Assignment of Invention Rights to the Inventor: The inventor may request assignment of invention rights. Agencies support requests of this type to variously. In all cases, documentation is required when a grantee organization waives rights to the invention and the inventor(s) wishes to retain the invention rights.	At the time the grantee organization elects not to pursue title and the inventor requests rights in the invention.	First, the grantee organization must elect not to retain rights in the invention. Second, the inventor must request the assignment of rights, agree to all terms associated with invention reporting as detailed in 37 CFR 401, and must pursue commercialization of the invention through patent filing or licensing as a research tool. Specific procedures for any agency should be determined prior to initiating the request.	401.14(k)(1) non-profits	This status shall be indicated using iEdison. Submission of all other issues (such as outstanding required documents) should be resolved prior to proceeding further. Submission of the required documents will be done electronically by uploading either a PDF, TIFF, or text file through iEdison.

Action	When	Discussion	37 CFR Reference	Submission to DTRA
Initial Patent Application: The grantee must inform the government of the initial patent application that related to any subject invention. The patent application must include a government support clause.	Within 1 year after election of title, unless there is an extension.	Time frame may vary if invention becomes public. The term initial patent application means a nonprovisional U.S. national application for patent as defined in 37 CFR 1.9(a)(3). The notification must include the patent application number and filing date assigned by the USPTO. A copy of the full application is not required.	401.14(e)(3) 401.2(n)	All filing data shall be submitted via iEdison. Evidence of inclusion of government support clause shall be submitted electronically as either a PDF or TIFF file through iEdison.
Assignment to Third Party: Documentation necessary when a grantee contractor wishes to assign invention rights to third party. If the grantee contractor is a non-profit, the government must approve the assignment. For profit or small business grantee contractors do not need to seek approval. If the rights are assigned, new rights holder assumes the same reporting responsibilities as the grantee contractor organization.		If assignment approved, third party must pursue commercialization of the invention through patent filing or licensing of the invention as a research tool. Specific procedures to request third party assignment may vary between agencies. Consult DTRA prior to initiating request	401.14(k) for non-profits Note the distinction between small businesses and non-profit organizations.	Documentation shall be submitted electronically as either a PDF or TIFF file through iEdison.
Issued Patent: Grantee must provide federal agency sponsor with patent issue date, number, title of patent, and evidence of government support clause.	At the time of issue	Patent must include government support clause	401.5(f)(2) 401.14(f)(4)	All issued patent information shall be provided using iEdison. Evidence of inclusion of government support clause will be provided electronically as a PDF or TIFF file through iEdison.
Request for Extension of Time: An extension of up to two years may be requested for election of title, or one year for filing a patent application.	Prior to any statutory bar	Extension of 2 years for title election and one year for patent application are preapproved for funded inventions. Additional extensions need written approval from the federal agency sponsor.	401.14(e)(4)	Request electronically using iEdison.
Discontinuance of Patent Application, Payment of Maintenance Fees, or Defense in a Reexamination or Opposition proceeding on a Patent: Grantee must notify federal agency sponsor of changes in patent status.	At any time in the process, but prior to established deadlines	Relevant information and documents (e.g., patent application or patent) must be provided such that a determination to protect government interests can be made. The federal agency sponsor has the option to pursue the patent application or the patent if not being properly pursued or maintained. Any change in status must be reported at least 30 days prior to pending PTO office actions.	401.14(f)(3) 401.6	Indication shall be made via iEdison.

Action	When	Discussion	37 CFR Reference	Submission to DTRA
Annual Utilization Report: DTRA requires utilization reporting for all subject inventions that have had title elected or are licensed without a patent. Report includes stage of development, date of first commercial sale or use, number and type of licenses, gross income, licensing to small business, status of U.S. manufacturing and identification of any FDA-approved product names.	Annually	DTRA requires invention utilization reports on a 12 month reporting cycle beginning in the month of grantee choosing and continuing throughout duration of patent. Information requirements defined in iEdison. Note: this reporting requirement, if applicable, extends beyond the grant period.	401.14(h)	Submit electronically using iEdison.
Annual Summary Report of Inventions: Summarize all previously reported subject inventions under this grant.	Annually	Invention reports shall be filed annually due no later than 1 July of each year. Grants effective after 31 January will not require a report until 1 July of the following year. The recipient shall use DD Form 882, Report of Inventions and Subcontracts, to file invention reports. If no inventions occurred during the annual reporting period a negative report must be submitted --Email Form DD882 to dtrabas:cresearch:@mail.mil (file size must be less than 10MB). File should be named by the Grant number and "Invention Report" (e.g. HDTRA1-12-1-9999 Invention Report). --The Grant shall not be closed out until all invention reporting requirements are met.	401.5(f)(3)	No iEdison submission allowed. Submit DD Form 882, Report of Inventions and Subcontracts to: --DTRA Grants Officer, 8725 John J. Kingman Rd., MSC 6201 (#2730B), Ft. Belvoir VA 22060-6201 --Administrative Office identified in the Grant --As directed by DTRA, email or portal.
Final Invention Statement and Certification: Report all subject inventions derived or reduced to practice during the performance of the grant.	Due with the Final Technical Report within 90 days after the project ends	Invention reports shall be filed at the end of the Grant's PoP. If no inventions occurred during the lifetime of the award, a negative report must be submitted. --Email Form DD882 to dtrabas:cresearch:@mail.mil (file size must be less than 10MB). File should be named by the Grant number and "Invention Report" (e.g. HDTRA1-12-1-9999 Invention Report). --The Grant shall not be closed out until all invention reporting requirements are met.	401.5(f)(1)	No iEdison submission allowed. Submit DD Form 882, Report of Inventions and Subcontracts to: --DTRA Grants Officer, 8725 John J. Kingman Rd., MSC 6201 (#2730B), Ft. Belvoir VA 22060-6201 --Administrative Office identified in the Grant --As directed by DTRA, email or portal.

9. **<u>Technical Reporting Requirements</u>.**

Research Performance Progress Report (RPPR). Except under rare cases, RPPRs are required annually. The RPPR is due no later than 1 July of each year. Grants effective after 31 January will not require a RPPR until 1 July of the following year.

The RPPR is *not* a cumulative report. The first RPPR shall <u>only</u> include actions that occurred from the Period of Performance start date up to submission of the first RPPR. Each subsequent report shall only include actions that occurred during the 12-month period following the previous year's RPPR.

A RPPR is not required in the final year of the award if the period of performance ends within 60 days of the RPPR due date. In this instance the Final Report will satisfy the requirement. Broadly the RPPR shall address the following items:

- Accomplishments
- Products
- Participants and Other Collaborating Organizations
- Impact
- Changes/Problems

Templates and specific instructions will be provided each year in advance of the submission deadline. All files must be submitted via email to dtrabasicresearch@mail.mil (individual file size must be less than 10MB). A copy of the RPPR should also be provided to the Administrative Office identified in the Grant. The file names should be as follows:

- RPPR: Year Annual Report Grant Number, e.g. 2017 Annual Report HDTRA1-12-1-9999.
- Metrics: Year Metrics Grant Number, e.g. 2017 Metrics HDTRA1-12-1-9999.

Quad Chart. An updated quad chart must be submitted annually. A template will be provided each year in advance of the submission deadline. All files must be submitted via email to dtrabasicresearch@mail.mil (individual file size must be less than 10MB). The file name should be as follows:

- Quad Chart: Year Quad Chart Grant Number, e.g. 2017 Quad Chart HDTRA1-12-1-9999.

Annual Technical Review. At least one representative (preferably the PI) for each award is expected to attend and present at an annual technical program review meeting, unless otherwise exempted by DTRA in writing. For planning purposes reviews will typically be for two days in Northern Virginia during the spring or summer months.

Final Technical Report. A comprehensive final technical report is required: the draft document is required forty-five (45) days prior to the end of the Period of Performance and the final document is required ninety (90) days after the expiration or termination of the award.

The purpose of the final report is to document and to transition the results of the effort into the DTRA and DoD applied research community. The final report will always be sent to the Defense Technical Information Center (DTIC) and unclassified reports may be made available to the public through the National Technical Information Service (NTIS).

The final report is more than an extension of previous annual reports. The final report shall be a **comprehensive** technical summary of the significant work accomplished. The final report, where it is not readily accessible in published form should, where applicable:

- Clearly describe and illustrate the experimental equipment, setup, and procedures;
- Characterize and tabulate collected/computed data in an appendix;

- Sufficiently describe computational codes so they can be reproduced. Include a listing of the code in an appendix if possible and appropriate; and
- When the research effort culminates in the production of one or more student theses or dissertations, in these cases, the most significant advancements and conclusions (equations, figures, relationships, etc.) should be included in an executive summary. The theses or dissertations should be attached as appendices only if they are not readily available. If they are, clearly reference them and how they can be obtained. Also include in the executive summary, cumulative lists of people involved in, and publications stemming from, the research effort. Do not include copies of already submitted or published articles in the final report.

Standard Form (SF) 298, Report Documentation Page, must be used. Item 13 of the SF-298 should contain a 100 to 200 word abstract summarizing technical progress during the reporting period. The SF-298 may be found on the Internet at: http://www.gsa.gov/portal/forms/download/116146

All of the report pages should be prepared for acquisition and distribution by DTIC. All of the report pages should be of good quality for copying purposes. No pages should be missing.

The format and standard required by your institution for the preparation of theses and dissertations shall be used for the final report. In the absence of any institutional standards, you may wish to refer to the American National Standards Institute (ANSI) document Z39.18-1987, "Scientific and Technical Reports: Organization, Preparation, and Production," for guidance. The report may be obtained from:

American National Standards Institute, Inc.
1430 Broadway
New York, NY 10018

It is anticipated that all final technical reports will be unclassified and that distribution will not be limited. However, for final technical reports that require a limited distribution as deemed necessary by DTRA, a Distribution List will be provided with the comments on the draft final technical report. The Distribution List should be formatted to match the rest of the report, placed at the end of the report, and added to the Table of Contents. The number of pages in the Distribution List should be added to the total page count and included in the total number of pages cited in Block 15 of the SF-298.

The draft of the final technical report will be due not later than forty-five (45) days prior to the end of the period of performance. The draft of the final technical report (including a draft SF-298) must be submitted electronically as follows:

- Email the draft of the final technical report to dtrabasicresearch@mail.mil (file size must be less than 10MB). The file name should be 'Draft Final Report' and the Grant number, e.g. Draft Final Report HDTRA1-12-1-9999.
- Provide a copy of the report to the Administrative Office identified in the Grant.

Within thirty (30) days, this draft will be reviewed by DTRA and comments will be provided to the Grantee to ensure the report complies with DTRA final report requirements. Such review and comment does not restrict the conduct or reporting of the project research

findings/outcomes and, in accordance with Article 35, does not restrict Grantee's ability to publish. Grantee shall incorporate such requested changes so that the report incorporates and complies with agreement final reporting requirements terms. Final Technical Reports are due ninety (90) days after the expiration or termination of the award. The final submission should be made in accordance with the draft final report submission instructions.

Final Metrics. A final metrics table (in MS Excel format) is required. A template and specific instructions will be provided in advance of the submission deadline. The final metrics file should be submitted along with the Final Technical Report. The fields contained in the final metrics file are analogous to those of the annual submissions. The final metrics file shall contain only data from the last annual reporting period until the end of the award's funded Period of Performance.

- Email the final Metrics File to dtrabasicresearch@mail.mil (file size must be less than 10MB). The file name should be 'Final Metrics' and the Grant number, e.g. Final Metrics HDTRA1-12-1-9999.

10. Financial Reporting Requirements.

Federal Financial Reports (SF-425) are due no later than 1 July of each year with data "as of" 30 May of that year. Grants effective after 31 January will not require a Federal Financial Report until 1 July of the following year. All financial reports shall be submitted to the Administration Office identified in Block 6 of the Research Grant. In addition, the Federal Financial Report must be submitted electronically as follows:

- Email the Federal Financial Report to dtrabasicresearch@mail.mil (file size must be less than 10MB). The file name should be the Year, 'Federal Financial Report' and the Grant number, e.g. 2015 Federal Financial Report HDTRA1-12-1-9999.

11. Delegation of Administration Duties.

Certain grant administration duties have been delegated to the Administration Office identified in Block 6 of the Research Grant. These duties are as follows:

1) Provisionally approve all Grant and Cooperative Agreement Vouchers.
2) Perform all property administration services except the approval of recipient's requests to purchase equipment with grant funds. Such approvals must be granted by the DTRA Grants Officer.
3) Perform all plant clearance functions.
4) Approve requests for Registration for Scientific and Technical Information Services (DD Form 1540).
5) Obtain all financial report(s) (see Article 10 of this document).
6) Execute administrative closeout procedures, which include the following:
   a. Obtain the final Report of Inventions and Subcontracts (DD Form 882).
   b. Obtain final payment request, if any.
   c. Obtain final property report and dispose of purchased property and government furnished equipment (GFE) in accordance with the DoDGARs Part 22, Subpart G.
   d. Perform a review of final incurred costs and assist the Grants Officer in resolving exceptions, if any, resulting from questioned costs.
   e. Assure that all refunds due the Government are received by the Grantor.

NOTE: This term and condition is **not applicable** to instrumentation and equipment grant awards.

12. Security.

As a general rule, PI's will not need access to classified security information in the conduct of research supported under this Grant. Should it appear that access to such information is desirable the recipient shall advise the Grantor and request clearance for the investigator. Should information be developed during the course of work under this Grant that, in the judgment of the PI or the recipient, should be classified, the Grants Officer shall be notified immediately.

13. Representations and Assurances.

By accepting funds under this Grant, the recipient assures that it will comply with applicable provisions of the national policies and statutory/regulatory/executive-based requirements detailed below.

LIVE ORGANISMS. By signing this agreement or accepting funds under this agreement, the recipient assures that it will comply with applicable provisions of the following national policies concerning live organisms:

1) For human subjects:

   a) Adhere to the requirements for protection of human subjects per the DoD level terms and conditions as well as the following DTRA requirements:
   b) The recipient shall adhere to DTRA local clause 252.223-9002 – Protection of Human Subjects (Aug 2010). The full text of this clause is as follows:

      All research under this grant involving human subjects must be conducted in accordance with 32 CFR 219, 10 U.S.C 980, and DoDD 3216.02, as well as other applicable federal and state regulations. Grantees must be cognizant of and abide by the additional restrictions and limitations imposed on the DoD regarding research involving human subjects, specifically as regards vulnerable populations (32 CFR 219 modifications to subparts B-D of 45 CFR 46), recruitment of military research subjects (32 CFR 219), and surrogate consent (10 U.S.C. 980).

      DTRA Directive 3216.01 of June 9, 2010 establishes the DTRA Human Subjects Protection Program, sets forth the policies, defines the applicable terms, and delineates the procedures necessary to ensure DTRA compliance with federal and DoD regulations and legislation governing human subject research. The regulations mandate that all DoD activities, components, and agencies protect the rights and welfare of human subjects of study in DoD-supported research, development, test and evaluation, and related activities hereafter referred to as "research". The requirement to comply with the regulations applies to new starts and to continuing research.

      The DTRA directive requires that research using human subjects may not begin or continue until the Defense Threat Reduction Agency's Research Oversight Board (ROB) has reviewed and approved the proposed protocol. Grantees and subcontractors are required to submit a valid federal assurance for their organization

(institution, laboratory, facility) that has been issued by either DoD or the Department of Health and Human Services, and documentation of review of proposed protocols by the local Institutional Review Board (IRB) to include consent forms for any planned research using human subjects to the DTRA ROB for its review through the Grants Officer's representative (if assigned) or the Grants Officer. The ROB review is separate from, and in addition to, local IRB review.

A study is considered to involve human research subjects if: 1) there is interaction with the subject (simply talking to the subject qualifies; no needles are required); and 2) if the study involves collection and/or analysis of personal/private information about an individual, or if material used in the study contains links to such information.

Written approval to begin research or subcontract for the use of human subjects under the proposed protocol will be provided in writing from the DTRA ROB, through the Grants Officer. A copy of this approval shall be maintained by both the Grantee and the government. Any proposed modifications or amendments to the approved protocol or consent forms must be submitted to the local IRB and the DTRA ROB for review and approval. Examples of modifications/ amendments to the protocol include but are not limited to:

- a change of the PI;
- changes in duration or intensity of exposure to some stimulus or agent;
- changes in the information requested of volunteers, or changes to the use of specimens or data collected; or
- changes in perceived or measured risks or benefits to volunteers that require changes to the study.

Research pursuant to such modifications or amendments shall not be initiated without IRB and ROB approval except when necessary to eliminate apparent and immediate hazards to the subject(s).

Research projects lasting more than one year require IRB review at least annually, or more frequently as required by the responsible IRB. ROB review and approval is required annually. The Grantee or subcontractor must provide documentation of continued IRB review of protocols for ROB review and approval in accordance with these Terms and Conditions. Research must not continue without renewed ROB approval unless necessary to eliminate apparent and immediate hazards to the subject(s).

Non-compliance with any provision of this clause may result in withholding of payments under the grant pursuant to the grant's payments clause(s) and/or grant termination pursuant to the grant's termination clause(s). The government shall not be responsible for any costs incurred for research involving human subjects prior to protocol approval by the ROB.

2) For animals:

   a. Adhere to the requirements for protection of animal subjects per the DoD level terms and conditions as well as the following DTRA requirements:

b. DTRA local clause 252.235-9001 – Prohibition of Use of Laboratory Animals (Jul 2010). The full text of this clause is as follows:

The grant recipient shall obtain approval from the US Army Medical Research and Material Command (MRMC), Animal Care and Use Review Office (ACURO) prior to conducting research on live nonhuman vertebrates. Studies involving non-human primates, dogs, cats, or marine mammals will require a site visit by an ACURO laboratory animal veterinarian as a condition of approval. DoD may also conduct site visits involving research on other animals when deemed appropriate. The animal research facility is responsible for notifying the DoD sponsor if Association for the Assessment and Accreditation of Laboratory Animal Care accreditation is lost or the facility is under USDA inspection. DoD also has the right to a site inspection under these circumstances.

The grant recipient (including subcontractors) is expressly forbidden to use laboratory animals in any manner whatsoever without the express written approval of MRMC ACURO.

The grant recipient shall complete the ACURO Animal Use Appendix for Research Involving Animals found at the following web site: http://mrmc.amedd.army.mil/index.cfm?pageid=research_protections.acuro_animalappendix. Submit the completed ACURO appendix, contact information, the DTRA grant number and a copy of the grant for processing to the email address listed at the ACURO website. Once ACURO approves the effort, the grant recipient will receive written approval to begin animal use from the US Army MRMC ACURO by separate email. The grant recipient shall promptly provide a copy of the approval to the Grants Officer and Grants Officer representative. After approval, changes or protocol amendments must be submitted to and approved by ACURO before implementation.

The grant recipient, or subcontractors as appropriate, shall submit the most recent U.S. Department of Agriculture Animal Care Inspection Report annually in accordance with instructions provided.

Non-compliance with any provision of this clause may result in termination of the grant.

DoD Instruction 3216.01, dated September 13, 2010, provides policy and requirements for the use of animals in DoD-funded research based on Army Regulation 40-33. The DoD definition of animal is any live nonhuman vertebrate. All proposals that involve the use of animals must be in compliance with DoD Instruction 3216.01 and AR 40-33. DTRA requires that research using animals not begin or continue until the ACURO has reviewed and approved the proposed animal use. For animals, the provisions include rules on animal acquisition, transport, care, handling, and use in: (i) 9 CFR parts 1-4, Department of Agriculture rules that implement the Laboratory Animal Welfare Action of 1966 (U.S.C. 2131-2156); and (ii) the "Guide for the Care and Use of Laboratory Animals," National Institutes of Health Publication No. 86-23

RESEARCH INVOLVING RECOMBINANT DNA MOLECULES. Any recipient performing research involving recombinant DNA molecules and/or organisms and viruses

containing recombinant DNA molecules agrees by acceptance of this award to comply with the National Institutes of Health "Guidelines for Research Involving Recombinant DNA Molecules," July 5, 1994 (59 FR34496) amended August 5, 1994 (59 FR40170) amended April 27, 1995 (60 FR 20726), or such later revision of those guidelines as may be published in the Federal Register.

COMBATING TRAFFICKING IN PERSONS. The recipient agrees to comply with the trafficking in persons requirement in Section 106(g) of the Trafficking Victims Protection Act of 2000 (TVPA), as amended (22 U.S.C. 7104(g)) as implemented by 2 CFR 175.

1) Provisions applicable to a recipient that is a private entity.

   a. You as the recipient, your employees, sub-recipients under this award, and sub-recipients' employees may not—
      - Engage in severe forms of trafficking in persons during the period of time that the award is in effect;
      - Procure a commercial sex act during the period of time that the award is in effect; or
      - Use forced labor in the performance of the award or subawards under the award.

   b. We as the Federal awarding agency may unilaterally terminate this award, without penalty, if you or a sub-recipient that is a private entity—
      - Is determined to have violated a prohibition in paragraph 1)a. of this award term; or
      - Has an employee who is determined by the agency official authorized to terminate the award to have violated a prohibition in paragraph 1)a. of this award term through conduct that is either—
        - Associated with performance under this award; or
        - Imputed to you or the sub-recipient using the standards and due process for imputing the conduct of an individual to an organization that are provided in 2 CFR Part 180, "OMB Guidelines to Agencies on Government-wide Debarment and Suspension (Non-procurement)," as implemented by our agency at 2 CFR Part 376.

2) Provision applicable to a recipient other than a private entity.

   a. We as the Federal awarding agency may unilaterally terminate this award, without penalty, if a sub-recipient that is a private entity—
      - Is determined to have violated an applicable prohibition in paragraph 1)a. of this award term; or
      - Has an employee who is determined by the agency official authorized to terminate the award to have violated an applicable prohibition in paragraph 1)a. of this award term through conduct that is either—
        - Associated with performance under this award; or
        - Imputed to the sub-recipient using the standards and due process for imputing the conduct of an individual to an organization that are provided in 2 CFR Part 180, "OMB Guidelines to Agencies on Government-wide

Debarment and Suspension (Non-procurement)," as implemented by our agency at 2 CFR Part 376.

3) Provisions applicable to any recipient.

   a. You must inform us immediately of any information you receive from any source alleging a violation of a prohibition in paragraph 1)a. of this award term.

   b. Our right to terminate unilaterally that is described in paragraph 1)b. or 2)a. of this Article:
      - Implements Section 106(g) of the TVPA, as amended (22 U.S.C. 7104(g)), and
      - Is in addition to all other remedies for noncompliance that are available to us under this award.

   c. You must include the requirements of paragraph 1)a. of this award term in any subaward you make to a private entity.

4) Definitions. For purposes of this award term:

   a. "Employee" means either:
      - An individual employed by you or a sub-recipient who is engaged in the performance of the project or program under this award; or
      - Another person engaged in the performance of the project or program under this award and not compensated by you including, but not limited to, a volunteer or individual whose services are contributed by a third party as an in-kind contribution toward cost sharing or matching requirements.

   b. "Forced labor" means labor obtained by any of the following methods: the recruitment, harboring, transportation, provision, or obtaining of a person for labor or services, through the use of force, fraud, or coercion for the purpose of subjection to involuntary servitude, peonage, debt bondage, or slavery.

   c. "Private entity":
      - Means any entity other than a State, local government, Indian tribe, or foreign public entity, as those terms are defined in 2 CFR 175.25.
      - Includes:
        - A non-profit organization, including any non-profit institution of higher education, hospital, or tribal organization other than one included in the definition of Indian tribe at 2 CFR 175.25(b).
        - A for-profit organization.

   d. "Severe forms of trafficking in persons," "commercial sex act," and "coercion" have the meanings given at Section 103 of the TVPA, as amended (22 U.S.C. 7102).

PROHIBITION ON USING FUNDS UNDER GRANTS AND COOPERATIVE AGREEMENTS WITH ENTITIES THAT REQUIRE CERTAIN INTERNAL CONFIDENTIALITY AGREEMENTS. The recipient agrees to comply with the requirements in section 743 of the Financial Services and General Government Appropriations Act, 2015 (Division E of the Consolidated and Further Continuing Appropriations Act, 2015, Pub. L. 113-235):

1) The recipient may not require its employees, contractors, or sub-recipients seeking to report fraud, waste, or abuse to sign or comply with internal confidentiality agreements or statements prohibiting or otherwise restricting them from lawfully reporting that waste, fraud, or abuse to a designated investigative or law enforcement representative of a Federal department or agency authorized to receive such information.
2) The recipient must notify its employees, contractors, or sub-recipients that the prohibitions and restrictions of any internal confidentiality agreements inconsistent with paragraph 1) of this award provision are no longer in effect.
3) The prohibition in paragraph 1) of this award provision does not contravene requirements applicable to Standard Form 312, Form 4414, or any other form issued by a Federal department or agency governing the nondisclosure of classified information.
4) If the Government determines that the recipient is not in compliance with this award provision, it:
    a. Will prohibit the recipient's use of funds under this award, in accordance with section 743 of Division E of the Consolidated and Further Continuing Resolution Appropriations Act, 2015, (Pub. L. 113-235) or any successor provision of law; and
    b. May pursue other remedies available for the recipient's material failure to comply with award terms and conditions.

14. Data Collection.

Data collection activities, if any, performed under this Grant are the responsibility of the recipient. Awarding agency support of the project does not constitute approval of the survey design, questionnaire content, or data collection procedures. The recipient shall not represent to respondents that such data are being collected for or in association with the awarding agency without the specific written approval of the cognizant awarding agency official. However, this requirement is not intended to preclude mention of the awarding agency support of the project in response to an inquiry or acknowledgment of such support in any publication of this data.

15. Publications and Acknowledgement of Sponsorship.

Publication of results of the research project in an appropriate professional journal is encouraged as an important method of recording and reporting scientific information. .

The recipient agrees that in the release of information relating to the grant, such release shall include the following statement, "The project or effort depicted was or is sponsored by the Department of the Defense, Defense Threat Reduction Agency. The content of the information does not necessarily reflect the position or the policy of the federal government, and no official endorsement should be inferred." For purposes of this provision, information includes news releases, articles, manuscripts, brochures, advertisements, still and motion pictures, speeches, trade association proceedings, symposia, etc.

When issuing statements, press releases, requests for proposals, bid solicitations, and other documents describing projects or programs funded in whole or in part with federal money, all recipients receiving federal funds, shall clearly state: (i) the percentage of total costs of the

program or project which will be financed with federal money, and (ii) the dollar amount of federal funds for the project or program.

16. Authorization to Perform Activities Abroad.

If the award recipient is a foreign institution, the recipient assures that it has been duly authorized to operate and do business in the country or countries in which the grant is to be performed; that it has obtained all appropriate licenses, permits, and approvals required in connection with the grant's proposed activities; and that it will fully comply with all the laws, decrees, labor standards and regulations of such country or countries during the performance of the grant. U.S. Government funds may not be used in support of a project which is prohibited by law in the country or countries in which it is undertaken. DTRA does not assume responsibility for the recipient's compliance with the laws and regulations of the country or countries in which the activities are to be conducted.

17. Inconsistency between English Version and Translation of Grant.

The foreign recipient shall ensure that all contract correspondence that is addressed to the U.S. Government is submitted in English or with an English translation. In the event of inconsistency between the terms of the grant and any translation thereof into another language, the meaning in the English language shall control.

18. Value Added Tax (VAT) and Other Taxes.

Prior to grant proposal submission, the recipient will require any supplier of goods or services using grant funds to consult with it, so as to avoid the imposition of such charges with respect to the goods and/or services in question, where possible. As regards to excise duties and other taxes imposed on the sale of goods or services (e.g. VAT), the recipient will require any supplier of goods or services using grant funds to verify in consultation with the recipient whether in the country where the VAT would be payable, if the recipient is exempt from such VAT or other taxes at the source, or entitled to claim reimbursement thereof. If the recipient is exempt from VAT or other taxes or entitled to claim reimbursement thereof, the recipient shall not include costs for VAT or other taxes in the grant proposal. However, the recipient may include costs in their proposal to pay for VAT costs associated with travel, including and limited to lodging, meals, and transportation. In the event that the recipient is not exempt from VAT or other taxes and is unable to claim reimbursement thereof, the recipient must itemize VAT and/or other taxes in the grant proposal. Prior to grant award, DTRA and the recipient shall mutually agree upon the use of DTRA funds for VAT or other taxes or if needed, revise project activities accordingly.

During implementation of grant activities, the recipient will notify DTRA as soon as they become aware of any VAT or other taxes, exceeding $500.00 per transaction, not identified in the grant proposal and outside those considered VAT costs associated with travel, including and limited to lodging, meals, and transportation. A "transaction" is defined as a single purchase by the recipient and transactions may not be deliberately split in order to avoid compliance with the $500.00 limit. DTRA approval in writing with documentation of extraordinary circumstances is required prior to the recipient using any DTRA funds for VAT

or other taxes exceeding $500.00 per transaction, and a grant modification may be required. The recipient understands that in the event that DTRA is unable to secure approval to use DTRA funds for VAT or other taxes exceeding $500.00 per transaction, the purchase of applicable items may not proceed. If DTRA and the recipient mutually agree to use DTRA funds to pay VAT or other taxes on any item(s) exceeding $500.00 per transaction, the recipient will include this information in its financial reports to DTRA.

Dear (b)(6)

We have a budget for the project in Excel format, but it contains more itemized details than that required for submission into the proposal submission system - i.e. multiple rows in our version have to be combined to result in the totals for some of the fields we entered into grants.gov < Caution-http://grants.gov > < Caution-Caution-http://grants.gov < Caution-http://grants.gov > > .

We can send you the version we have, but do understand that the rows will not all match one-to-one with the submission format.

Please let me know how you would like us to proceed.

Reducing the Threat of Rift Valley Fever through Ecology, Epidemiology and Socio-Economics
PI: William B. Karesh
Thrust Area 6 - Cooperative Counter Weapons of Mass Destruction Research with Global Partners FRCWMD

Statement of Work

Project Title: *Reducing the Threat of Rift Valley Fever through Ecology, Epidemiology and Socio-Economics*
Document Date: December 5, 2018

Objective: The objective of this grant is to reduce the threat of RVF by improving the understanding of RVFV circulation during inter-epidemic periods, improving local capacity to predict periods of high risk for RVF outbreaks and determining the multi-sectoral cost of RVF in the Republic of South Africa (RSA). Studies in the Free State/Northern Cape (FS/NC) and KwaZulu-Natal (KZN) regions will generate new understanding of RVF maintenance, circulation and impacts and improve risk prediction models for the country. Through multi-disciplinary investigation of three core hypotheses, the project shall strengthen South Africa's leadership role within the African continent to reduce the threat of RVF and other vector-borne diseases through the characterization of RVFV epidemiology and ecology in tropical and temperate ecosystems.

Scope: The grantee proposes a five-year multi-disciplinary study of epidemiology, ecology and socio-economic factors in RSA. The grantee team shall focus on the following major goals and milestones:

1. Characterize changes in RVFV activity in mosquitoes and sheep as the length of the inter-epidemic period increases (Y1-OY2).
   - Implement sheep cohort (FS), vector sampling (FS & KZN) and the collection of remote-sensing data; develop and implement new aspects of vector field studies (Y1 & Y3); create an *Aedes* pan distribution map (Y2).
2. Determine seroprevalence and characterize the risk factors associated with RVFV exposure in humans and domestic ruminants in KZN (Y1).
   - Modify research materials for the isiZulu speaking population; adapt the approach and implement a One Health cross-sectional study; conduct risk factor analysis.
3. Identify the socioeconomic impact of RVFV in regions where RVFV is present with and without a history of RVFV outbreaks (Y1-Y3; OY4).
   - Establish study protocols, identify economic variables and assess the economic impact of RVFV in FS/NC, KZN (Y1-3) and nationally (OY4), produce a report for policy makers.
4. Develop and implement a sustainable early warning system for RVFV in RSA.
   - Collate data collected previously and this study (Y1-3); launch prediction system on ARC website (Y3); maintain/test the prediction system (OY1-2).
5. Improving knowledge and capacity (Y1-OY2)
   - Maintain and develop new collaborations with stakeholders; transfer technology for additional diagnostic capacity at OVR; provide policy recommendations based on socio-economic analysis, training of local technical personnel; training of graduate students and post-doctoral fellow; publishing and sharing of project findings; host entomological and One Health economics workshops and annual Partners and Stakeholders Meetings.

Background: Rift Valley fever virus (RVFV) is a mosquito-borne virus of public and animal health significance. The WHO recently listed RVFV as an R&D Blueprint priority disease, noting that **fundamental research is needed on the epidemiology and entomology of RVF, including multidisciplinary studies**. RVFV ecology is complex and poorly understood, involving ruminant hosts, human behavior, and mosquito vectors with associated climatic and environmental factors. These gaps in knowledge hinder determination of risk of RVF. **RVF outbreaks are devastating to farmers**, resulting in abortion in nearly 100% of pregnant ruminants and high mortality rates among young ruminants (up to 90%). RVFV causes influenza-like symptoms and occasional retinitis in people, with a small percentage developing severe complications, such as, hepatitis, hemorrhagic fever and encephalitis, which may result in death. RVF outbreaks also have significant socio-economic impacts and are interspersed with apparent quiescent periods (no reported clinical RVF cases). Multiple species of mosquito vectors are responsible for transmitting RVFV to animals. Floodwater *Aedes* spp. are hypothesized to transmit the virus transovarially and their desiccation-resistant **eggs can lie dormant for unquantified periods of time**. Newly emerged, infected *Aedes* adults can initiate epizootics when conditions are suitable. Susceptible *Culex* spp. can subsequently amplify the outbreak. Given the high spatial resolution required to characterize flooded areas (pans), pan density and other characteristics have frequently been left out of most spatio-temporal models. The evidence for cryptic RVF transmission among livestock in some areas is clear, yet the underlying mechanisms are poorly understood.

Preliminary Data: This project builds on the five-year BTRP-funded "Understanding Rift Valley Fever in the Republic of South Africa" Project (URVFRSAP), which was focused on identifying a variety of ecological factors associated with the abundance and succession of *Aedes* and *Culex* mosquitoes, as well as patterns of immunity in ruminant and human hosts in a region where multiple, large outbreaks of RVF are known to have occurred in the Free State and Northern Cape Provinces. Despite the magnitude of these outbreaks (producers lost an estimated US$26.1 million in 2010-11) we found livestock to be highly susceptible (estimated at only 30% seroprevalence of antibodies against RVF). During the inter-epidemic period, we identified an incidence rate of 3.2% seroconversions per sheep-year. We associated several soil and vegetation factors with previous RVF livestock cases that will provide a foundation for improved RVF predictions. Preliminary findings from project partners suggest RVFV may be endemic in parts of KwaZulu-Natal (KZN), where clinical RVF has not been reported but where the seroconversion rate is extremely high (54% per animal-year; Van den Bergh, In Prep). We developed a strong relationship with stakeholders in South Africa, with 54 participants from 26 public and private institutions attending our recent Stakeholders and Partners Meeting in Pretoria. We strengthened our relationship with the Department of Agriculture, Forestry and Fisheries, by presenting regular updates and incorporating their feedback into our project. Applying a rigorous One Health investigation, the URVFRSAP has generated critical knowledge, capacity and a strong stakeholder base for South Africa to serve as a regional leader in the threat reduction of RVF.

***Tasks/Scientific Goals:* (Format: Year #(s).Task #. Sub-task#)**

Task Y1.1-YO2.1: Characterizing ecological factors affecting RVFV and RVFV vectors.
To improve understanding of RVFV risk in relation to climate and remote sensing indicators, vector distribution and RVFV circulation in mosquitoes, and mosquito egg survival to elucidate the role of ecological determinants, the grantee shall monitor rainfall (verified by on-site weather stations installed during the URVFRSAP), temperature, and vegetation conditions. The grantee shall utilize geospatial information sources (including long-term (2000-2017) high-resolution scenes covering areas where the 2008 to 2011 outbreaks occurred, Landsat data, ARC Land Type maps, and historical outbreak maps) to assess changes over time that may be correlated with RVF risk, including *Aedes* abundance. To monitor vector dynamics, the grantee shall select approximately 5 sites (pans) from among previous URVFRSAP sites for weekly longitudinal mosquito sampling in the FS/NC study region during the wet season (and at intervals during the dry season/winter). The awardee shall select 1-3 sites in KZN for monthly sampling to improve our understanding of the vector dynamics in this region. The grantee shall conduct quantitative real time RT-PCR for RVFV on pooled mosquito samples (by species) at NICD. The awardee shall analyze bioecological and ecological factors, produce an *Aedes* pan distribution map and develop a real-time RVF outbreak prediction system monitoring RSA. To understand survival, *Aedes* eggs shall be collected and maintained in controlled conditions for varying periods of time. After varying time periods, eggs shall be stimulated to hatch in a containment facility at the NICD before being collected for species identification and PCR-testing.

Y1.1.1-OY2.1.1 Collection of climatic data to identify different patterns associated with *Aedes* abundance.
Y1.1.2-OY2.1.2 Assess the abundance and diversity of mosquitoes, conduct egg desiccation trials.
Y2.1.3 Develop *Aedes* pan distribution map.
Y3.1.4 Complete research synthesis report across project tasks.
Y3.1.5 Mosquito mark-recapture study on the ecology of floodwater *Aedes*.
Y3.1.6 Develop an early warning system for RVF in the Republic of South Africa.
OY2.1.7 Complete analysis of all mosquito data.

Task Y1.2-YO2.2: Improve the capacity for South Africa to be a regional leader in vector-borne diseases and Rift Valley fever virus epidemiology.
Strengthening scientific capacity is a key pathway for promoting sustainability of hypothesis-driven research for RVF threat reduction. The grantee shall mentor four graduate students in project-related subjects, including epidemiology, public health, entomology, soil sciences, or laboratory sciences at local universities. The awardee shall support a post-doctoral fellow (named in key personnel) who is interested in becoming an expert in medical entomology and will split his time between UP and NICD and contribute to sample collection, identification, and analysis. The project shall facilitate technology transfer of inhibition ELISA to OVR to expand

laboratory capacity for the detection of RVFV exposure in animals and concurrently supporting operational capacity of the RSA National One Health Forum. To provide capacity strengthening and development in vector-borne disease and RVFV epidemiology to aide in threat reduction, the grantee shall organize three workshops with participants from southern/South Africa, including one on entomology (Y1) and two on One Health economics (Y3 and OY2).

Y1.2.1-OY2.2.1 Train a minimum of four graduate students in fields related to RVF.
Y1.2.2-OY2.2.2 Train post-doctoral fellow in medical entomology.
Y1.2.3 Conduct entomology workshop for participants from southern Africa.
Y2.2.4 Technology transfer of inhibition ELISA to OVR.
Y3.2.5 & OY2.2.5 Conduct One Health economics workshop for participants from southern Africa.

Task Y1.3-OY2.3: Identify patterns of RVFV exposure in ruminants in the absence of an RVF outbreak.

The project shall monitor RVFV exposure in ruminants to inform understanding of inter-epidemic circulation in sheep populations. Despite an absence of reported cases in areas of KZN, preliminary findings from project partners have indicated that RVF may be endemic in some of these areas within the province. The grantee shall conduct a cross-sectional study of domestic ruminants from up to 158 households in the KZN study area to determine RVFV seroprevalence. Under a One Health approach, households will be enrolled (Task 5) in the cross-sectional study to analyze epidemiology factors and human and animal seroprevalence levels. To improve the knowledge of antibody waning and changes in seroconversion rates, cohort sheep from the URVFRSAP in the FS/NC study area shall be re-enrolled to complete a longitudinal study over the useful lifespan of a sheep (8 years total). Serological testing of cross-sectional and cohort animal blood samples will be conducted using inhibition ELISA and may be confirmed with IgM ELISA or virus neutralization testing.

Y1.3.1 Local permissions are obtained.
Y1.3.2 Conduct cross-sectional study in KZN.
Y1.3.3-OY2.3.3 Implement sheep cohort in FS.
Y1.3.4-OY2.3.4 Conduct serological testing on all cohort and/or cross-sectional animal blood samples.
Y3.3.5 Complete research synthesis report across project tasks.
OY2.3.6 Complete analysis of ruminant cohort data.

Task Y1.4-OY2.4: Identify the socioeconomic impact of RVF within the study areas and nationally.

The awardee team believes that socio-economic determinants of RVF risk are important to understand in tandem with epidemiological and ecological factors to inform successful threat reduction. Prior studies by project partners have estimated substantial agricultural production losses to farmers in the FS and NC during the 2010-2011 outbreak; however, wider impacts of RVF, including those that may be occurring but not reported in inter-epidemic periods and those to a wider range of agricultural and non-agricultural sectors, have not been accounted for to date. The grantee shall use a One Health approach to more comprehensively investigate micro-and macro-socio-economic impacts of RVF across multiple sectors. The grantee shall collect socio-economic, spending, and loss data at household/farm level to estimate micro-socio-economic impact in KZN (conducted concurrently with the cross-sectional studies in described in Tasks 3

and 5). The grantee shall collect the same socio-economic data from households/farms in the FS/NC study area in Year 3. The grantee shall also conduct a study of national-level impacts, targeted to government and industry to identify multi-sectoral implications of RVF risk (OY1). Economic data will be paired with epidemiological data to inform prevention and control scenarios and compare cost-effectiveness. Workshops shall be held in Y3 and OY2 to strengthen regional capacity for economic analysis using a One Health approach, with a focus on policy-making for threat reduction of RVF and other zoonotic diseases. Holding two workshops should allow for multi-sectoral involvement and framing of the workshop exercises around timely stakeholder-informed policy questions and topics.

Y1.4.1 Obtain local permissions to conduct surveys.
Y1.4.2 & Y3.4.2 Conduct survey of livestock farmers to estimate spending and losses related to RVF.
Y3.4.3 Complete research synthesis report across project tasks.
OY1.4.4 Conduct survey of public and private institutions at provincial and national level to estimate spending and losses related to RVF.
OY1.4.5 Determine sectoral costs and benefits and develop associated policy recommendations.
OY2.4.6 Complete final report for policy makers.

Task Y1.5-OY2.5: Compare RVFV exposure in people in areas with different patterns of clinical RVF.

The grantee shall conduct a cross-sectional study of humans (and animals, see Task 3) in the KZN region to compare RVFV exposure patterns with the FS/NC region. The awardee shall characterize the risk of RVFV infection to people by initiating a household level cross-sectional study (a questionnaire and blood sampling). The grantee shall translate the previously written (URVFRSAP) vector-borne and zoonotic diseases booklet into isiZulu for distribution in KZN. Laboratory testing of the samples will be conducted at NICD and may include the following tests: total antibody (IgG/IgM) RVF ELISAs, inhibition ELISA, IgG specific RVF ELISAs, IgM specific RVF ELISAs, and RVFV neutralization test.

Y1.5.1 Modify and translate written questionnaire for risk analyses of RVFV infection and the written information booklet on RVF and other vector-borne diseases.
Y1.5.2 Serosurvey awareness to the community.
Y1.5.3 Conduct written questionnaire in conjunction with blood collection.
Y1.5.4 Collect blood samples from participants in the household cross-sectional study.
Y1.5.5 & Y2.5.5 Conduct serological analyses for human anti-RVFV IgG and IgM.
Y2.5.6 Complete report of results.
Y3.5.7 Complete research synthesis report across project tasks.

Task Y1.6-OY2.6: Disseminate reports to relevant stakeholders.

The grantee shall synthesize all data collected through the projects described above as well as capacity building activities in South Africa. An annual report shall be developed and disseminated to local stakeholders. A database for the extensive amount of data shall be developed and used for epidemiological analyses. The project shall submit annual sample repository information using a DTRA-specified format. Access to all samples collected and data generated during the course of the project, up to and including at least 12 months after the project end date. Scientific and general reports shall be generated and findings shall be presented as

specified in the grant schedule. A stakeholder meeting shall be held annually to describe the project and the current results. Community feedback meetings shall be held to provide aggregate findings and engage with local stakeholders through the project. These dissemination pathways shall provide opportunities to gain stakeholder input, including to inform policy questions and considerations to optimize recommendations for threat reduction to be generated by the socio-economic study.

Y1.6.1-OY2.6.1 Submit reports, including sample repository data, to DTRA.
Y1.6.2-OY2.6.2 Complete annual report to local stakeholders.
Y1.6.3-OY2.6.3 Host annual stakeholders meeting.
Y1.6.4-OY2.6.4 Conduct presentations/meetings at times and places specified in the grant schedule (Y1 Task 6), including DTRA Annual Technical Review.
Y1.6.5-OY2.6.5 Submit publications.

Performance Schedule:

Task	Year 1	Year 2	Year 3	Option Year 1	Option Year 2
Task 1. Characterizing ecological factors affecting RVFV and RVFV vectors.					
1.2 Assess the abundance and diversity of mosquitoes, conduct egg desiccation trials.					
1.3 Develop Aedes pan distribution map.					
1.4 Complete research synthesis report across project tasks.					
1.5 Mosquito mark-recapture study on the ecology of floodwater *Aedes*.					
1.6 Develop an early warning system for RVF in the Republic of South Africa					
1.7 Complete analysis of all mosquito data.					
Task 2. Improve the capacity for South Africa to be a regional leader in vector-borne diseases and Rift Valley fever virus epidemiology.					
2.2 Train post-doctoral fellow in medical entomology.					
2.3 Conduct entomology workshop for participants from southern Africa.					
2.4 Technology transfer of inhibition ELISA to OVR.					
2.5 Conduct One Health economics workshop for participants from southern Africa.					
Task 3. Identify patterns of RVFV exposure in ruminants in the absence of an RVF outbreak.					
3.1 Local permissions are obtained.					
3.2 Conduct cross-sectional study in KZN.					
3.3 Implement sheep cohort in FS.					
3.4 Conduct serological testing on all cohort and/or cross-sectional animal blood samples.					
3.5 Complete research synthesis report across project tasks.					
3.6 Complete analysis of ruminant cohort data.					
Task 4. Identify the socioeconomic impact of RVF within the study areas and nationally.					
4.1 Obtain local permissions to conduct surveys.					
4.2 Conduct survey of livestock farmers to estimate spending and losses related to RVF.					
4.3 Complete research synthesis report across project tasks.					
4.4 Conduct survey of public and private institutions at provincial and national level to estimate spending and losses related to RVF.					
4.5 Determine sectoral costs and benefits and develop associated policy recommendations.					
4.6 Complete final report for policy makers.					
Task 5. Compare RVFV exposure in people in areas with different patterns of clinical RVF.					
5.1 Modify and translate written questionnaire for risk analyses of RVFV infection and the written information booklet on RVF and other vector-borne diseases.					
5.2 Serosurvey awareness to the community.					
5.3 Conduct written questionnaire in conjunction with blood collection.					
5.4 Collect blood samples from participants in the household cross-sectional study.					
5.5 Conduct serological analyses for human anti-RVFV IgG and IgM.					
5.6 Complete report of results.					
5.7 Complete research synthesis report across project tasks.					
Task 6. Disseminate reports to relevant stakeholders.					
6.1 Submit reports, including sample repository data, to DTRA.					
6.2 Complete annual report to local stakeholders.					
6.3 Host annual stakeholders meeting.					
6.4 Conduct presentations/meetings at times and places specified in the grant schedule (Y1 Task 6), including DTRA Annual Technical Review.					
6.5 Submit publications.					

BUDGET JUSTIFICATION FOR ECOHEALTH ALLIANCE

EcoHealth Alliance requests a total of $4,899,297.20 over all-years of the proposed project to support personnel, travel, equipment, consortium agreements, and applicable indirect costs.

A. Key Personnel

William B. Karesh, D.V.M., Principal Investigator (2 calendar months for all years) 3 calendar months for OY2). Dr. Karesh will be responsible for the overall coordination of this project. He will provide overall project oversight, study design development and refinement, data analysis, publication support, and annual stakeholder meeting participation. We request $48,535 in Y1 with a 5% cost of living increase each subsequent year.

Jonathan Epstein, Ph.D., Co-Investigator (1.0 calendar month in all years). Dr. Epstein will be a technical advisor to the project, advising on data interpretation, targeted animal sampling based on data as they come in over the course of the project, and laboratory techniques. He will also assist with writing and dissemination. We request $14,597 in Y1 with a 5% cost of living increase each subsequent year.

Noam Ross, Ph.D., Senior Research Scientist, Modeler (1 calendar month in all years). Dr. Ross will be a technical advisor to the project, advising on data organization, analysis, and writing with a focus on statistical analytics. We request $8,138 in Y1 with a 5% cost of living increase each subsequent year.

Emily Hagan, M.P.H., Behavioral Risk Scientist (3.0 calendar months in all years). Ms. Hagan will provide medical anthropology expertise for the questionnaires and analysis, supervise and conduct the IRB processes and trainings on the human subject work for local partners, and assist with data organization and analysis. We request $16,937 in Y1 with a 5% cost of living increase each subsequent year.

Catherine Machalaba, M.P.H, Policy Advisor (3.5 calendar months in all years), Ms. Machalaba will be a technical advisor to the project, advising on study design and risk reduction. She will conduct a risk reduction workshop in OY2 and will help develop revised biosurveillance and reporting strategies with and for Liberian partners. We request $25,050 in Y1 with a 5% cost of living increase each subsequent year.

Whitney Bagge, Ph.D., Modeler (7 calendar months Y1-OY1, 7.5 calendar months in OY2). Dr. Bagge will provide day-to-day project development and strategic management, including through regular in-person meetings and weekly phone and other direct communications with partners. She will also supervise field sampling, data analysis, and data and information dissemination through workshops, conferences, and papers, for which we request $50,225 in Y1 with a 5% cost of living increase each subsequent year.

B. Other Personnel

Amanda Andre, LMSW, Operations Assistant (5.5 calendar months in all years). 4 calendar months for OY2. Ms. Andre will be the administrative lead handling project management responsibilities related to budgeting, expenses, managing of subcontracts, and meeting scheduling and logistics. She will coordinate all meetings and travel and ensure compliance with funding and contractual requirements. We request $27,373 in Y1 with a 5% cost of living increase each subsequent year.

Fringe Benefits

Fringe benefits are calculated as 36.8% of base salary p.a. with $70,234 requested in Y1 calculated from the base salary for all Personnel. In Y2 – OY2, we budget for a 5% per year cost of living allowance increase in all salaries.

C. Equipment
No funds are requested for equipment.

D. Travel
Domestic Travel
Domestic travel is requested for one trip per year for three program staff to travel from New York City to Washington, DC to meet with Co-Investigator Carlin and key personnel at Georgetown University. Transportation is estimated at $400 per trip along with the government GSA per diem rates for each city. Additional domestic travel support will facilitate four EcoHealth Alliance staff presenting at two domestic conferences annually. In total, we are requesting $13,795 in each year of our proposed work.

International Travel
Foreign travel is requested for partner meetings, in-country trainings, and field research. Seven EHA employees will attend annual meetings. Two EHA staff will make additional trips each year for trainings and field research. Flights for each of these trips is estimated at $3,500 and the federal per diem rates of $200 for lodging in Monrovia, Liberia and $70 for field work as well as the $95 for meals in Monrovia, Liberia and $46 for field work are requested. Additionally, we are requesting travel for staff to present on project findings at international conferences each year with flights estimated at $1,500 and hotels and meals at the government GSA per diem rates for Vienna, Austria for International Meeting on Emerging Diseases and Surveillance (IMED). Travel costs are increased 5% each year to account for pricing increases based upon past, actual, annual price increases.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
Co-Investigator Epstein & Modeler/Ecologist Bagge will need a new computer, equipped with Microsoft and Adobe software for which we request $5,178 in Y1.

We request $6,830, annually for material and supplies, including office and travel supplies necessary for project aims for a total of $27,320 over five years. Materials estimated in this cost include Cell Phone Communication costs, Dropbox, Adobe, and Stata costs, and basic office supplies.

Publication Costs
To facilitate the dissemination of project findings, $3,190 per year in only Y2-OY2 is requested for open access publication costs in international peer-reviewed journals.

Consultant Services
For the human behavioral risk part of the project, $1,449 is requested in Y1, $1,126 in Y2 & OY1-OY2 and $1,526 in YR 3 for New England IRB and $3,500 in Y1 for required Collaborative Institutional Training Initiative training for personnel handling human and non-human animals and samples as per IRB and IACUC requirements. For Dr. Carlin, $15,000 per year is

requested. Dr Carlin will assist with partner communication, data analysis, and data and information dissemination through workshops, conferences, and papers.

Subawards/Consortium/Contractual Costs
Subcontracts for the National Public Health Institute of Liberia, Society for the Conservation of Nature-Liberia, Liberia Chimpanzee Rescue and Protection, University of Nebraska Medical Center and Georgetown University are outlined in their individual budget justifications.

H. Indirect Costs
We are requesting the EcoHealth Alliance federally approved indirect cost rate of 32% on all applicable direct costs. The USA Department of Defense's Department of the Navy has approved this rate on 17 July 2019. We have applied our indirect cost rate to the first $25,000 of the subcontracts only in Y1.

BUDGET JUSTIFICATION FOR NATIONAL PUBLIC HEALTH INSTITUDE OF LIBERIA, LIBERIA

The National Public Health Institute of Liberia (NPHIL) requests a total of $920,968 over all years of the proposed project to support personnel, travel, equipment, other direct costs and indirect costs.

A. Key Personnel

Mosoka Fallah, Ph.D., Co-Investigator (.6 calendar month for Y1-OY2). Dr. Fallah will provide overall project oversight for Liberia-based activities. NPHIL is charged with leading all public health and biomedical research in Liberia, and Dr. Fallah assumes that role for this project, leading all elements on the human subjects research side of the project as well as the laboratory diagnostics elements. Dr. Fallah will ensure NPHIL meets project tasks and milestones, will oversee NPHIL's budget, and will assist with dissemination of findings through publications and conference presentations. We do not request salary at this time as Dr. Fallah will be fully covered by other funding sources during the project period.

Fatorma Bolay, Ph.D., Co-Investigator (1.5 calendar month for Y1-OY2). As head of the Liberia Institute for Biomedical Research (LIBR) at NPHIL, Dr. Bolay will provide direct oversight of all laboratory activity for the project, for which $2,500 is requested starting in Y1.

John Dogba, Ph.D. Candidate, Co-Investigator (1.5 calendar month for Y1-OY2). Dr. Dogba directs the national reference laboratory at NPHIL and will ensure compliance with biosafety and biosecurity project requirements; as a lecturer at the University of Liberia he will also assist with identification and recruitment of students to work in the laboratory, activities for which $3,000 is requested starting in Y1.

Bode Shobayo, M.S.C., Co-Investigator (1.5 calendar month for Y1-OY2). As a research scientist within NPHIL's medical and public health research division, Dr. Shobayo will participate in training workshops, processing and testing a subset of samples, and reporting recommendations to Dr. Bolay and Dr. Wiley for process refinements and mitigating challenges with the day-to-day laboratory workflow, for which $2,075 is requested starting in Y1.

B. Other Personnel

Laboratory Scientists/Technicians (4 calendar months for Y1-OY2). Four laboratory scientists and/or technicians—two from NPHIL and two seconded from the Ministry of Agriculture—will process and test all project samples at LIBR. They will participate in all laboratory workshops, provide all bench activity (under the supervision of key personnel), and advise on inventory needs and any problems implementing the laboratory protocol. We request $18,667 for all four laboratory technicians starting in Y1.

Hospital Project Coordinators (6 calendar months for Y1-OY2). One coordinator will be appointed to each of two human clinical study sites (Redemption Hospital and Phebe Hospital) operating in Y1-Y3. These coordinators will be chosen from existing staff already participating in other febrile illness studies at the hospitals and will be responsible for participating in human subjects research training, ensuring hospital staff are sensitized to our inclusion criteria (and thus able to identify proper candidates), being available for consultation when patients enroll in the study, collecting consent form and questionnaire data from the patients, and ensuring samples are collected, stored, and transported in timely fashion. Similarly, one coordinator will

be appointed to each of two human clinical study sites (hospitals in Nimba and Lofa counties) in the option years, if funded. In an effort to train and engage Liberian nurses in public health surveillance and in research, at least one and possibly both of these sites will be staffed through Nursing for All, a non-profit that builds capacity in the nursing profession in Liberia and is presently operating at Ganta United Methodist Hospital in Nimba, one of the sites at which we would like to implement the study in OY1-2. We request $26,250 over the proposed five years of the project.

Hospital Laboratory Technicians (1 calendar month for Y1-OY2). Hospital laboratory technicians will assist with initial processing of patient samples (spinning serum, labeling, and storing) prior to transport to NPHIL. We will similarly provide salary support for technicians at the two option year hospitals if funded. We request $1,667 p.a. for these activities.

Post-doctoral Researcher (6 calendar months for Y3-OY2). Beginning in Y3, we propose to add a post-doctoral researcher to the laboratory team. Liberia does not have a PhD-granting institution, but a number of Liberians are presently undertaking PhD degree programs outside of the country; by Y3 we plan to bring one Liberian individual who has received a PhD in laboratory pathogen research into the project to work with the laboratory scientists on sample processing, testing, and data analysis, for which we request $5,000 starting in Y3.

Bachelors and Masters Students. We intend to include approximately three students per semester on the project, to include undergraduate and graduate students from the University of Liberia (Monrovia) and Cuttington University (Bong). Their duties will depend on their degree program but will include assignments at the human clinical sites (nursing, medical, public health, anthropology students); animal field collection sites (biology, animal science, ecology, anthropology); and laboratory (molecular biology, microbiology). We will preferentially choose students interested in developing their theses based on the project. Each student will receive a stipend of $500 per semester.

Administrator/Program Manager (6 months in Y1-OY2). This individual will act as the administrative lead, handling project management responsibilities related to budgeting, expenses, managing of subcontracts, and meeting scheduling and logistics, activities for which we request $5,000 p.a.

C. Equipment

The existing freezer in which PREDICT samples are stored at LIBR will remain there when the project ends, and will be available for this project's use, but its capacity is limited. LIBR will therefore require increased storage capacity for the specimens generated by this project (2,250 humans, up to 4,500 specimens; 3,840 animals, up to 14,560 specimens). A -80°C freezer is requested for sample storage and is estimated at $29,885. Liberia does not have a VAT and our conversations with Liberian partners indicate it is unlikely they will instate one in the near future. Government agencies and non-profits would be exempt from any such tax. If absolutely necessary, we would seek unrestricted funding sources to cover any such costs.

D. Travel

We are requesting travel for one Liberian project participant to attend a regional conference and an international conference in Y3 and OY2 to present on project findings, with flights estimated. For the regional conference flights are estimated at $750 and hotels and meals at the government GSA per diem rates for Accra, Ghana. For the international conference flights are estimated at $2,500 and hotels and meals at the government GSA per diem rates for Vienna, Austria.

In Y3 we plan to bring one Liberian individual who has received a PhD in laboratory pathogen research into the project to work with the laboratory scientists on sample processing, testing, and data analysis as a post-doctoral associate. We will fund a one-month trip for this individual to the University of Nebraska Medical Center to train in the laboratory of co-Investigator Dr. Michael Wiley. A flight is estimated at $3,000 and hotels and meals at the government GSA per diem rates for Omaha, Nebraska.

In total over the course of the project, we are requesting $20,038 in for International Travel.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
We will supply the participating hospitals with all consumables required to collect patient samples, including serum tubes, EDTA tubes, cryovials, vacutainer holder, needles, syringes, nitrile gloves, and nasal swabs, for which we request $2,504 p.a. For the human clinical study implementation sites, our request also includes funding for a centrifuge to enable processing of serum at the hospital clinical laboratories ($460 each), an ultracold freezer to store the samples until picked up for transport ($4695 each) and a tablet for data collection and tracking at each site ($229 each).

Commented [MOU1]: Quote needed

Laboratory Testing
Our laboratory request covers three primary types of molecular testing: next-generation sequencing, real-time PCR, and ELISA-based antibody serology. In Y1, we will test 300 existing PREDICT bat and rodent samples, pooled by three, via NGS Ampliseq on LIBR's existing MiSeq machine. We will barcode 5% these, a process that most likely will be done outside of Liberia. In Y2-OY2, we will use a Taqman Array Card system (modified for a 96-well plate to run on LIBR's ABI 7000 sequencer) to test human samples for up to 31 pathogens at three samples per plate, and will run nasopharyngeal samples on singleplex PCR to test for key respiratory pathogens. We will run specific real-time PCR to confirm positives; NGS Ampliseq to further sequence viral-positive human samples (expect not more than 10% to fall into this category) and 10% of negative human samples; and specific antibody ELISAs on convalescent samples from humans who tested positive on TAC plus 20 of their neighbors. For animals in Y2-OY2, we have budgeted for specific antibody ELISAs on all animals, averaging 5 tests each, pooled by 5; NGS on 10% of animal samples pooled by three; singleplex PCR for confirmation of NGS positives (expect ~4%); a new ELISA reader; a new ELISA plate shaker; Mastermix; and miscellaneous consumables. We request $453,414 over the five years of the proposed project. Of this amount, $152,400 is for next-generation sequencing, $4,000 is for barcoding, and the remainder supports the PCR and ELISA testing, which are and will continue to be mainstays of the laboratory.

Meetings and Conferences
We request support for an annual meeting each year for 45 people including personnel from all partner institutions (EHA, NPHIL, SCNL, LCRP, UNMC, GU) as well as local stakeholders. Travel costs for United States-based participants to attend the annual meeting are covered in the EcoHealth Alliance budget. We estimate that for the three-day meeting, eight Liberian partners traveling from outside Monrovia will require transportation, meals and accommodation to be covered, and for Y3, when the annual meeting will function as a broader regional technical meeting, we will also fund two attendees from elsewhere in West Africa (likely Guinea) working

on similar studies. Additionally, the meetings will require a room rental, lunch for all participants, and printing of materials and supplies. Overall costs are estimated at $10,000 p.a.

We will conduct a series of workshops across the study period, as outlined in the technical proposal and in more detail in Attachment 3. *Workshop 1a* will cover the overall research study protocol, will occur at the Y1 kickoff meeting, and will include all project participants. *Workshop 2a* will cover the human study protocol and human subjects research, will occur mid-Y1 and again toward the end of Y3, and will include Tasks 2 and 4 personnel and students. *Workshops 3a and 3b* will cover biosafety, biosecurity, and laboratory techniques training, will occur twice during Y1 (at the kickoff meeting and again in the middle of the year) and during Y3, and will include all Task 3 personnel. *Workshop 4a* will cover the animal sampling protocol and animal subjects research, will occur at the kickoff meeting and during Y3, and will include all Task 4 personnel and students. *Workshop 5a* will cover analysis of laboratory data (including bioinformatics), will occur during Y2 as the laboratories ramp up their sample testing, and will include Task 3 personnel. *Workshop 6a* will cover risk reduction analysis and opportunities, will occur during OY2, and all personnel including many from ministries not directly involved in the project will be invited to attend. Across the workshops, the number of participants will vary from 10-20 people for whom we will require catering (lunch) for all participants, room rental, and some materials and supplies. Over the five proposed years of the project, $18,940 is requested to support these workshop trainings.

Two NPHIL personnel will travel to each of the five study communities for two-day, one-night trips to share study findings with community members and discuss risk reduction opportunities in OY1-2. Lodging, meals, and printed materials and supplies are estimated at $310 per visit.

Freezer Maintenance
Support of $500 p.a is requested to cover the cost of freezer maintenance (the newly-purchased freezer and LIBR's existing freezer) to ensure they are properly maintained, calibrated and in full working order at all times.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 10% on all direct costs.

BUDGET JUSTIFICATION FOR SOCIETY FOR CONSERVATION OF NATURE, LIBERIA

The Society for Conservation of Nature, Liberia (SCNL) requests a total of $685,069 over all years of the proposed project to support personnel, travel, equipment, and indirect costs.

A. Key Personnel
Michael Garbo, M.S., Co-Investigator (0.6 calendar months per year for all years). As head of SCNL, Mr. Garbo will be responsible for the oversight of all non-human animal sampling activities including preparation, staffing, implementation, and follow-up. He will further oversee the sample transport activity of both animal and human samples, for which SCNL is responsible. We do not request salary for him, since he will be fully covered by other SCNL funding sources.

B. Other Personnel
Annual support is requested for a field supervisor ($650/month), social scientist ($550/month), three field technicians ($550/month each), and two drivers ($330/month each) to make up the field research team. This team will be responsible for all aspects of animal field sampling, including planning, ordering supplies, implementation, ensuring all samples are safely and securely transferred to LIBR for testing, and any needed follow-up. This team will also administer a survey to the patients whose community they visit, administer a similar questionnaire to up to twenty additional community members, and with consent collect blood samples from these individuals for serological testing. Support is requested for an accounting assistant ($720/month) and an administrative assistant ($1,350/month) to assist with procurement, invoicing, scheduling, and field team logistics.

C. Equipment
A field vehicle for field sampling and sample transport is estimated at $45,000. Liberia does not currently have a VAT. Our conversations with Liberian partners indicate that it is unlikely that VAT will be instated in the near future. If it were, Government agencies and non-profits such as SCNL would be exempt from VAT.

D. Travel
Domestic Travel
Domestic travel support will cover fuel, vehicle maintenance, lodging and per diems for overnight trips ($50/day) for eight field team members for four, week-long field sampling trips. In addition to transporting the animal samples that it collects in the field, SCNL will also be responsible for picking up and safely and securely transporting all human samples from the clinical study sites to the Liberian Institute for Biomedical Research via the standing cold chain procedures they follow for the animal samples. Vehicle maintenance is calculated at $10,942 in Y1 for the two field vehicles, with higher costs estimated for the current vehicle due to its age and the condition of roads to be utilized, with a 2% increase in cost for each subsequent year. Fuel is estimated based on km to be traveled (664 total) weekly for sample transportation costs to both Phebe Hospital and Robertsport, as well as field travel from those locations and within a 50km radius. Vehicles are estimated to have a fuel efficiency of 20km/gallon with fuel currently costing $3.80/gallon. Cost is calculated at $45,103 in Y1.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies

We request $458 in Y1 for the purchase of two hand-held tablets with cases to be utilized by the field research team for data collection and organization (animal and human). Tablets will be used to conduct surveys off-line in the field, and to upload the data collected upon returning to SCNL offices. We request $589 for the purchase of a tarp, spade and 40 pitfall traps for rodent sampling. We request $442 for the purchase of a centrifuge to enable processing of medium- and large-animal blood samples in preparation for serological testing.

Field consumables including gloves, Tyvek suits, vacutainers, syringes and needles, EDTA collection tubes, non-EDTA collection tubes, cryotubes, TRIzol, and swabs are needed to conduct field sampling. The budget for consumables will enable us to test 3,360 animals over the course of the project (Y1: 160; Y2: 1,200; Y3: 800; OY1: 800; OY2: 400) and will cover a total of 12 sampling events (Y1: 4; Y2: 3; Y3: 2; OY1: 2; OY2: 1), with $37,943 budgeted for Y1 .

H. Indirect Costs

We are requesting a *de minims* rate of 10% on all allowable direct costs.

Criteria for Publication

1. The study presents the results of original research.
2. Results reported have not been published elsewhere.
3. Experiments, statistics, and other analyses are performed to a high technical standard and are described in sufficient detail.
4. Conclusions are presented in an appropriate fashion and are supported by the data.
5. The article is presented in an intelligible fashion and is written in standard English.
6. The research meets all applicable standards for the ethics of experimentation and research integrity.
7. The article adheres to appropriate reporting guidelines and community standards for data availability.

PLOS ONE encourages researchers to share early versions of their manuscripts via preprint server, either before or after submission; posting to a preprint server will not preclude consideration of your manuscript.

Peer Review at PLOS ONE

PLOS ONE is a fully peer reviewed journal with a rigorous multi-stage editorial screening and assessment process.

First, we undertake an initial in-house quality check to identify potential issues such as competing interest, compliance with ethical standards for studies involving human and animal subjects, financial disclosures, data availability, and other scientific and policy requirements. Submissions may be returned to authors for changes or clarifications at this stage.

After passing quality control, each manuscript is placed with a member of the Editorial Board who conducts peer review and makes the decision to accept, invite revision, or reject the submitted manuscript. Read the detailed Editorial and Peer Review Process overview.

Good Afternoon (b)(6)

All salaries for key personnel are increased annually by 5% due to the exceptionally high cost of living increases in New York City where we are headquartered. EcoHealth Alliance bases this calculation on the Consumer Price Index plus an annual merit increase.

Cheers

Joe

The field work refers to all project activities outside of Monrovia. We will be working in health care settings in rural areas in Bong County, Liberia and in small communities in the county. Thus we used the "other" category in the US State Department rate guide for activities outside of Monrovia. We used the same approach for are work over the last few years for USAID funded projects in Liberia.

Plan let us know if you would like additional information.

Good Morning and I hope all is well.

I do have a question as I am working on this. You stated " Flights for each of these trips is estimated at $3,500 and the federal per diem rates of $200 for lodging in Monrovia, Liberia and $70 for field work as well as the $95 for meals in Monrovia, Liberia and $46 for field work are requested". I noticed that you used the Per diem rates for Other, Liberia from the US State Department. Can you tell me what the field work entails?

Please find attached the documentation requested for our FRBAA14-6-2-0436 cost proposal. We have responded to the clarification questions and indicated both the document and page number where the full documentation/justification can be found. For each partner we have provided two files:

a) PDF document of our updated justification using tracked changes according to the current costs for all items based on the documentation.

b) PDF of the documentation that was requested on the clarification sheet.

Also included, an excel spreadsheet that includes our calculations for all costs and all partners corresponding to our updated justifications and documentation. Necessarily and following the documentation now provided, various costs have changed since our initial submission and our budget has been updated accordingly.

Our overall budget request is 4,899,297.20 with the annual amounts as follows:

Y1: $993,001.53
Y2: $979,399.40
Y3: $997,585.93
OY1: S962,036.71
OY2: S 967,273.63

Please e-mail or call if anything else is needed.

Cheers,

Joe

	DTRA Questions	EHA Responses	Documentation
1	Please provide documentation to support the proposed salaries (key and other personnel)	Please see the attached documentation of the salaries of current staff as well as that of the positions created by this grant.	PG.1
2	For domestic travel, please provide documentation (screenshots, links, quotes, etc.) for transportation cost	A detailed breakdown is provided in the FRBAA14-6-2-0436 Detailed Budget and documentation of all items is provided in the LHA Documentation file.	PG.2 3
3	Please provide documentation (quotes, screen shots, links, etc.) for consultant services to support the proposed cost.	A detailed breakdown is provided in the FRBAA14 6 2 0436 Detailed Budget. Hummingbird IRB has been aquired by New England IRB since original submission, Additionally, Key Personnel Ellen Carlin is no longer employed at EHA but will rather work on this project as a consultant. Please see attached documentation for all consultant costs.	PG. 4-15
4	Please provide a breakdown of the proposed materials and supplies, to include quantities and unit prices. Also, provide documentation (quotes, screen shots, links, etc) to support the proposed cost	A detailed breakdown is provided in the FRBAA14-6-2-0436 Detailed Budget and documentation of all items is provided in the LHA Documentation file.	PG. 4 15
5	Domestic conference location	A detailed breakdown is provided in the FRBAA14 6 2 0436 Detailed Budget for domestic conferences. There are two domestic conferences included in the budget one the ASTMH in Maryland along with WDA. For price estimates, the 2019 conference was hels in Tahoe City. Documentation is provided for flights from New York to the closest airport in Reno, NV.	
6	Departure location that the staff will be leaving from to present on project findings at the International conference in Austria	Staff will be departing from New York City to attend IMED in Austria.	
7			
8			
9			
10			

	DTRA Questions	LCRP Responses	Documentation Page Number
1	Please provide documentation to support the proposed salaries (Key and other personnel)	LCRP is being subcontracted as a consultancy for the expertise of the director James Desmond who has years field experince working on EIDs generally, and in Liberia specifically. His previous contract with EHA for work on the PREDICT project is attached as salary support.	Pg. 1
2	For all travel proposed whether domestic and international, please provide departure and arrival locations, number of trips, purpose of each trip, length of each trip, number of travelers, etc.	A detailed breakdown is provided in the FRBAA14-6-2-0436 Detailed Budget. Hotels, meals and incidentals are at the federal per diem levels. Each year there are two international trips: one from Monrovia, Liberia to Nyew York, New York for 7 days to collaborate with EcoHealth Alliance program staff, and one trip to an international conference to present on project findings. For budgeting purposes, this trip is from Monrovia, Liberia to Vienna, Austria to attend IMED for 4 days.	N/A
3	Please provide a breakdown of the proposed materials and supplies, to include quantities and unit prices. Also, provide documentation (quotes, screen shots, links, etc) to support the proposed cost.	A computer will be purchased for use during this project, price justification provided in the LCRP Documentation file.	Pg. 2
4	Please provide any current agreements with or submissions to either DCMA or DCAA. Please also explain how the rates in these documents are utilized in the proposal calculations	N/A	N/A
5			

	DTRA Questions	UNMC Responses	Documentation	NOTES
1	Please provide documentation to support the proposed salaries (key and other personnel)	Personnel from UNMC will be receiving funding to conduct work from another funding source and we are no longer requesting the proposed salaries. ASM will be another laboratory partner but neither needs funding under this project	N/A	
2	For all travel (proposed within the domestic and international), please provide (screenshots or links) the departure and arrival locations, number of trips, purpose of each trip, length of each trip, number of travelers, etc	Personnel from UNMC will be receiving funding to conduct work from another funding source and we are no longer requesting the proposed salaries. ASM will be another laboratory partner but neither needs funding under this project	N/A	
3	For all travel (proposed (domestic and international)), please provide a breakdown of the travel costs (airfare, ground transportation, lodging, per diem, etc.)	Personnel from UNMC will be receiving funding to conduct work from another funding source and we are no longer requesting the proposed salaries. ASM will be another laboratory partner but neither needs funding under this project	N/A	
4	Please provide any current agreements with or submissions to either DCMA or DCAA. BUDGET JUSTIFICATION FOR GEORGETOWN UNIVERSITY CENTER FOR GLOBAL HEALTH AND SECURITY, UNITED STATES

The Georgetown University Center for Global Health and Security requests a total of $196,834 over all years of the proposed project to support personnel, travel, other direct costs, and indirect costs.

A. Key Personnel
Erin Sorrell, Ph.D., Co-Investigator (1.2 calendar months for Y1, .6 calendar months for Y2-OY2). Dr. Sorrell will provide subject matter expertise in support of the execution of the project, specifically related to study design and analysis and dissemination of findings for which $11,477 is requested in Y1, with a 2% increase each subsequent year. Dr. Sorrell's time will vary over the five years of the project based on involvement in specific tasks.

Claire Standley, Ph.D. Co-Investigator (1.2 calendar months for Y1, Y3, OY2, .6 calendar months for Y1, OY1). Dr. Standley will serve as the GU PI for the award, and will be the lead for all aspects of GU's contribution to the project, notably related to project design and analysis and dissemination of the findings for which $10,819 is requested in Y1, with a 2% increase each subsequent year. Dr. Standley's time will vary over the five years of the project based on involvement in specific tasks.

Fringe Benefits
Fringe benefits are calculated as 32.4% of base salary p.a. with $7,224 requested in Y1 for Key Personnel.

B. Other Personnel
No funds are requested for other personnel.

C. Equipment
No funds are requested for equipment.

D. Travel
International Travel
International travel will be used to support Dr. Sorrell to travel from Frankfurt, Germany to Monrovia, Liberia to attend the kick off meeting in Y1 and annual meetings in Y3 and OY2 for six days, and to continue onto the field in Y1 and OY2 for an additional 5 days. Dr. Standley will travel from Washington, DC to Monrovia, Liberia to attend the kick off meeting in Y1 and annual meeting in OY2 for six days, and to continue onto the field in Y1 and OY2 for an additional 5 days. Flights for all trips are priced at $1,500, along with $75 each way for airport taxis as well as $25 per day for in-country transportation. The federal per diem rates for Monrovia and Other are utilized. A total of $18,811 is requested for international travel over the five proposed project years.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies

We request $55 in Y1 to purchase an encrypted storage device and $30 to purchase 3 USB drives. Over the five years of the project we request $331 for other office supplies including pens ($51), notebooks ($75) and printing ($205).

Telecommunications
We request $550 over the five years of the project to support telecommunication costs including a Skype subscription ($25 p.a), mobile phone charges for project communication, including roaming charges while on international travel in Liberia ($285 total) and local airtime and data ($90 total). A cell phone for travel will be purchased in Y1 for $50.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 55.5% on all direct costs.

RE: Confirmation of salary rates

To Whom It May Concern:

This letter is to confirm the base salary rates used for the development of the proposal "Reducing the threat from high-risk pathogens causing febrile illness in Liberia", submitted to the Defense Threat Reduction Agency under Broad Agency Announcement HDTRA1-14-24-FRCWMDBAA.

I can confirm the following base annual salary rates for the two Center for Global Health Science and Security personnel for the proposed period of performance of the project:

- Dr. Claire J. Standley: $108,191.00
- Dr. Erin M. Sorrell: $114,767.00

We are projecting 10% effort for Dr. Standley in Y1, Y3, and OY2 of the project, and 5% in Y2 and OY1. For Dr. Sorrell, we are projecting 10% effort in Y1 and 5% effort thereafter. We use an assumption of a 2% annual salary increase, effective from the start of our fiscal year (July 1), when generating our proposal budgets. This is our standard practice across all submitted proposals.

If further evidence of salary levels is required, I would be happy to discuss this with you further over the phone or via email. My contact information is provided below.

Sincerely,

Rebecca Katz

Price: $10.99 prime FREE Same-Day & FREE Returns

[illegible] Pay $10.99 $10.99 upon approval for the Amazon Prime Rewards Visa Card. No annual fee.

- For study notes that last: Oxford 3-Subject Poly notebooks are wear-, tear- & moisture-resistant so your important notes will survive through spills, midterms, finals & overcrowded backpacks
- GEL PENS & HIGHLIGHTERS WELCOME: Each notebook contains 150 sheets of smooth paper that resists ink smearing & bleed through for pinnable, A+ notes
- Keep only the pages you want: Oxford micro-perforated sheets are designed so the notes you want stay, and the notes you don't detach easily without effort or fuss
- Carry as needed: 3-hole punched spiral notebooks let you carry multiple notebooks in your 3-ring binder or zip binder for maximum versatility
- The right ruling: these college-ruled notebooks fit more writing per page than wide-ruled; 150 double-sided sheets with red margin lines; 3 Poly divider pockets; 2 pack in blue & black

Re: **Confirmation of Incentives to be paid Key and other personnel working on the DTRA Grants**

Dear Sir/Madam
I extend compliments as I write you this communication verifying salaries of Key personnel enlisted and budgeted for in the DETRA grant proposal.

The salaries proposed in the budget are percentages of their individual base salaries. The key staffs on the project will be working on a Full Time Equivalent bases.

Thanks so much for your kind consideration and please be assured that our office is willing at all times to provide you additional clarifications as may be required.

Best Regards,

Mr. Fidel D. Wiah
Deputy Director General for Administration (Acting)

Re: Laboratory test cost confirmation

Dear Mr. Desmond

I am writing to confirm the laboratory testing costs associated with the project titled: *Reducing the threat from high-risk pathogens causing febrile illness in Liberia.*

Based on an analysis of previous costs associated with testing biological samples in similar projects, we estimate a cost of $33.74 per sample.

Thanks so much for your kind consideration and please be assured that our office is willing at all times to provide you additional clarifications as may be required.

Best Regards.

Mr. Fidel D. Wiah
Deputy Director General for Administration (Acting)

Michael Garbo
Executive Director
Society for Conservation of Nature of Liberia
Congo Town, Monrovia

March 2, 2020

To: DTRA C-WMD Thrust Area 6 Program

This letter is intended to confirm the salary levels for following positions for the project, *Reducing the threat from high-risk pathogens causing febrile illness in Liberia*: social scientist (1), field technician (3), field supervisor (1), driver (2), administrative assistant (1), accounting assistant (1).

Position	No. of Staff	Monthly Salary	Percent Covered	Annual Total
Social Scientist	1	$550.00	100%	$6,600.00
Field Technician	3	$550.00	100%	$19,800.00
Field Supervisor	1	$650.00	100%	$7,800.00
Administrative Asst.	1	$1,350.00	50%	$8,100.00
Accounting Asst.	1	$720.00	50%	$4,320.00
Driver	2	$330.00	100%	$7,290.00
Total	**9**	**$4150.00**	**NA**	**$54,540.00**

These salary levels are based on funding levels for previous projects of a similar nature, primarily the USAID funded PREDICT project. Please feel free to contact me if you have any questions or need additional information.

Sincerely yours,

Mr. Michael F. Garbo
Executive Director/SCNL

Vehicle & Fleet Insurance

TGS has partnered with the leading international insurance firm Clements, to offer its customers competitive world-wide insurance coverage specifically designed for Aid & Humanitarian organisations. Through this partnership, TGS can provide insurance cover on a global flat rate for your vehicle or fleet and includes towing, theft, rental reimbursements amongst other benefits, as listed below:

- Worldwide comprehensive cover
- A simple, fast and hassle-free claim procedure
- In addition to the physical damage cover, the policy may be adjusted to your needs and include optional modules (such as excess liability, political violence, personal accident, duty coverage)
- Customers will benefit from a unique premium discount structure if specific accessories or services are also purchased with your vehicle

P.O Box 176. 40 Dovi's Tower Road. Gibraltar

Incoterms
Batch 1: CIF
Under CIF terms, the buyer is responsible for customs clearance at destination.

Payment Terms
Bank transfer with order

Batch 1: Warranty Service - Liberia:36 Months or 100000 Kms (whichever comes first)
Full Toyota warranty and after-sales service is included in the price of the vehicles supplied by Toyota Gibraltar Stockholdings Ltd (TGS). It's important to note that unauthorised traders cannot offer Toyota approved in-country warranty and after-sales service. A free pre-delivery inspection (PDI) and the issue of the Toyota Warranty Booklet will be carried out by the local Toyota Distributor. Please note that the local Toyota Distributor may charge for the installation of unassembled accessories, such as roof rack(s). The Distributor will also carry out a 1000 Km service check, free of charge except for lubricants, fluids or filters used, and will arrange the application of warranty if necessary. Please note that non-Toyota equipment fitted as a TGS option is not endorsed by Toyota and consequently shall not benefit from the Toyota warranty and warranty service. This non-Toyota equipment will be separately warranted by TGS who will match the conditions of the warranty of the original manufacturer. It is important that the Pre-Delivery Inspection is carried out by the Toyota Distributor before the vehicle is put into operational use.

Batch 1: Warranty Service - Note
Please note that any spare parts purchased from TGS may not be accepted or used by the local distributor during routine maintenance or servicing of your vehicle(s) at their premises.

Batch 1 - The Main Official Toyota Distributor is located in Monrovia

Validity
Prices are valid until the **7th June 2019**. this does not include indicative prices provided in alternative currencies). Please note that the freight price is only valid for the number of vehicles quoted. Any changes in quantities will require a revised quotation.

Spare Parts Service
We have enclosed details of Spare Parts Packages available for each model. Please note the service package is shown with and without tyres; the maintenance package includes tyres as standard. Please also note that when spare parts are shipped with vehicles, considerable savings can be made as the parts will be freighted inside the vehicle free of charge to the final destination.
We hope that our quotation is of interest and look forward to hearing from you. Should you have any queries or require more information, please do not hesitate to contact us quoting our reference.

Yours sincerely

Michael Garbo
Executive Director
Society for Conservation of Nature of Liberia
Congo Town, Monrovia

March 20, 2020

Dear James Desmond,

This letter is intended to confirm the approximate costs for field sampling per animal. These costs are based on extensive field operations for the USAID funded PREDICT project in which nearly 6000 animals (bats and rodents) were sampled. We estimate that the field costs for consumables is approximately $27.03 per animal sampled.

We are using this rate for the proposed project: *Reducing the threat from high-risk pathogens causing febrile illness in Liberia*. Please feel free to contact me if you have any questions or need additional information.

Sincerely yours,

Mr. Michael F. Garbo
Executive Director/SCNL

Michael Garbo
Executive Director
Society for Conservation of Nature of Liberia
Congo Town, Monrovia

March 20, 2020

Dear James Desmond,

Due to difficult road conditions in Liberia and the age of the vehicle, a White Toyota Land Cruiser (2012 – model: HZJ76L-RKMRS; JTEEB71J407015751), our vehicle costs per month over the past 12-months have been approximately $428.00 for a total of $5136 annually. This costs were incurred during extensive field work under the USAID funded PREDICT project. In addition, in order to make this vehicle roadworthy for fieldwork it will require an investment of $670. The annual total for year 1 is $10,942.00 notwithstanding the purchase of a new vehicle, also included in the budget.

Sincerely yours,

Mr. Michael F. Garbo
Executive Director/SCNL

Fisherbrand™ Portible Centrifuge Kit

Fisherbrand Portible Centrifuge Kit offers a convenient way to spin down and prepare samples outside of a convential laboratory environment

Catalog No. 14-127-556

$442.00 / Each

Qty Check Availability

Includes:

- Fisherbrand Standard Centrifuge
- 6 Place 1.5/2.0mL tube rotor
- 16 Place 0.2mL tube rotor (singles or 2 x 8 strip)
- 6 tube adaptors (0.2mL)
- 6 tube adaptors (0.5mL)
- 4 Replacement O-Rings
- Storage case for rotors and adapters
- 16 place tube rack
- Low voltage, double insulated power adapter with 4 interchangable plugs
- Fisherbrand Transport Box
- 16 place tube rack insert
- Transport Box dividers
- Centrifuge cradle
- 12V Car Adapter

Description

Features:

- Enables the processing of samples before deterioration can take place
- Can be used in remote enviorments where a normal electrical supply is not an option
- Kit enables immediate on-site testing for faster results
- Kit includes its own 12V car adapter and a 12V DC power adapter
- Carry the centrifuge and its components securely in the Fisherbrand Transport Box
- Fisherbrand transport box is transparent so samples contained can be viewed and their integrity checked

Compliance

Meets all global certifications. Suitable for worldwide voltages 100 to 240 VAC 50/60 Hz

Warranty and Services

2-Year warranty

- Multi-catch technology allows you to catch multiple pests at one time without the need to reset the trap again and again
- Size of the opening can be adjusted to accommodate the size of the rodent being trapped
- Simple hinged bottom makes for easy removal and reuse
- Steel construction resists rust and corrosion
- Easy-to-use design

Product Summary

This non-mechanical Grip Catch and Release Rodent Trap with multi-catch technology is the ideal and humane way to trap and relocate larger rodents, rats, squirrels, chipmunks and other similarly-sized gnawing rodents and animal pests. Fully assembled and ready to use. 12 1/2in.L x 8in.W x 6in.H.

What's Included
(1) Live catch mouse trap

Features + Benefits

- Multi-catch technology allows you to catch multiple pests at one time without the need to reset the trap again and again
- Size of the opening can be adjusted to accommodate the size of the rodent being trapped
- Simple hinged bottom makes for easy removal and reuse
- Steel construction resists rust and corrosion
- Easy-to-use design

Technical Abstract (Limit your abstract to 200 words with no classified or proprietary information)

Project summary/abstract This publicly releasable abstract is provided to DTRA for use in fulfillment of Section 8123 of the Defense Appropriations Act and future versions of the same. This project is designed to help identify the causes of infectious acute febrile illness (AFI) in Liberia, particularly among patients with a history of animal contact. AFI is a group of illnesses characterized by the rapid onset of fever and may include related symptoms like headache, chills, joint pain. Many of the pathogens that cause AFI are difficult to diagnose. This is especially true in countries where a malaria diagnosis is often presumed and no further testing is performed, a situation that creates vulnerability to unexpected outbreaks. In Liberia, one of the countries directly impacted during the 2014-2016 West Africa Ebola outbreak, the pathogens and risk factors that result in a burden of febrile illness in the population have not been systematically identified. This project's goal is to build capacity in Liberia for threat reduction through an integrated human-animal surveillance approach to high consequence zoonotic pathogens associated with human AFI. We will do this by testing samples from patients presenting at hospitals with febrile illness for high-risk pathogens, while also assessing the animals with which these patients interact. At the National Public Health Institute of Liberia, we will use molecular methods including real-time PCR, next generation sequencing, and antibody serology to identify viral, bacterial, and protozoal causes of

fever. Laboratory results will be compared to the presumptive clinical diagnoses. We will interview patients to characterize their animal exposure and will sample domestic and peridomestic animals (rodents, bats, livestock, dogs) in the homes and communities of pathogen-positive patients. Results will allow us to develop improved clinical diagnostic protocols, estimate the frequency of human exposure to high consequence pathogens, characterize exposure to potential animal reservoirs and carriers, and implement risk reduction strategies. This project will support the goals of Liberia's One Health Coordination Platform and provide a basis for future detection, surveillance, and threat reduction activities. The work will build on U.S. investments that have begun to reveal circulating animal pathogens of highconsequence concern, utilize the substantial laboratory infrastructure built in Liberia in the last four years, and sustain personnel capacities that have been developed to support it.

I. ABSTRACT: To test the hypothesis that a proportion of acute febrile illness in Liberia is misdiagnosed and potentially the result of emergent zoonotic pathogens of public health and proliferation risks, we will build local capacity using One Health approach to assess circulating pathogens and improve clinical and biosurveillance protocols for biological threat reduction. With the National Public Health Institute of Liberia (NPHIL), we will enroll patients presenting with acute fever at major hospitals in Monrovia and Bong County. Patient samples will be screened at the point of care per normal clinical protocols and tested at NPHIL for high-consequence viral, bacterial, and protozoal causes of fever via multiplexed specific real-time PCR, next generation sequencing, and convalescent serology. Laboratory results will be compared to the presumptive clinical diagnoses and both datasets will be compared to county surveillance records. We will interview patients to characterize their animal exposure and, with a local non-governmental organization and the Ministry of Agriculture, will sample domestic and peridomestic animals (rodents, bats, livestock, dogs) in the homes and communities of pathogen-positive patients to identify evidence of those pathogens in animals. Results will allow us to develop improved clinical diagnostic protocols, estimate the frequency of human exposure to high consequence pathogens, characterize exposure to potential animal reservoirs and carriers, and implement risk reduction strategies. This project will support the goals of Liberia's One Health Coordination Platform and provide a basis for future detection, surveillance, and threat reduction activities.

II. SCOPE

A. Objective: This project's goal is to build Liberian capacity for threat reduction through an integrated human-animal surveillance approach to high consequence zoonotic pathogens associated with human acute febrile illness (AFI). AFI is a group of illnesses caused by a variety of pathogens difficult to differentiate clinically due to similarities in presentation.[1] While there is no universal definition, AFI is often considered as rapid onset (i.e., acute) fever with or without related symptoms (headache, chills, joint pain). Many AFI causative agents may go undetected empirically by common rapid diagnostic tests or by existing surveillance platforms. We will work to mitigate this challenge through scientific discovery, hypothesis testing, and capacity building while leveraging significant U.S. government and other investment in workforce building and laboratory infrastructure. As many emerging diseases have been inadequately studied in Liberia,[2] this project will provide fundamental baseline knowledge of pathogens circulating and potentially causing human illness. Its outcomes will suggest opportunities for improved clinical training, tailored case definitions, and other methods to improve identification rates for especially dangerous pathogens at the index case level and prior to widespread transmission.[3] The desired endpoint is a broad, sustainable surveillance program that enhances public and global health security. We outline three objectives toward the project goal and three hypotheses to test in support of their achievement:

Hypothesis 1: Emergent and/or high-risk pathogens cause an undiagnosed subset of acute febrile illness in humans in Liberia → **Objective 1**: Identify causative agents of AFI in Liberia
Hypothesis 2 (a sub-hypothesis of H1): A subset of AFI cases are due to high-consequence zoonoses, even among patients who test positive for endemic pathogens → **Objective 2**: Identify evidence for zoonotic transmission of high-consequence AFI pathogens
Hypothesis 3: Exposure to domestic animals and wildlife increases the likelihood that AFI cases result from zoonotic animal to human transmission → **Objective 3**: Identify risk factors for zoonotic AFI in humans

B1. Background: Limited detection and diagnostic capacity reduces the ability of clinicians and public health professionals to accurately identify infectious agents. Febrile illness presents an unquantified and undifferentiated burden to Liberian health and the health care system and continues to do so. Liberia's public health authorities do not assess incidence of febrile illness. Some studies are just beginning to assess this. Other published studies have reported on causative agents of infectious fever in other low- and middle-income countries (LMIC), including in West Africa.[2,4-6] In low resource settings where malaria is endemic, patients presenting with febrile illness may be treated presumptively for malaria[7] and not receive an accurate diagnosis for reasons such as poor differential protocols or lack of available diagnostics.[8-11] Co-infections may also be common, particularly with malaria parasites; for example, 19% of Ebola PCR-positive samples from an Ebola Treatment Unit in Liberia were also positive for *Plasmodium* spp.[12] Malaria was the clinical diagnosis for >60% of fever cases in a recent study in Tanzania, but the actual cause of fever in only 1.6%.[13] Where studies have sought to investigate the source of febrile illness, high-risk pathogens of proliferation concern such as *Brucella*, dengue virus, and viral hemorrhagic fevers have been observed.[2,4,14] In Sierra Leone, over 25% of patients negative for Lassa virus showed serological evidence of infection with other arthropod-borne hemorrhagic fever viruses.[6] **The specific challenge** for Liberian health authorities is that pathogens that result in a burden of febrile illness in the population—and the zoonotic transmission pathways that may drive it—have not been systematically nor comprehensively identified.

B2. Research Justification: Inaccurate identification of pathogens may result in untreated illness, further transmission, and development of antimicrobial resistance.[15,16] It can increase the risk of accidental acquisition of dangerous pathogens from the environment or diagnostic specimens. Improper diagnosis can also skew health care providers' perceptions of disease prevalence among health care providers.[3] Diagnosis limited to a single disease (malaria, typhoid) ignores the risks of co-infection. Further, a poor understanding of the diversity of zoonotic viruses in animal reservoirs creates an impediment to preventing outbreaks of novel zoonotic viruses; developing an *a priori* understanding of these pathogens' molecular characteristics may help reduce the time to identification of the animal reservoir and mechanism of spillover in an outbreak.[17] Because many emerging diseases have been inadequately studied in Liberia, this project will provide new knowledge of pathogens circulating in people and animals and potentially causing human illness there. This baseline will enable more informed biosurveillance and decision-making, and the process to develop this knowledge offers significant opportunity for building Liberia's capacity to rapidly and accurately detect and diagnose biological threats. The study will promulgate new findings about especially dangerous and other high-consequence agents (U.S. "Select Agents" and other emerging infections with pandemic potential) circulating in Liberia that may result in pandemics or be appropriated for misuse, and for which risk assessments and mitigation measures are yet to be developed. Hypothesis testing will leverage preliminary data we have collected through USAID's PREDICT project about the general Liberian population, which suggest that the split among those who do and do not have live animal contact is up to 60%/40%, enabling a control group and thus a strong statistical basis from which to test hypothesis 3. While causation cannot be definitively confirmed in any case in which we find a zoonotic pathogen, by uncovering individuals' exposures to animals that are known hosts to those pathogens, and by identifying the same pathogen (and genetic relatedness) or antibodies in such animals, we can develop an evidence base tied to transmission risk. The use of human subjects is necessary to enable testing the hypotheses at the core of this proposal about human febrile illness their interactions with livestock and wildlife. Human sample testing will be for research purposes only, not diagnosis; the multiplex

screening assays we will employ are not approved for clinical use and the tests in most cases will not be run immediately. An Institutional Review Board application is pending. Sampling of animals (non-lethally) is necessary to assess the presence and prevalence of circulating high-consequence pathogens and antibodies in animal populations, and to test the hypothesis that human interaction with these animals may increase transmission risk. An Institutional Animal Care and Use Committee application is pending. Bats and rodents are prioritized because they are key wildlife reservoirs for zoonotic viruses;[18] livestock and dogs can also harbor zoonotic agents and are likely to have relatively significant direct and indirect interfaces with humans.

B3. Expected Outcomes and Scientific Impact for C-WMD Science: This project will help further identify and characterize the etiological agents of infectious AFI in Liberia, particularly among patients with a history of animal contact. It will build on U.S. investments that have begun to reveal circulating animal pathogens of high-consequence concern and will utilize the laboratory infrastructure built in Liberia in the last four years and support personnel that have been trained to support it. It will also support Liberia's One Health Coordination Platform (OHCP) by using an integrated human-animal approach to surveillance and detection of high consequence zoonotic pathogens, and by ensuring that relevant sectors including those representing the environment (through the national Forestry Development Authority and through EHA's sustainable forestry research initiative) are included in data sharing and are represented at project workshops. The combined approach of PCR (singleplex and multiplex), next-generation sequencing (NGS), and antibody serology will maximize detection capability more than any single test alone,[17] and enable the design of more routine single- or multi-plex qPCR testing flows based on the most common pathogens for the national labs to use when receiving AFI samples. Serology will be especially relevant for animal sampling because antigen positive sample rates may be low (PREDICT bat sampling, for instance, provided ~ 4% positive viral infection rate on PCR; unpublished data). The project will also produce a unique incidence profile of high-consequence viral and bacterial agents in the human febrile population and their relatedness to pathogens circulating in animal species with close human contact, and differentiate the illness they cause from routine or endemic pathogens including protozoal species. Establishing a pathogen baseline or a microbiodiversity inventory is critical for: 1) enabling rapid identification of agents of high-consequence concern to the national and international communities; 2) creating a comparator for future surveillance data and intervention activities; and 3) building capacity for sampling and diagnostics to enable targeted and syndromic surveillance. Accurate and timely detection of rare and high-risk pathogens based on clinical assessment of febrile patients combined with appropriate and accurate laboratory testing can greatly facilitate implementation of appropriate control measures, reducing population morbidity and mortality, and minimizing potential biological threats.[10,19,20] Building on existing DTRA investments, this project will help ensure continuity of past and ongoing training and capacity building efforts. By collating results from a similar project in development for Guinea and coordinating with other febrile illness studies in-country, this work will help produce a regional picture of febrile zoonotic disease risk in West Africa that can inform U.S. personnel decisions in the region, surveillance efforts, and medical countermeasure investment priorities.

B4. Potential Challenges and Proposed Solutions: Collaborative research projects assume a degree of risk (communication difficulties, pressures on sustainability of each partner's commitment). We have selected core collaborators based on their excellent scientific reputation and existing relationships with EcoHealth Alliance (EHA). The Liberian ministries and scientists implementing this project are heavily invested in the success of their surveillance and detection capacity building, demonstrated through their successful PREDICT partnerships and collaboration

with DTRA to construct a new reference laboratory; all U.S. partners have demonstrated a sustained commitment to and successful track record in West Africa and to strengthening surveillance and detection. To overcome laboratory diagnostic challenges, we will employ a multi-platform laboratory approach to achieve the greatest sensitivity and specificity possible and the addition of NGS will improve power to detect positive samples. Socially, we do not believe that mistrust of government/health workers post-Ebola crisis presents a risk: our patient population will have already sought health care, and we will be using local hires to implement the study; EHA also has a track record of successful enrollment of human subjects in Liberia for PREDICT over the last three years. EHA will provide financial oversight over all project partners' budgets and expenditures. Liberia does not have a VAT and our conversations with Liberian partners indicate it is unlikely they will instate one in the near future.

C. Programmatics

1. Study site: Liberia has been working to mitigate challenges in infectious disease diagnosis, surveillance, and case reporting to the national level.[21,22] In accordance with Integrated Disease Surveillance and Response (IDSR) system guidelines, national protocols require diagnostic confirmation for many of the known causes of febrile illness,[23] but in many cases no further testing is performed. We choose to work in Liberia because: 1) recent federally-funded evaluations have begun to document a presence of high-consequence and potentially high-consequence zoonotic pathogens circulating in animal populations there, including Zaire ebolavirus;[24] 2) the presence of and risk factors for emerging infections are still relatively understudied; and 3) historically weak laboratory infrastructure has recently benefitted from construction and capacity building since the Ebola outbreak, and now requires further training and sustainment. At the county level, Montserrado is chosen due to the greatest potential for a large sample size from one of its major public, high-volume hospitals with 200 beds, Redemption Hospital on the outskirts of Monrovia. Bong County is a rural comparator with Phebe Hospital, a private hospital that receives public money and affords a reasonably well-equipped facility with good patient volume. Further, Bong County borders the Forest Region of Guinea, where inaccessibility inhibits research on the Guinea side of the border. Both counties also demonstrate relatively detailed weekly reporting to their health ministries, thereby providing a sizable basis for comparison to weekly epidemiological data.

