical and agricultural sectors, and are critical components of vaccination programs and bio-medical surveillance activities.

Many biological samples deteriorate when exposed to heat, sunlight, or fluorescent light. When transporting and storing such biological substances, it is imperative that field and laboratory teams control environmental conditions, ensuring that exposure to potentially damaging environmental factors is minimized.

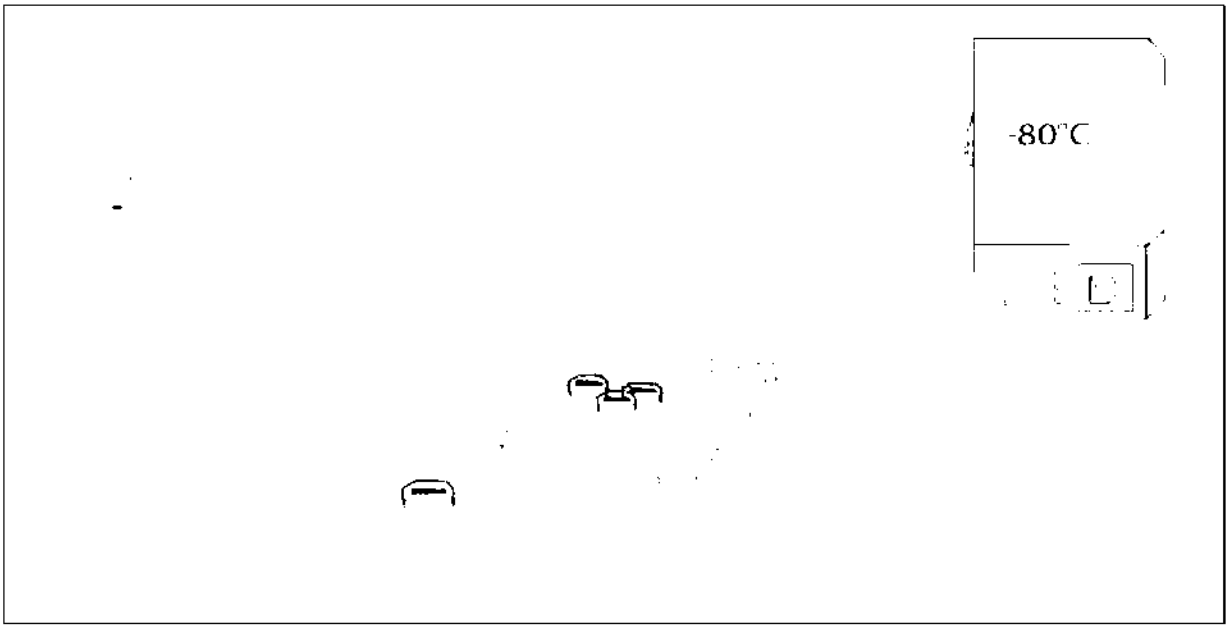

Figure 1: Illustration of a typical cold chain from field to lab storage for PREDICT biological samples. Field teams sample an animal and place specimens in liquid nitrogen dewar for storage. The dewar with specimens is transported in the back of a project vehicle to long-term storage at a PREDICT laboratory or field station, inventoried, and archived until testing in an ultra-low temperature freezer (<-80°C).

Freezing is the simplest way to ensure that the biological samples remain viable for laboratory analysis. The cold chain for PREDICT samples can be maintained through the use of ice packs, coolers and dry ice (for a very brief period immediately following collection), liquid nitrogen (LN2) containers and freezers, and the use of ultra-low temperature (-80°C and colder) freezers. It is recommended that PREDICT samples be placed in LN2 or ultra-low temperature freezers as soon as possible to optimize sample viability for diagnostics and pathogen testing.

Repeated exposure to heat leads to a cumulative and irreversible loss of sample viability and may render a sample useless for laboratory analysis.

PREDICT Sample Cold Chain Requirements: All biological samples from PREDICT surveillance activities should be stored and transported at temperatures colder than -80ºC suitable for the preservation of targeted PREDICT pathogens and viral detection.

Section 6.1.2. Implementing the Cold Chain

This section introduces recommended steps for cold chain planning and implementation.

Section 6.1.2a. Planning

The first step in implementing the cold chain is planning. Your team must identify the cold storage needs for your sampling activities, then identify and procure all necessary materials and resources. In addition, it is critical to train your team to understand the logistics of the cold chain, how to monitor cold chain temperature, and how to maintain system records.

Considerations for Cold Chain Planning:

1. What is your surveillance plan and what type of cold chain is appropriate for that plan? What types of samples are you collecting? What are the temperature requirements for safely storing these samples?
2. Assess local context and conditions. Do you have access to long-term sample storage facilities? Are your sampling activities located in remote rural locations several days or weeks from the project infrastructure or laboratory?
3. Determine where the cold chain ends. If your field team delivers samples to a laboratory with an ultra low temperature freezer, then initiating your cold chain may require simply extending it from laboratory to sampling site through the use of LN2 dry-shippers or dewars. If you are developing a cold chain without any pre-existing infrastructure, mapping out an appropriate cold chain from sample collection to endpoint is essential (Figure 2).
4. Determine the maximum amount of time samples will be located outside of long-term cold storage. If your field activities are 5 days away from long-term storage, then you will need a minimum of 5 days mobile cold storage in LN2. If you plan to export samples, how long will it take to ship from origin to destination?
5. Determine the minimum amount of time samples will stay in long-term storage. Planning for long-term storage requires assessing the space necessities of your cold chain. Are you

maintaining a sample bank or archive? If so, you will need to plan for sufficient storage space for the life of the project to preserve sample viability.

6. Establish procedures for monitoring the cold chain and tracking the samples moving through the cold chain. Confirm all team members have been trained in cold chain maintenance and record keeping. Prepare forms for data logging and recording. Prepare a schedule for re-filling LN2 containers and contingency plans for equipment failure.

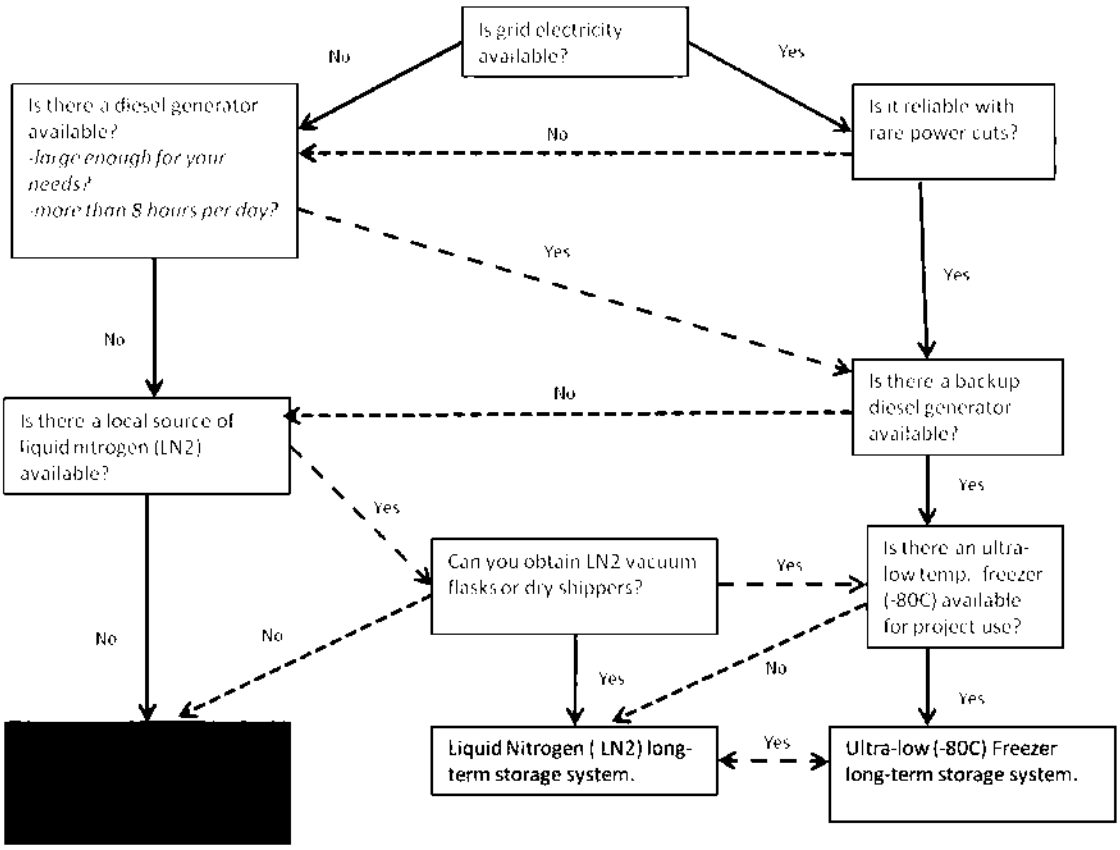

Figure 2: A decision tree for cold chain planning. Based on United Nations World Food Program Logistics Cluster "Logistics Operational Guide".

Developing a Cold Chain System

To develop and maintain a cold chain, a series of simple and routine processes must be established. These processes should be designed to function efficiently in each team's environmental and local conditions, and should be easy to maintain with available materials and resources.

1. Assess the opportunities and constraints to developing a cold chain in your area. These may include:
    a. Access to a pre-existing cold chain
    b. Access to LN2, and LN2 transport and storage supplies
    c. Access to an ultra-low temperature (sub -80°C) freezer available for use
        i. If freezer available, does it have a backup generator and alarm system?

2. Identify the appropriate materials and resources needed to implement and maintain the cold chain. Required materials and resources may include:
    a. Personal Protective Equipment (PPE) for working with LN2 and -80ºC freezers
    b. Coolers
    c. Ice/gel freezer packs
    d. Liquid Nitrogen (LN2) dewars and/or LN2 vapor-phase dry shippers (see distinctions below in Table 2)
    e. Source of LN2
    f. Large capacity LN2 storage dewars or ultra-low temperature (<-80°C) freezers for longer-term sample storage
    g. Temperature gauges, thermometers, data loggers (as needed), alarm systems, and an alert network for staff when facilities are unoccupied
    h. Appropriate sample storage containers and racks for sample organization
3. Identify local suppliers or other sources for procurement of materials and resources. (Note: Carefully assess the reliability/sustainability, and costs of any suppliers to assure procurement of reliable supplies and ability to service equipment.)
4. Establish a written protocol for monitoring the cold chain and stored samples. The protocol should cover:
    a. Temperature regulation and record
    b. Sample storage and tracking system
    c. Equipment maintenance schedules
    d. Response procedures in event of container/freezer failure or power outage
    e. Training programs to ensure continued and safe operation of cold chain system
    f. Annual review of cold chain operation and sample storage procedures

Cold Chain Materials and Resources

A cold chain can consist of any combination of materials and resources that serve to maintain samples at a desired temperature. **For all PREDICT samples, that temperature is -80°C or lower.** This temperature range requires the use of specialized cooling technologies and specially designed freezers. Gas-based coolants (LN2) do not require electricity, and can be deployed to remote and rural areas. In contrast, ultra low temperature (< -80°C) commercial freezers are dependent upon an electrical grid and emergency generators in the event of blackouts or grid failure.

Safety Considerations for Coolants

Working with cold chain coolants can be dangerous if appropriate precautions are not taken. The recommended PREDICT cold chain requires samples to be stored in temperatures well below freezing. Exposure to these temperatures can cause severe burns and damage to living tissue. There are three coolants commonly used in implementing a cold chain: 1) ice/gel packs, 2) dry ice, and 3) liquid nitrogen (LN2). Dry ice and LN2 give off gases that can cause asphyxiation and should only be handled by trained personnel in ventilated areas. In addition, dry ice and LN2 containers must be able to vent evaporated gas to avoid the risk of explosion. Characteristics and safety considerations for working with cold chain coolants are listed in Table

1. For more information on human safety when working with PREDICT field and laboratory activities, please review the *PREDICT guide to* ***Biosafety and PPE Use (Section 4.)***.

Table 1: Characteristics and safety considerations for PREDICT cold chain coolants.

Coolant	Characteristics	Use and Maintenance	Safety Considerations
Ice Packs	Ice packs are water filled packs that obtain the temperature of a standard freezer (approx.-18°C). **Ice packs DO NOT achieve temperatures sufficient for the preservation of PREDICT biological samples.**	Ice packs must be kept in a freezer for 12-24 hours to achieve maximum coldness. Keep at a temperature colder than the freezing point of the ice pack, to ensure longer cold life.	None (water-based product). Do not chill ice packs used for samples in refrigerators or freezers used for food and beverages.
Gel Packs	Gel packs consist of a liquid blend of chemicals that depress the melting point of a cold pack allowing the gel pack to remain colder than 0°C for longer time intervals than an ice pack. **Gel packs DO NOT achieve temperatures sufficient for the preservation of PREDICT biological samples.**	Before purchase, request documentation from the manufacturer to validate manufacturer claims on the product's cold life, and to obtain instructions on appropriate use of the product, including packaging a cooler with biological samples and the gel packs. Gel packs take at least 24 hours to reach their lowest temperature and can take even longer if chilled in a domestic refrigerator.	Though most gel packs are non-toxic, be careful to not ingest gel from ruptured gel packs. Consult manufacturer guidelines for product use on safety.
Dry Ice	Dry ice is the solid form of carbon dioxide (CO_2), and is approximately -78.5ºC. In ambient conditions, dry ice is unstable and evaporates quickly. Therefore, samples packed in dry ice should be transferred to a <-80º container within 24 hours. **Dry ice is recommended as a SHORT-TERM COOLANT ONLY**, to be used for transporting samples from the field to more reliable temperature controlled storage containers.	Dry ice is easily manufactured, often as a byproduct of other processes, and is widely used in the food industry for preservation. Dry ice can frequently be sourced from breweries, importers of frozen products like ice cream, and meat processing facilities. Any specimens transported on dry ice must be placed in specially insulated containers capable of venting gaseous CO_2. Note: sealing seams of containers like Styrofoam cold boxes prevents ventilation of the gas and can lead to unsafe pressure build-up.	Wear insulated gloves. Always work in well-ventilated areas. Always transport dry ice in containers approved for transport, ensuring that the CO_2 can diffuse minimizing pressure build-up.

Liquid Nitrogen (LN2)	LN2 is a readily transportable and highly effective compound used for the cryopreservation of blood, reproductive cells, and other biological samples and materials. LN2 is produced through the distillation of liquid air, and is stored and transported in vacuum flasks insulated from ambient heat.	LN2 can often be locally obtained through international airports (urban areas), and services that work with artificial insemination (beef/dairy industry located primarily in rural areas). LN2 boils at -196°C, and can cause rapid freezing on contact with living tissue, and severe damage to materials if spilt.	Wear insulated gloves, a thermal apron and a face shield. Always work in well-ventilated areas. LN2 tanks feature pressure relief devices, which if not routinely checked and properly maintained can fail resulting in tank explosion and considerable damage. Consult the manufacturer's recommendations for tank maintenance to ensure compliance. Transporting LN2 tanks or dewars inside project vehicles can be dangerous: there is a risk of rupture or tank failure, and the tanks can potentially explode. When possible, transport LN2 in dry shippers or vacuum flasks approved for transport. If using LN2 tanks or dewars, be sure to secure these containers on the exterior of the vehicle to maximize safety in transport. LN2 tanks should only be placed in an upright position.

Containers for Cold Chain Transport and Shipping

There are two main types of LN2 containers: dry shippers (vapor shippers) and vacuum flasks (dewar flasks). The insulating capacity of LN2 containers varies considerably from a few hours to weeks, requiring constant vigilance for signs of leakage, and routine assessment of container temperature.

Dry shippers (vapor shippers)

Dry shippers are large vacuum containers that contain an absorbent material to hold LN2. A properly prepared dry shipper does not contain any free LN2, and can safely store samples at the optimal temperature range for a period of 24 hours to several weeks depending on the type. Dry shippers are highly recommended for sample storage when samples need to be transported or shipped (bicycle, car, airplane, etc.). Because of their transport utility, dry shippers are often smaller and more compact, and well suited to more short-term storage applications.

Vacuum (dewar) flasks

Vacuum flasks are non-pressurized LN2 containers lacking absorbent material, in which biological samples or specimens are suspended in LN2 within the container. Vacuum flasks should not be used to transport or ship biological specimens. Rather, vacuum flasks are suited

for longer-term storage application (storage time dependent on size of the flask – consult the manufacturers guidelines) in laboratories, field offices, or other locations where samples are expected to reside for longer period of time. Vacuum flasks come in a range of sizes from small to very large capacity containers.

Recommended steps for using dry shippers/vacuum flasks:

- Always consult and follow the manufacturer's instructions for filling, as procedures for each type of container can vary.
- Always wear a face shield and insulated gloves made for handling liquid nitrogen.
- Always work in well-ventilated areas, as a significant amount of nitrogen gas will be generated as the cold liquid contacts the warm surfaces inside the shipper.

Refrigerators and Freezers

Domestic (e.g., household/home) refrigerators and freezers are designed and built for food and drink storage; they do not meet the requirements for sample storage, and do not reach the temperature levels needed for preservation of PREDICT biological material (e.g., specimens for viral screening). **DO NOT STORE SAMPLES IN REFRIGERATORS OR FREEZERS THAT CONTAIN FOOD OR BEVERAGES FOR CONSUMPTION.** In addition, temperature in domestic refrigerators varies significantly with door opening, defrosting, and variable ambient temperatures; they should not be used in a cold-chain for storage of PREDICT samples. Additionally, freezers designated as "frost free" should not be used for sample storage; because the temperature cycling mechanisms they utilize to avoid ice accumulation can damage samples.

Only specially designed ultra-low temperature (< -80°C) commercial freezers are recommended for use with samples when viral isolation is an objective.

Ultra-low temperature (< -80°C) commercial freezers

Commercial freezers come in a variety of temperature settings (-20, -40, -50, -85, and cryogenic freezers at -150°C), and in a variety of configurations (upright, chest, and bench top freezers). It is important to be sure any commercial freezers utilized for biological sample and specimen storage are able to consistently maintain a sub 80°C environment.

Operating a commercial freezer requires a constant source of electricity to maintain temperatures colder than -80°C temperatures and ensure the viability of the cold chain. In many places where PREDICT projects are being conducted, electricity is intermittent and blackouts are common. **It is imperative that the electrical source for a commercial freezer be supported by a back-up generator to ensure continued power for the freezer and viability of the samples.** It is equally imperative that each team has a contingency plan for power outages, to ensure that the back-up generator is functioning and that the freezer remains operational. Teams should clearly mark the power source to the freezer to prevent accidental disconnection, which can cause heat damage if unnoticed over long periods of time. The power source can also be protected by placing a sticker above the power plug or switch, or by installing a lockable

switch. Additional steps on maintaining the cold chain during blackouts are included in Section 3 below.

The location of the freezer in the laboratory or field office impacts performance. Avoid placing a freezer in direct sunlight or near heat sources (hot water or a warm external wall), because that makes the freezer work harder to maintain cool temperatures. In addition, -80°C freezers often require a certain amount of airspace in their immediate surroundings for ventilation and to function efficiently; -80°C freezers should not be located in close proximity to other freezers, equipment, counters, etc. When possible, leave at least 1 meter of space between the -80°C freezer and other freezers or equipment.

Temperature Gauging Equipment

Continual temperature monitoring of the cold chain assures that all samples remain in an optimal environment for preservation. There are a number of methods to monitor cold chain temperatures, from simple thermometers to more complex temperature gauges, cold chain monitors, and data loggers. When combined with an appropriate record keeping system, temperature monitoring provides an ideal method to evaluate the viability of the cold chain and to respond accordingly to any interruptions.

Table 2: Temperature gauging equipment used in the cold chain.

Type	Description	Guidelines for use
Thermometers	Minimum/maximum thermometers are essential equipment for temperature monitoring, and come in two main types: dial and digital.	All thermometers used for temperature monitoring should be set to Celsius, must be reset on a daily basis, and require annual checks to ensure accuracy, as battery failure or damages temperature probes can impact readings. In addition, a temperature-monitoring chart should be maintained to provide a record of variation in temperature that may indicate problems with the freezer or thermometer.
Temperature Chart Recording Systems	Temperature Chart Recording Systems are automated systems that record temperature and provide visual or audio alarms at signs of malfunction.	These systems are fully automated and provide digital output of temperature variations over time. These are typically after-market modifications to freezers, and if installed, should be verified to function with the freezer manufacturer as they may void product warranty.
Data loggers	Data loggers are used to record temperature patterns over time by recording temperature data electronically, and providing an electronic and downloadable record.	Data loggers are not a replacement for manual monitoring, and daily minimum and maximum temperatures should still be recorded to ensure the maintenance of the cold chain. When used for routine temperature monitoring, a data logger must be equipped with a visual min/max temperature display to allow for daily real-time recordings.

Cold chain monitors	Cold chain monitors generally consist of dual-time temperature indicators (WarmMark™ and MonitorMark™) and function by displaying changes in temperature through color change on an indicator strip. Other types of cold chain monitors include freeze indicators (Freeze Watch™, ColdMark™) consisting of color bulbs that release a dye at a threshold temperature. There are also combined indicators featuring dual time-temperature indicators and freeze indicators.	Cold chain monitor color change allows for an estimation of the amount of time a temperature exceeds a pre-determined threshold. No color change means the cold chain was not interrupted and temperature remained safe for sample transport. Note: these monitors are often for temperatures warmer than -80°C (e.g. cold boxes/coolers, refrigerators, -20°C freezers) and are often not designed for samples kept at or colder than -80°C.

Management of Cold Chain Equipment.

Procuring the needed equipment is only one aspect of keeping a functional cold chain. Equipment management and maintenance is equally important, and requires:

- Maintaining an equipment inventory
- Planning and budgeting for equipment operation (e.g., electricity), maintenance, and repair
- Planning and budgeting for equipment replacement
- Emergency response or contingency planning in the event of cold chain breach or equipment failure

Equipment Inventory

An inventory should be developed to track all equipment, tools, and parts that are used as part of the cold chain. A good inventory will allow team members to track the location of all materials used in the cold chain, schedule maintenance and repair, arrange for replacement and evaluate the project supplies. Table 3 includes some information recommended for a sample storage equipment inventory.

Table 3: Sample storage equipment inventory database example.

Item	Specifications (brand, model, SN, date of acquisition)	Current Location	Current Condition (Working, Under repair, Out of commission)	Date of purchase – warranty number	Estimated Replacement Date	Notes
Ultra-low freezer	TS Revco ElitePlus, S/N 007054568, Oct. 2010	Morogoro	Working	September 2010	October 2013 (MFR warranty expiration)	Recently purchased and installed
Dryshipper	MVE Cryomoover, S/N 9989900745, Oct. 2010	Serengeti, PREDICT Mobile team	Working	September 2010	October 2013 (MFR warranty expiration)	Field sampling with TAWIRI team
LN2 Generator	StirLITE, S/N 356777456, Oct. 2010	Iringa, PREDICT office	Out of Commission	September 2010	October 2013 (MFR warranty expiration)	Installation issues: working with support services to resolve; sourcing LN2 from supplier in Dar es Salaam currently.

Equipment Operation, Maintenance, and Repair

All equipment requires maintenance to protect against failure and degradation. Maintenance planning involves identifying procedures and plans to keep equipment functioning properly, as well as planning for emergency repair in the event of equipment failure. Some equipment requires routine maintenance (daily, weekly, or monthly), while others may require maintenance following use (dry shippers, vacuum flasks, cold boxes, etc.). Maintenance instructions are usually included with the equipment, and can often be obtained from the manufacturer. It is important that team members receive training in routine maintenance and repair within reason, while skilled technicians should be identified for complex maintenance and repair procedures.

In addition, it is important to estimate the costs of installing, operating, and maintaining the equipment. Ultra-low temperature freezers utilize significant quantities of electricity, though newer models are designed to minimize power consumption. It is possible that the installation of new equipment will drastically increase power consumption requiring a re-budget of operational costs.

You may use the following equation to estimate the cost of your electrical equipment using the manufactures specifications to obtain the value for kilowatt hours (kWh). [kWh / 24 h] x [kWh costs in your location] x [365 days] = Operational Cost / Year

Maintenance of equipment over time will also require a budget, and should be included in operational cost planning.

Equipment Replacement

Equipment will eventually wear out, and if plans are not in place to address equipment failure, a significant cold chain breach may occur (See Section 6.1.3.). It is important that teams understand the lifecycle of all cold chain materials and equipment, and that plans are in place to address equipment failure when it occurs. Most manufacturers provide estimates of equipment life expectancy. When developing the equipment inventory, estimated replacement dates should be included in documentation to assist in replacement planning. As equipment can often take months for order and delivery, temporary cold chain storage plans should be considered to ensure no breach or interruption.

Emergency Planning

Cold chains are fragile, material dependent, and subject to interruption through breakdowns of background infrastructure (electricity failure) and equipment failure (leakages of cold storage containers or freezer malfunction). Team members must set up emergency planning for identifying equipment failure early, along with arrangements for maintaining the cold chain during repairs or replacement. Equipment outages caused by shortages of spare parts or materials should not occur.

Power surges and "brown-outs" are often frequent occurrences in areas where PREDICT teams are active. A brown-out is a drop in voltage in an electrical power supply, most commonly observed by the dimming of lights. Black outs are covered below in the Section 6.1.3.. To prevent adverse impacts to cold chain equipment during power surges, it is imperative to have stand-by generators, back-up power sources, and other mechanisms in place (surge protectors, CO2 backup systems, etc.). Often electrical equipment is sensitive to undercurrent (for example a 220V system running at 205V temporarily), and equipment failure and destruction is possible.

Section 6.1.2b. Recommended Temperature Requirements for Sample Transport and Storage

An essential component of cold chain planning is knowing the optimal temperature requirements for different diagnostic methods, sample types and storage media.

For PREDICT purposes all samples (stored in VTM and Trizol) must be frozen in liquid nitrogen immediately in the field and transferred to a -80°C freezer once back in the lab. If the location of the field site allows, you may use short term (maximum 48 hrs.) refrigeration (i.e., ice/gel packs) prior to transfer to -80°C freezer or LN2 dewar.

ONLY if there is no **short term** access (i.e., within 24 hours) to cold chain such as in an emergency situation samples can be collected in 200 µL of RNAlater instead of Trizol and VTM. Storage times and temperatures for samples in RNAlater are as follows: 1 day at 37°C (i.e., room temperature), 1 week in the refrigerator, and transfer to -80°C for long term storage as soon as possible and within 1 week until analysis.

Do not collect samples onto dried blot spot cards.

Section 6.1.2c. Cold Chain Initiation at the Sampling Sites

Following collection in the field, samples must be immediately introduced to the optimum temperature range. When possible, collected samples should be initially stored in cryotubes allowing for immediate introduction to the cold chain and minimizing any freeze/thaw issues involved in sample transfer at a later time.

Table 4 provides an overview of temperature ranges used in PREDICT activities, along with procedures for optimizing these ranges for short-term storage. This table is followed by recommendations on the use of referenced equipment.

Table 4: Maintenance of transit temperature by optimum temperature range.

4°C *Commercial Refrigerator or "on-ice"*	**-70°C** *Dry ice*	**-80°C or colder** *LN2*
Time interval: 1-2 days (chilled). Limit to a minimum	Time interval: 1-2 days (frozen).	Time Interval: Indefinite (as long as LN2 quantities are maintained)
*Procedure: The sample transport container (cold box or cooler) should be fitted with as many ice/gel packs as possible. Temperature should not exceed 4°C. If available, a cold chain monitor should also be inserted.	*Procedure: Place a minimum 1 kg of dry ice per 1 kg of samples (but double or triple dry ice amount if possible) for every 24 hours in transit. Place in a sturdy Styrofoam container, allowing for release of carbon dioxide gas to prevent explosion. Use solid dry ice cubes when possible as their duration greatly exceeds that of chips or snow.	*Procedure: Place samples into special cryotubes with screw-down lids (no snap-tops). Cryotubes are then inserted into a LN2 "charged" dry shipper or vacuum flask.

**Maintain at least 4 frozen gel packs and an additional transport container as a contingency plan in case of package or container failure with dry ice or LN2.*

Using temporary cold boxes or coolers

Insulated cold boxes or coolers may be used for sample transport of less than 48 hours duration for all samples requiring storage at -80° C or if no LN2/dry ice supplies are available, or during equipment failure or emergency maintenance periods.

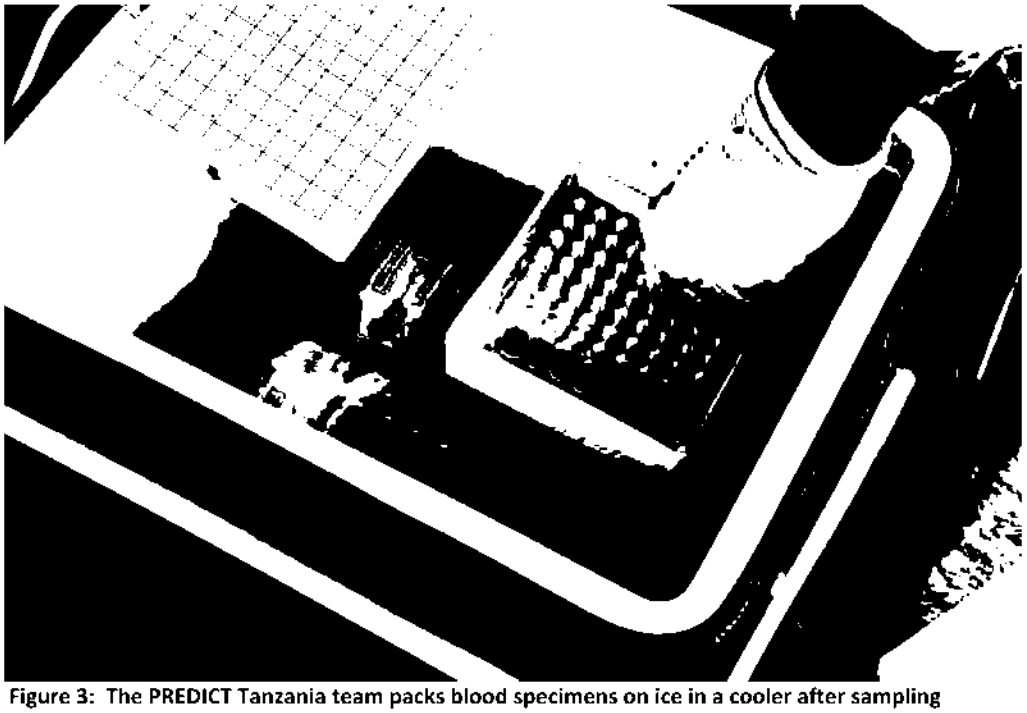

Figure 3: The PREDICT Tanzania team packs blood specimens on ice in a cooler after sampling rodents. Other specimens from field collection were stored in LN2 consistent with sample storage guidelines (Table 6). Photo by Liz Vanwormer.

Recommended steps when using cold boxes or coolers:

- Samples must be protected from heat, sunlight and fluorescent light at all times.
- Check the temperature in the cold box using a mercury or digital thermometer every 3 hours. Note: repeated opening and closing of the cold box will cause temperatures inside the box to elevate more rapidly. Teams must use good judgment when deciding to monitor the cold box temperatures.
- Rotate ice/gel packs to maintain maximum coldness within the container. If possible have extra ice gels to replace thawing or thawed ones.
- Do not transport samples in the trunks of vehicles (or the floors of some vehicles) due to the risk of exposure to temperature extremes. Be familiar with the coolest part of the vehicles.
- Do not remove samples from cold box or cooler until ready to transfer to recommended vacuum flask, dry shipper, or commercial freezer.
- When transferring samples, do not leave them out on the counter or the floor subjected to room temperature and light.
- Keep records of amount of time samples were stored at temperatures warmer than -80°C, and record the date and time when samples were introduced to the -80°C cold chain.

Using containers with dry ice

Dry ice (-78.5°C) is colder than ice and gel packs and allows for maintenance of samples frozen in transit. Any specimens transported in dry ice must be placed in specially insulated containers capable of venting gaseous CO2.

Recommended steps when using dry ice:

- Pack samples in a good insulated container. Thick polystyrene/styrofoam boxes work well with dry ice as they allow for the necessary off gassing of CO_2 (release of CO_2 gas) and are durable enough to last through transport.
- Sufficient dry ice is needed for maintaining samples consistently frozen. If dry ice quantities are insufficient samples will thaw and rendered useless.
- Use a minimum 1 kg of dry ice for each **1** kg of samples for every 24-hour transit period. Keep in mind however that depending on the quality of your shipping container and environmental conditions you will need to adjust these quantities to ensure constant temperatures. In hot conditions and whenever possible use double or triple the recommended dry ice quantity (i.e., 2 or 3 kg dry ice per kg of samples). For longer than 24 storage/transit times, double the amount of dry ice.
- When packaging items, place dry ice and sample containers as close together as possible and cover with additional dry ice. Fill any empty space with newspaper (ideal) or cloth, bubble packs, or Styrofoam peanuts. Empty space allows the dry ice to sublimate (change from liquid to gas) more quickly.
- Dry ice blocks take longer to evaporate and are better at maintaining samples frozen for longer storage/transit periods. However, samples must be close to dry ice (or surrounded by it) for adequate preservation. Solid blocks of 2-3 kg are ideal, yet not always available. Avoid using "snow" or chip dry ice whenever possible as they evaporate very quickly.

Using dry shipper or vacuum flask storage (LN2)

Dry shippers and vacuum flasks when properly charged provide ideal low temperatures for preservation of PREDICT samples both in the short-term following sample collection, in transport, and in the long-term as samples await analysis and/or shipping for diagnostics.

Recommended steps for filling dry shippers/vacuum flasks for sample transport:

1. Use appropriate PPE!
2. Add the LN2 slowly into the container.
3. Stop filling the container when the liquid reaches the neck of the dry shipper. (**DO NOT OVERFILL**)
4. Then, attach the cap and set the container aside to saturate the absorbent for the period specified by the manufacturer. This is called "charging" the container.
5. Repeat the steps above until the liquid level no longer drops on standing (e.g. the container is "charged"). Some manufacturers provide empty and full weights for their containers. If the dry shipper will not reach the expected full weight specified by the manufacturer, there may be a problem with the absorbent's ability to hold the LN2, and could indicate the container is compromised, and that samples transported or stored in the container may be at risk of degradation. In this case, contact the manufacturer or supplier of the equipment to assess whether the container is fit for use with biological samples.
6. Remove all free liquid nitrogen from the container prior to transport.
7. Empty the container by pouring the excess liquid nitrogen back into a large LN2 vacuum flask.
8. If the LN2 cannot be poured back into the flask, pour the LN2 into an appropriate area.
9. Do not pour LN2 onto the floor or onto hard surfaces. LN2 can crack and destroy concrete and other hard surfaces, and the liquid could splash onto your shoes or legs and cause severe burns.
10. Ensure that any area where LN2 is poured away is well ventilated. Remember that handling or spilling LN2 in a small, confined space has been known to cause fatalities via asphyxiation /displacement of oxygen. Appropriate safety precautions outlined in the Protocol above must be considered.
11. After pouring out excess LN2, hold the dry shipper or vacuum flask upside down to be sure that all liquid has stopped flowing.
12. Stand the dry shipper upright for the period specified by the manufacturer.
13. Repeat the LN2 removal steps as many times as necessary to make sure there is no excess LN2 in the container.
14. Put the samples into the dry shipper/container and replace the cap.
15. Record the date, time, and ID of the samples for when they were placed into the container to initiate the cold chain data log.
16. Ready the dry shipper/container for transport by securing the container in the vehicle. If using a protective bin for the container, then secure the container in the bin first, before securing the bin in the vehicle.

Recommended steps for using dry shippers or vacuum flasks for sample storage:

- Make sure containers are fully charged prior to deployment in the field or removal from dry ice/LN2 source (See steps on filling shippers/flasks above).
- Make sure containers are not leaking.
- Make sure to have sufficient quantities of LN2 on hand for sample storage and emergencies.
- Develop a plan for obtaining additional dry ice/LN2 supplies in the event of emergency or container failure.
- When in the field, always keep additional cold boxes with conditioned (e.g., properly prepared) ice/gel packs as back up in event of container failure.
- Following sample collection, organize samples in the containers according to animal or sample ID consistent with PREDICT sample tracking recommendations for rapid retrieval.
- Remove samples from containers only when ready to prepare for analysis or shipping.
- Record the length-of-time samples were kept in containers and document the number of times and duration containers were opened.

