Do we have any NIH funded collaborations with Dr Shi from Wuhan? Replies would be appreciated. Responding to an inquiry

Thanks, Jim

Dear Jim,

Thanks for your information and we are working hard now on the related works. Hopefully some results could be relaesed soon.

The lab is under operation during the holiday and I will let you know the situation at the convenient time.

Regards

Zhiming

See link below on a story just released this morning in Wired Magazine. I tried to stress the dramatic improvements in PH and technology between 2003 and now—note title.

Too bad she misspelled my name...

Nice work, Jim

Here's a link to the story, which published this morning. Thanks again for sharing your story with me, very cool to see how much has changed in 20 years. If you've ever got any interesting infectious pathogen story tips going forward, don't hesitate to reach out.

Best regards,
Megan

Thanks again,
Megan

On Fri, Jan 10, 2020 at 7:03 AM LeDuc, James W. <jwleduc@utmb.edu> wrote:

> Megan, I spoke to Tom Ksiazek who conducted the original SARS isolation. As mentioned below, he was able to isolate the virus from a throat swab taken from Dr Urban on his arrival into Thailand where he was hospitalized and later died. The specimens were immediately sent to CDC and arrived the evening of 13 Mar and were inoculated into cell cultures that same evening. Evidence of virus growth was first seen on day 5 post-inoculation and a sample of the replicating virus was sent that same day to the electron microscopy laboratory where a coronavirus-like particle was visualized by Cynthia Goldsmith. Based on this preliminary information, Dr Dean Erdman and his team designed consensus primers for coronavirus and were able to amplify a product by RT-PCR, which was then sequenced, further supporting that the isolate as a coronavirus. Virus RNA was sent to the DeRisi lab in California where he confirmed coronavirus identity using his then state-of-the-art array.

> > Thanks for tracking this story Megan. I am tied up in a retreat unfortunately. The person who led this work is a brilliant global expert, Dr. James (Jim) LeDuc (copied above) who is now a Professor in charge of emerging pathogens at the University of Texas in Galveston. If you recall, with SARS Canadian scientists initially claimed that the infections were caused by a metapneumovirus but that proved to be a false positive. CDC took a more conservative approach. Though we strongly suspected we had isolated the causative coronavirus very early by observing its corona-like structure under an electron microscope, Dr. LeDuc made sure we first essentially satisfied Koch's postulates of disease causality and proved that we could isolate the virus from infected people, inoculate it into a non-human host and recapitulate the disease, and then isolate it from sites of infection in that host. Our approach involved collaborators in Europe who I believe did the actual animal work at the same time we were doing the genetic sequencing. (One lesson learned from the Canadian experience is that virus are ubiquitous

and that isolating and sequencing one does not necessarily mean it is causing the disease.). Hope this background helps. Dr. LeDuc can correct any lapses in my memory.
Best,

Specifically, I'm interested in how those methods compare to the search for the pathogen behind SARS in 2003. I reached out to the CDC to speak to someone on the agency's task force at the time and they recommended I get in touch with you. Do you have any time today for a quick phone interview?

Subject: RE: NASEM bio meetings in Harbin, China in Jan 2019 - travel memo and final agenda
Attachments: NAS SOS International_PrintCard.pdf; From -hvrizj- AGENDA_CAAS_NAS_JAN 2019 (20190103) from NAS clean.docx; Harbin Meeting Travel Memo for Jan 2019.docx

Greetings,

Happy new year! The (hopefully) final version of the Harbin meeting agenda (2019-1-03) is attached for your information, sorry for the delay. The agenda includes a visit to the 731 museum and a group tour of the Harbin International Ice and Snow Sculpture Festival on the last day of the meeting.

Due to the ongoing U.S. Government shutdown it is unlikely that Doug Gladue and David Swayne will be able to travel to the meeting. This is unfortunate and we will miss them. However they have provided their slides and other members of the delegation have volunteered to give their presentations on their behalf.

I have attached the latest version of the travel memo for your information. When you arrive in Harbin you will be met at the airport and driven to the Aoluguya Hotel (I do not have hotel room confirmation numbers yet, if I get those before Saturday I will send them in a second email.) **Please print out the memo and bring it with you.** It includes additional information that you may need before you leave.

FYI All travelers funded by NAS have been placed in the International SOS Global Assistance Program http://www.internationalsos.com/en/, (member number 11BMMS000238) while in Harbin (see attached card). Please also enroll in the U.S. Department of State Smart Traveler Enrollment Program (STEP) https://step.state.gov/step/ before you travel.

I will be in the office all day tomorrow if you have any final questions. Thanks again for agreeing to patriciate and I look forward to seeing you in China!

PS Some early photos of the festival:

Subject: RE: NASEM bio meetings in Harbin, China in Jan 2019 - conference call on 12/18 at 2 PM ET docs
Importance: High

Greetings,

Just a reminder that we are having a conference call to discuss the Harbin trip tomorrow **Tuesday, December 18th at 2:00 PM ET.**

At 2:00 PM ET please call 1-888-537-7715 and when prompted, enter passcode 552.136

Conference call agenda:
-Introduction
-Discussion of meeting and workshop goals (see attached one pager)
-Discussion of 12-11-18 agenda (attached)
-Discussion of DRAFT travel memo and logistics questions (attached)
-Other issues

We have attached a DRAFT travel memo for your initial review. We are missing a bit of information /detail so plan to send you the final memo (with more information about evening activities) the week before the meeting.

We look forward to talking to you tomorrow.

Kind regards,

Ben

Good Afternoon,

We will hold a 1-hour conference call for the Harbin trip on **Tuesday, December 18th at 2 PM ET.**

At 2:00 PM ET please call **1-888-537-7715** and when prompted, enter passcode **552.136**

We will also be sending out a conference call agenda and draft travel memo before the conference call.

Best regards,

Nicole

Subject: NASEM bio meetings in Harbin, China in Jan 2019 - update and conference call
Importance: High

Greetings,

Thank you for agreeing to participate in the U.S. National Academy of Sciences, Engineering and Medicine (NASEM) and the Chinese Academy of Agricultural Sciences (CAAS) U*.S. China Dialogue and Workshop on the Challenges of Emerging Infections, Laboratory Safety, Global Health Security and Responsible Conduct in the Use of Gene Editing in Viral Infectious Disease Research*.

As you know the meetings will take place on January 8-9-10, 2019 on the campus of CAAS's Harbin Veterinary Research Institute in Harbin, China. The U.S. group will stay at the **Aoluguya Hotel** (No. 800, the 3rd Road of Chuangxin, Harbin) during the meeting.

I have attached the latest DRAFT of the agenda for your review and information. It includes the names of confirmed Chinese speakers and possible session goals and discussion questions. Please review (and propose modifications to) the talk titles we proposed.

We would like to hold a conference call next week to discuss the agenda and other issues associated with the meeting. **Please send Nicole Cervenka (cced) your availability to participate in a one hour call from 9 AM to 6 PM ET, Monday Dec 17 to Thursday December 20th.** We will provide conference call in information when we send you the time for the call.

Thank you for working with Hope Hare (also cced) to make your flight arrangements and submit your visa application. We are working on the applications and will get passports back to you as soon as possible. We will also send you a travel memo with full logistical details before the conference call.

Kind regards,

Ben

WORLDWIDE REACH. HUMAN TOUCH. internationalsos.com/members

› **LOG ON TO:**
internationalsos.com/members to sign up for health and security email alerts using your membership number or:

› **DOWNLOAD:**
the free Assistance App* from app.internationalsos.com to contact us and help you make more informed travel decisions based on our online medical and security reports and country travel risk guides.

Available on Android•, BlackBerry", Windows• & iPhone•.

WORLDWIDE REACH. HUMAN TOUCH. **INTERNATIONALSOS.COM**

WHEN DO I USE INTERNATIONAL SOS?

Prepare before you leave home:

- Keep your membership card safe and with you at all times
- Call an assistance center for pre-travel information (i.e., vaccination, required medication and travel security concerns)
- Download the Assistance App, log in using your membership number to help you make more informed travel decisions based on our online medical and security reports and country travel risk guides
- Sign up for health and security email alerts
- Inform friends and family that you are with International SOS, so they can get in touch with us should they have any concerns for your welfare while you are away.

While abroad, contact us for all medical and travel security enquiries, be they of a routine or emergency nature:

- Free and unlimited health, safety, and security advice
- Find a local nurse, internationally -trained doctor or security specialist near you
- Find medication or medical equipment
- Travel advice on loss of travel documents or legal assistance
- Assistance paying your medical fees

In an emergency, we provide all necessary emergency services, including:

- Arranging medical transportation and care
- Monitoring your condition and provide advice along the way
- Evacuate you when necessary
- Contacting your family, so they know you are in good hands.

U.S.-China Dialogue and Workshop on the Challenges of Emerging Infections, Laboratory Safety, Global Health Security and Responsible Conduct in the Use of Gene Editing in Viral Infectious Disease Research

Harbin Veterinary Research Institute
Chinese Academy of Agricultural Sciences
Harbin, China

8-10 January 2019

Monday, 7 January

Some participants arrive at the Aoluguya Hotel (No. 800, the 3rd Road of Chuangxin, Harbin)

Evening activity for those that have arrived: group tour of the Harbin Ice Festival (proposed)

Tuesday, 8 January

7:50 Shuttle bus from Aoluguya Hotel to Harbin Veterinary Research Institute (HVRI)
(No 678 Haping Road, Xiangfang Qu, Haerbin, Heilongjiang Province, China 150060)

WELCOME AND OPENING REMARKS

9:00 **Welcome, Introductions, and Opening Remarks**
Chairs: Zhigao Bu

1. Welcome on behalf of Chinese Academy of Agricultural Sciences (CAAS): , **Kongming Wu**, Vice-President of CAAS
2. Remarks on Behalf of U.S. National Academies of Sciences, Engineering, and Medicine: **Benjamin Rusek**, Policy and Global Affairs, U.S. National Academy of Sciences (NAS) and **Diane Griffin**, Johns Hopkins Bloomberg School of Public Health and Vice-President of NAS

9:15 **Session 1. Keynote Addresses** *[20 min each]*
Chairs: Benjamin Rusek

1. **Prof. George F. Gao**, Director-General, Chinese Center for Disease Control and Prevention
   Oversight for Research on Viral Pathogens with Pandemic Potential – the Perspective from China
2. **Prof. Linda Saif**, Ohio State University
   Emerging swine coronaviruses and their interspecies transmission

Q&A/Discussion *[15-20 min]*

10:15 Coffee and Tea Break

EMERGING INFECTIOUS DISEASES

Goal for Sessions 2 and 3: Consider progress in understanding two diseases of concern to China and the U.S., including the health and economic implications and what advances in understanding may be enabled by recent scientific and technical developments such as gene editing.

10:30 Session 2. Swine Fever *[15 min each]*

Chairs: Linda Saif and **Hualan Chen**

1. **Prof. Xiaodong Wu**, China Animal Health and Epidemiology Center)
   Current Situation and Control Strategy of African Swine Fever in China
2. **Prof. Zhigao Bu,** Harbin Veterinary Research Institute, CAAS *Characterization of African Swine Fever Virus Isolated from China*
3. **Dr. Douglas Gladue**, U.S. Department of Agriculture
   Editing African swine fever virus field isolates for live attenuated vaccines: Current live attenuated vaccine status
4. **Prof. Hengsheng Ouyang,** Jilin University
   Genome-edited pigs protected from classical swine fever virus
   Q&A/Discussion *[10-15 min]*

Proposed discussion questions

- What is known about the epidemiology, health, and economic impacts of Africa Swine Fever?
- What is the latest progress on developing effective countermeasures and limiting the spread of this disease?
- What critical areas remain unknown or what are key challenges to preventing and responding to Africa Swine Fever outbreaks? How can new scientific and technical advances contribute to research and development?

11:45 Session 3. Influenza

Chairs: Linda Saif and **Hualan Chen**

1. **Overview: Perspectives on international collaborations for influenza research** *[10 min each]*
   Prof. Hualan Chen Harbin Veterinary Research Institute, CAAS
   Influenza Vaccine Research in China and Globally
   Prof. David Swayne, U.S. Department of Agriculture
   Collaborating on Influenza Research from the U.S. perspective
2. **Panel Discussion**
   Speakers provide 5 minutes opening remarks on the topics identified below, followed by discussion facilitated by the session Chairs
   Prof. Dayan Wang, National Institute for Viral Disease Control and Prevention, China CDC
   Human Infection with Zoonotic Influenza
   Prof. Chengjun Li, Harbin Veterinary Research Institute, CAAS
   Interactions between Influenza Viral RNP Complex Proteins and Host Cellular Factors

Proposed discussion questions

- What is known about the epidemiology, health, and economic impacts of Influenza?
- What is the latest progress on developing effective countermeasures?
- What critical areas remain unknown or what are key challenges to preventing and responding to influenza outbreaks? How can new scientific and technical advances contribute to research and development?

12:45 **Group Photo**

13:00 **Lunch**

VIRAL PATHOGENS: SCIENCE AND RESPONSIBILITY

Goal for Sessions 4, 5, and 6: Discuss relevant pathogen properties that researchers may seek to alter, and why, as part of studying viral pathogens with pandemic potential. Illustrate challenges and opportunities posed by new strategies such as use of gene editing, rational design approaches, other strategies enable by advancing biotechnology. Discuss the associated issues in the ethical planning and conduct of such research so that it can be conducted safety and securely.

14:30 **Session 4. Understanding and Engineering Viral Pathogens with Pandemic Potential** *[20 min each]*

Chairs: Diane Griffin and **George F. Gao**

1. **Ralph Baric**, University of North Carolina
   Advances in Understanding and Altering Pathogen Properties
2. **Prof. Weiwen Zhang**, Tianjin University
   Cutting Edging New Biotechnology: Strategies and Tools for Engineering

15:10 Coffee and Tea break

15:45 **Session 5. Bioethics and Responsible Planning for Pathogen Research** *[15 min each]*

Chairs: Diane Griffin and **George F. Gao**

1. **Prof. Zhiming Yuan**, Wuhan Institute of Virology, CAS
   Biosafey and Bioethics in Medical Research
2. **David Relman**, Stanford University
   Tradeoffs between benefits and risks in pathogen research
3. **Prof. Jianwei Wang,** Institute of Pathogen Biology, Chinese Academy of Medical Sciences & Peking Union Medical College
   Biosafety Management of Synthetic Biology: Challenges and Progress
4. **Associate Prof. Yang Xue**, Tianjin University
   Biosafety and Bioethis Considerations in Dual-Use Risks Management – China's Efforts and Future Works

16:45 **Session 6. Panel on Science and Ethics in Research with Pathogens with Pandemic Potential**

Chairs: **Diane Griffin** and **George F. Gao**

Chairs facilitate a discussion between **Ralph Baric, Weiwen Zhang, Zhiming Yuan, David Relman, Jianwei Wang, Yang Xue** and the audience. *[45 min]*

Proposed discussion questions

- *What do recent advances in biotechnology, such as genome editing, enable researchers to achieve in improved characterization and alteration of the properties of pathogenic viruses?*
- *What do you see coming in the near term? What still remains very challenging and why?*
- *Because research on viral pathogens can raise security concerns, how do you think about making decisions on whether or not to conduct such research or about modifying research proposals? What are the responsibilities and best practices of the PI to ensure that pathogen research is conducted safely and securely over the course of the project?*
- *What ethical and policy challenges remain and what actions do you think are needed to help overcome these challenges?*

17:30 Transportation from HVRI

18:30 Dinner at Restaurant

Wednesday, 9 January

07:50 Transportation to HVRI

VECTOR AND HOST ENGINEERING

Goal for Session 7: Research to understand and prepare for viral pathogens may also involve work conducted on the hosts or vectors of such pathogens, for example to better understand host-pathogen responses and vector transmission. Discuss how advances in areas such as gene editing are affecting such research and best practices for safely and responsibly conducting such studies

9:00 **Session 7. Vector and Host Engineering: Safety and Security** *[15-20 min each]*
Chair: Jim Le Duc and **Zhiming Yuan**

1. **Prof. Qian Han**, Hainan University
   Biochemical Pathway of a Mosquito Innate Immunity, Melanization
2. **Stephen Higgs**, Kansas State University
   Best practices in safety and security for working with arthropods that serve as pathogen vectors, including responsible research with gene drive modified vectors

Q&A/ Discussion *[20 min]*

10:00 Coffee and tea break

10:30 **Session 7 resumes**

3. **Highlights of Recent Research:**
   Prof. Tongyan Zhao, Institute of Microbiology and Epidemiology, Academy of Military Medical Sciences
   Vector Competence of Emerging Mosquito Borne Virus in China
4. **Prof. Gong Cheng**, Tsinghua University
   A Gut Commensal Bacterium Promotes Arbovirus Infection in Mosquitoes

Q&A/ Discussion *[30 min]*

Proposed discussion questions

- *What do recent advances in biotechnology, such as genome editing, enable researchers to achieve in studying and manipulating hosts and vectors of viral pathogens*
- *What do you see coming in the near term? What still remains very challenging and why?*
- *What are the responsibilities and best practices of the PI to ensure that pathogen research is conducted safely and securely over the course of the project?*
- *What ethical and policy challenges remain and what actions do you think are needed to help overcome these challenges?*

12:00 Lunch

EFFECTIVE OVERSIGHT SYSTEMS

Goal for Session 8: Discuss the systems of institutional review and oversight in China and in the US for safe and secure conduct of laboratory research on viral pathogens with pandeminc potential. Focus on the institutional systems including the important role of leadership in promoting institutional cultures that support responsible research practices.

13:30 Session 8. Best Practices in Laboratory Safety and Security for Pathogen Research

Chairs: Mifang Liang and **Joe Kanabrocki**

1. **Joseph Kanabrocki**, ***University of Chicago*** *[20 min]*
   Institutional review and oversight for research on viral pathogens with pandemic potential – a U.S. perspective
2. **David Franz** and **Zhiming Yuan** *[20 min together]*
   The Role of Leaders in Laboratory Safety: Culture and governance to steer toward behavior changes

Facilitated Discussion

Chair facilitates a discussion with the speakers and audience [25 min]

Proposed discussion questions

If assessment of anticipated risks and benefits results in the decision to undertake an experiment that involves characterizing or manipulating a pathogen with pandemic potential:

1. *How should the research-conducting institution oversee this research to ensure that it is conducted safely and securely over the course of the project? Does this oversight happen at one point or at multiple points over the course of the project?*
2. *What are the responsibilities of institutional leadership in promoting the culture of responsible conduct of science?*
3. *Are there particular scientific or experimental practices that should be incorporated into research design and conduct that can maximize safety and security for studies carried out to understand or alter the properties of pathogens with pandemic potential?*

14:40 Special Topic: One Health in China *[20 min]*

Chairs: Mifang Liang and **Joe Kanabrocki**

Understand how a One Health approach is shaping research to understand and address viral pathogens in China
Prof. Jiahai Lu, Sun Yat-sen University
Q&A/Discussion *[10 min]*

15:10 Coffee and Tea Break

RECENT RESEARCH AND PERSPECTIVES

Goal for Sessions 9 and 10: Gain further shared insights into how research communities are addressing issues in biosafety, biosecurity, and bioethics, particularly as applied to research on emerging infectious diseases caused by viral pathogens

15:30 **Session 9. Chinese Biosafety, Biosecurity, and Bioethics** *[15 min each]*
Chair: Mifang Liang and **Joe Kanabrocki** (give some opening comments)

1. **Dr. Peijun Zhai**, CNAS
   Overview of Laboratory Biosafety Management System in China
2. **Prof. Jiancheng Qi**, National Biological Protection Engineering Center, China
   Development and Application of Laboratory Biosafety Equipment in China
3. **Prof. Yunzhang Hu**, Institute of Medical Biology, Chinese Academy of Medical Sciences
   Kunming National Primate Research Center of High-Level Biosafety
4. **Prof. Ruifu Yang**, Institute of Microbiology and Epidemiology, Academy of Military Medical Sciences
   Microbial Forensics: Building Capability for Source Tracing of Bioterrorism Pathogen.

Q&A/Discussion *[30 min]*

17:00 Transportation from HVRI to Restaurant

18:30 Dinner and optional group outing

Thursday, 10 January

7:50 Hotel shuttle bus transport to HVRI

9:00 **Special Topic: Update on Acute Flaccid Myelitis**
Diane Griffin, Johns Hopkins Bloomberg School of Public Health [20 min]
Review of what is currently known about the cause of Acute Flaccid Myelitis
Q&A/Discussion [*10 min]*

9:30 **Session 10: Chinese Perspectives on Emerging Infectious Diseases** *[15 min each]*
Chair: Pei-yong Shi and **Zhengli Shi**

1. **Prof. Changjiang Weng,** Harbin Veterinary Research Institute, CAAS
   DDX19, A novel Viral RNA Sensor, Regulates IFN Signaling upon Viral Infection
2. **Prof. Zhengli Shi,** Wuhan Institute of Virology, CAS
   Risks of MERS-cluster coronaviruses in China

3. **Prof. Haixue Zheng**, Lanzhou Veterinary Research Institute, CAAS,
   Rational Design of Master Seed Virus to Improve the Safety and Effectiveness of Foot and Mouth Disease Vaccine

10:15 Coffee and Tea Break

10:45 Session 10, cont'd

4. **Prof. Rui Gong**, Wuhan Institute of Virology, CAS
   Development of Neutralizing Antibodies Domains as Therapeutic Candidates Against Infectious Diseases
5. **Prof. Longding Liu**, Institute of Medical Biology, Chinese Academy of Medical Sciences
   Development of inactivated EV71 Vaccine (Human diploid cell) and Pathogenic Study of EV71 Infection in Rhesus Macaque
6. **Prof. Chengfeng Qin**, Institute of Microbiology and Epidemiology, Academy of Military Medical Sciences
   Zika Virus Neurotropism the Bad and the Good

Q&A/Discussion *[30 min]*

12:00 Special Session 11

Chair: Pei-yong Shi and **Zhengli Shi**

1. **Prof. Chunbo Lou,** Institute of Microbiology, CAS
   Large Gene Cluster and Regulatory Manipulation for Activating the Cryptic Natural Product Clusters in Streptomyces
2. **Prof. Xiaoli Xue,** Key Laboratory of Synthetic Biology, Shanghai Institute of Plant Physiology, CAS
   Creating a Functional Single-chromosome Yeast

12:30 Lunch

13:00 Visit the Unit 731 Museum

LOOKING FORWARD (CLOSED SESSION, BY INVITATION ONLY)

Goal for Sessions 12: Identify shared priorities and potential opportunities for future discussions to advance safety and security

14:30 Session 12: China-U.S. Collaboration: Opportunities to Prevent Future Pandemics

Chairs: James Le Duc, Zhiming Yuan, Diane Griffin, and Zhigao Bu

Cooperating to combat emerging infectious diseases that affect China and the U.S. - Cooperation on laboratory safety: biocontainment research and collaboration across borders (including discussion on building a network of BSL-4 laboratories concept http://science.sciencemag.org/content/362/6412/267 and other collaborations between Chinese and American scientists)

16:00 Visit Harbin International Ice and Snow Festival

18:30 Transport to Restaurant

Friday, 11 January

AM and PM: transportation provided to airport

U.S.-China Dialogue and Workshop on the Challenges of Emerging Infections, Laboratory Safety, Global Health Security and Responsible Conduct in the Use of Gene Editing in Viral Infectious Disease Research

*May not be able to attend (due to USG shut down) If for some reason you are delayed or rerouted onto another flight, please e-mail or text Ben Rusek (brusek@nas.edu 001-202-839-0075) and let him know your new flight information.

IMMIGRATION AND CUSTOMS PROCEDURES

While on the plane to your first destination in China, you will receive a landing card to complete. You will need some of the information in this memo to fill out the card so please print it and take it with you. After departing the plane, you will pass through immigration, following the signs for foreign citizens. China has now started requiring fingerprinting of travelers at immigration checkpoints so you may need to go to a machine to do this before entering the immigration line. The immigration officer will check your passport and visa. After you clear immigration if you checked a bag you will then collect your luggage. After you have your bags, you will go through customs. You should select the "GREEN" channel if you have nothing to declare. If you go through the Green channel, you will not be asked to complete a Baggage Declaration Form. From there, you will enter the transfer hall, recheck your baggage, go through security for domestic flights, and go to your gate. When you arrive in Harbin, you can pick up your rechecked bag at baggage claim.

GROUND TRANSPORTATION TO HOTEL

Upon arrival in Harbin, you will be met at the airport by a driver and an English-speaking volunteer from the Harbin Veterinary Research Institute (HVRI). They will be holding a sign with HVRI, your name written in English or "NAS," and will take you to the **Aoluguya Hotel** (see address in hotel section) where you will stay while in Harbin. The area immediately outside of baggage claim may be crowded, you may have to take a second look, but the driver will be there. Should your flight be delayed, a driver will wait for you. Some people arrive on the same flights (see arrivals table) or at the same time so you may wish to communicate before arriving in Harbin and meet up on the plane or at the airport.

If you cannot find the driver after having thoroughly looked for the sign with your name, please take an OFFICIAL TAXI ONLY (do not take a taxi van) to the Aoluguya Hotel (see address below). The airport taxi stand is well marked after you leave the customs and immigration part of the airport. The cost of a taxi ride to the hotel from HRB is RMB 120 ¥ (approximately $18). The Chinese currency is the Renminbi, abbreviated RMB, and the unit is the Yuan, abbreviated as ¥ or CNY; currently 1 USD = 6.88 CNY/RMB. You can use the currency exchange offices at the airports. Please ask for a receipt from the driver as you will need it for reimbursement. It is not customary to tip the drivers. Please pay by the meter in the taxi. DO NOT ACCEPT offers from unofficial drivers under any circumstances.

TRAVEL TIPS

Getting Around

Taxis are inexpensive and convenient to use. To make communication easier, have the hotel write your destination in Chinese. Be aware that some drivers will attempt to negotiate the price of a ride and that asking them to run the meter will help avoid potential conflicts.

You can also use the app **DiDi,** which is similar to Uber of Lyft in the U.S. If you plan on using the app, download it from your smart phone's app store and set it up on your phone before you leave.

The bus system in Harbin is the most convenient public transportation option. Signage is in Chinese, but the stops should be announced in both Chinese and English. Passengers can pay by touching on with an "IC" card or by putting ¥1 or ¥2 into the fare box as they board the bus.

If for some reason you need a car and driver while in Harbin, you may request a car at the hotel front desk. Please arrange for payment directly with the hotel or with the car and driver service. Taxis can also be called by the concierge. It is helpful to have the hotel concierge write your destination in Chinese for the driver. Likewise, have the hotel address in Chinese for your return.

What to Pack

The weather will likely be cold at around 15°F. Therefore, it is a good idea to bring plenty of warm clothes, a hat, gloves, etc. The meeting will begin with business attire (coat and tie) and hope that it becomes less formal as the meeting proceeds.

Be sure to bring any medications or other items you will need, preferably in a carry-on just in case your luggage is delayed. **Many common over the counter medications are not available in China.**

A list of useful items includes: plenty of business cards, a travel alarm clock, warm layers, a hat, gloves, a small flashlight, pocket-packs of tissues and wet wipes, cold medication, Imodium, a camera and chapstick. It is best not to bring anything that would be an attractive target for thieves, such as expensive camera equipment. You will have to decide whether to bring a laptop computer. If you do bring one, it is generally a good idea to keep it with you at all times.

Money

You may want to obtain some Chinese money of your own for souvenir shopping, drinks, entertainment, and sightseeing. The exchange rate on December 12, 2018 was 6.88 Yuan per dollar. For purchases or exchanges, please bring cash, debit cards, or credit cards. Traveler's checks are much less useful and very inconvenient – only a few banks in China will change them – so we do not recommend that you bring them. Some ATM machines will accept international cards, including Bank of China and China Merchants Bank, and provide instructions in English. If an ATM requires a six-digit PIN, try adding two zeros to the front of your number. There are also Western Union locations in almost every China Post 中国邮政 and Agricultural Bank 农业银行; look for the yellow western union sign.

Some shops and restaurants will accept international credit cards. However some only accept Union Pay branded cards. It's always good to have one with you in case of emergency, but you should **not** rely on being able to use credit cards for all your purchases. Even some businesses that say that they take credit cards only take Chinese network credit cards (not Visa, MasterCard, or Amex). If you bring cash, please make sure that the bills are clean. Worn, stained, marked, or old bills are often rejected in China. When carrying Chinese currency an assortment of denominations is useful, as you might not always be able to change large bills. (Many people use their phone and the Chinese app WeChat to pay for purchases.)

Health Concerns

Drinking tap water in China is **not** recommended. Please drink bottled water whenever possible. The air quality in Harbin averaged around 100AQI (moderate) in December and January 2018, but has recently reached the 300s (hazardous). The U.S. Department of State recommends sensitive individuals should consider limiting prolonged outdoor activities, and that everyone should avoid outdoor exertion when the air quality is at hazardous levels.

Global Assistance for Travelers

Before you travel please enroll in the U.S. Department of State Smart Traveler Enrollment Program (STEP) https://step.state.gov/step/. All travelers funded by NAS have been placed on the International **SOS Global Assistance Program** http://www.internationalsos.com/en/, **(member number 11BMMS000238)** while in Harbin. As a traveler for NAS, you can utilize this resource by calling an International SOS Assistance center, which has physicians, multilingual coordinators, operations managers, logistics support personnel and medical and security professionals on hand to speak with you 24/7. SOS can give medical advice, arrange for you to be seen at a nearby medical center (pre-evaluated for quality), arrange for prescription medications, or even arrange for evacuation, if needed. Note that this is assistance, not insurance, but SOS

and NAS can arrange payment for services and work out reimbursement from your insurance later. The NAS membership number is 11BMMS000238. Your closest assistance center in China will be the Beijing office (+86-10-6462-9100). SOS International Alarm Centers can also be contacted in Hong Kong at (852) 2528 9900 and in the United States at (215) 942 8226. See the International SOS card or download the SOS App before you travel, which is the fastest way to access help in case of an emergency. NAS staff has experience working with International SOS and can provide assistance if requested; please ask for our assistance should you have medical concerns. Ben will have hard copies of SOS cards.

Additional information on medical providers specializing in treating foreigners for general medical, dental and orthodontic problems are available at https://china.usembassy-china.org.cn/

Information on vaccinations and other health precautions, such as safe food and water precautions and insect bite protection, may be obtained from the Centers for Disease Control and Prevention's hotline for international travelers at 1-877-FYI-TRIP (1-877-394-8747) or via the CDC's Internet site at: https://wwwnc.cdc.gov/travel/destinations/traveler/none/china

For information about outbreaks of infectious diseases abroad consult the World Health Organization's (WHO) website at http://www.who.int/en. Further health information for travelers is available at: http://www.who.int/countries/chn/en/

REIMBURSEMENT INFORMATION

For travel being funded by NAS, after you return to the United States, you will use an electronic Travel Expense Report (eTER) to request reimbursement for reasonable travel expenses, including:

- **Taxi cabs, shuttles, and public transportation expenses for meeting related trips are reimbursable.** *Sedan services are only reimbursable if the cost is comparable to a taxi fare.*
- **Meal costs** (based on actual expenses not paid by NAS; NAS does not reimburse for alcohol).
- **Incidental expenses**

Please retain all receipts for any expenses over $75 incurred during travel on Academy business, including original airline receipts, even if they were direct billed to NAS. No charges over $75 can be reimbursed without an accompanying receipt. This includes items such as airfare, taxi charges, and meals as described above. It is Academies policy that all travel expense reports (TER) are completed within 25 days of travel. Sponsors may reject expenses not submitted on time. If you have questions, or trouble completing your TER, please contact your travel coordinator for assistance.

Please complete your Travel Expense Reimbursement (TER) via Concur, our online reimbursement tool (https://www.concursolutions.com) or download the mobile app (https://www.concur.com/en-us/mobile). Your Concur sign-in information, password, and detailed instructions for completing your TER will be sent in a separate email from your travel coordinator.
*If you are having trouble logging in to Concur, please contact the Travel Office traveloffice@nas.edu.

Your pre-populated TER will contain your itinerary and all items billed directly to the Academies. Please enter all out-of-pocket expenses and upload a PDF (when using the Concur website) or a picture (when using the Concur app) of receipts for all transportation costs and all other expenses over $75. When you have entered your reimbursable expenses, please notify your travel coordinator. Please DO NOT CLICK "Submit Report".

The Travel code for this trip is PGA190018.

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Thanks Zhiming. You are in a very challenging position and doing a great job. I would however recommend that you organize and quickly implement a way to share reference isolates. With cases occurring outside China, others will soon have their own isolates and China will have lost the opportunity for leadership. And if scientific publications start appearing from Chinese investigators without the world having independent access to a strain, China will likely be heavily criticized.

Keep up the good work

Jim

Subject: Re. List of Chinese participants - Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Well done on getting confirmation of this meeting from CAS, and a very impressive list of senior people who will attend. Having so many senior academicians, including Chen Zhu - a former VP of CAS and essentially former Minister for Health is particularly important and shows that they are taking this meeting extremely seriously.

I look forward to seeing some familiar faces on the calls and to two great sessions!

Cheers,

Peter

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)

5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Kind regards,

Ben

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Greetings,

Thought it would be helpful to send you a basic outline for the follow up call (**at 11:30 ET today**).

1) Intro
2) Comments on the Day 1 and Day 2 discussion
3) Ideas for topics (and additional American experts) for future virtual dialogue sessions
4) Discussion of George Gao's joint statement idea
5) CAS idea to post a blurb about the meetings on the CAS website
6) Other issues, concerns

I have attached the dialogue agenda (American version) for reference along with Jim's summaries of future collaboration ideas from the sessions.

I know a few people can't make it but I would be happy to follow up with you individually over the phone or email.

I look forward to talking to the group soon.

Scientists from China and US Share Experience in COVID-19 Prevention and Control

About 30 scientists from China and the United States held an online dialogue to share their experience in COVID-19 prevention and control and opinions on the prevention of future pandemic on May 12th and 14th (Beijing time).

The virtual dialogue was jointly organized by the Chinese Academy of Sciences (CAS), the National Academy of Sciences (NAS) and the National Academy of Medicine (NAM).

Participants shared their experience in fighting against COVID-19 and exchanged views on such topics as clinical issues related to treatment and management of patients, and limiting the spread of COVID-19 and steps towards restarting society.

COVID-19, an infectious disease caused by the most recently discovered coronavirus, has so far spread to 216 countries, areas and territories, with over 4.5 million confirmed cases and claiming 300 thousand deaths globally, according to the World Health Organization.

"The pandemic will not really be controlled in any country, until it is ultimately controlled in every country. So it's in our mutual interest to do our best to learn as rapidly and as effectively as we can from one another," said Dr. Harvey Fineberg, President of the Gordon and Betty Moore Foundation, one participant of the dialogue.

Experts taking part in the dialogue agreed that it is of great importance to have a discussion to promote exchanges between the scientific communities of the two countries.

"It's an extension of a dialogue that's been going between scientists in China and the U.S.. We are very happy to be able to continue this dialogue in this time when actually all the work we are doing becomes very important," said Diane Griffin, Vice President of NAS, in the dialogue.

Dr. George F. Gao, convener from the Chinese side, Director-General of the Chinese Center for Disease Prevention and Control, said, "This is a great dialogue. We hope that both sides could continue to organize dialogues like this, and contribute to the global efforts in fighting against the COVID-19 pandemic from the scientific perspective."

SCIENCES · ENGINEERING · MEDICINE

Day 1

Introductory remarks and group introductions: **George Gao** and **Diane Griffin**

China situational overview: **George Gao** (5 mins)

U.S. situational overview: **Harvey Fineberg** (5 mins)

Clinical Issues Related to Treatment and Management of Patients

- **Clinical manifestations of COVID-19 disease:** What range of clinical, end-organ, organ, and other body system manifestations of disease has been documented in China? (Relman or Dzau)
- **Influence of Patient Characteristics:** How did patient age, gender, general health condition, or other characteristics influence the efficacy of drugs, NPIs, or best practices? How was this determined? (Relman or Dzau or Perlman)
- **Protection of Medical Personnel**: What measures have proven most effective in preventing infection of medical personnel? (Le Duc)
- **Drug Treatments:** What has been the Chinese experience with developing drug treatments or using existing drugs in treatment of patients, from prophylaxis to pre-symptomatic patients to patients with severe symptoms? (Hamburg)
- **Non-pharmaceutical Interventions**: Were effective non-pharmaceutical interventions (NPIs) for patient care identified? Were there other best practices for management of COVID-19 patients that emerged from the pandemic experience? (Hamburg)
- **Immune plasma:** What is China's experience in using immune plasma or other antibody-based therapies in the treatment of COVID-19 patients or prevention of further spread of disease? (Hamburg)
- **Lessons Learned:** Were other lessons learned from China's pandemic experience that should be applied to future staffing and equipping of hospitals or other patient care facilities? (Dzau or Griffin)
- **Future Collaboration**: What are the most fruitful areas of future scientific collaborations between our countries in this area? (Le Duc)

Day 2

Limiting the Spread of COVID-19 and Steps Toward Restarting Society

- **Incubation period:** Has the incubation period of the virus in humans been determined? What variability may exist and can factors be identified that may influence such variability? (Baric)
- **Viral Load**: What is known about magnitude of viral load required to initiate infection? Has it been determined at what point a patient is most infectious? (Baric)

- **Viral shedding**: What is the degree of shedding among pre-symptomatic/asymptomatic individuals? Do "recovered" patients continue to shed infectious virus? If yes, for how long? Has post-infection viral shedding been demonstrated to result in new infections? Has an explanation regarding pathogenesis leading to apparent recrudescence of disease in previously positive, then negative patients been arrived at? (Shi)
- **Immune response**: How is immune response being measured? Is it via binding assays versus neutralization tests; use of antibody assays in diagnosis of acute disease and as an indicator of protection? Was there standardization of your testing tools? (Saif)
- **Immunity**: After recovery, do patients have immunity? How protective is this immunity? Is there indication of persistence of such immunity? (Saif)
- **Vaccines:** Has the Chinese research community made progress in the development of COVID-19 vaccines? (Perlman or Baric)
- **Exposure routes:** Has progress been made in understanding the routes of exposure to COVID-19—air, water, and surfaces, both indoors and outdoors? (Fineberg)
- **Contact with Animals:** Would increased surveillance of or interventions to reduce contact with pets, wild, or livestock animal species help limit the future spread of COVID-19 or other coronaviruses? (Daszak)
- **Halting Spread:** What measures have proven most effective in halting viral spread in China? (Fineberg)
- **Preventing a Fall Resurgence:** What steps should be taken in anticipation of a fall resurgence in transmission? (Fineberg)
- **Reestablishing Normality:** What lessons has China learned about returning society and the economy to a "normal" state? (Fineberg)
- **Future Collaboration**: What are the most fruitful areas of future scientific collaborations between our countries in this area? (Franz)

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Attachments: Draft Covid-19 US-China dialogue agenda.docx

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password **552.136**

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Information on how to join the planning call **at 8:00 PM ET, Thursday, May 7 is below:**

Zoom link: https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Please join by Zoom (but the call in phone number is below my email signature if you need it). Thank you again for agreeing to participate in the planned virtual dialogue meeting next week.