2. Performers: EHA will lead on study design/methodological development, animal sampling field implementation (co-lead), and analysis and results development/dissemination. All other major activities will be led by country partners, including government agencies and NGOs. Our collaborative team incorporates the human, animal, and environmental sectors, critical to supporting a One Health approach and meeting project objectives to identify and mitigate zoonotic diseases. Team members have a long history of successful collaborations on research and capacity building initiatives (number of years of collaboration with EHA listed in first column):

EHA: EcoHealth Alliance; MOH: Liberia Ministry of Health; NPHIL: National Public Health Institute of Liberia; SCNL: Society for the Conservation of Nature of Liberia; LCRP: Liberia Chimpanzee Rescue and Protection; UNMC: University of Nebraska Medical Center; GU: Georgetown University Center for Global Health Science and Security.

D. Relevance

In Liberia, individuals suffering from fever who report to health care providers may be treated symptomatically or empirically for presumptive endemic diseases like malaria or typhoid. Positive results from rapid diagnostics (e.g., for malaria and typhoid), which are becoming increasingly available at the point of care even in remote areas, do not rule out other underlying febrile agents for which advanced testing is not the norm; in general, samples to test for Ebola are sent to the

national reference laboratory only when a clinician has a particular index of suspicion. The scientific community's fundamental understanding of infectious febrile illness in Liberia is thus based largely on conjecture. This project will advance the state of emerging infectious disease science by generating knowledge about a range of circulating pathogens in people and animals in Liberia, including presence, speciation, incidence, and estimated prevalence. This foundation will allow research and public health communities to measure change against this baseline—both naturally occurring changes, and reductions in incidence following effective interventions. It will also help establish baselines for incidence which can then inform procedures such as outbreak investigations or activation of the national emergency operations center. The project will also advance Liberia's capacity for research and biosurveillance. Improving ability to rapidly detect and report new incidence will improve the country's readiness for outbreaks whether natural or intentional. Informing interventions such as modified clinical intake, differential algorithms, and diagnostic protocols will minimize vulnerability to outbreaks. Little is known about viral dynamics of wildlife as they relate to spillover risk, creating a significant impediment to preventing human outbreaks of novel zoonotic viruses.[17] This study will help generate an evidence base and strengthen Liberia's experience in leading interdisciplinary research and surveillance efforts. The project will engage students from the University of Liberia and Cuttington University. Project staff will be fully trained in human subjects research, sample transport, biosafety and biosecurity, diagnostic testing, animal sampling, data analysis, risk reduction, and reporting. We will ensure that all surveillance data and other results are shared among the Liberian ministries of health, agriculture, and forestry, and we will assist them in their reporting to the World Health Organization (WHO) and the World Animal Health Organisation (OIE), thus advancing Liberia's commitment to meeting international obligations.

III. CREDENTIALS

Principal Investigator: Dr. William Karesh is the Executive Vice President for Health and Policy for EHA. He serves as the President of the OIE Working Group on Wildlife Diseases. Dr. Karesh was the Technical Director of the $75M USAID Emerging Pandemic Threats PREDICT project, Dr. Karesh designed, organized, and managed the implementation of zoonotic disease research in 28 countries and served as the liaison to coordinate with government, university, and NGO partners in the $140M second phase of the project resulting in the collection of over 350,000 specimens from humans, livestock, and wildlife yielding gene sequencing suggesting the identification of over 900 novel viruses, including a new filovirus and the first finding of Ebola Zaire in a bat in West Africa. He has created, directed, and/or managed projects and programs in more than 60 countries, including efforts to minimize the impact of diseases such as Ebola, influenza, and anthrax and to develop global surveillance systems for emerging diseases.

Prime Organization: EcoHealth Alliance is a leading research organization established more than 40 years ago that works with local partners in more than 30 countries at the nexus of health, biodiversity, conservation, and international development. EHA has extensive field experience in West Africa and expertise in pandemic prevention and the interconnectedness among zoonotic pathogens, humans, animals, and the environment. EHA has worked in Liberia since 2015 as the country lead for USAID's PREDICT project and since 2019 undertaking a privately funded forest sustainability and health initiative. Working with Liberian partners including NPHIL and SCNL, EHA recently detected Zaire ebolavirus for the first time in a bat in West Africa via the sampling methods that will be used in the present study. For the PREDICT project, our team in Liberia enrolled 585 people and sampled 5387 wild and domestic animals. EHA has a staff of

approximately 50 based primarily in New York City, including scientists (e.g., social scientists, veterinarians, ecologists, analysts, IT experts, economists, epidemiologists), administration, and communications staff. EHA has an extensive record of publishing high quality, peer-reviewed papers, journals, briefing documents, and reports. EHA's demonstrated multi-disciplinary expertise in producing highly utilized and understandable science-based outputs will contribute significantly to achieving project goals and provide objective methods for tracking project utilization of project findings.

Partners: The National Public Health Institute of Liberia (NPHIL) is responsible for infectious disease surveillance, detection, and reporting in Liberia. NPHIL is charged with public health and biomedical research functions and as such will lead the project with government partners through a memorandum of understanding (MOU). DTRA is working with NPHIL to build a biosafety level 3 laboratory that will replace its current research laboratory (Liberia Institute of Biomedical Research, LIBR); LIBR is already equipped with singleplex and multiplex real-time PCR and ELISA serology capability and is capable of safely and securely running a variety of assays; a related laboratory capacity building project is under consideration and if funded will work within LIBR emphasizing NGS. NPHIL will work via an MOU with the *Ministry of Health (MOH)* to implement the human clinical element of the present study by providing personnel to execute the study protocol at county hospitals. NPHIL will also support the training of scientists and technicians from the *Ministry of Agriculture's (MOA) Central Veterinary Laboratory (CVL)*. The scientists will train at NPHIL in the same techniques as the NPHIL scientists. Training a CVL technician and local students in field and laboratory work is a priority for this project and will support Liberia's own OHCP priorities. The scientists will ultimately bring the skills back to their own laboratory, which is equipped with modern equipment, test kits for priority zoonotic diseases, reagents, and consumables that can be used for PCR, ELISA, and bacteriological techniques. Liberia Chimpanzee Rescue and Protection (LCRP) is a Liberia-based non-governmental organization supporting chimpanzee conservation. LCRP works closely with Liberian ministries, including NPHIL and the Forestry Development Authority, on regulatory and policy matters; and advances research on chimpanzee health by working to mitigate infectious disease introduction, including high-consequence infections such as influenza and monkeypox. Its director has been an EHA employee or consultant for 10 years. Society for the Conservation of Nature of Liberia (SCNL) is a non-profit organization that promotes nature conservation, supports the establishment of a protected area network, encourages good governance of natural resource management, and increases public participation in biodiversity conservation. SCNL has implemented animal sampling requirements for the Ebola Host Project (part of PREDICT) through its field teams, who are highly trained in animal sampling, especially bat sampling. Given its experience with cold storage transport, SCNL will also transport the human samples. The University of Nebraska Medical Center (UNMC) is one of four campuses of the University of Nebraska, and one of the major research centers in the state with excellent laboratory and infectious disease credentials. UNMC is developing a separate laboratory capacity-building proposal with NPHIL at LIBR that, if funded, would create efficiencies with training and sample processing for this project. UNMC will leverage as appropriate ongoing work of the U.S. Naval Medical Research Unit-No. 3 (NAMRU-3) in the country in support of the project's laboratory testing objectives. The Georgetown University Center for Global Health Science and Security (GU) is a leading academic institution working on applied public health and policy objectives globally. Its scientists have backgrounds in threat reduction approaches, laboratory bench science, and biosurveillance

reporting structures. The team worked on a 5-year cooperative agreement to improve capacity in neighboring Guinea in emergency management, laboratory capacity, and One Health coordination.

IV. WORK TO BE PERFORMED

A. General. We will produce a cross-sectional data set that identifies pathogens and their relative abundance circulating in people and animals that are potentially resulting in human cases of acute febrile illness. Our approach will enable us to make preliminary epidemiological connections among species. It will also enable us to characterize zoonotic risk and allows for the potential to design interventions. We will compare our laboratory-confirmed human diagnostic data to hospital diagnoses and disease data as reported to the MOH, and in so doing will assess the level of sensitivity in current diagnoses, and work with local partners to develop improved clinical diagnostic pathways. Through workshops (Attachment 3) and laboratory training, Liberian partners will further strengthen their growing capabilities in diagnostics and surveillance, thereby increasing their opportunities for rapid detection and concomitant consequence mitigation. With two option years, we will create opportunities to expand the study to new sites to the north and northeast with different ecologies and occupational drivers of disease risk (livestock farming, mining), and host a regional technical workshop. Public health surveillance and biomedical research training will be a central component of the study.

Training Workshops	Timeline
Workshop 1a: All participants • Overall research study protocol	At Kickoff
Workshop 2a: Task 2 personnel, students • Overview of human study protocol • IRB/human subjects research protocol • Recruitment, consent, & enrollment • Patient questionnaire and administration • Community safety during sample collection	Mid Y1 End Y3
Workshop 3a: Task 3 personnel, students • Biosafety and biosecurity • Sample storage and disposition	At kickoff Mid Y1 Y3 refresh
Workshop 3b: Task 3 personnel, students • real-time PCR testing and analysis • NGS testing and analysis • Serology testing and analysis	At kickoff Mid Y1 Y3 refresh
Workshop 4a: Task 4 personnel, students • Overall animal study protocol • IACUC/animal subjects research • Personal protective equipment • Transport protocol	At Kickoff Mid Y1 Y3 refresh
Workshop 5a: Task 3 and other interested personnel • Results interpretation • Bioinformatics	Y2
Workshop 6a: All personnel, other invited ministries relevant to risk and impact mgt. • Questionnaire and diagnostic data analysis • Reporting (national and international) • Economic analysis • Risk reduction strategies	OY2

B. Summary of Tasks

Task 1: Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia (Y1); **Task 2**: Enroll human patients and undertake sampling (Y1-3 & OY1-2); **Task 3**: Undertake sample processing and testing (Y1-3 & OY1-2); **Task 4**: Undertake preliminary animal sampling (Y1); **Task 5**: Visit communities: human-animal interface assessment, animal sampling, and human serology (Y2-3 & OY1-2); **Task 6**: Analyze data (Y2-3 & OY1-2); **Task 7**: Disseminate information to stakeholders (Y2-3 & OY1-2)

C. Detailed Tasks

Year 1

Task 1: Establish an evidence-based research initiative for assessing and addressing high-consequence pathogens in Liberia

Description and Execution: EHA will oversee refinement and finalization of human and animal study protocols and data collection instruments. This stage incorporates planning and training in the protection of human subjects and animal subjects; training in laboratory biosafety, biosecurity, and safe disposal of samples or sampling materials after laboratory work (which will adhere to guidelines in the BMBL 5th edition, sections III VI[25]); laboratory diagnostic techniques; and any necessary revisions to original sampling and testing approach based on DTRA feedback and discussion at the kick-off meeting. We will refine our human subjects data collection tools, piloting our instruments within our research network to assure validity and reliability of the questionnaires. A database will be created for secure data entry and data storage of human subjects data. MOH will assign personnel to train clinical staff and oversee study in clinics in Monrovia and Bong. NPHIL and CVL will assign personnel to laboratory. EHA and Liberian partners will host kick-off meeting in Monrovia, Liberia to which all partners will be invited. Each study partner will present on its roles and specific desired outcomes to support its agency's priorities. In addition, we will invite other researchers undertaking febrile illness and related research in-country, such as the U.S. Centers for Disease Control and Prevention (AFI study), the Walter Reed Army Institute of Research (Joint West Africa Research Group), and the Henry Jackson Foundation (sepsis study). Human subjects research and lab training workshops will occur during kick-off.

Resources: EHA: Three EHA (3) scientists will oversee all necessary refinements to and finalization of human and animal study protocols; work will be done in collaboration with all study partners for input and review. One (1) scientist to provide human subjects research training and clinical protocol-specific training. NPHIL and SCNL: Will assist EHA with logistics for kick-off meeting (conference location, agenda development, etc.). All partners: at least one (1) scientist per partner (and three (3) from EHA) to attend kick-off meeting. UNMC scientists (2) will host first of three five-day laboratory training workshops (biosafety & biosecurity (1 day), diagnostic techniques (4 days)) concurrent with kick-off.

Metrics of success: Number of partner organizations and number of scientists from each organization who attended kick-off meeting; presentations delivered; partner agreement to finalized protocols; number of personnel assigned to field and lab positions.

Deliverables: Methods and related protocols available for distribution to all partners at or before kick-off meeting and revised as necessary after kick-off; list of Liberian personnel to be assigned to field and laboratory stations; database for secure human subjects data storing and analysis; data collection instruments; completed kick-off meeting.

Subtasks: (Format: Year#.Task#.Subtask#)

1.1.1 Refine and finalize human and animal study protocols and data collection instruments
1.1.2 Secure and finalize all research permits (human and animal) including IRB, IACUC, and national approvals in Liberia
1.1.3 Assign MOH, NPHIL, and CVL staff to field and laboratory positions
1.1.4 Host kick-off meeting in Liberia
1.1.5 Conduct Workshop 1a: overall research protocol (concurrent with Task 1.1.4)

Task 2: Enroll human patients and undertake sampling

Description and Execution: Due to the potentially prolonged timeframe to acquire IRB approval in country, human enrollment is expected toward the end of Year 1. EHA will train study staff in

human subjects research and patient recruitment; biosafety, safe and secure sample collection, handling, packaging, and transport; and implementation of the study protocol. Training will provide the principles for safe and ethical human subjects research; and project-specific teachings to ensure staff understand, practice, and can implement the study protocol (enrollment determination, informed consent, and questionnaire administration (demographic information, animal ownership), sample acquisition, data entry, and sample packaging and readying for transport). MOH will provide a locally hired on-site project coordinator to work with the hospital team and oversee the study protocol (train clinicians and nurses; be alerted when febrile patients arrive; work with hospital staff to oversee informed consent, enrollment, sample collection, and interviews). Hospital personnel from Redemption Hospital and Phebe Hospital will follow their routine intake and diagnostic procedures, then invite voluntary enrollment from adult patients and children older than four years of age (with parental consent) presenting with acute febrile illness (documented fever $\geq$37.5°C at presentation, with or without concomitant reported symptoms within five days of presentation). Fever may be accompanied by other signs but only fever is needed for enrollment. Patients too ill to provide informed consent will be excluded from enrollment. Once enrolled, blood specimens and a nasopharyngeal/oral swab will be collected (for research, not diagnosis), centrifuged (for serum samples), and temporarily stored in a portable ultracold freezer (Stirling, USA) until picked up for transport to LIBR; SCNL will transport research specimens from clinical study sites to LIBR following standard chain of custody protocols (strict cold-chain (liquid nitrogen), biosafety, and biosecurity) (Attachment 3). (Human samples will be collected in duplicate or in a single vial on site and aliquoted in the laboratory.) Clinicians will provide enrolled patient records to the study team to enable review to provide background medical history and other relevant information. Given the high expected number of acutely febrile patients and low expected incidence of high-consequence pathogens, we will recruit continuously, aiming for a total recruitment base of 1,500. For sample collection, clinical research staff will collect specimen concurrently with in-house diagnostic sample collection or shortly thereafter, whichever is least intrusive to patient care. Clinical study sites already employing in-house diagnostics for febrile patients will continue to follow their standard protocols to collect blood and process for ruling out pathogens per their routine protocols via rapid diagnostic and other in-hospital tests (Redemption: malaria rapid diagnostic test (RDT) and microscopy, typhoid RDT; Phebe: malaria and typhoid RDT). For enrolled subjects positive for malaria or typhoid, we will screen their samples to determine whether they are co-infected with other agents that may be contributing to their acute fever.

Study design: Cross-sectional sampling will be used to provide a representative sample of a relatively urban or relatively rural population (depending on site) of individuals with fever. Longitudinal sampling of target populations (not individuals) across up to 2.5 years per clinical study site will maximize the opportunity for detection and possibly reveal seasonal trends in infection or other time-related changes in trends. We will review historical and concurrent surveillance reports for the study counties and for neighboring counties as comparators.

Sample size: Sampling will be based on available volume in the clinical sites but is designed to assure detection of rare pathogens and answering questions about the relative proportion of febrile illness caused by each. We estimate a sample size of 1,500 will enable us to accurately determine the prevalence of causal agents of 95% of AFI cases within 5% of true prevalence with 90% power (based on 1,000 simulated studies). We will also be able to detect rare AFI agents with prevalences as low as 0.2% with 95% power.

Resources: EHA: One (1) scientist to train in human subjects research, including overall study protocol, informed consent, questionnaire administration, data storage, and one (1) scientist to train in sample storage and transport protocol. MOH: One (1) assigned project coordinator for each site; one (1) laboratory technician for sample processing and storage for each site. Two (2) students total from University of Liberia and/or Cuttington University to participate in field work (1 bachelors as a trainee, 1 masters as part of practicum) in biomedicine, public health, nursing, or anthropology. SCNL: One (1) driver to be trained in and to implement sample transport. NPHIL/MOA: Four (4) laboratory scientists (one from each ministry) to participate in training for complete awareness of sample collection, packaging, and transport protocols. Dedicated -80°C freezer.
Metrics of success: Completion dates and number of study staff trained in human subjects research and in specific project protocols; presence of project coordinators at each study site; number of patients enrolled; number of samples sent to LIBR, number of samples tested at LIBR.
Deliverables: Relevant project staff trained in protection of human subjects in research and project protocols; completed on-boarding of project coordinator for each study site; initial enrollment of patients into the study.
Subtasks: (Format: Year#.Task#.Subtask#)
1.2.1 Conduct Workshop 2a: IRB/human subjects research
1.2.2 Locally-hired project coordinator reports to hospital at each study site
1.2.3 Enroll patients (continuous)

Task 3: Undertake sample processing and testing

Description and Execution: NPHIL will receive and process samples at LIBR until the new DTRA-funded national reference laboratory in Monrovia comes online during the study. LIBR reception personnel will be briefed on the study protocol and will notify the project supervisor on receipt of the samples, at which point study-specific inventory and storage procedures will be followed. (One aliquot will be immediately stored while a second is processed for molecular testing.) LIBR has an ABI 7000 Sequence Detection System in operation on which the laboratory scientists and technicians are well trained; a MiSeq system for NGS that is available but requires staff training; and ELISA platforms for serology. NPHIL will budget for and be responsible for ordering needed consumables throughout the project, and UNMC will provide assistance, training, and oversight. LIBR staff are already trained in real-time PCR and ELISA platforms; UNMC will refresh these skills and provide additional training via two one-week didactic and hands-on workshops Y1; another dedicated workshop in Y3; and in other years if needed via visits to the laboratory. These will cover execution of specific pathogen tests, advanced techniques (NGS), and results interpretation (including NGS bioinformatics); sample inventory management; and biorisk management. UNMC will provide oversight and mentorship through their at least twice-yearly working visits to Monrovia and the laboratory as well as video and teleconference. UNMC will leverage its additional DTRA work at LIBR (under funding consideration) to assist with skill-building among laboratory scientists and technicians there. UNMC will assess competence at each visit via a standardized evaluation form to use as a basis for targeted future training.
Laboratory assays: Three types of tests quantitative real-time PCR, NGS, and ELISA will be used together to characterize infection with and exposure to high-consequence zoonotic pathogens in people and animals.[17] To establish a baseline library of viral and bacterial pathogens in common peridomestic wildlife hosts (e.g., bats and rodents), we will test 300 archived oral, fecal, and blood samples collected under the PREDICT Ebola Host Project and stored at LIBR, running them on the MiSeq NGS platform via Ampliseq panels that can be designed to target thousands of

amplicons (Illumina, USA) including specific pathogens and conserved primers. This will allow us to begin training technicians on the technique, which will be used in follow-on project years. Results from this unbiased screening will inform development of the real-time PCR array and provide early insights about potential pathogens and their locations. We are in discussion with NPHIL to determine whether archived human samples from overlapping areas (e.g., Montserrado and Bong) could be used for the same purpose.

For the main study protocol, human samples (which will arrive earliest at end of Y1) will be processed via a modified TAC system (ThermoFisher, USA) for PCR-based detection, a multiple parallel singleplex nucleic acid amplification system that can run on LIBR's existing ABI 7000 PCR machine using a standard 96-well plate.[5,26,27] Its sensitivity (88%), specificity (99%), modest run time (40-90 minutes), and array of available pathogen tests meet the needs of the project.[27] This assay can also be useful in the future for rapid pathogen detection in an outbreak. We will test for the viral, bacterial, and protozoal pathogens listed in the table, for most of which the TAC has already been validated and cycling optimization parameters are published.[5] The pathogens in the table are select agents, Liberian zoonotic disease priorities, and/or plausible febrile etiologies that will help us rule out most of the common etiologies while looking to identify rarer cases of emerging pathogens. Most can be detected in blood (simplifying sampling) except for influenzas and coronaviruses, which will require a nasopharyngeal swab tested by singleplex real-time PCR.

Samples positive by TAC array will be confirmed using specific real-time PCR assays, using published protocols. We will also apply NGS via AmpliSeq to viral positives (estimated ≤10%) to further characterize the pathogen by extending genomic sequence and the using phylogenetic analyses to determine how the sequence compares to known relatives. Using NGS will also allow us to determine whether the patient (or animal) is infected with additional pathogens. Specimens positive for any new pathogens via NGS will be confirmed via singleplex real-time PCR; findings will support the design of more refined single-plex PCR tests, a diagnostic mode already in routine use at LIBR, and potential refinement of the TAC assays. We estimate that ~10% of samples will be negative by TAC and will run these through NGS, pooled by three, to assess for novel pathogens.

	Pathogens of Interest	Major animal host(s) of interest
Virus	Zaire ebola	Bats, dogs
	Bombali	Bats
	Lassa	Rodents
	Marburg	Bats
	Crimean-Congo Hem. fever	Bats, rodents, ungulates
	Rift Valley fever	Bats, rodents, ungulates, dogs
	Monkeypox	Rodents
	Influenza	Bats, rodents, ungulates, dogs, poultry
	Dengue	Dogs
	West Nile fever	Bats, rodents, ungulates, dogs
	Chikungunya	Rodents
	Hepatitis B	n/a
	Hepatitis E	Rodents, chickens
Viral family	Arenavirus	Rodents
	Bunyavirus	Bats, rodents, ungulates, dogs, poultry
	Coronavirus	Bats, rodents, ungulates, dogs
	Filovirus	Bats, rodents, dogs
	Flavivirus	Bats
	Paramyxovirus	Bats, rodents, ungulates, dogs, poultry
	Poxvirus	Bats, rodents, ungulates, dogs
	Togavirus	Bats, rodents
Bacteria	*Coxiella burnetti*	Rodents, ungulates, dogs
	Yersinia pestis	Rodents, dogs, cats
	Brucella spp.	Rodents, ungulates, dogs
	Burkholderia mallei	Rodents, ungulates, dogs
	Burkholderia pseudomallei	Rodents, ungulates, dogs
	Leptospira spp.	Bats, rodents, ungulates, dogs
	Salmonella enterica	n/a
	Salmonella enterica serovar Typhi	n/a
	Neisseria meningitidis	n/a
	Borrelia spp.	Rodents, dogs
	Rickettsia spp.	Bats, rodents, ungulates, dogs
Protozoa	*Plasmodium spp.*	n/a
	Trypanosoma spp.	Rodents, ungulates, dogs
	Leishmania spp.	Bats, rodents, ungulates, dogs

Extraction of RNA/DNA using commercial kits lyses the viruses and bacteria and thus can be handled at BSL-2 conditions; any other steps prior to deactivation of the samples will be

performed under BSL2+ conditions, inside a BSL-3 biosafety cabinet. Aliquots of all samples, extractions, and serological preparations will be inventoried and stored in a dedicated, secure, on-site -80°C freezer for potential later project use and analysis. Biobank sample repository information and associated metadata will be maintained in a database developed by EHA. Consistent with BTRP guidance, we will ensure all samples are destroyed at the end of the project period pursuant to and consistent with Select Agent Program[28] and BMBL 5th edition protocols.[25]
Resources: EHA: One (1) scientist to participate as observer in laboratory training workshops; general project oversight; data management. UNMC: One (1) scientist to order/oversee ordering of equipment and consumables for LIBR. Two (2) scientists to conduct five-day in-country laboratory training workshop mid-Y1. In addition, one (1) lead scientist will be available outside the workshops throughout the project until the trainees are competent at each test the project requires. NPHIL and MOA: Two (2) lab technicians from each agency (4 total) to be trained and to conduct sample processing.
Metrics of success: Number and type of equipment provided to NPHIL; number of laboratorians trained and completion date of training; number and kind of tests in which trainees become competent; UNMC progress reports demonstrating new skillsets learned and areas for improvement; number of samples processed; number of pathogens/pathogen families identified.
Deliverables: Equipment and consumables provided to laboratory; training workshop completed; annual report-outs from training team at the annual stakeholder meetings; annual report-outs from trainees at annual stakeholder meetings demonstrating new techniques and competencies gained in prior year; data reports on tested samples.
Subtasks: (Format: Year#.Task#.Subtask#)

1.3.1 Provide necessary equipment and consumables to NPHIL laboratory (continuous)
1.3.2 Conduct Workshop 3a: laboratory biosafety and biosecurity, sample disposition
1.3.3 Conduct Workshop 3b: laboratory sample testing techniques
1.3.4 Provide continuous on-the-job training in laboratory techniques
1.3.5 Submit annual report

Task 4: Undertake preliminary animal sampling

Description and Execution: While laboratory training is beginning, preliminary field animal sampling will begin in Y1 with sampling in communities selected based on previous cases of AFI from historical hospital admissions trends, including some communities from which the study site hospitals draw patients. We will review a sampling of hospital records from Monrovia and Bong in search of geographic trends in AFI presentations going back three years, and begin randomized sampling of peridomestic and wild animals in four communities identified as part of this process and continue every three months. In five-day/five-night trips we will target approximately 50 bats, 50 rodents, 50 livestock (including chickens if poultry-transmitted infection is suspected), and 10 dogs per sampling event, allowing for approximately 640 animals sampled in Y1 to include blood and oral/nasopharyngeal specimens, and feces and urine when possible. Samples will be processed on site as outlined in Attachment 3. Our teams are trained in species identification, and we will also plan to barcode approximately 5% of individual bats and rodents in Y1 to improve species determination and team training. All animals will be non-lethally sampled with strict adherence to U.S. IACUC-approved protocols following those currently used by EHA scientists globally (Attachment 3) and using bat and rodent sampling protocols we developed for the PREDICT project (Attachment 3). All personnel undertaking animal sampling will be will be trained to ensure competency with a combination of didactic and practical training. SCNL will transfer samples to LIBR consistent with PREDICT protocols (Attachment 3).

Resources: EHA: One US-based (1) veterinarian (up to three Liberia trips per year) and one (1) EHA veterinarian based in Liberia; one (1) disease ecologist to take part in some of the trips and help oversee approach; one (1) scientist to oversee human subjects data collection. SCNL: One (1) lead scientist (for some trips) plus four (4) field technicians, one (1) social scientist, and two (2) drivers per sampling trip. LCRP: One (1) veterinarian for oversight and participation in some collection events. Other: At least one (1) MOA veterinary technician and one (1) student (e.g., University of Liberia) trained on as many of the sampling trips as possible.
Metrics of success: Number of animals sampled; number of samples successfully delivered to LIBR for processing; percentage of tests successfully completed; at least one veterinary technician trained; at least one student trained.
Deliverables: Blood and other biological samples to LIBR for processing.
Subtasks: (Format: Year#.Task#.Subtask#)
1.4.1 Conduct Workshop 4a: IACUC/animal subjects research
1.4.2 Review hospital records in search of geographic trends in acute febrile illness presentations
1.4.3 Sample in communities identified as part of this process and continue every three months

Year 2

Task 2: Continued: Enroll human patients and undertake sampling

Description and Execution: Same as Year 1, Task 2, with reduced focus on training and placing staff and more on continued implementation of study protocol.
Resources: MOH: One (1) project coordinator at each clinical site and one (1) clinical laboratory technician at each clinical site. SCNL: One (1) driver to transport samples.
Metrics of success: Number of patients enrolled; presence of project coordinators at each study site; number of patients enrolled; number of samples sent to LIBR.
Deliverables: Enrollment of patients into the study; completion of workshop on results interpretation to include advanced bioinformatics.
Subtasks: (Format: Year#.Task#.Subtask#)
2.2.2 Locally-hired project coordinator reports to hospital at each study site
2.2.3 Enroll patients (continuous)

Task 3: Continued: Undertake sample processing and testing

Description and Execution: Same as Year 1, Task 3 for human samples. With the addition of animal samples per Year 1, Task 4: MOA technicians (trained under Task 1.3.2 and 1.3.3) will lead sample processing with oversight from NPHIL project laboratory coordinator and UNMC. We will prioritize ELISA-based serology on the animal samples, using specific tests based on pathogens of relevance in that species to will increase our opportunity to detect key pathogens by applying serological techniques.[17] Serological assays are available for most of the pathogens of interest; we expect to average five ELISAs per sample and will pool by five. A subset of animal samples (10% pooled by three) will also be screened for the same pathogens using NGS, particularly important for testing Hypotheses 2 and 3 assessing shared zoonotic pathogens and characterizing phylogenetic relatedness and therefore potential evidence of transmission. Positives will be confirmed via singleplex PCR.
With the addition of human serology samples per Year 2, Task 5: We will run specific ELISA-based assays on patients' convalescent serum and on community members' serum (ELISAs are available for all pathogens of interest, either commercially or from research laboratories).
Resources: Same as Year 1, Task 3
Metrics of success: Number and kind of tests in which trainees become competent; self-reported trainee progress reports demonstrating new skillsets learned; number and kind of tests in which

trainees become competent; UNMC progress reports demonstrating new skillsets learned and areas for improvement; number of samples processed; number of pathogens/pathogen families identified.

Deliverables: Same as Year 1, Task 3

Subtasks: (Format: Year#.Task#.Subtask#)

2.3.1 Provide necessary equipment and consumables to NPHIL laboratory (continuous)

2.3.4 Provide on-the-job training in laboratory techniques (continuous)

2.3.5 Submit annual report

2.3.6 Conduct Workshop 5a: Host workshop on results interpretation/bioinformatics

Task 5: Visit communities: human-animal interface assessment, animal sampling, and human serology

Description and Execution: Study design: Animal sampling will continue in Y2, expanding to communities of enrolled patients, sampling in and around study enrollees' homes and surrounding areas; we plan to reach three communities in Y2 . This task predominantly supports Hypothesis 3. It is designed to: a) assess the risk interface between people and animals; b) strategically target and sample animal species for the pathogens/antibodies they are most likely to have based on what is already known about pathogen-host proclivity; and c) enable follow-up serology on patients and their community neighbors. Specifics of the design are provided for each goal.

a. Human-animal interface assessment: As patients begin enrolling (by Y1 Q4) they will be informed about the potential study follow-up; those that test positive for a zoonotic pathogen per Task 3 will qualify for a follow-up visit. With their agreement, they will participate in a second, more detailed human-animal interface questionnaire (assessing variables such as age, occupation, species and location of owned animals, type and frequency of animal contact (livestock and wildlife), perceptions and knowledge of zoonotic disease). The expected percentage of positive patients for other than malaria will likely maximize at ~10% based on published studies in other countries (and unpublished PREDICT data for Liberia, <10%),[2,26,29] although some bacterial agents could push that number higher.[13] We expect most of the positives to cluster geographically and will visit a total of five communities with the highest incidence of positives, targeting 20 humans and 400 animals (which may be split by more than one taxon) per community. These visits will occur every 2-3 months, ideally within 1-2 months of recognizing the cluster, but certainly within 12 months as we will be looking for serological (IgG) evidence of the same pathogens in the animal populations. At the start of the visit, an SCNL team member will administer a questionnaire (collecting responses on a tablet) to assess potential risk factors and enable characterization of the frequency and nature of animal exposure. The questionnaires will be designed by study staff experienced in survey development and implementation in LMIC and in infectious disease contexts in particular.

b. Animal sampling: With consent of the animal's owner, we will sample the patient's animals and animals living peridomestically; in addition, we will sample owned, peridomestic, and wild animals in and near the community. The goal is comprehensive sampling of community animals. This will be a cross-sectional study of animals in communities where evidence (based on lab findings) exists of zoonotic infection. Sampling is designed to maximize the detection of rare pathogens and answering questions about the relative proportion of febrile illness caused by each. If the 400 animals in each community are sampled across up to four taxa (100 each), we will be able to detect pathogen seroprevalence in each taxon/community as low as 3% with 95% power, with greater power when targeting fewer than four taxa per community. For detailed capture and sampling methods, see Year 1 Task 4, modified to reflect sampling targeted toward patients. In

areas where patients frequent (such as fields, livestock grazing areas, hunting grounds, etc.), we will perform line transects or a grid within each; average trapping success in rainy season is 13% and 8% in dry season for peridomestic animals; for domestic animals can be as high as 50% all year if traps are adapted.

c. Human serology: We will follow up with the patient and with their reaffirmed consent we will collect a blood specimen. We will also enroll up to 20 consenting community members from which to collect a biological blood specimen for serological testing (specific ELISAs) and administer the questionnaire on animal contact. The follow-up sampling in the patient will enable us to confirm the previous diagnosis (empirical or PCR-based); and to compare it to the serologic profile of the animals. Sampling the surrounding community members will give insight into the antibody profile of the community members, those with historical exposure, those where exposure did not progress to disease, and those who did not go to a participating research hopsital. This combined with the questionnaire on animal contact will provide strong evidence, where it exists, of spillover. Serology may be important as a correlate for infection risk; for detecting circulation of the pathogen in the absence of clinical illness; and for considering "prevalence of exposure" since we know certain antibodies can persist over time.

Resources: Same as Year 1, Task 4 with the addition of one (1) EHA scientist to oversee human subjects data collection.

Metrics of success: Number of animals sampled; number of samples successfully delivered to LIBR for processing; percentage of tests successfully completed; at least one veterinary technician trained; at least one student trained.

Deliverables: Blood and other biological samples to LIBR for processing.

Subtasks: (Format: Year#.Task#.Subtask#)

2.5.1 Review study patient records for geographic trends in AFI presentations
2.5.2 Undertake sampling in and around study enrollees' homes
2.5.3 Undertake sampling from broader patients' communities
2.5.4 Administer human-animal interface assessment
2.5.5 Collect human samples for serology

Task 6: Analyze data

Description and Execution: We will compare any diagnoses established at the clinical sites to laboratory results; and compare clinical study site diagnoses and laboratory results to national weekly and monthly county surveillance records. We will estimate population in catchment areas (from where the patient population comes) to develop prevalence estimates of each detected pathogen. We will compare phylogenetic sequence data from humans and animals to identify possible shared strains and infer transmission. Using the questionnaire data comparisons of exposure variables across varying demographics measures in study sites will be conducted to characterize high risk behaviors and statistical analysis will be employed to identify differences between groups with a 95% probability of detecting a difference. As appropriate, multivariate analysis will be utilized to evaluate the relationship between the positive biological findings and key measures of contact to evaluate the factors that influence and may have led to AFI pathogen exposure. The pathogen and human interface data collected in this study; characterization of zoonotic potential through phylogenetic analyses undertaken in this and other studies (such as PREDICT); and additional data such as available spatial, ecological, and environmental data will inform models designed to help tease correlation from causation. Understanding the diversity of circulating pathogens in animals and the behavioral interactions between people and animals can

inform risk mitigation;[17] the data will thus provide the foundation of an OY2 risk reduction workshop (see that section for more detail).
Resources: EHA: Four (4) scientists to analyze data and prepare summaries. NPHIL, MOH, MOA: Up to three (3) scientists representing one from each entity to assist with analysis. UNMC: One (1) scientist to assist with analysis. GU: One (1) scientist to assist with analysis.
Metrics of success: Development of research analyses and compilations for sharing with partners; completion of annual reports to DTRA; specimens shared with other researchers.
Deliverables: Annual stakeholders meeting; annual report to DTRA.
Subtasks: (Format: Year#.Task#.Subtask#)
2.6.1 Undertake data analysis

Task 7: Disseminate information to stakeholders
Description and Execution: We will host the annual stakeholders meeting to which we will invite all project partners as well as others doing related research in country. We will discuss preliminary data and analyses and use these to inform any needed modifications to forward sampling strategy. We will review protocols for biosafety, specimen transport, and animal handling at each annual meeting. We will provide support travel for at least one (1) Liberian scientist to present at an international conference. We will share samples as appropriate with other in-country projects to ensure synergies. We will compile and summarize research results and share with all partners and other in-country researchers as appropriate and use it to develop an annual report for DTRA.
Resources: EHA: Four (4) scientists to prepare summaries, present at annual meetings and other conferences, prepare annual report to DTRA, host annual meeting. NPHIL, MOH, MOA: Up to three (3) scientists representing one from each entity to assist with writing and presenting; up to one (1) scientist to present at an international conference. LCRP, UNMC, GU: One (1) scientist to assist with writing and presenting. Representatives from all partners to attend annual meeting.
Metrics of success: Development of compilations for sharing with partners; completion of annual reports to DTRA; specimens shared with other researchers
Deliverables: Annual stakeholders meeting; annual report to DTRA
Subtasks: (Format: Year#.Task#.Subtask#)
2.7.1 Host annual stakeholders meeting
2.7.2 Present to DTRA at Annual Technical Review
2.7.3 Submit annual report
2.7.4 Share specimens if available and appropriate with other in-country researchers
2.7.5 Support Liberian scientist to present at international conference

Year 3
Task 2: Continued: Enroll human patients and undertake sampling
Description and Execution, Resources, Metrics of success, Deliverables, Subtasks: Same as Year 2, Task 2
Task 3: Continued: Undertake sample processing and testing
Same as Year 2, Task 3 minus analytics workshop. Addition of one (1) post-doc to the laboratory to work on this project half-time and attend training in the United States at UNMC for one month.
Task 5: Continued: Visit communities: human-animal interface assessment, animal sampling, and human serology
Description and Execution, Resources, Metrics of success, Deliverables: Same as Year 2, Task 5. We plan to reach two communities in Y2.
Subtasks: (Format: Year#.Task#.Subtask#)
Task 6: Continued: Analyze data

Description and Execution: Same as Year 2, Task 6. We will also compare diagnostic results for endemic agents to reports for these diagnoses in the preceding years to allow for control for any changed practices (even if subconscious) in our target counties based on the project team's presence; this will also allow for a controlled comparison of the impact on incidence of any differential diagnosis or testing interventions we may implement in OY1 and OY2. MOH and CVL will lead the selection of Liberian laboratorians and at least one (1) Liberian student for analytics trainings; train in-country in basic bioinformatics analysis. We will develop recommendations for adapted differential diagnostic protocols and testing practices.
Resources, Metrics of success, Deliverables, Subtasks: Same as Year 2, Task 6

Task 7: Continued: Disseminate information to stakeholders

Description and Execution: Same as Year 2, Task 7. Broaden annual stakeholders meeting to include regional partners from Guinea and possibly other adjacent countries; share information about ongoing research; plan cross-border study for OY1. Importantly, broaden outreach to communities that have engaged in sampling to share results and discuss preliminary risk mitigation strategies.
Resources, Metrics of success, Deliverables: Same as Year 2, Task 7
Subtasks: (Format: Year#.Task#.Subtask#)
Same as Year 2, Task 7 minus Liberian conference travel, and with the addition of:

3.7.6 Host regional technical and networking workshop (concurrent with Subtask 3.6.1)
3.7.7 Prepare/submit up to two (2) peer-reviewed manuscripts
3.7.8 Engage sampled communities for follow-up education

Option Year 1

Task 2: Continued: Enroll human patients and undertake sampling

Same as Year 1, Task 2 with following difference:
Description and Execution: Same as Year 1, Task 2 except enrollment will occur in two new county clinical sites enabling broader geographical data capture including a border region with Guinea. Pending human and animal research results in Y1-3 and review of relevant infectious disease reporting country-wide, we will likely work in: 1) Ganta, a large city in Nimba county which borders Guinea, and a county in which mining activity hypothetically presents increased risk of bat-borne zoonoses; and 2) Lofa county, which shares a large border with both Guinea and Sierra Leone. The clinical studies in Monrovia and Bong will draw down at the end of Y3 once patient targets are reached. Should sufficient diagnostic data be available at this stage to inform improved clinical intake and diagnostic protocols, we will implement an intervention in one of the two hospitals and compare outcomes in the intervention location. Data will not be directly comparable since sites are unique (variations in community occupational hazards, pathogen prevalence in animal populations, etc.) but this approach may provide an opportunity for a preliminary assessment of how well an intervention could improve diagnostic test choice and accuracy of results. With a shorter timeframe for collecting data, if hospital studies in OY1 and the first quarter of OY2 generate 750 patients, our power for accurate prevalence measurement goes from 90% to 80% and the rare prevalence we are likely to detect at 95% power goes from 0.2% to 0.4%.

Task 3: Continued: Undertake sample processing and testing

Same as Year 3, Task 3

Task 5: Continued: Visit communities: human-animal interface assessment, animal sampling, and human serology

Same as Year 3, Task 5. We expect to visit two communities in OY1.

Task 6: Continued: Analyze data
Same as Year 3, Task 6
Task 7: Continued: Disseminate information to stakeholders
Description and Execution: Same as Year 3, Task 7 minus regional workshop and community engagement. In addition, review findings to date on prevalence and transmission pathways and economic information for prevention and control options for acceptability and prioritization in preparation for OY2 risk reduction workshop.
Deliverables: Same as Year 3, Task 7.
Resources: Same as Year 3, Task 7 minus Liberian international conference travel.
Metrics of success and Subtasks: Same as Year 3, Task 7

Option Year 2
Task 2: Continued: Enroll human patients in the two new counties and undertake sampling
Description and Execution: Same as Year 1 Task 2. Sampling in Monrovia and Bong will have concluded (unless a decision has been made that more samples are needed or desired at this stage). Sampling in the two new counties will be complete by the middle of OY2. Analyze results of the clinical intervention and use them to develop guidelines for improved management of acute febrile illness diagnostic procedures; discuss at OY2 annual meeting.
Task 3: Continued: Undertake sample processing and testing
Same as Year 3, Task 3
Task 5: Continued: Visit communities: human-animal interface assessment, animal sampling, and human serology
Same as Year 2 Task 5, with sampling winding down within the first quarter of Y1. We are targeting one final sampling event in OY2.
Task 6: Continued: Analyze data
Same as Year 2, Task 5
Task 7: Continued: Disseminate information to stakeholders
Description and Execution: Same as Option Year 1, Task 7 with the addition of risk reduction workshop. Project data will provide the foundation of an OY2 risk reduction workshop at the annual meeting to engage multi-sectoral Liberian participants to review statistical evaluation of diagnostic data, identify key risk interfaces, assess economic options for prevention and control, and develop threat reduction measures. Workshop products include 1) development of priorities for refined PCR and serological tests based on study findings, 2) recommendations for an updated national surveillance and reporting strategy and plan, 3) inclusion of stakeholders (e.g., National Disaster Management Authority, the Forestry Development Authority, the Ministry of Finance) to consider options for risk and impact reduction and generate policy recommendations. In addition, community engagement will be especially important as the project ends; we will work with MOH and MOA to develop written educational products designed for laypersons to explain project results, community impact, and risk mitigation, and thank community members for their participation.
Resources: Same as Year 2, Task 7 with the addition of one (1) additional EHA scientist to conduct the risk reduction workshop
Metrics of success: Same as Year 2, Task 7 with the addition of completion of attendance at risk reduction workshop, tangible outcomes in the form of revised protocols, etc.
Deliverables: Annual stakeholders meeting; annual report to DTRA; completion of risk reduction workshop; development of risk reduction options, cost-benefit analysis, and policy recommendations tied to Liberia's multi-sectoral National Action Plan for Health Security.

Subtasks: (Format: Year#.Task#.Subtask#)
Same as Year 2, Task 7 with the addition of:
OY2.7.9 Conduct Workshop 6a: risk reduction (concurrent with annual stakeholders meeting)

V. PERFORMANCE SCHEDULE

Task	Y1	Y2	Y3	OY1	OY2
Task 1: Establish evidence-based research initiative for high-consequence pathogens in Liberia					
1.1 Refine and finalize human and animal study protocols					
1.2 Secure and finalize all research permits (human and animal)					
1.3 Assign MOH, NPHIL, and CVL staff to field and lab positions					
1.4 Host kick-off meeting in Liberia					
1.5 Conduct Workshop 1a: overall research protocol					
Task 2: Enroll human patients and undertake sampling					
2.1 Conduct Workshop 2a: IRB/human subjects research					
2.2 Local project coordinator reports to hospital at each study site					
2.3 Enroll patients (continuous)					
Task 3: Undertake sample processing and testing					
3.1 Provide equipment and consumables to LIBR					
3.2 Conduct Workshop 3a: biosafety/biosecurity, sample disp.					
3.3 Conduct Workshop 3b: laboratory sample testing techniques					
3.4 Provide on-the-job training in lab techniques (continuous)					
3.5 Submit Y1 annual report					
3.6 Conduct Workshop 5a: results interpretation, bioinformatics					
3.7 Host regional technical and networking workshop					
Task 4: Preliminary animal sampling					
4.1 Conduct Workshop 4a: IACUC/animal subjects research					
4.2 Review hospital records for geo. trends in AFI presentations					
4.3 Sample animals in select communities (preliminary)					
Task 5: Visit communities: interface assessment, animal sampling, human serology					
5.1 Review study patient records for geographic AFI trends					
5.2 Administer human-animal interface assessment					
5.3 Undertake animal sampling in/around study enrollees' homes					
5.4 Undertake animal sampling from patients' communities					
5.5 Collect human samples for serology					
Task 6: Analyze data					
6.1 Undertake data analysis					
Task 7: Disseminate research results to stakeholders					
7.1 Host annual Stakeholders meeting					
7.2 Present to DTRA at Annual Technical Review					
7.3 Submit annual report					
7.4 Share specimens if appropriate w/ other in-country researchers					
7.5 Support Liberian scientist to international conference					
7.6 Host regional technical and networking workshop					
7.7 Prepare/submit up to two (2) peer-reviewed manuscripts					
7.8 Engage sampled communities for follow-up education					
7.9 Conduct Workshop 6a: risk reduction workshop					

Confirmed Proposal Expiration Date: "EHA holds the proposal, to include proposed costs, firm for 180 days after the submission date as stated in the invitation to submit a full proposal."

BUDGET JUSTIFICATION FOR ECOHEALTH ALLIANCE

EcoHealth Alliance requests a total of $4,912,818 over all-years of the proposed project to support personnel, travel, equipment, consortium agreements, and applicable indirect costs.

A. Key Personnel

William B. Karesh, D.V.M., Principal Investigator (1.5 calendar months for all years). Dr. Karesh will be responsible for the overall coordination of this project. He will provide overall project oversight, study design development and refinement, data analysis, publication support, and annual stakeholder meeting participation. We request $35,513 in Y1 with a 5% cost of living increase each subsequent year.

Ellen P. Carlin, D.V.M., Co-Investigator (6.0 calendar months in all years). Dr. Carlin will provide day-to-day project development and strategic management, including through regular in-person meetings and weekly phone and other direct communications with partners. She will also supervise field sampling, data analysis, and data and information dissemination through workshops, conferences, and papers. We request $73,710 in Y1 with a 5% cost of living increase each subsequent year.

Jonathan Epstein, Ph.D., Co-Investigator (1.0 calendar month in all years). Dr. Epstein will be a technical advisor to the project, advising on data interpretation, targeted animal sampling based on data as they come in over the course of the project, and laboratory techniques. He will also assist with writing and dissemination. We request $14,241 in Y1 with a 5% cost of living increase each subsequent year.

Anne Laudisoit, Ph.D. Senior Ecologist (1.2 calendar months in all years). Ms. Laudisoit will assist with data organization, analysis, and writing with a focus on ecological strategies to maximize animal sampling data collection and creating an evidence basis through this sampling to infectious pathogen transmission dynamics. We request $7,550 in Y1 with a 5% cost of living increase each subsequent year.

Noam Ross, Ph.D., Senior Research Scientist, Modeler (0.6 calendar months in all years). Dr. Ross will be a technical advisor to the project, advising on data organization, analysis, and writing with a focus on statistical analytics. We request $4,587 in Y1 with a 5% cost of living increase each subsequent year.

Emily Hagan, M.P.H., Behavioral Risk Scientist (4.0 calendar months in all years). Ms. Hagan will provide medical anthropology expertise for the questionnaires and analysis, supervise and conduct the IRB processes and trainings on the human subject work for local partners, and assist with data organization and analysis. We request $22,031 in Y1 with a 5% cost of living increase each subsequent year.

Catherine Machalaba, M.P.H, Policy Advisor (1.0 calendar months in all years), 2 calendar months for OY2). Ms. Machalaba will be a technical advisor to the project, advising on study design and risk reduction. She will conduct a risk reduction workshop in OY2 and will help develop revised biosurveillance and reporting strategies with and for Liberian partners. We request $6,983 in Y1 with a 5% cost of living increase each subsequent year.

B. Other Personnel
Amanda Andre, LMSW, Operations Assistant (6 calendar months in all years). Ms. Andre will be the administrative lead handling project management responsibilities related to budgeting, expenses, managing of subcontracts, and meeting scheduling and logistics. She will coordinate all meetings and travel and ensure compliance with funding and contractual requirements. We request $27,853 in Y1 with a 5% cost of living increase each subsequent year.

Fringe Benefits
Fringe benefits are calculated as 35% of base salary p.a. with $68,134 requested in Y1 calculated from the base salary for all Personnel. In Y2 – OY2, we budget for a 5% per year cost of living allowance increase in all salaries.

C. Equipment
No funds are requested for equipment.

D. Travel
Domestic Travel
Domestic travel is requested for one trip per year for program staff to travel from New York City to Washington, DC to meet with Co-Investigator Carlin and key personnel at Georgetown University; and for Co-Investigator Carlin to travel to New York City from Washington, DC four times per year to collaborate with EcoHealth Alliance program staff in the New York office. Transportation is estimated at $300 per trip along with the government GSA per diem rates for each city. Additional domestic travel support will facilitate two EcoHealth Alliance staff presenting at two domestic conferences annually. In total, we are requesting $16,402 in each year of our proposed work.

International Travel
Foreign travel is requested for partner meetings, in-country trainings, and field research. Six EHA employees as well as three partners from UNMC and GU will attend annual meetings. Two to three EHA staff and two partners from UNMC will make a second trip each year for trainings and field research; in OY2, one additional staff scientist will travel to Liberia to conduct a risk reduction workshop. Flights for each of these trips is estimated at $3,000 and the federal per diem rates of $200 for lodging in Monrovia, Liberia and $70 for field work as well as the $95 for meals in Monrovia, Liberia and $46 for field work are requested. Additionally, we are requesting travel for staff to present on project findings at international conferences each year with flights estimated at $1,500 and hotels and meals at the government GSA per diem rates for Vienna, Austria for International Meeting on Emerging Diseases and Surveillance (IMED). Travel costs are increased 5% each year to account for pricing increases based upon past, actual, annual price increases.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
Co-Investigator Carlin will need a new computer, equipped with Microsoft and Adobe software for which we request $3,000, in Y2.

Publication Costs
To facilitate the dissemination of project findings, $4,000 per year in only Y2-OY2 is requested for open access publication costs in international peer-reviewed journals.

Consultant Services
For the human behavioral risk part of the project, $1,000 is requested p.a Y1-OY2 for Hummingbird IRB and $3,500 in Y1 for required Collaborative Institutional Training Initiative training for personnel handling human and non-human animals and samples as per IRB and IACUC requirements.

Subawards/Consortium/Contractual Costs
Subcontracts for the National Public Health Institute of Liberia, Society for the Conservation of Nature-Liberia, Liberia Chimpanzee Rescue and Protection, University of Nebraska Medical Center and Georgetown University are outlined in their individual budget justifications.

H. Indirect Costs
We are requesting the EcoHealth Alliance federally approved indirect cost rate of 32% on all applicable direct costs. The USA Department of Defense's Department of the Navy has approved this rate on 17 July 2019. We have applied our indirect cost rate to the first $25,000 of the subcontracts only in Y1.

BUDGET JUSTIFICATION FOR LIBERIA CHIMPANZEE RESCUE AND PROTECTION, LIBERIA

Liberia Chimpanzee Rescue & Protection requests a total of $412,625 over all years of the proposed project to support personnel, travel, equipment, and indirect costs.

A. Key Personnel
James Desmond, D.V.M., Co-Investigator (6 calendar months for Y1-OY2). Dr. Desmond will oversee field sampling and training (along with Michael Garbo), and will assist with study design and analysis and dissemination of findings for which $67,500 is requested in Y1.

B. Other Personnel
No funds are requested for other personnel.

C. Equipment
No funds are requested for equipment.

D. Travel
International Travel
Foreign travel support will cover one trip p.a. to New York to meet with project collaborators for which flights are estimated at $3,000 along with the government GSA per diem rates for New York, New York. Travel support will be used for dissemination of project findings at one international conference p.a, with flights estimated at $2,000 along with the government GSA per diem rates. Combined international travel for Y1 is $8,312.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
We request $3,000 in Y1 for the purchase of a computer.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 8% on all direct costs.

BUDGET JUSTIFICATION FOR UNIVERSITY OF NEBRASKA MEDICAL CENTER, UNITED STATES

The University of Nebraska Medical Center (UNMC) requests a total of $164,559 over all years of the proposed project to support personnel and indirect costs.

A. Key Personnel
Michael R. Wiley, Ph.D., Co-Investigator (1.2 calendar month for Y1-OY2). Dr. Wiley will provide oversight of laboratory work including all necessary training (biosafety, biosecurity, and testing techniques, and analysis), quality control, assistance with inventory and ordering, and will also assist with study design, data analysis, and dissemination, for which $11,275 is requested in Y1, with a 3% increase each subsequent year.

Fringe Benefits
Fringe benefits are calculated as 27.9% of base salary p.a. with $3,145 requested in Y1 for Key Personnel.

B. Other Personnel
Catherine Pratt, Training Coordinator (1.2 calendar month for Y1- OY2). Ms. Pratt will assist with laboratory training and quality control for which $8,290 is requested in Y1.

Fringe Benefits
Fringe benefits are calculated as 27.9% of base salary p.a. with $2,313 requested in Y1 for Other Personnel.

C. Equipment
No funds are requested for equipment.

D. Travel
No funds are requested for travel.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
No funds are requested for other direct costs.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 27% on all direct costs.

BUDGET JUSTIFICATION FOR SOCIETY FOR CONSERVATION OF NATURE, LIBERIA

The Society for Conservation of Nature, Liberia (SCNL) requests a total of $594,710k over all years of the proposed project to support personnel, travel, equipment, and indirect costs.

A. Key Personnel
Michael Garbo, M.S., Co-Investigator (0.6 calendar months per year for all years). As head of SCNL, Mr. Garbo will be responsible for the oversight of all non-human animal sampling activities including preparation, staffing, implementation, and follow-up. He will further oversee the sample transport activity of both animal and human samples, for which SCNL is responsible. We do not request salary for him, since he will be fully covered by other SCNL funding sources.

B. Other Personnel
Annual support is requested for a social scientist ($550/month), four field technicians ($550/month each), and two drivers ($330/month each) to make up the field research team. This team will be responsible for all aspects of animal field sampling, including planning, ordering supplies, implementation, ensuring all samples are safely and securely transferred to LIBR for testing, and any needed follow-up. This team will also administer a survey to the patients whose community they visit, administer a similar questionnaire to up to twenty additional community members, and with consent collect blood samples from these individuals for serological testing SCNL employees at least one nurse who will be deployed for this purpose. Support is requested for two administrative assistants ($450/month) to assist with procurement, invoicing, scheduling, and field team logistics.

C. Equipment
A field vehicle for field sampling and sample transport is estimated at $40,000. Liberia does not currently have a VAT. Our conversations with Liberian partners indicate that it is unlikely that VAT will be instated in the near future. If it were, Government agencies and non-profits such as SCNL would be exempt from VAT.

D. Travel
Domestic Travel
Domestic travel support will cover fuel, vehicle maintenance ($700/month), lodging and per diems for overnight trips ($50/day) for eight field team members for four, week-long field sampling trips. Cost is calculated at $32,600 in Y1, Y3, and OY1. In Y2 the sampling trips will be for two-weeks in duration calculated at $42,000. In OY2, there will only be 1 trip for two-weeks calculated at $22,800.

In addition to transporting the animal samples that it collects in the field, SCNL will also be responsible for picking up and safely and securely transporting all human samples from the clinical study sites to the Liberian Institute for Biomedical Research via the standing cold chain procedures they follow for the animal samples. They will use their existing vehicles for this purpose. They will visit Redemption Hospital in Monrovia daily as required by sample volume and Phebe Hospital in Bong weekly at an estimated round-trip distance of 250 km total weekly. We request $13,000 per year in all years to cover fuel and vehicle maintenance for this function.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs

Materials and Supplies
We request $400 in Y1 for the purchase of two hand-held tablets to be utilized by the field research team for data collection and organization (animal and human). Tablets will be used to conduct surveys off-line in the field, and to upload the data collected upon returning to SCNL offices. We request $500 for the purchase of a tarp, spade and 40 pitfall traps for rodent sampling. We request $400 for the purchase of a centrifuge to enable processing of medium- and large-animal blood samples in preparation for serological testing.

Field consumables including gloves, Tyvek suits, vacutainers, syringes and needles, EDTA collection tubes, non-EDTA collection tubes, cryotubes, TRIzol, and swabs are needed to conduct field sampling. The budget for travel and consumables will enable us to test 3,360 animals over the course of the project (Y1: 160; Y2: 1,200; Y3: 800; OY1: 800; OY2: 400) and will cover a total of 12 sampling events (Y1: 4; Y2: 3; Y3: 2; OY1: 2; OY2: 1).

H. Indirect Costs
We are requesting a *de minims* rate of 8% on all allowable direct costs.

BUDGET JUSTIFICATION FOR GEORGETOWN UNIVERSITY CENTER FOR GLOBAL HEALTH AND SECURITY, UNITED STATES

The Georgetown University Center for Global Health and Security requests a total of $196,342 over all years of the proposed project to support personnel, travel, other direct costs, and indirect costs.

A. Key Personnel

Erin Sorrell, Ph.D., Co-Investigator (1.2 calendar months for Y1, .6 calendar months for Y2-OY2). Dr. Sorrell will provide subject matter expertise in support of the execution of the project, specifically related to study design and analysis and dissemination of findings for which $11,477 is requested in Y1, with a 2% increase each subsequent year. Dr. Sorrell's time will vary over the five years of the project based on involvement in specific tasks.

Claire Standley, Ph.D. Co-Investigator (1.2 calendar months for Y1, Y3, OY2, .6 calendar months for Y1, OY1). Dr. Standley will serve as the GU PI for the award, and will be the lead for all aspects of GU's contribution to the project, notably related to project design and analysis and dissemination of the findings for which $10,819 is requested in Y1, with a 2% increase each subsequent year. Dr. Standley's time will vary over the five years of the project based on involvement in specific tasks.

Fringe Benefits

Fringe benefits are calculated as 29% of base salary p.a. with $6,533 requested in Y1 for Key Personnel.

B. Other Personnel

No funds are requested for other personnel.

C. Equipment

No funds are requested for equipment.

D. Travel

International Travel

Foreign travel support will be used to support travel for two GU personnel to attend the kickoff meeting in Y1 and annual meeting in OY2, and for one GU personnel to attend the annual meeting in Y3. Flights are estimated at $3,000 along with the government GSA per diem rates for Monrovia, Liberia.

E. Participant/Trainee Support Costs

No funds are requested for participant or trainee support costs.

F. Other Direct Costs

Materials and Supplies

We request $600 over the five years of the project for miscellaneous supplies to support execution of the project, including stationery, printing, and other supplies.

Telecommunications

We request $500 over the five years of the project to support telecommunication costs (including Skype subscriptions/charge and mobile phone charges) for project communication, including roaming charges while on international travel in Liberia.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 56% on all direct costs.

BUDGET JUSTIFICATION FOR NATIONAL PUBLIC HEALTH INSTITUDE OF LIBERIA, LIBERIA

The National Public Health Institute of Liberia (NPHIL) requests a total of $910,955 over all years of the proposed project to support personnel, travel, equipment, other direct costs and indirect costs.

A. Key Personnel

Mosoka Fallah, Ph.D., Co-Investigator (.6 calendar month for Y1-OY2). Dr. Fallah will provide overall project oversight for Liberia-based activities. NPHIL is charged with leading all public health and biomedical research in Liberia, and Dr. Fallah assumes that role for this project, leading all elements on the human subjects research side of the project as well as the laboratory diagnostics elements. Dr. Fallah will ensure NPHIL meets project tasks and milestones, will oversee NPHIL's budget, and will assist with dissemination of findings through publications and conference presentations. We do not request salary at this time as Dr. Fallah will be fully covered by other funding sources during the project period.

Fatorma Bolay, Ph.D., Co-Investigator (1.5 calendar month for Y1-OY2). As head of the Liberia Institute for Biomedical Research (LIBR) at NPHIL, Dr. Bolay will provide direct oversight of all laboratory activity for the project, for which $2,500 is requested starting in Y1.

John Dogba, Ph.D. Candidate, Co-Investigator (1.5 calendar month for Y1-OY2). Dr. Dogba directs the national reference laboratory at NPHIL and will ensure compliance with biosafety and biosecurity project requirements; as a lecturer at the University of Liberia he will also assist with identification and recruitment of students to work in the laboratory, activities for which $3,000 is requested starting in Y1.

Bode Shobayo, M.S.C., Co-Investigator (1.5 calendar month for Y1-OY2). As a research scientist within NPHIL's medical and public health research division, Dr. Shobayo will participate in training workshops, processing and testing a subset of samples, and reporting recommendations to Dr. Bolay and Dr. Wiley for process refinements and mitigating challenges with the day-to-day laboratory workflow, for which $2,075 is requested starting in Y1.

B. Other Personnel

Laboratory Scientists/Technicians (4 calendar months for Y1-OY2). Four laboratory scientists and/or technicians—two from NPHIL and two seconded from the Ministry of Agriculture—will process and test all project samples at LIBR. They will participate in all laboratory workshops, provide all bench activity (under the supervision of key personnel), and advise on inventory needs and any problems implementing the laboratory protocol. We request $18,667 for all four laboratory technicians starting in Y1.

Hospital Project Coordinators (6 calendar months for Y1-OY2). One coordinator will be appointed to each of two human clinical study sites (Redemption Hospital and Phebe Hospital) operating in Y1-Y3. These coordinators will be chosen from existing staff already participating in other febrile illness studies at the hospitals and will be responsible for participating in human subjects research training, ensuring hospital staff are sensitized to our inclusion criteria (and thus able to identify proper candidates), being available for consultation when patients enroll in the study, collecting consent form and questionnaire data from the patients, and ensuring samples are collected, stored, and transported in timely fashion. Similarly, one coordinator will

be appointed to each of two human clinical study sites (hospitals in Nimba and Lofa counties) in the option years, if funded. In an effort to train and engage Liberian nurses in public health surveillance and in research, at least one and possibly both of these sites will be staffed through Nursing for All, a non-profit that builds capacity in the nursing profession in Liberia and is presently operating at Ganta United Methodist Hospital in Nimba, one of the sites at which we would like to implement the study in OY1-2. We request $26,250 over the proposed five years of the project.

Hospital Laboratory Technicians (1 calendar months for Y1-OY2). Hospital laboratory technicians will assist with initial processing of patient samples (spinning serum, labeling, and storing) prior to transport to NPHIL. We will similarly provide salary support for technicians at the two option year hospitals if funded. We request $1,667 p.a. for these activities.

Post-doctoral Researcher (6 calendar months for Y3-OY2). Beginning in Y3, we propose to add a post-doctoral researcher to the laboratory team. Liberia does not have a PhD-granting institution, but a number of Liberians are presently undertaking PhD degree programs outside of the country; by Y3 we plan to bring one Liberian individual who has received a PhD in laboratory pathogen research into the project to work with the laboratory scientists on sample processing, testing, and data analysis, for which we request $5,000 starting in Y3.

Bachelors and Masters Students. We intend to include approximately three students per semester on the project, to include undergraduate and graduate students from the University of Liberia (Monrovia) and Cuttington University (Bong). Their duties will depend on their degree program but will include assignments at the human clinical sites (nursing, medical, public health, anthropology students); animal field collection sites (biology, animal science, ecology, anthropology); and laboratory (molecular biology, microbiology). We will preferentially choose students interested in developing their theses based on the project. Each student will receive a stipend of $500 per semester.

Administrator/Program Manager (6 months in Y1-OY2). This individual will act as the administrative lead, handling project management responsibilities related to budgeting, expenses, managing of subcontracts, and meeting scheduling and logistics, activities for which we request $5,000 p.a.

C. Equipment

The existing freezer in which PREDICT samples are stored at LIBR will remain there when the project ends, and will be available for this project's use, but its capacity is limited. LIBR will therefore require increased storage capacity for the specimens generated by this project (2,250 humans, up to 4,500 specimens; 3,840 animals, up to 14,560 specimens). A -80°C freezer is requested for sample storage and is estimated at $25,000. Liberia does not have a VAT and our conversations with Liberian partners indicate it is unlikely they will instate one in the near future. Government agencies and non-profits would be exempt from any such tax. If absolutely necessary, we would seek unrestricted funding sources to cover any such costs.

D. Travel

We are requesting travel for one Liberian project participant to attend a regional conference and an international conference in Y3 and OY2 to present on project findings, with flights estimated. For the regional conference flights are estimated at $750 and hotels and meals at the government GSA per diem rates for Accra, Ghana. For the international conference flights are estimated at $2,500 and hotels and meals at the government GSA per diem rates for Vienna, Austria.

In Y3 we plan to bring one Liberian individual who has received a PhD in laboratory pathogen research into the project to work with the laboratory scientists on sample processing, testing, and data analysis as a post-doctoral associate. We will fund a one-month trip for this individual to the University of Nebraska Medical Center to train in the laboratory of co-Investigator Dr. Michael Wiley. A flight is estimated at $3,000 and hotels and meals at the government GSA per diem rates for Omaha, Nebraska.

In total over the course of the project, we are requesting $20,038 in for International Travel.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
We will supply the participating hospitals with all consumables required to collect patient samples, including serum tubes, EDTA tubes, cryovials, vacutainer holder, needles, syringes, nitrile gloves, and nasal swabs, for which we request $2,378 p.a. Some supplies will be purchased in the United States and shipped to Liberia, for which we request $2,500 p.a. For the human clinical study implementation sites, our request also includes funding for a centrifuge to enable processing of serum at the hospital clinical laboratories ($400 each), an ultracold freezer to store the samples until picked up for transport ($4,800 each) and a tablet for data collection and tracking at each site ($200 each).

Laboratory Testing
Our laboratory request covers three primary types of molecular testing: next-generation sequencing, real-time PCR, and ELISA-based antibody serology. In Y1, we will test 300 existing PREDICT bat and rodent samples, pooled by three, via NGS Ampliseq on LIBR's existing MiSeq machine. We will barcode 5% these, a process that most likely will be done outside of Liberia. In Y2-OY2, we will use a Taqman Array Card system (modified for a 96-well plate to run on LIBR's ABI 7000 sequencer) to test human samples for up to 31 pathogens at three samples per plate, and will run nasopharyngeal samples on singleplex PCR to test for key respiratory pathogens. We will run specific real-time PCR to confirm positives; NGS Ampliseq to further sequence viral-positive human samples (expect not more than 10% to fall into this category) and 10% of negative human samples; and specific antibody ELISAs on convalescent samples from humans who tested positive on TAC plus 20 of their neighbors. For animals in Y2-OY2, we have budgeted for specific antibody ELISAs on all animals, averaging 5 tests each, pooled by 5; NGS on 10% of animal samples pooled by three; singleplex PCR for confirmation of NGS positives (expect ~4%); a new ELISA reader; a new ELISA plate shaker; Mastermix; and miscellaneous consumables. We request $453,414 over the five years of the proposed project. Of this amount, $152,400 is for next-generation sequencing, $4,000 is for barcoding, and the remainder supports the PCR and ELISA testing, which are and will continue to be mainstays of the laboratory.

Meetings and Conferences
We request support for an annual meeting each year for 45 people including personnel from all partner institutions (EHA, NPHIL, SCNL, LCRP, UNMC, GU) as well as local stakeholders. Travel costs for United States-based participants to attend the annual meeting are covered in the EcoHealth Alliance budget. We estimate that for the three-day meeting, eight Liberian partners traveling from outside Monrovia will require transportation, meals and accommodation to be covered, and for Y3, when the annual meeting will function as a broader regional technical

meeting, we will also fund two attendees from elsewhere in West Africa (likely Guinea) working on similar studies. Additionally, the meetings will require a room rental, lunch for all participants, and printing of materials and supplies. Overall costs are estimated at $9,550 p.a.

We will conduct a series of workshops across the study period, as outlined in the technical proposal and in more detail in Attachment 3. *Workshop 1a* will cover the overall research study protocol, will occur at the Y1 kickoff meeting, and will include all project participants. *Workshop 2a* will cover the human study protocol and human subjects research, will occur mid-Y1 and again toward the end of Y3, and will include Tasks 2 and 4 personnel and students. *Workshops 3a and 3b* will cover biosafety, biosecurity, and laboratory techniques training, will occur twice during Y1 (at the kickoff meeting and again in the middle of the year) and during Y3, and will include all Task 3 personnel. *Workshop 4a* will cover the animal sampling protocol and animal subjects research, will occur at the kickoff meeting and during Y3, and will include all Task 4 personnel and students. *Workshop 5a* will cover analysis of laboratory data (including bioinformatics), will occur during Y2 as the laboratories ramp up their sample testing, and will include Task 3 personnel. *Workshop 6a* will cover risk reduction analysis and opportunities, will occur during OY2, and all personnel including many from ministries not directly involved in the project will be invited to attend. Across the workshops, the number of participants will vary from 10-20 people for whom we will require catering (lunch) for all participants, room rental, and some materials and supplies. Over the five proposed years of the project, $12,440 is requested to support these workshop trainings.

Two NPHIL personnel will travel to each of the five study communities for two-day, one-night trips to share study findings with community members and discuss risk reduction opportunities in OY1-2. Lodging, meals, and printed materials and supplies are estimated at $310 per visit.

Freezer Maintenance
Support of $500 p.a is requested to cover the cost of freezer maintenance (the newly-purchased freezer and LIBR's existing freezer) to ensure they are properly maintained, calibrated and in full working order at all times.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 10% on all direct costs.

Reducing the threat from high-risk pathogens causing febrile illness in Liberia

PI: William B. Karesh, EcoHealth Alliance, BTRP-TA.6 CC

HDTRA1-14-24-FRCWMD-BAA WMD GRANT # 12819625

Objective: Work with government and NGO partners in Liberia reduce the threat from high consequence zoonotic pathogens associated with acute febrile illness (AFI) via integrated human-animal pathogen surveillance and diagnostic approach.

Method: Collect clinical samples from febrile patients to investigate etiologies via PCR, next-generation sequencing, and ELISA serology in Liberia. Follow up with interviews to assess human contact with animals and identify evidence of same pathogens in the humans' environments; develop and implement risk reduction interventions.

Status of effort: Collaborative team in place, preliminary data on circulating viral pathogens in key wildlife species and preliminary data on human-animal interface risks collected

Personnel Supported: Liberians--17 Researchers (4 clinical study technicians/nurses, 8 animal field technicians, 4 lab scientists, 1 post-doc), ≥3 Liberian students (undergrad and Masters) per semester educated in field and lab techniques

Publications and Meetings: ~10 presentations in Liberia and globally, >5 peer-review articles are expected to be published

Major Goals and Milestones:

- Study human pathogens in four unique counties to determine causative agent of acute fever (Y1-OY2)
- Undertake field sampling of key animal species and assess transmission risk to humans (Y1-OY2)
- Develop basic and advanced laboratory diagnostic skills and capacity (Y1-OY2)

Funding Profile Y1:995,517 Y2:$989,251 Y3:$996,113 OY1:$962,716 OY2:$969,218

Contact information PI: Dr. William B. Karesh, karesh@ecohealthalliance.org, 212-380-4463

Statement of Work

Project Title: Reducing the threat from high-risk pathogens causing febrile illness in Liberia

Document Date: July 26, 2019

Objective: This project will build Liberian capacity for threat reduction through an integrated human-animal surveillance approach to high consequence zoonotic pathogens associated with human acute febrile illness (AFI) including Ebola virus, Lassa virus, and other emerging infections. We will identify and characterize the etiological agents of infectious AFI in Liberia, particularly among patients with a history of animal contact. Many AFI causative agents may go undetected empirically by common rapid diagnostic tests or by existing surveillance platforms. We will work to mitigate this challenge through scientific discovery, hypothesis testing, and capacity building while leveraging significant U.S. government and other investment in workforce building and laboratory infrastructure. Training provided to local partners in critical biosecurity and biosafety skillsets will include: sample transport and laboratory biosafety and biosecurity; human and animal sampling approaches; performance of both routine and advanced molecular diagnostic assays; cold-chain transport implementation; and data analysis and reporting. As many emerging diseases have been inadequately studied in Liberia, this project will provide fundamental baseline knowledge of pathogens circulating and potentially causing human illness. Its outcomes will suggest opportunities for improved clinical training, tailored case definitions, and other methods to improve identification rates for especially dangerous pathogens at the index case level and prior to widespread transmission. The desired endpoint is a broad, sustainable surveillance program that enhances public and global health security.

Scope: The grantee proposes a five-year multi-disciplinary study incorporating the epidemiology, ecology, and microbiology of AFI in Liberia. The grantee team shall focus on the following major **goals** and milestones:

1. **Identify causative agents of AFI in Liberia**
    - Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia (Y1)
    - Enroll human patients and undertake sampling (Y1-3 & OY1-2)
    - Undertake sample processing and testing (Y1-3 & OY1-2)
2. **Identify evidence for zoonotic transmission of high-consequence AFI pathogens**
    - Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia (Y1)
    - Undertake sample processing and testing (Y1-3 & OY1-2)
    - Undertake preliminary animal sampling (Y1)
    - Visit communities: human-animal interface assessment, animal sampling, and human serology (Y2-3 & OY1-2)
    - Analyze data (Y2-3 & OY1-2)
3. **Identify risk factors for zoonotic AFI in humans**
    - Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia (Y1)
    - Undertake preliminary animal sampling (Y1)
    - Visit communities: human-animal interface assessment, animal sampling, and human serology (Y2-3 & OY1-2)

- Analyze data (Y2-3 & OY1-2)
- Disseminate information to stakeholders (Y2-3 & OY1-2)

Background: Limited detection and diagnostic capacity by definition results in a limited ability of clinicians and public health professionals to accurately identify infectious agents. Febrile illness can be caused by pathogens other than malaria and typhoid that may include dozens of pathogens unassessed by health providers, including hemorrhagic fever viruses; bacterial Select Agents such as *Burkholderia mallei/pseudomallei, Yersinia pestis, and Coxiella burnetti;* and any number of as-yet unknown pathogens. Because the incidence of such agents has not been assessed in Liberia, febrile illness thus presents an unquantified and undifferentiated burden to Liberian health and the health care system and continues to do so. Liberia's public health authorities do not assess incidence of febrile illness. Some studies are just beginning to assess this. Other published studies have reported on causative agents of infectious fever in other low- and middle-income countries (LMIC), including in West Africa. In low resource settings, and particularly where malaria is endemic, patients presenting with febrile illness may be treated presumptively for malaria and may not receive an accurate diagnosis. Co-infections may also be common, particularly with malaria parasites. Where studies have sought to investigate the source of febrile illness, high-risk pathogens of proliferation concern such as *Brucella*, dengue virus, and viral hemorrhagic fevers have been observed. The specific challenge for Liberian health authorities is that pathogens that result in a burden of febrile illness in the population—and the zoonotic transmission pathways that may drive it have not been systematically nor comprehensively identified.

Preliminary Data: This project will leverage more than four years of human and animal data collected during the USAID PREDICT Ebola Host Project in Liberia and in neighboring countries. To date, our team in Liberia has enrolled 585 people and sampled 5387 wild and domestic animals. That project has focused on determining the animal reservoir of Zaire ebolavirus and human behavior/activities to evaluate risk factors for spillover to people. Our research team, which included U.S. and Liberian partners, made the first discovery of the virus in a bat in West Africa. Partner discoveries have included a virus new to science, Bombali ebolavirus, in a bat in Sierra Leone. Anthropological investigation of the risk factors associated with zoonotic spillover events were also extensively addressed; data are still being collated and analyzed, but preliminary evaluation reveals trends in animal contact that vary by country, gender, age, and occupation. The data suggest that in the general Liberian population, some communities are nearly evenly split (up to 60%/40%) with members that have and do not have animal contact as defined by the survey; this informs our own study design in that it provides a sound statistical basis testing the questions at the root of our hypotheses, including whether animal contact is a risk factor for certain zoonotic febrile infections.

Most of the work of the Ebola Host Project is presently being prepared for publication. Key references available include:

Tasks/Scientific Goals: **(Format: Year #(s).Task #. Sub-task#)**

TASK 1

1.1: Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia

The grantee shall oversee refinement and finalization of human and animal study protocols and data collection instruments. This stage incorporates planning and training in the protection of human subjects and animal subjects; training in laboratory biosafety, biosecurity, and safe disposal of samples or sampling materials after laboratory work (which will adhere to guidelines in the BMBL 5th edition, sections III – VI[25]); laboratory diagnostic techniques; and any necessary revisions to original sampling and testing approach based on DTRA feedback and discussion at the kick-off meeting. We will refine our human subjects data collection tools, piloting our instruments within our research network to assure validity and reliability of the questionnaires. A database will be created for secure data entry and data storage of human subjects data. MOH will assign personnel to train clinical staff and oversee study in clinics in Monrovia and Bong. NPHIL and CVL will assign personnel to laboratory. EHA and Liberian partners will host kick-off meeting in Monrovia, Liberia to which all partners will be invited. Each study partner will present on its roles and specific desired outcomes to support its agency's priorities. In addition, we will invite other researchers undertaking febrile illness and related research in-country, such as the U.S. Centers for Disease Control and Prevention (AFI study), the Walter Reed Army Institute of Research (Joint West Africa Research Group), and the Henry Jackson Foundation (sepsis study). Human subjects research and lab training workshops will occur during kick-off.

1.1.1 Refine and finalize human and animal study protocols and data collection instruments
1.1.2 Secure and finalize all research permits (human and animal) including IRB, IACUC, and national approvals in Liberia
1.1.3 Assign MOH, NPHIL, and CVL staff to field and laboratory positions
1.1.4 Host kick-off meeting in Liberia
1.1.5 Conduct Workshop 1a: overall research protocol (concurrent with Task 1.1.4)

TASK 2

1.2 – O2.2: Enroll human patients and undertake sampling

We will enroll febrile patients at two hospitals in Y1-3 and two hospitals in Y4-5 to collect blood and respiratory samples and transport them to the Liberia Institute for Biomedical Research (LIBR) for testing. Cross-sectional sampling will be used to provide a representative sample of a relatively urban or relatively rural population (depending on site) of individuals with fever. Longitudinal sampling of target populations (not individuals) across up to 2.5 years per clinical study site will maximize the opportunity for detection and possibly reveal seasonal trends in infection or other time-related changes in trends. Sampling will be based on available volume in the clinical sites but is designed to assure detection of rare pathogens and answering questions about the relative proportion of febrile illness caused by each; we are targeting 1,500 patients at the first two hospitals total, and 1,500 at the second set of sites in the option years. We will review historical and concurrent surveillance reports for the study counties and for neighboring counties as comparators. MOH will provide a locally hired on-site project coordinator to work with the hospital team and oversee the study protocol (train clinicians and nurses; be alerted when febrile patients arrive; work with hospital staff to oversee informed consent, enrollment, sample collection, and interviews). will train study staff in human subjects research and patient

recruitment; biosafety, safe and secure sample collection, handling, packaging, and transport; and implementation of the study protocol. Training will provide the principles for safe and ethical human subjects research; and project-specific teachings to ensure staff understand, practice, and can implement the study protocol (enrollment determination, informed consent, and questionnaire administration (demographic information, animal ownership), sample acquisition, data entry, and sample packaging and readying for transport).

1.2.1, 3.2.1 Conduct Workshop 2a: IRB/human subjects research
1.2.2-O2.2.2 Locally-hired project coordinator reports to hospital at each study site
1.2.3-O2.2.3 Enroll patients (continuous)

TASK 3

1.3 – O2.3: Undertake sample processing and testing

LIBR reception personnel will be briefed on the study protocol and will notify the project supervisor on receipt of the samples, at which point study-specific inventory and storage procedures will be followed. LIBR has an ABI 7000 Sequence Detection System in operation on which the laboratory scientists and technicians are well trained; a MiSeq system for NGS that is available but requires staff training; and ELISA platforms for serology. NPHIL will budget for and be responsible for ordering needed consumables throughout the project, and UNMC will provide assistance, training, and oversight. LIBR staff are already trained in real-time PCR and ELISA platforms; UNMC will refresh these skills and provide additional training via two one-week didactic and hands-on workshops Y1; another dedicated workshop in Y3; and in other years if needed via visits to the laboratory. These will cover execution of specific pathogen tests, advanced techniques (NGS), and results interpretation (including NGS bioinformatics); sample inventory management; and biorisk management. UNMC will provide oversight and mentorship through their at least twice-yearly working visits to Monrovia and the laboratory as well as video and teleconference. UNMC will leverage its additional DTRA work at LIBR (under funding consideration) to assist with skill-building among laboratory scientists and technicians there. UNMC will assess competence at each visit via a standardized evaluation form to use as a basis for targeted future training.

1.3.1-O2.3.1 Provide necessary equipment and consumables to NPHIL laboratory (continuous)
1.3.2, 3.3.2 Conduct Workshop 3a: laboratory biosafety and biosecurity, sample disposition
1.3.3, 3.3.3 Conduct Workshop 3b: laboratory sample testing techniques
1.3.4-O2.3.4 Provide continuous on-the-job training in laboratory techniques
1.3.5 Submit annual report (Y1)
2.3.6 Host workshop on results interpretation/bioinformatics
3.3.7 Host regional technical ad networking workshop

TASK 4

1.4 – 3.4 Undertake preliminary animal sampling

While laboratory training is beginning, preliminary field animal sampling will begin in Y1 with sampling in communities selected based on previous cases of AFI from historical hospital admissions trends, including some communities from which the study site hospitals draw patients. We will review a sampling of hospital records from Monrovia and Bong in search of geographic trends in AFI presentations going back three years, and begin randomized sampling

of peridomestic and wild animals in four communities identified as part of this process and continue every three months. In five-day/five-night trips we will target approximately 50 bats, 50 rodents, 50 livestock (including chickens if poultry-transmitted infection is suspected), and 10 dogs per sampling event, allowing for approximately 640 animals sampled in Y1 to include blood and oral/nasopharyngeal specimens, and feces and urine when possible. Our teams are trained in species identification, and we will also plan to barcode approximately 5% of individual bats and rodents in Y1 to improve species determination and team training. All animals will be non-lethally sampled with strict adherence to U.S. IACUC-approved protocols following those currently used by EHA scientists globally (Attachment 3) and using bat and rodent sampling protocols we developed for the PREDICT project (Attachment 3). All personnel undertaking animal sampling will be will be trained to ensure competency with a combination of didactic and practical training. SCNL will transfer samples to LIBR consistent with PREDICT protocols (Attachment 3).

1.4.1, 3.4.1 Conduct Workshop 4b: IRB/human subjects research (for animal teams)

1.4.2 Review hospital records in search of geographic trends in acute febrile illness presentations

1.4.3 Sample in communities identified as part of this process and continue every three months

TASK 5

1.5 – O2.5: Visit communities: human-animal interface assessment, animal sampling, and human serology

Animal sampling will continue in Y2, expanding to communities of enrolled patients, sampling in and around study enrollees' homes and surrounding areas; we plan to reach three communities in Y2. This task predominantly supports Hypothesis 3. It is designed to: a) assess the risk interface between people and animals; b) strategically target and sample animal species for the pathogens/antibodies they are most likely to have based on what is already known about pathogen-host proclivity; and c) enable follow-up serology on patients and their community neighbors. We will sample five communities in the catchment areas of Redemption and Phebe Hospital, targeting 400 animals per community, and the patient plus 20 neighbors per community for human interviews and blood sampling. In option years, we will target three communities with the same numbers of animal and human subjects per community.

2.5.1-O2.5.2 Review study patient records for geographic trends in AFI presentations

2.5.2-O2.5.3 Undertake sampling in and around study enrollees' homes

2.5.3-O2.5.4 Undertake sampling from broader patients' communities

2.5.4-O2.5.5 Administer human-animal interface assessment

2.5.5-O2.5.6 Collect human samples for serology

TASK6

2.6 – O2.6: Analyze data

We will compare any diagnoses established at the clinical sites to laboratory results; and compare clinical study site diagnoses and laboratory results to national weekly and monthly county surveillance records. We will estimate population in catchment areas (from where the patient population comes) to develop prevalence estimates of each detected pathogen. We will compare phylogenetic sequence data from humans and animals to identify possible shared strains and infer transmission. Using the questionnaire data comparisons of exposure variables across

varying demographics measures in study sites will be conducted to characterize high risk behaviors and statistical analysis will be employed to identify differences between groups with a 95% probability of detecting a difference. As appropriate, multivariate analysis will be utilized to evaluate the relationship between the positive biological findings and key measures of contact to evaluate the factors that influence and may have led to AFI pathogen exposure. The pathogen and human interface data collected in this study; characterization of zoonotic potential through phylogenetic analyses undertaken in this and other studies (such as PREDICT); and additional data such as available spatial, ecological, and environmental data will inform models designed to help tease correlation from causation. The data will thus provide the foundation of an OY2 risk reduction workshop. We will also compare diagnostic results for endemic agents to reports for these diagnoses in the preceding years to allow for control for any changed practices (even if subconscious) in our target counties based on the project team's presence; this will also allow for a controlled comparison of the impact on incidence of any differential diagnosis or testing interventions we may implement in OY1 and OY2. We will develop recommendations for adapted differential diagnostic protocols and testing practices.

2.6.1-O2.6.1 Undertake data analysis

TASK 7

2.7-O2.7: Disseminate information to stakeholders

We will host the annual stakeholders meeting to which we will invite all project partners as well as others doing related research in country. We will discuss preliminary data and analyses and use these to inform any needed modifications to forward sampling strategy. We will review protocols for biosafety, specimen transport, and animal handling at each annual meeting. We will provide support travel for at least one (1) Liberian scientist to present at an international conference. We will share samples as appropriate with other in-country projects to ensure synergies. We will compile and summarize research results and share with all partners and other in-country researchers as appropriate and use it to develop an annual report for DTRA. In Y3, we will broaden annual stakeholders meeting to include regional partners from Guinea and possibly other adjacent countries; share information about ongoing research; plan cross-border study for OY1. We will broaden outreach in Y3 and OY2 to communities that have engaged in sampling to share results and discuss preliminary risk mitigation strategies. Project data will provide the foundation of an OY2 risk reduction workshop at the annual meeting to engage multi-sectoral Liberian participants to review statistical evaluation of diagnostic data, identify key risk interfaces, assess economic options for prevention and control, and develop threat reduction measures. Workshop products include 1) development of priorities for refined PCR and serological tests based on study findings, 2) recommendations for an updated national surveillance and reporting strategy and plan, 3) inclusion of stakeholders (e.g., National Disaster Management Authority, the Forestry Development Authority, the Ministry of Finance) to consider options for risk and impact reduction and generate policy recommendations. We will work with MOH and MOA to develop written educational products designed for laypersons to explain project results, community impact, and risk mitigation, and thank community members for their participation.

2.7.1-O2.7.1 Host annual stakeholders meeting

2.7.2-O2.7.2 Present to DTRA at Annual Technical Review

2.7.3-O2.7.3 Submit annual report

2.7.4-O2.7.4 Share specimens if available and appropriate with other in-country researchers

2.7.5, O2.7.5 Support Liberian scientist to present at international conference
3.7.6 Host regional technical and networking workshop
3.7.7-O2.7.7 Prepare/submit up to two (2) peer-reviewed manuscripts
3.7.8, O2.7.8 Engage sampled communities for follow-up education
O2.7.9 Conduct Workshop 6a: risk reduction workshop

Cost estimate: Y1: $995,517.56 Y2: S989,251.55 Y3: S996,113.74 OY1: $962,716.26
OY2: S969,218.86

Performance Schedule:

Task	Y1	Y2	Y3	OY1	OY2
Task 1: Establish evidence-based research initiative for high-consequence pathogens in Liberia					
1.1 Refine and finalize human and animal study protocols					
1.2 Secure and finalize all research permits (human and animal)					
1.3 Assign MOH, NPHIL, and CVL staff to field and lab positions					
1.4 Host kick-off meeting in Liberia					
1.5 Conduct Workshop 1a: overall research protocol					
Task 2: Enroll human patients and undertake sampling					
2.1 Conduct Workshop 2a: IRB/human subjects research					
2.2 Local project coordinator reports to hospital at each study site					
2.3 Enroll patients (continuous)					
Task 3: Undertake sample processing and testing					
3.1 Provide equipment and consumables to LIBR					
3.2 Conduct Workshop 3a: biosafety/biosecurity, sample disp.					
3.3 Conduct Workshop 3b: laboratory sample testing techniques					
3.4 Provide on-the-job training in lab techniques (continuous)					
3.5 Submit Y1 annual report					
3.6 Conduct Workshop 5a: results interpretation, bioinformatics					
3.7 Host regional technical and networking workshop					
Task 4: Preliminary animal sampling					
4.1 Conduct Workshop 4a: IACUC/animal subjects research					
4.2 Review hospital records for geo. trends in AFI presentations					
4.3 Sample animals in select communities (preliminary)					
Task 5: Visit communities: interface assessment, animal sampling, human serology					
5.1 Review study patient records for geographic AFI trends					
5.2 Administer human-animal interface assessment					
5.3 Undertake animal sampling in/around study enrollees' homes					
5.4 Undertake animal sampling from patients' communities					
5.5 Collect human samples for serology					
Task 6: Analyze data					
6.1 Undertake data analysis					
Task 7: Disseminate research results to stakeholders					
7.1 Host annual Stakeholders meeting					
7.2 Present to DTRA at Annual Technical Review					
7.3 Submit annual report					
7.4 Share specimens if appropriate w/ other in-country researchers					
7.5 Support Liberian scientist to international conference					
7.6 Host regional technical and networking workshop					
7.7 Prepare/submit up to two (2) peer-reviewed manuscripts					
7.8 Engage sampled communities for follow-up education					
7.9 Conduct Workshop 6a: risk reduction workshop

Current and Pending Support

(See GPG Section II.D.8 for guidance on information to include on this form.)

The following information should be provided for each investigator and other senior personnel. Failure to provide this information may delay consideration of this proposal.

Investigator: William Karesh	Other agencies (including NSF) to which this proposal has

Support: ☐ Current ☒ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Reducing the Threat from high-risk pathogens causing febrile illness in Liberia (current proposal)

Source of Support: DTRA

Total Award Amount: $4,912,818.06 Total Award Period Covered: 01/01/2020-12/31/2024

Location of Project: United States, Liberia

Person-Months Per Year Committed to the Cal: 1.5 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Understanding the Risk of Bat-Bourne Zoonotic Disease Emergence in Western Asia

Source of Support: DTRA

Total Award Amount: $4,391,443.65 Total Award Period Covered: 10/02/2017-10/01/2022

Location of Project: Global

Person-Months Per Year Committed to the Cal: 1.56 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Ground Truth Network

Source of Support: DHS

Total Award Amount: $2,231,114.13 Total Award Period Covered: 09/30/2016-09/29/2021

Location of Project: United States

Person-Months Per Year Committed to the Cal: 1.56 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

READY: Augmenting Capacity for Humanitarian Emergencies of Infectious Diseases with Epidemic or Pandemic Potential

Source of Support: USAID

Total Award Amount: $143,605 Total Award Period Covered: 09/25/2018-09/30/2021

Location of Project: Global

Person-Months Per Year Committed to the Cal: 1.56 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support

Project/Proposal Title:

Emerging Pandemic Threats PREDICT-2

Source of Support: USAID

Total Award Amount: $100,000,000.00 Total Award Period Covered: 10/01/2014-09/30/2019

Location of Project: Global

Person-Months Per Year Committed to the Cal: 4.56 Acad: Sumr:

*If this project has previously been funded by another agency, please list and furnish information for immediately preceding funding period.

EcoHealth Alliance, New York, USA

EcoHealth Alliance is an US-based NGO that specializes in scientific research on the causes, origins and spread of zoonotic emerging diseases. EcoHealth Alliance scientists have been conducting field research on infectious zoonotic diseases for over three decades. EcoHealth Alliance is based in New York City with 10,000 square feet of office space including a meeting room and basic laboratory freezer storage and light microscopy. The scientific staff (15 core scientists, 100+ field staff) is supported by a core admin staff of 11, which is available for work on this project and is also funded through private individual and foundation support.

EcoHealth Alliance is equipped with 25 networked computers (PCs and Macs) including ARRA funded International LifeSize Video Conferencing facilities, and high-speed video conferencing facilities have been installed with key international collaborators. EcoHealth Alliance has access to a 24-7 server, server support, and all required software including ArcGIS, MatLab, SPSS, Microsoft Office, and Adobe CS3 running on both Apple and Windows Operating Systems. Additionally we have a four-processor, public IP addressed Linux server which can be used for intensive computational modeling and database processing by all the grantees.

EcoHealth Alliance is the headquarters of two networks that provide exceptional leverage for the core scientists: 1) The EcoHealth Alliance Local Conservation Partners: A global partnership of 15 NGOs in Asia (including Bangladesh, India, and China), Africa and Latin America (including Argentina and Brazil). This network provides access to fieldwork in countries (such as India) that are often difficult to work in, and obtain samples from; 2) The Consortium for Conservation Medicine: A unique collaborative institution linking Johns Hopkins Bloomberg School of Public Health, Tufts University School of Veterinary Medicine Center for Conservation Medicine, The University of Pittsburgh Graduate School of Public Health, The University of Wisconsin-Madison Nelson Institute for Environmental Studies, The USGS National Wildlife Health Center, and EcoHealth Alliance. The CCM provides access to hundreds of high caliber scientists, their facilities, and their students at 6 leading institutes of public health, veterinary medicine, and environmental science in the USA.

Society for the Conservation of Nature of Liberia (SCNL), Monrovia, Liberia

The Society for the Conservation of Nature of Liberia (SCNL) is an accredited, non-governmental organization based in Monrovia, Liberia that serves as the oldest, most well respected, and important civil service organization devoted to the environment and conservation in Liberia. With over 50+ staff based in the office and in the field, SCNL has had an enormous impact, and has been the driving force behind many conservation efforts in the country.

SCNL partners with numerous international NGO's including the Wild Chimpanzee Foundation, Conservation International, Fauna and Flora International, Liberia Chimpanzee Rescue and Protection, Rainforest Trust, EcoHealth Alliance, World Resources Institute and Birdlife International. SCNL's experience as the implementing partner of PREDICT Liberia

has placed the organization at the forefront of a new paradigm within the public health sector in Liberia. In the post-Ebola environment, Liberia has adopted a One Health approach to public health and because SCNL has played such an important role in operationalizing and promoting this new paradigm, the organization has positioned itself as a leader in the field.

Society for the Conservation of Nature of Liberia (SCNL) is equipped with the necessary equipment and facilities to conduct fieldwork throughout Liberia. Located in Congo Town a suburb of Monrovia, SCNL has easy access to vendors in order to procure supplies. SCNL has several 4WD vehicles able to handle Liberia's rough terrain. SCNL is equipped with 4 Stirling Ultracold portable -86°C freezers, 2 dry shippers to maintain cold chain, 3 mobile centrifuges for use in the field, various sized mist nets, 2 harp traps for catching bats, has a label printer for labeling cryovials. SCNL also has a warehouse built from a converted shipping container and other basic equipment needed to conduct proper field work.

National Public Health Institute of Liberia (NPHIL), Monrovia, Liberia

National Public Health Institute of Liberia (NPHIL) is an autonomous agency of the Government of Liberia. In 2016, through an Act of the Legislature, NPHIL was established to collaborate with and strengthen the Ministry and other institutions in the health sector through the carrying out of research into public health concerns of the Nation and to provide direction for disease prevention activities. NPHIL's facilities include two campuses with the headquarters based in Monrovia, Montserrado County, and research and reference laboratories based in Charlesville, Margibi in Liberia under the Integrated Disease Surveillance and Response (IDSR) System. At the NRL,30% of the staff are core lab technicians, 46% lab aides and 24% lab assistants.

The Division of Public Health and Medical Research (DPHMR) is housed at the Charlesville campus and includes 91 acres with multiple research suites. DPHMR includes three research units in Microbiology, Parasitology and Vector Biology, and Nutritional Epidemiology; and have 13 scientific staff.

NPHIL has a strategic and an operational plan with support from the US Center for Disease Control (CDC), the World Health Organization (WHO) and the US National Institutes of Health (NIH).

NPHIL's Laboratory complex is located in Charlesville, Margibi County. Contained within the facility are two laboratories: the National Public Health Reference Lab and the Medical and Public Health Research lab. The reference lab is responsible for confirming surveillance samples for priority diseases in Liberia and has three sections, namely; molecular, serology and microbiology suites. The Public Health and Medical Research labs are involved with Ebola research in collaboration with the NIH/PREVAIL and studies in Malaria, AMR and Nutritional Epidemiology and also being conducted in these labs. NPHIL's laboratory complex hosts two BSL-2 suites and a BSL-3 lab is currently being completed for work on MDR-TB and other level 3 risk pathogens. The complex is equipped with uninterrupted

power supply from one 250 KVA generator and three backups (One 220KVA and two 155 KVA).

Significant equipment at the NPHIL facilities include ELISA plate readers and washers (2), light-cycler real-time quantitative PCR machines (2) conventional PCR machines (2), GeneXpert Real-time PCR (6), CO_2 incubator (5), class II biosafety cabinets (6), Illumina MiSeq (1), liquid nitrogen (LN2) tanks (3) and a 30 liter per day LN2 generator. Other available equipment includes, gel electrophoresis equipment, conventional microscopes, table top centrifuges, microfuges, Autoclaves, Water distillers, refrigerators and freezers, Millipore Direct Q water purification system, weighing balances and PAPR equipment and chargers.

Trained and competent laboratory staff include seven junior scientists and eight laboratory technicians with proficiency in varying laboratory techniques such as PCR, RT-PCR, serology, blood processing and DNA/RNA extraction, DNA/RNA sequencing and Microbiology.

Liberia Chimpanzee Rescue and Protection, Charlesville, Liberia/Golden, CO, USA

Liberia Chimpanzee Rescue and Protection (LCRP) is an NGO operating in Liberia with a US based 501c3 affiliate. LCRP is one of the leading animal welfare and conservation organizations in Liberia focused on protecting and conserving wildlife, primarily chimpanzees. LCRP has a staff of 22, mostly dedicated to chimpanzee care. One of the co-directors, Dr. James Desmond, DVM, MS, is a veterinarian specializing in great ape health and zoonotic disease research.

LCRP currently operates on the grounds of the National Public Health Institute of Liberia (NPHIL) and has an MOU with the Society for the Conservation of Nature of Liberia (SCNL) and close relationships with the other prominent conservation and public health NGOs operating in the country such as: Conservation, Fauna and Flora International, and Wild Chimpanzee Foundation. In addition, LCRP works very closely with several government entities such as the Forestry Development Authority, Ministry of Agriculture, and NPHIL.

LCRP has four vehicles that are capable of handling the difficult road conditions present in Liberia, several laptop computers, various medical supplies and equipment, and shares office space and facilities with SCNL in Monrovia.

University of Nebraska Medical Center, Omaha, Nebraska, USA

The University of Nebraska Medical Center (UNMC) is a vital enterprise in the nation's heartland and has mission to improve the future of health care in Nebraska and beyond. As Nebraska's only public academic health sciences center, UNMC is committed to the education of a 21st century health care work force, to finding cures and treatments for devastating diseases, to providing the best care for patients, and to serving our state and its communities through award-winning outreach. UNMC is one of four campuses that make up the University of Nebraska

system. UNMC has six colleges, two institutes and a graduate studies program, serving nearly 4,000 students in more than two dozen programs.