Figure 1: The PREDICT Tanzania team packs up equipment after collecting specimens from rodents. The mushroom shaped container in the background is a specially designed transport container for LN2 dryshippers, ensuring the dryshipper container is well protected during overland or air travel, and that all stored specimens are well within the temperature range required for viral isolation. Photo by Liz Vanwormer.

Section 6.1.2d. Sample Transport

Following sample collection, it is imperative that the field teams coordinate with the receiving laboratories or PREDICT Country Coordinators on all details involving sample transport and storage planning. In many cases, samples will be delivered from the field/collection site to a temporary storage facility prior to shipment to end-use processing laboratories, and may involve multiple phases of the cold chain. In the event of international transport of samples to a processing laboratory, all PREDICT personnel must follow the guidelines specified in ***Section 6.2 Packing and Shipping Biological Samples*.**

All sample transport containers must be secured (e.g., tied down) in the transport vehicle. If possible, LN2 dryshippers should be secured in a separate compartment space from the passengers (e.g., rooftop bin or a covered canopy of a flatbed truck), and equipped with a spill kit containing absorbent materials to protect personnel from any accidents involving spillage. Non-LN2 containers with unprocessed samples may be secured in the project vehicle with proper secondary containment to minimize sample jostling during transport. There is a risk that containers may leak during transport, so it is imperative that teams understand the risk of asphyxiation in a closed vehicle and be prepared to address any spills and leakages with appropriate equipment. **PREDICT vehicles should be equipped with cold chain PPE (e.g., disinfectant, heavy reusable gloves, disposable gloves, mask, apron, goggles, and a sealable and leak proof disposal container) to respond to any incidents involving sample spillage**. To ensure maintenance of the cold chain, additional ice/gel packs, dry ice and appropriate containers, or an additional LN2 dry shipper should be available to prepare for travel delays or primary container failure.

Section 6.1.2e. Safe Storage of Samples

Upon delivery of samples from the field, it is the responsibility of the receiving party to ensure that cold chain is continued and samples are appropriately stored, documentation transferred (See Section 6.1.3.. Records below), and Country Coordinator or other supervisor notified. **For PREDICT purposes ALL SAMPLES must be stored frozen at -80°C or lower temperatures.**

Additional Sample Storage Guidelines

- Samples should be divided or aliquoted into the smallest useful units during initial processing in order to avoid excessive freeze-thaw cycles, and to avoid damage leading to a loss of infectivity.
- When samples are removed from cold storage and shipped to a laboratory facility for analysis, teams should follow the PREDICT training guidelines on ***Packing and Shipping Biological Samples (Section 6.2)***.

Long-term Sample Storage

It is strongly recommended that all samples kept for long-term storage be maintained at temperatures at or below -80°C. This can be achieved either through the use of large capacity LN2 dewars or through ultra-low temperature freezers.

Using Liquid Nitrogen

There are generally two types of sample storage systems available for LN2 dewars: box/rack (or canister systems) and cane/straw systems. While cane/straw systems are acceptable for short-term storage, it is highly recommended that samples for long-term storage be kept in box/rack systems, which allow for quick retrieval and identification with minimal temperature reduction upon retrieval. Cane/straw systems have less storage capacity and often increase the amount of time required to locate samples for pathogen testing.

Recommended steps for using LN2 in long-term sample storage:

- Make sure containers are filled to capacity, functioning properly, and are not leaking.
- Develop a plan for obtaining additional LN2 supplies in the event of emergency or container failure.
- Maintain a supply of ice/gel packs to maintain temperature in the container in the event of container failure, or for use in emergency storage or transport.
- Organize samples in box/rack systems according to animal or specimen ID consistent with PREDICT sample tracking recommendations for rapid retrieval.
- Remove samples from containers only when ready for testing or shipping.
- Record the length-of-time samples were kept in containers and document the number of times and duration containers were opened.

Using Ultra-low Temperature Freezers

Like samples in LN2, samples stored in ultra-low temperature freezers (-70/80°C and colder) must also be easily identifiable and organized in a way to minimize the time required for sample location and access. Freezers must be well managed, and staff must be prepared for disruption of electricity, blackout, or other event where the freezer malfunctions.

Recommended steps for using ultra-low temperature freezers:

- Store material in the freezer leaving space between boxes/containers to allow for air to circulate.
- Organize samples according to animal or sample ID consistent with PREDICT sample tracking recommendations for rapid retrieval.
- Remove samples from freezer only when ready to prepare for testing or shipping.
- Minimize the number of times the freezer is opened, and make sure the freezer door is closed tightly.
- Secure the electrical outlet and freezer plug to prevent accidental disconnection and freezer failure.
- Post a highly visible sign or sticker by the electrical outlet to ensure the freezer is not unplugged, or cover the electrical outlet with a cage to prevent disconnection.
- Maintain a supply of ice/gel packs in the freezer to maintain temperature in the event of freezer failure, and for use in emergency storage or transport.
- Employ a temperature monitoring system.
- Train all staff members in monitoring and documenting temperatures.

Section 6.1.2f. Cold Chain Maintenance

Checking, Recording and Monitoring Cold Chain Temperature

Implementing a temperature-monitoring plan through consistent and regular thermometer readings is essential to maintaining a secure and reliable cold chain.

Recommended Steps for Cold Chain Temperature Monitoring:

- Check LN2 levels and container temperature (if using gauge), and ensure that the container is not leaking twice per day in the mornings and evenings.
- Check and record freezer temperature twice per day in the mornings and evenings (Figure X) as follows: (Note: these readings must be done more frequently if samples are temporarily stored in cold boxes or coolers).
    - Check and record the current freezer temperature.
    - Check and record the maximum freezer temperature.
    - Clear the maximum reading after it is documented.
    - Check and record the minimum freezer temperature.
    - Clear the minimum reading after it is documented.
    - Reset the thermometer.
- Do not open the freezer door to take the temperature readings; an external temperature gauge should be used for commercial freezers.
- Change the thermometer or temperature gauge battery every 6 months (i.e., seasonally with the time change) or as recommended by the manufacturer, as a low functioning battery may give false temperature readings.
- Keep a supply of spare batteries in case of device failure.

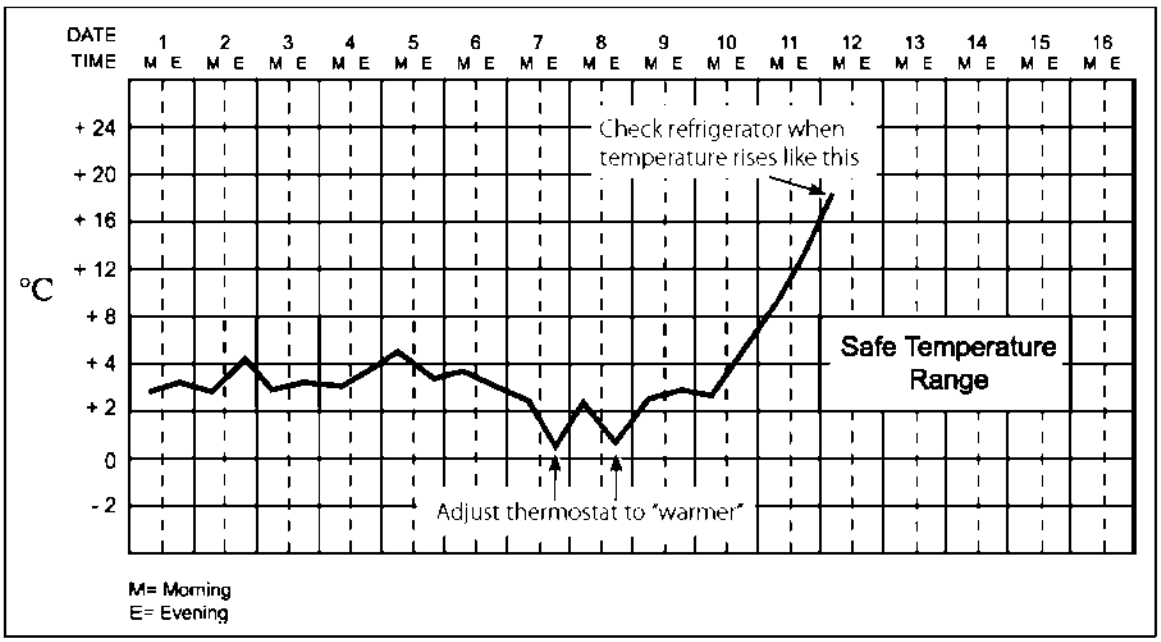

Figure 5. An example of a cold chain temperature monitoring chart. Source: WHO, 2004.
Note: this chart is for a cold chain optimized for vaccines at 2-8ºC. Use the chart included in the Appendix for the PREDICT cold chain at lower storage temperatures optimal for viral isolation.

Section 6.1.3. Contingency Planning and Responding to a Cold Chain Breach

Preserving and maintaining below freezing temperatures in tropical conditions requires attention to detail and intensive logistical planning, linking equipment, people, policies, and procedures into an integrated system. Country coordinators, laboratory technicians, and field personnel all have a role to play in ensuring that PREDICT samples are collected, transported, stored, and shipped (if necessary) without breaks in the cold chain. In addition, team members must be trained and prepared to address incidents in which there is a cold chain breach, to enact response measures for rapid cold chain rehabilitation.

Contingency Planning

It is imperative that all PREDICT teams have a pre-determined contingency plan for maintaining the cold chain in the event of freezer or container malfunction or electricity disruption. It is highly recommended that all facilities using commercial -80°C freezers be linked with a back-up generator for continued electrical operation (see box below). However, it is the team's responsibility to make sure that the back-up generator is of sufficient capacity to operate the freezer, is functioning and has sufficient fuel to maintain electricity, or that alternative measures for maintaining the cold chain are necessary. Arrangements with other facilities for temporary sample storage (if necessary) should be made in advance, along with plans for rapid sample transfer with minimal cold chain disruption.

Essential Steps in Setting-up your Back-up Generator System

Generators should be connected to freezers before a power failure to determine:

a) If the generator can effectively operate the freezer
b) The temperature at which the freezer operates when connected to the generator, and whether an appropriate temperature is maintained for samples over an extended period of time
c) How long the generator can be used in the event of a power outage

If these three conditions are met, then the generator is sufficient to act as a back-up system in the event of a breach. If these conditions are not met, please see "Recommended Steps for Contingency Planning" below.

Recommended Steps for Contingency Planning:

- Identify possible sources of cold chain interruption or breach (e.g., equipment failure, supply shortages, power outages, etc.).
- Identify preparations and solutions for possible chain interruptions
- Prepare back-up infrastructure for sample storage.
- Identify alternate storage facilities for samples and initiate communication to facilitate emergency use.
- Monitor and evaluate equipment regularly and maintain records to assist in understanding potential weaknesses in the cold chain.
- Ensure staff are trained on cold chain maintenance and monitoring for prevention of a breach.

Recommendations for a Power Failure Contingency Plan

Power Failure Contingency Plan (Example)

Start-up the Generator! If Generator is not working, or is insufficient to provide adequate backup (See Box above), then proceed with these steps below:

Samples stored in refrigerator

Monitor the temperature of refrigerator (temperature gauges should be battery powered).

During a power failure of 4 hours or less, the refrigerator door should be kept closed at all times.

If samples are at risk of warming, implement alternative storage arrangements. All samples must be transferred to cold boxes/coolers with prepared ice/gel packs. Monitor sample temperature through the use of a thermometer probe placed near the samples inside the cold box or cooler.

Samples stored in commercial freezer

Monitor the temperature of freezer (temperature gauges should be battery powered).

If samples are at risk of thawing, implement alternative storage arrangements (either in dry ice or LN2, or in cold boxes and coolers with prepared ice/gel packs).

Responding to a Cold Chain Breach

A cold chain breach is an interruption in the cold chain exposing samples to temperatures above the required range for viral preservation (for prolonged periods – opening and closing a freezer door will often cause temperature fluctuation, but does not qualify as a "breach"). If not quickly rehabilitated, such an interruption can destroy sample viability and render samples useless for PREDICT pathogen testing activities. It is imperative that all teams have documented plans for addressing a breach in the cold chain, and that all team members have received training on appropriate response and cold chain rehabilitation.

Recommended steps in responding to a cold chain breach:

1. Contact your PREDICT Country Coordinator (or supervisor) as soon as possible for advice on emergency response measures, and consult your contingency plans.
2. Define the incident: check all temperature monitoring records, equipment, and discuss with staff possible explanations for the breach.
3. Confirm accuracy of equipment by referencing manufacturer specifications to ensure that the breach is not simply equipment malfunction (data loggers, cold chain monitors and temperature gauges may have operational failure. It is important that emergency measures are not implemented until staff is certain the failure is with the freezer or storage container).
4. Assess the condition of the freezer/storage container. Can the cause be identified (e.g., leaky dewar, freezer door no longer closing completely)?
5. Record:
    a. When the cold chain was last guaranteed?
    b. What monitoring has been recorded prior to breach?
    c. What is the time interval of breach?
    d. What is the temperature range of the breach period?
    e. What samples were involved in incident? Enter record in sample database.

6. Continuously monitor temperatures of the containers/freezers and record the duration of time samples are exposed to temperatures warmer than -80°C.
7. If temperatures approach -30°C, begin planning for sample transfer to temporary cold boxes or coolers, or other laboratory facilities.
8. If temperatures climb to warmer than -20°C, transfer samples to temporary storage containers and continue monitoring temperature. If there is no -20°C capacity, actively pursue an alternative storage facility and prepare insulated boxes for sample transport.
9. DO NOT discard any samples until advice has been sought from PREDICT Country Coordinators and laboratory personnel.
10. Label all samples exposed to elevated temperatures in the PREDICT sample tracking information database.

Take active steps to correct and prevent the problem from recurring.
In the event of a cold chain breach, it is important to keep records to guide in response implementation, to help prevent future breaches, and to inform PREDICT team members of any potentially affected samples. The following table includes an example data sheet for a cold chain breach. A blank data sheet is included in the Appendix.

Example data sheet for cold chain breach

Date and suspected time of the breach	Date: Aug. 13, 2010	Time: 5:14 PM
Do you store your samples in a commercial freezer or vacuum flask container?	Commercial Freezer	LN2 vacuum flask
Minimum and maximum temperature readings	Minimum: -88°C	Maximum: -57°C
When was the thermometer last reset	Dave of reset: July 12, 2010	Time of reset: 11:12 AM

Equipment Inventory Template

Item	Specifications (brand, model, SN, date of acquisition)	Current Location	Current Condition (working, in repair, out of commission)	Date of Purchase	Estimated Replacement Date	Notes

Equipment Maintenance Record Template

Model No.	Serial No.	Purchase Date	Last Service Date	Work (Maintenance) Performed

**Note: It is also recommended that teams catalog recommended maintenance forms, registries, and schedules that accompany equipment to help plan for equipment maintenance and minimize interruptions in the cold chain. It may also be helpful to keep a record of responsible team members so staff are aware of equipment maintenance duties.*

Data Sheet Template for Cold Chain Breach

Date and suspected time of the breach	Date:	Time:
Do you store your samples in a commercial freezer of vacuum flask container?	Yes	No
Minimum and maximum temperature readings?	Minimum	Maximum
Are Cold Chain Monitors (CCMs) stored with the samples? If 'yes', be ready to report the reading when breach was noticed.	Yes	No
When was the thermometer last reset?	Date of reset:	Time of reset:
When was the thermometer battery last changed?	Date of battery change:	Time of batter change:
When was the last check on the accuracy of the thermometer done?	Date:	Time:
How long do you think the temperature was above -80°C?	Minimum Estimate	Maximum Estimate:
How long do you think these problems have been occurring?	First breach	Recurring (state number):
Where is the temperature probe situated?	Location:	Notes:
What type and number of samples were exposed to the breach?	Type of samples:	Number of samples:
Are all samples labeled and accessible?	Yes	No
Are there ice/gel packs in the freezer to use if transfer is necessary?	Yes	No
What do you think was the cause of the cold chain breach?	Suspected cause:	Notes:
Has the cause of the cold chain breach been rectified?	Yes	No

USAID | PREDICT

Section 6.3. Basic Laboratory Safety

Prepared by
Tracey Goldstein, University of California Davis,
Simon Anthony, Columbia University,
Carlos Sanchez, Smithsonian Institution,
and the PREDICT One Health Consortium

Objective: To provide a safe and healthy environment for staff, volunteers and all personnel involved in PREDICT activities. This Guide is to provide basic information to ensure a safe laboratory environment and to comply with environmental standards. The recommendations in this Guide are consistent with the requirements of the U.S. Occupational Safety and Health (OSHA) Act of 1970, Executive Order 12196.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Basic Laboratory Safety.

Table of Contents: Basic Laboratory Operations

Section 6.3.1. Learning Objectives

If you understand the material in this Guide, you should be able to:

- Work safely in a basic laboratory environment.
- Recognize laboratory hazards and take the appropriate measures to reduce those hazards.
- Obtain a Material Data Safety Sheet (MSDS) for a hazardous material and explain the kinds of information in an MSDS.
- Explain important precautions to avoid needlestick injuries.
- Explain how to avoid exposure to pathogens in the laboratory.
- Describe the safety measures for a BSL 2 laboratory.
- Explain why medical monitoring of laboratory personnel is important.
- Describe the proper disposal of sharps and medical waste.
- Describe safety procedures for handling chemicals in the laboratory.

Confirm you understand the material of this Guide:
When you are familiar with the information in this Guide, take the PREDICT quiz on ***Basic Laboratory Safety (Section 8.4.16.)***.

This training module is mandatory for all laboratory and field staff.
Once you have passed the quiz please supply proof of training and completion to your supervisor.

Section 6.3.2. Principles

Guiding principles for PREDICT laboratory operations:

1. Prevent loss of life, personal injury or illness, property loss or damage, or environmental harm.
2. Comply with the ***PREDICT Environmental Compliance Protocol*** and local and national safety and health requirements.
3. Comply with applicable local building safety codes.
4. Ensure all PREDICT personnel understand relevant safe and healthy work practices.
5. Identify and assess hazards in the laboratory environment.
6. Establish overall safety and health guidelines that ensure employee safety and health at all times during PREDICT activities.
7. Periodically review and evaluate PREDICT plans, facilities, equipment, and activities to ensure that safety and health objectives are achieved.

Section 6.3.3. General Guidance for Laboratory Safety

This Laboratory Safety Guide describes safe work practices, personal protective equipment, and other control measures necessary for the safe use of chemicals and other hazardous materials

and procedures in the basic laboratory environment. PREDICT personnel involved in laboratory activities must review and follow this Guide. Staff, interns, visiting scientists, and volunteers are to receive this Guide prior to conducting laboratory activities for the PREDICT Program. This Guide will be updated as needed to improve safety procedures.

Ensure Safe Working Conditions

- Inspect your personal protective equipment (PPE), such as goggles and gloves, to ensure that each component fits well and works properly. Examine your gloves for cracks. Nitrile and latex gloves are disposable and a new pair should be used for each task.
- If you are working with PPE kits, ensure that the kit is complete (a list with the contents of the PPE kit should be available).
- Dispose of broken glass and biohazard materials in designated sharps and hazardous waste containers in the laboratory.
- Help provide a safe work environment by keeping the workspace neat and uncluttered.
- Sinks and eye wash stations should be kept clear.
- Wash your hands and forearms after you have removed and disposed of your PPE.

Hazard Identification and Assessment

Personnel should be able to recognize the possible hazards and inherent risks associated with laboratory procedures and equipment.

Table 1: Hazards associated with laboratory procedures

Procedure	Possible hazards	Likelihood of illness or injury	Risk
Using autoclave or hotplate	High temperature	Moderate	Burns
Handling animal and human samples including body fluids, tissues, swabs	Infectious organisms	Low to moderate	Pathogen exposure zoonotic diseases
Reagent preparation	Acids or alkalines Solvents (alcohols, acetone)	Low Low	Burns Inhalation irritant
Disposal of needles and slides	Sharp objects Infectious organisms	Low to moderate	Needlesticks, cuts, zoonotic disease, pathogen exposure
Dry ice, liquid nitrogen or ultra-low freezers	Extreme cold (~-100F)	Low	Burns
Media preparation	Extreme heat	Low	Burns
Formaldehyde	Inhalation of vapors, ingestion of liquid or direct contact with the liquid or vapor (skin, eye contact)	Moderate	Cancer, skin, eye and respiratory tract irritation
TRIzol Reagent (or Tri reagent; phenol solution)	Toxic if inhaled, absorbed through skin or ingested; reacts with bleach	Moderate	Contact burns, systemic poisoning; creates toxic gas if mixed with bleach

Safe Laboratory and Operating Procedures

Personnel must understand and follow the safe operating procedures of laboratory equipment and PPE to minimize health and safety risks. **The use of the PPE for specific laboratory tasks, listed in Table 2, is mandatory** and all PREDICT personnel must follow the special precautions listed for handling highly hazardous materials.

Table 2: PPE required for laboratory tasks

Lab Task	Health or Safety Hazards	Required PPE	Precautions for Highly Hazardous Materials*
Handling all samples from animals and humans (body fluids, tissues, swabs)	Zoonotic disease potential	Lab coat, closed shoes, disposable nitrile gloves, eye protection and respirator (N95 minimum)	Use of Biosafety Cabinet Class II and eye protection for samples known to be highly infectious or use PPE kits.
Handling acids or chemicals that are irritants (i.e. formaldehyde)	Respiratory irritation, acid or alkaline burns	Lab coat, laboratory gloves, face mask, closed toe shoes.	Chemical fume hood
Operation of autoclaves	Burns	Appropriate gloves, eye protection, closed toe shoes.	Care in opening the door to avoid burns from escaping steam.
Dry ice, liquid nitrogen	Burns, asphyxiation risk	Appropriate gloves, eye protection, closed toe shoes, and use in well-ventilated room.	Dispose of any unused dry ice or liquid nitrogen in ventilated fume hood.
Centrifuges	Aerosolized fluids, zoonotic disease	Lab coat, facemask, appropriate gloves when handling samples or cleaning centrifuge.	Ensure proper balancing of centrifuge and contents. Do not open until rotor has stopped. Use closed-top swinger rotors to spin biological materials.
Hot plate	Possible burns	Appropriate gloves, closed toe shoes.	Do not leave unattended for extended periods.
Use of bleach to disinfect	Possible burns, respiratory irritation	Lab coat, gloves, closed toe shoes, and eye protection.	Use of chemical fume hood recommended when preparing bleach.
Disposing of needles, glass slides	Cuts, zoonotic disease	Gloves, sharps container, closed toe shoes.	Follow sharps safety procedures in this guide.
TRIzol Reagent (or Tri reagent; phenol solution)	Contact burns, systemic poisoning	In lab: Gloves, lab coat, close toe-shoes, eye goggles In field: Gloves, close toed-shoes, appropriate field PPE (e.g. coveralls, N95 mask, goggles per the task being performed – See Biosafety Guide)	Aliquot TRIzol for sampling in the field in a ducted biosafety cabinet or fume hood; Perform RNA extraction of samples collected into TRIzol in a biosafety cabinet

Definitions

***Highly hazardous materials** are chemicals, toxics and reactives that have the potential to cause immediate and permanent harm at feasible exposure levels. Chemicals that are highly toxic, are known to cause cancer or birth defects, have very low "permissible exposure limits," are highly reactive, or that react vigorously with common materials (such as water or air) should all be considered "highly hazardous materials." Chemicals that are under pressure, that can build up pressure, that can auto-ignite at possible temperatures, that burn vigorously and energetically, or that when burning cannot be extinguished with conventional methods, should be considered highly hazardous.

For a complete and updated list of Highly Hazardous Materials, visit the following OSHA link:
http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_id=9761&p_table=standards

****Personal Protective Equipment (PPE)** is specialized clothing or equipment worn by an employee for protection against infectious and other hazardous materials. The warranted components of PPE vary according to the tasks being performed by personnel. A basic PPE kit may include: gloves, gowns or other protective clothing (e.g., plastic apron), shoe and head covers, mask or respirator, and face or eye protection (e.g., goggles).

Review of Material Safety Data Sheets

PREDICT personnel must verify that a Material Safety Data Sheet (MSDS) for each product to be used during PREDICT activities is readily available, complete and updated (less than three years old).

Coordinators must ensure that personnel have read and understand the MSDS BEFORE using a chemical product.

Personnel must be familiar with the name of the chemical and understand the hazards, safe handling and storage, and specific emergency procedures BEFORE using a chemical product.

Copies of MSDSs for all chemicals used in the laboratory should be kept together in a binder and placed in an accessible location known to all laboratory personnel.

What is a Material Safety Data Sheet?

A MSDS is prepared by the supplier or manufacturer of the material and contains information on the potential hazards (health, fire, reactivity and environmental) and safe use of the chemical product. It is an essential information resource for all health and safety programs. The MSDS also contains information on the safe use, storage, handling and emergency procedures for all hazardous materials. The MSDS contains much more information about the material than found on the product label including what to do if accidents occur, and how to recognize and treat overexposure to the chemical product.

What information is on the MSDS?

The information of greatest concern to workers is featured at the beginning of the data sheet, including information on chemical composition and first aid measures. More technical information that addresses topics regarding the physical and chemical properties of the material and toxicological data appears later in the document. The 16-section MSDS is now recognized internationally. Each MSDS must include:

1. Identification (name, manufacturer and supplier names, address and emergency phone numbers)
2. Hazard(s) identification
3. Composition/information on ingredients
4. First-aid measures
5. Fire-fighting measures
6. Accidental release measures
7. Handling and storage
8. Exposure controls/personal protection
9. Physical and chemical properties
10. Stability and reactivity
11. Toxicological information
12. Ecological information
13. Disposal considerations
14. Transport information
15. Regulatory information
16. Other information

Emergency Overview

Harmful or fatal if swallowed. May be corrosive. This product contains a material which causes skin burns. This product contains a material which causes irreversable eye damage. May be harmful if absorbed through the skin. Vapor and/or spray must harmful if inhaled. Vapor irritates eyes, nose, and throat. Vapor generated at elevated temperatures irritates eyes, nose, and throat.

Route(s) of Entry: Inhalation? No Skin? No Eyes? No Ingestion? No

Potential Health Effects (Acute and Chronic)

INGESTION: Harmful or fatal if swallowed.

EYE CONTACT: This product contains a material which causes irreversible eye damage.

SKIN CONTACT: May be corrosive. This product contains a material which causes skin burns. May be harmful if absorbed through the skin.

INHALATION: Vapor and/or spray must harmful if inhaled. Vapor irritants eyes, nose, and throat. Vapor generated at elevated temperatures irritates the eyes, nose, and throat. Repeated exposure to high vapor concentrations may cause irritation of the respiratory system and permanent brain and nervous system damage.

CHRONIC OVEREXPOSURE: Avoid long-term and repeated contact. This product contains an ethylene series glycol ether and/or acetate which has been shown to cause adverse effects on the kidneys, liver, blood and/or blood-forming tissue. This product contains diethylene glycol monobutyl ether (DEGBE). DEGBE consumed in drinking water at low levels by rats for 30 days caused injury to either the liver, kidney, spleen, or testes.

Licensed to A V Systems, Inc. MSDS MSDS, (c) A V Systems, Inc. ANSI Format

Different jurisdictions have different content requirements for Material Safety Data Sheets. Despite the internationally recognized standard, a MSDS prepared in accordance with the United States OSHA Hazard Communication Standard is not necessarily acceptable in other countries. Check with local health authorities to ensure that your MSDSs are in compliance with local regulations.

Where to obtain MSDSs for chemical products?

A MSDS can be requested from the manufacturer or supplier of the product; in addition several MSDS databases exist online including:

SIRI MSDS index: **http://siri.org/msds/index.php**
MSDS online: **http://www.msdsonline.com** or **http://www.msdsonfile.com/mctx/msds/msdsonfile.jsp**
MSDS Hazard Communication Library: **http://www.setonresourcecenter.com/MSDSs/comply1.htm**

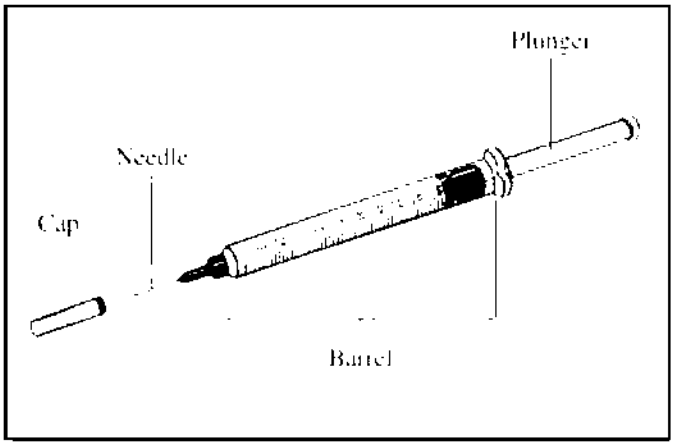
Needlestick Injury Prevention

Needlestick injuries are of concern in basic laboratory settings because they can result in the inoculation of personnel with infected materials. Additionally, skin breaks from needlesticks can act as portal of entry for environmental pathogens.

Most needlestick injuries occur during the following activities

- Recapping, bending, or breaking needles.
- Inserting a needle into a test tube or specimen container and missing the target.
- Carrying unprotected sharps.
- Leaving sharps in unexpected places, such as clothing.
- Handling or disposing of waste that contains used sharps.

Parts of a Syringe and Needle



Procedures to Prevent Needlestick Injuries

- Follow proper techniques when using needles and syringes.
- Be familiar with the different types and components of syringes and needles.
- When **uncapping a syringe needle**, pull the cap straight off to remove it and expose the needle.
- **Never leave an uncapped needle lying around.** A used syringe with the attached needle should be placed in a sharp disposal container immediately after use (a sharps disposal

container is designed for safe containment of medical articles that may cause punctures or cuts to those handling them – see below).

- **Removal of the syringe needle** may be necessary for transfer of the sample to another container, or for disposal of only the needle in the sharp container. When removal of the needle is necessary:
- Make sure not to remove the cap--twist the entire needle to take it off the syringe along with the cap. Alternatively, the needle may be removed from the syringe by use of forceps.
- Uncapped needles should never be removed from the syringe by hand.
- **Syringes and needles** used on humans should never be recapped. However, when working with animals and in the field, it may be necessary to carefully recap a needle to avoid accidental sticks if a sharps container is not immediately available.

If you recap a needle, use the *ONE HAND METHOD*

1. Lay the cap on a table or on a flat surface.
2. Hold the syringe by the end.
3. Tilt the end of the syringe up, so that the needle inside the cap is point down onto the surface.
4. Insert the needle on the syringe into the cap.
5. "Fish" up the cap with the needle.
6. Use the same hand to recap the needle.
7. Apply enough pressure to set the cap onto the needle.

If a needlestick occurs, it must be reported to your local PREDICT Supervisor and a medical professional immediately.

Section 6.3.4. Biohazards of Zoonotic Pathogens

Investigators working with domestic and wild animals and humans or with animal and human samples are at risk of disease due to exposure to zoonotic pathogens (pathogens transmitted between animals to humans). The zoonotic disease risk varies depending on the animal species being handled, but is generally caused by direct contact (e.g., contaminated/dirty hands), through open cuts, contact with blood and other body fluids, or inhalation of contaminated materials.

When performing tasks with risk of exposure to zoonotic pathogens (such as handling live or dead animals or samples from humans, collecting, testing, or packaging samples), PREDICT personnel should always wear the appropriate PPE as warranted by the assessed risk. It is the responsibility of the supervising veterinarian or medical specialist to determine the required PPE components for specific activities, based on an established PREDICT protocol or based on a risk assessment. (*See **Section 4. Biosafety and PPE Use** for more information about determining the appropriate PPE.)*

In the event that any personnel believe they have been exposed to material from a person or animal, they should immediately report the exposure to their supervisor, and if warranted seek the appropriate medical attention and follow-up.

Species-Specific Biosafety Precautions

The PREDICT Program will conduct surveillance and sampling among several groups of species. This section discusses special biosafety considerations for some of the key groups of species (bats, rodents, and non-human primates) likely to be handled as part of PREDICT activities.

Rodents, bats, non-human primates and other wild species may harbor pathogens that are transmittable to, and highly pathogenic in, humans. When handling these rodents, bats or non-human primates, careful consideration needs to be given to conscientious use of PPE, good personal hygiene (i.e., hand washing), safety training, and application of good animal handling and sampling techniques to minimize exposure to infection or injury.

In the event of an injury while handling animals that pose risk of zoonotic pathogen exposure, appropriate first aid must be applied. The risk of infection can be significantly reduced with immediate and thorough scrubbing of the wound with soap or antiseptic.

Vaccination to prevent rabies infection: Personnel who are handling animals that are known reservoirs for rabies (e.g., bats and dogs) should be immunized against rabies virus according to World Health Organization and CDC recommendations.

Investigators should familiarize themselves with known biohazards specific to species under study and with the procedures for the isolation and control of zoonotic pathogens.
Specific considerations with regard to working with rodents, bats and non-human primates are discussed below:

Rodents

Wild rodents have the potential to carry a variety of zoonotic bacteria and viruses that can be passed on to those handling them. Because of the serious consequences of becoming infected, personnel must always follow good personal hygiene and animal handling procedures and use the provided PPE to protect against exposure.

Special Precautions:

- Wear the minimum PPE for handling rodents as specified in the PREDICT PPE Use Guide, this includes an N95 mask, eye-protection, gloves and coveralls, or clean dedicated clothing.
- Personnel who are handling animals should be immunized against rabies virus according to the World Health Organization and CDC recommendations.

Bats

Exposure to wild bat roosts (in caves or trees), handling of bats in the field or handling bat excreta (urine or feces) presents a potential for exposure to zoonotic pathogens. Rabies, Nipah virus, Ebola virus, and the fungal disease histoplasmosis are examples of zoonotic pathogens carried by some bat species. Bat bites, scratches and wound and mucous membrane exposure to bat saliva are the ways in which rabies can be transmitted. Spores of histoplasmosis can be present in soil and debris enriched with bird and bat droppings. When this dry soil is disturbed, spores can become airborne and cause infection by inhalation.

Special Precautions:

- When working around bats in enclosed spaces, such as in a cave, wear at a minimum an N95 respirator, goggles, gloves and Tyvek coveralls (or dedicated long-sleeved clothing).
- Personnel who are handling animals such as bats should be immunized against rabies virus and be aware of appropriate post exposure prophylaxis in the case of bites according to World Health Organization and CDC recommendations.

Non-Human Primates

Non-human primates may be infected with a number of potentially serious zoonoses. For example, all macaque monkeys and their fluids should be considered to be infected with **Herpes Simian B virus**. Marmosets, although they do not carry the herpes B virus, can carry other disease agents that affect humans such as lymphocytic choriomeningitis virus and *Trypanosoma cruzii*, the cause of Chagas' disease. It is critical that work with non-human primates be done while wearing the appropriate personal protective equipment and with the well-established safe protocols and procedures.

Special Precautions:

- Personnel must follow strict hygiene procedures. Frequent and thorough hand washing, although too often overlooked by the staff, is critical to physically remove bacterial contamination and prevent ingestion exposure.
- PREDICT personnel must wear the minimum PPE for handling non-human primates as specified in the PREDICT PPE Use Guide. This includes an N95 mask, eye-protection, gloves and coveralls or clean dedicated clothing.

Biosafety Levels and Practices

General

All laboratories handling biological agents must post signage indicating that the site is a potential biological hazard area, and identifying all agents in use. Supervisors shall ensure that employees are informed of biological hazards and that suitable biosafety controls are in place. Country Coordinators and lab and field supervisors managing surveillance and other field and laboratory activities should ensure that appropriate biosafety practices are implemented by personnel. Biological safety cabinets are to be certified annually.

It is important to know the biosafety level of the disease that you are working with before beginning work, so that the correct precautions can be taken.

Note: All samples collected for the PREDICT project are to be handled in a Class II Biosafety Laboratory.

Basics of Biosafety Level 1

Biosafety Level 1 (BSL1) practices represent a basic level of containment that relies on standard microbiological practices and basic safety equipment and lab design for laboratories that work with defined and characterized strains of viable microorganisms not known to consistently cause disease in healthy adult humans. However, many agents not ordinarily associated with disease processes in humans are opportunistic pathogens and may cause infection in the young, the aged, and immuno-deficient or immunosuppressed individuals.