Kind regards,

Ben

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Attachments:	Topics for future collaborations between the NAS and CAS on COVID-draft 1.docx

Greetings,

Thank you for participating in and asking thoughtful questions during the Zoom call last night. Thanks especially to Diane Griffin for outstanding moderating, to Harvey Fineberg for giving a clear and concise overview of the U.S. situation and to Jim Le Duc for drafting a list (see attachment) of possible future areas of collaboration that came up during the discussion.

Although Zoom seemed to work well for most of the participants I asked CAS staff to help the group move on quickly if a Chinese speaker's audio is malfunctioning. I let CAS know that during the next session we want to start discussing the agenda / remaining list of questions right away. I reiterated that we find a discussion format to be the most useful and asked that they send any slide presentations to me in advance of the call (so I can send them to you). I also asked CAS for copies of the PPT slides that were shared with the group last night. Please let me know if you have any thoughts on how to make the Zoom session tomorrow night more productive.

Here is the Zoom link for the next session
Meeting Time: **Wednesday, May 13, 2020 9:00 -11:00 PM (ET)**

Subject: Virtual U.S. China dialogue meeting on COVID-19: final docs, Zoom link (and back up phone number)
Importance: High

Greetings,

I have attached all the documents that you need for **the first U.S. China dialogue Zoom call tonight [Monday, May 11 from 9:00 PM – 11:00 PM (ET)]** so you have them all in one place. They are 1) the slightly updated Chinese participant list (availability is Beijing time) 2) the American participant list and 3) the American version of the agenda. Please remember that because we want the Chinese participants to lead the discussion their version of the agenda does not include your names after the questions.

At the beginning of the call Diane Griffin will ask each person to introduce themselves briefly (just say your name and affiliations). **Please do this in the order that you appear on the American participant list.** (FYI Peter Daszak and Victor Dzau will join the call later.) George Gao and then Harvey Fineberg will give the brief overviews and then we will discuss the Day 1 questions. Re this discussion, please try and prompt the Chinese participants to answer and address the questions and issues on the agenda, we will also need to mind the time closely if we are going to get through the entire Day 1 question list.

The Zoom link is here again:
Time: Monday, May 11, 2020 9:00 PM (ET)
Meeting Link: https://nasem.zoom.us/j/94861525373?pwd **552.136**
(Password **552.136** Meeting ID: 948 6152 5373, but you should not need it, it's in the link)

Re logistics, CAS agreed to allow us to use the Zoom record feature to produce a transcript of the call. I will have host access to Zoom and there will be an NAS IT professional (David Clark) in the Zoom call in case there is a problem. If for some reason we need to abandon the Zoom call and reconvene over the phone we have set up an alternative conference call in line (with Conference America). That number is 1-888-537-7715 (and then enter 12223052#), CAS will also be able to access the line via a toll free Chinese phone number. We will only activate this line if we decide to abandon the Zoom call.

If you have any final questions or concerns please feel free to email or call me (at the number below) before the meeting. Thank you again for agreeing to participate in the virtual dialogue, I looks forward to seeing and hearing you all later this evening.

Kind regards,

Ben

'Jennifer Ryan' <jennifer.ryan@moore.org>; Bowman, Katherine <KBowman@nas.edu>
Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Greetings,

We have created a proposed draft agenda (with topics slightly rearranged) that, as we discussed during the call on Thursday, starts with a brief introduction of the situation in China and the U.S. We hope that Harvey Fineberg can give a (very) brief overview of the situation in the U.S.

To ensure that each question is addressed during the discussion, we have listed the names of American delegation member after each question. We have asked and expect the Chinese group to take the lead but we hope that those listed can ensure that each question is covered. (FYI this version is for your information only, we will send an agenda without the names listed after the questions to the Chinese.) Please let me know if you have thoughts or concerns about this plan.

FYI I plan to send a new version of the agenda to CAS and George Gao on Sunday evening (before I test the Zoom connection with CAS at 9:00 PM ET).

Kind regards,

Ben

Importance: High

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd **552.136**
Meeting ID: 934 1863 7725
Password **552.136**

Kind regards,

Ben

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

1-202-334-3975

Topics for future collaborations between the NAS and CAS on COVID-19, Day 1.

1. Natural experiment underway in the USA as states implement various strategies of public health response to address COVID-19 and resume normal activities
2. Clinical Disease—Acute and Convalescence
    a. Early predictors of severe disease/cytokine storm
    b. Long-term sequela seen in survivors
    c. Better understanding/recognition of Pediatric Inflammatory Syndrome of COVID
3. Pathogenesis and Treatment options
    a. Antiviral drug targets and development (not really discussed but important for future dialogue)
    b. Monoclonal antibody therapies (anti-IL-6 monoclonal antibody treatment; "balance" with coagulation dysfunction)
    c. Clinical trial of chloroquine treatment (preliminary results shared)
4. Prophylactics and Preventatives
    a. Passive antibody therapy (raised question but not really discussed)
    b. Vaccine development
        i. Various techniques under development (not discussed)
        ii. Animal models (mentioned but details not shared)
        iii. Clinical testing (not discussed)
        iv. Production capacity (not discussed)
        v. Ethics considerations (not discussed)
    c. Isolation of contacts (Wuhan lock-down)
    d. Educational tools for communications with populations at risk

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Greetings,

We have created a proposed draft agenda (with topics slightly rearranged) that, as we discussed during the call on Thursday, starts with a brief introduction of the situation in China and the U.S. We hope that Harvey Fineberg can give a (very) brief overview of the situation in the U.S.

To ensure that each question is addressed during the discussion, we have listed the names of American delegation member after each question. We have asked and expect the Chinese group to take the lead but we hope that those listed can ensure that each question is covered. (FYI this version is for your information only, we will send an agenda without the names listed after the questions to the Chinese.) Please let me know if you have thoughts or concerns about this plan.

FYI I plan to send a new version of the agenda to CAS and George Gao on Sunday evening (before I test the Zoom connection with CAS at 9:00 PM ET).

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)

5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Kind regards,

Ben

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Benjamin Rusek
The U.S. National Academy of Sciences
1-202-334-3975

Day 1

Introductory remarks and group introductions: **George Gao** and **Diane Griffin**

China situational overview: **George Gao** (5 mins)

U.S. situational overview: **Harvey Fineberg** (5 mins)

Clinical Issues Related to Treatment and Management of Patients

- **Clinical manifestations of COVID-19 disease:** What range of clinical, end-organ, organ, and other body system manifestations of disease has been documented in China? (Relman or Dzau)
- **Influence of Patient Characteristics:** How did patient age, gender, general health condition, or other characteristics influence the efficacy of drugs, NPIs, or best practices? How was this determined? (Relman or Dzau or Perlman)
- **Protection of Medical Personnel**: What measures have proven most effective in preventing infection of medical personnel? (Le Duc)
- **Drug Treatments:** What has been the Chinese experience with developing drug treatments or using existing drugs in treatment of patients, from prophylaxis to pre-symptomatic patients to patients with severe symptoms? (Hamburg)
- **Non-pharmaceutical Interventions**: Were effective non-pharmaceutical interventions (NPIs) for patient care identified? Were there other best practices for management of COVID-19 patients that emerged from the pandemic experience? (Hamburg)
- **Immune plasma:** What is China's experience in using immune plasma or other antibody-based therapies in the treatment of COVID-19 patients or prevention of further spread of disease? (Hamburg)
- **Lessons Learned:** Were other lessons learned from China's pandemic experience that should be applied to future staffing and equipping of hospitals or other patient care facilities? (Dzau or Griffin)
- **Future Collaboration**: What are the most fruitful areas of future scientific collaborations between our countries in this area? (Le Duc)

Day 2

Limiting the Spread of COVID-19 and Steps Toward Restarting Society

- **Incubation period:** Has the incubation period of the virus in humans been determined? What variability may exist and can factors be identified that may influence such variability? (Baric)
- **Viral Load**: What is known about magnitude of viral load required to initiate infection? Has it been determined at what point a patient is most infectious? (Baric)

- **Viral shedding**: What is the degree of shedding among pre-symptomatic/asymptomatic individuals? Do "recovered" patients continue to shed infectious virus? If yes, for how long? Has post-infection viral shedding been demonstrated to result in new infections? Has an explanation regarding pathogenesis leading to apparent recrudescence of disease in previously positive, then negative patients been arrived at? (Shi)
- **Immune response**: How is immune response being measured? Is it via binding assays versus neutralization tests; use of antibody assays in diagnosis of acute disease and as an indicator of protection? Was there standardization of your testing tools? **(Saif)**
- **Immunity**: After recovery, do patients have immunity? How protective is this immunity? Is there indication of persistence of such immunity? **(Saif)**
- **Vaccines:** Has the Chinese research community made progress in the development of COVID-19 vaccines? **(Saif)**
- **Exposure routes:** Has progress been made in understanding the routes of exposure to COVID-19—air, water, and surfaces, both indoors and outdoors? (Fineberg)
- **Contact with Animals:** Would increased surveillance of or interventions to reduce contact with pets, wild, or livestock animal species help limit the future spread of COVID-19 or other coronaviruses? (Daszak)
- **Halting Spread:** What measures have proven most effective in halting viral spread in China? (Fineberg)
- **Preventing a Fall Resurgence:** What steps should be taken in anticipation of a fall resurgence in transmission? (Fineberg)
- **Reestablishing Normality:** What lessons has China learned about returning society and the economy to a "normal" state? (Fineberg)
- **Future Collaboration**: What are the most fruitful areas of future scientific collaborations between our countries in this area? (Franz)

Greetings,

Thank you for participating in the call tonight. We thought it would be useful to have an American group conversation about the calls and discuss potential next steps.

Please let me know what times you are available between 2:00 PM - 6:00 PM ET today (Thursday, May 14) and on Friday, May 15 between 11:00 AM - 3:00 PM ET for a 30-45 min discussion.

Once we find the least worst time for folks I will send out a Zoom link.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: Zoom link for Wednesday May 13 call 9pm et
Importance: High

Greetings,

Thank you for participating in and asking thoughtful questions during the Zoom call last night. Thanks especially to Diane Griffin for outstanding moderating, to Harvey Fineberg for giving a clear and concise overview of the U.S. situation and to Jim Le Duc for drafting a list (see attachment) of possible future areas of collaboration that came up during the discussion.

Although Zoom seemed to work well for most of the participants I asked CAS staff to help the group move on quickly if a Chinese speaker's audio is malfunctioning. I let CAS know that during the next session we want to start discussing the agenda / remaining list of questions right away. I reiterated that we find a discussion format to be the most useful and asked that they send any slide presentations to me in advance of the call (so I can send them to you). I also asked CAS for copies of the PPT slides that were shared with the group last night. Please let me know if you have any thoughts on how to make the Zoom session tomorrow night more productive.

Here is the Zoom link for the next session

Subject: Virtual U.S. China dialogue meeting on COVID-19: final docs, Zoom link (and back up phone number)
Importance: High

Greetings,

I have attached all the documents that you need for **the first U.S. China dialogue Zoom call tonight [Monday, May 11 from 9:00 PM – 11:00 PM (ET)]** so you have them all in one place. They are 1) the slightly updated Chinese participant list (availability is Beijing time) 2) the American participant list and 3) the American version of the agenda. Please remember that because we want the Chinese participants to lead the discussion their version of the agenda does not include your names after the questions.

At the beginning of the call Diane Griffin will ask each person to introduce themselves briefly (just say your name and affiliations). **Please do this in the order that you appear on the American participant list.** (FYI Peter Daszak and Victor Dzau will join the call later.) George Gao and then Harvey Fineberg will give the brief overviews and then we will discuss the Day 1 questions. Re this discussion, please try and prompt the Chinese participants to answer and address the questions and issues on the agenda, we will also need to mind the time closely if we are going to get through the entire Day 1 question list.

The Zoom link is here again:
Time: Monday, May 11, 2020 9:00 PM (ET)
Meeting Link: [redacted] **552.136**
(Password: **552.136** Meeting ID: 948 6152 5373, but you should not need it, it's in the link)

Re logistics, CAS agreed to allow us to use the Zoom record feature to produce a transcript of the call. I will have host access to Zoom and there will be an NAS IT professional (David Clark) in the Zoom call in case there is a problem. If for some reason we need to abandon the Zoom call and reconvene over the phone we have set up an alternative conference call in line (with Conference America). That number is 1-888-537-7715 (and then enter 12223052#), CAS will also be able to access the line via a toll free Chinese phone number. We will only activate this line if we decide to abandon the Zoom call.

If you have any final questions or concerns please feel free to email or call me (at the number below) before the meeting. Thank you again for agreeing to participate in the virtual dialogue, I looks forward to seeing and hearing you all later this evening.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Greetings,

We have created a proposed draft agenda (with topics slightly rearranged) that, as we discussed during the call on Thursday, starts with a brief introduction of the situation in China and the U.S. We hope that Harvey Fineberg can give a (very) brief overview of the situation in the U.S.

To ensure that each question is addressed during the discussion, we have listed the names of American delegation member after each question. We have asked and expect the Chinese group to take the lead but we hope that those

listed can ensure that each question is covered. (FYI this version is for your information only, we will send an agenda without the names listed after the questions to the Chinese.) Please let me know if you have thoughts or concerns about this plan.

FYI I plan to send a new version of the agenda to CAS and George Gao on Sunday evening (before I test the Zoom connection with CAS at 9:00 PM ET).

Kind regards,

Ben

Importance: High

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Greetings,

Thank you for participating in and asking thoughtful questions during the Zoom call last night. Thanks especially to Diane Griffin for outstanding moderating, to Harvey Fineberg for giving a clear and concise overview of the U.S. situation and

to Jim Le Duc for drafting a list (see attachment) of possible future areas of collaboration that came up during the discussion.

Although Zoom seemed to work well for most of the participants I asked CAS staff to help the group move on quickly if a Chinese speaker's audio is malfunctioning. I let CAS know that during the next session we want to start discussing the agenda / remaining list of questions right away. I reiterated that we find a discussion format to be the most useful and asked that they send any slide presentations to me in advance of the call (so I can send them to you). I also asked CAS for copies of the PPT slides that were shared with the group last night. Please let me know if you have any thoughts on how to make the Zoom session tomorrow night more productive.

Here is the Zoom link for the next session

Subject: Virtual U.S. China dialogue meeting on COVID-19: final docs, Zoom link (and back up phone number)
Importance: High

Greetings,

I have attached all the documents that you need for **the first U.S. China dialogue Zoom call tonight [Monday, May 11 from 9:00 PM – 11:00 PM (ET)]** so you have them all in one place. They are 1) the slightly updated Chinese participant list (availability is Beijing time) 2) the American participant list and 3) the American version of the agenda. Please remember that because we want the Chinese participants to lead the discussion their version of the agenda does not include your names after the questions.

At the beginning of the call Diane Griffin will ask each person to introduce themselves briefly (just say your name and affiliations). **Please do this in the order that you appear on the American participant list.** (FYI Peter Daszak and Victor Dzau will join the call later.) George Gao and then Harvey Fineberg will give the brief overviews and then we will discuss the Day 1 questions. Re this discussion, please try and prompt the Chinese participants to answer and address the questions and issues on the agenda, we will also need to mind the time closely if we are going to get through the entire Day 1 question list.

The Zoom link is here again:
Time: Monday, May 11, 2020 9:00 PM (ET)
Meeting Link: https://nasem.zoom.us/j/94861525373?pwd= **552.136**
(Password: **552.136** Meeting ID: 948 6152 5373, but you should not need it, it's in the link)

Re logistics, CAS agreed to allow us to use the Zoom record feature to produce a transcript of the call. I will have host access to Zoom and there will be an NAS IT professional (David Clark) in the Zoom call in case there is a problem. If for some reason we need to abandon the Zoom call and reconvene over the phone we have set up an alternative conference call in line (with Conference America). That number is 1-888-537-7715 (and then enter 12223052#), CAS will also be able to access the line via a toll free Chinese phone number. We will only activate this line if we decide to abandon the Zoom call.

If you have any final questions or concerns please feel free to email or call me (at the number below) before the meeting. Thank you again for agreeing to participate in the virtual dialogue, I looks forward to seeing and hearing you all later this evening.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Greetings,

We have created a proposed draft agenda (with topics slightly rearranged) that, as we discussed during the call on Thursday, starts with a brief introduction of the situation in China and the U.S. We hope that Harvey Fineberg can give a (very) brief overview of the situation in the U.S.

To ensure that each question is addressed during the discussion, we have listed the names of American delegation member after each question. We have asked and expect the Chinese group to take the lead but we hope that those listed can ensure that each question is covered. (FYI this version is for your information only, we will send an agenda without the names listed after the questions to the Chinese.) Please let me know if you have thoughts or concerns about this plan.

FYI I plan to send a new version of the agenda to CAS and George Gao on Sunday evening (before I test the Zoom connection with CAS at 9:00 PM ET).

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Importance: High

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Importance: High

Greetings,

Thank you for participating in and asking thoughtful questions during the Zoom call last night. Thanks especially to Diane Griffin for outstanding moderating, to Harvey Fineberg for giving a clear and concise overview of the U.S. situation and to Jim Le Duc for drafting a list (see attachment) of possible future areas of collaboration that came up during the discussion.

Although Zoom seemed to work well for most of the participants I asked CAS staff to help the group move on quickly if a Chinese speaker's audio is malfunctioning. I let CAS know that during the next session we want to start discussing the agenda / remaining list of questions right away. I reiterated that we find a discussion format to be the most useful and asked that they send any slide presentations to me in advance of the call (so I can send them to you). I also asked CAS for copies of the PPT slides that were shared with the group last night. Please let me know if you have any thoughts on how to make the Zoom session tomorrow night more productive.

Here is the Zoom link for the next session

Subject: Virtual U.S. China dialogue meeting on COVID-19: final docs, Zoom link (and back up phone number)
Importance: High

Greetings,

I have attached all the documents that you need for **the first U.S. China dialogue Zoom call tonight [Monday, May 11 from 9:00 PM – 11:00 PM (ET)]** so you have them all in one place. They are 1) the slightly updated Chinese participant list (availability is Beijing time) 2) the American participant list and 3) the American version of the agenda. Please remember that because we want the Chinese participants to lead the discussion their version of the agenda does not include your names after the questions.

At the beginning of the call Diane Griffin will ask each person to introduce themselves briefly (just say your name and affiliations). **Please do this in the order that you appear on the American participant list.** (FYI Peter Daszak and Victor Dzau will join the call later.) George Gao and then Harvey Fineberg will give the brief overviews and then we will discuss the Day 1 questions. Re this discussion, please try and prompt the Chinese participants to answer and address the questions and issues on the agenda, we will also need to mind the time closely if we are going to get through the entire Day 1 question list.

The Zoom link is here again:
Time: Monday, May 11, 2020 9:00 PM (ET)
Meeting Link: [redacted] **552.136**
(Password: **552.136** Meeting ID: 948 6152 5373, but you should not need it, it's in the link)

Re logistics, CAS agreed to allow us to use the Zoom record feature to produce a transcript of the call. I will have host access to Zoom and there will be an NAS IT professional (David Clark) in the Zoom call in case there is a problem. If for some reason we need to abandon the Zoom call and reconvene over the phone we have set up an alternative conference call in line (with Conference America). That number is 1-888-537-7715 (and then enter 12223052#), CAS will also be able to access the line via a toll free Chinese phone number. We will only activate this line if we decide to abandon the Zoom call.

If you have any final questions or concerns please feel free to email or call me (at the number below) before the meeting. Thank you again for agreeing to participate in the virtual dialogue, I looks forward to seeing and hearing you all later this evening.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Greetings,

We have created a proposed draft agenda (with topics slightly rearranged) that, as we discussed during the call on Thursday, starts with a brief introduction of the situation in China and the U.S. We hope that Harvey Fineberg can give a (very) brief overview of the situation in the U.S.

To ensure that each question is addressed during the discussion, we have listed the names of American delegation member after each question. We have asked and expect the Chinese group to take the lead but we hope that those listed can ensure that each question is covered. (FYI this version is for your information only, we will send an agenda without the names listed after the questions to the Chinese.) Please let me know if you have thoughts or concerns about this plan.

FYI I plan to send a new version of the agenda to CAS and George Gao on Sunday evening (before I test the Zoom connection with CAS at 9:00 PM ET).

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725
Password **552.136**

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Importance: High

Greetings,

Thank you for participating in and asking thoughtful questions during the Zoom call last night. Thanks especially to Diane Griffin for outstanding moderating, to Harvey Fineberg for giving a clear and concise overview of the U.S. situation and to Jim Le Duc for drafting a list (see attachment) of possible future areas of collaboration that came up during the discussion.

Although Zoom seemed to work well for most of the participants I asked CAS staff to help the group move on quickly if a Chinese speaker's audio is malfunctioning. I let CAS know that during the next session we want to start discussing the agenda / remaining list of questions right away. I reiterated that we find a discussion format to be the most useful and asked that they send any slide presentations to me in advance of the call (so I can send them to you). I also asked CAS for copies of the PPT slides that were shared with the group last night. Please let me know if you have any thoughts on how to make the Zoom session tomorrow night more productive.

Here is the Zoom link for the next session

Subject: Virtual U.S. China dialogue meeting on COVID-19: final docs, Zoom link (and back up phone number)
Importance: High

Greetings,

I have attached all the documents that you need for **the first U.S. China dialogue Zoom call tonight [Monday, May 11 from 9:00 PM – 11:00 PM (ET)]** so you have them all in one place. They are 1) the slightly updated Chinese participant list (availability is Beijing time) 2) the American participant list and 3) the American version of the agenda. Please remember that because we want the Chinese participants to lead the discussion their version of the agenda does not include your names after the questions.

At the beginning of the call Diane Griffin will ask each person to introduce themselves briefly (just say your name and affiliations). **Please do this in the order that you appear on the American participant list.** (FYI Peter Daszak and Victor Dzau will join the call later.) George Gao and then Harvey Fineberg will give the brief overviews and then we will discuss the Day 1 questions. Re this discussion, please try and prompt the Chinese participants to answer and address the questions and issues on the agenda, we will also need to mind the time closely if we are going to get through the entire Day 1 question list.

The Zoom link is here again:
Time: Monday, May 11, 2020 9:00 PM (ET)
Meeting Link: https://nasem.zoom.us/j/94861525373?pwd= **552.136**
(Password: **552.136** Meeting ID: 948 6152 5373, but you should not need it, it's in the link)

Re logistics, CAS agreed to allow us to use the Zoom record feature to produce a transcript of the call. I will have host access to Zoom and there will be an NAS IT professional (David Clark) in the Zoom call in case there is a problem. If for some reason we need to abandon the Zoom call and reconvene over the phone we have set up an alternative conference call in line (with Conference America). That number is 1-888-537-7715 (and then enter 12223052#), CAS will also be able to access the line via a toll free Chinese phone number. We will only activate this line if we decide to abandon the Zoom call.

If you have any final questions or concerns please feel free to email or call me (at the number below) before the meeting. Thank you again for agreeing to participate in the virtual dialogue, I looks forward to seeing and hearing you all later this evening.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Information on how to join the planning call **at 8:00 PM ET, Thursday, May 7 is below:**

Zoom link: https://nasem.zoom.us/j/93418637725?pwd **552.136**
Meeting ID: 934 1863 7725
Password: **552.136**

Please join by Zoom (but the call in phone number is below my email signature if you need it). Thank you again for agreeing to participate in the planned virtual dialogue meeting next week.

Kind regards,

Ben

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

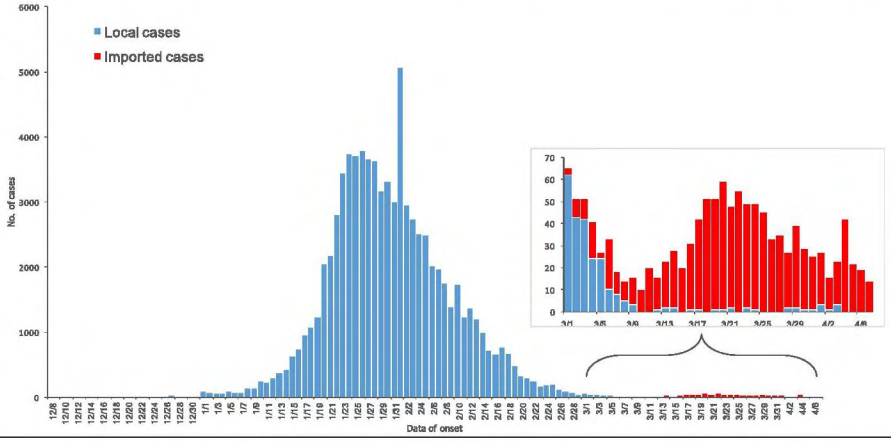
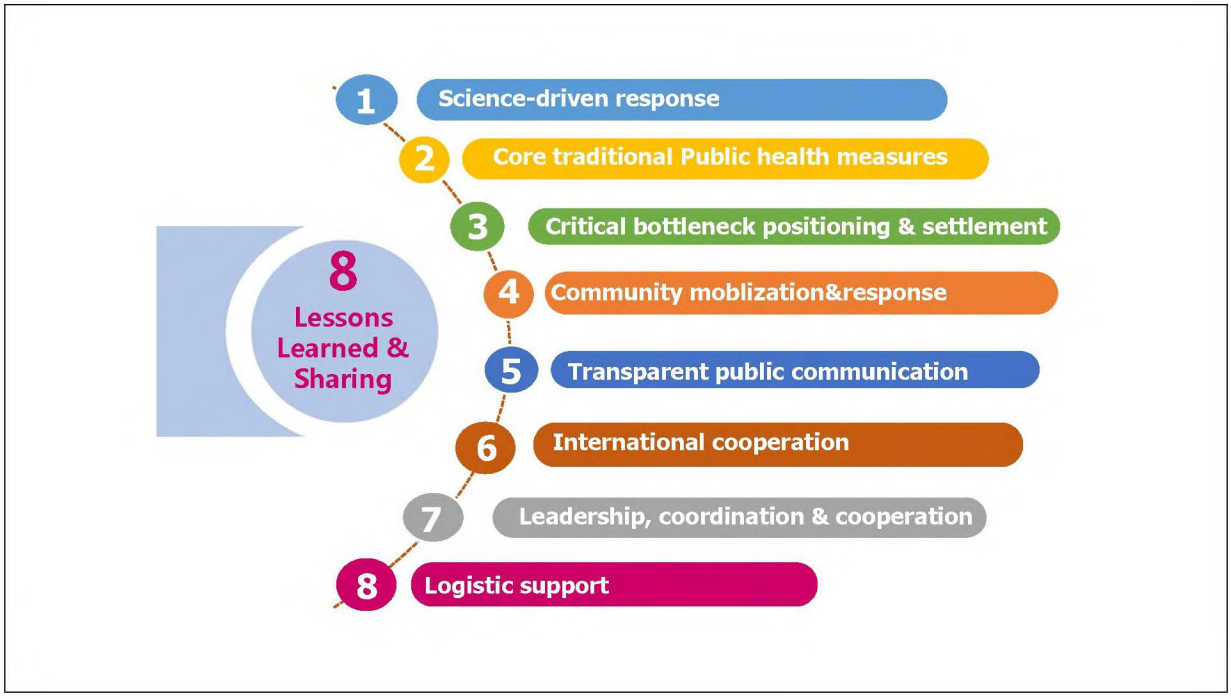
Key Experiences
FOUR Defense Lines
• 1st Line-Wuhan and Hubei
• 2nd Line-Beijing
• 3rd Line-Hubei's surrounding regions
• 4th Line-nationwide
FOUR Earlys
• Early Detection
• Early Reporting
• Early Isolation
• Early Treatment
For the People, By the People
• Community engagement
• Community health education
• Communities hygiene & Disinfection
Coordination
Cooperation
Communicati
• Resources allocation (HCW, PPE, etc)
• Logistic support
• Public understanding & Infodemic response

Epidemic of COVID-19 in China

Lab confirmed (as of April 18)	*Imported cases*	*"Asymptomatic infections"*
● *Cumulative cases: 82735* ● *Cumulative recovered: 77062* ● *Cumulative deaths: 4632* ● *Crude CFR: 5.60%*	● *Jan 31, the 1st imported case* ● *By April 18, 1575 confirmed, 44 possible*	● *By April 18, 1105 individuals, including 44 newly report, 999 under medical observation*





1
Science-driven response
2
Core traditional Public health measures
3
Critical bottleneck positioning & settlement
4
Community moblization&response
5
Transparent public communication
6
International cooperation
7
Leadership, coordination & cooperation
8
Logistic support
8
Lessons Learned & Sharing

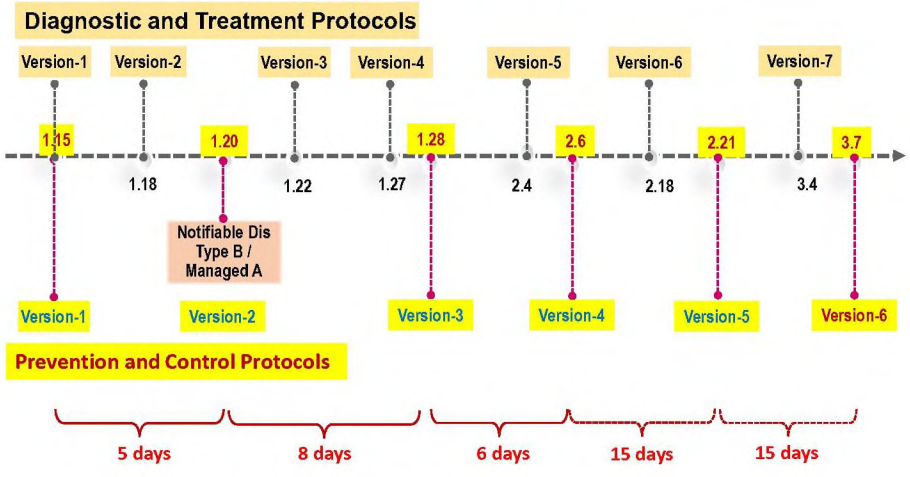
Timely Risk-based Precise Strategy

Science-driven timely adjustment

- **Low-risk areas -- strictly prevent importation**
  - No confirmed cases were reported, or no new confirmed cases were reported for 14 consecutive days.
- **Middle-risk areas -- prevent importation, stop local transmission**
  - Cumulative number of confirmed cases does not exceed 50, and there are new confirmed cases reported within 14 days; Or
  - Cumulative number of confirmed cases exceeds 50, and there are new confirmed cases reported within 14 days but without clustering outbreaks.
- **High-risk areas -- stop local transmission, prevent exportation, implement strict measures**
  - There are more than 50 confirmed cases with a clustered outbreak within 14 days.

Development and Revisions of Technical Documents

Science-driven timely adjustment



Traditional Containment Measures (Non-pharmaceutical intervention)

Mask Wearing

Protect yourself, Protect others

Wearing a mask based on risk assessment

- For general public
  - No need in general, e.g., at home, in open areas.
  - Wearing a surgical mask when gathering, in an elevator or public vehicle, face-to-face interact, high risk area (hospital, clinics)
- For Occupational exposure
  - Settings: Health care settings; airplane, public vehicle (e.g., train, bus), supermarket, restaurant, etc.
  - KN95/N95 for health professionals, surgical mask for others

Proactive Defense Strategy
"Dance" with the virus

Strictly prevent importation and community resurgence

- Control strategy for imported cases
- Tailored control measures at varied risk levels
- Four early measures in new situation
  - Strengthen case reporting and surveillance
  - Enhance laboratory test capability in county level
  - Maintain gridded community prevention and control measures
- Resuming production and work
- Prevention and control protocols at varied risk levels

Control Strategy for Imported Cases

- Whole chain management from border to community to home
- Entry Screening
  - 14-day history and health status reporting
  - Temperature screening
  - Four categories of persons: confirmed case, suspicious case, person with fever, close contacts
  - Medical examination for suspected symptoms
  - Transfer
    - Suspected cases to designated hospitals
    - Close contacts to designated hotels for quarantine
- Quarantine policy for travelers
  - 2 weeks' quarantine in the designated hotels
  - Depending on the risk evaluation and local policy
  - Regardless of domestic or foreigners

Resuming Measures

- **Health code and travel cards**
  - Jointly promote travel card service; provide different colors of "health codes" for the accurate management of people with different risk score results to provide support for the orderly flow of personnel
- **"point-to-point" labor cooperation**
  - Organize migrant workers to return to work in an orderly manner through cross-regional **"point-to-point" labor cooperation**; implement "point-to-point" one-stop direct chartered car (railway and highway) transportation services;
  - Carry out the mode of “delivering labor to the door” in the labor export place and “returning to the factory” in the labor input place
- **Prevention & control guidance for work resumption in enterprises**
  - Health monitoring & reporting; workplace and individual precautions

国务院应对新型冠状病毒感染肺炎疫情联防联控机制关于印发企事业单位复工复产疫情防控措施指南的通知
国发明电〔2020〕4号 http://www.gov.cn/zhengce/content/2020-02/22/content_5482025.htm

Learned from Transition Stage

- **Risk-based adjustment of strategies and measures adapted to local context by local government**
- **Adhere to Four Early Measures:**
  - Control importation (cross boarder and province), esp. in key and big cities
  - Prevent local spread (epidemiological investigation, close contact tracking and management)
- **Fine-tune approaches to balance the reponses and economic development**
  - strengthen the surveillance to and response measures by employers/workplaces while resuming work
- **Utilize hi-tech such as big data and AI technologies to carry out targeted measures** (e.g. tracing of travel history, close contacts, transmission chain, etc.)

Has the second round epidemic been begun?

On 10th-11th May, 5~10 new local cases were reported from Jilin Province and Wuhan City.

Thank You

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Clinical Issues Related to Treatment and Management of Patients

- **Clinical manifestations of COVID-19 disease:** What range of clinical, end-organ, organ, and other body system manifestations of disease has been documented in China?
- **Drug Treatments:** What has been the Chinese experience with developing drug treatments or using existing drugs in treatment of patients, from prophylaxis to presymptomatic patients to patients with severe symptoms?
- **Non-pharmaceutical Interventions**: Were effective non-pharmaceutical interventions (NPIs) for patient care identified? Were there other best practices for management of COVID-19 patients that emerged from the pandemic experience?
- **Protection of Medical Personnel**: What measures have proven most effective in preventing infection of medical personnel?
- **Lessons Learned:** Were there any other lessons learned from China's pandemic experience that should be applied to future staffing and equipping of hospitals or other patient care facilities?
- **Future Collaboration**: What are the most fruitful areas of future scientific collaborations between our countries in this area?
- **Influence of Patient Characteristics:** How did patient age, gender, general health condition, or other characteristics influence the efficacy of drugs, NPIs, or best practices? How was this determined?
- **Immune plasma:** What is China's experience in using immune plasma or other antibody-based therapies in the treatment of COVID-19 patients or prevention of further spread of disease?
- **Vaccines:** Has the Chinese research community made progress in the development of COVID-19 vaccines?
-

Limiting the Spread of COVID-19 and Steps Toward Restarting Society

- **Incubation period:** Has the incubation period of the virus in humans been determined? What variability may exist and can factors be identified that may influence such variability?
- **Viral Load**: What is known about magnitude of viral load required to initiate infection? Has it been determined at what point a patient is most infectious?
- **Viral shedding**: What is the degree of shedding among pre-symptomatic/asymptomatic individuals? Do "recovered" patients continue to shed infectious virus? If yes, for how long? Has post-infection viral shedding been demonstrated to result in new infections? Has an explanation regarding pathogenesis leading to apparent recrudescence of disease in previously positive, then negative patients been arrived at?
- **Immunity**: After recovery, do patients have immunity? How protective is this immunity? Is there indication of persistence of such immunity?

- **Halting Spread:** What measures have proven most effective in halting viral spread in China?
- **Preventing a Fall Resurgence:** What steps should be taken in anticipation of a fall resurgence in transmission?
- **Reestablishing Normality:** What lessons has China learned about returning society and the economy to a "normal" state?
- **Future Collaboration**: What are the most fruitful areas of future scientific collaborations between our countries in this area?
- **Exposure routes:** Has progress been made in understanding the routes of exposure to COVID-19—air, water, and surfaces, both indoors and outdoors?
- **Immune response**: How is immune response being measured? Is it via binding assays versus neutralization tests; use of antibody assays in diagnosis of acute disease and as an indicator of protection? Was there standardization of your testing tools?
- **Contact with Animals:** Would increased surveillance of or interventions to reduce contact with pets, wild, or livestock animal species help limit the future spread of COVID-19 or other coronaviruses?

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: Zoom link for Wednesday May 13 call 9pm et

Greetings,

Thank you for participating in the call tonight. We thought it would be useful to have an American group conversation about the calls and discuss potential next steps.

Please let me know what times you are available between 2:00 PM - 6:00 PM ET today (Thursday, May 14) and on Friday, May 15 between 11:00 AM - 3:00 PM ET for a 30-45 min discussion.

Once we find the least worst time for folks I will send out a Zoom link.

Kind regards,

Ben

Importance: High

Greetings,

Thank you for participating in and asking thoughtful questions during the Zoom call last night. Thanks especially to Diane Griffin for outstanding moderating, to Harvey Fineberg for giving a clear and concise overview of the U.S. situation and to Jim Le Duc for drafting a list (see attachment) of possible future areas of collaboration that came up during the discussion.

Although Zoom seemed to work well for most of the participants I asked CAS staff to help the group move on quickly if a Chinese speaker's audio is malfunctioning. I let CAS know that during the next session we want to start discussing the agenda / remaining list of questions right away. I reiterated that we find a discussion format to be the most useful and asked that they send any slide presentations to me in advance of the call (so I can send them to you). I also asked CAS for copies of the PPT slides that were shared with the group last night. Please let me know if you have any thoughts on how to make the Zoom session tomorrow night more productive.

Here is the Zoom link for the next session

Subject: Virtual U.S. China dialogue meeting on COVID-19: final docs, Zoom link (and back up phone number)
Importance: High

Greetings,

I have attached all the documents that you need for **the first U.S. China dialogue Zoom call tonight [Monday, May 11 from 9:00 PM – 11:00 PM (ET)]** so you have them all in one place. They are 1) the slightly updated Chinese participant list (availability is Beijing time) 2) the American participant list and 3) the American version of the agenda. Please remember that because we want the Chinese participants to lead the discussion their version of the agenda does not include your names after the questions.

At the beginning of the call Diane Griffin will ask each person to introduce themselves briefly (just say your name and affiliations). **Please do this in the order that you appear on the American participant list.** (FYI Peter Daszak and Victor Dzau will join the call later.) George Gao and then Harvey Fineberg will give the brief overviews and then we will discuss the Day 1 questions. Re this discussion, please try and prompt the Chinese participants to answer and address the questions and issues on the agenda, we will also need to mind the time closely if we are going to get through the entire Day 1 question list.

The Zoom link is here again:
Time: Monday, May 11, 2020 9:00 PM (ET)
Meeting Link: [redacted] **552.136**
(Password: **552.136** Meeting ID: 948 6152 5373, but you should not need it, it's in the link)

Re logistics, CAS agreed to allow us to use the Zoom record feature to produce a transcript of the call. I will have host access to Zoom and there will be an NAS IT professional (David Clark) in the Zoom call in case there is a problem. If for some reason we need to abandon the Zoom call and reconvene over the phone we have set up an alternative conference call in line (with Conference America). That number is 1-888-537-7715 (and then enter 12223052#), CAS will also be able to access the line via a toll free Chinese phone number. We will only activate this line if we decide to abandon the Zoom call.