The recently established UNMC Global Center for Health Security (GCHS) is one of the nation's primary biosecurity resources for training, education, research, and clinical care. The Center has become the focal point of state, national and international collaborations having created a spectrum of biosecurity and biodefense services to help prepare for natural and man-made disasters. The network of experts help to advance the coordinated, interdisciplinary development of new research and clinical practice and to disseminate innovative approaches to keep communities safe from epidemics and to counter weapons of mass destruction.

The GCHS provides a unique platform for health system preparedness, awareness, recognition, and response for public health and hospital emergencies. With a comprehensive capability in research, education & training, and health system operations, we strive to facilitate 21st-century care for public health emergencies in all environments. Below are some of the centers and initiatives that fall under GCHS.

Nebraska Biocontainment Unit (NBU)

- A collaborative project involving the University of Nebraska Medical Center & Nebraska Medicine (UNMC/NM), as well as the Nebraska Department of Health and Human Services
- The 10-bed unit opened in 2005 and cared for three of the ten patients with Ebola Virus Disease (EVD) managed in U.S. biocontainment units during the Fall of 2014 outbreak
- Now serves as Region VII RESPTC for treatment of Ebola/HCI patients
- Partner with the Nebraska Public Health Laboratory BSL-3 lab at UNMC
- Volunteer-rostered staff of specialty physicians, nurses, technicians, and respiratory therapists, who are trained in high-level isolation and bio-preparedness. These volunteers are employed in other areas of the health system, train quarterly & can report promptly for duty when unit is activated

National Training, Simulation and Quarantine Center (TSQC)

- Selected as the National Training, Simulation, and Quarantine Center in 2017. This $20 million HHS-funded capability will be home to the National Disaster Medical System & CStars ID training programs, and includes:
  - Λ 20-bed National Quarantine Unit, on the 1st floor of UNMC's Davis Global Center building in July 2019
  - The National Biocontainment Training Center, a fully equipped mock-up of a patient biocontainment unit with six patient care rooms, support spaces, autoclave, and training laboratory
  - An Emergency Operations Center(EOC) and multipurpose room for incident management training and skills training. This space will serve as the UNMC/NM EOC for exercises and real-world events
  - Access to the Davis Global Center facility and the interprofessional Experiential Center for Enduring Learning (iEXCEL), which includes a 360 degree laser projection simulated

environment immersion cave, CAD wall, iWall, holographic theater, and other virtual- and augmented-reality training & simulation tools

Nebraska Drug Development Pipeline

- Collaboration among the Department of Defense, the National Strategic Research Institute (NSRI), the University of Nebraska-Lincoln, UNMC, and the pharmaceutical industry to develop new therapeutics and radiation countermeasures, products not currently prioritized for development
- An expandable model for other public health emergency countermeasures

Nebraska Mobile Genomics Unit

- Able to respond to a public health emergency by providing genomic characterization of the pathogen at the site of the outbreak
- Setup sequencing laboratory and provided training to local scientist in the Democratic Republic of the Congo, in May 2018.

U.S. Air Force Center for the Sustainment of Trauma and Rediness Skills (C-STARS)

- First C-STARS infectious disease program dedicated to developing protocols, best practices, and training for USAF medical personnel in the care and transport of individuals with active or suspected HCI
- Established in late 2018 and projected to begin full-scale training in late 2019

Georgetown University, Washington, DC, USA

The Georgetown University Medical Center (GUMC) consists of a nationally-ranked School of Medicine (SOM), School of Nursing & Health Studies (NHS), Lombardi Comprehensive Cancer Center (LCCC), and Biomedical Graduate Research Organization (BGRO). GUMC is home to more than 400 basic and clinical research scientists, and 300 active clinical trials. Clinical care is provided at Medstar Georgetown University Hospital (MGUH) and satellite clinics through a partnership with MedStar Health, Inc. The Georgetown University Medical Center is the largest and most prominent Catholic medical center in the country.

Georgetown's School of Medicine provides a comprehensive approach to medical education, following the Jesuit ideal of *cura personalis*, or "care of the whole person." As one of the most selective medical schools in the country, the School of Medicine is consistently ranked in US News and World Report's top 50 graduate programs at research universities. In 2004, the School of Medicine opened its Integrated Learning Center, which supports the School of Medicine's emphasis on a patient centered, competence-based curriculum and provides the latest methods of clinical teaching and evaluation. Georgetown medical students consistently match into top medical schools around the country for their residency programs.

LABORATORY

GU does not anticipate requiring laboratory facilities for the purposes of their contribution to the research project. We anticipate all laboratory activities will take place in Liberia, as part of the capacity building effort inherent to the proposal. However, if required, there is also extensive reach-back laboratory facilities available via GUMC as needed, including the state of the art Discovery Center in the School of Nursing and Health Sciences. Located on the third floor of the School of Medicine's Med-Dent Building, accessible at 3900 Reservoir Road NW, the Discovery Center covers 3,000 square feet and includes a teaching laboratory, a research laboratory, a cell culture room, and a Zeiss Axiovert 200 microscope. The facility is equipped with modern laboratory teaching tables and equipment; adjacent to the teaching laboratory is a preparation and instrumentation room that serves both the teaching laboratory and the interconnected research laboratory, which houses a separate cell culture room. The research areas are outfitted with state-of-the-art shared core instrumentation that includes centrifuges, cell incubators, microscopes, DNA amplifying, electronic cell counting and electrophoresis equipment. While primarily used by students and faculty within the Department of Human Science, students from the other academic departments at Nursing and Health Sciences also take courses and conduct scientific investigation with faculty in this core, shared facility. Additional laboratory facilities are available via the Department of Microbiology and Immunology in GUMC. Specific laboratory space for virology studies can be made available for students for training in laboratory techniques including RNA extraction, PCR and sequencing.

COMPUTER

The PI, Co-PI, and all research staff at Georgetown University have exclusive use of PC-based desktop computers with extended RAM, significant GB hard disk space, dual-color flat-panel LCD monitors, and high-speed HP laser printers. The PI and Co-PI will also have access to exclusive access to Macbook Pro or Dell laptops. Available software for desktop and laptop computers used for the project includes WINDOWS and Mac operating systems, MS-Office 2010, SPSS 20.0, and SAS 9.3. Study personnel will have full Internet and e-mail access; will be networked to shared, secure drives for data access; and will have full communication capabilities through the use of phone, fax, and email. GUMC provides complete hardware, software, and network support through its University Information Systems department. Box is also available for secure storage and access of files and folders on the Internet enabling the user to access files from any available computer with a web browser and Internet connection.

OFFICE

All study investigators have secured private offices and study personnel also have office space. All investigators have access to conference rooms with video and teleconferencing equipment.

HUMAN SUBJECT REGULATORY COMPLIANCE TRAINING

The PI has completed on-line certification from the IRB and NIH related to protection of human subjects in research. Georgetown University Policy on Protection of Research Data Standard operating procedures regarding data protection and patient confidentiality have been adopted throughout the institution. Office spaces, databases, and e-mail usage all have specific security requirements. The University and Medical Center recently launched a new effort regarding protection of patient data. The PI and other members of the research team will attend relevant seminars/trainings.

OTHER

All research team members have direct access to a full range of library, computer, audiovisual, shop, and clinical facilities at GUMC.

SHARED RESOURCES

Although additional resources are not anticipated to be required for GU's contribution to the project, the following shared resources are available as needed as reach-back capability or for provision of subject matter expertise while developing and implementing the research project in Liberia.

Animal Models Shared Resource (AMSR) and Division of Comparative Medicine (DCM)

Animal models are powerful cancer research tools and a vital link in translating laboratory studies into the clinic. The function of the Animal Models Shared Resource (AMSR) is to facilitate efficient, economical, and state-of-art use of animals for the performance of cancer-related studies. This is accomplished through a centralized resource, where AALAS-certified, highly trained veterinary technicians provide preclinical research services. A significant emphasis is placed on assisting users with the design and performance of animal studies using a wide-range of models, including zebrafish and a recently developed model to study endocrine resistance and breast cancer recurrence in an estrogen receptor positive rat model. Major services provided include all aspects of rodent studies, such as establishing genetically modified mouse colonies, administrating carcinogens, monitoring tumor growth, collecting tissues and tumors at necropsy, and administering drugs, diets or other compounds. Studies using zebrafish include generating gene knockout or gene overexpressing models, screening for toxicity/drugs, and xenotransplantation experiments. Imaging services are also provided to monitor tumor initiation, progression, and response to therapy.

The AMSR is located within Georgetown University Medical School's Division of Comparative Medicine (DCM). The DCM is a centralized, AAALAC-accredited, USDA-registered animal facility and has an approved letter of assurance on file at the NIH. The DCM is a 50,000 sq ft facility located in the Georgetown University Medical Center. It was originally constructed in 1984 as a research resource facility. It was later expanded in 1994 and became the Division of Comparative Medicine. There are a variety of different areas within the DCM that range from barrier level protection to bio safety level 2 containment. The DCM also has surgical and procedure rooms, a cage wash area, autoclaves, cold boxes, dedicated loading docks, a Hydropac machine, and feed and bedding storage.

The animal housing locations in the DCM include:

- A and B zones as well as perimeter rooms: A combination of conventional and SPF housing rooms, using either ventilated caging systems or static "shoebox" cages. There are also rooms designed to house large animals and for aquatic species.
- C, E, & F zones: Rodent barrier areas specifically designed to offer our highest level of bio-security.
- D zone: Designed and used for research with hazardous materials.

All of our areas are climate controlled to control temperature, humidity and lighting to fall within the recommendations of "The Guide for the Care and Use of Laboratory Animals".

The doors to each zone are security controlled using the University's GoCard system. Access must be requested and approved by the main office before entering any zone. The AMSR is codirected by Leena Hilakavi-Clarke, PhD, and Christopher Albanese, PhD, who oversee the animal and imaging components, respectively. The DCM is directed by Dr. Patricia Foley, DVM.

Biostatistics & Bioinformatics Shared Resource (BBSR) goal is to provide basic, translational, clinical and population science investigators with access to high quality statistical science and informatics. Ming Tan, PhD, Chair of the Biostatistics, Bioinformatics, and Biomathematics Department and Subha Madhavan, PhD, Director of Innovation Center for Biomedical Informatics are Codirectors of BBSR. BBSR functions include: study design; statistical analysis and reporting of research studies including clinical trials, studies with high dimensional "omics" and imaging data including pathway analysis; review and monitoring of clinical protocols through membership on the Protocol Review and Monitoring System and Data and Safety Monitoring Committees; and provision of biostatistics and informatics training and expertise in the collection, integration, management, and application of biomedical data. In addition, the BBSR provides investigators with advanced statistical and bioinformatics methods and expertise developed independently by BBSR faculty. The BBSR has excellent computing resources, informatics systems, and informatics and statistical software necessary for efficient and effective support of research. BBSR supports the development of the information architecture for connecting data and metadata from clinical, biospecimen, and research systems to enable all forms of research.

Clinical Research Unit (CRU) is located on 7th floor East Wing of the Main Building, Georgetown University Hospital (GUH). This location is central to the medical center, and is convenient for investigators, clinicians, staff, patients and families. The GU-CRU is equipped to provide around-the-clock support for research studies, seven days a week.

The GU-CRU provides 10 patient-care rooms and occupies approximately 5411 square feet of space. It has the flexibility to support either inpatient or outpatient services, thereby, maximizing use of all rooms (2 are dedicated for cognitive testing; 4 are dedicated for outpatient testing; 4 are mixed inpatient/outpatient use). The GU-CRU, although a University unit, is part of the MedStar JCAHO approved institution.

The GU-CRU provides outpatient and inpatient clinical research support to both pediatric and adult research subjects. Some of the procedures that nurses currently perform or assist with include:

- Exercise Stress Testing
- Pulse Wave Analysis
- Chemotherapy Administration
- Complex Pharmacokinetic Sampling and Collection
- Complex Sample Processing

- Expert IV / Phlebotomy Services
- Insulin Clamp Studies
- Diabetes Education
- Vaccination
- Telemetry
- Cognitive Testing
- Specialized Room for Cognitive Testing with Video Monitoring
- Complex Medication Administration with Monitoring
- 6-Minute Walk Testing
- Lumbar Puncture
- Allergy Testing
- Metabolic Cart and Pulmonary Function Testing
- DXA Hologic Q Series

The staff of the GU-CRU is not limited to these procedures. The GU-CRU staff are continually learning and extending their capabilities based on the needs of the investigators.

Cultural and Linguistic Competence Resources Faculty, postdoctoral fellows, staff, and researchers also have access to The National Center for Cultural Competence (NCCC) provides national leadership and contribute to the body of knowledge on cultural and linguistic competency within systems and organizations. Major emphasis is placed on translating evidence into policy and practice for programs and personnel concerned with health and mental health care delivery, administration, education and advocacy. The NCCC is a component of the Georgetown University Center for Child and Human Development (GUCCHD) and is housed within the Department of Pediatrics of the Georgetown University Medical Center. The NCCC provides training, technical assistance, and consultation, contributes to knowledge through publications and research, creates tools and resources to support health and mental health care providers and systems, supports leaders to promote and sustain cultural and linguistic competency, and collaborates with an extensive network of private and public entities to advance the implementation of these concepts. The NCCC provides services to local, state, federal, and international governmental agencies, family advocacy and support organizations, local hospitals and health centers, healthcare systems, health plans, mental health systems, universities, quality improvement organizations, national professional associations, and foundations. In addition, the NCCC's on-line training, publications, and products are accessed by tens of thousands of individuals each year.

Data Management Core (DMC) provides research investigators at LCCC with high-quality survey data collection and management services, study tracking, data cleaning and data manipulation services as well as consultation services for all population science research projects.

For this study the Core will be responsible for programming the study surveys in REDCap - a secure, IRB-approved, web-based application designed for managing online surveys and for communication between study sites; and develop a tracking database application in MS Access to track study participants from both sites – LCCC and JTCC, throughout the study from

recruitment to study closeout. The Core will be responsible for checking, cleaning and curating the study data collected at different time points in the study to ensure completeness and accuracy of data. The Core will also be responsible for interpretation, organization, validation and merging of data from the survey and tracking database applications along with abstracted EMR/hospitalization/medical event records. They will use advanced data manipulation techniques to create, manipulate, validate and analyze study data and provide ready to use analytic datasets to statisticians and investigators during and at the end of the study. They will provide ongoing maintenance of the Survey and Tracking data applications throughout the study period and backup and secure all study data as per institution standards.

The tracking database will reside on a Georgetown server and can only be accessed using the Georgetown login and a database login. Staff at JTCC will be provided with affiliate Georgetown NetIDs so that they can remotely access the study tracking MS Access database on the server via remote desktop. The web-based survey application, REDCap, is also hosted on a secure Georgetown server that can only be accessed via a secure study login.

Library Resources provide optimum services, facilities and resources to enhance the pursuit of knowledge and academic excellence. The present holdings of all University libraries total over 1,740,000 volumes and 1,850,000 microforms. The Joseph Mark Lauinger Memorial Library has a collection of over one million volumes. Georgetown is a U.S. Government Documents Depository. Blommer Science Library covers the subject fields of biology, chemistry, mathematics, physics, and computer science. The book and bound journal collection there numbers over 63,000 volumes; and almost 900 journals are currently received. Other library resources include: The Maternal and Child Health Library, the Woodstock Theological Library and the National Reference Center for Bioethics Literature. The John Vinton Dahlgren Memorial Library is the major library for the Georgetown Medical Center. The Library occupies over 31,000 square feet on four levels. The staff is comprised of academic librarians, computer scientists, and support staff. The Library provides access to several medical databases including MEDLINE, EMBASE Alerts, and the Micromedex drug information system. The library's print collection includes more than 176,442 volumes (including 43,372 books and 118,188 bound journal volumes), current subscriptions to 1,831 journals, and over 2,700 audiovisual and microcomputer software programs.

Survey, Research, and Biospecimen Collection Shared Resource (SRBSR) was established in July 2011, encompasses and expands upon two prior Shared Resources, the Clinical and Molecular Epidemiology Shared Resource (CMESR) and the Familial Cancer Registry (FCR). Led by a clinical investigator (Isaacs) and a genetic counselor (Peshkin), the SRBSR has created a platform for a unified subject recruitment infrastructure to streamline subject recruitment into nontherapeutic studies while minimizing redundancy of data collection across individual studies through a protocol called the Lombardi Research Participant Registry (LRPR). From protocol activation (6/18/12) to 12/31/12, the SRBSR team has enrolled 547 subjects to the LRPR, which includes access to medical records, data, fluid and tissue biospecimens from consented subjects. These data are useful for pilot studies and project design. Essentially all (98.5%) of these subjects also consented to be re-contacted for participation in future nontherapeutic research studies for which they may be eligible. The SRBSR has successfully utilized the LRPR to triage and enroll 84 subjects into seven investigator- initiated studies at LCCC as of 12/31/12. The

biospecimen repository, built by the subsumed Shared Resources, includes over 2,000 BRCA1/2 characterized subjects with a family history of cancer as well as over 1,800 subjects with sporadic cancer, many with clinical and demographic data. Integration of databases of several Shared Resources is underway with the goal of integrating all clinical and research information into the Georgetown Database of Cancer (G-DOC®). Patient and participant confidentiality is maintained with careful standard operating procedures across the SRBSR and its associated studies.

Office of Minority Health and Health Disparities Research is a new community based space for The Georgetown Office of Minority Health and the Health Disparities, led by Dr. Lucile L. Adams-Campbell, opened in 2011, located at 1000 New Jersey Ave, SE, Washington, DC, 20003. The new space allows for improved access between LCCC and minority and underserved communities which facilitate research engaging the local minority community in our effort to address cancer health disparities. The location is 15 minutes from Lombardi and in close proximity to metro stops and several bus lines, which provide easy access to the community outside of Georgetown.

The office space measures 4,437 square feet, and includes 8 offices for faculty and patient/participant intake privacy, and 9 modular offices for staff, graduate students and postdoctoral fellows. Each staff member is provided with a data encrypted desktop computer, or equivalent. The suite also houses a conference room, reception and waiting areas, photocopy machine, and data/voice access. There is also an exercise physiology lab, and a nutritional education area that includes a kitchen. The exercise physiology lab includes a metabolic unit, treadmills, elliptical machines, and weight training machines. In addition there are 2 Wii-Fit exercise rooms including video games and televisions, and a room with a DEXA machine, which measures body position. The nutritional education area includes a wet sink and kitchen.

University Information Services (UIS) is located in St. Mary's Hall and provides the technology infrastructure to support the teaching and scholarship activities of the school and will be the main resource for instructing students in computer programs (i.e., Excel, PowerPoint) to facilitate learning. Faculty members collaborate with UIS personnel to optimize technology support. Additionally, the school has its own systems manager to provide on-site assistance for faculty, students, and staff for issues pertaining to hardware, software, and Internet-based functions.

ATTACHMENT 3 – SUPPORTING DOCUMENTATION

1. FOREIGN PRINCIPLE INVESTIGATORS AND OTHER MEMBERS OF FOREIGN RESEARCH TEAM

Foreign PI:
None

Foreign Co-I:
Mosokah Fallah, PhD, MPH, MA
Deputy Director General/Technical Services, National Public Health Institute of Liberia

Other members (alphabetical order):
Fatorma Bolay, PhD, MS
Director of Public Health and Biomedical Research, National Public Health Institute of Liberia

John Dogba, MPH
Director of the National Public Health Reference Laboratory, National Public Health Institute of Liberia

Michael Garbo, MS
Executive Director, Society for Conservation of Nature, Liberia

Anne Laudisoit, PhD
Senior Scientist, EcoHealth Alliance, United States of America

Bode I. Shobayo, MSc
Research Scientist, Division of Medical and Public Health Research, National Public Health Institute of Liberia

2. DESCRIPTION OF RELATIONSHIP BETWEEN PROJECT AND CURRENT RESEARCH EFFORTS OF FOREIGN RESEARCH TEAM

PI William Karesh is the Technical Lead on USAID's PREDICT project. Since 2015, PREDICT's Ebola Host Project has operated in Liberia, sampling thousands of wild animals and discovery new viruses in circulation in some of these populations. Co-PI Jonathan Epstein and James Desmond support this project through field sampling, scientific oversight, and project management.

Co-PI James Desmond is an American citizen living in Liberia. He has worked closely with Mosokah Fallah, Fatorma Bolay, John Dogba, and Bode Shobayo, as well as with the director of NPHIL, Tolbert Nyasewah, on the Ebola Host Project since 2015.

Co-PI Ellen Carlin and Catherine Machalaba worked most recently with the National Public Health Institute of Liberia in 2018 to develop a global health security gaps analysis. We engaged NPHIL, the Ministry of Health, and the Ministry of Agriculture in a roundtable to support data and information gathering for this project. We also worked with Co-PI James Desmond on this analysis.

Catherine Machalaba is a policy research on the project, "Forest Health Futures, Liberia," which launched in Liberia in 2019. Ms. Machalaba is working with James Desmond and key partners (e.g., Liberia's Forestry Development Authority, NPHIL, Environmental Protection Agency of Liberia) on applied research to understand the bioeconomics of forest resources and how they relate to human health and conservation.

Through the USAID PREDICT project in Liberia, Ms. Machalaba works closely with the country's One Health Coordination Platform to evaluate operational strategies for cost-effective risk reduction measures.

3. FACILITIES, EQUIPMENT, AND OTHER RESOURCES

EcoHealth Alliance, New York, USA
EcoHealth Alliance is an NGO that specializes in scientific research on the causes, origins and spread of zoonotic emerging diseases. EcoHealth Alliance scientists have been working on spatial modeling of zoonoses for over 15 years, and on modeling of infectious disease emergence and spread for over a decade. EcoHealth Alliance is based in New York City with 10,000 square feet of office space. The scientific staff (31 core scientists, 100+ field staff) is supported by a core admin staff of 18 who are available for work on this project and funded through foundation and federal support. EcoHealth Alliance does not support diagnostic facilities at its core headquarters and works in partnership with a network of leading diagnostic labs in the USA and around the world.

EcoHealth Alliance is equipped with fiber optic Internet access and video conferencing facilities to facilitate easy communication between collaborators. EcoHealth Alliance employees have around the clock access to servers, VPNs, encryption software, IT support, and all necessary software including Git and Github (hosted software revision/audit service), Sublime and Vim text editors, Vagrant and Oracle Virtualbox virtual machines, Google Apps (hosted email and collaboration web based software), Ansible (server provisioning software framework), Python, NodeJS, and R programming languages, Meteor (Javascript framework), Bash shell scripts, Jenkins (continuous integration server), Microsoft Office and Adobe CS6 running on both Apple Mac OS X, Ubuntu linux, and Windows Operating Systems. Additionally, EcoHealth Alliance has a dedicated quad-core Linux server and another dedicated dual quad-core Mac Pro Server - each with 4TB hard drives. Either server individually or in combination may be used for intensive computational modeling and/or database processing by all the grantees. Access to the cloud and supercomputing services (Amazon) is provided by core funding to EcoHealth Alliance.

EcoHealth Alliance is the headquarters of a global network of over 70 partners that

provides exceptional leverage for the core scientists. This network includes staff from: intergovernmental agencies (WHO, OIE, FAO, DIVERSITAS, IUCN); locally-based wildlife conservation organizations in Asia, Africa and Latin America; infectious disease surveillance laboratories including BSL-3 and -4 laboratories; and scientific institutions. EcoHealth Alliance is the headquarters of the One Health Alliance of South Asia (OHASA); the Consortium for Conservation Medicine (CCM); the journal *EcoHealth*; an NSF Research Coordination Network (EcoHealthNET); the IUCN Wildlife Health Specialist Group; and the OIE Wildlife Health Network. EcoHealth Alliance is a member of the IUCN and Columbia University's Center for Environmental Research and Conservation (CERC), so that many scientific staff are adjuncts at Columbia University's E3B Department, or in the Mailman School of Public Health.

National Public Health Institute of Liberia
National Public Health Institute of Liberia (NPHIL) is an autonomous agency of the Government of Liberia. In 2016, through an Act of the Legislature, NPHIL was established to collaborate with and strengthen the Ministry and other institutions in the health sector through the carrying out of research into public health concerns of the Nation and to provide direction for disease prevention activities. NPHIL's facilities include two campuses with the headquarters based in Monrovia, Montserrado County, and research and reference laboratories based in Charlesville, Margibi in Liberia under the Integrated Disease Surveillance and Response (IDSR) System. At the NRL, 30% of the staff are core lab technicians, 46% lab aides, and 24% lab assistants.

The Division of Public Health and Medical Research (DPHMR) is housed at the Charlesville campus and includes 91 acres with multiple research suites. DPHMR includes three research units in Microbiology, Parasitology and Vector Biology, and Nutritional Epidemiology; and have 13 scientific staff.

NPHIL has a strategic and an operational plan with support from the US Center for Disease Control (CDC), the World Health Organization (WHO) and the US National Institutes of Health (NIH).

NPHIL's Laboratory complex is located in Charlesville, Margibi County. Contained within the facility are two laboratories: the National Public Health Reference Lab and the Medical and Public Health Research lab. The reference lab is responsible for confirming surveillance samples for priority diseases in Liberia and has three sections, namely; molecular, serology and microbiology suites. The Public Health and Medical Research labs are involved with Ebola research in collaboration with the NIH/PREVAIL and studies in Malaria, AMR and Nutritional Epidemiology and also being conducted in these labs. NPHIL's laboratory complex hosts two BSL-2 suites and a BSL-3 lab is currently being completed for work on MDR-TB and other level 3 risk pathogens. The complex is equipped with uninterrupted power supply from one 250 KVA generator and three backups (One 220KVA and two 155 KVA).

Significant equipment at the NPHIL facilities include ELISA plate readers and washers (2), light-cycler real-time quantitative PCR machines (2) conventional PCR

machines (2), GeneXpert Real-time PCR (6), CO_2 incubator (5), class II biosafety cabinets (6), Illumina MiSeq (1), liquid nitrogen (LN2) tanks (3) and a 30 liter per day LN2 generator. Other available equipment includes, gel electrophoresis equipment, conventional microscopes, table top centrifuges, microfuges, Autoclaves, Water distillers, refrigerators and freezers, Millipore Direct Q water purification system, weighing balances and PAPR equipment and chargers.
Trained and competent laboratory staff include seven junior scientists and eight laboratory technicians with proficiency in varying laboratory techniques such as PCR, RT-PCR, serology, blood processing and DNA/RNA extraction, DNA/RNA sequencing and Microbiology.

Liberia Chimpanzee Rescue and Protection
Liberia Chimpanzee Rescue and Protection (LCRP) is an NGO operating in Liberia with a US based 501c3 affiliate. LCRP is one of the leading animal welfare and conservation organizations in Liberia focused on protecting and conserving wildlife, primarily chimpanzees. LCRP has a staff of 22, mostly dedicated to chimpanzee care. One of the co-directors, Dr. James Desmond, DVM, MS, is a veterinarian specializing in great ape health and zoonotic disease research.

LCRP currently operates on the grounds of the National Public Health Institute of Liberia (NPHIL) and has an MOU with the Society for the Conservation of Nature of Liberia (SCNL) and close relationships with the other prominent conservation and public health NGOs operating in the country such as: Conservation, Fauna and Flora International, and Wild Chimpanzee Foundation. In addition, LCRP works very closely with several government entities such as the Forestry Development Authority, Ministry of Agriculture, and NPHIL.

LCRP has four vehicles that are capable of handling the difficult road conditions present in Liberia, several laptop computers, various medical supplies and equipment, and shares office space and facilities with SCNL in Monrovia.

Society for the Conservation of Nature of Liberia
The Society for the Conservation of Nature of Liberia (SCNL) is an accredited, non-governmental organization based in Monrovia, Liberia that serves as the oldest, most well respected, and important civil service organization devoted to the environment and conservation in Liberia. With over 50+ staff based in the office and in the field, SCNL has had an enormous impact, and has been the driving force behind many conservation efforts in the country.

SCNL partners with numerous international NGO's including the Wild Chimpanzee Foundation, Conservation International, Fauna and Flora International, Liberia Chimpanzee Rescue and Protection, Rainforest Trust, EcoHealth Alliance, World Resources Institute and Birdlife International. SCNL's experience as the implementing partner of PREDICT Liberia has placed the organization at the forefront of a new paradigm within the public health sector in Liberia. In the post-Ebola environment, Liberia has adopted a One Health approach to public health and

because SCNL has played such an important role in operationalizing and promoting this new paradigm, the organization has positioned itself as a leader in the field.

Society for the Conservation of Nature of Liberia (SCNL) is equipped with the necessary equipment and facilities to conduct fieldwork throughout Liberia. Located in Congo Town a suburb of Monrovia, SCNL has easy access to vendors in order to procure supplies. SCNL has several 4WD vehicles able to handle Liberia's rough terrain. SCNL is equipped with 4 Stirling Ultracold portable -86°C freezers, 2 dry shippers to maintain cold chain, 3 mobile centrifuges for use in the field, various sized mist nets, 2 harp traps for catching bats, and a label printer for labeling cryovials. SCNL also has a warehouse built from a converted shipping container and other basic equipment needed to conduct proper field work.

University of Nebraska Medical Center, Omaha, Nebraska, USA
The University of Nebraska Medical Center (UNMC) is a vital enterprise in the nation's heartland and has mission to improve the future of health care in Nebraska and beyond. As Nebraska's only public academic health sciences center, UNMC is committed to the education of a 21st century health care work force, to finding cures and treatments for devastating diseases, to providing the best care for patients, and to serving our state and its communities through award-winning outreach. UNMC is one of four campuses that make up the University of Nebraska system. UNMC has six colleges, two institutes and a graduate studies program, serving nearly 4,000 students in more than two dozen programs. No laboratory research for this project will occur at UNMC; project datasets accessed from UNMC computers will be password protected and secure connections such as VPN will be used when accessing the data from off-site.

The recently established UNMC Global Center for Health Security (GCHS) is one of the nation's primary biosecurity resources for training, education, research, and clinical care. The Center has become the focal point of state, national and international collaborations having created a spectrum of biosecurity and biodefense services to help prepare for natural and man-made disasters. The network of experts helps to advance the coordinated, interdisciplinary development of new research and clinical practice and to disseminate innovative approaches to keep communities safe from epidemics and to counter weapons of mass destruction.

UNMC The GCHS provides a unique platform for health system preparedness, awareness, recognition, and response for public health and hospital emergencies. With a comprehensive capability in research, education & training, and health system operations, we strive to facilitate 21st-century care for public health emergencies in all environments. Below are some of the centers and initiatives that fall under GCHS:

- Nebraska Biocontainment Unit (NBU). A collaborative project involving the University of Nebraska Medical Center & Nebraska Medicine (UNMC/NM), as well as the Nebraska Department of Health and Human Services
- National Training, Simulation and Quarantine Center (TSQC). Selected as the National Training, Simulation, and Quarantine Center in 2017. This $20 million

HHS-funded capability will be home to the National Disaster Medical System & CStars ID training programs, and includes

- Nebraska Drug Development Pipeline. Collaboration among the Department of Defense, the National Strategic Research Institute (NSRI), the University of Nebraska-Lincoln, UNMC, and the pharmaceutical industry to develop new therapeutics and radiation countermeasures, products not currently prioritized for development.
- Nebraska Mobile Genomics Unit. Able to respond to a public health emergency by providing genomic characterization of the pathogen at the site of the outbreak.
- U.S. Air Force Center for the Sustainment of Trauma and Rediness Skills (C-STARS). First C-STARS infectious disease program dedicated to developing protocols, best practices, and training for USAF medical personnel in the care and transport of individuals with active or suspected HCI

Georgetown University, Washington, DC, USA
The Georgetown University Medical Center (GUMC) consists of a nationally-ranked School of Medicine (SOM), School of Nursing & Health Studies (NHS), Lombardi Comprehensive Cancer Center (LCCC), and Biomedical Graduate Research Organization (BGRO). GUMC is home to more than 400 basic and clinical research scientists, and 300 active clinical trials. Clinical care is provided at Medstar Georgetown University Hospital (MGUH) and satellite clinics through a partnership with MedStar Health, Inc. The Georgetown University Medical Center is the largest and most prominent Catholic medical center in the country.

All research staff at Georgetown University have exclusive use of PC-based desktop computers with extended RAM, significant GB hard disk space, dual-color flat-panel LCD monitors, and high-speed HP laser printers. Investigators will also have access to exclusive access to Macbook Pro or Dell laptops. Available software for desktop and laptop computers used for the project includes WINDOWS and Mac operating systems, MS-Office 2010, SPSS 20.0, and SAS 9.3. Study personnel will have full Internet and e-mail access; will be networked to shared, secure drives for data access; and will have full communication capabilities through the use of phone, fax, and email. GUMC provides complete hardware, software, and network support through its University Information Systems department. Box is also available for secure storage and access of files and folders on the Internet enabling the user to access files from any available computer with a web browser and Internet connection. All study investigators have secured private offices and study personnel also have office space. All investigators have access to conference rooms with video and teleconferencing equipment.

Dr. Standley has completed on-line certification from the IRB and NIH related to protection of human subjects in research. Georgetown University Policy on Protection of Research Data Standard operating procedures regarding data protection and patient confidentiality have been adopted throughout the institution. Office spaces, databases, and e-mail usage all have specific security requirements. The University and Medical

Center recently launched a new effort regarding protection of patient data. Dr. Standley and other members of the research team will attend relevant seminars/trainings.

Biostatistics & Bioinformatics Shared Resource (BBSR) provides basic, translational, clinical and population science investigators with access to high quality statistical science and informatics. BBSR functions include: study design; statistical analysis and reporting of research studies including clinical trials, studies with high dimensional "omics" and imaging data including pathway analysis; review and monitoring of clinical protocols through membership on the Protocol Review and Monitoring System and Data and Safety Monitoring Committees; and provision of biostatistics and informatics training and expertise in the collection, integration, management, and application of biomedical data. In addition, the BBSR provides investigators with advanced statistical and bioinformatics methods and expertise developed independently by BBSR faculty. The BBSR has excellent computing resources, informatics systems, and informatics and statistical software necessary for efficient and effective support of research. BBSR supports the development of the information architecture for connecting data and metadata from clinical, biospecimen, and research systems to enable all forms of research.

4. PLANNED WORKSHOPS: TOPIC, IMPLEMENTER, AND TIMELINE

All trainings to be conducted in Monrovia, Liberia or at field sites in Liberia.

Description	Lead	Timeline
Workshop 1a: All participants **Overall study protocol** *Half-day review of entire research design and anticipated outputs during kick-off meeting* • Overall research study protocol	Billy Karesh/ Ellen Carlin (EHA)	At Kickoff
Workshop 2a: Task 2 personnel, Task 4 personnel, students **Human subjects** *Two-day didactic workshop targeted to all personnel engaged with human subjects at clinical and field study sites and others who will handle human data* • Overview of human study protocol and project aims • IRB/human subjects research protocol • Ethical considerations and practices for conducting human research • Recruitment, consent, and enrollment of human subjects • Patient questionnaire and administration • Community safety during sample collection • Ethical practices for storing and conducting human research data and analysis • Transport protocol	Emily Hagan (EHA) James Desmond (LCRP)	Mid Y1 End Y3
Workshop 3a: Task 3 personnel, students **Biosafety and biosecurity**	Michael Wiley (UNMC)	At kickoff Mid Y1

One-day didactic and hands-on workshop in adherence to core principles and requirements for safe and secure sample handling and management (based on written DTRA requirements and BMBL 5th Edition Sections III-VI) • Biosafety and biosecurity • Sample storage and disposition		Y3 refresh
Workshop 3b: Task 3 personnel, students **Laboratory techniques** *Four-day didactic and hands-on intensive training in multiplex real-time PCR, and refresher training on singleplex PCR and ELISA serology* • real-time PCR testing and analysis • NGS testing and analysis • Serology testing and analysis	Michael Wiley (UNMC)	At kickoff Mid Y1 Y3 refresh
Workshop 4a: Task 4 personnel, students **Animal subjects** *Two-day didactic and hand-on training in ethics in animal research, personal protection during animal and sample handling, and storage and transport requirements* • Overall animal study protocol • IACUC/animal subjects research • Personal protective equipment • Transport protocol	James Desmond (LCRP)/ Ellen Carlin (EHA)	At Kickoff Y3 refresh
Workshop 5a: Task 3 and other interested personnel **Lab data analytics** *Three-day training workshop for results interpretation from all diagnostic testing modes used in project protocol* • Results interpretation • Bioinformatics	Michael Wiley (UNMC)	Y2
Workshop 6a: All personnel, other invited ministries relevant to risk and impact management **Risk reduction** *Four-day stakeholder workshop, especially those working on publications and policy and program implementation, to focus on analyzing project data and designing risk reduction and reporting changes* • Questionnaire and diagnostic data analysis (statistical methods, data analysis, and interpretation) • Reporting (national and international) • Economic analysis • Risk reduction strategies	Catherine Machalaba (EHA)	OY2

Annual training timeline:

Trainings	**Y1**	**Y2**	**Y3**	**OY1**	**OY2**
Workshop 1a: Overall study protocol					
Workshop 2a: Human subjects					
Workshop 3a: Biosafety and biosecurity	2x				
Workshop 3b: Lab techniques	2x				
Workshop 4a: Animal subjects	2x				
Workshop 5a: Lab data analytics					
Workshop 6a: Risk reduction					

5. FOREIGN PI AND KEY PERSONNEL LETTERS OF COLLABORATION

See next page.

National Public Health Institute Of Liberia

Preventing and Controlling Public Health Threats

Office of the Deputy Director General
for Technical Services
Ref. No:NPHIL/RL/MPF-DDGT/088/'19

July 23, 2019

To: DTRA C-WMD Thrust Area 6 Program

This letter signifies my commitment to support the proposal, *Reducing the threat from high-risk pathogens causing febrile illness in Liberia.*

I strongly support this project. It is designed to build on significant investment already underway in Liberia to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

My own experience directing and overseeing the National Public Health Reference Laboratory and the Public Health Diagnostics and Research Laboratory in Liberia are directly relevant to the project objectives.
My academic and professional background in epidemiology, bio surveillance, case management and community mobilization equip me with both the technical skills and contextual perspective needed to ensure that this project meets mutual goals for Liberia and for the U.S. funder.
My oversight will make certain that all of the research being undertaken in the field and in NPHIL's laboratories meet Liberia's specific priorities for research and capacity building.

I am looking forward to being co-Principal Investigator and ensuring a successful outcome for the project.

Best regards,

Mosoka P. Fallah, PhD, MPH, MA

Michael Garbo
Executive Director
Society for Conservation of Nature of Liberia
Congo Town, Monrovia

July 23, 2019

To: DTRA C-WMD Thrust Area 6 Program

This letter signifies my commitment to support the proposal, *Reducing the threat from high-risk pathogens causing febrile illness in Liberia.*

I strongly support this project. It is designed to build on significant investment already underway in Liberia to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

My own experience as Executive Director of the Society of Conservation of Nature of Liberia is directly relevant to the project objectives. My experience overseeing and implementing multiple conservation projects and most recently the USAID funded PREDICT project provides me with the requisite experience to ensure the project meets the goals set forth in the proposal. My involvement will ensure that the wildlife surveillance component of this project will be professionally executed in the field and financially.

Sincerely yours,

Mr. Michael F. Garbo
Executive Director/SCNL

Liberia Chimpanzee Rescue and Protection
rescuing chimpanzees in need to keep wild chimps wild

July 24, 2019

To: DTRA C-WMD Thrust Area 6 Program

This letter signifies my commitment to support the proposal, *Reducing the threat from high-risk pathogens causing febrile illness in Liberia.*

I strongly support this project. It is designed to build on significant investment already underway in Liberia to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

As the Country Coordinator of PREDICT Liberia and over a decade conducting fieldwork around the world on zoonotic disease surveillance, my experience is directly relevant to the aims of this project. As the Co-Director of Liberia Chimpanzee Rescue and Protection as well as a consultant for many international conservation and public health I have a great deal of experience overseeing and implementing successful zoonotic disease surveillance projects in wild animal and domestic animal populations under a variety of settings and cultures. Having resided in Liberia for the past four years, I have built strong professional relationships with most of the principals involved in this project and have a very good understanding of Liberia's public health landscape. LCRP's involvement will ensure successful implementation and execution of this project.

Sincerely,

Dr. James S. Desmond DVM, MS
Co-Director, Liberia Chimpanzee Rescue and Protection

University of Nebraska Medical Center

From: Claire J. Standley, PhD

This letter signifies my commitment to support the proposal, *Reducing the threat from high-risk pathogens causing febrile illness in Liberia.*

I strongly support this project. It is designed to build on significant investment already underway in Liberia to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

Georgetown University is a leading academic and research institution in the USA, with multiple schools and departments contributing to a strong cross-campus research agenda that encompasses various aspects of public health and migration. The Center for Global Health Science and Security consists of a multi-disciplinary team that focuses on research to support capacity building for preparedness and response to public health emergencies and expertise in translating public health evidence into actionable policies and practices for decision-makers.

My own experience with health systems strengthening, with an emphasis on prevention and control of infectious disease in both humans and animals is directly relevant to the project objectives of building Liberian capacity for high consequence zoonotic pathogen surveillance associated with human acute febrile illness. I have extensive experience in international capacity building for public health and One Health efforts.

Sincerely,

Claire J. Standley, PhD
Assistant Research Professor
Center for Global Health Science and Security
Georgetown University

REPUBLIC OF LIBERIA
MINISTRY OF HEALTH
P. O. BOX 10-9009
1000 MONROVIA 10, LIBERIA
WEST AFRICA

Office of the Deputy
Minister for Planning
Research & Human Development
Ref. No.:

MOH/GOL/AVT-DMP/786/*19

July 24, 2019

To: DTRA C-WMD Thrust Area 6 Program

From: Ministry of Health, RL

This letter signifies the Libera's Ministry of Health commitment to support the proposal, *Reducing the threat from high-risk pathogens causing febrile illness in Liberia.*

The Ministry of Health pledged her support to this project which is designed to build on significant investment already underway in Liberia to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. This initiative will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

The Ministry of Health will work with the National Public Health Institute of Liberia (NPHIL) on this project via a memorandum of understanding to implement the human clinical element of the present study by providing personnel to execute the study protocol at county hospitals. For the first three years, the study sites will be Redemption Hospital in Monrovia (a public hospital) and Phebe Hospital in Bong (a private hospital that received public funding from our ministry).

Sincerely,

A. Vaifee Tulay
Deputy Health Minister for Policy Planning, Research and M&

nurses empowering nurses worldwide

July 17, 2019

To: DTRA C-WMD Thrust Area 6 Program
From: Nursing for All

This letter signifies my commitment to support the proposal, *Reducing the threat from high-risk pathogens causing febrile illness in Liberia*.

Nursing for All (NFA) strongly supports this project as relevant to the health needs of Liberia itself and the surrounding region. The project effectively leverages work that has already been accomplished in Liberia to augment country capacity for surveillance, detection, and reporting of infectious diseases. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced to prevent the next Ebola crisis. The project is highly likely to advance that goal, while furthering our knowledge of zoonotic infectious diseases of epidemic potential.

NFA's six years of experience with nurse capacity development in Liberia will be germane to this project as we assist in training and coordinating hospital personnel to collect the samples this project needs. NFA has operated in Nimba County since our inception and is delighted to support a project so relevant to the concerns of nurses currently practicing in that county.

Sincerely,

Laura Jean Ridge, ANP-BC, AAHIVE
Founder
Nursing for All

---

6. GUIDELINES AND PROTCOLS FOR HUMAN AND ANIMAL SUBJECTS RESEARCH

For human subjects research, our protocols will align with PREDICT protocols with which our in-country teams have been complying for four years. They will be modified to reference the specifics of this project's IRB (as opposed to PREDICT's IRB).

- 5.4 Human Syndromic Surveillance (see next page)

Brian Bird, UC Davis
David Wolking, PREDICT Operations Officer
Tracey Goldstein, PREDICT Pathogen Discovery Lead
and the PREDICT One Health Consortium

Objectives: To safely and ethically collect biological samples and data from humans in clinical settings.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

The authors assert that human surveillance and sampling should always occur in compliance with all applicable laws and regulations and should only be undertaken after securing all necessary permits and approvals, including ethical approvals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

Procedures for Patients in Hospitals and Clinics

References and Appendices

Section 5.4.1. Confirmation of Knowledge

When you are familiar with the information in this guide, take the PREDICT quiz ***Section 8.4.12. Human Syndromic Surveillance***.

PREDICT team members involved in the human surveillance activities described in this guide must be familiar with PREDICT's Institutional Review Board (IRB)-approved Master Protocol and related IRB obligations and should take and pass the quiz ***Section 8.4.18. PREDICT IRB Compliance and Monitoring***.

Section 5.4.2. Ethical and Training Considerations

All PREDICT activities involving human subjects must adhere to the most up-to-date version of the Master Protocol that has been approved by the UC Davis Institutional Review Board (IRB). The Master Protocol is available online through the PREDICT Operating Procedures e-Book under "Section 5.3" (https://eidith.org/Resources/PREDICTOperatingProcedureseBook.aspx). In addition, PREDICT activities involving human subjects may only be initiated after obtaining ethical approval from country institutional review boards.

Before implementing human subjects research related activities, documentation of all necessary country approvals along with attestations of trainings and adherence to ethical standards must be provided for review to UCD, and the UCD IRB as appropriate. These include

1) documentation of local IRB/ethical approvals and all approved documents (including the consent form and human questionnaire translated into the local language and any additional introduction letters and recruitment scripts planned for use);
2) completion of CITI training for all personnel listed on the country protocol (with training events documented in EIDITH);
3) training of project staff in procedures outlined in this SOP (with training events documented in EIDITH);
4) identification and documentation of local institutional biosafety committee (IBC) requirements (if any);
5) a consultation from a local expert summarizing risks to the area; and
6) an attestation that all personnel will adhere to USA and local government federal and state regulations regarding protection of human subjects research.

A checklist with both country IRB preparation guidance and post country IRB approval procedures relating to UC Davis IRB authorization has been created to assist country teams with this process (Appendix 1). Please review this checklist when preparing your application for

country IRB submission and to guide the final UCD IRB authorization process following local IRB approval. **The UC Davis IRB must approve each country's protocol before local activities are initiated.**

Effort will be made in all recruitment, consent, sampling, and interview activities to assure potential participants that their **participation in the study is completely voluntary** and that all information shared with researchers will be kept confidential. Every effort will be made to avoid coercion and ensure the privacy, respect, dignity, and freedom of each participant.

PREDICT staff named on the country protocol must complete Collaborative Institutional Training Initiative (CITI) training in human research ethics for biomedical researchers. In addition, PREDICT staff listed in the country protocol will need to ensure proper training of hospital/clinic POC(s) in study procedures, including recruitment, enrollment, informed consent, and sample collection, to ensure compliance with our Master IRB protocol and PREDICT practices.

When the staffing and implementation plans have been established, a plan should be developed to train clinic and hospital staff on protocol procedures to ensure implementation of agreed upon study design. Consideration should be given to how information will be presented, as not every facility staff member will need to know every detail of the PREDICT plan.

Section 5.4.3. Partnerships with Participating Health Facilities

Symptomatic patients will be recruited for syndromic surveillance in collaborating health facilities that have a catchment area that includes high-risk communities and PREDICT field sites where linked animal and human samples are being collected concurrently.

Syndromic surveillance of patients presenting to health facilities is necessary to identify symptomatic individuals. In order to optimize the chances of accessing the most relevant acute symptomatic individuals presenting at health facilities, appropriate selection and engagement of health facilities is key. While each individual site will require a slightly different approach, teams can be guided by the following methodology when looking to engage and maintain relationships with their sites in each country.

Assessment of the Health Facility

After initial engagement with key personnel, teams will need to work collaboratively with health facility personnel to consider the most optimal way to engage with clinical, laboratory and professional staff. A short form to assist with initial assessment of potential partners for syndromic surveillance is attached in Appendix 2 (Health Facility Screening Form).

Understanding Patient Flow

A thorough review of patient flow from arrival at the facility to discharge should be done by country teams through scoping site visits including:

- Where do patients normally present upon arrival to the facility and who would they first come into contact with for initial screening and assessment?
- What health professionals would potentially be involved in the assessment, diagnosis and treatment of individuals presenting with syndromes of interest throughout their stay at the health facility?
- If patients are not admitted to a health facility but might require follow-up care, what are the normal follow-up and discharge procedures?
- If patients are admitted to the health facility, what service units/departments might be involved in their care and treatment?

Understanding Staffing Needs

Understanding normal daily routine of staff and diagnostic practices, and identifying point of contact(s) (POC), will ensure that PREDICT procedures fit in as seamlessly as possible into the normal clinic routine.

- What is staff workload like?
- Who is your POC(s) to help identify symptomatic individuals?
- Who is your POC(s) for recruitment of appropriate individuals?
- Who may be best suited for assisting with study procedures, including sample collection and administration of questionnaire?
- Are these POC(s) likely to be the same person or different?
- What will be the best way to engage and train staff about study procedures and protocol?
- Are clinical staff skilled in proposed sampling procedures?
- How will costs for staff time at hospitals be covered and implemented?

The team should identify how PREDICT activities will fit into hospital workflow and develop an implementation plan that will need to be agreed upon with the hospital team. Decisions will need to be made about whether current hospital staff will be assigned additional duties or whether a new staff person(s) will be hired.

A detailed implementation plan, taking into consideration the following issues, should be developed with participating hospital staff:

- What are some potential barriers to implementation?
- What level of visibility and follow-up will be appropriate to keep sites engaged for the duration of the study?
- How will you maintain clear and open communication with health facility staff?
- What is the plan if key personnel involved in implementation leave the health facility?
- How will you take into consideration any known or observed differences religious/ethnic/immigration status in targeting individuals for recruitment?
- How will you monitor for adverse events?

Section 5.4.4. Patient Recruitment in Hospitals and Clinics

PREDICT targets patients that have been recently admitted to clinics and hospitals with acute conditions that match the case definitions for undiagnosed febrile syndromes of likely viral origin. **The objective of PREDICT's testing strategy is to detect novel viruses that are causing diseases in patients without a known etiology.** PREDICT testing should not overlap or duplicate diagnostic testing already being conducted at the hospital.
In communications with clinic medical staff, clinic administration and patients who might be enrolled, it is critical to note that **PREDICT's testing strategy will not directly inform on patient diagnoses or treatment. Our testing strategy is exploratory at the community level and not designed as a point of care diagnostic platform for normative (known) diseases.**
Case definitions should be reviewed closely with hospital POC(s) in advance of study implementation to identify patients for enrollment. Patients for enrollment may be identified in the emergency room, in the ward, or in the intensive care unit of each participating clinic and hospital. The POC(s) at each location should use the **clinical case definitions below** to target potential participants. Case definitions for syndromes have been standardized with those commonly used by WHO and CDC to allow national health authorities to interpret data in an international context.

Syndromic Category Clinical Case Definitions

Surveillance should be designed to target specific syndromes as appropriate in each clinical setting. Identification of relevant syndromes for each facility should be done on a facility-by-facility basis with participating partners and facility staff. Selected syndromes should reflect 1) high priority undiagnosed syndromes with likely animal origins, and 2) the clinical caseload of the hospital or clinic so that a large number of patients with targeted syndromes can be enrolled. Additionally, targeted syndromes should take into account local needs and seek to not duplicate ongoing syndromic surveillance programs by other partners at the clinic or hospital.

In larger referral hospitals with high caseloads, enrollment of patients in the PREDICT study will most likely want to focus on the following three severe syndromes and clinical case definitions to better target individuals with potentially unknown viral pathogens of concern:

1. **Severe Acute Respiratory Illness (SARI) of unknown origin:**
Acute onset of a fever greater than or equal to 38°C (100.4 °F) within the last 5 days
AND cough
AND requires hospitalization (or referral to a hospital)
AND absence of a more likely clinical explanation.

2. **Acute Encephalitis Syndrome (AES) of unknown origin:**
Acute onset of a fever (greater than or equal to 38°C or 100.4 °F) within the last 5 days
AND clinical signs consistent with meningitis, encephalitis, acute flaccid paralysis, or other

acute signs of central or peripheral neurologic dysfunction, as documented by a physician or a health-care provider
AND absence of a more likely clinical explanation.

3. **Hemorrhagic fever of unknown origin:**
Acute onset illness with a fever greater than or equal to 38°C (100.4 °F) within the last 5 days in a severely ill patient
AND clinical findings of bleeding or hemorrhage with no apparent cause
AND one or more of the following clinical findings: 1) severe headache, 2) muscle pain, 3) rash on the trunk within 3–4 days after rash onset, 4) vomiting, 5) diarrhea, 6) abdominal pain, or 7) pharyngitis, as documented by a physician or a health-care provider
AND absence of a more likely clinical explanation.

See also http://wwwn.cdc.gov/nndss/script/casedef.aspx?CondYrID=893&DatePub=2010-01-01

In smaller rural clinics, with limited diagnostic capabilities and lower patient caseloads, it may be appropriate to enroll a broader range of patients with suspected illness of unknown origin. In these circumstances, the following 2 clinical case definitions, for less severe and less specific syndromes, may be appropriate to target in addition to the severe syndromes targeted above.

4. **Fever of Unknown Origin (FUO):**
A temperature greater than or equal to 38°C (100.4 °F) for more than 24 hours as reported or measured by the patient or a health-care provider
AND absence of a more likely clinical explanation or failure to reach a diagnosis.

5. **Influenza-like Illness (ILI) of unknown origin**:
Acute onset of a fever greater than or equal to 38°C (100.4 °F) within the last 5 days.
AND cough
AND absence of a more likely clinical explanation.

Be sure to follow the most up-to-date version of the PREDICT Master IRB protocol with respect to all procedures, including recruitment, enrollment, inclusion, and exclusion criteria, and sample sizes.

Additional Enrollment Criteria and Considerations

PREDICT and hospital/clinic staff must take special care to ensure that patient recruitment and enrollment is not adversely impacting patients seeking medical care, or hindering patients' ability or willingness to seek medical care in any way. Recruitment and enrollment of patients should only occur after patients have established access to health services. Patient recruitment for this study should not be linked to patient intake or admission. Enrollment must be completely voluntary.

Eligible individuals should be recruited as soon as safely possible after presentation to the health facility, and after initial screening to ascertain whether patients meet the above clinical case definition, in order to maximize the utility of the biologic specimen collected. Successful recruitment of syndromic individuals will require monitoring of incoming patients to health facilities. Recruitment from health facilities involves many coordinated steps, involving coordination between PREDICT and health facility staff.

In addition to the clinical case syndromes identified above, inclusion and exclusion criteria outlined in the approved Master IRB protocol that must be applied to all PREDICT studies is reiterated below:

Additional Inclusion Criteria	***Exclusion Criteria***
1. Adults (18 years of age or greater) who provide informed consent	1. Individuals aged 18 years or older who refuse to provide informed consent, a parent or guardian of a child who refuses to provide consent on behalf of their child, or a child 12 years or older unable or unwilling to provide assent
2. Children (2 -17 years of age) * with an accompanying parent or guardian who is able to provide informed consent. Assent of children 12 years or older also required.	2. Adults unable to provide informed consent, including individuals with physiologically or medically induced cognitive impairments. **
3. Pregnant women	3. Children without an accompanying parent or guardian who is able to provide informed consent
	4. Children < 2 year of age
	5. Prisoners

**Children defined as 2-17 years unless the age of majority in a participating country differs. In these cases, the age range for children will be listed in the country specific IRB protocols.*

***Patients who are incapacitated and unable to provide informed consent may be enrolled if an appropriate patient representative (e.g., family member) is present, willing, and able to provide consent on the patient's behalf. If, in the course of study operations, such a patient become capable of providing informed consent, the patient will be directly consented.*

Section 5.4.5. Determining the Number of Patients to Enroll in Clinical Settings

Estimated sample sizes of patients approved in the Master IRB is a maximum of 1,620 in each country for syndromic surveillance activities over the course of the project. Any deviations from this total estimate will need to be reviewed and authorized by the UCD IRB (See Section 5.8.1b).

Patients meeting targeted case definitions should be enrolled systematically across the year so that the patient population is sampled across all relevant seasons. Monthly sample sizes throughout the year should reflect a consistent proportion of patients meeting targeted case definitions.

In general, patients should be enrolled using a quota system until approximately 20% of the participants are children < 18 years of age and 80% are adult. For larger hospitals and clinics, interval sampling will be implemented by selecting every N^{th} case at the site among those individuals who meet enrollment criteria. The interval should be determined by country teams based on an evaluation of the expected number of cases presenting at the site within a given year in order to best meet study design and sample size criteria. For example, in a large hospital with many patients meeting enrollment criteria, the first patient meeting criteria would be selected for study participation followed by selection of every 3^{rd} or 5^{th} individual (depending on the appropriate interval) until the maximum sample size is obtained.

Procedures for Patients in Hospitals and Clinics

Section 5.4.6. Overview of Procedures in Hospitals and Clinics

PREDICT and hospital/clinic staff should consider and make arrangements to conduct the following steps. These steps may need to be adjusted depending on the circumstances of each enrolled health facility. An overview is summarized below for ease of use in training PREDICT staff. Details for each procedure are described further below and in the IRB protocol.

Outline of Activities Involving Patients:

1. **Patient Triage and Intake**: Patients arrive at health facilities and present to patient triage and/or intake units. Clinic or hospital POC(S) will assess patient etiology as part of their normal routine. Following patient triage and intake, patients with presenting syndromes of interest will need to be actively referred to PREDICT POC(s). This active referral will deviate from the health facility staff's normal routine. Country coordinators will need to establish a protocol with the health facility staff prior to beginning recruitment and *ensure that this process does not negatively impact patient access to health services, or health facility workflow*.

2. **Administer Informed Consent**: Patients determined eligible via the Screening Form will be offered participation in PREDICT. Study staff will administer the informed consent form to interested patients. *No study procedures can be conducted without having first obtained informed consent.* Informed consent must happen in a private space and should not involve anyone other than research staff, the patient, a representative if the patient is incapacitated, an impartial witness if the participant is illiterate, and a

parent/guardian if the patient is a child. Once consented, the patient is considered an enrolled participant.

Note: The presence of clinical staff directly involved in patients' care during the consenting process should be construed as coercive. Patients may think they need to consent in order to continue receiving care. PARTICIPATION MUST BE STRICTLY VOLUNTARY.

3. **Collect PREDICT Specimens**: Once enrolled, PREDICT POC(s) will coordinate human biologic specimen collection. Samples may be taken concurrently when collecting samples for normative diagnostics or independently.

4. **Administer Human Questionnaire**: Study staff will administer the **standardized IRB approved human questionnaire to all enrolled participants** at a point in time that ensures patient privacy and is not disruptive to patient care. The human questionnaire must be administered to all patients from which a biologic specimen is collected.

   In clinical settings with critically ill patients, the full human questionnaire may not be possible or appropriate to administer. At a minimum, the "**Core Human Questionnaire" (pages 1-6 of Human Questionnaire)** and the **Human Hospital & Clinic Module** for Patients should be completed.

5. **Normative Diagnostics**: Throughout a patient's inpatient stay, a variety of normative diagnostics, if available, might be run by the health facility staff to determine patient etiology. If additional sampling procedures are conducted as part of normative diagnotics that do not overlap with PREDICT specimen types already collected, PREDICT may request that any unused or remaining diagnostic specimen types be saved from patients enrolled in the PREDICT study (such as cerebral spinal fluid, pleural fluid, etc) to expand the sample set for PREDICT testing.

   Once health facility staff obtain diagnostic results, patients' etiologies will be updated. This information can be used to prioritize samples for testing with PREDICT viral family protocols. If an etiology for fever or clinical syndromes is identified, samples from this patient are of lower priority, unless a novel viral infection is still suspected because the objective of PREDICT's testing strategy is to detect novel viruses that are causing disease in patients. PREDICT POC(s) will need to follow the inpatient progress of enrolled participants to know when etiologies are updated.

6. **Second PREDICT Serum Specimen Collected**: 7 days after the first sample collection or later, an additional serum sample (the discharge serum) should be obtained from participants when possible.

Section 5.4.7. Administering Informed Consent

Participation of human subjects in the study will be strictly voluntary and will require signed, informed consent. All consent discussions and procedures will be conducted in a private room or location with a trained staff member fluent in the local language. Only the PREDICT staff person/POC and the patient will be present during the consent process. Additionally, the patient's representative if the participant is incapacitated, an impartial witness if the participant is illiterate, and/or the patient's parent or guardian if the patient is a child, can be present during the consent process. CITI-trained PREDICT staff may occasionally observe consent procedures to ensure they are appropriately and thoroughly conducted.

All participants will be given an information sheet and consent form prior to being asked to participate in this study. Potential participants will review the information sheet and consent form with the PREDICT POC(s) and will be given time to ask questions. During the review, POC(s) will explain details of the study, including:

- Purpose of the study,
- Why they were selected,
- What will happen if they enroll in the study,
- Potential risks due to their participation,
- How their participation is beneficial to understanding viral pathogens in the community,
- That their participation is completely voluntary,
- How they can withdraw their participation at any time,
- How participation in the study will not interfere with, nor affect, their routine medical care in the health facility,
- How PREDICT testing is exploratory research, and not diagnostic, and this will not inform on patient diagnosis or treatment.
- Test results, these will not be directly communicated back to the participant

PREDICT Study staff POC(s) will review the consent form with participants, answering any questions participants have. It should be made clear to all participants that any data or information collected will be kept strictly confidential. Measures will be taken to ensure the respect, dignity, freedom, and privacy of each participant. PREDICT POC(s) involved in the enrollment and recruitment of participants must avoid coercion of any kind. The PREDICT representative conducting informed consent procedures will not enroll the participant in the study unless confident that the participant or his or her representative fully understands the study and all potential associated risks and benefits.

After reviewing the forms and discussing the study, individuals who agree to participate will sign and date two copies of the consent form, and the staff member conducting the consent discussion will also sign and date the consent forms. If the participant is a child, he or she will

be asked to provide assent to participate in the study and the patient's parent or guardian will sign and date the consent forms. If the patient is illiterate, the witness will sign and date two consent forms. If the patient is incapacitated, his or her representative will sign and date the consent forms. The patient will be given a copy of all consent documents.

Section 5.4.8. Brief Overview of PPE

Minimum PPE Required for Safe Human Specimen Collection
The minimum PPE used by healthcare professionals for human sampling should follow the CDC and other international guidelines for best practices and precautions.

The following are the minimum PPE requirements:

- Gloves
- Designated clothing (which may include gown, apron, long sleeve lab coat)
- Closed-toed shoes
- Eye protection (glasses or goggles), face mask or shield

(See the PREDICT ***Biosafety and PPE Guide (Section 4.1)*** for detailed instructions regarding PPE Use.)

Section 5.4.9. Collecting Clinical Specimens

Enrolled patients who satisfy inclusion criteria as described above (with signed consent form) will be asked to provide clinically relevant biological specimens based on clinical symptoms. To ensure patient privacy, no identifying information from patients will be stored with, or paired with, biological specimens or test results.

Patients should be enrolled with specimens and data collected within 3-5 days of onset of symptoms if possible, and not longer than 10 days after onset becase we are targeting viral etiologies. Critically, patients must have specimens collected as soon as possible after admission in order to ensure they are captured in the viremic phase and/or while they are still shedding the virus, if the illness turns out to be of viral origin. If feasible, hospitalized patients may have repeated serum samples collected at seven days after enrollment, or later before discharge.

Biological samples may only be collected by trained personnel certified by the country's authority for certification of medical professionals. All personnel collecting or handling PREDICT biological specimens must wear appropriate PPE and practice Universal Precaution procedures.

Study representatives should conduct activities in a secure location and a confidential

manner to ensure participant privacy. A barrier or private room should be utilized so that participants cannot be seen by outside observers while they are being sampled. During and immediately after sample collection, trained medical professionals and/or clinic staff will monitor specimen collection site(s) and treat any complications according to existing health facility protocols.

Summary of Clinical Specimen Types

The decisions about which specimens to collect should be based on the patient's clinical symptoms (eg. blood and oral/nasal swabs for respiratory patients;):

- 2 x Oral or Nasal or Oropharyngeal swabs - one in 500 µL VTM and one in 500 µL Trizol
- 2 x Whole blood samples - one with max of 500 µL of whole blood in 500 µL VTM and one with max of 500 µL of whole blood in 500 µL Trizol
- 2 x Serum samples - 2 x 500 µL aliquots, frozen without media
- 2 x Urogenital swab samples – one swab each in 500 µl VTM and 500 µl Trizol
  OR
  2 x Urine samples - one 500 µL urine sample each in 500 µL VTM and in 500 µL Trizol
- 2 x Rectal swabs - one swab in 500 µL VTM and one in 500 µL Trizol
  OR
  2 x Fecal samples - 0.5cc (pea size) feces in 500 µL VTM and 0.5cc (pea size) feces in 1 mL Trizol
- Additional samples or aliquots of specimens collected for standard normative diagnostic purposes by hospital staff may be requested, as appropriate and based on clinical symptoms (see below).

Whole Blood and Serum

Trained phlebotomists, doctors, or nurses will collect venous blood samples by standard venipuncture from the right or left antebrachium.

A minimum of two blood samples will be collected from each participant. Collect one sample into a vacutainer tube containing serum separator and the other into a vacutainer tube containing EDTA. For children aged 12 years or younger, collect a maximum of 6mL in each tube. From individuals aged 13 years and older, collect a maximum of 12mL per tube.

Ensure adherence to appropriate PPE while handling biological specimens.
Allow blood in the red top or serum separator tube to clot, then centrifuge. After clotting and centrifugation, aliquot a minimum of two (and up to four) 0.5 mL aliquots of serum into individual cryovials without Trizol or VTM.

From the EDTA lavender top tube, place up to 500 µL whole blood directly into 2 vials, one containing 500 µL VTM and one containing 500 µL Trizol. Mix each vial well.

Samples will be frozen immediately in liquid nitrogen and then transferred to an ultralow (-80°C) freezer as soon as possible for storage until analysis.

Note that two blood sampling events are warranted if feasible in a hospital or clinic setting, one on the day of enrollment and one seven days after enrollment or later (before discharge), to collect a serum sample only. If serologic assays are available for use for targeted viruses, a rise in IgM with convalescence might assist in establishing causality with disease syndromes.

Oral, Nasal, or Oropharyngeal Swabs

Each patient may have duplicate oral, nasal, or oropharyngeal swabs collected on the day of enrollment to the study.

Oral and nasal swabs will be collected by applying a sterile, flexible, nylon-tipped swab to the appropriate tissue and gently rubbing for 2-5 seconds. Oropharyngeal swabs will be collected by medically trained personnel by gently inserting sterile, flexible, nylon-tipped swabs into the pharyngeal cavity for 2-5 seconds and rotating while removing, as is done for diagnostic procedures.

Place each swab into its own vial, one containing 500 µL VTM and one containing 500 µL of Trizol, mix each tube well, and freeze immediately.

Rectal Swab or Feces

Rectal swabs will be collected by gently inserting 2 sterile, flexible, nylon-tipped swabs into the anal canal, moving them from side to side, and rotating while removing. Place each swab into a vial, one containing 500 µL VTM and one containing 500 µL of Trizol. Mix each tube well and freeze immediately.

If patients are to provide a stool sample instead, they will be provided containers labeled with their individual ID number and instructions on how to collect an uncontaminated fecal sample, including appropriate guidelines for hand washing after sample collection.

Add 500 µL (a pea-sized piece) of feces directly into each of two vials, one containing 500 µL VTM and one containing 1ml Trizol. Mix each tube well and freeze immediately.

Urogenital Swab or Urine

A urine sample will be collected in a sterile universal container. Patients will be provided containers labeled with their unique ID numbers and instructions on how to collect an uncontaminated urine sample, including appropriate guidelines for hand washing after

sample collection.

Add up to 500 µL of urine directly into each of two vials, one containing 500 µL VTM and one containing 500 µL Trizol. Mix each tube well and freeze immediately.

If urine can't be obtained, collect two urogenital swabs and place into two vials, one containing 500 µL VTM and one containing 500 µL of Trizol. Mix each tube well and freeze immediately.

Additional Samples

For hospitalized patients, PREDICT also may receive remnants or aliquots of appropriate clinical specimens that have already been collected for diagnostic purposes. PREDICT testing should be conducted on remaining sample aliquots only after standard diagnostic procedures have been completed to ensure PREDICT activities do not interfere with patient care. These samples may include urogenital swabs, cerebral spinal fluid (CSF), pericardial fluid, pleural fluid, ocular swabs, or others. PREDICT should collect these remnants or aliquots in keeping with the respective participant's clinical symptoms, for instance, pleural fluid would be sourced from participants with respiratory distress, CSF from participants with encephalitis, etc. These samples can be frozen at −80 °C without Trizol or VTM. If additional PREDICT analyses are done on hospital diagnostic screening samples, results will not be communicated to patients or participating health facilities.

Section 5.4.10. Medical History and Behavioral Risk Data Collection in Clinical Setting

All enrolled patients will complete the required elements of the ***Human Questionnaire*** and the ***Human Hospital and Clinic Module for Patients***. If appropriate given the clinical setting and patient condition, the full PREDICT Human Questionnaire with all relevant modules can be completed.[1]

Questionnaire data will be collected by trained staff in a strictly confidential manner. Individual interviews will be conducted in private with no other individuals within a 10-foot distance, ensuring that others cannot hear the interviews. A barrier will be created so that no other individuals can view the participant while they are in their interview. Staff will take care to pair interviewers and respondents by sex to ensure protection of women and children and privacy

[1] To access the Human Questionnaire and desired module bubble forms, log in to EIDITH at https://connect.eidith.org/. Click the "Download Bubble Forms" button and select "Human Questionnaire" under the Choose Type drop-down menu. Select the Questionnaire or module you wish to download, indicate the number of forms you would like, and press "Submit." When prompted to do so, click on the word "here" to download your form/s. Additional instructions for completing and uploading the forms may be found in the Videos and Instructions menus on the connect.EIDITH.org dashboard.

and confidentiality of responses. Children will not be interviewed in the absence of a parent or guardian.

As many questions are sensitive in nature, the presence of support persons may make it difficult for participants to feel comfortable answering questions honestly. PREDICT POC(s) should liaise with clinical staff and family members for critically ill participants, as appropriate, to determine the most patient-centered means of collecting sensitive data, while still maintaining the accuracy of the data collection methods.

Where participants are intubated and unable to communicate verbally, but alert and appropriately communicative, POC(s) may administer the human questionnaire using paper and pencil with participants, if possible. Where patients are sedated and/or comatose, a shortened version of the questionnaire may be completed with a family member or substitute decision maker, if deemed appropriate by all parties. The human questionnaire must be completed if a biologic specimen is drawn; therefore, if the POC(s) is unable to complete the questionnaire for any reason with a participant, they will be excluded from the study. In all instances, the decision to complete the human questionnaire with critically ill individuals must weigh the benefits and downsides with family/friends, clinical staff, and the research team. The POC(s) must also consider patient privacy in immobile or critically ill participants and deem if there is appropriate space in which to conduct the questionnaire to ensure privacy and confidentiality.

Participants may be given a small token of appreciation for participation in the study that is appropriate with local culture and customs and valued at no more than $10 USD. Local research teams will determine the most appropriate item to give as a token of gratitude to research participants. This item should be given to participants after consent and baseline sampling and interviews are complete.

Section 5.4.11. Record Maintenance and Ensuring Participant Privacy

A study participant log should be maintained at each site to track participant enrollment. Information on new participant enrollments should be added to the log in a timely fashion after their consent; the enrollment of pregnant women and children, in particular, should be noted. If, after signing a consent form, a participant decides that they wish to withdraw from study activities, this information must be recorded in the participant log. In addition, each site may wish to maintain a confidential linking log that links participant names to their unique identification number; this log should also be maintained in an up-to-date manner, with information on study enrollees added shortly after their consent. An example participant log is attached in Appendix III.

No identifying information from patients will be stored with or paired with questionnaire data, biological specimens, or analytical test results. Further, identifying information must not be stored electronically and must be stored securely in locked drawers or cabinets in areas accessible only by PREDICT staff. When questionnaires are moved to the country headquarters,

they will contain only coded data to ensure the safety and confidentiality of participants and will be maintained in a secure database. The only document that will link the participant with a unique ID number is the consent form, which will be stored in a locked file separately from participant data in the offices of the Country Coordinator.

Section 5.4.12. Reporting Results

The PREDICT team will inform collaborating partners of the aggregate patient test and behavioral risk findings as well as provide information about viral detection and zoonotic diseases detected, as appropriate. One key benefit of this study to participating clinics and hospitals is to enhance understanding of viruses that could be causing syndromes in local people but that have previously gone undiagnosed. This information will inform participating clinics and hospitals about viruses common in target patient communities and may lead to practices that could reduce exposure and health risks.

Report summaries of interpreted data generated from the project will be provided to the Ministry of Health for approval for release. Following approval for release, report summaries from the project can be shared with other in-country collaborating investigators and hospitals. Adverse events or serious adverse events will be included in report summaries provided to Ministries of Health upon request.

Section 5.4.13. Protocol Deviations, Unanticipated Problems, and Adverse Events

For complete information on protocol deviations, unanticipated problems, and adverse events, see the PREDICT Compliance and Monitoring Guide.

Protocol Deviations
Country teams and hospital and clinic POCs responsible for conducting PREDICT surveillance activities must be familiar with PREDICT's IRB protocols and knowledgeable about expected human surveillance operations. If, during the course of study activities, a team member becomes aware that any human surveillance activities have not been conducted in accordance with protocols or training guides, the team member should promptly inform the country field coordinator/human surveillance officer (if one is active in the country) or Country Coordinator about the deviation. The Country Coordinator should promptly contact the regional lead and complete any documentation, including developing any Corrective and Protective Action plans.

Unanticipated Problems
Unanticipated problems are events that are **unexpected** and **related to the research study** and that put one or more study participants at **greater risk of harm**. Unanticipated problems can include events or issues arising during standard research operations that may not cause detectable harm or adverse effects to research participants, but nonetheless raise the level of

risk associated with research participation (e.g., stolen consent forms or linking logs; breaches of privacy during research interviews). All problems meeting the three criteria above must be reported to the Operations Officer (predict@ucdavis.edu) within 24 hours (if the unanticipated problem is serious) or 72 hours (if the problem is not serious) using the form in Appendix IV.

Adverse Events and Serious Adverse Events

It is possible that during the course of study activities, a participant may experience discomfort or distress. Certain discomforts, such as pain at the site of blood collection and discomfort answering sensitive questions, are expected and detailed in the study protocol. Additional possible risks to study participation may be identified for a given site upon consultation with a local risk expert.

If, during the course of study operations, a participant reports or exhibits one of these anticipated adverse reactions to study participation (be it physical, mental, emotional, or social), that adverse reaction, or "adverse event," should be documented and reported to the human surveillance/field coordinator (if one is active in the country) and Country Coordinator promptly, but no later than within five working days (see the Reportable Information, Unanticipated Problem, and Adverse Event Reporting Form, Appendix IV). Once the Country Coordinator learns of the Adverse Event, he or she should report it to the Lead PREDICT PI (Dr. Mazet) and Operations Officer (predict@ucdavis.edu) within **72 hours**.

In the event a participant reports or exhibits a ***serious*** adverse event that is ***unexpected,*** that is likely ***related*** to study activities, and that implies the ***level of risk to all study participants may be higher than previously expected***, that serious adverse event should be reported to the human surveillance/field coordinator (if one is active in the country) or Country Coordinator within five working days. The human surveillance/field coordinator should report the event to the Country Coordinator, and the Country Coordinator should report the event to the Lead PREDICT PI (Dr. Mazet) and Operations Officer (predict@ucdavis.edu) **within 24 hours**.

The Lead PREDICT PI and Operations Officer are responsible for notifying the UCD IRB within the same time frame (72 hours for adverse events; 24 hours for serious adverse events). The Country Coordinator should report these adverse events to the in-country IRB or ethical committee if and as required to do so.

After becoming aware of any adverse event, the Country Coordinator should confer with their regional lead, the PREDICT global team, and relevant IRBs/ethical boards to determine what steps, if any, should be taken to address the adverse event and prevent similar future events.

Section 5.4.14. Site Monitoring

Each in-country team should work together in the first year to implement key procedures from the PREDICT IRB Compliance and Monitoring Guide on site monitoring and reporting (summarized in Appendix 5). Country Coordinators will be expected to work with PREDICT POCs at hospital and clinic sites to develop a regular system for transferring key study documents, reviewing records for completion, and addressing issues or concerns that arise during study activities.

As part of monitoring and reporting plans, at the completion of each surveillance period, generally on a calendar year schedule, a data and safety review will be conducted by a representative of the PREDICT global or regional management team. At this review, safety information and adverse events collected during the performance period will be discussed and addressed. Data may include case report forms, notes from study visits, and or any telephone calls to the PI from participants.

6. GUIDELINES AND PROTCOLS FOR HUMAN AND ANIMAL SUBJECTS RESEARCH

For human subjects research, our protocols will align with PREDICT protocols with which our in-country teams have been complying for four years. They will be modified to reference the specifics of this project's IRB (as opposed to PREDICT's IRB).

- 5.4 Human Syndromic Surveillance (see next page)

For animal subjects research, our protocols will align with PREDICT protocols, with which our in-country teams have been complying for four years. These protocols are listed below and, as they are very extensive, a link to access them is provided. They will be modified to reference the specifics of this project's IACUC (as opposed to PREDICT's IACUC):

- 5.2.5 Safe Animal Capture and Sampling
- 5.2.7 Bat Sampling Methods
- 5.2.8 Rodent Sampling Methods
- 5.2.9 Small Carnivore Sampling Methods
- 5.2.11 Livestock Sampling Methods

Available at: https://ohi.vetmed.ucdavis.edu/programs-projects/predict-project/publications under "Field Sampling Guides."

7. GUIDELINES FOR SAMPLE TRANSPORT

Sample transport from the animal field sites will follow established protocols from the PREDICT project, which SCNL has been implementing for four years. SCNL will also transport the human samples from the hospital sites and the field sites; we will adhere to these cold chain protocols except where necessary to modify to meet the project's specific requirements:

- 6.1 Implementing Cold Chain for Safe Sample Transport and Storage

Available at: https://ohi.vetmed.ucdavis.edu/programs-projects/predict-project/publications under "General Information."

8. OPERATIONAL FRAMEWORK

Please see next two pages for the operational framework and mapping of performers to tasks, hypotheses, and objectives.

July 25, 2019

To Whom It May Concern:

Please find enclosed our technical proposal, ***Reducing the threat from high-risk pathogens causing febrile illness in Liberia*** **(HDTRA1-14-24-FRCWMD-BAA WMD, Grant #12819625)**. We request that this Phase II application be assigned for review by the Defense Threat Reduction Agency, Biological Threat Reduction Program Thrust Area 6—Cooperative Counter WMD Research with Global Partners.

The West Africa Ebola crisis underscored the critical need to examine etiology of acute febrile illness (AFI) toward understanding prevalence, improving in-country syndromic surveillance, diagnostic capability, and research capacities, and promoting adherence to international health security frameworks such as the International Health Regulations (2005), the Biological & Toxins Weapons Convention, and the Performance of Veterinary Services Pathway. The proposed effort is designed to test hypotheses related to the causative and underappreciated agents of AFI and is distinct from other studies in its rigorous investigation of these illnesses in the context of the human-animal interface.

With Liberian and other partners, we will identify critical weaknesses in disease detection in Liberia at clinical and laboratory stages and enable the development of updated clinical, surveillance, and reporting protocols to reduce risk. The project will support Liberia's One Health Coordination Platform (OHCP) by using an integrated human-animal approach to surveillance and detection of high-consequence zoonotic pathogens, and by ensuring that all relevant sectors are included in data sharing and training workshops. The efforts will support Liberia's priority of multi-sectoral health coordination and leverage the relationships established through the OHCP. Building on existing DTRA investments, this project will help ensure continuity of past and ongoing training and capacity building efforts. By collating results from a similar project in development for Guinea and coordinating with other in-country febrile illness studies, this work will help produce a regional picture of febrile zoonotic disease risk in West Africa that can inform U.S. and global personnel decisions in the region, surveillance efforts, and medical countermeasure investment priorities.

We thank you for your consideration of our request.

Sincerely,

William B. Karesh, DVM
Executive Vice President for Health and Policy

EcoHealth Alliance

Statement of Work

Project Title: Reducing the threat from high-risk pathogens causing febrile illness in Liberia

Document Date: July 26, 2019

Objective: This project will build Liberian capacity for threat reduction through an integrated human-animal surveillance approach to high consequence zoonotic pathogens associated with human acute febrile illness (AFI) including Ebola virus, Lassa virus, and other emerging infections. We will identify and characterize the etiological agents of infectious AFI in Liberia, particularly among patients with a history of animal contact. Many AFI causative agents may go undetected empirically by common rapid diagnostic tests or by existing surveillance platforms. We will work to mitigate this challenge through scientific discovery, hypothesis testing, and capacity building while leveraging significant U.S. government and other investment in workforce building and laboratory infrastructure. Training provided to local partners in critical biosecurity and biosafety skillsets will include: sample transport and laboratory biosafety and biosecurity; human and animal sampling approaches; performance of both routine and advanced molecular diagnostic assays; cold-chain transport implementation; and data analysis and reporting. As many emerging diseases have been inadequately studied in Liberia, this project will provide fundamental baseline knowledge of pathogens circulating and potentially causing human illness. Its outcomes will suggest opportunities for improved clinical training, tailored case definitions, and other methods to improve identification rates for especially dangerous pathogens at the index case level and prior to widespread transmission. The desired endpoint is a broad, sustainable surveillance program that enhances public and global health security.

Scope: The grantee proposes a five-year multi-disciplinary study incorporating the epidemiology, ecology, and microbiology of AFI in Liberia. The grantee team shall focus on the following major **goals** and milestones:

1. **Identify causative agents of AFI in Liberia**
    - Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia (Y1)
    - Enroll human patients and undertake sampling (Y1-3 & OY1-2)
    - Undertake sample processing and testing (Y1-3 & OY1-2)
2. **Identify evidence for zoonotic transmission of high-consequence AFI pathogens**
    - Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia (Y1)
    - Undertake sample processing and testing (Y1-3 & OY1-2)
    - Undertake preliminary animal sampling (Y1)
    - Visit communities: human-animal interface assessment, animal sampling, and human serology (Y2-3 & OY1-2)
    - Analyze data (Y2-3 & OY1-2)
3. **Identify risk factors for zoonotic AFI in humans**
    - Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia (Y1)
    - Undertake preliminary animal sampling (Y1)
    - Visit communities: human-animal interface assessment, animal sampling, and human serology (Y2-3 & OY1-2)

- Analyze data (Y2-3 & OY1-2)
- Disseminate information to stakeholders (Y2-3 & OY1-2)

Background: Limited detection and diagnostic capacity by definition results in a limited ability of clinicians and public health professionals to accurately identify infectious agents. Febrile illness can be caused by pathogens other than malaria and typhoid that may include dozens of pathogens unassessed by health providers, including hemorrhagic fever viruses; bacterial Select Agents such as *Burkholderia mallei/pseudomallei, Yersinia pestis, and Coxiella burnetti;* and any number of as-yet unknown pathogens. Because the incidence of such agents has not been assessed in Liberia, febrile illness thus presents an unquantified and undifferentiated burden to Liberian health and the health care system and continues to do so. Liberia's public health authorities do not assess incidence of febrile illness. Some studies are just beginning to assess this. Other published studies have reported on causative agents of infectious fever in other low- and middle-income countries (LMIC), including in West Africa. In low resource settings, and particularly where malaria is endemic, patients presenting with febrile illness may be treated presumptively for malaria and may not receive an accurate diagnosis. Co-infections may also be common, particularly with malaria parasites. Where studies have sought to investigate the source of febrile illness, high-risk pathogens of proliferation concern such as *Brucella*, dengue virus, and viral hemorrhagic fevers have been observed. The specific challenge for Liberian health authorities is that pathogens that result in a burden of febrile illness in the population—and the zoonotic transmission pathways that may drive it have not been systematically nor comprehensively identified.

Preliminary Data: This project will leverage more than four years of human and animal data collected during the USAID PREDICT Ebola Host Project in Liberia and in neighboring countries. To date, our team in Liberia has enrolled 585 people and sampled 5387 wild and domestic animals. That project has focused on determining the animal reservoir of Zaire ebolavirus and human behavior/activities to evaluate risk factors for spillover to people. Our research team, which included U.S. and Liberian partners, made the first discovery of the virus in a bat in West Africa. Partner discoveries have included a virus new to science, Bombali ebolavirus, in a bat in Sierra Leone. Anthropological investigation of the risk factors associated with zoonotic spillover events were also extensively addressed; data are still being collated and analyzed, but preliminary evaluation reveals trends in animal contact that vary by country, gender, age, and occupation. The data suggest that in the general Liberian population, some communities are nearly evenly split (up to 60%/40%) with members that have and do not have animal contact as defined by the survey; this informs our own study design in that it provides a sound statistical basis testing the questions at the root of our hypotheses, including whether animal contact is a risk factor for certain zoonotic febrile infections.

Most of the work of the Ebola Host Project is presently being prepared for publication. Key references available include:

Tasks/Scientific Goals: **(Format: Year #(s).Task #. Sub-task#)**

TASK 1

1.1: Establish an evidence-based research platform for assessing and addressing high-consequence pathogens in Liberia

The grantee shall oversee refinement and finalization of human and animal study protocols and data collection instruments. This stage incorporates planning and training in the protection of human subjects and animal subjects; training in laboratory biosafety, biosecurity, and safe disposal of samples or sampling materials after laboratory work (which will adhere to guidelines in the BMBL 5th edition, sections III – VI[25]); laboratory diagnostic techniques; and any necessary revisions to original sampling and testing approach based on DTRA feedback and discussion at the kick-off meeting. We will refine our human subjects data collection tools, piloting our instruments within our research network to assure validity and reliability of the questionnaires. A database will be created for secure data entry and data storage of human subjects data. MOH will assign personnel to train clinical staff and oversee study in clinics in Monrovia and Bong. NPHIL and CVL will assign personnel to laboratory. EHA and Liberian partners will host kick-off meeting in Monrovia, Liberia to which all partners will be invited. Each study partner will present on its roles and specific desired outcomes to support its agency's priorities. In addition, we will invite other researchers undertaking febrile illness and related research in-country, such as the U.S. Centers for Disease Control and Prevention (AFI study), the Walter Reed Army Institute of Research (Joint West Africa Research Group), and the Henry Jackson Foundation (sepsis study). Human subjects research and lab training workshops will occur during kick-off.

1.1.1 Refine and finalize human and animal study protocols and data collection instruments
1.1.2 Secure and finalize all research permits (human and animal) including IRB, IACUC, and national approvals in Liberia
1.1.3 Assign MOH, NPHIL, and CVL staff to field and laboratory positions
1.1.4 Host kick-off meeting in Liberia
1.1.5 Conduct Workshop 1a: overall research protocol (concurrent with Task 1.1.4)

TASK 2

1.2 – O2.2: Enroll human patients and undertake sampling

We will enroll febrile patients at two hospitals in Y1-3 and two hospitals in Y4-5 to collect blood and respiratory samples and transport them to the Liberia Institute for Biomedical Research (LIBR) for testing. Cross-sectional sampling will be used to provide a representative sample of a relatively urban or relatively rural population (depending on site) of individuals with fever. Longitudinal sampling of target populations (not individuals) across up to 2.5 years per clinical study site will maximize the opportunity for detection and possibly reveal seasonal trends in infection or other time-related changes in trends. Sampling will be based on available volume in the clinical sites but is designed to assure detection of rare pathogens and answering questions about the relative proportion of febrile illness caused by each; we are targeting 1,500 patients at the first two hospitals total, and 1,500 at the second set of sites in the option years. We will review historical and concurrent surveillance reports for the study counties and for neighboring counties as comparators. MOH will provide a locally hired on-site project coordinator to work with the hospital team and oversee the study protocol (train clinicians and nurses; be alerted when febrile patients arrive; work with hospital staff to oversee informed consent, enrollment, sample collection, and interviews). will train study staff in human subjects research and patient

recruitment; biosafety, safe and secure sample collection, handling, packaging, and transport; and implementation of the study protocol. Training will provide the principles for safe and ethical human subjects research; and project-specific teachings to ensure staff understand, practice, and can implement the study protocol (enrollment determination, informed consent, and questionnaire administration (demographic information, animal ownership), sample acquisition, data entry, and sample packaging and readying for transport).

1.2.1, 3.2.1 Conduct Workshop 2a: IRB/human subjects research

1.2.2-O2.2.2 Locally-hired project coordinator reports to hospital at each study site

1.2.3-O2.2.3 Enroll patients (continuous)

TASK 3

1.3 – O2.3: Undertake sample processing and testing

LIBR reception personnel will be briefed on the study protocol and will notify the project supervisor on receipt of the samples, at which point study-specific inventory and storage procedures will be followed. LIBR has an ABI 7000 Sequence Detection System in operation on which the laboratory scientists and technicians are well trained; a MiSeq system for NGS that is available but requires staff training; and ELISA platforms for serology. NPHIL will budget for and be responsible for ordering needed consumables throughout the project, and UNMC will provide assistance, training, and oversight. LIBR staff are already trained in real-time PCR and ELISA platforms; UNMC will refresh these skills and provide additional training via two one-week didactic and hands-on workshops Y1; another dedicated workshop in Y3; and in other years if needed via visits to the laboratory. These will cover execution of specific pathogen tests, advanced techniques (NGS), and results interpretation (including NGS bioinformatics); sample inventory management; and biorisk management. UNMC will provide oversight and mentorship through their at least twice-yearly working visits to Monrovia and the laboratory as well as video and teleconference. UNMC will leverage its additional DTRA work at LIBR (under funding consideration) to assist with skill-building among laboratory scientists and technicians there. UNMC will assess competence at each visit via a standardized evaluation form to use as a basis for targeted future training.

1.3.1-O2.3.1 Provide necessary equipment and consumables to NPHIL laboratory (continuous)

1.3.2, 3.3.2 Conduct Workshop 3a: laboratory biosafety and biosecurity, sample disposition

1.3.3, 3.3.3 Conduct Workshop 3b: laboratory sample testing techniques

1.3.4-O2.3.4 Provide continuous on-the-job training in laboratory techniques

1.3.5 Submit annual report (Y1)

2.3.6 Host workshop on results interpretation/bioinformatics

3.3.7 Host regional technical ad networking workshop

TASK 4

1.4 – 3.4 Undertake preliminary animal sampling

While laboratory training is beginning, preliminary field animal sampling will begin in Y1 with sampling in communities selected based on previous cases of AFI from historical hospital admissions trends, including some communities from which the study site hospitals draw patients. We will review a sampling of hospital records from Monrovia and Bong in search of geographic trends in AFI presentations going back three years, and begin randomized sampling

of peridomestic and wild animals in four communities identified as part of this process and continue every three months. In five-day/five-night trips we will target approximately 50 bats, 50 rodents, 50 livestock (including chickens if poultry-transmitted infection is suspected), and 10 dogs per sampling event, allowing for approximately 640 animals sampled in Y1 to include blood and oral/nasopharyngeal specimens, and feces and urine when possible. Our teams are trained in species identification, and we will also plan to barcode approximately 5% of individual bats and rodents in Y1 to improve species determination and team training. All animals will be non-lethally sampled with strict adherence to U.S. IACUC-approved protocols following those currently used by EHA scientists globally (Attachment 3) and using bat and rodent sampling protocols we developed for the PREDICT project (Attachment 3). All personnel undertaking animal sampling will be will be trained to ensure competency with a combination of didactic and practical training. SCNL will transfer samples to LIBR consistent with PREDICT protocols (Attachment 3).

1.4.1, 3.4.1 Conduct Workshop 4b: IRB/human subjects research (for animal teams)

1.4.2 Review hospital records in search of geographic trends in acute febrile illness presentations

1.4.3 Sample in communities identified as part of this process and continue every three months

TASK 5

1.5 – O2.5: Visit communities: human-animal interface assessment, animal sampling, and human serology

Animal sampling will continue in Y2, expanding to communities of enrolled patients, sampling in and around study enrollees' homes and surrounding areas; we plan to reach three communities in Y2. This task predominantly supports Hypothesis 3. It is designed to: a) assess the risk interface between people and animals; b) strategically target and sample animal species for the pathogens/antibodies they are most likely to have based on what is already known about pathogen-host proclivity; and c) enable follow-up serology on patients and their community neighbors. We will sample five communities in the catchment areas of Redemption and Phebe Hospital, targeting 400 animals per community, and the patient plus 20 neighbors per community for human interviews and blood sampling. In option years, we will target three communities with the same numbers of animal and human subjects per community.

2.5.1-O2.5.2 Review study patient records for geographic trends in AFI presentations

2.5.2-O2.5.3 Undertake sampling in and around study enrollees' homes

2.5.3-O2.5.4 Undertake sampling from broader patients' communities

2.5.4-O2.5.5 Administer human-animal interface assessment

2.5.5-O2.5.6 Collect human samples for serology

TASK6

2.6 – O2.6: Analyze data

We will compare any diagnoses established at the clinical sites to laboratory results; and compare clinical study site diagnoses and laboratory results to national weekly and monthly county surveillance records. We will estimate population in catchment areas (from where the patient population comes) to develop prevalence estimates of each detected pathogen. We will compare phylogenetic sequence data from humans and animals to identify possible shared strains and infer transmission. Using the questionnaire data comparisons of exposure variables across

varying demographics measures in study sites will be conducted to characterize high risk behaviors and statistical analysis will be employed to identify differences between groups with a 95% probability of detecting a difference. As appropriate, multivariate analysis will be utilized to evaluate the relationship between the positive biological findings and key measures of contact to evaluate the factors that influence and may have led to AFI pathogen exposure. The pathogen and human interface data collected in this study; characterization of zoonotic potential through phylogenetic analyses undertaken in this and other studies (such as PREDICT); and additional data such as available spatial, ecological, and environmental data will inform models designed to help tease correlation from causation. The data will thus provide the foundation of an OY2 risk reduction workshop. We will also compare diagnostic results for endemic agents to reports for these diagnoses in the preceding years to allow for control for any changed practices (even if subconscious) in our target counties based on the project team's presence; this will also allow for a controlled comparison of the impact on incidence of any differential diagnosis or testing interventions we may implement in OY1 and OY2. We will develop recommendations for adapted differential diagnostic protocols and testing practices.

2.6.1-O2.6.1 Undertake data analysis

TASK 7

2.7-O2.7: Disseminate information to stakeholders

We will host the annual stakeholders meeting to which we will invite all project partners as well as others doing related research in country. We will discuss preliminary data and analyses and use these to inform any needed modifications to forward sampling strategy. We will review protocols for biosafety, specimen transport, and animal handling at each annual meeting. We will provide support travel for at least one (1) Liberian scientist to present at an international conference. We will share samples as appropriate with other in-country projects to ensure synergies. We will compile and summarize research results and share with all partners and other in-country researchers as appropriate and use it to develop an annual report for DTRA. In Y3, we will broaden annual stakeholders meeting to include regional partners from Guinea and possibly other adjacent countries; share information about ongoing research; plan cross-border study for OY1. We will broaden outreach in Y3 and OY2 to communities that have engaged in sampling to share results and discuss preliminary risk mitigation strategies. Project data will provide the foundation of an OY2 risk reduction workshop at the annual meeting to engage multi-sectoral Liberian participants to review statistical evaluation of diagnostic data, identify key risk interfaces, assess economic options for prevention and control, and develop threat reduction measures. Workshop products include 1) development of priorities for refined PCR and serological tests based on study findings, 2) recommendations for an updated national surveillance and reporting strategy and plan, 3) inclusion of stakeholders (e.g., National Disaster Management Authority, the Forestry Development Authority, the Ministry of Finance) to consider options for risk and impact reduction and generate policy recommendations. We will work with MOH and MOA to develop written educational products designed for laypersons to explain project results, community impact, and risk mitigation, and thank community members for their participation.

2.7.1-O2.7.1 Host annual stakeholders meeting

2.7.2-O2.7.2 Present to DTRA at Annual Technical Review

2.7.3-O2.7.3 Submit annual report

2.7.4-O2.7.4 Share specimens if available and appropriate with other in-country researchers

2.7.5, O2.7.5 Support Liberian scientist to present at international conference
3.7.6 Host regional technical and networking workshop
3.7.7-O2.7.7 Prepare/submit up to two (2) peer-reviewed manuscripts
3.7.8, O2.7.8 Engage sampled communities for follow-up education
O2.7.9 Conduct Workshop 6a: risk reduction workshop

Cost estimate: Y1: $995,517.56 Y2: S989,251.55 Y3: S996,113.74 OY1: $962,716.26
OY2: S969,218.86

Performance Schedule:

Task	Y1	Y2	Y3	OY1	OY2
Task 1: Establish evidence-based research initiative for high-consequence pathogens in Liberia					
1.1 Refine and finalize human and animal study protocols					
1.2 Secure and finalize all research permits (human and animal)					
1.3 Assign MOH, NPHIL, and CVL staff to field and lab positions					
1.4 Host kick-off meeting in Liberia					
1.5 Conduct Workshop 1a: overall research protocol					
Task 2: Enroll human patients and undertake sampling					
2.1 Conduct Workshop 2a: IRB/human subjects research					
2.2 Local project coordinator reports to hospital at each study site					
2.3 Enroll patients (continuous)					
Task 3: Undertake sample processing and testing					
3.1 Provide equipment and consumables to LIBR					
3.2 Conduct Workshop 3a: biosafety/biosecurity, sample disp.					
3.3 Conduct Workshop 3b: laboratory sample testing techniques					
3.4 Provide on-the-job training in lab techniques (continuous)					
3.5 Submit Y1 annual report					
3.6 Conduct Workshop 5a: results interpretation, bioinformatics					
3.7 Host regional technical and networking workshop					
Task 4: Preliminary animal sampling					
4.1 Conduct Workshop 4a: IACUC/animal subjects research					
4.2 Review hospital records for geo. trends in AFI presentations					
4.3 Sample animals in select communities (preliminary)					
Task 5: Visit communities: interface assessment, animal sampling, human serology					
5.1 Review study patient records for geographic AFI trends					
5.2 Administer human-animal interface assessment					
5.3 Undertake animal sampling in/around study enrollees' homes					
5.4 Undertake animal sampling from patients' communities					
5.5 Collect human samples for serology					
Task 6: Analyze data					
6.1 Undertake data analysis					
Task 7: Disseminate research results to stakeholders					
7.1 Host annual Stakeholders meeting					
7.2 Present to DTRA at Annual Technical Review					
7.3 Submit annual report					
7.4 Share specimens if appropriate w/ other in-country researchers					
7.5 Support Liberian scientist to international conference					
7.6 Host regional technical and networking workshop					
7.7 Prepare/submit up to two (2) peer-reviewed manuscripts					
7.8 Engage sampled communities for follow-up education					
7.9 Conduct Workshop 6a: risk reduction workshop

252.601-9001 GRANTS OFFICER'S REPRESENTATIVE (GOR) (MAY 2009)

g. Grants Officer's Representative (GOR) for this Grant is:
Name: (b)(6)
Defense Threat Reduction Agency/
8725 John J. Kingman Road, MS 6201
Fort Belvoir, VA 22060-6201
telephone (b)(6)
email address: (b)(6)

b. SCOPE AND LIMITATIONS OF AUTHORITY FOR DTRA GRANTS OFFICER'S REPRESENTATIVE

1. The Grants Officer's Representative (GOR) is responsible for monitoring the technical and programmatic performance of the grant or cooperative agreement (hereinafter referred to as agreement) including compliance with the agreement's reporting requirements. Perceived deviations from the agreement's terms and conditions shall be brought to the attention of appropriate recipient personnel and if not corrected, to the attention of the Grants Officer. Deviations or other occurrences indicative of the recipient's inability or unwillingness to conform to the agreement's requirements shall be brought to the immediate attention of the Grants Officer.

2. The GOR has no authority to modify the stated terms of the agreement or specifications in any manner, or to approve any action that would result in additional charges to the Government. The DTRA Grants Officer must make all such changes in writing.

3. The GOR is authorized to correspond directly with the recipient on matters within the scope and limitations of his or her authority. All such correspondence shall be signed personally by the GOR and a copy will be furnished the Grants Officer for placement in the official agreement file.