BSL-1 Standard Microbiological Practices

1. Access to work areas is limited at the discretion of the supervisor.
2. Hands must be washed after handling biological materials, removing gloves, or before leaving the laboratory.
3. No eating or drinking is allowed in the laboratory.
4. Only mechanical devices are used for pipetting.
5. Safety devices such as self-protected injection syringe or non-sharps should be used as an alternative to sharps. Sharps used should be handled and disposed of properly.
6. Activities that are likely to create splashes, sprays, or aerosols should be minimized.
7. Work surfaces should be decontaminated with 10% bleach (70% ethanol for metal surfaces) at least daily (before and after work with infectious samples) and after any spills.
8. Waste materials should be disposed of properly.
9. Secondary containment should be used when transporting bio-hazardous materials outside of the laboratory. Avoid public areas during transport.

BSL-1 Safety Equipment (Primary Barriers)

1. BUTTONED lab coats should be worn to protect street clothes.
2. Barrier (preferably non-latex) gloves should be worn, particularly if hands have broken skin or a rash.
3. Appropriate eye/face protection (safety goggles as a minimum) should be worn if splashes or sprays are anticipated, or if wearing contact lenses during lab work.

BSL-1 Laboratory Facilities (Secondary Barriers)

1. The lab should have a sink for hand washing.
2. The lab should have an eye wash station.
3. The lab should have a door for access control.
4. The lab fixtures and floors should be easily cleaned and disinfected (no carpets or rugs); bench tops are to be impervious to water and resistant to both moderate heat and the chemicals used to decontaminate the work surface and equipment.

Note: BSL-1 is NOT APROPRIATE for PREDICT samples.

Basics of Biosafety Level 2

Biosafety Level 2 is more restrictive than BSL-1 and is suitable for work involving agents of moderate potential hazard to personnel and the environment. All PREDICT samples are to be handled in a Biosafety level 2 laboratory. It differs in that (a) laboratory personnel have specific training in handling pathogenic agents and are directed by trained technologists, (b) access to the laboratory is limited when work is being conducted, (c) extreme precautions are taken with contaminated sharp items, and (d) certain procedures in which infectious aerosols or splashes may be created are conducted in biological safety cabinets or other physical containment equipment. **All PREDICT samples are to be handled in Class II biological safety cabinets, in Biosafety level 2 laboratory.**

BSL-2 Standard Microbiological Practices

1. Personnel must wash their hands after they handle viable materials, after removing gloves, and before leaving the laboratory.
2. Eating, chewing gum, drinking, smoking, handling contact lenses, and applying cosmetics should not be permitted in the laboratory. Persons who wear contact lenses in laboratories should also wear goggles or a face shield. Food should be stored outside the work area in cabinets or refrigerators designated for this purpose only.
3. Only mechanical pipetting devices are used for pipetting.
4. Policies for safe handling of sharps (when non-sharps are not available) should be instituted.
5. All procedures should be performed carefully to minimize the creation of splashes or aerosols.
6. Work surfaces should be decontaminated with 10% bleach (70% ethanol for metal surfaces) at least once a day (before and after working with infectious samples) and after any spill of viable material.

7. All cultures, stocks, and other regulated wastes are disposed of in the biohazard trash by placing them in a durable, leak-proof container, closed for transport from the laboratory, and transferred to the designated receptacle for disposal. Materials to be decontaminated at off-site locations from the laboratory should be packaged in accordance with applicable local, state, and federal regulations, before removal from the facility.

BSL-2 Special Practices

1. Access to the laboratory is limited or restricted by the laboratory supervisor when work with infectious agents is in progress. In general, persons who are at increased risk of acquiring infection, or for whom infection may be unusually hazardous are not allowed in the laboratory. Persons who are immuno-compromised, immunosuppressed, pregnant or at higher risk of acquiring infections, should not be permitted in the laboratory.
2. The laboratory director establishes policies and procedures whereby only persons who have been advised of the potential hazard and meet specific entry requirements (e.g., immunization) enter the laboratory.
3. Laboratory personnel receive appropriate immunizations or tests for the agents handled or potentially present in the laboratory (e.g., hepatitis B vaccine or TB skin testing).
4. A high degree of precaution must always be taken with any contaminated sharp items, including needles and syringes, slides, pipettes, capillary tubes, and scalpels.
    - Only needle-locking syringes or disposable syringe-needle units (i.e., needle is integral to the syringe) are used for injection or aspiration of infectious materials. Used disposable needles must not be bent, sheared, broken, recapped, removed from disposable syringes, or otherwise manipulated by hand before disposal; rather, they must be carefully placed in conveniently located puncture-resistant containers used for sharps disposal. Non-disposable sharps must be placed in a hard-walled container for transport to a disposal area.
    - Broken glassware must not be handled directly by hand, but must be removed by mechanical means such as a brush and dustpan, tongs, or forceps. Containers of contaminated needles, sharp equipment, and broken glass should be decontaminated with 10% bleach before disposal, according to any local, state, or federal regulations.
5. Cultures, tissues, or specimens of body fluids are placed in a container that prevents leakage during collection, handling, processing, storage, transport, or shipping.
6. Laboratory equipment and work surfaces should be decontaminated with an appropriate disinfectant (such as 10% bleach) on a routine basis, before and after work with infectious materials is finished, and especially after overt spills, splashes, or other contamination by infectious materials. Contaminated equipment must be decontaminated according to any local, state, or federal regulations before it is sent for repair or maintenance or packaged for transport in accordance with applicable local, state, or federal regulations, before removal from the facility. Bleach (10%) can be used on all non-steel surfaces; however, 70% ethanol or other recommended disinfectant should be used when those chemicals are not available.

7. Spills and accidents that result in overt exposures to infectious materials should be reported immediately to the laboratory director. Medical evaluation, surveillance, and treatment should be provided as appropriate and written records should be maintained.

BSL-2 Safety Equipment (Primary Barriers)

1. **Properly maintained biological safety cabinets, Class II,** and other appropriate personal protective equipment or physical containment devices **should be used**.

Procedures with a potential for creating infectious aerosols or splashes are a hazard. These may include centrifuging, grinding, blending, vigorous shaking or mixing, sonic disruption, opening containers of infectious materials whose internal pressures may be different from ambient pressures, inoculating animals, and harvesting infected tissues from animals, eggs or cell cultures.

2. Face protection (goggles, mask, face-shield or other splatter guards) should be used for anticipated splashes or sprays of infectious or other hazardous materials to the face, when the microorganisms must be manipulated outside of the biosafety cabinet.
3. Protective laboratory coats, gowns, smocks, or uniforms designated for lab use should be worn while in the laboratory. This protective clothing should be removed and left in the laboratory before leaving for non-laboratory areas (e.g., cafeteria, library, administrative offices). All protective clothing should be disposed of either in the laboratory or laundered by the institution; it should never be taken home by personnel.
4. Gloves (nitrile or latex) should be worn when hands may contact infectious materials, contaminated surfaces or equipment. Wearing two pairs of gloves may be appropriate, if a spill or splatter occurs; the hand will be protected after the contaminated glove is removed. Gloves should be removed and disposed of when contaminated, removed when work with infectious materials is completed, and should not be worn outside the laboratory. Disposable gloves are not washed or reused.

BSL-2 Laboratory Facilities (Secondary Barriers)

1. Each laboratory should contain a sink for hand washing.
2. The laboratory is designed so that it can be easily cleaned and disinfected. Rugs in laboratories are not appropriate, and should not be used because proper decontamination following a spill is extremely difficult to achieve.
3. Bench tops are impervious to water and resistant to acids, alkalis, organic solvents, and moderate heat.
4. Laboratory furniture is sturdy, and spaces between benches, cabinets, and equipment are accessible for cleaning.
5. An eyewash facility is readily available.
6. The laboratory should be at negative pressure with respect to areas outside the lab. Hoods and biosafety cabinets should be positioned away from doors, supply vents and air conditioner airflow.

Biosafety Level 3

Biosafety Level 3 is applicable to working with indigenous or exotic agents, such as brucella and tuberculosis, that may cause serious or potentially lethal disease through the inhalation route of exposure. Laboratory personnel must receive specific training in handling pathogenic and potentially lethal agents, and must be supervised by scientists competent in handling infectious agents and associated procedures. All procedures involving the manipulation of infectious materials must be conducted within a BSC (preferably Class II or Class III), or other physical containment devices. A BSL-3 laboratory has special engineering and design features.

Biosafety Level 4

Biosafety Level 4 is required for work with dangerous and exotic agents, such as Ebola, that pose a high individual risk of aerosol-transmitted laboratory infections and life-threatening disease that is frequently fatal, for which there are no vaccines or treatments, or a related agent with unknown risk of transmission. Agents with a close or identical antigenic relationship to agents requiring BSL-4 containment must be handled at this level until sufficient data are obtained either to confirm continued work at this level, or re-designate the level. Laboratory staff must have specific and thorough training in handling extremely hazardous infectious agents. Laboratory staff must understand the primary and secondary containment functions of standard and special practices, containment equipment, and laboratory design characteristics. All laboratory staff and supervisors must be competent in handling agents and procedures requiring BSL-4 containment. The laboratory supervisor in accordance with institutional policies controls access to the laboratory.

Section 6.3.5. Medical Monitoring

The major purpose of medical monitoring is the early detection of disease or conditions for which treatment can prevent further illness. Medical monitoring is conducted to evaluate exposure to human and zoonotic diseases and unanticipated adverse health effects of exposure. It can also be a valuable tool for hazard control to monitor if initially effective control or work practice has lost effectiveness, or by detecting previously unknown exposures.

Medical consultations should take place:

- Whenever an injury occurs, such as a needlestick, or splash with contaminated material.
- Whenever an employee develops symptoms of exposure to a hazardous chemical or biological agent to which the employee may have been exposed in the laboratory.
- Whenever a spill, leak, explosion, or other occurrence results in the likelihood of an overexposure to a hazardous chemical or biological agent.
- When an employee requests a medical consultation due to health concerns related to assigned tasks and/or change in personal medical history, such as pregnancy, special medications, diagnosed hypersensitivities or other illnesses.
- When exposure monitoring results trigger medical surveillance requirements or when other regulations mandate medical consultations, such as for the use of respiratory protection.

Section 6.3.6. Medical Waste Management

Safe Sharps Disposal

The term "sharps" refers to any object that can cut or puncture the skin including, but not limited to, needles (hypodermic and suture), scalpels, lancets, broken vials or glass, broken capillary tubes, slides and coverslips, and exposed ends of contaminated wires. The primary cause of occupational exposure to blood-borne pathogens in field and laboratory personnel is injury from needlesticks or other sharp objects. At least 20 pathogens are known to have been transmitted following percutaneous exposure to blood. Infections with each of these pathogens are potentially life threatening – and preventable.

How to prevent sharp injuries:

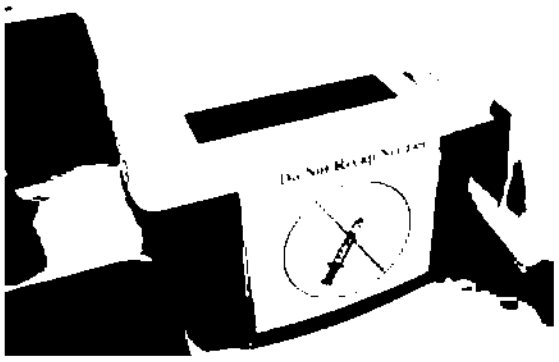
- Do not bend, break, or cut sharps. Shearing or breaking of needles is prohibited.
- Concentrate on what you are doing and do not get distracted.
- Dispose of all sharps in an approved puncture-resistant container as soon after use as possible.
- Ensure this container is placed in the area where sharps are used.
- Ideally, needle and syringe should be disposed as one unit if possible. If a needle must be removed follow the directions on the **Removal of the syringe needle** section above.
- Do not recap needles unless absolutely necessary. If recapped, never use two hands, instead use the one-hand "scoop" technique (see **Removal of the syringe needle** section above).
- Do not overfill sharps disposal container. Seal the container and replace when it is ¾ full.
- Do not empty sharps containers. Dispose of whole container as one unit.
- Wear utility gloves when disposing of medical waste including sharps containers.
- To prevent sharp injuries during transport of medical waste, use a puncture-proof container that remain closed.

Sharps Disposal Containers

Never discard needles and sharps in waste bags, as personnel might be injured when they handle the bags.

Sharp containers are available commercially or can be adapted from some containers that comply with minimal safety standards.

Commercial sharp disposal container boxes)



Non-commercial sharp disposal containers (safety

There are four major criteria for sharps disposal container safety performance, functionality, accessibility, visibility, and accommodation:

Functionality: Containers should remain in a good state during their entire usage. They should be leak-resistant on their sides and bottoms and puncture-resistant until final disposal. Individual containers should have adequate volume and safe access to the opening.

Accessibility: Containers should be accessible to all workers who use, maintain, or dispose of sharp devices. Containers should be placed in all areas where sharps are used and, if necessary, be portable within the workplace or for fieldwork. Portable containers must have a lid to prevent spills and injuries during transport or while working in the field.

Visibility: Containers should be plainly visible to the workers who use them. Workers should be able to see the warning labels and the degree to which the container is full.

Accommodation: Container designs should be convenient, environmentally sound, and easy to store.

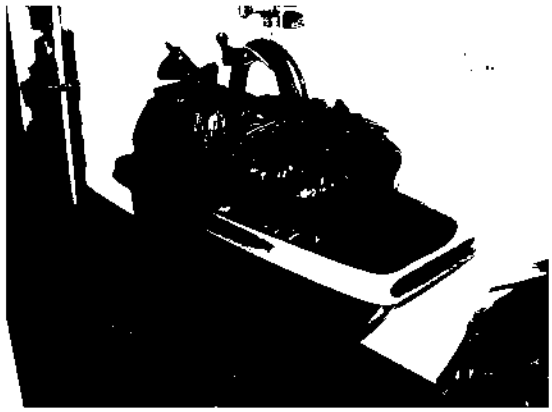
Medical Waste Disposal

Biological waste includes human and animal tissues, fluids and animal carcasses. These are generated along with the sharps and other biologically contaminated equipment that typically need to be discarded in all laboratories (e.g. pipette tips, gloves).

Animal carcasses should be bagged, sealed, and stored in freezers located in the facility until pick up for incineration.

All other biologically contaminated material should be placed in a red bag-lined medical waste box. When the medical waste box is full, it is the responsibility of the field and laboratory personnel to seal the bag, seal the box, and apply a label that contains information about the generating lab.

Medical waste container appropriate for storing and transporting biological waste



Inappropriate container and method for storing and transporting biological waste

Section 6.3.7. Special Chemical Storage and Handling Practices

Laboratory chemical storage and handling hazards can be effectively managed if you:

- Maintain good inventory control and purchase/use the least amount possible.
- Label all stored and in-process chemicals clearly and completely.
- Adopt safe handling practices.
- Use secondary containment and practice your spill response plan.
- Segregate incompatible chemicals and store them in separate appropriate cabinets or cold-storage.
- Develop special controls for highly hazardous materials.

Inventory Control

- Purchase chemicals only in the quantities needed and in containers of the smallest practical size. Although the cost may be higher, significant savings will be gained by reduced hazardous waste disposal or clean-up costs.

- Inventory your chemical supplies at least annually and actively share or distribute excess stocks with other departments to minimize waste. Dispose of all unused and outdated chemicals through appropriate hazardous waste programs.
- Products that could also be purchased for home use, such as soap, oil, or cleaning sprays, should be part of your chemical inventory and have an MSDS on file if the product will be used in an occupational setting and could cause a health exposure in the workplace.
- Before laboratory personnel leave the laboratory, all leftover chemicals should be inventoried and distributed or disposed of.

Labeling

Personnel should ensure that labels on containers of hazardous chemicals are not removed or altered, particularly the manufacturer's original label. Empty chemical containers must never be reused for another purpose, even if the labeling is changed as reactions with new liquid and residual chemical could be extremely dangerous. All bottles, containers, and other apparatus containing chemicals should be accurately and clearly labeled as to contents, hazards, and where practical, the appropriate precautions required when handling the chemical.

Avoid the use of grease pencils or other markers that will wear off.

There are three levels of complexity to labeling: original container, secondary transfer containers, and small container (vials, flask, beakers) for immediate, same-day use.

1. The manufacturer's original labels must contain the following information:
    - Name of chemical or solution
    - Manufacturer name and emergency telephone number
    - Hazard warning (health effect or target organs)

    When opening you must add:
    - Date received and opened
    - Initials

2. For laboratory-prepared solutions and when chemicals are transferred to secondary containers not intended for immediate use, labels should include:
    - Name (no abbreviations) of the chemical and its concentration.
    - For prepared solutions or any secondary containers: initial and date prepared.
    - Hazard warning on the most serious health or safety hazard posed (consult MSDS). Stickers can be applied indicating "corrosive," "carcinogen," "water-reactive," "flammable," etc.
    - If special precautions are critical, expand the hazard warning to include the target organ and the required protection (e.g., "Corrosive, esp. to skin and eyes. Use gloves and goggles").

3. Containers for immediate (same-day) use should have:
    - Chemical name and its concentration
    - Date
    - Initials

Safe Handling and Transfer

Hand-carried chemicals should be placed in unbreakable secondary containers such as bottle carriers or acid-carrying buckets. Wheeled carts used to transport chemicals should have side guards and lipped surfaces capable of containing a break, and sturdy wheels that move easily over uneven surfaces.

Staff should wear protective aprons, gloves, goggles and closed-toed shoes when transporting chemicals.

Class I flammable liquids (any liquid having a flash point below 37.7°C should not be stored or transferred from one vessel to another in an exit access corridor, open plan building, or in an ancillary space unprotected from the exit access corridor.

Transfer of Class I liquids to smaller containers from bulk stock containers not exceeding 5 gallons in capacity should be performed in a laboratory hood, in an area provided with ventilation adequate to prevent accumulations of flammable vapor exceeding 25% of the lower flammable limit, or within an inside liquid storage area approved for dispensing.

Class I liquids should not be transferred between conductive containers of greater than 1.1 gallons, unless the containers are bonded and grounded (the process of providing an electrically conductive pathway - usually by clipping connecting wires - between a dispensing container and a receiving container [bonding], and the receiving container and an earth ground).

Secondary Containment and Spill Control

Liquid chemicals should be stored in corrosion-resistant trays or on spill pallets or other secondary containment to contain a break or leak.

Concentrated acids and bases should be stored in acid or caustic storage cabinets. If possible, keep corrosives stored in their original (e.g. Styrofoam cubes) shipment containers.

In the event of a chemical spill, try to turn off all reaction apparatus, especially heat sources, notify supervision immediately and follow the response steps in your facility.

Cabinet and Shelf Storage – General Precautions

Cabinets and other storage areas should be marked with the general class of chemical stored, and any other pertinent warnings.

Storage areas should have good general ventilation and be well lighted.

On shelves, containers should be staggered for easy access, with labels facing out. DO NOT ALPHABETIZE STORED CHEMICALS; SEPARATE BY COMPATIBILITY (see next section).

Heavy and large containers are to be placed on bottom shelves. Chemicals, especially liquids, should be stored below eye level. Larger containers should be stored on lower shelves. Exposure to heat or direct sunlight should be avoided. Avoid storing chemicals on the floor unless in approved shipping containers. Minimize open shelf or bench top storage, except for those chemicals currently being used, to prevent accidental spills and reduce the risk of fires.

Cabinets specifically for corrosives (either acids or bases) should have corrosion-resistant paint. Flammable storage cabinets should provide an airtight seal; vent holes should be kept covered and flame-arrestor kept in place.

Oxidizers MUST be stored in separate cabinets from flammables and combustibles. Oxidizers, explosives, and organic peroxides must be separated from combustibles and placed in a metal cabinet, or in an approved dry, cool, and well-ventilated location.

If acids and bases must be stored together in the same cabinet, place each in separate secondary containers (non-reactive trays) on opposite sides of the cabinet to minimize intermingling in case of a spill or drip (in other words, do not store all the acids on one shelf, and all the bases on the shelf below).

Initially assign each chemical to broad hazard classes, for example: flammable, corrosive (acids and bases), reactive oxidizer or reducer, special hazard (air/water reactive, peroxide forming chemical, store at reduced temperature or under an inert atmosphere, highly toxic).

Chemicals that possess more than one hazard (i.e., oxidizer and corrosive) are assigned to the class that represents the greater hazard for that laboratory.

Post incompatibility lists (from your MSDSs) for reference.

Hazardous chemicals should be disposed of in clearly labeled containers, and as with storage, separated by class. For example, acids should not be disposed of with bases but should be separated. The same is true for corrosives and flammables.

Refrigerators and Freezers – Flammable Storage

All refrigerators or freezers should be distinctly marked as to whether they are suitable for the storage of flammable liquids.

Standard household-variety refrigerators should not be used to store flammable liquids.

Flammable liquids stored in refrigerated equipment should be in closed containers.

Storage of Chemicals by Class

Flammables and Combustibles

Flammables are chemicals that have a flash point less than 37°C (100°F). Combustible chemicals have flash points that are 37-93°C. If stored or used improperly, flammables and combustibles can be a fire hazard.

Examples of flammable liquids include benzene, alcohols, acetone, ethers, organic acids (i.e., glacial acetic acid).

The quantity of flammable/combustible hazardous chemicals within a laboratory unit or in a laboratory work area, that is stored in the open, shall be limited to the minimum necessary to perform required tasks.

Bulk supplies of alcohol (such as 95% EtOH in drums) should be stored in an approved flammable liquids storage room.

To the greatest degree possible, the storage of flammable liquids in a laboratory work area, outside of an approved flammable liquids cabinet, or storage room should be limited to what is needed for a single day's use. Otherwise, flammable liquids should be stored within an approved flammable liquids cabinet when not in use.

Corrosives: Acids

Acids are corrosive and react violently with bases. There are two main groups of acids: organic acids, and inorganic (mineral) acids. Some inorganic (mineral) acids are oxidizers and will react with organics, increase burning rate of combustibles and contribute an oxygen source to a combustion reaction. Therefore, inorganic (mineral) acids should be stored separately from organic acids.

Examples of inorganic OXIDIZING acids: perchloric acid (particularly dangerous at elevated temperature), chromic acid, nitric acid, sulfuric acid (particularly dangerous at elevated temperature).

Examples of inorganic MINERAL acids: hydrochloric acid, hydrofluoric acid, phosphoric acid.

Examples of organic acids: acetic acid, formic acid, butyric acid, propionic acid, picric acid, acrylic acid.

Oxidizing inorganic acids should be segregated from organic acids, flammable and combustible materials. Most mineral acids can be stored together, except perchloric acid (see below):

Nitric acid shall be stored separate from other acids.

Segregate acids from bases and active metals such as potassium and magnesium.

Segregate acids from chemicals that could generate toxic gases upon contact, such as sodium cyanide.

Segregate acids from solvents such as toluene and xylene.

Organic acids (e.g., glacial acetic acid) are combustible and should be stored separately or with flammables rather than with inorganic acids. Several inorganic acids are oxidizers and are therefore incompatible with organics.

Corrosives: Bases
Bases are corrosive and react violently with acids.

Examples: ammonium hydroxide, sodium hydroxide, calcium hydroxide, organic amines.

Segregate bases from acids. Bases are also corrosive to skin and tissue. Pay meticulous attention to PPE when using bases.

Reactive: Oxidizers
Oxidizers react vigorously with reducing materials. The reaction can lead to fires or explosions. Oxidizers will increase the burning rate of combustible materials and contribute oxygen to a combustion reaction.

Examples: halogens, ammonium persulfate, hydrogen peroxide, sodium dichromate, potassium permanganate, perchloric acid; at elevated temperature, ammonium nitrate (and other nitrate salts).

Keep oxidizers away from flammables, combustibles (such as paper, wood) and other reducing agents.

Reactive: Reducers
Reducing materials react vigorously with oxidizers. The reaction can lead to fires or explosions.

Examples: ammonia, carbon, metals, metal hydrides, phosphorus, silicon, sulfur.

Store reducing materials away from oxidizers.

Water-reactive Chemicals
Water reactive materials react with water, water solutions, moisture, or humidity in the air to produce heat and/or flammable gases, which can ignite.

Examples: sodium (elemental), potassium (elemental), calcium carbide, phosphorous pentachloride.

Store water reactives away from any sources of water or moisture. Review manufacturer's recommendations for special storage conditions, such as under an inert atmosphere or, as in the case of elemental sodium, under mineral oil.

Peroxide Forming Chemicals

Potentially explosive peroxides are formed by a free-radical reaction of hydrocarbons with molecular oxygen. Distillation, evaporation or other concentration of the peroxide can cause an explosion in contaminated hydrocarbons.

Examples: diethyl ether, tetrahydrofuran, acetaldehyde, isopropyl ether.

Store peroxide-forming chemicals away from light and heat. Carefully label all containers with the date received and the date opened. Monitor container dates and avoid keeping peroxide-forming chemicals on hand for more than a year after receipt and 6 months after opening.

Highly Hazardous Chemicals

Highly hazardous chemicals are defined as chemical carcinogens, reproductive toxins, acutely toxic substances, and highly reactive materials (ex. Ethidium bromide used in molecular laboratories).

Designate a Restricted Work Area. Conduct all transfers and work with these substances in a "controlled area" (i.e., a restricted access hood, glove box, or portion of a lab designated for use of highly-toxic substances) for which all personnel with access are aware of the substances being used and the necessary precautions that must be taken. Only trained and authorized personnel should work in or have access to controlled areas.

Signs and labels. Assure that the controlled area is conspicuously marked with restricted access and warning signs, such as, "WARNING: Highly-Toxic Substance in Use: Authorized Personnel Only" or "WARNING: Cancer-Suspect Agent: Authorized Personnel Only." All containers of these substances must be appropriately labeled with identity and warning such as, "Warning: High Chronic Toxicity or Cancer Suspect Agent."

Storage. Store containers of these chemicals in a ventilated, limited access area in appropriately labeled, unbreakable, chemically resistant, secondary containers.

Establish Decontamination Procedures. The need for routine decontamination of designated work area, equipment, or personnel depends on the laboratory circumstances.

Medical surveillance. When using a highly toxic substance on a regular basis (e.g., 3 times per week), consult with your supervisor concerning medical surveillance or other health concerns you may have.

Cleanup and Waste Disposal. Use chemical decontamination whenever possible. Use a vacuum cleaner equipped with a High Efficiency Particulate Air (HEPA) filter, instead of dry sweeping

when the toxic substance is a dry powder. A wet mop may also be used when the chemical is not water reactive or otherwise incompatible with water. Ensure that all vacuum filters, bag debris, mop heads or cleaning rags, as well as waste chemicals are transferred from the designated control according to a hazardous waste disposal container. Ensure that contingency plans, equipment, and materials are available to minimize exposures to personnel and property in the event of an accident. Do not ask/expect custodial staff to clean hazardous materials spills, unless they are already members of the facility's trained response team.

Hazardous Waste Disposal and Spill Control

Each container of hazardous waste is to be labeled with the following legends:

"HAZARDOUS WASTE"
Contents (be specific as to chemical):
Accumulation start date:

If a reagent container label has been removed or becomes illegible, and the identity of the contents is unknown, the container must be disposed of as soon as possible by arrangement with the facility hazardous waste coordinator.

Prior to the departure of staff, chemicals for which that person was responsible should be inventoried and discarded or returned to storage.

Pouring hazardous waste chemicals down the drain, adding them to regular trash, or evaporating them in a local exhaust hood could be illegal actions!

Section 6.3.8. Training in Basic Laboratory Procedures and Protocols

Training and education in laboratory safety need to be an ongoing process, not just an annual presentation. The most effective way to reinforce good work practices is to involve all personnel from principal researchers to volunteers in regular, periodic reviews and updates of this Basic Laboratory Safety Guide. Documentation of all forms of training is to be maintained in the laboratory as well as reported to the facility safety coordinator.

INITIAL BASIC LAB HAZARD AWARENESS TRAINING **is mandatory for all staff** and must be provided to all employees doing field and laboratory work prior to actual lab and field work, and prior to assignments involving new potential exposures. Information provided during trainings should include:

The location and availability of the Laboratory Safety Plan, chemical inventory, Material Safety Data Sheets (MSDSs), applicable regulatory exposure limits, and other reference material regarding the safe handling, storage, and disposal of hazardous chemicals (or hazardous collections) in the lab.

Signs and symptoms associated with exposures to hazardous chemicals and biological agents used in the laboratory, as well as the health hazards themselves.

Methods that may be used to detect the presence or release of a hazardous chemical. This could include industrial hygiene monitoring, the use of continuous monitoring devices, visual appearance, or odors of chemicals.

Methods employees can take to protect themselves from hazards, including work practices, personal protective equipment and emergency procedures listed in the LSP. This should include a discussion of the proper use and limitations of engineering controls and safety devices, including chemical and biological hoods.

Emergency response plans established by each facility's Emergency/Disaster Response Plan, any medical or first aid response specifically recommended, extinguishment of clothing fires (Stop, Drop, and Roll), and Chemical Spill Response Plans established by each facility.

Section 6.3.9. Basic Standards and Guide Checklists

- ☐ Coordinators should provide a "Useful Contacts" list with address and numbers of local medical and emergency response services.
- ☐ Personnel should know the locations of the emergency supplies (fire extinguishers, first aid kits, spill kits, safety showers and eye wash stations), phone numbers of supervisor and exits.
- ☐ Coordinators must verify that a Material Safety Data Sheet (MSDS) for each product to be used during PREDICT activities is readily available, complete and updated.
- ☐ Personnel should know where the MSDSs are located.
- ☐ Coordinators must ensure that personnel have read and understood the MSDS before using a chemical product
- ☐ Coordinators must have MSDS data available for emergency responders.
- ☐ Individuals that have been exposed to any hazardous chemical or biological agent should immediately report the exposure to medical authorities and supervisor.
- ☐ A complete list with the contents of the PPE kit should be available to the personnel.
- ☐ Personnel should wear appropriate PPE (lab-coat, protective glasses, gloves, closed toed shoes) for laboratory procedures.
- ☐ Inspect your PPE to ensure that it is in proper working condition before use (goggles, gloves, etc.).
- ☐ If you are working with PPE kits, ensure that the kit is stocked and material has not expired.
- ☐ Personnel must use a chemical, fume or laminar flow hood when indicated.
- ☐ All needles, scalpel blades and any other sharp instruments should be used and disposed of in a manner that prevents accidental human injury.
- ☐ All stored and in-process chemicals should be labeled clearly and completely.
- ☐ Segregate incompatible chemicals and store in appropriate cabinets or special cold-storage.
- ☐ Develop special controls for highly hazardous materials.
- ☐ Purchase chemicals only in the quantities needed and in containers of the smallest practical size.
- ☐ Inventory your chemical supplies at least annually and actively share or distribute excess stocks with other departments.
- ☐ Dispose of all unused and outdated chemicals through appropriate hazardous waste programs and NOT down the drain or by adding them to regular trash.
- ☐ Sinks and eye wash stations should be kept clear and in proper working condition.
- ☐ Staff should wash their hands and forearms after they have removed and disposed their PPE or after removing gloves.
- ☐ Food and beverages are NOT allowed in any of the labs.
- ☐ Report any lab failure (equipment, facilities, etc.) to the supervisor.
- ☐ Staff should keep BUTTONED lab coats at all times when working in the laboratory.
- ☐ All human and animal tissues, fluids and excrement should be handled in a Class II Biosafety Cabinet so that the potential for human exposure is minimized.
- ☐ Specific Biosafety levels 1 and 2 practices should be followed by personnel as warranted.
- ☐ Personnel must be familiar with hazard controls and safe operating procedures.

Section 6.3.10. List of Equipment and Supplies

- [ ] Lab-coat
- [ ] Nitrile gloves ideal, latex if not available
- [ ] Face-mask
- [ ] Goggles
- [ ] Face-shield
- [ ] Closed toed shoes
- [ ] Disposable (Tyvek) suit
- [ ] Sharp-container
- [ ] Medical waste box
- [ ] Respirator
- [ ] PPE Kits or Supplies
- [ ] Eyewash station
- [ ] Liquid nitrogen gloves

Section 4. Biosafety and Personal Protective Equipment (PPE) Use

Prepared by
Terra Kelly, UC Davis
Matthew LeBreton, Metabiota
and the PREDICT One Health Consortium.

Objective: To provide principles and general guidelines for the use of Personal Protective Equipment (PPE) to prevent exposure to and transmission of infectious pathogens during PREDICT activities.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Suggested Citation Form: PREDICT One Health Consortium 2016. PREDICT Operating Procedures: Biosafety and Personal Protective Equipment (PPE) Use.

Table of Contents: Biosafety and Personal Protective Equipment (PPE) Use

*Adapted from the *USAID STOP-AI Training Module: Introduction to PPE*

Section 4.1. Learning Objectives and Confirmation

After studying this guide, you will be able to:

- Implement basic biosafety precautions.
- Describe the factors to consider when assessing the biological risk of handling animals and collecting human and animal samples, and other field and laboratory activities that may have potential risk for zoonotic disease exposure.
- Understand factors to consider when choosing appropriate PPE based on identified risks.
- Identify and describe the functions of each component of PPE.
- Correctly put on and take off appropriate PPE for PREDICT sample collection and handling activities in a non-outbreak setting. For collecting samples from hospital and clinic patients and during disease outbreaks, specific PPE components and procedures to put on and take off PPE should be adapted based on the determined risk level.
- Describe the importance of respirator fit and fit testing.

Confirm you understand the material of this guide:
When you are familiar with the information in this guide, take the PREDICT quiz in ***Section 8.4.3. Biosafety and PPE Use***.

Section 4.2. Biosafety Overview

Personal Safety Responsibilities

- Individuals have the primary responsibility for their own health and safety. Nothing substitutes for good training and vigilance.
- Follow safety procedures outlined in PREDICT protocols regarding each activity that involves potential exposure to infectious pathogens.
- Use appropriate safety equipment.
- Report unsafe or hazardous situations, injuries, and accidents immediately to your supervisor or instructor.
- Report any illness to your PREDICT supervisor.
- Participate in required safety training.

Follow PREDICT waste disposal procedures (see ***Basic Laboratory Safety (Section 6.3.)*** *and* ***Safe Disposal of Carcasses and Infectious Waste Guide (Section 2.5.)***) consistent with the ***PREDICT Environmental Mitigation and Monitoring Plan (Section 2.4.)***.

Responsibilities of the Country Coordinator and Field Supervisors

- Provide and document training for all personnel who will participate in PREDICT project activities.
- Ensure compliance with relevant PREDICT or organizational task protocols.
- Ensure compliance with the PREDICT Environmental Mitigation and Monitoring Plan.
- Ensure compliance with local permit requirements and regulations.
- Report injuries/accidents and ensure compliance with associated mitigation.
- Ensure that all field personnel are trained on the safe use of field equipment.

General Zoonoses Biosafety Precautions

There is a risk of exposure to pathogens, including zoonotic pathogens, when handling animals, and human and animal samples in the field. Therefore, it is important to implement measures to minimize the risk of pathogen transmission.

The following list of general precautions applies to most situations:

- Inform all who enter potential zoonotic pathogen risk areas of their potential for exposure and the associated risks.
- Review information regarding the zoonotic agents likely to be found in the samples or animals to which you or others may be exposed.
- Wear the appropriate PPE based on protocols for the activity and species and as directed by the Country Coordinator or Field Supervisor.
- Use disposable supplies whenever possible.
- Wash hands and wrists after removing your gloves.
- Don't wear field or lab clothing or shoes outside of work areas where there may be zoonotic pathogen exposure. Change clothing and shoes before getting into your vehicle.
- Launder contaminated protective clothing at work. Don't take your protective clothing home with you.
- Never eat or drink in areas where human sampling, animals, their wastes, or their products (e.g., blood) are present.
- Wash your hands frequently and practice good hygiene. Avoid touching your face while working with animals, human and animal samples, or other sources of pathogens. Although a normal, healthy adult person may have only mild symptoms of a zoonotic disease, that person may unknowingly spread the disease to others. Unfortunately, animal handlers have "carried home" zoonotic pathogens to their infants with fatal consequences. Therefore, good hygiene is not only to protect the person working directly with human and animal samples; but it is also for all persons and animals with whom they have contact.
- When seeking medical advice for any illness, inform your physician of your work with humans and animals.
- Make sure a first aid kit is immediately available during all field and laboratory activities.
- Refer to established procedures for how to respond to a bite, cut, scratch, puncture or other injury that results in possible zoonosis exposure.

- Refer to established procedures for disinfecting all equipment, samples, cages, and traps according to guidance provided below.

Hand Washing - Teach and Practice Good Hand Washing Technique

The importance of hand washing in preventing infection and the spread of infectious pathogens cannot be over emphasized.