If you have any final questions or concerns please feel free to email or call me (at the number below) before the meeting. Thank you again for agreeing to participate in the virtual dialogue, I looks forward to seeing and hearing you all later this evening.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7

Greetings,

We have created a proposed draft agenda (with topics slightly rearranged) that, as we discussed during the call on Thursday, starts with a brief introduction of the situation in China and the U.S. We hope that Harvey Fineberg can give a (very) brief overview of the situation in the U.S.

To ensure that each question is addressed during the discussion, we have listed the names of American delegation member after each question. We have asked and expect the Chinese group to take the lead but we hope that those listed can ensure that each question is covered. (FYI this version is for your information only, we will send an agenda

without the names listed after the questions to the Chinese.) Please let me know if you have thoughts or concerns about this plan.

FYI I plan to send a new version of the agenda to CAS and George Gao on Sunday evening (before I test the Zoom connection with CAS at 9:00 PM ET).

Kind regards,

Ben

Greetings,

Thanks for joining the call last night. We received good news from CAS this morning. They agreed to hold the two sessions as we requested. However because George Gao is not available on the second day they want to push the second session back by one day. That's not bad because as I noted on the call, Jim Le Duc and Harvey Fineberg were not available at that time anyway.

So for the Americans we will keep the time on Monday, May 11 (from 9-11:00 PM ET) as planned but move the second session back one day to Wednesday, May 13th (from 9-11:00 PM ET). I hope the new time for the second session works for most of you.

In addition they said that the topical agenda (topic list we sent) looks fine and that there would about a dozen Chinese experts (said no more than 13) on the call on their side.

I will send you more info later today.

Kind regards,

Ben

Greetings,

Below you will find an agenda for tonight's **(8:00 PM ET)** call. Diane is the U.S. chair so will lead the call (with input from others).

1) Introductions (Diane, Ben, group)
2) The China bio dialogue: brief background, previous meetings and key Chinese participants (Jim, Dave, Diane, Peggy, Pei-yong, Ben, others)
3) Recent work (2020) to set up the virtual dialogue sessions, purpose of the call and issues we should probably avoid (Diane, Ben, others)
4) Discussion topics/questions (see attachment), assign discussion leaders for each question (Diane, others)
5) Call logistics (best way to interact on the Zoom call, recording the sessions, plan between calls, etc.) (Ben, Micah, Diane)
6) Other questions or concerns (group)

I have re attached the "agenda" (list of topics/questions) for the dialogue meetings next week for your information. Also the Zoom call in information is below:

https://nasem.zoom.us/j/93418637725?pwd= **552.136**
Meeting ID: 934 1863 7725

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Thanks, Fei
Although US CDC has already shared the virus isolate with a number of US institutions (including UTMB) last week, it is still important to successfully transfer and share the isolate(s) from China.
Best,
- Pei-Yong

Diane E. Griffin, Vice President, NAS,
Margaret Hamburg, Foreign Secretary, NAM

Dear Prof. Griffin and Prof. Hamburg,

Thank you for your concerns on the recent outbreak of the 2019 novo-coronavirus epidemic. Upon receiving your letter dated January 28, my colleagues have discussed with Dr. George Fu Gao and other experts and we are willing to share isolates of the 2019 nCoV with the international community. We believe this is critical to engaging joint international efforts to contain the spread of the virus.

The National Biosafety Laboratory Wuhan of the Chinese Academy of Sciences is prepared and willing to work with The University of Texas Medical Branch and other international research institutions on the specifics for the sharing and distribution of the isolates. We are in the process of getting it ready.

I look forward to hearing your further advice on this matter.

With best regards,

Chunli Bai

Subject: Virtual U.S. China dialogue meeting on COVID-19: planning discussion on May 7
Importance: High

Greetings,

Thank you for agreeing to participate in a virtual bilateral dialogue meeting between Chinese and American experts studying and fighting the COVID-19 pandemic. I am reaching out to you now so 1) the group is connected by email and 2) to organize the planning teleconference for the American participants on May 7. The purpose of the May 7 discussion is to fill you in on the dialogue background, discuss the topics/questions (list in your invitation letter and attached) and issues we should probably avoid (origin questions, politics), logistics, and address any other questions or concerns you may have.

We are proposing that this ~1 hour discussion take place over Zoom at 8:00 PM ET on Thursday, May 7. If this time does not work for someone we could push the time up or back slightly. Please let me know. Also if Thursday evening is impossible I can brief you on the discussion over the phone sometime on Friday.

Re the actually dialogue meeting with the Chinese group, as your invitation letter notes we have proposed that the dialogue meeting take place on the evenings of Monday, May 11th (to address the first set of bullet points) and Tuesday, May 12th (to ask/answer follow-up questions and address the second set of bullet points), at 9:00 PM ET for the Americans. George Gao has not yet let us know if these exact times work but we should hear back from him soon (the Chinese May day holidays end on the 5th).

Kind regards,

Ben

Subject: RE: National Academies Travel Reimbursement: Harbin 2019 meeting - docs and photos

Greetings,

I trust that everyone made it back to the U.S. safely. Please do send Hope any expenses that you might have incurred during your travel.

Please also send me the final version of your presentation as delivered. We will not post your slides publically but will create and send you a PDF document that contains the final agenda, participant list and the presentations. I have about half of the Chinese presentations right now and am working to get as many of the rest as HVRI will release. Katie and I are working on meeting reports and summary documents.

I put the photos I took during the trip in a Google Photo album (Friday trip to the snow festival and my indoor ski slope adventure is at the end): https://photos.app.goo.gl/rayKqR4X46ZLND7g7

Feel free to add your pictures to the album or email pictures and I will add them.

Thank again for making the trip.

Kind regards,

Ben

Subject: National Academies Travel Reimbursement: Harbin 2019 meeting

Thank you for participating in our meeting! Please let me know if you incurred any expenses during this trip that you would like reimbursed. If so, please send me a list so that I can enter them onto your travel report.
I will need the following details for each expense:

- Date incurred
- Type of expense
- Amount of expense

If the expense is over $75, please include a receipt. If it is not over $75, I only need the details.

Thank you and best wishes,

Hope Hare

Subject: RE: Application for collaboration funding

Dear Han,

Thank you very much for sending the CAS funding opportunity. We discussed this amongst us today, and we believe that the production for horse anti-CCHFV serum based on VSV-CCHFV-GP is a good idea. However, we think it should be a part of a larger applications which will include Chao's vaccine platform as well. We believe that this will make it more competitive. Chao will reach out to you in the next days.
Dr. LeDuc will also try to find a US based funding mechanism to see if we can match the Chinese funds with US funds (if the project gets funded).

Best wishes,

Dennis

Subject: Application for collaboration funding

Hi Dennis, Dr.Peiyong Shi and Dr. Leduc

Hope you are doing well!

We missed the funding application support by CAS for the collaboration study of BSL-4 agent last year. The new round application for 2019 is opening and the deadline is May 5 (http://english.whiov.cas.cn/Notice2016/201904/t20190404_207607.html). The application information attached (English).

Based on Dennis and I discussed previously, I am thinking about if we can try to put the "Production for horse anti-CCHFV serum based on VSV-CCHFV-GP" as a proposal if Dr. Tom Geisbert agreed. The VSV-CCHFV-GP has constructed in the UTMB and the horse immunizing will conducted in Wuhan. The neutralization work for the horse serum in cells of Chinese strains will be done in Wuhan and other strains in UTMB. If it worked in vitro, then we can test it in the mice.

Please let me know what's your thought.

Thanks,
Han

Subject: Payment for your upcoming article in mBio , ms. mBio02375-19

Dear Dr. Pei-Yong Shi,

Your article, Zika virus NS2A-mediated virion assembly (Manuscript # mBio02375-19), is scheduled to be published in issue 6 of mBio.

To facilitate prompt publication of your article, please use this link to the Author Services system to do any of the following:

- Pay publication fees
- Pay additional fees (Open Access, supplemental materials, etc.)
- Order reprints or eprints

https://authorservices.cadmus.com/Shibboleth.sso/Login?entityID=https://login.asm.org/idp/shibboleth&target=/DRIPShopperWeb%2Foffer.do%3FarticleID%3D3087836%26emailAddress%3Dpeshi%40utmb.edu

You may pay by credit card, or purchase order. Doing so will create a printable invoice that you can include with your payment, or submit to your funding institution as a pro-forma invoice. The invoice you create will contain information about payment by credit card, bank wire, or check. You must use this system to create an accurate invoice for payment.

ASM Members receive substantial discounts on publication fees and when ordering reprints and eprints. If you are a current ASM member, these discounts are applied automatically when you log in. If you are just now joining or renewing, we must first receive your payment for the membership discounts to be available.

To join or renew your ASM membership, go to: www.asm.org/join.

If you experience problems with your fees or with the Author Services website, please email ASM.AuthorServicesSupport@cenveo.com.

Thank you,

ASM Reprint/Billing Account Manager.

Subject: Wuhan CCHFV application
Attachments: Application Form Wuhan-UTMB May 3 2019.doc

Dear All,

Here is the application I wrote with help from Han for Wuhan collaboration. Please take a look and let me know if anything needs to be changed.

Thanks very much for all the supports from you.

Best,
Chao

Wuhan National Biosafety Laboratory, Chinese Academy of Sciences

Advanced Customer Cultivation Project

Application Form

Project name: Vaccine Development and Polyclonal Antiserum for Crimean-Congo Hemorrhagic Fever Virus

Project leader (Signature): _____

Organization: University of Texas Medical Branch, Texas, USA

Phone number: +1(409) 266-6500

E-mail: jwleduc@utmb.edu

Made by Research Planning Office of Wuhan Institute of Virology, CAS

Filled in on 30/4/2019

Instruction for Form Filling

1. Each item of the application form must be true, complete, accurate and clarified.
2. The "Confidentiality Level" on the cover shall be filled in with "Open".
3. All the application materials shall be submitted in duplicate in A4 book size in print (double page).
4. After the form is filled in completely, the applicant's organization shall review the truthfulness, completeness and effectiveness of the information filled in.
5. The application form shall only be considered effective with the signature of the principal of the applicant's organization.

.

Text

[= 1 * ROMAN]. Research Background

1. Research purpose

The purposes of the project (1) Develop a replicon-based DNA vaccine for Crimean-Congo hemorrhagic fever virus (CCHFV). (2) Generation horse source polyclonal antibody for anti-CCHFV therapy.

2. Foreign and domestic research background, trend of development

Crimean-Congo hemorrhagic fever (also known as Xinjiang hemorrhagic fever) is caused by CCHFV in humans. CCHFV is a tick-borne virus with a wide geographical distribution, including Africa, the Balkans, the Middle East, Russia, western Asia and eastern Asia and needs high containment laboratory to conduct research. There are currently no licensed vaccines to prevent CCHFV-associated disease. CCHFV causes severe disease in human beings with a reported mortality rate of 3%–30% [ADDIN EN.CITE <EndNote><Cite><Author>Bente</Author><Year>2013</Year><RecNum>110</RecNum><DisplayText>(1)</DisplayText><record><rec-number>110</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556812014" guid="a4688135-8d5c-4363-a3ef-afb1028964bb">110</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Bente, D. Subunit CCHFV vaccine. Since CCHFV glycoproteins are displayed on the surface of the virion, it was used as the target to develop vaccine. Using vaccinia virus as vehicle to deliver the glycoproteins of CCHFV was shown to provide 100% protection to lethally challenged mice [ADDIN EN.CITE ADDIN EN.CITE.DATA]. DNA vaccine expressing nucleoprotein (NP) and ubiquitin-linked versions of GPC-derived Gn and Gc or virus-like particle vaccination has been shown to confer protection against lethal CCHFV challenge [ADDIN EN.CITE ADDIN EN.CITE.DATA]. Mice fed transgenic plants expressing the CCHFV glycoproteins and immunized with purified glycoprotein from *Drosophila* insect cell developed antibodies against the glycoproteins, while the latter did not confer the protection[ADDIN EN.CITE ADDIN EN.CITE.DATA].

Polyclonal antibody was widely used for antiviral treatment. The FDA has approved the production of anti-rabies virus polyclonal antibodies for commercial use. The polyclonal anti-Ebola antibody from horse can effectively protect mice from lethal Ebola virus infection. During the 2014 Ebola outbreak, the antibody was used to treat Ebola virus infection and rescued patient life. Those cases indicate that antibody therapy plays an important role in prevention and control outbreaks of emerging diseases[ADDIN EN.CITE ADDIN EN.CITE.DATA].

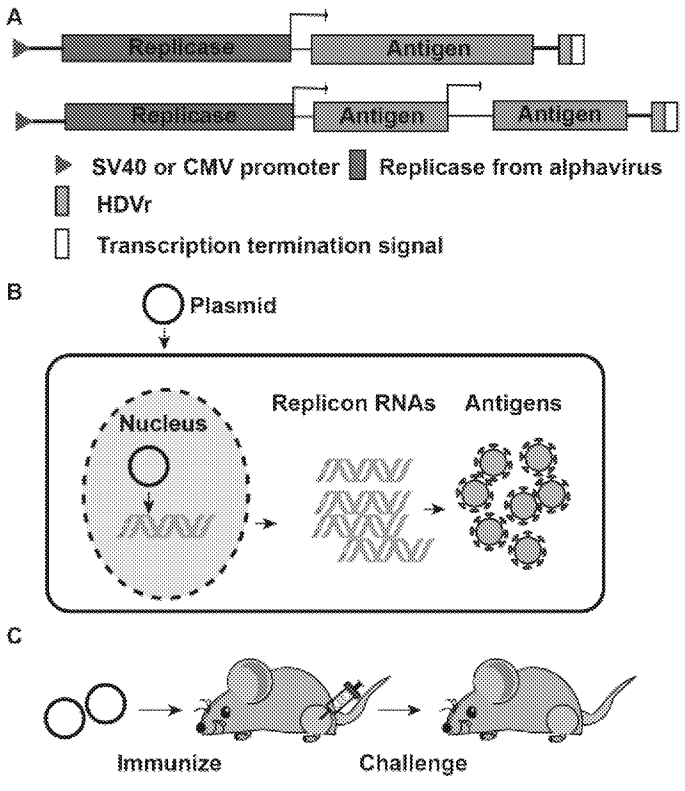
[= 2 * ROMAN]. Research Contents

1. Research contents

Aim 1 Develop a replicon-based DNA vaccine for Crimean-Congo hemorrhagic fever virus (CCHFV). We will first develop the DNA-launched replicon of alphavirus due to its rapid replication capacity in mammalian cells to deliver foreign genes (Figure 1A). The replicon will be launched by eukaryotic cytomegalovirus (CMV) promoter or SV40 promoter. After the replicon built, we will engineer the CCHFV glycoproteins G_N and G_C (e.g., GPC open-reading frame) into the replicon DNA plasmids and characterize the immunogenicity and vaccine efficacy in a mouse model (Figure 1 B&C). We choose CCHFV as a target vaccine because (i) CCHFV represents the second most widespread of all medically important arboviruses (after dengue virus) and (ii) WHO and NIAID have classified it as an R&D Blueprint priority disease and Category A priority pathogen, respectively.

Aim 2 Generation horse source polyclonal antibody for anti-CCHFV therapy. VSV-CCHFV-GPC recombinant virus will be generated and used to immunized the horse. Multiple doses may be used to boost horse and facilitate the immune response. The polyclonal antibody from horse will be analyzed. Once positive antibody was confirmed, the antibody will be purified from horse and used for mice efficacy study.



2. Research methods and experimental program

Figure 1 Experimental scheme. (A) A CHIKV (alphavirus) replicon-based antigen deliver system. CHIKV replicon RNA containing one or two

antigen-expressing subgenomes is launched through DNA plasmid using eukaryotic promoter (red triangle) to transcribe CHIKV replicon RNA inside mammalian cells. An HDVr (hepatitis delta ribozyme; orange box) and a transcription termination signal sequence (white box) are engineered at the 3' end of viral RNA. (B) DNA plasmid is delivered into cells to launch CHIKV replicon. The replication of replicon RNAs results in robust expression of antigens. (C) Immunization of mice with CHIKV replicon DNA. The plasmid DNA is delivered to animals. The vaccinated animals are analyzed for immunogenicity and challenged for efficacy testing.

Aim 1 Develop a replicon-based DNA vaccine for Crimean-Congo hemorrhagic fever virus (CCHFV).

(1) **Construct alphavirus replicon as delivery system.** Alphavirus replicons are genomes with one or more of the structural protein genes deleted, but with all nonstructural genes and cis-acting sequences retained such that they replicate once introduced or produced in the cytoplasm (Fig. 1A). However, because the compatible alphavirus structural proteins are missing, infectious virus cannot be produced. The alphavirus replicon subgenomic promoter can be left intact such that subgenomic RNA is produced, which for alphaviruses is in high molar excess compared to the genomic RNA. Thus, if a foreign gene is used to replace the alphavirus structural polyprotein encoded by the subgenomic RNA, large amounts are expressed but viral spread cannot occur. Here we choose chikungunya virus (CHIKV) replicon among other alphaviruses in this proposal.

(2) **Antigen selection of CCHFV vaccine.** Like other Bunyaviruses, CCHFV contains a tri-segmented, negative sense RNA genome: small (S), medium (M), and large (L) segments. Among the six genetically distinct clades of CCHFV, there are 20, 31, and 22% sequence divergence for S, M, and L segment, respectively [ADDIN EN.CITE <EndNote><Cite><Author>Bente</Author><Year>2013</Year><RecNum>110</RecNum><DisplayText>(1)</DisplayText><record><rec-number>110</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556812014" guid="a4688135-8d5c-4363-a3ef-afb1028964bb">110</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Bente, D. F.</author></authors></contributors><titles><title>Identification of broadly neutralizing monoclonal antibodies against Crimean-Congo hemorrhagic fever virus</title><secondary-title>Antiviral Res</secondary-title></titles><periodical><full-title>Antiviral

Res</full-title></periodical><pages>112-120</pages><volume>146</volume><edition>2017/08/24</edition><keywords><keyword>Animals</keyword><keyword>Antibodies, Monoclonal</keyword><keyword>Antibodies, Neutralizing</keyword><keyword>Antibodies, Viral</keyword><keyword>Epitopes</keyword><keyword>Glycoproteins</keyword><keyword>Hemorrhagic Fever Virus, Crimean-Congo</keyword><keyword>Hemorrhagic Fever, Crimean</keyword><keyword>Humans</keyword><keyword>Mutation</keyword><keyword>Neutralization Tests</keyword><keyword>Phylogeny</keyword><keyword>Sequence Analysis, DNA</keyword><keyword>Crimean-Congo hemorrhagic fever virus</keyword><keyword>Monoclonal antibodies</keyword><keyword>Neutralization assay</keyword><keyword>Virus-like particles</keyword></keywords><dates><year>2017</year><pub-dates><date>Oct</date></pub-dates></dates><isbn>1872-9096</isbn><accession-num>28842265</accession-num><urls><related-urls><url>https://www.ncbi.nlm.nih.gov/pubmed/28842265</url></related-urls></urls><electronic-resource-num>10.1016/j.antiviral.2017.08.014</electronic-resource-num><language>eng</language></record></Cite></EndNote>], and adoptive transfer of these antibodies confer *in vivo* protection in suckling mice [ADDIN EN.CITE ADDIN EN.CITE.DATA]. These results support the possibility of cross-protection against all strains from the six CCHFV clades. The results also justify expression of the complete GPC polyprotein for vaccine development.

(3) **Construction of CCFHV vaccine candidates.** We will engineer the full open-reading frame of CCHFV GPC into the CHIKV replicon plasmid. The complete GPC is selected to ensure the correct processing and conformation of the individual G_N and G_C proteins. The GPC sequence from clinical CCHFV strain FK16116 (China) [ADDIN EN.CITE ADDIN EN.CITE.DATA] and Turkey200406546 (UTMB), rather than laboratory strain IbAr10200, will be used for human codon optimization and inserted into the replicon plasmids. The resulting GPC-replicon plasmids will be evaluated in cell culture for the expression and processing of GN and GC proteins using Western blot. Once the protein expression has been confirmed, we will test the GPC-replicon plasmid in a CCHFV mouse model.

(4) **Testing CCHFV vaccine candidates *in vivo*.** We will test the GPC-replicon plasmids for immunogenicity, safety, and efficacy in a mouse model. Over the last seven decades, attempts have

been made to establish an animal model for CCHF in adult mice, rats, guinea pigs, hamsters, rabbits, and other laboratory animals. They met with very limited success showing little or no signs of infection or disease when infected with CCHFV. Until 2010, the only animal that manifested disease after CCHFV infection was the newborn suckling mouse. In recent years, small animal models have been developed using STAT-1$^{-/-}$ [ADDIN EN.CITE <EndNote><Cite><Author>Bente</Author><Year>2010</Year><RecNum>115</RecNum><DisplayText>(16)</DisplayText><record><rec-number>115</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556812015" guid="3f1f6230-804e-46e3-8483-dac0c54cf730">115</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Bente, D. A.</author><author>Alimonti, J. B.</author><author>Shieh, W. J.</author><author>Camus, G.</author><author>Ströher, U.</author><author>Zaki, S.</author><author>Jones, S. Since these mice succumb to CCHFV infection, we will test our vaccine candidates in the IFNAR$^{-/-}$ mice. More recently, transient depletion of interferon receptors through intraperitoneal injection with a monoclonal antibody (Mab MAR1-5A3, Leinco Technologies) immediately prior to challenge has been shown to allow efficient

viral replication [ADDIN EN.CITE ADDIN EN.CITE.DATA]. We will also use the wild-type C57BL/6 mice to evaluate the vaccine efficacy since this model allows a full immune response to immunization while allowing the virus replicate after challenge. The mouse efficacy experiments with CCHFV will be performed by Dr. Chao Shan and Dr. Han Xia at the BSL-4 facility at Wuhan Institute of Virology, Chinese Academy of Sciences.

Using the IFNAR$^{-/-}$ mice, we will intramuscularly immunize different doses of replicon-GPC plasmid (1, 5, 10, and 20 μg; n=12 per group, male and female) or PBS (as sham control) using the TriGrid Delivery System. On day 28 post-immunization, the immunized mice will be bled and measured for antibody titers using CCHFV VLP ELISA [ADDIN EN.CITE <EndNote><Cite><Author>Zivcec</Author><Year>2015</Year><RecNum>136</RecNum><DisplayText>(20)</DisplayText><record><rec-number>136</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556821443" guid="951bec17-5bed-4e75-80a1-9f1b854ce673">136</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Zivcec, M.</author><author>Metcalfe, M. G.</author><author>Albariño, C. G.</author><author>Guerrero, L. W.</author><author>Pegan, S. D.</author><author>Spiropoulou, C. Replication</keyword></keywords><dates><year>2015</year><pub-dates><date>Dec</date></pub-dates></dates><isbn>1935-2735</isbn><accession-num>26625182</accession-num><urls><related-urls><url>https://www.ncbi.nlm.nih.gov/pubmed/26625182</url></related-urls></urls><custom2>PMC4666410</custom2><electronic-resource-num>10.1371/journal.pntd.0004259</electronic-resource-num><language>eng</language></record></Cite></EndNote>]. On the same day, the animals will be challenged with 100 PFU of clinical CCHFV strain FK16116 (China). The challenged animals will be measured for the following parameters for efficacy: (i) Viremia and viral loads in different organs using qRT-PCR and plaque assays, (ii) weight loss, (iii) survival (Deaths are expected on days 2-6 post-challenge in the sham group), (iv) antibody titers on 28 days after challenge, and (v) T cell activation. Comparison of the antibody titers before and after challenge will indicate if the vaccine elicits sterilizing immunity (i.e., no detectable viremia and no increase in antibody titers after challenge). Using the wild-type mice, we will immunize C57BL/6 mice with the GPC-replicon plasmid and measure the five parameters described above. The immunized mice will be challenged with 100 PFU of clinical CCHFV strain FK16116 (China) by the intraperitoneal route; however, to facilitate viral infection and replication, the animals will be pretreated with 2 mg of interferon receptor-blocking antibodies one day before the CCHFV challenge, and further treated with 0.5 mg of antibody at 24 h after challenge [ADDIN EN.CITE ADDIN EN.CITE.DATA]. These *in vivo* studies will reveal the immunogenicity, safety, and efficacy of the vaccine candidates. Comparison of the results from different dosage groups (1, 5, 10, and 20 μg DNA) will also allow us estimate the correlates of protections against CCHFV infection in the mouse model.

Aim 2 Generation horse source polyclonal antibody for anti-CCHFV therapy.

(1) Production of VSV-CCHFV-GPC recombinant virus.

(2) Immunization horse for polyclonal antibody. VSV-CCHFV-GPC recombinant virus (1×10^6 PFU) will be used to immunized horse by intramuscularly (multi-point injection) route. On day 28 post-immunization, the immunized mice will be bled and measured for antibody titers using CCHFV VLP ELISA [ADDIN EN.CITE <EndNote><Cite><Author>Zivcec</Author><Year>2015</Year><RecNum>136</RecNum><DisplayText>(20)</DisplayText><record><rec-number>136</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556821443"

guid="951bec17-5bed-4e75-80a1-9f1b854ce673">136</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Zivcec, M.</author><author>Metcalfe, M. G.</author><author>Albariño, C. G.</author><author>Guerrero, L. W.</author><author>Pegan, S. D.</author><author>Spiropoulou, C. If the antibody titer reaches desired point, the blood will be bled for antibody purification. If not, the boost will be happened to facilitate immune response and wait another 28 days.

(3) Polyclonal antibody purification from horse blood. Once desired anti-CCHFV antibody titer reached, the horse blood will be bled. Protein G Agarose will be used to purify the horse polyclonal antibody based on the manufacture manual. The eluted polyclonal antibody will be

dialyed in PBS and aliquoted. Purified polyclonal antibody will be measured by CCHFV VLP ELISA to confirm antibody titer.

(4) Mice efficacy study.

Using the IFNAR$^{-/-}$ mice, we will intraperitoneal inject different doses of purified antibody (or PBS (as sham control) one day before CCHFV FK16116 infection. On the day of infection, the blood will be collected and 100 PFU CCHFV will be injected subcutaneously. The challenged animals will be measured for the following parameters for efficacy: (i) Viremia and viral loads in different organs using qRT-PCR and plaque assays, (ii) weight loss, (iii) survival (Deaths are expected on days 2-6 post-challenge in the sham group).

3. Expected outcome

The proposed experiments will generate CCHFV vaccine candidate built upon the FK16116 and Turkey200406546 strain. The cross-protection against different stain will be evaluated after challenge. Comparison of the immunogenicity and efficacy from the mouse experiments will allow us down select the final candidate. In an unlikely situation that a single-shot immunization of the replicon-GPC plasmid is not sufficient to elicit protective antibody titers or full protection against CCHFV infection, we will boost the animals with a second dose of replicon-GPC plasmid. The mouse efficacy results will allow us strategize further preclinical development, including efficacy test in a non-human primate model. In addition, by selecting the polyclonal antibody from horse will allow us have the potential candidate for anti-CCHFV treatment.

4. Key problems and technical difficulties to be solved

Vaccine development. The proposed study will establish a DNA replicon platform for CHIKV. And the platform will be served as the vehicle to deliver the CCHFV-GPC for vaccine candidate. The cell culture and mouse study will define the expression pattern. This information will be critical to guide vaccine and therapeutics development. We will also explore the cross-protection when use two different antigens to immunize mice. The polyclonal antibody will provide potential treatment option for CCHFV infection.

5. Innovations of the research proposal

The innovation of this project derives from the research plan that integrates three powerful components into a translational product: (i) the robust self-amplifying ability of alphavirus replicon,

(ii) the ease of DNA plasmid as a vector to launch the replicative RNAs (using the mammalian transcription machinery), and (iii) the cutting-edge device for DNA delivery in clinical use. Although alphavirus replicon has been used for protein expression and vaccine development for almost three decades, previous efforts have mainly focused on the virus-like particle-RNA packaging (VLP) approach [ADDIN EN.CITE <EndNote><Cite><Author>Lundstrom</Author><Year>2017</Year><RecNum>137</RecNum><DisplayText>(21)</DisplayText><record><rec-number>137</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556823011" guid="45f9f958-084b-4a4f-a13b-67585a1d3c8d">137</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Lundstrom, K.</author></authors></contributors><titles><title>Oncolytic Alphaviruses in Cancer Immunotherapy</title><secondary-title>Vaccines (Basel)</secondary-title></titles><periodical><full-title>Vaccines (Basel)</full-title></periodical><volume>5</volume><number>2</number><edition>2017/04/12</edition><keywords><keyword>cancer immunotherapy</keyword><keyword>oncolytic alphaviruses</keyword><keyword>tumor eradication</keyword></keywords><dates><year>2017</year><pub-dates><date>Apr</date></pub-dates></dates><isbn>2076-393X</isbn><accession-num>28417936</accession-num><urls><related-urls><url>https://www.ncbi.nlm.nih.gov/pubmed/28417936</url></related-urls></urls><custom2>PMC5492006</custom2><electronic-resource-num>10.3390/vaccines5020009</electronic-resource-num><language>eng</language></record></Cite></EndNote>]. For the VLP approach, viral structural proteins are supplied in trans to package the viral replicon RNA (carrying an antigen of interest) into VLPs; such VLPs are used to immunize animals. The drawbacks of the VLP approach include the requirement of eukaryotic cell culture electroporation for VLP production, moderate yield of VLP manufacture (when compared with the doses required for vaccination and treatment), pre-immune inhibition when multiple rounds of VLP infection are needed, and the "cold chain" transportation from manufactures to clinics. All the above drawbacks of the VLP approach could be mitigated by the proposed DNA-launched replicon in this project.

Despite the potential concern of integration of exogenous DNA into the cellular chromosome, the DNA plasmid approach has been actively pursued for vaccine development and cancer therapy. For example, the current frontrunner ZIKV vaccine in the phase II clinical trial is built upon a DNA plasmid (expressing two viral structure proteins prM and E). This type of traditional DNA vaccine requires multiple high doses to achieve protective immunity. For the ZIKV DNA vaccines, each human volunteer requires three shots, with 1 to 5 mg of DNA per shot, to achieve short-term neutralizing antibody titers [ADDIN EN.CITE ADDIN EN.CITE.DATA]. It should be noted that the adverse potential of DNA integration into the cellular genome remains to be determined in clinics. Compared with the traditional non-amplifying DNA vaccine, our DNA-launched replicon is self-replicative, and requires a much lower dose to achieve efficacy. The significantly reduced dose will minimize the risk of potential DNA integration. In addition, due to the self-amplifying nature of the proposed replicon DNA platform, protective immunity and efficacy could potentially be achieved with a single dose to control explosive outbreaks, which is particularly important when responding to public health emergency. Therefore, the replicon DNA platform has the potential to overcome the most critical weakness of the traditional DNA vaccine, and could be developed into a transformative new DNA delivery technology.

Collectively, we hypothesize that, in combination with the cutting-edge device for delivery, the DNA-launched replicon platform will transform into robust translational products for vaccine and therapeutics development. Since the goal of the Advanced Customer Cultivation Project to develop solutions to prevent and control human diseases, the combination of the well-proven alphaviral replicon system with the ease of DNA engineering and the state-of-the-art DNA delivery represents a practical innovation for vaccine platform development.

Passive immunotherapy with sera of animal origin has been used for over 120 years to treat bacterial and viral infections, envenomations and drug intoxications. The lower manufacturing costs of hyperimmune equine antisera therefore represents an attractive alternate avenue of treatment, especially to developing and third-world countries, compared to the more costly production process of viral specific mAbs. However, currently the study of anti-CCHFV antisera via the immunization of horses and the safety and efficiency has not been reported. Since the highly replication efficiency

and the safety of the VSV vector, in this study the VSV-CCHFV-GP will be chose as the antigen for horse.

2. Conditions necessary to conduct the research (including lab equipments, instruments and etc.)

Biosafety cabinet

PCR thermal cycler

Real-Time PCR thermal cycler

Table top centrifuge

Water bath

DNA gel electrophoresis system

Protein gel electrophoresis system

TriGrid Delivery System (Ichor, for DNA vaccine delivery)

ChemiDoc System

Pipettes

CO2 incubators

Microscopy

Refrigerator

-80 freezer

-30 freezer

Liquid nitrogen tank

IV. Introduction of Leader and Participants

James Le Duc, PhD, is the director of the Galveston National Laboratory, one of the largest active biocontainment facilities on a U.S. academic campus. Dr. Le Duc joined UTMB in late 2006 from the Centers for Disease Control and Prevention in Atlanta, where he was the influenza coordinator and director of the Division of Viral and Rickettsial Diseases. With more than four decades of experience working in the fields of biodefense and public health, his work has taken him around the world, from West Africa, where he began his professional career as a field biologist working for the Smithsonian Institution, to Brazil and Panama during a 23-year career as a U.S. Army officer in the medical research and development command.

Pei-Yong Shi, PhD, is I.H. Kempner Professor of Human Genetics, University of Texas Medical Branch, Galveston Texas, USA. He is an elected Fellow of American Academy of Microbiology, adjunct Professor of Emerging Infectious Diseases at the Duke-NUS Graduate Medical School in Singapore, and Honorary Professor at the Wuhan Institute of Virology, Chinese Academy of Sciences. He received his Ph.D. in virology in 1996 from Georgia State University. After postdoctoral training at Yale University, he joined Bristol-Myers Squibb as a Principal Scientist to develop HIV and HCV therapeutics from 1998 to 2000. He then moved to the Wadsworth Center, New York State Department of Health, to study West Nile virus. From 2008 to 2015, he served as Dengue Unit Head and Executive Director to lead drug discovery at Novartis Institute for Tropical Diseases. His group developed the first infectious clones of the epidemic strain of West Nile virus and Zika virus, discovered two RNA cap methylation activities of flavivirus NS5 protein, identified essential RNA elements for flavivirus replication, established various platforms for flavivirus vaccine and drug discovery, and pioneered therapeutics development for dengue virus. He is internationally recognized for his scholar and administrative accomplishments at leading research institution, public health sector, and pharmaceutical industry. Dr. Shi has more than 20 years experiences in handling BSL2 and ABSL2 agent.

Dennis A. Bente, DVM, Ph.D., is an associate professor from University of Texas Medical Branch, Galveston Texas, USA. Dr. Bente received his DVM in 2000 and Ph.D. in 2003 from University of Veterinary Medicine at Germany. The goal of Dr. Bente's research is to better understand the

transmission and pathogenesis of tick - borne hemorrhagic fever viruses and to develop countermeasures to combat the disease. The intersection between arbovirology and hemorrhagic fever research requires an interdisciplinary approach, involving virology (classical techniques as well as molecular techniques such as reverse genetics), immunology (human and animal models), and tick physiology. Dr. Bente's is the first laboratory in the world to establish a tick - host transmission model in a BSL-4 setting. A number of collaborations have been established with other virologists at UTMB, including Drs. Alan Barrett, Thomas Ksiazek, David Beasley, Alexander Freiberg and Thomas Geisbert, that include studies on Crimean - Congo hemorrhagic fever virus, Kyasanur forest disease virus, Alkhurma hemorrhagic fever virus, and West - Nile virus. Dr. Bente has more than 10 years experiences in handling BSL2, BSL3, BSL4, ABSL2, ABSL3 and ABSL4 agent.

Zhiming Yuan, Ph.D., professor from Wuhan Institute of Virology, the director of the Wuhan National biosafety laboratory (BSL-4), and the President of Wuhan Branch, Chinese Academy of Sciences. His research interest including: (1) Diagnosis, evolution, and pathogenesis of aborviruses, (2) Tropical Disease vector control with microbial agents, and (3) Laboratory biorisk management and applied biosafety research.

Chao Shan, Ph.D., professor from Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan, China. Dr. Shan Received his Ph.D. in Biochemistry and Molecular Biology in Wuhan Institute of Virology, Chinese Academy of Sciences in China in 2014. And he joined Novartis Institute for Tropical Diseases (NITD) from 2013 to 2015. He served as postdoctoral fellow in University of Texas Medical Branch from 2015 to 2019. During his training at Wuhan Institute of Virology and NITD, he worked with Dengue virus, Japanese encephalitis virus and EV71 virus *in vitro*. After joining in UTMB in December 2015, Dr. Shan has completed BSL3, BSL4, ABSL2, ABSL3 and ABSL4 training in University of Texas Medical Branch. He built the first reverse genetic system for Zika virus and developed the first live-attenuated Zika vaccine in the world.

Han Xia, Ph.D., is associate professor from Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan, China. Dr. Xia received his Ph.D. in Biochemistry and Molecular Biology in Wuhan Institute of Virology, Chinese Academy of Sciences in China in 2014. And she served as postdoctoral fellow and the

complete the BSL-4 training in University of Texas Medical Branch from 2013 to 2016, working with the reverse genetic system developing of CCHFV and CCHFV-vector-host interaction through NGS strategy. Currently, her research interest is the epidemiology, diagnoses, and evolution of arbovirus.

[= 7 * ROMAN]. Budget

Unit: RMB 10,000 yuan

Budget Form of Project Expenditure		
Item	Amount	Detailed calculation
1. Equipment		
(1) Equipment purchase	0	
(2) Trial-manufacture purchase	0	
(3) Equipment modification and rent	0	
2. Reagents and consumables	15	Cloning and related reagent, kit, sequencing, cell culture reagent and consumables
3. Analysis	15	Horse purchase, immunization, antibody purification, DNA synthesis
4. Fuel and power	3	Transport
5. Travel/meeting/international cooperation and exchanges	5	Project meeting for WHIOV and UTMB, hotel etc.
6. Publication/literature/information dissemination/intellectual property	3	Publication and patent
7. Labor costs	5	Subsidy
8. Expert consultation	1	Project consultation
9. Other expenditure	3	Shipping fee about reagent and material
Total	50	

Note: Budget preparation and expenditure execution are conducted according to *Measures of Academy-Level Scientific Research Projects of Chinese Academy of Sciences*.

[= 8 * ROMAN]. Review opinions of applicant's organization

Our joint proposal, "Vaccine Development and Polyclonal Antiserum for Crimean-Congo Hemorrhagic Fever Virus" represents the culmination of many years of collaboration between the Galveston National Laboratory, the U.S. National Academy of Sciences and the Wuhan Institute of Virology, Wuhan National Biosafety Laboratory of the Chinese Academy of Sciences. We are very excited about the possibility of collaborating in the implementation of this important study and making use of the unique resources of both our biocontainment laboratories.

The study is non-confidential and we anticipate that our findings will be published in the peer reviewed scientific literature under shared co-authorship.

Text

[= 1 * ROMAN]. Research Background

1. Research purpose

The purposes of the project (1) Develop a replicon-based DNA vaccine for Crimean-Congo hemorrhagic fever virus (CCHFV). (2) Generation horse source polyclonal antibody for anti-CCHFV therapy.