4. The GOR will provide technical advice to the recipient to the extent such advice will not alter any of the agreement's terms and conditions or result in an increase in the estimated cost of the agreement's performance as specified in the agreement. The GOR is encouraged to discuss with the recipient new ideas related to the original scope of the agreement that may be of special interest to DTRA. The GOR should also be alert for indications that any part of the research is becoming unfruitful. If, as a result of such discussions, questions arise as to the possible need for a modification, the matter shall be brought to the immediate attention of the Grants Officer. The GOR shall not direct the recipient to undertake any action that the recipient believes to be contrary to the agreement's scope, terms or conditions without the written approval of the Grants Officer.

5. Any visits to the recipient's facilities on matters pertaining to the agreement will be documented in a brief memorandum. A copy will be provided the Grants Officer for placement in the official agreement file.

6. The GOR will maintain such work files as he or she deems necessary to properly document performance of the duties and responsibilities as a GOR. Upon completion of the agreement and delivery of all required reports, such work files will be forwarded to the Grants Officer for placement in the official agreement file.

7. In performance of the GOR's duties, the GOR shall constantly stress protection of the Government's interests. Similarly, the GOR shall avoid any act which may tend to compromise the position of DTRA, any individual member of DTRA or which will impact confidence in the integrity of DTRA with the business community.

(End of Clause)

FUNDING PROFILE:

The amount of $4,912,818.06 is obligated for work to be performed during the period beginning with grant award and continuing through May 31, 2025

The Government's liability is limited to the amount obligated

252.601-9001 GRANTS OFFICER'S REPRESENTATIVE (GOR) (MAY 2009)

g. Grants Officer's Representative (GOR) for this Grant is:
Name: (b)(6)
Defense Threat Reduction Agency/
8725 John J. Kingman Road, MS 6201

Fort Belvoir, VA 22060-6201
telephone (b)(6)
email address (b)(6)

b. SCOPE AND LIMITATIONS OF AUTHORITY FOR DTRA GRANTS OFFICER'S REPRESENTATIVE

1. The Grants Officer's Representative (GOR) is responsible for monitoring the technical and programmatic performance of the grant or cooperative agreement (hereinafter referred to as agreement) including compliance with the agreement's reporting requirements. Perceived deviations from the agreement's terms and conditions shall be brought to the attention of appropriate recipient personnel and if not corrected, to the attention of the Grants Officer. Deviations or other occurrences indicative of the recipient's inability or unwillingness to conform to the agreement's requirements shall be brought to the immediate attention of the Grants Officer.

2. The GOR has no authority to modify the stated terms of the agreement or specifications in any manner, or to approve any action that would result in additional charges to the Government. The DTRA Grants Officer must make all such changes in writing.

3. The GOR is authorized to correspond directly with the recipient on matters within the scope and limitations of his or her authority. All such correspondence shall be signed personally by the GOR and a copy will be furnished the Grants Officer for placement in the official agreement file.

4. The GOR will provide technical advice to the recipient to the extent such advice will not alter any of the agreement's terms and conditions or result in an increase in the estimated cost of the agreement's performance as specified in the agreement. The GOR is encouraged to discuss with the recipient new ideas related to the original scope of the agreement that may be of special interest to DTRA. The GOR should also be alert for indications that any part of the research is becoming unfruitful. If, as a result of such discussions, questions arise as to the possible need for a modification, the matter shall be brought to the immediate attention of the Grants Officer. The GOR shall not direct the recipient to undertake any action that the recipient believes to be contrary to the agreement's scope, terms or conditions without the written approval of the Grants Officer.

5. Any visits to the recipient's facilities on matters pertaining to the agreement will be documented in a brief memorandum. A copy will be provided the Grants Officer for placement in the official agreement file.

6. The GOR will maintain such work files as he or she deems necessary to properly document performance of the duties and responsibilities as a GOR. Upon completion of the agreement and delivery of all required reports, such work files will be forwarded to the Grants Officer for placement in the official agreement file.

7. In performance of the GOR's duties, the GOR shall constantly stress protection of the Government's interests. Similarly, the GOR shall avoid any act which may tend to compromise the position of DTRA, any individual member of DTRA or which will impact confidence in the integrity of DTRA with the business community.

(End of Clause)

FUNDING PROFILE:
The amount of $4,995,106.37 is obligated for work to be performed during the period beginning with grant, July 1 2020, award and continuing through June 30 2025.

The Government's liability is limited to the amount obligated

Statement of Work

Project Title: Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania

Document Date: March 18, 2018.

Objective: The objective of this grant is to reduce the threat of Crimean-Congo hemorrhagic fever (CCHF) by determining the presence and scale of CCHF virus (CCHFV) circulation in Tanzania. The awardee shall establish a multi-disciplinary team of Tanzanian and international One Health professionals to collect fundamental data on CCHFV, conduct rigorous scientific analyses and support the Government of Tanzania in the development of policies to control and reduce the threat of CCHF. Using a One Health approach the awardee shall investigate the following three hypotheses: 1) CCHFV is circulating in ticks, livestock and wildlife in Tanzania; 2) CCHFV is present and circulating in the human population in Tanzania; 3) CCHFV prevalence, seroprevalence and vector abundance will vary across an environmental disturbance gradient from peri-urban communities, to pastoral rangelands, to protected wildlife areas. The awardee shall support the capacity of Tanzanian human and animal health laboratories to detect anti-CCHFV antibodies, train Tanzanian field researchers and provide vital data to Tanzanian government partners and stakeholders to develop policies to prepare for and reduce the threat of a CCHF outbreak.

Scope: The grantee proposes a five-year multi-disciplinary study of epidemiology, ecology and impact of CCHF in northern Tanzania. The grantee team shall focus on the following major goals and milestones:

- Improve awareness of and capacity to respond to potential CCHF epidemics.
    - Host an annual stakeholders' and partners' meeting in Tanzania (Y1-OY2); initiate and maintain diagnostic capacity for detection of CCHFV (Y2-OY1); provide training for students and scientists (Y1-OY2).
- Use a One Health approach to identify CCHFV infection patterns in wildlife, cattle and humans across an environmental disturbance gradient.
    - Establish field study protocols (Y1); implement small mammal, cattle and human serosurveys (Y1-2); conduct serological assays on blood samples (Y3-OY1); conduct longitudinal study in humans (OY1); train a Tanzanian post-doctoral fellow to use spatial analyses to determine environmental correlates of CCHFV infection risk (OY2).
- Determine the abundance and CCHFV infection prevalence of tick vectors.
    - Establish tick field study protocols (Y1); implement tick sampling (Y1-2); conduct PCR assays on *Hyalomma* spp. ticks (Y3); analyze tick abundance in relation to environmental factors (Y3).
- Support One Health communication and policy development to reduce the threat of CCHF.
    - Host a policy development workshop (OY1); host an East African CCHF symposium (OY2).

Background: Crimean-Congo hemorrhagic fever is a **WHO Blueprint R&D priority disease** for which **there is an urgent need for accelerated research** given its **epidemic potential and the lack of countermeasures against CCHFV**. The Department of Health and Human Services considers CCHF as having the potential to pose a **severe threat to human health**. Similarly, **Tanzania identified viral hemorrhagic fevers as one of six priority zoonoses of greatest national concern**. Clinical signs and symptoms include fever, headache, thrombocytopenia, hemorrhagic disease and death in 30-40% of patients. CCHFV can be transmitted via multiple routes, including direct contact with infected animal tissues and transmission from *Hyalomma* spp. ticks. Human-to-human transmission has frequently been reported and if isolation practices are not implemented, nosocomial outbreaks can occur. Though it is not known to cause disease in animals, CCHFV circulates among both small mammals and large ruminants. Little is known about the status of CCHFV in Tanzania as the most recent cattle serosurvey occurred in 1974-75 (identifying a 9% seroprevalence) and despite neighboring Uganda and Kenya reporting multiple cases, no studies have investigated CCHF in humans in Tanzania.

Similar to the situation with Ebola virus prior to the 2014-16 outbreak, CCHFV antibodies were detected in people in Turkey as far back as 1980, yet no cases were reported until the start of the large outbreak in 2002-06 during which there were 1,103 confirmed cases. This "sudden" appearance of CCHF has been described in many regions that thereafter remain endemic for the virus, including Pakistan, Crimea and Turkey. **Human epidemics have often been linked to environmental and social changes,** which are associated with an increase in the abundance of CCHFV vectors. Thus using a One Health approach is vital to understanding CCHFV ecology, particularly in regions where environmental changes might drive disease emergence. CCHF is a frequent threat faced by U.S. warfighters working in endemic countries in Central Asia and the Middle East. Indeed, war is considered a driver for the emergence of CCHF as demonstrated by the outbreak among 200 Soviet troops in Crimea.

Tasks/Scientific Goals: (given in the format: Year.Task.Subtask)

Task Y1.1-YO2.1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.
Strengthening Tanzania's capacity to consider CCHF as a differential diagnosis, conduct CCHFV diagnostic assays and improve inter-sector communication about this important zoonosis will improve their ability to identify, respond and prevent CCHF outbreaks. 1) The grantee shall mentor four graduate students or FETP fellows in fields that can contribute to our understanding of the epidemiology and ecology of CCHFV in Tanzania (Y1-OY2). 2) The awardee shall provide equipment to TVLA to permit them to sustainably maintain the sample cold chain and diagnostic workflow (e.g. a generator and an ultrafreezer) in Y1. 3) The awardee

shall train all field and laboratory staff (based on what is pertinent for their role) in: biosafety, safe and humane handling of animals, ethical conduct of research with human subjects, biosecurity, etc. in Y1, Y3 and OY1. 4) Through the annual meetings (Y1-OY2), additional meetings throughout the year and communication among stakeholders and between project partners the project shall strengthen the communication between relevant One Health sectors. 5) As the grantee knows of no laboratories conducting CCHFV diagnostics in Tanzania, the awardee shall provide intensive training in the use of serological and polymerase chain reaction (PCR) based assays for the diagnosis of CCHFV (Y3-OY1). The awardee shall select an assay for testing humans that requires recombinant antigen that would be possible to produce in country or in a neighboring country in order to improve the sustainability of the establishment of these assays at diagnostic laboratories in Tanzania. The awardee shall conduct two laboratory workshops on the importance of CCHFV and its diagnosis (Y3). 6) Following a majority of the field and laboratory work, the awardee shall host a policy workshop to present the results to an invited group of government and non-government representatives and using those results develop and provide a set of policy recommendations for the reduction of the threat of CCHFV in Tanzania to the Government of Tanzania (OY1). 7) The awardee shall train one Tanzanian post-doctoral fellow in the spatial ecology of infectious diseases at EcoHealth Alliance in New York City (OY2). 8) The awardee shall host a symposium on CCHF in East Africa and invite global leaders in CCHF research to exchange ideas on additional research that is needed, ways of increasing support for the growing group of CCHF experts in East Africa and ideas about the applicability of control measures being used in other regions that may be transferable to the situation in East Africa (OY2).

1.1.1-OY2.1.1 Train a minimum of four graduate students in fields related to CCHFV.
1.1.2-Y3.1.2 Strengthen the capacity of the Arusha Regional TVLA laboratory.
1.1.3-OY1.1.3 Train staff *in situ* in epidemiological field methods.
1.1.4-OY2.1.4 Support One Health relationships between partners and stakeholders.
1.1.5-OY1.1.5 Support laboratory capacity to conduct CCHFV diagnostics.
3.1.6 Host one workshop on diagnostic testing for CCHFV at each KCRI and TVLA.
OY1.1.7 Host a workshop to support CCHF policy development in Tanzania.
OY2.1.8 Mentor a Tanzanian post-doctoral fellow in spatial ecology of infectious diseases.
OY2.1.9 Host East African CCHF Symposium.

Task Y1.2-YO1.2: Determine CCHFV infection patterns, risk factors and incidence in humans.

To identify and characterize the risk of infection with CCHFV in people within the study area in northern Tanzania the grantee shall conduct several epidemiological studies. Despite the lack of CCHF outbreaks reported in Tanzania, there are confirmed cases of CCHF in neighboring Uganda and Kenya, the vector is present in Tanzania and we have previously identified circulating antibodies in livestock within the proposed study area. In order to confirm our hypothesis that CCHFV does infect people in Tanzania, the grantee shall 1) finalize IRB approvals in the U.S. and obtain the required permits and ethical approvals in Tanzania (Y1). 2) The awardee shall conduct a cross-sectional study approximately 1,586 people. People who

enroll shall be given a questionnaire in Swahili and asked to provide a blood sample (Y1-Y2). 3) Laboratory testing using an enzyme linked immunosorbent assay (ELISA) will be conducted at KCRI in Y3-OY1. A subset of samples will be shipped to UoG for confirmation. 4) A preliminary analysis of initial results of the human serosurvey will be completed in Y3 and reported with the results from the animal serosurveys (Y3). 5) In OY1 we will re-sample all willing participants to determine the incidence of CCHFV infection within the sampled population. These samples will be tested at KCRI as described in subtask 1.2.3.

1.2.1 Obtain local permissions and approvals to work with human subjects. 1.2.2-OY1.2.2 Conduct a cross-sectional study in people within the study area. 3.2.3-OY1.2.3 Conduct serological assays for the presence of anti-CCHFV antibodies. 3.2.4-OY1.2.4 Analyze human serosurvey results. OY1.2.5 Conduct incidence sampling among cross-sectional study participants.

Task Y1.3-Y3.3: Determine CCHFV infection patterns in cattle across varying environments.

The grantee shall conduct a cross-sectional study in cattle (and other animals, see Task 4) throughout the pastoral livestock and peri-urban areas of the study area to determine whether there is a difference in seroprevalence. 1) The awardee shall finalize the U.S. IACUC approvals and obtain all appropriate permits and ethical approvals required in Tanzania (Y1). 2) The grantee shall collect blood samples and ticks from cattle in Y1-Y2. The grantee shall use conduct an environmental disturbance assessment transect at each site to complement remote sensing data to establish the disturbance levels across the study area. 3) The collected ticks will be identified at TVLA by an experienced entomologist (Y3). 4) Cold chain will be maintained and the serum samples will be transferred to TVLA for analysis with the ID Screen® CCHF Double Antigen Multi-Species ELISA by IDVet. The ticks shall be tested for CCHFV via PCR at TVLA (Y3). A subset of samples shall be shipped to UoG for confirmation. 5) The cattle serosurvey results shall be analyzed and reported at the end of Y3.

1.3.1 Obtain local permits and permissions.

1.3.2-3.3.2 Conduct a cross-sectional serosurvey in cattle across two levels of environmental disturbance.

3.3.3 Collect and identify *Hyalomma spp.* ticks from sampled cattle.

3.3.4 Conduct laboratory analyses on cattle ticks and sera.

3.3.5 Analyze cattle serosurvey results.

Task Y1.4-OY2.4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.

Using a One Health approach the grantee shall conduct a cross-sectional study to compare the tick burden, CCHFV seroprevalence (in wildlife only) and CCHFV prevalence (in ticks only) across three different levels of environmental disturbance: peri-urban, pastoral livestock and protected areas. 1) The awardee shall finalize the U.S. IACUC approvals and obtain all appropriate permits and ethical approvals required in Tanzania (Y1). 2) The awardee shall trap small mammals at the sites where people and livestock are also being sampled as well as in the protected area (Y1-Y2). 3) The grantee shall also conduct tick transects to collect ticks from the vegetation (Y1-Y2). The cold chain shall be maintained and samples will be transferred to TVLA. 4) Ticks shall be speciated by an experienced TVLA technician. 5) Serum samples shall

be tested with the multispecies CCHFV ELISA kit. *Hyalomma* spp. ticks shall be tested for CCHFV by PCR (Y3). 6) The grantee shall work with partner TAWIRI to access banked serum and ticks collected from wild ruminants in protected areas (Y3). 7) The awardee shall complete and analysis and report of the wildlife serosurvey results at the end of Y3. 8) Since the multispecies ELISA has not been validated using seropositive sera from wildlife (it has been assessed in seropositive livestock samples) the grantee shall transfer 100 samples to PHE for confirmation using the gold standard CCHFV virus neutralization assay (OY2).

1.4.1 Obtain local permits and permissions.
1.4.2-2.4.2 Conduct cross-sectional study in small mammals.
1.4.3-2.4.3 Collect ticks from vegetation at study sites.
3.4.4 Identify ticks collected from small mammals and transects.
3.4.5 Conduct laboratory analyses for CCHFV antibodies and viral RNA.
3.4.6 Test banked serum from wild ungulates.
3.4.7 Analyze wildlife serosurvey results.
OY2.4.8 Confirm seropositive wildlife samples with virus neutralization assays.

Task Y1.5-OY2.5: Disseminate reports to relevant stakeholders.

The awardee shall synthesize all research and capacity building activities described above and 1) An Annual Research Performance Progress Report, Quad Chart and Metrics will be submitted to DTRA and the project shall submit the Annual Sample Repository information using a DTRA-specified format (Y1-OY2). Quarterly reports shall also be submitted as requested by DTRA. 2) An annual report shall be made to local stakeholders. 3) A stakeholder meeting shall be held annually to describe the project and the current results. Community feedback meetings shall be held to provide aggregate findings and engage with local stakeholders through the project. 4) Scientific and general reports shall be generated and presentations of findings shall be made at national and/or international meetings (e.g. ASM, ASTHM, IMED, One Health etc.) as indicated in the performance schedule below. The grantee shall attend the Annual Technical Review when invited to the review by DTRA. 5) Samples will be maintained in biobanks at KCRI and TVLA, with a subset of duplicated samples stored at UoG and PHE following confirmatory testing of these samples (Y1-OY2). Access to all samples collected and data generated during the course of the project will be maintained, up to and including at least 12 months after the project end date. 6) In Y3 a synthetic report on the cross-sectional studies will be submitted to DTRA. These dissemination pathways shall provide opportunities to gain stakeholder input, including to inform policy to reduce the threat of CCHF in Tanzania. The awardee shall submit a Research Performance Final Report and submit a Final Metrics File at the end of the entire project period.

1.5.1-OY2.5.1 Submit reports, including sample repository data, to DTRA.
1.5.2-OY2.5.2 Complete annual report to local stakeholders.
1.5.3-OY2.5.3 Host annual partners' and stakeholders' meeting.
1.5.4-OY2.5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
1.5.5-OY2.5.5 Maintain samples in biobanks.
3.5.6 Complete reports on results of human, cattle and wildlife cross-sectional studies and comparison across the gradient.

Task OY2.6: Identify environmental correlates with CCHFV seroprevalence.

The grantee shall 1) access remote sensing data sets including the following remote sensing products: NASA's ECOSTRESS data (ECOsystem Spaceborne Thermal Radiometer Experiment on Space Station) that provides data on vegetation water stress and LandSat data, as well as remote sensing derived data such as normalized difference vegetation index (NDVI) and enhanced vegetation index (EVI). 2) Spatially explicit correlates shall be performed to understand the relationship between environmental factors and seropositivity in humans, livestock and wildlife as well as vector and viral prevalence.

OY2.6.1 Access appropriate remote sensing data.

OY2.6.2 Conduct spatial analysis to identify correlates between environmental and ecological factors and CCHFV seropositivity.

Performance Schedule:

Task	Year 1	Year 2	Year 3	Option Year 1	Option Year 2
Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.					
1.2 Strengthen the capacity of the Arusha Regional TVLA laboratory.					
1.3 Train staff *in situ* in epidemiological field methods					
1.4 Support One Health relationships between partners and stakeholders.					
1.5 Support laboratory capacity to conduct CCHFV diagnostics.					
1.6 Host one workshop on diagnostic testing for CCHFV at each KCRI and TVLA.					
1.7 Host a workshop to support CCHF policy development in Tanzania.					
1.8 Mentor a Tanzanian post-doctoral fellow in spatial ecology of infectious diseases.					
1.9 Host East African CCHF Symposium.					
Task 2. Determine CCHFV infection patterns, risk factors and incidence in humans.					
2.2 Conduct a cross-sectional study in people within the study area.					
2.3 Conduct serological assays for the presence of anti-CCHFV antibodies					
2.4 Analyze human serosurvey results					
2.5 Conduct incidence sampling among cross-sectional study participants					
Task 3. Determine CCHFV infection patterns in cattle across varying environments.					
3.1 Obtain local permits and permissions.					
3.2 Conduct a cross-sectional serosurvey in cattle across two levels of environmental disturbance.					
3.3 Collect and identify *Hyalomma* spp. ticks from sampled cattle					
3.4 Conduct laboratory analyses on cattle ticks and sera					
3.5 Analyze cattle serosurvey results.					
Task 4. Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.					
4.1 Obtain local permits and permissions.					
4.2 Conduct cross-sectional study in small mammals.					
4.3 Collect ticks from vegetation at study sites.					
4.4 Identify ticks collected from small mammals and transects.					
4.5 Conduct laboratory analyses for CCHFV antibodies and viral RNA.					
4.6 Test banked serum from wild ungulates					
4.7 Analyze wildlife serosurvey results					
4.8 Confirm seropositive wildlife samples with virus neutralization assays					
Task 5. Disseminate reports to relevant stakeholders.					
5.1 Submit reports, including sample repository data, to DTRA.					
5.2 Complete annual report to local stakeholders.					
5.3 Host annual partners' and stakeholders' meeting.					
5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.					
5.5 Maintain samples in biobanks.					
5.6 Complete reports on results of human, cattle and wildlife cross-sectional studies and comparison across the gradient.					
Task 6. Identify environmental correlates with CCHFV seroprevalence.					
6.1 Access appropriate remote sensing data.					
6.2 Conduct spatial analysis to identify correlates between environmental and ecological factors and CCHFV seropositivity

Fuel Policy:
Fuel: Pick up and return full.

Important information

Popular Driver Payment Insurance Supplier

Fuel policy

Full to Full

Your vehicle will be supplied with a full tank of fuel. To avoid incurring fuel charges, you will need to return it with the same amount of fuel as it had when you collected it. You may be required to leave a fuel deposit reserved or charged on your credit card, this will be released or refunded when you return the car full. Missing fuel will be charged on your return. The price per litre charged by the rental agent may be significantly higher than the price at the local service station. A refuelling charge may also be applicable.

Fuel charges are payable at the rental desk unless otherwise stated in the top section of rate details.

Mileage policy

Limited

Charge: 0.8 per kilometer. (Includes tax)

Kilometers included per day: 120

Special equipment/optional extras

Booster seat: 10 USD (Excludes tax); On request

Child toddler seat: 10 USD (Excludes tax); On request

Infant child seat: 10 USD (Excludes tax); On request

GPS: 10 USD per day. Includes 14% tax; On request

Special equipment/optional extras may be requested at the time of booking, but they are not included in the rental price. They are paid in the local currency at the rental desk.

Conditions of optional extras

Please note the following: The price of optional extras is subject to change without notice.

Kilometers included per day: 120

Special equipment/optional extras

GPS: 10 USD per day, Includes 14% tax: On request

Special equipment/optional extras may be requested at the time of booking, but they are not included in the rental price. They are paid in the local currency at the rental desk.

Conditions of optional extras

Please note the following: The price of optional extras is subject to change without notice. Optional extras are subject to availability. Charges made at the desk may be subject to local/airport surcharges.

Travel Restrictions

All international/State cross-border travel is disallowed.

Vehicles are prohibited to enter or be driven through the National Parks and Game Reserves within Tanzania. Should the renter drive the rented vehicle into the national park, a penalty of $1000 (non-refundable) will be charged. For a comprehensive list of all National Parks and Game Reserves kindly visit the Tanzania National Parks website.

CappWash™ Microplate Washer, APS BE

APS BE

CappWash™ is the ideal washing tool for small scale immunoassays

- Compact and made for small-scale work
- Unique two-in-one design
- Simple washing matches all well types
- No programming and no electrical wiring connection required

The vacuum pump is available for 115V connections

Fitting into even the tightest budget, CappWash™ is a perfect alternative for washing micro plates and strips

Generator

Genset Model
C22 D5, 22kVA Standby, 20kVA , Diesel, Open

Bill of Material

Emergency Standby Power (ESP)
Emissions Level : No Certification
Local Codes and/or Regulation : CE
Output Voltage : 200/115, 3 Phase, Wye, 4 Wire
Engine
X2.5G2
Engine Air Cleaner - Duty Rating : Heavy Duty
Engine Oil Heater : None Supplied
Engine Speed Governing : Mechanical Droop Governor
Engine Coolant Heater : None Supplied
Sub-Base Anti-Vibration Mounts
None Supplied
Main Generator
S0L2G1, 50 Hertz (Hz), 200V and 400V, 163C, Emergency Standby Power (ESP)
Generator Accessories
Voltage Regulator - Torque Match
Main Generator Heater : None Supplied
Exhaust System
Silencer Grade : Residential, Flange On Connection Inlet 3 Inch, Outlet 3 Inch, Side Entry
Exhaust System Accessories : Bellows, System Fixing Kit
Cooling System
Genset Mounted Radiator, 50C / 122F, Genset Mounted
Engine Coolant Mixture : 50% Antifreeze, 50% Water
Primary Electrical Isolation Device
One Circuit Breaker
Primary Electrical Isolation Device
80A MCB, 440V IEC, 4 Pole, 100%, Left
Entrance Box / Terminal Housing
Cable Entrance Box Required : None Supplied
Control System Options
PowerStart 0600
Control Panel Mounting (Viewed From Generator End) : Left Facing

Control Language : English
Warning - Low Battery Voltage
Emergency Stop Switch - External
Control Cabinet Heater : None Supplied
Starting Batteries
Pure Lead-Tin Thin Plate Valve Regulated Lead-Acid (VRLA) Battery - Maintenance Free
Battery Charger
Set Mounted, 6A, 110 - 240 V
Genset Testing
Genset Testing : Standard Factory Test
Test Records : Certified Test
Warranty
Standby, 40 Months, 800 Hours

Notes:

1. Spec sheet provided to quote
2. Price includes freight Factory via standard ground to nearest port of generator manufacturer, Shipping to final destination Tanzania by others and not included in this quote.
3. Price does not include field connections, installation or rigging.
4. This proposal is based on information supplied to Cummins which may or may not have been correct or complete. The customer is responsible for reviewing this proposal for compliance with the complete and final drawings and specifications.
5. All quotations automatically expire thirty (30) days from date issued.

We thank you for giving us the opportunity to quote this equipment. If you need any further assistance or clarification, please do not hesitate to contact us

Sincerely,

Colm Kelly

Senior Sales Representative

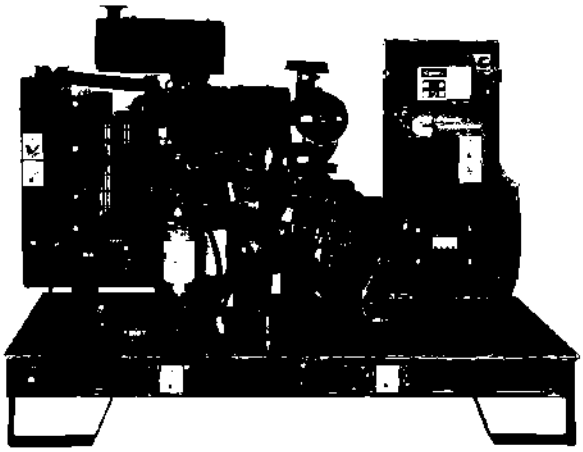
Specification sheet

BOM for our standard C22D5 Open type @50Hz using the X2.5 engine.

Diesel generator set X2.5 series engine

15 kVA - 28 kVA 50 Hz

10.8 kW - 20 kW 60 Hz



Description

This Cummins® commercial generator set is a fully integrated power generation system, providing optimum performance, reliability, and versatility for Stationary Standby, Prime Power, and Continuous Duty applications.

Features

Cummins heavy-duty engine - Rugged 4-cycle industrial diesel delivers reliable power, low emissions and fast response to load changes.

Optional excitation boost system (EBS) - Offers enhanced motor starting and fault clearing short circuit capability.

Alternator - Several alternator sizes offer selectable motor starting capability with low reactance 2/3 pitch windings; low waveform distortion with non-linear loads and fault clearing short-circuits capability.

Cooling system - Standard integral set-mounted radiator system, designed and tested for rated ambient temperatures, simplifies facility design requirements for rejected heat.

Control system - PowerStart control, microprocessor-based generator set monitoring and control system provides a simple operator interface to the generator set, manual and remote start/stop control and shutdown fault indication.

Enclosures - Optional weather-protective and sound-attenuated enclosure.

Warranty - Backed by a comprehensive warranty and worldwide distributor network.

Generator set specifications

Governor regulation class	ISO 8528 G2
Voltage regulation, no load to full load	± 2.5%
Random voltage variation	± 2.5%
Frequency regulation	Droop
Random frequency variation	± 0.75 %
Radio frequency emissions compliance	BS EN 61000-6-1 / BS EN 61000-6-3

Engine specifications

Design	4 cycle, in-line, naturally aspirated
Bore	91.4 mm
Stroke	127 mm
Displacement	2.5 liter (153 in^3)
Cylinder block	Alloy cast iron, in-line, 3 cylinder
Battery charging alternator	36 A
Starting voltage	12 volt, negative ground
Fuel system	Direct injection
Fuel filter	Spin on fuel filters with water separator
Air cleaner type	Dry replaceable element
Lube oil filter type(s)	Spin on full flow filter, filtration efficiency 25 micron 99% (min)
Standard cooling system	122 °F (50 °C) ambient radiator with coolant recovery system

Alternator specifications

Design	Brushless, single bearing
Stator	2/3 pitch
Insulation system	Class H
Standard temperature rise	125-163 °C
Exciter type	Self excited
Phase rotation	A (U), B (V), C (W)
Alternator cooling	Direct drive centrifugal blower fan
AC waveform Total Harmonic Distortion (THDV)	No load to full linear load < 5%. For any single harmonic < 2.5%
Telephone Influence Factor (TIF)	< 75 (for 60 Hz)
Telephone Harmonic Factor (THF)	< 2% (for 50 Hz)

Available voltages

50 Hz Line–Line/Line-Neutral			60 Hz Line–Line/Line-Neutral		
3-phase		1-phase	3-phase		1-phase

Note: Consult factory for other voltages.

Generator set options

Engine
- Electronic engine governing
- Coolant heater 120/240 V

Cooling
- Antifreeze 50/50 (Ethylene glycol)

Enclosure
- Optional silent power canopy

Base frame
- Dual skin fully contained fuel tank
- 500 litre fuel tank
- Set mounted battery

Alternator
- Alternator heater
- Control panel
- PowerCommand 1.1
- 2/4 pole main circuit breaker
- Aux 101

Warranty
- 2 years for Prime application
- 5 years for Standby application

- 1500/3000 hours service kit
- Optional language literature
- Engine oil heater 120/240 V
- External fuel fill (3 way valve)

Note: Some options may not be available on all models - consult factory for availability.

Control system

Generator set control PowerStart 600 – The PowerStart contol is a microprocessor-based generator set monitoring and control system. The control provides a simple operator interface to the generator set, auto/ manual and remote start/stop control and shutdown fault indication. The integration of all control functions into a single control provides enhanced reliability and performance compared to conventional generator set control systems. This control has been designed and tested to meet the harsh environment in which gensets are typically applied.

- The PowerStart generator set control is suitable for use on a wide range of generator sets in non-paralleling applications. It is suitable for use with reconnectable or non-reconnectable generators, can be configured for either 50 Hz or 60 Hz and voltage and power connection from 190-600 VAC line-to-line.
- This control includes an intuitive operator interface that allows for complete genset control as well as system metering, fault annunciation, maintenance alarm, over imbalance current, configuration and diagnostics. The interface includes seven generator set status LED lamps with both internationally accepted symbols and English text to comply with customer needs. The interface also includes an LED backlit LCD display with tactile-feel soft-switches for easy operation and screen navigation. The manual/auto/stop switch function is integrated into the interface panel.
- All data on the control can be viewed by scrolling through screens with the navigation keys. The control displays the current active fault and a time-ordered history of the five previous faults.
- Power for this control is derived from the generator set starting batteries and functions over a voltage range from 8VDC to 16 VDC.

Major Features

- Integrated 128x64 Pixel monochrome graphic LCD Display
- 12 and 24V battery operation
- Genset monitoring-monitor status of all critical engine and alternator functions
- Digital genset metering (AC and DC)
- Genset battery monitoring system to warn against a weak battery connection
- Configurable for single phase or three phase or split phase AC metering
- Engine starting includes solid state output to operate external relay to start the engine, fuel shut off (FSO) and glow Plug
- Genset Protection: protects engine and alternator
- Real time clock for fault and event stamping
- Fuel level measurement using 4-20mA input sensor
- Exerciser clock and time of delay start/stop initiate a test without load.
- Maintenance due alarm based on engine running time and real time clock
- Auto Main Failure (AMF) Provides load transfer operation in open transition mode
- AMF Test with or without load options
- Utility Voltage monitoring and protection
- Remote start capability in Auto mode
- Advanced service ability using Inpower™ a PC based Software service tool
- Modbus interface for interconnecting to customer PLC/BMS
- Configurable Inputs and Outputs
- Environmental protection: The Control is designed for reliable operation in harsh environment
- Warranty and service backed by a comprehensive warranty and worldwide distributor service network
- Certification-suitable for use on generator sets that are designed, manufactured, tested and certified relevant ISO, IEC and CE standards.

Base control functions

LCD capability

LED INDICATING LAMPS

- For Genset Running, Remote Start, AMF Test Active, Genset Shutdown, Warning, Load connected to Genset, Load connected to Utility, Manual Mode, Stop Mode and Auto Mode.

LCD display

- 128 x 64 Pixel Monochrome Graphics display

OPERATION INTERFACE

Six tactile-feel soft switches for LCD navigation, genset operation and control setup. These switches are indicated by internationally accepted symbols and English text.

OPERATOR ADJUSTMENTS

- The LCD includes provisions for necessary set up and adjustment functions.
- Data Log includes engine run time and controller ontime Fault History.
- Provides a record of the most recent fault Condition with Engine run time stamp, RTC stamp and occurances
- Up to 5 events are stored in the control non-volatile memory.

AMF FUNCTIONALITY

When Auto Mains Failure is enabled and controller is in Auto Mode and if utility goes off then control starts the Genset automatically and transfers load onto Genset. If Utility returns and is healthy then load again gets retransferred onto Utility. AMF provides load transfer operation in Open Transition transfer mode.

FUEL LEVEL FEATURE

The Control will show the warning fault when the fuel level in the tank goes below the predefined threshold. Control includes time delays to prevent nuisance warning signals.

Exercise Scheduler

It is used only when genset is in Auto mode. It is used to start a Scheduler schedule at No Load condition. A trim Exercise Scheduler Enable is available to enable or disable the feature.

Maintenance

Maintenance due alarm based on Engine Running Time or Real time clock

Control data

Access to the control software part number and software version are provided from the LCD or InPower™.

Alternator data

- Voltage (single or three phase line-to-line and line-to- neutral)
- Current (single or three phase)
- kVA, kVAR, kW, Power Factor (Three phase and total)
- Frequency
- Totalized positive and negative kWH, kVARH, kVAH

Utility AC data

- Voltage (three/single phase LL and LN) - Frequency

ENGINE DATA

- Starting battery voltage
- Engine running hours
- Engine temperature
- Engine oil pressure

Service adjustments

- The control includes provisions for adjustment and calibration of generator set control functions. Functions include:
- Voltage selection
- Frequency selection
- Genset and Utility AC Meter Calibration

ENGINE CONTROL

- CT ratio, and Genset ratings setup
- Start/Stop time delay setup
- Real time clock setup with daylight saving
- AMF Setup with test mode and transfer/retransfer time delays
- Modbus baud rate, parity setup
- Exercise scheduler repeat interval, Day, time and duration setup
- Maintenance due setup
- LCD brightness and contrast control

Battery operation

- Control will operate on 12V/24V batteries

Auto start mode

Accepts a ground signal from remote devices to automatically start the generator set. The remote start signal will also wake up the control from sleep mode. The control can incorporate a time delay start and stop.

Emergency stop

The control annunciates when an emergency stop signal is received and the generator set immediately shuts down. The generator set is prevented from running or cranking with the switch engaged E-stop switch.

Sleep mode

The control includes a configurable low current draw state to minimize starting battery current draw when the genset is not operating.

Engine starting

The control supports automatic engine starting. Primary and backup start disconnects are achieved by battery charging alternator feedback or main alternator output frequency. The control also supports configurable glow plug control when applicable.

Cycle cranking

Configurable for the number of starting cycles (1 to 7) and duration of crank and rest periods. Control includes starter protection algorithms to prevent the operator from specifying a starting sequence that might be damaging.

Time delay start and stop (cooldown) Configurable for time delay of 0-300 seconds prior to starting after receiving a remote start signal and for

time delay of 0-600 seconds prior to shutdown after signal to stop in normal operation modes. Default for both time delay periods is 0 seconds.

Auto Mains Failure functions

AMF primarily means that the genset controller is controlling both the genset breaker and a utility breaker in a transfer pair arrangement. AMF is only for use in a single genset / single utility arrangement. AMF's primary job is to keep loads powered. AMF completely manages the system by automatically starting the genset and transferring load when it detects utility failure. AMF has numerous built-in configurable sensors to determine the availability of the utility and genset sources. Sensors include under voltage, overvoltage, over/under frequency and breaker failure. PS0600 control supports only open transition (Break before Make) AMF functionality.

AMF Test mode

AMF supports test mode with or without load options along with test mode duration.

Load Transfer Switch Type

AMF breaker outputs can be continuous (contact pair) or pulsed (GTEC) type based on load transfer switch selection.

Undervoltage sensor

- Three phase LL and LN undervoltage sensing for pickup 85-100% and dropout adjustable from 75-98% of nominal and dropout adjustable delay from 0.1-30 sec

Overvoltage sensor

- Three phase LL and LN overvoltage sensing for dropout adjustable from 105-135% of nominal and dropout adjustable delay from 0.5-120 sec

Over/under frequency sensor

- Underfrequency sensing for pickup 85-100% and dropout adjustable from 70-85% of nominal and dropout adjustable delay from 0.1-15 sec
- Overfrequency sensing for dropout adjustable from 105-115% of nominal and dropout adjustable delay from 0.1-15 sec

Timers

- Control provides transfer time delays including Time delay engine start (0-3600 sec), time delay normal to emergency (0-300 sec) and programmed transition delay (0-600 sec). impending failure.

- **Cranking lockout** - The control will not allow the starter to attempt to engage or to crank the engine when the engine is running.

- Control provides retransfer time delays including time delay emergency to normal (0-1800 sec) and programmed transition delay (0-600 sec), time delay engine cooldown (0-3600 sec)

Protective functions:

On operation of a protective function, the control will indicate a fault by illuminating the appropriate status LED, as well as display the fault code and fault description on the LCD. The nature of the fault and time of occurrence are logged in the control. The service manual and InPower™ Service Tool provide service keys and procedures based on the service codes provided. In Power is used to configure settings.

Configurable alarm input

The control accepts maximum three alarm inputs (contact closed to ground) to cause a shutdown or warning response from the control.

Emergency stop

- Annunciate whenever an emergency stop signal is received from external switch.

Engine protection

- **Low lube oil pressure warning/shutdown** - Level is pre-set to match the capabilities of the engine used. Control includes time delays to prevent nuisance shutdown signals.
- **High coolant temperature warning/shutdown** - Level is pre-set to match the capabilities of the engine used. Control includes time delays to prevent nuisance shutdown signals.
- **Low coolant temperature warning** - Indicates that engine temperature may not be high enough for 1 min. and start or proper load acceptance.
- **Sensor failure indication** - Logic is provided on the base control to detect analog sensor or interconnecting wiring failures.

General engine protection:

Low Fuel Level Warning - Indicates that engine fuel level reached the Low Fuel Level Warning Threshold (30% by default).

Charging Alternator Failure Warning - Indicates that engine charging alternator voltage reached the low/high charging alternator threshold when charging alternator enable trim is enabled.

- **Low and high battery voltage warning** - Indicates status of battery charging system (failure) by continuously monitoring battery voltage.
- **Weak battery warning** - The control will test the battery each time the generator set is signaled to start and indicate a warning if the battery indicates

- **Fail to start shutdown** - The control will indicate a fault if the generator set fails to start by the completion of the engine crack sequence.

ALTERNATOR PROTECTION

Battleshort Mode

- When enabled and Battle short switch is active, the control will allow non-critical shutdown faults to be bypassed. If a bypass shutdown fault occurs, the fault code and description will still be annunciated, but the genset will not shutdown. This will be followed by a fail to shutdown fault. Emergency stop critical shutdown faults are not bypassed.

Please refer to control service and operator manual for list of critical faults

High AC voltage shutdown (59)

- Output voltage on any phase exceeds pre-set values. Values adjustable from 105-125% of nominal voltage, with time delay adjustable from 1-10 seconds. Default value is 110% for 5 seconds.

Low AC voltage shutdown (27)

- Voltage on any phase has dropped below a preset value. Adjustable over a range of 50-95% of voltage, time delay 2-20 seconds. Default value is 90% for 5 seconds.

Under frequency shutdown (81 u)

- Generator set output frequency cannot be maintained. Settings are adjustable from 2-10 Hz below nominal governor set point, for a 500-2000 half cycles delay. Default: 5 Hz, 1000 half cycles.

Over frequency shutdown/warning (81 o)

- Generator set is operating at a potentially damaging frequency level. Settings are adjustable from 2-10 Hz above nominal governor set point for 100-2000 half cycles delay. Default: 5 Hz, 1000 half cycles.

Loss of sensing voltage shutdown

- Shutdown of generator set will occur on loss of voltage sensing inputs to the control.

Current Imbalance Warning Fault

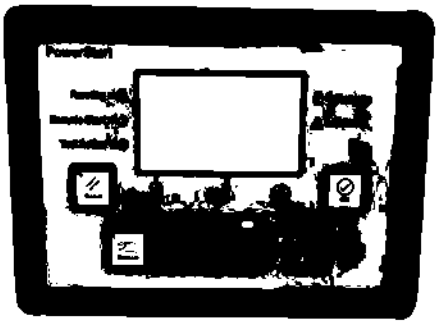
- Issues warning when current imbalance is observed per phase when genset is in running state.

High Current warning/shutdown (51)

- Implementation of the thermal damage curve with instantaneous trip level calculated based on current transformer ratio and application power rating.

Auto Mains Failure Protections:

- Breaker/ATS Switch fail to close warning - when the control signals a ATS switch to close, it will monitor the ATS switch feedback contacts and verifies that switch is closed. If the control does not sense ATS switch closure within an adjustable time period of ter the close signal, the fail to close warning will be initiated.
- Breaker/ATS Switch fail to open warning - when the control signals a ATS switch to open, it will monitor the ATS switch feedback contacts and verifies that switch is opened. If the control does not sense ATS switch opened within an adjustable time period after the open signal, the fail to open warning will be initiated.



Environment

The control is designed for proper operation without recalibration in ambient temperatures from -15 °C (5 °F) to +70° C (158 °F), and for storage from -20 °C (-4 °F) to +80 °C (176 °F). Control will operate with humidity up to 95%, non-condensing.
The control board is conformal coated to provide resistance to dust and moisture. The single membrane surface, which is impervious to effects of dust, moisture, oil and exhaust fumes. This panel uses a sealed membrane to provide long reliable service life in harsh environments. The control is specifically designed and tested for resistance to RFI/EMI and to resist effects of vibration to provide a long reliable life when mounted on a generator set. The control includes transient voltage surge suppression to provide compliance to referenced standards.

FIELD CONTROL INTERFACE

Input signals to the control include:

- configured to AMF specific outputs (Utility/ Genset CB Open/ Close driver) when Auto mains failure is enabled.

Communications connections include:

Control provides one RS-485 port which can be used either for PCTool interface or Modbus master interface based on protocol selection from LCD or Inpower™.

- Modbus RS485 port: Allows the control to communicate with external devices such as PLCs using Modbus protocol.
- PC tool interface: This RS-485 communication port allows the control to communicate with a personal computer running InPower™ software.
- Note — An RS-485 or USB to RS-232 converter is required for communication between control and PC.

Software

InPower (beyond 11.5.2.0 version) is a PC-based software service tool that is designed to directly communicate to Power Start generator sets and transfer switches, to facilitate service and monitoring of these products.

Certifications

PowerStart meets or exceeds the requirements of the following codes and standards:

- Remote start
- Emergency stop
- Configurable customer inputs:

Control includes (1 Control includes 3 input signals which can be configured for diagnostic inputs. Out of which 1st input can also be configured as Battle short input. 2nd and 3rd inputs gets configured to Utility CB status and Genset CB status when Auto mains failure is enabled.)

Output signals from the control include:
Control includes 6 configurable outputs which can be configured to Diagnostic Output, Glow Plug, Ready to load, L series governor.
Configurable output 3, Configurable output 4, Configurable output 5 and Configurable output 6 get

- CE marking: The control is suitable for use on generator sets to be CE-marked. EN 50081-1,2 residential/light industrial emissions or industrial emissions.
- EN 50082-1,2 residential/light industrial or industrial susceptibility.
- ISO 7637-2, level 2; DC supply surge voltage test.
- PowerStart control and generator sets are designed and manufactured in ISO 9001 certified facilities.

Warranty

All components and subsystems are covered by an express limited one year warranty. Other optional and extended factory warranties and local distributor maintenance agreements are available.

Ratings definitions

Emergency Standby Power (ESP):

Applicable for supplying power to varying electrical load for the duration of power interruption of a reliable utility source. Emergency Standby Power (ESP) is in accordance with ISO 8528. Fuel Stop power in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Limited-Time Running Power (LTP):

Applicable for supplying power to a constant electrical load for limited hours. Limited Time Running Power (LTP) is in accordance with ISO 8528.

Prime Power (PRP):

Applicable for supplying power to varying electrical load for unlimited hours. Prime Power (PRP) is in accordance with ISO 8528. Ten percent overload capability is available in accordance with ISO 3046, AS 2789, DIN 6271 and BS 5514.

Base Load (Continuous) Power (COP):

Applicable for supplying power continuously to a constant electrical load for unlimited hours. Continuous Power (COP) in accordance with ISO 8528, ISO 3046, AS 2789, DIN 6271 and BS 5514.

Ethical Clearance in Tanzania

For KCMC application the following is required:

1/ Pay Slip (500$ if it is an Ordinary study / 700 $ if it is a Clinical Trial.)
2/ Cover letter
3/ Application Form - CRERC FORM 2
4/ Full Protocol
5/ Questionnaires / Informed Consent forms (in English and Swahili)
6/ Investigators CVs - CRERC FORM 13

For NIMR application the following is required: (see next page)

1/ Pay Slip (600 USD if it is an Ordinary study / 2,100 USD if it is a Clinical Trial)
2/ Cover letter
3/ NIMR Application Form
4/ KCMC EC - Approval Certificate. (Approval from international collaborating institution if applicable)
4/ Full Protocol
5/ Investigators CVs - CRERC FORM 13
6/ Letter from RMO
7/ Material Transfer Agreement (if samples will be transferred)
8/ Data Transfer Agreement (if data will be transferred)
9/ Informed Consent forms (in English and Swahili)
10/ Questionnaires (in English and Swahili)

Please make sure to use the following format while preparing the submission to KCMC and NIMR:

1. Abstract
2. Introduction
3. Literature review
4. Problem statement
5. Rationale of the study
6. Broad Objective and specific objectives should clearly be stipulated
7. Methodology which should include 1. Study design, study area, study population, inclusion and exclusion criteria, sample size and sample size techniques, data collection methods and tools, study variables
8. Ethical considerations and limitation of the study
9. Dissemination of the results
10. The budget **(and Budget justification)** should have 10% - 25% overhead costs

LOGICAL PRESENTATION OF REQUIREMENTS FOR APPLICATION OF RESEARCH CLEARANCE AND PERMIT AT COSTECH

The objective of the analysis that led to this presentation was to find a much more easier to understand presentation of the requirements to the prospective applicants.

GENERAL REQUIREMENTS: These apply to all applications

	Item	**Foreigners Affiliated to Local Research and Higher Learning Institutions**	**Others (Tanzanian, Non Tanzanians, affiliated in a foreign country, affiliated locally, etc)**
1	Detailed curriculum vitae	Required for all involved researchers	Required for all involved researchers
2	Full research proposal	Required	Required
3	Sponsor cover letter	Required	Required
4	Support letter from local collaborating institution / contact person	Required	Required
5	Recommendation letter for endorsement of the proposed research within the institution	Required	Not applicable
6	Front-page of passport	Required	Required
7	Proof of payment non-refundable application fees	50 USD	50 USD
8	Application form	Required	Required

REQUIREMENTS FOR SPECIFIC SCENARIOS

a) Research related to medical, public health, drugs, clinical trials, and wildlife issues require special clearance from relevant authorities i.e National Institute of Medical Research (NIMR) for the study that involves medical, public health and / or human subject (health); Tanzania Food and Drug Authority for Clinical Trials; and Tanzania Wildlife Research Institute (TAWIRI) for the study that involves wildlife and natural resources conservation.

b) In case of joining a new researcher to an on-going research which has already been granted a research permit, a Principal Investigator shall submit a request of research permit for a new member to COSTECH at least 2 months prior to his/her joining the research team with detailed curriculum vitae, clear justification and roles for an additional staff / researcher to the on-going project.

c) It is anticipated that the PI will remain responsible for the entire lifetime of the project, unless circumstances necessitate a change of PI. In such rare situation the head of hosting research institution shall write to notify COSTECH within 6 months since termination of outgoing PI. This will be done in writing explaining the reason for the changes and suitability of a newly identified PI. The letter requesting for amendment, accompanied by an up to date progress report shall be subjected to approval process before continuing with the research. It is the responsibility of the hosting institution to submit the request for change of PI within specified time.

POST CLEARANCE

a) After the research has been cleared, the PI will be notified by email. All FOREIGNERS who then wishes to undertake research activities in the country under the cleared research project will be required to apply for permit by presenting a proof of payment of research permit fees (300 USD) and three passport size photos.

b) All researchers granted research permit that involve collecting human, plant or animal materials / data that will be exported outside Tanzania must submit a signed Material Transfer Agreement (MTA) / Data Transfer Agreement (DTA) between Tanzania host institution and the foreign counterpart. The MTA/DTA will indicate terms for collecting, storing/managing, transporting, disposal or returning of the materials/DATA to Tanzania after the closure of the research project.

c) An Applicant who has been permitted to conduct research in Tanzania is obliged to submit soft and **two (2) hard copies** (printed) and soft copy of his/her research report /thesis with COSTECH on completion of research.

d) COSTECH will have an access to data and research premises of the permitted research projects.

e) A Principal Investigator (PI) permitted to conduct research in Tanzania is obliged to submit a quarterly/annually report.

f) Persons who have not submitted satisfactory final reports / thesis on previous research work in Tanzania may not be cleared for new projects. Attention will be drawn to the sponsoring institutions and referees on shared responsibility of making sure that researchers sponsored by them observe the foregoing regulations. A breach of the regulations could result in refusal of permits for other researchers sponsored by same institutions or referees.

g) Any patent or intellectual property and royalty emanating from any research approved by the National Research Registration Committee (NRRC) should be owned by the respective research institutions involved.

Criteria for Publication

1. The study presents the results of original research.
2. Results reported have not been published elsewhere.
3. Experiments, statistics, and other analyses are performed to a high technical standard and are described in sufficient detail.
4. Conclusions are presented in an appropriate fashion and are supported by the data.
5. The article is presented in an intelligible fashion and is written in standard English.
6. The research meets all applicable standards for the ethics of experimentation and research integrity.
7. The article adheres to appropriate reporting guidelines and community standards for data availability.

PLOS ONE encourages researchers to share early versions of their manuscripts via preprint server, either before or after submission; posting to a preprint server will not preclude consideration of your manuscript.

Peer Review at PLOS ONE

PLOS ONE is a fully peer reviewed journal with a rigorous multi-stage editorial screening and assessment process.

First, we undertake an initial in-house quality check to identify potential issues such as competing interest, compliance with ethical standards for studies involving human and animal subjects, financial disclosures, data availability, and other scientific and policy requirements. Submissions may be returned to authors for changes or clarifications at this stage.

After passing quality control, each manuscript is placed with a member of the Editorial Board who conducts peer review and makes the decision to accept, invite revision, or reject the submitted manuscript. Read the detailed Editorial and Peer Review Process overview.

Fringe Benefits Allocation Policy

Compensated absences, including vacations, sick, holidays and personal days are considered salaries and wages and, as such, are recorded as salaries and wages when used.

No separate claims are made for those costs under fringe benefits costs category. Compensated absences earned, but not used, are not carried over to the next fiscal year. There is a grace period of using the earned compensated absences by September 30.

All employees are covered for Social Security, NYC commuter taxes, payroll transit taxes, Worker's compensation insurance and unemployment.

Employees working 35 hours or more per week are eligible:

- Health Insurance, including medical, dental and vision;
- Life Insurance;
- 403(B) pension plan (After nine (9) months of employment);
- Short and long term disability.

Employees working more than 20 hours but less than 35 hours per week are eligible for the following fringe benefits:

- Life Insurance;
- Short-Term/long-Term Disability;
- 403(B) pension plan (After nine (9) months of employment).

Fringe Benefits are tracked by employees and charged directly or indirectly in the same manner as employees' salaries and wages.

Although, the costs principles policy for fringe benefits has not changed, effective fiscal year 2020 starting July 1, 2019, EcoHealth Alliance no longer negotiates a fringe benefits rate with the Department of Defense.

For funding proposals, fiscal year 2019 actual data will be used to budget fringe benefit costs. For billing, invoicing and reporting purposes to federal and non-federal donors the actual benefits will be allocated and requested.

ECOHEALTH ALLIANCE, INC.

OFFICE OF NAVAL RESEARCH
875 NORTH RANDOLPH STREET
SUITE 1425
ARLINGTON, VA 22203-1995

Agreement Date: July 17, 2019

NEGOTIATION AGREEMENT

INSTITUTION: **ECOHEALTH ALLIANCE, INC.**
460 WEST 34TH ST. 17TH FLR
NEW YORK, NY 10001-2320

The Indirect Cost rate contained herein is for use on grants, contracts and/or other agreements issued or awarded to the EcoHealth Alliance, Inc. by all Federal Agencies of the United States of America, in accordance with the provisions and cost principles mandated by 2 CFR Part 200. The rate shall be used for forward pricing and billing purposes for the EcoHealth Alliance, Inc. Fiscal Year 2020. This rate agreement supersedes all previous rate agreements/determinations for Fiscal Year 2020.

Section I: RATES - TYPE: PROVISIONAL (PROV)

Indirect Rates:

TYPE	FROM	TO	RATE	BASE	APPLICABLE TO	LOCATION
Prov.	07/01/19	06/30/20	32.0%	(a)	All	All

DISTRIBUTION BASES

(a) Total direct costs excluding capital expenditures (buildings, individual items of equipment; alterations and renovations), the portion of each subaward in excess of $25,000, participant support costs, and flow-through funds.

SECTION II - GENERAL TERMS AND CONDITIONS

A. **LIMITATIONS:** Use of the rate set forth under Section I is subject to availability of funds and to any other statutory or administrative limitations. The rate is applicable to a given grant or contract or other agreement only to the extent that funds are available. Acceptance of the rate agreed to herein is predicated upon the following conditions: (1) that no costs other than those incurred by the organization were included in this indirect cost pool as finally accepted and that such costs are legal obligations of the organization and allowable under governing cost principles; (2) that the same costs that have been treated as indirect costs are not claimed as direct costs; (3) that similar types of costs have been accorded consistent accounting treatment; and (4) that the information provided by the organization which was used as a basis for acceptance of the rate agreed to herein, and expressly relied upon by the Government in negotiating and accepting the said rate is not subsequently found to be materially incomplete or inaccurate.

B. **ACCOUNTING CHANGES**: The rate contained in Section I of this agreement is based on the accounting system in effect at the time the agreement was negotiated. Changes to the method(s) of accounting for costs, which affect the amount of reimbursement resulting from the use of the rate require the prior written approval of the authorized representative of the cognizant agency for indirect costs. Such changes include but are not limited to changes in the charging of a particular type of cost from indirect to direct. Failure to obtain such approval may result in subsequent cost disallowances.

C. **PROVISIONAL RATES:** The provisional rate contained in this agreement is subject to unilateral amendment by the Government or bilateral amendment by the contracting parties at any time.

D. **USE BY OTHER FEDERAL AGENCIES**: The rate set forth in Section I is negotiated in accordance with and under the authority set forth in 2 CFR Part 200. Accordingly, such rate shall be applied to the extent provided in such regulations to grants, contracts, and other agreements to which 2 CFR Part 200 applies, subject to any limitations in part A of this section. Copies of this document may be provided by either party to other federal agencies to provide such agencies with documentary notice of this agreement and its terms and conditions.

E. **SPECIAL REMARKS**: The Government's agreement with the rate set forth in Section I is not an acceptance of the EcoHealth Alliance, Inc.'s accounting practices or methodologies. Any reliance by the Government on cost data or methodologies submitted by EcoHealth Alliance, Inc. is on a non-precedence-setting basis and does not imply Government acceptance.

One Health Coordination Desk (OHCD-PMO) Budget Justification

A. Senior Personnel

We request a total of S14, to support Key Personnel over the five years of the proposed project.

Dr. Justine Assenga, Research Scientist, Molecular Epidemiologist, will commit 0 months per year for which we request salary support of $2 in Year 1, with a 3% increase per annum (p.a.). Dr. Justine Assenga is the Animal Health Focal Person at the Ministry of Livestock and Fisheries One Health Coordination Desk and will join meetings, assist with keeping the government ministries apprised of our activities, contribute to the development of the epidemiological plan as well as facilitate communication to stakeholders. In order to prepare for and facilitate the policy workshop and CCHF Symposium, Dr. Assenga's time will increase in Y for a total of $7,2 over the five years of the project.

Dr. Jubilate Bernard, Research Scientist, Public Health Specialist, will commit 0 months per year for which we request salary support of $25 in Year 1, with a 3% increase p.a. Dr. Jubilate Bernard is the Animal Health Focal Person at the Ministry of Livestock and Fisheries One Health Coordination Desk will join meetings, assist with keeping the government ministries apprised of our activities, contribute to the development of the epidemiological plan as well as facilitate communication to stakeholders. In order to prepare for and facilitate the policy workshop and CCHF Symposium, Dr. Bernard's time will increase to months per year in - for a total of S7, over the five years of the project.

D. Travel

We request a total of S3,185 to support local travel for them in Tanzania over the five years of the proposed project.

We request $600 in Y1 so that both Dr. Assenga and Dr. Bernard may attend project meetings held in Tanzania and take other meetings to improve One Health stakeholder relationships.

Travel expenses will increase at a rate of 3% per year over the five years of the project.

H. Indirect Costs

We request a total of S , 5 in overhead over the five years of the project. The rate of overhead will be 10% each year, starting with S11 in Y1.

Dear Melinda,

PHE Other Direct Costs (exc. Facilities) confirmation for DTRA CCHF Tanzania grant:

PHE have costed £6,600 (which converted $7,119 in original justification) for materials and supplies to conduct 100 CCHFV virus neutralization assays to confirm the positive ELISA results on the wildlife samples

This budget is broken down as follows:

1. Travel Budget £1500
This would be for senior PHE scientist to attend meeting in the field in Tanzania. The costing is based on a projected flight cost of approx. £800 (see Appendix 1- page 3) with the remainder for travel to/from airports and accommodation and sustenance. PHE involvement would be in 2023/24 so it is not possible at this moment to forecast accurate costs for these items but any shortfall in budget will be covered by PHE.

2. Materials and supplies £3600

Agreed with to supply 100x CCHF virus neutralisation tests for £36 per test.

Materials include CCHF antibodies, IgG, cells and general laboratory consumables.

3. Postage of samples
Samples would be taken from the field laboratory and shipped on dry ice under UN packing code 3373 to PHE Porton Down site. The quotation provided by Dangerous Goods International for each delivery would be £525.60.

This postage cost is £1051.20.

The grand total for all other direct cost would be £6119.34. The costs of the items are based on the current prices. The reason to request the additional £~480 is to cover the inflationary costs over the 4 years between now and when we anticipate activity to start.

Your Sincerely,

Neil McLeod
Senior Scientific Project Manager

Dear Melinda,

PHE Briefing Note on current agreements and submissions with DCAA and DCMA for DTRA CCHF Tanzania grant:

PHE have an agreed rate of 37.8% for indirect costs for use on grants, contracts and other agreements with the Federal Government. This is enclosed with email dated 5th November 2019 (Public Health England RA). Please note this is an increase from the 37.5% rate the original costings were based upon, the rate has since been updated since the original proposal was submitted.

This agreement was with the US federal government on behalf of the Department of Health and Human Services. PHE is currently undertaking several contracts funded via US federal agencies NIAID, BARDA and FDA on a range of projects in the area of infectious disease research.

PHE also have a current submission for US-DTRA FRCWMD funding as follows:

Grant agreement: 12753455
Title: Ecological and Epidemiological Investigation of Crimean-Congo hemorrhagic fever virus (CCHFV) in Azerbaijan.
This application is in final stage and is still under consideration. The rate of 37.5% indirect costs was used in the submission.

Your Sincerely,

Neil McLeod

Dear Melinda,

PHE Facilities cost confirmation for DTRA CCHF Tanzania grant:

PHE have costed £5,896 for two weeks use of the high containment biosafety level 4 laboratory at PHE Porton Down site. The standard laboratory rental rate is set at £2948 per week for this laboratory.

The laboratory recharges are generated from a model that allocates a cost based on the specific lab or portion of a lab for the specific time period of use. The cost is a proportion of the total costs of the site allocated to the labs based on the weighted cost of subjective headings.
Table 1 (overleaf, page 2) shows a breakdown of the percentage cost allocations to each heading.

Your Sincerely,

Neil McLeod
Senior Scientific Project Manager

Public Health England-Porton Down Budget Justification

A. Senior Personnel

We request a total of $ to support Key Personnel (KP) during the project.

Roger Hewson, Ph.D, Research Scientist, Virologist will commit 0. months in OY2 of the project. KP Hewson will engage with project partners, supervise and collate scientific reporting from PHE. We request a total of $.

B. Other Personnel

We request a total of $ to support Other Personnel during the proposed project.

Technicians. Two CL4 laboratory will commit 1 month each in OY2 in order to confirm 100 wildlife samples using virus neutralization assays. CCHFV is a Hazard Group 4 pathogen necessitating work with infectious substances to be carried out at Containment Level 4, and the UK operates a dual worker or buddy system for all laboratory work with HG4 pathogens. We request $ per month for a total of for both

Project Manager. The project manager will commit 0. 5 months in OY2 in order to manage staff and ensure efficient project progress. We request $ in OY2. The project manager will also set up DEFRA license applications for sample transport and liaise with colleagues in Tanzania on sample details.

F. Other Direct Costs

We request a total of $1 ,1 for direct costs during the project.

Materials and Supplies

We will conduct 100 CCHFV virus neutralization assays to confirm the positive ELISA results on the wildlife samples, as this has not previously been assessed for this multispecies commercial ELISA. We request $ in OY2 to conduct the testing

Facility Rental

CCHFV is a Hazard Group 4 pathogen necessitating work with infectious substances to be carried out at Containment Level 4. We request $ in OY2 to support the use of the CL-4 laboratory for 2 weeks in order to complete the testing indicated above.

Dear Melinda.

RE: SALARY FOR DR. JULIUS D. KEYYU AND SUBSISTENCE (NIGHT OUT) ALLOWANCE DURING FIELD WORK

Please refer to the above heading and also to communications regarding implementation of the Crimean Congo Haemorrhagic Fever (CCHF) project.

The Tanzania Wildlife Research Institute (TAWIRI) is a parastatal organisation under the Ministry of Natural Resources and Tourism (TAWIRI) established by Act. No. 4 of 1980 of the Parliament (CAP 260 R.E. 2002), with the mandate to conduct, promote and oversee wildlife research in Tanzania.

This letter is to confirm that the monthly salary of Dr. Julius D. Keyyu is Five Million Eighty Hundred and Eight Thousand Tanzanian Shillings (TZS 5.808.000/=); and that the rate for daily subsistence (night out) allowance during field work as per the Government is TZS 120.000 (USD 60) per day to cater for accommodation and food.

Do not hesitate to contact me in case you need any clarification

Yours sincerely.
TANZANIA WILDLIFE RESEARCH INSTITUTE

Dr. Victor Kakengi
FOR: DIRECTOR GENERAL

TVLA Budget Justification

A. Key Personnel

We request a total of S , to support Key Personnel over the five years of the proposed project.

Dr. Furaha Mramba, Co-PI, Entomologist, will commit 1 month per year. We request salary of S3,000 in Year 1, with a 3% increase for Y2- Y , respectively. Her time increase in Y3 to 6.0 months in order to support the testing of samples in the TVLA laboratory. Co-PI Mramba is the Chief Executive of TVLA and holds a PhD in medical entomology. Co-PI Mramba will conduct or supervise the identification and diagnostic testing of animals and ticks, oversee the design, implementation and analysis of the animal study and facilitate communication with stakeholders.

B. Other Personnel

We request a total of S23, to support Other Personnel over the five years of the proposed project.

Laboratory Technicians.

There will be three technicians, who will who commit months per year in Y1 and Y2 to assist with the installation of the equipment purchased for the TVLA laboratory in Arusha (e.g. generator for the building, an ultrafreezer – see the EcoHealth Alliance Y1 part C for a full list of items to be installed), for which we are requesting $. Salaries will increase 3% in subsequent years. They will commit to months for Y3 in order to assist with the diagnostic testing of samples. For this we are requesting S over the five years of the project.

During Year 3 we will hire three additional technicians to conduct the diagnostic testing of samples and tick identification. This includes one ELISA technician and one PCR technician that will be based in Arusha and who will commit 12 months per year for Y3 to assist with sera and ticks, respectively, for which we request $5, 00 per technician . The technician hired to identify ticks will be contracted for 12 months from the TVLA lab in Tanga, for which we request .

D. Travel

We request a total of S to support travel over the five years of the proposed project.

In order to complete the tick identifications in Y3 of the project, we request $ 0 that will cover -day trips to Arusha. Transportation is calculated at S50 per day (S50/day x trips S 00) and overnights are calculated at an average cost of S per day , for trips of days each (S /day x days x trips = S).

Co-PI Mramba will require one trip per year during Y1, Y2, OY1, and OY2 for project meetings and to visit stakeholders, calculated at $50 per day for transportation, and S per day for days for field visit ($1 per year). During Y3 when there is active laboratory work and tick identifications ongoing, co-PI Mramba will make trips to visit the laboratory in Arusha.

Ref. No. BD/332/372/12

Dear Dr. Melinda,

RE: CONFIRMATION AND JUSTIFICATION OF THE TVLA BUDGET

Senior Personnel.

Dr. Furaha Mramba, a Co-PI, and a Medical Entomologist, will commit 1 month per year. Her monthy salary is documented below and is approximately $3,000 in Year 1, with a 3% increase for Y2-OY2, respectively.

Other Personnel:

The average salary for a general laboratory technician at TVLA Laboratory in Arusha is $450 per month or S5,400 per year.

Travel

We confirm that the **Tanzanian Government Rate per night** is S55 and transportation to Arusha is $50.

Other Direct Costs

TVLA Arusha has agreed to the following diagnostic assay table for the CCHF project.

Assay	Number of Samples	Cost per Assay	Total Cost
ELISA	3200	S9.58	S30,656
PCR	3,496	S26.67	S93,238

We estimate that we will need the generator for 26.6 hours per month (S1.25/L*5hours/L*26.6 hours/month*12 months/year = S2000). In Y3 only, we request $300 for a 100 pack of 20 mL Petri dishes.

Grateful if this request will be considered
Faithfully yours,

Dr Joseph Masambu

University of Glasgow (UoG)

A. Senior Personnel

We request a total of S to support co-PI/Key Personnel (KP) over the five years of the proposed project.

Sarah Cleaveland, Ph.D., co-PI, will commit 1.2 months (mo.) per annum (p.a.) for all five years, with an increase of approximately (allowing for exchange rates) 3. % annually. We request S1 , in Y1 and $ 9, 6 total. Co-PI Cleaveland will provide key support and oversight for the field epidemiological studies by contributing to the design and implementation of the field study, liaising with partner institutions and stakeholders in Tanzania and linking with policy makers at national, regional and international levels for the dissemination of findings and development of guidelines.

Brian Willett, Ph.D., Research Scientist, Viral Immunologist, will commit 0.6 mo. p.a. for all five years with an increase of approximately 3. % annually. We request $, in Y1 and S , for all five years. Key Personnel Willett will provide oversight, support and training for CCHFV serological and molecular analyses and will coordinate activities with collaborating laboratories (Public Health England, Pirbright Institute).

B. Other Personnel

We request a total of S1 to support Other Personnel over the five years of the proposed project.

Technician. A full-time laboratory technician based in KP Willett's laboratory will commit 3 mo. per year in Y1 2 and OY1. We request S , 5 in Y1 with a 4. % increase annually. The technician will commit 12 mo. per year in Y3 and OY1 as the in-country laboratory work will be conducted during these two years. We request $, 6 in Y3, totalling $, across all five years. The laboratory technician will support the laboratory analyses, including optimisation of assays, and establishment of laboratory diagnostic capacity in Tanzania.

John Claxton, Administrator, will commit 1.2 months p.a. for all five years with an approximately (allowing for exchange rates) % increase annually. We request $,56 in Y1 and a total of $,8 for all five years. Mr. Claxton, a highly experienced international project manager, will provide support for financial management and reporting, sub-contracts and agreements, ethical clearance, procurement and shipment of supplies.

D. Travel

We request a total of S 3, 2 for international travel across all five years.

We request trips per year for either co-PI Cleaveland or the laboratory technician in Y1-OY1. Each trip is estimated S1, 3 flight

In OY2 we request trip for KP Willett .

We request $, over five years for research visas. We request a permit for the technician in Y1 to assist with the installation of capacity building equipment at TVLA, 2 permits per year in Y2-OY1 for the technician and co-PI Cleaveland and one permit in OY2 for co-PI Cleaveland. We request $2, 0 in Y1 with a 3% increase across all years.

E. Participant Support Costs

We request $3, 00 in Y3 for travel subsistence costs for participants ($5 per day * 5 days * 10 participants *2 trainings). Costs for the UoG trainer are covered by travel costs.

F. Other Direct Costs.

We request a total of $6 , in other direct costs across 5 years.

In Y3 and OY1 we request $ p.a. for the shipment of samples from Tanzania to the University of Glasgow. This is required for quality assurance of assays carried out in Tanzania and based on recent estimates for similar shipments provided by .

We request a total of $58,500 for laboratory across the 5 years. Materials and consumables costs are based upon the average actual annual expenditure (over 4 years) by researchers within this laboratory performing similar experiments to those in the project. These costs were extracted from the University of Glasgow purchasing system Agresso , including antibody reagents, secondary antibody conjugates, specific control sera, buffers, blocking agents and substrates for ELISA. This will produce sufficient reagent to

LOGICAL PRESENTATION OF REQUIREMENTS FOR APPLICATION OF RESEARCH CLEARANCE AND PERMIT AT COSTECH

The objective of the analysis that led to this presentation was to find a much more easier to understand presentation of the requirements to the prospective applicants.

GENERAL REQUIREMENTS: These apply to all applications

	Item	Foreigners Affiliated to Local Research and Higher Learning Institutions	Others (Tanzanian, Non Tanzanians, affiliated in a foreign country, affiliated locally, etc)
1	Detailed curriculum vitae	Required for all involved researchers	Required for all involved researchers
2	Full research proposal	Required	Required
3	Sponsor cover letter	Required	Required
4	Support letter from local collaborating institution / contact person	Required	Required
5	Recommendation letter for endorsement of the proposed research within the institution	Required	Not applicable
6	Front-page of passport	Required	Required
7	Proof of payment non-refundable application fees	50 USD	50 USD
8	Application form	Required	Required

REQUIREMENTS FOR SPECIFIC SCENARIOS

a) Research related to medical, public health, drugs, clinical trials, and wildlife issues require special clearance from relevant authorities i.e National Institute of Medical Research (NIMR) for the study that involves medical, public health and / or human subject (health); Tanzania Food and Drug Authority for Clinical Trials; and Tanzania Wildlife Research Institute (TAWIRI) for the study that involves wildlife and natural resources conservation.

b) In case of joining a new researcher to an on-going research which has already been granted a research permit, a Principal Investigator shall submit a request of research permit for a new member to COSTECH at least 2 months prior to his/her joining the research team with detailed curriculum vitae, clear justification and roles for an additional staff / researcher to the on-going project.

c) It is anticipated that the PI will remain responsible for the entire lifetime of the project, unless circumstances necessitate a change of PI. In such rare situation the head of hosting research institution shall write to notify COSTECH within 6 months since termination of outgoing PI. This will be done in writing explaining the reason for the changes and suitability of a newly identified PI. The letter requesting for amendment, accompanied by an up to date progress report shall be subjected to approval process before continuing with the research. It is the responsibility of the hosting institution to submit the request for change of PI within specified time.

POST CLEARANCE

a) After the research has been cleared, the PI will be notified by email. All FOREIGNERS who then wishes to undertake research activities in the country under the cleared research project will be required to apply for permit by presenting a proof of payment of research permit fees (300 USD) and three passport size photos.

Conditions:

The above quote is subject to variation depending on the final weight of the shipment.
If at the time of shipping the volumetric weight is found to be greater than the actual weight, overweight and the tranship surcharge will be applied using the volumetric weight, v = (L x W x **H**) / 6000, where the dimensions are in cm.
If additional attempts are required due to a rescheduled collection or delivery or to preposition / recover reusable packaging then additional charges will apply.
Final origin and destination drive charges are subject to variation based on exact pick up and delivery locations.
If this information was not provided during the quoting process then the displayed amount will be estimated based on a central point for the named city and subject to change.

Customs Taxes / Duty have not been included in this quote. Taxes/ Duty will be charged where applicable in line with declared Incoterms and in line with Local Legislation
Airline Warehousing and storage charges will be charged in addition when applicable
This Quote is only valid if mentioned when booking
All rates shown are route specific and subject to change depending on any specific collection time and delivery requirements advised at booking
The Fuel & Security surcharge is applied to the base, overweight and driveaway charges only. This rate is reviewed on a quarterly basis & will be charged at the current rate at the time of shipping.

All Quoted charges are exclusive of VAT. Export Brokerage has been added to this quotation if applicable. Any applicable Import Customs Brokerage charges have not been included in this quotation unless specified. Any brokerage services performed by WC will be charged at £81. If WC are invoiced by an external broker for this service then extra charges could apply in addition to this rate.
All Shipments Collected or delivered on a local weekend day or public holiday will incur a surcharge of £90. Weekday shipments collected or delivered between 1900-0700 will incur an after hours surcharge of £25
If additional attempts are required to either collect or deliver shipments or preposition / recover reusable packaging then a charge of £60 + Applicable drive charges will be applied
Charges for reusable packaging (VIP / GTC) may be subject to Extra rental days if the shipment duration exceeds 7 days or if the packaging is not made available on delivery. Dry Ice shipments will be monitrored and replenishments (if required) will be charged in addition to the above quoted amounts.

Notes:

Materials and consumables costs are based upon the average actual annual expenditure (over 4 years) by researchers within this laboratory performing similar experiments to those in the project. These costs were extracted from the University of Glasgow purchasing system Agresso

Moved (insertion) [2]

Formatted: Left

Deleted: **Budget Justification**
Washington State University /
WSU Global Animal Health Tanzania (GAHT)

Note: Cost calculations are rounded to nearest dollar

Senior/Key Personnel
Dr. Felix Lankester, Co-Investigator, 2.4 cal. mo. (years 1-2); 2.0 cal. mo. (years 3-5).
Dr. Lankester is a Clinical Assistant Professor at Washington State University's Paul G. Allen School for Global Animal Health. Now based in the UK, Dr. Lankester has conducted zoonotic disease research since 2009 and has extensive experience with project leadership within the African and One Health research contexts. He serves as Country Representative of WSU's non-profit subsidiary Global Animal Health Tanzania (GAHT), legally registered in Tanzania to facilitate in-country research and support research capacity-building activities on zoonotic infectious diseases. Dr. Lankester will commit 20% effort to the project in Years 1-2 and 16.67% effort in Years 3-5. He will oversee all GAHT activities and supervise GAHT project staff, assist in the coordination of the field activities, serve as liaison with high level Ministerial collaborators and interested parties within the Government of the United Republic of Tanzania, and will collaborate with the PI on data analysis and the drafting of manuscripts, reports and policy documents.
Salary request for Dr. Lankester is $26,192 in Year 1 and budgeted to inflate at 3% annually.
Fringe benefits for Dr. Lankester are calculated at 18% of salary. Year 1 request: $4,715

Senior/Key Personnel Total, 5-year project period: $147,198

B. Other Personnel
WSU Global Animal Health Tanzania (GAHT) maintains an office in Arusha, TZ, to support WSU investigators [1]

Moved (insertion) [1]

Moved up [1]: Travel support within Tanzania is also requested for Dr. Lankester and the Project Coordinator to carry out project activities. Dr. Lankester's travel includes:
Two road trips, 3 days each in Years 1 and 2 to field sites to oversee animal health team activities and sampling procedures. Year 1 budget includes lodging and meal per diem ($157/day x 3 days x 2 trips = $942) and fuel for 720 km per trip ($150 x 2 trips = $300) = $1,242; 3% inflation in Year 2.
One 2-day trip in Years 1 and 2 to visit the wildlife sampling field team. Year 1 costs include return flight Arusha to Seronera ($241) and lodging and per diem ($157/day x 2 days = $314): $555; budgeted with 3% inflation Year 2.
Field visits, Years 1 and 2, total $3,648.

One trip, 2 days each annually to Dar es Salaam and/or Dodoma for meetings with United Republic of Tanzania Ministry officials and other stakeholders. Year 1 costs

WASHINGTON STATE UNIVERSITY

Global Animal Health - Tanzania

August 1st, 2019

Godfrey A. Kassanga
Mjimwema Area/Kigamboni
Dar es salaam
TANZANIA

Dear Godfrey Kassanga,

RE: APPOINTMENT AS ADMINISTRATIVE MANAGER FOR GLOBAL ANIMAL HEALTH TANZANIA

The Washington State University-Global Animal Health Tanzania (GAHT) program is pleased to offer you the position indicated below.

Position Title:	Administrative Manager	
Working Title:	Administrative Manager	
Place of Recruitment:	Arusha	
Location of work:	Global Animal Health Tanzania, Uzunguni Area, Sekou Toure Road, Gymkhana, Arusha	
Reporting:	School for Global Animal Health, Director of Finance and Administration	
Appointment Duration:	1st of September 2019 to 31st of August 2020	
Gross Monthly Salary:	5,762,000 TZS	$2,516.68
Start Date:	1st of September, 2019	

Your position is responsible for the overall administrative coordination of Global Animal Health Tanzania (GAHT), a Non-Governmental Organization (NGO) in Arusha, Tanzania. In this position you will serve as the primary financial and personnel officer for GAHT and will operate with a broad level of independent judgment and decision making authority. You will report directly to the Paul G. Allen School for Global Animal Health, Director of Finance and Administration, an academic unit of Washington State University. You will manage the administrative functions of GAHT personnel, procurement, contracts, and finance units for GAHT. You will also manage the requisite NGO registrations and official documents, ensuring all are in order and filed with the respective United Republic of Tanzania agencies. Your responsibilities include assisting the Director of Finance and Administration and the President of

Global Animal Health-Tanzania: Improving Public Health and Catalyzing Human Opportunity
Rivergardens Business Park, Usa River, Arusha
PO Box 1642, Arusha, Tanzania
Telephone: Office Line +255-688521020
www.globalhealth.wsu.edu

GAHT in the development of long-and-short-term strategic plans for GAHT as a sustainable and responsive NGO, leading and managing administrative activities associated with the GAHT office, and ensuring operations are aligned with GAHT and Washington State University policies and procedures as well as in compliance with United Republic of Tanzania laws, regulations, and policies.

A detailed description of the position scope of work is provided in the position description that will be given to you upon reporting.

Note: **See attached position description**

The terms of engagement are as follows:

1. **Engagement Duration:** The period of service is for one (1) year from the start date indicated herein above (1st of September, 2019 to 31st of August, 2020), on a renewable basis upon consultation with and advice from the Director of Finance and Administration and approval of the officers of GAHT. Renewal is not automatic and no action or omission by the GAHT program or its management shall constitute or support any expectation of renewal, even where you may have had a previous renewal of contract.

3. **Working Hours:** The normal working hours are 40 hours a week from 8:00am to 5:00pm, with one-hour lunch break, from Monday to Friday. At times you will be expected to work outside of the normal working hours, however the position is not eligible for overtime due to the senior level of the employment. You will have teleconference meetings, normally weekly, with the Paul G. Allen School for Global Animal Health administrative team as well as with faculty engaged in research in Tanzania. These meetings, due to time zone difference, are likely to be scheduled outside of your normal working hours.

4. **Salary:** You will be paid a Gross Monthly Salary of 5,762,000 TZS. The salary is paid in arrears at the end of each working month for the duration of engagement as per the employment contract.

The said gross salary shall be subjected to statutory deductions as provided in relevant Legislation including but not limited to PAYE (income tax) and pension deductions.

5. **Benefits:** In addition to the salary, you will receive health insurance that you can enlist up to four immediate dependents who must be either your spouse or your legal child (biological child, legally adopted child or a child over whom you have a court mandated guardianship or custody).

6. **Annual Leave:** You will be entitled to annual leave of 22 days per year. These should be utilized within the duration of the contract through mutual agreement between you and your supervisor. You are also entitled to sick leave, maternity leave and compassionate leave as stipulated by law.

7. **Confidentiality:** During and after the term of employment (unless expressly authorized in writing) all information respecting the organization, management, policy, finances and others shall be confidential and not subject to disclosure to 3rd parties.

You will be required to complete training regarding prevention of discrimination and sexual harassment within six months of your date of hire. Information regarding this training is available at the following web site: hrs.wsu.edu/dshp.

All GAHT employees are required to adhere to the institution's policies and procedures. Please return a copy of this letter to Dr. Guy Palmer, President of GAHT, indicating whether you accept or decline the offer, not later than the 12th of August, 2019.

We are confident you will find this opportunity both challenging and rewarding, and we are delighted that you have chosen to pursue your career with the Global Animal Health Tanzania program.

Sincerely,

Dr. Guy Palmer

Sarah Mollel
P.O. Box 772,
Arusha, Tanzania

Dear Sarah Mollel,

RE: APPOINTMENT AS PROGRAM COORDINATOR FOR GAHT

The Washington State University-Global Animal Health Tanzania (GAHT) program is pleased renew your position as indicated below.

Position Title:	Program Coordinator	
Working Title:	Country Coordinator	
Place of Recruitment:	Arusha	
Location of work:	Global Animal Health Tanzania, Uzunguni Area, Sekou Toure Road, Gymkhana, Arusha	
Reporting:	School for Global Animal Health Administrative Manager	
Appointment Duration:	16th April, 2019 to 15th April, 2020	
Gross Monthly Salary:	4,095,793.97 TSH	$1788.93
Start Date:	16th of April 2019	

The position provides coordination and oversight for the numerous research projects that are carried out by Washington State University (WSU) and GAHT employees in Tanzania. Responsibilities include overseeing the purchase of supplies, disbursing funds, maintaining financial records for each project, managing reimbursements, processing payroll, managing all in country banking issues, working closely with in country auditors and legal counsel, assisting researchers in various research activities, organizing project related meetings and seminars, and managing the Arusha based GAHT office. Your position will report directly to School for Global Animal Health Administrative Manager. Additionally, you will receive direction and leadership from GAHT officers and WSU faculty coordinating research in Tanzania, and from the Washington State University administrative team, most directly from School for Global Animal Health Fiscal Analyst 3.

A detailed description of the position scope of work is provided in the position description.
Note: **See attached position description**

The terms of engagement are as follows:

1. Engagement Duration: The period of service is for one (1) year from the start date indicated herein above (16 April 2019 to 15 April 2020), on a renewable basis upon consultation with and advice from the GAHT officers,and Administrative Manager Rebecca Manning. The contemplated renewal is not automatic and no action or omission by the GAHT program or its management shall constitute or support any expectation of renewal even where you may have had a previous renewal of contract.

3. Working Hours: The normal working hours are 40 hours a week from 8:00am to 5:00pm, with one-hour lunch break, from Monday to Friday. At times the Program Coordinator will be expected to work outside of the normal working hours, however the position is not eligible for overtime due to the senior level of the employee. Weekly you will have skype meetings, which due to time zone difference are likely to be scheduled outside of normal working hours, with WSU Research faculty and administrative team.

4. Salary: You will be paid a Gross Monthly Salary of 4,095,793.97 TZS. The salary is paid in arrears at the end of each working month for the duration of engagement as per the employment contract.

The said gross salary shall be subjected to statutory deductions as provided in relevant Legislation including but not limited to PAYE (income tax) and pension deductions.

5. Benefits: In addition to the salary, you will receive health insurance that can enlist up to four immediate dependents who must be either your spouse or your legal child (biological child, legally adopted child or a child over whom you have a court mandated guardianship or custody).

6. Annual Leave: You will be entitled to annual leave of 22 days per year. These should be utilized within the duration of the contract through mutual agreement between you and WSU research faculty. The employee is also entitled to sick leave, maternity leave and compassionate leave as stipulated by law.

7. Confidentiality: During and after the term of employment (unless expressly authorized in writing) all information respecting the organization, management, policy, finances and others shall be confidential and not subject to disclosure to 3rd parties.

All GAHT employees are required to adhere to the institution's policies and procedures. Please return a copy of this letter to Dr. Guy Palmer President of GAHT, indicating whether you accept or decline the offer, not later than April 15, 2019.

We are confident you will find this opportunity both challenging and rewarding, and we look forward to continuing to work with you at the Global Animal Health Tanzania program.

Sincerely,

Dear,

RE: APPOINTMENT AS PROJECT VETERINARIAN FOR GAHT

The Washington State University-Global Animal Health Tanzania (GAHT) program is pleased to offer you the position indicated below.

Position Title:	Project Veterinarian
Place of Recruitment:	Arusha
Location of work:	Arusha and Meru Region, Tanzania
Reporting:	Dr. Felix Lankester
Appointment Duration:	One year
Gross Monthly Salary:	5,446,800 Tsh $2,379
Start Date:	XXXX

The role of the Project Veterinarian is to participate in field activities for collection of biological samples from livestock and wildlife species, including collection of samples and management of sample transport to laboratory facilities, and collection of survey data.

The terms of engagement are as follows:

1. **Engagement Duration:** The period of service is for one (1) year from the start date indicated herein above (xx/xx/xxxx to xx/xx/xxxx). The Contemplated renewal is not automatic and no action or omission by the GAHT program or its management shall constitute or support any expectation of renewal even where you may have had a previous renewal of contract. You also recognize that your position may be retrenched in the event of cessation or reduction funding and you accept that you will be retrenched by being given one (1) month notice and other minimum terms required by local legislation.

2. **Working Hours:** The normal working hours are 40 hours a week from 8:30am to 5:30pm, with one-hour lunch break, from Monday to Friday. Occasionally you may be required to work beyond 40 hours and anything beyond 45 hours per week shall be considered overtime. Overtime shall be paid in accordance with local legislation requirements but only in instances where you have received prior written approval to work overtime.

3. Salary: You will be paid a Gross Monthly Salary of 5,446,800 Tsh. The salary is paid in arrears at the end of each working month for the duration of engagement as per the employment contract.

The said gross salary shall be subjected to statutory deductions as provided in relevant Legislation including but not limited to PAYE (income tax) and pension deductions.

4. Benefits: In addition to the salary, you will receive health insurance that can enlist up to four immediate dependents who must be either your spouse or your legal child (biological child, legally adopted child or a child over whom you have a court mandated guardianship or custody).

5. Annual Leave: Upon completing 12 months of continuous service, you will be entitled to annual leave of 28 consecutive days per year. These should be utilized within the duration of the contract through mutual agreement between you and the Country Director. Employees are also entitled to sick leave, maternity leave, paternity leave and compassionate leave as stipulated by law and clarified in the Employee Handbook.

6. Bereavement: In the case where the employee losses his immediate family member (child or spouse) the organization will provide 1,000,000Tsh as a support to the employee. Furthermore, when the employee dies GAHT will assist the family on funeral arrangements by providing them with 3,000,000Tsh.

7. Confidentiality: During the term of employment, (unless expressly authorized in writing) all information respecting the organization, management, policy, finances and others shall be confidential and not subject to disclosure to third parties.

All GAHT employees are required to adhere to the institution's policies and procedures as issued from time to time.

Please return a copy of this letter to the GAHT Country Coordinator, indicating whether you accept or decline the offer by XXXX.

We are confident you will find this new opportunity both challenging and rewarding, and are delighted that you have chosen to pursue your career with the Global Animal Health Tanzania program.

Sincerely,

.....

Dr. Guy Palmer

Dear,

RE: APPOINTMENT AS FIELD ASSISTANT FOR GAHT

The Washington State University-Global Animal Health Tanzania (GAHT) program is pleased to offer you the position indicated below.

Position Title:	Field Assistant
Place of Recruitment:	Arusha
Location of work:	Arusha and Meru Region, Tanzania
Reporting:	Dr. Felix Lankester or Country Director
Appointment Duration:	One year
Gross Monthly Salary:	1,144,800 Tsh $1000
Full time equivalent:	50%
Start Date:	XXXX

The role of the Field Assistant is to drive project vehicles and assist with field activities.

The terms of engagement are as follows:

1. Engagement Duration: The period of service is for one (1) year from the start date indicated herein above (xx/xx/xxx to xx/xx/xxx). The Contemplated renewal is not automatic and no action or omission by the GAHT program or its management shall constitute or support any expectation of renewal even where you may have had a previous renewal of contract. You also recognize that your position may be retrenched in the event of cessation or reduction funding and you accept that you will be retrenched by being given one (1) month notice and other minimum terms required by local legislation.

2. Probation: You shall be subjected to a three-month probation period, after which a performance assessment will be conducted by the Country Director. Confirmation of appointment is subject to the satisfactory completion of the probationary period and approval by the Country Director.

During the probation period either party may terminate the contract for whatever reason upon giving one (1) week notice in writing or payment in lieu of such notice.

Thereafter either party may terminate the contract upon giving a minimum of 28 days' notice in writing or payment in lieu of such notice

3. **Working Hours:** The Field Assistant is expected to work the equivalent of 50% of a 40 hour per week full-time appointment. As this is not a full-time position, the hours of work will vary from week to week.

4. **Salary:** You will be paid a Gross Monthly Salary of 1,144,800 Tsh. The salary is paid in arrears at the end of each working month for the duration of engagement as per the employment contract.

The said gross salary shall be subjected to statutory deductions as provided in relevant Legislation including but not limited to PAYE (income tax) and pension deductions.

5. **Annual Leave:** Upon completing 12 months of continuous service you will be entitled to annual leave of 6 working days per year. These should be utilized within the duration of the contract through mutual agreement between you and the Country Director. Employees are also entitled to sick leave, maternity leave, paternity leave and compassionate leave as stipulated by law and clarified in the Employee Handbook.

6. **Confidentiality:** During the term of employment, (unless expressly authorized in writing) all information respecting the organization, management, policy, finances and others shall be confidential and not subject to disclosure to third parties.

All GAHT employees are required to adhere to the institution's policies and procedures. These policies are summarized in the Employee Handbook, which will be issued to all employees.

Please return a copy of this letter to the GAHT Country Director, indicating whether you accept or decline the offer, not later than XXXX.

We are confident you will find this new opportunity both challenging and rewarding, and are delighted that you have chosen to pursue your career with the Global Animal Health Tanzania program.

Sincerely,

.....

Dr. Guy Palmer
Regents Professor
Washington State University
Chairman, Global Animal Health-Tanzania

LOGICAL PRESENTATION OF REQUIREMENTS FOR APPLICATION OF RESEARCH CLEARANCE AND PERMIT AT COSTECH

The objective of the analysis that led to this presentation was to find a much more easier to understand presentation of the requirements to the prospective applicants.

GENERAL REQUIREMENTS: These apply to all applications

	Item	**Foreigners Affiliated to Local Research and Higher Learning Institutions**	**Others (Tanzanian, Non Tanzanians, affiliated in a foreign country, affiliated locally, etc)**
1	Detailed curriculum vitae	Required for all involved researchers	Required for all involved researchers
2	Full research proposal	Required	Required
3	Sponsor cover letter	Required	Required
4	Support letter from local collaborating institution / contact person	Required	Required
5	Recommendation letter for endorsement of the proposed research within the institution	Required	Not applicable
6	Front-page of passport	Required	Required
7	Proof of payment non-refundable application fees	50 USD	50 USD
8	Application form	Required	Required

REQUIREMENTS FOR SPECIFIC SCENARIOS

a) Research related to medical, public health, drugs, clinical trials, and wildlife issues require special clearance from relevant authorities i.e National Institute of Medical Research (NIMR) for the study that involves medical, public health and / or human subject (health); Tanzania Food and Drug Authority for Clinical Trials; and Tanzania Wildlife Research Institute (TAWIRI) for the study that involves wildlife and natural resources conservation.

b) In case of joining a new researcher to an on-going research which has already been granted a research permit, a Principal Investigator shall submit a request of research permit for a new member to COSTECH at least 2 months prior to his/her joining the research team with detailed curriculum vitae, clear justification and roles for an additional staff / researcher to the on-going project.

c) It is anticipated that the PI will remain responsible for the entire lifetime of the project, unless circumstances necessitate a change of PI. In such rare situation the head of hosting research institution shall write to notify COSTECH within 6 months since termination of outgoing PI. This will be done in writing explaining the reason for the changes and suitability of a newly identified PI. The letter requesting for amendment, accompanied by an up to date progress report shall be subjected to approval process before continuing with the research. It is the responsibility of the hosting institution to submit the request for change of PI within specified time.

POST CLEARANCE

a) After the research has been cleared, the PI will be notified by email. All FOREIGNERS who then wishes to undertake research activities in the country under the cleared research project will be required to apply for permit by presenting a proof of payment of research permit fees (300 USD) and three passport size photos.

b) All researchers granted research permit that involve collecting human, plant or animal materials / data that will be exported outside Tanzania must submit a signed Material Transfer Agreement (MTA) / Data Transfer Agreement (DTA) between Tanzania host institution and the foreign counterpart. The MTA/DTA will indicate terms for collecting, storing/managing, transporting, disposal or returning of the materials/DATA to Tanzania after the closure of the research project.

c) An Applicant who has been permitted to conduct research in Tanzania is obliged to submit soft and **two (2) hard copies** (printed) and soft copy of his/her research report /thesis with COSTECH on completion of research.

d) COSTECH will have an access to data and research premises of the permitted research projects.

e) A Principal Investigator (PI) permitted to conduct research in Tanzania is obliged to submit a quarterly/annually report.

f) Persons who have not submitted satisfactory final reports / thesis on previous research work in Tanzania may not be cleared for new projects. Attention will be drawn to the sponsoring institutions and referees on shared responsibility of making sure that researchers sponsored by them observe the foregoing regulations. A breach of the regulations could result in refusal of permits for other researchers sponsored by same institutions or referees.

g) Any patent or intellectual property and royalty emanating from any research approved by the National Research Registration Committee (NRRC) should be owned by the respective research institutions involved.

WASHINGTON STATE UNIVERSITY

WSU CONTRACT ##### DRAFT1

CONTRACT FOR PERSONAL SERVICES
BETWEEN

WASHINGTON STATE UNIVERSITY
AND

This contract is made and entered into by and between the state of Washington, **Washington State University**, hereinafter referred to as the "**UNIVERSITY**", and the below named firm or individual, hereinafter referred to as "**CONTRACTOR.**"

NAME
ADDRESS
CITY STATE AND ZIP
TELEPHONE
EMAIL
FEDERAL ID NO.
WASHINGTON STATE UBI NO
WSU VENDOR NO.
STATE OF WA OMWBE CERTIFICATION NO.

1. PURPOSE

The purpose of this Contract is to provide expertise for a federally funded project entitled, "Crimean Congo Hemorrhagic Fever: Reducing an emerging health threat in Tanzania," University lead investigator Dr. Felix Lankester. CONTRACTOR will serve as the project mammologist.

2. SCOPE OF WORK

A. The CONTRACTOR will provide services, and otherwise do all things necessary for or incidental to the performance of work, as set forth below:

1. Assist field teams with the live trapping, sample collection and identification of small mammal species
2. Ensure proper documentation of the species identified
3. Write bi-monthly reports and submit to the University lead investigator, which will include a summary of field activities
4. Attend study meetings as requested and report on progress of work

B. Exhibits A and B contain the General Terms and Conditions governing work to be performed under this contract, the nature of the working relationship between the UNIVERSITY and the CONTRACTOR, and specific obligations of both parties.

C. The CONTRACTOR shall produce the following deliverables by the dates indicated in the chart below:

DATE	DESCRIPTION OF DELIVERABLE ITEM
	• A schedule of travel to be undertaken with field teams to conduct sampling activities and species identification of small mammals • Bi-monthly reports of field activities and species identification • Attendance at study related meetings as requested

3. PERIOD OF PERFORMANCE

The period of performance under this contract will be from xxxx through xxxx.

The execution of this Contract shall constitute a ratification of that earlier verbal agreement between the parties, the terms and conditions of which are contained herein. Accordingly, the beginning date of performance under this Contract shall be xxxx regardless of the date of execution. UNIVERSITY shall reimburse the CONTRACTOR for those costs incurred in performance hereunder, for that period between the beginning date of performance and the date of execution of this Contract.

4. COMPENSATION AND PAYMENT

All compensation amounts and funds due to CONTRACTOR are stated in U.S. Dollars (USD Payments will be made in Tanzania Shilling by UNIVERSITY'S Local Affiliate, PFK Limited and non-government agency, Global Animal Health Tanzania (GAHT). UNIVERSITY and GAHT will not compensate CONTRACTOR for currency exchange fluctuations through the issuance of payment.

Payments to CONTRACTOR will be subjected to all Tanzanian tax regulation.

UNIVERSITY shall pay **an amount not to exceed $12,000.00** for the performance of all things necessary for or incidental to the performance of work as set forth in the Scope of Work. CONTRACTOR'S compensation for services rendered shall be based on the following rates or in accordance with the following terms:

A. **Fees:** At the rate of **$500.00** per month an amount not to exceed **$6,000.00 per year**; which amount is included in the not-to-exceed compensation amount.

B. **Expenses:** The UNIVERSITY shall provide coverage of travel expenses related to official work that has been approved in advance by the Project Manager, including:

1. Lodging and subsistence necessary during periods of required travel.

5. BILLING PROCEDURES

UNIVERSITY will pay CONTRACTOR upon receipt of properly completed invoices, which may be submitted to the Contract Manager via email. The billing address for invoices is:

Washington State University
Controllers Office
Attn: WSU Contract XXXX~ Rebecca Manning, Mail Code 7090
P.O. Box 641025
Pullman, WA 99164-1025

The invoices shall describe and document to the UNIVERSITY'S satisfaction a description of the work performed, the progress of the project, and fees. If expenses are invoiced, provide a detailed breakdown of each type. Any single expense in the amount of $50.00 or more must be accompanied by a receipt in order to receive reimbursement.

Payment shall be considered timely if made by the UNIVERSITY within thirty (30) days after receipt of properly completed invoices. Payment shall be sent to the address designated by the CONTRACTOR.

The UNIVERSITY may, in its sole discretion, terminate the contract or withhold payments claimed by the CONTRACTOR for services rendered if the CONTRACTOR fails to satisfactorily comply with any term or condition of this contract.

No payments in advance or in anticipation of services or supplies to be provided under this contract shall be made by the UNIVERSITY.

6. CONTRACT MANAGEMENT

A. The Contract Manager for each of the parties shall be the contact person for all communications regarding the performance of this contract and billing.

7. INSURANCE

The CONTRACTOR shall insure themselves and any persons working for their organization; and they shall be exclusively liable for any claims arising from them and/or their employees, from performance of their obligations of this Contract.

CONTRACTOR shall submit to UNIVERSITY within 15 days of the Contract effective date, a certificate of insurance that outlines the coverage and limits defined in the Insurance section. The mailing address for certificate holder is:

Washington State University
Contract #####
PO Box 641020
Pullman, WA 99164-1020

8. ASSURANCES

UNIVERSITY and the CONTRACTOR agree that all activity pursuant to this contract will be in accordance with all the applicable current federal, state and local laws, rules, and regulations.

9. ORDER OF PRECEDENCE

Each of the Exhibits listed below is by this reference hereby incorporated into this contract. In the event of an inconsistency in this contract, the inconsistency shall be resolved by giving precedence in the following order:

1. Applicable Federal and state of Washington statutes and regulations
2. Special Terms and Conditions as contained in this basic contract instrument
3. Exhibit B – FAR Terms and Conditions (for Federal Grant Funded Purchases only)
4. Exhibit A UNIVERSITY General Terms and Conditions
5. Any other provision, term or material incorporated herein by reference or otherwise incorporated.