Always wash your hands before:

- Putting on PPE for handling animals or collecting or handling human and animal samples
- Contact with a sick or injured person or animal
- Treating wounds or administering medications
- Preparing food
- Eating
- Inserting or removing contact lenses

Always wash your hands after:

- Taking off PPE
- Touching an animal, human and animal samples, waste, products or animal equipment
- Collecting and handling diagnostic samples
- Visiting field sampling sites or clinics/hospitals
- Preparing foods, especially raw meat or poultry
- Using a toilet
- Changing a diaper
- Blowing your nose, coughing or sneezing into your hands
- Treating wounds
- Touching a sick or injured person
- Touching garbage or other potentially contaminated materials
- Finishing work in the laboratory

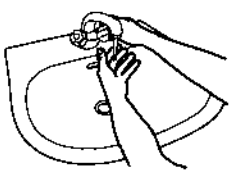
Plan for hand washing:

- Plan for hand washing in the field by identifying any locations with running water near the site and bringing supplies (i.e., water, soap, bucket, paper towels, hand sanitizing gels and germicidal wipes that contain at least 60% alcohol)
- Plan when you will need to wash to ensure supplies are ready and available

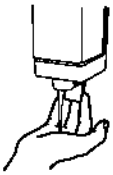
See the WHO guidelines below for proper hand washing technique. If soap and water are not available, use an alcohol-based hand sanitizing gel that contains at least 60% alcohol. These products significantly reduce the number of microbes on the skin and are fast acting. However, they are not effective if hands are visibly dirty. Organic matter and natural oils on hands create a barrier that blocks the effectiveness of the sanitizer. See http://www.cdc.gov/handwashing/show-me-the-science-hand-sanitizer.html for more information.

How to Hand

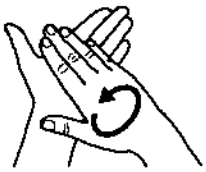
Duration of the entire procedure:



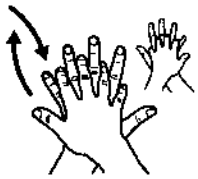
Wet hands with water;



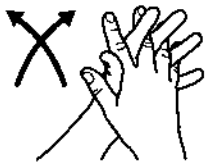
Apply enough soap to cover all hand surfaces;



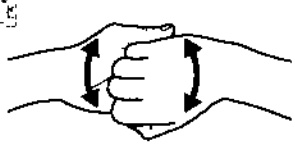
Rub hands palm to palm;



Right palm over left dorsum with interlaced fingers and vice versa;



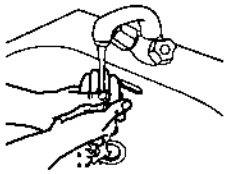
Palm to palm with fingers interlaced;



Backs of fingers to opposing palms with fingers interlocked;

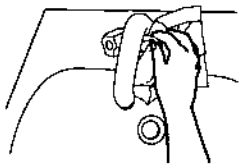
Rotational rubbing of left thumb clasped in right palm and vice versa;

Rotational rubbing, backwards and forwards with clasped fingers of right hand in left palm and vice versa;

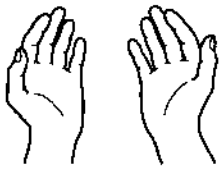


Rinse hands with water;

Dry hands thoroughly with a single use towel;



Use towel to turn off faucet;



Your hands are now safe.

Disinfection of Surfaces and Materials

Dirt and organic matter can protect microbes from decontaminants (antiseptics, chemical germicides and disinfectants). Therefore, precleaning contaminated surfaces as well as reusable supplies, equipment and PPE is important to achieve proper disinfection. Precleaning should be carried out cautiously to avoid exposure to pathogens.

Contact times for disinfectants are specific to the type of solution and the manufacturer. Therefore, it is important to follow the manufacturers' specifications. Further, solutions used for precleaning and disinfection should be the same or chemically compatible.

There are several types of disinfectants on the market and formulations should be selected for specific needs. High temperatures can degrade chemical disinfectants, so shelf-life may be decreased in areas with high ambient temperatures.

Chlorine bleach or Virkon disinfectant solution are commonly used as general-purpose disinfectants. See the WHO Laboratory Biosafety Manual (http://www.who.int/csr/resources/publications/biosafety/en/Biosafety7.pdf) for frequently used classes of disinfectants, with general information on their applications and safety profiles, as well as recommended dilutions for chlorine-releasing compounds, such as chlorine bleach.

Section 4.3. Assessing Biosafety Risk of Zoonotic Pathogens and Selecting PPE

Key to the practice of biosafety is assessing the risk of infection associated with a specific procedure under specific environmental conditions. There are many considerations in the assessment of risk and it is the job of the supervisor to weigh these considerations to determine the appropriate measures to protect humans and animals from infection.

Factors to Consider when Assessing Biological Risk of Procedures to Determine Necessary PPE

1. Species to be handled and sampled.
2. Pathogens likely to be present in these species/samples.
3. Pathogenicity of these pathogens (see WHO classification of infective microorganisms by risk group below).
4. Potential exposure opportunities and routes of infection for the pathogens given the planned activity.
5. Potential result of exposure to the pathogens.
6. Estimated infectious dose and stability of the pathogens in the environment.
7. Information available in the literature, including animal studies and clinical reports that would help inform on risk.
8. Measures to reduce the risk of exposure, such as sanitary measures (e.g., food and water hygiene) and control of animal reservoirs or arthropod vectors, the movement of people or animals, and the importation of infected animals or animal products.
9. Local availability of effective prophylaxis and treatment. Prophylaxis may include vaccination or antisera. Treatment options may include passive immunization and post-

exposure vaccination, antibiotics, and chemotherapeutic agents, taking into consideration the possibility of the emergence of resistant strains.

Based on the risk assessment considering the factors listed above, the following should be determined by the PREDICT activity supervisor (often Country Coordinators):

1. Hazards and risk of exposure.
2. Appropriate PPE required to implement the activity safely and to prevent transmission of infectious pathogens. (Components of PPE to consider are discussed later in this document).
3. Special procedures, such as disinfection procedures between handling individual animals and people or between site visits, that may be required to reduce risk of transmission and provide adequate protection for humans and animals.
4. Vaccinations or prophylaxis required for PREDICT personnel before the activity.

World Health Organization (WHO) Classification of Infective Microorganisms by Risk Group (2004)

WHO provides the guidelines below for classifying biological risk categories, based on pathogenicity of the organism and modes of transmission and host range of the organism. These primary factors are affected by existing levels of immunity, density and movement of host population (human or animal), presence of appropriate vectors and environmental conditions, and availability of effective preventive measures and treatment. Countries usually adopt a similar set of risk categories. The WHO risk group classification was developed for laboratory work. See **http://www.absa.org/riskgroups/** for more information and a link to the Risk Group Database where information on risk can be obtained for specific microbes and/or microbe families.

The WHO risk categories are:

WHO Risk Group 1 (no or low individual and community risk) -- A microorganism that is unlikely to cause human disease or animal disease.

WHO Risk Group 2 (moderate individual risk, low community risk) -- A pathogen that can cause human or animal disease but is unlikely to be a serious hazard to laboratory workers, the community, livestock or the environment. Laboratory exposures may cause serious infection, but effective treatment and preventative measures are available and the risk of spread of infection is limited.

WHO Risk Group 3 (high individual risk, low community risk) -- A pathogen that usually causes serious human or animal disease but does not ordinarily spread from one infected individual to another. Effective treatment and preventive measures are available.

WHO Risk Group 4 (high individual and community risk) -- A pathogen that usually causes serious human or animal disease and that can be readily transmitted from one individual to another, directly or indirectly. Effective treatment and preventive measures are not usually available.

Appropriate PPE for PREDICT Activities

While PREDICT field staff will be working in very different environments with varying levels of biological risk, there are some tasks for which **minimum PPE requirements** have been established and detailed in Table 1.

Table 1. Minimum PPE to wear for some PREDICT Tasks:

Taxa/Task	Respirator (N95 or respirator with comparable filtering rating	Goggles, Face shield or protective glasses	Gloves*	PPE Coveralls or Dedicated Clothing with washable shoes
Handling human and animal specimens	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Handling primates (live or carcass)	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Handling rodents or bats (live or carcass)	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Sampling in bat caves	Yes	Yes	Yes	PPE coveralls
Sampling or necropsy of sick/dead animals	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing) with apron
Sampling bushmeat	Yes	Yes	Yes	Yes (either PPE coveralls or dedicated clothing) with apron
Handling poultry or waterfowl	Yes	Yes	Yes	Yes (either PPE or coveralls or dedicated clothing)
Handling livestock	Depends**	Depends**	Yes	Yes (either PPE or coveralls or dedicated clothing)
Sampling apparently healthy humans	Depends***	Depends***	Yes	Depends***
Collection of animal feces or urine from the environment	Depends****	Depends****	Yes	Depends****
Sampling an animal once it has been anesthetized	Recommended if in close contact with the animal during sampling activity	Recommended for those in close contact with the animal during sampling activity	Yes	Yes (either PPE or coveralls or dedicated clothing)

Table Definitions

* When handling live animals that pose a bite or scratch risk, it is recommended that leather gloves be worn above nitrile gloves for added protection. Nitrile gloves are more puncture resistant than latex and may reduce the risk of exposure from a bite or scratch. In many cases chemical restraint (anesthesia) is recommended to prevent injury to either the handler or the animal during sample collection.

** It is recommended to use a respirator, full protective clothing and eye protection when in contact with livestock suspected of harboring a biohazardous agent and pregnant livestock or livestock recently giving birth, and upon entering and/or working in abattoir settings or other settings where livestock are being slaughtered and/or butchered.

*** For routine sample collection from apparently healthy people, gloves are recommended. For collecting samples from hospital and clinic patients and during outbreaks, PPE should be adapted based on the determined risk level.

**** In some cases, such as during the collection of urine underneath a colony of fruit bats roosting in trees where there is a high risk of aerosolizing of excreta and microbial agents, then it is recommended to use a respirator (N95 respirator is recommended as the minimum level of protection), full protective clothing and eye protection.

Higher Risk Taxa

Below is a summary of special biosafety considerations for some of the key groups of species (bats, rodents, and non-human primates) to be handled as part of PREDICT activities.

Rodents, bats, non-human primates and other wild species may harbor pathogens that are transmittable to, and highly pathogenic in, humans. When handling these rodents, bats or non-human primates, careful consideration needs to be given to conscientious use of PPE, good personal hygiene (i.e., hand washing), safety training, and application of good animal handling and sampling techniques to minimize exposure to infection or injury.

In the event of an injury while handling animals that pose risk of zoonotic pathogen exposure, appropriate first aid must be applied. The risk of infection can be significantly reduced with immediate and thorough scrubbing of the wound with soap or antiseptic.

Vaccination to prevent rabies infection: Personnel who are handling animals that are known reservoirs for rabies (i.e., bats and dogs) should be immunized against rabies virus according to World Health Organization and CDC recommendations.

Investigators should familiarize themselves with known biohazards specific to species under study and with the procedures for the isolation and control of zoonotic pathogens.

Specific considerations with regard to working with rodents, bats and non-human primates are discussed below:

Rodents

Wild rodents have the potential to carry a variety of zoonotic bacteria and viruses that can be passed on to those handling them. Because of the serious consequences of becoming infected, personnel must always follow good personal hygiene and animal handling procedures and use the provided PPE to protect against exposure.

Special Precautions:

- Wear the minimum PPE for handling rodents including an N95 mask, eye-protection, gloves and coveralls, or clean dedicated clothing.
- Personnel who are handling animals should be immunized against rabies virus according to the World Health Organization and CDC recommendations.

Bats

Exposure to wild bat roosts (in caves or trees), handling of bats in the field or handling bat excreta (urine or feces) presents a potential for exposure to zoonotic pathogens. Rabies, Nipah virus, Ebola virus, and the fungal disease histoplasmosis are examples of zoonotic pathogens carried by some bat species. Bat bites, scratches and wound and mucous membrane exposure to bat saliva are the ways in which rabies can be transmitted. Spores of histoplasmosis can be present in soil and debris enriched with bird and bat droppings. When this dry soil is disturbed, spores can become airborne and cause infection by inhalation.

Special Precautions:

- When working around bats in enclosed spaces, such as in a cave, wear at a minimum an N95 respirator, goggles, gloves and Tyvek coveralls (or dedicated long-sleeved clothing).
- Personnel who are handling animals such as bats should be immunized against rabies virus and be aware of appropriate post exposure prophylaxis in the case of bites according to World Health Organization and CDC recommendations.

Non-Human Primates

Non-human primates may be infected with a number of potentially serious zoonoses. For example, all macaque monkeys and their fluids should be considered to be infected with **Herpes Simian B virus**. Marmosets, although they do not carry the herpes B virus, can carry other disease agents that affect humans such as lymphocytic choriomeningitis virus and *Trypanosoma cruzii,* the cause of Chagas' disease. It is critical that work with non-human primates be done while wearing the appropriate personal protective equipment and with the well-established safe protocols and procedures.

Special Precautions:

- Personnel must follow strict hygiene procedures. Frequent and thorough hand washing, although too often overlooked by the staff, is critical to physically remove bacterial contamination and prevent ingestion exposure.
- PREDICT personnel must wear the minimum PPE for handling non-human primates including an N95 mask, eye-protection, gloves and coveralls or clean dedicated clothing.

Section 4.4. Use and Disposal of PPE

Considerations When Using PPE

Personnel wearing PPE may experience heat stress and general discomfort in hot or humid environments. It is important to remain hydrated by drinking adequate water before and after wearing PPE. Length of time wearing full PPE should be limited, based on environmental conditions, to avoid the risk of heat exhaustion or heat stroke. Personnel should inform their supervisor(s) if they experience severe discomfort during animal capture or sampling activities, so that they may take a break.

When workers are heat-stressed, uncomfortable, or unable to see out of their fogged goggles, they are more likely to remove their goggles or mask in risky environments, exposing themselves to potential pathogens.

Most PPE items to be worn during PREDICT activities are disposable and designed to be used only once, and should be properly disposed of as medical waste after each use. Plastic goggles and rubber boots may be re-used, but must be disinfected between each use.

Designate a clean area for putting on PPE. It should ideally be a clean area away from any potentially contaminated animal equipment, such as cages, crates, or farm tools. All personnel should use this area to put on their PPE. Also, designate a decontamination and PPE removal site.

Always wear the respirator properly when you are working. Ensure that there is a tight seal formed around the mask and never hang it around your neck.

When wearing coveralls, ensure there is no exposed skin between your sleeves and gloves. If any piece of PPE is torn, it should be changed at the PPE decontamination site as soon as possible following the steps outlined in the section on how to take off PPE.

It is beneficial to have a colleague confirm that PPE is properly worn. Working in teams when putting on and removing PPE can help avoid mistakes and react immediately if accidents occur.

Planning and Preparations for PPE Use

1. Prior to going to the field, the level of risk for the field tasks and the appropriate PPE needed to safely perform the field tasks should be determined.
2. PPE kits should be assembled for each person who will be involved in the field tasks. Multiple kits per person may be required, based on the number of animals to be handled, the number of breaks that personnel may take, and to account for potential tears in gloves and coveralls, etc.
3. Prior to going to the field, PPE supplies should be organized. Along with required sets of PPE, supplies should include disinfectants, alcohol-based hand sanitizing gel and germicidal wipes, large color coded bags for infectious waste disposal according to national codification, and collection bags for equipment (such as plastic goggles, face shields and rubber boots) that will be disinfected for re-use.
4. Bottled water should be available for consumption before and after use of PPE. PPE can be very hot, and personnel are more likely to suffer heat stress if they do not consume adequate amounts of water.
5. Bring additional tape and extra collection and disposal bags. Tape can be used to secure shoe covers and protective clothing and seal bags.
6. Plan for disposing of PPE:
    a. An area for removing PPE should be identified. This area should be away from the contaminated area and away from animals. All personnel should use this area to remove their PPE.
    b. Remove all of your PPE carefully, following the recommended steps for PPE removal (below) and discard them (or put reusable items in bags for disinfection) before taking a break. Put on a new set after the break.
    c. Immediately after removing PPE, place it directly into the color coded infectious waste bag (or marked biohazard waste bag).
    d. Color coded infectious waste bags should be sealed and properly disposed. Follow the instructions of the local officials or person supervising the work on where to dispose infectious waste bags when they are full.
    e. Disposal methods (such as burning or burial) may differ by situation or location. Local officials and/or those supervising the work will likely decide on how best to dispose of used PPE and other disposable items that are potentially contaminated. For guidelines, see PREDICT Safety Guide: Laboratory Operations, Environmental Guidelines for Small-Scale Activities in Africa (EGSSAA) Ch. 8: Healthcare Waste: Generation, Handling, Treatment and Disposal (http://www.encapafrica.org/egssaa/medwaste.pdf); and WHO Safe Management of Wastes from Health-Care Activities (http://www.who.int/water_sanitation_health/medicalwaste/wastemanag/en/).

Components of PPE Kits

1. Coveralls, dedicated clothing and shoes, and aprons – for high-risk tasks, full coverage may be warranted. In that case, Tyvek or Tychem coveralls, shoe covers or boots, and an apron may be used. For lower-risk tasks, just an apron and/or dedicated clothing and shoes may be appropriate. An apron should be a disposable type that is properly disposed of together with

gloves and masks after each use. Dedicated clothing (e.g., cotton coveralls) at the work site should be removed and laundered after each use.

Regarding the use of Tyvek or Tychem coveralls:

- Wear these coveralls to protect your skin and/or clothing against contamination when in contact with human samples, animal droppings, dust, animal urine or droppings, or animal fluids such as blood, saliva, and mucous.
- The synthetic material Tyvek is water resistant and Tychem is water proof, so even if the coveralls get dirty or wet, they will offer protection. Tychem offers more protection from liquids and should be considered in situations with high risk of exposure to blood-borne pathogens (e.g., hemorrhagic disease, EVD outbreak investigations).
- You can wear your dedicated shoes and clothing under the coveralls.

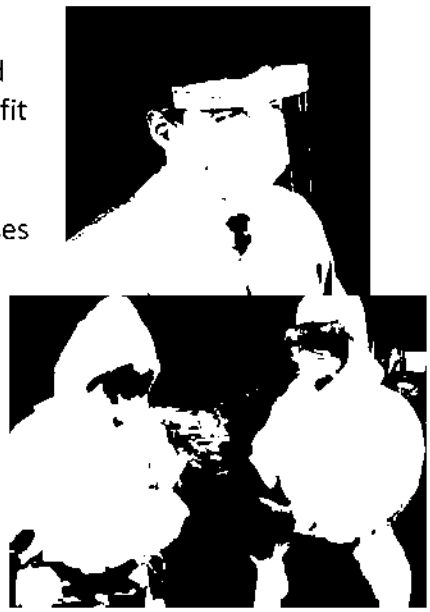
2. Shoe Covers or Washable Rubber Boots

- Because pathogens in human and animal samples including feces, secretions, or blood can easily contaminate your footwear, it is important to have disposable shoe covers or rubber boots that can be disinfected.
- The shoe covers provided in some PPE kits fit over your coverall feet, or over your shoes.
- Rubber boots may be worn with dedicated pants pulled over the top of them. If using PPE coveralls with rubber boots, purchase the coveralls without feet (or cut the feet off) and pull the pant legs of the coveralls over the top of the boots.
    - A footbath should be prepared with either chlorine bleach or Virkon disinfectant. This can be used to disinfect boots and other footwear upon leaving the field site. A boot brush should be available for scrubbing surfaces of footwear prior to using the footbath. It is critical to remove all organic material from footwear prior to disinfection to ensure effectiveness of disinfectants.

3. N95 Respirator

- N95 respirators (masks) protect you from inhaling droplet or aerosolized pathogens into your nose and lungs. Surgical masks are not respirators. They do not protect against aerosol and small droplets. They filter out large-size particles in the air and offer protection from large droplets and direct contact.
- There are several different models, styles, and sizes of N95 and comparable respirators that fit a variety of face shapes and sizes. Each person requiring a respirator for PREDICT activities should be individually fit tested to identify a respirator that appropriately and comfortably fits her or his face.
- Respirators with exhalation valves are generally more comfortable as the exhalation valve prevents resistance to exhalation when the filters load with dust.
- See ***Section 4.5*** on respirator use to learn more about respirators and fit testing.

4. Goggles and Face Shields



- Goggles protect your eyes from splashes and liquids.
- They are adjustable to ensure the best fit. Adjust the head strap before putting on all of the PPE. The goggles should fit snuggly over and around your eyes.
- Personal glasses are not a substitute for goggles or safety glasses; if you wear eyeglasses, the goggles or safety glasses should be placed over them.
- If ordering goggles, be sure to order fog-free goggles. If they are not fog-free, they are likely to fog up in a few minutes, rendering them useless. If all you have are non-fog-free (regular) goggles, you may rub a little soapy water on the inside of the lens prior to use to reduce fogging.
- Goggles (and rubber boots) are one of the few components that may be re-used if disinfected properly after each use.

5. Gloves

- Nitrile gloves are best for use for infectious agent exposure protection. **Gloves are a component of minimum PPE required for sample collection and handling tasks conducted under PREDICT.**
- Two pairs of nitrile gloves are recommended when using sharps.
- Heavy rubber gloves or leather gloves may be required when handling animals and can be worn over the nitrile gloves. PREDICT teams have good success with Hexarmor Hercules 400R6E gloves.

6. Disinfecting Wipes and Alcohol-based Hand Sanitizing Gel (at least 60% alcohol) -- for disinfecting gloves and hands.

- Disinfecting wipes that contain at least 60% alcohol should be used to clean your gloves and other PPE before removing them.
- Alcohol-based wipes or hand sanitizing gel can be used to clean areas of skin that may have been contaminated. It is critical to remove organic material before using sanitizers to ensure effectiveness of disinfectant.
- It is recommended that you ALWAYS disinfect and wash your hands after removing gloves, regardless of contamination.

7. Infectious Waste Bag—for the safe disposal of PPE and other medical waste.

- A color coded infectious waste bag (or otherwise labeled biohazard bag) should be available at the field site for containing and disposing of used PPE items.
- As soon as you remove a contaminated item, place it in the infectious waste bag.
- Do not over fill bags and ensure they can be closed and tied.
- Tie the bag at the top and spray the outside of the bag with disinfectant once it is closed and tied. Wet waste should be double-bagged to prevent leakage.
- Leave it at the designated collection site or place it in in a secure container for transport to a proper disposal site.
- Containers should be constructed to contain all contents and prevent leakage of fluids during handling, storage, and transport.
- It is strongly recommended that field teams do not burn or bury medical waste at the field site. Incomplete burning may leave infectious or dangerous materials, and animals or children may dig up buried waste. All bio-hazardous waste should be contained and returned to a medical center for autoclaving or incineration. **See *Section 2.5 Safe Disposal of Carcasses and Infectious Waste Guide* for information regarding guidelines for waste disposal.**

Procedure for Putting on PPE

All of the components of PPE discussed below are not necessary or appropriate for all PREDICT tasks. For instance, Tyvek or Tychem coveralls and aprons are not necessary for many PREDICT tasks. However, when investigating disease outbreaks or other potentially high-risk situations, the PPE and donning and doffing procedures may be substantially enhanced to reduce risk of exposure. See http://www.cdc.gov/vhf/ebola/hcp/ppe-training/index.html for CDC Guidelines for Personal Protective Equipment (PPE) Donning and Doffing Procedures during management of Ebola virus disease cases.

1. Wash your hands and/or disinfect them with alcohol-based hand sanitizing gel prior to putting on PPE.

2. Coveralls or dedicated clothing go on FIRST. Always start with the coveralls (which should be big and loose to fit over clothing and not restrict movement) or dedicated clothing. Be certain to zip up coveralls or button up clothing.

3. **Shoe covers or boots go on SECOND.** Shoe covers fit over the coverall feet. Pant legs of dedicated clothing and coveralls should fit over the boots.

4. **Respirator or surgical mask goes on THIRD.** Of the equipment to be worn around the head and face, the mask or respirator is always first on and last off. On a mask with a metal nose clip, be sure to form the clip around the nose for a nice fit. Any time you put on a respirator, perform a seal check by inhaling sharply. If there is air leakage around the edges of the mask, readjust to ensure a proper seal.

5. **Goggles go on after the respirator.** Goggles should fit snuggly over and around your eyes. Goggle straps should be adjusted to fit your head.

Once the respirator and goggles are in place, pull the hood on your coveralls over your head (or put on the separate head cover if the coveralls do not have a hood).

6. **Tie on the apron over the coveralls or your dedicated clothing.** Place the apron over your head and then tie it in the back.

7. **Put on two pairs of gloves.** The inner glove should go under the sleeve of the coverall to prevent exposed skin between the coverall and the glove. Coveralls with finger loops that secure the sleeve over the first pair of gloves are ideal to avoid exposure of the wrist area (or you can make a small cut in the coverall sleeve and introduce your thumb). Otherwise, tape the coverall sleeve to the inner glove. Put the second pair of gloves on over the first pair and extend the gloves over the coverall cuffs.

Procedure for Removing PPE

After completing your work, assume the exterior of the PPE is contaminated. The goal of correct removal of PPE is to minimize contact between your clothes and skin and the contaminated outer surfaces of the PPE.

1. **Wipe off any visible contamination of the PPE** using germicidal or alcohol-based wipes and dispose of the used wipe in the infectious waste bag.

2. **Remove and dispose of the apron** in the infectious waste bag.

3. **Wipe off outer gloves with a germicidal wipe and dispose of the used wipe** in the infectious waste bag.

4. **Remove boots or remove shoe covers** by holding the top and rolling them off of your feet. Place the shoe covers in the infectious waste bag. Place the boots in the equipment collection bag for disinfection and re-use.

5. **Remove the outer gloves** and place them in the infectious waste bag. Using one gloved hand, grasp the outside of the opposite glove near the wrist. Pull and peel the glove inside-out and away from the hand. Hold the removed glove in the opposite gloved hand. Then, slide one or two fingers of the ungloved hand under the wrist of the remaining glove. Peel glove off from the inside, creating a bag for both gloves. Dispose of the gloves in the infectious waste bag.

6. **Disinfect your inner gloves with alcohol-based hand sanitizing gel.**

7. Unzip and roll down the coveralls until they are inside out and place them in the infectious waste bag.

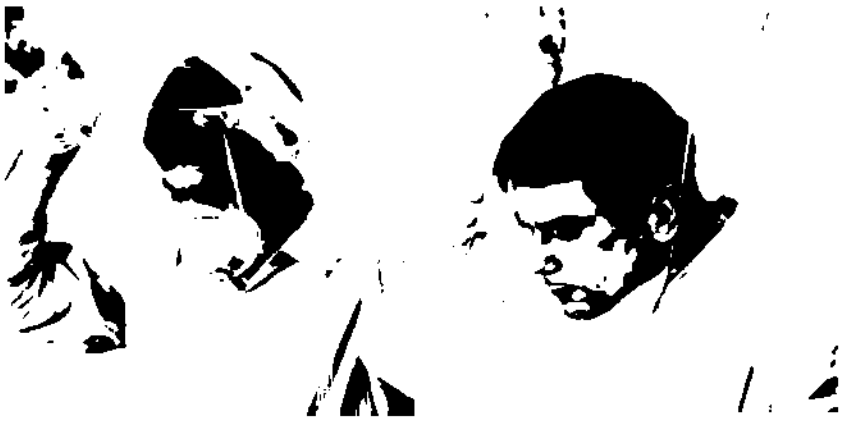
8. Disinfect gloves with alcohol-based hand sanitizing gel.

9. Remove the goggles by the strap and place them in the infectious waste bag or equipment collection bag for disinfection and re-use if re-usable. Re-suable goggles can be disinfected using a chlorine bleach solution.

10. Disinfect gloves with alcohol-based hand sanitizing gel.

11. Close the biohazard bag by tying the corners of the top of the bag together.

12. Remove the respirator by grabbing the top and then the bottom elastic bands, and pulling the bands up over your head or by grabbing the nose and pulling forward and then off. Place the respirator **in a second clean red infectious waste bag**.



13. Disinfect gloves with alcohol-based hand sanitizing gel.

14. Remove the inside gloves using the procedures listed in #5 above and place them in the second infectious waste bag. Dispose of infectious waste bags according to guidelines in Section 4, #6 e above.

15. Disinfect your hands with alcohol-based hand sanitizing gel.

16. Wash your hands and wrists using soap and running water (from a tap or poured) following the guidelines presented in Section 2.

If PPE is compromised, falls off, rips or is removed while you are handling or are exposed to biological hazardous materials, stop your current activity, remove PPE in the designated area, and wash or disinfect the exposed skin/surfaces. In addition, immediately inform your supervisor to determine if prophylaxis is indicated.

Section 4.5. Respirator Use

- Using respirators alone will not fully protect you from acquiring an infection – the respirator must be used in combination with all of the other PPE components.
- Each person using respirators must be fit tested to identify a respirator that he or she can comfortably and securely wear. Fit testing is a process that takes approximately 15-20 minutes to complete and should be performed for each member of the field team before he or she uses any respirators in the field. Qualitative fit test kits are available for purchase through 3M. A video on fit testing is available online at **https://www.youtube.com/watch?v=7IAsoU6h-8g**. After passing a fit test with a respirator, you should always use the same make, model, style, and size of respirator that was found during the fit test process to create an effective seal around your face. If you have facial hair, it is unlikely that you can properly fit a disposable particulate respirator. Workers who cannot ensure a proper fit because of facial hair or other fit limitations should consider a loose-fitting (i.e., helmeted or hooded) powered air purifying respirator equipped with high-efficiency filters. More information on respirators and respiratory protection can be found at: **https://www.osha.gov/SLTC/etools/respiratory/index.html**.
- Do not use or provide others with respirators without instruction on the health risks associated with them. For example, workers with respiratory problems may not be able to wear these respirators. Anytime someone indicates they are having trouble breathing while wearing a respirator, they should go to the PPE removal site and remove their respirator.

- When disposable particulate respirators become wet from saliva, sweat, or respiratory secretions, they lose their protective properties and must be changed.
- If a respirator is splashed and becomes wet, it should be changed using gloves and the gloves disinfected or washed following hand washing procedures.
- Respirators should be discarded and replaced after 4-6 hours of use.
- Respirators should not be hung around your neck when working. Always wear them when working.

To Whom It May Concern:

Please find enclosed our technical proposal, ***Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity*** (**HDTRA1-14-24-FRCWMD-BAA WMD, GRANT12862917**). We request that this Phase II application be assigned for review by the Defense Threat Reduction Agency, Biological Threat Reduction Program Thrust Area 6 Cooperative Counter WMD Research with Global Partners.

This project proposes the first multi-disciplinary One Health research project to identify factors which allow or facilitate the transmission of Middle East Respiratory Syndrome Coronavirus (MERS-CoV), avian influenza (AI), and other infectious agents which spread from animals to humans in Jordan, while simultaneously strengthening local capabilities for prevention, detection, and reporting of these diseases in Jordan, Iraq, and Lebanon. To fill this gap and contribute to biological threat reduction, we have designed a hypothesis-driven One Health research project to characterize exposure risks for high consequence zoonotic diseases in Jordan along with capacity-building cross-trainings to be conducted with visiting laboratory scientists from Iraq and Lebanon. This multifaceted One Health approach will advance scientific knowledge on the risk of MERS-CoV, AI, and other zoonoses in Jordan, strengthen local zoonotic disease surveillance capabilities, and enhance scientific partnerships in Jordan, Iraq and Lebanon to prevent, detect, and report MERS-CoV, AI, and other zoonotic threats.

We thank you for your consideration of our request.

Sincerely,

William B. Karesh, DVM
Executive Vice President for Health and Policy

Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning

(b)(6) EcoHealth Alliance

Project Kick-Off, 2021-08-17

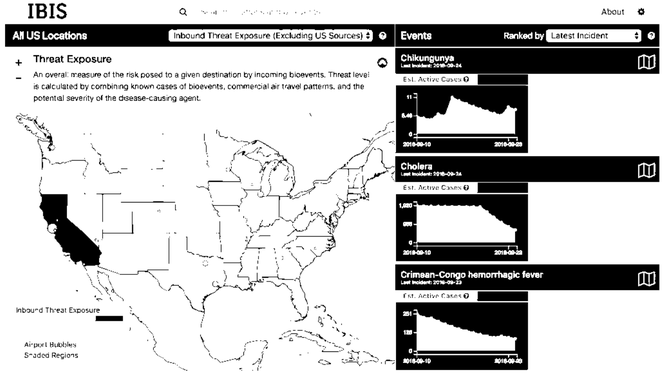
Agenda

- Presentation (<30 min)
  - Introduction and Team
  - Technical review: Data and Algorithms
  - Project approach, management, and communication
- Discussion (~30 min)

About EcoHealth Alliance

- Non-profit focused on research and prevention of emerging infectious disease
- High-impact field, lab, and analytical research
- Science-informed policy advisory and tool development
- Extensive network of over 60 collaborating agencies and organizations, nationally and globally

Applied tool-building for disease surveillance and discovery



Policy advisory via a global network of partners

- Complements our applied and basic field and lab research, advisory, and partnerships
- Tight integration and collaboration with biological and behavioral teams
  - Additional project oversight: (b)(6)

(b)(6)

(b)(6)

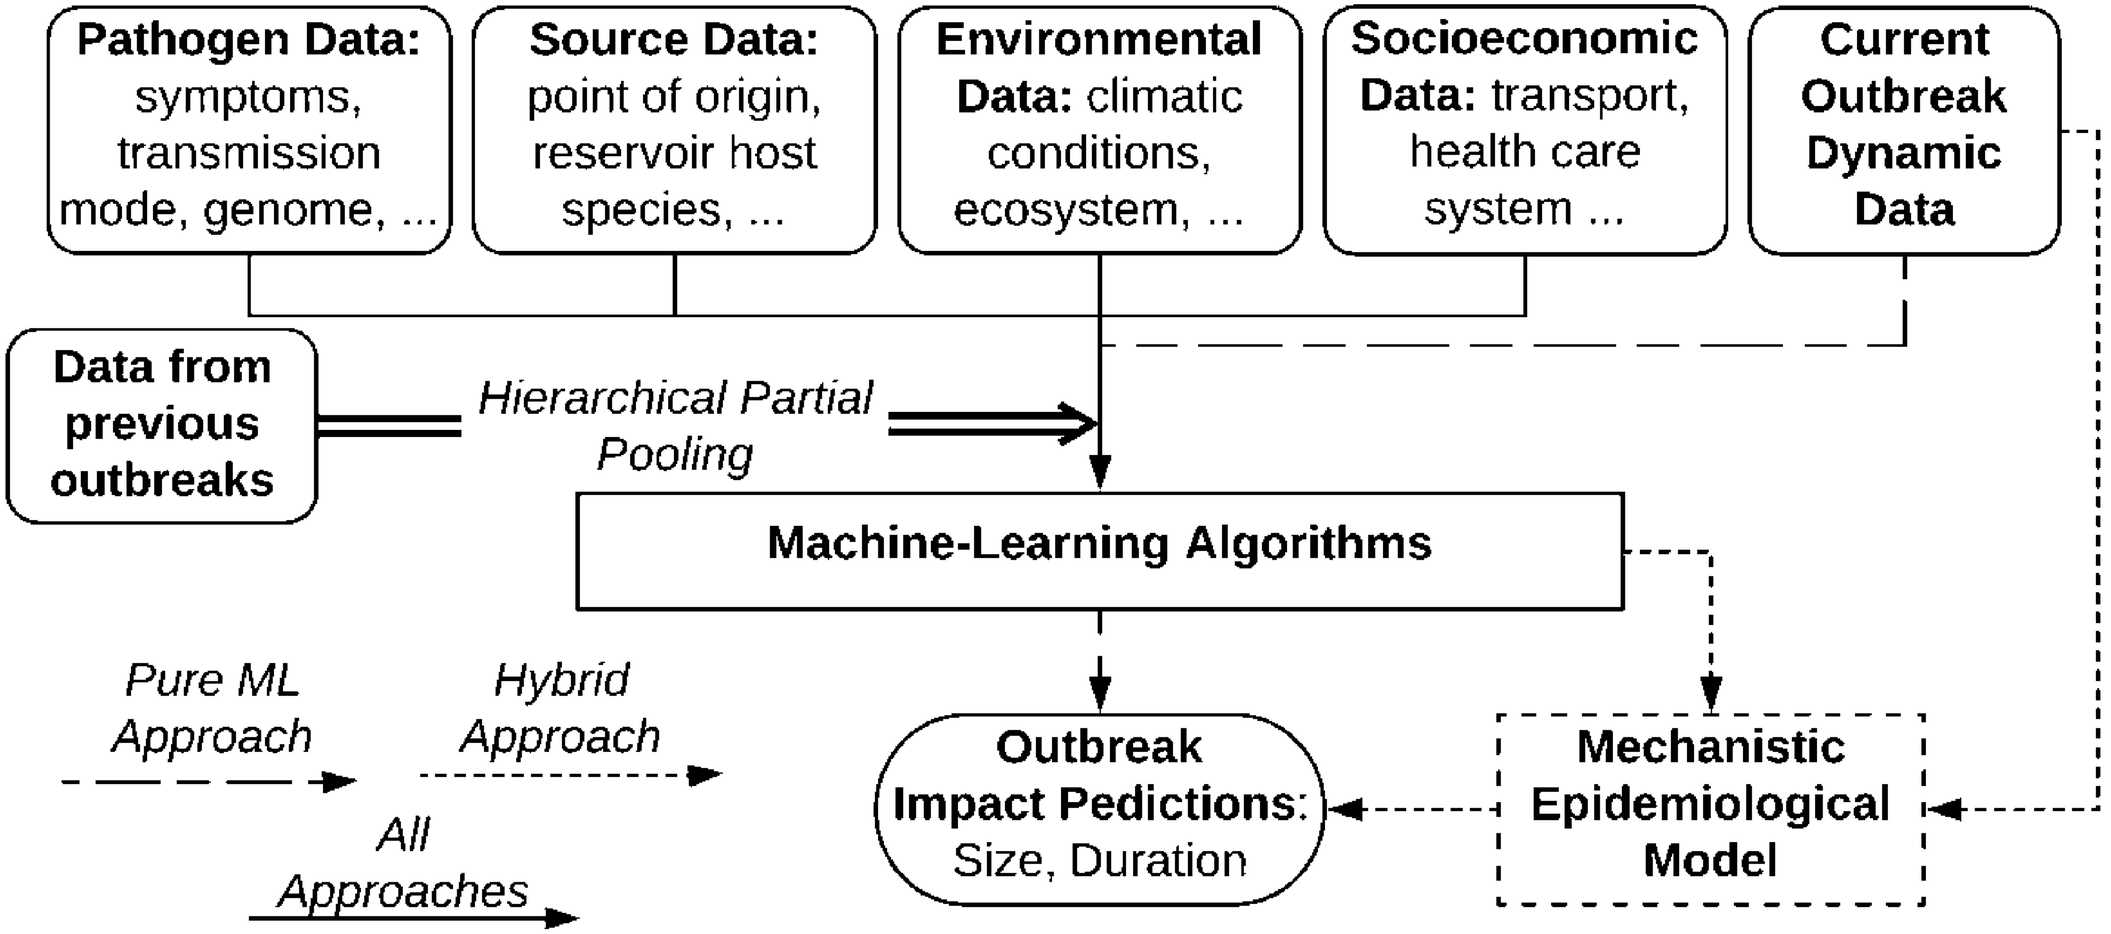
Technical Review: Core Questions

How well can we predict the course of disease outbreaks from data available at early stages?