2. Foreign and domestic research background, trend of development

Crimean-Congo hemorrhagic fever (also known as Xinjiang hemorrhagic fever) is caused by CCHFV in humans. CCHFV is a tick-borne virus with a wide geographical distribution, including Africa, the Balkans, the Middle East, Russia, western Asia and eastern Asia and needs high containment laboratory to conduct research. There are currently no licensed vaccines to prevent CCHFV-associated disease. CCHFV causes severe disease in human beings with a reported mortality rate of 3%–30% [ADDIN EN.CITE <EndNote><Cite><Author>Bente</Author><Year>2013</Year><RecNum>110</RecNum><DisplayText>(1)</DisplayText><record><rec-number>110</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556812014" guid="a4688135-8d5c-4363-a3ef-afb1028964bb">110</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Bente, D. Subunit CCHFV vaccine. Since CCHFV glycoproteins are displayed on the surface of the virion, it was used as the target to develop vaccine. Using vaccinia virus as vehicle to deliver the glycoproteins of CCHFV was shown to provide 100% protection to lethally challenged mice [ADDIN EN.CITE ADDIN EN.CITE.DATA]. DNA vaccine expressing nucleoprotein (NP) and ubiquitin-linked versions of GPC-derived Gn and Gc or virus-like particle vaccination has been shown to confer protection against lethal CCHFV challenge [ADDIN EN.CITE ADDIN EN.CITE.DATA]. Mice fed transgenic plants expressing the CCHFV glycoproteins and immunized with purified glycoprotein from *Drosophila* insect cell developed antibodies against the glycoproteins, while the latter did not confer the protection[ADDIN EN.CITE ADDIN EN.CITE.DATA].

Polyclonal antibody was widely used for antiviral treatment. The FDA has approved the production of anti-rabies virus polyclonal antibodies for commercial use. The polyclonal anti-Ebola antibody from horse can effectively protect mice from lethal Ebola virus infection. During the 2014 Ebola outbreak, the monoclonal anti-Ebola antibody was used to treat Ebola virus infection and rescued patient life. Those cases indicate that antibody therapy may plays an important role in prevention and control outbreaks of emerging diseases[ADDIN EN.CITE ADDIN EN.CITE.DATA].

Comment [LIW1]: this suggests that the horse anti-Ebola antibody was successfully used to treat humans during the West Africa Ebola outbreak. We need to be clear that it was monoclonal antibody used for treatment as referenced. See suggested changes

1. Research contents

Aim 1 Develop a replicon-based DNA vaccine for Crimean-Congo hemorrhagic fever virus (CCHFV). We will first develop the DNA-launched replicon of alphavirus due to its rapid replication capacity in mammalian cells to deliver foreign genes (Figure 1A). The replicon will be launched by eukaryotic cytomegalovirus (CMV) promoter or SV40 promoter. After the replicon is built, we will engineer the CCHFV glycoproteins G_N and G_C (e.g., GPC open-reading frame) into the replicon DNA plasmids and characterize the immunogenicity and vaccine efficacy in a mouse model (Figure 1 B&C). We choose CCHFV as a target vaccine because (i) CCHFV represents the second most widespread of all medically important arboviruses (after dengue virus) and (ii) WHO and NIAID have classified it as an R&D Blueprint priority disease and Category A priority pathogen, respectively.

Aim 2 Generation horse ~~source~~ polyclonal antibody for anti-CCHFV therapy. VSV-CCHFV-GPC recombinant virus will be generated and used to immunized the horse. Multiple booster doses may be used to ~~boost horse and facilitate~~enhance the horse immune response. The polyclonal antibody from the horse will be analyzed for specificity and titer. Once positive antibody ~~wa~~is confirmed, the horse antibody will be purified ~~from horse~~ and assayed for protective and therapeutic efficacy in ~~used for~~ mice. ~~efficacy study.~~

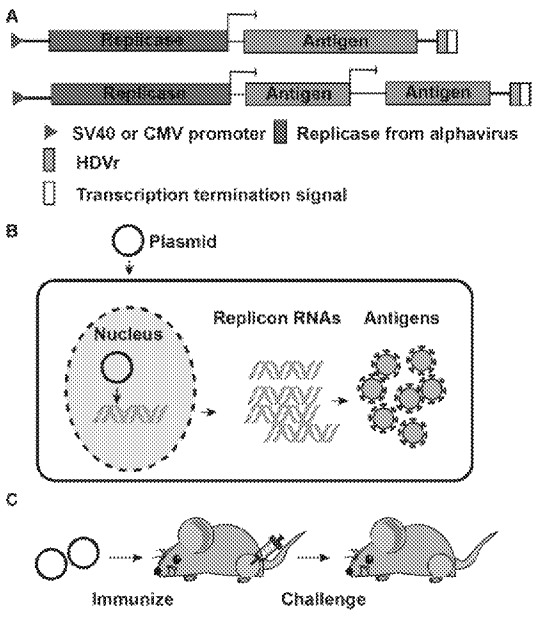

Figure 1 Experimental scheme. (A) A CHIKV (alphavirus) replicon-based

2. Research methods and experimental program

antigen deliver system. CHIKV replicon RNA containing one or two antigen-expressing subgenomes be ~~is~~ launched through DNA plasmid using eukaryotic promoter (red triangle) to transcribe CHIKV replicon RNA inside mammalian cells. An HDVr (hepatitis delta ribozyme; orange box) and a transcription termination signal sequence (white box) will be ~~are~~-engineered at the 3' end of viral RNA. (B) DNA plasmid will be~~is~~ delivered into cells to launch CHIKV replicon. The replication of replicon RNAs results in robust expression of antigens. (C) Immunization of mice with CHIKV replicon DNA. The plasmid DNA will be~~is~~ delivered to animals. The vaccinated animals will be~~are~~ analyzed for immunogenicity and challenged for efficacy testing.

Aim 1 Develop a replicon-based DNA vaccine for Crimean-Congo hemorrhagic fever virus (CCHFV).

(1) **Construct alphavirus replicon as delivery system.** Alphavirus replicons are genomes with one or more of the structural protein genes deleted, but with all nonstructural genes and cis-acting sequences retained such that they replicate once introduced or produced in the cytoplasm (Fig. 1A). However, because the compatible alphavirus structural proteins are missing, infectious virus cannot be produced. The alphavirus replicon subgenomic promoter can be left intact such that subgenomic RNA is produced, which for alphaviruses is in high molar excess compared to the genomic RNA. Thus, if a foreign gene is used to replace the alphavirus structural polyprotein encoded by the subgenomic RNA, large amounts are expressed but viral spread cannot occur. Here we choose chikungunya virus (CHIKV) replicon among other alphaviruses in this proposal.

Comment [LJW2]: not sure what is meant in this sentence. "We choose chik virus recplion as our delivery system in this proposal."?

(2) **Antigen selection of CCHFV vaccine.** Like other Bunyaviruses, CCHFV contains a tri-segmented, negative sense RNA genome: small (S), medium (M), and large (L) segments. Among the six genetically distinct clades of CCHFV, there are 20, 31, and 22% sequence divergence for S, M, and L segment, respectively [ADDIN EN.CITE <EndNote><Cite><Author>Bente</Author><Year>2013</Year><RecNum>110</RecNum><DisplayText>(1)</DisplayText><record><rec-number>110</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556812014" guid="a4688135-8d5c-4363-a3ef-afb1028964bb">110</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Bente, D. Res</secondary-title></titles><periodical><full-title>Antiviral Res</full-title></periodical><pages>112-120</pages><volume>146</volume><edition>2017/08/24</edition><keywords><keyword>Animals</keyword><keyword>Antibodies, Monoclonal</keyword><keyword>Antibodies, Neutralizing</keyword><keyword>Antibodies, Viral</keyword><keyword>Epitopes</keyword><keyword>Glycoproteins</keyword><keyword>Hemorrhagic Fever Virus, Crimean-Congo</keyword><keyword>Hemorrhagic Fever, Crimean</keyword><keyword>Humans</keyword><keyword>Mutation</keyword><keyword>Neutralization Tests</keyword><keyword>Phylogeny</keyword><keyword>Sequence Analysis, DNA</keyword><keyword>Crimean-Congo hemorrhagic fever virus</keyword><keyword>Monoclonal antibodies</keyword><keyword>Neutralization assay</keyword><keyword>Virus-like particles</keyword></keywords><dates><year>2017</year><pub-dates><date>Oct</date></pub-dates></dates><isbn>1872-9096</isbn><accession-num>28842265</accession-num><urls><related-urls><url>https://www.ncbi.nlm.nih.gov/pubmed/28842265</url></related-urls></urls><electronic-esource-num>10.1016/j.antiviral.2017.08.014</electronic-resource-num><language>eng</language></record></Cite></EndNote>], and adoptive transfer of these antibodies confer *in vivo* protection in suckling mice [ADDIN EN.CITE ADDIN EN.CITE.DATA]. These results support the possibility of cross-protection against all strains from the six CCHFV clades. The results also justify expression of the complete GPC polyprotein for vaccine development.

(3) **Construction of CCFHV vaccine candidates.** We will engineer the full open-reading frame of CCHFV GPC into the CHIKV replicon plasmid. The complete GPC will be used~~is selected~~ to ensure the correct processing and conformation of the individual G_N and G_C proteins. The GPC sequence from clinical CCHFV strain FK16116 (China) [ADDIN EN.CITE ADDIN EN.CITE.DATA] and Turkey200406546 (UTMB), rather than laboratory strain IbAr10200, will be used for human codon optimization and inserted into the replicon plasmids. The resulting GPC-replicon plasmids will be evaluated in cell culture for the expression and processing of GN and GC proteins using Western blot. Once the protein expression has been confirmed, we will test the GPC-replicon plasmid in a CCHFV mouse model.

(4) **Testing CCHFV vaccine candidates *in vivo*.** We will test the GPC-replicon plasmids for immunogenicity, safety, and efficacy in a mouse model. Over the last seven decades, attempts have been made to establish an animal model for CCHF in adult mice, rats, guinea pigs, hamsters, rabbits, and other laboratory animals. They met with very limited success showing little or no signs of infection or disease when infected with CCHFV. Until 2010, the only animal that manifested disease after CCHFV infection was the newborn suckling mouse. In recent years, small animal models have been developed using STAT-1$^{-/-}$ [ADDIN EN.CITE <EndNote><Cite><Author>Bente</Author><Year>2010</Year><RecNum>115</RecNum><DisplayText>(16)</DisplayText><record><rec-number>115</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556812015" guid="3f1f6230-804e-46e3-8483-dac0c54cf730">115</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Bente, D. A.</author><author>Alimonti, J. B.</author><author>Shieh, W. J.</author><author>Camus, G.</author><author>Ströher, U.</author><author>Zaki, S.</author><author>Jones, S. M.</author></authors></contributors><titles><title>Pathogenesis and immune response of Crimean-Congo hemorrhagic fever virus in a STAT-1 knockout mouse model</title><secondary-title>J Virol</secondary-title></titles><periodical><full-title>J Virol</full-title></periodical><pages>11089-100</pages><volume>84</volume><number>21</number><edition>2010/08/25</edition><keywords><keyword>Animals</keyword><keyword>Disease Models, Animal</keyword><keyword>Disease Susceptibility</keyword><keyword>Hemorrhagic Fever Virus, Crimean-Congo</keyword><keyword>Hemorrhagic Fever, Crimean</keyword><keyword>Humans</keyword><keyword>Mice</keyword><keyword>Mice, Knockout</keyword><keyword>STAT1 Transcription Factor</keyword></keywords><dates><year>2010</year><pub-dates><date>Nov</date></pub-dates></dates><isbn>1098-5514</isbn><accession-num>20739514</accession-num><urls><related-urls><url>https://www.ncbi.nlm.nih.gov/pubmed/20739514</url></related-urls></urls><custom2>PMC2953203</custom2><electronic-resource-num>10.1128/JVI.01383-10</electronic-resource-num><language>eng</language></record></Cite></EndNote>] or IFNAR$^{-/-}$ (type-I interferon receptor) knockout mice [ADDIN EN.CITE ADDIN EN.CITE.DATA]. Since these mice succumb to CCHFV infection, we will test our vaccine candidates in the IFNAR$^{-/-}$ mice. More recently, transient

depletion of interferon receptors through intraperitoneal injection with a monoclonal antibody (Mab MAR1-5A3, Leinco Technologies) immediately prior to challenge has been shown to allow efficient viral replication [ADDIN EN.CITE ADDIN EN.CITE.DATA]. We will also use the wild-type C57BL/6 mice to evaluate the vaccine efficacy since this model allows a full immune response to immunization while allowing the virus to replicate after challenge. The mouse efficacy experiments with CCHFV will be performed by Dr. Chao Shan and Dr. Han Xia at the BSL-4 facility at Wuhan Institute of Virology, Chinese Academy of Sciences.

Using the IFNAR$^{-/-}$ mice, we will intramuscularly immunize different doses of replicon-GPC plasmid (1, 5, 10, and 20 μg; n=12 per group, male and female) or PBS (as sham control) using the TriGrid Delivery System. On day 28 post-immunization, the immunized mice will be bled and measured for antibody titers using CCHFV VLP ELISA [ADDIN EN.CITE <EndNote><Cite><Author>Zivcec</Author><Year>2015</Year><RecNum>136</RecNum><DisplayText>(20)</DisplayText><record><rec-number>136</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556821443" guid="951bec17-5bed-4e75-80a1-9f1b854ce673">136</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Zivcec, M.</author><author>Metcalfe, M. G.</author><author>Albariño, C. G.</author><author>Guerrero, L. W.</author><author>Pegan, S. D.</author><author>Spiropoulou, C. F.</author><author>Bergeron, É</author></authors></contributors><titles><title>Assessment of Inhibitors of Pathogenic Crimean-Congo Hemorrhagic Fever Virus Strains Using Virus-Like Particles</title><secondary-title>PLoS Negl Trop Dis</secondary-title></titles><periodical><full-title>PLoS Negl Trop Dis</full-title></periodical><pages>e0004259</pages><volume>9</volume><number>12</number><edition>2015/12/01</edition><keywords><keyword>Antibodies, Monoclonal</keyword><keyword>Antibodies, Neutralizing</keyword><keyword>Antibodies, Viral</keyword><keyword>Drug Evaluation, Preclinical</keyword><keyword>Genes, Reporter</keyword><keyword>Hemorrhagic Fever Virus, Crimean-Congo</keyword><keyword>Molecular Sequence Data</keyword><keyword>Sequence Analysis, DNA</keyword><keyword>Transcription,

Genetic</keyword><keyword>Virion</keyword><keyword>Virus Internalization</keyword><keyword>Virus Replication</keyword></keywords><dates><year>2015</year><pub-dates><date>Dec</date></pub-dates></dates><isbn>1935-2735</isbn><accession-num>26625182</accession-num><urls><related-urls><url>https://www.ncbi.nlm.nih.gov/pubmed/26625182</url></related-urls></urls><custom2>PMC4666410</custom2><electronic-resource-num>10.1371/journal.pntd.0004259</electronic-resource-num><language>eng</language></record></Cite></EndNote>]. On the same day, the animals will be challenged with 100 PFU of clinical CCHFV strain FK16116 (China). The challenged animals will be measured for the following parameters for efficacy: (i) Viremia and viral loads in different organs using qRT-PCR and plaque assays, (ii) weight loss, (iii) survival (Deaths are expected on days 2-6 post-challenge in the sham group), (iv) antibody titers on 28 days after challenge, and (v) T cell activation. Comparison of the antibody titers before and after challenge will indicate if the vaccine elicits sterilizing immunity (i.e., no detectable viremia and no increase in antibody titers after challenge). Using the wild-type mice, we will immunize C57BL/6 mice with the GPC-replicon plasmid and measure the five parameters described above. The immunized mice will be challenged with 100 PFU of clinical CCHFV strain FK16116 (China) by the intraperitoneal route; however, to facilitate viral infection and replication, the animals will be pretreated with 2 mg of interferon receptor-blocking antibodies one day before the CCHFV challenge, and further treated with 0.5 mg of antibody at 24 h after challenge [ADDIN EN.CITE ADDIN EN.CITE.DATA]. These *in vivo* studies will reveal the immunogenicity, safety, and efficacy of the vaccine candidates. Comparison of the results from different dosage groups (1, 5, 10, and 20 μg DNA) will also allow us to estimate the correlates of protections against CCHFV infection in the mouse model.

Aim 2 Generation horse ~~source~~ polyclonal antibody for anti-CCHFV therapy.

(1) Production of VSV-CCHFV-GPC recombinant virus.

(2) Immunization of the horse for polyclonal antibody production. VSV-CCHFV-GPC recombinant virus (1×10^6 PFU) will be used to immunized a horse by intramuscularly (multi-point injection) route. On day 28 post-immunization, the immunized ~~horse/mice~~ will be bled and measured for antibody titers using CCHFV VLP ELISA [ADDIN EN.CITE <EndNote><Cite><Author>Zivcec</Author><Year>2015</Year><RecNum>136</RecNum><

If the antibody titer reaches desired point, the horse~~blood~~ will be bled for antibody purification. If not, ~~a~~the booster innoculation will be given~~happened~~ to facilitate the immune response and antibody titer will be assayed at ~~wait another~~ 28 days.

Comment [LJW4]: what's the target titer?

(3) Polyclonal antibody purification from horse blood. Once desired anti-CCHFV antibody titer is reached, the horse ~~blood~~ will be bled. Protein G Agarose will be used to purify the horse polyclonal antibody based on the manufacture manual. The eluted polyclonal antibody will be ~~dialyzed~~dialyzed in PBS and aliquoted. Purified polyclonal antibody will be measured by CCHFV VLP ELISA to confirm antibody titer.

Comment [LJW5]: identify titer desired someplace in the proposal

(4) Mice efficacy study.

Using the IFNAR$^{-/-}$ mice, we will intraperitoneally inject different doses of purified antibody (or PBS (as sham control) one day before CCHFV FK16116 infection. On the day of infection, the blood will be collected and 100 PFU CCHFV will be injected subcutaneously. The challenged animals will be measured for the following parameters for efficacy: (i) Viremia and viral loads in different organs using qRT-PCR and plaque assays, (ii) weight loss, (iii) survival (Deaths are expected on days 2-6 post-challenge in the sham group).

3. Expected outcome

The proposed experiments will generate a CCHFV vaccine candidate built upon the FK16116 and Turkey200406546 strain. The cross-protection against different stains will be evaluated after challenge. Comparison of the immunogenicity and efficacy from the mouse experiments will allow us to down select the final candidate. In an unlikely situation that a single-shot immunization of the replicon-GPC plasmid is not sufficient to elicit protective antibody titers or full protection against CCHFV infection, we will boost the animals with a second dose of replicon-GPC plasmid. The mouse efficacy results will allow us to strategize further regarding preclinical development, including efficacy test in a non-human primate model. In addition, by producing~~selecting~~ the horse polyclonal antibody, ~~from horse~~ we will ~~allow us~~ have ~~the~~ potential candidate for anti-CCHFV treatment.

Comment [LJW6]: please confirm that this is your intent

4. Key problems and technical difficulties to be solved.

Vaccine development. ~~The~~ proposed study will establish a DNA replicon platform for CHIKV. ~~And~~ ~~t~~This platform will ~~be~~ served as the vehicle to deliver the CCHFV-GPC for our vaccine candidate. The cell culture and mouse study will define the expression pattern. This information will be critical to guide vaccine and therapeutics development. We will also explore the cross-protection by

Comment [LJW7]: should these activities be listed as problems to be resolved over the course of the study?

using~~when use~~ two different antigens to immunize mice. The polyclonal antibody will provide potential treatment option for CCHFV infection.

5. Innovations of the research proposal

The innovation of this project derives from the research plan that integrates three powerful components into a translational product: (i) the robust self-amplifying ability of alphavirus replicon, (ii) the ease of DNA plasmid as a vector to launch the replicative RNAs (using the mammalian transcription machinery), and (iii) the cutting-edge device for DNA delivery in clinical use. Although alphavirus replicon has been used for protein expression and vaccine development for almost three decades, previous efforts have mainly focused on the virus-like particle-RNA packaging (VLP) approach [ADDIN EN.CITE <EndNote><Cite><Author>Lundstrom</Author><Year>2017</Year><RecNum>137</RecNum><DisplayText>(21)</DisplayText><record><rec-number>137</rec-number><foreign-keys><key app="EN" db-id="fw5a0favmxv0w2ex9wqvwxwnz9pat9z0szft" timestamp="1556823011" guid="45f9f958-084b-4a4f-al3b-67585ald3c8d">137</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Lundstrom, K.</author></authors></contributors><titles><title>Oncolytic Alphaviruses in Cancer Immunotherapy</title><secondary-title>Vaccines (Basel)</secondary-title></titles><periodical><full-title>Vaccines (Basel)</full-title></periodical><volume>5</volume><number>2</number><edition>2017/04/12</edition><keywords><keyword>cancer immunotherapy</keyword><keyword>oncolytic alphaviruses</keyword><keyword>tumor eradication</keyword></keywords><dates><year>2017</year><pub-dates><date>Apr</date></pub-dates></dates><isbn>2076-393X</isbn><accession-num>28417936</accession-num><urls><related-urls><url>https://www.ncbi.nlm.nih.gov/pubmed/28417936</url></related-urls></urls><custom2>PMC5492006</custom2><electronic-resource-num>10.3390/vaccines5020009</electronic-resource-num><language>eng</language></record></Cite></EndNote>]. For the VLP approach, viral structural proteins are supplied in trans to package the viral replicon RNA (carrying an antigen of interest) into VLPs; such VLPs are used to immunize animals. The drawbacks of the VLP approach include the requirement of eukaryotic cell culture electroporation for VLP production, moderate

yield of VLP manufacture (when compared with the doses required for vaccination and treatment), pre-immune inhibition when multiple rounds of VLP infection are needed, and the "cold chain" transportation from manufactures to clinics. All the above drawbacks of the VLP approach could be mitigated by the proposed DNA-launched replicon in this project.

Despite the potential concern of integration of exogenous DNA into the cellular chromosome, the DNA plasmid approach has been actively pursued for vaccine development and cancer therapy. For example, the current frontrunner ZIKV vaccine in the phase II clinical trial is built upon a DNA plasmid (expressing two viral structure proteins prM and E). This type of traditional DNA vaccine requires multiple high doses to achieve protective immunity. For the ZIKV DNA vaccines, each human volunteer requires three shots, with 1 to 5 mg of DNA per shot, to achieve short-term neutralizing antibody titers [ADDIN EN.CITE ADDIN EN.CITE.DATA]. It should be noted that the adverse potential of DNA integration into the cellular genome remains to be determined in clinics. Compared with the traditional non-amplifying DNA vaccine, our DNA-launched replicon is self-replicative, and requires a much lower dose to achieve efficacy. The significantly reduced dose will minimize the risk of potential DNA integration. In addition, due to the self-amplifying nature of the proposed replicon DNA platform, protective immunity and efficacy could potentially be achieved with a single dose to control explosive outbreaks, which is particularly important when responding to public health emergency. Therefore, the replicon DNA platform has the potential to overcome the most critical weakness of the traditional DNA vaccine, and could be developed into a transformative new DNA delivery technology.

Collectively, we hypothesize that, in combination with the cutting-edge device for delivery, the DNA-launched replicon platform will transform into robust translational products for vaccine and therapeutics development. Since the goal of the Advanced Customer Cultivation Project is to develop solutions to prevent and control human diseases, the combination of the well-proven alphaviral replicon system with the ease of DNA engineering and the state-of-the-art DNA delivery represents a practical innovation for vaccine platform development.

Passive immunotherapy with sera of animal origin has been used for over 120 years to treat bacterial and viral infections, envenomations and drug intoxications. The lower manufacturing costs of hyperimmune equine antisera therefore represents an attractive alternate avenue of treatment,

especially to developing and third-world countries, compared to the more costly production process of viral specific mAbs. However, currently the study of anti-CCHFV antisera via the immunization of horses and the safety and efficiency has not been reported. Since the highly replication efficiency and the safety of the VSV vector, in this study the VSV-CCHFV-GP will be used~~chose~~ as the antigen for horse.

2. Conditions necessary to conduct the research (including lab equipments, instruments and etc.)

Biosafety cabinet

PCR thermal cycler

Real-Time PCR thermal cycler

Table top centrifuge

Water bath

DNA gel electrophoresis system

Protein gel electrophoresis system

TriGrid Delivery System (Ichor, for DNA vaccine delivery)

ChemiDoc System

Pipettes

CO2 incubators

Microscopy

Refrigerator

-80 freezer

-30 freezer

Liquid nitrogen tank

IV. Introduction of Leader and Participants

James Le Duc, PhD, is the director of the Galveston National Laboratory, one of the largest active biocontainment facilities on a U.S. academic campus. Dr. Le Duc joined UTMB in late 2006 from the Centers for Disease Control and Prevention in Atlanta, where he was the influenza coordinator and director of the Division of Viral and Rickettsial Diseases. With more than four decades of experience working in the fields of biodefense and public health, his work has taken him around the world, from West Africa, where he began his professional career as a field biologist working for the Smithsonian Institution, to Brazil and Panama during a 23-year career as a U.S. Army officer in the medical research and development command.

Pei-Yong Shi, PhD, is I.H. Kempner Professor of Human Genetics, University of Texas Medical Branch, Galveston Texas, USA. He is an elected Fellow of American Academy of Microbiology, adjunct Professor of Emerging Infectious Diseases at the Duke-NUS Graduate Medical School in Singapore, and Honorary Professor at the Wuhan Institute of Virology, Chinese Academy of Sciences. He received his Ph.D. in virology in 1996 from Georgia State University. After postdoctoral training at Yale University, he joined Bristol-Myers Squibb as a Principal Scientist to develop HIV and HCV therapeutics from 1998 to 2000. He then moved to the Wadsworth Center, New York State Department of Health, to study West Nile virus. From 2008 to 2015, he served as Dengue Unit Head and Executive Director to lead drug discovery at Novartis Institute for Tropical Diseases. His group developed the first infectious clones of the epidemic strain of West Nile virus and Zika virus, discovered two RNA cap methylation activities of flavivirus NS5 protein, identified essential RNA elements for flavivirus replication, established various platforms for flavivirus vaccine and drug discovery, and pioneered therapeutics development for dengue virus. He is internationally recognized for his scholar and administrative accomplishments at leading research institution, public health sector, and pharmaceutical industry. Dr. Shi has more than 20 years experiences in handling BSL2 and ABSL2 agent.

Dennis A. Bente, DVM, Ph.D., is an associate professor from University of Texas Medical Branch, Galveston Texas, USA. Dr. Bente received his DVM in 2000 and Ph.D. in 2003 from University of Veterinary Medicine at Germany. The goal of Dr. Bente's research is to better understand the

transmission and pathogenesis of tick - borne hemorrhagic fever viruses and to develop countermeasures to combat the disease. The intersection between arbovirology and hemorrhagic fever research requires an interdisciplinary approach, involving virology (classical techniques as well as molecular techniques such as reverse genetics), immunology (human and animal models), and tick physiology. Dr. Bente's is the first laboratory in the world to establish a tick - host transmission model in a BSL-4 setting. A number of collaborations have been established with other virologists at UTMB, including Drs. Alan Barrett, Thomas Ksiazek, David Beasley, Alexander Freiberg and Thomas Geisbert, that include studies on Crimean - Congo hemorrhagic fever virus, Kyasanur forest disease virus, Alkhurma hemorrhagic fever virus, and West - Nile virus. Dr. Bente has more than 10 years experiences in handling BSL2, BSL3, BSL4, ABSL2, ABSL3 and ABSL4 agent.

Zhiming Yuan, Ph.D., professor from Wuhan Institute of Virology, the director of the Wuhan National biosafety laboratory (BSL-4), and the President of Wuhan Branch, Chinese Academy of Sciences. His research interest including: (1) Diagnosis, evolution, and pathogenesis of aborviruses, (2) Tropical Disease vector control with microbial agents, and (3) Laboratory biorisk management and applied biosafety research.

Chao Shan, Ph.D., professor from Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan, China. Dr. Shan Received his Ph.D. in Biochemistry and Molecular Biology in Wuhan Institute of Virology, Chinese Academy of Sciences in China in 2014. And he joined Novartis Institute for Tropical Diseases (NITD) from 2013 to 2015. He served as postdoctoral fellow in University of Texas Medical Branch from 2015 to 2019. During his training at Wuhan Institute of Virology and NITD, he worked with Dengue virus, Japanese encephalitis virus and EV71 virus *in vitro*. After joining in UTMB in December 2015, Dr. Shan has completed BSL3, BSL4, ABSL2, ABSL3 and ABSL4 training in University of Texas Medical Branch. He built the first reverse genetic system for Zika virus and developed the first live-attenuated Zika vaccine in the world.

Han Xia, Ph.D., is associate professor from Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan, China. Dr. Xia received his Ph.D. in Biochemistry and Molecular Biology in Wuhan Institute of Virology, Chinese Academy of Sciences in China in 2014. And she served as postdoctoral fellow and the

complete the BSL-4 training in University of Texas Medical Branch from 2013 to 2016, working with reverse genetic system developing of CCHFV and CCHFV-vector-host interaction through NGS strategy. Currently, her research interest is the epidemiology, diagnoses, and evolution of arbovirus.

[= 7 * ROMAN]. Budget

Unit: RMB 10,000 yuan

Budget Form of Project Expenditure		
Item	Amount	Detailed calculation
1. Equipment		
(1) Equipment purchase	0	
(2) Trial-manufacture purchase	0	
(3) Equipment modification and rent	0	
2. Reagents and consumables	15	Cloning and related reagent, kit, sequencing, cell culture reagent and consumables
3. Analysis	15	Horse purchase, immunization, antibody purification, DNA synthesis
4. Fuel and power	3	Transport
5. Travel/meeting/international cooperation and exchanges	5	Project meeting for WHIOV and UTMB, hotel etc.
6. Publication/literature/information dissemination/intellectual property	3	Publication and patent
7. Labor costs	5	Subsidy
8. Expert consultation	1	Project consultation
9. Other expenditure	3	Shipping fee about reagent and material
Total	50	

Note: Budget preparation and expenditure execution are conducted according to *Measures of Academy-Level Scientific Research Projects of Chinese Academy of Sciences*.

[= 8 * ROMAN]. Review opinions of applicant's organization

Our joint proposal, "Vaccine Development and Polyclonal Antiserum for Crimean-Congo Hemorrhagic Fever Virus" represents the culmination of many years of collaboration between the Galveston National Laboratory, the U.S. National Academy of Sciences and the Wuhan Institute of Virology, Wuhan National Biosafety Laboratory of the Chinese Academy of Sciences. We are very excited about the possibility of collaborating in the implementation of this important study and making use of the unique resources of both our biocontainment laboratories.

The study is non-confidential and we anticipate that our findings will be published in the peer reviewed scientific literature under shared co-authorship.

Chinese Response to New Virus: Good News/Bad News

By James W. Le Duc

Fast action and open communications by China is helping the world prepare for another potentially devastating infectious disease outbreak. While the situation is rapidly evolving, there is good news that may not make the headlines. Many will recall the dark days in the spring of 2003 when Asia and the world were threatened by the appearance of a new virus disease, Severe Acute Respiratory Syndrome, or SARS, which first appeared in southern China and quickly spread to other countries around the world, ultimately causing over 8000 cases with nearly 10% of those ending in death. SARS was caused by a novel coronavirus then unknown to medical science. There was no known cure, no diagnostic tests and little understanding of where it came from or how it was spread, although person-to-person transmission was obvious as health care workers treating the first cases were themselves among the early victims. Initially, China was reluctant to share information or alert the international community of the magnitude of the epidemic, leading to international criticism and a dangerous global health situation. Fortunately, China reversed its position, opened to collaborations with the WHO, U.S. and others, and the epidemic was eventually controlled.

Today, with another novel coronavirus discovered in China, the start is very different. In quick measure, Chinese health officials recognized that a new disease had emerged, quickly isolated patients, and instituted an impressive set of interventions in attempts to limit disease spread and characterize the new pathogen. Importantly, they have been transparent in sharing their findings with the world, thus allowing other nations to take precautions and be on the lookout for the new disease. Already, the genome of the new virus was sequenced and posted for easy access by international experts, allowing rapid exploration of possible treatments, development of diagnostics and epidemiological investigations.

China's ability to respond quickly and efficiently to this new threat is the result of nearly two decades of investments and collaborations to improve public health in China. The Chinese Centers for Disease Control incorporates many of the strengths of our own CDC, but is designed to meet the needs of a 1.4 billion plus population. In addition, China has invested in building a robust scientific capacity and partnered with containment laboratories such as ours to incorporate best practices when studying dangerous pathogens.

The current outbreak demonstrates a welcome openness to health information sharing with the global community. To diagnose an outbreak early requires astute healthcare providers able to recognize when something new or unusual is occurring; however, clinical recognition alone is meaningless if there is no capacity to investigate cases or characterize the disease-causing agent.

For the last few years, our National Academy of Science, Engineering and Medicine has worked with the Chinese Academy of Sciences to build relationships and share information on emerging diseases and advancements in vaccines and treatments. In Galveston, we welcomed leading Chinese health officials to collaborate on biocontainment facility design, biosafety training and laboratory operations. This dialogue, along with U.S.-based educational opportunities for Chinese students, benefit us all.

China's response to the new coronavirus demonstrates their investments in physical laboratories and scientific collaborations over the past decade are paying dividends, not only to China, but the entire world. Control of a new disease efficiently transmitted person-to-person is nearly impossible as we witnessed during the 2009 novel influenza pandemic and much must still be done together during this quickly evolving situation.

The outbreak is still in the early stages, but it is now clear that the new virus may be transmitted person-to-person, although the efficiency of such transmission remains in question. A few hundred patients have been identified, deaths occurred and the disease has spread from the epicenter in Wuhan to major cities in China and other Asian countries. Our CDC is now screening travelers arriving from Wuhan at U.S. airports, and the WHO is set to consider a global emergency response. With millions about to travel for the Chinese New Year, avoiding a global catastrophe must be the current goal.

The good news is that, at a time when US-China relations are being tested on many fronts, relations within the public health and scientific research arenas remain open and positive, which lays a solid foundation for curtailing this latest threat.

James Le Duc, PhD, is the Director of the Galveston National Laboratory at the University of Texas Medical Branch and a professor in UTMB's Department of Microbiology and Immunology.

MATERIAL TRANSFER AGREEMENT

This Material Transfer Agreement ("**Agreement**") is made between The University of Texas Medical Branch at Galveston, d/b/a UTMB Health ("**UTMB**"), a health institution of The University of Texas System ("System"), an agency of the State of Texas, located at 301 University Blvd., Galveston, TX 77555-0926, and Wuhan Institute of Virology Chinese Academy of Sciences Wuhan, China ("**Provider**") located at [redacted].

From the laboratory of Professor Fei Deng, Ph.D., Professor Zhengli Shi, Ph.D., ("**Provider Scientists**"), Provider agrees to provide UTMB with certain materials for the purpose stated herein under the following conditions:

1. **Material and Research.** The Materials covered by this Agreement are as follows: New coronavirus 2019 isolate: nCoV-2019 (IVCAS 6.7512), ("**Material**"). The Material shall be used by UTMB in research ("**Research**"), as defined in **Attachment A**, and the Research will be conducted by UTMB under the supervision of, Pei-Yong Shi, Ph.D. and Dr. James LeDuc, ("**UTMB Scientists**").
2. **Use of Material.** This Material is made available for internal research use only in laboratory animals or in vitro experiments. The Material is considered proprietary to Provider and Provider shall be free, in its sole discretion, to distribute the Material to others and to use it for its own purposes. Except as provided for by this Agreement, UTMB shall not distribute, transfer, or release the Material to any person or entity other than laboratory personnel under UTMB Scientist's direct supervision, unless written permission is obtained from Provider. UTMB agrees that all of its UTMB Scientist(s) involved in the Research will have read the terms and conditions of this Agreement and abide by the terms and conditions of this Agreement.
3. **Rights.** The Material shall not be used by UTMB for any products or processes for any purpose other than performing the Research hereunder. .
4. **Confidentiality**. All Material and information relating to the Material that is disclosed by Provider to UTMB shall be considered to be confidential, subject to Section 5. Publication of this Agreement. UTMB will use reasonable efforts to prevent the disclosure of Provider's confidential information to third parties for a period of three (3) years from receipt, provided that UTMB's obligation shall not apply to information that:
   a) is already in the UTMB's possession at the time of disclosure;
   b) is or later becomes part of the public domain through no fault of the UTMB;

c) is received from a third party having no obligations of confidentiality to UTMB;
d) is independently developed by the UTMB; or
e) is required by law or regulation to be disclosed.

In the event that information is required to be disclosed pursuant to subsection (e), UTMB shall notify the UTMB, in order to allow UTMB to assert whatever exclusions or exemptions may be available to it under such law or regulation.

5. **Publication.** UTMB will inform Provider of results of Research, in confidence, related to the Material by providing Provider with a draft manuscript describing such results. If UTMB's Scientist desires to publish or present such Research results, then, not less than forty-five (45) days prior to submission to a third-party, UTMB will provide Provider with a copy of any manuscript or abstract disclosing such Research results for the purpose of protecting the Material and intellectual property of Provider that might be disclosed by such publication. In any such publication or presentation of Research results, UTMB agrees to acknowledge Provider scientist as provider of the Material.
6. **Intellectual Property.** Inventorship of any invention will be determined based on U.S. patent law. Ownership shall follow inventorship.
7. **Warranty.** The Material is experimental in nature and it is provided "AS IS" WITHOUT WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR SAFETY OR ANY OTHER WARRANTY, EXPRESS OR IMPLIED. UTMB MAKES NO REPRESENTATION OR WARRANTY THAT THE USE OF THE MATERIAL WILL NOT INFRINGE ANY PATENT OR OTHER PROPRIETARY RIGHT.
8. **Liability.** Provider shall indemnify and hold harmless UTMB, System, their Regents, officers, agents and employees, from any liability, loss or damage they may suffer as a result of claims, demands, costs or judgments against them arising out of the Provider's use of the results generated by UTMB's activities to be carried out pursuant to this Agreement excluding claims, loss, or damage that arise from the negligence or willful malfeasance of any Regent, officer, agent or employee of UTMB or System.
9. **Compliance.** UTMB will use the Material in compliance with all laws, governmental regulations and guidelines applicable to the Material. Moreover, if the Material is used in the United States, then UTMB will comply with current United States NIH guidelines.
10. **Export Control.** UTMB further agrees that if the U.S. export laws are or become applicable, it will not export any Materials received under this Agreement to any countries for which the United States government requires an export license or other supporting documentation at the time of export or transfer, unless UTMB

has obtained prior written authorization from the appropriate authority responsible for such matters.

11. **Assignment.** This Agreement is not assignable, whether by operation of law or otherwise, without the prior written consent of Provider.
12. **Publicity.** Except as stated herein, neither party shall use the name of the other without express written consent, subject to Section 5. Publication of this Agreement.
13. **Term and Termination.** This Agreement shall be effective as of the date of the last signature and terminate one (1) year from that date. Upon termination, UTMB will immediately destroy all the Material then in its possession.

Attachment A – Scope of Research

We are studying the new coronavirus through sharing the viral isolate (strain IVCAS 6.7512). Our goal is to use the viral isolate for testing vaccine, therapeutics, and viral pathogenesis. UTMB scientists will use the viral isolate to test vaccine, therapeutics, and viral pathogenesis.