10. ENTIRE AGREEMENT

This contract including referenced exhibits represents all the terms and conditions agreed upon by the parties. No other statements or representations, written or oral, shall be deemed a part hereof.

11. CONFORMANCE

If any provision of this contract violates any statute or rule of law of the state of Washington, it is considered modified to conform to that statute or rule of law.

12. APPROVAL

This contract shall be subject to the written approval of the UNIVERSITY'S authorized representative and shall not be binding until so approved. The contract may be altered, amended, or waived only by a written amendment executed by both parties.

This CONTRACT, consisting of FOUR pages and two attachments named Exhibit A and Exhibit B, is executed by the persons signing below who warrant that they have the authority to execute the agreement.

WSU Contract XXXX
Exhibit A

GENERAL TERMS AND CONDITIONS FOR PERSONAL SERVICES CONTRACT

DEFINITIONS
As used throughout this CONTRACT, the following terms shall have the meaning set forth below:

A. "UNIVERSITY" shall mean Washington State University, an institution of higher education of the State of Washington, any division, section, office, unit or other entity of the UNIVERSITY, or any of the officers or other officials lawfully representing that UNIVERSITY.

B. "AGENT" shall mean the delegated individual authorized in writing to act on the UNIVERSITY'S behalf.

C. "CONTRACTOR" shall mean that firm, provider, organization, individual or other entity performing service(s) under this contract, and shall include all employees of the CONTRACTOR.

D. "SUBCONTRACTOR" shall mean one not in the employment of the CONTRACTOR, who is performing all or part of those services under this contract under a separate contract with the CONTRACTOR. The terms "SUBCONTRACTOR" and "SUBCONTRACTORS" means SUBCONTRACTOR(s) in any tier.

ACCESS TO DATA
In compliance with RCW 39.26.180, the CONTRACTOR shall provide access to data generated under this contract to UNIVERSITY, the Joint Legislative Audit and Review Committee, and the State Auditor at no additional cost. This includes access to all information that supports the findings, conclusions, and recommendations of the CONTRACTOR'S reports, including computer models and methodology for those models.

ADVANCE PAYMENTS PROHIBITED
In accordance with state law, no payments in advance of or in anticipation of goods or services to be provided under this CONTRACT shall be made by the UNIVERSITY.

AMENDMENTS
This CONTRACT may be amended by mutual agreement of the parties. Such amendments shall not be binding unless they are in writing and signed by personnel authorized to bind each of the parties.

ASSIGNMENT
Neither this contract, nor any claim arising under this contract, shall be transferred or assigned by the CONTRACTOR without prior written consent of the UNIVERSITY.

ATTORNEYS' FEES
In the event of litigation or other action brought to enforce contract terms, each party agrees to bear its own attorney fees and costs.

CONFIDENTIALITY/SAFEGUARDING OF INFORMATION
The CONTRACTOR shall not use or disclose any information concerning the UNIVERSITY, or information that may be classified as confidential, for any purpose not directly connected with the administration of this contract, except with prior written consent of the UNIVERSITY, or as may be required by law.

CONFLICT OF INTEREST
Notwithstanding any determination by the Executive Ethics Board or other tribunal, the UNIVERSITY may, in its sole discretion, by written notice to the CONTRACTOR terminate this contract if it is found after due notice and examination by the UNIVERSITY that there is a violation of the Ethics in Public Service Act, Chapter 42.52 RCW; or any similar statute involving the CONTRACTOR in the procurement of, or performance under this contract.

In the event this contract is terminated as provided above, the UNIVERSITY shall be entitled to pursue the same remedies against the CONTRACTOR as it could pursue in the event of a breach of the contract by the CONTRACTOR. The rights and remedies of the UNIVERSITY provided for in this clause shall not be exclusive and are in addition to any other rights and remedies provided by law. The existence of facts upon which the AGENT makes any determination under this clause shall be an issue and may be reviewed as provided in the "Disputes" clause of this contract.

COPYRIGHT PROVISIONS
Unless otherwise provided, all materials produced under this contract shall be considered "works for hire" as defined by the U.S. Copyright Act and shall be owned by the UNIVERSITY. The UNIVERSITY shall be considered the author of such materials. In the event the materials are not considered "works for hire" under the U.S. Copyright laws, CONTRACTOR hereby irrevocably assigns all right, title, and interest in materials, including all intellectual property rights, to the UNIVERSITY effective from the moment of creation of such materials.

Materials means all items in any format and includes, but is not limited to, data, reports, documents, pamphlets, advertisements, books, magazines, surveys, studies, computer programs, films, tapes, and/or sound reproductions. Ownership includes the right to copyright, patent, register and the ability to transfer these rights.

For materials that are delivered under the contract, but that incorporate pre-existing materials not produced under the contract, CONTRACTOR hereby grants to the UNIVERSITY a nonexclusive, royalty-free, irrevocable license (with rights to sublicense others) in such materials to translate, reproduce, distribute, prepare derivative works, publicly perform, and publicly display. The CONTRACTOR warrants and represents that CONTRACTOR has all rights and permissions, including intellectual property rights, moral rights and rights of publicity, necessary to grant such a license to the UNIVERSITY.

The CONTRACTOR shall exert all reasonable effort to advise the UNIVERSITY, at the time of delivery of materials furnished under this contract, of all known or potential invasions of privacy contained therein and of any portion of such document that was not produced in the performance of this contract.

The UNIVERSITY shall receive prompt written notice of each notice or claim of infringement received by the CONTRACTOR with respect to any data delivered under this contract. The UNIVERSITY shall have the right to modify or remove any restrictive markings placed upon the data by the CONTRACTOR.

COVENANT AGAINST CONTINGENT FEES
The CONTRACTOR warrants that no person or selling agent has been employed or retained to solicit or secure this contract upon an agreement or understanding for a commission, percentage, brokerage or contingent fee, excepting bona fide employees or bona fide established agents maintained by the CONTRACTOR for securing business.

The UNIVERSITY shall have the right, in the event of breach of this clause by the CONTRACTOR, to annul this contract without liability or, in its discretion, to deduct from the contract price or consideration or recover by other means the full amount of such commission, percentage, brokerage or contingent fee.

DISALLOWED COSTS
The Contractor is responsible for any audit exceptions or costs disallowed by the UNIVERSITY that are incurred by the Contractor or its Subcontractors.

DISPUTES
In the event that a dispute arises under this Contract that the parties can't resolve, they shall allow the dispute to be decided by a Dispute Panel in the following manner: each party to this Contract shall appoint one member to the Dispute Panel, and the members so appointed shall jointly appoint an additional member to the Dispute Panel. The Dispute Panel shall review the facts, contract terms and applicable statutes and rules and make a determination of the dispute. The determination of the Dispute Panel shall be final and binding on the parties hereto. The parties shall equally share the costs, if any, for the services of the Dispute Panel.

Nothing in this contract shall be construed to limit the parties' choice of a mutually acceptable alternate dispute resolution method in addition to the dispute resolution procedure outlined above.

DUPLICATE PAYMENT
The UNIVERSITY shall not pay the CONTRACTOR, if the CONTRACTOR has charged or will charge Washington State University, the State of Washington or any other party under any other contract or agreement, for the same services or expenses.

FUNDING CONTINGENCY
In the event funding from state, federal, or other sources is withdrawn, reduced, or limited in any way after the effective date of this contract and prior to normal completion, the UNIVERSITY may terminate the contract under the "Termination for Convenience" clause, without the ten-day notice requirement, subject to renegotiation at the UNIVERSITY'S discretion under those new funding limitations and conditions.

GOVERNING LAW
This contract shall be construed and interpreted in accordance with the laws of the State of Washington, and the venue of any action brought hereunder shall be in the Superior Court for Whitman County.

INDEMNIFICATION
To the fullest extent permitted by law, CONTRACTOR shall indemnify, defend, and hold harmless Washington State University, the State of Washington, agencies of the State and all officials, agents and employees of the State, from and against all claims for injuries or death arising out of or resulting from the performance of the contract. "Claim," as used in this contract, means any financial loss, claim, suit, action, damage, or expense, including but not limited to attorney's fees, attributable for bodily injury, sickness, disease, or death, or injury to or destruction of tangible property including loss of use resulting therefrom.

CONTRACTOR'S obligations to indemnify, defend, and hold harmless includes any claim by CONTRACTORS' agents, employees, representatives, or any subcontractor or its employees.

CONTRACTOR expressly agrees to indemnify, defend, and hold harmless Washington State University and the State of Washington for any claim arising out of or incident to CONTRACTOR'S or any subcontractor's performance or failure to perform the contract. CONTRACTOR'S obligation to indemnify, defend, and hold harmless Washington State University and the State of Washington shall not be eliminated or reduced by any actual or alleged concurrent negligence of State or its agents, agencies, employees and officials.

CONTRACTOR waives its immunity under Title 51 RCW to the extent it is required to indemnify, defend and hold harmless Washington State University and the State of Washington and its agencies, officials, agents or employees.

INDEPENDENT CAPACITY OF THE CONTRACTOR
The parties intend that an independent contractor relationship will be created by this contract. The CONTRACTOR and his or her employees or agents performing under this contract are not employees or agents of the UNIVERSITY. The CONTRACTOR will not hold himself/herself out as or claim to be an officer or employee of the UNIVERSITY or of the State of Washington by reason hereof, nor will the CONTRACTOR make any claim of right, privilege or benefit that would accrue to such employee under law. Conduct and control of the work will be solely with the CONTRACTOR.

INDUSTRIAL INSURANCE COVERAGE
The CONTRACTOR shall comply with the provisions of Title 51 RCW, Industrial Insurance. If the CONTRACTOR fails to provide industrial insurance coverage or fails to pay premiums or penalties on behalf of its employees, as may be required by law, UNIVERSITY may collect from the CONTRACTOR the full amount payable to the Industrial Insurance accident fund. The UNIVERSITY may deduct the amount owed by the CONTRACTOR to the accident fund from the amount payable to the CONTRACTOR by the UNIVERSITY under this contract, and transmit the deducted amount to the Department of Labor and Industries, (L&I) Division of Insurance Services. This provision does not waive any of L&I's rights to collect from the CONTRACTOR.

LICENSING, ACCREDITATION AND REGISTRATION
The CONTRACTOR shall comply with all applicable local, state, and federal licensing, accreditation and registration requirements/standards, necessary for the performance of this contract.

LIMITATION OF AUTHORITY
Only a WSU UNIVERSITY'S personnel authorized in writing to bind UNIVERSITY (delegation to be made prior to action) shall have the express, implied, or apparent authority to alter, amend, modify, or waive any clause or condition of this contract. Any alterations, amendment, modifications, or waivers made by UNIVERSITY personnel or employees without such written authority will not be effective or binding unless also made in writing and signed by an authorized UNIVERSITY representative.

NONDISCRIMINATION
During the performance of this contract, the CONTRACTOR shall comply with all federal and state nondiscrimination laws, regulations and policies, including the AMERICANS WITH DISABILITIES ACT (ADA) OF 1990, PUBLIC LAW 101-336, also referred to as the "ADA" 28 CFR Part 35.

In the event of the CONTRACTOR'S non-compliance or refusal to comply with any nondiscrimination law, regulation, or policy, this contract may be rescinded, canceled or terminated in whole or in part, and the CONTRACTOR may be declared ineligible for further contracts with the UNIVERSITY. The CONTRACTOR shall, however, be given a reasonable time in which to cure this noncompliance. Any dispute may be resolved in accordance with the "Disputes" procedure set forth herein.

PRIVACY
Personal information including, but not limited to, "Protected Health Information," collected, used, or acquired in connection with this contract shall be protected against unauthorized use, disclosure, modification or loss. CONTRACTOR shall ensure its directors, officers, employees, subcontractors or agents use personal information solely for the purposes of accomplishing the services set forth herein. CONTRACTOR and its subcontractors agree not to release, divulge, publish, transfer, sell or otherwise make known to unauthorized persons personal information without the express written consent of the UNIVERSITY or as otherwise required by law.

Any breach of this provision may result in termination of the contract and the demand for return of all personal information. The CONTRACTOR agrees to indemnify and hold harmless the UNIVERSITY for any damages related to the CONTRACTOR'S unauthorized use of personal information.

PUBLICITY
The CONTRACTOR agrees to submit to the UNIVERSITY all advertising and publicity matters relating to this contract wherein the UNIVERSITY'S name is mentioned or language used from which the connection of the UNIVERSITY'S name may, in the UNIVERSITY'S judgment, be inferred or implied. The CONTRACTOR agrees not to publish or use such advertising and publicity matters without the prior written consent of the UNIVERSITY.

RECORDS MAINTENANCE
The CONTRACTOR shall maintain books, records, documents, data and other evidence relating to this contract and performance of the services described herein, including but not limited to accounting procedures and practices that sufficiently and properly reflect all direct and indirect costs of any nature expended in the performance of this contract.

CONTRACTOR shall retain such records for a period of six years following the date of final payment. At no additional cost, these records, including materials generated under the contract, shall be subject at all reasonable times to inspection, review or audit by the UNIVERSITY, personnel duly authorized by the UNIVERSITY, the Office of the State Auditor, and federal and state officials so authorized by law, regulation or agreement.

If any litigation, claim or audit is started before the expiration of the six (6) year period, the records shall be retained until all litigation, claims, or audit findings involving the records have been resolved.

REGISTRATION WITH DEPARTMENT OF REVENUE
If required to do so by law, the CONTRACTOR shall complete registration with the Washington State Department of Revenue and be responsible for payment of all taxes due on payments made under this contract.

RIGHT OF INSPECTION
The CONTRACTOR shall provide right of access to its facilities to the UNIVERSITY, or any of its officers, or to any other authorized agent or official of the state of Washington or the federal government, at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

SEVERABILITY
The provisions of this contract are intended to be severable. If any term or provision is illegal or invalid for any reason whatsoever, such illegality or invalidity shall not affect the validity of the remainder of the contract.

SITE SECURITY
While on UNIVERSITY premises, CONTRACTOR, its agents, employees, or subcontractors shall conform in all respects with UNIVERSITY'S physical, fire or other security policies or regulations.

SUBCONTRACTING
Neither the CONTRACTOR nor any approved SUBCONTRACTOR shall enter into subcontracts for any of the work contemplated under this Contract without obtaining prior written approval of the UNIVERSITY. In no event shall the existence of the subcontract operate to release or reduce the liability of the CONTRACTOR to the UNIVERSITY for any breach in the performance of the CONTRACTOR's duties. This clause does not include contracts of employment between the contractor and personnel assigned to work under this contract.

Additionally, the CONTRACTOR is responsible for ensuring that all terms, conditions, assurances and certifications set forth in this CONTRACT are carried forward to any subcontracts. CONTRACTOR and its subcontractors agree not to release, divulge, publish, transfer, sell or otherwise make known to unauthorized persons personal information without the express written consent of the UNIVERSITY or as provided by law.

TAXES
All payments accrued because of payroll taxes, unemployment contributions, any other related taxes, insurance or other expenses for the CONTRACTOR or its staff shall be the sole responsibility of the CONTRACTOR.

TERMINATION FOR CAUSE
In the event the UNIVERSITY determines the CONTRACTOR has failed to comply with the conditions of this contract in a timely manner, the UNIVERSITY has the right to suspend or terminate this contract. Before suspending or terminating the contract, the UNIVERSITY shall notify the CONTRACTOR in writing of the need to take corrective action. If corrective action is not taken within 30 calendar days of date of notice, the contract may be terminated or suspended.

In the event of termination or suspension, the CONTRACTOR shall be liable for damages as authorized by law including, but not limited to, any cost difference between the original contract and the replacement or cover contract and all administrative costs directly related to the replacement contract, e.g., cost of the competitive bidding, mailing, advertising and staff time.

The UNIVERSITY reserves the right to suspend all or part of the contract, withhold further payments, or prohibit the CONTRACTOR from incurring additional obligations of funds during investigation of the alleged compliance breach and pending corrective action by the CONTRACTOR or a decision by the UNIVERSITY to terminate the contract. A termination shall be deemed a "Termination for Convenience" if it is determined that the CONTRACTOR: (1) was not in default; or (2) failure to perform was outside of his or her control, fault or negligence.

The rights and remedies of the UNIVERSITY provided in this contract are not exclusive and are, in addition to any other rights and remedies, provided by law.

TERMINATION FOR CONVENIENCE
Except as otherwise provided in this Contract, the UNIVERSITY may, by 30 calendar days written notice terminate this Contract, in whole or in part. If this Contract is so terminated, the UNIVERSITY shall be liable only for payment required under the terms of this contract for services rendered or goods delivered prior to the effective date of termination.

TERMINATION PROCEDURES
Upon termination of this CONTRACT, the UNIVERSITY, in addition to any other rights provided in this CONTRACT, may require the CONTRACTOR to deliver to the UNIVERSITY any property specifically produced or acquired for the performance of such part of this contract as has been terminated. The provisions of the "Treatment of Assets" clause shall apply in such property transfer.

The UNIVERSITY shall pay to the CONTRACTOR the agreed upon price, if separately stated, for completed work and services accepted by the UNIVERSITY, and the amount agreed upon by the CONTRACTOR and the UNIVERSITY for (i) completed work and services for which no separate price is stated, (ii) partially completed work and services, (iii) other property or services that are accepted by the UNIVERSITY, and (iv) the protection and preservation of property, unless the termination is for default, in which case the AGENT shall determine the extent of the liability of the UNIVERSITY. Failure to agree with such determination shall be a dispute within the meaning of the "Disputes" clause of this contract. The UNIVERSITY may, in good faith, withhold from any amounts due the CONTRACTOR such sum as the AGENT determines to be necessary to protect the UNIVERSITY against potential loss or liability.

The rights and remedies of the UNIVERSITY provided in this section shall not be exclusive and are in addition to any other rights and remedies provided by law or under this Contract.

After receipt of a notice of termination, and except as otherwise directed by the UNIVERSITY, the CONTRACTOR shall:

1. Stop work under the contract on the date, and to the extent specified, in the notice;
2. Place no further orders or subcontracts for materials, services, or facilities except as may be necessary for completion of such portion of the work under the contract that is not terminated;
3. Assign to the UNIVERSITY, in the manner, at the times, and to the extent directed by the UNIVERSITY, all of the rights, title, and interest of the CONTRACTOR under the orders and subcontracts so terminated, in which case the UNIVERSITY has the right, at its discretion, to settle or pay any or all claims arising out of the termination of such orders and subcontracts;
4. Settle all outstanding liabilities and all claims arising out of such termination of orders and subcontracts, with the approval or ratification of the UNIVERSITY to the extent UNIVERSITY may require, which approval or ratification shall be final for all the purposes of this clause;
5. Transfer title to the UNIVERSITY and deliver in the manner, at the times, and to the extent directed by the UNIVERSITY any property which, if the contract had been completed, would have been required to be furnished to the UNIVERSITY;
6. Complete performance of such part of the work as shall not have been terminated by the UNIVERSITY; and
7. Take such action as may be necessary, or as the UNIVERSITY may direct, for the protection and preservation of the property related to this contract, which is in the possession of the CONTRACTOR and in which the UNIVERSITY has or may acquire an interest.

TREATMENT OF ASSETS

A. Title to all property furnished by the UNIVERSITY shall remain in the UNIVERSITY. Title to all property furnished by the CONTRACTOR, for the cost of which the CONTRACTOR is entitled to be reimbursed as a direct item of cost under this contract, shall pass to and vest in the UNIVERSITY upon delivery of such property by the CONTRACTOR. Title to other property, the cost of which is reimbursable to the CONTRACTOR under this contract, shall pass to and vest in the UNIVERSITY upon (i) issuance for use of such property in the performance of this contract, or (ii) commencement of use of such property in the performance of this contract, or (iii) reimbursement of the cost thereof by the UNIVERSITY in whole or in part, whichever first occurs.

B. Any property of the UNIVERSITY furnished to the CONTRACTOR shall, unless otherwise provided herein or approved by the UNIVERSITY, be used only for the performance of this contract.

C. The CONTRACTOR shall be responsible for any loss or damage to property of the UNIVERSITY that results from the negligence of the CONTRACTOR or which results from the failure on the part of the CONTRACTOR to maintain and administer that property in accordance with sound management practices.

D. If any UNIVERSITY property is lost, destroyed or damaged, the CONTRACTOR shall immediately notify the UNIVERSITY and shall take all reasonable steps to protect the property from further damage.

E. The CONTRACTOR shall surrender to the UNIVERSITY all property of the UNIVERSITY prior to settlement upon completion, termination or cancellation of this contract

F. All reference to the CONTRACTOR under this clause shall also include CONTRACTOR'S employees, agents or SUBCONTRACTORS.

WAIVER

Waiver of any default or breach shall not be deemed a waiver of any subsequent default or breach. Any waiver shall not be construed to be a modification of the terms of this contract unless stated to be such in writing and signed by authorized representative of the UNIVERSITY.

CONTRACT TERMS AND CONDITIONS FOR FEDERAL GRANT FUNDED PURCHASES

The WASHINGTON STATE UNIVERSITY by and through its Board of Regents has entered into an agreement with the United States of America. This Contract is entered into with the Contractor in furtherance of the performance of the work required by that agreement. When interpreting applicable provisions of 2 CFR Part 200 and its appendices, "Federal Agency" or "Federal Awarding Agency" shall refer to the agency of the United States Government from whom the Washington State University ("WSU") has received grant funds to be expended under this Contract, "Non-Federal Entity" shall refer to the Washington State University, "Contractor" shall refer to the contractor with whom the Washington State University has entered into this contract and "Contract" shall refer to this contract between the Washington State University and Contractor.

By accepting this order or by entering into this Contract, a Contract between the Washington State University and the Contractor is formed. Contractor agrees to furnish the subject matter required by this order or Contract and agrees to all terms and conditions included by Washington State University, including the terms and conditions specified below. Any other applicable provisions of 2 CFR Part 200 are hereby incorporated by reference and shall have full force and effect.

1. **Breach, Default, Termination:** The Washington State University reserves the right to pursue all available legal, administrative, contractual or equitable remedies in the event of Contractor's breach of contract or violation of any term of this contract. The Washington State University shall have the right to terminate this contract for cause, and shall retain all rights and remedies against Contractor. The Washington State University shall also have the right to terminate this Contract for convenience upon thirty (30) days' notice to Contractor. Breach and/or Termination of this Contract shall be addressed in the manner prescribed in the WSU Standards Terms and Conditions.

2. **Equal Employment Opportunity:** Except as otherwise provided in 41 CFR Part 60, all "federally assisted construction contracts," as defined in 41 CFR Part 60-1.3 are subject to the Equal Opportunity clause contained in 41 CFR 60-1.4(b), incorporated by reference. Furthermore, the Equal Opportunity clause contained in 41 CFR 60-1.4(b) applies to all nonexempt subcontracts entered into by Contractor under this Contract, and Contractor agrees to include the Equal Opportunity clause contained in 41 CFR 60-1.4(b) in all nonexempt subcontracts.

3. **Davis-Bacon Act, as amended (40 U.S.C. 3141-3148):** Where applicable, all prime construction contracts in excess of $2,000 shall comply with the Davis-Bacon Act (40 U.S.C. 3141-3144, and 3146-3148) as supplemented by Department of Labor regulations (29 CFR Part 5, "Labor Standards Provisions Applicable to Contracts Covering Federally Financed and Assisted Construction"). In accordance with the Davis-Bacon Act, contractors must pay wages to laborers and mechanics at a rate not less than prevailing wages specified in a wage determination made by the Secretary of Labor. In addition, contractors must pay wages not less than once per week. If the Davis-Bacon Act applies to this Contract award of this Contract is conditioned upon the acceptance of the wage determination. The Washington State University will report all suspected or reported violations of the Davis-Bacon Act to the Federal Awarding Agency.

4. **Copeland "Anti-Kickback" Act (40 U.S.C. 3145):** Where applicable, all prime construction contracts over $2,000 are subject to the Copeland "Anti-Kickback" Act (40 U.S.C. 3145), as supplemented by Department of Labor regulations (29 CFR Part 3, "**Contractors** and Subcontractors on Public Building or Public Work Financed in Whole or in Part by Loans or Grants from the United States"). The Washington State University will report all suspected or reported violations to the Federal Awarding Agency. The Act provides that each contractor or subrecipient shall be prohibited from inducing, by any means, any person employed in the construction, completion, or repair of public work, to give up any part of the compensation to which he is otherwise entitled. The recipient shall report all suspected or reported violations to the Federal awarding agency.

5. **Contract Work Hours and Safety Standards Act (40 U.S.C. 3701-3708):** Where applicable, all contracts over $100,000 which will involve the use of mechanics or laborers shall comply with 40 U.S.C. 3702 and 3704, as supplemented by Department of Labor regulations (29 CFR Part 5). Under 40 U.S.C. 3702 of the Act, each Contractor is required to compute the wages of every mechanic and laborer on the basis of a standard work week of 40 hours. Work in excess of the standard work week is permissible provided that the worker is compensated at a rate of not less than one and a half times the basic rate of pay for all hours worked in excess of 40 hours in the work week. The requirements of 40 U.S.C. 3704 apply to construction work and provide that no laborer or mechanic must be required to work in surroundings or under working conditions which are unsanitary, hazardous or dangerous. These requirements do not apply to the purchases of supplies or materials or articles ordinarily available on the open market, or contracts for transportation or transmission of intelligence.

6. **Rights to Inventions Made Under a Contract or Agreement:** For Contracts awarded by the Washington State University under a "funding agreement," as defined in 37 CFR 401.2(a) between a Federal Awarding Agency and the Washington State University, if the Washington State University or Contractor wishes to enter into a contract with a small business firm or nonprofit organization regarding the substitution of parties, assignment or performance of experimental, developmental, or research work under the "funding agreement," the Washington State University or Contractor must comply with the requirements of 37 CFR Part 401, "Rights to Inventions Made by Nonprofit Organizations and Small Business Firms Under Government Grants, Contracts and Cooperative Agreements," and any implementing regulations issued by the awarding agency.

7. **Clean Air Act (42 U.S.C. 7401-7671q):** For Contracts and subgrants over $150,000, the Washington State University and Contractor shall comply with all applicable standards, orders or regulations issued pursuant to the Clean Air Act (42 U.S.C. 7401-7671q). The Washington State University shall report violations to the Federal Awarding Agency and the Regional Office of the Environmental Protection Agency (EPA).

8. **Federal Water Pollution Control Act (33 U.S.C. 1251-1387), as amended:** For Contracts and subgrants over $150,000, the Washington State University and Contractor shall comply with all applicable standards, orders or regulations issued pursuant to the Federal Water Pollution Control Act as amended (33 U.S.C. 1251-1387). The Washington State University shall report violations to the Federal Awarding Agency and the Regional Office of the Environmental Protection Agency (EPA).

9. **Energy Policy and Conservation Act (42 U.S.C. 6201):** The Contractor shall comply with all mandatory standards and policies relating to energy efficiency contained in the state energy conservation plan issued in compliance with the Energy Policy and Conservation Act (42 U.S.C. 6201).

10. **Debarment and Suspension (Executive Orders** 12549 **and 12689):** The Washington State University's award of this Contract is conditioned upon the Contractor's current and continued eligibility. Contractor is eligible unless Contractor is listed on the government-wide Excluded Parties List System in the System for Award Management (SAM), in accordance with the OMB guidelines at 2 CFR 180 that implement Executive Orders 12549 (3 CFR Part 1986 Comp., p. 189) and 12689 (3 CFR Part 1989 Comp., p. 235), "Debarment and Suspension." The Excluded Parties List System in SAM contains the names of parties debarred, suspended, or otherwise excluded by agencies, as well as parties declared ineligible under statutory or regulatory authority other than Executive Order 12549. If a contractor is listed on the Excluded Parties List System in SAM, Contractor shall have the obligation to promptly inform a Washington State University contract manager, and this Contract shall be immediately terminated without liability on the part of the Washington State University or the Federal Awarding Agency.

11. **Byrd Anti-Lobbying Amendment (31 U.S.C. 1352):** For Contracts over $150,000, Contractor warrants it filed the required certification prior to Contract award and payment. Contractor certifies that it will not and has not used Federal appropriated funds to pay any person or organization for influencing or attempting to influence an officer or employee of any agency, a member of Congress, officer or employee of Congress, or an employee of a member of Congress in connection with obtaining any Federal contract, grant or any other award covered by 31 U.S.C. 1352. Contractor shall require such certification and disclosure from any subcontractors used. Any further subcontractors must certify and disclose to the subcontractor awarding the subcontract. Each tier must also disclose any lobbying with non-Federal funds that takes place in connection with obtaining any Federal award. Such disclosures under this Contract shall be forwarded up from tier to tier up to the Washington State University.

12. **Solid Waste Disposal Act (42 USC 6901-6992k):** Contractor must comply with section 6002 of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act. The requirements of Section 6002 include procuring only items designated in guidelines of the Environmental Protection Agency (EPA) at 40 CFR part 247 that contain the highest percentage of recovered materials practicable, consistent with maintaining a satisfactory level of competition, where the purchase price of the item exceeds $10,000 or the value of the quantity acquired by the preceding fiscal year exceeded $10,000; procuring solid waste management services in a manner that maximizes energy and resource recovery; and establishing an affirmative procurement program for procurement of recovered materials identified in the EPA guidelines.

Dear (b)(6)

Mr. Joe Ricardi will speak to you about the difference in the total between when the budget was originally submitted on March 26, 2019 and when we submitted the documentation you requested for all costs on December 5, 2019. Unfortunately, our offices are closed both today and Monday for the observation of Memorial Day. He will be able to speak to you on Tuesday.

He has your (b)(6) phone number.

Kind regards,

Mindy

Dear (b)(6)

I have reattached the documentation here. All of the documentation is 23.8MB, perhaps that is why it did not go through? I will split it into three emails and send smaller emails. Please confirm receipt of the three emails. 1. The budget, response, 01 EHA Justification, 02, KCRI Justification, 02 KCRI documentation. Please note that the 01 EHA documentation was the largest file (11.3MB) and so that one was sent in the second email.

Please find attached the documentation requested for our FRBAA14-6-2-0356 cost proposal. We have responded to the clarification questions and indicated both the document and page number where the full documentation/justification may be viewed. For each partner we have provided two files:

(a) a PDF document of our updated justification using tracked changes according the the current costs for all items based on the documentation
(b) a PDF of the documentation that was requested on the clarification sheet

We have also included an Excel spreadsheet that includes our calculations for all costs and all partners corresponding to our updated justifications and documentation. Necessarily and following the documentation now provided, various costs have changed since our initial submission in April 2018 and our budget has been updated accordingly. Therefore, our overall budget request has also increased to $4,995,106.37 with annual amounts as follows.

Y1: $999,888.16
Y2: $997,047.51
Y3: $999,782.70
OY1: $998,704.80
OY2: $999,683.19.

Please email anytime or contact me directly at +1.212.380.4489 with any questions about our documentation, cost proposal, or other details.

Best,

Mindy

KCRI Budget Justification

A. Senior Personnel

We request a total of S3 ,000 to support Key Personnel over the five years of the proposed project.

Blandina Mmbaga, Co-PI, Epidemiologist, will commit 1.2 months per year. We request salary of $6,000 in Year 1- . Co-PI Mmbaga is the Research Director of KCRI and holds a PhD in Public Health and Epidemiology. Co-PI Mmbaga will contribute to the study design, lead the implementation of field work with human subjects and the laboratory analysis of human samples, provide training and mentorship, develop policy recommendations and facilitate collaboration with stakeholders.

B. Other Personnel

We request a total of S2 , to support Other Personnel over the five years of the proposed project.

Technicians. We request $2,000 per year in Y1-2 for a laboratory technician, who will commit 1 months per year to aliquot the serum samples that come in from the field and store them. laboratory technician will increase the time commitment to months , and laboratory technician will be hired committing 12 months per year, for which we are requesting per technician to complete the ELISA testing on the human sera collected in Y1, Y2 and OY1.

Nurses. We request S 4,000 over the five years of the project for two nurses. In Y1- , we request support for nurse who will commit months per year at a rate of $12,000 who will collect blood samples from participants in the serosurvey (Task 2). In OY1 of the project, we who will commit months for the year in order to collect blood samples for the incidence study .

Administrator. We request $2,400 in Y1 to support a Program Administrator who will assist co-PI Mmbaga in the administration of the project. We request a total of $12,000 over the five years of the project.

Anthropologist/Epidemiologist. We request S ,000 for an Anthropologist/Epidemiologist, with a 3% increase in subsequent years, who will commit 12.0 months Y1-2, OY1 and 6 months in Y3 to contribute to the development of the serosurvey and incidence studies, field data collection and data analysis.

We request $10,500 over the five years of the project to support a Finance Specialist who will commit .84 months per year for Y1-5. The Finance Specialist will work with project staff to ensure timely invoicing for all program expenses.

D. Travel

We request $3,500 , with a 3% annual increase, for travel. This will cover a travel stipend of $35 per day for 100 days in each of Y1 and Y2 for the original serosurvey 15 days in OY1 for the incidence study while they are working in the field. We request $18, over the five years.

E. Participant Support Costs

We request a total of $1,80 for a CCHFV Diagnostics Training Workshop Y3 of the project. We will host a workshop to train participants from local and national public health laboratories to conduct CCHFV ELISA and PCR testing as well as to understand the importance of including CCHFV as a differential diagnosis.

F. Other Direct Costs

We request a total of $8 , for other direct costs over the five years of the proposed project.

We request $2,4 for the storage of samples in Y1 of the project, and an increase of 5% in each subsequent year for a total of $13, over the five years of the project We request $14, for laboratory access and utilization for the processing of human IgG ELISA samples in Y3 of the project, and an increase of 5% in Y for a total of $29, over the five years of the project. There is a separate cost to perform the tests, for which we request a total of $42,656, $10,66 in Y3 to perform 800 tests and $31,99 in Y to perform 2400 tests all at a cost of 30,000 Tanzanian Shilling, or $13.33 USD, per test.

H. Indirect Costs

We request a total of $4 in overhead, a rate of 10% per year, over the five years of the proposed project.

	DTRA Questions	EcoHealth Responses	Document and Page number
1	Please provide documentation to support the proposed salaries (key personnel and other personnel)	Please see the attached documentation of the salaries of current staff as well as that of the positions created by this grant	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 1
2	Please justify the 5% increase, per year, for key personnel	All salaries for key personnel are increased annually by 5% due to the exceptionally high cost of living increases in New York City where we are headquartered. EcoHealth Alliance bases this calculation on the Consumer Price Index plus an annual merit increase.	
3	For the 4 wheel drive, specifically: - More detailed description as to why this is needed - What is the plan to disposition of the four wheel drive - The comparison between renting and buying	We request a 4x wheel drive land cruiser/jeep for driving off roads (the roads in Tanzania are very poorly maintained) for 6 passengers (driver/technician, field coordinator, vet, nurse, PhD student, TAWIRI wildlife team member, plus equipment). A 6-person land cruiser is available for rent from Dar es Salaam (very few vehicles are available from Arusha). The cost is $3,112.27 per month (see documentation attached). We will need a vehicle daily for field work, visiting the communities prior to the start and at the end of the work for Years 1, 2 and OY1. Thus, the cost for these three years for 6 people = $3112.27 x 2 vehicles x 36 months = $224,083.44. Additionally, we will need a vehicle to move between laboratories, meet with collaborators and prepare for workshops during Years 3 and OY2, which would increase the cost of the rental vehicle even higher. Finally, one is not permitted to drive the rental vehicle into the national parks, which would mean our team would not be able to access one of the three environmental disturbance levels. Thus, it is far more economical for the project for us to purchase two vehicles rather than rent them. The only way to access our study areas is to drive. For each sampling trip in years 1-2 we will need to bring supplies for rodent, livestock and human sampling as well as a dry shipper for tick sampling. Additionally, the rodent sampling will take three days per site, whereas the human and livestock sampling will only take one day. Thus, the team can increase their efficiency by having the rodent sampling team in a separate vehicle from the human sampling team. Additionally, when the PIs join the team in the field they will need additional seating, which will be provided by two vehicles. At the end of the project, the vehicle will be transferred for use on other zoonotic disease research projects that our collaborators at EcoHealth Alliance or GAHI are working on	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 2-7, 01 - FRBAA14-6-2-0356 - EHA Budget Justification Pg 2
4	Please provide a breakdown of the proposed materials and equipment, to include quantities and unit prices. Please provide documentation (quotes, screen shots, links, etc.) to support the proposed prices	A detailed breakdown is provided in the FRBAA14-6-2-0356 Detailed Budget and documentation of all items is provided in the EHA Documentation file.	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 8-80, FRBAA14-6-2-0356 Detailed Budget, Tabs Prime Budget, EHA Travel Budget, EHA Materials and supplies and Visas and Permits
5	Please provide any current agreements with or submissions to either DCMA or DCAA. Please also explain how the rates in these documents are utilized in the proposal calculations	We have provided our federally negotiated indirect rate in the documentation and applied this to all modified direct costs	01 - FRBAA14-6-2-0356 - EHA DocumentationPg p67
6	Documentation to justify the permit needed to enter Tanzania	The cost of non-Tanzanians obtaining research permits to conduct research in Tanzania includes: A COSTech research permit ($300 and $50 = $350). Then there is the additional TAWIRI permit, which is $3,800 per person ($1,800 for the research fee and in Y1 and Y2 and additional $2,000 for the animal protection area fee). The documentation is provided.	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 53-56, 01 - FRBAA14-6-2-0356 - EHA Budget Justification Pg 2-5
7	What does the misc. travel cost entail	The misc. travel costs are requested to cover ground transportation round trip to/from the airport or train station in NYC and to/from the hotel at the meeting location. These are estimated at a $25 taxi ride each way per person	01 - FRBAA14-6-2-0356 - EHA Budget Justification Pg 2-5
8	Please explain how you came up with the cost associated with the international and domestic conferences	Domestic travel estimates are based on attending the APHA Conference which for 2018 was held in San Diego, CA. Therefore the estimates are based on the per diem of $173 for lodging and $71 for meals and incidentals per day for a total of $245 and conference registration fees of $700. International travel is based on attending the International Conference on Veterinary Epidemiology and Animal Health in Paris, France. Therefore the estimates are based on the per diem of $391 for lodging and $169 for meals and incidentals for a total of $560 and conference registration fees of 450 EURO, or $500	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 69-74; 01 - FRBAA14-6-2-0356 - EHA Budget Justification Pg 2-5
9	Please provide documentation to justify the conference space, amenities and printing documents for stakeholders meeting	We provided a quote from the Sheraton for facilities for our stakeholder meeting in November 2019 in Pretoria South Africa for a similar DTRA project.	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 78-80
10	Please provide documentation to justify the rental of a conference facility for the CCHF Symposium in OY2	We provided a quote from the Sheraton for facilities for our stakeholder meeting in November 2019 in Pretoria South Africa for a similar DTRA project.	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 78-80
11	Please provide documentation for cost of recruitment of the Tanzanian post doctoral fellow in OY2	The costs associated with recruiting the Tanzanian post-doctoral fellow in OY2 include: the costs of the legal and visa filing fees associated with obtaining a work visa for the fellow ($450 for the application filing fee, $2,030 for the legal fees, $2,000 for the flight). As well as moving expenses etc. that will need to be reimbursed to the fellow ($1,500 for housing until an apartment is found, $910 for moving belongings)	01 - FRBAA14-6-2-0356 - EHA Documentation Pg 74-77

	DTRA Questions	KCRI Responses	Document and Page number
1	Please provide documentation to support the proposed salaries (key personnel and other personnel)	Please see the attached documentation of the salaries of current staff at KCRI.	02 - FRBAA14-6-2-0356 - KCRI Documentation Pg 2
2	Please break down ODCs and provided documentation to justify any cost	We have provided the requested documentation in the documentation and updated justification files.	02 - FRBAA14-6-2-0356 - KCRI Documentation Pg 3-6; 02 FRBAA14 6 2 0356 KCRI Budget Justification Pg 2
3	For all travel proposed whether domestic and international, please provide (screenshots or links) the departure and arrival locations, number of trips, purpose of each trip, length of each trip, number of travelers, etc.	Travel costs include a stipend of $35 per day (non-governmental rate) for 100 days in each of Y1 and Y2 for the original serosurvey and 151 days in OY1 for the incidence study for the nurse(s) while they are working in the field.	FRBAA14-6-2-0356 - KCRI Documentation Pg 6-7; 02 - FRBAA14-6-2-0356 - KCRI Budget Justification Pg 2
4	For all travel proposed (domestic and international), please provide a breakdown of the travel costs (airfare, ground transportation, lodging, per diem, etc.).	Please see above explanation of travel costs	FRBAA14-6-2-0356 - KCRI Documentation Pg 6-7; 02 - FRBAA14-6-2-0356 - KCRI Budget Justification Pg 2

	DTRA Questions	UoG Responses	Document and Page number
1	Please provide documentation to support the proposed salaries (key personnel and other personnel)	Please see the attached documentation of the salaries of current staff at UoG	07 - FRBAA14-6-2-0356 - UoG Documentation Pg 2
2	For all travel proposed whether domestic and international, please provide (screenshots or links) the departure and arrival locations, number of trips, purpose of each trip, length of each trip, number of travelers, etc.	Screenshots for flight prices between Glasgow and Dar es Salaam, Glasgow and Kilimanjaro, and Kilimanjaro and Dar es Salaam are provided in the documentation attached. The breakdown of all costs associated with travel is provided in the updated justification.	07 - FRBAA14-6-2-0356 - UoG Documentation Pg 3-8; 07 - FRBAA14 G 2 0356 UoG Budget Justification Pg 1-2
3	For all travel proposed (domestic and international), please provide a breakdown of the travel costs (airfare, ground transportation, lodging, per diem, etc.).	The breakdown of all costs associated with travel is provided in the updated justification	07 - FRBAA14-6-2-0356 - UoG Budget Justification Pg 1-2
4	Please provide documentation to support ODCs (screenshots links, quotes, etc.)	Documentation is attached to confirm the costs of direct costs including shipping and lab expenses including testing kits. Full explanation of costs is outlined in the updated justification.	07 - FRBAA14-6-2-0356 - UoG Documentation Pg 9-16; 07 - FRBAA14 G 2 0356 UoG Budget Justification Pg 2-3
5	Please break down participant costs	We request $3,300 in Y3 for travel subsistence costs for participants at a rate of $55/day (standard government rate) over 5 days for 10 participants, who will attend 2 trainings. The costs for the UoG trainer are covered by travel costs (above).	07 FRBAA14 G 2 0356 UoG Budget Justification Pg 2

	DTRA Questions	WSU Responses	Document and Page number
1	Please provide documentation to support the proposed salaries (key personnel and other personnel)	Please see the attached documentation of the salaries of current staff at WSU. We have also documented a draft employment contract for the employees to be hired at the standard rate for GAHT/WSU. We have included a bill for annual insurance for 7 employees to document the annual cost of benefits. We have also included a current salary statement from GAHT (including salaries for Ms. Mollo and Mr. Kassagati) to document the cost of the social security tax (NSSF), which is 10% of the gross salary).	08 - FRBAA14-6-2-0356 - WSU Documentation Pg 2-14
3	Please provide documentation to support ODCs (screenshots, links, quotes, etc.)	We have provided the documentation of all ODCs - this includes permits, insurance and medical waste management (individually described below) as well as a list of prices for office supplies. Please note that not all supplies are listed as stores in Tanzania do not have websites that indicate the prices and so we were not able to provide screen shots; however, we did provide a list of common office supplies and an example of a receipt for a recent purchase. An estimate for the translations was also provided.	08 - FRBAA14-6-2-0356 - WSU Documentation Pg 15-38; 08 - FRBAA14-6-2-0356 - WSU Budget Justification Pg 4-5
4	Please provide any current agreements with or submissions to either DCMA or DCAA. Please also explain how the rates in these documents are utilized in the proposal calculations	WSU has a federally negotiated rate for overhead. The documentation attached includes a rate for work that takes place off campus (as our project does).	WSU Documentation Pg 39-44
5	Need documentation to justify the permit needed to enter Tanzania	Documentation is provided for the following costs: all non-Tanzanians must pay a $400 application fee for a COSTech permit (the fee is only $50 for Tanzanians); once the COSTech application is approved, each non-Tanzanian researcher must pay a $1500 fee to conduct research in Tanzania. In Years 3 and 4 there is an additional fee for working in a critical protected area (Serengeti of $2000	08 - FRBAA14-6-2-0356 - WSU Documentation Pg 15-18; 08 - FRBAA14-6-2-0356 - WSU Budget Justification Pg 15-16
6	Need documentation to justify medical waste management (screenshots, links, quotes)	Documentation is provided for the cost of medical waste incineration. This will be necessary to handle the biohazardous waste that is produced during the field sampling.	08 - FRBAA14-6-2-0356 - WSU Documentation Pg 25
7	Please provide documentation to support equipment insurance (screenshots, links, quotes, etc.)	The only equipment that is required to be insured are the project vehicles. As in the US there is a lower cost if the vehicle will be used for fewer kilometers in a year ($692 vs the $1,364 cost documented) as this is the years without field work (Y3 and Y4).	08 - FRBAA14-6-2-0356 - WSU Documentation Pg 21-22
8	For all travel proposed whether domestic and international, please provide (screenshots or links) the departure and arrival locations, number of trips, purpose of each trip, length of each trip, number of travelers, etc	Screen shots for the cost of a flight was documented for all proposed travel between London and Arusha (JRO), Arusha and Dar es Salaam, Arusha and Seronera (Serengeti) and London and a European city. The number, purpose and length of each trip and the number of travelers is specified in the budget justification	08 - FRBAA14-6-2-0356 - WSU Documentation Pg 45-49; FRBAA14-6-2-0356 Detailed Budget, Tab WSU_08 - FRBAA14-6-2-0356 - WSU Budget Justification Pg 1-3
9	For all travel proposed (domestic and international), please provide a breakdown of the travel costs (airfare, ground transportation, lodging, per diem, etc.).	The breakdown of all costs associated with travel is provided in the justification.	08 - FRBAA14-6-2-0356 - WSU Budget Justification Pg 1-3; 08 - FRBAA14-6-2-0356 - WSU Documentation Pg 45-50; FRBAA14-6-2-0356 Detailed Budget, Tab WSU

Dear Melinda Rostal

I am writing to confirm the salaries mentioned in Cremean Congo Hemorrhagic Fever study for KCRI personnel as listed below.

Personnel-KCRI	Annual salary	Monthly salary
Scientist – Local PI	$ 60,000.00	$ 5,000.00
Senior- Lab Technician 1	$ 24,000.00	$ 2,000.00
Lab Technician 2	$ 12,000.00	$ 1,000.00
Lab Technician 3	$ 12,000.00	$ 1,000.00
Nurse 1	$ 12,000.00	$ 1,000.00
Nurse 2	$ 12,000.00	$ 1,000.00
Administrator	$ 24,000.00	$ 2,000.00
Anthropologist/epidemiologist	$ 24,000.00	$ 2,000.00
Scientist 2 -Veterinary	$ 30,000.00	$ 2,500.00
Scientist 3-Physician	$ 30,000.00	$ 2,500.00
Finance	$ 30,000.00	$ 2,500.00

Dear Dr. Melinda Rostal,

I am writing to confirm the agreed upon testing and travel costs for the Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania Project.

We have agreed to a fee of $13.33 per ELISA.

We have agreed to use the travel rate of $35 per day for our nurse while in the field.

Sincerely,

CPA(T) Gilbert Shao

One Health Coordination Desk (OHCD-PMO) Budget Justification

A. Senior Personnel

We request a total of S14, to support Key Personnel over the five years of the proposed project.

Dr. Justine Assenga, Research Scientist, Molecular Epidemiologist, will commit 0 months per year for which we request salary support of $2 in Year 1, with a 3% increase per annum (p.a.). Dr. Justine Assenga is the Animal Health Focal Person at the Ministry of Livestock and Fisheries One Health Coordination Desk and will join meetings, assist with keeping the government ministries apprised of our activities, contribute to the development of the epidemiological plan as well as facilitate communication to stakeholders. In order to prepare for and facilitate the policy workshop and CCHF Symposium, Dr. Assenga's time will increase in Y for a total of $7,2 over the five years of the project.

Dr. Jubilate Bernard, Research Scientist, Public Health Specialist, will commit 0 months per year for which we request salary support of $25 in Year 1, with a 3% increase p.a. Dr. Jubilate Bernard is the Animal Health Focal Person at the Ministry of Livestock and Fisheries One Health Coordination Desk will join meetings, assist with keeping the government ministries apprised of our activities, contribute to the development of the epidemiological plan as well as facilitate communication to stakeholders. In order to prepare for and facilitate the policy workshop and CCHF Symposium, Dr. Bernard's time will increase to months per year in - for a total of S7, over the five years of the project.

D. Travel

We request a total of S3,185 to support local travel for them in Tanzania over the five years of the proposed project.

We request $600 in Y1 so that both Dr. Assenga and Dr. Bernard may attend project meetings held in Tanzania and take other meetings to improve One Health stakeholder relationships.

Travel expenses will increase at a rate of 3% per year over the five years of the project.

H. Indirect Costs

We request a total of S , 5 in overhead over the five years of the project. The rate of overhead will be 10% each year, starting with S11 in Y1.

Dear (b)(6)

Please find attached the documentation requested for our FRBAA14-6-2-0356 cost proposal. We have responded to the clarification questions and indicated both the document and page number where the full documentation/justification may be viewed. For each partner we have provided two files:

(a) a PDF document of our updated justification using tracked changes according the the current costs for all items based on the documentation
(b) a PDF of the documentation that was requested on the clarification sheet

We have also included an Excel spreadsheet that includes our calculations for all costs and all partners corresponding to our updated justifications and documentation. Necessarily and following the documentation now provided, various costs have changed since our initial submission in April 2018 and our budget has been updated accordingly. Therefore, our overall budget request has also increased to $4,995,106.37 with annual amounts as follows.

Y1: $999,888.16
Y2: $997,047.51
Y3: $999,782.70
OY1: $998,704.80
OY2: $999,683.19.

Please email anytime or contact me directly at +1.651.308.5498 with any questions about our documentation, cost proposal, or other details.

Best,

Mindy

Technical Abstract (Limit your abstract to 200 words with no classified or proprietary information)

"This publicly releasable abstract is provided to DTRA for use in fulfillment of Section 8123 of the Defense Appropriations Act and future versions of the same." Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania Crimean-Congo hemorrhagic fever (CCHF) is a deadly disease caused by a virus that is spread through a tick bite. The World Health Organization and U.S. Department of Health and Human Services consider CCHF to be a severe threat to human health with epidemic potential, for which there is an urgent need for accelerated research, especially as there is no known treatment. CCHF virus (CCHFV) occurs from South Africa to northern Europe and east into Central Asia, including countries such as Afghanistan and Iraq where U.S. troops are stationed and potentially at risk for infection. Like Ebola virus in West Africa, CCHFV has been known to circulate silently in livestock and wildlife for decades with no cases in people reported before causing massive outbreaks (affecting more than a thousand people in Turkey) that are further spread through human-to-human transmission. These "surprise" outbreaks are often linked to people making changes to the environment that allow the ticks and the small wild mammals they feed on to increase in abundance. We propose to conduct the first investigation into the patterns and rates of CCHFV infection in people in northern Tanzania to reduce the threat of disease. While CCHFV is spread by ticks to people, the virus

does infect (though does not make sick) livestock and small wild mammals and if people contact the blood of infected animals they can also become infected. Therefore, to understand the risk of infection in people in this region we need to take a One Health approach and investigate CCHFV infection patterns in cattle and wildlife and identify environmental factors that are associated with higher rates of CCHFV infection. While there is evidence that CCHF is circulating in animals in Tanzania and neighboring Uganda has had 6 outbreaks of CCHF since 2010, CCHF is not routinely tested for in Tanzania. This will be the first study to evaluate the risk of an outbreak in Tanzania. To maximize the impact of the project, we will work closely with our partners in the Government of Tanzania to develop policy recommendations to reduce the risk of CCHFV infection in people living where the ticks are present as well as to reduce the risk of a case snow-balling into an epidemic. We will establish sustainable diagnostic capacity at regional health laboratories in northern Tanzania. This collaboration will also support communication between animal and human health officials, which is important not only for CCHF, but also for the many other zoonotic diseases (diseases that spread from animals to people) that threaten people. This project strives to collaborate with the Government of Tanzania to assess and understand the risk of CCHF epidemics while at the same time producing sound policy recommendations that will reduce the threat that CCHF poses for the people in Tanzania and those traveling through Tanzania.

Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania
Phase II Technical Proposal

I. ABSTRACT. In line with Thrust Area 6 - Cooperative Counter Weapons of Mass Destruction Research with Global Partners FRCWMD we propose to reduce the threat of Crimean-Congo hemorrhagic fever (CCHF) by conducting the first collaborative One Health investigation of the ecology and epidemiology of CCHF virus (CCHFV) in Tanzania. Through hypothesis driven research we will evaluate: 1) the current seroprevalence of CCHFV in people, cattle and wildlife; 2) ecological factors (e.g. environmental disturbance) associated with CCHFV vector abundance and seroprevalence in the three groups; and 3) risk factors associated with CCHFV incidence in human populations. Understanding CCHFV ecology in Tanzania is critical to improving Tanzania's capacity to evaluate and manage the risk of CCHF and reduce the threat to people, including Americans working or traveling in the country.

II. SCOPE.

A. OBJECTIVE. We will establish a multi-disciplinary team of Tanzanian and international One Health experts to collect fundamental data on CCHFV, conduct rigorous scientific analyses and support the Government of Tanzania in the development of policies to prevent CCHF outbreaks. We will use a One Health approach to investigate the following three hypotheses: **1) CCHFV is circulating in ticks, livestock and wildlife in Tanzania; 2) CCHFV is present and circulating in the human population in Tanzania; 3) CCHFV prevalence, seroprevalence and vector abundance will vary across an environmental disturbance gradient from peri-urban communities, to pastoral rangeland to protected wildlife areas.** The project will support the **capacity of Tanzanian human and animal health laboratories to conduct CCHFV diagnostics, train Tanzanian field researchers** and provide valuable data to Tanzanian government partners and stakeholders to **develop policies to prepare for and reduce the threat of CCHF.**

B. BACKGROUND. Crimean-Congo hemorrhagic fever is a **WHO Blueprint R&D priority disease** for which **there is an urgent need for accelerated research** given the **epidemic potential and lack of countermeasures against CCHFV**[1]. The Department of Health and Human Services reports that CCHF has the potential to pose a **severe threat to human health**. Similarly, **Tanzania identified viral hemorrhagic fevers as one of six priority zoonoses of greatest national concern**[2]. CCHFV is thought to be transmitted primarily by *Hyalomma* spp. ticks and occurs throughout the ticks' range, from South Africa to northern Europe[3]. CCHFV was first identified in Crimea, after an **epidemic in more than 200 troops**[4]. People may be infected with CCHFV through the bite of an infected tick or via direct contact with fluids from an infected animal or human[5]. Clinical signs include fever, headache, hemorrhagic disease and death in 30-40% of patients[4-6]. Human-to-human transmission is possible, and if isolation practices are not implemented, nosocomial outbreaks can occur[7].

While CCHFV is not known to cause disease in any animal species[3], **a One Health approach is necessary to understand the ecology of CCHFV** and thereby better estimate the potential for infection in people. *Hyalomma* spp. ticks are capable of transstadial, transovarial, sexual, and co-feeding transmission of CCHFV[8]. *Hyalomma* spp. ticks feed preferentially on small mammals or birds during the larval/nymph stage and on large animals (livestock/antelope) and humans during the adult stage[9].

Serological evidence of CCHFV circulation in a country highlights the potential for outbreaks, even where human cases have not yet been reported[10]. In Turkey, for example, CCHFV antibodies were detected as far back as 1980[11], but no cases were reported until an outbreak of 1,103 cases occurred in 2002-06[12]. This "sudden" appearance of CCHF has been described in many regions that thereafter remain endemic for the virus, including Pakistan, Crimea and Turkey[3,12]. This phenomenon has also been described for other hemorrhagic fever, including the Ebola outbreak in West Africa in 2014-16[13].

Human epidemics have often been linked to environmental and social changes, which are associated with an increase in the abundance of CCHFV vectors. These drivers include: climatic changes, abandoned agricultural lands, wartime activities, introduction of a susceptible human population, changing pasture patterns, and converting floodplains to farmland[3].

Although Tanzania is listed by the WHO as a having CCHFV virological or serological evidence and vector presence[14], little is known about the current status of CCHFV in Tanzania with the most recent cattle serosurvey conducted in 1974-75 (identifying a 9% seroprevalence)[3]. Furthermore, despite two recent modeling studies that predicted northern Tanzania to be at high risk for CCHFV[15,16] and neighboring Uganda reporting multiple cases since 2016[17], CCHF has not yet been investigated in people in Tanzania. Given that anthropogenic environmental changes can lead to large CCHF outbreaks and that environmental and land use changes are occurring rapidly in Tanzania, it is important and timely to generate a better understanding of CCHFV ecology. **We theorize that CCHFV is causing human infections in Tanzania and that the risk of CCHFV infection in people is being modified by current and ongoing environmental changes. This One Health project will provide critical data and analyses to support policy development for reducing the threat of CCHF.** We will do this through four activities aligned with the project's scientific hypotheses and tasks:

1) Characterize differences in CCHFV seroprevalence in animals and humans, abundance of CCHFV vectors, and CCHFV prevalence across a gradient of environmental disturbance.
2) Characterize the exposure, behavioral risk and incidence of CCHFV in human populations.
3) Identify environmental factors associated with higher levels of CCHFV seroprevalence, incidence, and presence as well as with higher abundance of CCHFV vectors.
4) Develop policy recommendations to reduce the risk of CCHF epidemics in Tanzania.

Study Sites: We propose to conduct this work in Tanzania. The serological evidence of CCHFV infection in livestock[3] (see preliminary data) and the proximity of diagnosed cases of CCHF in Uganda[17] and Kenya[18] indicate that it is probable that CCHFV is present in Tanzania. The Government of Tanzania has prioritized hemorrhagic fevers[2] and predictive modeling studies have identified northern Tanzania as being at high risk for CCHF[15,16]. **We have a strong history of conducting research in Tanzania and have an established network of collaborators and partners therein** (see Credentials). The study site will be in the Arusha Region of northern Tanzania and

Figure 1. The proposed study area in Northern Tanzania, from just east of Arusha, west to the Serengeti National Park and north to the border with Kenya. The human disturbance index identifies high disturbance around Arusha and East of it, with the least disturbance occurring in the protected areas.

will stretch from the town of Arusha, the third largest city in Tanzania, westwards to the Serengeti National Park and northwards to the international border with Kenya (see Figure 1). This study site will allow investigation across three levels of environmental disturbance: peri-urban areas, pastoral livestock areas, and natural protected areas.

Research Justification: In Tanzania, the most recent investigation of CCHFV was conducted in 1975 and was limited to livestock serology[3]. To compile contemporary preliminary data, we assayed 276 cattle, goat and sheep samples collected from the study area using the newly released ID Screen® CCHF Double Antigen Multi-species ELISA by IDVet (Grabels, France). **We detected anti-CCHFV antibodies in 41% of cattle, 30% of goats and 25% sheep from Tanzania (see Table 1).** In neighboring Uganda, prior to the launch of a viral hemorrhagic fever surveillance program in 2010, the most recent cases of CCHF were reported in 1972[3]. Following the launch of the surveillance program, six outbreaks of CCHF (2013, 2015 and 2017) have been detected[17]. The first case of CCHF in Kenya was reported in 2000[18]. Isolated cases can snowball into an epidemic in rural health centers[19]. **Without baseline data to identify patterns of CCHFV exposure in human populations, health care workers, facilities and government agencies cannot prepare for and take measures to reduce the threat of CCHF.** We will use a One Health approach to collect samples from humans, livestock, wildlife and ticks from the same locations and during the same sampling trip. This method will increase the power of our analysis to detect associations between human and animal seroprevalences[20].

Table 1. Preliminary data screening 92 of each cattle, goats and sheep with the multispecies ELISA for CCHFV antibodies. Samples were collected from animals within part of the proposed study area in Tanzania through co-PI Cleaveland's previous work on the Social, Economic and Environmental Drivers of Zoonoses in Tanzania (SEEDZ) project during 2016.

Species	Number Tested	Number Positive	Percent Positive	Confidence Interval
Cattle	92	38	41%	32-52%
Goats	92	28	30%	17-35%
Sheep	92	23	25%	22-40%

CCHF outbreaks have been linked to environmental changes, specifically those that increase the abundance of small mammal hosts. **In tropical areas anthropogenic environmental changes occur on a rapid timescale and affect large regions. These anthropogenic drivers have been linked to outbreaks of various hemorrhagic viruses, including CCHF**[21] and to changing community structure among small mammals[22]. Shifts in small mammal communities following anthropogenic changes are associated with large and protracted CCHF outbreaks (e.g. Turkey[12]). Studies have identified environmental factors, such as increasing temperature, normalized difference vegetation index (NDVI), and **savannah-type habitat as being associated with more human CCHF cases**[23]. Few studies have investigated how intermediate changes in environmental disturbance may impact the risk of CCHF as measured by the direct prevalence of CCHFV and vector abundance. Therefore, we **propose to compare three levels of anthropogenic disturbance by characterizing the epidemiology of CCHFV in peri-urban, pastoral rangeland, and protected savanna areas in northern Tanzania.** These vital data can be used to predict future changes in CCHFV prevalence given continued environmental disturbance that supports specific communities of small mammals. In OY2 we propose to include **remote-sensing data to identify other important ecological factors associated with viral and vector prevalence as well as seroprevalence**.

In East Africa, surveys in people have identified seroprevalences of 2.2% in Uganda[24] and 14% and 23% in two areas in Kenya[25]. **Few incidence studies have been conducted**, and those have only identified cases retrospectively using hospital records[23]. As **the proportion of people infected with CCHFV that become symptomatic is unknown** (one model estimated 22% of people exposed to CCHFV become ill[26]), and to better **understand the potential for a CCHF outbreak in Tanzania, we propose to prospectively resample participants within 2 years of our initial serosurvey to estimate the incidence of CCHFV seroconversion**, giving us a more accurate estimate of true incidence.

C. PROGRAMMATICS. We established a collaborative team of Tanzanian, U.S. and U.K. partners to implement the proposed project. We demonstrated the functionality of our team by generating preliminary CCHFV serology results from Tanzanian livestock samples. PI Rostal has worked for over a decade with bunyavirales, including a previous project on CCHFV[27]. PI Rostal and co-PI Cleaveland first collaborated in 2005 and in 2019 PI Rostal will complete her Ph.D. in epidemiology under the supervision of co-PI Cleaveland at the University of Glasgow. Co-PIs Cleaveland, Lankester, Mmbaga and Key Personnel (KP) Keyyu have co-authored publications together[28,29] and KP Hewson has authored over 30 publications on CCHFV[30-32].

As the prime institution, EcoHealth Alliance (EHA) will coordinate the collaboration between all parts of the project (livestock, wildlife, and tick studies and laboratory and ecological results) as well as analyses and publications. EHA will also mentor the post-doctoral fellow and be responsible for all contractual obligations with DTRA. This One Health investigation into the ecology and epidemiology of CCHFV will be led by experts from: Kilimanjaro Clinical Research Institute (KCRI), Tanzanian Veterinary Laboratory Agency (TVLA), Global Animal Health Tanzania (GAHT), Tanzania Wildlife Research Institute (TAWIRI), One Health Coordination Desk-Prime Minister's Office (OHCD-PMO), University of Glasgow (UoG), Washington State University (WSU), and Public Health England (PHE).

D. RELEVANCE. This project seeks to characterize the epidemiology and ecology of CCHFV in the context of **evaluating CCHF as a public health threat in Tanzania and improving Tanzania's ability to respond to and reduce the risk of a CCHF epidemic**. It is critical to support this capability in countries where there is evidence that CCHFV is circulating, especially as development will continue to lead to rapid environmental changes that could drive the emergence of CCHF epidemics. **We will answer important questions regarding the epidemiology of the virus in people, cattle and wildlife** as well as how current environmental conditions in peri-urban, pastoral and protected areas impact the abundance and prevalence of *Hyalomma* spp. ticks and CCHFV, respectively. Finally, we will identify the key environmental drivers impacting CCHFV in Tanzania specifically.

CCHF is a public health threat requiring a One Health approach to disease mitigation. We have built an **integrated One Health team of researchers,** which includes several **Tanzanian government institutions that will directly use the outputs of this research to inform policy on CCHF prevention and control**. We will train Tanzanian scientists by supporting graduate students (or FETP fellows) and a Tanzanian post-doctoral fellow, as well as by hosting two workshops on CCHF diagnostics, a workshop on policy development, and a symposium to bring East Africa into focus for global experts and to support the flow of information and networks of CCHF researchers. **We will continue to be transparent and**

disseminate our results broadly in peer-reviewed journals and public venues. We will report all surveillance data to ministries responsible for health, livestock and environment in Tanzania. Results will also be disseminated via regular presentations that the PIs and KP give to the public, media, to governmental (USDA, NIH, USAID) and intergovernmental (WHO, FAO, OIE) agencies and scientific conferences, such as ASTMH, IMED, ASM Biothreats and the DTRA Annual Technical Review.

Scientific Impact for C-WMD science: CCHF is a threat frequently faced by U.S. warfighters working in endemic countries in Central Asia and the Middle East and war is considered to be a driver for the emergence of CCHF[4]. Though rarely tested for in East Africa, evidence is mounting that CCHF cases occur in people more frequently than previously thought. If CCHFV remains uninvestigated in Tanzania, it may continue to circulate undetected until an epidemic occurs, carrying the threat of transmission outside of Tanzania. Further, ever-changing environmental disturbances may drive a large CCHF outbreak. **This study will identify patterns of CCHFV seroprevalence in people, cattle and wildlife; measure the incidence of CCHFV infection in people as well as identify how different levels of environmental disturbance affect the prevalence of CCHFV vectors and the virus itself. By improving our understanding of the ecology of CCHFV in East Africa we are building the foundation to monitor for changes in prevalence, vectors and seroprevalence as the development drives environmental changes. Thereby reducing the threat of a CCHF large epidemic**, as occurred in Turkey[12]. We propose to collaborate directly with Tanzania's One Health Coordination Desk (Prime Minister's Office) to develop policies that can reduce the risk of CCHF outbreaks as well as prepare health care workers to use proper isolation precautions should a suspected case present at a health center.

III. CREDENTIALS.

PI: Dr. Melinda Rostal is a Senior Research Scientist at EcoHealth Alliance. Currently, Dr. Rostal is a co-PI and project manager for the DTRA-funded Understanding Rift Valley Fever (RVF) in the Republic of South Africa and the EHA surveillance coordinator for the USAID Emerging Pandemic Threats PREDICT-2 program, a $130 million effort focused on predicting and preventing pandemic diseases. She has developed, coordinated and managed projects and programs in 16 countries, including efforts to minimize the impact of diseases such as RVF and avian influenza, and supporting global emerging infectious disease surveillance systems.

Prime Organization: EcoHealth Alliance is a science-based organization incorporated over 45 years ago, currently working with local partners in over 20 countries at the nexus of public health, biodiversity conservation and international development. EHA has a staff of 50 in New York, including science (modelers, economists, social scientists, veterinarians and ecologists), administrative and communications staff. EHA has an extensive record of publishing high quality, peer-reviewed papers, journals, briefing documents and reports, including work on vector-borne viruses such as RVF[20,33,34] and West Nile[35,36]. EHA's demonstrated multi-disciplinary expertise in producing highly utilized and understandable science-based outputs will contribute significantly to achieving project goals and provide objective methods for tracking utilization of project findings.

Partners:

Kilimanjaro Clinical Research Institute is located in Moshi, Tanzania and provides necessary research infrastructure and logistics for infectious disease projects. The KCRI Zoonoses

Laboratory Unit has a unique infrastructure to support training and conduct diagnostic assays, including molecular diagnostics. The site serves as a Training Node for the Eastern African Consortium for Clinical Research. KCRI will conduct CCHFV ELISAs in BSL-2 laboratories.

Tanzanian Veterinary Laboratory Agency is headquartered in Dar es Salaam and delivers laboratory services to 11 centers located across Tanzania. TVLA is mandated to undertake research, diagnosis and investigation of animal diseases and vectors. TVLA will support its Arusha Centre to conduct the CCHFV serological tests and PCR in BSL-2 laboratories.

University of Glasgow has a well-established One Health and infectious disease research program involving Tanzanian collaborators from human, livestock and wildlife health sectors. The MRC-UoG Centre for Virus Research (CVR) houses an excellent infrastructure and equipment for molecular biology and virology. These include a category 3 high-containment suite and insectaries, automatic robotic systems for high throughput assays and qPCR machines.

Washington State University will support the proposed research by leveraging existing WSU research facilities, capacity, and scientific personnel in the U.S. and in Tanzania. The Paul G. Allen School for Global Animal Health, College of Veterinary Medicine is legally registered to conduct research in Tanzania and maintains an office in Arusha to support WSU investigators with local procurement, accounting, research permitting, and logistics.

Global Animal Health Tanzania is a non-governmental organization registered in Tanzania to facilitate infectious disease field research. GAHT's office space in Arusha has sufficient storage space for field equipment, GAHT also coordinates the use of four field vehicles with internal mobile refrigerators to transport temperature sensitive items.

Tanzania Wildlife Research Institute is a government institution mandated to conduct, coordinate and oversee wildlife research in Tanzania. TAWIRI investigates wildlife diseases and zoonoses. TAWIRI will provide expertise in small mammal sampling as well as provide access to banked samples from wild ruminants.

One Health Coordination Desk is housed in the Prime Minister's Office. The OHCD collaborates on the prioritization of zoonotic diseases; the creation of surveillance guidelines for priority zoonotic diseases; the development and review of control strategies for selected diseases in Tanzania; and the implementation of the national response to rabies and anthrax.

Public Health England-Porton Down has extensive experience in applied microbiology including access to a BSL-4 facility. The institute has over 40 years of experience in CCHF virology including the original isolation and characterization of Congo virus in 1958 and more recent studies involving CCHFV molecular epidemiology, disease modelling and vaccines.

WORK TO BE PERFORMED.

A. <u>GENERAL</u>. By the end of the project period and two option years we propose to have completed a synthesis of ecological and host factors that impact the ecology and epidemiology of CCHFV in Tanzania, improved the capacity of regional laboratories in Tanzania to detect and diagnose CCHFV, collaboratively developed policy recommendations to reduce the threat of CCHF in Tanzania and raised the awareness of the emerging issue of CCHF in East Africa through a symposium designed to bring together global leaders in CCHFV epidemiology with regional African public health specialists and researchers. Our collaboration of multi-disciplinary scientists will successfully execute a One Health investigation of CCHFV in Tanzania. We will investigate patterns of CCHFV seroprevalence in people, risk factors associated with CCHFV infection and estimate the incidence of infection in the study population; characterize patterns of CCHFV seropositivity in wildlife and cattle, as well as vector abundance and actual viral

prevalence within tick vectors; compare the exposure risks for CCHFV in populations within peri-urban and pastoral regions; determine environmental factors associated with the seroprevalence of CCHFV and confirm the accuracy of the only commercially available multi-species anti-CCHFV antibody ELISA using virus neutralization testing in wildlife samples. Together our team will support the coordination of One Health work in Tanzania by bringing together a wide-array of partners and stakeholders to discuss the importance of CCHF in Tanzania, hosting an international symposium on CCHF in East Africa, training a number of Tanzanian students and a post-doctoral fellow and developing policy recommendations to identify the public health risk of CCHF and reduce the threat of a CCHF outbreak in Tanzania.

B. SUMMARY.

Year # 1

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.
Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.
Task 3: Determine CCHFV infection patterns in cattle across varying environments.
Task 4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.
Task 5: Disseminate reports to relevant stakeholders.

Year # 2

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.
Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.
Task 3: Determine CCHFV infection patterns in cattle across varying environments.
Task 4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.
Task 5: Disseminate reports to relevant stakeholders.

Year #3

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.
Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.
Task 3: Determine CCHFV infection patterns in cattle across varying environments.
Task 4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.
Task 5: Disseminate reports to relevant stakeholders.

Year #4 (Optional)

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.
Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.
Task 5: Disseminate reports to relevant stakeholders.

Year #5 (Optional)

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.
Task 4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.
Task 5: Disseminate reports to relevant stakeholders.
Task 6: Identify environmental correlates with CCHFV seroprevalence.

C. DETAILED TASKS.

Year 1:

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.

Subtasks:

1.1.1 Train a minimum of four graduate students in fields related to CCHFV.
1.1.2 Strengthen the capacity of the Arusha Regional TVLA laboratory.
1.1.3 Train staff *in situ* in epidemiological field methods.
1.1.4 Support One Health relationships between partners and stakeholders.

Description and execution: **1) Students:** We will mentor, at minimum, four graduate students or Field Epidemiology Training Program participants in project-related subjects, including field epidemiology, ecology, spatial analysis, public health, entomology and laboratory sciences at local universities. Students may be nominated by Tanzanian partners (including mid-career students that will complete their degree while employed by the Tanzanian government), or will be recruited from local universities (such as Nelson Mandela or Sokoine University of Agriculture). The students, hired as research assistants, will conduct field and laboratory analyses as part of the project (e.g. environmental factors associated with vector prevalence) under the supervision and mentorship of the project staff and their university advisor. The students will be mentored both by project staff in Tanzania and remotely by support staff at EcoHealth Alliance. They will receive the same training as project staff and will be provided comments on study design, implementation plans, analytical methods and drafts of their written work. Skype will be utilized to ensure students are receiving appropriate training by their project mentors and ensure the students are able to hone writing and field/laboratory skills that will further their careers. Students may also have the option to conduct a small, but related, project on another important pathogen using our samples (limited to PCR and/or ELISAs at a BSL-2 level or below). Examples of such pathogens include *Brucella* spp., *Bacillus anthracis*, foot and mouth disease and Rift Valley fever virus. **2) Improve Arusha Centre's (TVLA) laboratory capacity:** Rather than sending samples to the central government laboratories, we will improve the capacity of TVLA's Arusha laboratory to conduct the CCHFV serological and PCR tests (BSL-2). Critical among the sustainable improvements to the Arusha Centre laboratory will be the provision of a generator that will provide backup power during the frequent power outages, thereby protecting samples stored in a provided ultra-freezer and enabling sensitive laboratory analyses to continue. **3) *In situ* training:** Before each of the field studies (Tasks 2, 3, 4 in Y1 and OY1), we will train/retrain the One Health field team. Project staff will be trained to collect biological samples and ticks, to promote animal welfare and ethics, and to understand human subjects research ethics, obtaining valid, informed consent and administering questionnaires (please see the agenda attached). The staff will be cross-trained so that members of the animal health team will be trained to give questionnaires and members of the human health team will be trained to record animal data. **4) Support One Health relationships:** The project will reach out to relevant stakeholders among public health, animal health and environmental agencies operating in and around the study area. We will support relationships between the One Health sectors through outreach and meetings between project partner institutions and stakeholders, who will all be invited to our annual stakeholder meetings.

Resources: **EHA**: 3 research scientists (mentor students, conduct field trainings, support TVLA, support CCHF policy workshop (Y3), organize CCHF symposium (OY2), mentor post-doctoral fellow (OY2), coordinate activities between collaborators); **KCRI**: 1 research scientist, (mentor students, conduct laboratory trainings, organize CCHF symposium, coordinate activities between

collaborators); **TVLA**: 1 research scientist & 1 laboratory technician (ensure Arusha laboratory equipment is installed, mentor students, coordinate activities between collaborators); **UoG**: 2 research scientists & 1 laboratory technician (mentor students, lead the laboratory capacity building, organize CCHF symposium, coordinate activities between collaborators).**WSU**: 1 research scientist (mentor students, conduct field trainings, organize CCHF symposium, coordinate activities between collaborators); **TAWIRI**: 1 research scientist (mentor students, support field trainings, support CCHF policy workshop, coordinate activities between collaborators); **OHCD**: 2 research scientists (mentor students, lead CCHF policy workshop, organize CCHF symposium, coordinate activities between collaborators.

Metrics of success: The number of students recruited, number of pieces of equipment installed in Arusha, number of meetings with partners and stakeholders, number of team members trained.

Deliverable: Students selected to join the project; equipment installed at TVLA.

Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.

Subtasks:

1.2.1 Obtain local permissions and approvals to work with human subjects.

1.2.2 Conduct a cross-sectional study in people within the study area.

Description and execution: **1) Local permissions:** A questionnaire will be developed for use in the cross-sectional study as will the digital data collection tool to implement the survey. Once U.S. ethical approval is finalized, we will submit protocols for local ethical clearance and permits to conduct research with human subjects. As part of obtaining local permissions we will also meet with local/village leaders. **2) Human serosurvey:** A human serosurvey will be conducted in the communities within our study area. As the risk of CCHFV infection in people in Tanzania is unknown, villages or geological points will be randomly selected as will the households within the village. All people living or working at the household will be invited to participate. If a household is empty or does not want to participate for any reason another household will be randomly selected. The participants will constitute the population at risk in the prevalence and incidence studies and the random sampling will allow us to estimate the risk of CCHFV infection within the population in the study area. The questionnaire will collect general health information with a focus on potential risk factors for CCHF and tick-borne diseases. Assuming a 23% seroprevalence within the population (based on a serosurvey in Kenya[25]), this study requires 793 people per environmental disturbance level to estimate the expected seroprevalence with 5% absolute precision and 95% confidence in each area (for both areas, n = 1,586). This was calculated using an intra-cluster correlation coefficient of 0.2, and the intention of sampling ten people per household/unit from 79 households/units[37]. The first serosurvey will be initiated in Y1 and completed in Y2. The second serosurvey will be conducted at the same households in OY1. Focusing on pastoral and peri-urban environments, we will specifically evaluate the level of environmental disturbance as a risk factor using a combination of satellite imagery and on the ground surveys/transects to quantify characteristics of disturbance (e.g. human presence). Sample transfer from the field to KCRI is described under Task 3, Y1.

Resources: **EHA**: 3 research scientists, (design study methods, coordinate field activities, design digital data collection tool for collecting data, coordinate activities between collaborators, ensure the curation and analysis of data); **KCRI**: 2 research scientists, 1 nurse & 1 laboratory technician (design study methods, coordinate and implement field activities, conduct CCHFV serological analyses on human sera and analysis of data); **UoG:** 2 research scientists & 1 laboratory technician (design study methods, coordinate activities between collaborators, collaborate with

KCRI on laboratory analyses); **WSU**: 1 research scientist (design study methods and analysis of data); **GAHT**: 1 field assistant (implement field activities).

Metrics of success: The number of permits and permissions obtained, number of people sampled, number of environmental surveys completed.

Deliverable: Obtain all permits and permissions; initiate cross-sectional study.

Task 3: Determine CCHFV infection patterns in cattle across varying environments.

Subtasks:

1.3.1 Obtain local permits and permissions.

1.3.2 Conduct a cross-sectional serosurvey in cattle across two levels of environmental disturbance.

1.3.3 Collect and identify *Hyalomma spp.* ticks from sampled cattle.

Description and execution: **1) Local permissions:** Once U.S. ethical approval is finalized, we will submit protocols for local ethical clearance and permits to conduct research with human and animal subjects, and discuss the project with local community leaders. **2) Cattle serosurvey:** Assuming a 41% seroprevalence within the cattle population (preliminary data), this study requires at least 542 animals per level of environmental disturbance to estimate the seroprevalence with 5% absolute precision and 95% confidence in each area; however, we will collect blood samples from all cattle that are sampled for the tick analysis (n = 1,200) **3) Tick abundance:** To evaluate the difference in CCHFV vector abundance and viral prevalence in the ticks across two of the landscape disturbance gradients (peri-urban and pastoral lands), we will collect and test ticks from the cattle in the serosurvey. Using a mixed effect negative binomial simulation model in R[38], we determined that by sampling 15 cattle per herd, at a minimum of 40 sites in each of the two environmental disturbance levels (n= 1,200) and assuming a ratio of 1:3 in the mean number of ticks between the two levels, this study will have a power of 0.97 to detect a difference in infection prevalence between the two areas (estimated by 700 simulations using a random variance from ticks of 1.4 , calculated using the same model on ticks collected from cattle on farms in South Africa; M. Rostal, unpublished data). The characterization of the environmental disturbance is described in Task 2. Samples will be transferred directly to TVLA (animal samples) or KCRI (human samples) following the return of the team from the field. Samples will be processed by each laboratory (see the PRAT for details), serum will be aliquoted and logged into the DTRA inventory. Until testing, samples will be frozen at -20°C or -80°C in the designated and secure freezers within each laboratory. While it is not anticipated that CCHFV will be present in the serum samples, sera will be inactivated. Aside from a randomly selected subset of samples transferred to the U.K. for confirmatory testing (see Y3, Task 3), all samples will remain in their respective laboratories for the duration of the project and kept as a biobank following the study to allow for serological studies targeting other pathogens. Both the field and laboratory teams will receive safe sample handling and biosecurity training (see attached syllabi). Laboratory security details are indicated the PRAT form.

Resources: **EHA**: 2 research scientists (design study methods, conduct field sampling, coordinate activities between collaborators, ensure the curation and analysis of data); **TVLA**: 1 research scientist & 3 laboratory technicians (Y3) (identification of ticks, conduct serological analyses, conduct PCR on tick samples and contribute to analysis of data); **UoG**: 2 research scientists & 1 laboratory technician (design study methods, coordinate activities between collaborators, collaborate with TVLA on laboratory analyses); **WSU**: 1 research scientist (design study

methods, coordinate field activities and analysis of data); **GAHT**: 1 veterinarian & 1 field team assistant (conduct field sampling, and contribute to analysis).
Metrics of success: The number of permits and permissions obtained, number of cattle sampled, number of ticks collected.
Deliverable: Obtained permits and permissions; initiated the cattle cross-sectional study.

Task 4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.
Subtasks:
1.4.1 Obtain local permits and permissions.
1.4.2 Conduct cross-sectional study in small mammals.
1.4.3 Collect ticks from vegetation at study sites.

Description and execution: **1) Local permissions:** Once U.S. ethical approval is finalized, we will submit protocols for local ethical clearance and permits to conduct research with wildlife subjects. **2) Wildlife serosurvey:** Small mammals will be trapped at each of the cattle/human sampling sites for two nights per site. Traps will be set, mammals that are captured will be immobilized, sampled, and (following recovery) released under the supervision of the veterinarian. We will collect all ticks observed on the small mammals to determine the relative abundance and diversity of tick species. Using a mixed effect negative binomial simulation model, we determined that by sampling 15 small mammals per site, assuming that three animals per site have *Hyalomma* spp. ticks, from at least 40 sites in each of the three gradients (peri-urban, pastoral and protected land) and assuming there is a difference in the mean number of ticks between each gradient of 1:3 this study will have a power of 1.00 to detect differences in seropositivity after 700 simulations (using the random variance from ticks collected from rodents at sites in South Africa, 1.5[39]). The characterization of the environmental disturbance is described in Task 2. **3) Tick abundance**: At each site, a set of four transects will be conducted to collect ticks. Ticks will be collected from the vegetation using flagging [40].
Resources: **EHA**: 2 research scientists (design study methods, coordinate activities between collaborators, conduct field work, ensure the curation and analysis of data); **TVLA**: 1 research scientist & 3 laboratory technicians (Y3) (identification of ticks; conduct serological and PCR analyses and contribute to analysis of data); **UoG**: 2 research scientists & 1 laboratory technician (Y3) (design study methods, coordinate activities between collaborators, collaborate with TVLA on laboratory analyses); **WSU**: 1 research scientist (design study methods, coordinate field activities and analysis of data); **GAHT**: 1 veterinarian & 1 field team assistant (conduct field sampling, and contribute to analysis of data); **TAWIRI**: 1 research scientist & 1 field technician (design study methods, implement and coordinate field sampling); **PHE**: 1 research scientist & 3 laboratory technicians (test a subset of wildlife samples using virus neutralization; OY2).
Metrics of success: The number of permits and permissions obtained, number of small mammals sampled, number of ticks transects conducted, the number of ticks collected.
Deliverable: Obtained permits and permissions; initiated wildlife cross-sectional study.

Task 5: Disseminate reports to relevant stakeholders.
Subtasks:
1.5.1 Submit reports, including sample repository data, to DTRA.
1.5.2 Complete annual report to local stakeholders.
1.5.3 Host annual partners' and stakeholders' meeting.
1.5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.

1.5.5 Maintain samples in biobanks.

Description and execution: **1) Submit reports:** All activities, results and capacity building activities will be summarized on a quarterly or annual basis. **2) Report to stakeholders:** We will work with stakeholders and community members to inform them of the project prior to initiating work in their communities and to identify and use the best method to communicate the aggregate results back to the communities that participate in the study. These community meetings are especially important as, not having been diagnosed in Tanzania previously, awareness of CCHF is low. **3) Stakeholder meeting:** An annual Stakeholders' and Partners' Meeting will be hosted to inform stakeholders of progress and receive feedback and input on the project. Local and national representatives of public, veterinary and environmental health/sciences as well as medical and laboratory officers and community leaders will be invited. **4) Presentations:** PIs and KP will give presentations at the times and places specified in the grant schedule. **5) Biobanks:** Biobank sample repository information will be maintained in a DTRA-specified format and all samples and data generated during the course of the project will be available for at least 12 months after the project end date. Additionally, a database will be developed, used for epidemiological analyses and shared among implementing partners (including government partners). While sensitive human data will remain protected, we will work with government partners and stakeholders to provide aggregated data as requested.

Resources: **EHA**: 4 research scientists (synthesize communication between partners, ensure data management for reporting, develop reports for DTRA and stakeholders; host stakeholder meeting); **KCRI**: 1 research scientist (submit human serological results and human survey data to database, contribute to reporting, maintain human samples in a biobank and complete the DTRA inventory); **TVLA**: 1 research scientist (submit animal and tick laboratory results, contribute to reporting, maintain animal and tick samples in a biobank and complete the DTRA inventory); **UoG**: 1 research scientist (contribute to reporting, maintain any project samples submitted for confirmation at UoG and complete the DTRA inventory); **WSU**: 1 research scientist (contribute to reporting); **GAHT**: 1 veterinarian (upload field data into database from animal studies, contribute to reporting); **TAWIRI**: 1 research scientist (contribute to reporting); **OHCD-PMO**: 2 research scientists (contribute to reporting); **PHE**: 1 research scientist (contribute to reporting).

Metrics of success: The number of reports (quarterly, annual, repository, etc.) written, number of samples in biobanks, number of attendees to stakeholder meeting, number of presentations given.

Deliverable: Communication via reports to the funder; scientific community and stakeholders; biobank sample repository maintained in a DTRA specified format.

Year 2:

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.

Subtasks:

2.1.1 Train a minimum of four graduate students in fields related to CCHFV.

2.1.2 Strengthen the capacity of the Arusha Regional TVLA laboratory.

2.1.3 Train staff *in situ* in epidemiological field methods.

2.1.4 Support One Health relationships between partners and stakeholders.

2.1.5 Support laboratory capacity to conduct CCHFV diagnostics.

Description, execution and resources: Same as above; see Y1, Task 1. **5) CCHF diagnostics:** UoG will prepare CCHFV-specific reagents (recombinant antigen for ELISA and primers and

probes for PCR) for KCRI and TVLA, as well as additional recombinant antigen to transfer reagents to local health laboratories whose technicians will attend the Y3 workshop.
Metrics of success: The number of students working on the project, number of laboratory reagent kits prepared for TVLA and KCRI, number of meetings with partners and stakeholders.
Deliverable: Continue training graduate students.

Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.

Subtasks:

2.2.2 Conduct a cross-sectional study in people within the study area.

Description, execution and resources: Same as above; see Y1, Task 2.
Metrics of success: Number of people sampled, number of environmental surveys completed.
Deliverable: Completed sampling for human cross-sectional study.

Task 3: Determine CCHFV infection patterns in cattle across varying environments.

Subtasks:

2.3.2 Conduct a cross-sectional serosurvey in cattle across two levels of environmental disturbance.

2.3.3 Collect and identify *Hyalomma spp.* ticks from sampled cattle.

Description, execution and resources: Same as above; see Y1, Task 3.
Metrics of success: The number of cattle sampled, number of ticks collected.
Deliverable: Completed cross-sectional cattle sampling.

Task 4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.

Subtasks:

2.4.2 Conduct cross-sectional study in small mammals.

2.4.3 Collect ticks from vegetation at study sites.

Description, execution and resources: Same as above; see Y1, Task 4.
Metrics of success: The number of small mammals sampled, number of tick transects completed.
Deliverable: Completed cross-sectional wildlife sampling and tick transects.

Task 5: Disseminate reports to relevant stakeholders.

Subtasks:

2.5.1 Submit reports, including sample repository data, to DTRA.

2.5.2 Complete annual report to local stakeholders.

2.5.3 Host annual partners' and stakeholders' meeting.

2.5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.

2.5.5 Maintain samples in biobanks.

Description, execution and resources: Same as above; see Y1, Task 5.
Metrics of success: The number of reports written, number of samples in biobanks, number of attendees to stakeholder meeting, number of presentations given.
Deliverable: Communication via reports to the funder; scientific community and stakeholders; biobank sample repository maintained in a DTRA specified format.

Year 3:

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.

Subtasks:

3.1.1 Train a minimum of four graduate students in fields related to CCHFV.

3.1.2 Strengthen the capacity of the Arusha Regional TVLA laboratory.

3.1.4 Support One Health relationships between partners and stakeholders.
3.1.5 Support laboratory capacity to conduct CCHFV diagnostics.
3.1.6 Host one workshop on diagnostic testing for CCHFV at each KCRI and TVLA.

Description, execution and resources: Same as above; see Y1, Task 1. **5) CCHF diagnostics:** During the two years of laboratory work, we will have a dedicated UoG technician that will work directly with the Tanzanian laboratories (KCRI and TVLA) to train local technicians to perform CCHFV serological and PCR assays. To ensure the training is sustainable, the UoG technician will spend 8 months in Tanzania working directly with project laboratory technicians at KCRI and TVLA and will remain in contact with the teams at TVLA and KCRI for the duration of the laboratory activities (Y3-OY1). **6) CCHFV laboratory diagnostics workshops:** PIs Mmbaga and Mramba and the UoG technician will host a workshop at each TVLA and KCRI. Participants of the TVLA workshop will include staff from KCRI and TVLA that will be working on this project as well as other laboratory technicians/scientists from other animal health laboratories. In addition to the laboratory techniques demonstrated (ELISA and PCR), there will be a focus on biosecurity (appropriate sample handling, storage and inactivation) as well as the importance of One Health, demonstrating the role that animal health workers play in protecting humans from CCHFV. The second workshop, at KCRI, will target laboratory scientists and technicians from local, regional and national public health or medical laboratories. This training will focus on the diagnostics, biosecurity, clinical manifestations, epidemiology and infection control for laboratories, clinics and hospitals that may treat or diagnose CCHFV-infected patients. Following both workshops, all participating laboratories will be provided with PCR primers and probes and human health labs will be given the recombinant CCHFV antigen as well as protocols to reproduce it so that it may be sustainably and locally used after the project ends. As the CCHFV protocols are new to KCRI and TVLA, a randomly selected subset of human and cattle serum aliquots will be submitted to UoG for confirmatory testing using ELISA (Y3). A subset of the wildlife sera will be submitted to PHE to confirm the results using virus neutralization (see OY2.4.8). Samples that are shipped to the UK will be inactivated prior to shipment and packed and labeled according to IATA standards on dry ice, with a chain of custody.

Metrics of success: The number of students working on the project, number of meetings with partners and stakeholders, number of team members trained, number of workshops hosted, number of laboratories attending the workshops.

Deliverable: Completed CCHFV diagnostics workshops; initiated testing at the Tanzanian laboratories.

Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.

Subtasks:
3.2.3 Conduct serological assays for the presence of anti-CCHFV antibodies.
3.2.4 Analyze human serosurvey results.

Description, execution and resources: Same as above; see Y1, Task 2. **3) Laboratory assays:** Human samples will be analyzed using a CCHFV ELISA[31] at KCRI. **4) Statistical analyses:** Similar analytical methods will be applied across species (people, cattle, wildlife and ticks). CCHFV prevalence (ticks) and seroprevalence (people, cattle and wildlife) will be calculated using standard methods[41]. Risk factors for individuals will be determined using standard multiple logistic regression techniques. Comparisons between different levels of environmental disturbance will be conducted using Generalized Linear Mixed Models (GLMMs) in a manner similar to the simulation used to calculate the sample size and power.

Metrics of success: Number of human samples tested.
Deliverable: Initiated the laboratory analyses of the human samples.

Task 3: Determine CCHFV infection patterns in cattle across varying environments.

Subtasks:
3.3.3 Collect and identify *Hyalomma spp.* ticks from sampled cattle.
3.3.4 Conduct laboratory analyses on cattle ticks and sera.
3.3.5 Analyze cattle serosurvey results.

Description, execution and resources: Same as above; see Y1, Task 3. **3) Tick identification:** An experienced TVLA technician will identify the ticks to the species level. **4) Laboratory analyses:** Serum samples will be analyzed using the ID Screen® CCHF Double Antigen Multi-species ELISA at TVLA, which has been vetted using livestock samples. Ticks will be screened by RT-PCR for viral RNA[30]. **5) Statistical analyses:** The analytical methods indicated in Task 2 will be used to calculate the cattle seroprevalence.
Metrics of success: The number of cattle samples tested, number of ticks identified, number of ticks tested.
Deliverable: Completed the testing of cattle samples and ticks and reported the results.

Task 4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.

Subtasks:
3.4.4 Identify ticks collected from small mammals and transects.
3.4.5 Conduct laboratory analyses for CCHFV antibodies and viral RNA.
3.4.6 Test banked serum from wild ungulates.
3.4.7 Analyze wildlife serosurvey results.

Description, execution and resources: Same as above; see Y1, Task 4. **4) Tick identification:** An experienced TVLA technician will identify the ticks to species. **5) Laboratory analyses:** Wildlife samples will be analyzed using the ID Screen® CCHF Double Antigen Multi-species ELISA at TVLA, a subset of samples will be confirmed by virus neutralization at PHE (see OY2.4.8). Ticks will be tested using rt-PCR[30]. **6) Wild ruminant samples:** We have established a relationship with an ongoing TAWIRI study investigating peste des petits ruminants virus, which will collect and archive blood and tick samples from wild ruminants that may be accessed. TAWIRI will also provide samples collected opportunistically from wild ruminants immobilized for management reasons in the Serengeti. This will provide serology results from ruminants in the protected area and will be screened using the ID Screen® CCHF Double Antigen Multi-species ELISA at TVLA. **7) Statistical Analyses:** The analytical plan described in Task 2 will also be used for the wild ruminant study. Tick abundance and richness measures will be estimated and will be compared between the different levels of environmental disturbance within the study area using traditional ecological tools such as Non-Metric Multidimensional Scaling (NMDS) to compare diversity metrics with environmental factors.
Metrics of success: The number of wildlife samples tested, number of ticks identified, number of ticks tested.
Deliverable: Completed ELISA testing of wildlife samples; completed tick identification and PCR testing; completed Y3 report of serosurvey results.

Task 5: Disseminate reports to relevant stakeholders.

Subtasks:
3.5.1 Submit reports, including sample repository data, to DTRA.
3.5.2 Complete annual report to local stakeholders.

3.5.3 Host annual partners' and stakeholders' meeting.
3.5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
3.5.5 Maintain samples in biobanks.
3.5.6 Complete reports on results of human, cattle and wildlife cross-sectional studies and comparison across the gradient.

Description, execution and resources: Same as above; see Y1, Task 5. **6) Summary report:** A report on the results of the cattle and wildlife cross-sectional studies, a comparison across gradient and the preliminary results of the serosurvey in people will be written.
Metrics of success: The number of reports written, number of samples in biobanks, number of attendees to stakeholder meeting, number of presentations given.
Deliverable: Communication via reports to the funder; scientific community and stakeholders; biobank sample repository maintained in a DTRA specified format; completed the syntheses report on serological results, tick abundances and viral prevalence.

Year OY1:

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.

Subtasks:
OY1.1.1 Train a minimum of four graduate students in fields related to CCHFV.
OY1.1.3 Train staff *in situ* in epidemiological field methods.
OY1.1.4 Support One Health relationships between partners and stakeholders.
OY1.1.5 Support laboratory capacity to conduct CCHFV diagnostics.
OY1.1.7 Host a workshop to support CCHF policy development in Tanzania.

Description, execution and resources: Same as above; see Y1, Task 1. **6) Policy development workshop:** We propose to bring together a group of One Health participants from government agencies, including representatives from the Ministry of Health, Community Development, Gender, Elderly and Children, Ministry of Natural Resources and Tourism and the Ministry of Livestock and Fisheries to discuss the potential implications of the study results and develop a series of recommendations for reducing the risk of CCHF outbreaks in Tanzania. The workshop will be led by OHCD-PMO and supported by the PI institutions.
Metrics of success: The number of students working on the project, number of meetings with partners and stakeholders, number of team members trained, number of attendees at the CCHF policy workshop.
Deliverable: Successfully conducted the CCHF policy workshop.

Task 2: Determine CCHFV infection patterns, risk factors and incidence in humans.

Subtasks:
OY1.2.3 Conduct serological assays for the presence of anti-CCHFV antibodies.
OY1.2.4 Analyze human serosurvey results.
OY1.2.5 Conduct incidence sampling among cross-sectional study participants.

Description, execution and resources: Same as above; see Y1, Task 2. **5) Incidence study:** During OY1 we propose to resample voluntary participants that were sampled during the initial cross-sectional study completed in Y1-Y2 in order to estimate the incidence of CCHFV infection. The diagnostic assays will be completed at KCRI (see Y3). CCHFV incidence will be calculated using standard methods[41]. We will use multiple logistic regression to identify risk

factors for CCHFV infection and compared to those identified through the prevalence study. We will also develop species specific and combined seropositivity hot spot maps of the study area.
Metrics of success: The number of people resampled, the number of samples tested.
Deliverable: Completed human longitudinal sampling and testing.

Task 5: Disseminate reports to relevant stakeholders.

Subtasks:
OY1.5.1 Submit reports, including sample repository data, to DTRA.
OY1.5.2 Complete annual report to local stakeholders.
OY1.5.3 Host annual partners' and stakeholders' meeting.
OY1.5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
OY1.5.5 Maintain samples in biobanks.
Description and execution: Same as above; see Y1, Task 5.
Metrics of success: The number of reports written, number of samples in the biobanks, number of participants at the stakeholders' meeting, number of presentations given.
Deliverable: Communication via reports to the funder; scientific community and stakeholders; biobank sample repository maintained in a DTRA specified format.

Year OY2:

Task 1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.

Subtasks:
OY2.1.1 Train a minimum of four graduate students in fields related to CCHFV.
OY2.1.4 Support One Health relationships between partners and stakeholders.
OY2.1.8 Mentor a Tanzanian post-doctoral fellow in spatial ecology of infectious diseases.
OY2.1.9 Host East African CCHF Symposium.
Description and execution: Same as above; see Y1, Task 1. **7) Train post-doctoral fellow:** We will identify a Tanzanian post-doctoral fellow (through an application process or partner recommendations) to be trained in the spatial ecology of infectious diseases, work with scientists at EcoHealth Alliance and complete the remote sensing analysis of environmental variables associated with CCHF seroprevalence. The post-doctoral fellow will be supervised by KP Zambrana-Torrelio as well as PIs Rostal and Karesh (see post-doctoral mentoring plan). **8) Host CCHF Symposium:** As CCHF is an emerging disease and it has rarely been studied in East Africa, we will host a symposium to bring together experts on CCHF from other regions of the world (e.g. Central Asia, South Africa) to exchange ideas on additional research that is needed, ways of increasing support for the growing group of CCHF experts in East Africa, including through further networking, and ideas about the applicability of control measures being used in other regions that may be transferable to the situation in East Africa.
Metrics of success: The number of students working on the project, number of meetings with partners and stakeholders, number of attendees at the CCHF symposium.
Deliverable: Post-doctoral fellow completed his/her fellowship; hosted a CCHF symposium.

Task 4: Determine CCHFV exposure and CCHFV infection patterns in wildlife and ticks.