Q1: Which early-stage data features are most predictive?

Q2: How well well does partial pooling across different diseases improve predictions?

Modeling Approach

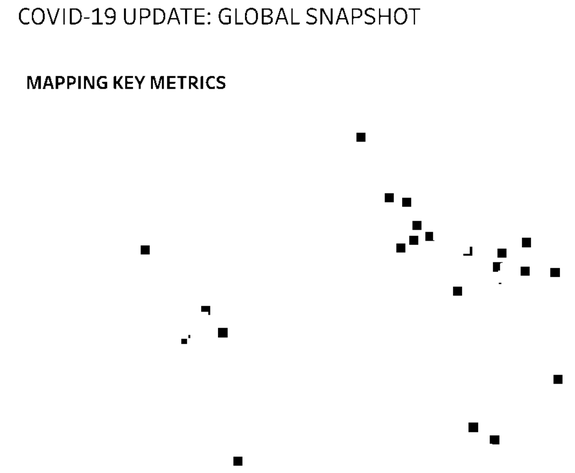


Data Sources: Longitudinal Outbreaks

Epidemiological data limitations are the largest barrier to applying new forecasting methods. We aggregate a variety of applicable sources

Previous DTRA Investments

Veterinary Data

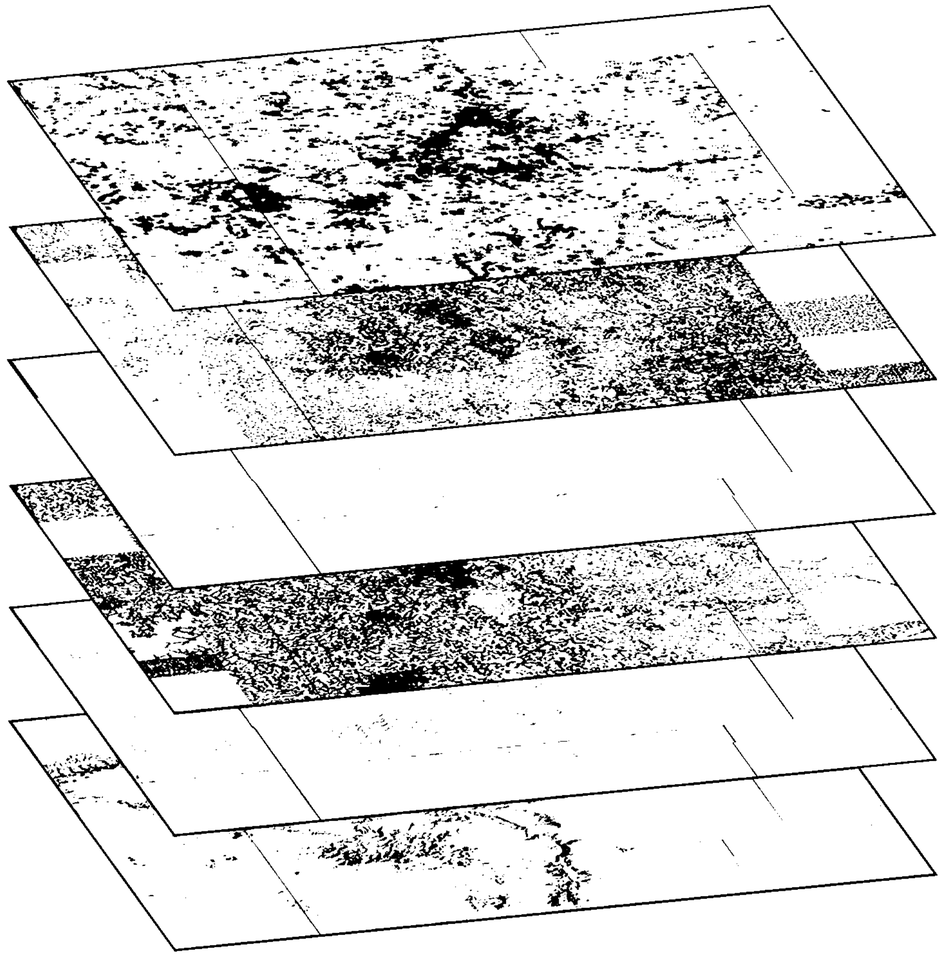


New COVID-19 Datasets

EHA's Data Repository

Data Sources: Outbreak Conditions

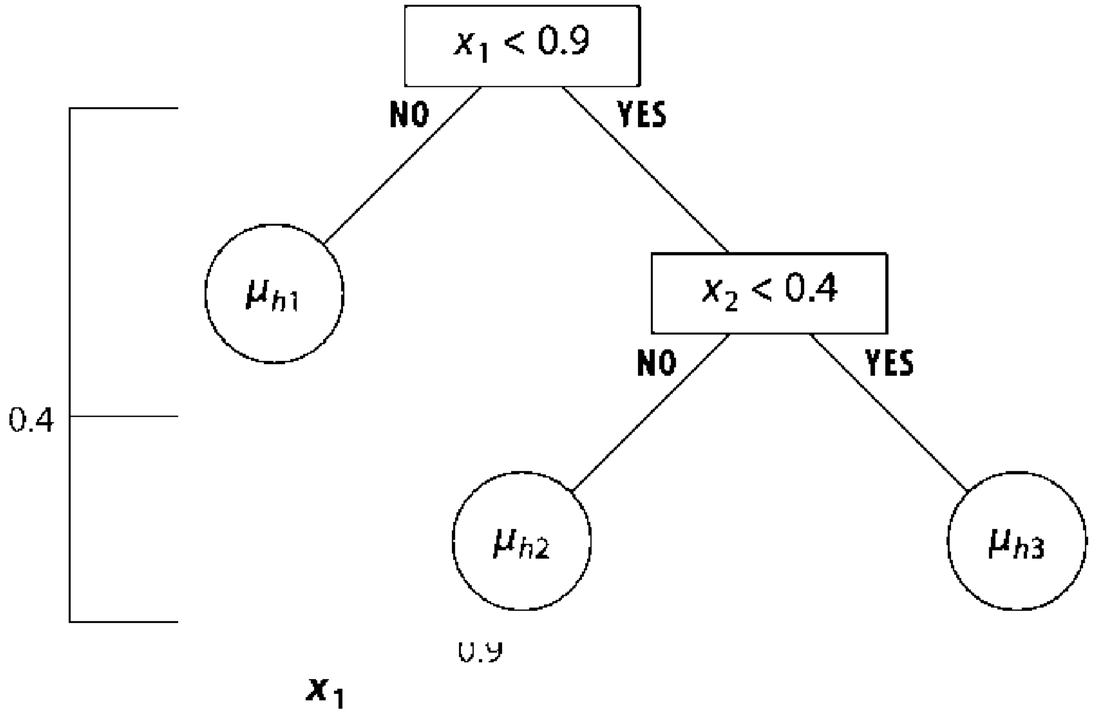
- Environmental data layers
- Disease host source and distribution
- Human population, infrastructure, and transport layers
- Resource availability and response capacity
- Pathogen traits, transmission modes, disease etiology



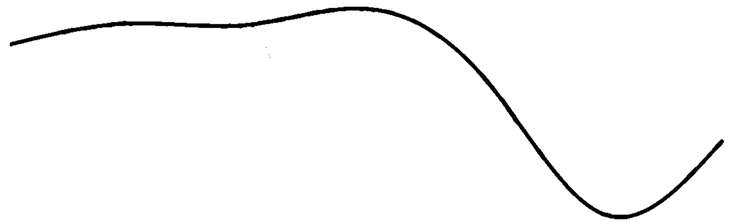
Algorithms: Two General Approaches with a Common Bayesian Twist

We use and compare two general approaches with different strengths

Regression Trees

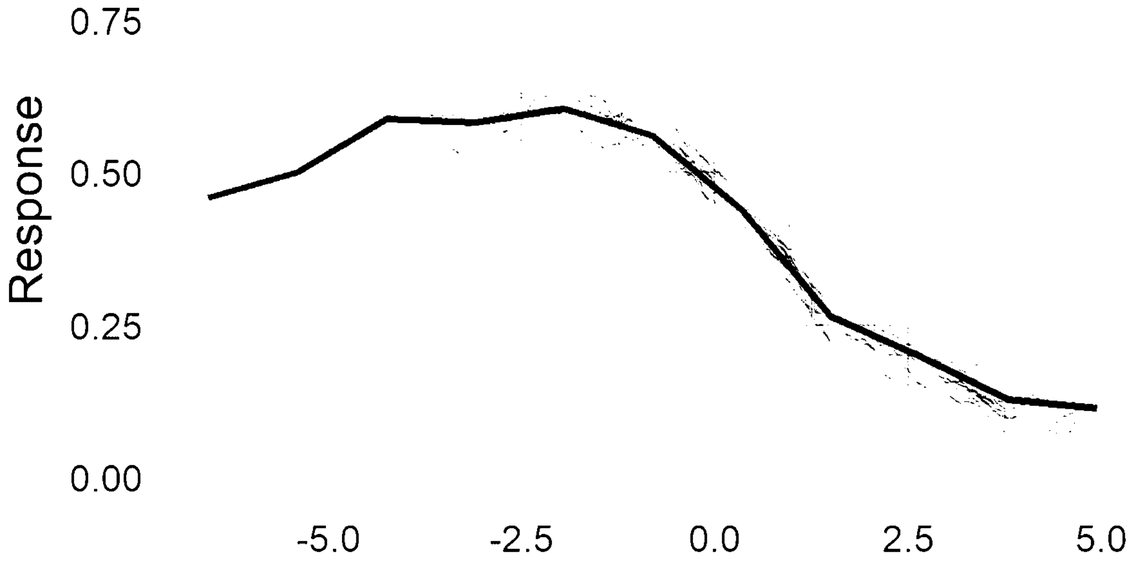


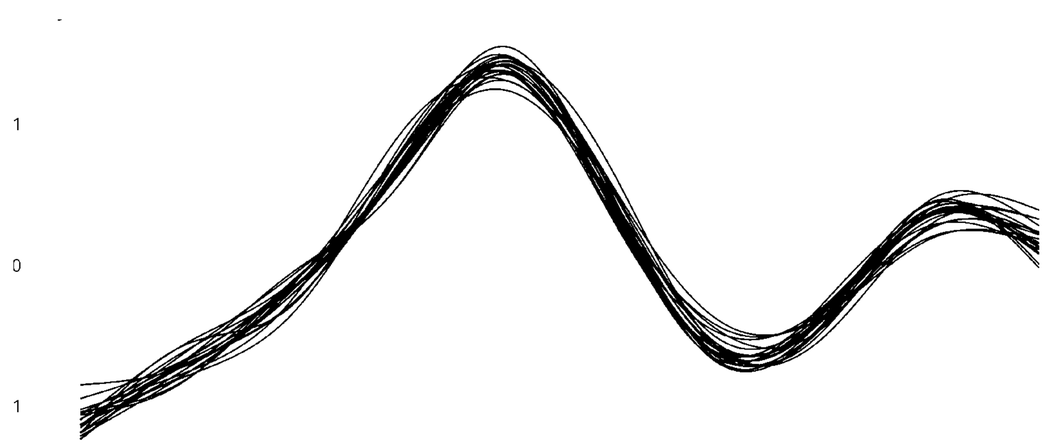
Additive Splines



Algorithms: Two General Approaches with a Common Bayesian Twist

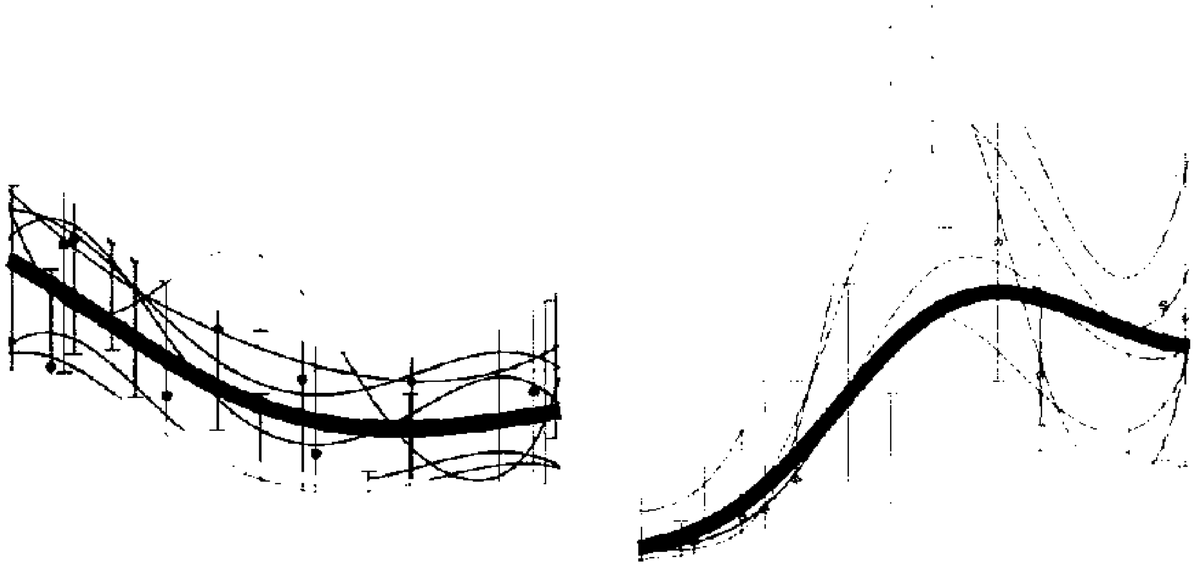
For both trees and splines, we use a Bayesian approach that provides a range of possible relationships, quantifying uncertainty in predictions





Algorithms: Partial Pooling

Partial Pooling *allows us to capture relationships that are shared across diseases while letting the data guide how much information and transfer*



Year 2 Options: Mechanistic Models, Genomic Data, Interactivity

Q3: How do hybrid machine-learning / mechanistic models compare to pure models in performance

Q4: Can genomic data improve early-stage outcome predictions?

T1: Build an interactive interface to generate forecasts

Approach: Deployment-Ready R&D

- Principled validation approaches
  - Practical, real-world performance baselines
  - Differential privacy-based hold out testing
- Design for rapid application
  - R&D in portable computing containers
  - Release-ready data and models with APIs

Project Work Plan

	Year 1 S1	Year 1 S2
Data and Infrastructure Engineering	Database design and population, feature engineering	Refinement and linking
Algorithm Development	Performance metric design	Core model development
Interface Development		Static performance reports

Iteration, documentation, and reporting

Detail: SOW P. 7

Reporting and Deliverables

- Monthly status reports and cost statements
  - Semi-annual milestones
- Annual technical reports
- Source code and project databases
- Publications and conference papers

To:
Subject: CB11030 NEW GRANT - EcoHealth Alliance ready for your review and signatures
Date: Wednesday, March 24, 2021 12:55:33 PM

(b)(6)

1. The PR package for CB11030 (New Grant) for EHA is ready for your review and signatures here:

J:\Restricted\RD\CB\1601.01 Project Mgmt\CBI\2 - Projects\1 - Active\Analytics & Data\CB11030 - EHA Predicting Biothreat Impacts\1 - Contract documents\1_FY21_New Grant

2. The following require your signature:

01 REGA

02 DURC

03 HSAU

04 FRDC

07 GOR Appointment Letter

3. (b)(6)

4. Two things I do not have that are required for the REGA include the financial POC and information, and the EHA address for sending over the funds. I did not see a cover sheet with that information and am happy to reach out to Noam, but assume you have more contact info. Let me know what you decide.

5. Lastly, our allotted BR funding is $250k, but the final cost came in at $253,279.10. We obviously can't snag the excess from the planning line because it's LFIBR. I'm working on how to ameliorate that with (b)(6)
(b)(6)
and sign all, and I will adjust the number on the REGA when we get adjudication.

Let me know if you have questions!

Thanks,

(b)(6)

DTRA Monthly Project Update DRAFT

Project Number: HDTRA-121-100023

Project Title: Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning

Prepared By: (b)(6)

Reporting Period: August 2021

Summary of Progress

For this start-up month, we set up our workflow structures and began data design and ingest tasks. We expect project pace to increase in months 2-3 when we complete new hiring for the project.

- Setting up repositories and hosting for project code, output, and automated workflows (1.1.1)
- Testing several options for a project database structure to optimize our workflow (1.1.1)
- Building a pipeline to ingesting data from the AIDO system (1.2.2)
- Administrative: Project kick-off with DTRA, setting up of internal project management system
- Personnel: Hiring new research scientist to join team

SOW Tasks Underway

1.1.1 Layout a provision internal project network
1.2.1 Design database schema
1.2.2 Write pipelines to ingest data
1.4.1 Write and maintain initial codebase documentation

SOW Tasks Completed

None

Current Outstanding Issues, Risks and Mitigations

We are completing team hiring this month.

Cost

TBD

DTRA/SCC-WMD HUMAN RESEARCH / ANIMAL USE CLEARANCE

Instructions for the DTRA/SCC-WMD Human Research / Animal Use Clearance Checklist

This checklist is to accompany all research, development, test, and evaluation (RDT&E) purchase requests forwarded to J4/8C for contracting action. Its purpose is to (1) document whether an RDT&E activity is human subjects research or extramural animal use, (2) if so, if it is compliant with applicable regulations, and (3) has been approved for funding by the Research Oversight Board (ROB) on behalf of the HSPA/AUPA.

Section A: Does the work proposed constitute human research?

As outlined in the LMS online training course titled *Human Research & Animal Use*. *Research* is defined in DoDI 3216.02 as "any systematic investigation, including (RDT&E) designed to develop or contribute to generalizable knowledge." The same reference defines research involving a human being as an experimental subject as "an activity, for research purposes, where there is an intervention or interaction with a human being for the purpose of (1) obtaining data on the effect of the intervention or interaction with the individual, or (2) identifiable private information" (32 CFR 219.102f). From the above definitions, contracts to provide goods and general services to DTRA/SCC-WMD (e.g., contracts for housekeeping, security, maintenance, utilities, office supplies, etc.) are not research. Similarly, RDT&E activities that do not involve testing of human beings or human-derived materials (for example, testing the effects of decontaminating solutions on electronic equipment) are not human subjects research and are not subject to the requirements of 32 CFR 219, DoDI 3216.02 or DTRA/SCC-WMD Directive 3216.01. ***Checking NO in this section means that no further review is required,*** and J4/8C will process the acquisition action.

Section A1: Does the effort involve the use of vertebrate animals at an extramural site?

If this research study plans to use a living vertebrate animal, including birds, cold-blooded animals, rats of the genus *Rattus* and mice of the genus *Mus*, birds, fish or amphibians in a DTRA/SCC-WMD funded effort at a non-DoD location, then answer YES to this question. Studies performed at DoD locations (e.g. USAMRIID, USAMRICD) are exempt from DTRA/SCC-WMD oversight since all DoD locations have active animal use oversight programs.

Section B: Research Oversight Board JDIR/Directorate POC Review

Each JDIR has a representative on the DTRA/SCC-WMD Research Oversight Board. Submit this checklist, proposal, and other supporting documentation to your Directorate/directorate representative and e-mail it to the ROB at dtra.belvoir.J9.mbx.research-oversight-board@mail.mil. Your ROB representative will review the request and assist you in obtaining approval for submission to the Research Oversight Board.

DTRA/SCC-WMD HUMAN RESEARCH / ANIMAL USE CLEARANCE

Section C: Directorate Review

- CONCUR if Directorate or designee agrees with PM/STM/GOR/COR assessment to forward package to ROB for DTRA/SCC-WMD administrative review.

- NON-CONCUR if Directorate or designee has determined that compliance issues must be addressed before the package may be forwarded to the ROB. If NON-CONCUR, attach basis for non-concurrence and return to PM.

Section D: ROB Review

- CONCUR if Executive Secretary of the ROB agrees with PM assessment. HSPA/AUPA has delegated approval authority to the Executive Secretary of the ROB.
- NON-CONCUR if Executive Secretary of the ROB has determined that compliance issues must be addressed before the package can be approved for expenditure of DTRA/SCC-WMD funds. If NON-CONCUR, attach basis for non-concurrence and return to Directorate.

HSPA/AUPA Review/Approval

- The HSPA/AUPA has delegated approval authority to the Executive Secretary of the ROB. Accordingly, Senior Financial Officers and contracting personnel will accept ROB concurrence and signature as authority to process the acquisition order and release/transfer funds.

DTRA HUMAN RESEARCH / ANIMAL USE CLEARANCE

Instructions for the DTRA Human Research / Animal Use Clearance Checklist

This checklist is to accompany all research, development, test, and evaluation (RDT&E) purchase requests forwarded to the Acquisition, Finance, and Logistics Directorate (AL) for contracting action. Its purpose is to (1) document whether an RDT&E activity is human subjects research or extramural animal use, (2) if so, if it is compliant with applicable regulations, and (3) has been approved for funding by the Research Oversight Board (ROB) on behalf of the HSPA/AUPA.

Section A: Does the work proposed constitute human research?

As outlined in the LMS online training course titled *Human Research & Animal Use*. *Research* is defined in DoDI 3216.02 as "any systematic investigation, including (RDT&E) designed to develop or contribute to generalizable knowledge." The same reference defines research involving a human being as an experimental subject as "an activity, for research purposes, where there is an intervention or interaction with a human being for the purpose of (1) obtaining data on the effect of the intervention or interaction with the individual, or (2) identifiable private information" (32 CFR 219.102f). From the above definitions, contracts to provide goods and general services to DTRA (e.g., contracts for housekeeping, security, maintenance, utilities, office supplies, etc.) are not research. Similarly, RDT&E activities that do not involve testing of human beings or human-derived materials (for example, testing the effects of decontaminating solutions on electronic equipment) are not human subjects research and are not subject to the requirements of 32 CFR 219, DoDI 3216.02 or DTRA Directive 3216.01. ***Checking NO in this section means that no further review is required,*** and the AL Directorate will process the acquisition action.

Section A1: Does the effort involve the use of vertebrate animals at an extramural site?

If this research study plans to use a living vertebrate animal, including birds, cold-blooded animals, rats of the genus *Rattus* and mice of the genus *Mus*, birds, fish or amphibians in a DTRA funded effort at a non-DoD location, then answer YES to this question. Studies performed at DoD locations (e.g. USAMRIID, USAMRICD) are exempt from DTRA oversight since all DoD locations have active animal use oversight programs.

Section B: Research Oversight Board (ROB)/Directorate/Staff Office/POC Review

Each Directorate has a representative on the DTRA Research Oversight Board. Submit this checklist, proposal, and other supporting documentation to your Directorate/directorate representative and e-mail it to the ROB at dtra.belvoir.rd.mbx.research-oversight-board@mail.mil. Your ROB representative will review the request and assist you in obtaining approval for submission to the Research Oversight Board.

DTRA HUMAN RESEARCH / ANIMAL USE CLEARANCE

Section C: Directorate Review

- CONCUR if Directorate or designee agrees with PM/STM/GOR/COR assessment to forward package to ROB for DTRA administrative review.

- NON-CONCUR if Directorate or designee has determined that compliance issues must be addressed before the package may be forwarded to the ROB. If NON-CONCUR, attach basis for non-concurrence and return to PM.

Section D: ROB Review

- CONCUR if Executive Secretary of the ROB agrees with PM assessment. HSPA/AUPA has delegated approval authority to the Executive Secretary of the ROB.
- NON-CONCUR if Executive Secretary of the ROB has determined that compliance issues must be addressed before the package can be approved for expenditure of DTRA funds. If NON-CONCUR, attach basis for non-concurrence and return to Directorate.

HSPA/AUPA Review/Approval

- The HSPA/AUPA has delegated approval authority to the Executive Secretary of the ROB. Accordingly, Senior Financial Officers and contracting personnel will accept ROB concurrence and signature as authority to process the acquisition order and release/transfer funds.

REPORT OF INVENTIONS AND SUBCONTRACTS

(Pursuant to "Patent Rights" Contract Clause) (See Instructions on back)

Form Approved

DTRA HUMAN SUBJECTS / ANIMAL USE RESEARCH CLEARANCE

RESEARCH INVOLVING HUMAN SUBJECTS:

(10/15/21) HRPO Log Numbers E02803.1a (EHA), E02803.1b (WSU), and E02803.1e (PHEL) HRPO Approval Memorandum. Human Research Protections Office (HRPO) reviewed the protocol and found it complies with applicable DOD, U.S. Army, and USAMRDC human subjects protection requirements. This no greater than minimal risk study is approved for the enrollment of 1586 subjects in Northern Tanzania for this study. This protocol is a multi-institution collaborative surveillance study conducted in rural Tanzania in search for evidence of Crimean-Congo Hemorrhagic Fever.

RESEARCH INVOLVING ANIMAL USE:

(03/18/21) ACURO has completed the review of Tuft's Medical Center protocol # G2020-43, entitled, "Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania," supporting DTRA proposal CT00001, award # HDTRA1-20-1-0018, and this protocol is approved for the use of animals as of 18 March 2021.

Subject: EcoHealth Alliance Grant Kick Off
Start: Tuesday, August 17, 2021 10:00:00 AM
End: Tuesday, August 17, 2021 11:00:00 AM
Location: Virtual (TBD)

All,

This grant kick off meeting is an opportunity for our team to review the proposed approach and deliverables for the base period tasks as outlined in the SOW, discuss programmatic expectations (reporting requirements, deliverables), and address any outstanding issues/questions prior to initiating the R&D effort (See draft agenda below).

1000-1030: EcoHealth Alliance Briefing (PPT format is preferred)

1030-1100: Open Discussion (All)

Please forward to any other team members you would like in attendance for this initial meeting.

We look forward to officially starting this effort!

Thanks,

(b)(6)

DD FORM 882, JUL 2005 PREVIOUS EDITION IS OBSOLETE. Reset FormFlow/Adobe Professional 6.0

DD FORM 882 INSTRUCTIONS

GENERAL

This form is for use in submitting INTERIM and FINAL invention reports to the Contracting Officer and for use in reporting the award of subcontracts containing a "Patent Rights" clause. If the form does not afford sufficient space, multiple forms may be used or plain sheets of paper with proper identification of information by item number may be attached.

An INTERIM report is due at least every 12 months from the date of contract award and shall include (a) a listing of "Subject Inventions" during the reporting period, (b) a certification of compliance with required invention identification and disclosure procedures together with a certification of reporting of all "Subject Inventions," and (c) any required information not previously reported on subcontracts containing a "Patent Rights" clause.

A FINAL report is due within 6 months if contractor is a small business firm or domestic nonprofit organization and within 3 months for all others after completion of the contract work and shall include (a) a listing of all "Subject Inventions" required by the contract to be reported, and (b) any required information not previously reported on subcontracts awarded during the course of or under the contract and containing a "Patent Rights" clause.

While the form may be used for simultaneously reporting inventions and subcontracts, it may also be used for reporting, promptly after award, subcontracts containing a "Patent Rights" clause.

Dates shall be entered where indicated in certain items on this form and shall be entered in six or eight digit numbers in the order of year and month (YYYYMM) or year, month and day (YYYYMMDD). Example: April 2005 should be entered as 200504 and April 15, 2005 should be entered as 20050415.

1.a. Self-explanatory.

1.b. Self-explanatory.

1.c. If "same" as Item 2.c., so state.

1.d. Self-explanatory.

2.a. If "same" as Item 1.a., so state.

2.b. Self-explanatory.

2.c. Procurement Instrument Identification (PII) number of contract (DFARS 204.7003).

2.d. through 5.e. Self-explanatory.

5.f. The name and address of the employer of each inventor not employed by the contractor or subcontractor is needed because the Government's rights in a reported invention may not be determined solely by the terms of the "Patent Rights" clause in the contract.

Example 1: If an invention is made by a Government employee assigned to work with a contractor, the Government rights in such an invention will be determined under Executive Order 10096.

Example 2: If an invention is made under a contract by joint inventors and one of the inventors is a Government employee, the Government's rights in such an inventor's interest in the invention will also be determined under Executive Order 10096, except where the contractor is a small business or nonprofit organization, in which case the provisions of 35 U.S.C. 202(e) will apply.

5.g.(1) Self-explanatory.

5.g.(2) Self-explanatory with the exception that the contractor or subcontractor shall indicate, if known at the time of this report, whether applications will be filed under either the Patent Cooperation Treaty (PCT) or the European Patent Convention (EPC). If such is known, the letters PCT or EPC shall be entered after each listed country.

6.a. Self-explanatory.

6.b. Self-explanatory.

6.c. Self-explanatory.

6.d. Patent Rights Clauses are located in FAR 52.227.

6.e. Self-explanatory.

6.f. Self-explanatory.

7. Certification not required by small business firms and domestic nonprofit organizations.

7.a. through 7.d. Self-explanatory.

Attachment 1 - Statement of Work (SOW)
Project Title: Predictin Biothreat Impacts from Early-Stage Data via Transfer Learning
Document Date: February 26, 2021

Objective
The project's objectives are to determine the efficacy of machine learning (ML) techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats, both intentional (e.g. novel genetically-modified pathogens) and natural (e.g. zoonotic). We define "early stage" as the initial period in an outbreak when only short time-series data are available, prior to rapid growth and geographic spread, and epidemiological parameters are not well-established. Specifically, we will answer three questions that will enable rapid decision-making based on ML models of epidemic impacts:

Q1: How much does partial-pooling improve predictions of epidemic impacts, and what information transfers best across diseases?
Q2: What variables are most predictive of epidemic impacts at early stages of an outbreak?
Q3: At what point in epidemic growth do hybrid models that incorporate mechanistic epidemiological components become more accurate than pure ML models?

This work will contribute to fundamental knowledge of properties and variables that contribute most to predictive accuracy at early-stage stages in emerging outbreak prediction and forecasting. It will enable the development of robust and deployable predictive models at early stages of outbreaks, and support informed choices for data collection and model selection.

Scope
The awardee proposes a two-year study to determine the efficacy of ML techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats. The awardee team shall focus on the following major goals and milestones:

- *Year 1, Milestone 1 (0-6 months)*: Create and curate predictor database, project infrastructure, continuous integration/validation, establish data-imputation and automatic predictor workflow (Tasks 1.1-1.2).
- *Year 1, Milestone 2 (6-12 months)*: Bayesian additive regression tree (BART) model fitting and tuning, determination of variable contribution to prediction accuracy (Task 1.3). Document and validate project code and infrastructure (Task 1.4)
- *Option Year 1, Milestone 3 (12-18 months)*: Extend the database to include additional predictors, extend the BART model to ingest genetic data (Tasks 2.1-2.3)
- *Option Year, Milestone 4 (18-24 months):* Construction of hybrid ML/mechanistic model structure, comparative testing of pure and hybrid version, determination of timing when current data overtakes transfer data (Task 2.4). Document and validate project code and infrastructure (Task 2.5)
- *Option Task 1, (12-18 months):* Develop a graphical user interface (GUI) for the model, allowing users to input of early-stage outbreak data and generate predictions, uncertainty bounds, and interpretable explanations of influential variables. Document GUI and validate code.

Background

Situational awareness and risk assessment are critical at early stages of disease outbreaks, when interventions can best mitigate adverse outcomes. Yet decision-makers often face a paucity of data at these stages. Traditional modeling methods to forecast disease impact severity rely heavily on prior knowledge or assumptions about mechanisms of disease spread progression, and they frequently do not anticipate the actual mechanisms.[1-3] They also take considerable time and effort to develop.

Recent theory suggests disease dynamics are fundamentally predictable[4], and ML methods have been successfully applied in emerging disease science. ML refers to a group of methods, ranging from simple nearest-neighbor approaches to function-approximation methods such as boosted trees and penalized splines, to complex deep-learning neural networks. ML has been used to predict the likelihood of disease emergence and the zoonotic potential of various hosts and viruses[5,6], and deep-learning approaches have been used to infer viral hosts from the comparatively richer data of genetic sequences of viruses.[7,8]

ML methods are generally unstructured, flexible, and offer greater predictive power over traditional statistical approaches. However, these methods are data-intensive, and a key challenge with ML development is data paucity and/or a low signal-to-noise ratio. Surveillance data for even existing, well-studied diseases is rarely rich enough for the data scale of many modern ML techniques. For instance, a ML approach to predict impacts from a new outbreak of Ebola would draw training data from fewer than twenty previous events, each with varying levels of data coverage.

Transfer learning, or data fusion, provides a solution to data paucity issues by using data from other domains to train parts of models that are general, thus limiting new data requirements for more specific components. Hierarchical modeling, or *partial pooling*, is a transfer learning approach for partitioning out which data can be shared between models and which are only applicable to a specific case. For instance, Ebola forecasts for countries outside the historic range of the disease may be improved by calibrating against Cholera outbreaks, which have occurred both within and outside countries with Ebola outbreaks. The degree to which the disease outcomes are correlated is learned, rather than assumed.

An alternative recent development in disease forecasting is the development of hybrid models that incorporate simple mechanistic structures and predictive ML methods to learn model parameters. These approaches have demonstrated high predictive accuracy for near-term forecasting of epidemic growth and impact, particularly during the COVID-19 pandemic[9]. However, these approaches require adequate time-series of data to project forward from current conditions. Their utility in early stages and long-term forecasting accuracy has yet to be determined. In opting to apply these models, it is critical to understand these data requirements and at what point in an outbreak hybrid approaches can overtake pure ML early-stage predictions in accuracy. This project seeks to develop, apply, and compare pure and hybrid-ML techniques to enable the development of robust, rapidly usable predictions at early stages of outbreaks.

Data Sources
Fitting and testing models will draw from disease outbreak data (counts, timing, and geography) and predictor data including pathogen traits (disease symptoms, pathogen traits, modes of transmission), pathogen sources (point of origin, geographic range of potential natural hosts), environmental context (climatic conditions, ecosystem traits), and socioeconomic context (local population densities, demographics, transportation networks, healthcare systems). Please see the Technical Proposal for available data sources.