Subject: RE: RE: Help

Hi Yi,

Thanks for the follow up. I asked our biosafety engineer to summarize how we provide oversight for the construction and validation of biocontainment labs in the USA and his response is pasted below. Some additional thoughts for your consideration include:

- Oversight of some especially dangerous pathogens is managed by the federal government under the select agent program. You can find the complete list if you google "select agents list." Human pathogens are managed by the Department of Health and Human Services/Centers for Disease Control and Prevention (CDC), agricultural pathogens are managed by the Department of Agriculture (USDA), and those pathogens affecting both humans and animals are jointly managed.
- CDC and USDA inspect laboratories prior to allowing them to handle select agents based on criteria outlined in the Biosafety in Microbiological and Biomedical Laboratories (BMBL). The latest edition is available on line.
- Pathogens not designated as select agents are managed by local oversight, usually provided by the institutional biosafety committee (IBC). Details are available on line. It is important to ensure the quality of the individuals involved in the IBC and the independence of the IBC from those attempting to conduct the studies.
- Some localities have established local laws/regulations that require prior notification of work with certain pathogens be approved by the city or other jurisdiction; however, this varies considerably from location to location and is not a requirement in our community. Nonetheless, we have found it quite valuable to actively engage with our community members to ensure that they understand the work that we are doing, have seen first-hand the safety and security measures that are in place to protect both our scientists and the local community, and that they take personal pride in the work we are doing.
- There are strict restrictions on certain experiments that could enhance virulence or transmissibility of a pathogen and oversight of these "gain of function studies" and "dual use research of concern" projects continues to evolve. Most funding for such research is provided by the US government and studies that may fall into this area of concern are very carefully reviewed prior to funding. Reports from the National Science Advisory Board for Biosecurity (NSABB) are available on line and provide very detailed consideration of this issue.

Here in the US we use the BMBL and even though it is guidance and non-prescriptive document, we need to comply with it. For International laboratories, I would recommend following the WHO Biosafety guidelines. Other good resources are the Canadian Biosafety Standards (https://www.canada.ca/en/public-health/services/canadian-biosafety-standards-guidelines.html) and the Australian/New Zealand Standard AS/NZS 2243.3:2010.

I hope this helps. Please feel free to contact me again should you have additional questions. With best wishes during these stressful times.

Jim

Hi Jim,

First, thanks for introduction to you by Pei-Yong. I remembered that I have met you in the P4 meeting in Galveston.

Here, I just have several questions about the admission of pathogen manipulation in P3 lab and P4 lab. As you know, in China, the admission of pathogen manipulation has to be approved by the national and local governments. Usually, it will take a long time and many documents to get the approval. How about in USA?

If we want to manipulate one pathogen in P3 and P4 labs in USA, do we need the approval of the governments?
Shall we communicate with the residents near the P3 and P4 labs about the pathogen manipulation?
How the government administer these issues? Pei-Yong told me that the government will have a guidance about the pathogen manipulation and the affiliations can determine it by themselves.

We want to give some suggestions to the Chinese government.

Best,

Yi Shi

Dear Fei and Zhengli,

Thanks you for the rapid response to our request. Please see the attached request letter. As indicated in the letter, this collaboration will use the viral isolate to test vaccine, therapeutics, and viral pathogenesis.

I'm copying our Technology Transfer Office to send you the MAT for signatures.

Hi Ade,
Would you please email UTMB's MTA for this request to Professor Fei Deng (df@wh.iov.cn)?

Sender: Professor Fei Deng, Wuhan Institute of Virology, Chinese Academy of Sciences, China
Receiver: Pei-Yong Shi and James LeDuc, UTMB
Reagent: New coronavirus 2019 isolate: nCoV-2019 (IVCAS 6.7512)
Scope of work: UTMB scientists will use the viral isolate to test vaccine, therapeutics, and viral pathogenesis

Since this is an urgent matter, please help with the process as soon as possible.

Thanks!

Pei-Yong

Dear Prof.Peiyong,
Nice to hear from you.

Yes we glad to share the virus isolate with UTMB for research collaborate. I suggest you send a formal request letter to our institute. And a MTA is needed, you can use your UTMB MTA and fill the information, and I suggest you to discuss with Prof.Zhengli for the detail research content for collaboration. Our strain is nCoV-2019 (IVCAS 6.7512).
You can send your documents to me, I will try to get export permittion for this.

With best wishes,
Fei

Subject: Request for new coronavirus isolates
Dear Zhengli and Fei,

Happy Chinese New Year and congratulations for your amazing work on the new coronavirus!

We are writing to see if you are willing to collaborate with UTMB on studying the nCoV through sharing the viral isolates. We understand that, since many labs are currently isolating the viruses through imported cases, the window of leadership for Chinese scientists is closing rapidly. We greatly appreciate your rapid response to this request.

Best regards from Galveston,
Pei-Yong

Subject: Antiviral Research editorial board meeting at ICAR

Dear AVR editorial board members,

ICAR will begin on Sunday in Baltimore, and I'm looking forward to seeing many of you at the meeting. Els Frensdorff-Breuring at Elsevier sent you an invitation some time ago to attend the annual EB breakfast, which she said would be at 6:30 Tuesday morning. In fact, the AVR editors will meet at 6:30, and **you're invited to join us in the same room at 7:30**, so you'll get an extra hour of sleep! The breakfast will be held in the Columbia/Frederick room at the Hyatt.

[We have a confirmed attendance list for the EB breakfast, so if you won't be at ICAR, there's no need for you to let me know.]

As every year, the purpose of the EB meeting is threefold. First, it's an opportunity for we editors to thank you for the help you provide by reviewing manuscripts – we couldn't maintain the high qualify of the journal without you. Second, it gives you the chance to meet and chat with the AVR editors and your fellow EB members. And third, our publisher at Elsevier, Donna Wilson, will give an overview of the journal's performance during the past year.

In that regard, AVR continues to do very well. We're in our 38th year, and the number of papers we publish and their quality continue to increase. Our impact factor has consistently been above 4.0 in recent years, placing us in the top third of virology journals. As a sign of confidence, Elsevier has allowed us to increase the number of editors, so we now have 8 editors handling manuscripts, with Johan Neyts, our current ISAR president, in the role of advisory editor.

I'll end the EB meeting and this message by inviting you to contribute review articles or commentaries to the journal. AVR's scope is quite broad, and all of you are doing interesting work, so I'm sure that there are many different topics you could write about. Please feel free to discuss your ideas directly with me if you're at ICAR, or by email if you're not able to join us.

Best wishes,

Mike

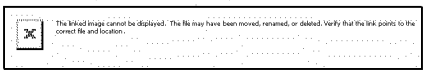
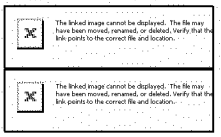
Editor-in-Chief, *Virologica Sinica*

Browse the website www.virosin.org for more information

Enjoy **rapid** & **free** publication in *Virologica Sinica*



Virologica Sinica is an academic journal which aims at presenting the cutting-edge research on viruses. The journal publishes peer-reviewed original research articles, reviews, and letters to the editor, to encompass the latest developments in all branches of virology, including research on animal, plant and microbe viruses. The journal welcomes articles on virus discovery and characterization, viral epidemiology, viral pathogenesis, virus-host interaction, vaccine development, antiviral agents and therapies, and virus related biotechniques. *Virologica Sinica*, the official journal of the Chinese Society for Microbiology, will serve as a platform for the communication and exchange of academic information and ideas in an international context.



The journal is indexed by: Science Citation Index (SCI), Journal Citation Reports (JCR), PubMed/Medline, Pubmed Central, Scopus, BIOSIS, Google Scholar.

About the cover: While host proteins incorporated into virions during viral budding from infected cell are known to play essential roles in multiple process of viral life cycle of progeny virus, these characteristics have been largely neglected in studies on rabies virus (RABV). In this issue, Zhang *et*

al. performed proteomics studies of the RABV virions with good purity and integrity to define 49 cellular proteins incorporated into mature virions, and 24 of them were likely involved in virus replication according to the functional annotation analysis. Furthermore, Zhang et al. used cryo-electron microscopy (Cryo-EM) to observe the purified RABV virions, generating high-resolution pictures of RABV particles with unprecedented structure details. The cover image clearly displays an intact bullet-shaped structure with four distinct electron-dense layers consisting of glycoprotein spike, viral envelope, matrix protein helix and RNP complex from outside to inside. Please see page 143–155 for details.

REVIEW

Bacteriophages and Lysins in Biofilm Control

Free Full Text (HTML) *Free* Full Text (PDF)

Marzanna Łusiak-Szelachowska, Beata Weber-Dąbrowska, Andrzej Górski

To formulate the optimal strategy of combatting bacterial biofilms, in this review we update current knowledge on the growing problem of biofilm formation and its resistance to antibiotics which has spurred the search for new strategies to deal with this complication. Based on recent findings, the role of bacteriophages in the prevention and elimination of biofilm-related infections has been emphasized. *In vitro*, *ex vivo* and *in vivo* biofilm treatment models with single bacteriophages or phage cocktails have been compared. A combined use of bacteriophages with antibiotics *in vitro* or *in vivo* confirms earlier reports of the synergistic effect of these agents in improving biofilm removal. Furthermore, studies on the application of phage-derived lysins *in vitro, ex vivo* or *in vivo* against biofilm-related infections are encouraging. The strategy of combined use of phage and antibiotics seems to be different from using lysins and antibiotics. These findings suggest that phages and lysins alone or in combination with antibiotics may be an efficient weapon against biofilm formation *in vivo* and *ex vivo*, which could be useful in formulating novel strategies to combat bacterial infections. Those findings proved to be relevant in the prevention and destruction of biofilms occurring during urinary tract infections, orthopedic implant-related infections, periodontal and peri-implant infections. In conclusion, it appears that most efficient strategy of eliminating biofilms involves phages or lysins in combination with antibiotics, but the optimal scheme of their administration requires further studies.

RESEARCH ARTICLE

Genome Analysis of Dasineura jujubifolia Toursvirus 2, A Novel Ascovirus

Free Full Text (HTML) *Free* Full Text (PDF)

Jun Wang, Minglu Yang, Haibing Xiao, Guo-Hua Huang, Fei Deng, Zhihong Hu

So far, ascoviruses have only been identified from Lepidoptera host insects and their transmission vectors—endoparasitic wasps. Here, we reported the first finding of a complete novel ascovirus genome

from a Diptera insect, *Dasineura jujubifolia.* Initially, sequence fragments with homology to ascoviruses were incidentally identified during metagenomic sequencing of the mitochondria of *D. jujubifolia* (Cecidomyiidae, Diptera) which is a major pest on *Ziziphus jujuba*. Then a full circular viral genome was assembled from the metagenomic data, which has an A+T percentage of 74% and contains 142,600 bp with 141 open reading frames (ORFs). Among the 141 ORFs, 37 were conserved in all sequenced ascoviruses (core genes) including proteins predicted to participate in DNA replication, gene transcription, protein modification, virus assembly, lipid metabolism and apoptosis. Multi-gene families including those encode for baculovirus repeated open reading frames (BROs), myristylated membrane proteins, RING/U-box E3 ubiquitin ligases, and ATP-binding cassette (ABC) transporters were found in the virus genome. Phylogenetic analysis showed that the newly identified virus belongs to genus *Toursvirus* of *Ascoviridae*, and is therefore named as *Dasineura jujubifolia toursvirus 2* (DjTV-2a). The virus becomes the second reported species of the genus after *Diadromus pulchellus toursvirus 1* (DpTV-1a). The genome arrangement of DjTV-2a is quite different from that of DpTV-1a, suggesting these two viruses separated in an early time of evolution. The results suggest that the ascoviruses may infect a much broader range of hosts than our previous knowledge, and shed lights on the evolution of ascoviruses and particularly on that of the toursviruses.

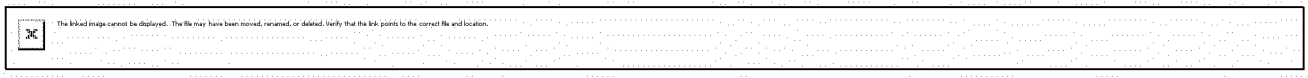
RESEARCH ARTICLE

Proteomic Profiling of Purified Rabies Virus Particles

Free Full Text (HTML) ***Free*** Full Text (PDF)

Yan Zhang, Yuyang Wang, Ye Feng, Zhongzhong Tu, Zhiyong Lou, Changchun Tu

While host proteins incorporated into virions during viral budding from infected cell are known to play essential roles in multiple process of the life cycle of progeny virus, these characteristics have been largely neglected in studies on rabies virus (RABV). Here, we purified the RABV virions with good purity and integrity, and analyzed their proteome by nano LC–MS/MS, followed by the confirmation with immunoblot and immuno-electronic microscopy. In addition to the 5 viral proteins, 49 cellular proteins were reproducibly identified to be incorporated into matured RABV virions. Function annotation suggested that 24 of them were likely involved in virus replication. Furthermore, cryo-EM was employed to observe the purified RABV virions, generating high-resolution pictures of the bullet-shaped virion structure of RABV. This study has provided new insights into the host proteins composition in RABV virion and shed the light for further investigation on molecular mechanisms of RABV infection, as well as the discovery of new anti-RABV therapeutics.



RESEARCH ARTICLE

Structural Basis of Glycan Recognition in Globally Predominant Human P[8] Rotavirus

Free Full Text (HTML) ***Free*** Full Text (PDF)

Xiaoman Sun, Lei Dang, Dandi Li, Jianxun Qi, Mengxuan Wang, Wengang Chai, Qing Zhang, Hong Wang, Ruixia Bai, Ming Tan, Zhaojun Duan

Rotavirus (RV) causes acute gastroenteritis in infants and children worldwide. Recent studies showed that glycans such as histo-blood group antigens (HBGAs) function as cell attachment factors affecting RV host susceptibility and prevalence. P[8] is the predominant RV genotype in humans, but the structural basis of how P[8] RVs interact with glycan ligands remains elusive. In this study, we characterized the interactions between P[8] VP8*s and glycans which showed that VP8*, the RV glycan binding domain, recognized both mucin core 2 and H type 1 antigens according to the ELISA-based oligosaccharide binding assays. Importantly, we determined the structural basis of P[8] RV-glycans interaction from the crystal structures of a Rotateq P[8] VP8* in complex with core 2 and H type 1 glycans at 1.8 Å and 2.3 Å,

respectively, revealing a common binding pocket and similar binding mode. Structural and sequence analysis demonstrated that the glycan binding site is conserved among RVs in the P[II] genogroup, while genotype-specific amino acid variations determined different glycan binding preference. Our data elucidated the detailed structural basis of the interactions between human P[8] RVs and different host glycan factors, shedding light on RV infection, epidemiology, and development of anti-viral agents.

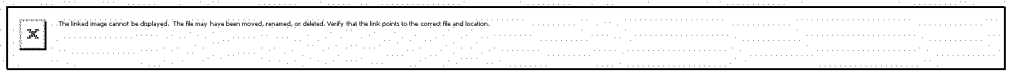
RESEARCH ARTICLE

Analysis of Expression Profiles of Long Noncoding RNAs and mRNAs in A549 Cells Infected with H3N2 Swine Influenza Virus by RNA Sequencing

Free Full Text (HTML) *Free* Full Text (PDF)

Yina Zhang, Tianqi Yu, Yingnan Ding, Yahui Li, Jing Lei, Boli Hu, Jiyong Zhou

Long noncoding RNAs (lncRNAs) participate in regulating many biological processes. However, their roles in influenza A virus (IAV) pathogenicity are largely unknown. Here, we analyzed the expression profiles of lncRNAs and mRNAs in H3N2-infected cells and mock-infected cells by high-throughput sequencing. The results showed that 6129 lncRNAs and 50,031 mRNA transcripts in A549 cells displayed differential expression after H3N2 infection compared with mock infection. Among the differentially expressed lncRNAs, 4963 were upregulated, and 1166 were downregulated. Functional annotation and enrichment analysis using gene ontology and Kyoto Encyclopedia of Genes and Genomes databases (KEGG) suggested that target genes of the differentially expressed lncRNAs were enriched in some biological processes, such as cellular metabolism and autophagy. The up- or downregulated lncRNAs were selected and further verified by quantitative real-time polymerase chain reaction (RT-qPCR) and reverse transcription PCR (RT-PCR). To the best of our knowledge, this is the first report of a comparative expression analysis of lncRNAs in A549 cells infected with H3N2. Our results support the need for further analyses of the functions of differentially expressed lncRNAs during H3N2 infection.



RESEARCH ARTICLE

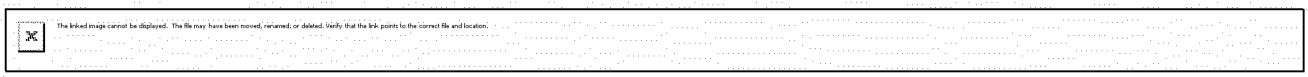
Premature Stop Codon at Residue 101 within HIV-1 Rev Does Not Influence Viral Replication of Clade BC but Severely Reduces Viral Fitness of Clade B

Free Full Text (HTML) *Free* Full Text (PDF)

Zheng Wang, Xiaolin Ji, Yanling Hao, Kunxue Hong, Liying Ma, Dan Li, Yiming Shao

HIV-1 Rev is an accessory protein that plays a key role in nuclear exportation, stabilization, and translation of the viral mRNAs. Rev of HIV-1 clade BC often shows a truncation of 16 AAs due to a premature stop codon at residue 101. This stop codon presents the highest frequency in clade BC and the lowest frequency in clade B. In order to discover the potential biological effect of this truncation on Rev activity and virus replication of clade BC, we constructed Rev expression vectors of clade BC with or without 16 AAs within C-terminal separately, and replaced the stop codon by Q in a CRF07_BC infectious clone. We found that 16 AAs truncation had no effect on expression and activity of Rev in clade BC. Also, the mutation from the stop codon to Q had no effect on virus replication of clade BC. Next, to investigate the effect of this truncation on Rev activity and replication capacity of clade B, Rev expression vectors of clade B carrying or lacking 16 AAs in C-terminal were constructed respectively, and residue Q at position 101 within Rev was substituted by the stop codon in a clade B infectious clone. It was found that 16 AAs truncation significantly down-regulated Rev expression and impaired clade B Rev activity. Furthermore, a Q-to-stop codon substitution within Rev significantly reduced viral replication

fitness of clade B. These results indicate that the premature stop codon at residue 101 within Rev exerts diverse impact on viral replication among different HIV-1 clades.



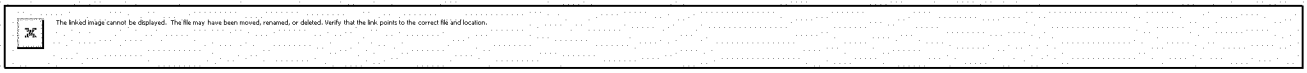
RESEARCH ARTICLE

Highly Efficient Base Editing in Viral Genome Based on Bacterial Artificial Chromosome Using a Cas9-Cytidine Deaminase Fused Protein

Free Full Text (HTML) ***Free*** Full Text (PDF)

Ke Zheng, Fang-Fang Jiang, Le Su, Xin Wang, Yu-Xin Chen, Huan-Chun Chen, Zheng-Fei Liu

Viruses evolve rapidly and continuously threaten animal health and economy, posing a great demand for rapid and efficient genome editing technologies to study virulence mechanism and develop effective vaccine. We present a highly efficient viral genome manipulation method using CRISPR-guided cytidine deaminase. We cloned pseudorabies virus genome into bacterial artificial chromosome, and used CRISPR-guided cytidine deaminase to directly convert cytidine (C) to uridine (U) to induce premature stop mutagenesis in viral genes. The editing efficiencies were 100%. Comprehensive bioinformatic analysis revealed that a large number of editable sites exist in pseudorabies virus (PRV) genomes. Notably, in our study viral genome exists as a plasmid in *E. coli*, suggesting that this method is virus species-independent. This application of base-editing provided an alternative approach to generate mutant virus and might accelerate study on virulence and vaccine development.



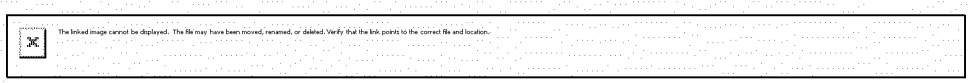
RESEARCH ARTICLE

Endosomes and Microtubles are Required for Productive Infection in Aquareovirus

Free Full Text (HTML) ***Free*** Full Text (PDF)

Fuxian Zhang, Hong Guo, Qingxiu Chen, Zheng Ruan, Qin Fang

Grass carp reovirus (GCRV), the genus *Aquareovirus* in family *Reoviridae*, is viewed as the most pathogenic aquareovirus. To understand the molecular mechanism of how aquareovirus initiates productive infection, the roles of endosome and microtubule in cell entry of GCRV are investigated by using quantum dots (QDs)-tracking in combination with biochemical approaches. We found that GCRV infection and viral protein synthesis were significantly inhibited by pretreating host cells with endosome acidification inhibitors NH_4Cl, chloroquine and bafilomycin A1 (Bafi). Confocal images indicated that GCRV particles could colocalize with Rab5, Rab7 and lysosomes in host cells. Further ultrastructural examination validated that viral particle was found in late endosomes. Moreover, disruption of microtubules with nocodazole clearly blocked GCRV entry, while no inhibitory effects were observed with cytochalasin D treated cells in viral infection, hinting that intracellular transportation of endocytic uptake in GCRV infected cells is via microtubules but not actin filament. Notably, viral particles were observed to transport along microtubules by using QD-labeled GCRV. Altogether, our results suggest that GCRV can use endosomes and microtubules to initiate productive infection.



RESEARCH ARTICLE

A Deleted Deletion Site in a New Vector Strain and Exceptional Genomic Stability of Plaque-Purified Modified Vaccinia Ankara (MVA)

Free Full Text (HTML) ***Free*** Full Text (PDF)

Ingo Jordan, Deborah Horn, Kristin Thiele, Lars Haag, Katharina Fiddeke, Volker Sandig

Vectored vaccines based on highly attenuated modified vaccinia Ankara (MVA) are reported to be immunogenic, tolerant to pre-existing immunity, and able to accommodate and stably maintain very large transgenes. MVA is usually produced on primary chicken embryo fibroblasts, but production processes based on continuous cell lines emerge as increasingly robust and cost-effective alternatives. An isolate of a hitherto undescribed genotype was recovered by passage of a non-plaque-purified preparation of MVA in a continuous anatine suspension cell line (CR.pIX) in chemically defined medium. The novel isolate (MVA-CR19) replicated to higher infectious titers in the extracellular volume of suspension cultures and induced fewer syncytia in adherent cultures. We now extend previous studies with the investigation of the point mutations in structural genes of MVA-CR19 and describe an additional point mutation in a regulatory gene. We furthermore map and discuss an extensive rearrangement of the left telomer of MVA-CR19 that appears to have occurred by duplication of the right telomer. This event caused deletions and duplications of genes that may modulate immunologic properties of MVA-CR19 as a vaccine vector. Our characterizations also highlight the exceptional genetic stability of plaque-purified MVA: although the phenotype of MVA-CR19 appears to be advantageous for replication, we found that all genetic markers that differentiate wildtype and MVA-CR19 are stably maintained in passages of recombinant viruses based on either wildtype or MVA-CR.

Monoclonal Antibody-Based Serological Detection of Rice Stripe Mosaic Virus Infection in Rice Plants or Leafhoppers

Free Full Text (HTML) ***Free*** Full Text (PDF)

Liqian Guo, Jiayu Wu, Rui Chen, Jian Hong, Xueping Zhou, Jianxiang Wu

Rice stripe mosaic virus (RSMV) is a rhabdovirus recently found in southern part of China and can cause severe reduction in rice production. To establish serological methods for RSMV epidemiological studies and to establish a control strategy for this virus, we first purified RSMV virions from infected rice plants and then used them as an immunogen to produce four RSMV-specific monoclonal antibodies (MAbs) (i.e.,1D4, 4A8, 8E4 and 11F11). With these MAbs, we have developed a highly specific and sensitive antigen-coated plate enzyme-linked immunosorbent assay (ACP-ELISA), a Dot-ELISA and a Tissue print-ELISA for rapid detections of RSMV infection in rice plants or in leafhoppers. Our results showed that RSMV can be readily detected in RSMV-infected rice plant tissue crude extracts diluted at 1:20,971,520 (w/v, g/mL) through ACP-ELISA or diluted at 1:327,680 (w/v, g/mL) through Dot-ELISA. Both ACP-ELISA and Dot-ELISA can also be used to detect RSMV infection in individual RSMV viruliferous leafhopper (*Recilia dorsalis*) homogenate diluted at 1:307,200 and 1:163,840 (individual leafhopper/μL), respectively. Detection of RSMV infection in field-collected rice samples or in RSMV viruliferous leafhoppers indicated that the three serological methods can produce same results with that produced by RT-PCR (19 of the 33 rice samples and 5 of the 16 leafhoppers were RSMV-positive). We consider that the four MAbs produced in this study are very specific and sensitive, and the three new serological methods are very useful for detections of RSMV infection in rice plants or in leafhoppers and the establishment of the disease control strategies.

Screening and Identification of Marburg Virus Entry Inhibitors Using Approved Drugs

Free Full Text (HTML) ***Free*** Full Text (PDF)

Li Zhang, Shan Lei, Hui Xie, Qianqian Li, Shuo Liu, Qiang Liu, Weijin Huang, Xinyue Xiao, Youchun Wang

Marburg virus (MARV), the causative agent of lethal hemorrhagic fever, causes similar clinical symptoms and mortality as the related Ebola virus. However, fewer studies have been conducted on MARV, and no drugs specific for this virus are currently available. Repurposing of clinically approved drugs is among the most efficient ways to identify novel drugs for existing viral diseases, offering the advantages of lower costs and faster clinical development. In this study, a high-throughput pseudovirus system expressing the MARV glycoprotein was used to screen 767 approved drugs in a compound library obtained from the National Institutes for Food and Drug Control, China (NIFDC). Thirty-three drugs with known activities (including antimalarial, antipsychotic, antihistamine, and anticholinergic) proved to be entry inhibitors against MARV *in vitro*. The anti-MARV activity of these drugs was further verified *in vivo* using a bioluminescent imaging mouse model, in which 10 drugs exhibited over 50% inhibitory activity. This study identifies multiple leads for the further development of drugs against MARV.

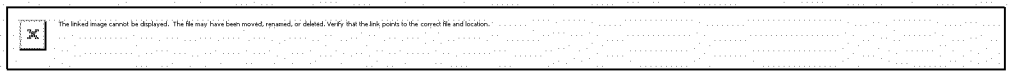
Meta-Transcriptome Profiling of Novel Invasive Pest *Spodoptera frugiperda* in Yunnan, China

Free Full Text (HTML) ***Free*** Full Text (PDF)

Junming Shi, Weiwei Li, Yunyu Wang, Quanyan Chen, Fei Deng

Summarily, this work documented the bio-community of the novel invasive pest *S. frugiperda* in China via meta-transcriptome, which presents a high biodiversity, especially concerning bacterial community. And the presence of parasitoids and pathogens of the fall armyworm larvae in China suggests a great capacity to utilize them as biological control agents. Additionally, evidences of Corn strain and Rice strain were simultaneously detected via different molecular marker, suggesting a possible mixed species invasion or interstrain hybrids of *COI-RS Tpi-C* invasion.



LETTER

Identification and Characterization of the First Equine Parainfluenza Virus 5

Free Full Text (HTML) ***Free*** Full Text (PDF)

Jinxin Xie, Panpan Tong, Aoyuntuya Zhang, Lei Zhang, Xiaozhen Song, Ling Kuang

Parainfluenza virus 5 (PIV5), known as canine parainfluenza virus in the veterinary field, is a negative-sense, nonsegmented, single-stranded RNA virus belonging to the *Paramyxoviridae* family (Chen 2018). The virus was first reported in primary monkey kidney cells in 1954 (Hsiung 1972), then it has been frequently discovered in various hosts, including humans, dogs, pigs, cats, rodents, calves, and lesser pandas (Chatziandreou *et al*. 2004; Lee and Lee 2013; Liu *et al*. 2015; Zhai *et al*. 2017; Jiang *et al*. 2018). So far, PIV5 has not been reported in horse. In this study, using metagenomics analysis we have identified a novel equine PIV5.

Dear Xuping Xie,

I am writing to you on behalf of the journal, ***Emerging Microbes & Infections***. Thank you very much for sending in the corrections to your article, **Genetic and biochemical characterizations of Zika virus NS2A protein**. I have gone through your corrected proofs and request you to respond to the below queries at the earliest to avoid any delays in the publication process.

Queries:

Please note, you have removed the affiliation ([b]University of Chinese Academy of Sciences, Beijing, People's Republic of China) of author (Xinwen Chen), but according to T&F policy, the affiliation should not be removed once the manuscript has been submitted for publication. Can you please confirm if the author was not present in that affiliation when the research was conducted? If yes, then we can remove the affiliation, otherwise we will retain the affiliation as is in the proof.

Please advise how to proceed with affiliation.

Please reply to all recipients of this message.

Thanks in advance for your understanding in this regard.

Best wishes,

Subject: 向史佩勇老师请教Zika相关研究问题

佩勇老师您好！
　久闻大名！我是武汉大学基础医学院的吴莹，是秦成峰和周溪的师妹，以前在中科院微生物研究所工作了十年，是高福老师的助理和秘书，目前在武汉大学工作，自己有个独立的课题组，进行Zika病毒致病机制的研究。我拜读了很多您发表的文献，也在很多会上听过您的报告，受益匪浅。目前我们发现zika病毒2A蛋白很可能与雄性不育有关，我们自己表达的2A功能很明显，但是很难用western检测出来。我们精读了您和陈新文所长的Genetic and biochemical characterizations of Zika virus NS2A protein这篇文章，看到让我们崇拜的Zika-2A 蛋白的western 检测结果。 想求您馈赠Zika-2A 以及这些截短体的质粒（共10个，请见如下列表）来进一步做机制及筛选主要相关功能域的研究，冒昧了，不知可否？

具体10个质粒如下：
①pXJ-SPG-C16-ctNS2A-eGFP-Glyc plasmids：（9个）
1-226；
1-192；
1-147；
1-123；
1-103；
1-56；
1-26；
0（SPG-C16eGFP）；
eGFP-Glyc；
②pXJ-SPG-C16-NS2A-HA（1个）

期待您的回复，非常感谢！

祝好！
吴莹

Dr Menachery and Professor Baric

I've just read this article:

https://nam03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2Fnm.3985%23ref-CR2&data=02%7C01%7Cvimenach%40utmb.edu%7C8a0a1896f8b74dfc1bcd08d7e0c65347%7C7bef256d85db4526a72d31aea2546852%7C0%7C1%7C637225014744618770&sdata=5TaM5gL2PEAINggeBJstR6zFiN4n2A0V94lHs96cnfQ%3D&reserved=0

which says:

"Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve in vitro titers equivalent to epidemic strains of SARS-CoV. Additionally, in vivo experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis."

Did you and your group, deliberately or inadvertantly, create the virus now known as COVID-19?

Was that virus then somehow released into the environment in Wuhan, deliberately or accidentally, by one or more of your co-authors, who live and work there?

Please respond openly and honestly, thank you.

Look forward to hearing from you.

best wishes

EIDD-2801 science trans med.pdf

Dear Professor Menachery,

I hope this note finds you well in this challenging time.

I'm a reporter with Chemical & Engineering News, a weekly newsmagazine about chemistry. I am working on a story about the discovery of EIDD-2801, a compound currently in Phase I trials for COVID-19. I've attached a recent Science Translational Medicine paper about this compound. I am looking to speak with someone about the challenges of making antivirals in general and an oral antiviral specifically. Do you have a little time to chat with me this week? I don't think it would take more than 20 minutes. Just let me know when a good time to talk might be and what is the best number to reach you.

Thanks for your help,
Beth

Coronaviruses (CoVs) traffic frequently between species resulting in novel disease outbreaks, most recently exemplified by the newly emerged SARS-CoV-2, the causative agent of COVID-19. Herein, we show that the ribonucleoside analog β-D-N^4-hydroxycytidine (NHC, EIDD-1931) has broad spectrum antiviral activity against SARS-CoV-2, MERS-CoV, SARS-CoV, and related zoonotic group 2b or 2c Bat-CoVs, as well as increased potency against a coronavirus bearing resistance mutations to the nucleoside analog inhibitor remdesivir. In mice infected with SARS-CoV or MERS-CoV, both prophylactic and therapeutic administration of EIDD-2801, an orally bioavailable NHC-prodrug (β-D-N^4-hydroxycytidine-5′-isopropyl ester), improved pulmonary function, and reduced virus titer and body weight loss. Decreased MERS-CoV yields in vitro and in vivo were associated with increased transition mutation frequency in viral but not host cell RNA, supporting a mechanism of lethal mutagenesis in CoV. The potency of NHC/EIDD-2801 against multiple coronaviruses and oral bioavailability highlight its potential utility as an effective antiviral against SARS-CoV-2 and other future zoonotic coronaviruses.

INTRODUCTION

The genetically diverse *Orthocoronavirinae* (coronavirus, CoV) family circulates in many avian and mammalian species. Phylogenetically, CoVs are divided into 4 genera: alpha (group 1), beta (group 2), gamma (group 3) and delta (group 4). Three new human CoV have emerged in the past 20 years with severe acute respiratory syndrome CoV (SARS-CoV) in 2002, Middle East respiratory syndrome CoV (MERS-CoV) in 2012, and now SARS-CoV-2 in 2019 (*1-3*). In fact, all human CoV are thought to have emerged originally as zoonoses (*4-6*). The ongoing SARS-CoV-2 pandemic (referred to as COVID-19, Coronavirus disease 2019) has caused over 500,000 infections and over 25,000 deaths in 199 countries. Like SARS- and MERS-CoV, the respiratory disease caused by SARS-CoV-2 can progress to acute lung injury (ALI), an end stage lung disease with limited treatment options and very poor prognoses(*3, 7, 8*). This emergence paradigm is not limited to humans. A novel group 1 CoV called swine acute diarrhea syndrome CoV (SADS-CoV) recently emerged from bats causing the loss of over 20,000 pigs in Guangdong Province, China (*9*). More alarmingly, many group 2 SARS-like and MERS-like coronaviruses are circulating in bat reservoir species that can use human receptors and replicate efficiently in primary human lung cells without adaptation(*9-12*). The presence of these "pre-epidemic" zoonotic strains foreshadow the emergence and epidemic potential of additional SARS-

like and MERS-like viruses in the future. Given the diversity of CoV strains in zoonotic reservoirs and a penchant for emergence, broadly active antivirals are clearly needed for rapid response to new CoV outbreaks in humans and domesticated animals.

Currently, there are no approved therapies specific for any human CoV. β-D-N4-hydroxycytidine (NHC, EIDD-1931) is orally bioavailable ribonucleoside analog with broad-spectrum antiviral activity against various unrelated RNA viruses including influenza, Ebola, CoV, and Venezuelan equine encephalitis virus (VEEV)(*13-16*). For VEEV, the mechanism of action (MOA) for NHC has been shown to be through lethal mutagenesis where deleterious transition mutations accumulate in viral RNA(*14, 17*). Thus, we sought to determine NHC's breadth of antiviral activity against multiple emerging CoV, its mechanism of action for CoV and its efficacy in mouse models of CoV pathogenesis.

RESULTS

NHC potently inhibits MERS-CoV and newly emerging SARS-CoV-2 replication

To determine whether NHC blocks the replication of highly pathogenic human CoV, we performed antiviral assays in cell lines with MERS-CoV and the newly emerging SARS-CoV-2. We first assessed the antiviral activity of NHC against MERS-CoV in the human lung epithelial cell line Calu-3 2B4 ("Calu3" cells). Using a recombinant MERS-CoV expressing nanoluciferase (MERS-nLUC)(*18*), we measured virus replication in cultures exposed to a dose range of drug for 48hr. NHC was potently antiviral with an average half-maximum effective concentration (IC_{50}) of 0.15 μM and no observed cytoxicity in similarly treated uninfected cultures across the dose range (50% cytotoxic concentration, CC_{50}, >10 μM) (Fig. 1A). The therapeutic index for NHC was >100. Using a clinical isolate of SARS-CoV2 (2019-nCoV/USA-WA1/2020), we performed antiviral assays in African green monkey kidney (Vero) cells and found NHC was potently antiviral with an IC_{50} of 0.3 μM and CC_{50} of >10 μM (Fig. 1B). We then determined the antiviral activity of NHC against SARS-CoV-2 in the Calu-3 cells through the measurement of infectious virus production and viral genomes. We observed a dose-dependent reduction in virus titers (Fig. 1C) with an IC_{50} of 0.08 μM. Viral genomic RNA was quantitated in clarified supernatants by qRT-PCR (Fig. 1D). Like the effect on infectious titers, we found a dose-dependent reduction in viral genomic RNA and a similar calculated IC_{50} of 0.09 μM. Collectively, these data demonstrate that NHC is potently antiviral against two genetically distinct emerging CoV.

NHC is highly active against SARS-CoV-2, MERS-CoV, and SARS-CoV in primary human airway epithelial cell cultures

To determine if NHC would be similarly antiviral in primary human cells, we performed a series of studies in primary airway epithelial (HAE) cell cultures. HAE model the architecture and cellular complexity of the conducting airway and are readily infected by multiple human and zoonotic CoV, including SARS- and MERS-CoV (*19*). We first assessed cytotoxicity of NHC in HAE treated with an extended dose range for 48hr using quantitative PCR of cell death-related gene transcripts as our metric. NHC treatment did not appreciably alter gene expression even at doses up to 100 μM (fig. S1). We then sought to determine if NHC would inhibit clinical isolate SARS-CoV-2 replication in HAE. We observed a dose dependent reduction in SARS-CoV-2 infectious virus production (Fig. 2A). In MERS-CoV infected HAE, NHC substantially reduced virus production with maximal titer reduction of > 5 logs at 10 μM (average IC_{50} = 0.024 μM), which correlated with reduced genomic (ORF1) and subgenomic (ORFN) RNA in paired samples (Fig. 2B). We observed similar trends in titer reduction (> 3 log at 10 μM, average IC_{50} = 0.14 μM) and in copies of genomic and subgenomic RNA in SARS-CoV- infected HAE (Fig. 2C). Thus, NHC was potently antiviral against SARS-CoV-2, MERS-CoV and SARS-CoV in primary human epithelial cell cultures without cytotoxicity.

NHC is effective against remdesivir (RDV)-resistant virus and multiple distinct zoonotic CoV

CoV are taxonomically divided into multiple genogroups (alpha, beta, gamma, delta) but human-infecting CoV are found in only the alpha and beta subgroups thus far (Fig. 3A). There is high sequence conservation in the RNA-dependent RNA polymerase (RdRp, nsp12) across CoV (Fig. 3A). For example, the RdRp of SARS-CoV-2 has 99.1% similarity and 96% amino acid identity to that of SARS-CoV (Fig. 3A). To gain insight into structural conservation of RdRp across the CoV family, we modeled the variation reflected in the RdRp dendrogram in Fig. 3A onto the structure of the SARS-CoV RdRp (*20*) (Fig. 3B). The core of the RdRp molecule and main structural motifs that all RdRp harbor (Fig. 3B and fig. S2) are highly conserved among CoV including SARS-CoV-2. We previously reported that CoV resistance to another broad spectrum nucleoside analog, RDV, was mediated by RdRp residues F480L and V557L in a model coronavirus mouse hepatitis virus (MHV) and in SARS-CoV, resulting in a 5-fold shift in IC_{50} (Fig. 3C)(*21*). Consequently, we tested whether RDV resistance mutations in MHV conferred cross-resistance to NHC. In fact, the two RDV resistance mutations, alone or together, conferred increased sensitivity to inhibition by NHC (Fig. 3D). As our previous studies have demonstrated a high genetic barrier to NHC for VEEV, influenza and CoV (*14-16*), the lack of cross-resistance further suggests that NHC and RDV may select for exclusive and mutually sensitizing resistance pathways.