Subtasks:
OY2.4.8 Confirm seropositive wildlife samples with virus neutralization assays.
Description, execution and resources: **8) Confirm seropositive samples:** The serological analysis of small mammal sera will allow the estimation of seroprevalence and implication of

potentially important species for future research on CCHFV ecology in Tanzania and East Africa. While this multispecies ELISA is designed to work in multiple species, it is able to differentiate CCHFV seropositive and seronegative sera from livestock as well as correctly identify seronegative wildlife, it has not been validated on any seropositive wildlife samples[42]. Thus, it is important to validate this safe (BSL-2) multispecies ELISA. As CCHFV is a select agent requiring BSL-4 containment, we have partnered with PHE to verify the ELISA results on a subsample of wildlife samples that will be tested using virus neutralization (VNT). PHE has a biosecure facility (see facilities and the PRAT form) and protocols in place to conduct such assays (details of sample shipments are given Task 3.2).
Metrics of success: The number of wildlife samples tested with VNT.
Deliverable: Completed the verification of wildlife serology results.
Task 5: Disseminate reports to relevant stakeholders.
Subtasks:
OY2.5.1 Submit reports, including sample repository data, to DTRA.
OY2.5.2 Complete annual report to local stakeholders.
OY2.5.3 Host annual partners' and stakeholders' meeting.
OY2.5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
OY2.5.5 Maintain samples in biobanks.
Description and execution: Same as above; see Y1, Task 5.
Metrics of success: The number of reports written, number of samples in biobanks, number of attendees to stakeholder meeting, number of presentations given.
Deliverable Communication via reports to the funder; scientific community and stakeholders; biobank sample repository maintained in a DTRA specified format; completed final report with policy recommendations.
Task 6: Identify environmental correlates with CCHFV seroprevalence.
Subtasks:
OY2.6.1 Access appropriate remote sensing data.
OY2.6.2 Conduct spatial analysis to identify correlates between environmental and ecological factors and CCHFV seropositivity.
Description and execution: The Tanzanian post-doctoral fellow would be supported for one year at EcoHealth Alliance to conduct the analysis proposed within this task and will be directly supervised by KP Zambrana-Torrelio. **1) Remote sensing and other spatial data:** We will access and use the following remote sensing products: NASA's ECOSTRESS data (ECOsystem Spaceborne Thermal Radiometer Experiment on Space Station) that provides data on vegetation water stress and LandSat data, as well as remote sensing derived data such as NDVI and enhanced vegetation index (EVI). Additional datasets will be obtained from different sources, including soil type maps and climate predictions. **2) Correlates between CCHFV seropositivity and the environment:** Spatially explicit correlates will be used to understand the relationship between environmental factors and seropositivity in humans, livestock and wildlife as well as vector and viral prevalence. We will characterize the potential ecological niche of CCHFV in our study sites and use this to identify other areas in Tanzania where CCHFV may be present but has not yet been detected. These results will be shared with government partners in Tanzania to be considered with the policy recommendations produced under Task 1 OY1.

Resources: **EHA**: 3 research scientists (design study methods, coordinate activities between collaborators, conduct the analysis of data); **KCRI**: 1 research scientist (contribute to the analysis); **TVLA**: 1 research scientist (contribute to the analysis); **UoG**: 1 research scientist (contribute to the analysis); **WSU**: 1 research scientist (contribute to the analysis).
Metrics of success: Number of remote sensing datasets accessed.
Deliverable: Completed environmental analysis.

Confirmed Proposal Expiration Date "EHA holds the proposal, to include proposed costs, firm for 180 days after the submission date as stated in the invitation to submit a full proposal."

EcoHealth Alliance (EHA): Y1-5

A. Senior Personnel

We request a total of $466,612 to support co-PI/Key Personnel (KP) over the five years of the proposed project.

Melinda Rostal, DVM, PI, will commit 5 months ($42,315) per annum (p.a.) (Y1-OY2) with a 5% annual increase (due to the exceptionally high cost of living increases in New York City). She will coordinate the many partners involved in this collaboration. She will work with our Tanzanian colleagues to ensure all the proper permits, IACUC/IRB equivalents are submitted and approved. She will also manage the U.S.-based IACUC and IRB. She will make multiple trips to Tanzania, including for the annual meeting, meetings with local collaborators and local stake holders, to assist with community preparation prior to the start of the field work in Year 1 and Option Year 1 as well as to provide feedback to the communities, and one to conduct training and assist with the start of sampling. She will work closely with the field coordinator and Key Personnel (KP) on the various parts of the project and ensure all aspects of the project are progressing on schedule and effectively.

William B Karesh, DVM, co-PI, will commit 1 month of time p.a. in Y1-OY1. We request 1 month's (mo.) salary ($23,676) p.a. for co-PI Karesh, with a 5% increase p.a. PI Karesh will be very involved in the CCHF symposium that will be hosted and therefore we request 2 mo. salary in OY2 ($57,556). PI Karesh will meet with PIs, Key Personnel and senior governmental officials in Tanzania to initiate the project. He will work with Co-PI Rostal to coordinate the wide array of partners involved in this collaboration and promote stakeholder engagement.

Carlos Zambrana-Torrelio, PhD, will commit 0.5 mo. p.a. in Y1, Y3, OY1. We request 0.5 mo. p.a. ($4,961) for those years with a 5% increase p.a. KP Zambrana-Torrelio will advise on the ecological analyses and study design during the Y1, Y3 and OY1. KP Zambrana-Torrelio will commit 2 months in Y2 ($20,837) in order to analyze the environmental gradient data from the transects and the remote sensing data and 3 months in OY2 ($36,183) to mentor the post-doctoral fellow. In OY2 KP Zambrana-Torrelio will mentor the Tanzanian post-doctoral fellow in conducting the spatial analysis to identify correlates between environmental factors and CCHFV seropositivity.

B. Other Personnel

We request a total of $538,110 to support Other Personnel over the five years of the proposed project.

Field Coordinator, PhD will commit 12 months p.a. (Y1-OY1) to the project. We request $65,000 p.a. with a 5% annual increase. The field coordinator will spend a significant amount of time in Tanzania ensuring that the field, laboratory and training activities proceed smoothly. The field coordinator will interface directly with the students to ensure they gain experience in how to safely conduct field work. They will directly manage the field team for tick, animal and human sampling and will frequently communicate with community and collaborating partners. The coordinator will ensure that the capacity building activities and equipment purchases proceed smoothly and will help finalize and organize the training workshops and the participants who will attend.

Research and Operations Assistants. The research assistant will commit 5 months p.a. (Y1-OY2) to assist in the development of reports, coordination of collaborators, and data cleaning/maintenance and analysis. In Y1 we request $24,375 for salary for the research assistant, with a 5% annual increase. We will have an operations assistant committed to 3.5 mo. in Y1 and 2.0 mo. p.a. (Y2-OY2) thereafter. In Year 1 we request $16,247 of salary, with a 5% annual increase. In Y1 the operations assistant will need the additional time in order to initially establish and process the subcontracts with new partners. Once the subcontracts are established, the operations assistant will only need 2 mo. p.a. to maintain them and assist with communication among the collaborators, managing subcontracts and invoicing from the subcontractors.

In OY2 we request support for a Tanzanian post-doctoral fellow based at EcoHealth Alliance for the year. We request $65,000 p.a. for a 12-month fellowship in New York City with $20,456 of fringe (calculated at the rate of 31.47%).

Fringe Benefits

Fringe benefits are calculated as 31.47% of base salary for PIs, KPs and other project staff p.a. (not including student stipends), with $54,034 requested in Y1 and $314,652 over the full five years.

C. Equipment

We request $125,489 in Y1 to purchase equipment. We request $77,489 to fund a four-wheel drive vehicle for the project. As the project vehicle will be out in the field daily for most of Y1-OY1, it will be more cost effective for the project to purchase a vehicle rather than to rent one. We request $23,000 to purchase a generator for the TVLA Arusha laboratory. Currently, the laboratory does not have a generator and all laboratory work must cease during frequent power outages. More crucially, the samples collected for this project must remain frozen until PCR or serological assays can be conducted. Multiple freeze-thaw cycles would be very detrimental to the success in detecting CCHFV. We request $5,000 for a large centrifuge that can spin many blood tubes at once as human, livestock and small mammal sampling will be ongoing concurrently. Finally, we request $20,000 for a -80 ultra freezer to be installed at TVLA after the generator is installed. This will permit our samples to be maintained at the appropriate temperature (KCRI already has this capacity in their facility).

D. Travel

International Travel

All flights to/from Tanzania from/to New York City were calculated at $2,000 RT airfare to/from Arusha and $300 for flights from Arusha to Dar es Salam. Lodging and M&I for Arusha is $240 a day and $309 in Dar es Salam, and are within the federal guidelines for foreign travel per diem rates.

The following travel is requested on an annual basis:
PI Rostal will make two trips per year to the field site and to Dar es Salam to oversee field and laboratory work and meet with collaborators (Trip: $2,000 airfare + $1,680($240*7 days) + $300 airfare to Dar es Salam + $1,545($309*5 days) + $200 misc. travel costs ($100 per location) = $5,725*2 trips = $11,450). Co-PI Karesh will visit Tanzania once a year to meet with collaborators and join the Annual Stakeholders and Partners Meeting once in Y1- OY5 ($2,000

airfare + $2,163($309*7 days) + $100 misc. travel costs = $4,263). The field coordinator will make at least two trips per year, the time the coordinator will stay in the field each year will vary as described below (Trip: $2,000 airfare + $1,680 ($240*7 days) + $300 airfare to Dar es Salam + $1,545($309*5 days) + $200 misc. travel costs ($100 per location) = $5,725*2 trips = $11,450). In total this amounts to $27,163 p.a.

There is also a cost of $2,000 per person p.a. for a permit to enter Tanzania for the purpose of research. We are requesting $4,000 in Y1, for Dr. Rostal and the field coordinator to conduct research in Tanzania. This cost will increase at a rate of 3% per year to be included in international travel as well.

This provides a baseline of $31,163 per year (not including the 3% increase in the cost of permits per year).

U.S. Domestic Travel
The following is requested on an annual basis:
We are requesting $1,750 for PI Rostal or co-PI Karesh to attend the DTRA Annual Technical Review ($400 airfare/train + $1,250($250 lodging and M & I * 5 nights + $100 misc. travel costs = 1,750).

Year 1
International: $67,571
Domestic: $1,750

In Year 1, we request an additional trip with 14 days in Arusha and 7 in Dar es Salaam (to have additional meetings with government partners and be in the field as the project is starting) for PI Rostal at the same rate as described above (Trip: $2,000 airfare + $3,360 ($240 * 14 days) + $300 airfare to Dar es Salam + $2,163($309*7 days) + $200 misc. travel costs ($100 per location) = $8,023). Additionally, we request that one of the two baseline trips have an additional 6 days in Arusha ($240*6 = $1,440). For the field coordinator who will be spending time in the field with the team, we request an additional 14 days per trip in Arusha (14*$240 = 3,360*2 trips = $6,720) and two additional trips for 21 days in Arusha and with only one additional trip of 5 days in Dar es Salam (Trip 1: $2,000 airfare + $5,040($240 * 21 days) + $300 airfare to Dar es Salam + $1,545($309*5 days) + $200 misc. travel costs ($100 per location) = $9,085; Trip 2: $2,000 airfare + $5,040($240 * 21 days) + $100 misc. travel costs = $7,140).

We request funds for a permit to conduct research in a protected area (e.g. Serengeti), which costs $2,000 per person for Dr. Rostal and the field coordinator in Y1 and Y2, for a total of $4,000 in Y1.

Year 2
International: $78,513
Domestic: $6,350

In Year 2, we request one additional trips to the field site in Arusha and to Dar es Salaam (with 1 additional day in Dar es Salaam) for PI Rostal to have meetings with partners and ensure the field work is going smoothly at the same rate as described above (Trip: $2,000 airfare + $1,680 ($240*7 days) + $300 airfare to Dar es Salam + $1,854($309*6 days) + $200 misc. travel costs ($100 per location)= $6,034). For the field coordinator to support the field work, we request an additional 21 days per trip in Arusha (20*$240 = 4,800*2 trips = $9,600) and two additional trips to the field site in Arusha (for 27 days) with one of those including a trip to Dar es Salam for 4

days to meet with stakeholders (Trip 1: $2,000 airfare + $6,480($240*27 days) + $300 airfare to Dar es Salam + $1,236($309*4 days) + $200 misc. travel costs ($100 per location)= $10,216; Trip 2: Trip 1: $2,000 airfare + $6,480($240*27 days) + $100 misc. travel costs = $8,580). To ensure the environmental transects are being conducted correctly, we request KP Zambrana-Torrelio have one trip to Arusha in Y2. We request $3,780($2,000 airfare + $1,680($240*7 days) + $100 misc. travel costs). We also request funds to present the project at an international conference, estimated at $4,900 ($1,300 flight + $500 registration fee + $3,000($500 lodging and M & I * 6 days) + $100 misc. travel costs).

We also request funds to support presenting the project at two domestic conferences (Trip: $600 flight + $350 registration + $1,250($250 lodging and M&I * 5 days) + $100 misc. travel costs = $2,300 *2 = $4,600).

We request funds for a permit to conduct research in a protected area (e.g. Serengeti), which costs $2,000 per person for Dr. Rostal and the field coordinator in Y1 and Y2, for a total of $4,000 in Y2.

Year 3
International: $41,207
Domestic: $6,350

In Year 3, we request funds to present the project at two international conferences, estimated at $4,900 each ($1,300 flight + $500 registration fee + $3,000($500 lodging and M & I * 6 days) + $100 misc. travel costs), for a total of $9,800.

We also request funds to support presenting the project at two domestic conferences (Trip: $600 flight + $350 registration + $1,250($250 lodging and M&I * 5 days) + $100 misc. travel costs = $2,300 *2 = $4,600).

Option Year 1
International: $58,969
Domestic: $6,350

In Option Year 1, we request that PI Rostal have 3 additional days in Dar es Salaam to be able to join the team for the policy workshop, in addition to her regular meetings in Dar es Salaam. We request $927($309*3) in OY1 for this. Co-PI Karesh have a second trip to assist with the CCHF policy workshop in Dar es Salaam, thus we request $4,263($2,000 airfare + $2,163($309*7 days) + $100 misc. travel costs). To assist with the human incidence study, we also request that the field coordinator spend an additional 14 days during one trip to Arusha (14 additional days * $240 = $3,360) and that they may take one additional trip with 21 days in Arusha (Trip: $2,000 airfare + $5,040($240*21 days) + $300 airfare to Dar es Salam + $1,545($309*5 days) + $200 misc. travel costs ($100 per location) = $9,085). We also request funds to present the project at two international conferences, estimated at $4,900 ($1,300 flight + $500 registration fee + $3,000($500 lodging and M & I * 6 days) + $100 misc. travel costs) each, for a total of $9,800.

We also request funds to support presenting the project at two domestic conferences (Trip: $600 flight + $350 registration + $1,250($250 lodging and M&I * 5 days) + $100 misc. travel costs = $2,300 *2 = $4,600).

Option Year 2
International: $50,555
Domestic: $6,350

In Year 4, we request 1 additional day in Arusha on one trip for PI Rostal to have sufficient time to support community engagement and give final results and 2 extra days on each trip to Dar es Salaam (1*$240 + 2 days*$309*2 trips = $1,476). Co-PI Karesh have a second trip to assist with the East Africa CCHF symposium in Dar es Salaam, thus we request $4,263($2,000 airfare + $2,163($309*7 days) + $100 misc. travel costs). We also request that the research assistant and Key Personnel Zambrana-Torrelio may come to the CCHF in East Africa Symposium in Dar es Salam (Trip: $2,000 airfare + $2,163($309*7 days) + $100 misc. travel costs = $4,263 * 2 people = $8,526). The field coordinator will not make any trips this year, which is less (-)$11,450 from the annual travel baseline given above. We request that the Tanzanian post-doctoral fellow be permitted to make two trips to Tanzania during the year, one for the annual meeting and one for the CCHF Symposium (Trip: $2,000 airfare + $2,163 ($309*7 days) + $100 misc. travel costs = $4,263 * 2 trips = $8,526). We also request funds to present the project at two international conferences, estimated at $4,900 ($1,300 flight + $500 registration fee + $3,000($500 lodging and M & I * 6 days) + $100 misc. travel costs) for a total of $9,800.

We also request funds to support presenting the project at two domestic conferences (Trip: $600 flight + $350 registration + $1,250($250 lodging and M&I * 5 days) + $100 misc. travel costs = $2,300 *2 = $4,600).

E. Participant Support Costs

We request $54,710 in participant support costs during the five years.

CCHF Symposium

We request $54,710 to support a symposium on CCHF in East Africa in OY2. We request $1,500($510*2 nights in Dar es Salaam + $480 flight to Dar es Salaam) per person for 20 CCHF researchers or people interested in CCHF from East Africa ($30,000) and $3,530($510*3 nights in Dar es Salaam + $2,000 flight) per person for 7 international CCHF researchers ($24,710).

F. Other Direct Costs

Materials and Supplies
Y1: $66,773
In Y1, we request $32,103 to cover field supply costs. This includes enough cryovials, blood tubes, needles, syringes and vacutainer holders for the people, cattle, small mammals and ticks sampled and collected in the first year (which is half of the total number that will be sampled during the first cross-sectional study; $13,126). This also includes biosafety equipment for the team such as nitrile gloves (with extended cuffs) and biohazard bags (coveralls will be purchased locally and are under the GAH-T budget, $3,322). To conduct the surveys and bolster participation among cattle owners we request $7 per livestock animal to provide an incentive such as free deworming for that animal for the owners to have their cattle participate, we also request $2 per participant to provide a snack and juice box to participants that give a blood sample to prevent light-headedness after giving blood ($6,000), and we request funds to purchase 8 tablets on which to administer the questionnaires (8*$240 = $1,920). For small mammal trapping and anesthesia (in order to ethically obtain blood sample) we request $7,735, which will cover anesthetic supplies ($1,500) and the purchase of traps (50*$76.14 large Tomahawk traps for hares = $3,807; 30* $59.73 medium Tomahawk traps = $1,792.80; and 23*$27.6 Sherman traps for rodents = $634.80).

As these supplies will be purchased in the United States to ensure there are no delays to the project due to procurement we request $10,000 to cover shipping the supplies to Tanzania. We request $3,600 to purchase a label printer for the field team to ensure samples are properly marked and funds to purchase two theory computers and accessories (e.g. a computer bag, mouse or keyboard etc.) for the team to use on the project (2*$2000 = $4,000). This subtotal is $17,600.

We also request funds to support TVLA's laboratory infrastructure that do not meet the definition of equipment, we request $2,400 for a laboratory grade refrigerator, $120 for a thermometer for the new refrigerator, an ELISA plat reader lamp ($180), a sterial microscope ($3,600), a water distiller ($3,000), pH Meter ($120) and an ELISA washer ($2,400). We request $1,500 for supplies to support the project's student, $750 in miscellaneous costs and $3,000 in labels and printer ribbon for the label printer. This subtotal is $17,070.

Y2: $40,069
In Y2, we request $28,284 to cover field supply costs. This includes enough cryovials, blood tubes, needles, syringes and vacutainer holders for the people, cattle, small mammals and ticks sampled and collected in the second year (which is half of the total number that will be sampled during the first cross-sectional study; $13,490) with an anticipated 3% increase in the cost of supplies for each year. This also includes biosafety equipment for the team such as nitrile gloves (with extended cuffs) and biohazard bags (coveralls will be purchased locally and are under the GAH-T budget, $3,407). To conduct the surveys and bolster participation among cattle owners we request $7 per livestock animal to provide an incentive such as free deworming for that animal for the owners to have their cattle participate, we also request $2 per participant to provide a snack and juice box to participants that give a blood sample to prevent light-headedness after giving blood ($6,180), and we request funds to purchase 8 tablets on which to administer the questionnaires (8*$247.2 = $1,978). For small mammal trapping and anesthesia (in order to ethically obtain blood sample) we request $3,229, which will cover anesthetic supplies ($1,545) and the purchase of replacement traps (10*$78.42 large Tomahawk traps for hares = $784.24; 10* $61.55 medium Tomahawk traps = $615.53; and 10*$28.42 Sherman traps for rodents = $284.28).

As these supplies will be purchased in the United States to ensure there are no delays to the project due to procurement we request $5,150 to cover shipping the supplies to Tanzania. We request $2,000 to purchase a theory computer and accessories (e.g. a computer bag, mouse or keyboard etc.) for the team to use on the project. This subtotal is $7,150.

We request $1,545 for supplies to support the project's student, and $3,090 in labels and printer ribbon for the label printer; these costs reflect a 3% increase from the previous year. This subtotal is $4,635.

Y3: $4,683
In Y3, we request $1,500 to cover laboratory supplies purchased specifically for the workshop (e.g. cryovials, ELISA plates, Eppendorf tubes, pipette tips etc.).

We request $3,183 for supplies to support the project students; this cost reflects a 3% increase from the previous year. This subtotal is $3,183.

OY1: $36,890
In OY1, we request $22,120 to cover field supply costs. This includes enough cryovials, blood tubes, needles, syringes and vacutainer holders for resampling all of the people that were

sampled in Y1-Y2 ($16,711) with an anticipated 3% increase in the cost of supplies for each year. This also includes biosafety equipment for the team such as nitrile gloves (with extended cuffs) and biohazard bags (coveralls will be purchased locally and are under the GAHT budget, $2,836). To conduct the surveys, we request $2 per participant to provide a snack and juice box to participants that give a blood sample to prevent light-headedness after giving blood ($2,573).

As these supplies will be purchased in the United States to ensure there are no delays to the project due to procurement we request $5,464 to cover shipping the supplies to Tanzania. We request $2,000 to purchase a theory computer and accessories (e.g. a computer bag, mouse or keyboard etc.) for the team to use on the project. This subtotal is $7,464.

We request $3,278 for supplies to support two project's students, $3,278 in labels and printer ribbon for the label printer; these costs reflect a 3% increase from the previous year, and $750 in miscellaneous costs. This subtotal is $7,306.

OY2: $6,188
In OY2, we request $1,500 to cover supplies needed by the post-doctoral fellow for his/her project.

We request $3,000 to purchase a theory computer and accessories (e.g. a computer bag, mouse or keyboard etc.) with GIS and other required software for the Tanzanian post-doctoral.

We request $1,688 for supplies to support the project's student; this cost reflects a 3% increase from the previous year.

Publication Costs
We request $9,000 to cover the costs of publishing in open-access, peer-reviewed, scientific journals. We request $1,500 to publish one article per year in Y2-Y3 and $3,000 p.a. in OY1-OY2 to publish two articles per year.

Consultants
We requested funds for a Tanzanian-based PhD student to be supported by a stipend for $25,000 p.a. (Y1-Y3) to work for the project. The PhD student will contribute to the project through the completion of their research project. Three additional masters' level graduate students will be supported in subsequent years, each for 2 years at a rate of $15,000 p.a. ($90,000).

ADP / Computer Services
We requested $4,000 p.a. ($20,000) for communication costs, such as printing fees for reports for stakeholders and frequent communication with all partners and the field team. In OY2 we request $20,000 to cover the costs of server uses and back-ups in order to analyze the large satellite images and remote sensing data.

Subawards / Consortium / Contractual Costs
We request the following for each subcontractor in Y1 and over the total five years. For the details of justification please see the budget justification attached to each subaward below.

Kilimanjaro Clinical Research Institute: Y1 $66,440 for a total of $456,963.
One Health Coordination Desk – Prime Minister's Office: Y1$1,210 for a total of $19,844.
Public Health England: Y1$0 for a total of $53,948.
Tanzania Wildlife Research Institute: Y1$7,040 for a total of $24,272.
Tanzania Veterinary Laboratory Agency: Y1$6,127 for a total of $213,154.
University of Glasgow: Y1 55,941 for a total of $481,716.

Washington State University and Global Animal Health Tanzania: Y1$167,764 for a total of $602,766.

Other Stakeholder and Partners Meeting
We request funds to support a stakeholder and partners meeting in Dar es Salam, this includes the cost of the conference space and amenities, printing documents for the meeting. We request $10,000 p.a. for a total of $50,000 during the 5-year project.

We request $10,000 for the rental of the conference facilities for the CCHF Symposium in OY2.

Other – Recruitment
We request $7,500 to cover the costs of recruitment of the Tanzanian post-doctoral fellow in OY2 in order to cover the costs of the legal and visa filing fees associated with obtaining a work visa for the fellow. This will also cover moving expenses etc. that will need to be reimbursed to the fellow.

H. Indirect Costs

We are requesting the federally agreed indirect cost of 32.74% on all direct costs, which amounts to roughly $115,763-$156,398 p.a. We have applied this IC rate to the first $25,000 of the subcontracts valued over $25,000 p.a. ($25,000 x 5 subcontracts x 0.3274(%) = $40,925) and two subcontracts valued at a combined total of $44,117 ($44,117 x 0.3274(%) = $14,443) for a total of $55,369.

Washington State University &
WSU Global Animal Health Tanzania (GAHT)

A. Senior/Key Personnel

We request $177,066 to support Key Personnel over the five years of the proposed project.

Dr. Felix Lankester, Co-PI, will commit 2.75 months per year in each year of this project. We request an annual salary of $30,011 at 23% effort each year. Dr. Lankester is a Clinical Assistant Professor at Washington State University's Paul G. Allen School for Global Animal Health. Based in East Africa, Dr. Lankester has conducted zoonotic disease research since 2009 and has extensive experience with project leadership within the African and One Health research contexts. He serves as Country Representative of WSU's non-profit subsidiary Global Animal Health Tanzania (GAHT), legally registered in Tanzania to facilitate in-country research and support research capacity-building activities on zoonotic infectious diseases. Dr. Lankester will oversee all GAHT activities and supervise GAHT project staff, assist in the coordination of the field activities, serve as liaison with high level Ministerial collaborators and interested parties within the Government of the United Republic of Tanzania, and will collaborate with the PI on data analysis and the drafting of manuscripts, reports and policy documents.

Fringe Benefits
Fringe benefits are calculated as 18% of Dr. Lankester's base salary with $5,402 requested each year.

B. Other Personnel

We request $84,000 to support Other Personnel over the five years of the proposed project. WSU Global Animal Health Tanzania (GAHT) maintains an office to support its investigators with local hiring and payroll, procurement, accounting, vehicle maintenance, research permitting, and logistics. The GAHT office manages funds in-country using accounting software fully compliant with WSU's audited standards and with oversight by and regular reconciliations with WSU Allen School finance staff. No fringe benefits are requested for Other Personnel.

Veterinarian, (TBD) A Tanzanian registered veterinarian will be hired for the Animal Health team. She or he will commit 12 months (at 100% effort) per year in years 1 and 2 only. We request $28,500 for salary in each year. The veterinarian will lead the Animal Health team, coordinating activities such as the selection of households for sampling, collection of biological samples from livestock species, implementation of survey tools and the management and transportation of samples to the respective diagnostic laboratory facilities for analysis. In addition, the veterinarian will work with the wildlife sampling team from the Tanzanian Wildlife Research Institute to collect biological samples from wild herbivore species.

Field Assistant, (TBD) A field assistant on the Animal Health team will be required only in years 1 and 2. The field assistant will commit 6 months in year 1 and 11 months in year 2 with additional support of 1 month in year 3, option year 1, and option year 2. We request $6,000 for year 1 (50% effort); $11,000 for year 2 (100% effort); $1,000 in each year for years 3, option year 1, and option year 2 (8.3% effort, each). The responsibilities of the field assistant will include driving and maintaining road worthiness of the project vehicle and assisting the field teams during field sampling activities, and surveys.

Sarah Mollel, Project Administrator/Coordinator will commit 1.0 calendar month per year (8.3% effort) in each year of the project. We request $2,000 per year for Ms. Mollel. Administrative oversight for the proposed project will be provide by Ms. Mollel. This will include being responsible for the distribution of Tanzanian-based project funds, ensuring up-to-date accounting of all field expenses, liaising with Tanzanian review boards to ensure permits are in place and current, managing the road-worthiness of the field vehicles (insurance, servicing, repair work etc.) and organizing travel arrangements.

D. Travel

International Travel

Funds are requested for Dr. Lankester's travel to project meetings and project-related professional conferences at international locations outside of Tanzania. Two international trips outside of Tanzania across the 5-year project period are budgeted at $3255 in years 3 and option year 1: ($1,115 airfare from Arusha to Washington DC) + $1535 (5 nights x $307) + $480 (6 days * $80) meals and incidentals) + $125 for ground transportation). Totaling $6,510 over all of the years of the project.

International Travel - Domestic Travel in Tanzania

We request support for our local field team within Tanzania to conduct and oversee project activities. These include support for the project veterinarian and the field assistant on the Animal Health field team. We request $7,200 in years 1 and 2 to cover travel costs include lodging and per diem within Serengeti National Park. This will cover each of the two persons ($60/day x 60 days). This totals $14,400 over the two years.

We request $7,00 in year 1 and option year 1 each for two field personnel travel outside of Serengeti Park. Costs include lodging and per diem for two persons each in year 1 and option year 1 ($58.33/day x 60 days). This totals $14,000 over the two years.

We request $3,500 ($35/day*100 days) in years 1 and 2 totaling $7,000. Funds are also budgeted for the driver/field assistant travel in option year 1 to conduct the human incidence study ($40/day x 200 days = $8,000).

We request support to cover cost of project vehicle fuel for trips to field locations, totaling $13,888.97 in year 1. Mileage is calculated as 40,000 km/year in years 1 and 2 for the cross-sectional study; 26,667 km in option year 1 for the human incidence study; 24,000 km in years 2 and option year 2 for travel around Arusha for local meetings. Fuel is budgeted at $0.2083335/km for a total of $34,722.32 over the 5-years of our project.

An additional field vehicle will be required during portions of the field work to adequately accommodate project personnel and supplies. We request $6,840 to cover the vehicle rental for 38 days in years 1 and 2 each as well as an estimated 30 days in option year 1. We request $6,840 in year 1 ($190 x 38 days) for a total of $20,140 during the five years of our project.

The PhD student working on the project is estimated to have the following expenses for accommodation

- 40 days within Serengeti National Park in each of years 1, 2, and option year 1 ($60/day x 40 = $2,400 per year).
- 100 travel days outside the National Park in each of years 1, 2, and option year 1. We request $3,500 ($35/day x 100) in years 1, 2, and option year 1.
- Additional travel is requested in years 3 and option year 2 for only 2 months' time ($983.33 in each year).

Travel support within Tanzania is also requested for Dr. Lankester and for the Project Administrator. Dr. Lankester's travel includes:

- Community outreach to provide information on the study and share results. Cost per year is estimated at $1.906 ($546.18 for fuel + $1.200 ($60 x 20 days). Only two months are expected to be required in year 1 ($291.03) with 12 months required in all other years and 40 days per year ($60 x 40 = $2,400). The five year estimated cost is $12,075.75.
- 2 trips for 2 days each annually to Dar es Salaam and Dodoma for meetings with United Republic of Tanzania Ministry officials and other stakeholders for our project. The cost per trip is calculated at $525 ($300 flight + $450 for lodging and MIEs estimated at $225 x 2 days) x 2 = $1,050 x 2 = $2,100 each year for only years 2, 3, and option years 1 and 2 - totaling $8,400 for the five years.

- 4 trips for 3 days each in years 2 and option year 1 to field sites to supervise and evaluate the field activities and sampling procedures. The average per trip cost is $555 ($375 flight + $540 for lodging and MIEs estimated at $180 x 3 days) x 4 trips = $2,220 in each of years 2 and option year 1 totaling $4,440. Two additional trips are estimated for years 3 and option year 2 at $1,110 per year.

- Project Administrator Sarah Mollel will require occasional travel for purposes of securing research permits, procurement, assisting with outreach activities and other project-related duties. We estimate this at $600 per year in years 2, 3, and option years 1 and 2 with $2,400 requested for the full 5-year period.

E. Participant Support Costs

No participant support costs requested.

F. Other Direct Costs

- *Materials and Supplies ($10,000.00)*
  We request $2,000.00 per year to support purchase of materials and supplies. These annual expenses will be required for community outreach and field supplies including printer paper (10 reams at $7.00 each = $70), toner (4 cartridges for CMYK at $150 each with an extra K or black cartridge, since most printing will be in black and white = $750), field notebooks (at $10 two each for ten field personnel = $200), dedicated field coveralls ($22 each for 10 field personnel with two back-up coveralls per field team personnel = $660), buckets (at $8 each with a total of 15 estimated to be used during the sampling year = $120), and disinfectants ($50 per bottle and 4 required for the field sampling year = $200).
- *Consultant Services ($25,920)*
  - We request support for a consultant with expertise in mammalogy and species identification. She or he will be contracted to aid in identification of rodents and other mammal species captured in the live animal traps. Biological samples collected from these animals before they are released will be assayed for virus which will enable reservoirs and vectors of the CCHF virus to be determined. Consequently, accurate species identification is critical. The current annual rate for these services is estimated at $6,000. We will require only 9 months of this service in year 1 (prorated to 66% -> $3,960) and 12 months in year 2 (100% time -> $6000).

  - We request support for translation services and estimate these at $2,000 per year = $10,000). These translation services will pay for translation of survey tools from English into Swahili and vernacular tribal languages. Translation services will be sourced in Arusha town.

  - We request support for the field team vehicle maintenance including tire replacement, minor repairs, oil changes, other regular services. We estimate these at $6,000 per year and only require them in years 1 and 2 during field activities. In year 1 and as the vehicle will be new, we request only 9 months' coverage (66%) $3,960 and $6,000 in year 2 for maintenance during the cross-sectional study during which the field vehicle will be frequently required for field work. The vehicle will primarily be used to go back and forth between the laboratories in Moshi and Arusha, as well as to the communities for meetings with community leaders.
- *Other – Permits ($13,849.75)*
  We request funding for annual Tanzanian work permits for Dr. Lankester. We estimate this cost in year one at $2,787 with a 3% increase per year in each of the five years of the project to account for inflation and exchange rate fluctuations.
- *Other – Medical Waste Management ($1,575.00)*

We have estimated medical waste management for biohazardous waste disposal at $1,575 with an annual cost of $525 in each year of field work, so only in years 1, 2, and option year 1.

- *Other – Equipment Insurance ($5,000.00)*
  Insurance coverage for field vehicles and for project (field and laboratory) equipment is estimated at $1,000 per year

H. Indirect Costs

WSU's off-campus federally negotiated and approved research rate for indirect costs is 26% of all allowable direct costs. We request a total of $124,425.83 over the five years of our proposed project.

Public Health England-Porton Down Budget Justification

A. Senior Personnel

We request a total of $1,191 to support Key Personnel (KP) during the project.

Roger Hewson, Ph.D, Scientific Leader, Virologist will commit 0.1 months in OY2 of the project. KP Hewson will engage with project partners, supervise and oversee scientific reporting from PHE. We request a total of $1,191.

B. Other Personnel

We request a total of $22,858 to support Other Personnel during the proposed project.

Stuart Dowall, Ph.D, Senior Scientist, Virologist will commit 1.1 months in OY2 of the project. KP Dowall will set up DEFRA license applications for sample transport and liaise with colleagues in Tanzania on sample details, plan and supervise the containment level 4 activity, collate data and lead the scientific reporting. We request a total of $10,077

Technicians: Kevin Richards, Ph.D and James Pitman. Two experienced CL4 laboratory virologists will commit 1 month each in OY2 in order to confirm 100 wildlife samples using virus neutralization assays. CCHFV is a Hazard Group 4 pathogen necessitating work with infectious substances to be carried out at Containment Level 4, and the UK operates a dual worker or buddy system for all laboratory work with HG4 pathogens. We request $6,139 per person per month for a total of $12,278 for both.

Project Manager: Neil McLeod. The project manager will commit 0.05 months in OY2 in order to manage staff and budgets to ensure efficient project progress. We request $503 in OY2.

F. Other Direct Costs

We request a total of $15,190 for direct costs during the project.

Materials and Supplies

We will conduct 100 CCHFV virus neutralization assays to confirm the positive ELISA results on the wildlife samples, as this has not previously been assessed for this multispecies commercial ELISA. This includes the cost of running the test as well as laboratory supplies such as petri dishes, culture media, reagents, tubes etc. We request $7,119 in OY2 to procure these supplies and conduct the testing.

6. Facility Rental

CCHFV is a Hazard Group 4 pathogen necessitating work with infectious substances to be carried out at Containment Level 4. We request $8,071 in OY2 to support the use of the CL-4 laboratory for 2 weeks in order to complete the testing indicated above.

H. Indirect Costs

We are requesting the federally agreed indirect cost of 37.5% on all direct costs during the project. We request $14,715 in OY2.

University of Glasgow (UoG)

A. Senior Personnel

We request a total of $131,107 to support co-PI/Key Personnel (KP) over the five years of the proposed project.

Sarah Cleaveland, Ph.D., co-PI, will commit 1.2 months (mo.) per annum (p.a.) for all five years, with an increase of approximately (allowing for exchange rates) 3.4% annually. We request $17,625 in Y1 and $94,600 total. Co-PI Cleaveland will provide key support and oversight for the field epidemiological studies by contributing to the design and implementation of the field study, liaising with partner institutions and stakeholders in Tanzania and linking with policy makers at national, regional and international levels for the dissemination of findings and development of guidelines.

Brian Willett, Ph.D., Research Scientist, Viral Immunologist, will commit 0.6 mo. p.a. for all five years with an increase of approximately 3.4% annually. We request $6,801 in Y1 and $36,507for all five years. Key Personnel Willett will provide oversight, support and training for CCHFV serological and molecular analyses and will coordinate activities with collaborating laboratories (Public Health England, Pirbright Institute).

B. Other Personnel

We request a total of $171,950 to support Other Personnel over the five years of the proposed project.

Technician. A full-time laboratory technician based in KP Willett's laboratory will commit 3 mo. per year in Y1, Y2, and OY1. We request $10,539 in Y1 with an approximately (allowing for exchange rates) 4.8% increase annually (the other personnel are paid on a Grade 5 scale vs the Senior Personnel that are paid on a professional scale at Glasgow). The technician will commit 12 mo. per year in Y3 and OY1 as the in-country laboratory work will be conducted during these two years. We request $46,627 in Y3, totalling $130,092 across all five years. The laboratory technician will support the laboratory analyses, including optimisation of assays, and establishment of laboratory diagnostic capacity in Tanzania.

John Claxton, Administrator, will commit 1.2 months p.a. for all five years with an approximately (allowing for exchange rates) 4.8% increase annually. We request $7,560 in Y1 and a total of $41,857 for all five years. Mr. Claxton, a highly experienced international project manager, will provide support for financial management and reporting, sub-contracts and agreements, ethical clearance, procurement and shipment of supplies.

D. Travel

We request a total of $63,032 for international travel across all five years.

We request 2 trips per year for either co-PI Cleaveland or the laboratory technician in Y1-OY1. Each trip is estimated at a $1,300 flight + $700($70 x 10 days for food and lodging in Arusha) + $480(flight to Dodoma or Dar es Salaam) + $300($150 x 2 days for food and lodging in Dar es Salaam) = $2,780. We request $5,560 in Y1 with a 3% increase in costs per year for a total of $23,260 across four years.

In Y3 and OY1 we request an additional $28.52 per day for the technician to an extended stay (about 6 months and 2 months respectively) in Tanzania to support the laboratory assays and establishment of diagnostic capacity (this amount covers rental costs for staying at the UoG research house at KCMC-KCRI). We request $5,305($28.52 x 186 days) to cover this extended stay in Y3 and $1,974 ($28.52 x 67.2 days x 3% increase) in OY1, totalling $7,279.

In OY2 we request 2 trips to for co-PI Cleaveland and 1 trip for KP Willett. As this year will be more focused on building relationships, co-PI will spend more time in Dar es Salaam and less time in Arusha. For co-PI Cleaveland we request trip 1: $3,035($1,300 flight + $280($70 x 4 days) + $380 flight to Dar es Salaam + $750($150*5)*12% increase from Y1; trip 2: $3,360($1,300 flight + $420($70 x 6 days) + $380 flight to Dar es Salaam + $900($150*6) *12%; and for KP Willett to join the CCHF Symposium $2,890 ($1,300 flight + $380 flight to Dar es Salaam + $900($150*6)*12% increase from Y1. For a total of $9,285.

We request $23,525 over five years for research visas. We request a permit for the technician in Y1 to assist with the installation of capacity building equipment at TVLA, 2 permits per year in Y2-OY1 for the technician and co-PI Cleaveland and one permit in OY2 for co-PI Cleaveland. We request $2,770 in Y1 with a 3% increase across all years.

E. Participant Support Costs

We request $3,500 in Y3 for travel subsistence costs for participants ($50 per day * 5 days * 10 participants *2 trainings). Costs for the UoG trainer are covered by travel costs.

F. Other Direct Costs.

We request a total of $63,830 in other direct costs across 5 years.

In Y3 and OY1 we request $2,650 with a 3% increase p.a. for the shipment of samples from Tanzania to the University of Glasgow. This is required for quality assurance of assays carried out in Tanzania and based on recent estimates for similar shipments provided by Arusha Freight.

Lab work

We request a total of $58,500 for laboratory work across the 5 years. Materials and consumables costs are based upon the average actual annual expenditure (over 4 years) by researchers within this laboratory performing similar experiments to those in the project. These costs were extracted from the University of Glasgow purchasing system Agresso. All consumables purchased benefit from significant bulk purchase discounts negotiated centrally with major suppliers including Thermo Fisher, QIAgen, and VWR International.

We request a total of $18,322 over the five years for immunologicals and viral detection. We request $3,862 in Y2-OY1 ($4,038 total; $1,700 in Y2, $479 in Y3 and $2,410, which averages at $1,346 p.a. but is adjusted to account for the number of kits purchased per year as indicated below) for the purchase and production of the human ELISA reagents, including antibody reagents, secondary antibody conjugates, specific control sera, buffers, blocking agents and substrates for ELISA. This will produce sufficient reagent to facilitate ELISA analyses at KCRI, UoG and the laboratories participating in the workshops. These funds will also be used to purchase of sufficient CCHF Multispecies ELISA kits (430 animals can be tested per kit) at the end of Y2 for analyses at TVLA on the 3,200 animal samples in Y3 ($1,205 per kit * 7 kits = $8,435), and a contingency of kits sufficient to process an additional 1000 samples in each of Y4 ($1,205 per kit * 3 kits = $3,615) and Y5 (2 kits = $2,410) for confirmatory analyses and assay validation at UoG. Thus, we request a sufficient number of kits to test 5,200 samples over the three years (5,200/430 = 12 kits * $1,205 = $14,460.

We request a total of $22,049 over the five years for cell culture plasticware/media for the synthesis and purification of recombinant antigens (for the human ELISA). This includes culture flasks, plates, media and supplements, ELISA plates, plate sealers, reservoirs, pipettes, tips and tubes. This includes using pre-cast polyacrylamide gels, buffers and supplies for the iBlot transfer system, Sarstedt tubes and storage boxes for sera. We request $3,322 in Y2 to prepare sufficient reagent for KCRI to begin testing at the start of Y3 and

increasing to $9,364 p.a. in Y3 and OY1 for full production to be used by KCRI, given to the laboratories participating in the training and for UoG to confirm the results in 1000 samples.

We request $3,504 p.a. in Y2-OY1 for a total of $10,511 over the five years for molecular biologicals, nucleic acid purification kits, restriction enzymes and kits for mutagenesis and sequencing for vector preparation and cloning, and transfection. Also included in this category are preparing primers and probes for viral detection by real-time PCR for TVLA to use, confirmatory testing primers for sub-cloning and mutagenesis, and small-scale sequence confirmation of plasmid constructs.

We request $2,539 p.a. (Y2-OY1) for general laboratory supplies, including microcentrifuge tubes, plates, petri dishes, fine chemicals, and general laboratory costs.

H. Indirect Costs

We request a total of $43,792 in overhead, a rate of 10% per year on other direct costs, over the five years of the proposed project.

TVLA Budget Justification

A. Senior Personnel

We request a total of $28,563 to support Key Personnel over the five years of the proposed project.

Dr. Furaha Mramba, Co-PI, Entomologist, will commit 1 months per year. We request salary of $3,000 in Year 1, with a 3% increase for Y2-Y5, respectively. Her time with increase in Y3 to 6.0 months in order to support the testing of samples in the TVLA laboratory. Co-PI Mramba is the Chief Executive of TVLA and holds a PhD in medical entomology. Co-PI Mramba will conduct or supervise the identification and diagnostic testing of animals and ticks, oversee the design, implementation and analysis of the animal study and facilitate communication with stakeholders.

B. Other Personnel

We request a total of $23,842 to support Other Personnel over the five years of the proposed project.

Laboratory Technicians.

There will be three technicians, who will who commit 1 months per year in Y1 and Y2 to assist with the installation of the equipment purchased for the TVLA laboratory in Arusha (e.g. generator for the building, an ultrafreezer – see the EcoHealth Alliance Y1 part C for a full list of items to be installed), for which we are requesting $450. Salaries will increase of 3% in subsequent years. They will commit to 12 months per year for Y3 in order to assist with the diagnostic testing of samples. For this we are requesting $6,642.36 over the five years of the project.

During Year 3 we will hire three additional technicians to conduct the diagnostic testing of samples and tick identification. This includes one ELISA technician and one PCR technician that will be based in Arusha and who will commit 12 months per year for Y3 to assist with sera and ticks, respectively, for which we request $5,000 per technician. The technician hired to identify ticks will be contracted for 12 months from the TVLA lab in Tanga, for which we request $7,200.

D. Travel

We request a total of $2,100 to support travel over the five years of the proposed project.

In order to complete the tick identifications in Y3 of the project, we request $1,140 that will cover six 14-day trips to Arusha. Transportation is calculated at $50 per day ($50/day x 6 trips = $300) and overnights are calculated at an average cost of $10 per day, for 6 trips of 14 days each ($10/day x 14 days x 6 trips = $840).

Co-PI Mramba will require one trip per year during Y1, Y2, OY1, and OY2 for project meetings and to visit stakeholders, calculated at $50 per day for transportation, and $10 per day for 7 days for field visit ($120 per year). During Y3 when there is active laboratory work and tick identifications ongoing, co-PI Mramba will make 3 additional trips to visit the laboratory in Arusha, for which we are requesting $480 in Y3.

E. Participant Support Costs

We request a total of $1,800 for a CCHF Diagnostics Training Workshop held at TVLA during Y3 of the project. These funds will be used to support the travel costs of the trainees during the 5-day workshop.

F. Other Direct Costs

We request a total of $134,193 for other direct costs over the five years of the proposed project.

We request $123,893 for testing during Y3 of the project, including PCR testing and serology. We request $30,656 for PCR testing covering 1,200 cattle samples, 1,800 small mammal samples and 200 wildlife samples, at a discounted rate of $9.58 (the rate is discounting as the University of Glasgow is providing the multispecies ELISA kits for analysis). We request $93,238 for serology testing covering 200 wildlife samples and 3296 tick pools, at a cost of 60,000 Tanzanian Shilling, or $26.67 USD, per test.

We request $10,300 over the five years of the project for supplies. There will a cost of $2,000 each year in fuel for the generator to maintain samples (which will begin to be collected in Year 1) at -80°C during power outages. In Y3 only, we request $300 for a 100 pack of 20 mL Petri dishes.

H. Indirect Costs

We request a total of $19,378 in overhead, a rate of 10% per year on other direct costs, over the five years of the proposed project.

KCRI Budget Justification

A. Senior Personnel

We request a total of $38,000 to support Key Personnel over the five years of the proposed project.

Blandina Mmbaga, Co-PI, Epidemiologist, will commit 1.2 months per year. We request salary of $6,000 in Year 1-Y5. Co-PI Mmbaga will commit 2.8 months per year in OY1 as we will have both human field sampling and lab testing ongoing. Co-PI Mmbaga is the Research Director of KCRI and holds a PhD in Public Health and Epidemiology. Co-PI Mmbaga will contribute to the study design, lead the implementation of field work with human subjects and the laboratory analysis of human samples, provide training and mentorship, develop policy recommendations and facilitate collaboration with stakeholders.

B. Other Personnel

We request a total of $288,095.31 to support Other Personnel over the five years of the proposed project.

Technicians. We request $2,000 per year in Y1-2 for a laboratory technician, who will commit 1 months per year to aliquot the serum samples that come in from the field and store them. In Y3 of project, the laboratory technician will increase their time commitment to 12 months per year, and a second laboratory technician will be hired committing 12 months per year, for which we are requesting $24,000 per technician for Y3-4 to complete the ELISA testing on the human sera collected in Y1, Y2 and OY1.

Nurses. We request $48,000 over the five years of the project for two nurses. In Y1-2, we request support for one nurse who will commit 6 months per year at a rate of $12,000 per year who will collect blood samples from participants in the serosurvey (Task 2). In OY1 of the project, we request $24,000 for two nurses who will each commit 6 months for the year in order to collect blood samples for the incidence study.

Administrator. We request $2,400 in Y1 to support a Program Administrator who will assist co-PI Mmbaga in the administration of the project. We request a total of $12,000 over the five years of the project.

Anthropologist/Epidemiologist. We request $30,000 for an Anthropologist/Epidemiologist, with a 3% increase in subsequent years, who will commit 12.0 months Y1-2, OY1 and 6 months in Y3 to contribute to the development of the serosurvey and incidence studies, field data collection and data analysis.

We request $10,500 over the five years of the project to support a Finance Specialist who will commit .84 months per year for Y1-5. The Finance Specialist will work with project staff to ensure timely invoicing for all program expenses.

D. Travel

We request $3,500 per year, with a 3% annual increase, for Year 1 and 2 and $11,483 in OY1 for travel. This will cover a travel stipend of $35 per day for 100 days in each of Y1 and Y2 for the original serosurvey and 150.5 days in OY1 for the incidence study for the nurse(s) while they are working in the field. We request $18,588 over the five years.

E. Participant Support Costs

We request a total of $1,800 for a CCHFV Diagnostics Training Workshop Y3 of the project. We will host a workshop to train participants from local and national public health laboratories to conduct CCHFV ELISA and PCR testing as well as to understand the importance of including CCHFV as a differential diagnosis.

F. Other Direct Costs

We request a total of $84,948.19 for other direct costs over the five years of the proposed project.

We request $2,400 for the storage of samples in Y1 of the project, and an increase of 5% in each subsequent year for a total of $13,261.52 over the five years of the project. We request $14,156.10 for laboratory access and utilization for the processing of human IgG ELISA samples in Y3 of the project, and an increase of 5% in Y4 for a total of $29,020.01 over the five years of the project. There is a separate cost to perform the tests, for which we request a total of $42,656, $10,667 in Y3 to perform 800 tests and $31,989 in Y4 to perform 2400 tests all at a cost of 30,000 Tanzanian Shilling, or $13.33 USD, per test.

H. Indirect Costs

We request a total of $40,484 in overhead, a rate of 10% per year, over the five years of the proposed project.

One Health Coordination Desk (OHCD-PMO) Budget Justification

A. Senior Personnel

We request a total of $14,855 to support Key Personnel over the five years of the proposed project.

Dr. Justine Assenga, Research Scientist, Molecular Epidemiologist, will commit 1.0 months per year for which we request salary support of $250 in Year 1, with a 3% increase per annum (p.a.). Dr. Justine Assenga is the Animal Health Focal Person at the Ministry of Livestock and Fisheries One Health Coordination Desk and will join meetings, assist with keeping the government ministries apprised of our activities, contribute to the development of the epidemiological plan as well as facilitate communication to stakeholders. In order to prepare for and facilitate the policy workshop and CCHF Symposium, Dr. Assenga's time will increase from 1 month to 12 months per year in Y4-5 for a total of $7,427 over the five years of the project.

Dr. Jubilate Bernard, Research Scientist, Public Health Specialist, will commit 1.0 months per year for which we request salary support of $250 in Year 1, with a 3% increase p.a. Dr. Jubilate Bernard is the Animal Health Focal Person at the Ministry of Livestock and Fisheries One Health Coordination Desk will join meetings, assist with keeping the government ministries apprised of our activities, contribute to the development of the epidemiological plan as well as facilitate communication to stakeholders. In order to prepare for and facilitate the policy workshop and CCHF Symposium, Dr. Bernard's time will increase from 1 month to 12 months per year in Y4-5 for a total of $7,427 over the five years of the project.

D. Travel

We request a total of $3,185 to support local travel for them in Tanzania over the five years of the proposed project.

We request $600 in Y1 for so that both Dr. Assenga and Dr. Bernard may attend project meetings held in Tanzania and take other meetings to improve One Health stakeholder relationships. Travel expenses will increase at a rate of 3% per year over the five years of the project.

H. Indirect Costs

We request a total of $3,185 in overhead over the five years of the project. The rate of overhead will be 10% each year, starting with $110 in Y1.

TAWIRI Budget Justification

A. Senior Personnel

We request a total of $13,273 to support Key Personnel over the five years of the proposed project.

Julius Dotto Keyyu, Ph.D., Research Scientist, Disease Ecologist, will commit 1.0 months per year. We request salary of $2,814 in Year 1, with a 3% increase for Y2-Y5, respectively. Dr. Julius D. Keyyu is a Chief Research Officer who holds a PhD in ecosystem and population health specifically on disease ecology. Dr. Keyyu will support the wildlife sampling team, create the animal epidemiological study design, implementation and analysis and facilitate communication with stakeholders.

B. Other Personnel

We request a total of $7,200 to support Other Personnel over the five years of the proposed project.

Wildlife Technician. There will be one wildlife technician, who will support the team while they are sampling small mammals in the protected area. They will be paid $60 per day for food an accommodation, each working for 60 days ($60 x 60 days x 2 years) for a total of $7,200, for Year 1 and Year 2 of the project.

D. Travel

We request a total of $1,593 to support local travel in Tanzania over the five years of the proposed project.

We request $300 in Y1 for Key Personnel Keyyu to join project meetings and meet with stakeholders. Local travel expenses will increase at a rate of 3% per year throughout the project.

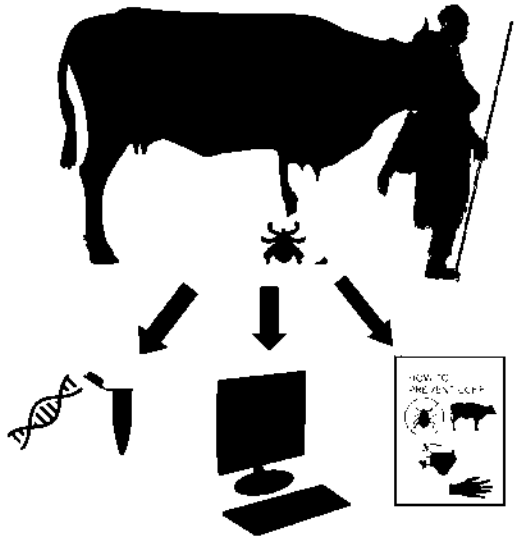
H. Indirect Costs

We request a total of $22,066 in overhead, a rate of 10% per year on other direct costs, over the five years of the proposed project.

Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania, PI: Melinda Rostal, EcoHealth Alliance, GRANT12759679

Objective: Conduct the first collaborative One Health investigation of Crimean-Congo hemorrhagic fever virus (CCHFV) in Tanzania to estimate current seroprevalence of CCHFV in people, cattle and wildlife, identify risk factors associated with seroprevalence and develop threat reduction policy recommendations for the government of Tanzania.

Method: Work with local partners and government to scientifically investigate CCHFV infection patterns in people, animals, vector ecology and ecological determinants to improve awareness in local communities, the government and among the medical and research community in Tanzania and recommend policies to reduce the threat of CCHF outbreaks.



Status of effort: The collaborative team has been established and already generated preliminary data.

Personnel Supported: We plan to support 20 researcher scientists, 8 technicians, 1 Post-Doc, and 4 graduate students.

Publications & Meetings: We plan to publish at least 6 peer-reviewed articles and present at at least 10 meetings.

Major Goals and Milestones:

- Raise awareness about CCHF within communities, health laboratories and government (Y1-OY2).
- Estimate the seroprevalence in humans, cattle and wildlife and the prevalence in ticks (Y1-3).
- Build capacity through laboratory diagnostic and policy workshops, and an international CCHF symposium.

Funding Profile Yr 1: $997,801 Yr 2: $927,086 Yr 3: $992,671 OYr 1: $999,748 OYr 2: $931,177

Contact information PI: Dr. Melinda Rostal, rostal @ecohealthalliance.org, 1-212-380-4489; Co-PI: Dr. William Karesh, karesh@ecohealthalliance.org, 1-212-380-4463

Statement of Work

Project Title: Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania

Document Date: March 18, 2018.

Objective: The objective of this grant is to reduce the threat of Crimean-Congo hemorrhagic fever (CCHF) by determining the presence and scale of CCHF virus (CCHFV) circulation in Tanzania. The awardee shall establish a multi-disciplinary team of Tanzanian and international One Health professionals to collect fundamental data on CCHFV, conduct rigorous scientific analyses and support the Government of Tanzania in the development of policies to control and reduce the threat of CCHF. Using a One Health approach the awardee shall investigate the following three hypotheses: 1) CCHFV is circulating in ticks, livestock and wildlife in Tanzania; 2) CCHFV is present and circulating in the human population in Tanzania; 3) CCHFV prevalence, seroprevalence and vector abundance will vary across an environmental disturbance gradient from peri-urban communities, to pastoral rangelands, to protected wildlife areas. The awardee shall support the capacity of Tanzanian human and animal health laboratories to detect anti-CCHFV antibodies, train Tanzanian field researchers and provide vital data to Tanzanian government partners and stakeholders to develop policies to prepare for and reduce the threat of a CCHF outbreak.

Scope: The grantee proposes a five-year multi-disciplinary study of epidemiology, ecology and impact of CCHF in northern Tanzania. The grantee team shall focus on the following major goals and milestones:

- Improve awareness of and capacity to respond to potential CCHF epidemics.
    - Host an annual stakeholders' and partners' meeting in Tanzania (Y1-OY2); initiate and maintain diagnostic capacity for detection of CCHFV (Y2-OY1); provide training for students and scientists (Y1-OY2).
- Use a One Health approach to identify CCHFV infection patterns in wildlife, cattle and humans across an environmental disturbance gradient.
    - Establish field study protocols (Y1); implement small mammal, cattle and human serosurveys (Y1-2); conduct serological assays on blood samples (Y3-OY1); conduct longitudinal study in humans (OY1); train a Tanzanian post-doctoral fellow to use spatial analyses to determine environmental correlates of CCHFV infection risk (OY2).
- Determine the abundance and CCHFV infection prevalence of tick vectors.
    - Establish tick field study protocols (Y1); implement tick sampling (Y1-2); conduct PCR assays on *Hyalomma* spp. ticks (Y3); analyze tick abundance in relation to environmental factors (Y3).
- Support One Health communication and policy development to reduce the threat of CCHF.
    - Host a policy development workshop (OY1); host an East African CCHF symposium (OY2).

Background: Crimean-Congo hemorrhagic fever is a **WHO Blueprint R&D priority disease** for which **there is an urgent need for accelerated research** given its **epidemic potential and the lack of countermeasures against CCHFV**. The Department of Health and Human Services considers CCHF as having the potential to pose a **severe threat to human health**. Similarly, **Tanzania identified viral hemorrhagic fevers as one of six priority zoonoses of greatest national concern**. Clinical signs and symptoms include fever, headache, thrombocytopenia, hemorrhagic disease and death in 30-40% of patients. CCHFV can be transmitted via multiple routes, including direct contact with infected animal tissues and transmission from *Hyalomma* spp. ticks. Human-to-human transmission has frequently been reported and if isolation practices are not implemented, nosocomial outbreaks can occur. Though it is not known to cause disease in animals, CCHFV circulates among both small mammals and large ruminants. Little is known about the status of CCHFV in Tanzania as the most recent cattle serosurvey occurred in 1974-75 (identifying a 9% seroprevalence) and despite neighboring Uganda and Kenya reporting multiple cases, no studies have investigated CCHF in humans in Tanzania.

Similar to the situation with Ebola virus prior to the 2014-16 outbreak, CCHFV antibodies were detected in people in Turkey as far back as 1980, yet no cases were reported until the start of the large outbreak in 2002-06 during which there were 1,103 confirmed cases. This "sudden" appearance of CCHF has been described in many regions that thereafter remain endemic for the virus, including Pakistan, Crimea and Turkey. **Human epidemics have often been linked to environmental and social changes,** which are associated with an increase in the abundance of CCHFV vectors. Thus using a One Health approach is vital to understanding CCHFV ecology, particularly in regions where environmental changes might drive disease emergence. CCHF is a frequent threat faced by U.S. warfighters working in endemic countries in Central Asia and the Middle East. Indeed, war is considered a driver for the emergence of CCHF as demonstrated by the outbreak among 200 Soviet troops in Crimea.

Tasks/Scientific Goals: (given in the format: Year.Task.Subtask)

Task Y1.1-YO2.1: Improve the capacity within Tanzania to understand the potential impacts of CCHF and strengthen One Health collaborations between sectors.
Strengthening Tanzania's capacity to consider CCHF as a differential diagnosis, conduct CCHFV diagnostic assays and improve inter-sector communication about this important zoonosis will improve their ability to identify, respond and prevent CCHF outbreaks. 1) The grantee shall mentor four graduate students or FETP fellows in fields that can contribute to our understanding of the epidemiology and ecology of CCHFV in Tanzania (Y1-OY2). 2) The awardee shall provide equipment to TVLA to permit them to sustainably maintain the sample cold chain and diagnostic workflow (e.g. a generator and an ultrafreezer) in Y1. 3) The awardee

shall train all field and laboratory staff (based on what is pertinent for their role) in: biosafety, safe and humane handling of animals, ethical conduct of research with human subjects, biosecurity, etc. in Y1, Y3 and OY1. 4) Through the annual meetings (Y1-OY2), additional meetings throughout the year and communication among stakeholders and between project partners the project shall strengthen the communication between relevant One Health sectors. 5) As the grantee knows of no laboratories conducting CCHFV diagnostics in Tanzania, the awardee shall provide intensive training in the use of serological and polymerase chain reaction (PCR) based assays for the diagnosis of CCHFV (Y3-OY1). The awardee shall select an assay for testing humans that requires recombinant antigen that would be possible to produce in country or in a neighboring country in order to improve the sustainability of the establishment of these assays at diagnostic laboratories in Tanzania. The awardee shall conduct two laboratory workshops on the importance of CCHFV and its diagnosis (Y3). 6) Following a majority of the field and laboratory work, the awardee shall host a policy workshop to present the results to an invited group of government and non-government representatives and using those results develop and provide a set of policy recommendations for the reduction of the threat of CCHFV in Tanzania to the Government of Tanzania (OY1). 7) The awardee shall train one Tanzanian post-doctoral fellow in the spatial ecology of infectious diseases at EcoHealth Alliance in New York City (OY2). 8) The awardee shall host a symposium on CCHF in East Africa and invite global leaders in CCHF research to exchange ideas on additional research that is needed, ways of increasing support for the growing group of CCHF experts in East Africa and ideas about the applicability of control measures being used in other regions that may be transferable to the situation in East Africa (OY2).

1.1.1-OY2.1.1 Train a minimum of four graduate students in fields related to CCHFV.
1.1.2-Y3.1.2 Strengthen the capacity of the Arusha Regional TVLA laboratory.
1.1.3-OY1.1.3 Train staff *in situ* in epidemiological field methods.
1.1.4-OY2.1.4 Support One Health relationships between partners and stakeholders.
1.1.5-OY1.1.5 Support laboratory capacity to conduct CCHFV diagnostics.
3.1.6 Host one workshop on diagnostic testing for CCHFV at each KCRI and TVLA.
OY1.1.7 Host a workshop to support CCHF policy development in Tanzania.
OY2.1.8 Mentor a Tanzanian post-doctoral fellow in spatial ecology of infectious diseases.
OY2.1.9 Host East African CCHF Symposium.

Task Y1.2-YO1.2: Determine CCHFV infection patterns, risk factors and incidence in humans.

To identify and characterize the risk of infection with CCHFV in people within the study area in northern Tanzania the grantee shall conduct several epidemiological studies. Despite the lack of CCHF outbreaks reported in Tanzania, there are confirmed cases of CCHF in neighboring Uganda and Kenya, the vector is present in Tanzania and we have previously identified circulating antibodies in livestock within the proposed study area. In order to confirm our hypothesis that CCHFV does infect people in Tanzania, the grantee shall 1) finalize IRB approvals in the U.S. and obtain the required permits and ethical approvals in Tanzania (Y1). 2) The awardee shall conduct a cross-sectional study approximately 1,586 people. People who

enroll shall be given a questionnaire in Swahili and asked to provide a blood sample (Y1-Y2). 3) Laboratory testing using an enzyme linked immunosorbent assay (ELISA) will be conducted at KCRI in Y3-OY1. A subset of samples will be shipped to UoG for confirmation. 4) A preliminary analysis of initial results of the human serosurvey will be completed in Y3 and reported with the results from the animal serosurveys (Y3). 5) In OY1 we will re-sample all willing participants to determine the incidence of CCHFV infection within the sampled population. These samples will be tested at KCRI as described in subtask 1.2.3.

1.2.1 Obtain local permissions and approvals to work with human subjects.
1.2.2-OY1.2.2 Conduct a cross-sectional study in people within the study area.
3.2.3-OY1.2.3 Conduct serological assays for the presence of anti-CCHFV antibodies.
3.2.4-OY1.2.4 Analyze human serosurvey results.
OY1.2.5 Conduct incidence sampling among cross-sectional study participants.

Task Y1.3-Y3.3: Determine CCHFV infection patterns in cattle across varying environments.

The grantee shall conduct a cross-sectional study in cattle (and other animals, see Task 4) throughout the pastoral livestock and peri-urban areas of the study area to determine whether there is a difference in seroprevalence. 1) The awardee shall finalize the U.S. IACUC approvals and obtain all appropriate permits and ethical approvals required in Tanzania (Y1). 2) The grantee shall collect blood samples and ticks from cattle in Y1-Y2. The grantee shall use conduct an environmental disturbance assessment transect at each site to complement remote sensing data to establish the disturbance levels across the study area. 3) The collected ticks will be identified at TVLA by an experienced entomologist (Y3). 4) Cold chain will be maintained and the serum samples will be transferred to TVLA for analysis with the ID Screen® CCHF Double Antigen Multi-Species ELISA by IDVet. The ticks shall be tested for CCHFV via PCR at TVLA (Y3). A subset of samples shall be shipped to UoG for confirmation. 5) The cattle serosurvey results shall be analyzed and reported at the end of Y3.

1.3.1 Obtain local permits and permissions.
1.3.2-3.3.2 Conduct a cross-sectional serosurvey in cattle across two levels of environmental disturbance.
3.3.3 Collect and identify *Hyalomma spp.* ticks from sampled cattle.
3.3.4 Conduct laboratory analyses on cattle ticks and sera.
3.3.5 Analyze cattle serosurvey results.

Task Y1.4-OY2.4: Determine CCHFV seroprevalence and infection patterns in wildlife and ticks.

Using a One Health approach the grantee shall conduct a cross-sectional study to compare the tick burden, CCHFV seroprevalence (in wildlife only) and CCHFV prevalence (in ticks only) across three different levels of environmental disturbance: peri-urban, pastoral livestock and protected areas. 1) The awardee shall finalize the U.S. IACUC approvals and obtain all appropriate permits and ethical approvals required in Tanzania (Y1). 2) The awardee shall trap small mammals at the sites where people and livestock are also being sampled as well as in the protected area (Y1-Y2). 3) The grantee shall also conduct tick transects to collect ticks from the vegetation (Y1-Y2). The cold chain shall be maintained and samples will be transferred to TVLA. 4) Ticks shall be speciated by an experienced TVLA technician. 5) Serum samples shall

be tested with the multispecies CCHFV ELISA kit. *Hyalomma* spp. ticks shall be tested for CCHFV by PCR (Y3). 6) The grantee shall work with partner TAWIRI to access banked serum and ticks collected from wild ruminants in protected areas (Y3). 7) The awardee shall complete and analysis and report of the wildlife serosurvey results at the end of Y3. 8) Since the multispecies ELISA has not been validated using seropositive sera from wildlife (it has been assessed in seropositive livestock samples) the grantee shall transfer 100 samples to PHE for confirmation using the gold standard CCHFV virus neutralization assay (OY2).

1.4.1 Obtain local permits and permissions.
1.4.2-2.4.2 Conduct cross-sectional study in small mammals.
1.4.3-2.4.3 Collect ticks from vegetation at study sites.
3.4.4 Identify ticks collected from small mammals and transects.
3.4.5 Conduct laboratory analyses for CCHFV antibodies and viral RNA.
3.4.6 Test banked serum from wild ungulates.
3.4.7 Analyze wildlife serosurvey results.
OY2.4.8 Confirm seropositive wildlife samples with virus neutralization assays.

Task Y1.5-OY2.5: Disseminate reports to relevant stakeholders.

The awardee shall synthesize all research and capacity building activities described above and 1) An Annual Research Performance Progress Report, Quad Chart and Metrics will be submitted to DTRA and the project shall submit the Annual Sample Repository information using a DTRA-specified format (Y1-OY2). Quarterly reports shall also be submitted as requested by DTRA. 2) An annual report shall be made to local stakeholders. 3) A stakeholder meeting shall be held annually to describe the project and the current results. Community feedback meetings shall be held to provide aggregate findings and engage with local stakeholders through the project. 4) Scientific and general reports shall be generated and presentations of findings shall be made at national and/or international meetings (e.g. ASM, ASTHM, IMED, One Health etc.) as indicated in the performance schedule below. The grantee shall attend the Annual Technical Review when invited to the review by DTRA. 5) Samples will be maintained in biobanks at KCRI and TVLA, with a subset of duplicated samples stored at UoG and PHE following confirmatory testing of these samples (Y1-OY2). Access to all samples collected and data generated during the course of the project will be maintained, up to and including at least 12 months after the project end date. 6) In Y3 a synthetic report on the cross-sectional studies will be submitted to DTRA. These dissemination pathways shall provide opportunities to gain stakeholder input, including to inform policy to reduce the threat of CCHF in Tanzania. The awardee shall submit a Research Performance Final Report and submit a Final Metrics File at the end of the entire project period.

1.5.1-OY2.5.1 Submit reports, including sample repository data, to DTRA.
1.5.2-OY2.5.2 Complete annual report to local stakeholders.
1.5.3-OY2.5.3 Host annual partners' and stakeholders' meeting.
1.5.4-OY2.5.4 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
1.5.5-OY2.5.5 Maintain samples in biobanks.
3.5.6 Complete reports on results of human, cattle and wildlife cross-sectional studies and comparison across the gradient.

Task OY2.6: Identify environmental correlates with CCHFV seroprevalence.

The grantee shall 1) access remote sensing data sets including the following remote sensing products: NASA's ECOSTRESS data (ECOsystem Spaceborne Thermal Radiometer Experiment on Space Station) that provides data on vegetation water stress and LandSat data, as well as remote sensing derived data such as normalized difference vegetation index (NDVI) and enhanced vegetation index (EVI). 2) Spatially explicit correlates shall be performed to understand the relationship between environmental factors and seropositivity in humans, livestock and wildlife as well as vector and viral prevalence.

OY2.6.1 Access appropriate remote sensing data.

OY2.6.2 Conduct spatial analysis to identify correlates between environmental and ecological factors and CCHFV seropositivity.

Performance Schedule:

Current and Pending Support

(See GPG Section II.D.8 for guidance on information to include on this form.)

The following information should be provided for each investigator and other senior personnel. Failure to provide this information may delay consideration of this proposal.

Investigator: Melinda Rostal	Other agencies (including NSF) to which this proposal has been submitted: N/A

Support: ☐ Current ☒ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support
Project/Proposal Title:
Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania (current proposal)

Source of Support: DTRA
Total Award Amount: $4,848,483 Total Award Period Covered: 10/1/2019-07/31/2024
Location of Project: EcoHealth Alliance, Tanzania
Person-Months Per Year Committed to the Project. Cal: 5.0 Acad: Sumr:

Support: ☐ Current ☒ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support
Project/Proposal Title:
Reducing the Threat of Rift Valley Fever through Ecology, Epidemiology and Socio-Economics

Source of Support: DTRA
Total Award Amount: $4,988,526.00 Total Award Period Covered: 6/1/19-5/31/24
Location of Project: EcoHealth Alliance, South Africa
Person-Months Per Year Committed to the Project: Cal: 6.0 Acad: Sumr:

Support: ☒ Current ☐ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support
Project/Proposal Title:
Understanding Rift Valley Fever in Republic of South Africa

Source of Support: DTRA
Total Award Amount: $4,936,359.00 Total Award Period Covered: 5/28/14-5/27/19
Location of Project: EcoHealth Alliance, South Africa
Person-Months Per Year Committed to the Project. Cal: 7.0 Acad: Sumr:

Support: ☐ Current ☒ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support
Project/Proposal Title:
Rift Valley Fever Virus in a Hyperendemic Region

Source of Support: NIH
Total Award Amount: $338,570.00 Total Award Period Covered: 12/1/2019-11/30/21
Location of Project: EcoHealth Alliance, South Africa
Person-Months Per Year Committed to the Project. Cal: 0.5 Acad: Sumr:

Support: ☐ Current ☒ Pending ☐ Submission Planned in Near Future ☐ *Transfer of Support
Project/Proposal Title:
Viral interactions within hosts influence transmission dynamics between hosts

Source of Support: NSF
Total Award Amount: $2,510,757.40 Total Award Period Covered: 7/1/2019-6/30/2024
Location of Project: EcoHealth Alliance, Bangladesh
Person-Months Per Year Committed to the Project. Cal: 0.0 Acad: Sumr:

*If this project has previously been funded by another agency, please list and furnish information for immediately preceding funding period.

ATTACHMENT 3 – SUPPORTING DOCUMENTATION

1) FOREIGN PRINCIPLE INVESTIGATORS AND OTHER MEMBERS OF FOREIGN RESEARCH TEAM.

Complete details and biosketches provided in the **Research and Related Senior/Key Person Profile Form**

Foreign PIs (alphabetical order):

Dr. Felix Lankester
Assistant Professor, Paul G Allen School for Global Animal Health
Washington State University, Pullman, WA, 99164, USA
Dr. Blandina Mmbaga
Research Director
Kilimanjaro Clinical Research Institute, KCRI 2236 Moshi, Tanzania
Dr. Furaha Mramba
Chief Executive Officer of Tanzania
Veterinary Laboratory Agency, P.O. Box 9254, Dar-es-salaam, Tanzania

Other members of Key Personnel (alphabetical order):

Dr. Justine Assenga
Animal Health Focal Person – One Health Coordination Desk,
Ministry of Livestock and Fisheries, Box 2870, Dodoma, Tanzania

Ms. Jubilate Bernard Minja
Focal Person for Human Health – One Health Coordination Desk
Ministry of Health, Community Development, Gender, Elderly and Children, University of Dodoma, Building No.11, P.O. Box 743, 40478 Dodoma, Tanzania

Dr. Roger Hewson
Scientific Leader - Viral Hemorrhagic Fevers & Arboviruses
Virology & Pathogenesis Group, National Infection Service, Public Health England, United Kingdom

Dr. Julius Dotto Keyyu
Director of Research Development and Coordination, Tanzania Wildlife Research Institute (TAWIRI) , Box 661, Arusha Tanzania

Dr. Venance Maro
Chief, Department of Medicine, Kilimanjaro Christian Medical Centre
KCRI 2236 Moshi, Tanzania

Brian James Willett
Professor of Viral Immunology
University of Glasgow Centre for Virus Research Garscube Estate, Glasgow G61 1QH, United Kingdom

Carlos Zambrana-Torrelio
Associate Vice President for Conservation and Health
EcoHealth Alliance, 460 W. 34th St, New York City, NY 10001, USA

2) DESCRIPTION OF RELATIONSHIP BETWEEN PROJECT AND CURRENT RESEARCH EFFORTS OF FOREIGN RESEARCH TEAM

American co-PI Sarah Cleaveland is a Professor of Comparative Epidemiology at the University of Glasgow (UoG) and the leader of the foreign research team at UoG. Co-PI Cleaveland has been working on zoonotic diseases in northern Tanzania for more than 20 years. Co-PI Cleaveland has previously worked with PI Rostal on a related bunyavirales virus, Rift Valley fever virus, as well as co-PI Mmbaga, co-PI Lankester and KP Keyyu. Co-PI Cleaveland has focused her research on identifying animal reservoirs of infection, understanding risk factors for new and emerging infectious diseases, quantifying the burden of disease, understanding infection dynamics in linked human and animal populations, designing cost-effective disease control strategies that benefit public health, livestock economies and wildlife conservation, and exploring innovative strategies for surveillance of emerging and zoonotic diseases.

Foreign co-PI Blandina Mmbaga is the Research Director at the Kilimanjaro Clinical Research Institute (KCRI). Co-PI Mmbaga has been a practicing physician in northern Tanzania for over a decade and is interested in better understanding the burden of tick-borne diseases in the local patient population, specifically that of CCHF. Co-PI Mmbaga supported the creation of the Zoonoses Laboratory at KCRI, which can process both human and animal samples and supports using a One Health approach to determining zoonotic disease risk to populations in northern Tanzania. Co-PI Mmbaga has previously worked closely with co-PIs Cleaveland and Lankester.

Foreign co-PI Furaha Mramba is the Chief Executive Officer of the Tanzania Veterinary Laboratory Agency (TVLA). Co-PI Mramba has collaborated with co-PIs Cleaveland and Lankester previously. TVLA has a mandate to support research and animal diagnostic capabilities – both of which will be met through this proposed project. Co-PI Mramba is a trained entomologist and will support her staff in identifying *Hyalomma* spp. ticks collected by the proposed project. Finally, TVLA supports One Health communication and understands the important role that animals play in the maintenance of CCHFV despite the fact that it is only known to cause diseases in people.

Foreign co-PI Lankester is a professor at Washington State University (WSU) as well as the Vice President of WSU's non-profit subsidiary Global Animal Health Tanzania (GAHT). GAHT is legally registered in Tanzania to facilitate in-country research and support research capacity-building activities on zoonotic infectious diseases. Co-PI Lankester has worked at the intersection of human and domestic animal health for in Tanzania for a decade and has collaborated closely with co-PIs Cleaveland and Mmbaga, and he has previously worked with co-PI Mramba and KP Keyyu.

The Tanzania Wildlife Research Institute (TAWIRI) is the government agency mandated to conduct and coordinate research with wildlife in Tanzania. KP Keyyu has previously worked with co-PIs Cleaveland and Lankester. TAWIRI supports this CCHF project proposal as they understand the importance of investigating the ecology of zoonoses in wildlife, even if they do not affect the wildlife. This in turn supports the One Health collaboration among the Tanzanian partners. TAWIRI has begun collecting additional aliquots of samples for this proposed project to use in assessing the infection rates of CCHF in wildlife.

The Tanzanian One Health Coordination Desk-Prime Minister's Office (OHCD-PMO), has prioritized viral hemorrhagic fevers (which includes CCHF) as one of the six priority zoonoses.

Tanzania is focusing its efforts of threat reduction on these zoonoses and CCHF is counted among them. The OHCD-PMO is tasked with coordinating research efforts on these six zoonoses and their collaboration on this proposed project will support their aims of threat reduction.

Public Health England (PHE) – Porton Down has been conducting research on CCHFV since 1958, but have not yet studied the virus in Tanzania. PHE has a BSL-4 containment laboratory and the capacity to conduct viral neutralization testing for CCHFV. They have experience conducting many laboratory trainings for select agents, including those specifically on CCHFV. PHE has shared reagents and previously collaborated with KP Willett (UoG).

3) FACILITIES, EQUIPMENT, AND OTHER RESOURCES

EcoHealth Alliance (EHA)

EcoHealth Alliance is a New York-based 501(c)(3) non-profit institution that conducts scientific research on emerging zoonoses and global health capacity building. EcoHealth Alliance New York headquarters has 10,000 square feet of office space including a meeting room. The scientific staff (34 core scientists, 100+ field staff) is supported by a core admin staff of 18 who are available for work on this project and funded through private donor and federal support. EcoHealth Alliance does not support diagnostic facilities at its core headquarters and works in partnership with a network of leading diagnostic labs both in the U.S.A. and around the world.

EcoHealth Alliance is equipped with fiber optic Internet access and video conferencing facilities to facilitate easy communication between collaborators. EcoHealth Alliance employees have around-the-clock access to servers, VPNs, encryption software, IT support, and all necessary software including Git and Github (Hosted software revision/audit service), Sublime and Vim text editors, Vagrant and Oracle Virtualbox virtual machines, Google Apps (Hosted email and collaboration web based software), Ansible (Server provisioning software framework), Python, NodeJS, and R programming languages, Meteor (Javascript framework), Bash shell scripts, Jenkins (Continuous Integration server), Microsoft Office and Adobe CS6 running on both Apple Mac OS X, Ubuntu linux, and Windows Operating Systems. EcoHealth Alliance has a dedicated quad-core Linux server and another dedicated dual quad-core Mac Pro Server - each with 4TB hard drives. Either server individually or in combination may be used for intensive computational modeling and/or database processing by all the grantees. Access to the cloud and supercomputing services (Amazon) is provided by core funding to EcoHealth Alliance.

EcoHealth Alliance is the headquarters of a global network of over 70 partners that provides exceptional leverage for the core scientists. This network includes staff from: academic institutions at leading national universities; intergovernmental agencies (WHO, OIE, FAO, DIVERSITAS, IUCN); infectious disease surveillance laboratories including BSL-3 and -4 laboratories; national government agency offices and labs; locally-based wildlife conservation organizations in Asia, Africa and Latin America. EcoHealth Alliance is the headquarters of: The Consortium for Conservation Medicine (CCM); the journal EcoHealth; an NSF Research Coordination Network (EcoHealthNET); the IUCN Wildlife Health Specialist Group; and the OIE Wildlife Health Network. EcoHealth Alliance is a voting member of the IUCN and a partner in Columbia University's Earth Institute Center for Environmental Sustainability (EICES) and all senior scientific staff members are Adjunct Faculty at Columbia University's Department of Ecology, Evolution, and Environmental Biology or at the Mailman School of Public Health.

University of Glasgow (UoG)

The Institute of Biodiversity, Animal Health and Comparative Medicine (IBAHCM) is one of seven Research Institutes in the College of Medical, Veterinary & Life Sciences (MVLS) created in 2010 in a major restructure that brings together three biomedical faculties with over 400 academic staff, involved over £100 million invested in research infrastructure and facilities and allows a high degree of integration across departments and disciplines. The Institute has been awarded The Queen's Anniversary Prize for innovative research in global health, an Athena SWAN Institutional Silver Award in recognition of commitment to gender equality for recruitment, career development and progression of our staff and students, the European Commission "Excellence in Research" award and the BBSRC award for Innovator of the Year (2017) in the category of international impact in recognition of its work in Tanzania. Facilities at IBAHCM include office space, computing resources, university library resources with facilities for the CCHF laboratory work provided through the MRC-University of Glasgow Centre for Virus Research (CVR). Academic facilities will also be available through interdisciplinary centers that involve researchers from across the University, including the Boyd Orr Centre for Population and Ecosystem Health, the Glasgow Centre for International Development and the One Health Research in Bacterial Infectious Diseases.

In Tanzania, the Institute has a strong research platform established in partnership with Tanzanian institutions, with facilities that include secure accommodation (a 2-bedroom research house) at the Kilimanjaro Christian Medical Centre, dedicated office space at the Kilimanjaro Clinical Research Institute (KCRI) with access to information and communications technology (ICT) and data management support, and two 4x4 field vehicles for use by project staff, in addition to field vehicles available for zoonoses research at partner institutions. The University of Glasgow research team provided support for establishment of the zoonoses laboratory at the KCRI biotechnology laboratory with capacity for processing and archiving animal samples (including -80^{0}C freezers), microbiology, molecular diagnostics and serological analyses.

The MRC-UoG CVR occupies a state-of-the-art purpose-built facility within the Garscube campus of the University of Glasgow. The CVR provides a well-equipped and intellectually stimulating environment, and has all the features necessary to carry out the proposed project. Excellent infrastructures and equipment are available for molecular biology and virology. These include automatic robotic systems for high throughput assays, confocal microscopy (including live cell imaging), electron and cryo-electron microscopy (the CVR is home to the Scottish Macromolecular Imaging Centre), qPCR machines, phosphoimagers, luminometers, fluorimeters, a nanoparticle detection system and several FACS machines and cell sorters. The CVR's genomics and bioinformatics hub operates an Illumina MiSeq platform and provides dedicated sequencing and bioinformatics analysis support. In addition to extensive category 2 tissue culture facilities, the CVR also has a category 3 high containment suite and insectaries.

Tanzania Veterinary Laboratory Agency (TVLA)

Tanzania Veterinary Laboratory Agency (TVLA) is a government agency focused on promoting animal health welfare through animal disease and vector research, surveillance and diagnostic services to livestock stakeholders in order to enhance food safety, food security and the national economy. TVLA was established under the Executive Agency Act Cap 245 (Revised Edition; R.E 2009) and became operational in July, 2012.

TVLA has 11 laboratory centers that are strategically located to provide services to livestock farmers across the country. Nine of them conduct diagnosis services. In each center there is

diagnostic equipment such as ELISA machines, PCR machines, microscopes, computers, and laboratory buildings. There are 190 working staff. The agency is equipped with 11 networking computers which are linked by SiLabs, a web-based laboratory information management system.

Kilimanjaro Clinical Research Institute (KCRI)

The Kilimanjaro Christian Medical Centre (KCMC) is located in Moshi, Tanzania at the base of Mount Kilimanjaro. KCMC is one of four referral hospitals in Tanzania, and it serves a catchment area of 15,000,000 persons. Research is central to the mission of KCMC, and a robust research infrastructure has been developed under the Kilimanjaro Clinical Research Institute (KCRI). The three Good Samaritan Foundation (GSF) entities have complementary roles in achieving their mission; healing (KCMC), training (KCMU College), and research (KCRI). The vision of KCRI is to be an internationally recognized center of excellence in health research, embedded in the academic medical setting of KCMC, the Tanzanian health care system and connected to international research networks. KCRI provides research training and necessary research infrastructure and logistics for KCMC/KCMU College investigators, and their collaborating partners. KCRI hosts both investigator-initiated single site studies in addition to being a member of multiple consortia such as East African Consortium for Clinical Research (EACCR), Esophageal Squamous Cell Carcinoma African PrEvention research (ESCCAPE), Ministry of Foreign Affairs Denmark (DANIDA), European and Developing Countries Clinical Trials Partnership (EDCTP), PhArmaco VIgilance Africa (PAVIA), and the TB Alliance. KCRI has collaborations with other international universities including Duke University and University of Virginia in the U.S., the University of Glasgow, the London School of Tropical Medicine and Hygiene and St Andrew's in the UK, and St. Radboud University in the Netherlands.

KCRI has been participating in infectious disease studies and clinical trials including those on febrile illness, bacterial zoonosis and antimicrobial resistance. The research institution has the capacity to do blood culture and sensitivity equipped by the BacT/ALERT, recently received a BioFire from the U.S. Department of Defense to conduct a validation analysis on the identification of infectious agents. Through the University of Virginia and CDC, KCRI has analyzed national outbreak samples using the TaqMan array cards using real--time PCR Vii7. The laboratory is also equipped with a whole genome sequencing (WGS) machine (Illumina MiSeq) for performing molecular identification of antimicrobial resistant genes. The laboratory technicians are experienced in conducting febrile illness studies as well as the isolation of bacterial and other organisms. KCRI has a BSL-2 zoonoses laboratory that analyzes human and animal samples for zoonoses including, brucellosis, leptospirosis, and testing for residual antibiotics in poultry products. Additional equipment includes a BSC-II, centrifuge, autoclave, pipettors and other standard laboratory equipment.

KCMC/KCRI have been performing clinical trials on HIV/AIDS drugs as part of the AIDS Clinical Trial Group (ACTG) and the International Maternal Pediatric Adolescent AIDS Clinical Trial (IMPAACT) under NIAID-NIH since 2007. Since 2013, the site has been working under the National Institute of Child Health and Human Development (NICHD) WESTAT for IMPAACT clinical trials studies for maternal, adolescent and pediatric HIV and TB clinical trials. KCRI is interested in extending its activities to include other infectious diseases of public health importance such as malaria, HIV and tuberculosis, emerging and reemerging diseases such as dengue and Chikungunya.

Washington State University (WSU)

The proposed research will leverage existing Washington State University (WSU), research facilities, capacity, and scientific personnel in the U.S. and in Tanzania. The Paul G. Allen School for Global Animal Health is administratively located within the College of Veterinary Medicine on the WSU campus in Pullman, WA. Its facilities include the Allen Center, a 62,000 sq. ft. state-of-the-art biomedical research facility fully equipped for research in molecular biology and infectious diseases, including 5,000 square feet of certified BSL-3 space, two floors of BSL-2 laboratories, private offices for 16 investigators adjacent to the laboratories and open plan work space for graduate students and postdoctoral associates. The Allen Center also provides common areas on each floor, a classroom and conference rooms with capacity for global connection, and a full suite of administrative staff and services. The Allen School administrative team works closely with WSU's central services for all grant administration, including the Office for Research Support and Operations and the Sponsored Programs Services unit.

WSU is legally registered to conduct research in Tanzania and the co-PI, Felix Lankester, and all scientific personnel conducting research in Tanzania have legal approval through Tanzania's Commission for Science and Technology (COSTECH). WSU maintains an office in Arusha to support the co-PIs and other WSU investigators with local procurement, accounting, research permitting, and logistics. The office is equipped with internet-connected and networked computers and uses accounting software fully compliant with WSU standards. Specific to disease surveillance field work, there is a team of trained field staff, led by a veterinarian trained and registered in Tanzania, that is highly experienced in all aspects of field work and data collection.

Field research is supported by five facilities including the WSU office in Arusha for administration, accounting, and logistics; a field center in Seronera (Serengeti National Park), which is close to all of the study sites of the proposed study, and provides telephone communication and living quarters for field teams and visiting project scientists, storage of field equipment, short-term biological sample storage, post-mortem kits, and personal protective equipment; a cold room facility based at the Tanzanian Veterinary Laboratory Agency in Mwanza with the capacity to store vaccines and other temperature sensitive material under monitored conditions; and modern research laboratories at the Nelson Mandela African Institution of Science and Technology (NM-AIST) funded by the Paul G. Allen School for Global Animal Health that provide molecular and serological diagnostic instrumentation and freezers for long-term sample storage. Additionally, WSU provides and supports vehicles required for field research in Tanzania through funding provided to Global Animal Health Tanzania.

Global Animal Health Tanzania (GAHT)

The co-PI Dr. Felix Lankester is based in Arusha, Tanzania where he is a Director of Global Animal Health Tanzania (GAHT), a not for profit non-governmental organization registered in Tanzania to facilitate infectious disease surveillance and research. GAHT occupies a small office space in Arusha from which the project's activities are coordinated. The office is equipped with internet connected computers, printers and other essential office furniture.

GAHT works in close association with the Nelson Mandela African Institute for Science and Technology (NMAIST) whose campus and extensive laboratory facilities are 5 km from the GAHT office. The laboratory facilities, which GAHT has access to, contain molecular and serological diagnostic equipment and sample storage facilities. GAHT owns a field-ready 4-wheel drive vehicle, which is based at the office in Arusha, and three Land Rover Discovery vehicles, which are based at the project house. The team consists of 4 field staff and a Project Manager who is a Tanzanian trained veterinary doctor. Four have been working for GAHT for between five and ten years and all are extremely experienced at carrying out infectious disease field program activities, including data collection using handheld digital devices. In addition, the Project Manager is extremely well connected within the Tanzanian veterinary community and works closely with all of the District Veterinary Officers based in the proposed study site.

GAHT owns a large liquid nitrogen canister, used for storing biological samples prior to virological analyses. There are several nearby facilities (Arusha and Mwanza) with functioning liquid nitrogen compressors that GAHT staff visit regularly to top up the canister. Additionally, they own two - 20°C deep freezers, used for preserving biological samples, which are stored in the dedicated GAHT lab space at the NMAIST lab along with three 12-volt mobile fridge / freezers, used for the transportation and temporary storage of vaccines and other temperature sensitive items. GAHT has contributed to the construction of a cold room facility based at the Tanzanian Veterinary Laboratory Agency lab in Mwanza, western Tanzania. This facility is used by GAHT to store temperature sensitive materials prior to shipment to the field.

One Health Coordination Desk, Dodoma, Tanzania

The One Health Coordination Desk is part of the Office of the Prime Minister (OHCD-PMO) in Dodoma, Tanzania with a mission to reinforce Tanzania's ability to detect, prevent, and respond to emerging pandemics, support Tanzania's commitment to implementing Global Health Security Agenda regulations, and create a solid foundation for effective preparedness and response activities. The OHCD-PMO has office space for the four staff members and is equipped with telephones, internet and computers with Microsoft Office programs for staff.

Public Health England-Porton Down, Wiltshire U.K.

The Public Health England (PHE) is an executive agency, sponsored by the Department of Health and Social Care. It is a distinct organization with operational autonomy that provides government, local government, the NHS, Parliament, industry and the public with evidence-based professional, scientific expertise. PHE employs over 5,000 staff which are mostly scientists, researchers and public health professionals at 8 centers.

The PHE facility at Porton Down focuses on a range of hazardous pathogens including those in hazard groups 3 and 4 which mandate specialist laboratory infrastructure such as Containment Level 3 (CL3) or maximum containment at CL4 for work with infectious agents. PHE-Porton is located 7 miles northeast of Salisbury, Wiltshire, UK. The facility is situated in a rural setting, remote from main population areas. Physical security is assured by a security fence, which completely surrounds the complex. Video cameras are used to monitor sensitive areas of the facility. Two gates provide access for vehicles and security staff man the guardhouses adjoining these gates, 24 hours a day, 7 days a week. Access to the site requires staff members to display a personal security pass. Staff presence on site is monitored through a 'Swipe' record system.

PHE-Porton is recognized as an international leader in work on high containment pathogens. It performs research into microbiological hazards for the UK's Department of Health as well as providing diagnosis & reference facilities for the NHS and emergency response capabilities for the UK collaborating EU laboratories and the World Health Organization (WHO). It has proven research experience in the study of hazard group 3 and 4 viruses, bacteria, Ricketsiae and toxins.

BSL-4 Laboratories: The UK operates a system of linked microbiological safety cabinets. This system was designed for research and diagnostic work involving a range of organisms now categorized as Hazard Group 4 organisms. The established BSL-4 laboratory envelope at PHE-Porton is integrated with an autoclave for solid and liquid waste, designated high containment liquid effluent waste disposal and HEPA filtered supply and extract ventilation systems. There are two BSL-4 suites within PHE-Porton a linked cabinet laboratory line for in vitro virology and a flexible-film containment animal facility. These laboratory suites are located within restricted containment facilities designed to comply with national and international BSL-4 requirements.

The cabinet line system of linked Microbiological Safety Cabinet (MSC) Class III, is designed to separate operators from infectious material handled within them, and prevent the leakage of biological particles. The linked cabinets form a solid shell with gloves fitted along one or two sides to enable material to be handled within them. The gloves are securely fitted over ports so as to provide an effective seal.

The institute is a WHO collaborating center for virus research and reference for a range of BSL4 pathogens. It often accepts international samples couriered in a regulated fashion via packaging and transport requirements set out by UN2814 Category A (infectious substance infecting humans) for diagnostics testing at PHE-Porton (e.g. samples from Spanish CCHF cases in 2018).

Tanzania Wildlife Research Institute (TAWIRI)

The Tanzania Wildlife Institute (TAWIRI) was established by Act of Parliament No. 4 of 1980 (CAP 260 R.E. 2002) with the mandate to conduct, coordinate and oversee wildlife research in Tanzania. The overall purpose of TAWIRI is to advise the Government, Management Authorities and the general public on sustainable conservation and utilization of wildlife resources. The Head Office of TAWIRI is in Arusha Municipality in Northern Tanzania, and TAWIRI has five centers strategically distributed in various zones of Tanzania to cater to specific ecosystems (Serengeti, Kingupira, Njiro, Gombe and Mahale). TAWIRI currently has a total of 104 employees with 37 research staff, of which 21 are PhD holders. The research staff is supported by human resource and administration unit, accounts unit, procurement management unit, internal audit unit, and information and education unit.

Among other functions of TAWIRI as stipulated in the Act, function number four entails TAWIRI to carry out research and investigations on wildlife diseases including zoonoses in order to know their causes and suggest rational methods for preventing and controlling their occurrence. In order to achieve this function, TAWIRI has a veterinary section in the organization structure, which currently has six wildlife veterinarians, two laboratory technicians, and two laboratory attendants. TAWIRI has two veterinary laboratories, one being a field veterinary laboratory that is located in Serengeti national park, and secondly a molecular biology laboratory that is located at the Head Office at Njiro in Arusha. TAWIRI veterinary laboratories are equipped with an ELISA machine, tissue section machine, conventional PCR, a -80°C freezer, four -20°C freezers, 3 liquid nitrogen containers (40-45lt capacity each), a dry shipper, 3

dart guns (pneu darts), 2 wildlife capture nets, mist nets, 4 refrigerators, solar panels, two 40KV generators, 1 autoclave and 4 cool boxes, post mortem kits, and water purification system. The laboratories also have all basic laboratory consumables including pipettes, pipette tips, cryovials, latex gloves, alcohol, flasks, tubes, and ethanol. Most importantly, TAWIRI maintains a wildlife biological specimen bank of tissues, whole blood, EDTA blood, heparinized blood, FTA cards, serum, feces, ticks, worms; the specimens date back two decades. These valuable specimens will be readily available for this important project's retrospective CCHFV analysis in wildlife. TAWIRI also hosts a wildlife population database, which is among the largest wildlife population database in Africa. Also, TAWIRI has a GIS unit with four senior experts in all aspects of spatial data analysis and remote sensing. The unit will be very useful in spatial analysis and interpretation of CCHF ecology.

TAWIRI has 52 computers for research and support staff, internet connection and Wi-Fi facilities, and has 17 field vehicles. All these facilities will be availed for use during project activities, as well as office space for project researchers.

4) SYLLABI FOR WORKSHOPS LISTED IN TECHNICAL PROPOSAL

Proposed One Health Field Team *in situ* Training Agenda
*Note all participants attending the training who will work with human subjects will have already completed on-line CITI training.