Tasks/Scientific Goals (Format: Year.Task.Subtask)

YEAR 1

Task 1.1 – Develop and deploy project infrastructure

The awardee shall develop a computational environment that enables continuous model development and testing and allows for research and models to be reproduced and extended by external teams. The computational environment will include continuous maintenance and documentation of project codebase.

Subtasks

1.1.1 Layout a provision internal project network
1.1.2 Set up continuous integration pipelines
1.1.3 Implement backup and data verification jobs
1.1.4 Implement differential privacy testing

Task 1.2 – Engineer project database

The awardee shall curate, integrate, cross-link, and validate relevant datasets from various sources into a project database, accounting for differing space and time scales, data formats, and data completeness.

Subtasks

1.2.1 Design database schema
1.2.2 Write pipelines to ingest data
1.2.3 Cross-link data sources via common ontology

1.2.4 Write quality assurance/quality control (QA/QC) tests for data and perform data cleaning
1.2.5 Create automatic extraction routines to populate relevant predictors from location information
1.2.6 Update data from live sources and clean and maintain data continuously

Task 1.3 – Machine Learning (ML) model development and testing
The awardee shall design, implement, test, and analyze performance of ML model structures and iteratively improve them.

Subtasks
1.3.1 Establish quantitative and qualitative metrics of model performance
1.3.2 Implement "practical naïve" model baseline
1.3.3 Design Bayesian additive regression tree (BART) model structure
1.3.4 Design alternative generalized additive model (GAM) structure
1.3.5 Implement within-disease, all-disease, and partial-pooled disease model versions
1.3.6 Measure variable contribution by re-fitting
1.3.7 Analyze prediction-level variable contributions and model performance
1.3.8 Iteratively update models to improve performance

Task 1.4 – Maintain and document project infrastructure
The awardee shall document the methodology for database schema, data ingestion pipelines, QA/QC tests, extraction routes, and ML models established in Tasks 1.1-1.3.
Subtasks
1.4.1 Write and maintain initial codebase documentation
1.4.2 Perform code review, testing, and validation

OPTION YEAR (OPTION I):

Task 2.1 – Extend project database
In the option year, the awardee shall extend the database to include additional predictors and continuously maintain and update to accumulate more data from upstream sources.

Subtasks
2.1.1 Extend database schema to include genetic data and auto-encoded variables
2.1.2 Write pipelines to ingest genetic data
2.1.3 Cross-link data sources via common ontologies
2.1.4Write QA/QC tests for data and perform data cleaning
2.1.5Update data from live sources and clean and maintain data continuously

Task 2.2 – Extend BART model
In the option year, the awardee shall extend the BART model to ingest genetic data and test the contribution of this data in enhancing or recapitulating pathogen trait data.

Subtasks
2.2.1Develop genetic predictor variable set via neural-network autoencoding
2.2.2 Modify BART and GAM structures to incorporate genetic variables
2.2.3 Implement within-disease, all-disease, and partial-pooled disease model versions
2.2.4 Compare performance of genetic, pathogen-trait, and combined models

Task 2.3 Hybrid ML-mechanistic model development and testing

In the option year, the awardee shall develop the hybrid machine-learning mechanistic model, compare its performance to a pure ML model, and determine the switch-over time when the mechanistic model becomes more predictive in the course of the outbreak.

Subtasks

2.4.1 Establish quantitative and qualitative metrics of model performance
2.4.2 Design mechanistic model structure
2.4.3 Determine mechanistic model prior forms
2.4.4 Modify ML model to predict mechanistic parameters rather than outcomes
2.4.5Implement within-disease, all-disease, and partial-pooled disease model versions
2.4.6Measure variable contribution by re-fitting
2.4.7Analyze prediction-level variable contributions and model performance using criteria developed in Task 1.3
2.4.8Compare Hybrid and ML performance along outbreak time-series progression
2.4.9Iteratively update models to improve performance

Task 2.4 – Maintain and document project infrastructure

In the option year, the awardee shall document the methodology for extended database schema, and data ingestion pipelines, QA/QC tests, extraction routes, and ML models established in Tasks 2.1-2.3.

Subtasks

2.4.1 Write and maintain initial codebase documentation
2.4.2 Perform code review, testing, and validation

OPTION TASK (OPTION II):

Task 3.1 – Develop Model Graphical User Interface

As an additional optional task, the awardee shall develop a graphical user interface (GUI) for the ML model developed in task 1.3, allowing users to input of early-stage outbreak data and generate predictions, uncertainty bounds, and interpretable explanations of influential variables.

Subtasks

3.1.1 Port model into portable framework usable for standalone or web-based interaction
3.1.2 Optimize for rapid response time and application size
3.1.3 Design input interface
3.1.4 Design visualizations for predictions, uncertainty, and variable importance

Task 3.2 – Maintain and document project infrastructure

In the option task, the awardee shall document usage of the GUI, and perform code review of testing and validation of the GUI codebase created in tasks 3.1

Subtasks

3.2.1 Create GUI documentation
3.2.2 Perform code review, testing, and validation

Deliverables

- Reports and Documents
  - Monthly reports on task status
  - Monthly cost statement
  - Periodic program reviews (virtual and/or in person)
  - Annual technical report, which shall include
    - Executive Summary
    - I. Introduction/Background
    - II. Methodology
    - III. Findings
    - IV. Discussion/Future Recommendations
    - V. Conclusion
    - VI. Appendices
      - a. Snapshots of GUI/how to use
      - b. Data worksheet (summarizing list of data sources used, metadata abstracted, links, etc.)
- Source and executable software code
- Project databases
- Technical papers describing algorithm design and performance
- Conference presentations

Code Modules and Database Archives

Code and databases will be made available for download and provided electronically via DoD SAFE and/or on-disk to DTRA at the end of the period of performance.

Note: The data and information collected in this effort is funded on the condition that it will not be released to another nation or international organization without the specific authority from the Defense Threat Reduction Agency. Individual or corporate rights originating in the information, whether patented or not, will be respected; that the recipient government will report promptly to the Defense Threat Reduction Agency any known or suspected compromise and that the information will be provided substantially the same degree of security afforded it by the Department of Defense of the United States. No U.S. Government commitment to sell, lend, lease, co-develop, or co-produce defense articles is implied or intended. Also, regardless of any other markings on the document, it will not be downgraded or declassified without written approval of the originating U.S. agency.

Gantt Chart

Description	Y1 Q1-2	Y1 Q3-4	Y2 Q1-2	Y3 Q3-4
Year 1, Milestone 1				
1.1.1 Layout a provision project network	■			
1.1.2 Set up continious integration pipelines	■			
1.1.3 Implement backup and data verification jobs	■

Attachment 1 - Statement of Work (SOW)
Project Title: Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning
Document Date: ~~May 28~~ November 25, 2020

Objective
The project's objectives are to determine the efficacy of machine learning (ML) techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats, both intentional (e.g. novel genetically-modified pathogens) and natural (e.g. zoonotic). Specifically, we will answer three questions that will enable rapid decision-making based on ML models of epidemic impacts:

Q1: How much does partial-pooling improve predictions of epidemic impacts, and what information transfers best across diseases?
Q2: What variables are most predictive of epidemic impacts at early stages of an outbreak?
Q3: At what point in epidemic growth do hybrid models that incorporate mechanistic epidemiological components become more accurate than pure ML models?

This work will contribute to fundamental knowledge of properties and variables that contribute most to predictive accuracy at early-stage stages in emerging outbreak prediction and forecasting. It will enable the development of robust and deployable predictive models at early stages of outbreaks, and support informed choices for data collection and model selection.

Scope
The awardee proposes a two-year study to determine the efficacy of ML techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats. The awardee team shall focus on the following major goals and milestones:

- *Year 1, Milestone 1 (6 months)*: Create and curate predictor database, project infrastructure, continuous integration/validation, establish data-imputation and automatic predictor workflow (Tasks 1.1-1.2).
- *Year 1, Milestone 2 (12 months)*: Bayesian additive regression tree (BART) model fitting and tuning, determination of variable contribution to prediction accuracy (Task 1.3).
- ~~*Option* Year 1~~, *Milestone 3 (12~~8~~ months)*: Maintain and document project infrastructure.
- *Option Year 1, Milestone 4 (18 months)*: Extend the database to include additional predictors, extend the BART model to ingest genetic data (Tasks 2.1-2.3)
- *Option Year, Milestone 5~~4~~* (24 months): Construction of hybrid ML/mechanistic model structure, comparative testing of pure and hybrid version, determination of timing when current data overtakes transfer data (Task 2.4)

Background
Situational awareness and risk assessment are critical at early stages of disease outbreaks, when interventions can best mitigate adverse outcomes. Yet decision-makers often face a paucity of data at these stages. Traditional modeling methods to forecast disease impact severity rely heavily on prior knowledge or assumptions about mechanisms of disease spread progression, and they frequently do not anticipate the actual mechanisms.[1-3] They also take considerable time and effort to develop.

Commented (b)(6) By early stage do you mean prior to an epidemic being defined as an epidemic i.e., The ML algorithm will be able to detect a spike in initial few case counts above baseline and then forecast outcomes or do you intend for the ML algorithm to forecast impacts once an epidemic has been declared then forecasting outcomes in the early stages of an epidemic? Ideally it is the former, as that would address the capability gap of "preparing for surprise." Please clarify.

Recent theory suggests disease dynamics are fundamentally predictable[4], and ML methods have been successfully applied in emerging disease science. ML refers to a group of methods, ranging from simple nearest-neighbor approaches to function-approximation methods such as boosted trees and penalized splines, to complex deep-learning neural networks. ML has been used to predict the likelihood of disease emergence and the zoonotic potential of various hosts and viruses[5,6], and deep-learning approaches have been used to infer viral hosts from the comparatively richer data of genetic sequences of viruses.[7,8]

ML methods are generally unstructured, flexible, and offer greater predictive power over traditional statistical approaches. However, these methods are data-intensive, and a key challenge with ML development is data paucity and/or a low signal-to-noise ratio. Surveillance data for even existing, well-studied diseases is rarely rich enough for the data scale of many modern ML techniques. For instance, a ML approach to predict impacts from a new outbreak of Ebola would draw training data from fewer than twenty previous events, each with varying levels of data coverage.

Transfer learning, or data fusion, provides a solution to data paucity issues by using data from other domains to train parts of models that are general, thus limiting new data requirements for more specific components. Hierarchical modeling, or *partial pooling*, is a transfer learning approach for partitioning out which data can be shared between models and which are only applicable to a specific case. For instance, Ebola forecasts for countries outside the historic range of the disease may be improved by calibrating against Cholera outbreaks, which have occurred both within and outside countries with Ebola outbreaks. The degree to which the disease outcomes are correlated is learned, rather than assumed.

An alternative recent development in disease forecasting is the development of hybrid models that incorporate simple mechanistic structures and predictive ML methods to learn model parameters. These approaches have demonstrated high predictive accuracy for near-term forecasting of epidemic growth and impact, particularly during the COVID-19 pandemic[9]. However, these approaches require adequate time-series of data to project forward from current conditions. Their utility in early stages and long-term forecasting accuracy has yet to be determined. In opting to apply these models, it is critical to understand these data requirements and at what point in an outbreak hybrid approaches can overtake pure ML early-stage predictions in accuracy. This project seeks to develop, apply, and compare pure and hybrid-ML techniques to enable the development of robust, rapidly usable predictions at early stages of outbreaks.

Data Sources

Fitting and testing models will draw from disease outbreak data (counts, timing, and geography) and predictor data including pathogen traits (disease symptoms, pathogen traits, modes of transmission), pathogen sources (point of origin, geographic range of potential natural hosts), environmental context (climatic conditions, ecosystem traits), and socioeconomic context (local population densities, demographics, transportation networks, healthcare systems). Please see the Technical Proposal for available data sources.

Tasks/Scientific Goals (Format: Year.Task.Subtask)

YEAR 1

Task 1.1 – Develop and deploy project infrastructure

The awardee shall develop a computational environment that enables continuous model development and testing and allows for research and models to be reproduced and extended by external teams. The computational environment will include continuous maintenance and documentation of project codebase.

Subtasks

1.1.1 Layout a provision project network
1.1.2 Set up continuous integration pipelines
1.1.3 Implement backup and data verification jobs
1.1.4 Implement differential privacy testing
1.1.5 Write and maintain codebase documentation
1.1.6 Perform code review, testing and validation

Task 1.2 – Engineer project database

The awardee shall curate, integrate, cross-link, and validate relevant datasets from various sources into a project database, accounting for differing space and time scales, data formats, and data completeness.

Subtasks

1.2.1 Design database schema
1.2.1 Write pipelines to ingest time-series data
1.2.2 Write pipelines to ingest predictor data
1.2.3 Cross-link data sources via common ontologies

1.2.4 Write quality assurance/quality control (QA/QC) tests for data and perform data cleaning
1.2.5 Create automatic extraction routines to populate relevant predictors from location information
1.2.6 Update data from live sources and clean and maintain data continuously

Task 1.3 – Machine Learning (ML) model development and testing
The awardee shall design, implement, test, and analyze performance of ML model structures and iteratively improv them.

Subtasks
1.3.1 Implement "practical naïve" model baseline
1.3.2 Design Bayesian additive regression tree (BART) model structure
1.3.3 Design alternative generalized additive model (GAM) structure
1.3.4 Implement within-disease, all-disease, and partial-pooled disease model versions
1.3.5 Measure variable contribution by re-fitting
1.3.6 Analyze prediction-level variable contributions and model performance
1.3.7 Iteratively update models to improve performance

Commented (b)(6): Need to establish quantitative and qualitative metrics of success to evaluate model performance and compare two modeling approaches.

Task 1.4—Maintain and document project infrastructure
The awardee shall document the methodology for database schema, data ingestion pipelines, QA/QC tests, extraction routes, and ML models established in Tasks 1.1-1.3.

Subtasks
1.4.1 Write and maintain initial codebase documentation
1.4.2 Perform code review, testing, and validation
1.3.7

Formatted: Normal, No bullets or numbering

Formatted: Font: Not Italic

Formatted: Font: 12 pt

OPTION YEAR:

Task 2.1 – Maintain and document project infrastructure
~~In the option year, the awardee shall continue to perform maintenance and documentation of~~ project codebase to ensure reproducibility and reusability of additional components

Subtasks
~~2.1.1 Write and maintain codebase documentation~~
~~2.1.2 Perform code review, testing and validation~~

Task 2.12 – Extend project database
In the option year, the awardee shall extend the database to include additional predictors and continuously maintain and update to accumulate more data from upstream sources.

Subtasks
2.2.1 Extend database schema to include genetic data and auto-encoded variables
2.2.2 Write pipelines to ingest genetic data
2.2.3 Cross-link data sources via common ontologies
2.2.4 Write QA/QC tests for data and perform data cleaning
2.2.5 Update data from live sources and clean and maintain data continuously

Task 2.3 – Extend BART model
In the option year, the awardee shall extend the BART model to ingest genetic data and test the contribution of this data in enhancing or recapitulating pathogen trait data.

Subtasks

2.3.1 Develop genetic predictor variable set via neural-network autoencoding
2.3.2 Modify BART and GAM structures to incorporate genetic variables
2.3.3 Implement within-disease, all-disease, and partial-pooled disease model versions
2.3.4 Compare performance of genetic, pathogen-trait, and combined models

Task 2.4 – Hybrid ML-mechanistic model development and testing

In the option year, the awardee shall develop the hybrid machine-learning mechanistic model, compare its performance to a pure ML model, and determine the switch-over time when the mechanistic model becomes more predictive in the course of the outbreak.

Subtasks

2.4.1 Design mechanistic model structure
2.4.2 Determine mechanistic model prior forms
2.4.3 Modify ML model to predict mechanistic parameters rather than outcomes
2.4.4 Implement within-disease, all-disease, and partial-pooled disease model versions
2.4.5 Measure variable contribution by re-fitting
2.4.6 Analyze prediction-level variable contributions and model performance using criteria developed in SubTask 1.3.6
2.4.7 Compare Hybrid and ML performance along outbreak time-series progression
2.4.8 Iteratively update models to improve performance

Commented (b)(6): Need to establish quantitative and qualitative metrics of success to evaluate model performance and compare two modeling approaches.

2.4.8

Formatted: Font: 12 pt, Bold

Formatted: Normal, No bullets or numbering

OPTIONAL Task 2.5—Develop GUI of alpha prototype (Year 1)

The awardee shall develop an alpha prototype of an end user GUI of the hybrid machine-learning mechanistic model and pure ML model to include data visualizations to forecast one class of diseases (e.g., airborne person to person transmissible).

Deliverables

Reports and Documents

- Monthly reports on task status
- Monthly cost statement
- Annual technical report
- Source and executable software code
- Technical papers describing algorithm design and performance
- Conference presentations

Commented (b)(6): The annual technical report shall include the following sections at a minimum:
Executive Summary
I. Introduction/Background
II. Methodology
III. Findings
IV. Discussion/Future Recommendations
V. Conclusion
VI. Appendices
a. Snapshots of GUI/how to use
b. Data worksheet (summarizing list of data sources used, metadata abstracted, links, etc.)
User specified format on report is acceptable.

Code Modules and Database Archives

All code modules and documentation will be continually available on EcoHealth Alliance's GitHub page with access provided to DTRA. Databases will be made available for download and provided electronically via DoD SAFE and/or on-disk to DTRA at the end of the period of performance. ~~per request~~.

Please note: The data and information collected in this effort is funded on the condition that it will not be released to another nation or international organization without the specific authority from the Defense Threat Reduction Agency. Individual or corporate rights originating in the information, whether patented or not, will be respected; that the recipient government will report promptly to the Defense Threat Reduction Agency any known or suspected compromise and that the information will be provided substantially the same degree of security afforded it by the Department of Defense of the United States. No U.S. Government commitment to sell, lend, lease, co develop, or co produce defense articles is implied or intended. Also, regardless of any other markings on the document, it will not be downgraded or declassified without written approval of the originating U.S. agency.

Subject: FY21 DTRA Fundamental Research Award

(b)(6)

Congratulations on your selection as a recipient of DTRA Fundamental Research Funding for your proposal in response to HDTRA1-14-24c-FRCWMD-BAA, "Predicting Biothreat Impacts from Early Stage Data via Transfer Learning." My name is (b)(6) and I am a Science and Technology Manager (STM) in the Digital Battlespace Management Division at the Defense Threat Reduction Agency (DTRA). I am the Grant Officer's Representative (GOR) for this award. In this capacity, I will be your DTRA POC for this effort which includes monitoring the progress of the effort throughout its active R&D, conducting periodic program reviews via MS TEAMS, ensuring funding is sent in a timely manner for the R&D effort, and answering questions you may have relating to the R&D during this effort.

DTRA CB is still awaiting receipt of the remaining FY21 funds Congress has appropriated, however, prior to award and kick off of this effort, we can work collaboratively to finalize the SOW and cost negotiations so we are on track to kick off this grant award in the first quarter of this calendar year. To that end, I have attached a red lined SOW that has DTRA requested changes for the proposed effort. Please review so we can discuss next steps. During these follow on discussions, please be prepared to discuss any questions, concerns, and associated cost, schedule, and contract changes that may need to be completed to address the requested changes.

The next couple weeks are hectic for me, but would either Monday February 8th or Tuesday February 9th from 1000-1100 work for your team?

Look forward to working with you.

Attachment 1 - Statement of Work (SOW)
Project Title: Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning
Document Date: ~~May 28~~ November 25, 2020

Objective
The project's objectives are to determine the efficacy of machine learning (ML) techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats, both intentional (e.g. novel genetically-modified pathogens) and natural (e.g. zoonotic). Specifically, we will answer three questions that will enable rapid decision-making based on ML models of epidemic impacts:

Q1: How much does partial-pooling improve predictions of epidemic impacts, and what information transfers best across diseases?
Q2: What variables are most predictive of epidemic impacts at early stages of an outbreak?
Q3: At what point in epidemic growth do hybrid models that incorporate mechanistic epidemiological components become more accurate than pure ML models?

This work will contribute to fundamental knowledge of properties and variables that contribute most to predictive accuracy at early-stage stages in emerging outbreak prediction and forecasting. It will enable the development of robust and deployable predictive models at early stages of outbreaks, and support informed choices for data collection and model selection.

Scope
The awardee proposes a two-year study to determine the efficacy of ML techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats. The awardee team shall focus on the following major goals and milestones:

- *Year 1, Milestone 1 (6 months)*: Create and curate predictor database, project infrastructure, continuous integration/validation, establish data-imputation and automatic predictor workflow (Tasks 1.1-1.2).
- *Year 1, Milestone 2 (12 months)*: Bayesian additive regression tree (BART) model fitting and tuning, determination of variable contribution to prediction accuracy (Task 1.3).
- ~~*Option*~~ *Year 1, Milestone 3 (12~~*8 months)*: Maintain and document project infrastructure,
- *Option Year 1, Milestone 4 (18 months)*: Extend the database to include additional predictors, extend the BART model to ingest genetic data (Tasks 2.1-2.3)
- *Option Year, Milestone 54* (24 months): Construction of hybrid ML/mechanistic model structure, comparative testing of pure and hybrid version, determination of timing when current data overtakes transfer data (Task 2.4)

Background
Situational awareness and risk assessment are critical at early stages of disease outbreaks, when interventions can best mitigate adverse outcomes. Yet decision-makers often face a paucity of data at these stages. Traditional modeling methods to forecast disease impact severity rely heavily on prior knowledge or assumptions about mechanisms of disease spread progression, and they frequently do not anticipate the actual mechanisms.[1-5] They also take considerable time and effort to develop.

Commented [BSC1]: By early stage do you mean prior to an epidemic being defined as an epidemic i.e., The ML algorithm will be able to detect a spike in initial few case counts above baseline and then forecast outcomes or do you intend for the ML algorithm to forecast impacts once an epidemic has been declared then forecasting outcomes in the early stages of an epidemic? Ideally it is the former, as that would address the capability gap of "preparing for surprise." Please clarify.

Recent theory suggests disease dynamics are fundamentally predictable[4], and ML methods have been successfully applied in emerging disease science. ML refers to a group of methods, ranging from simple nearest-neighbor approaches to function-approximation methods such as boosted trees and penalized splines, to complex deep-learning neural networks. ML has been used to predict the likelihood of disease emergence and the zoonotic potential of various hosts and viruses[5,6], and deep-learning approaches have been used to infer viral hosts from the comparatively richer data of genetic sequences of viruses.[7,8]

ML methods are generally unstructured, flexible, and offer greater predictive power over traditional statistical approaches. However, these methods are data-intensive, and a key challenge with ML development is data paucity and/or a low signal-to-noise ratio. Surveillance data for even existing, well-studied diseases is rarely rich enough for the data scale of many modern ML techniques. For instance, a ML approach to predict impacts from a new outbreak of Ebola would draw training data from fewer than twenty previous events, each with varying levels of data coverage.

Transfer learning, or data fusion, provides a solution to data paucity issues by using data from other domains to train parts of models that are general, thus limiting new data requirements for more specific components. Hierarchical modeling, or *partial pooling*, is a transfer learning approach for partitioning out which data can be shared between models and which are only applicable to a specific case. For instance, Ebola forecasts for countries outside the historic range of the disease may be improved by calibrating against Cholera outbreaks, which have occurred both within and outside countries with Ebola outbreaks. The degree to which the disease outcomes are correlated is learned, rather than assumed.

An alternative recent development in disease forecasting is the development of hybrid models that incorporate simple mechanistic structures and predictive ML methods to learn model parameters. These approaches have demonstrated high predictive accuracy for near-term forecasting of epidemic growth and impact, particularly during the COVID-19 pandemic[9]. However, these approaches require adequate time-series of data to project forward from current conditions. Their utility in early stages and long-term forecasting accuracy has yet to be determined. In opting to apply these models, it is critical to understand these data requirements and at what point in an outbreak hybrid approaches can overtake pure ML early-stage predictions in accuracy. This project seeks to develop, apply, and compare pure and hybrid-ML techniques to enable the development of robust, rapidly usable predictions at early stages of outbreaks.

Data Sources

Fitting and testing models will draw from disease outbreak data (counts, timing, and geography) and predictor data including pathogen traits (disease symptoms, pathogen traits, modes of transmission), pathogen sources (point of origin, geographic range of potential natural hosts), environmental context (climatic conditions, ecosystem traits), and socioeconomic context (local population densities, demographics, transportation networks, healthcare systems). Please see the Technical Proposal for available data sources.

Tasks/Scientific Goals (Format: Year.Task.Subtask)

YEAR 1

Task 1.1 – Develop and deploy project infrastructure

The awardee shall develop a computational environment that enables continuous model development and testing and allows for research and models to be reproduced and extended by external teams. The computational environment will include continuous maintenance and documentation of project codebase.

Subtasks

1.1.1 Layout a provision project network
1.1.2 Set up continuous integration pipelines
1.1.3 Implement backup and data verification jobs
1.1.4 Implement differential privacy testing
1.1.5 Write and maintain codebase documentation
1.1.6 Perform code review, testing and validation

Task 1.2 – Engineer project database

The awardee shall curate, integrate, cross-link, and validate relevant datasets from various sources into a project database, accounting for differing space and time scales, data formats, and data completeness.

Subtasks

1.2.1 Design database schema
1.2.1 Write pipelines to ingest time-series data
1.2.2 Write pipelines to ingest predictor data
1.2.3 Cross-link data sources via common ontologies

1.2.4 Write quality assurance/quality control (QA/QC) tests for data and perform data cleaning
1.2.5 Create automatic extraction routines to populate relevant predictors from location information
1.2.6 Update data from live sources and clean and maintain data continuously

Task 1.3 – Machine Learning (ML) model development and testing
The awardee shall design, implement, test, and analyze performance of ML model structures and iteratively improv them.

Subtasks
1.3.1 Implement "practical naïve" model baseline
1.3.2 Design Bayesian additive regression tree (BART) model structure
1.3.3 Design alternative generalized additive model (GAM) structure
1.3.4 Implement within-disease, all-disease, and partial-pooled disease model versions
1.3.5 Measure variable contribution by re-fitting
1.3.6 Analyze prediction-level variable contributions and model performance
1.3.7 Iteratively update models to improve performance

Commented [BSC2]: Need to establish quantitative and qualitative metrics of success to evaluate model performance and compare two modeling approaches.

Task 1.4—Maintain and document project infrastructure
The awardee shall document the methodology for database schema, data ingestion pipelines, QA/QC tests, extraction routes, and ML models established in Tasks 1.1-1.3.
Subtasks
1.4.1 Write and maintain initial codebase documentation
1.4.2 Perform code review, testing, and validation
~~1.3.7~~

OPTION YEAR:
~~**Task 2.1 – Maintain and document project infrastructure**~~
~~In the option year, the awardee shall continue to perform maintenance and documentation of~~ project codebase to ensure reproducibility and reusability of additional components
~~*Subtasks*~~
~~2.1.1 Write and maintain codebase documentation~~
~~2.1.2 Perform code review, testing and validation~~

Task 2.1~~2~~ – Extend project database
In the option year, the awardee shall extend the database to include additional predictors and continuously maintain and update to accumulate more data from upstream sources.
Subtasks
2.2.1 Extend database schema to include genetic data and auto-encoded variables
2.2.2 Write pipelines to ingest genetic data
2.2.3 Cross-link data sources via common ontologies
2.2.4 Write QA/QC tests for data and perform data cleaning
2.2.5 Update data from live sources and clean and maintain data continuously

Task 2.3 – Extend BART model
In the option year, the awardee shall extend the BART model to ingest genetic data and test the contribution of this data in enhancing or recapitulating pathogen trait data.
Subtasks

2.3.1 Develop genetic predictor variable set via neural-network autoencoding
2.3.2 Modify BART and GAM structures to incorporate genetic variables
2.3.3 Implement within-disease, all-disease, and partial-pooled disease model versions
2.3.4 Compare performance of genetic, pathogen-trait, and combined models

Task 2.4 – Hybrid ML-mechanistic model development and testing

In the option year, the awardee shall develop the hybrid machine-learning mechanistic model, compare its performance to a pure ML model, and determine the switch-over time when the mechanistic model becomes more predictive in the course of the outbreak.

Subtasks

2.4.1 Design mechanistic model structure
2.4.2 Determine mechanistic model prior forms
2.4.3 Modify ML model to predict mechanistic parameters rather than outcomes
2.4.4 Implement within-disease, all-disease, and partial-pooled disease model versions
2.4.5 Measure variable contribution by re-fitting
2.4.6 Analyze prediction-level variable contributions and model performance using criteria developed in SubTask 1.3.6
2.4.7 Compare Hybrid and ML performance along outbreak time-series progression
2.4.8 Iteratively update models to improve performance

~~2.4.8~~

OPTIONAL Task 2.5—Develop GUI of alpha prototype (Year 1)

The awardee shall develop an alpha prototype of an end user GUI of the hybrid machine-learning mechanistic model and pure ML model to include data visualizations to forecast one class of diseases (e.g., airborne person to person transmissible).

Deliverables

Reports and Documents

- Monthly reports on task status
- Monthly cost statement
- Annual technical report
- Source and executable software code
- Technical papers describing algorithm design and performance
- Conference presentations

Code Modules and Database Archives

All code modules and documentation will be continually available on EcoHealth Alliance's GitHub page with access provided to DTRA. Databases will be made available for download and provided electronically via DoD SAFE and/or on-disk to DTRA at the end of the period of performance, per request.

Please note: The data and information collected in this effort is funded on the condition that it will not be released to another nation or international organization without the specific authority from the Defense Threat Reduction Agency. Individual or corporate rights originating in the information, whether patented or not, will be respected; that the recipient government will report promptly to the Defense Threat Reduction Agency any known or suspected compromise and that the information will be provided substantially the same degree of security afforded it by the Department of Defense of the United States. No U.S. Government commitment to sell, lend, lease, co-develop, or co-produce defense articles is implied or intended. Also, regardless of any other markings on the document, it will not be downgraded or declassified without written approval of the originating U.S. agency.

Commented [BSC3]: Need to establish quantitative and qualitative metrics of success to evaluate model performance and compare two modeling approaches.

Commented [BSC4]: The annual technical report shall include the following sections at a minimum:
Executive Summary
I.Introduction/Background
II. Methodology
III.Findings
IV.Discussion/Future Recommendations
V.Conclusion
VI.Appendices
a.Snapshots of GUI/how to use
b.Data worksheet (summarizing list of data sources used, metadata abstracted, links, etc.)

(b)(6)

Congratulations on your selection as a recipient of DTRA Fundamental Research Funding for your proposal in response to HDTRA1-14-24c-FRCWMD-BAA, "Predicting Biothreat Impacts from Early Stage Data via Transfer Learning." My name is (b)(6) and I am a Science and Technology Manager (STM) in the Digital Battlespace Management Division at the Defense Threat Reduction Agency (DTRA). I am the Grant Officer's Representative (GOR) for this award. In this capacity, I will be your DTRA POC for this effort which includes monitoring the progress of the effort throughout its active R&D, conducting periodic program reviews via MS TEAMS, ensuring funding is sent in a timely manner for the R&D effort, and answering questions you may have relating to the R&D during this effort.

DTRA CB is still awaiting receipt of the remaining FY21 funds Congress has appropriated, however, prior to award and kick off of this effort, we can work collaboratively to finalize the SOW and cost negotiations so we are on track to kick off this grant award in the first quarter of this calendar year. To that end, I have attached a red lined SOW that has DTRA requested changes for the proposed effort. Please review so we can discuss next steps. During these follow on discussions, please be prepared to discuss any questions, concerns, and associated cost, schedule, and contract changes that may need to be completed to address the requested changes.

The next couple weeks are hectic for me, but would either Monday February 8th or Tuesday February 9th from 1000-1100 work for your team?

Look forward to working with you.

V/r,

Attachment 1 - Statement of Work (SOW)
Project Title: Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning
Document Date: ~~May 28~~ November 25, 2020

Objective
The project's objectives are to determine the efficacy of machine learning (ML) techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats, both intentional (e.g. novel genetically-modified pathogens) and natural (e.g. zoonotic). Specifically, we will answer three questions that will enable rapid decision-making based on ML models of epidemic impacts:

Q1: How much does partial-pooling improve predictions of epidemic impacts, and what information transfers best across diseases?
Q2: What variables are most predictive of epidemic impacts at early stages of an outbreak?
Q3: At what point in epidemic growth do hybrid models that incorporate mechanistic epidemiological components become more accurate than pure ML models?

This work will contribute to fundamental knowledge of properties and variables that contribute most to predictive accuracy at early-stage stages in emerging outbreak prediction and forecasting. It will enable the development of robust and deployable predictive models at early stages of outbreaks, and support informed choices for data collection and model selection.

Scope
The awardee proposes a two-year study to determine the efficacy of ML techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats. The awardee team shall focus on the following major goals and milestones:

- *Year 1, Milestone 1 (6 months)*: Create and curate predictor database, project infrastructure, continuous integration/validation, establish data-imputation and automatic predictor workflow (Tasks 1.1-1.2).
- *Year 1, Milestone 2 (12 months)*: Bayesian additive regression tree (BART) model fitting and tuning, determination of variable contribution to prediction accuracy (Task 1.3).
- ~~*Option*~~ *Year 1, Milestone 3 (12~~*8 months)*: Maintain and document project infrastructure,
- *Option Year 1, Milestone 4 (18 months)*: Extend the database to include additional predictors, extend the BART model to ingest genetic data (Tasks 2.1-2.3)
- *Option Year, Milestone 54* (24 months): Construction of hybrid ML/mechanistic model structure, comparative testing of pure and hybrid version, determination of timing when current data overtakes transfer data (Task 2.4)

Background
Situational awareness and risk assessment are critical at early stages of disease outbreaks, when interventions can best mitigate adverse outcomes. Yet decision-makers often face a paucity of data at these stages. Traditional modeling methods to forecast disease impact severity rely heavily on prior knowledge or assumptions about mechanisms of disease spread progression, and they frequently do not anticipate the actual mechanisms.[1-5] They also take considerable time and effort to develop.

Commented [BSC1]: By early stage do you mean prior to an epidemic being defined as an epidemic i.e., The ML algorithm will be able to detect a spike in initial few case counts above baseline and then forecast outcomes or do you intend for the ML algorithm to forecast impacts once an epidemic has been declared then forecasting outcomes in the early stages of an epidemic? Ideally it is the former, as that would address the capability gap of "preparing for surprise." Please clarify.

Recent theory suggests disease dynamics are fundamentally predictable[4], and ML methods have been successfully applied in emerging disease science. ML refers to a group of methods, ranging from simple nearest-neighbor approaches to function-approximation methods such as boosted trees and penalized splines, to complex deep-learning neural networks. ML has been used to predict the likelihood of disease emergence and the zoonotic potential of various hosts and viruses[5,6], and deep-learning approaches have been used to infer viral hosts from the comparatively richer data of genetic sequences of viruses.[7,8]

ML methods are generally unstructured, flexible, and offer greater predictive power over traditional statistical approaches. However, these methods are data-intensive, and a key challenge with ML development is data paucity and/or a low signal-to-noise ratio. Surveillance data for even existing, well-studied diseases is rarely rich enough for the data scale of many modern ML techniques. For instance, a ML approach to predict impacts from a new outbreak of Ebola would draw training data from fewer than twenty previous events, each with varying levels of data coverage.

Transfer learning, or data fusion, provides a solution to data paucity issues by using data from other domains to train parts of models that are general, thus limiting new data requirements for more specific components. Hierarchical modeling, or *partial pooling*, is a transfer learning approach for partitioning out which data can be shared between models and which are only applicable to a specific case. For instance, Ebola forecasts for countries outside the historic range of the disease may be improved by calibrating against Cholera outbreaks, which have occurred both within and outside countries with Ebola outbreaks. The degree to which the disease outcomes are correlated is learned, rather than assumed.

An alternative recent development in disease forecasting is the development of hybrid models that incorporate simple mechanistic structures and predictive ML methods to learn model parameters. These approaches have demonstrated high predictive accuracy for near-term forecasting of epidemic growth and impact, particularly during the COVID-19 pandemic[9]. However, these approaches require adequate time-series of data to project forward from current conditions. Their utility in early stages and long-term forecasting accuracy has yet to be determined. In opting to apply these models, it is critical to understand these data requirements and at what point in an outbreak hybrid approaches can overtake pure ML early-stage predictions in accuracy. This project seeks to develop, apply, and compare pure and hybrid-ML techniques to enable the development of robust, rapidly usable predictions at early stages of outbreaks.