To explore the breadth of antiviral efficacy against zoonotic CoV, we performed antiviral assays in HAE with three

zoonotic Bat-CoV: SHC014, HKU3, and HKU5. Closely related to the beta 2b SARS-CoV, Bat-CoV SHC014 is capable of replicating in human cells without adaptation(*11*), suggesting its potential for zoonotic emergence into humans. The more distantly related SARS-like beta 2b CoV, recombinant Bat-CoV HKU3, has a modified receptor binding domain to facilitate growth in cell culture (*22*). Lastly, Bat-CoV HKU5 is a MERS-like beta 2c CoV (*23*). NHC diminished infectious virus production and the levels of genomic/subgenomic viral RNA in HAE in a dose-dependent manner for all three Bat-CoVs (Fig. 4). Therefore, the antiviral activity of NHC was not limited by natural amino acid variation in the RdRp, which among the group 2b and group 2c CoV can vary by almost 20%. Moreover, these data suggest that if another SARS- or MERS-like virus were to spillover into humans in the future, they would likely be susceptible to the antiviral activity of NHC.

NHC antiviral activity is associated with increased viral mutation rates

It has recently been shown that NHC treatment increases the mutation rate in viral genomic RNA of RSV (*24*), VEEV (*14*), influenza (*24*), and our previous study used RNA seq to show that overall transition mutation frequency is increased during NHC treatment of MHV and MERS-CoV during infection in continuous cell lines(*16*). We sought to determine if NHC would increase the mutation frequency during MERS-CoV infection in human primary HAE. Using MERS-CoV-infected HAE treated with either vehicle or a dose range of NHC or RDV, we show that both drugs reduced virus titers in a dose-dependent manner (Fig. 5A). We then used a highly-sensitive high-fidelity deep sequencing approach (Primer ID NGS), which uses barcoded degenerate primers and Illumina indexed libraries to determine accurate mutation rates on viral RNA production (*25*). Using this approach, we analyzed a 538 bp region of viral genomic RNA in nonstructural protein 15 (nsp15). The error rates (#mutations/10,000 bases) in vehicle- (0.01) or RDV- (0.01) treated cultures were very low. RDV is reported to act via chain termination of nascent viral RNA, and thus the low error rates in RDV-treated cultures are in line with the proposed MOA (*26*). In contrast, the error rate was significantly increased in NHC-treated MERS-CoV RNA in a dose-dependent manner (Two-way ANOVA with Dunnett's multiple comparison test; 10-fold increase at 10 μM, $P < 0.0001$ at 24 and 48 hpi; 5-fold increase at 1μM, $P < 0.0001$ at 24 hpi and $P = 0.0015$ at 48 hpi) (Fig. 5C). The magnitude of the error rate in NHC-treated cultures correlated with virus titer reduction. At 48 hpi the respective error rate and virus titer was 0.015 and 3.96E+06 pfu/mL for vehicle treatment, 0.045 and 2.86E+04 pfu/mL with 1 μM NHC; and 0.090 and 1.5E+02 pfu/mL 10 μM NHC. Thus, with 1 μM NHC a 3-fold increase in error rate resulted in a 138-fold decrease in virus titer, while with 10 μM NHC a 6-fold increase in error rate resulted in a 26,000-fold decrease in virus titer.

We then examined the mutational spectra induced by NHC, which can be incorporated into viral RNA as a substitution for either cytosine (C) or uracil (U). RNA-mutagenic antivirals may incorporate in both nascent negative and positive sense RNA during genome replication (Fig. 5D). Adenine-to-guanine (A-to-G) and uracil-to-cytosine (U-to-C) transitions were enriched in MERS-CoV genomic RNA in an NHC dose-dependent manner (Fig. 5E). Collectively, these data used high-fidelity sequence analysis to demonstrate a specific enrichment for A:G and C:U transitions in MERS-CoV RNA after NHC treatment of primary HAE cell cultures.

Therapeutic EIDD-2801 reduces SARS-CoV replication and pathogenesis

Given the promising antiviral activity of NHC in vitro, we next evaluated its in vivo efficacy using EIDD-2801, an orally bioavailable prodrug of NHC (β-D-N^4-hydroxycytidine-5′-isopropyl ester), designed for improved in vivo pharmacokinetics and oral bioavailability in humans and non-human primates (*15*). Importantly, the plasma profiles of NHC and EIDD-2801 are similar in mice following oral delivery (*15*). We first performed a prophylactic dose escalation study in C57BL/6 mice where we orally administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or 50, 150, or 500 mg/kg EIDD-2801 2hr prior to intranasal infection with 5E+04 PFU of mouse-adapted SARS-CoV (SARS-MA15), and then vehicle or drug every 12 hours thereafter. Beginning on 3 days post-infection (dpi) and through the end of the study, body weight loss compared to vehicle treatment was significantly diminished (50 mg/kg) or prevented (150, 500 mg/kg) with EIDD-2801 prophylaxis (Two-way ANOVA with Dunnett's multiple comparison test, $P < 0.0001$) (fig. S3A). Lung hemorrhage was also significantly reduced 5 dpi with 500 mg/kg EIDD-2801 treatment (Kruskal-Wallis Test, $P = 0.010$, fig. S3B). Interestingly, there was a dose-dependent reduction in SARS-CoV lung titer (median titers: 50 mg/kg = 7E+03 pfu/mL, 150 mg/kg = 2.5E+03 pfu/mL, 500 mg/kg = 50 pfu/mL, vehicle = 6.5E+04 pfu/mL) with significant differences (Kruskal-Wallis with Dunn's multiple comparisons test) among the vehicle, 150 mg/kg ($P = 0.03$) and 500 mg/kg ($P = 0.006$) groups. Thus, prophylactic orally administered EIDD-2801 was robustly antiviral and able to prevent SARS-CoV replication and disease.

Since only the 500 mg/kg group significantly diminished weight loss, hemorrhage and reduced lung titer to near undetectable levels, we tested this dose under therapeutic treatment conditions to determine if EIDD-2801 could improve the outcomes of an ongoing CoV infection. As a control, we initiated oral vehicle or EIDD-2801 2 hours prior to infection with 1E+04 pfu SARS-MA15. For therapeutic conditions, we initiated EIDD-2801 treatment 12, 24, or 48 hours after infection. After initiating treatment, dosing for all groups was performed every 12 hours for the duration of the study. Both

prophylactic treatment initiated 2 hours prior to infection and therapeutic treatment initiated 12 hours after infection significantly (Two-way ANOVA with Tukey's multiple comparison test) prevented body weight loss following SARS-CoV infection on 2 dpi and thereafter (-2 hours: P = 0.0002 to <0.0001; +12 hours: P = 0.0289 to <0.0001) as compared to vehicle treated animals (Fig. 6A). Treatment initiated 24 hpi also significantly reduced body weight loss (3-5 dpi, P = 0.01 to <0.0001) although not to the same degree as the earlier treatment initiation groups. When initiated 48 hpi, body weight loss was only different from vehicle on 4 dpi (P = 0.037, Fig. 6A). Therapeutic EIDD-2801 significantly (Kruskal-Wallis with Dunnett's multiple comparison test) reduced lung hemorrhage when initiated up to 24 hours after infection (-2, +12, and +24 hours P < 0.0001) mirroring the body weight loss phenotypes (Fig. 6B). Interestingly, all EIDD-2801 treated mice had significantly (Kruskal-Wallis with Dunnett's multiple comparison test) reduced viral loads in the lungs even in the +48 hours group (All P < 0.0001, Fig. 6C), which experienced the least protection from body weight loss and lung hemorrhage. We also measured pulmonary function via whole body plethysmography (WBP). In Fig. 6D, we show the WBP enhanced pause (PenH) metric, which is a surrogate marker for bronchoconstriction or pulmonary obstruction (*27*), was significantly (Two-way ANOVA with Dunnett's multiple comparison test) improved throughout the course of the study if treatment was initiated up to 12 hours after infection (-2 hours: 2d pi to 5 dpi, P < 0.0001 to 0.019, +12 hours: 2 dpi to 5 dpi, P < 0.0001 to 0.0192) although the +24 hours group showed sporadic improvement as well (3 dpi P = 0.002) (Fig. 6D). Lastly, we blindly evaluated hematoxylin and eosin-stained lung tissue sections for histological features of ALI using two different and complementary scoring tools (*18*), which show that treatment initiated up to +12 hours significantly reduced ALI (Kruskal-Wallis with Dunn's multiple comparison test) (American Thoracic Society (ATS) Lung Injury Score: -2 hours P = 0.0004, +12 hours P = 0.0053, Diffuse alveolar damage (DAD) Score: -2 hours P = 0.0015, +12 hours P = 0.0004, Fig. 6E). Altogether, therapeutic EIDD-2801 was potently antiviral against SARS-CoV in vivo but the degree of clinical benefit was dependent on the time of initiation post-infection.

EIDD-2801 prophylactic and therapeutic efficacy correlates with increased MERS-CoV mutation rate

After obtaining promising in vivo efficacy data with SARS-CoV, we investigated whether EIDD-2801 would be effective against MERS-CoV. As the murine ortholog of the MERS-CoV receptor, dipeptidyl peptidase 4 (DPP4), does not support viral binding and entry, all in vivo studies were performed in genetically modified mice encoding a murine DPP4 receptor encoding two human residues at positions 288 and 330 (hDPP4 288/330 mice)(*18, 28*). Similar to our SARS-CoV data, all doses of prophylactic EIDD-2801 (50, 150 and 500 mg/kg) protected hDPP4 288/330 mice (fig. S4) from significant body weight loss (Two-way ANOVA with Dunnett's multiple comparison test, P = 0.03 to < 0.0001), lung hemorrhage (Kruskal-Wallis with Dunn's multiple comparison test, P = 0.01 to <0.0001), and virus replication which was undetectable (Kruskal-Wallis with Dunn's multiple comparison test, P < 0.0001) regardless of drug dose following intranasal infection with 5E+04 PFU mouse-adapted MERS-CoV (fig. S4).

We then evaluated the therapeutic efficacy EIDD-2801 following the promising results of our prophylactic studies. Similar to our SARS-CoV study, EIDD-2801 treatment administered before or 12 hours after intranasal mouse-adapted MERS-CoV infection (5E+04 PFU) prevented body weight loss from 2 through 6 dpi (Two-way ANOVA with Tukey's multiple comparison test, Fig. 7A, P = 0.02 to <0.0001) and lung hemorrhage on 6 dpi (Kruskal-Wallis with Dunn's multiple comparison test, P = 0.0004 to < 0.0001, Fig. 7B), but treatment initiated 24 or 48 hours did not offer similar protection. Unlike body weight loss and lung hemorrhage data which varied by treatment initiation time, virus lung titer on 6 dpi was significantly reduced to the limit of detection in all treatment groups (Kruskal-Wallis with Dunn's multiple comparison test, Fig. 7C, P < 0.0001). Interestingly, when viral genomic RNA was quantified in paired samples of lung tissue, EIDD-2801 significantly reduced quantities of viral RNA (One-way ANOVA with Dunnett's multiple comparison test, P <0.0001 to 0.017) in an initiation time-dependent manner for all groups except for +48 hours (Fig. 7D). The discrepancy among infectious titers and viral RNA suggests that accumulated mutations render the particles non-infectious and undetectable by plaque assay, consistent with the MOA. To gauge the effect of EIDD-2801 treatment on lung function, we assessed pulmonary function by WBP. Mirroring the body weight loss data, normal pulmonary function was only observed in groups where treatment was initiated prior to or 12 hours after infection (Two-way ANOVA with Tukey's multiple comparison test, -2hr: P < 0.0001 3 dpi, P = 0.0002 4 dpi, +12hr: P < 0.0001 3 dpi, P = 0.0008 4 dpi, Fig. 7E). Collectively, these data demonstrate that NHC prodrug, EIDD-2801, robustly reduces MERS-CoV infectious titers, viral RNA, and pathogenesis under both prophylactic and early therapeutic conditions.

To study the molecular mechanisms associated with drug performance in vivo, we investigated the correlation between infectious virus production and EIDD-2801-mediated mutagenesis of MERS-CoV RNA under therapeutic treatment conditions. Using Primer ID NGS, we measured the mutation rates of both viral genomic RNA (non-structural protein 10, nsp10) and host interferon stimulated gene 15 (*ISG15*) mRNA, a highly up-regulated innate immune-related gene after MERS-CoV infection (Fig. 7F). Primer ID NGS measures the

mutational frequency in single RNA molecules, each of which are represented by a single template consensus sequence (TCS) (*25*). Viral TCS were significantly reduced (Two-way ANOVA with Tukey's multiple comparison test, -2 hours P <0.0001, +12 hours P = 0.0001, +24 hours P = 0.02) in a treatment initiation time-dependent manner (Fig. 7G) similar to viral genomic RNA measured by qRT-PCR. In contrast, the numbers of ISG15 TCS were similar (P = 0.2 to 0.8) for all groups indicating that neither vehicle nor drug treatment significantly affected the levels of or mutated ISG15 mRNA transcripts (Fig. 7G). Similar to our TCS data in Fig. 6G, the total error rate in viral nsp10 was significantly increased (Two-way ANOVA with Tukey's multiple comparison test) in groups where treatment was initiated prior to (-2 hours, median error rate = 10.5 errors/10,000 bases, P < 0.0001) and up to 24 hours post infection (12 hours, median error rate = 8.2 errors/10,000 bases, P < 0.0001 ; +24 hours, median error rate = 5.4 errors/10,000 bases, P = 0.0003) but the error rates in ISG15 remained at baseline for all groups (Fig. 7H). In addition, nucleotide transitions observed in MERS-CoV genomes in vitro, were also observed in vivo in groups where treatment was initiated prior to and up to 12 hours post infection (Two-way ANOVA with Tukey's multiple comparison test, P = 0.0003 to < 0.0001) (Fig. 7I). Importantly, these transitions were not observed in host ISG15 mRNA (Fig. 7I). Lastly, the EIDD-2801 dose-dependent mutagenesis of viral RNA correlated with an increase in codon change frequency, including stop codons, in mice where treatment was initiated 12 hours or before (Two-way ANOVA with Tukey's multiple comparison test, vehicle median = 3.4; -2hr median = 22.8, P = 0.0035; +12 hours median = 20.0, P = 0.0004, Fig. 7J). Thus, approximately 20% of the mutations observed in the -2 hours and +12 hours groups resulted in a codon change and alteration of the nsp10 protein sequence. When extrapolating our results from nsp10 to the entirety of the 30kb MERS-CoV genome, EIDD-2801 likely causes between 15 (+24 hours treatment) and 30 (-2 hours treatment) mutations per genome, 10-20% of which result in amino acid coding changes. Altogether, our data demonstrates that EIDD-2801-driven mutagenesis correlates well with the reductions in viral load, strongly suggestive of an error catastrophe-driven mechanism of action under therapeutic conditions.

DISCUSSION

In the past 20 years, three novel human coronaviruses have emerged (*29, 30*). The group 2b SARS-like CoV represent an existential and future threat to global health as evidenced by the emergence of SARS-CoV and SARS-CoV-2. Zoonotic SARS-like bat CoV strains can use human angiotensin-converting enzyme 2 (ACE2) receptors, grow well in primary human airway cells, and vary by as much as 25% in key therapeutic and vaccine gene targets (*11, 31*). Thus, to address the current public health emergency of COVID-19 and to maximize pandemic preparedness in the future, broad-based vaccines and therapeutics, which are active against the higher risk RNA virus families prone to emergence, are desperately needed.

Small molecule antivirals can exert their antiviral effect through multiple mechanisms including blocking viral entry, inhibiting a virally encoded enzyme, blocking virus particle formation, or targeting a host factor required for replication (*32*). Multiple direct acting antivirals are currently under evaluation in randomized control trials to treat COVID-19 including hydroxychloroquine, remdesivir, lopinavir/ritonavir(*33-35*). Here, we report the broad-spectrum antiviral activity of NHC and its orally bioavailable prodrug EIDD-2801, against SARS-CoV, MERS-CoV, and the current pandemic strain SARS-CoV-2 in primary human airway epithelial cells. In addition to CoV, NHC is broadly active against multiple genetically distinct viruses including VEE, influenza A and B, Ebola, and Chikungunya viruses (*13-16, 19, 21, 24, 36-38*). Here, we show that prophylactic and therapeutic EIDD-2801 significantly reduced lung viral loads and improved pulmonary function in mouse models of both SARS- and MERS-CoV pathogenesis. Although the improvement in both SARS- and MERS-CoV outcomes diminished with the delay of treatment initiation time, it is important to note that the kinetics of disease in mice are compressed as compared to that in humans. Whereas SARS- and MERS-CoV lung titers peak on 1-2 dpi in mice concurrent with the onset of clinical signs and notable damage to the lung epithelium, in humans this occurs 7-10 days after the onset of symptoms (*19, 28, 39, 40*). Thus, in mice, the window within which to treat emerging CoV infection prior to peak replication is compressed (e.g., 24-48 hours). As with oseltamivir treatment for influenza which fails to provide a protective effect if administered >5 days after the onset of symptoms, the window in which to treat COVID-19 patients prior to peak virus replication is likely during the first week of symptoms when pharyngeal shedding is at its highest(*41, 42*). However, virus replication and shedding may continue for several weeks in the most severe COVID-19 patients(*34*). Thus, early intervention with an antiviral like EIDD-2801 is likely to provide the most clinical benefit although there may opportunities in severe patients where the duration of virus replication may be extended. Our current study is clearly limited by the lack of in vivo efficacy testing with SARS-CoV-2. Currently, robust mouse models that recapitulate the SARS-CoV-2 pathogenesis observed in humans do not yet exist due to a noted virus spike glycoprotein and mouse ACE2 receptor incompatibility complicating the evaluation of medical countermeasures(*43, 44*). In addition, SARS-CoV and MERS-CoV, SARS-CoV-2 disease severity increases with increasing age. Our studies are limited by the lack of drug efficacy testing in CoV aged mouse models that

recapitulate the age-related increase in pathogenesis observed in humans(*45*). The data provided in this manuscript suggest that EIDD-2801 should be quickly evaluated in primate models of human disease, using immediate models for MERS-CoV and SARS-CoV pathogenesis or newly described cynomolgus and rhesus macaque models for SARS-CoV-2 (*46-49*).

For VEE and influenza, NHC/EIDD-2801 exerts its antiviral activity on the RNA-dependent RNA polymerase leading to error catastrophe by inducing an error rate of replication that surpasses the error threshold allowed to sustain a virus population (*14, 15*). This process occurs when NHC is incorporated during RNA synthesis then subsequently misread thus increasing mutation rates. Therefore, for CoV, the NHC MOA would appear less likely to be affected by the RNA proofreading activity encoded by the nsp14 exonuclease function that otherwise limits misincorperation (*50*). Here, we present data using Primer ID NGS to quantitate the frequency and identity of the mutational spectra in the MERS-CoV genome in both drug-treated primary human airway cells and in mice at single genome resolution. As CoV are positive sense RNA viruses that replicate through a negative sense RNA intermediate, NHC incorporation as a C or a U can occur in both polarities of RNA. We found increased nucleotide transitions (A to G, G to A, C to U, U to C) consistent with those reported after influenza and VEE infections (*14, 15*). Under identical conditions, RDV did not alter the mutation rate in MERS-CoV genomic RNA, supporting its reported mechanism of action as a chain terminator of viral RNA synthesis (*26*). In primary human lung cell cultures and mice infected with MERS-CoV, the NHC mutation rates inversely correlated with a reduction in infectious virus. In addition, we found a positive correlation between increased mutation rates and the frequency of nonsynonymous mutations and the degree of therapeutic efficacy in mice. To explore the potential off-target effect in host mRNA which may contribute to drug toxicity, we also examined the impact of NHC treatment on *ISG15* transcripts, a gene highly induced following MERS-CoV infection. Although ISG15 transcripts are present in great abundance, an accumulation of mutations was not observed in *ISG15* in this model even at 500 mg/kg dosing. These data also support previous studies using RNAseq to demonstrate that the model coronavirus MHV displayed increased mutation frequencies following NHC treatment in vitro (*16*). With regard to nucleic acid specificity, ribonucleotides are efficiently removed from eukaryotic cell DNA; therefore, treating a viral infection with a mutagenic ribonucleoside analog should show a selectivity for incorporation into the viral genome and not be efficient at being incorporated into and inducing mutations into host cell DNA (*51*). All together, these data strongly support the notion that EIDD-2801 and its active nucleoside analog NHC exert their antiviral effect through the induction of error catastrophe in the targeted virus. While our data suggest that the MERS-CoV nsp14 proofreading activity appeared ineffective against NHC in vitro and EIDD-2801 in vivo, future studies should investigate the antiviral activity of NHC in the presence or absence of the nsp14 proofreading activity, as loss of this activity increased the sensitivity of MHV and SARS-CoV replication to RDV treatment (*50*).

Together, our data support the continued development of EIDD-2801 as a potent broad spectrum antiviral that could be useful in treating contemporary, newly emerged and emerging coronavirus infections of the future.

MATERIALS AND METHODS

Study Design

The primary goal of this study was to determine the antiviral activity of the nucleoside analog NHC (EIDD-1931) against multiple emerging CoV in vitro and antiviral efficacy of its prodrug, EIDD-2801, in mouse models of CoV pathogenesis. Coupling cell lines and primary HAE cell cultures, we evaluated the antiviral activity of NHC against the three most recently emerged human CoV: SARS-CoV, MERS-CoV, and SARS-CoV-2. For both SARS-CoV and MERS-CoV, the data presented for HAE studies are representative of those from 2-3 separate human donors. For SARS-CoV-2, the HAE were from a single human donor. We evaluated drug cytotoxicity in both Calu-3 2B4 and HAE cell cultures. Calu-3 and the SARS-CoV and MERS-CoV HAE studies were performed in biological triplicate. HAE studies with SARS-CoV-2 and the SARS- and MERS-like bat CoV were performed with two wells per condition. Drug effects were measured relative to vehicle controls in vitro and comparisons in vivo were performed to vehicle controls. We also aimed to determine the antiviral efficacy of EIDD-2801 in mouse models of CoV pathogenesis. These studies were intended to provide the preclinical data to justify nonhuman primate studies and human clinical trials. Mice were age- and sex-matched and randomly assigned into groups before infection and treatment. Pathology was scored blinded by a board-certified veterinary pathologist. Primary data for all studies are provided in data file S1.

Ethics regulation of laboratory animals

Efficacy studies were performed in animal biosafety level 3 facilities at UNC Chapel Hill. All work was conducted under protocols approved by the Institutional Animal Care and Use Committee at UNC Chapel Hill (IACUC protocol #16-284) according to guidelines set by the Association for the Assessment and Accreditation of Laboratory Animal Care and the U.S. Department of Agriculture.

Compounds

The parental compound β-D-N^4-hydroxycytidine (NHC, all in vitro studies) and its prodrug EIDD-2801 (all in vivo studies) was supplied by Emory University Institute for Drug

Discovery (EIDD). NHC was supplied as a 10 mM stock in DMSO and EIDD-2801 as a solid and solubilized in vehicle containing 10% PEG400, 2.5% Cremophor RH40 in water (10/2.5/87.5%, all v/v) prior to use. RDV was solubilized in 100% DMSO and provided by Gilead Sciences, Inc as previously described (*18, 19*).

Cell cultures

At UNC, the human lung epithelial cell line Calu-3 2B4 cells was maintained in Dulbecco's modified Eagle's medium (DMEM, Gibco), 20% fetal bovine serum (Hyclone) and 1x antibiotic/antimycotic (Gibco). At Vanderbilt University Medical Center (VUMC), Calu-3 2B4 were propagated in DMEM supplemented with 20% FBS (Gibco), 100 U/ml penicillin and streptomycin (Gibco), and 0.25 μM amphotericin B (Corning). At VUMC, VeroE6 cells were cultured in DMEM supplemented with 10% FBS (Gibco), 100 U/ml penicillin and streptomycin (Gibco), and 0.25 μM amphotericin B (Corning). At UNC, VeroE6 cells were cultured in DMEM supplemented with 10% Fetal Clone II (Hyclone) and 1x antibiotic/antimycotic (Gibco). Murine delayed brain tumor (DBT) cells were maintained in DMEM supplemented with 10% FBS (Gibco), 100 U/ml penicillin and streptomycin (Gibco), and 0.25 μM amphotericin B (Corning). Primary human airway epithelial (HAE) cell cultures were obtained from the Tissue Procurement and Cell Culture Core Laboratory in the Marsico Lung Institute/Cystic Fibrosis Research Center at UNC and are described more thoroughly below (*52*).

Virus strains

Except for SARS-CoV-2, all viruses used for these studies were derived from infectious clones and isolated as previously described (*53*). SARS-CoV-2 clinical isolate was obtained at VUMC and UNC from the CDC (2019-nCoV/USA-WA1/2020 strain, GenBank accession no. MN985325.1) and passaged twice in Vero E6 cells at each respective institution to create a passage 5 working stock (*54*). Virus strains for in vitro experiments include SARS-CoV expressing the green fluorescent protein (GFP) in place of open reading frames 7a/b (ORF7a/b, SARS-GFP)(*53*), bat-spike receptor binding domain (Bat-SRBD)(*22*), a chimeric CoV strain derived from the HKU3 SARS-like bat coronavirus genomic sequence that has the wild type (Urbani SARS-CoV strain) RBD in the HKU3 spike gene to allow for virus replication in non-human primate cell lines and HAE cultures, SHC014 SARS-like bat coronavirus (*11*), MERS-CoV expressing nanoluciferase in the place of ORF3 (MERS-nLUC)(*19*), and MERS-CoV expressing the red fluorescent protein gene in the place of ORF 5 (RFP, MERS-RFP)(*55*). The virus stock utilized for MERS-CoV in vivo studies was derived from a plaque-purified isolate of the mouse-adapted MERS-CoV p35C4 strain (*56*). The virus stock utilized for SARS-CoV in vivo studies was derived from the infectious clone of the mouse-adapted SARS-CoV MA15 (MA15) strain (*57*). All work with MHV was performed using the recombinant WT strain MHV-A59 (GenBank accession no. AY910861)(*58*).

In vitro antiviral activity experiments

MERS-CoV nLUC in Calu-3: At 48 hours prior to infection, Calu-3 2B4 cells were plated in a 96-well black-walled clear bottom plate at $5x10^4$ cells/well. A 10 mM stock of NHC was serially diluted in 100% DMSO in 3-fold increments to obtain a ten-point dilution series. MERS-nLUC was diluted in DMEM supplemented with 10% FBS, and 1% Antibiotic-Antimycotic to achieve a multiplicity of infection (MOI) of 0.08. Cells were infected and concurrently treated with NHC in triplicate per drug dilution for 1hr, after which viral inoculum was aspirated, cultures were rinsed once and fresh medium containing drug or vehicle was added. At 48 hours post infection, nanoluciferase expression as a surrogate for virus replication was quantitated on a Spectramax plate reader (Molecular Devices) according to the manufacturer's instructions (Promega, NanoGlo). For the 100% inhibition control, diluted MERS-nLUC was exposed to short-wave UV light (UVP, LLC) for 6 min to inhibit the ability of the virus to replicate. For the 0% inhibition control, cells were infected in the presence of vehicle only. DMSO was kept constant in all conditions at 0.05%. Values from triplicate wells per condition were averaged and compared to controls to generate a percent inhibition value for each drug dilution. The IC_{50} value was defined as the concentration at which there was a 50% decrease in luciferase expression. Data were analyzed using GraphPad Prism 8.0. The IC_{50} values were calculated by nonlinear regression analysis using the dose-response (variable slope) equation (four parameter logistic equation): Y = Bottom + (Top-Bottom)/(1+10^((LogIC50-X)*HillSlope)). To measure cell viability to determine if there was any NHC-induced cytotoxicity, Calu-3 2B4 cells were plated and treated with NHC only as described above. Cells were exposed to the same ten-point dilution series created for the in vitro efficacy studies. As above, 0.05% DMSO-treated cells served as the 0% cytotoxicity control. Wells without cells served as the 100% cytotoxic positive control. After 48 hours, cell viability was measured on a Spectramax (Molecular Devices) via Cell-Titer Glo Assay (Promega) according to the manufacturer's protocol. Similar data were obtained in three independent experiments.

SARS-CoV-2 in Calu-3: Calu-3 2B4 cells were adsorbed with MOI 0.1 PFU/cell of SARS-CoV-2 (2019-nCoV/USA-WA1/2020 strain) at 37°C. Plates were manually rocked every 10 min to redistribute the inoculum. After 30 min, virus inoculum was removed, cells were washed with Phosphate buffered saline (PBS) once to remove unbound virus, medium containing NHC or vehicle control (DMSO) was added back onto the cells, and cells were incubated for 72 hours at 37°C.

SARS-CoV-2 in Vero E6: Vero E6 cells were plated at 20,000 cells/well in a 96-well plate. 24hr later, medium

containing a dose response of NHC was added concurrent with SARS-CoV-2 (2019-nCoV/USA-WA1/2020 strain) at an MOI of 0.05. 48 hours post infection, cell viability was measured by CellTiter Glo assay.

SARS-CoV, MERS-CoV, and SARS-CoV-2 in HAE: Human tracheobronchial epithelial cells provided by Dr. Scott Randell were obtained from airway specimens resected from patients undergoing surgery under University of North Carolina Institutional Review Board-approved protocols (#03-1396) by the Cystic Fibrosis Center Tissue Culture Core. Primary cells were expanded to generate passage 1 cells and passage 2 cells were plated at a density of 250,000 cells per well on Transwell-COL (12mm diameter) supports (Corning). Human airway epithelium cultures (HAE) were generated by provision of an air-liquid interface for 6 to 8 weeks to form well-differentiated, polarized cultures that resembled in vivo pseudostratified mucociliary epithelium (*59*).· At 48 hours prior to infection the apical surface of the culture was washed with 500 μL PBS for 1.5 hours at 37°C and the cultures moved into fresh air liquid interface (ALI) media. Immediately prior to infection, apical surfaces were washed twice to remove accumulated mucus with 500 μL of PBS with each wash lasting 30 min at 37°C and HAE cultures were moved into ALI media containing various concentrations of NHC ranging from 10 μM to 0.0016 μM as indicated for each experiment (final % DMSO < 0.05%). Upon removing the second PBS wash, 200 μL of viral inoculum (SARS-GFP, MERS-RFP or 2019-nCoV/USA-WA1/2020 strain) at an MOI of 0.5 was added to the apical surface and HAE cultures were incubated for 2 hours at 37°C. Viral inoculum was then removed, and the apical surface of the cultures were washed three times with 500μL PBS and then incubated at 37°C until 48 hours post infection (hpi). For all HAE cultures, infectious virus produced was collected by washing the apical surface of the culture with 100 μL PBS. Apical washes were stored at -80°C until analysis and titered by plaque assay as previously described (*19*).

qRT-PCR approach to assess cytotoxicity

Total RNA was isolated using the Zymo Direct-zol RNA MiniPrep Kit (Zymo Research Corp.) according to the manufacturer's directions. Cells were treated with 1μM staurosporine (Sigma-Aldrich) as a positive control. First-strand cDNA was generated using Superscript III reverse transcriptase (Life Technologies). For quantification of cellular markers of toxicity/apoptosis, real-time PCR was performed using commercially validated TaqMan-based primer-probe sets (**table S1**) and TaqMan Universal PCR Mix (Life Technologies). Results were then normalized as described above.

MERS-CoV genomic RNA qRT-PCR

Mouse lungs were stored in RNAlater (ThermoFisher) at -80°C until processed via homogenization in TRIzol (Invitrogen). Total RNA was isolated using Direct-zol RNA MiniPrep kit (Zymo Research). Previously published TaqMan primers were synthesized by Integrated DNA Technologies (IDT) to quantify MERS genomic RNA (targeting orf1a: Forward: 5′-GCACATCTGTGGTTCTCCTCTCT-3′, Probe (6-FAM/ZEN/IBFQ): 5′- TGCTCCAACAGTTACAC-3′, Reverse: 5′-AAGCCCAGGCCCTACTATTAGC)(*60*). qRT-PCR was performed using 100ng total RNA compared to an RNA standard curve using TaqMan Fast Virus 1-Step Master Mix (ThermoFisher) on a Quant Studio 3 (Applied Biosystems).

Quantification of SARS-CoV-2 viral RNA genome copy number by qRT-PCR

Cell supernatants were harvested in TRIzol LS reagent (Invitrogen), and RNA was purified following phase separation by chloroform as recommended by the manufacturer. The RNA in the aqueous phase was collected and further purified using PureLink RNA Mini Kits (Invitrogen) according to the manufacturer's protocol. Viral RNA was quantified using one-step quantitative reverse transcription PCR (qRT-PCR) on a StepOnePlus Real-Time PCR system (Applied Biosystems) by TaqMan Fast Virus 1-Step Master Mix chemistry (Applied Biosystems). SARS-CoV-2 N gene RNA was amplified using forward (5′-GACCCCAAAATCAGCGAAAT) and reverse (5′-TCTGGTTACTGCCAGTTGAATCTG) primers and probe (5′-FAM-ACCCCGCATTACGTTTGGTGGACC-BHQ1) designed by the United States Centers for Disease Control and Prevention (oligonucleotides produced by IDT, cat# 10006606). Copy numbers were interpolated from a standard curve produced with dilutions of N gene RNA. Briefly, SARS-CoV-2-N positive control plasmid DNA (IDT, cat# 10006625) was amplified using forward (5′-TAATACGACTCACTATAGGGATGTCTGATAATGGACCCCA) and reverse (5′- TTAGGCCTGAGTTGAGTCAG) primers, resulting in a 1280 nucleotide fragment containing a T7 promoter. The PCR product was purified by column (Promega) and in vitro transcribed using the mMESSAGE mMACHINE T7 Transcription Kit (Invitrogen) according to the manufacturer's protocol. Transcribed RNA was purified using RNeasy mini kit (Qiagen) according to the manufacturer's protocol, and serial 10-fold dilutions were quantified as described above.

Primer ID and deep sequencing

Primer ID NGS is designed to specifically identify and remove RT-PCR mutations, while facilitating highly accurate sequence determination of single RNA molecules, because each cDNA is created with a barcoded degenerate primer (N10, 4^{10} combinations) from which Illumina indexed libraries are made. We used a multiplexed Primer ID library prep approach and MiSeq sequencing to investigate the presence of mutations in the viral genomes and murine mRNA. We designed cDNA primers targeting multiple regions on the viral genome and murine mRNA, each with a block of random

nucleotides (11 bp long) as the Primer ID (*25, 61*) (**table S2**). Viral RNA was extracted using QIAamp viral RNA kit. A pre-amplification titration of templates was performed to estimate the amount of template to use. We used SuperScript III to make cDNA with multiplexed cDNA primers based on the regions to be sequenced. We used 41R_PID11 for the pilot sequencing and titration determination. For the MERS-CoV sequencing, we multiplexed nsp10_PID11, nsp12_PID11 and nsp14_PID11 for the cDNA reaction; for the murine mRNA sequencing, we used mixed primers of nsp10_PID11, ifit3_PID11, isg15_PID11. After bead purification, we amplified the cDNA with a mixture of forward primers (based on the described schemes) and a universal reverse primer, followed by another round of PCR to incorporate Illumina sequencing adaptors and barcodes in the amplicons. After gel-purification and quantification, we pooled 24 libraries for MiSeq 300 base paired-end sequencing. The TCS pipeline version 1.38 (https://github.com/SwanstromLab/PID) was used to process the Primer ID sequencing data and construct template consensus sequences (TCSs) to represent each individual input templates, and the sequences of each region in the pool was de-multiplexed. The RUBY package viral_seq version 1.0.6 (https://rubygems.org/gems/viral_seq) was used to calculate the mutation rate at each position. NCBI SRA Accession numbers for sequence data are as follows: PRJNA613261 (Fig. 5) and PRJNA613454 (Fig. 7).

In vivo experiments

We performed 4 mouse studies to evaluate the in vivo efficacy of the NHC prodrug (EIDD-2801). First, we performed prophylactic dose escalation studies for both SARS- and MERS-CoV to determine the most efficacious dose of EIDD-2801 per virus. For SARS-CoV, in cohorts of equivalent numbers of male and female 20-29 week old SPF C57BL/6J (Stock 000664 Jackson Labs) mice (n = 10/dose group), we administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or 50, 150 or 500 mg/kg EIDD-2801 by oral gavage 2 hours prior to intranasal infection with 1E+04 PFU mouse-adapted SARS-CoV strain MA15 in 50μl. Mice were anaesthetized with a mixture of ketamine/xylazine prior to intranasal infection. Vehicle or drug was administered every 12hr for the remainder of the study. Body weight and pulmonary function by whole body plethysmography were measured daily. On 5 dpi, animals were sacrificed by isoflurane overdose, lungs were scored for lung hemorrhage, and the inferior right lobe was frozen at −80°C for viral titration via plaque assay. Briefly, 500,000 Vero E6 cells/well were seeded in 6-well plates. The following day, medium was removed and serial dilutions of clarified lung homogenate were added per plate (10^{-1} to 10^{-6} dilutions) and incubated at 37°C for 1hr after which wells were overlaid with 1X DMEM, 5% Fetal Clone 2 serum, 1X antibiotic/antimycotic, 0.8% agarose. Two days after, plaques were enumerated to generate a plaque/ml value. Lung hemorrhage is a gross pathological phenotype readily observed by the naked eye driven by the degree of virus replication where the coloration of the lung changes from pink to dark red (*62, 63*). The large left lobe was placed in 10% buffered formalin and stored at 4°C for 1-3 weeks until histological sectioning and analysis. For MERS-CoV, the prophylactic dose escalation studies we performed similarly as done for SARS-CoV with our recently developed a mouse model for MERS-CoV, which has a humanized DPP4 receptor (hDPP4) (*28*). We performed all in vivo studies with EIDD-2801 in equivalent numbers of 10-14 week old female and male C57BL/6J hDPP4 mice. Second, we intranasally infected mice with 5E+04 PFU mouse-adapted MERS-CoV strain M35C4 in 50μl. Third, to titer lungs by plaque assay, Vero CCL81 cells were used and plaques were enumerated 3 dpi.

To determine the time at which therapeutic administration of EIDD-2801 would fail to improve outcomes with SARS-CoV or MERS-CoV infection, we performed therapeutic efficacy studies in mice where we initiated treatment 2 hours prior to infection or 12, 24 or 48 hours after infection. As 500 mg/kg provided the most complete protection from disease in prophylactic SARS-CoV studies, this dose was used for both therapeutic efficacy studies. Vehicle or EIDD-2801 was given via oral gavage twice daily following initiation of treatment. For both SARS-CoV and MERS-CoV, the infectious dose for the therapeutic studies and the mouse strains were the same as that used in the prophylactic studies. The numbers of mice per group for the SARS-CoV studies were as follows: Vehicle (n = 10), -2 hours (n = 10), +12 hours (n = 10), +24 hours (n = 10), +48 hours (n = 10). The numbers of mice per group for the MERS-CoV therapeutic studies were as follows: Vehicle (n = 9), -2 hours (n = 9), +12 hours (n = 9), +24 hours (n = 7), +48 hours (n = 10). As described above, each day mouse body weight and pulmonary function were quantitated. On 5 dpi for SARS-CoV and 6 dpi for MERS-CoV, animals were humanely sacrificed and tissues were harvested and analyzed as described above. In addition, for the MERS-CoV study, lung tissue was harvested and stored in RNAlater (Thermo Fisher) at -80°C and then thawed, homogenized in Trizol reagent (Invitrogen) and total RNA was isolated using a Direct-zol RNA MiniPrep kit (Zymo Research). This total RNA was then used for Primer ID and qRT-PCR.