Day 1:

13:00-14:00	Introduction to CCHF and the CCHF Project
14:00-14:45	Overview of project protocols
14:45-15:00	Break
15:00-16:00	How communities were selected to be invited to participate?
16:00-17:00	Specific protocol on arrival at a community

Day 2:

9:00-10:00	Obtaining consent for animal and human work and the ethics of working with human participants
10:00-11:00	Practice obtaining valid informed consent
11:00-12:00	Lunch
12:00-13:00	Overview of project protocols
13:00-14:00	CCHF Project questionnaires
14:00-14:15	Break
14:15-16:00	Practice giving questionnaires

Day 3:

9:00-9:30	The ethics of working with animals
9:30-10:00	Team member safety in the field
10:00-10:30	Animal safety and handling
10:30-10:45	Break
10:45-11:15	Biohazardous waste management in the field
11:15-12:00	Personal Protective Equipment
12:00-12:30	Sample management and handling

Proposed CCHF Laboratory Diagnostics Workshop Syllabus for TVLA

	Day 1	Day 2	Day 3	Day 4	Day 5
9:00-10:00	Introduction to CCHF the syndrome	CCHFV ecology/epidemiology	CCHFV positive diagnostic test - what do we do now?	One Health in a laboratory setting	Producing recombinant antigen for human ELISA
10-10:30	Coat ELISA plates for Dowall - human	I. Considerations for potentially working with select agents (CCHFV)	PCR Standard Curve development	Group Photo	
10:30-11:00	BREAK	BREAK	BREAK	BREAK	BREAK
11:00-12:00	CCHFV - the etiological agent and biosecurity	LAB PRAC: CCHFV ELISA training - washing, blocking	LAB PRAC: CCHFV PCR screening known control samples	Preventing zoonoses in the laboratory	EXAM: Written to test knowledge of the relevance of CCHFV and its diagnostics
12:00-13:00		12:00-12:30 II. Considerations for potentially working with select agents (CCHFV)	CCHF is a human disease, why is animal health involved? One Health	LAB PRAC: CCHFV ELISA training - run ELISA	
13:00-14:00	LUNCH	12:30-13:30 LUNCH	LUNCH	13:00-13:45 LUNCH	
14:00-15:00	Safe handling of biohazardous samples	13:00 -14:00 LAB PRAC: CCHFV ELISA training Sample dilution 14:00 -15:15	PCR result interpretation	13:45-15:00 LAB PRAC: CCHFV ELISA training - run ELISA	LUNCH 13:30-14:30
15:00-15:15	BREAK	15:15-15:30 BREAK	BREAK	BREAK	
15:15-16:00	Overview of diagnostic tests available for CCHFV	15:30-16:00 LAB PRAC: CCHFV ELISA training - Add Conjugate	LAB PRAC: CCHFV PCR testing of blind samples	LAB PRAC: CCHFV ELISA training - run ELISA	Closing Remarks and Discussion
					15:45-16:00 BREAK
16:00-16:30	LAB PRAC: CCHFV PCR training - Extraction of RNA from vectors	III. Considerations for potentially working with select agents (CCHFV)		CCHF - communicating CCHF results to the right stakeholders	Awarding of certificates.
16:30-17:00		LAB PRAC: CCHFV ELISA training - Stopping and reading plates	LAB PRAC: CCHFV Multispecies ELISA - Coat ELISA Plates		

Proposed CCHF Laboratory Diagnostics Workshop Syllabus for KCRI

	Day 1	Day 2	Day 3	Day 4	Day 5
9:00-10:00	Introduction to CCHF the syndrome	CCHFV ecology/epidemiology	CCHFV positive diagnostic test - what do we do now?	Communication of CCHF results	Producing recombinant antigen for human ELISA
10-10:30	Coat ELISA plates for Dowall - human	I. Considerations when potentially working with select agents (CCHFV)	III. Considerations when potentially working with select agents (CCHFV)	PCR Standard Curve development	
10:30-11:00	BREAK	BREAK	BREAK	BREAK	BREAK
11:00-12:00	CCHFV - the etiological agent and biosecurity	LAB PRAC: CCHFV ELISA training - washing, blocking	LAB PRAC 2: CCHFV ELISA training - washing, blocking	LAB PRAC: CCHFV PCR screening known control samples	EXAM: Written to test knowledge of the relevance of CCHFV and its diagnostics
12:00-13:00		12:00-12:30 II. Considerations when potentially working with select agents (CCHFV)	12-12:30 When to test for CCHF?	Protocols for isolation of CCHF patients	
13:00-14:00	LUNCH	12:30-13:30 LUNCH	12:30-13:30 LUNCH	LUNCH	
	Safe handling of biohazardous samples	13:00 -14:00 LAB PRAC: CCHFV ELISA training Sample dilution	13:00 -14:00 LAB PRAC 2: CCHFV ELISA training Sample dilution	PCR result interpretation	LUNCH 13:30-14:30
14:00-15:00					Closing Remarks and Discussion
15:00-15:15	BREAK	15:15-15:30 BREAK	BREAK	BREAK	15:45-16:00 BREAK
15:15-16:00	Overview of diagnostic tests available for CCHFV	15:30-16:00 LAB PRAC: CCHFV ELISA training - Add Conjugate	15:30-16:00 LAB PRAC 2: CCHFV ELISA training - Add Conjugate	LAB PRAC: CCHFV PCR testing of blind samples	
16:00-16:30	LAB PRAC: CCHFV PCR training - Extraction of RNA from vectors	LAB PRAC 2: Coat ELISA plates for Dowall - human ; Repeat testing	Group Photo		Awarding of certificates.
16:30-17:00		LAB PRAC: CCHFV ELISA training - Stopping and reading plates	LAB PRAC 2: CCHFV ELISA training - Stopping and reading plates

Post-Doctoral Fellow Mentoring Plan

Summary: The one-year fellow from Tanzanian will be based in New York City at EcoHealth Alliance's (EHA) office. Mentorship will be provided by PI-Rostal and Senior Personnel-Zambrana-Torrelio. EcoHealth Alliance comprises a multi-disciplinary group of 34 scientists, including theoretical ecologists, veterinarians, economists, public health specialists and social-scientists, which will provide exposure to a myriad of different techniques for statistical analysis.

Candidate search: We will recruit a Tanzanian that has completed a Ph.D. or equivalent doctoral degree. We will include specific language in our job postings expressing a preference for candidates with experience in conducting ecology or epidemiology in Tanzania. The candidate will be recruited via a recommendation from partner institutions and/or through posted advertisements for the position in Tanzania and at specific Institutions such as Nelson Mandela University or Sokoine University of Agriculture. Final acceptance will be based on assurances of the candidate's commitment to work in Tanzania at the completion of the fellowship.

Orientation: Orientation will include in-depth conversations between PIs Rostal and Karesh, KP Zambrana-Torrelio and the post-doctoral fellow. Mutual expectations will be discussed and agreed upon in advance. Orientation will include discussion of productivity, including the importance of scientific publications, ethics in research, conflict of interest and work with international collaborators.

Development of Core Competencies: We have developed a one-year multi-disciplinary fellowship that incorporates training in geographic information systems, remote sensing, and spatial ecological analyses. The fellow will become proficient in the following competencies: key concepts in spatial analysis (e.g. vector vs raster), principles in remote sensing, key concepts in infectious diseases, spatial autocorrelation, integrating space and infectious diseases, reproducible research, and open source tools (e.g. R, QGIS, which will allow the fellow to continue his/her work in the future without requiring expensive analytical software).

Supplementary training: At EHA, the fellow will also be trained on the preparation of manuscripts for scientific journals, grant writing and presentation skills. He/she will participate in weekly a journal club/lab meeting to aid scientific development, and will be expected to present his/her research at EHA office, at that year's stakeholder meeting in Tanzania and at least one local or regional conference. The fellow will have to the opportunity to attend seminars hosted by EHA's partners in New York City including Mailman School of Public Health and the Department of Ecology, Evolution and Environmental Biology at Columbia University, and the American Natural History Museum (AMNH). These institutions hold seminars in different topics through the year. The post-doctoral fellow will also have the opportunity to meet with senior researchers working in the field of infectious diseases and One Health.

Experience with Preparation of Grant Proposals: In collaboration with EHA's staff, the post-doctoral fellow will be involved in writing proposals. The researcher will have an opportunity to learn best practices including identification of key research questions, definition of objectives, description of approach and rationale, and construction of a work plan, timeline, and budget.

Publications and Presentations: The fellow will be expected to present and submit publications related to the grant. These will be prepared under the direction of PIs Rostal and Karesh and KP Zambrana-Torrelio and in close collaboration with Co-PIs. The fellow will receive guidance and

training in the preparation of manuscripts for scientific journals and funding to present results at a conference.

Success of the Mentoring Plan: Performance of the fellow will be assessed by monitoring by tracking his/her progress toward his/her career goals through semi-annual performance reviews

TVLA

18th January 2019

Dr. Melinda K. Rostal
Eco Health Alliance
460 W 34th St
FL 17
New York, NY 10001

Dear Dr. Rostal,

I am writing this letter in support of the "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***" proposal. As co-PI of the proposed project, I agree to undertake the tasks assigned to me or my organizations, as described in the project narrative of the proposal, and I commit to provide or make available the resources specified therein. As a co-PI, I feel that it is very important for animal health experts work directly with human health professionals toward understanding of the public health impact of CCHF in Tanzania. This project will strengthen the One Health communication between these two sectors.

This project aligns with the work that TVLA is mandated to conduct research in animal diseases and also laboratory analyses on animal diagnostic samples. This project will support our Arusha Centre laboratory and will strengthen its capacity through personnel training and equipment installation. The key factor among these is the installation of a generator at the laboratory that will permit work to be ongoing during electrical outages and maintain the integrity of our sample bank. Additionally, TVLA will host the animal laboratory workshop on CCHF in the third year of the project, which will enhance our relationship with other laboratories. Our Arusha Centre will support the diagnostic and entomological work that is being conducted through this project. I look forward to working closely with you and EcoHealth Alliance and strengthening my relationship with co-PIs Mbaga, Cleaveland and Lankester – whom I have worked with for several years and on several projects. I am confident enough that the team assembled by PI Rostal will successfully execute the project portrayed in the proposal should it be selected for funding.

Thank you

Sincerely yours,

Dr Furaha Mramba
MEDICAL ENTOMOLOGIST

Dr. Melinda K. Rostal

EcoHealth Alliance

460 W 34th St

FL 17

New York, NY 10001

Dear Dr. Rostal,

I am writing this letter in support of the "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***" proposal. As co-PI of the proposed project, I agree to undertake the tasks assigned to my organizations and myself, as described in the project narrative of the proposal, and I commit to provide or make available the resources specified therein. I have been working in clinical medicine for the past 15 years and Research for the past 10 years. At KCRI we have made significant strides in understanding the burden of zoonotic diseases in Tanzania, but have not yet initiated research on the neglected field of tick borne zoonoses, such as CCHF. I believe this research is critical to improving public health and has merit in improving our understanding of CCHF epidemiology in the region.

CCHF has the potential to occur in Tanzania, especially as we know it occurs with relative frequency in Uganda, and gaining a baseline understanding of the exposure level and exposure risks in people is necessary. This work will support our new Zoonoses Laboratory and it will provide opportunity to improve Tanzania's public health system by training laboratory technicians and providing the assay reagents to their laboratory. I think it is important that this project be initiated and maintained to ensure training is provided year after year to the technicians in our institutions and in the public health laboratories around the northern zone. KCRI with experience of training will host several proposed training to the public health institutions and KCRI staff, trainees and facilitators as needed will utilize infrastructure available. The facility will also be available for sample analysis and storage of collected materials.

The project will strengthen the One Health relationships among the PI and Key Personnel institutions, particularly in animal and public health and in wildlife. I foresee significant mutual benefits as our zoonoses program will benefit and we will provide our expertise to guide the work with human subjects. I look forward to working closely with you and EcoHealth Alliance and strengthening my relationship with co-PIs Cleaveland and Lankester – whom I have worked with for several years and on several projects. I am confident that the team assembled by PI Rostal will successfully execute the project portrayed in the proposal should it be selected for funding.

Sincerely,

Blandina T. Mmbaga MD, Mmed, PhD

To Whom It May Concern

RE: Letter of support for Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania

I am writing this letter in support of the proposal entitled "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***". As co-PI of the proposed project, I agree to undertake the tasks assigned to me or my organization, as described in the project narrative of the proposal, and I commit to provide or make available the resources specified therein.

I have been conducting research on infectious diseases in Tanzania for more than 20 years with an increasing emphasis and focus on One Health approaches to reduce the threat of zoonotic diseases. As such, this proposal on CCHF aligns very closely with the research interests of our Institute as well as Tanzanian partner institutions, and I am very excited by the potential of the project to generate valuable, timely and informative insights on this emerging disease threat.

CCHF is among the viral haemorrhagic fevers that have been identified as a high priority in Tanzania, but very little is known about the disease in Tanzania. As far as I am aware, this will be the first comprehensive investigation in Tanzania of CCHF infection patterns in multiple host species, and associated risk factors in people. In addition, the project is pursuing an interesting hypothesis as to how environmental changes impact the prevalence of the virus and the tick vector. The project will provide training and support for local laboratories to implement CCHF diagnostics and will also help strengthen capacity for tackling tick-borne diseases, which comprise a very important group of emerging diseases. I have a long-standing relationship with our collaborators at TVLA, KCRI and TAWIRI and, through our zoonoses research programme, work closely with the One Health Coordination Desk in Tanzania.

I am confident that the collaboration established within this proposal will strengthen ties both among Tanzanian institutions and between the US and UK institutions. I have worked closely with Dr. Rostal during the past three years as her advisor and will continue to do so while she completes her PhD in epidemiology in the summer of 2019. During this time, she has simultaneously and successfully managed the "Understanding Rift Valley Fever in Republic of South Africa" project as a co-PI (funded by DTRA BTRP/CBEP), and she has my full confidence and support as the PI for this CCHF project.

This project will include key stakeholders in the Tanzanian government at both the national and regional level and provide fundamental data required to support the government in understanding and responding to the threat of a high-priority zoonotic disease.

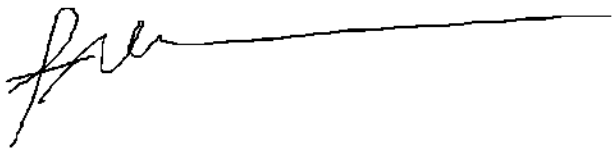
Dear Dr. Rostal,

I am writing this letter in support of the "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***" proposal. As co-PI of the proposed project, I agree to undertake the tasks assigned to me or my organizations, as described in the project narrative of the proposal, and I commit to provide or make available the resources specified therein. Based in East Africa, I have been conducting research on zoonotic diseases in Tanzania for the past 10 years. As a representative of Washington State University and Global Animal Health-Tanzania, I have developed a relationship with the One Health Coordination Desk. I believe this project will strengthen that relationship by supporting the One Health Coordination Desk and providing critical data on a priority zoonotic disease. I have worked previously with co-PIs Mbaga and Cleaveland, and Key Personnel Keyyu and Mramba, and I believe that this team has the skills to successfully complete the project objects. Given the lack of research on tick borne zoonoses in Tanzania, specifically for CCHF, this project will be key to providing critically needed data on the epidemiology and ecology of CCHF. Additionally, over the past ten years I have worked closely with the regional veterinary and medical laboratories in northern Tanzania, which, although staffed with enthusiastic personnel, have suffered from a chronic lack of investment and provision of staff training. As such I am very excited that the project will improve capacity of these regional laboratories to conduct molecular and serological testing for CCHF. This capacity development will have a lasting impact on health surveillance in the region.

Yours sincerely,



Felix Lankester

Dear Dr. Melinda,

Re: LETTER OF SUPPORT FOR THE UPCOMING PROJECT ENTITLED "A ONE HEALTH APPROACH TO UNDERSTANDING THE EPIDEMIOLOGY OF CRIMEAN-CONGO HEMORRHAGIC FEVER VIRUS IN TANZANIA"

On behalf of the Ministry of Livestock and Fisheries, I write to express my support of the proposed project "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***" with Dr Melinda Rostal as the Principal Investigator. This interdisciplinary Tanzania to develop evidence-based strategies for identifying Crimean Congo virus which is an emerging priority heamorrhagic fever that can be spread from animals, especially livestock, to humans.

In my capacity as a Chief Executive of Tanzania Veterinary Laboratory Agency of which TVLA Centre in Arusha where the project will be conducted, I will therefore give all the support which will give us the results that will lead into disease interventions, I am therefore extending my personal support and cooperation to the project.

Yours sincerely,

Dr Joseph Masambu

Dear Dr. Rostal,

RE: ONE HEALTH COORDINATION DESK TO SUPPORT CRIMEAN-CONGO HAEMORRHAGIC FEVER PROJECT

I am writing in my capacity as Animal Health Focal person at the One Health Coordination Desk, Tanzania in support of the "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***" proposal. This proposal is focused on obtaining fundamental baseline data on a priority zoonotic disease for Tanzania (viral hemorrhagic fevers) as identified by the One Health Coordination Desk and collaborators. We support this proposal and will be engaged in the project, which will ensure that the Government of Tanzania will be kept appraised of the project's work, results and recommendations. We will co-lead the policy workshop, which will bring together relevant stakeholders to develop policy recommendations based on the outcomes of the field study. We support the involvement of public health, veterinary health and wildlife and environmental health experts in this project and believe that this will strengthen One Health communication amongst these sectors. It will also provide valuable training opportunities for students and young scientists in Tanzania. The One Health Coordination Desk agrees to support the project as described in the proposal. We believe the proposed scientific investigation will provide valuable information on the epidemiology and ecology of CCHFV and importantly conduct the first serosurvey of CCHFV in people in Tanzania.

Sincerely,

Dr. Justine Alphonce Assenga

Dear Dr. Rostal,

RE: LETTER OF SUPPORT FOR A PROPOJECT PROPOSAL

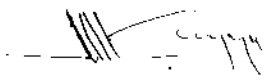
Please refer to the above subject.

The Tanzania Wildlife Research Institute (TAWIRI) is a Parastatal organization under the Ministry of Natural Resources and Tourism (MNRT) with the mandate to conduct, coordinate and oversee wildlife research in Tanzania.

This letter is to support the project proposal titled "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***". I hereby agree to undertake the tasks assigned to me or my organization, as described in the project narrative of the proposal, and I commit to provide or make available the resources specified therein. Crimean Congo hemorrhagic fever (CCHF) illustrates the importance of using a One Health approach to investigate zoonotic pathogens – particularly as animals are the reservoir for CCHF, yet are unaffected themselves by the virus. Therefore it is important to engage veterinary and conservation scientists to understand the ecology and epidemiology of an important public health threat. I believe this project will strengthen the One Health ties between TAWIRI, Tanzania Veterinary Laboratory Agency (TVLA) and Kilimanjaro Clinical research Institute (KCRI), and support the aims of the One Health Coordination Desk at the Prime Minister's Office in Tanzania.

I am looking forward to a fruitful collaboration and implementation of the project.

Yours sincerely,



Dr. Julius D. Keyyu
DIRECTOR OF RESEARCH-TAWIRI
Email: julius.keyyu@tawiri.or.tz

Dear Dr. Rostal,

I am writing this letter in support of the "***Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***" proposal. As co-PI of the proposed project, I agree to undertake the tasks assigned to me or my organizations, as described in the project narrative of the proposal, and I commit to provide or make available the resources specified therein. Global Animal Health Tanzania (GAHT) was established to facilitate zoonotic disease research, such as the proposed project. GAHT has experience in coordinating project activities and logistics, has worked with many other Tanzanian institutions and has an office conveniently located in Arusha. I support the scientific, capacity building and relationship-building aspects of the proposed project and believe that it will contribute to reducing the risk of Crimean-Congo hemorrhagic fever in Tanzania.

Sincerely,

Dr. Felix Lankester

March 14, 2019

Dear Dr. Rostal,

I am writing this letter in support of the "Crimean-Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania" proposal. I agree to undertake the tasks assigned to our group in the project narrative of the proposal, and I commit to provide or make available the resources specified therein. I have a keen interest in CCHF and support the transfer of any low containment diagnostic assays that may be used in Tanzania. While the main focus of our work in this project will be at BSL4 and therefore not easily transferable, other aspects of our work can be carried out at low containment and may be reproduced in BSL-2 laboratories. I look forward to expanding collaboration to our Tanzanian colleagues. I believe this project will not only provide critical laboratory capacity in Tanzania, but it will also answer critical epidemiological questions regarding the epidemiology of CCHF in a region where it has not previously been studied.

Professor Roger Hewson

Dear Dr. Rostal,

I am writing this letter in support of the "***Crimean Congo hemorrhagic fever: Reducing an emerging health threat in Tanzania***" proposal. Given that there have been several cases of CCHF in Uganda recently and that the tick vector is present here in Tanzania, I believe it is very important to conduct the fundamental research proposed in this study. These baseline data, in addition to the laboratory diagnostic training and the transfer of the CCHFV serological reagents to the regional health laboratory, will strengthen our ability to diagnose CCHF. The potential for human-to-human transmission in health care facilities highlights the importance of accurately identifying the virus in infected patients to ensure sufficient protective measures are taken by our staff.

Sincerely,

Dr. Wedson A. Sichalwe
For. REGIONAL ADMINISTRATIVE SECRETARY

Title: ***Crimean-Congo Hemorrhagic Fever: Reducing an Emerging Health Threat in Tanzania***

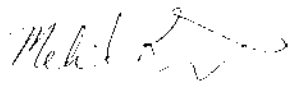
Funding Opportunity: HDTRA1-14-24-FRCWMD-BAA
To whom it may concern:

We request that this phase II application be assigned to be reviewed by the following:
Defense Threat Reduction Agency, Biological Threat Reduction Program Thrust Area 6—Cooperative Counter WMD Research with Global Partners

This program has established a One Health team of Tanzanian and international partners and proposes to determine and assess the risk of Crimean-Congo hemorrhagic fever virus (CCHFV) infection to people across different levels of environmental disturbance. The program also proposes to determine the CCHFV seroprevalence in people, cattle and wildlife as well as investigate the abundance of the vector ticks and environmental correlates associated with higher abundance and seropositivity. This program also proposes to establish CCHFV diagnostics at regional public and animal health laboratories, develop policy recommendations and establish relationships among East African scientists working on CCHF and with international experts on CCHF, thereby reducing the risk of a CCHF outbreak in Tanzania.

We thank you for your consideration of our request.

Sincerely,



Melinda Rostal DVM, MPH

Dear (b)(6)

Please find our excel file with a breakdown of EcoHealth Alliance costs and with separate tabs for our subcontracts.

Call me anytime, if you have additional questions or need other documents.

Many thanks!

-Aleksei

Good morning,

Thank you for documents as they will come in handy. Would you be able to provide an excel breakdown of EHA and subs?

Much appreciated,(b)(6)

I cannot imagine how you get through all these documents. We only have a few proposals/awards to justify and it seems like an enormous task for us!

If I may help you quickly locate certain documents in our forms and files, please call or text my handphone anytime day or night.

Many thanks again!

Dear (b)(6)

Please find attached seven files:

1) FRBAA14-6-2-0471_Clarifications_FINAL.xlsx
2) EHA Budget Justification_FINAL.docx
3) EHA Documentation_FINAL.pdf
4) Human Link Budget Justification_FINAL.docx
5) Human Link Documentation_FINAL.pdf
6) JUST Budget Justification_FINAL.docx
7) JUST Documentation_FINAL.pdf

There are three sets of paired files with the requested documentation (PDFs) and track-change budget justifications (MS Word) for EcoHealth Alliance and our two subcontracts under this proposal. We have also included the clarifications (MS Excel) with responses to the specific questions in each tab.

Please let me know, if there are additional questions or any other documentation is required.

Many thanks!

Much appreciated (b)(6)

I cannot imagine how you get through all these documents. We only have a few proposals/awards to justify and it seems like an enormous task for us!

If I may help you quickly locate certain documents in our forms and files, please call or text my handphone anytime day or night.

Many thanks again!

-Aleksei

Dear (b)(6)

I just wanted to confirm that you received the email below earlier this week.

Thanks!!

William B. Karesh, D.V.M
Executive Vice President for Health and Policy

Dear (b)(6)

Please find attached seven files:

1) FRBAA14-6-2-0471_Clarifications_FINAL.xlsx
2) EHA Budget Justification_FINAL.docx
3) EHA Documentation_FINAL.pdf
4) Human Link Budget Justification_FINAL.docx
5) Human Link Documentation_FINAL.pdf
6) JUST Budget Justification_FINAL.docx
7) JUST Documentation_FINAL.pdf

There are three sets of paired files with the requested documentation (PDFs) and track-change budget justifications (MS Word) for EcoHealth Alliance and our two subcontracts under this proposal. We have also included the clarifications (MS Excel) with responses to the specific questions in each tab.

Please let me know, if there are additional questions or any other documentation is required.

Many thanks!

-Aleksei

DEFENSE THREAT REDUCTION AGENCY (DTRA)
GENERAL TERMS AND CONDITIONS FOR GRANT AWARDS

Table of Contents

1. Terms and Conditions Incorporated by Reference.

The DoD Research and Development General Terms and Conditions, most current version as of the date of grant award, are hereby incorporated by reference and are available for download at website http://www.onr.navy.mil/Contracts-Grants/submit-proposal/grants-proposal/grants-terms-conditions.aspx.

2. Acceptance of Grant.

The recipient is not required to countersign the Grant document; however, the recipient agrees to the conditions specified in the Research Grant and the Articles contained herein unless notice of disagreement is furnished to the Grants Officer within fifteen (15) calendar days after the date of the Grants Officer's signature. In case of disagreement, the recipient shall not assess the Grant any costs of the research unless and until such disagreement(s) is resolved.

3. Recipient Responsibilities.

The recipient will bear primary responsibility for the conduct of the research and will exercise judgment towards attaining the stated research objectives within the limits of the Grant's Terms and Conditions.

The Principal Investigator(s) (PI) specified in the Grant award will be continuously responsible for the conduct of the research project and will be closely involved with the research effort. The PI, operating within the policies of the recipient, is in the best position to determine the means by which the research may be conducted most effectively.

4. Standards for Financial Management Systems.

Where the Federal Government guarantees or insures the repayment of money borrowed by the recipient, DTRA, at its discretion, may require adequate bonding and insurance if the bonding and insurance requirements of the recipient are not deemed adequate to protect the interest of the Federal Government.

DTRA may require adequate fidelity bond coverage where the recipient lacks sufficient coverage to protect the Federal Government's interest.

Where bonds are required in the situations described above, the bonds shall be obtained from companies holding certificates of authority as acceptable sureties, as prescribed in 31 CFR Part 223, "Surety Companies Doing Business with the United States."

5. Modification of the Grant.

The only method by which this Grant may be modified is by a formal, written modification signed by the Grants Officer. No other communications, whether oral or in writing, are valid.

Prior Approvals are required as follows:

1) Expenditures on equipment costing $5,000 or more not specifically identified in the budget at time of award. (Approval via written notification from the Grants Officer.)
2) Expenditures for foreign travel not specifically identified in the budget at time of award. (Approval via written notification from the Grants Officer.)

3) Prior approval is not required to transfer amounts budgeted for indirect costs to absorb increases in direct costs, or vice versa.
4) Prior approval is not required to carry forward an unobligated balance to a subsequent period of performance under this award.

6. Payments.

The 2 CFR 200 governs responsibilities concerning payments, with the following clarifications:

Recipients shall submit requests for payment using Invoicing, Receipt, Acceptance, and Property Transfer (iRAPT) at https://wawf.eb.mil/. Any request for advance payments must be approved by the Administrative Grants Office shown in Block 6 of the award. The request shall be submitted to the Administrative Office identified in Block 6 of the Research Grant by entering the following routing codes:

1) *Pay Office DoDAAC*: See Block 12 (Code) on the first page of the Grant.
2) *Invoice Type*: Non Procurement Instrument (NPI) Voucher.
3) *Issue By DoDAAC*: See Block 5 (Code) on the first page of the Grant.
4) *Admin DoDAAC*: See Block 6 (Code) on the first page of the Grant.
5) *Grant Approver*: Same as Admin DoDAAC (Leave Ext. blank).

Payments will be made by the Defense Finance and Accounting Service (DFAS) office specified in the Research Grant (Block 12).

A foreign awardee must have a U.S. bank account and be signed up for electronic payments (electronic funds transfers (EFT)).

7. Funding Increments and/or Options.

The recipient is advised that the Grantor's obligation to provide funding for increments and/or options included in the Grant is contingent upon satisfactory performance in the judgment of the DTRA Scientific Officer/Technical Monitor and the availability of funds. Other factors will be considered before options will be exercised (for example, expenditure rate and current programmatic objectives). Accordingly, no legal liability on the part of the Grantor exists unless or until funds are made available to the Grantor and notice of such availability is confirmed in writing to the recipient. Refer to the Funding Profile in Section G of the Grant for additional incremental funding planned, but not currently obligated for the Grant.

Funding Increments – In no event is the Government obligated to reimburse the recipient for expenditures in excess of the total funds allotted by the Government to this agreement. Recipients should note that low expenditure rates reported on payment requests may be cause for deferral of future increments. The Government anticipates unilateral modifications for funding increments.

Options – If the agreement contains Option(s), the Government reserves the right to exercise the Option(s) unilaterally.

8. Patent Rights.

Patent Rights are governed by 37 CFR 401.14 with the following clarifications: All DTRA-related disclosures, confirmatory licenses to the government, patent applications, and other communications should be submitted using iEdison (https://public.era.nih.gov/iedison), a single web interface for government grantees to report details of inventions and patents. .

The 37 CFR Part 401 invention reporting requirements are summarized at iEdison (https://era.nih.gov/iedison/invention_timeline.htm). If the grantee organization is not already an iEdison registrant, then iEdison registration is required prior to submission of the below invention reports. The grant shall not be closed out until all invention reporting requirements are met.

The recipient shall also submit interim and final Reports of Inventions using the DD882 form (https://www.arl.army.mil/www/pages/218/d882.pdf). Interim invention reports shall be submitted annually, listing subject inventions reported during that period or that there are no such inventions. These reports are due no later than 1 July of each year. Grants effective after 31 January will not require a report until 1 July the following year. A final report shall be submitted within ninety (90) days after end of the project, listing all subject inventions or stating that there were no such inventions. These Reports of Inventions should be submitted to:

1) The DTRA Grants Officer via email (the address specified in the grant's clause 252.601-9000 may be used);
2) The Administrative Officer listed in the Grant via email (Block 6 of the SF-26 award or Block 7 of the SF-30 modification);
3) As directed by DTRA, email or portal; and
4) E-mailed to dtrabasicresearch@mail.mil (file size must be less than 10MB). File should be named by the Grant number and "Invention Report" (e.g. HDTRA1-12-1-9999 Invention Report).

9. Technical Reporting Requirements.

Research Performance Progress Report (RPPR). Except under rare cases, RPPRs are required annually. The RPPR is due no later than 1 July of each year. Grants effective after 31 January will not require a RPPR until 1 July of the following year.

The RPPR is *not* a cumulative report. The first RPPR shall only include actions that occurred from the Period of Performance start date up to submission of the first RPPR. Each subsequent report shall only include actions that occurred during the 12-month period following the previous year's RPPR.

A RPPR is not required in the final year of the award if the period of performance ends within 60 days of the RPPR due date. In this instance the Final Report will satisfy the requirement. Broadly the RPPR shall address the following items:

- Accomplishments
- Products
- Participants and Other Collaborating Organizations

- Impact
- Changes/Problems

Templates and specific instructions will be provided each year in advance of the submission deadline. All files must be submitted via email to dtrabasicresearch@mail.mil (individual file size must be less than 10MB). A copy of the RPPR should also be provided to the Administrative Office identified in the Grant. The file names should be as follows:

- RPPR: Year Annual Report Grant Number, e.g. 2017 Annual Report HDTRA1-12-1-9999.
- Metrics: Year Metrics Grant Number, e.g. 2017 Metrics HDTRA1-12-1-9999.

Quad Chart. An updated quad chart must be submitted annually. A template will be provided each year in advance of the submission deadline. All files must be submitted via email to dtrabasicresearch@mail.mil (individual file size must be less than 10MB). The file name should be as follows:

- Quad Chart: Year Quad Chart Grant Number, e.g. 2017 Quad Chart HDTRA1-12-1-9999.

Annual Technical Review. At least one representative (preferably the PI) for each award is expected to attend and present at an annual technical program review meeting, unless otherwise exempted by DTRA in writing. For planning purposes reviews will typically be for two days in Northern Virginia during the spring or summer months.

Final Technical Report. A comprehensive final technical report is required: the draft document is required forty-five (45) days prior to the end of the Period of Performance and the final document is required ninety (90) days after the expiration or termination of the award.

The purpose of the final report is to document and to transition the results of the effort into the DTRA and DoD applied research community. The final report will always be sent to the Defense Technical Information Center (DTIC) and unclassified reports may be made available to the public through the National Technical Information Service (NTIS).

The final report is more than an extension of previous annual reports. The final report shall be a **comprehensive** technical summary of the significant work accomplished. The final report, where it is not readily accessible in published form should, where applicable:

- Clearly describe and illustrate the experimental equipment, setup, and procedures;
- Characterize and tabulate collected/computed data in an appendix;
- Sufficiently describe computational codes so they can be reproduced. Include a listing of the code in an appendix if possible and appropriate; and
- When the research effort culminates in the production of one or more student theses or dissertations, in these cases, the most significant advancements and conclusions (equations, figures, relationships, etc.) should be included in an executive summary. The theses or dissertations should be attached as appendices only if they are not readily available. If they are, clearly reference them and how they can be obtained. Also include in the executive summary, cumulative lists of people involved in, and publications

stemming from, the research effort. Do not include copies of already submitted or published articles in the final report.

Standard Form (SF) 298, Report Documentation Page, must be used. Item 13 of the SF-298 should contain a 100 to 200 word abstract summarizing technical progress during the reporting period. The SF-298 may be found on the Internet at: http://www.gsa.gov/portal/forms/download/116146

All of the report pages should be prepared for acquisition and distribution by DTIC. All of the report pages should be of good quality for copying purposes. No pages should be missing.

The format and standard required by your institution for the preparation of theses and dissertations shall be used for the final report. In the absence of any institutional standards, you may wish to refer to the American National Standards Institute (ANSI) document Z39.18-1987, "Scientific and Technical Reports: Organization, Preparation, and Production," for guidance. The report may be obtained from:

American National Standards Institute, Inc.
1430 Broadway
New York, NY 10018

It is anticipated that all final technical reports will be unclassified and that distribution will not be limited. However, for final technical reports that require a limited distribution as deemed necessary by DTRA, a Distribution List will be provided with the comments on the draft final technical report. The Distribution List should be formatted to match the rest of the report, placed at the end of the report, and added to the Table of Contents. The number of pages in the Distribution List should be added to the total page count and included in the total number of pages cited in Block 15 of the SF-298.

The draft of the final technical report will be due not later than forty-five (45) days prior to the end of the period of performance. The draft of the final technical report (including a draft SF-298) must be submitted electronically as follows:

- Email the draft of the final technical report to dtrabasicresearch@mail.mil (file size must be less than 10MB). The file name should be 'Draft Final Report' and the Grant number, e.g. Draft Final Report HDTRA1-12-1-9999.
- Provide a copy of the report to the Administrative Office identified in the Grant.

Within thirty (30) days, this draft will be reviewed by DTRA and comments will be provided to the Grantee to ensure the report complies with DTRA final report requirements. Such review and comment does not restrict the conduct or reporting of the project research findings/outcomes and, in accordance with Article 35, does not restrict Grantee's ability to publish. Grantee shall incorporate such requested changes so that the report incorporates and complies with agreement final reporting requirements terms. Final Technical Reports are due ninety (90) days after the expiration or termination of the award. The final submission should be made in accordance with the draft final report submission instructions.

Final Metrics. A final metrics table (in MS Excel format) is required. A template and specific instructions will be provided in advance of the submission deadline. The final metrics file should be submitted along with the Final Technical Report. The fields contained

in the final metrics file are analogous to those of the annual submissions. The final metrics file shall contain only data from the last annual reporting period until the end of the award's funded Period of Performance.

- Email the final Metrics File to dtrabasicresearch@mail.mil (file size must be less than 10MB). The file name should be 'Final Metrics' and the Grant number, e.g. Final Metrics HDTRA1-12-1-9999.

10. Financial Reporting Requirements.

Federal Financial Reports (SF-425) are due no later than 1 July of each year with data "as of" 30 May of that year. Grants effective after 31 January will not require a Federal Financial Report until 1 July of the following year. All financial reports shall be submitted to the Administration Office identified in Block 6 of the Research Grant. In addition, the Federal Financial Report must be submitted electronically as follows:

- Email the Federal Financial Report to dtrabasicresearch@mail.mil (file size must be less than 10MB). The file name should be the Year, 'Federal Financial Report' and the Grant number, e.g. 2015 Federal Financial Report HDTRA1-12-1-9999.

11. Delegation of Administration Duties.

Certain grant administration duties have been delegated to the Administration Office identified in Block 6 of the Research Grant. These duties are as follows:

1) Provisionally approve all Grant and Cooperative Agreement Vouchers.
2) Perform all property administration services except the approval of recipient's requests to purchase equipment with grant funds. Such approvals must be granted by the DTRA Grants Officer.
3) Perform all plant clearance functions.
4) Approve requests for Registration for Scientific and Technical Information Services (DD Form 1540).
5) Obtain all financial report(s) (see Article 10 of this document).
6) Execute administrative closeout procedures, which include the following:
   a. Obtain the final Report of Inventions and Subcontracts (DD Form 882).
   b. Obtain final payment request, if any.
   c. Obtain final property report and dispose of purchased property and government furnished equipment (GFE) in accordance with the DoDGARs Part 22, Subpart G.
   d. Perform a review of final incurred costs and assist the Grants Officer in resolving exceptions, if any, resulting from questioned costs.
   e. Assure that all refunds due the Government are received by the Grantor.

NOTE: This term and condition is **not applicable** to instrumentation and equipment grant awards.

12. Security.

As a general rule, PI's will not need access to classified security information in the conduct of research supported under this Grant. Should it appear that access to such information is desirable the recipient shall advise the Grantor and request clearance for the investigator. Should information be developed during the course of work under this Grant that, in the

judgment of the PI or the recipient, should be classified, the Grants Officer shall be notified immediately.

13. Representations and Assurances.

By accepting funds under this Grant, the recipient assures that it will comply with applicable provisions of the national policies and statutory/regulatory/executive-based requirements detailed below.

LIVE ORGANISMS. By signing this agreement or accepting funds under this agreement, the recipient assures that it will comply with applicable provisions of the following national policies concerning live organisms:

1) For human subjects:

   a) Adhere to the requirements for protection of human subjects per the DoD level terms and conditions as well as the following DTRA requirements:
   b) The recipient shall adhere to DTRA local clause 252.223-9002 – Protection of Human Subjects (Aug 2010). The full text of this clause is as follows:

      All research under this grant involving human subjects must be conducted in accordance with 32 CFR 219, 10 U.S.C 980, and DoDD 3216.02, as well as other applicable federal and state regulations. Grantees must be cognizant of and abide by the additional restrictions and limitations imposed on the DoD regarding research involving human subjects, specifically as regards vulnerable populations (32 CFR 219 modifications to subparts B-D of 45 CFR 46), recruitment of military research subjects (32 CFR 219), and surrogate consent (10 U.S.C. 980).

      DTRA Directive 3216.01 of June 9, 2010 establishes the DTRA Human Subjects Protection Program, sets forth the policies, defines the applicable terms, and delineates the procedures necessary to ensure DTRA compliance with federal and DoD regulations and legislation governing human subject research. The regulations mandate that all DoD activities, components, and agencies protect the rights and welfare of human subjects of study in DoD-supported research, development, test and evaluation, and related activities hereafter referred to as "research". The requirement to comply with the regulations applies to new starts and to continuing research.

      The DTRA directive requires that research using human subjects may not begin or continue until the Defense Threat Reduction Agency's Research Oversight Board (ROB) has reviewed and approved the proposed protocol. Grantees and subcontractors are required to submit a valid federal assurance for their organization (institution, laboratory, facility) that has been issued by either DoD or the Department of Health and Human Services, and documentation of review of proposed protocols by the local Institutional Review Board (IRB) to include consent forms for any planned research using human subjects to the DTRA ROB for its review through the Grants Officer's representative (if assigned) or the Grants Officer. The ROB review is separate from, and in addition to, local IRB review.

      A study is considered to involve human research subjects if: 1) there is interaction with the subject (simply talking to the subject qualifies; no needles are required); and

2) if the study involves collection and/or analysis of personal/private information about an individual, or if material used in the study contains links to such information.

Written approval to begin research or subcontract for the use of human subjects under the proposed protocol will be provided in writing from the DTRA ROB, through the Grants Officer. A copy of this approval shall be maintained by both the Grantee and the government. Any proposed modifications or amendments to the approved protocol or consent forms must be submitted to the local IRB and the DTRA ROB for review and approval. Examples of modifications/ amendments to the protocol include but are not limited to:

- a change of the PI;
- changes in duration or intensity of exposure to some stimulus or agent;
- changes in the information requested of volunteers, or changes to the use of specimens or data collected; or
- changes in perceived or measured risks or benefits to volunteers that require changes to the study.

Research pursuant to such modifications or amendments shall not be initiated without IRB and ROB approval except when necessary to eliminate apparent and immediate hazards to the subject(s).

Research projects lasting more than one year require IRB review at least annually, or more frequently as required by the responsible IRB. ROB review and approval is required annually. The Grantee or subcontractor must provide documentation of continued IRB review of protocols for ROB review and approval in accordance with these Terms and Conditions. Research must not continue without renewed ROB approval unless necessary to eliminate apparent and immediate hazards to the subject(s).

Non-compliance with any provision of this clause may result in withholding of payments under the grant pursuant to the grant's payments clause(s) and/or grant termination pursuant to the grant's termination clause(s). The government shall not be responsible for any costs incurred for research involving human subjects prior to protocol approval by the ROB.

2) For animals:

a. Adhere to the requirements for protection of animal subjects per the DoD level terms and conditions as well as the following DTRA requirements:

b. DTRA local clause 252.235-9001 – Prohibition of Use of Laboratory Animals (Jul 2010). The full text of this clause is as follows:

The grant recipient shall obtain approval from the US Army Medical Research and Material Command (MRMC), Animal Care and Use Review Office (ACURO) prior to conducting research on live nonhuman vertebrates. Studies involving non-human primates, dogs, cats, or marine mammals will require a site visit by an ACURO laboratory animal veterinarian as a condition of approval. DoD may also conduct site visits involving research on other animals when deemed appropriate. The animal

research facility is responsible for notifying the DoD sponsor if Association for the Assessment and Accreditation of Laboratory Animal Care accreditation is lost or the facility is under USDA inspection. DoD also has the right to a site inspection under these circumstances.

The grant recipient (including subcontractors) is expressly forbidden to use laboratory animals in any manner whatsoever without the express written approval of MRMC ACURO.

The grant recipient shall complete the ACURO Animal Use Appendix for Research Involving Animals found at the following web site: http://mrmc.amedd.army.mil/index.cfm?pageid=research_protections.acuro_animalappendix. Submit the completed ACURO appendix, contact information, the DTRA grant number and a copy of the grant for processing to the email address listed at the ACURO website. Once ACURO approves the effort, the grant recipient will receive written approval to begin animal use from the US Army MRMC ACURO by separate email. The grant recipient shall promptly provide a copy of the approval to the Grants Officer and Grants Officer representative. After approval, changes or protocol amendments must be submitted to and approved by ACURO before implementation.

The grant recipient, or subcontractors as appropriate, shall submit the most recent U.S. Department of Agriculture Animal Care Inspection Report annually in accordance with instructions provided.

Non-compliance with any provision of this clause may result in termination of the grant.

DoD Instruction 3216.01, dated September 13, 2010, provides policy and requirements for the use of animals in DoD-funded research based on Army Regulation 40-33. The DoD definition of animal is any live nonhuman vertebrate. All proposals that involve the use of animals must be in compliance with DoD Instruction 3216.01 and AR 40-33. DTRA requires that research using animals not begin or continue until the ACURO has reviewed and approved the proposed animal use. For animals, the provisions include rules on animal acquisition, transport, care, handling, and use in: (i) 9 CFR parts 1-4, Department of Agriculture rules that implement the Laboratory Animal Welfare Action of 1966 (U.S.C. 2131-2156); and (ii) the "Guide for the Care and Use of Laboratory Animals," National Institutes of Health Publication No. 86-23

RESEARCH INVOLVING RECOMBINANT DNA MOLECULES. Any recipient performing research involving recombinant DNA molecules and/or organisms and viruses containing recombinant DNA molecules agrees by acceptance of this award to comply with the National Institutes of Health "Guidelines for Research Involving Recombinant DNA Molecules," July 5, 1994 (59 FR34496) amended August 5, 1994 (59 FR40170) amended April 27, 1995 (60 FR 20726), or such later revision of those guidelines as may be published in the Federal Register.

COMBATING TRAFFICKING IN PERSONS. The recipient agrees to comply with the trafficking in persons requirement in Section 106(g) of the Trafficking Victims Protection Act of 2000 (TVPA), as amended (22 U.S.C. 7104(g)) as implemented by 2 CFR 175.

1) Provisions applicable to a recipient that is a private entity.

   a. You as the recipient, your employees, sub-recipients under this award, and sub-recipients' employees may not—
      - Engage in severe forms of trafficking in persons during the period of time that the award is in effect;
      - Procure a commercial sex act during the period of time that the award is in effect; or
      - Use forced labor in the performance of the award or subawards under the award.

   b. We as the Federal awarding agency may unilaterally terminate this award, without penalty, if you or a sub-recipient that is a private entity—
      - Is determined to have violated a prohibition in paragraph 1)a. of this award term; or
      - Has an employee who is determined by the agency official authorized to terminate the award to have violated a prohibition in paragraph 1)a. of this award term through conduct that is either—
        - Associated with performance under this award; or
        - Imputed to you or the sub-recipient using the standards and due process for imputing the conduct of an individual to an organization that are provided in 2 CFR Part 180, "OMB Guidelines to Agencies on Government-wide Debarment and Suspension (Non-procurement)," as implemented by our agency at 2 CFR Part 376.

2) Provision applicable to a recipient other than a private entity.

   a. We as the Federal awarding agency may unilaterally terminate this award, without penalty, if a sub-recipient that is a private entity—
      - Is determined to have violated an applicable prohibition in paragraph 1)a. of this award term; or
      - Has an employee who is determined by the agency official authorized to terminate the award to have violated an applicable prohibition in paragraph 1)a. of this award term through conduct that is either—
        - Associated with performance under this award; or
        - Imputed to the sub-recipient using the standards and due process for imputing the conduct of an individual to an organization that are provided in 2 CFR Part 180, "OMB Guidelines to Agencies on Government-wide Debarment and Suspension (Non-procurement)," as implemented by our agency at 2 CFR Part 376.

3) Provisions applicable to any recipient.

   a. You must inform us immediately of any information you receive from any source alleging a violation of a prohibition in paragraph 1)a. of this award term.

   b. Our right to terminate unilaterally that is described in paragraph 1)b. or 2)a. of this Article:
      - Implements Section 106(g) of the TVPA, as amended (22 U.S.C. 7104(g)), and

- Is in addition to all other remedies for noncompliance that are available to us under this award.

c. You must include the requirements of paragraph 1)a. of this award term in any subaward you make to a private entity.

4) Definitions. For purposes of this award term:

a. "Employee" means either:
- An individual employed by you or a sub-recipient who is engaged in the performance of the project or program under this award; or
- Another person engaged in the performance of the project or program under this award and not compensated by you including, but not limited to, a volunteer or individual whose services are contributed by a third party as an in-kind contribution toward cost sharing or matching requirements.

b. "Forced labor" means labor obtained by any of the following methods: the recruitment, harboring, transportation, provision, or obtaining of a person for labor or services, through the use of force, fraud, or coercion for the purpose of subjection to involuntary servitude, peonage, debt bondage, or slavery.

c. "Private entity":
- Means any entity other than a State, local government, Indian tribe, or foreign public entity, as those terms are defined in 2 CFR 175.25.
- Includes:
  - A non-profit organization, including any non-profit institution of higher education, hospital, or tribal organization other than one included in the definition of Indian tribe at 2 CFR 175.25(b).
  - A for-profit organization.

d. "Severe forms of trafficking in persons," "commercial sex act," and "coercion" have the meanings given at Section 103 of the TVPA, as amended (22 U.S.C. 7102).

PROHIBITION ON USING FUNDS UNDER GRANTS AND COOPERATIVE AGREEMENTS WITH ENTITIES THAT REQUIRE CERTAIN INTERNAL CONFIDENTIALITY AGREEMENTS. The recipient agrees to comply with the requirements in section 743 of the Financial Services and General Government Appropriations Act, 2015 (Division E of the Consolidated and Further Continuing Appropriations Act, 2015, Pub. L. 113-235):

1) The recipient may not require its employees, contractors, or sub-recipients seeking to report fraud, waste, or abuse to sign or comply with internal confidentiality agreements or statements prohibiting or otherwise restricting them from lawfully reporting that waste, fraud, or abuse to a designated investigative or law enforcement representative of a Federal department or agency authorized to receive such information.

2) The recipient must notify its employees, contractors, or sub-recipients that the prohibitions and restrictions of any internal confidentiality agreements inconsistent with paragraph 1) of this award provision are no longer in effect.

3) The prohibition in paragraph 1) of this award provision does not contravene requirements applicable to Standard Form 312, Form 4414, or any other form issued by a Federal department or agency governing the nondisclosure of classified information.

4) If the Government determines that the recipient is not in compliance with this award provision, it:

    a. Will prohibit the recipient's use of funds under this award, in accordance with section 743 of Division E of the Consolidated and Further Continuing Resolution Appropriations Act, 2015, (Pub. L. 113-235) or any successor provision of law; and

    b. May pursue other remedies available for the recipient's material failure to comply with award terms and conditions.

14. Data Collection.

Data collection activities, if any, performed under this Grant are the responsibility of the recipient. Awarding agency support of the project does not constitute approval of the survey design, questionnaire content, or data collection procedures. The recipient shall not represent to respondents that such data are being collected for or in association with the awarding agency without the specific written approval of the cognizant awarding agency official. However, this requirement is not intended to preclude mention of the awarding agency support of the project in response to an inquiry or acknowledgment of such support in any publication of this data.

15. Publications and Acknowledgement of Sponsorship.

Publication of results of the research project in an appropriate professional journal is encouraged as an important method of recording and reporting scientific information. .

The recipient agrees that in the release of information relating to the grant, such release shall include the following statement, "The project or effort depicted was or is sponsored by the Department of the Defense, Defense Threat Reduction Agency. The content of the information does not necessarily reflect the position or the policy of the federal government, and no official endorsement should be inferred." For purposes of this provision, information includes news releases, articles, manuscripts, brochures, advertisements, still and motion pictures, speeches, trade association proceedings, symposia, etc.

When issuing statements, press releases, requests for proposals, bid solicitations, and other documents describing projects or programs funded in whole or in part with federal money, all recipients receiving federal funds, shall clearly state: (i) the percentage of total costs of the program or project which will be financed with federal money, and (ii) the dollar amount of federal funds for the project or program.

16. Authorization to Perform Activities Abroad.

If the award recipient is a foreign institution, the recipient assures that it has been duly authorized to operate and do business in the country or countries in which the grant is to be performed; that it has obtained all appropriate licenses, permits, and approvals required in connection with the grant's proposed activities; and that it will fully comply with all the laws,

decrees, labor standards and regulations of such country or countries during the performance of the grant. U.S. Government funds may not be used in support of a project which is prohibited by law in the country or countries in which it is undertaken. DTRA does not assume responsibility for the recipient's compliance with the laws and regulations of the country or countries in which the activities are to be conducted.

17. Inconsistency between English Version and Translation of Grant.

The foreign recipient shall ensure that all contract correspondence that is addressed to the U.S. Government is submitted in English or with an English translation. In the event of inconsistency between the terms of the grant and any translation thereof into another language, the meaning in the English language shall control.

18. Value Added Tax (VAT) and Other Taxes

During implementation of grant activities, the recipient will notify DTRA as soon as they become aware of any VAT or other taxes, exceeding $500.00 per transaction, not identified in the grant proposal and outside those considered VAT costs associated with travel, including and limited to lodging, meals, and transportation. A "transaction" is defined as a single purchase by the recipient and transactions may not be deliberately split in order to avoid compliance with the $500.00 limit. DTRA approval in writing with documentation of extraordinary circumstances is required prior to the recipient using any DTRA funds for VAT or other taxes exceeding $500.00 per transaction, and a grant modification may be required. The recipient understands that in the event that DTRA is unable to secure approval to use DTRA funds for VAT or other taxes exceeding $500.00 per transaction, the purchase of applicable items may not proceed. For those instances where the recipient has received written approval to use DTRA funds to pay VAT or other taxes on any item(s) exceeding $500.00 per transaction, the recipient will include this information in its financial reports (e.g., SF 425) to DTRA.

19. Prohibition on the Use of Cooperative Threat Reduction Funds in the Russian Federation

Recipients of grants or cooperative agreements in Thrust Area 6 are prohibited from using DTRA funds for activities in the Russian Federation.

252.601-9001 GRANTS OFFICER'S REPRESENTATIVE (GOR) (MAY 2009)

d. Grants Officer's Representative (GOR) for this Grant is:
Name: (b)(6)
Defense Threat Reduction Agency/BTRP
8725 John J. Kingman Road
Fort Belvoir, VA 22060-6201
telephone (b)(6)
email address: (b)(6)

b. SCOPE AND LIMITATIONS OF AUTHORITY FOR DTRA GRANTS OFFICER'S REPRESENTATIVE

1. The Grants Officer's Representative (GOR) is responsible for monitoring the technical and programmatic performance of the grant or cooperative agreement (hereinafter referred to as agreement) including compliance with the agreement's reporting requirements. Perceived deviations from the agreement's terms and conditions shall be brought to the attention of appropriate recipient personnel and if not corrected, to the attention of the Grants Officer. Deviations or other occurrences indicative of the recipient's inability or unwillingness to conform to the agreement's requirements shall be brought to the immediate attention of the Grants Officer.

2. The GOR has no authority to modify the stated terms of the agreement or specifications in any manner, or to approve any action that would result in additional charges to the Government. The DTRA Grants Officer must make all such changes in writing.

3. The GOR is authorized to correspond directly with the recipient on matters within the scope and limitations of his or her authority. All such correspondence shall be signed personally by the GOR and a copy will be furnished the Grants Officer for placement in the official agreement file.

4. The GOR will provide technical advice to the recipient to the extent such advice will not alter any of the agreement's terms and conditions or result in an increase in the estimated cost of the agreement's performance as specified in the agreement. The GOR is encouraged to discuss with the recipient new ideas related to the original scope of the agreement that may be of special interest to DTRA. The GOR should also be alert for indications that any part of the research is becoming unfruitful. If, as a result of such discussions, questions arise as to the possible need for a modification, the matter shall be brought to the immediate attention of the Grants Officer. The GOR shall not direct the recipient to undertake any action that the recipient believes to be contrary to the agreement's scope, terms or conditions without the written approval of the Grants Officer.

5. Any visits to the recipient's facilities on matters pertaining to the agreement will be documented in a brief memorandum. A copy will be provided the Grants Officer for placement in the official agreement file.

6. The GOR will maintain such work files as he or she deems necessary to properly document performance of the duties and responsibilities as a GOR. Upon completion of the agreement and delivery of all required reports, such work files will be forwarded to the Grants Officer for placement in the official agreement file.

7. In performance of the GOR's duties, the GOR shall constantly stress protection of the Government's interests. Similarly, the GOR shall avoid any act which may tend to compromise the position of DTRA, any individual member of DTRA or which will impact confidence in the integrity of DTRA with the business community.

(End of Clause)

FUNDING PROFILE:
The amount of $2,956,308.78 is obligated for work to be performed during the period beginning with grant award and continuing through September 28, 2023. Additional incremental funding planned, but not obligated, is:

FY 21 $855.41

The Government's liability is limited to the amount obligated

Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity/PI Karesh
Thrust Area 6 - CCWMD Research with Global Partners FRCWMD
Statement of Work

Project Title: Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity.

Document Date: 18 March 2020.

Objective: The objective of this grant is to reduce the threat of high-consequence zoonotic pathogens in Jordan and improve regional disease surveillance capacity. Jordan faces risk of several zoonoses of concern to human and animal health, including Middle East Respiratory Syndrome (MERS-CoV) and Avian Influenza (AI), with fundamental knowledge and capacity gaps around the distribution and determinants of zoonoses. Recent work by our team detected MERS-CoV in camels and people in Jordan, suggesting ongoing and unmitigated transmission risk of a priority pathogen. The proposed study will generate critical advances in determining the presence of zoonotic pathogens in the country and opportunities for public health intervention. Through a prospective human cohort study coordinated with animal sampling, we will conduct biological and behavioral surveillance in five regions of Jordan with livestock production interfaces to determine the presence and risk factors for MERS-CoV, AI, brucellosis, and leptospirosis to identify modifiable risk factors. By testing three core policy-relevant hypotheses and providing multi-disciplinary training opportunities, the awardee shall enhance scientific capacity in Jordan and support disease detection and reporting in Jordan, Iraq and Lebanon. Taking a coordinated, multi-hazard approach to threat reduction, the proposed study will add critical understanding of presence and risk factors for zoonotic diseases in Jordan and advance scientific capacity and application of the One Health concept to counter biothreats in the region.

Scope: The awardee proposes a five-year One Health study of zoonotic diseases in Jordan. The awardee team shall focus on the following major goals and milestones:

1) Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and poultry in Jordan: *Implement animal study (Y1-OY1); Conduct PCR and serology testing (Y1-OY2)*

2) Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses: *Implement human cohort study (Y1-OY1); Conduct PCR and serology testing (Y1-OY2)*

3) Characterize causal factors in animal-to-human transmission of these zoonoses: *Implement behavioral risk survey (Y1-OY1); Conduct epidemiological analyses (Y1-OY2)*

4) Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk: *Generate geospatial distribution and risk maps (Y1-OY2)*

5) Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon: *Host workshops (Y1-2, OY1-2); Submit reports and publications (Y1-OY2); Attend presentations/meetings (Y1-OY2)*

6) Identify specific modifiable risk factors for human infection with these zoonoses: *Conduct causal interference analyses (Y3-OY2); Policy recommendations on modifiable risk factors (Y3-OY2)*

This research will generate critical advances in detecting the presence of and exposure risk to high-consequence zoonotic viruses and bacteria across geographic regions and interfaces in Jordan, contributing to enhanced understanding of modifiable risk factors to inform government authorities on prevention activities to reduce disease threats.

Background: Jordan has experienced outbreaks of several high-consequence zoonotic diseases, including MERS-CoV and AI. Since its emergence in 2012, MERS-CoV has resulted in over 2,400 human cases globally and is recognized as a priority disease under the WHO R&D Blueprint. While the first human cases of MERS-CoV were traced back to Jordan, little is known about its underlying and ongoing risk of zoonotic disease in animal populations, particularly around primary transmission risk factors and pathways that precede spread in healthcare settings. MERS-CoV is one of several zoonoses posing threat to animal and human populations in the country. Highly Pathogenic Avian Influenza outbreaks, including subtype H5N1, have been reported, and brucellosis is considered endemic in Jordan, with recurring spillover but inadequate understanding of specific modes of transmission and poor vaccination coverage. While human cases of leptospirosis have not been reported in Jordan to date, high rates of certain Leptospira serovars have been detected in animals. Key questions and capacity gaps hinder understanding of the presence, distribution and risk factors in the country, leaving the country vulnerable to zoonotic biothreats, as well as wider regional gaps in detection and reporting. The threat of zoonotic disease is especially pertinent given the rapidly-growing poultry production industry in Jordan and camel, livestock, and poultry rearing in the region.

Jordan has recently made recent several notable scientific advances in detection of MERS-CoV, generating preliminary data that the proposed project will build on. While camels are the presumptive source of primary human MERS-CoV infections, the exact mechanisms of transmission and the possible role of other livestock species are unclear. Blood samples collected from camels and humans in the northern region of Jordan were positive for MERS-CoV, leading to the first-ever report of this disease to OIE in camels in Jordan in 2016. To date, only few countries have reported virus-positive MERS-CoV test results to the OIE so this is a significant and important step toward improving both MERS-CoV detection and reporting in the Middle East. Studies of zoonotic pathogens in the region to date have largely focused on single sites or interfaces, cross-sectional sampling events, or select taxonomic groups, limiting understanding of causal factors. Research is needed to monitor presence and transmission of zoonotic pathogens spatially, temporally, and by biohazard exposure (e.g. blood, urine, feces, and/or nasal secretions) and practices and conduct epidemiological analyses to identify modifiable risk factors for public health intervention. As a key area of stability in the region, it is crucial to support Jordan's biosurveillance capacity, enable understanding of baseline disease risk to allow differentiation of natural versus nefarious emergence events, and ensure responsible bio-risk management to ethically monitor and reduce disease threats. The country has also recently established a One Health platform that indicates the country's commitment to countering zoonotic disease threats. Given the volume of migration between Jordan and its neighbors, including in animal trade, regional coordination in disease monitoring and threat reduction is a critical component in effectively characterizing and addressing disease risk. This project seeks to fill current capacity gaps to advance Jordan as a leader in scientific research and zoonotic disease management and creating new capacity and scientific collaboration pathways for hypothesis-driven research and zoonotic disease monitoring and threat reduction in the region.

Tasks/Scientific Goals: **(Format: Year #(s). Task #. Subtask#).**

TASK 1: Y1.1-O2.1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan.

The awardee shall study presence of MERS-CoV, AI, Brucellosis and Leptospirosis in animals. Sites will be selected in five geographically-representative regions across Jordan: Northern Jordan (Al Ramtha), Middle Jordan (Al Zarqa), and Southern Jordan (Al Karak, Ma'an, and Aqaba). These regions were selected based on preliminary findings by our team and the presence of livestock production activities. Sites in each region shall reflect interfaces with poultry, camels, and other livestock animals are represented (e.g. farms or markets). The awardee shall receive permissions and approvals to work with animals prior to initiating sampling. Nasopharyngeal and oropharyngeal swabs will be collected from 300 camels, poultry and other livestock quarterly in Year 1, Q3 through Option Year 1, Q3 (a total of 13 sampling visits). At three points during the project (in Y1, Y3, and OY1 during the 1st, 7th, and 13th sampling visits, respectively), blood samples (serum) will be collected from 300 animals. Nasopharyngeal and oropharyngeal swabs will be tested for MERS-CoV and AI using real time PCR. Serum samples will be tested using serology for MERS-CoV, AI, Brucellosis, and Leptospirosis. Staff training on proper study techniques (e.g. sampling, transport, and laboratory) will occur as detailed in Task 5. This task will contribute to testing the hypothesis that livestock species and poultry in Jordan show evidence of infection with MERS-CoV, AI, and/or other assayed zoonoses, as well as inform type of transmission pathways.

Y1.2.1 Identify sites for project study.

Y1.2.2 Obtain local permissions and approvals to work with animals.

Y1.2.3-O1.2.3 Conduct biological sampling in animals within the study area.

Y1.2.4-O2.2.4 Conduct PCR and/or serology testing for AI, MERS-CoV, brucellosis and leptospirosis.

TASK 2: Y1.2- OY2.1: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses.

The awardee shall conduct a prospective cohort study of humans to evaluate behavioral and occupational risk factors for zoonotic infectious diseases (MERS-CoV, avian influenza, brucellosis, and leptospirosis) among persons living in Jordan in any of the five study regions. The study will enroll persons regularly working with livestock or poultry or sharing their living areas with these animals as well as persons unexposed to these factors. Sites will be selected as in Task 1 and in surrounding communities to enroll both exposed and unexposed populations. In Year 1, the awardee will receive local permissions and approvals to work with human subjects prior to initiating enrollment and sampling. Nasopharyngeal and oropharyngeal swabs will be collected from 300 enrolled humans quarterly in Year 1, Q3 through Option Year 1, Q3 (a total of 13 sampling visits). At three points during the project (in Year 1, Year 3, and Option Year 1

during the 1st, 7th, and 13th sampling visits, respectively), blood samples (serum) will be collected from 300 humans. Nasopharyngeal and oropharyngeal swabs will be tested for MERS-CoV and AI using real time PCR. Serum samples will be tested using serology for MERS-CoV, AI, brucellosis, and leptospirosis (Years 1-4). Biological sampling will be paired with behavioral surveillance data as in Task 3.

Y1.2.1 Identify sites and conduct enrollment for human study component.

Y1.2.2 Obtain local permissions and approvals to work with human subjects.

Y1.2.3-O1.2.3 Conduct biological sampling (nasopharyngeal and oropharyngeal swabs, and/or blood) of in people within the study area.

Y1.2.4-O2.2.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

TASK 3: Y1.3-OY2.3: Characterize causal factors in animal-to-human transmission of these zoonoses.

The awardee shall monitor behaviors of persons enrolled in the prospective cohort study (as in Task 2) to identify and characterize causal factors for animal-to-human transmission of MERS-CoV, AI, brucellosis and leptospirosis. The PREDICT-2 Human Behavioral Risk Questionnaire will be augmented with animal-specific exposure frequency questions to collect demographic data, symptom and medical history data, social history data, and specific animal-related behaviors and practices that are possible risk factors for infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. The project team will administer the survey to enrolled participants at the first sampling visit (Year 1). During all future visits (Year 1- Option Year 1), enrolled participants will be administered a brief follow-up questionnaire designed primarily to capture time-varying exposure and covariate data. This longitudinal information will provide critical information about the context of exposures and pathways to link biological sampling and provide the wider context of practices and risk factors. Epidemiologic analysis of the questionnaire data (including time-varying data) in this Task will identify current practices and exposure pathways and initial modifiable risk factors. Specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) will be assessed under Task 6 for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. Results will be shared via annual reports and stakeholder meetings as in Task 5.

Y1.3.1 Obtain local permissions and approvals to work with human subjects.

Y1.3.2-O1.3.2 Conduct behavioral risk factor surveys in people.

Y1.3.3-O2.3.3 Analyze epidemiologic causal inference to identify modifiable risk factors.

TASK 4: Y1.4-OY2.4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk.

The awardee shall map findings from Tasks 1-2 to show the distribution of detected pathogens across the regions and sampling sites. Geospatial mapping is a highly relevant visual tool to assist authorities in targeting surveillance and risk management activities. Using QGIS, laboratory results of human and animal testing for MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and mapped to show the distribution of detected pathogens. Maps will be generated beginning Y1, Q3 when laboratory findings are available. Geospatial risk maps will be generated using statistical models to link human behavioral data to laboratory findings beginning in Y1, Q4. Geospatial maps will be updated quarterly and shared with USG/DTRA and Jordanian project partners. Training on geospatial analysis will be provided to project team

members and will be covered under a regional workshop to promote broader uptake of geospatial mapping as a low-cost tool to enhance disease monitoring programs in the region (Task 5).

Y1.4.1-O2.4.1 Generate maps of laboratory results

Y2.4.2-O2.4.2 Generate risk maps of human behavioral risk data

TASK 5: Y1.5-OY2.5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.

Strengthening disease detection and reporting capacity is a key contributor to health security and the ability to target risk factors for threat reduction. The project team is committed to improving this capacity in Jordan as well as more widely in the region through involvement of scientists and government officials in Iraq and Lebanon. We will train local staff in proper techniques for all project activities (Year 1 and Option Year 1). Each year we will support four students from medical and veterinary disciplines in Jordan to participate in training, field activities, project analyses and workshops to provide scientific mentorship and promote the One Health concept. Jordanian scientists and students will also be trained in laboratory techniques to be deployed in Jordan by the Human Link laboratory consultant that has led capacity development for MERS-CoV diagnostics in other countries. The awardee shall organize workshops in Jordan open to scientists from the Ministries of Health and Agriculture from Jordan, Iraq, and Lebanon (Years 1-2, Option Years 1-2). A secure project database will be developed for use in the epidemiological analyses. The awardee shall provide submission of annual sample repository information using a DTRA-specified format and shall grant access to all samples collected and data generated during the course of the project, up to and including at least 12 months after the project end date. The awardee shall conduct presentations/meetings at times and places specified in the grant schedule (Year 1 Task 5), including the DTRA Annual Technical Review. In Year 1 the awardee shall hold a kick-off meeting to introduce the project objectives and promote buy-in in study findings and capacity sustainment. Annual reports and stakeholder meetings and scientific presentations and publications will be used to disseminate results. The project will reinforce Jordan's national One Health platform, promoting the One Health concept for multiple diseases of concern for public and animal health and advancing capacity for hypothesis-driven research with direct application for policy decisions for threat reduction.

Y1.5.1 Conduct project kick-off meeting in Amman with local stakeholders.

Y1.5.2 & O1.5.2 Train local project staff in proper techniques.

Y1.5.3-O2.5.3 Host annual partners and stakeholders meeting.

Y1.5.4-O2.5.4 Complete annual report and share with project partners and local stakeholders.

Y1.5.5-Y2.5.5 & O1.5.5-O2.5.5 Conduct local/regional training workshops.

Y1.5.6- O2.5.6 Data management.

Y1.5.7- O2.5.7 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.

TASK 6: Y3.6-OY2.6: Identify specific modifiable risk factors for human infection with these zoonoses.

The awardee shall integrate the findings of the biological testing (animal and human) and behavioral surveys in Tasks 1-3, assessing specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions)

for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. These potential modifiable risk factors will be determined through epidemiologic analysis of the questionnaire data (including time-varying data) paired with individual laboratory results (e.g., detection of viral RNA, bacterial DNA, or antibodies). Using quarterly, longitudinal data collected in Tasks 1-3, we will examine any major temporal dynamics that may be associated with elevated transmission risk (e.g. seasonality, animal birthing periods). Causal inference techniques within the potential outcomes framework will be employed to solidify statistical associations as concretized biological/clinical/environmental pathways by operationalizing exposures as well-defined interventions and ensuring exchangeability is maintained through confounder control informed by directed acyclic graphs of the conceptual exposure-disease pathways. The awardee will examine multiple zoonotic pathogens (as above) to inform general threat reduction guidelines. Identification of modifiable risk factors will inform intervention development that may interrupt future zoonotic transmission of the four pathogens in this study. Findings will be shared with USG/DTRA and the Jordanian Ministry partners at the annual stakeholders meetings, the threat reduction workshop, scientific presentations and publications as specified in Task 5. This information will provide a strong basis for potential policy guidance and the generation of solutions at the threat reduction workshop in OY2.

Y3.6.1-O2.6.1 Conduct causal inference analyses bases on Tasks 1, 2, 3.

Y3.6.2-O2.6.2 Share results of analyses at annual partners and stakeholders meeting.

Y3.6.3 & O2.6.3 Submit written report to DTRA and local partners and stakeholders.

Performance Schedule:

Task	Year 1	Year 2	Year 3	OY 1	OY 2
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan					
1.1. Identify sites for project study					
1.2 Obtain local permissions and approvals to work with animals					
1.3 Conduct biological sampling in animals within the study area					
1.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection					
2.1 Identify sites and conduct enrollment for human study component					
2.2 Obtain local permissions and approvals to work with human subjects					
2.3 Conduct biological sampling

Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity

Phase II Technical Proposal Text in blue indicates responses to reviewer comments.

I. ABSTRACT

In line with Thrust Area 6 - Cooperative Counter WMD Research with Global Partners FRCWMD, we propose a multi-disciplinary One Health research project to identify causal factors in the transmission of Middle East Respiratory Syndrome Coronavirus (MERS-CoV), avian influenza (AI), and other zoonoses from animals to humans in Jordan, while simultaneously strengthening local capacity for prevention, detection, and reporting of these zoonoses in Jordan, Iraq, and Lebanon. To contribute to biological threat reduction, we propose a hypothesis-driven One Health research project to characterize exposure risks for high consequence zoonotic diseases in Jordan using epidemiological causal inference techniques and improving serological testing using methods that do not require manipulation or culturing of live viruses. This prospective cohort study involves interviews and longitudinal sampling of humans and opportunistic non-lethal sampling of livestock and poultry at animal markets, and farms for MERS-CoV, *Brucella* spp., and *Leptospira* spp. (humans/livestock) and for AI subtypes (humans/poultry). Partner laboratories in Jordan will screen and characterize these zoonotic pathogens, and capacity-building cross-trainings will be conducted with visiting laboratory scientists from Iraq and Lebanon. This multifaceted One Health approach will advance scientific knowledge on the risk of MERS-CoV, AI, and other zoonoses in Jordan, strengthen local zoonotic disease surveillance capabilities, and enhance scientific partnerships in Jordan, Iraq and Lebanon to prevent, detect, and report biological threats.

II. SCOPE

A. Objective

Our primary research objectives are to characterize causal factors in animal-to-human transmission of MERS-CoV, AI, and other zoonoses in Jordan and to strengthen regional capacity for detection of these pathogens in order to reduce the threat of infectious diseases. Our proposed project will rigorously test the following initial hypotheses:

- **H_1.** Livestock species and poultry in Jordan show evidence of infection with MERS-CoV, AI, and/or other assayed zoonoses.
- **H_2.** Humans regularly exposed to livestock and/or poultry or their living areas have a greater risk of infection with MERS-CoV, AI, and/or other assayed zoonoses compared to other community members in Jordan.
- **H_3.** Some specific occupational practices that promote exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) pose a greater risk of infection with MERS-CoV, AI, and other assayed zoonoses compared to others.

Together, this research will generate critical advances in detecting the presence of and exposure risk to high-consequence zoonotic viruses and bacteria across geographic regions and interfaces, contributing to enhanced understanding of modifiable risk factors to inform government authorities on prevention activities to reduce disease threats.

B. Background

Jordan has experienced several important zoonotic diseases in the few past years including Influenza A (H1N1 pdm09) and MERS-CoV. Furthermore, an outbreak of H5N1 was reported in Jordan in 2006. A pandemic influenza surveillance plan that includes Severe Acute Respiratory

Infection and other influenza-like illnesses has been in written1 but needs capacity building to implement.

High-consequence zoonotic pathogens in the Middle East have resulted in disease epidemics of international importance, raising the need for health security enhancements to strengthen the region's ability to prevent, detect and respond to multiple zoonotic disease threats. In Jordan, MERS-CoV, AI and brucellosis are major public health concerns, with limited multisectoral preparedness capacity.2 MERS-CoV is recognized as a threat to global health security, with designation as a priority disease under the World Health Organization (WHO) Research and Development Blueprint.3 Although most cases have been reported in the Kingdom of Saudi Arabia (KSA), the first known human infections occurred in Jordan.4,5 Most cases in KSA have been healthcare-associated, stemming from secondary generations of transmission.6,7 Identification of factors involved in *primary* transmission may inform interventions to prevent future primary cases and therefore prevent them from seeding healthcare or community outbreaks. Camels are the presumptive source of primary human MERS-CoV infections; however, the exact mechanisms of transmission and the possible role of other livestock species are unclear.8 These uncertainties highlight the need to better understand the causal factors of primary human infection with MERS-CoV at human-livestock interfaces given the high livestock-human contact in camel production systems in Jordan.9 **Understanding modifiable risk factors may lead to development of public health interventions that can prevent animal-to-human transmission of zoonoses.**

Avian influenza viruses circulate worldwide among migratory bird populations and occasionally spill into poultry at mass production sites, farms, or backyard coops. Although not every AI subtype is capable of infecting humans or causing severe illness, highly pathogenic strains present risk to both animal and humans and are associated with major socio-economic losses. **In Jordan, the rapidly expanding poultry industry driven by ever-increasing demand poses a distinct global health security risk.** Identification and characterization of AI subtypes circulating among poultry across Jordan will provide critical information needed to understand baseline activity and risks. If human AI infections are detected, the project could identify causal factors in poultry-to-human influenza transmission, and therefore inform interventions to prevent future primary cases. **Given the human AI infections in neighboring countries, this is a critical gap to be filled in Jordan.**

To understand and reduce the threat of major zoonotic diseases in Jordan, we propose a One Health study in animals and humans to characterize exposure risks for priority pathogens that may potentially be associated with specific interfaces, behavioral practices, and environmental determinants (i.e., seasonality). To maximize potential for sustainability of zoonotic disease capacity in the country, the project is built around an all-hazards approach to detect pathogens and identify risk factors. Therefore, in addition to MERS-CoV and AI, *Brucella* spp. and *Leptospira* spp., which also cause morbidity in Jordan, will be integrated into the research study as secondary outcomes. Preliminary studies indicate associations between poor biosecurity and elevated seroprevalence of these bacterial diseases in animals in Jordan, as well as poor disease management practices when disease is suspected.10-12

Scientific Impact for C-WMD Science: Given that transmission of high-consequence zoonotic pathogens such as MERS-CoV and AI, whether by nature or ill intent, poses a significant threat to global security, existing gaps in biosurveillance/detection capabilities, prevention/response activities, and reporting weakens our ability to counter biological WMD threats. Over 60% of emerging infectious diseases originate in animals, so it is imperative to strengthen local capacity

to conduct biosurveillance for zoonotic disease threats to understand existing baselines of transmission, characterize risk factors to inform prevention activities that can interrupt transmission, and preempt and/or rapidly respond to emerging disease threats. As a key area of stability in the region, enhancing Jordan's capacity for threat reduction for these diseases that pose serious potential human health, economic, and food production and security consequences is critical to protect U.S. warfighters as well as our regional allies (e.g. Jordan, Israel). Based on our analysis of risk drivers, the study regions are identified as elevated risk for disease emergence; ground-truthing is imperative to detect circulation trends and mitigate threats.[13]

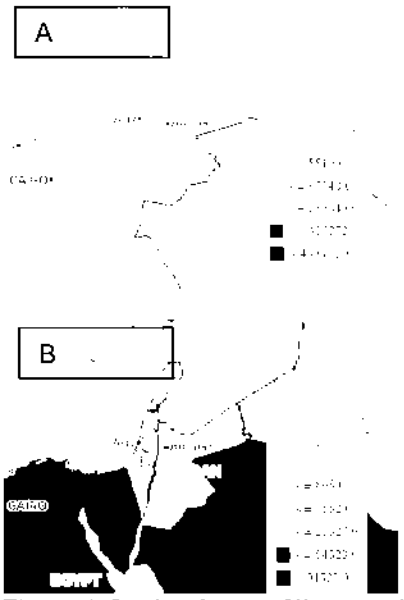

Figure 1. Regional map of live camel (A) and poultry (B) production, 2015

Through regional cross-training workshops held in Jordan, the project will also build upon and boost local capacity for prevention, detection, and reporting of zoonotic disease threats in Jordan, Iraq and Lebanon, all of which have substantial camel and poultry production (**Figure 1**). This will fill capacity gaps, strengthen collaborative relationships, and foster goodwill in a politically fragile region, enhancing our ability to combat biological threats.

Data will be analyzed to generate geospatial maps of livestock and poultry zoonoses, geospatial maps of human zoonotic disease risk (including static and temporal versions), exposure risk models using causal inference techniques, and prediction models for transmission that can account for seasonal variations and wide-scale livestock/poultry practice trends.

Regional Capacity Building: Iraqi and Lebanese scientists from their Ministries of Health and Agriculture will be invited to participate in capacity-building workshops in Jordan. Workshops will cover topics including implementing/using technology, animal and human sampling fieldwork, ethical human subjects research, biosafety and biosecurity best practices, data management and storage, and reporting procedures pursuant to OIE and WHO obligations. Advanced training for key individuals from Iraq and Lebanon is proposed for Year 3 and Option Years.

Our research project will serve multiple goals and objectives of the BTRP mission, by: 1) engaging partner country scientists in hypothesis-driven research; 2) supporting biosurveillance capacity building by enhancing partner capability to detect and report select agents; 3) enhancing understanding of zoonotic diseases to allow differentiation of natural versus nefarious emergence events; 4) employing responsible bio-risk management best practices; 5) training partner country researchers to think critically about ethical research and be competitive in soliciting international funding; and 6) promoting the One Health concept.

Major Goals and Milestones (details in Section VI): 1) Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan: *Implement animal study; Conduct PCR and serology testing.* **2)** Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses: *Implement human cohort study; Conduct PCR and serology testing.* **3)** Characterize causal factors in animal-to-human transmission of these zoonoses: *Implement behavioral risk survey; Conduct epidemiological analyses.* **4)** Produce geospatial maps of zoonoses in livestock/poultry and human zoonotic transmission risk: *Generate geospatial distribution and risk maps.* **5)**

Strengthen capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon: *Host workshops; Submit reports and publications; Attend presentations/meetings*. **6)** Identify specific modifiable risk factors for human infection with these zoonoses: *conduct causal interference analyses; provide policy recommendations.*

Methodology

Ethical Considerations: The study team will obtain required ethical approvals for both humans and animals prior to study initiation. For human subjects research, the informed consent documents (English and Arabic), study protocol (English), and questionnaires (English and Arabic) will be submitted to the Jordan University of Science and Technology (**JUST**) Institutional Review Board (IRB) in Irbid, Jordan and HummingbirdIRB in Needham, Massachusetts, USA (via EcoHealth Alliance (**EHA**)). For animal subjects research, the study protocol (English) will be submitted to the JUST Institutional Animal Care and Use Committee (IACUC) and a U.S. institution. All study team members will be trained on Collaborative Institutional Training Initiative (CITI) human subjects research (social/behavioral and biomedical), ethical research with animals ("Working with the IACUC"), and the USAID funded PREDICT-2 project training modules (basic laboratory safety, biosafety and biosecurity, safe animal sampling, cold chain implementation, and various other preparatory trainings). To maintain privacy, results will be presented in aggregate; no individual data will be shared.

Study Design: The proposed study is a prospective cohort study to evaluate behavioral and occupational risk factors for zoonotic infectious diseases (MERS-CoV, avian influenza, brucellosis, and leptospirosis) among persons living in Jordan in any of the five study regions. The exposure of interest is regularly (once a month or more) working with any livestock animal or poultry or sharing their living areas with these animals. Key sub-exposures will be evaluated to determine whether specific behavioral or occupational interactions with specific animal taxa or their living areas increase the risk of acquiring one of the four zoonotic infections being studied. The key sub-exposures, such as "milking camels" or "cleaning poultry cages," which may be identified as risk factors in this study, will be identified as modifiable risk factors – behaviors or interactions that can be targeted during future disease prevention activities (e.g., using gloves, wearing a face mask, vaccinations, hand washing, pasteurization, etc.).

Study Sites: Sites will be selected in five geographically-representative regions across Jordan: Northern Jordan (Al Ramtha), Middle Jordan (Al Zarqa), and Southern Jordan (Al Karak, Ma'an, and Aqaba). These regions were selected based on preliminary findings by our team and the presence of livestock production activities where we theorize pathogen transmission is likely to occur. Al Ramtha and Al Zarqa were included as part of the PREDICT-2 study on MERS-CoV in people, camels, and bats. Two individuals having a confirmed MERS-CoV seropositive test result were previously identified in Al Ramtha by our PREDICT-2 project. Al Zarqa is the location of the first ever known human cases of MERS-CoV reported to the WHO. In 2016, the Food and Agriculture Organization of the United Nations (FAO) detected MERS-CoV virus-positive camels in both Al Ramtha and Al Zarqa. Little is known about the current circulation of MERS-CoV among human or camel populations in Southern Jordan, but Southern Jordan has a greater density of camel livestock than Northern and Middle Jordan. There are numerous poultry farms in all five study regions; while avian influenza in poultry has been detected previously in Jordan, regional or national estimates of avian influenza incidence or prevalence are lacking and this study will therefore better elucidate distribution trends.

In each of the five study regions, sampling sites will be selected to ensure interfaces with poultry, camels, and other livestock animals are represented (e.g. farms or markets). Each region

will include one or more of three types of sampling sites: poultry farm or production interface, camel farm or production interface, and "other" livestock farm or production interface where a least one other non-poultry/non-camel livestock animal is present, such as cattle or sheep.

Potential sampling sites within each of the five regions will be identified and assessed prior to the beginning of the study and will be categorized by interface type (i.e., poultry, camels, "other," or a combination of multiple interface types) and expected number of persons in and around the site (<20, 21-50, 51-100, or 101+ persons). In each region, the study team will randomly select one site at a time until each of the three animal interface types are evenly represented, then continue to select additional sites until the combined expected number of persons in and around the selected sites exceeds 600 so the region enrollment goal (60) will remain less than 10% of the available population in the region. If it is not possible to reach this number, then all identified sites will be visited for that region. Selected sites will be visited in a random order during each region's first enrollment visit until all three interface types have been visited at least once and the site enrollment goal has been reached.

Study Population: The study will enroll persons regularly working with livestock or poultry or sharing their living areas with these animals as well as persons unexposed to these factors. Based on site selection, people living or working in the five regions will be eligible for recruitment in the study. Inclusion criteria are adults (18 years or older) providing informed consent and children (12 years or older) providing verbal assent and having a parent or guardian able to provide informed consent. Informed consent or assent may be withdrawn by the participant or their parent or guardian at any time during the study procedures or at any future study visit. Exclusion criteria are children less than 12 years old, adults unwilling or unable to provide informed consent, children aged 12-17 years old unwilling or unable to provide assent, and children aged 12-17 years old without a parent or guardian willing or able to provide informed consent. Those approached for recruitment who provide informed consent (and assent if a child) and complete a brief pre-screening questionnaire will be enrolled if they are selected based on their exposure status and the study recruitment quota for the exposed or the unexposed.

Sample Size Calculations: Using an acceptable Type I error rate of 5% and power of 80%, the minimum sample size was computed to detect a difference where 1% (1 out of 100) of unexposed persons (those who do not regularly work with livestock animals or poultry or share their living areas) will have at least one positive test result for at least one of the four zoonotic infections during the study and 12.5% (1 out of 8) of exposed persons (those who regularly work with livestock animals or poultry or share their living areas) will have at least one positive test result for at least one of the four zoonotic infections during the study. Given these parameters while using the Fleiss method with a continuity correction applied, the minimum sample size needed for the study is 73 unexposed and 145 exposed individuals.

It is estimated that up to 20% of study participants may be lost to follow-up over the course of the study. To maintain the minimum sample size needed to detect the statistical associations of interest, a correction factor of 1.25 (division of 80%) was applied to the minimum sample size. This results in 91 unexposed and 181 exposed individuals needed at the beginning of the study. To account for the marginal possibility that some participants already have evidence of infection with at least one of the four zoonotic infections at the beginning of the study (and therefore must be excluded from the prospective cohort study), these enrollment goals will be rounded up to 100 unexposed and 200 exposed persons, for a total of 300 participants. This results in enrollment goals of 20 unexposed and 40 exposed persons in each of the five regions.

Study Procedures: All written and verbal interactions with potential study participants will be conducted in Arabic by native Arabic-speaking study team members. Individuals present at each study site will be approached for possible recruitment into the study through systematic random sampling until the site's exposed and unexposed enrollment goals are met. Cell phone calling cards are deemed to be a culturally- and financially-appropriate token of appreciation and will be offered to enrolled participants at each visit to encourage retention in the study but not to unduly influence a participant's willingness to participate. Livestock herders will also be offered veterinary medicines and supplies every other visit to recognize their time and to raise awareness about disease management. Participants providing informed consent will be asked to complete a pre-screening checklist to determine enrollment status. This checklist will rapidly assess whether the participant would be categorized as "exposed" or "unexposed" in the study based on their interactions with livestock and poultry or their living areas. Participants will be enrolled at each site until the maximum enrollment for the exposure category for the site has been reached.

Enrolled participants will be assigned a unique identifier to track their future participation over the course of the study. Contact information will be collected to reach them for future visits. Study site visits will be made every three months for a total of 13 study visits per site. Although it is expected that not all participants will be available at every study site visit, every effort will be made to provide ample opportunities for continued participation.

Upon initial enrollment, participants will be verbally administered a standardized questionnaire by a trained member of the field team based on our PREDICT-2 Human Behavioral Risk Questionnaire (example provided in Attachment 3) augmented with animal-specific exposure frequency questions to collect demographic data, symptom and medical history data, social history data, and specific animal-related behaviors and practices that are possible risk factors for infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. During all future visits, enrolled participants will be administered a brief follow-up questionnaire designed primarily to capture time-varying exposure and covariate data. Participants will be asked to have NP/OP swabs taken at all visits. Serum will be collected on the 1st, 7th, and 13th visit. Beginning with the first visit, the study team will also conduct opportunistic sampling of livestock taxa and poultry at each site as described in the following section. To detect potential pathogen sharing, animal and human sampling will occur within the same week (ideally the same days) at each site. Since animals are not the subject of the cohort study design (and instead will be sampled to provide covariate data for statistical modeling), there is no minimum sample size required at a given site or sampling visit. The livestock or poultry present at each site may differ from sampling visit to sampling visit, and therefore individual animals will not be sampled longitudinally. Animal sampling parameters are provided below.

Sampling Schedule and Laboratory Assays: Sampling will begin during the third quarter of Year 1. Each site will be visited every 3 months until the final visit during the third quarter of Option Year 1 for a total of 13 sampling visits (**Table 1**). Sites will be visited sequentially during each sampling period, with several days allotted for sampling at each site.

Table 1. Sampling schedule for proposed study.

Year 1	Q1		**Year 2**	Q1	S_3	**Year 3**	Q1	S_7	**OY1**	Q1	S_{11}
	Q2			Q2	S_4		Q2	S_8		Q2	S_{12}
	Q3	S_1		Q3	S_5		Q3	S_9		Q3	S_{13}
	Q4	S_2		Q4	S_6		Q4	S_{10}		Q4	-

*OY=Option Year; Q=Quarter; S_n=Sampling visit number

Human Sampling: Individuals enrolled in the study will be asked to have two NP/OP swabs taken at each visit (**Table 2**). Each participant's swabs will be tested for MERS-CoV and influenza via RT-PCR after each sampling visit. At the 1st, 7th, and 13th (or final) sampling visit, serum will be collected for serology testing for MERS-CoV, AI, brucellosis, and leptospirosis antibodies (**Table 2**). Depending on location and participant preference, sampling will occur at the field site (in a safe sheltered area) or via appointment at a medical clinic in areas where there is access to one. All human samples will be collected under the supervision of a trained nurse.

Table 2. Specimen type, assay, and sampling frequency for humans.

Specimen Type	**Assay**	**Infection**	**Frequency**
NP/OP swabs (2x each)	RT-PCR	MERS-CoV	Each visit (3 mos.)
		Influenza	Each visit (3 mos.)
Serum	Serology	MERS-CoV	1st, 7th, and 13th visit
		Influenza	1st, 7th, and 13th visit
		Brucellosis	1st, 7th, and 13th visit
		Leptospirosis	1st, 7th, and 13th visit

*NP/OP=Nasopharyngeal and oropharyngeal

Livestock and Poultry Sampling: During each site visit, livestock and poultry will be opportunistically sampled by a licensed veterinarian or technician to assess infectious activity among animals present as well as to provide covariate data for the human study (i.e., "MERS-CoV-positive camels present at site"). Nasal swabs will be collected from up to 20 livestock animals per animal taxa at each site per visit, and oropharyngeal (OP) swabs will be collected from up to 20 poultry at each site per visit. Sampled animals will be temporarily marked with an adhesive colored band to avoid redundant sampling during the duration of the study site visit, which may last several days. Animal sampling schedule is provided in **Table 3**.

Laboratory testing: All testing will be conducted in Jordan at laboratories at the Jordan University of Science and Technology (JUST). Nasal swabs will be tested for MERS-CoV by RT-PCR at the Molecular Biology and Virology lab (MBVL) in the Faculty of Veterinary Medicine to detect whether at least one MERS-CoV-positive livestock animal was present at the site when humans were being sampled. MERS-CoV real time PCR is based on targeting upE and ORF 1a as proposed by Corman, 2012.[14] OP swabs will be tested for Influenza A by RT-PCR at the MBVL/JUST. Real time PCR for influenza A will be done according to Spackman and Suarez, 2008,[15] and for H5, H7 and H9 the protocol will be based on Monne et al, 2008.[16]

On the 1st, 7th, and 13th (final) sampling visit, blood for serum testing will be collected from humans, livestock and poultry to be tested for MERS-CoV, influenza, brucellosis, and leptospirosis antibodies using serology (**Table 3**). Human serum will be tested for MERS-CoV antibodies at the Princess Haya Biotechnology Center (**JUST**) employing methods to be transferred by Co-I Kayali (**Human Link**) from the Human Link lab at the National Research Centre in Egypt using a pseudoparticle neutralization (ppNT) assay where the spike protein of MERS-CoV is expressed by a replication-incompetent human immunodeficiency virus (HIV), thus avoiding the use of live MERS-CoV in the assay as described by Co-I Kayali.[17] Sera will be screened at a dilution of 1:10 and positive sera will be tested for end-point titers. As this capacity will be novel for Jordan, Co-I Kayali will provide training and quality control for testing.

Animal serum will be tested for MERS-CoV antibodies at the Diagnostic Laboratory-Faculty of Veterinary Medicine using a S1-based ELISA kit from EUROIMMUN.[18] Human and animal serology for avian influenza will be performed at the Diagnostic Laboratory using Hemagglutination inhibition and serology according to the published protocol by Kayali et al,

2008.[19] Human and animal serology for brucellosis will be conducted at the Diagnostic Laboratory using the rose Bengal test for screening and a brucellosis complement fixation test (from Jordan Bio Industries Center (JOVAC), Amman, Jordan) for confirmation. Human and animal serology for Leptospirosis will also be conducted at the Diagnostic Laboratory using a commercially available ELISA test. **All samples will be made available to other DTRA- or USG-funded researchers. All collected materials will be will be transported from field to labs on wet or dry ice by project personnel and stored in approved facilities indicated in the PRAT forms and destroyed at the conclusion of the study.**

Please see Attachment 3 for a flowchart with the overall sampling and laboratory study design. The proximity of the three laboratories at JUST will enable safe and efficient specimen transport, and has the added benefit of making interaction between the human and animal laboratories more routine to promote uptake and sustainability of a One Health approach.

Positive tests results for reportable diseases will be provided to relevant Jordanian authorities immediately for action as done by our group under USAID PREDICT-2.

Table 3. Specimen type, assay, and sampling frequency for livestock and poultry.

Specimen Type	Assay	Infection	Frequency
Nasal swabs (by taxa + site) - livestock	RT-PCR	MERS-CoV	Each visit (3 mos.)
Oropharyngeal swabs (by site) - poultry	RT-PCR	Influenza	Each visit (3 mos.)
Serum – livestock	Serology	MERS-CoV	1st, 7th, and 13th visit
		Brucellosis	1st, 7th, and 13th visit
		Leptospirosis	1st, 7th, and 13th visit
Serum – poultry	Serology	Influenza	1st, 7th, and 13th visit

Analysis Plans

Geospatial Risk Mapping: Following completion of each quarter's sampling visits and testing, geospatial maps of human and animal infections with MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and updated. These will be shared with USG/ DTRA and Jordanian Ministry partners quarterly. Once human behavioral risk data become available, preliminary statistical models will be constructed to generate geospatial risk maps directly linking human-animal interactions with risk of human infection with the four zoonoses.

Temporal Assessment: At the completion of the third year's sampling visits, human and animal zoonotic infections with MERS-CoV, avian influenza, brucellosis, and leptospirosis will be assessed for potential temporal effects in Jordan. This will be updated should the option years be exercised. This will provide critical information on expected background activity of each zoonosis geographically by time of year, which will be essential in determining whether future zoonotic infection activity is exceeding baseline activity due to either a life course (e.g. birthing) or seasonal factor or other unintended outbreak or nefarious activity.

Epidemiologic Causal Inference to Identify Modifiable Risk Factors: Specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) will be assessed for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. These potential modifiable risk factors will be determined through epidemiologic analysis of the questionnaire data (including time-varying data) paired with individual laboratory results (e.g., detection of viral RNA, bacterial DNA, or antibodies). Causal inference techniques within the potential outcomes framework will be employed to solidify statistical associations as concretized biological/ clinical/environmental pathways by operationalizing exposures as well-defined interventions and ensuring exchangeability is maintained through confounder control informed by directed acyclic

graphs of the conceptual exposure-disease pathways. While the study may detect associations specific to each of the four diseases, the intent of the study is designed to examine multiple zoonotic pathogens to inform general threat reduction guidelines and identify areas for future study. Identification of modifiable risk factors will inform intervention development that may interrupt future zoonotic transmission of the four pathogens in this study, which will be shared with USG/DTRA and the Jordanian Ministry partners at the annual stakeholders meeting in Year 3 and Option Year 2 as well as during in-person meetings with ministry officials and the threat reduction workshop as potential policy guidance for Jordanian authorities.

Training and Workshops: Training workshops will be held in Jordan throughout the project and will be open to scientists from the Ministries of Health and Agriculture from Jordan, Iraq, and Lebanon (**Table 4 and Attachment 3**) based on recommendations from existing partnerships. The workshops will be delivered by scientists from EHA, JUST and Human Link. Project staff will be trained to collect biological samples, to promote animal welfare and ethics, and on human subjects research ethics, obtaining valid, informed consent and administering questionnaires (**Attachment 3**). Staff will be cross-trained so that members of the animal health team will be trained to give questionnaires and members of the human health team will be trained to record animal data to promote efficient collaboration in field activities and the One Health concept. We will invite additional stakeholders to select workshops via Jordan's One Health platform to encourage multisectoral buy-in, interpretation and understanding of study findings, and novel collaborations on solutions for threat reduction. We anticipate including 4 professional students per year (20 total) in field, laboratory and analytical components of the project. estimated at four students from public health (field studies and socio-economic analyses). four nursing students (field studies), four undergraduate and four graduate students from the School of Veterinary Sciences (field studies). and four graduate students in biomedical sciences (laboratory). Three Jordanian scientists and three students will also be trained in laboratory techniques at the Human Link laboratory in Egypt in year 1. followed by on-site training in Jordan in remaining years. In addition, in-service training will be provided to the Ministry of Health and Ministry of Agriculture laboratory scientists and epidemiologists during the workshops (Table 4). We estimate a minimum of 20 government staff will participate in each of the training workshops. providing wide reach for sustainability of capacity generated in the region. The laboratories in the South of Jordan in particular will greatly benefit from the 5 years of sharing techniques and skills transfer to their ministry officials to directly advance their day-to-day capacity.

Table 4. Proposed training and regional capacity-building workshops (see Attachment 3 for more details).

Date	Workshop Topic(s)	Audience
Year 1 Q2	• Basic Laboratory Safety, Biosafety and Biosecurity, Cold Chain Implementation, Ethical Human Subjects Research, Ethical Animal Subjects Research, Safe Human Sampling, Safe Animal Sampling, Questionnaire Administration, Data Management and Storage	Study team
Year 2 Q3	• All Topics Covered by First Workshop • Disease Reporting Procedures (OIE, WHO IHR)	Regional MOH/ MOA scientists
OY 1 Q3	• Influenza Subtyping, Genomic Analysis of MERS-CoV • Biosafety and Biosecurity Refresher Training	Study Team, Regional MOH/ MOA scientists
OY 2 Q3	• Workshop 1: Geospatial Analysis, Advanced Epidemiology, One Health Disease Surveillance; Workshop 2: Risk Reduction • Biosafety and Biosecurity Refresher Training	Regional MOH/ MOA scientists; OH Platform

III: PROGRAMMATICS

In the past three years, EHA and JUST have co-led implementation of the USAID Emerging Pandemic Threats PREDICT-2 project in Jordan, developing critical surveillance and laboratory capacity for MERS-CoV detection in the country. Through regional partnerships under PREDICT-2 the organizations also collaborated with Human Link on MERS-CoV and broader CoV and Influenza sampling and diagnostics in Jordan and Egypt. **Data collected from these studies in coordination with Ministries of Health and Agriculture represent some of the leading multi-year studies of viral circulation in animals in the region and generation of some the first evidence of camel-human transmission dynamics, which form the basis of the proposed study.** EHA also leads a bat CoV pathogen research network in Western and Central Asia (WAB-Net), with Co-Investigators from Jordan (RSS). Our project team facilitated the establishment of Jordan's One Health platform, which brings together focal points from Ministries of Agriculture, Environment and Health, WHO, FAO, OIE, JUST, and the Royal Scientific Society of Jordan. This platform provides a foundation for our multisectoral project to disseminate results and develop practical, country-relevant policy recommendations and promote long-term capacity sustainment.

Table 5. Project partners and roles.

Institution	Study design	Human cohort recruitment	Human sampling, & training	Animal sampling, & training	Lab testing & training	Analysis & dissemin-ation
EHA	✓(Lead)	✓ (Co-Lead)	✓	✓ (Co-Lead)		✓ (Lead)
Overall project oversight; weekly phone calls with partners; study design development and refinement field sampling; human subjects research & training; data analysis; and information dissemination through workshops, conferences, and papers; Tasks 1-6				*William B. Karesh*, DVM (PI); *Catherine Machalaba*, MPH, (CoI) Epidemiologist, Project Coordinator; *Emily Hagan*, MPH, Behavioral Risk Scientist; *Whitney Bagge*, PhD, Data Analyst/Mapping/Modeling		
JUST	✓	✓ (Lead)	✓ (Lead)	✓ (Lead)	✓ (Lead)	✓ (Co-Lead)
Overall project oversight for Jordan-based activities; study design; field and lab oversight and personnel decisions; Jordan staff management; laboratory training, staffing, & testing; liaison with MOH on human studies; liaison with MOA for animal studies; data analysis & dissemination; Tasks 1-6				*Ehab Abu-Basha*, MSc, DVM, PhD (Co-I) *Zaidoun Saleh Hijazeen*, MSVet Med, Infectious Diseases, Veterinarian *Moh'd Borhan Al-Zghoul*, MS, PhD, Immunologist, Molecular Biologist *Mustafa Ababneh*, BSVetMed, PhD, Laboratory Diagnostics, Virologist *Saad Gharaibeh*, BSVetMed, PhD, Avian Diseases, Virologist *Zuhair Bani Ismail*, BSVetMed, Clinical Med, Camels, Leptospirosis *Hani A. Jordan FDA	✓					✓
Project advisor on zoonotic diseases; data analyses; implementation support; Tasks 2-6				*Wail Hayajneh*, MBBS (MD), Chairman, Infectious Diseases Comm., Jordan FDA		

IV: RELEVANCE

Our team in collaboration with FAO, Kansas State University, and the National Institute of Health (NIH)'s Rocky Mountain Laboratories conducted a nationwide study of MERS-CoV in camels. Out of 120 samples, 36 were positive. This was the first-ever report of this disease to OIE in camels in Jordan. To date, only few countries have reported virus-positive MERS-CoV test results to the OIE so this is a significant and important step in improving both detection and reporting in the Middle East. Furthermore, humans were sampled at two sites to screen for MERS-CoV and 2 samples were confirmed positive. This demonstrates One Health in action in Jordan led by the JUST/EHA PREDICT-2 team. These results were published under the title "High Prevalence of Middle East Respiratory Coronavirus in Young Dromedary Camels in Jordan".[20] There are no reports of human leptospirosis in Jordan. However, a recently published article showed that approximately 27% and 53% of apparently healthy dairy cows and recently aborted cows are seropositive to Leptospira Hardo and Pomona.[10] Therefore, a serious outbreak of human leptospirosis could occur due to close contact between humans and dairy cows in the country. Regarding brucellosis, a study revealed that people who milk sheep and goats, consume raw cheese made from sheep and goat milk, consume raw cows' milk, and boiled cheese are more likely to be treated for brucellosis.[21] The limited diagnostic capacity in the south of Jordan is one barrier to effective risk monitoring and gaps in knowledge, and this project will provide the data and training needed to build their capacity as well as strengthen capacity nation-wide. While MERS-CoV is a national priority in policy, at present the country lacks the capacity for detection which hinders threat monitoring and reduction. Equipping JUST with diagnostic capacity to safety test for MERS will provide a platform for future use for surveillance, including with the government, and will make for easy skills transfer to government agencies that can be sustained through future collaboration. Success of prior projects demonstrates that JUST will maintain the technology once established. By emphasizing in-service training and involving government partners in all project components from sampling methods to risk reduction strategy development, this project will facilitate implementation of plans to counter MERS-CoV, HPAI and other priority diseases such that they become routine and valued and can be self-sustained through government operations, academic training, and research programs. We also anticipate that as the poultry industry grows it will better utilize Avian Influenza surveillance (including via inputting resources) for poultry as seen in other countries with developing poultry industries.