Data Sources

Fitting and testing models will draw from disease outbreak data (counts, timing, and geography) and predictor data including pathogen traits (disease symptoms, pathogen traits, modes of transmission), pathogen sources (point of origin, geographic range of potential natural hosts), environmental context (climatic conditions, ecosystem traits), and socioeconomic context (local population densities, demographics, transportation networks, healthcare systems). Please see the Technical Proposal for available data sources.

Tasks/Scientific Goals (Format: Year.Task.Subtask)

YEAR 1

Task 1.1 – Develop and deploy project infrastructure

The awardee shall develop a computational environment that enables continuous model development and testing and allows for research and models to be reproduced and extended by external teams. The computational environment will include continuous maintenance and documentation of project codebase.

Subtasks

1.1.1 Layout a provision project network
1.1.2 Set up continuous integration pipelines
1.1.3 Implement backup and data verification jobs
1.1.4 Implement differential privacy testing
1.1.5 Write and maintain codebase documentation
1.1.6 Perform code review, testing and validation

Task 1.2 – Engineer project database

The awardee shall curate, integrate, cross-link, and validate relevant datasets from various sources into a project database, accounting for differing space and time scales, data formats, and data completeness.

Subtasks

1.2.1 Design database schema
1.2.1 Write pipelines to ingest time-series data
1.2.2 Write pipelines to ingest predictor data
1.2.3 Cross-link data sources via common ontologies

1.2.4 Write quality assurance/quality control (QA/QC) tests for data and perform data cleaning
1.2.5 Create automatic extraction routines to populate relevant predictors from location information
1.2.6 Update data from live sources and clean and maintain data continuously

Task 1.3 – Machine Learning (ML) model development and testing
The awardee shall design, implement, test, and analyze performance of ML model structures and iteratively improv them.

Subtasks
1.3.1 Implement "practical naïve" model baseline
1.3.2 Design Bayesian additive regression tree (BART) model structure
1.3.3 Design alternative generalized additive model (GAM) structure
1.3.4 Implement within-disease, all-disease, and partial-pooled disease model versions
1.3.5 Measure variable contribution by re-fitting
1.3.6 Analyze prediction-level variable contributions and model performance
1.3.7 Iteratively update models to improve performance

Commented [BSC2]: Need to establish quantitative and qualitative metrics of success to evaluate model performance and compare two modeling approaches.

Task 1.4—Maintain and document project infrastructure
The awardee shall document the methodology for database schema, data ingestion pipelines, QA/QC tests, extraction routes, and ML models established in Tasks 1.1-1.3.
Subtasks
1.4.1 Write and maintain initial codebase documentation
1.4.2 Perform code review, testing, and validation
~~1.3.7~~

OPTION YEAR:
~~**Task 2.1 – Maintain and document project infrastructure**~~
~~In the option year, the awardee shall continue to perform maintenance and documentation of~~ project codebase to ensure reproducibility and reusability of additional components
~~*Subtasks*~~
~~2.1.1 Write and maintain codebase documentation~~
~~2.1.2 Perform code review, testing and validation~~

Task 2.1~~2~~ – Extend project database
In the option year, the awardee shall extend the database to include additional predictors and continuously maintain and update to accumulate more data from upstream sources.
Subtasks
2.2.1 Extend database schema to include genetic data and auto-encoded variables
2.2.2 Write pipelines to ingest genetic data
2.2.3 Cross-link data sources via common ontologies
2.2.4 Write QA/QC tests for data and perform data cleaning
2.2.5 Update data from live sources and clean and maintain data continuously

Task 2.3 – Extend BART model
In the option year, the awardee shall extend the BART model to ingest genetic data and test the contribution of this data in enhancing or recapitulating pathogen trait data.
Subtasks

2.3.1 Develop genetic predictor variable set via neural-network autoencoding
2.3.2 Modify BART and GAM structures to incorporate genetic variables
2.3.3 Implement within-disease, all-disease, and partial-pooled disease model versions
2.3.4 Compare performance of genetic, pathogen-trait, and combined models

Task 2.4 – Hybrid ML-mechanistic model development and testing

In the option year, the awardee shall develop the hybrid machine-learning mechanistic model, compare its performance to a pure ML model, and determine the switch-over time when the mechanistic model becomes more predictive in the course of the outbreak.

Subtasks

2.4.1 Design mechanistic model structure
2.4.2 Determine mechanistic model prior forms
2.4.3 Modify ML model to predict mechanistic parameters rather than outcomes
2.4.4 Implement within-disease, all-disease, and partial-pooled disease model versions
2.4.5 Measure variable contribution by re-fitting
2.4.6 Analyze prediction-level variable contributions and model performance using criteria developed in SubTask 1.3.6
2.4.7 Compare Hybrid and ML performance along outbreak time-series progression
2.4.8 Iteratively update models to improve performance

~~2.4.8~~

OPTIONAL Task 2.5—Develop GUI of alpha prototype (Year 1)

The awardee shall develop an alpha prototype of an end user GUI of the hybrid machine-learning mechanistic model and pure ML model to include data visualizations to forecast one class of diseases (e.g., airborne person to person transmissible).

DD FORM 882 INSTRUCTIONS

GENERAL

This form is for use in submitting INTERIM and FINAL invention reports to the Contracting Officer and for use in reporting the award of subcontracts containing a "Patent Rights" clause. If the form does not afford sufficient space, multiple forms may be used or plain sheets of paper with proper identification of information by item number may be attached.

An INTERIM report is due at least every 12 months from the date of contract award and shall include (a) a listing of "Subject Inventions" during the reporting period, (b) a certification of compliance with required invention identification and disclosure procedures together with a certification of reporting of all "Subject Inventions," and (c) any required information not previously reported on subcontracts containing a "Patent Rights" clause.

A FINAL report is due within 6 months if contractor is a small business firm or domestic nonprofit organization and within 3 months for all others after completion of the contract work and shall include (a) a listing of all "Subject Inventions" required by the contract to be reported, and (b) any required information not previously reported on subcontracts awarded during the course of or under the contract and containing a "Patent Rights" clause.

While the form may be used for simultaneously reporting inventions and subcontracts, it may also be used for reporting, promptly after award, subcontracts containing a "Patent Rights" clause.

Dates shall be entered where indicated in certain items on this form and shall be entered in six or eight digit numbers in the order of year and month (YYYYMM) or year, month and day (YYYYMMDD). Example: April 2005 should be entered as 200504 and April 15, 2005 should be entered as 20050415.

1.a. Self-explanatory.

1.b. Self-explanatory.

1.c. If "same" as Item 2.c., so state.

1.d. Self-explanatory.

2.a. If "same" as Item 1.a., so state.

2.b. Self-explanatory.

2.c. Procurement Instrument Identification (PII) number of contract (DFARS 204.7003).

2.d. through 5.e. Self-explanatory.

5.f. The name and address of the employer of each inventor not employed by the contractor or subcontractor is needed because the Government's rights in a reported invention may not be determined solely by the terms of the "Patent Rights" clause in the contract.

Example 1: If an invention is made by a Government employee assigned to work with a contractor, the Government rights in such an invention will be determined under Executive Order 10096.

Example 2: If an invention is made under a contract by joint inventors and one of the inventors is a Government employee, the Government's rights in such an inventor's interest in the invention will also be determined under Executive Order 10096, except where the contractor is a small business or nonprofit organization, in which case the provisions of 35 U.S.C. 202(e) will apply.

5.g.(1) Self-explanatory.

5.g.(2) Self-explanatory with the exception that the contractor or subcontractor shall indicate, if known at the time of this report, whether applications will be filed under either the Patent Cooperation Treaty (PCT) or the European Patent Convention (EPC). If such is known, the letters PCT or EPC shall be entered after each listed country.

6.a. Self-explanatory.

6.b. Self-explanatory.

6.c. Self-explanatory.

6.d. Patent Rights Clauses are located in FAR 52.227.

6.e. Self-explanatory.

6.f. Self-explanatory.

DTRA Monthly Project Update DRAFT

Project Number: HDTRA-121-100023

Project Title: Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning

Prepared By: (b)(6)

Reporting Period: August 2021

Summary of Progress

For this start-up month, we set up our workflow structures and began data design and ingest tasks. We expect project pace to increase in months 2-3 when we complete new hiring for the project.

- Setting up repositories and hosting for project code, output, and automated workflows (1.1.1)
- Testing several options for a project database structure to optimize our workflow (1.1.1)
- Building a pipeline to ingesting data from the AIDO system (1.2.2)
- Administrative: Project kick-off with DTRA, setting up of internal project management system
- Personnel: Hiring new research scientist to join team

SOW Tasks Underway

1.1.1 Layout a provision internal project network
1.2.1 Design database schema
1.2.2 Write pipelines to ingest data
1.4.1 Write and maintain initial codebase documentation

SOW Tasks Completed

None

Current Outstanding Issues, Risks and Mitigations

We are completing team hiring this month.

Cost

TBD

REPORT OF INVENTIONS AND SUBCONTRACTS

(Pursuant to "Patent Rights" Contract Clause) (See Instructions on back)

Form Approved
OMB No. 9000-0095
Expires Jan 31, 2008

PLEASE DO NOT RETURN YOUR COMPLETED FORM TO THE ABOVE ORGANIZATION. RETURN COMPLETED FORM TO THE CONTRACTING OFFICER.

1.a. NAME OF CONTRACTOR/SUBCONTRACTOR	c. CONTRACT NUMBER	2.a. NAME OF GOVERNMENT PRIME CONTRACTOR	c. CONTRACT NUMBER	3. TYPE OF REPORT (X one)
International Society for Infectious Diseases	GRITS-ISID-FY16-1	EcoHealth Alliance	HDTRA1-15-0041	a. INTERIM [X] b. FINAL

b. ADDRESS (Include ZIP Code)	d. AWARD DATE (YYYYMMDD)	b. ADDRESS (Include ZIP Code)	d. AWARD DATE (YYYYMMDD)	4. REPORTING PERIOD (YYYYMMDD)
9 Babcock Street, Unit 3 Brookline, MA, 02446	20160409	460 West 34th street, 17th floor New York, NY 10001	20150409	a. FROM 20150409 b. TO 20170930

SECTION I - SUBJECT INVENTIONS

5. "SUBJECT INVENTIONS" REQUIRED TO BE REPORTED BY CONTRACTOR/SUBCONTRACTOR *(If "None," so state)*

NAME(S) OF INVENTOR(S) (Last, First, Middle Initial) a.	TITLE OF INVENTION(S) b.	DISCLOSURE NUMBER, PATENT APPLICATION SERIAL NUMBER OR PATENT NUMBER c.	ELECTION TO FILE PATENT APPLICATIONS (X) d.				CONFIRMATORY INSTRUMENT OR ASSIGNMENT FORWARDED TO CONTRACTING OFFICER (X) e.	
			(1) UNITED STATES		(2) FOREIGN			
			(a) YES	(b) NO	(a) YES	(b) NO	(a) YES	(b) NO
Huff, Andrew; Slagle, Amy; Horton, Russell; Breit, Nathan; Preston, Nico; Allen, T	Global Rapid Identification Tool Set (GRITS)			X		X		X
Allen, Toph; Arnold, Brock; Breit, Nathan; Whiting, Karissa; Huff, Andrew	Flight Risk Tracker (FLIRT)			X		X		X
Allen, Toph; Arnold, Brock; Breit, Nathan; Whiting, Karissa	EIDR Connect			X		X		X

SECTION III - CERTIFICATION

7. CERTIFICATION OF REPORT BY CONTRACTOR/SUBCONTRACTOR *(Not required if: (X as appropriate))* [ ] SMALL BUSINESS or [ ] NONPROFIT ORGANIZATION

I certify that the reporting party has procedures for prompt identification and timely disclosure of "Subject Inventions," that such procedures have been followed and that all "Subject Inventions" have been reported.

a. NAME OF AUTHORIZED CONTRACTOR/SUBCONTRACTOR OFFICIAL (Last, First, Middle Initial)	b. TITLE	c. SIGNATURE	d. DATE SIGNED
Trimmer, Chris	Executive Director	Chris Trimmer	20180216

DD FORM 882 INSTRUCTIONS

GENERAL

This form is for use in submitting INTERIM and FINAL invention reports to the Contracting Officer and for use in reporting the award of subcontracts containing a "Patent Rights" clause. If the form does not afford sufficient space, multiple forms may be used or plain sheets of paper with proper identification of information by item number may be attached.

An INTERIM report is due at least every 12 months from the date of contract award and shall include (a) a listing of "Subject Inventions" during the reporting period, (b) a certification of compliance with required invention identification and disclosure procedures together with a certification of reporting of all "Subject Inventions," and (c) any required information not previously reported on subcontracts containing a "Patent Rights" clause.

A FINAL report is due within 6 months if contractor is a small business firm or domestic nonprofit organization and within 3 months for all others after completion of the contract work and shall include (a) a listing of all "Subject Inventions" required by the contract to be reported, and (b) any required information not previously reported on subcontracts awarded during the course of or under the contract and containing a "Patent Rights" clause.

While the form may be used for simultaneously reporting inventions and subcontracts, it may also be used for reporting, promptly after award, subcontracts containing a "Patent Rights" clause.

Dates shall be entered where indicated in certain items on this form and shall be entered in six or eight digit numbers in the order of year and month (YYYYMM) or year, month and day (YYYYMMDD). Example: April 2005 should be entered as 200504 and April 15, 2005 should be entered as 20050415.

1.a. Self-explanatory.

1.b. Self-explanatory.

1.c. If "same" as Item 2.c., so state.

1.d. Self-explanatory.

2.a. If "same" as Item 1.a., so state.

2.b. Self-explanatory.

2.c. Procurement Instrument Identification (PII) number of contract (DFARS 204.7003).

2.d. through 5.e. Self-explanatory.

5.f. The name and address of the employer of each inventor not employed by the contractor or subcontractor is needed because the Government's rights in a reported invention may not be determined solely by the terms of the "Patent Rights" clause in the contract.

Example 1: If an invention is made by a Government employee assigned to work with a contractor, the Government rights in such an invention will be determined under Executive Order 10096.

Example 2: If an invention is made under a contract by joint inventors and one of the inventors is a Government employee, the Government's rights in such an inventor's interest in the invention will also be determined under Executive Order 10096, except where the contractor is a small business or nonprofit organization, in which case the provisions of 35 U.S.C. 202(e) will apply.

5.g.(1) Self-explanatory.

5.g.(2) Self-explanatory with the exception that the contractor or subcontractor shall indicate, if known at the time of this report, whether applications will be filed under either the Patent Cooperation Treaty (PCT) or the European Patent Convention (EPC). If such is known, the letters PCT or EPC shall be entered after each listed country.

6.a. Self-explanatory.

6.b. Self-explanatory.

6.c. Self-explanatory.

6.d. Patent Rights Clauses are located in FAR 52.227.

6.e. Self-explanatory.

6.f. Self-explanatory.

7. Certification not required by small business firms and domestic nonprofit organizations.

7.a. through 7.d. Self-explanatory.

Dear (b)(6)

Find attached a preliminary monthly progress report for our project. As we have been hiring, our project cadence is just getting going. My finance department tells me we'll usually have everything together for previous month's costs three weeks or so into the next month, so that's not included in this initial report, but I wanted to check that this is the level of detail you want.

Could you let us know specifically what you'd like detailed in the cost statements going forwards?

Thanks,

(b)(6)

Date: Monday, September 20, 2021 2:55:00 PM

Received and approved, thanks (b)(6)

Going forward, you can submit the monthly report after you receive your internal reporting of expenditures for the previous month.

We are looking for the total monthly expenditure each month, no need to break it down by subcatgories (e.g., labor, equipment, etc), a simple report is fine. For example:

Cost
Total funding received: XXXX
Monthly Expenditure: XXXX
Funds Remaining: XXXX

Hope this helps.

Thanks,
(b)(6)

Hi (b)(6)

Thanks for following up. Could you please set up a Zoom conference link for Tuesday's kick off. Our virtual platform is limited to DoD users at this time, but hopefully that will change in the future...

As far as participants for Tuesday's kick off, it will only be (b)(6) from the DTRA (b)(6) side for the meeting, now that the grant was awarded, we no longer need a grant officer present.

Please let us know if you have any other questions. Look forward to Tuesday's meeting.

Dear (b)(6)

We are looking forward to this meeting next Tuesday. Do you have a conferencing system you use, or would you like us to set up a Zoom meeting? Also, can you tell us who will be attending?

Best,

(b)(6)

Thanks for following up. Could you please set up a Zoom conference link for Tuesday's kick off. Our virtual platform is limited to DoD users at this time, but hopefully that will change in the future...

As far as participants for Tuesday's kick off, it will only be(b)(6) from the DTRA(b)(6) side for the meeting, now that the grant was awarded, we no longer need a grant officer present.

Please let us know if you have any other questions. Look forward to Tuesday's meeting.

Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning

(b)(6)

EcoHealth Alliance Project Kick-Off, 2021-08-17

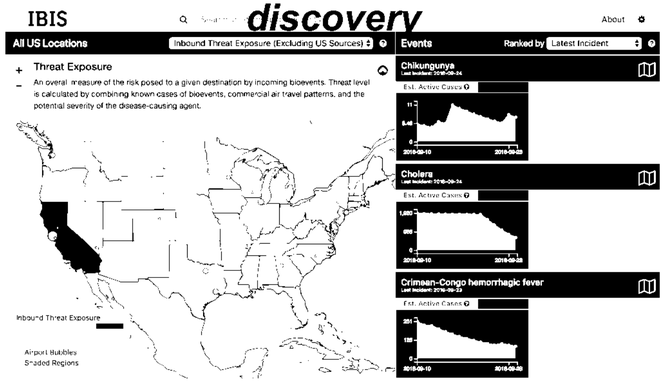
Agenda

- Presentation (<30 min)Introduction and TeamTechnical review: Data and AlgorithmsProject approach, management, and communicationDiscussion (~30 min)

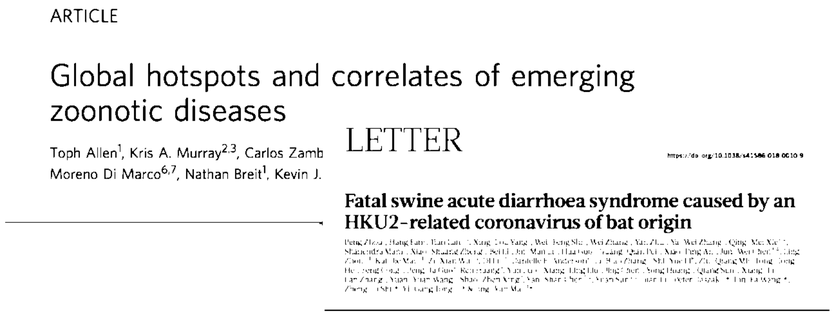
About EcoHealth Alliance

- Non-profit focused on research and prevention of emerging infectious diseaseHigh-impact field, lab, and analytical researchScience-informed policy advisory and tool developmentExtensive network of over 60 collaborating agencies and organizations, nationally and globally

Applied tool-building for diseasesurveillance and discovery



Policy advisory via a global network of partners



ARTICLE

Global hotspots and correlates of emerging zoonotic diseases

Toph Allen[1], Kris A. Murray[2,3], Carlos Zamb
Moreno Di Marco[6,7], Nathan Breit[1], Kevin J.

High-Impact Scientific Outputs

LETTER

https://doi.org/10.1038/s41586-018-0010-9

Fatal swine acute diarrhoea syndrome caused by an HKU2-related coronavirus of bat origin

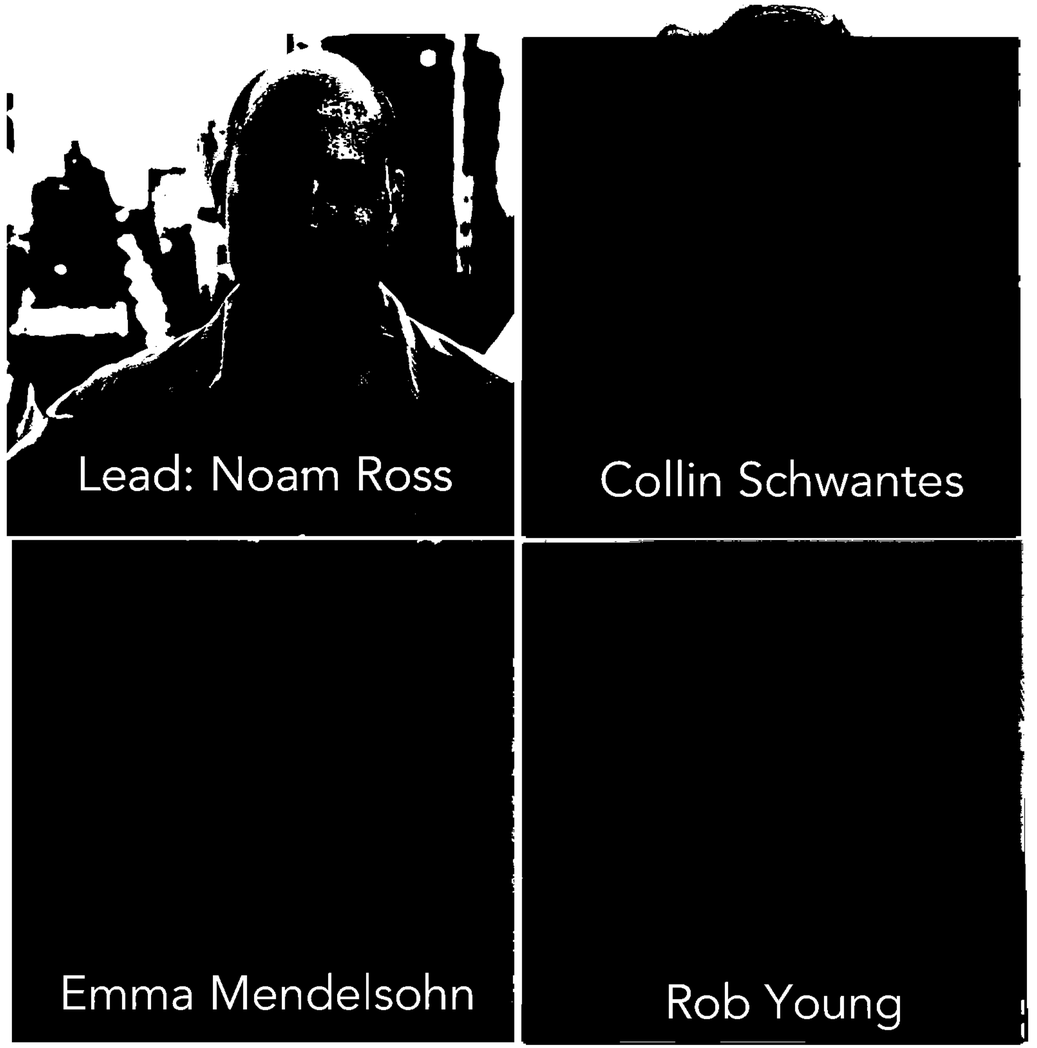
Operational Framework for Strengthening Human, Animal, and Environmental Public Health Systems at their Interface

WORLD BANK GROUP

Global collaborations

The EHA Computational Sciences Team

- A machine-learning and computational epidemiology team within EHAComplements our applied and basic field and lab research, advisory, and partnershipsTight integration and collaboration with biological and behavioral teamsAdditional project oversight: Peter Daszak, William Karesh

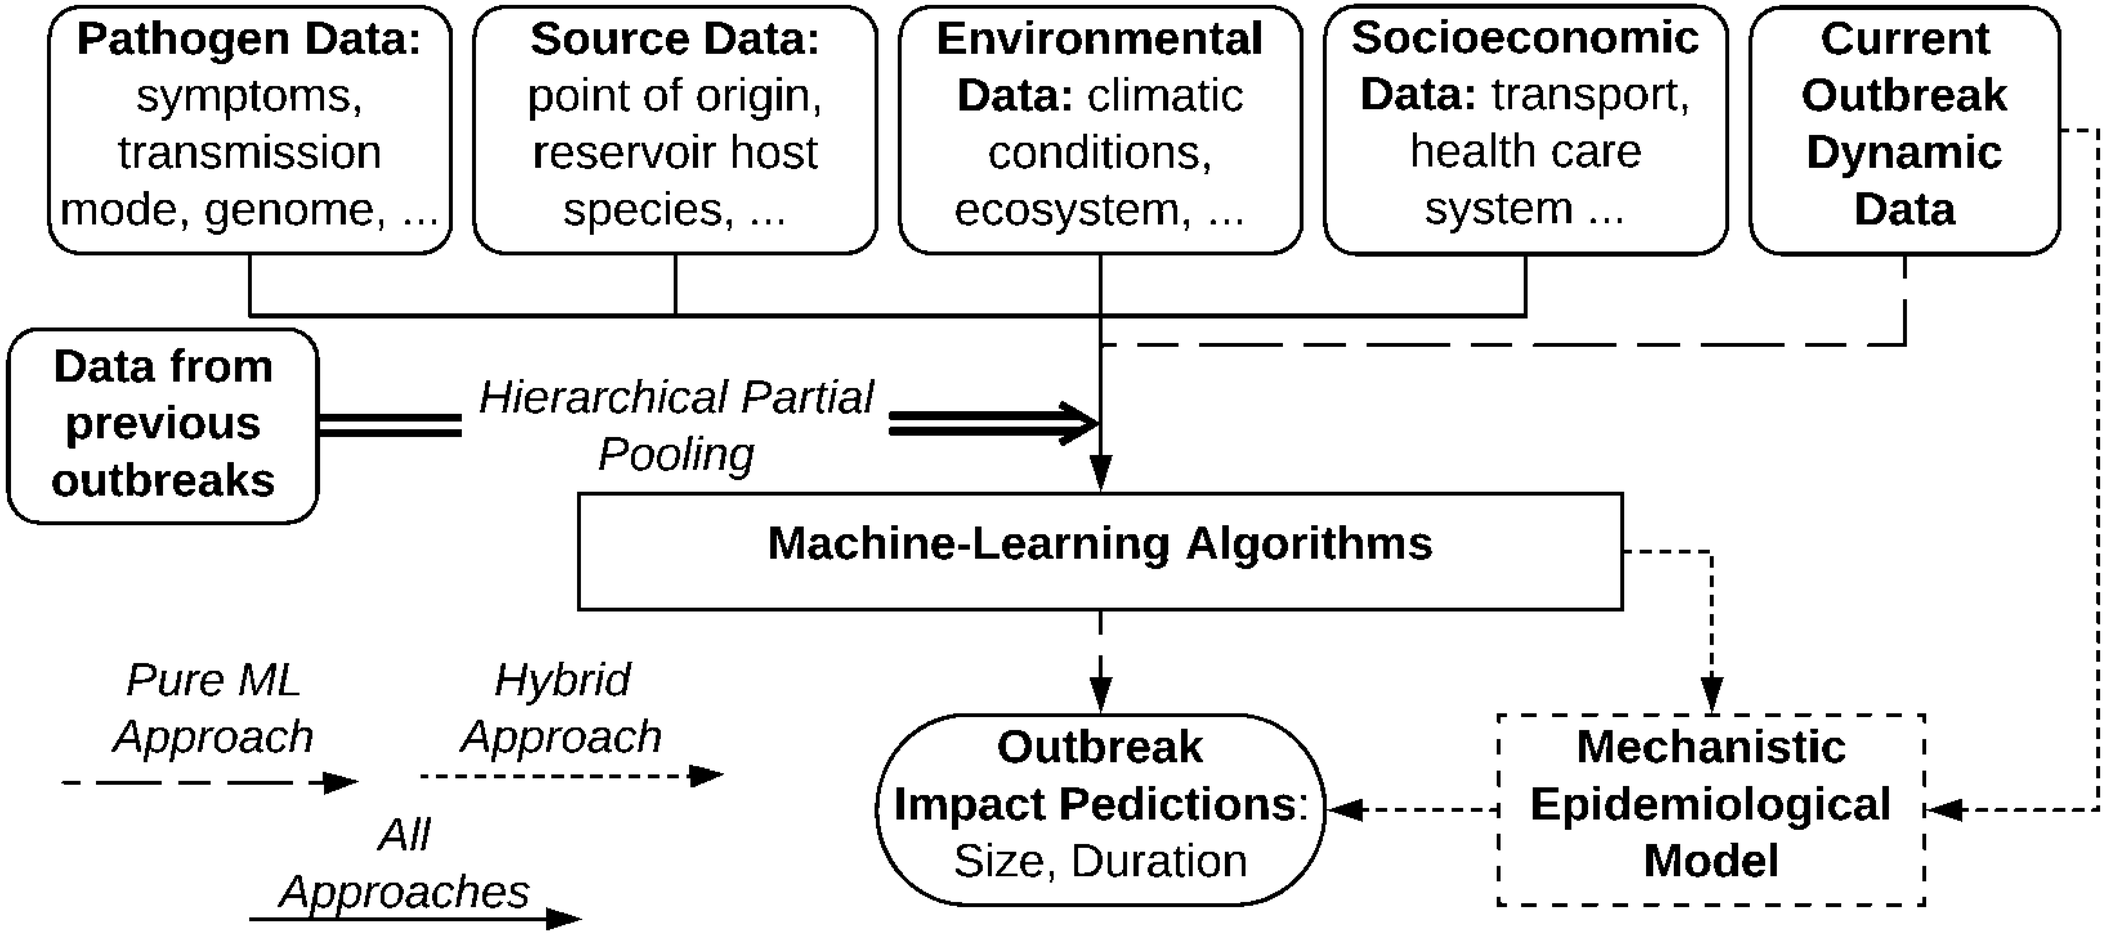


Technical Review: Core Questions

How well can we predict the course of disease outbreaks from data available at early stages?

Q1: Which early-stage data features are most predictive?Q2: How well well does partial pooling across different diseases improve predictions?

Modeling Approach

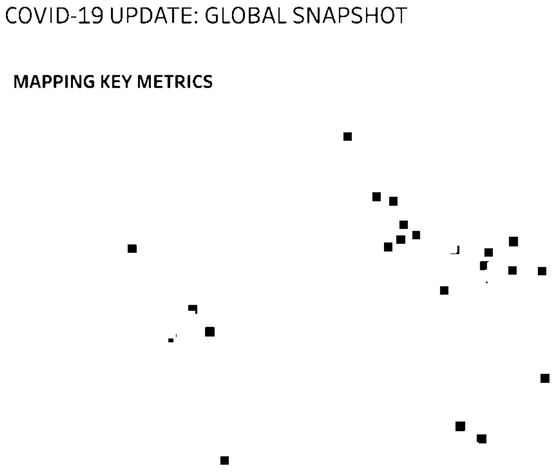


Data Sources: Longitudinal Outbreaks

Epidemiological data limitations are the largest barrier to applying new forecasting methods. We aggregate a variety of applicable sources

Previous DTRA Investments

Veterinary Data

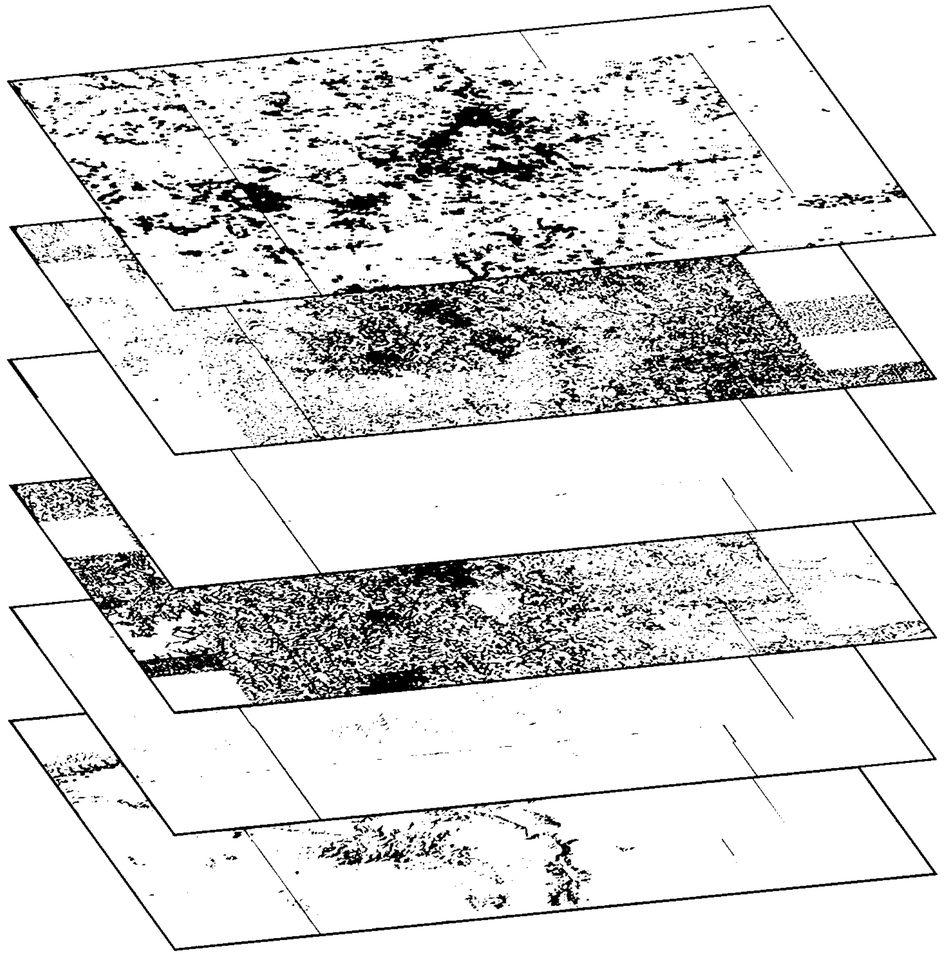


New COVID-19 Datasets

EHA's Data Repository

Data Sources: Outbreak Conditions

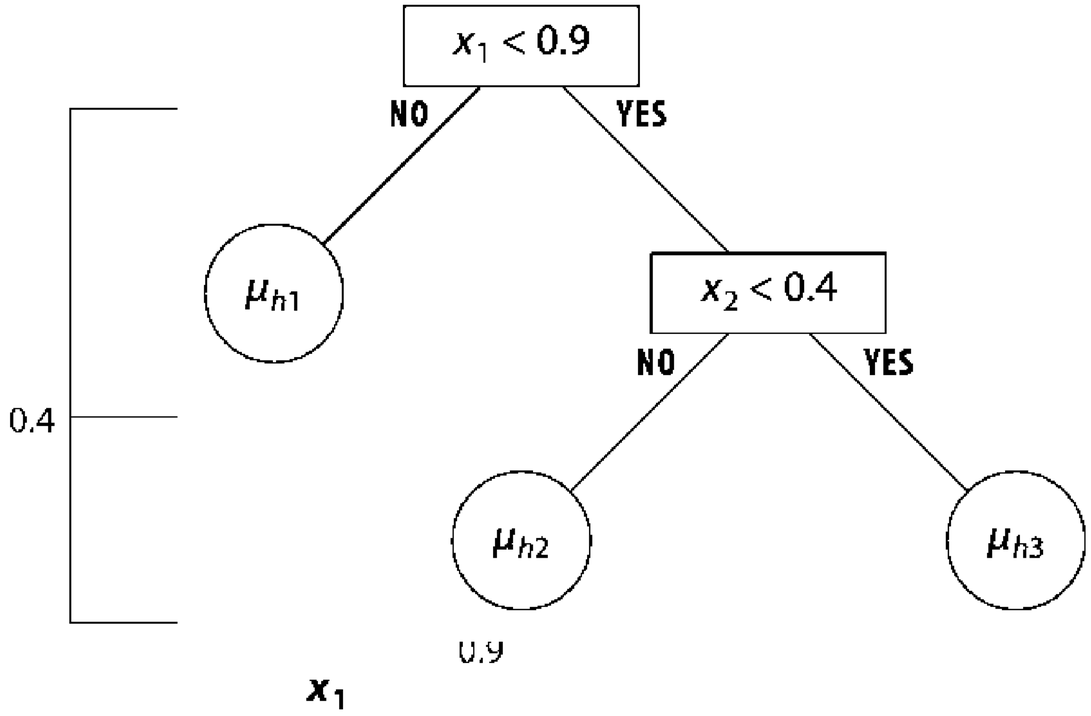
- Environmental data layersDisease host source and distributionHuman population, infrastructure, and transport layersResource availability and response capacityPathogen traits, transmission modes, disease etiology



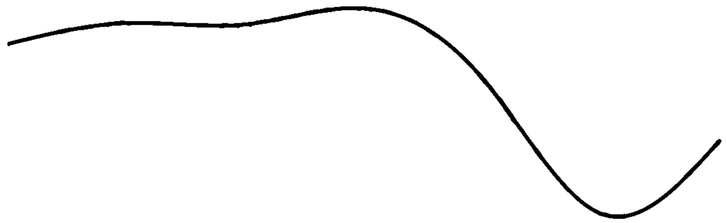
Algorithms: Two General Approaches with a Common Bayesian Twist