Whole body plethysmography

Pulmonary function was monitored once daily via whole-body plethysmography (Buxco Respiratory Solutions, DSI Inc.). Mice intended for this analysis were randomly chosen prior to the initiation of the study. Briefly, after a 30-min acclimation time in the plethysmograph, data for 11 parameters was recorded every 2 s for 5 min.

Acute lung injury histological assessment tools

Two different and complementary quantitative histologic tools were used to determine if antiviral treatments

diminished the histopathologic features associated with lung injury. Both analyses and scoring were performed by a Board Certified Veterinary Pathologist who was blinded to the treatment groups.

American Thoracic Society lung injury scoring tool. In order to help quantitate histological features of ALI observed in mouse models and increase their translation to the human condition, we used the ATS scoring tool (*63*). In a blinded manner, we chose three random diseased fields of lung tissue at high power (60 ×), which were scored for the following: (A) neutrophils in the alveolar space (none = 0, 1–5 cells = 1, > 5 cells = 2), (B) neutrophils in the interstitial space/ septae (none = 0, 1–5 cells = 1, > 5 cells = 2), (C) hyaline membranes (none = 0, one membrane = 1, > 1 membrane = 2), (D) Proteinaceous debris in air spaces (none = 0, one instance = 1, > 1 instance = 2), (E) alveolar septal thickening (< 2× mock thickness = 0, 2–4× mock thickness = 1, > 4× mock thickness = 2). To obtain a lung injury score per field, the scores for A–E were then put into the following formula, which contains multipliers that assign varying levels of importance for each phenotype of the disease state.: score = [(20x A) + (14 x B) + (7 x C) + (7 x D) + (2 x E)]/100. The scores for the three fields per mouse were averaged to obtain a final score ranging from 0 to and including 1.

Diffuse Alveolar Damage (DAD) tool. The second histological tool to quantitate lung injury was reported by Schmidt *et al.*(*64*). DAD is the pathological hallmark of ALI (*63, 64*). Three random diseased fields of lung tissue were scored at high power (60 ×) for the following in a blinded manner: 1 = absence of cellular sloughing and necrosis, 2 = Uncommon solitary cell sloughing and necrosis (1–2 foci/field), 3 = multifocal (3 + foci) cellular sloughing and necrosis with uncommon septal wall hyalinization, or 4 = multifocal (>75% of field) cellular sloughing and necrosis with common and/or prominent hyaline membranes. The scores for the three fields per mouse were averaged to get a final DAD score per mouse.

nsp12 phylogenetic analysis and conservation modeling

Coronavirus RdRp (nsp12) protein sequence alignments and phylogenetic trees were generated using Geneious Tree Builder in Geneious Prime (version 2020.0.5) and visualized using Evolview (https://www.evolgenius.info/evolview/). Protein similarity scores were calculated using Blosom62 matrix. The accession numbers used were: PDCoV (KR265858), AIBV (NC_001451), HCoV-229E (JX503060), PEDV (NC_003436), MHV (AY700211), HCoV-HKU1 (DQ415904), HCoV-NL63 (JX504050), HCOV-OC43 (AY903460), HKU5-1 (NC_009020), MERS-CoV (JX869059), HKU9-4 (EF065516), 2019-nCoV (MN996528), HKU3-1 (DQ022305), SHC014 (KC881005), WIV1 (KF367457), SARS-CoV (AY278741). Amino acid conservation scores of coronavirus RdRp were generated using ConSurf Server (https://consurf.tau.ac.il/) using the protein alignment described above and visualized on the SARS-CoV RdRp structure (PDB: 6NUR) in PyMol (version 1.8.6.0)(*20, 65*).

Statistical analysis

All statistical data analyses were performed in Graphpad Prism 8. Statistical significance for each endpoint was determined with specific statistical tests. In general, for metrics with multiple treatment groups with longitudinal data (e.g., mouse weight loss or pulmonary function over time), two-way ANOVA was performed with the suggested multiple comparison test as advised by Prism. For comparative data with for a single timepoint (e.g., lung titer) Kruskal-Wallis or one-way ANOVA was performed with the suggested multiple comparison test. For each test, a p-value <0.05 was considered significant. Specific tests are noted in each figure legend.

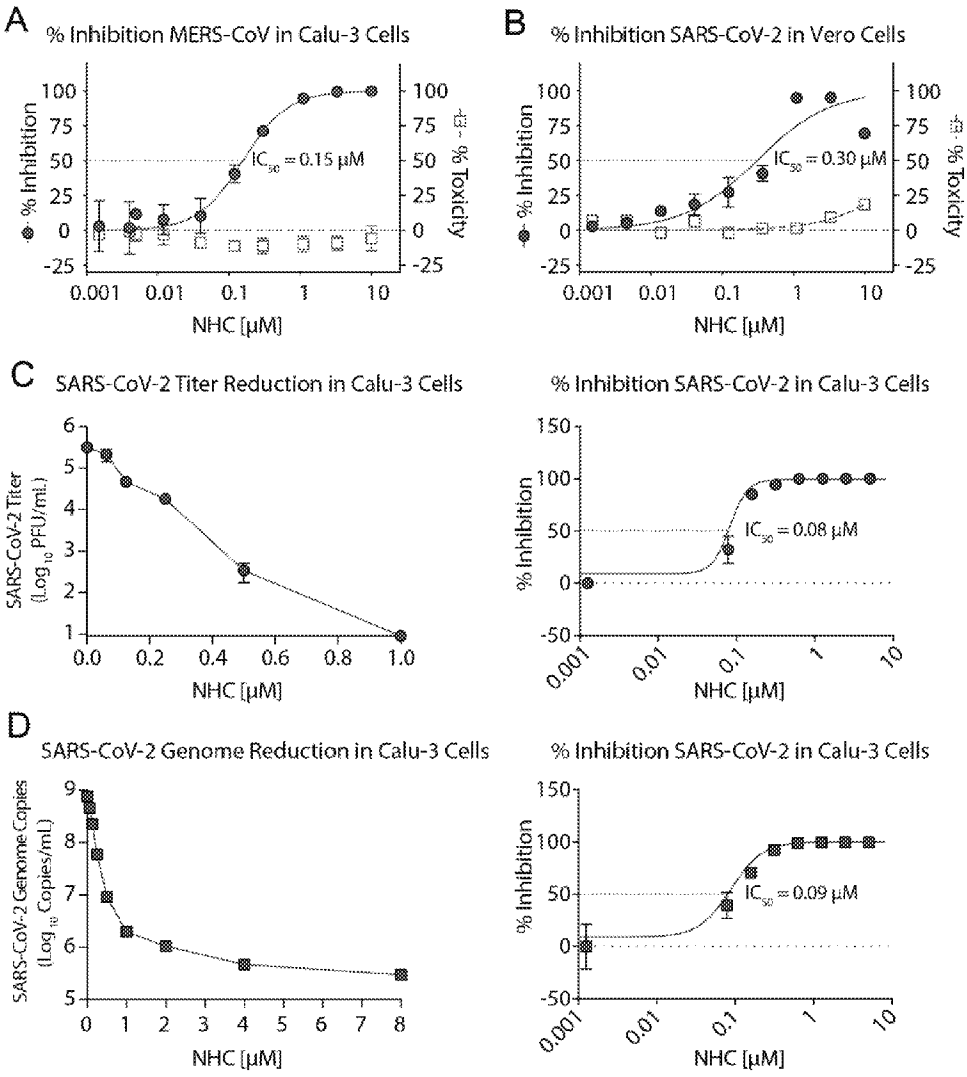

Fig. 1. NHC potently inhibits MERS-CoV and newly emerging SARS-CoV-2 replication. (A) Percent inhibition of MERS-CoV replication and NHC cytotoxicity in Calu-3 cells. Calu-3 cells were infected in triplicate with MERS-CoV nanoluciferase (nLUC) at a multiplicity of infection (MOI) of 0.08 in the presence of a range of drug for 48 hours, after which replication was measured through quantitation of MERS-CoV–expressed nLUC. Cytotoxicity was measured in similarly treated but uninfected cultures via Cell-Titer-Glo assay. Data are combined from 3 independent experiments. **(B)** NHC antiviral activity and cytotoxicity in Vero E6 cells infected with SARS-CoV-2. Vero E6 cells were infected in duplicate with SARS-CoV-2 clinical isolate 2019-nCoV/USA-WA1/2020 virus at an MOI of 0.05 in the presence of a range of drug for 48 hours, after which replication was measured through quantitation of cell viability by Cell-Titer-Glo assay. Cytotoxicity was measured as in **A**. Data are combined from 2 independent experiments. **(C)** SARS-CoV-2 titer reduction (left) and percent inhibition (right) in Calu-3 cells. Cells were infected with at an MOI of 0.1 for 30 min, washed and exposed to a dose response of NHC in triplicate per condition. 72 hours post infection, virus production was measured by plaque assay. **(D)** SARS-CoV-2 genomic RNA reduction (left) and percent inhibition (right) in Calu-3 cells. Viral RNA was isolated from clarified supernatants from the study in panel **C**. Genome copy numbers were quantitated by qRT-PCR with primer/probes targeting the N gene. For **A-D**, the symbol is at the mean and the error bars represent the standard deviation.

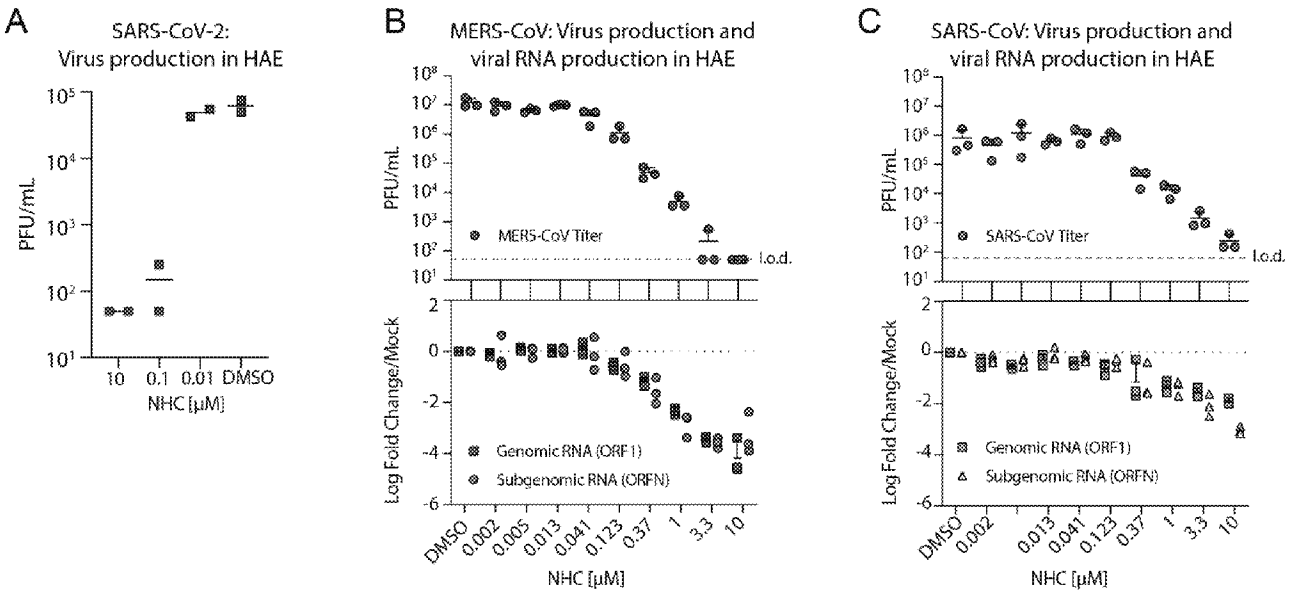

Fig. 2. NHC is highly active against SARS-CoV-2, MERS-CoV, and SARS-CoV in primary human airway epithelial cell cultures. (A) HAE were infected at an MOI of 0.5 with clinical isolate SARS-CoV-2 for 2 hours in the presence of NHC in duplicate after which virus was removed and cultures were washed in incubated in NHC for 48 hours when apical washes were collected for virus titration by plaque assay. The line is at the mean. Each symbol represents the titer from a single well. **(B)** HAE cells were infected with MERS-CoV red fluorescent protein (RFP) at an MOI of 0.5 in triplicate and treated similarly to **A**. qRT-PCR for MERS-CoV ORF1 and ORFN mRNA. Total RNA was isolated from cultures in **C** for qRT-PCR analysis. Representative data from three separate experiments with three different cell donors are displayed. PFU, plaque-forming units. **(C)** Studies performed as in **A** but with SARS-CoV green fluorescent protein (GFP). Representative data from two separate experiments with two different cell donors are displayed. Each symbol represents the data from one HAE culture, the line is at the mean and the error bars represent the standard deviation.

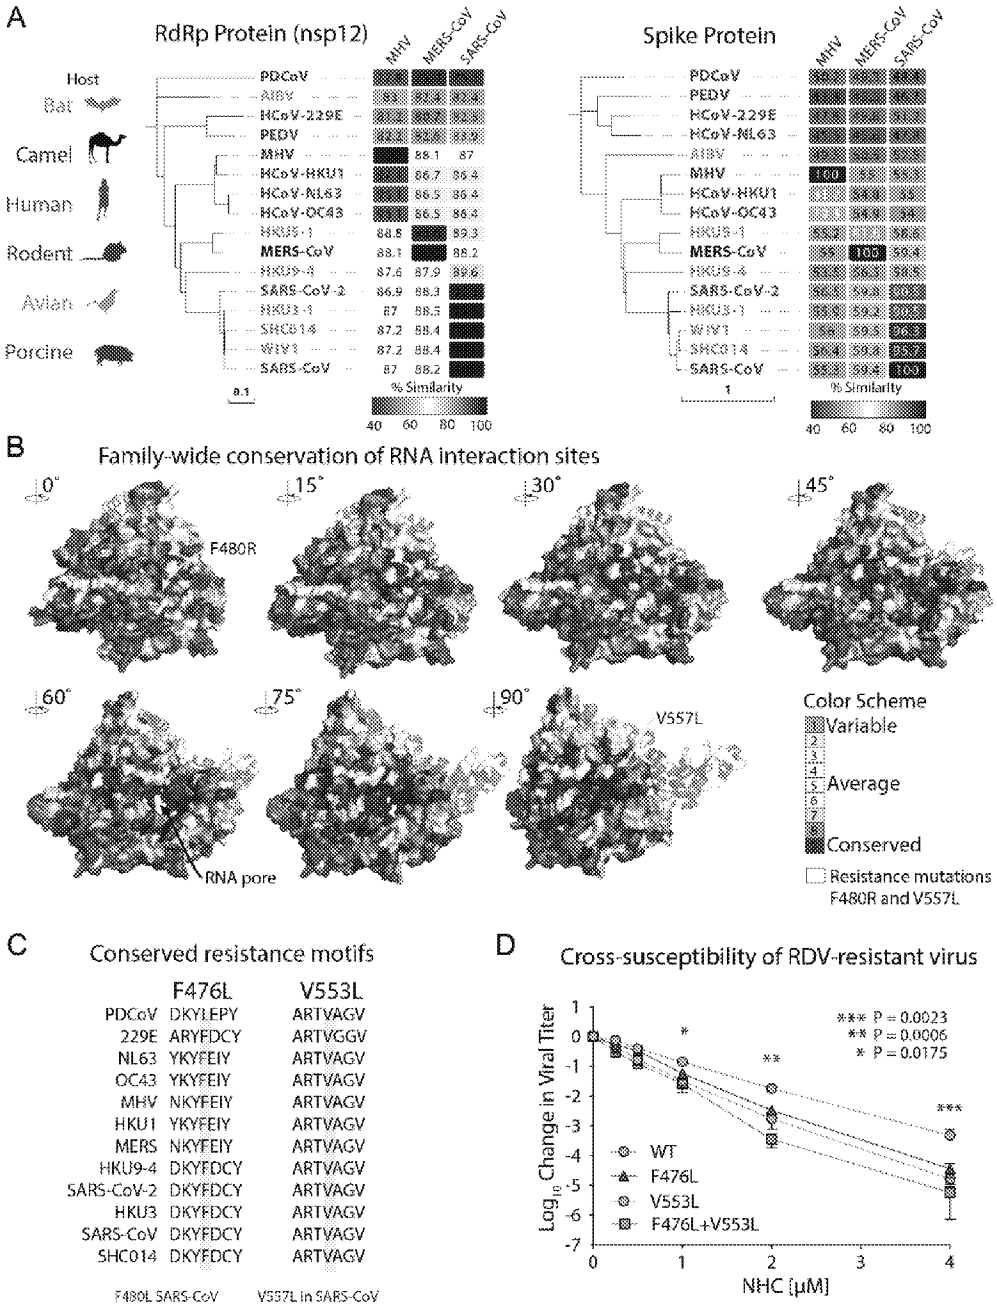

Fig. 3. Remdesivir (RDV) resistance mutations in the highly conserved RNA-dependent RNA polymerase increase susceptibility to NHC. (A) Neighbor-joining trees created with representatives from all four CoV genogroups showing the genetic similarity of CoV nsp12 (RdRp) and CoV spike glycoprotein, which mediates host tropism and entry into cells. Text color of the virus strain label corresponds to virus host species on the left. The heatmap adjacent to each neighbor-joining tree depicts percent amino acid identity (% A.A. similarity) against mouse hepatitis virus (MHV), SARS-CoV, or MERS-CoV. **(B)** The variation encompassed in panel **A** was modeled onto the RdRp structure of the SARS-CoV RdRp. **(C)** Amino acid sequence of CoV in panel **A** at known resistance alleles to antiviral drug RDV. **(D)** Virus titer reduction assay in DBT cells across a range of NHC with recombinant MHV bearing resistance mutations to RDV. Data shown are combined from three independent experiments performed with biological duplicates or triplicates per condition. Asterisks indicate statistically significant differences by Mann-Whitney test as indicated on the graph.

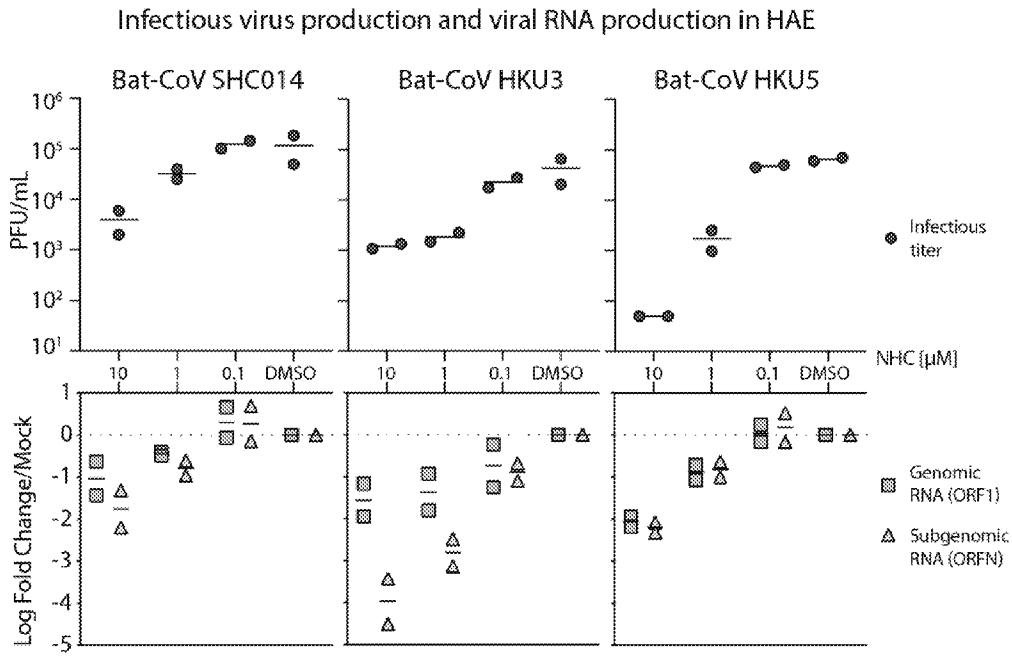

Fig. 4. NHC is effective against multiple genetically distinct Bat-CoV. Top: Antiviral efficacy of NHC in HAE cells against SARS-like (HKU3, SHC014, group 2b) and MERS-like (HKU5, group 2c) bat-CoV. HAE cells were infected at an MOI of 0.5 in the presence of NHC in duplicate. After 48 hours, virus produced was titrated via plaque assay. Each data point represents the titer per culture. Bottom: qRT-PCR for CoV ORF1 and ORFN mRNA in total RNA from cultures in the top panel. Mock, mock-treated. Representative data from two separate experiments with two different cell donors are displayed.

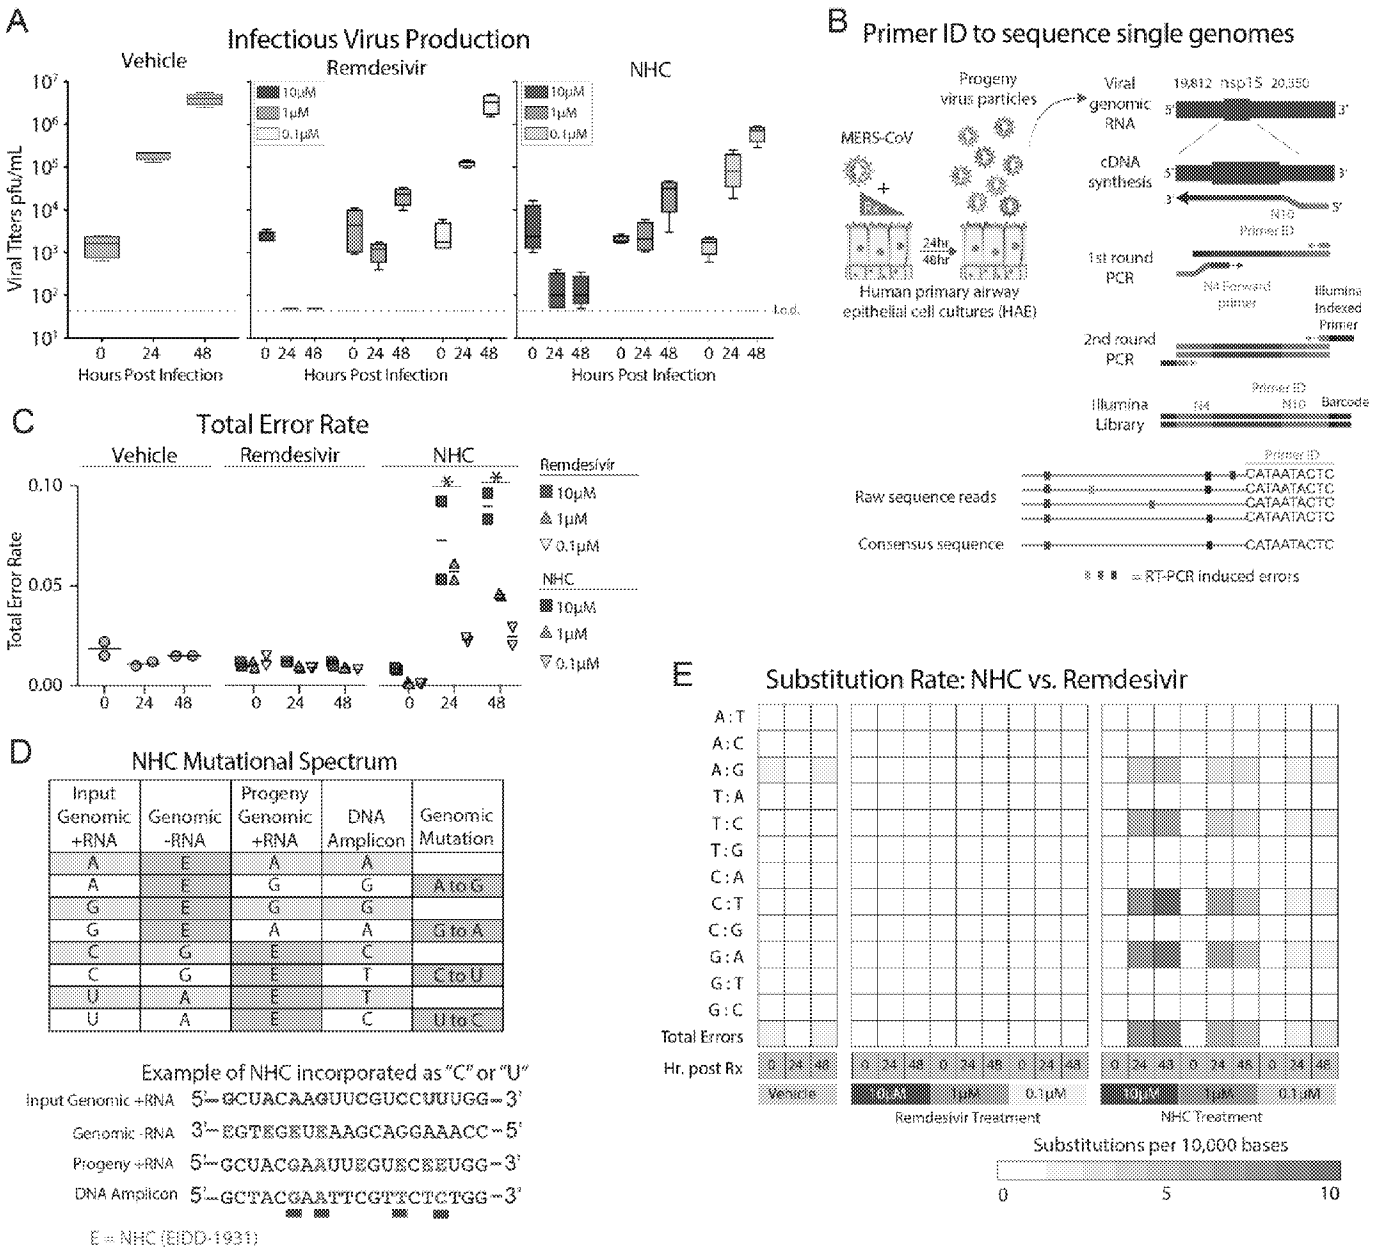

Fig. 5. NHC antiviral activity is associated with increased viral mutation rates. (**A**) HAE cultures were infected with MERS-CoV red fluorescent protein (RFP) at an MOI of 0.5 in duplicate in the presence of vehicle, RDV, or NHC for 48 hours, after which apical washes were collected for virus titration. Data are combined from two independent studies. The boxes encompass the 25th to 75th percentile, the line is at the median, while the whiskers represent the range. **(B)** Schematic of Primer ID deep sequencing for single RNA genomes of MERS-CoV. **(C)** The total error rate for MERS-CoV RNA isolated from cultures in panel **A** as determined by Primer ID. Error rate values are # mutations per 10,000 bases. Asterisks indicate significant differences as compared to untreated group by two-way ANOVA with a Dunnett's multiple comparison test. **(D)** Description of potential NHC mutational spectra on both positive and negative sense viral RNA. **(E)** Nucleotide transitions in cDNA derived from MERS-CoV genomic RNA.

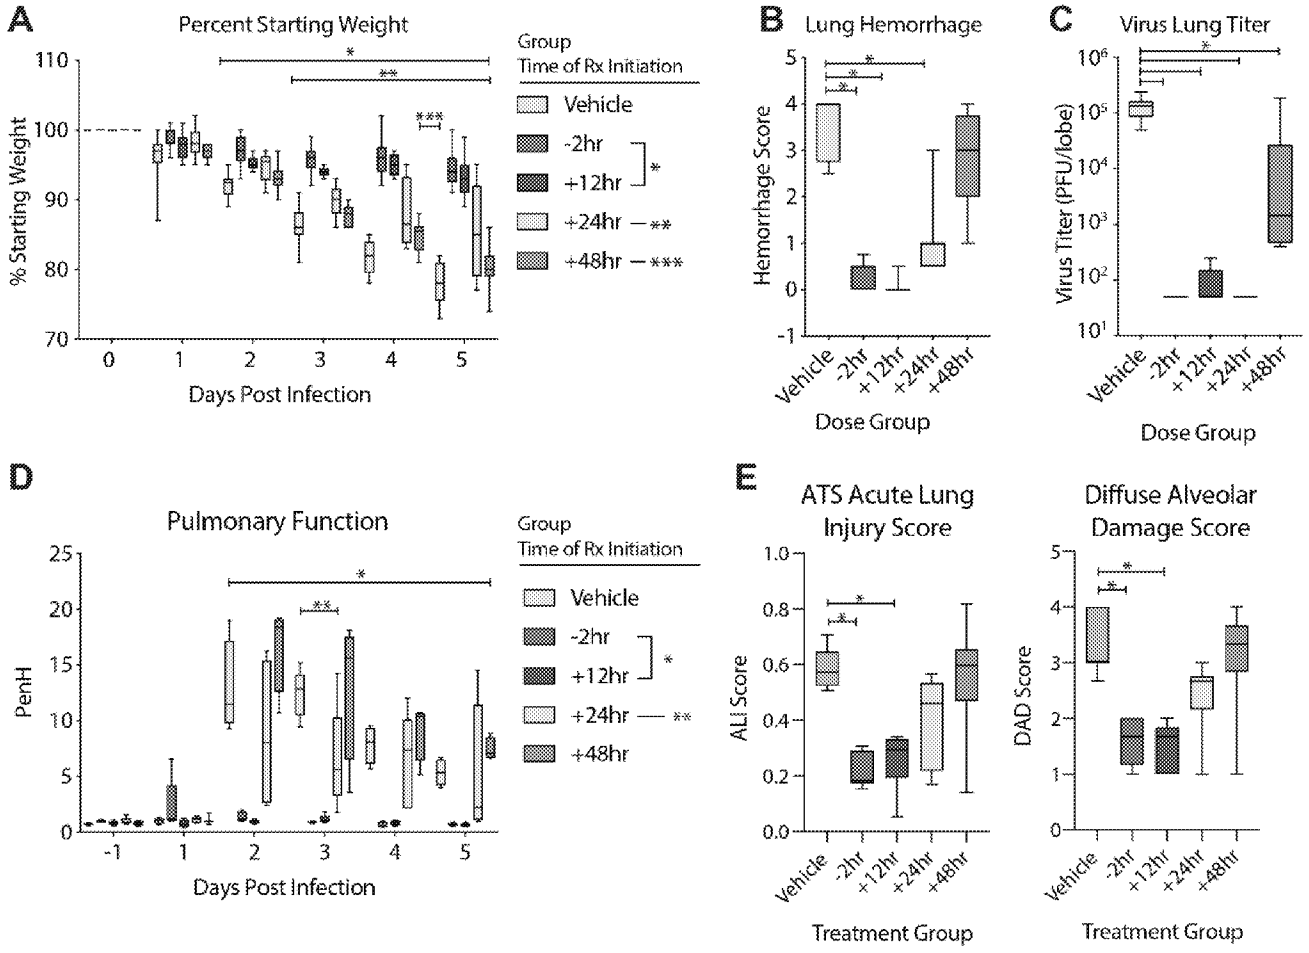

Fig. 6. Prophylactic and therapeutic EIDD-2801 reduces SARS-CoV replication and pathogenesis. Equivalent numbers of 25-29 week old male and female C57BL/6 mice were administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or NHC prodrug EIDD-2801 beginning at -2 hours, +12, +24 or +48 hours post infection and every 12 hours thereafter by oral gavage (n = 10/group). Mice were intranasally infected with 1E+04 PFU mouse-adapted SARS-CoV MA15 strain. **(A)** Percent starting weight. Asterisks indicate differences from vehicle treated by two-way ANOVA with Tukey's multiple comparison test. **(B)** Lung hemorrhage in mice from panel **A** scored on a scale of 0-4 where 0 is a normal pink healthy lung and 4 is a diffusely discolored dark red lung. **(C)** Virus lung titer in mice from panel **A** as determined by plaque assay. Asterisks in both panel **B** and **C** indicate differences from vehicle by one-way ANOVA with a Dunnett's multiple comparison test. **(D)** Pulmonary function by whole body plethysmography was performed daily on five animals per group. Asterisks indicate differences from vehicle by two-way ANOVA with a Dunnett's multiple comparison test. **(E)** The histological features of acute lung injury (ALI) were blindly scored using the American Thoracic Society Lung Injury Scoring system and a Diffuse Alveolar Damage Scoring System. Three randomly chosen high power (60X) fields of diseased lung were assessed per mouse. The numbers of mice scored per group: Vehicle N = 7, -2 hours N = 9, +12 hours N = 9, +24 hours N = 10, +48 hours N = 9. Asterisks indicate statistical significance compared to vehicle by Kruskal-Wallis with a Dunn's multiple comparison test. For all panels, the boxes encompass the 25th to 75th percentile, the line is at the median, while the whiskers represent the range. *, -2 hours and +12 hours compared to vehicle; **, +24 hours compared to vehicle; ***, +48 hours compared to vehicle.

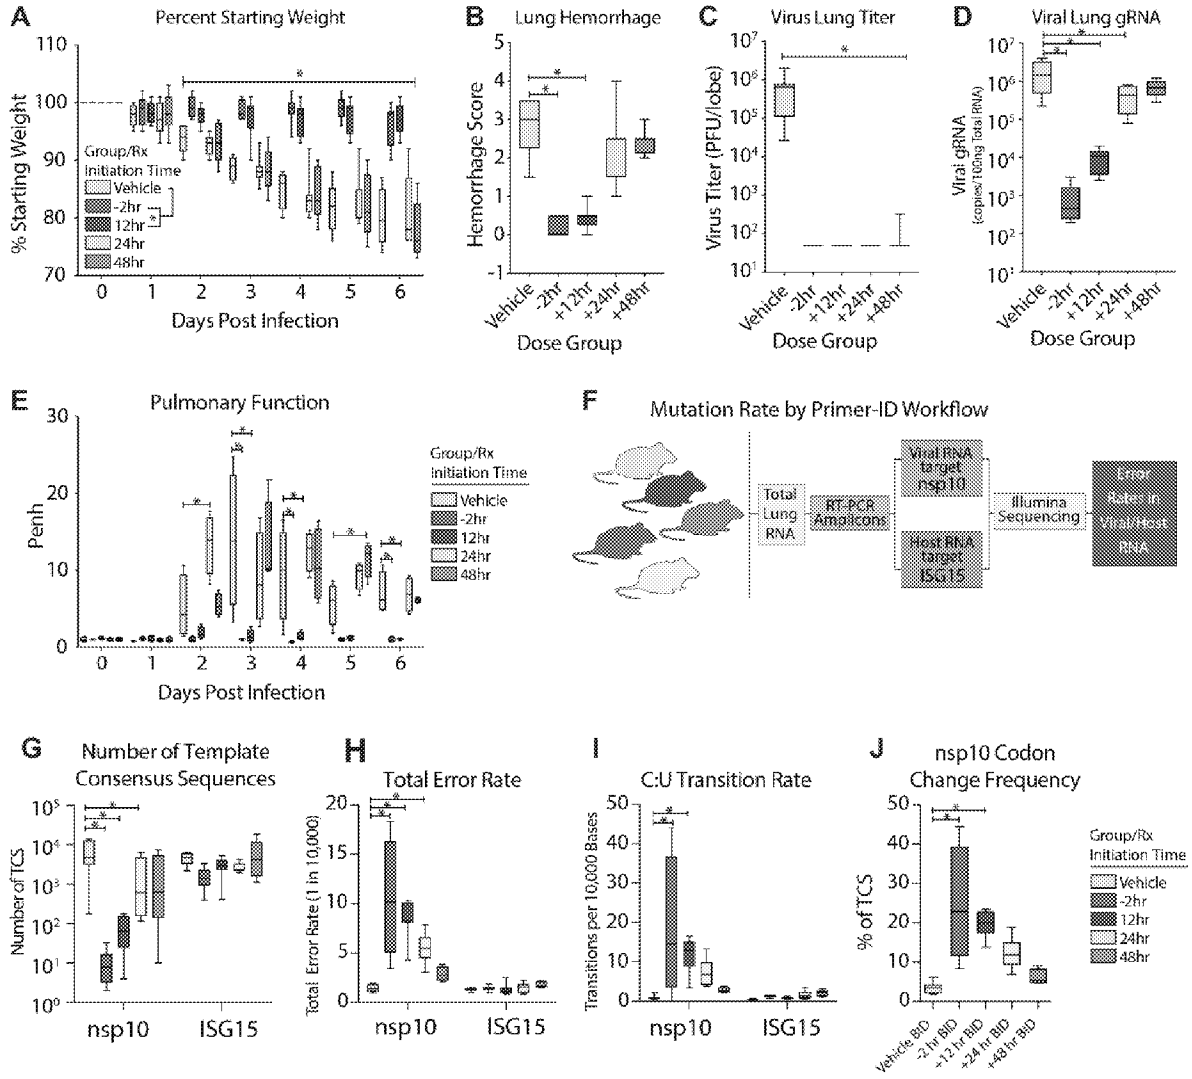

Fig. 7. Prophylactic and therapeutic EIDD-2801 reduces MERS-CoV replication and pathogenesis coincident with increased viral mutation rates. Equivalent numbers of 10-14 week old male and female C57BL/6 hDPP4 mice were administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or NHC prodrug EIDD-2801 beginning at -2 hours, +12, +24 or +48 hours post infection and every 12 hours thereafter by oral gavage (n = 10/group). Mice were intranasally infected with 5E+04 PFU mouse-adapted MERS-CoV M35C4 strain. (**A**) Percent starting weight. Asterisks indicate differences between -2 hours and +12 hours group from vehicle by two-way ANOVA with Tukey's multiple comparison test. (**B**) Lung hemorrhage in mice from panel **A** scored on a scale of 0-4 where 0 is a normal pink healthy lung and 4 is a diffusely discolored dark red lung. (**C**) Virus lung titer in mice from panel **A** as determined by plaque assay. Asterisks in both panel **B** and **C** indicate differences from vehicle by Kruskal-Wallis with Dunn's multiple comparison test. (**D**) MERS-CoV genomic RNA in lung tissue by qRT-PCR. Asterisks indicate differences by one-way ANOVA with a Dunnett's multiple comparison test. (**E**) Pulmonary function by whole body plethysmography was performed daily on four animals per group. Asterisks indicate differences from vehicle by two-way ANOVA with Tukey's multiple comparison test. (**F**) Workflow to measure mutation rate in MERS-CoV RNA and host transcript ISG15 by Primer ID in mouse lung tissue. (**G**) Number of template consensus sequences (TCS) for MERS-CoV nsp10 and ISG15. (**H**) Total error rate in MERS-CoV nsp10 and ISG15. (**I**) The cytosine to uridine transition rate in MERS-CoV nsp10 and ISG15. In panels **G-I,** asterisks indicate differences from vehicle by two-way ANOVA with Tukey's multiple comparison test. (**J**) Codon change frequency in MERS-CoV nsp10. Asterisks indicate differences from vehicle by Kruskal-Wallis with Dunn's multiple comparison test. For all panels, the boxes encompass the 25th to 75th percentile, the line is at the median, while the whiskers represent the range.