V. CREDENTIALS

PI: Dr. William Karesh is the Executive Vice President for Health and Policy at EHA. He serves as the President of the OIE Working Group on Wildlife Diseases and on the WHO IHR Roster of Experts. Dr. Karesh has served as PI on several large-scale, multi-partner projects, including two DTRA-funded projects on RVF in South Africa, and as Technical Director and EPT Partners Liaison for the USAID Emerging Pandemic Threats PREDICT and PREDICT-2 projects, together a $200+ million effort focused on predicting and preventing pandemic diseases. Dr. Karesh coined the term One Health in 2004. He has created, directed and managed projects and programs in 56 countries, including efforts to minimize the impact of diseases such as RVF,

Ebola, avian influenza, and anthrax as well as supporting global surveillance systems for emerging diseases. He is a leading global expert on MERS, recently serving on the OIE *ad hoc* group on MERS-CoV, and assisted the Kingdom of Saudi Arabia in implementing MERS investigations in animals. He is currently Co-PI of the DTRA BTRP West Asia Bat Research Network, which will promote project synergies in the region.

Prime Organization: EcoHealth Alliance (EHA) is a science-based organization incorporated over 45 years ago, currently working with local partners in over 20 countries at the nexus of human, animal, and environmental health. EHA's staff in New York includes leading scientists from a wide range of disciplines (veterinarians, epidemiologists, diagnostic experts, modelers, economists, social scientists, ecologists, analysts and IT researchers), and administrative and communications staff. EHA has an extensive record of publishing high-quality, peer-reviewed papers, journals, and briefing documents. Our team led development of a human behavioral risk surveillance protocol and questionnaire that has now been implemented in 28 hotspot countries for disease emergence.

JUST: Co-I Dr. Abu-Basha has led several projects related to emerging zoonotic infectious diseases including "Enhanced Surveillance of Trans-boundary Animal Diseases in Rural Areas of Jordan Affected by the Crisis in Syria" and "Cross-sectional surveillance of MERS-CoV and related coronaviruses in camels in Jordan". He was country project lead and coordinator of the USAID PREDICT-2 Project, which advanced a global early warning system to detect, track, and predict the emergence of new zoonotic pathogens from wildlife that could pose a threat to human health. The MBVL/JUST laboratory is an important hub for training and preparing future scientists to perform techniques from sample handling to DNA extraction, cDNA synthesis, performing PCR protocols, cloning, plasmid purification, and sequencing analysis.

Human Link: Co-I Dr. Kayali has extensive experience on both MERS and Avian Influenza in the Middle East and Africa, conducting surveillance for avian influenza and MERS-CoV in humans and different animal species in several countries in the Middle East and Africa. He oversees two virology laboratories, one in Egypt at the National Research Centre in Egypt to be used in this project and one in Lebanon. Dr. Kayali is a world-renowned SME for influenza and coronaviruses. He is part of the NIAID CEIRS network and DTRA/GCRF CANARIES network and served as USAID PREDICT-2 lead for Egypt.

US CDC: Co-Investigator Dr. Patrick Dawson worked for EHA for 3 years overseeing the Jordan PREDICT-2 project work on viral zoonoses. As an EIS officer at CDC, he requires no funding from this project. He will be serving as project advisor on zoonotic diseases, and after Year 2, providing data analyses and dissemination. **Jordanian Ministry of Agriculture**'s Chief Veterinary Officer Dr. Mahmoud Alhanatleh served as an advisor on the USAID EPT PREDICT-2 project for the animal studies components. He will continue in this role for the proposed project. **Jordanian Food and Drug Administration** Chairman of the Infectious Diseases Committee Dr. Wail Hayajneh is a subject matter expert on zoonotic diseases, former dean of the JUST School of Medicine, and served as an advisor on the USAID EPT PREDICT-2 project. He will continue as a project advisor for the proposed project and serve as a liaison with the Jordanian government.

VI: WORK TO BE PERFORMED

Year 1:

Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and poultry in Jordan. *Subtasks*: (Format: Year #. Task #. Subtask #)

1.1.1 Identify sites for project study. **1.1.2** Obtain local permissions and approvals to work with animals. **1.1.3** Conduct biological sampling of animals in the study areas. **1.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description and execution: **1) Study sites:** Within each of the five study regions, sites will be selected as described in the methods section. **2) Local permissions:** Once U.S. ethical approval is finalized, we will submit protocols for local ethical clearance and permits to conduct research with animals. As part of obtaining local permissions we will also meet with community leaders, owners of animals, and poultry production facility managers. **3) Conduct biological sampling of animals:** Nasopharyngeal and oropharyngeal swabs will be collected from 300 camels, poultry and other livestock quarterly in Y1, Q3-Q4 as described above. Blood samples will be collected from 300 animals in Y1, Q3 as described above. **4) Conduct laboratory testing** for pathogens in Y1, Q3 and Q4 as described above. Laboratory security details are indicated in the PRAT form.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 7 laboratory scientists and veterinarians (conduct field and laboratory work, coordinate field and laboratory activities); **HL:** 1 research scientist, (laboratory technical advisor, laboratory training, data analysis); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Selection of study sites; Permits and ethical clearance obtained for animal studies; Project staff trained; Animal sampling implemented; Sample testing implemented.
Deliverable: animal test results report produced and shared.

Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection.

Subtasks: **1.2.1** Identify sites and conduct enrollment for human study component. **1.2.2** Obtain approvals to work with human subjects. **1.2.3** Conduct biological sampling. **1.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description and execution: **1) Study sites and enrollment:** Based on site selection, people living or working in one of the 5 regions during the first, second, or third visits (until sample targets are reached) will be eligible for recruitment in the study as described above. **2) Local permissions:** Once U.S. ethical approval is finalized, we will submit protocols for local ethical clearance and permits to conduct research with human subjects. As part of obtaining local permissions we will also meet with community leaders and poultry production facility managers. **3) Human biological sampling:** Nasopharyngeal and oropharyngeal swabs will be collected from 300 people quarterly in Y1, Q3 and Q4 as described above. Blood samples will be collected from 300 people in Y1, Q3 as described above. **4) Conduct laboratory testing** for pathogens in Y1, Q3 and Q4 as described above. Laboratory security details are indicated in the PRAT form.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 7 laboratory scientists and medical doctor (conduct and coordinate field and laboratory work, organize partner and stakeholder meetings, coordinate field and laboratory activities); **HL:** 1 research scientist, 1 laboratory technician (human serology, laboratory training, data analysis); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Local permissions obtained to conduct human study; Project staff trained; Human sampling implemented; Sample testing implemented.
Deliverable: Human test results report produced and shared.

Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.

Subtasks: **1.3.1** Obtain local permissions and approvals to work with human subjects. **1.3.2**

Conduct behavioral risk factor surveys in people. **1.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description and execution: **1) Local permissions:** Develop owner/worker questionnaire for the behavioral survey. Once U.S. ethical approval is finalized, submit protocols for local ethical clearance and permits to conduct research as described in methods section and obtain concurrence from local community leaders. **2) Conduct behavioral surveys:** Conduct behavioral survey on 300 people in Y1, Q3 and brief follow-up survey in Q4 as described in the Methods. **3) Data analysis:** Preliminary data analysis will begin in Y1, Q3 and continue in Q4.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 5 research scientists and medical doctor (conduct behavioral work, coordinate field activities); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Obtain local permissions to conduct behavioral risk study; Questionnaire app developed; Project staff trained; behavioral study implemented.
Deliverable: Behavioral risk factor study initiated.
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk.
Subtasks: **1.4.1** Generate geospatial maps of laboratory results. **1.4.2** Generate geospatial risk maps by addition of human behavioral risk data.
Description and execution: **1) Geospatial maps**: Lab results of human and animal testing for MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and updated quarterly beginning Y1, Q3 and shared with USG/DTRA and Jordanian project partners. **2) Risk maps:** Use statistical models to link human behavioral data to laboratory findings beginning in Y1, Q4 and share with USG/DTRA and Jordanian project partners.
Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 5 research scientists (design methodology, conduct data collection and analyses); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Compile data; Develop models and conduct analyses; Develop and update geospatial maps and risk maps.
Deliverable: Initial geospatial maps and risk maps produced and shared.
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.
Subtasks: **1.5.1** Conduct project kick-off meeting in Amman with local stakeholders. **1.5.2** Train local project staff in proper techniques. **1.5.3** Host annual partners and stakeholders meeting. **1.5.4** Complete annual report and share with project partners and local stakeholders. **1.5.5** Conduct training workshops. **1.5.6** Data management. **1.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description and execution: **1) Project kick-off meeting:** Government partners and stakeholders will be invited to a project launch meeting to be held in Amman in Y1, Q1. **2) Train local project staff in proper techniques:** Before the field studies we will train (Y1)/retrain (OY1) our One Health field team as described above and in Attachment 3. **3) Annual partners and stakeholders meeting:** We will host an annual Stakeholders and Partners Meeting to inform stakeholders of our progress and receive feedback and input on the project. For this meeting we will invite local and national representatives of public health, veterinary health, environmental health/sciences, medical and laboratory officers as well as community leaders. To be held in

Amman Y1, Q4. **4) Annual Report:** compiled and delivered at the end of Y1, Q4. **5) Training Workshops:** To be held as described in Technical Narrative and Attachment 3 in Y1, Q2. **6) Data management:** A database will be developed, used for epidemiological analyses and shared among implementing partners (including government partners). While sensitive human data will remain protected, we will work with government partners and stakeholders to provide aggregated data as requested. Biobank sample repository information will be maintained in a DTRA-specified format and all samples and data generated during the course of the project will be available for at least 12 months after the project end date. Scientific and general reports will be generated. **7) Presentations and Meetings:** Project participants will attend DTRA Annual Technical Review as requested and other national or international meetings such as the International Meeting on Emerging Diseases or ASM Biothreats.

Resources: **EHA:** 4 research scientists (conduct trainings, support JUST scientists, support workshops, ensure the curation and analysis of data); **JUST:** 9 scientists and technicians (organize and support training workshops, organize partner and stakeholder meetings); **HL:** 1 research scientist (training in laboratory techniques and analyses); **CDC:** 1 research scientist (training in methods and data analyses).

Metrics of success: Training workshops completed; Hosting of project meetings; Completion of annual report with sample repository data to DTRA Thrust Area 6; Participation in DTRA and scientific meetings.

Deliverable: Trained project personnel, reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.

Year 2:

Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan.

Subtasks: **2.1.3** Conduct biological sampling in animals within the study area. **2.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

Description, execution and resources: as in Year 1 except: **3) Biological sampling of animals:** Swabs will be collected from 300 camels, poultry and other livestock quarterly in Y2. No blood samples collected in Y2. **4) Laboratory testing:** performed quarterly in Y2 (PCR testing only).

Metrics of success: Animal sampling conducted; Sample testing conducted.

Deliverable: Animal sampling and testing conducted; Test results report produced and shared.

Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection.

Subtasks: **2.2.3** Conduct biological sampling of people within the study area. **2.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

Description, execution and resources: as in Year 1 except: **3) Human biological sampling:** Swabs will be collected from 300 people quarterly. No blood samples will be collected from people in Y2. **4) Conduct laboratory testing:** performed quarterly in Y2 (PCR testing only).

Metrics of success: Participants re-enrolled; sampling conducted; Sample testing conducted.

Deliverable: Human sampling and testing conducted; Test results report produced and shared.

Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.

Subtasks: **2.3.2** Conduct behavioral risk factor surveys in people. **2.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.

Description, execution and resources: as in Year 1 except: **2) Conduct behavioral surveys:** Conduct brief follow-up behavioral survey (subset of larger survey with ethical clearance obtained) on 300 people in Y2, Q3. **3) Data analysis:** Data analysis will be conducted quarterly.

Metrics of success: Develop app for follow-up behavioral survey; Project staff re-trained; behavioral study conducted.
Deliverable: Behavioral risk factor study results report produced and shared.
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk.
Subtasks: **2.4.1** Generate geospatial maps of laboratory results. **2.4.2** Generate geospatial risk maps by addition of human behavioral risk data.
Description, execution and resources: as in Year 1 except: **1) Geospatial maps:** Lab results of human and animal testing for MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and updated quarterly and shared with USG/DTRA and Jordanian project partners. **2) Generate geospatial risk maps:** Use statistical models to link human behavioral data to laboratory findings quarterly and share with USG/DTRA and Jordanian project partners.
Metrics of success: Update geospatial maps and risk maps; Share with project partners.
Deliverable: Updated geospatial maps and risk maps produced and shared.
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.
Subtasks: **2.5.3** Host annual partners and stakeholders meeting. **2.5.4** Complete annual report and share with partners and stakeholders. **2.5.5** Conduct training workshops. **2.5.6** Data management. **2.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description, execution and resources: as in Year 1 except: **3) Annual partners and stakeholders meeting:** to be held in Amman Y2, Q4. **4) Annual Report:** compiled and delivered at the end of Y2, Q4. **5) Training Workshops:** To be held as described in the Technical Narrative and Attachment 3 in Y2, Q3 as a regional workshop.
Metrics of success: Hosting of project meetings; Completion of annual report with sample repository data to DTRA Thrust Area 6; Completed report to local stakeholders; Hosting of training workshops; Participation in DTRA and scientific meetings.
Deliverable: Training workshop conducted, reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.
Year 3:
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan.
Subtasks: **3.1.3** Conduct biological sampling in animals within the study area. **3.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in Year 2 except: **3) Biological Sampling:** Blood samples collected in Y3, Q1. **4) Conduct laboratory testing:** Serology will be tested in Y3, Q1.
Metrics of success: Animal sampling conducted; Sample testing conducted.
Deliverable: Animal sampling and testing conducted; Test results report produced and shared.
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses. *Subtasks*: **3.2.3** Conduct biological sampling of in people within the study area. **3.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in Year 2 except: **3) Human biological sampling:** Blood samples will be collected from people in Y3, Q1. **4) Conduct laboratory testing:** Serology will be tested in Y3, Q1.
Metrics of success: Participants re-enrolled; sampling conducted; Sample testing conducted.

Deliverable: Human sampling and testing conducted; Test results report produced and shared.
Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.
Subtasks: **3.3.2** Conduct behavioral risk factor surveys in people. **3.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description, execution and resources as in Year 2.
Metrics of success: Project staff re-trained; behavioral study conducted.
Deliverable: Behavioral risk factor study results report produced and shared.
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk. *Subtasks*: **3.4.1** Generate geospatial maps of laboratory results. **3.4.2** Generate geospatial risk maps with addition of human behavioral risk data.
Description, execution and resources as in Year 2.
Metrics of success: Update geospatial maps and risk maps; Share with project partners.
Deliverable: Updated geospatial maps and risk maps produced and shared.
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.
Subtasks: **3.5.3** Host annual partners and stakeholders meeting. **3.5.4** Complete annual report and share with project partners and local stakeholders. **3.5.6** Data management. **3.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description, execution and resources: as in Year 2 except: **3) Annual partners and stakeholders meeting:** to be held in Amman Y3, Q4. **4) Annual Report:** compiled and delivered the end of Y3, Q4. **5) Training Workshops:** no training workshops to be held in Y3.
Metrics of success: Hosting of project meetings; annual report with sample repository data to DTRA Thrust Area 6; reports to stakeholders; Participation in DTRA and scientific meetings.
Deliverable: Communication via reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.
Task 6: Identify specific modifiable risk factors for human infection with these zoonoses.
Subtasks: **3.6.1** Conduct causal inference analyses based on data from Task 1, 2, 3. **3.6.2** Share results of analyses at annual partners and stakeholders meeting. **3.6.3** Submit written report to DTRA, local partners and stakeholders.
Description and execution: **1) Causal inference analyses:** as described in technical narrative. **2) Share Results:** at annual partners and stakeholder meeting Y3, Q4. **3) Written Report:** Results of analyses with identification and recommendations on modifiable risk factors delivered Y3,Q4.
Resources: **EHA:** 3 research scientists (design methodology, support JUST scientists, support workshops, coordinate activities between collaborators, ensure the curation and analysis of data); **JUST:** 4 research scientists (conduct data collection and analyses, support training workshops, organize partner meetings); **CDC:** 1 research scientist (methods oversight, data analysis).
Metrics of success: Initiate causal inference analyses; Deliver report to project partners and stakeholders on modifiable risk factors.
Deliverable: Causal inference analysis report produced and shared.
Option Year 1
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan. *Subtasks*: **O1.1.3** Conduct biological sampling of animals within the study area. **O1.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in Year 3 except: **3) Biological Sampling:** Swabs will be collected in Q1, Q2, Q3 and blood samples will be collected from 300 animals in OY1, Q3.

Metrics of success: Project staff re-trained; Animal sampling and testing conducted.
Deliverable: Animal sampling completed; Test results report produced and shared.
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses. *Subtasks*: **O1.2.3** Conduct biological sampling within the study area. **O1.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in Year 3 except: **3) Human biological sampling:** Swabs will be collected in OY1 Q1, Q2, Q3 and blood samples will be collected from 300 people in OY1, Q3.
Metrics of success: Project staff re-trained; Participants re-enrolled; Sampling conducted; Sample testing conducted.
Deliverable: Human sampling and testing conducted; Test results report produced and shared.
Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.
Subtasks: **O1.3.2** Conduct behavioral risk factor surveys in people. **O1.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description, execution and resources: as in Year 3 except: **1) Behavioral surveys**: will be conducted in OY1 Q1, Q2, Q3.
Metrics of success: Project staff re-trained; Behavioral study conducted.
Deliverable: Behavioral risk factor study surveys completed; Results report shared.
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk. *Subtasks*: **O1.4.1** Generate geospatial maps of laboratory results. **O1.4.2** Generate geospatial risk maps by addition of human behavioral risk data.
Description, execution and resources as in Year 3.
Metrics of success: Update geospatial maps and risk maps; shared with project partners.
Deliverable: Geospatial maps and risk maps produced and shared with partners.
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.
Subtasks: **O1.5.2** Train local project staff in proper techniques. **O1.5.3** Host annual partners and stakeholders meeting. **O1.5.4** Complete annual report and share with project partners and local stakeholders. **O1.5.5** Conduct local/regional training workshops. **O1.5.6** Data management. **O1.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description, execution and resources: as in Y1 except: **2) Train local project staff:** retraining. **3) Annual partners and stakeholders meeting:** to be held in Amman OY1, Q4. **4) Annual Report:** compiled and delivered at the end of OY1, Q4. **5) Training Workshops:** To be held as described in the Technical Narrative and Attachment 3 in OY1, Q3 as a regional workshop.
Metrics of success: Hosting of project meetings; Completion of annual report with sample repository data to DTRA Thrust Area 6; Completed report to local stakeholders; Hosting of training workshops; Participation in DTRA and scientific meetings.
Deliverable: Communication via reports to the funder, scientific community and stakeholders. Biobank sample repository information maintained in a DTRA-specified format.
Task 6: Identify specific modifiable risk factors for human infection with these zoonoses.
Subtasks: **O1.6.1** Conduct causal inference analyses based on Task 1, 2, 3. **O1.6.2** Share results of analyses at annual partners and stakeholders meeting.

Description, execution and resources: as in Y3 except: **1) Conduct causal inference analyses:** continue as described in the Technical Narrative. **2) Share Results:** updated results at annual partners and stakeholder meeting OY1, Q4.
Metrics of success: Conduct causal inference analyses; Deliver report to project partners and stakeholders on modifiable risk factors.
Deliverable: Causal inference analysis report produced and shared.

Option Year 2

Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan. *Subtasks*: **O2.1.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in OY1 except: **4) PCR and Serology testing:** to be completed by end of OY2, Q2.
Metrics of success: Animal sample testing conducted and completed.
Deliverable: Animal testing results report produced and shared.

Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses. *Subtasks*: **O2.2.4** Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.
Description, execution and resources: as in OY1 except: **4) PCR and Serology testing:** to be completed by end of OY2, Q2.
Metrics of success: Human sample testing conducted and completed.
Deliverable: Human sample testing final test results report produced and shared.

Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses.
Subtasks: **O2.3.3** Analyze epidemiologic causal inference to identify modifiable risk factors.
Description, execution and resources: as in OY1 except: analysis of survey results be completed by end of OY2, Q4.
Metrics of success: Conduct analysis of epidemiologic causal inference.
Deliverable: Behavioral risk factor study analyses completed; Final results report generated with identified modifiable risk factors and delivered to partners and stakeholders.

Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk. *Subtasks*: **O2.4.1** Generate geospatial maps of laboratory results. **O2.4.2** Generate risk maps by addition of human behavioral risk data.
Description, execution and resources: as in OY1 except: to be completed by end of OY2, Q4. Geo-spatial analysis technology will be transferred in the regional geospatial workshop (Task 5).
Metrics of success: Update geospatial maps and risk maps; shared with project partners.
Deliverable: Completed final geospatial maps and risk maps.

Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.
Subtasks: **O2.5.3** Host annual partners and stakeholders meeting. **O2.5.4** Complete annual report and share with project partners and local stakeholders. **O2.5.5** Conduct local/regional training workshops. **O2.5.6** Data management. **O2.5.7** Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.
Description, execution and resources: as in Y3 except: **3) Annual partners and stakeholders meeting:** to be held in Amman OY2, Q4. **4) Annual Report:** compiled and delivered at the end of OY2, Q4. **5) Training Workshops:** To be held as described in Technical Narrative and Attachment 3 in OY2, Q3 as a regional workshop.
Metrics of success: Hosting of project meetings; Completion of annual report with sample

repository data to DTRA Thrust Area 6; Completed report to local stakeholders; Hosting of training workshops; Participation in DTRA and scientific meetings.
Deliverable: Biobank sample repository information maintained in a DTRA-specified format. Final project reports delivered to partners, stakeholders and DTRA.

Task 6: Identify specific modifiable risk factors for human infection with these zoonoses.
Subtasks: **O2.6.1** Conduct causal inference analyses based on Task 1, 2, 3. **O2.6.2** Share results of analyses at annual partners and stakeholders meeting. **O2.6.3** Submit written report to DTRA and local partners and stakeholders.
Description, execution and resources: as in OY1 except: **1) Final causal inference analyses:** continue and complete as described in technical narrative by end of OY2, Q4. **2) Final Results:** final results provided at annual partners and stakeholder meeting OY2, Q4. **3) Final Written Report:** Final analyses results with identification and recommendations on modifiable risk factors delivered at end of OY2, Q4.
Metrics of success: Complete causal inference analyses; Deliver final report to project partners and stakeholders on modifiable risk factors.
Deliverable: Generate and deliver written report of analyses with identification and recommendations on modifiable risk factors.

VII: PERFORMANCE SCHEDULE

Task	Year 1	Year 2	Year 3	OY 1	OY 2
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan					
1.1. Identify sites for project study					
1.2 Obtain local permissions and approvals to work with animals					
1.3 Conduct biological sampling in animals within the study area					
1.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection					
2.1 Identify sites and conduct enrollment for human study component					
2.2 Obtain local permissions and approvals to work with human subjects					
2.3 Conduct biological sampling					
2.4 Conduct testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses					
3.1 Obtain local permissions and approvals to work with human subjects					
3.2 Conduct behavioral risk factor surveys in people					
3.3 Analyze epi causal inference to identify modifiable risk factors					
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk					
4.1 Generate maps of laboratory results					
4.2 Generate risk maps with human beh. risk data					
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon					
5.1 Conduct project kick-off meeting in Amman with local stakeholders					
5.2 Train local project staff in proper techniques					
5.3 Host annual partners and stakeholders meeting					
5.4 Complete annual report and share with partners and stakeholders					
5.5 Conduct local/regional training workshops					
5.6 Data management					
5.7 Conduct presentations/meetings at times and places specified					
Task 6: Identify specific modifiable risk factors for human infection with these zoonoses					
6.1 Conduct causal inference analyses based on Task 1, 2, 3					
6.2 Share results of analyses at annual partners and stakeholders meeting					
6.3 Submit written report to DTRA and local partners and stakeholders					

Confirmed Proposal Expiration Date. "EHA holds the proposal, to include proposed costs, firm for 180 days after the submission due date, as included in the invitation to submit a full proposal."

BUDGET JUSTIFICATION FOR ECOHEALTH ALLIANCE

EcoHealth Alliance requests a total of $4.898.794 over all-years of the proposed project to support personnel, travel, equipment, consortium agreements, and applicable indirect costs.

A. Key Personnel
William B. Karesh, D.V.M., Principal Investigator (2.0 calendar months for all years). Dr. Karesh will be responsible for the overall coordination of this project. He will provide overall project oversight, study design development and refinement, data analysis, publication support, annual stakeholder meeting participation and visits to oversee field work. We request $48,535 in Y1 due to the high cost of living in New York City we request a 5% cost of living increase each subsequent year.

Catherine Machalaba, M.P.H., Co-Investigator (4.0 calendar months Y1-OY1, 5.0 calendar months OY2). Ms. Machalaba will be a technical advisor to the project, advising on study design and risk reduction. She to provide day-to-day project development and strategic management, including through regular in-person meetings and weekly phone and other direct communications with partners. She will also supervise field sampling, data analysis, and data and information dissemination through workshops, conferences, and papers. In OY2 she will conduct a risk reduction workshop as well as conduct a One Health economic analysis. We request $28,628 in Y1 with a 5% cost of living increase each subsequent year.

Emily Hagan, M.P.H., Behavioral Risk Scientist (3.0 calendar months in all years). Ms. Hagan will provide medical anthropology expertise for the questionnaires and analysis, supervise and conduct the IRB processes and trainings on the human subject work for local partners, and assist with data organization and analysis. We request $16,937 in Y1 with a 5% cost of living increase each subsequent year.

Whitney Bagge, Ph.D., Modeler (2.5 calendar months Y1, 2.0 calendar months in Y2-OY2). Dr. Bagge will be a technical advisor to the project, advising on data organization, analysis, and writing with a focus on statistical analytics and assist with study design, for which we request $17,938 in OY1.

B. Other Personnel
Amanda Andre, LMSW, Operations Assistant (3.0 calendar months in all years). Ms. Andre will be the administrative lead handling project management responsibilities related to budgeting, expenses, managing of subcontracts, and meeting scheduling and logistics. She will coordinate all meetings and travel and ensure compliance with funding and contractual requirements. We request $14.931 in Y1 with a 5% cost of living increase each subsequent year.

Research Assistant (12.0 calendar months in all years). A Research Assistant will be hired to assist in the development of reports, coordination of collaborators, and data cleaning, maintenance and analysis. We request $61,000 in Y1 with a 5% cost of living increase each subsequent year.

Fringe Benefits

Fringe benefits are calculated as 36.8% of base salary p.a. with $69,173 requested in Y1 calculated from the base salary for all Personnel. In Y2 OY2, we budget for a 5% per year cost of living allowance increase in all salaries.

C. Equipment
No funds are requested for equipment.

D. Travel
Domestic Travel
Domestic travel is requested for three trips per year for program staff to travel from New York City to Washington, DC for broader engagement of relevant partners and deliver presentations. EcoHealth Alliance has close relationships to the World Bank including a technical collaboration to optimize investments in health security and the application of the One Health approach. As requires, trips from New York City to Northern Virginia for two personnel to attend the CBEP meeting as included as well. Transportation is estimated at $400 per trip along with the government GSA per diem rates for Washington, DC ($251 for accommodation and $94 for meals and incidentals) and Northern Virginia ($161 for accommodation and $71 for meals and incidentals). Additional domestic travel support will facilitate EcoHealth Alliance staff presenting at a total of two domestic conferences annually, starting in Y2. One of these will be ASTMH in Maryland with transportation costs of $400, $157 for accommodation and $71 for meals and incidentals, along with one trip to APHA in San Diego with flights estimated at $500, $174 for accommodation and $71 for meals and incidentals. For each trip, $25 per day is estimated in taxi costs and for those that require transport to the airport $150 RT is included. In total, we are requesting $5,613 in Y1.

International Travel
Foreign travel is requested for partner meetings, in-country trainings, and field research. Three EHA employees will attend annual meetings each year, and two will make a second trip each year for trainings and field research. Flights for each of these trips is estimated at $1,500 and the federal per diem rates of $246 for lodging and $138 for meals in Amman, Jordan and $146 for lodging and $105 for meals while conducting field work outside of Amman, Jordan are requested. Additionally, we are requesting travel for staff to present on project findings at international conferences each year with flights estimated at $1,500 and hotels and meals at the government GSA per diem rates for Vienna, Austria for International Meeting on Emerging Diseases and Surveillance (IMED). There are additional costs included for visa fees, vaccinations and conference registration fees. The total requested for international travel in Y1 is $32,272.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

F. Other Direct Costs
Materials and Supplies
Co-Investigator Catherine Machalaba and the Research Assistant to be hired will both need a new computer, equipped with Microsoft and Adobe software, for which we request a total of $6,000 in Y1. In order to analyze, manage, and produce graphical visualizations of data

a Stata license will be needed for which we request $600 p.a. Program staff will need a variety of programs on their computers in order to conduct project work including Dropbox, Adobe, Endnote, Microsoft Office, and Paperpile. Some already have access to these for other project work, but licenses will need to be obtained for some or split among other EcoHealth Alliance projects. To enable communication with partners, we've included telecommunications costs, an annual Zoom membership as well as $25 to be used on Skype to make international phone calls. We request a total of $38,863 over the full five years.

Publication Costs
To facilitate the dissemination of project findings, $6,000 per year in only Y2-OY2 is requested for open access publication costs in international peer-reviewed journals. This amounts to a request for $24,000 over the 5 years.

Consultant Services
For the human behavioral risk part of the project, $1,449 is in Y1 New England IRB, with $1,126 requested in each subsequent year as well as $400 in case of protocol amendment. Additionally, we request $3,500 in Y1 for required Collaborative Institutional Training Initiative training for personnel handling human and non-human animals and samples as per IRB and IACUC requirements. Thus, we request a total of $9,853 over the five year project.

Subawards/Consortium/Contractual Costs
Subcontracts for the Jordan University of Science and Technology (JUST) and Human Link are outlined in their individual budget justifications.

H. Indirect Costs
We are requesting the EcoHealth Alliance federally approved indirect cost rate of 32% on all applicable direct costs. The USA Department of Defense's Department of the Navy has approved this rate on 17 July 2019. We have applied our indirect cost rate to the first $25,000 of the subcontracts. We request $112,377 in Y1 and $539,607 over the five years of the project.

BUDGET JUSTIFICATION FOR JORDAN UNIVERSITY OF SCIENCE AND TECHNOLOGY, JORDAN

The Jordan University of Science and Technology (JUST) requests a total of $2,576,018 over all years of the proposed project to support personnel, travel, equipment, other direct costs and indirect costs.

A. Key Personnel

Ehab Abu-Basha, Ph.D., Co-Investigator (12.0 calendar month for all years). Dr. Abu-Basha will provide overall project oversight for Jordan-based activities. Dr. Abu-Basha will be leading all elements on the human and animal subjects research side of the project as well as the laboratory diagnostics elements. Dr. Abu-Basha will ensure JUST meets project tasks and milestones, will oversee JUST's budget, and will assist with dissemination of findings through publications and conference presentations. We request $128,400 p.a. in salary for Dr. Abu-Basha.

Hani Talafha, M.S., Biologist (8.0 calendar month for all years). As Director of Research Services at JUST, Mr. Talafha will co-oversee field work and assist in Jordan staff management, for which $32,000 is requested p.a.

Zaidoun Hijazeen, M.S, Veterinarian (2.0 calendar month for Y1, 12.0 calendar month Y2-OY2) Dr. Hijazeen will co-oversee field work, assist in study design and train and manage Jordan staff for which $8,000 is requested starting in Y1.

Mustafa Ababneh, Ph.D., Virologist (2.5 calendar month for Y1-OY2). As Lab Director, Dr. Ababneh will provide oversight of laboratory staff and activities, conduct laboratory analyses, provide interpretation of test results, supervise and train students, for which $15,000 is requested p.a.

Zuhair Bani Ismail, B.S., Livestock Expert (2.5 calendar month for Y1-OY2). Mr. Ismail will be responsible for the livestock sampling compliance and interpretation of test results for which $12,500 is requested p.a.

Borhan Al-Zoghoul, Ph.D., Molecular Biologist (3.0 calendar month for Y1-OY2). As Lab Director, Dr. Al-Zoghoul will provide oversight of laboratory staff and activities, conduct laboratory analyses, provide interpretation of test results, supervise and train students, for which $15,000 is requested p.a.

Bilal Al-Omari, BSc, Lab Supervisor (3.0 calendar month for Y1-OY2). As Lab Supervisor, Mr. Al-Omari will conduct laboratory analyses, provide interpretation of test results, supervise and train students for which $9,000 is requested p.a.

Wail Hayajneh, MBBS, Human Identification Expert (1.0 calendar month for Y1-OY2). Mr. Hayajneh will assist with study design for the human components of the study and serve as government liaison, for which $5,000 is requested p.a.

B. Other Personnel

Saad Gharaibeh, Ph.D., Avian Pathologist (1.0 calendar month for Y1-3, 2.0 calendar months for OY1-OY2). Dr. Gharaibeh will assist with study design and implementation for the poultry components, provide interpretation of test results, and provide guidance on recommendations for which $5,000 is requested starting in Y1.

Administrative Assistant (3.5 calendar months for Y1-OY2). The administrative assistant will be handling project management responsibilities related to expenses, managing of the subcontract, scheduling and logistics, for which we request $6,300 p.a.

Nurses (2.0 calendar months for Y1, 4.0 calendar months for Y2-3, 3.0 calendar months for OY1). Two Jordanian nurses will be responsible for assisting with the human sampling at the field study sites. We request $78,800 over the proposed five years of the project for these two positions.

C. Equipment

A field vehicle for field sampling and sample transport is estimated at $35,000. A luminescence plate reader will be purchased to be utilized in the Princess Haya Biotechnology Center to conduct the pseudo-particle neutralization assay. This equipment is estimated at $30,000. The current agreement with DTRA and the US Embassy in Jordan will allow the vehicle and other equipment to be imported without having to pay VAT.

D. Travel

Domestic Travel

In order to conduct field sampling, teams of five, including two nurses, will be visiting five sites (Al Ramtha, Al Zarqa, Al Karak, Ma'an, Aqaba) for five days each twice in Y1, four times in Y2-Y3 and three times in OY1. Field staff will be provided with a per diem for food and lodging of $60 per person per day. In order to cover meals, lodging, fuel for both field work and meetings around Irbid and Amman (an estimated 30,000 km Y1-OY1 and 10,000 miles in OY2) and vehicle maintenance we request $21,580 in Y1.

An additional cost of field work will be to provide study participants with token of appreciation as well as refreshments for those participating in the human work. For human study participants, they will be provided with light refreshments (juice, snack), estimated at $1.25 per person per visit, as well as with a 5JD ($11.28 USD) pre-paid telephone calling card as incentive for participation. Camel and poultry farmers/owners (approximately 30 of each) will be provided with appropriate medicines and supplies for their animals at every other quarterly visit, valued at $100 per farmer/owner per visit. In total we are requesting $19,518 in Y1 for these tokens.

International Travel

We are requesting travel for Jordanian project participants to attend an average of five regional conferences and five international conferences each year to present on project findings. The regional conference flights are estimated at $600 and hotels and meals at the government GSA per diem rates for Istanbul, Turkey of $299 and $131, respectively. For the international conference flights are estimated at $800 and hotels and meals at the government GSA per diem rates for Vienna, Austria of $221 and $122, respectively. We are requesting travel for Dr. Abu-Basha to the DTRA meeting in Northern Virginia, with the flight estimated at $1,000 and hotels

and meals at the government GSA per diem rates of S251 and $76. Three project staff and three students will travel to the Human Link lab in Cairo for training in Y1 only. For this travel, flights are estimated at $400 and hotels and meals at the government GSA per diem rates for Cairo, Egypt of S175 for lodging and $98 for meals and incidentals for a seven day trip. We are requesting S3,000 p.a. to cover conference fees along with S500 p.a. for visa fees. For each trip, RT taxi to the airport are estimated at $75 along with $25 per day for in-country taxis.

In total over the course of the project, we are requesting S150,137 in for International Travel.

E. Participant/Trainee Support Costs

No funds are requested for participant or trainee support costs.

F. Other Direct Costs

Materials and Supplies

We will supply the field team with all consumables required to collect samples, including serum tubes, vacutainer holder, needles, syringes, nitrile gloves, cotton swabs, Tyvek suits, goggles, biohazard bags, and sharps containers as well as five tablets ($200 ea.) for data collection at field sites. To ensure cold chain, for field visits outside Amman dry ice is required at a cost of S150 per week. The Princess Haya Biotechnology Center requires the purchase of eyewash bottles in Y1 ($250) and installation of an electronic card reader system ($1,500). We request S73,616 over all years of the project for field supplies.

Laboratory Testing

Our laboratory cost request covers PCR for MERS-CoV and avian influenza as well as serology for MERS-CoV, avian influenza, brucellosis and leptospirosis. Pricing is based on in-house costs on a per test basis. Details on numbers of each test and unit price are provided here for each year that laboratory testing will be conducted, Year 1 Option Year 1. The MERS Serology testing was previously going to be conducted at the Human Link lab in Cairo, Egypt but will now be conducted at the Princess Haya Biotechnology Center in Jordan.

Meetings and Conferences

We request support for an annual meeting each year for 45 people including personnel from partner institutions (EHA and JUST) as well as local stakeholders. Travel costs for United States-based participants to attend the annual meeting are covered in the EcoHealth Alliance budget. We estimate that for the one-day meeting, ten Jordanian partners traveling from outside Amman will require transportation (estimated at S60 per person), meals and accommodation to be covered (S246 for lodging and $138 for meals and incidentals). Lunch will be provided for all participants and there will be costs associated with room rental ($1,000 per day), translation and sound equipment to facilitate translation ($2,000 per day) and printing and supplies. Overall costs for the annual meetings are estimated at $12,605 p.a.

In addition to the annual meeting, there will be a Kick Off meeting in Y1 only for 20 participants, five of which will be from outside of Amman. All cost estimates remain the same from the annual meeting, with the Kick Off Meeting estimated at S7,740.

There will be three regional meetings held in Amman in Y2, OY1 and OY2, for which regional transport will be required for two people each from Egypt ($200), Lebanon ($300) and Iraq ($500) as well as meals and accommodation to be covered (S246 for lodging and S138 for meals and incidentals). We will have the same printing, supplies, room rental and translation fees as above and lunch included for 24 participants. For the regional meetings, we request $19,865 each.

A threat reduction workshop in planned for OY2 with transportation and accommodation for ten participants from Jordan and international travel and accommodation for four participants each from Lebanon and Iraq; the workshop will consist of 45 total participants. The costs for flights, accommodation, meals and incidentals, lunch, room rental, and translation services remain the same as mentioned above. The printing and supplies is estimated for this meeting at S1,500 for the printing of booklets and reports. The total cost of this workshop is S45,743.

H. Indirect Costs

We are requesting the federally agreed indirect cost of 8% on all direct costs.

BUDGET JUSTIFICATION FOR HUMAN LINK, LEBANON

Human Link requests a total of $64,850 over all years of the proposed project to support testing and indirect costs.

A. Key Personnel
Ghazi Kayali, Ph.D., Co-Investigator (2 weeks for Y1-OY2). Dr. Kayali will assist in conducting a three day didactic training on biosafety and security, including real-time PCR testing and analysis, influenza subtyping, genomic analysis of MER-CoVs and serology testing and analysis. He will travel to Jordan University of Science and Technology for one week per year to re-train and supervise testing at the Princess Haya Biotechnology Center. For this he will be compensated one week salary, in addition to one week each year to advise on data analysis, interpretation, and publications related to the laboratory work to promote scientific sharing of the laboratory methods to enhance detection capacity, for which we are requesting a total of $7,708 p.a.

B. Other Personnel
No funds are requested for other personnel costs.

C. Equipment
No funds are requested for equipment costs.

D. Travel
In order to conduct the re-training in biosafety, security and laboratory techniques as well as oversee testing, we are requesting $3,103 in international travel to cover the flight from Cairo to Amman (estimated at $400) as well as the federal per diem rates of $246 for lodging in Amman, Jordan and $138 for meals in Amman, Jordan.

E. Participant/Trainee Support Costs
No funds are requested for participant or trainee support costs.

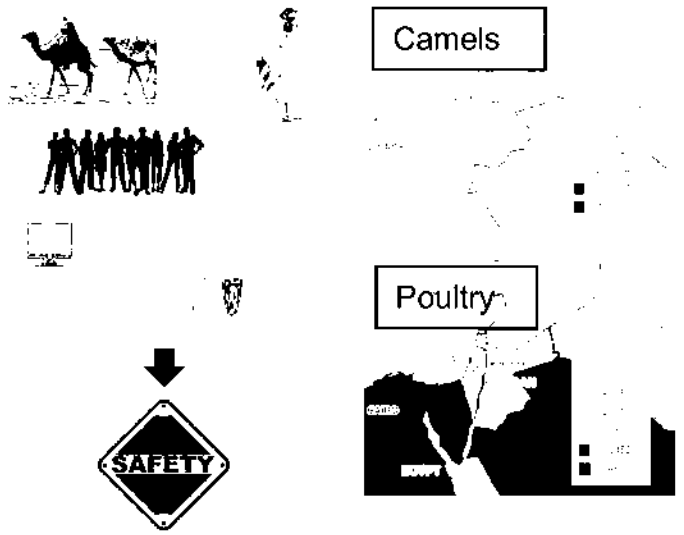
F. Other Direct Costs
Materials and Supplies
Pseudoparticles will be required to conduct the pseudo-particle neutralization assay. These will be prepared in batches in the lab in Cairo and are produced by transfecting HIV and MERS cloning vectors in 293T cells to obtain non-infectious particles displaying the spike protein of MERS. For this we request $2,000 p.a. starting in Y2, when Dr. Kayali will be travelling to Jordan.

H. Indirect Costs
We are requesting the federally agreed indirect cost of 10% on all direct costs.

Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan, PI: William B. Karesh, BTRP-TA.6 CC WMD GRANT # 12862917

Objective: Work with government and private sector partners to characterize causal factors in animal-to-human transmission of MERS, AI, and other zoonoses in Jordan, implement serological technology for enhanced diagnostic and detection capabilities, and strengthen regional detection and reporting capacity to reduce biological threats.

Method: Conduct a prospective cohort study at various human-livestock/poultry interfaces across Northern, Middle, and Southern Jordan. Conduct regional collaboration and capacity building workshops in Jordan for Iraqi and Lebanese scientists from Health, Agriculture, and related Ministries and agencies.



Status of effort: Collaborative team working on infectious diseases in humans and animals in place. Established relationships with Ministries, labs, university scientists, poultry industry, camel owners and Bedouin community.

Personnel Supported: 7 University Faculty, 6 Other Scientists, 2 Scientific Advisors, 20 professional students, >24 government workshop participants.

Publications & Meetings: 10 stakeholder/partner meetings and training workshops, 8 scientific publications, >40 conference presentations

Major Goals and Milestones:

- Determine evidence of MERS, AI, and other zoonoses in humans, livestock and poultry in Jordan (Y1-OY2)
- Identify risk factors and modifiable behaviors for threat reduction (Y1-OY2)
- Improve knowledge and diagnostic capacity (Y1-OY2)

Funding Profile Yr 1: $986,585, Yr 2: $981,495, Yr 3: $988,228, OYr 1: $994,751, OYr 2: $947,734

Contact information PI: Dr. William B. Karesh, 212-380-4463 Karesh@ecohealthalliance.org

Statement of Work

Project Title: Reducing the Threat of Middle East Respiratory Syndrome Coronavirus and Avian Influenza in Jordan & Strengthening Regional Disease Surveillance Capacity.

Document Date: 18 March 2020.

Objective: The objective of this grant is to reduce the threat of high-consequence zoonotic pathogens in Jordan and improve regional disease surveillance capacity. Jordan faces risk of several zoonoses of concern to human and animal health, including Middle East Respiratory Syndrome (MERS-CoV) and Avian Influenza (AI), with fundamental knowledge and capacity gaps around the distribution and determinants of zoonoses. Recent work by our team detected MERS-CoV in camels and people in Jordan, suggesting ongoing and unmitigated transmission risk of a priority pathogen. The proposed study will generate critical advances in determining the presence of zoonotic pathogens in the country and opportunities for public health intervention. Through a prospective human cohort study coordinated with animal sampling, we will conduct biological and behavioral surveillance in five regions of Jordan with livestock production interfaces to determine the presence and risk factors for MERS-CoV, AI, brucellosis, and leptospirosis to identify modifiable risk factors. By testing three core policy-relevant hypotheses and providing multi-disciplinary training opportunities, the awardee shall enhance scientific capacity in Jordan and support disease detection and reporting in Jordan, Iraq and Lebanon. Taking a coordinated, multi-hazard approach to threat reduction, the proposed study will add critical understanding of presence and risk factors for zoonotic diseases in Jordan and advance scientific capacity and application of the One Health concept to counter biothreats in the region.

Scope: The awardee proposes a five-year One Health study of zoonotic diseases in Jordan. The awardee team shall focus on the following major goals and milestones:

1) Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and poultry in Jordan: *Implement animal study (Y1-OY1); Conduct PCR and serology testing (Y1-OY2)*

2) Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses: *Implement human cohort study (Y1-OY1); Conduct PCR and serology testing (Y1-OY2)*

3) Characterize causal factors in animal-to-human transmission of these zoonoses: *Implement behavioral risk survey (Y1-OY1); Conduct epidemiological analyses (Y1-OY2)*

4) Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk: *Generate geospatial distribution and risk maps (Y1-OY2)*

5) Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon: *Host workshops (Y1-2, OY1-2); Submit reports and publications (Y1-OY2); Attend presentations/meetings (Y1-OY2)*

6) Identify specific modifiable risk factors for human infection with these zoonoses: *Conduct causal interference analyses (Y3-OY2); Policy recommendations on modifiable risk factors (Y3-OY2)*

This research will generate critical advances in detecting the presence of and exposure risk to high-consequence zoonotic viruses and bacteria across geographic regions and interfaces in Jordan, contributing to enhanced understanding of modifiable risk factors to inform government authorities on prevention activities to reduce disease threats.

Background: Jordan has experienced outbreaks of several high-consequence zoonotic diseases, including MERS-CoV and AI. Since its emergence in 2012, MERS-CoV has resulted in over 2,400 human cases globally and is recognized as a priority disease under the WHO R&D Blueprint. While the first human cases of MERS-CoV were traced back to Jordan, little is known about its underlying and ongoing risk of zoonotic disease in animal populations, particularly around primary transmission risk factors and pathways that precede spread in healthcare settings. MERS-CoV is one of several zoonoses posing threat to animal and human populations in the country. Highly Pathogenic Avian Influenza outbreaks, including subtype H5N1, have been reported, and brucellosis is considered endemic in Jordan, with recurring spillover but inadequate understanding of specific modes of transmission and poor vaccination coverage. While human cases of leptospirosis have not been reported in Jordan to date, high rates of certain Leptospira serovars have been detected in animals. Key questions and capacity gaps hinder understanding of the presence, distribution and risk factors in the country, leaving the country vulnerable to zoonotic biothreats, as well as wider regional gaps in detection and reporting. The threat of zoonotic disease is especially pertinent given the rapidly-growing poultry production industry in Jordan and camel, livestock, and poultry rearing in the region.

Jordan has recently made recent several notable scientific advances in detection of MERS-CoV, generating preliminary data that the proposed project will build on. While camels are the presumptive source of primary human MERS-CoV infections, the exact mechanisms of transmission and the possible role of other livestock species are unclear. Blood samples collected from camels and humans in the northern region of Jordan were positive for MERS-CoV, leading to the first-ever report of this disease to OIE in camels in Jordan in 2016. To date, only few countries have reported virus-positive MERS-CoV test results to the OIE so this is a significant and important step toward improving both MERS-CoV detection and reporting in the Middle East. Studies of zoonotic pathogens in the region to date have largely focused on single sites or interfaces, cross-sectional sampling events, or select taxonomic groups, limiting understanding of causal factors. Research is needed to monitor presence and transmission of zoonotic pathogens spatially, temporally, and by biohazard exposure (e.g. blood, urine, feces, and/or nasal secretions) and practices and conduct epidemiological analyses to identify modifiable risk factors for public health intervention. As a key area of stability in the region, it is crucial to support Jordan's biosurveillance capacity, enable understanding of baseline disease risk to allow differentiation of natural versus nefarious emergence events, and ensure responsible bio-risk management to ethically monitor and reduce disease threats. The country has also recently established a One Health platform that indicates the country's commitment to countering zoonotic disease threats. Given the volume of migration between Jordan and its neighbors, including in animal trade, regional coordination in disease monitoring and threat reduction is a critical component in effectively characterizing and addressing disease risk. This project seeks to fill current capacity gaps to advance Jordan as a leader in scientific research and zoonotic disease management and creating new capacity and scientific collaboration pathways for hypothesis-driven research and zoonotic disease monitoring and threat reduction in the region.

Tasks/Scientific Goals: **(Format: Year #(s). Task #. Subtask#).**

TASK 1: Y1.1-O2.1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan.

The awardee shall study presence of MERS-CoV, AI, Brucellosis and Leptospirosis in animals. Sites will be selected in five geographically-representative regions across Jordan: Northern Jordan (Al Ramtha), Middle Jordan (Al Zarqa), and Southern Jordan (Al Karak, Ma'an, and Aqaba). These regions were selected based on preliminary findings by our team and the presence of livestock production activities. Sites in each region shall reflect interfaces with poultry, camels, and other livestock animals are represented (e.g. farms or markets). The awardee shall receive permissions and approvals to work with animals prior to initiating sampling. Nasopharyngeal and oropharyngeal swabs will be collected from 300 camels, poultry and other livestock quarterly in Year 1, Q3 through Option Year 1, Q3 (a total of 13 sampling visits). At three points during the project (in Y1, Y3, and OY1 during the 1st, 7th, and 13th sampling visits, respectively), blood samples (serum) will be collected from 300 animals. Nasopharyngeal and oropharyngeal swabs will be tested for MERS-CoV and AI using real time PCR. Serum samples will be tested using serology for MERS-CoV, AI, Brucellosis, and Leptospirosis. Staff training on proper study techniques (e.g. sampling, transport, and laboratory) will occur as detailed in Task 5. This task will contribute to testing the hypothesis that livestock species and poultry in Jordan show evidence of infection with MERS-CoV, AI, and/or other assayed zoonoses, as well as inform type of transmission pathways.

Y1.2.1 Identify sites for project study.

Y1.2.2 Obtain local permissions and approvals to work with animals.

Y1.2.3-O1.2.3 Conduct biological sampling in animals within the study area.

Y1.2.4-O2.2.4 Conduct PCR and/or serology testing for AI, MERS-CoV, brucellosis and leptospirosis.

TASK 2: Y1.2- OY2.1: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection with these zoonoses.

The awardee shall conduct a prospective cohort study of humans to evaluate behavioral and occupational risk factors for zoonotic infectious diseases (MERS-CoV, avian influenza, brucellosis, and leptospirosis) among persons living in Jordan in any of the five study regions. The study will enroll persons regularly working with livestock or poultry or sharing their living areas with these animals as well as persons unexposed to these factors. Sites will be selected as in Task 1 and in surrounding communities to enroll both exposed and unexposed populations. In Year 1, the awardee will receive local permissions and approvals to work with human subjects prior to initiating enrollment and sampling. Nasopharyngeal and oropharyngeal swabs will be collected from 300 enrolled humans quarterly in Year 1, Q3 through Option Year 1, Q3 (a total of 13 sampling visits). At three points during the project (in Year 1, Year 3, and Option Year 1

during the 1st, 7th, and 13th sampling visits, respectively), blood samples (serum) will be collected from 300 humans. Nasopharyngeal and oropharyngeal swabs will be tested for MERS-CoV and AI using real time PCR. Serum samples will be tested using serology for MERS-CoV, AI, brucellosis, and leptospirosis (Years 1-4). Biological sampling will be paired with behavioral surveillance data as in Task 3.

Y1.2.1 Identify sites and conduct enrollment for human study component.

Y1.2.2 Obtain local permissions and approvals to work with human subjects.

Y1.2.3-O1.2.3 Conduct biological sampling (nasopharyngeal and oropharyngeal swabs, and/or blood) of in people within the study area.

Y1.2.4-O2.2.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis.

TASK 3: Y1.3-OY2.3: Characterize causal factors in animal-to-human transmission of these zoonoses.

The awardee shall monitor behaviors of persons enrolled in the prospective cohort study (as in Task 2) to identify and characterize causal factors for animal-to-human transmission of MERS-CoV, AI, brucellosis and leptospirosis. The PREDICT-2 Human Behavioral Risk Questionnaire will be augmented with animal-specific exposure frequency questions to collect demographic data, symptom and medical history data, social history data, and specific animal-related behaviors and practices that are possible risk factors for infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. The project team will administer the survey to enrolled participants at the first sampling visit (Year 1). During all future visits (Year 1- Option Year 1), enrolled participants will be administered a brief follow-up questionnaire designed primarily to capture time-varying exposure and covariate data. This longitudinal information will provide critical information about the context of exposures and pathways to link biological sampling and provide the wider context of practices and risk factors. Epidemiologic analysis of the questionnaire data (including time-varying data) in this Task will identify current practices and exposure pathways and initial modifiable risk factors. Specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions) will be assessed under Task 6 for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. Results will be shared via annual reports and stakeholder meetings as in Task 5.

Y1.3.1 Obtain local permissions and approvals to work with human subjects.

Y1.3.2-O1.3.2 Conduct behavioral risk factor surveys in people.

Y1.3.3-O2.3.3 Analyze epidemiologic causal inference to identify modifiable risk factors.

TASK 4: Y1.4-OY2.4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk.

The awardee shall map findings from Tasks 1-2 to show the distribution of detected pathogens across the regions and sampling sites. Geospatial mapping is a highly relevant visual tool to assist authorities in targeting surveillance and risk management activities. Using QGIS, laboratory results of human and animal testing for MERS-CoV, avian influenza, brucellosis, and leptospirosis will be populated and mapped to show the distribution of detected pathogens. Maps will be generated beginning Y1, Q3 when laboratory findings are available. Geospatial risk maps will be generated using statistical models to link human behavioral data to laboratory findings beginning in Y1, Q4. Geospatial maps will be updated quarterly and shared with USG/DTRA and Jordanian project partners. Training on geospatial analysis will be provided to project team

members and will be covered under a regional workshop to promote broader uptake of geospatial mapping as a low-cost tool to enhance disease monitoring programs in the region (Task 5).

Y1.4.1-O2.4.1 Generate maps of laboratory results

Y2.4.2-O2.4.2 Generate risk maps of human behavioral risk data

TASK 5: Y1.5-OY2.5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon through meetings and workshops.

Strengthening disease detection and reporting capacity is a key contributor to health security and the ability to target risk factors for threat reduction. The project team is committed to improving this capacity in Jordan as well as more widely in the region through involvement of scientists and government officials in Iraq and Lebanon. We will train local staff in proper techniques for all project activities (Year 1 and Option Year 1). Each year we will support four students from medical and veterinary disciplines in Jordan to participate in training, field activities, project analyses and workshops to provide scientific mentorship and promote the One Health concept. Jordanian scientists and students will also be trained in laboratory techniques to be deployed in Jordan by the Human Link laboratory consultant that has led capacity development for MERS-CoV diagnostics in other countries. The awardee shall organize workshops in Jordan open to scientists from the Ministries of Health and Agriculture from Jordan, Iraq, and Lebanon (Years 1-2, Option Years 1-2). A secure project database will be developed for use in the epidemiological analyses. The awardee shall provide submission of annual sample repository information using a DTRA-specified format and shall grant access to all samples collected and data generated during the course of the project, up to and including at least 12 months after the project end date. The awardee shall conduct presentations/meetings at times and places specified in the grant schedule (Year 1 Task 5), including the DTRA Annual Technical Review. In Year 1 the awardee shall hold a kick-off meeting to introduce the project objectives and promote buy-in in study findings and capacity sustainment. Annual reports and stakeholder meetings and scientific presentations and publications will be used to disseminate results. The project will reinforce Jordan's national One Health platform, promoting the One Health concept for multiple diseases of concern for public and animal health and advancing capacity for hypothesis-driven research with direct application for policy decisions for threat reduction.

Y1.5.1 Conduct project kick-off meeting in Amman with local stakeholders.

Y1.5.2 & O1.5.2 Train local project staff in proper techniques.

Y1.5.3-O2.5.3 Host annual partners and stakeholders meeting.

Y1.5.4-O2.5.4 Complete annual report and share with project partners and local stakeholders.

Y1.5.5-Y2.5.5 & O1.5.5-O2.5.5 Conduct local/regional training workshops.

Y1.5.6- O2.5.6 Data management.

Y1.5.7- O2.5.7 Conduct presentations/meetings at times and places specified in the grant schedule, including DTRA Annual Technical Review.

TASK 6: Y3.6-OY2.6: Identify specific modifiable risk factors for human infection with these zoonoses.

The awardee shall integrate the findings of the biological testing (animal and human) and behavioral surveys in Tasks 1-3, assessing specific animal-related behaviors and practices that involve exposure to specific animal biohazards (e.g., blood, urine, feces, and/or nasal secretions)

for whether they pose a greater risk of infection with MERS-CoV, avian influenza, brucellosis, or leptospirosis. These potential modifiable risk factors will be determined through epidemiologic analysis of the questionnaire data (including time-varying data) paired with individual laboratory results (e.g., detection of viral RNA, bacterial DNA, or antibodies). Using quarterly, longitudinal data collected in Tasks 1-3, we will examine any major temporal dynamics that may be associated with elevated transmission risk (e.g. seasonality, animal birthing periods). Causal inference techniques within the potential outcomes framework will be employed to solidify statistical associations as concretized biological/clinical/environmental pathways by operationalizing exposures as well-defined interventions and ensuring exchangeability is maintained through confounder control informed by directed acyclic graphs of the conceptual exposure-disease pathways. The awardee will examine multiple zoonotic pathogens (as above) to inform general threat reduction guidelines. Identification of modifiable risk factors will inform intervention development that may interrupt future zoonotic transmission of the four pathogens in this study. Findings will be shared with USG/DTRA and the Jordanian Ministry partners at the annual stakeholders meetings, the threat reduction workshop, scientific presentations and publications as specified in Task 5. This information will provide a strong basis for potential policy guidance and the generation of solutions at the threat reduction workshop in OY2.

Y3.6.1-O2.6.1 Conduct causal inference analyses bases on Tasks 1, 2, 3.
Y3.6.2-O2.6.2 Share results of analyses at annual partners and stakeholders meeting.
Y3.6.3 & O2.6.3 Submit written report to DTRA and local partners and stakeholders.

Performance Schedule:

Task	Year 1	Year 2	Year 3	OY 1	OY 2
Task 1: Determine the presence of MERS-CoV, AI, and other zoonoses among livestock and/or poultry in Jordan					
1.1. Identify sites for project study					
1.2 Obtain local permissions and approvals to work with animals					
1.3 Conduct biological sampling in animals within the study area					
1.4 Conduct lab testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 2: Determine whether (and if so, the extent to which) humans at human-livestock/poultry interfaces display evidence of infection					
2.1 Identify sites and conduct enrollment for human study component					
2.2 Obtain local permissions and approvals to work with human subjects					
2.3 Conduct biological sampling					
2.4 Conduct testing for AI, MERS-CoV, brucellosis and leptospirosis					
Task 3: Characterize causal factors in animal-to-human transmission of these zoonoses					
3.1 Obtain local permissions and approvals to work with human subjects					
3.2 Conduct behavioral risk factor surveys in people					
3.3 Analyze epi causal inference to identify modifiable risk factors					
Task 4: Produce geospatial maps of zoonoses in livestock and poultry and of human zoonotic transmission risk					
4.1 Generate maps of laboratory results					
4.2 Generate risk maps with human beh. risk data					
Task 5: Strengthen local capacity for detection and reporting of MERS-CoV, AI, and other zoonoses in Jordan, Iraq, and Lebanon					
5.1 Conduct project kick-off meeting in Amman with local stakeholders					
5.2 Train local project staff in proper techniques					
5.3 Host annual partners and stakeholders meeting					
5.4 Complete annual report and share with partners and stakeholders					
5.5 Conduct local/regional training workshops					
5.6 Data management					
5.7 Conduct presentations/meetings at times and places specified					
Task 6: Identify specific modifiable risk factors for human infection with these zoonoses					
6.1 Conduct causal inference analyses based on Task 1, 2, 3					
6.2 Share results of analyses at annual partners and stakeholders meeting					
6.3 Submit written report to DTRA and local partners and stakeholders					

OMB Number: 4040-0001
Expiration Date: 12/31/2022

APPLICATION FOR FEDERAL ASSISTANCE
SF 424 (R&R)

3. DATE RECEIVED BY STATE	State Application Identifier

1. TYPE OF SUBMISSION
☐ Pre-application ☒ Application ☐ Changed/Corrected Application

2. DATE SUBMITTED | **Applicant Identifier**

4. a. Federal Identifier

b. Agency Routing Identifier GRANT12862917

c. Previous Grants.gov Tracking ID GRANT12925672

5. APPLICANT INFORMATION

Organizational DUNS: 077090660000

Legal Name: EcoHealth Alliance
Department:
Division:
Street1: 460 W 34 St
Street2: 17th Floor
City: New York
County / Parish:
State: NY: New York
Province:
Country: USA: UNITED STATES
ZIP / Postal Code: 10001-2320

Person to be contacted on matters involving this application

Prefix: Dr.
First Name: William
Middle Name:
Last Name: Karesh
Suffix:
Position/Title: Executive Vice President of Health and Policy
Street1: 460 W 34th St
Street2: 17th Floor
City: New York
County / Parish:
State: NY: New York
Province:
Country: USA: UNITED STATES

Phone Number: 212-380-4463
Fax Number: 212-380-4465
Email: karesh@ecohealthalliance.org

6. EMPLOYER IDENTIFICATION *(EIN) or (TIN):* 311726494

7. TYPE OF APPLICANT: M: Nonprofit with 501C3 IRS Status (Other than Institution of Higher Education)
Other (Specify):
Small Business Organization Type ☐ Women Owned ☐ Socially and Economically Disadvantaged

8. TYPE OF APPLICATION:
☒ New ☐ Resubmission
☐ Renewal ☐ Continuation ☐ Revision

If Revision, mark appropriate box(es).
☐ A. Increase Award ☐ B. Decrease Award ☐ C. Increase Duration ☐ D. Decrease Duration
☐ E. Other (specify):

Is this application being submitted to other agencies? Yes ☐ No ☒ What other Agencies?

9. NAME OF FEDERAL AGENCY: Defense Threat Reduction Agency

10. CATALOG OF FEDERAL DOMESTIC ASSISTANCE NUMBER: 12.351
TITLE: Scientific Research: Combating Weapons of Mass Destruction

11. DESCRIPTIVE TITLE OF APPLICANT'S PROJECT:
Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity

12. PROPOSED PROJECT:
Start Date: 09/01/2020
Ending Date: 08/31/2025

13. CONGRESSIONAL DISTRICT OF APPLICANT
NY-010

14. PROJECT DIRECTOR/PRINCIPAL INVESTIGATOR CONTACT INFORMATION

Prefix: Dr. First Name: William Middle Name:
Last Name: Karesh Suffix:
Position/Title: Executive Vice President of Health and Policy
Organization Name: Ecohealth Alliance

3. FACILITIES, EQUIPMENT, AND OTHER RESOURCES

EcoHealth Alliance, New York, United States
EcoHealth Alliance is an US-based NGO that specializes in scientific research on the causes, origins and spread of zoonotic emerging diseases. EcoHealth Alliance scientists have been conducting field research on infectious zoonotic diseases for over three decades. EcoHealth Alliance is based in New York City with 10,000 square feet of office space including a meeting room and basic laboratory – freezer storage and light microscopy. The scientific staff (15 core scientists, 100+ field staff) is supported by a core admin staff of 11, which is available for work on this project and is also funded through private individual and foundation support.

EcoHealth Alliance is equipped with 25 networked computers (PCs and Macs) including ARRA funded International LifeSize Video Conferencing facilities, and high-speed video conferencing facilities have been installed with key international collaborators. EcoHealth Alliance has access to a 24-7 server, server support, and all required software including ArcGIS, MatLab, SPSS, Microsoft Office, and Adobe CS3 running on both Apple and Windows Operating Systems. Additionally, we have a four-processor, public IP addressed Linux server which can be used for intensive computational modeling and database processing by all the grantees.

EcoHealth Alliance is the headquarters of two networks that provide exceptional leverage for the core scientists: 1) The EcoHealth Alliance Local Conservation Partners: A global partnership of 15 NGOs in Asia (including Bangladesh, India, and China), Africa and Latin America (including Argentina and Brazil). This network provides access to fieldwork in countries (such as India) that are often difficult to work in, and obtain samples from; 2) The Consortium for Conservation Medicine: A unique collaborative institution linking Johns Hopkins Bloomberg School of Public Health, Tufts University School of Veterinary Medicine Center for Conservation Medicine, The University of Pittsburgh Graduate School of Public Health, The University of Wisconsin-Madison Nelson Institute for Environmental Studies, The USGS National Wildlife Health Center, and EcoHealth Alliance. The CCM provides access to hundreds of high caliber scientists, their facilities, and their students at 6 leading institutes of public health, veterinary medicine, and environmental science in the USA.

Jordan University of Science and Technology, Irbid, Jordan
The Faculty of Veterinary Medicine at JUST is the only veterinary school in Jordan. It was established in1998 by Royal Decree. The Faculty consists of 3 different departments; Clinical sciences, basic sciences, and pathology and public health. There are several teaching and research laboratories in the Faculty. The Faculty is the home of several PhD holders and board-certified clinicians. The Basic Science Department is the home of a state-of-the-art Molecular Biology and Virology Laboratory which is the only laboratory of its kind in Jordan. The laboratory is well equipped and implements many molecular and diagnostic assays by a group of well-trained national scientists, young graduate students and technicians according to the latest scientific standards. Highly advanced molecular diagnostic assays such as cloning into TOPO vector, preparing PCR products for sequencing, and sequence analysis are performed routinely in this laboratory. In Jordan, the JUST Molecular Biology and Virology Laboratory is now considered an important hub for training and preparing future scientists with many graduate

students now being trained in the lab to perform techniques from sample handling to DNA extraction, cDNA synthesis, performing PCR protocols, cloning, plasmid purification, and genetic sequencing analysis.

The Faculty is also the home of the Veterinary Health Center (VHC). It is the only veterinary teaching clinic in Jordan. At the VHC, the veterinary Diagnostic Laboratory is equipped with various state of the art tools that enable it to perform all needed diagnostic and research tests. The laboratory is equipped with hematology, clinical chemistry analyzers, PCR machines, ELISA readers. The laboratory is also able to perform basic bacteriology tests such as bacterial culture, identification and sensitivity tests.

JUST is also host to the Princess Haya Biotechnology Center, a state-of-the-art center promoting research, diagnostics and training in Molecular Genomics and Biorisk Management. The Center provides faculty members, graduate and undergraduate students, and regional organizations with a robust and excellent scientific infrastructure to support important experimental research in biotechnology, particularly in the fields of genomics, metabolomics and proteomics. The center comprises a total of sixteen research laboratories and occupies approximately 1,500 square meters.

Director of Research Services and Lecturer, Jordan University of Science and Technology, Jordan

2. DESCRIPTION OF RELATIONSHIP BETWEEN PROJECT AND CURRENT RESEARCH EFFORTS OF FOREIGN RESEARCH TEAM

Foreign Co-Investigator Dr. Ehab Abu-Basha is a professor at the Jordan University of Science and Technology (JUST) and former Dean of the School of Veterinary Medicine. He and the additional collaborators from JUST were the first to identify MERS-CoV in camels in Jordan during work with the USAID Emerging Pandemic Threats (EPT) program in coordination with PI Karesh and EcoHealth Alliance (EHA). Co-I Abu-Basha served as the Country Coordinator over the previous 3 years for the EHA/JUST implemented USAID EPT PREDICT project lead by PI Karesh and managed by Co-I Dawson from EHA and now at US CDC but participating in this proposed project. The staff included in this proposal at the three JUST laboratories identified for this project (Diagnostic Laboratory-Faculty of Veterinary Medicine, the Molecular Biology and Virology lab - Faculty of Veterinary Medicine and the Princess Haya Biotechnology Center) performed PCR and serology diagnostics for influenza and coronaviruses for the USAID EPT PREDICT-2 project. JUST field teams included in this proposal performed the human and animal sampling for the USAID EPT PREDICT project and conducted the behavioral interviews required for the project. Dr. Wail Hayajneh, MBBS, is Chairman of the Jordanian Food and Drug Administration and a professor at the JUST Medical University. He served as an advisor on the USAID EPT PREDICT-2 project for the human studies components and will continue in this role for the proposed project.

Foreign Co-Investigator Dr. Ghazi Kayali, CEO of Human Link, oversees two virology laboratories, one in Egypt to be used in this project and one in Lebanon. He has exclusive use of 2160 sq. ft. of contiguous laboratory and office space in the newly completed Advanced Science building at the National Research Centre in Egypt. The Human Link team includes 1 lab director, 1 postdoc, 1 research assistant, 9 graduate students, 7 field veterinarians, 4 zoologists, 4 field clinicians, and 19 field nurses working on various surveillance, cohort, and laboratory studies. Dr. Kayali is a world-renowned subject matter expert for influenza and coronaviruses. He is part of the NIAID CEIRS network and the DTRA/GCRF CANARIES network and served as USAID PREDICT-2 project leader for Egypt over the previous 3 years for the EHA/Human Link implemented USAID EPT PREDICT project lead by PI Karesh and managed by Co-I Dawson from EHA and now at US CDC but participating in this proposed project.

Dr. Mahmoud Alhanatleh is the Chief Veterinary Officer for the Jordanian Ministry of Agriculture. He served as an advisor on the USAID EPT PREDICT-2 project for the animal studies components, hosted partner and stakeholder meetings, and oversaw the project interface with government animal health care workers in all regions of Jordan. He

will continue in this role for the proposed project and serve as a liaison with the Jordanian government (see letter of support).

Dr. Wail Hayajneh is the Chairman of the Infectious Diseases Committee of the Jordanian Food and Drug Administration. He was formerly the Dean of the School of Medicine at Jordan University of Science and Technology. He is a subject matter expert on zoonotic diseases and served as an advisor on the USAID EPT PREDICT-2 project in humans. He will continue as a project advisor for the proposed project and serve as a liaison with the Jordanian government.

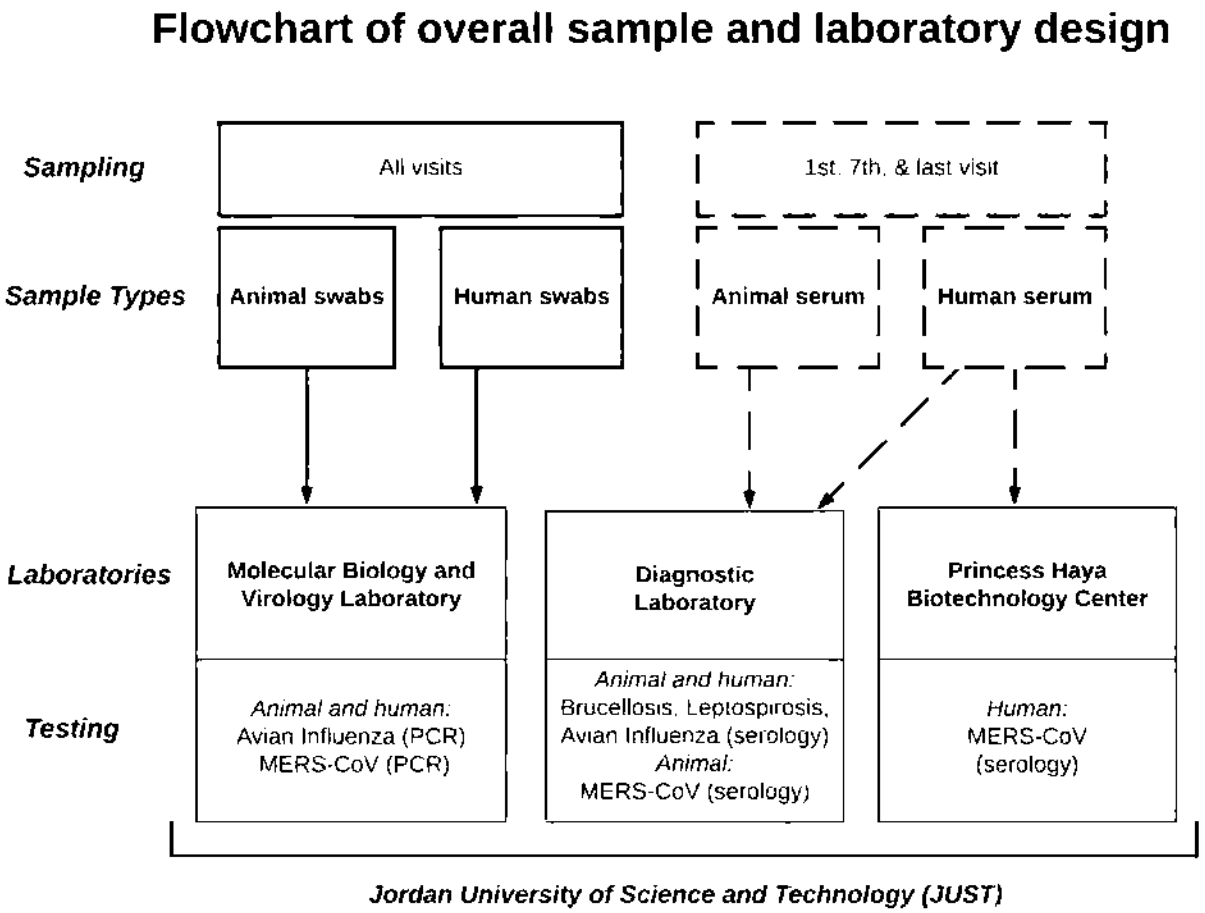
The center comprises a total of sixteen research laboratories and occupies approximately 1,500 square meters.



Human Link, Hazmich, Lebanon

Human Link is a Lebanese-based non-governmental organization, founded in 2014 by a multidisciplinary team of scientists and experts in the fields of human development, engineering, and public health, with a common goal of "research advancing knowledge." Human Link's mission is to design and conduct scientific research and projects in the fields of bio-medicine, public health, environment, economy, and human development aimed at improving global knowledge and enhancing local population livelihoods. Human Link adopts the One-Health philosophy that links human, animal, and environmental health. At the heart of this philosophy is the notion that a healthy environment leads to healthier humans and healthier animals. It aims at reducing the burden of diseases affecting humans through unhealthy animals and unhealthy environment. At the same time, it aims at reducing the burden on the environment exerted by humans and animals.

Dr. Ghazi Kayali, CEO of Human Link, oversees two virology laboratories, one in Egypt and one in Lebanon. Human Link has exclusive use of 2160 sq. ft. of contiguous laboratory and office space in the newly completed Advanced Science building at the National Research Centre in Egypt and 2000 sq. ft. in contiguous laboratory and office space in Lebanon. A 120 sq. ft. office adjoins the laboratory, used exclusively by Dr. Kayali, and a 120 Sq. ft. office for a Secretarial Assistant.

The team includes 1 lab director, 1 postdoc, 1 research assistant, 9 graduate students, 7 field veterinarians, 4 zoologists, 4 field clinicians, and 19 field nurses working on various surveillance, cohort, and laboratory studies. All personnel have institutional laptops connected to shared cloud-based work space. PCR stations, gel documentation systems, and a DNA quantification machine, etc. are operated by connected laptops.

The laboratory in Egypt includes a dedicated tissue culture facility with 2 laminar flow hoods. The main laboratory contains benches for 12 workers, 1 fume hood, 1 fluorescence microscope, 1 inverted light microscope, 3 sinks, a de-ionized water system, a class 3 glove box, a laminar flow hood, 3 -80 freezers, 6 -20 freezers, 5 refrigerators, 5 thermal cyclers, 2 real-time PCR machines, 1 nano-drop, 2 gel documentation systems, and all necessary small laboratory equipment. The laboratory also has access to shared Ion torrent and Illumina MiSeq sequencers.

The laboratory in Lebanon includes a dedicated tissue culture facility, dedicated dark room, and dedicated PCR preparation room. The main laboratory contains benches for 24 workers and trainees, 1 fume hood, 3 sinks, 1 -80 freezer, 1 -20 freezer, 1 refrigerator, 1 thermal cycler, 1 real-time PCR machine, 1 gel documentation system, and all necessary small laboratory equipment.

Dr. Kayali is part of the NIAID CEIRS network, USAID PREDICT network, and DTRA/GCRF CANARIES network. This enhances the work environment and provides access to additional expertise in virology, epidemiology, modeling, and genomics. Dr. Kayali also holds an adjunct assistant professor position at the department of Epidemiology, Genetics, and Environmental Sciences at the University of Texas School of Public Health.

4. FOREIGN PI AND KEY PERSONNEL LETTERS OF COLLABORATION

See next page.

Centers for Disease Control and Prevention

National Center for Emerging and Zoonotic Infectious Diseases
1600 Clifton Rd., MS E-93
Atlanta GA 30329

August 22nd, 2019

To: DTRA C-WMD Thrust Area 6 Program
From: Patrick Dawson

This letter signifies my commitment to support the proposal, *Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity.*

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

My own experience has been with working in Jordan and Egypt over the last seven years on research relating to MERS-CoV and Avian Influenza in animals and humans. Through this work I have partnered with the Jordan University of Science and Technology in Jordan and Human Link in Lebanon. Over the past four years we've developed a positive working relationship through EcoHealth Alliance that I hope to see continue. In my new role, I'll be able to stay to on in an advisory capacity at the start of the project, and assist with data analysis in Year 3.

Sincerely,

Patrick D. Dawson

To: DTRA C-WMD Thrust Area 6 Program
From: Dr. Mahmoud Alhanatleh, CVO, MOA- JORDAN

This letter signifies the Ministry of Agriculture commitment to support the proposal, *Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity.*

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

Our previous experience with one health initiatives is directly relevant to the project objectives. The projects "Cross-sectional surveillance of MERS-CoV and related coronaviruses in camels in Jordan", "Enhanced Surveillance of Trans-boundary Animal Diseases in Rural Areas of Jordan Affected by the Crisis in Syria" and "PREDICT-2 Jordan" has successfully achieved there's research objectives, including developing capacity within Jordan for research, training, surveillance and control. This new collaboration will serve to further build capacity in these areas, equipping Jordan to grow as a regional hub for interdisciplinary, one health approaches to the challenges posed by emerging infectious diseases such as MERS-CoV and Avian Influenza.

We whole heartedly endorse this proposal and the added capacity it will bring to the Ministry of Agriculture in Jordan forMERS-CoV and AI research, training, surveillance, and control.

Sincerely,

Director Of
Veterinary & Animal Health
Dr. Mahmoud Al Hanatleh

Dr. Mahmoud Alhanatleh
Director of Veterinary Directorate (CVO)

From: Ghazi Kayali PhD MPH

This letter signifies my commitment to support the proposal, *Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity*.

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

My own experience with studying Avian Influenza and MERS CoV at the human-animal interface is directly relevant to the project objectives. I have been conducting surveillance for influenza and MERS in poultry, wild birds, swine, camels, bats, humans, cattle, and ruminants in several countries in the Middle East and Africa since 2013. Furthermore, in my capacity as a WHO EMRO consultant, I am familiar with the needs of Jordan and believe that this project will enhance the country's One Health and disease surveillance capacities.

Sincerely,

August 18th, 2019

To: DTRA C-WMD Thrust Area 6 Program
From: Professor Ghassan Tashtoush, Dean of research, JUST

This letter signifies the Deanship of Research at Jordan University of Science and Technology (JUST) commitment to support the proposal "*Reducing the Threat of Middle East Respiratory Syndrome Coronavirus (MERS) and Avian Influenza (AI) in Jordan & Strengthening Regional Disease Surveillance Capacity*".

I strongly support this project. It is designed to build on significant investment already underway in Jordan to augment country capacity for surveillance, detection, and reporting of infectious diseases both endemic and emerging. As some of these projects come to an end, it is critical that the capacity underway be maintained and advanced. This initiative will allow for that. It will also support the creation of a body of scientific knowledge about the presence of pathogens in humans and animals and their epidemiological and ecological dynamics, and the testing of important hypotheses related to the movement of pathogens between humans and animals.

JUST is a leading center of excellence in MERS-CoV research in Jordan and the wider region, with a strong regional influence and a proven track record in delivering high quality scientific research of a global standard. Prof. Ehab Abu-Basha has become a regional expert in MERS-CoV research, policy and control. Over the past two years he has been coordinating monthly Focal Point Meetings among all relevant emerging infectious diseases stakeholders in Jordan (governmental, WHO, FAO and others) to promote synergy of effort, prevent unnecessary duplication of resources or activities and to advise on policy. Prof. Wail Hayajneh, is Professor of Infectious Diseases at Medical school and he is also coordinating the Infectious Diseases group of Jordan and as such is at the forefront of MERS-CoV diagnosis, treatment, surveillance and control in Jordan. In addition to a highly qualified team of experts in the field of Virology, Avian diseases, Livestock infectious diseases that will add great value to the outcomes of this project.

This project will also build upon the considerable research and training capacity already developed at JUST. We whole heartedly endorse this proposal and the research value that it will add to Jordan and to the region.

Sincerely,

Ghassan Tashtoush, Professor and Dean of research

JORDAN UNIVERSITY OF SCIENCE & TECHNOLOGY
OFFICE OF THE DEAN OF RESEARCH

5. PLANNED WORKSHOPS: TOPIC, IMPLEMENTER, AND TIMELINE

All trainings to be conducted in Amman or Irbid, Jordan except where noted.

Description	Participants	Timeline
Project Inception Workshop *One-day review of entire research design and anticipated outputs during kick-off meeting* • Overall research study protocol • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. FDA Min of Environ. Poultry Industry Camel "industry"	Y1 Q1
Jordan Training Workshop 1 *Three-day didactic workshop targeted to all personnel engaged with human subjects and animals at field study sites, laboratory staff and others who will handle human and animal data* • Basic Laboratory Safety Biosafety and Biosecurity • Cold Chain Implementation • Ethical Human Subjects Research • Ethical Animal Subjects Research • Safe Human Sampling • Safe Animal Sampling • Questionnaire Administration • Data Management and Storage	*Required attendance:* Project Personnel *Invited attendees:* Min. of Health Min. of Agric. FDA Min of Environ. Poultry Industry Camel "industry" Students	Y1 Q2
Training at Human Link lab at the National Research Centre, Egypt *Three-day hands on training in MERS-CoV diagnostics and advanced avian influenza diagnostics with Co-I Kayali to prepare for human sample MERS-CoV testing in Jordan (no samples will be transported outside of Jordan).*	Three Jordanian project personnel and three Jordanian students	Y1 Q4
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Review of research study design • Presentation of Results from Year 1 • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	Y2 Q1
Regional Training Workshop 1 *Three-day didactic workshop in adherence to core principles and requirements for safe and secure sample handling and management (based on written DTRA requirements and BMBL 5th Edition Sections III-VI and current best practice standards)* • Review of research study design • Presentation of Results from Year 1	Project Personnel *Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric.	Y2 Q3

• Basic Laboratory Safety Biosafety and Biosecurity • Cold Chain Implementation • Ethical Human Subjects Research • Ethical Animal Subjects Research • Safe Human Sampling • Safe Animal Sampling • Questionnaire Administration • Data Management and Storage • Disease Reporting Procedures for OIE and WHO IHR	Jordan FDA Min of Environ. Poultry Industry Camel "industry"	
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Review of research to date • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	Y3 Q1
Training at Princess Haya Biotechnology Centre, JUST *Hands on training and quality assurance checks and data interpretation training and collaboration on MERS-CoV diagnostics with Co-I Kayali.*	Jordanian project personnel and students	Y3 Q1
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Presentation of Results from Years 1-3 • Policy recommendations • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	Y3 Q4 *Or* OY1 Q1 If option is exercised
Regional Training Workshop 2 **Laboratory techniques, Biosafety and Biosecurity** *Three-day didactic and hands-on intensive training and refresher training on Biosafety and Biosecurity* • Real-time PCR testing and analysis • Influenza Subtyping, Genomic Analysis of MERS-CoVs • Serology testing and analysis • Biosafety and Biosecurity Refresher Training	Project Personnel *Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	OY1 Q3
Training at Princess Haya Biotechnology Centre, JUST *Hands on quality assurance checks and data interpretation training and collaboration on MERS-CoV diagnostics with Co-I Kayali.*	Jordanian project personnel and students	OY1 Q4
Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities*	Project Personnel Min. of Health	OY2 Q1

• Review of research to date • Discussion and input from partners and stakeholders	Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	
Regional Training Workshop 2 **Analyses and Surveillance, Biosafety and Biosecurity** *Three-day didactic and hands-on intensive training and refresher training on Biosafety and Biosecurity* • Geospatial Analysis • Advanced Epidemiology • One Health Disease Surveillance • Biosafety and Biosecurity Refresher Training	Project Personnel *Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	OY2 Q3
Threat Reduction Workshop *This three-day focused, Jordan country-level workshop will be developed and facilitated by the project team in consultation with partners and frameworks pertinent to zoonotic disease risk and impact mitigation (e.g. through World Bank, FAO, OIE, WHO, GHSA, UNDRR) to promote broader alignment and uptake.* • Targeting risk factors in production systems • Disease prevention and control strategies • Economic analysis • Multi-sectoral action plans and roadmaps	*Jordan, Lebanon, and Iraq Representatives from:* Min. of Health Min. of Agric. Jordan FDA Min of Environ. and representatives from other key sectors (e.g. disaster management, finance, industry)	OY2 Q3
Final Annual Partner/Stakeholder Meeting/Workshop *One-day review of project activities* • Presentation of all project results • Policy recommendations • Discussion and input from partners and stakeholders	Project Personnel Min. of Health Min. of Agric. Jordan FDA Min of Environ. Poultry Industry Camel "industry"	OY2 Q4

6. GUIDELINES AND PROTCOLS FOR HUMAN AND ANIMAL SUBJECTS RESEARCH

For human subjects research, our protocols will align with PREDICT protocols with which our in-country teams have been complying for three years. They will be modified to reference the specifics of this project's IRB (as opposed to PREDICT's IRB).

- 5.4 Human Syndromic Surveillance (see next page)

USAID | PREDICT

Section 5.4. Human Syndromic Surveillance

Prepared by
Christine K Johnson, PREDICT Biological and Ecological Surveillance Lead, UC Davis
Karen Saylors, PREDICT Behavioral Surveillance Co-Lead, Metabiota
Corina Monagin, Metabiota

With contributions from:
Maureen Miller PREDICT Behavioral Surveillance Lead
Jason Euren, Metabiota
Ashley Lucas, Metabiota
Nicole Ureda, UC Davis
Kim Dodd, Metabiota
Brian Bird, UC Davis
David Wolking, PREDICT Operations Officer
Tracey Goldstein, PREDICT Pathogen Discovery Lead
and the PREDICT One Health Consortium

Objectives: To safely and ethically collect biological samples and data from humans in clinical settings.

This document was made possible by the generous support of the American people through the United States Agency for International Development (USAID) Emerging Pandemic Threats PREDICT program. It was drafted to support activities conducted under PREDICT and is intended for an audience of qualified professionals trained in standard, associated best practices. This guide is not intended for use by untrained individuals.

The authors assert that human surveillance and sampling should always occur in compliance with all applicable laws and regulations and should only be undertaken after securing all necessary permits and approvals, including ethical approvals.

For more information about the contents of this guide, please contact predict@ucdavis.edu.

References and Appendices

Section 5.4.1. Confirmation of Knowledge

When you are familiar with the information in this guide, take the PREDICT quiz ***Section 8.4.12. Human Syndromic Surveillance***.

PREDICT team members involved in the human surveillance activities described in this guide must be familiar with PREDICT's Institutional Review Board (IRB)-approved Master Protocol and related IRB obligations and should take and pass the quiz ***Section 8.4.18. PREDICT IRB Compliance and Monitoring***.

Section 5.4.2. Ethical and Training Considerations

All PREDICT activities involving human subjects must adhere to the most up-to-date version of the Master Protocol that has been approved by the UC Davis Institutional Review Board (IRB). The Master Protocol is available online through the PREDICT Operating Procedures e-Book under "Section 5.3" (https://eidith.org/Resources/PREDICTOperatingProcedureseBook.aspx). In addition, PREDICT activities involving human subjects may only be initiated after obtaining ethical approval from country institutional review boards.

Before implementing human subjects research related activities, documentation of all necessary country approvals along with attestations of trainings and adherence to ethical standards must be provided for review to UCD, and the UCD IRB as appropriate. These include

1) documentation of local IRB/ethical approvals and all approved documents (including the consent form and human questionnaire translated into the local language and any additional introduction letters and recruitment scripts planned for use);
2) completion of CITI training for all personnel listed on the country protocol (with training events documented in EIDITH);
3) training of project staff in procedures outlined in this SOP (with training events documented in EIDITH);
4) identification and documentation of local institutional biosafety committee (IBC) requirements (if any);
5) a consultation from a local expert summarizing risks to the area; and
6) an attestation that all personnel will adhere to USA and local government federal and state regulations regarding protection of human subjects research.

A checklist with both country IRB preparation guidance and post country IRB approval procedures relating to UC Davis IRB authorization has been created to assist country teams with this process (Appendix 1). Please review this checklist when preparing your application for

country IRB submission and to guide the final UCD IRB authorization process following local IRB approval. **The UC Davis IRB must approve each country's protocol before local activities are initiated.**

Effort will be made in all recruitment, consent, sampling, and interview activities to assure potential participants that their **participation in the study is completely voluntary** and that all information shared with researchers will be kept confidential. Every effort will be made to avoid coercion and ensure the privacy, respect, dignity, and freedom of each participant.

PREDICT staff named on the country protocol must complete Collaborative Institutional Training Initiative (CITI) training in human research ethics for biomedical researchers. In addition, PREDICT staff listed in the country protocol will need to ensure proper training of hospital/clinic POC(s) in study procedures, including recruitment, enrollment, informed consent, and sample collection, to ensure compliance with our Master IRB protocol and PREDICT practices.

When the staffing and implementation plans have been established, a plan should be developed to train clinic and hospital staff on protocol procedures to ensure implementation of agreed upon study design. Consideration should be given to how information will be presented, as not every facility staff member will need to know every detail of the PREDICT plan.

Section 5.4.3. Partnerships with Participating Health Facilities

Symptomatic patients will be recruited for syndromic surveillance in collaborating health facilities that have a catchment area that includes high-risk communities and PREDICT field sites where linked animal and human samples are being collected concurrently.

Syndromic surveillance of patients presenting to health facilities is necessary to identify symptomatic individuals. In order to optimize the chances of accessing the most relevant acute symptomatic individuals presenting at health facilities, appropriate selection and engagement of health facilities is key. While each individual site will require a slightly different approach, teams can be guided by the following methodology when looking to engage and maintain relationships with their sites in each country.

Assessment of the Health Facility

After initial engagement with key personnel, teams will need to work collaboratively with health facility personnel to consider the most optimal way to engage with clinical, laboratory and professional staff. A short form to assist with initial assessment of potential partners for syndromic surveillance is attached in Appendix 2 (Health Facility Screening Form).

Understanding Patient Flow

A thorough review of patient flow from arrival at the facility to discharge should be done by country teams through scoping site visits including:

- Where do patients normally present upon arrival to the facility and who would they first come into contact with for initial screening and assessment?
- What health professionals would potentially be involved in the assessment, diagnosis and treatment of individuals presenting with syndromes of interest throughout their stay at the health facility?
- If patients are not admitted to a health facility but might require follow-up care, what are the normal follow-up and discharge procedures?
- If patients are admitted to the health facility, what service units/departments might be involved in their care and treatment?

Understanding Staffing Needs

Understanding normal daily routine of staff and diagnostic practices, and identifying point of contact(s) (POC), will ensure that PREDICT procedures fit in as seamlessly as possible into the normal clinic routine.

- What is staff workload like?
- Who is your POC(s) to help identify symptomatic individuals?
- Who is your POC(s) for recruitment of appropriate individuals?
- Who may be best suited for assisting with study procedures, including sample collection and administration of questionnaire?
- Are these POC(s) likely to be the same person or different?
- What will be the best way to engage and train staff about study procedures and protocol?
- Are clinical staff skilled in proposed sampling procedures?
- How will costs for staff time at hospitals be covered and implemented?

The team should identify how PREDICT activities will fit into hospital workflow and develop an implementation plan that will need to be agreed upon with the hospital team. Decisions will need to be made about whether current hospital staff will be assigned additional duties or whether a new staff person(s) will be hired.

A detailed implementation plan, taking into consideration the following issues, should be developed with participating hospital staff:

- What are some potential barriers to implementation?
- What level of visibility and follow-up will be appropriate to keep sites engaged for the duration of the study?
- How will you maintain clear and open communication with health facility staff?
- What is the plan if key personnel involved in implementation leave the health facility?
- How will you take into consideration any known or observed differences religious/ethnic/immigration status in targeting individuals for recruitment?
- How will you monitor for adverse events?

Section 5.4.4. Patient Recruitment in Hospitals and Clinics

PREDICT targets patients that have been recently admitted to clinics and hospitals with acute conditions that match the case definitions for undiagnosed febrile syndromes of likely viral origin. **The objective of PREDICT's testing strategy is to detect novel viruses that are causing diseases in patients without a known etiology.** PREDICT testing should not overlap or duplicate diagnostic testing already being conducted at the hospital.
In communications with clinic medical staff, clinic administration and patients who might be enrolled, it is critical to note that **PREDICT's testing strategy will not directly inform on patient diagnoses or treatment. Our testing strategy is exploratory at the community level and not designed as a point of care diagnostic platform for normative (known) diseases.**
Case definitions should be reviewed closely with hospital POC(s) in advance of study implementation to identify patients for enrollment. Patients for enrollment may be identified in the emergency room, in the ward, or in the intensive care unit of each participating clinic and hospital. The POC(s) at each location should use the **clinical case definitions below** to target potential participants. Case definitions for syndromes have been standardized with those commonly used by WHO and CDC to allow national health authorities to interpret data in an international context.

Syndromic Category Clinical Case Definitions

Surveillance should be designed to target specific syndromes as appropriate in each clinical setting. Identification of relevant syndromes for each facility should be done on a facility-by-facility basis with participating partners and facility staff. Selected syndromes should reflect 1) high priority undiagnosed syndromes with likely animal origins, and 2) the clinical caseload of the hospital or clinic so that a large number of patients with targeted syndromes can be enrolled. Additionally, targeted syndromes should take into account local needs and seek to not duplicate ongoing syndromic surveillance programs by other partners at the clinic or hospital.

In larger referral hospitals with high caseloads, enrollment of patients in the PREDICT study will most likely want to focus on the following three severe syndromes and clinical case definitions to better target individuals with potentially unknown viral pathogens of concern:

1. **Severe Acute Respiratory Illness (SARI) of unknown origin:**
Acute onset of a fever greater than or equal to 38°C (100.4 °F) within the last 5 days
AND cough
AND requires hospitalization (or referral to a hospital)
AND absence of a more likely clinical explanation.

2. **Acute Encephalitis Syndrome (AES) of unknown origin:**
Acute onset of a fever (greater than or equal to 38°C or 100.4 °F) within the last 5 days
AND clinical signs consistent with meningitis, encephalitis, acute flaccid paralysis, or other

acute signs of central or peripheral neurologic dysfunction, as documented by a physician or a health-care provider
AND absence of a more likely clinical explanation.

3. **Hemorrhagic fever of unknown origin:**
Acute onset illness with a fever greater than or equal to 38°C (100.4 °F) within the last 5 days in a severely ill patient
AND clinical findings of bleeding or hemorrhage with no apparent cause
AND one or more of the following clinical findings: 1) severe headache, 2) muscle pain, 3) rash on the trunk within 3–4 days after rash onset, 4) vomiting, 5) diarrhea, 6) abdominal pain, or 7) pharyngitis, as documented by a physician or a health-care provider
AND absence of a more likely clinical explanation.

See also http://wwwn.cdc.gov/nndss/script/casedef.aspx?CondYrID=893&DatePub=2010-01-01

In smaller rural clinics, with limited diagnostic capabilities and lower patient caseloads, it may be appropriate to enroll a broader range of patients with suspected illness of unknown origin. In these circumstances, the following 2 clinical case definitions, for less severe and less specific syndromes, may be appropriate to target in addition to the severe syndromes targeted above.

4. **Fever of Unknown Origin (FUO):**
A temperature greater than or equal to 38°C (100.4 °F) for more than 24 hours as reported or measured by the patient or a health-care provider
AND absence of a more likely clinical explanation or failure to reach a diagnosis.

5. **Influenza-like Illness (ILI) of unknown origin**:
Acute onset of a fever greater than or equal to 38°C (100.4 °F) within the last 5 days.
AND cough
AND absence of a more likely clinical explanation.

Be sure to follow the most up-to-date version of the PREDICT Master IRB protocol with respect to all procedures, including recruitment, enrollment, inclusion, and exclusion criteria, and sample sizes.

Additional Enrollment Criteria and Considerations

PREDICT and hospital/clinic staff must take special care to ensure that patient recruitment and enrollment is not adversely impacting patients seeking medical care, or hindering patients' ability or willingness to seek medical care in any way. Recruitment and enrollment of patients should only occur after patients have established access to health services. Patient recruitment for this study should not be linked to patient intake or admission. Enrollment must be completely voluntary.

Eligible individuals should be recruited as soon as safely possible after presentation to the health facility, and after initial screening to ascertain whether patients meet the above clinical case definition, in order to maximize the utility of the biologic specimen collected. Successful recruitment of syndromic individuals will require monitoring of incoming patients to health facilities. Recruitment from health facilities involves many coordinated steps, involving coordination between PREDICT and health facility staff.

In addition to the clinical case syndromes identified above, inclusion and exclusion criteria outlined in the approved Master IRB protocol that must be applied to all PREDICT studies is reiterated below:

Additional Inclusion Criteria	***Exclusion Criteria***
1. Adults (18 years of age or greater) who provide informed consent	1. Individuals aged 18 years or older who refuse to provide informed consent, a parent or guardian of a child who refuses to provide consent on behalf of their child, or a child 12 years or older unable or unwilling to provide assent
2. Children (2 -17 years of age) * with an accompanying parent or guardian who is able to provide informed consent. Assent of children 12 years or older also required.	2. Adults unable to provide informed consent, including individuals with physiologically or medically induced cognitive impairments. **
3. Pregnant women	3. Children without an accompanying parent or guardian who is able to provide informed consent
	4. Children < 2 year of age
	5. Prisoners

**Children defined as 2-17 years unless the age of majority in a participating country differs. In these cases, the age range for children will be listed in the country specific IRB protocols.*