We use and compare two general approaches with different strengths

Regression Trees

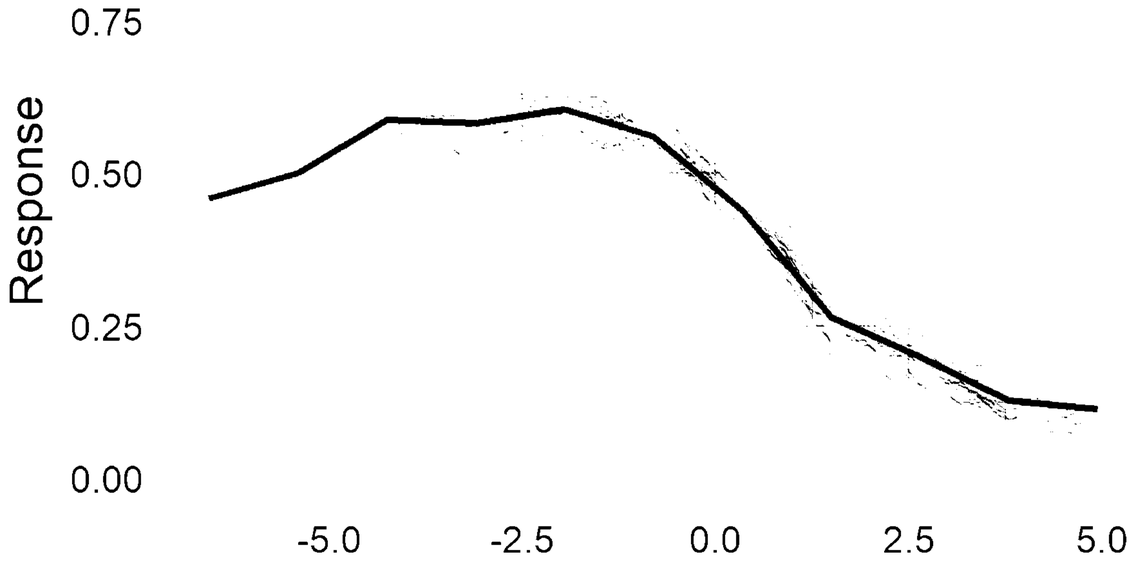


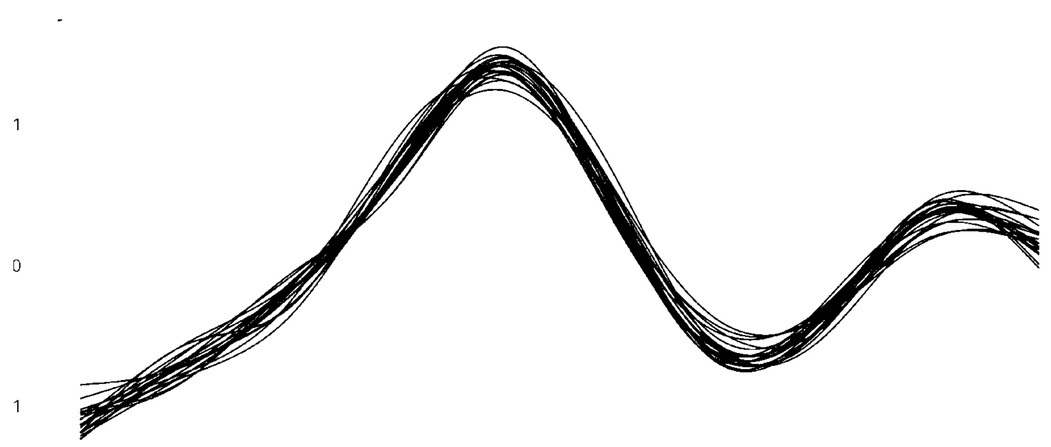
Additive Splines



Algorithms: Two General Approaches with a Common Bayesian Twist

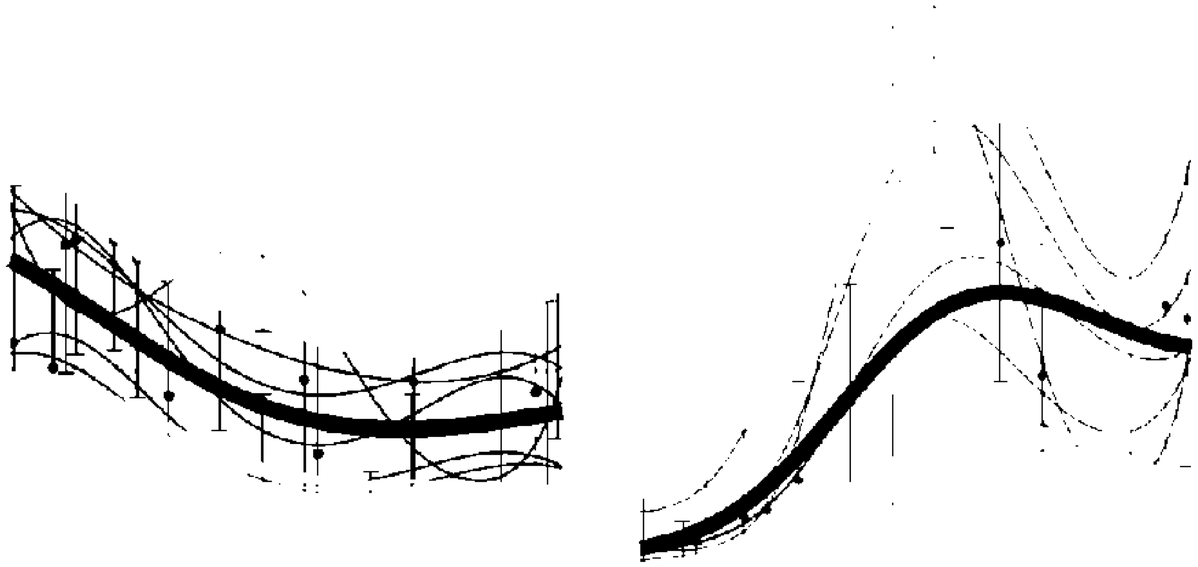
For both trees and splines, we use a Bayesian approach that provides a range of possible relationships, quantifying uncertainty in predictions





Algorithms: Partial Pooling

Partial Pooling allows us to capture relationships that are shared across diseases while letting the data guide how much information and transfer



Year 2 Options: Mechanistic Models, Genomic Data, Interactivity

Q3: How do hybrid machine-learning / mechanistic models compare to pure models in performanceQ4: Can genomic data improve early-stage outcome predictions?T1: Build an interactive interface to generate forecasts

Approach: Deployment-Ready R&D

- Principled validation approachesPractical, real-world performance baselinesDifferential privacy-based hold out testingDesign for rapid applicationR&D in portable computing containersRelease-ready data and models with APIs

Project Work Plan

	Year 1 S1	Year 1 S2
Data and Infrastructure Engineering	Database design and population, feature engineering	Refinement and linking
Algorithm Development	Performance metric design	Core model development
Interface Development		Static performance reports

Iteration, documentation, and reporting

Detail: SOW P. 7

Reporting and Deliverables

- Monthly status reports and cost statementsSemi-annual milestonesAnnual technical reportsSource code and project databasesPublications and conference papers

"See" you tomorrow.

Dear (b)(6)

Find attached our updated Scope of Work and budget, now in your template. We have made the changes we discussed in our last meeting. The budget now includes both an option year as well as another option task for a model GUI. Note also that some labor costs have been adjusted due to salary changes from our annual review process which occurred since our original submission.

Best,
(b)(6)

Great talking with you earlier today and excited to kick off this effort with you in the near future.

As discussed attached is the latest version of the SOW with some changes/requested edits that we discussed this morning. Apologies some of the formatting got messed up when I was trying to clean it up so please feel free to edit the formatting as necessary prior to sending back the revised version.

I have also attached a copy of the cost template for your use in preparing a revised cost estimate once we have finalized the SOW.

Please let me know if you have any questions.

Thanks,
(b)(6)

Great, thanks for your flexibility. Let's plan on Tuesday 09 February from 1000-1100, I just sent you a calendar invite with MS Teams information please share with any relevant personnel from EcoHealth Alliance.

Looking forward to the discussions.

Thanks,

(b)(6)

Dear (b)(6)

This is great to hear, thank you! Either February 8th or 9th at 10-11AM EST works for me. I will review your modifications to the SOW and be prepared to discuss them.

I look forward to working with you.

Best,

(b)(6)

(b)(6)

Congratulations on your selection as a recipient of DTRA Fundamental Research Funding for your proposal in response to HDTRA1-14-24c-FRCWMD-BAA, "Predicting Biothreat Impacts from Early Stage Data via Transfer Learning." My name is (b)(6) and (b)(6) (b)(6) I am the Grant Officer's Representative (GOR) for this award. In this capacity, I will be your DTRA POC for this effort which includes monitoring the progress of the effort throughout its active R&D, conducting periodic program reviews via MS TEAMS, ensuring funding is sent in a timely manner for the R&D effort, and answering questions you may have relating to the R&D during this effort.

DTRA CB is still awaiting receipt of the remaining FY21 funds Congress has appropriated, however, prior to award and kick off of this effort, we can work collaboratively to finalize the SOW and cost negotiations so we are on track to kick off this grant award in the first quarter of this calendar year. To that end, I have attached a red lined SOW that has DTRA requested changes for the proposed effort. Please review so we can discuss next steps. During these follow on discussions, please be prepared to discuss any questions, concerns, and associated cost, schedule, and contract changes that may need to be completed to address the requested changes.

The next couple weeks are hectic for me, but would either Monday February 8th or Tuesday

February 9th from 1000-1100 work for your team?

Look forward to working with you.

Attachment 1 - Statement of Work (SOW)
Project Title: Predicting Biothreat Impacts from Early-Stage Data via Transfer Learning
Document Date: February 9, 2021

Objective
The project's objectives are to determine the efficacy of machine learning (ML) techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats, both intentional (e.g. novel genetically-modified pathogens) and natural (e.g. zoonotic). Specifically, we will answer three questions that will enable rapid decision-making based on ML models of epidemic impacts:

Q1: How much does partial-pooling improve predictions of epidemic impacts, and what information transfers best across diseases?
Q2: What variables are most predictive of epidemic impacts at early stages of an outbreak?
Q3: At what point in epidemic growth do hybrid models that incorporate mechanistic epidemiological components become more accurate than pure ML models?

This work will contribute to fundamental knowledge of properties and variables that contribute most to predictive accuracy at early-stage stages in emerging outbreak prediction and forecasting. It will enable the development of robust and deployable predictive models at early stages of outbreaks, and support informed choices for data collection and model selection.

Scope
The awardee proposes a two-year study to determine the efficacy of ML techniques in predicting epidemic impacts in early-stage, data-sparse conditions, particularly novel biothreats. The awardee team shall focus on the following major goals and milestones:

- *Year 1, Milestone 1 (6 months)*: Create and curate predictor database, project infrastructure, continuous integration/validation, establish data-imputation and automatic predictor workflow (Tasks 1.1-1.2).
- *Year 1, Milestone 2 (12 months)*: Bayesian additive regression tree (BART) model fitting and tuning, determination of variable contribution to prediction accuracy (Task 1.3).
- ~~*Option* Year 1~~, *Milestone 3 (12~~8~~ months)*: Maintain and document project infrastructure,
- *Option Year 1, Milestone 4 (18 months)*: Extend the database to include additional predictors, extend the BART model to ingest genetic data (Tasks 2.1-2.3)
- *Option Year, Milestone 54* (24 months): Construction of hybrid ML/mechanistic model structure, comparative testing of pure and hybrid version, determination of timing when current data overtakes transfer data (Task 2.4)

Background
Situational awareness and risk assessment are critical at early stages of disease outbreaks, when interventions can best mitigate adverse outcomes. Yet decision-makers often face a paucity of data at these stages. Traditional modeling methods to forecast disease impact severity rely heavily on prior knowledge or assumptions about mechanisms of disease spread progression, and they frequently do not anticipate the actual mechanisms.[1-5] They also take considerable time and effort to develop.

Commented [BSC1]: By early stage do you mean prior to an epidemic being defined as an epidemic i.e., The ML algorithm will be able to detect a spike in initial few case counts above baseline and then forecast outcomes or do you intend for the ML algorithm to forecast impacts once an epidemic has been declared then forecasting outcomes in the early stages of an epidemic? Ideally it is the former, as that would address the capability gap of "preparing for surprise." Please clarify.

Commented [NR2R2]: By "early stage" we mean when time-series of case counts are short and the epidemic is not yet in a period of rapid exponential growth. Because of the focus on novel biothreats, either new pathogens or pathogens in novel contexts, we do not expect to have data on previous case counts of previous long-running or low-level endemic disease. Thus, we do not anticipate the algorithm detecting a break point from previous endemic disease, but to estimate impacts from the first few weeks of data from a new outbreak, declared as an epidemic or not. This is more like the latter.

A changepoint detection algorithm is an additional task we could discuss including in optional or future work. It could pair with this model to automatically estimate impacts of diseases that appear to be diverging from baseline endemic levels.

Commented [BSC3R2]: The changepoint detection algorithm is out of scope for this SOW, table discussion for this effort, revisit in future if appropriate.

Commented [BSC4]: DTRA is in agreement with your strategic vision and definition of "early stage" you proposed above. Please add generalizable language in the objective to clarify what "early stage" is meant specific to this effort.

Commented [BSC5]: Add a bullet to add optional task to the scope. Agreed timing should be ~6 months into the option period 1 of the effort. Provide revised GANTT chart including optional task and whether in parallel or sequential with other tasks.

Recent theory suggests disease dynamics are fundamentally predictable[4], and ML methods have been successfully applied in emerging disease science. ML refers to a group of methods, ranging from simple nearest-neighbor approaches to function-approximation methods such as boosted trees and penalized splines, to complex deep-learning neural networks. ML has been used to predict the likelihood of disease emergence and the zoonotic potential of various hosts and viruses[5,6], and deep-learning approaches have been used to infer viral hosts from the comparatively richer data of genetic sequences of viruses.[7,8]

ML methods are generally unstructured, flexible, and offer greater predictive power over traditional statistical approaches. However, these methods are data-intensive, and a key challenge with ML development is data paucity and/or a low signal-to-noise ratio. Surveillance data for even existing, well-studied diseases is rarely rich enough for the data scale of many modern ML techniques. For instance, a ML approach to predict impacts from a new outbreak of Ebola would draw training data from fewer than twenty previous events, each with varying levels of data coverage.

Transfer learning, or data fusion, provides a solution to data paucity issues by using data from other domains to train parts of models that are general, thus limiting new data requirements for more specific components. Hierarchical modeling, or *partial pooling*, is a transfer learning approach for partitioning out which data can be shared between models and which are only applicable to a specific case. For instance, Ebola forecasts for countries outside the historic range of the disease may be improved by calibrating against Cholera outbreaks, which have occurred both within and outside countries with Ebola outbreaks. The degree to which the disease outcomes are correlated is learned, rather than assumed.

An alternative recent development in disease forecasting is the development of hybrid models that incorporate simple mechanistic structures and predictive ML methods to learn model parameters. These approaches have demonstrated high predictive accuracy for near-term forecasting of epidemic growth and impact, particularly during the COVID-19 pandemic[9]. However, these approaches require adequate time-series of data to project forward from current conditions. Their utility in early stages and long-term forecasting accuracy has yet to be determined. In opting to apply these models, it is critical to understand these data requirements and at what point in an outbreak hybrid approaches can overtake pure ML early-stage predictions in accuracy. This project seeks to develop, apply, and compare pure and hybrid-ML techniques to enable the development of robust, rapidly usable predictions at early stages of outbreaks.

Data Sources

Fitting and testing models will draw from disease outbreak data (counts, timing, and geography) and predictor data including pathogen traits (disease symptoms, pathogen traits, modes of transmission), pathogen sources (point of origin, geographic range of potential natural hosts), environmental context (climatic conditions, ecosystem traits), and socioeconomic context (local population densities, demographics, transportation networks, healthcare systems). Please see the Technical Proposal for available data sources.

Tasks/Scientific Goals (Format: Year.Task.Subtask)

YEAR 1

Task 1.1 – Develop and deploy project infrastructure

The awardee shall develop a computational environment that enables continuous model development and testing and allows for research and models to be reproduced and extended by external teams. The computational environment will include continuous maintenance and documentation of project codebase.

Subtasks

1.1.1 Layout a provision project network
1.1.2 Set up continuous integration pipelines
1.1.3 Implement backup and data verification jobs
1.1.4 Implement differential privacy testing
1.1.5 Write and maintain codebase documentation
1.1.6 Perform code review, testing and validation

Task 1.2 – Engineer project database

The awardee shall curate, integrate, cross-link, and validate relevant datasets from various sources into a project database, accounting for differing space and time scales, data formats, and data completeness.

Subtasks

1.2.1 Design database schema
1.2.1 Write pipelines to ingest time-series data
1.2.2 Write pipelines to ingest predictor data
1.2.3 Cross-link data sources via common ontologies

1.2.4 Write quality assurance/quality control (QA/QC) tests for data and perform data cleaning
1.2.5 Create automatic extraction routines to populate relevant predictors from location information
1.2.6 Update data from live sources and clean and maintain data continuously

Task 1.3 – Machine Learning (ML) model development and testing
The awardee shall design, implement, test, and analyze performance of ML model structures and iteratively improv them.

Subtasks
1.3.1 Establish quantitative and qualitative metrics of model performance
1.3.2 Implement "practical naïve" model baseline
1.3.3 Design Bayesian additive regression tree (BART) model structure
1.3.4 Design alternative generalized additive model (GAM) structure
1.3.5 Implement within-disease, all-disease, and partial-pooled disease model versions
1.3.6 Measure variable contribution by re-fitting
1.3.7 Analyze prediction-level variable contributions and model performance
1.3.8 Iteratively update models to improve performance

Task 1.4—Maintain and document project infrastructure
The awardee shall document the methodology for database schema, data ingestion pipelines, QA/QC tests, extraction routes, and ML models established in Tasks 1.1-1.3.
Subtasks
1.4.1 Write and maintain initial codebase documentation
1.4.2 Perform code review, testing, and validation

Commented [BSC6]: Add the same task (i.e., Maintain and document project infrastructure) to Option Year (see below). Can note in Option Year that the task is a continuation of Task 1.4 above.

OPTION YEAR:

Task 2.1 – Extend project database
In the option year, the awardee shall extend the database to include additional predictors and continuously maintain and update to accumulate more data from upstream sources.

Subtasks
2.1.1 Extend database schema to include genetic data and auto-encoded variables
2.1.2 Write pipelines to ingest genetic data
2.1.3 Cross-link data sources via common ontologies
2.1.4Write QA/QC tests for data and perform data cleaning
2.1.5Update data from live sources and clean and maintain data continuously

Commented [BSC7]: Add the same task (i.e., Maintain and document project infrastructure) as Task 2.4 in Option Year. Can note in Option Year that the task is a continuation of Task 1.4 above.

Task 2.2 – Extend BART model
In the option year, the awardee shall extend the BART model to ingest genetic data and test the contribution of this data in enhancing or recapitulating pathogen trait data.

Subtasks
2.2.1Develop genetic predictor variable set via neural-network autoencoding
2.2.2 Modify BART and GAM structures to incorporate genetic variables
2.2.3 Implement within-disease, all-disease, and partial-pooled disease model versions
2.2.4 Compare performance of genetic, pathogen-trait, and combined models

Task 2.3 – Hybrid ML-mechanistic model development and testing

In the option year, the awardee shall develop the hybrid machine-learning mechanistic model, compare its performance to a pure ML model, and determine the switch-over time when the mechanistic model becomes more predictive in the course of the outbreak.

Subtasks

2.4.1 Establish quantitative and qualitative metrics of model performance
2.4.2 Design mechanistic model structure
2.4.3 Determine mechanistic model prior forms
2.4.4 Modify ML model to predict mechanistic parameters rather than outcomes
2.4.5 Implement within-disease, all-disease, and partial-pooled disease model versions
2.4.6 Measure variable contribution by re-fitting
2.4.7 Analyze prediction-level variable contributions and model performance using criteria developed in SubTasks 1.3.x
2.4.8 Compare Hybrid and ML performance along outbreak time-series progression
2.4.9 Iteratively update models to improve performance

OPTIONAL Task 2.5—Develop GUI of alpha prototype (Year 1)

The awardee shall develop an alpha prototype of an end user GUI of the hybrid machine-learning mechanistic model and pure ML model to include data visualizations to forecast one class of diseases (e.g., airborne person to person transmissible).

Deliverables

Reports and Documents

- Monthly reports on task status
- Monthly cost statement
- Periodic program reviews (virtual and/or in person)
- Annual technical report
- Source and executable software code
- Technical papers describing algorithm design and performance
- Conference presentations

Code Modules and Database Archives

~~All code modules and documentation will be continually available on EcoHealth Alliance's GitHub page with access provided to DTRA.~~ Databases will be made available for download and provided electronically via DoD SAFE and/or on-disk to DTRA at the end of the period of performance. .

Please note: The data and information collected in this effort is funded on the condition that it will not be released to another nation or international organization without the specific authority from the Defense Threat Reduction Agency. Individual or corporate rights originating in the information, whether
patented or not, will be respected; that the recipient government will report promptly to the Defense Threat Reduction Agency any known or suspected compromise and that the information will be provided substantially the same degree of security afforded it by the Department of Defense of the United States. No U.S. Government commitment to sell, lend, lease, co-develop, or co-produce defense articles is implied or intended. Also, regardless of any other markings on the document, it will not be downgraded
or declassified without written approval of the originating U.S. agency.

Commented [BSC8]: Expand this out more into subtasks, provide detail as to timing, and costs associated.

Commented [NR9]: This is a distinct new task from the original scope. Would it be possible to adjust the budget so that we can be sure to have adequate time and team members with the requisite skills for this?

Commented [BSC10R10]: Yes, in revised cost proposal please adjust budget accordingly to reflect additional resources to accomplish optional task.

Commented [BSC11]: The annual technical report shall include the following sections at a minimum:
Executive Summary
I.Introduction/Background
II. Methodology
III.Findings
IV.Discussion/Future Recommendations
V.Conclusion
VI.Appendices
a.Snapshots of GUI/how to use
b.Data worksheet (summarizing list of data sources used, metadata abstracted, links, etc.)
User specified format on report is acceptable.

Commented [BSC12]: Remove this sentence. All code modules and database archives will be cleared via DTRA OPSEC prior to release.

COST PROPOSAL

Prime 1 (Fill-in)

Sub 1 (Fill-in)

GENERAL INFORMATION

The purpose of the requested information in the attached worksheets is to assist government personnel in the review and evaluation of cost proposals submitted by offerors.

Options: Unpriced Options will not be accepted. Any Option that is not fully priced, will not be included in any resulting award.

Enter the proposed cost detail for the Base and each Option period (as needed) on the "Total Amount" tab.

- The formulas in this spreadsheet are based upon common business practices; however, Offerors may edit formulas as necessary (edited formulas must still be visible).
- Ensure all costs from other worksheets are correct.

Below is a summary of the proposed cost. This chart will automatically fill in from the "Total Amount" tab.

Total Direct Labor Costs	$0
Total Fringe Benefit Costs	$0
Total Labor Overhead Costs	$0
Total Subcontract Costs	$0
Total Consultant Costs	$0
Total Other Direct Costs	$0
Total Material Handling Costs	$0
Subtotal Costs	$0
Total G&A Costs	$0
Subtotal Costs	$0
Total Cost of Money	$0
Total Estimated Costs	$0
Fixed Fee (If proposing a CPFF contract)	$0
Total Estimated Costs Plus Fixed Fee	$0

Cost Proposal - Total Amount

Prime Offeror: None 1 (Fill-in)

Subcontractor: Sub 1 (Fill-in)

			BASE			OPTION 1			OPTION 2			OPTION 3			OPTION 4			Total	
Direct Labor (DL)			MM/YR to MM/YR			MM/YR to MM/YR			MM/YR to MM/YR			MM/YR to MM/YR			MM/YR to MM/YR

Fixed Fee (If proposing a CPFF contract)		(Note 2)	$0	0.000%	$0.00	$0	0.000%	$0.00	$0	0.000%	$0.00	$0	0.000%	$0.00	$0	0.000%	$0.00	$0.00	$0.00
Total Estimated Costs Plus Fixed Fee		(Note 3)			**$0.00**			**$0.00**			**$0.00**			**$0.00**			**$0.00**		**$0.00**

Instructions:

- For PR ME submission - Subcontractor Name: If there are subcontracts, list all subcontractor names.
- List Principal Investigator and Key Personnel working on the project even if they receive no salary support.
- Subcontracts/Interorganizational Transfers: If appropriate, place Subcontractor name(s) or Interorganizational Name/Code in Column B
- Consultants: If appropriate, place Consultant name(s) in Column B
- Remember that the total of all Base and Option worksheets should equal the total of the Total Amount worksheet.
- Add descriptions in Column B if costs are entered in the following areas: Fringe Benefits, Labor Overhead, Other Direct Costs/Other types, Material Handling, General and Administrative, and Facilities Cost of Money

Note 1: **Any proposed personnel in the technical proposal should be identified with their labor category.**

Note 2: **Profit or fee is not allowed on direct costs for travel. In addition, a DD Form 1547 (DFARS 215.404-70) will be utilized in calculating the Government objective for fee.**

Note 3: **This worksheet does not pull data from other worksheets within this Excel Spreadsheet**

=

LABOR Information Prime 1 (Fill-in)								
		Base Period	Option I	Option II	Option III	Option IV	Supporting Documentation	Supporting Rationale
Labor Category (Note 1)	Name	Direct Labor Rate	Escalation Rate	Escalation Rate	Escalation Rate	Escalation Rate	(Note 2)	(Note 3)

Indirect Rates								
	Base Period	Option I	Option II	Option III	Option IV	Basis of Rate	Applied Against (Note 5)	Supporting Documentation (Note 6)
Rate Category	Rate	Rate	Rate	Rate	Rate	(Example: FPRA, FPRP, Estimate, etc.)		
Fringe Benefits								
Labor Overhead								
Material Handling								
General and Administrative								
Facilities Cost of Money								

Note 1: Add additional labor categories if needed.
Note 2: Provide the location (section, page) in the proposal's Cost Narrative/Supporting Documentation (BAA para 3.5.2.2.1) to support your price basis (e.g. copy of current payroll record or signed offer letter)
Note 3: Provide the location (section, page) in the proposal's Technical Basis of Estimate (BAA para 3.5.2.1.2) of the rationale for the appropriateness and necessity of the proposed labor categories and the labor hours alloc
Note 4: Add additional indirect rates as needed.

If the offeror does not have a Forward Pricing Rate Agreement (FPRA), Forward Pricing Rate Recommendation (FPRR), or provisional billing rates; in order to assist the Government in evaluating the reasonableness of your proposed indirect rates, please provide the following information:

1. Performance data used to develop your proposed indirect rates. This typically consists of pool costs and base costs that demonstrate how the indirect rates were derived.
2. Information regarding your projections for out years, including your assumptions and method for developing these estimates.

SUBCONTRACTOR COST DATA Prime 1 (Fill-in)

Subcontracts/Interorganizational Transfers – A fully disclosed cost proposal as detailed as the Offeror's cost proposal including support documentation In accordance with FAR 15.404-3(b) and 15.404-3(c), the prime contractor **shall** perform and provide a cost/price analysis of each subcontractor's cost

Certified cost or pricing data may be required for subcontractor proposals over $2,000,000.00, in accordance with Section 811 of the National Defense Authorization Act for Fiscal Year 2018 (Pub. L. 115-91).

Subcontractor	CAGE Code	Competitive/Sole Source	Cost/price analysis included (Y/N)	Type of Subcontract (i.e., Fixed Price, Time and Materials, etc.)	Competitive Quotes or Sole Source Documentation Included (Y/N)	Total amount exceeds $750K (Y/N)	Cost/Price Analysis (Note 1)

Note 1: Provide the location (section, page) in the proposal's Cost Narrative/Supporting Documentation (BAA para 3.5.2.2.1) of the cost/price analysis for each individual subcontractor

CONSULTANTS Prime 1 (Fill-in)						
Name (Note 1)	Description of effort to be performed by the Consultant or attach Consultant Statement of Work	Number of Hours	Hourly Rate	Total	Supporting Documentation (Note 2)	Supporting Rationale (Note 3)
Base						
				$0.00		
				$0.00		
				$0.00		
Option I						
				$0.00		
				$0.00		
				$0.00		
				$0.00		

Instructions: • For Prime - fill out all columns if applicable. Indicate "Not Applicable" in B5 when there is no information to include.

Note 1: **Include a separate section in the above table for the Base and each Option.**

Note 2: **Provide the location (section, page) in the proposal's Cost Narrative/Supporting Documentation (BAA para 3.5.2.2.1) used to support your price basis (e.g. copy of quote or agreement).**

Note 3: **Provide the location (section, page) in the proposal's Technical Basis of Estimate (BAA para 3.5.2.1.2) of the rationale for the necessity of the proposed consultant(s).**

MATERIALS - SUPPLIES (Note 1)		Prime 1 (Fill-in)						
Item (Note 2)	**Description of Material (include model number)**	**Qty**	**Unit Price**	**Total Price**	**Competitive /Sole Source**	**Vendor/Source (If known)**	**Supporting Documentation (Note 3)**	**Supporting Rationale (Note 4)**
Base				$0.00				
1				$0.00				
2				$0.00				
3				$0.00				
Option I				$0.00				
4				$0.00				
5				$0.00				
6				$0.00				
7				$0.00				

Instructions:

- Fill out all columns on the Materials/Supplies Tab for each item.
- Add additional lines if needed.
- Ensure that descriptions and vendors listed on the Materials/Supplies worksheet match information provided in the backup.

Note 1: **Material is property that may be incorporated into or attached to a deliverable end item or that may be consumed or expended in performing a contract. It includes assemblies, components, parts, raw and processed materials, and small tools and supplies that may be consumed in normal use in performing a contract. Material should be proposed separately from Equipment (see following**

Note 2: **Include a separate section in the above table for the Base and each Option.**

Note 3: **Provide the location (section, page) in the proposal's Cost Narrative/Supporting Documentation (BAA para 3.5.2.2.1) of the documentation used to support your price basis (e.g. copy of quote, page from catalog, recent invoice or PO). If the supporting documentation is located on a website, then please provide a screen shot.**

Note 4: **Provide the location (section, page) in the proposal's Technical Basis of Estimate (BAA para 3.5.2.1.2) for the necessity of the proposed materials/supplies**

EQUIPMENT (NOTE 1)	Prime 1 (Fill-in)									
Item (Note 2)	Description of Equipment (include model number) (Note 1)	Will the equipment be included as part of a deliverable item under the award? (Y/N)	Type of Equipment (special test equipment, special tooling, general purpose equipment, or plant equipment) (Note 3)	Qty	Unit of Issue	Unit Price	Total Price	Vendor/Source	Supporting Documentation (Note 4)	Supporting Rationale (Note 5)
Base										
							$0			
							$0			
Option I										
							$0			

Instructions:

- Fill out all columns on the Equipment Tab for each item.
- Add additional lines if needed.
- Ensure that descriptions and vendors listed on the Equipment worksheet match information provided in the backup.

Note 1: **Contractors are normally required to furnish all equipment and/or facilities necessary to perform Government contracts (see FAR 45.102(a)). The Government may allow**

Note 2: **Include a separate section in the above table for the Base and each Option. Add additional lines labeled with Options if needed.**

Note 3: **Definitions:**
performing a contract. It consists of items or assemblies of equipment including standard or general purpose items or components that are interconnected and interdependent for installing special test equipment, and which are of such a specialized nature that without substantial modification or alteration their use is limited to the development or
Plant equipment means personal property of a capital nature (including equipment, machine tools, test equipment, furniture, vehicles, and accessory and auxiliary items) for

Note 4: **Provide the location (section, page) in the proposal's Cost Narrative/Supporting Documentation (BAA para 3.5.2.2.1) used to support your price basis (e.g. copy of quote, page from catalog, recent invoice or PO).**

Note 5: **Provide the location (section, page) in the proposal's Technical Basis of Estimate (BAA para 3.5.2.1.2) of the rationale for the necessity of the proposed materials/supplies**

- When completing the "From" and "To" information, enter the city and state where travel will originate and end. For example, from Seattle WA to Washington DC. Do not list airport codes.
- Include the trip purpose. It must be referred to in the Technical Proposal. Publications, conference attendance, and presentations are encouraged but must be justified to and approved by the Program Officer.
- Remember that you cannot stay overnight the same number of days that you travel. There must always be one more day than night.
- Do not combine any categories.
- For lodging and M&IE, use federal Per Diem Rates found at http://www.defensetravel.dod.mil/site/perdiemCalc.cfm.
- For M&IE, input the full rate in the white block. The gray block will automatically calculate the total to include 75% for the first and last day of travel.
- Submit backup for airfare and rental cars. Price airfare at economy rates; indicate if the airfare is refundable.

Estimates and the resultant costs claimed must conform to the applicable Federal cost principles.
Include a separate section in the above table for the base and each option
If there are miscellaneous expenses associated with the trip, provide description and rationale.

Provide the location (section, page) in the proposal's Cost Narrative/Supporting Documentation (BAA para 3.5.2.2.1) used to support your price basis (e.g. copy of quote, page from catalog, recent invoice or PO).

Great, thanks for your flexibility. Let's plan on Tuesday 09 February from 1000-1100, I just sent you a calendar invite with MS Teams information please share with any relevant personnel from EcoHealth Alliance.

Looking forward to the discussions.

Thanks,
(b)(6)

Congratulations on your selection as a recipient of DTRA Fundamental Research Funding for your proposal in response to HDTRA1-14-24c-FRCWMD-BAA, "Predicting Biothreat Impacts from Early Stage Data via Transfer Learning." My name is (b)(6)
(b)(6) I am the Grant Officer's Representative (GOR) for this award. In this capacity, I will be your DTRA POC for this effort which includes monitoring the progress of the effort throughout its active R&D, conducting periodic program reviews via MS TEAMS, ensuring funding is sent in a timely manner for the R&D effort, and answering questions you may have relating to the R&D during this effort.

DTRA CB is still awaiting receipt of the remaining FY21 funds Congress has appropriated, however, prior

to award and kick off of this effort, we can work collaboratively to finalize the SOW and cost negotiations so we are on track to kick off this grant award in the first quarter of this calendar year. To that end, I have attached a red lined SOW that has DTRA requested changes for the proposed effort. Please review so we can discuss next steps. During these follow on discussions, please be prepared to discuss any questions, concerns, and associated cost, schedule, and contract changes that may need to be completed to address the requested changes.

The next couple weeks are hectic for me, but would either Monday February 8th or Tuesday February 9th from 1000-1100 work for your team?

Look forward to working with you.

HI (b)(6)

Thanks for the heads up.

I think pulling (b)(4) from the (b)(4) effort would work best. Technically EcoHealth Alliance doesn't need the full base year amount in FY21 dollars, (b)(4) think it makes sense to fund as much of (or all) of the base year as possible so (b)(6) funded for all efforts to make decisions off of. (b)(4)
(b)(4)

With that being said, if (b)(6) strongly favors th (b)(4)

what is planned for EcoHealth, maybe we want to shift funds differently. Ultimately I defer to you both on priority for these two efforts. Hopefully that makes sense.

(b)(4)

Below is a summary of the changes (assuming you are good with the (b)(4) shift from (b)(4) EcoHealth), please confirm you are good with these and I can update SMART accordingly.

(b)(4)

CB11030 (EcoHealth) - LF1BR
Current: $250,000.00
Adjustment: +$3,279.10
Revised: $253,279.10

Hi (b)(6)

PR package coming your way for the CB11030 EcoHealth Alliance New Grant. Per our discussion, we have $250k allocated for the Base Year, but the final cost came in at $253,279.10. I know you are looking into pulling that remaining (b)(4) to cover. Let me know if you need anything else from me.

Thanks for working this!

Hi (b)(6)

I hope you are doing well! Contracting received a congressional inquiry today regarding EcoHealth Alliance's relationship with the Wuhan Institute of Virology. CBA had two contracts with EcoHealth for Global Rapid Identification Tool System (GRITS). The first effort was HDTRA1-13-C-0029 and the follow-on was HDTRA1-15-C-0041. You were the COR on 15-C-0041. I have reviewed both contracts and it does not appear that funding for these efforts was given to or used in collaboration with the WIV. Can you verify this to be correct, to your knowledge?

Thanks in advance!