Subject: Reg. your article from 2015 on "A SARS-like Cluster of Circulating Bat Coronaviruses Shows Potential for Human Emergence"

Dear Dr. Menachery,

My name is Banu Güven and I am a journalist from Turkey, residing in Germany, working mainly for WDR Cosmo and DW Turkish and other online news media.

In Turkey, a doctor (oncologist) is using your article "A SARS-like Cluster of Circulating Bat Coronaviruses Shows Potential for Human Emergence" from 2015 to suggest that COVID19 was man-made. His videos go viral, shared in WhatsApp groups etc. Please check 04'46"

https://www.instagram.com/tv/B-B_FwojLcz/?igshid=t1xm9m9rgd1w

Here he is showing the article and suggesting that the virus is man-made in cooperation with a biotech laboratory in Wuhan and academics in the USA and was leaked outside, accidentally or on purpose.

I am a journalist, and I understand what I read, but what I don't understand is, how he came to this conclusion.

In order to give an answer to people who are texting me, I would like to have your comment. I also think it is important for you to know, that your article is being shown as "evidence" to the thesis that the virus was man-made.

Although some of them may sound crazy, I have to ask you these questions:

Is the virus you have created with other co-scientists SARS Cov 2?

Your opinion on conspiracy theories on viruses and particularly SARS Cov 2?

What is your article from 2015 saying?

Have you foreseen this pandemic coming in 2015?

What could have been done since then to prevent it or cure the symptoms?

Your opinion on WHO's and govts' responses to combat SARS cov2?

Thank you and best regards,

Banu Güven

Coronaviruses (CoVs) traffic frequently between species resulting in novel disease outbreaks, most recently exemplified by the newly emerged SARS-CoV-2, the causative agent of COVID-19. Herein, we show that the ribonucleoside analog β-D-N^4-hydroxycytidine (NHC, EIDD-1931) has broad spectrum antiviral activity against SARS-CoV-2, MERS-CoV, SARS-CoV, and related zoonotic group 2b or 2c Bat-CoVs, as well as increased potency against a coronavirus bearing resistance mutations to the nucleoside analog inhibitor remdesivir. In mice infected with SARS-CoV or MERS-CoV, both prophylactic and therapeutic administration of EIDD-2801, an orally bioavailable NHC-prodrug (β-D-N^4-hydroxycytidine-5′-isopropyl ester), improved pulmonary function, and reduced virus titer and body weight loss. Decreased MERS-CoV yields in vitro and in vivo were associated with increased transition mutation frequency in viral but not host cell RNA, supporting a mechanism of lethal mutagenesis in CoV. The potency of NHC/EIDD-2801 against multiple coronaviruses and oral bioavailability highlight its potential utility as an effective antiviral against SARS-CoV-2 and other future zoonotic coronaviruses.

INTRODUCTION

The genetically diverse *Orthocoronavirinae* (coronavirus, CoV) family circulates in many avian and mammalian species. Phylogenetically, CoVs are divided into 4 genera: alpha (group 1), beta (group 2), gamma (group 3) and delta (group 4). Three new human CoV have emerged in the past 20 years with severe acute respiratory syndrome CoV (SARS-CoV) in 2002, Middle East respiratory syndrome CoV (MERS-CoV) in 2012, and now SARS-CoV-2 in 2019 (*1-3*). In fact, all human CoV are thought to have emerged originally as zoonoses (*4-6*). The ongoing SARS-CoV-2 pandemic (referred to as COVID-19, Coronavirus disease 2019) has caused over 500,000 infections and over 25,000 deaths in 199 countries. Like SARS- and MERS-CoV, the respiratory disease caused by SARS-CoV-2 can progress to acute lung injury (ALI), an end stage lung disease with limited treatment options and very poor prognoses(*3, 7, 8*). This emergence paradigm is not limited to humans. A novel group 1 CoV called swine acute diarrhea syndrome CoV (SADS-CoV) recently emerged from bats causing the loss of over 20,000 pigs in Guangdong Province, China (*9*). More alarmingly, many group 2 SARS-like and MERS-like coronaviruses are circulating in bat reservoir species that can use human receptors and replicate efficiently in primary human lung cells without adaptation(*9-12*). The presence of these "pre-epidemic" zoonotic strains foreshadow the emergence and epidemic potential of additional SARS-

like and MERS-like viruses in the future. Given the diversity of CoV strains in zoonotic reservoirs and a penchant for emergence, broadly active antivirals are clearly needed for rapid response to new CoV outbreaks in humans and domesticated animals.

Currently, there are no approved therapies specific for any human CoV. β-D-N4-hydroxycytidine (NHC, EIDD-1931) is orally bioavailable ribonucleoside analog with broad-spectrum antiviral activity against various unrelated RNA viruses including influenza, Ebola, CoV, and Venezuelan equine encephalitis virus (VEEV)(*13-16*). For VEEV, the mechanism of action (MOA) for NHC has been shown to be through lethal mutagenesis where deleterious transition mutations accumulate in viral RNA(*14, 17*). Thus, we sought to determine NHC's breadth of antiviral activity against multiple emerging CoV, its mechanism of action for CoV and its efficacy in mouse models of CoV pathogenesis.

RESULTS

NHC potently inhibits MERS-CoV and newly emerging SARS-CoV-2 replication

To determine whether NHC blocks the replication of highly pathogenic human CoV, we performed antiviral assays in cell lines with MERS-CoV and the newly emerging SARS-CoV-2. We first assessed the antiviral activity of NHC against MERS-CoV in the human lung epithelial cell line Calu-3 2B4 ("Calu3" cells). Using a recombinant MERS-CoV expressing nanoluciferase (MERS-nLUC)(*18*), we measured virus replication in cultures exposed to a dose range of drug for 48hr. NHC was potently antiviral with an average half-maximum effective concentration (IC_{50}) of 0.15 μM and no observed cytoxicity in similarly treated uninfected cultures across the dose range (50% cytotoxic concentration, CC_{50}, >10 μM) (Fig. 1A). The therapeutic index for NHC was >100. Using a clinical isolate of SARS-CoV2 (2019-nCoV/USA-WA1/2020), we performed antiviral assays in African green monkey kidney (Vero) cells and found NHC was potently antiviral with an IC_{50} of 0.3 μM and CC_{50} of >10 μM (Fig. 1B). We then determined the antiviral activity of NHC against SARS-CoV-2 in the Calu-3 cells through the measurement of infectious virus production and viral genomes. We observed a dose-dependent reduction in virus titers (Fig. 1C) with an IC_{50} of 0.08 μM. Viral genomic RNA was quantitated in clarified supernatants by qRT-PCR (Fig. 1D). Like the effect on infectious titers, we found a dose-dependent reduction in viral genomic RNA and a similar calculated IC_{50} of 0.09 μM. Collectively, these data demonstrate that NHC is potently antiviral against two genetically distinct emerging CoV.

NHC is highly active against SARS-CoV-2, MERS-CoV, and SARS-CoV in primary human airway epithelial cell cultures

To determine if NHC would be similarly antiviral in primary human cells, we performed a series of studies in primary airway epithelial (HAE) cell cultures. HAE model the architecture and cellular complexity of the conducting airway and are readily infected by multiple human and zoonotic CoV, including SARS- and MERS-CoV (*19*). We first assessed cytotoxicity of NHC in HAE treated with an extended dose range for 48hr using quantitative PCR of cell death-related gene transcripts as our metric. NHC treatment did not appreciably alter gene expression even at doses up to 100 μM (fig. S1). We then sought to determine if NHC would inhibit clinical isolate SARS-CoV-2 replication in HAE. We observed a dose dependent reduction in SARS-CoV-2 infectious virus production (Fig. 2A). In MERS-CoV infected HAE, NHC substantially reduced virus production with maximal titer reduction of > 5 logs at 10 μM (average IC_{50} = 0.024 μM), which correlated with reduced genomic (ORF1) and subgenomic (ORFN) RNA in paired samples (Fig. 2B). We observed similar trends in titer reduction (> 3 log at 10 μM, average IC_{50} = 0.14 μM) and in copies of genomic and subgenomic RNA in SARS-CoV- infected HAE (Fig. 2C). Thus, NHC was potently antiviral against SARS-CoV-2, MERS-CoV and SARS-CoV in primary human epithelial cell cultures without cytotoxicity.

NHC is effective against remdesivir (RDV)-resistant virus and multiple distinct zoonotic CoV

CoV are taxonomically divided into multiple genogroups (alpha, beta, gamma, delta) but human-infecting CoV are found in only the alpha and beta subgroups thus far (Fig. 3A). There is high sequence conservation in the RNA-dependent RNA polymerase (RdRp, nsp12) across CoV (Fig. 3A). For example, the RdRp of SARS-CoV-2 has 99.1% similarity and 96% amino acid identity to that of SARS-CoV (Fig. 3A). To gain insight into structural conservation of RdRp across the CoV family, we modeled the variation reflected in the RdRp dendrogram in Fig. 3A onto the structure of the SARS-CoV RdRp (*20*) (Fig. 3B). The core of the RdRp molecule and main structural motifs that all RdRp harbor (Fig. 3B and fig. S2) are highly conserved among CoV including SARS-CoV-2. We previously reported that CoV resistance to another broad spectrum nucleoside analog, RDV, was mediated by RdRp residues F480L and V557L in a model coronavirus mouse hepatitis virus (MHV) and in SARS-CoV, resulting in a 5-fold shift in IC_{50} (Fig. 3C)(*21*). Consequently, we tested whether RDV resistance mutations in MHV conferred cross-resistance to NHC. In fact, the two RDV resistance mutations, alone or together, conferred increased sensitivity to inhibition by NHC (Fig. 3D). As our previous studies have demonstrated a high genetic barrier to NHC for VEEV, influenza and CoV (*14-16*), the lack of cross-resistance further suggests that NHC and RDV may select for exclusive and mutually sensitizing resistance pathways.

To explore the breadth of antiviral efficacy against zoonotic CoV, we performed antiviral assays in HAE with three

zoonotic Bat-CoV: SHC014, HKU3, and HKU5. Closely related to the beta 2b SARS-CoV, Bat-CoV SHC014 is capable of replicating in human cells without adaptation(*11*), suggesting its potential for zoonotic emergence into humans. The more distantly related SARS-like beta 2b CoV, recombinant Bat-CoV HKU3, has a modified receptor binding domain to facilitate growth in cell culture (*22*). Lastly, Bat-CoV HKU5 is a MERS-like beta 2c CoV (*23*). NHC diminished infectious virus production and the levels of genomic/subgenomic viral RNA in HAE in a dose-dependent manner for all three Bat-CoVs (Fig. 4). Therefore, the antiviral activity of NHC was not limited by natural amino acid variation in the RdRp, which among the group 2b and group 2c CoV can vary by almost 20%. Moreover, these data suggest that if another SARS- or MERS-like virus were to spillover into humans in the future, they would likely be susceptible to the antiviral activity of NHC.

NHC antiviral activity is associated with increased viral mutation rates

It has recently been shown that NHC treatment increases the mutation rate in viral genomic RNA of RSV (*24*), VEEV (*14*), influenza (*24*), and our previous study used RNA seq to show that overall transition mutation frequency is increased during NHC treatment of MHV and MERS-CoV during infection in continuous cell lines(*16*). We sought to determine if NHC would increase the mutation frequency during MERS-CoV infection in human primary HAE. Using MERS-CoV-infected HAE treated with either vehicle or a dose range of NHC or RDV, we show that both drugs reduced virus titers in a dose-dependent manner (Fig. 5A). We then used a highly-sensitive high-fidelity deep sequencing approach (Primer ID NGS), which uses barcoded degenerate primers and Illumina indexed libraries to determine accurate mutation rates on viral RNA production (*25*). Using this approach, we analyzed a 538 bp region of viral genomic RNA in nonstructural protein 15 (nsp15). The error rates (#mutations/10,000 bases) in vehicle- (0.01) or RDV- (0.01) treated cultures were very low. RDV is reported to act via chain termination of nascent viral RNA, and thus the low error rates in RDV-treated cultures are in line with the proposed MOA (*26*). In contrast, the error rate was significantly increased in NHC-treated MERS-CoV RNA in a dose-dependent manner (Two-way ANOVA with Dunnett's multiple comparison test; 10-fold increase at 10 μM, $P < 0.0001$ at 24 and 48 hpi; 5-fold increase at 1μM, $P < 0.0001$ at 24 hpi and $P = 0.0015$ at 48 hpi) (Fig. 5C). The magnitude of the error rate in NHC-treated cultures correlated with virus titer reduction. At 48 hpi the respective error rate and virus titer was 0.015 and 3.96E+06 pfu/mL for vehicle treatment, 0.045 and 2.86E+04 pfu/mL with 1 μM NHC; and 0.090 and 1.5E+02 pfu/mL 10 μM NHC. Thus, with 1 μM NHC a 3-fold increase in error rate resulted in a 138-fold decrease in virus titer, while with 10 μM NHC a 6-fold increase in error rate resulted in a 26,000-fold decrease in virus titer.

We then examined the mutational spectra induced by NHC, which can be incorporated into viral RNA as a substitution for either cytosine (C) or uracil (U). RNA-mutagenic antivirals may incorporate in both nascent negative and positive sense RNA during genome replication (Fig. 5D). Adenine-to-guanine (A-to-G) and uracil-to-cytosine (U-to-C) transitions were enriched in MERS-CoV genomic RNA in an NHC dose-dependent manner (Fig. 5E). Collectively, these data used high-fidelity sequence analysis to demonstrate a specific enrichment for A:G and C:U transitions in MERS-CoV RNA after NHC treatment of primary HAE cell cultures.

Therapeutic EIDD-2801 reduces SARS-CoV replication and pathogenesis

Given the promising antiviral activity of NHC in vitro, we next evaluated its in vivo efficacy using EIDD-2801, an orally bioavailable prodrug of NHC (β-D-N^4-hydroxycytidine-5′-isopropyl ester), designed for improved in vivo pharmacokinetics and oral bioavailability in humans and non-human primates (*15*). Importantly, the plasma profiles of NHC and EIDD-2801 are similar in mice following oral delivery (*15*). We first performed a prophylactic dose escalation study in C57BL/6 mice where we orally administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or 50, 150, or 500 mg/kg EIDD-2801 2hr prior to intranasal infection with 5E+04 PFU of mouse-adapted SARS-CoV (SARS-MA15), and then vehicle or drug every 12 hours thereafter. Beginning on 3 days post-infection (dpi) and through the end of the study, body weight loss compared to vehicle treatment was significantly diminished (50 mg/kg) or prevented (150, 500 mg/kg) with EIDD-2801 prophylaxis (Two-way ANOVA with Dunnett's multiple comparison test, $P < 0.0001$) (fig. S3A). Lung hemorrhage was also significantly reduced 5 dpi with 500 mg/kg EIDD-2801 treatment (Kruskal-Wallis Test, $P = 0.010$, fig. S3B). Interestingly, there was a dose-dependent reduction in SARS-CoV lung titer (median titers: 50 mg/kg = 7E+03 pfu/mL, 150 mg/kg = 2.5E+03 pfu/mL, 500 mg/kg = 50 pfu/mL, vehicle = 6.5E+04 pfu/mL) with significant differences (Kruskal-Wallis with Dunn's multiple comparisons test) among the vehicle, 150 mg/kg ($P = 0.03$) and 500 mg/kg ($P = 0.006$) groups. Thus, prophylactic orally administered EIDD-2801 was robustly antiviral and able to prevent SARS-CoV replication and disease.

Since only the 500 mg/kg group significantly diminished weight loss, hemorrhage and reduced lung titer to near undetectable levels, we tested this dose under therapeutic treatment conditions to determine if EIDD-2801 could improve the outcomes of an ongoing CoV infection. As a control, we initiated oral vehicle or EIDD-2801 2 hours prior to infection with 1E+04 pfu SARS-MA15. For therapeutic conditions, we initiated EIDD-2801 treatment 12, 24, or 48 hours after infection. After initiating treatment, dosing for all groups was performed every 12 hours for the duration of the study. Both

prophylactic treatment initiated 2 hours prior to infection and therapeutic treatment initiated 12 hours after infection significantly (Two-way ANOVA with Tukey's multiple comparison test) prevented body weight loss following SARS-CoV infection on 2 dpi and thereafter (-2 hours: P = 0.0002 to <0.0001; +12 hours: P = 0.0289 to <0.0001) as compared to vehicle treated animals (Fig. 6A). Treatment initiated 24 hpi also significantly reduced body weight loss (3-5 dpi, P = 0.01 to <0.0001) although not to the same degree as the earlier treatment initiation groups. When initiated 48 hpi, body weight loss was only different from vehicle on 4 dpi (P = 0.037, Fig. 6A). Therapeutic EIDD-2801 significantly (Kruskal-Wallis with Dunnett's multiple comparison test) reduced lung hemorrhage when initiated up to 24 hours after infection (-2, +12, and +24 hours P < 0.0001) mirroring the body weight loss phenotypes (Fig. 6B). Interestingly, all EIDD-2801 treated mice had significantly (Kruskal-Wallis with Dunnett's multiple comparison test) reduced viral loads in the lungs even in the +48 hours group (All P < 0.0001, Fig. 6C), which experienced the least protection from body weight loss and lung hemorrhage. We also measured pulmonary function via whole body plethysmography (WBP). In Fig. 6D, we show the WBP enhanced pause (PenH) metric, which is a surrogate marker for bronchoconstriction or pulmonary obstruction (*27*), was significantly (Two-way ANOVA with Dunnett's multiple comparison test) improved throughout the course of the study if treatment was initiated up to 12 hours after infection (-2 hours: 2d pi to 5 dpi, P < 0.0001 to 0.019, +12 hours: 2 dpi to 5 dpi, P < 0.0001 to 0.0192) although the +24 hours group showed sporadic improvement as well (3 dpi P = 0.002) (Fig. 6D). Lastly, we blindly evaluated hematoxylin and eosin-stained lung tissue sections for histological features of ALI using two different and complementary scoring tools (*18*), which show that treatment initiated up to +12 hours significantly reduced ALI (Kruskal-Wallis with Dunn's multiple comparison test) (American Thoracic Society (ATS) Lung Injury Score: -2 hours P = 0.0004, +12 hours P = 0.0053, Diffuse alveolar damage (DAD) Score: -2 hours P = 0.0015, +12 hours P = 0.0004, Fig. 6E). Altogether, therapeutic EIDD-2801 was potently antiviral against SARS-CoV in vivo but the degree of clinical benefit was dependent on the time of initiation post-infection.

EIDD-2801 prophylactic and therapeutic efficacy correlates with increased MERS-CoV mutation rate

After obtaining promising in vivo efficacy data with SARS-CoV, we investigated whether EIDD-2801 would be effective against MERS-CoV. As the murine ortholog of the MERS-CoV receptor, dipeptidyl peptidase 4 (DPP4), does not support viral binding and entry, all in vivo studies were performed in genetically modified mice encoding a murine DPP4 receptor encoding two human residues at positions 288 and 330 (hDPP4 288/330 mice)(*18, 28*). Similar to our SARS-CoV data, all doses of prophylactic EIDD-2801 (50, 150 and 500 mg/kg) protected hDPP4 288/330 mice (fig. S4) from significant body weight loss (Two-way ANOVA with Dunnett's multiple comparison test, P = 0.03 to < 0.0001), lung hemorrhage (Kruskal-Wallis with Dunn's multiple comparison test, P = 0.01 to <0.0001), and virus replication which was undetectable (Kruskal-Wallis with Dunn's multiple comparison test, P < 0.0001) regardless of drug dose following intranasal infection with 5E+04 PFU mouse-adapted MERS-CoV (fig. S4).

We then evaluated the therapeutic efficacy EIDD-2801 following the promising results of our prophylactic studies. Similar to our SARS-CoV study, EIDD-2801 treatment administered before or 12 hours after intranasal mouse-adapted MERS-CoV infection (5E+04 PFU) prevented body weight loss from 2 through 6 dpi (Two-way ANOVA with Tukey's multiple comparison test, Fig. 7A, P = 0.02 to <0.0001) and lung hemorrhage on 6 dpi (Kruskal-Wallis with Dunn's multiple comparison test, P = 0.0004 to < 0.0001, Fig. 7B), but treatment initiated 24 or 48 hours did not offer similar protection. Unlike body weight loss and lung hemorrhage data which varied by treatment initiation time, virus lung titer on 6 dpi was significantly reduced to the limit of detection in all treatment groups (Kruskal-Wallis with Dunn's multiple comparison test, Fig. 7C, P < 0.0001). Interestingly, when viral genomic RNA was quantified in paired samples of lung tissue, EIDD-2801 significantly reduced quantities of viral RNA (One-way ANOVA with Dunnett's multiple comparison test, P <0.0001 to 0.017) in an initiation time-dependent manner for all groups except for +48 hours (Fig. 7D). The discrepancy among infectious titers and viral RNA suggests that accumulated mutations render the particles non-infectious and undetectable by plaque assay, consistent with the MOA. To gauge the effect of EIDD-2801 treatment on lung function, we assessed pulmonary function by WBP. Mirroring the body weight loss data, normal pulmonary function was only observed in groups where treatment was initiated prior to or 12 hours after infection (Two-way ANOVA with Tukey's multiple comparison test, -2hr: P < 0.0001 3 dpi, P = 0.0002 4 dpi, +12hr: P < 0.0001 3 dpi, P = 0.0008 4 dpi, Fig. 7E). Collectively, these data demonstrate that NHC prodrug, EIDD-2801, robustly reduces MERS-CoV infectious titers, viral RNA, and pathogenesis under both prophylactic and early therapeutic conditions.

To study the molecular mechanisms associated with drug performance in vivo, we investigated the correlation between infectious virus production and EIDD-2801-mediated mutagenesis of MERS-CoV RNA under therapeutic treatment conditions. Using Primer ID NGS, we measured the mutation rates of both viral genomic RNA (non-structural protein 10, nsp10) and host interferon stimulated gene 15 (*ISG15*) mRNA, a highly up-regulated innate immune-related gene after MERS-CoV infection (Fig. 7F). Primer ID NGS measures the

mutational frequency in single RNA molecules, each of which are represented by a single template consensus sequence (TCS) (*25*). Viral TCS were significantly reduced (Two-way ANOVA with Tukey's multiple comparison test, -2 hours P <0.0001, +12 hours P = 0.0001, +24 hours P = 0.02) in a treatment initiation time-dependent manner (Fig. 7G) similar to viral genomic RNA measured by qRT-PCR. In contrast, the numbers of ISG15 TCS were similar (P = 0.2 to 0.8) for all groups indicating that neither vehicle nor drug treatment significantly affected the levels of or mutated ISG15 mRNA transcripts (Fig. 7G). Similar to our TCS data in Fig. 6G, the total error rate in viral nsp10 was significantly increased (Two-way ANOVA with Tukey's multiple comparison test) in groups where treatment was initiated prior to (-2 hours, median error rate = 10.5 errors/10,000 bases, P < 0.0001) and up to 24 hours post infection (12 hours, median error rate = 8.2 errors/10,000 bases, P < 0.0001 ; +24 hours, median error rate = 5.4 errors/10,000 bases, P = 0.0003) but the error rates in ISG15 remained at baseline for all groups (Fig. 7H). In addition, nucleotide transitions observed in MERS-CoV genomes in vitro, were also observed in vivo in groups where treatment was initiated prior to and up to 12 hours post infection (Two-way ANOVA with Tukey's multiple comparison test, P = 0.0003 to < 0.0001) (Fig. 7I). Importantly, these transitions were not observed in host ISG15 mRNA (Fig. 7I). Lastly, the EIDD-2801 dose-dependent mutagenesis of viral RNA correlated with an increase in codon change frequency, including stop codons, in mice where treatment was initiated 12 hours or before (Two-way ANOVA with Tukey's multiple comparison test, vehicle median = 3.4; -2hr median = 22.8, P = 0.0035; +12 hours median = 20.0, P = 0.0004, Fig. 7J). Thus, approximately 20% of the mutations observed in the -2 hours and +12 hours groups resulted in a codon change and alteration of the nsp10 protein sequence. When extrapolating our results from nsp10 to the entirety of the 30kb MERS-CoV genome, EIDD-2801 likely causes between 15 (+24 hours treatment) and 30 (-2 hours treatment) mutations per genome, 10-20% of which result in amino acid coding changes. Altogether, our data demonstrates that EIDD-2801-driven mutagenesis correlates well with the reductions in viral load, strongly suggestive of an error catastrophe-driven mechanism of action under therapeutic conditions.

DISCUSSION

In the past 20 years, three novel human coronaviruses have emerged (*29, 30*). The group 2b SARS-like CoV represent an existential and future threat to global health as evidenced by the emergence of SARS-CoV and SARS-CoV-2. Zoonotic SARS-like bat CoV strains can use human angiotensin-converting enzyme 2 (ACE2) receptors, grow well in primary human airway cells, and vary by as much as 25% in key therapeutic and vaccine gene targets (*11, 31*). Thus, to address the current public health emergency of COVID-19 and to maximize pandemic preparedness in the future, broad-based vaccines and therapeutics, which are active against the higher risk RNA virus families prone to emergence, are desperately needed.

Small molecule antivirals can exert their antiviral effect through multiple mechanisms including blocking viral entry, inhibiting a virally encoded enzyme, blocking virus particle formation, or targeting a host factor required for replication (*32*). Multiple direct acting antivirals are currently under evaluation in randomized control trials to treat COVID-19 including hydroxychloroquine, remdesivir, lopinavir/ritonavir(*33-35*). Here, we report the broad-spectrum antiviral activity of NHC and its orally bioavailable prodrug EIDD-2801, against SARS-CoV, MERS-CoV, and the current pandemic strain SARS-CoV-2 in primary human airway epithelial cells. In addition to CoV, NHC is broadly active against multiple genetically distinct viruses including VEE, influenza A and B, Ebola, and Chikungunya viruses (*13-16, 19, 21, 24, 36-38*). Here, we show that prophylactic and therapeutic EIDD-2801 significantly reduced lung viral loads and improved pulmonary function in mouse models of both SARS- and MERS-CoV pathogenesis. Although the improvement in both SARS- and MERS-CoV outcomes diminished with the delay of treatment initiation time, it is important to note that the kinetics of disease in mice are compressed as compared to that in humans. Whereas SARS- and MERS-CoV lung titers peak on 1-2 dpi in mice concurrent with the onset of clinical signs and notable damage to the lung epithelium, in humans this occurs 7-10 days after the onset of symptoms (*19, 28, 39, 40*). Thus, in mice, the window within which to treat emerging CoV infection prior to peak replication is compressed (e.g., 24-48 hours). As with oseltamivir treatment for influenza which fails to provide a protective effect if administered >5 days after the onset of symptoms, the window in which to treat COVID-19 patients prior to peak virus replication is likely during the first week of symptoms when pharyngeal shedding is at its highest(*41, 42*). However, virus replication and shedding may continue for several weeks in the most severe COVID-19 patients(*34*). Thus, early intervention with an antiviral like EIDD-2801 is likely to provide the most clinical benefit although there may opportunities in severe patients where the duration of virus replication may be extended. Our current study is clearly limited by the lack of in vivo efficacy testing with SARS-CoV-2. Currently, robust mouse models that recapitulate the SARS-CoV-2 pathogenesis observed in humans do not yet exist due to a noted virus spike glycoprotein and mouse ACE2 receptor incompatibility complicating the evaluation of medical countermeasures(*43, 44*). In addition, SARS-CoV and MERS-CoV, SARS-CoV-2 disease severity increases with increasing age. Our studies are limited by the lack of drug efficacy testing in CoV aged mouse models that

recapitulate the age-related increase in pathogenesis observed in humans(*45*). The data provided in this manuscript suggest that EIDD-2801 should be quickly evaluated in primate models of human disease, using immediate models for MERS-CoV and SARS-CoV pathogenesis or newly described cynomolgus and rhesus macaque models for SARS-CoV-2 (*46-49*).

For VEE and influenza, NHC/EIDD-2801 exerts its antiviral activity on the RNA-dependent RNA polymerase leading to error catastrophe by inducing an error rate of replication that surpasses the error threshold allowed to sustain a virus population (*14, 15*). This process occurs when NHC is incorporated during RNA synthesis then subsequently misread thus increasing mutation rates. Therefore, for CoV, the NHC MOA would appear less likely to be affected by the RNA proofreading activity encoded by the nsp14 exonuclease function that otherwise limits misincorperation (*50*). Here, we present data using Primer ID NGS to quantitate the frequency and identity of the mutational spectra in the MERS-CoV genome in both drug-treated primary human airway cells and in mice at single genome resolution. As CoV are positive sense RNA viruses that replicate through a negative sense RNA intermediate, NHC incorporation as a C or a U can occur in both polarities of RNA. We found increased nucleotide transitions (A to G, G to A, C to U, U to C) consistent with those reported after influenza and VEE infections (*14, 15*). Under identical conditions, RDV did not alter the mutation rate in MERS-CoV genomic RNA, supporting its reported mechanism of action as a chain terminator of viral RNA synthesis (*26*). In primary human lung cell cultures and mice infected with MERS-CoV, the NHC mutation rates inversely correlated with a reduction in infectious virus. In addition, we found a positive correlation between increased mutation rates and the frequency of nonsynonymous mutations and the degree of therapeutic efficacy in mice. To explore the potential off-target effect in host mRNA which may contribute to drug toxicity, we also examined the impact of NHC treatment on *ISG15* transcripts, a gene highly induced following MERS-CoV infection. Although ISG15 transcripts are present in great abundance, an accumulation of mutations was not observed in *ISG15* in this model even at 500 mg/kg dosing. These data also support previous studies using RNAseq to demonstrate that the model coronavirus MHV displayed increased mutation frequencies following NHC treatment in vitro (*16*). With regard to nucleic acid specificity, ribonucleotides are efficiently removed from eukaryotic cell DNA; therefore, treating a viral infection with a mutagenic ribonucleoside analog should show a selectivity for incorporation into the viral genome and not be efficient at being incorporated into and inducing mutations into host cell DNA (*51*). All together, these data strongly support the notion that EIDD-2801 and its active nucleoside analog NHC exert their antiviral effect through the induction of error catastrophe in the targeted virus. While our data suggest that the MERS-CoV nsp14 proofreading activity appeared ineffective against NHC in vitro and EIDD-2801 in vivo, future studies should investigate the antiviral activity of NHC in the presence or absence of the nsp14 proofreading activity, as loss of this activity increased the sensitivity of MHV and SARS-CoV replication to RDV treatment (*50*).

Together, our data support the continued development of EIDD-2801 as a potent broad spectrum antiviral that could be useful in treating contemporary, newly emerged and emerging coronavirus infections of the future.

MATERIALS AND METHODS

Study Design

The primary goal of this study was to determine the antiviral activity of the nucleoside analog NHC (EIDD-1931) against multiple emerging CoV in vitro and antiviral efficacy of its prodrug, EIDD-2801, in mouse models of CoV pathogenesis. Coupling cell lines and primary HAE cell cultures, we evaluated the antiviral activity of NHC against the three most recently emerged human CoV: SARS-CoV, MERS-CoV, and SARS-CoV-2. For both SARS-CoV and MERS-CoV, the data presented for HAE studies are representative of those from 2-3 separate human donors. For SARS-CoV-2, the HAE were from a single human donor. We evaluated drug cytotoxicity in both Calu-3 2B4 and HAE cell cultures. Calu-3 and the SARS-CoV and MERS-CoV HAE studies were performed in biological triplicate. HAE studies with SARS-CoV-2 and the SARS- and MERS-like bat CoV were performed with two wells per condition. Drug effects were measured relative to vehicle controls in vitro and comparisons in vivo were performed to vehicle controls. We also aimed to determine the antiviral efficacy of EIDD-2801 in mouse models of CoV pathogenesis. These studies were intended to provide the preclinical data to justify nonhuman primate studies and human clinical trials. Mice were age- and sex-matched and randomly assigned into groups before infection and treatment. Pathology was scored blinded by a board-certified veterinary pathologist. Primary data for all studies are provided in data file S1.

Ethics regulation of laboratory animals

Efficacy studies were performed in animal biosafety level 3 facilities at UNC Chapel Hill. All work was conducted under protocols approved by the Institutional Animal Care and Use Committee at UNC Chapel Hill (IACUC protocol #16-284) according to guidelines set by the Association for the Assessment and Accreditation of Laboratory Animal Care and the U.S. Department of Agriculture.

Compounds

The parental compound β-D-N^4-hydroxycytidine (NHC, all in vitro studies) and its prodrug EIDD-2801 (all in vivo studies) was supplied by Emory University Institute for Drug

Discovery (EIDD). NHC was supplied as a 10 mM stock in DMSO and EIDD-2801 as a solid and solubilized in vehicle containing 10% PEG400, 2.5% Cremophor RH40 in water (10/2.5/87.5%, all v/v) prior to use. RDV was solubilized in 100% DMSO and provided by Gilead Sciences, Inc as previously described (*18, 19*).

Cell cultures

At UNC, the human lung epithelial cell line Calu-3 2B4 cells was maintained in Dulbecco's modified Eagle's medium (DMEM, Gibco), 20% fetal bovine serum (Hyclone) and 1x antibiotic/antimycotic (Gibco). At Vanderbilt University Medical Center (VUMC), Calu-3 2B4 were propagated in DMEM supplemented with 20% FBS (Gibco), 100 U/ml penicillin and streptomycin (Gibco), and 0.25 μM amphotericin B (Corning). At VUMC, VeroE6 cells were cultured in DMEM supplemented with 10% FBS (Gibco), 100 U/ml penicillin and streptomycin (Gibco), and 0.25 μM amphotericin B (Corning). At UNC, VeroE6 cells were cultured in DMEM supplemented with 10% Fetal Clone II (Hyclone) and 1x antibiotic/antimycotic (Gibco). Murine delayed brain tumor (DBT) cells were maintained in DMEM supplemented with 10% FBS (Gibco), 100 U/ml penicillin and streptomycin (Gibco), and 0.25 μM amphotericin B (Corning). Primary human airway epithelial (HAE) cell cultures were obtained from the Tissue Procurement and Cell Culture Core Laboratory in the Marsico Lung Institute/Cystic Fibrosis Research Center at UNC and are described more thoroughly below (*52*).

Virus strains

Except for SARS-CoV-2, all viruses used for these studies were derived from infectious clones and isolated as previously described (*53*). SARS-CoV-2 clinical isolate was obtained at VUMC and UNC from the CDC (2019-nCoV/USA-WA1/2020 strain, GenBank accession no. MN985325.1) and passaged twice in Vero E6 cells at each respective institution to create a passage 5 working stock (*54*). Virus strains for in vitro experiments include SARS-CoV expressing the green fluorescent protein (GFP) in place of open reading frames 7a/b (ORF7a/b, SARS-GFP)(*53*), bat-spike receptor binding domain (Bat-SRBD)(*22*), a chimeric CoV strain derived from the HKU3 SARS-like bat coronavirus genomic sequence that has the wild type (Urbani SARS-CoV strain) RBD in the HKU3 spike gene to allow for virus replication in non-human primate cell lines and HAE cultures, SHC014 SARS-like bat coronavirus (*11*), MERS-CoV expressing nanoluciferase in the place of ORF3 (MERS-nLUC)(*19*), and MERS-CoV expressing the red fluorescent protein gene in the place of ORF 5 (RFP, MERS-RFP)(*55*). The virus stock utilized for MERS-CoV in vivo studies was derived from a plaque-purified isolate of the mouse-adapted MERS-CoV p35C4 strain (*56*). The virus stock utilized for SARS-CoV in vivo studies was derived from the infectious clone of the mouse-adapted SARS-CoV MA15 (MA15) strain (*57*). All work with MHV was performed using the recombinant WT strain MHV-A59 (GenBank accession no. AY910861)(*58*).

In vitro antiviral activity experiments

MERS-CoV nLUC in Calu-3: At 48 hours prior to infection, Calu-3 2B4 cells were plated in a 96-well black-walled clear bottom plate at $5x10^4$ cells/well. A 10 mM stock of NHC was serially diluted in 100% DMSO in 3-fold increments to obtain a ten-point dilution series. MERS-nLUC was diluted in DMEM supplemented with 10% FBS, and 1% Antibiotic-Antimycotic to achieve a multiplicity of infection (MOI) of 0.08. Cells were infected and concurrently treated with NHC in triplicate per drug dilution for 1hr, after which viral inoculum was aspirated, cultures were rinsed once and fresh medium containing drug or vehicle was added. At 48 hours post infection, nanoluciferase expression as a surrogate for virus replication was quantitated on a Spectramax plate reader (Molecular Devices) according to the manufacturer's instructions (Promega, NanoGlo). For the 100% inhibition control, diluted MERS-nLUC was exposed to short-wave UV light (UVP, LLC) for 6 min to inhibit the ability of the virus to replicate. For the 0% inhibition control, cells were infected in the presence of vehicle only. DMSO was kept constant in all conditions at 0.05%. Values from triplicate wells per condition were averaged and compared to controls to generate a percent inhibition value for each drug dilution. The IC_{50} value was defined as the concentration at which there was a 50% decrease in luciferase expression. Data were analyzed using GraphPad Prism 8.0. The IC_{50} values were calculated by nonlinear regression analysis using the dose-response (variable slope) equation (four parameter logistic equation): Y = Bottom + (Top-Bottom)/(1+10^((LogIC50-X)*HillSlope)). To measure cell viability to determine if there was any NHC-induced cytotoxicity, Calu-3 2B4 cells were plated and treated with NHC only as described above. Cells were exposed to the same ten-point dilution series created for the in vitro efficacy studies. As above, 0.05% DMSO-treated cells served as the 0% cytotoxicity control. Wells without cells served as the 100% cytotoxic positive control. After 48 hours, cell viability was measured on a Spectramax (Molecular Devices) via Cell-Titer Glo Assay (Promega) according to the manufacturer's protocol. Similar data were obtained in three independent experiments.

SARS-CoV-2 in Calu-3: Calu-3 2B4 cells were adsorbed with MOI 0.1 PFU/cell of SARS-CoV-2 (2019-nCoV/USA-WA1/2020 strain) at 37°C. Plates were manually rocked every 10 min to redistribute the inoculum. After 30 min, virus inoculum was removed, cells were washed with Phosphate buffered saline (PBS) once to remove unbound virus, medium containing NHC or vehicle control (DMSO) was added back onto the cells, and cells were incubated for 72 hours at 37°C.

SARS-CoV-2 in Vero E6: Vero E6 cells were plated at 20,000 cells/well in a 96-well plate. 24hr later, medium

containing a dose response of NHC was added concurrent with SARS-CoV-2 (2019-nCoV/USA-WA1/2020 strain) at an MOI of 0.05. 48 hours post infection, cell viability was measured by CellTiter Glo assay.

SARS-CoV, MERS-CoV, and SARS-CoV-2 in HAE: Human tracheobronchial epithelial cells provided by Dr. Scott Randell were obtained from airway specimens resected from patients undergoing surgery under University of North Carolina Institutional Review Board-approved protocols (#03-1396) by the Cystic Fibrosis Center Tissue Culture Core. Primary cells were expanded to generate passage 1 cells and passage 2 cells were plated at a density of 250,000 cells per well on Transwell-COL (12mm diameter) supports (Corning). Human airway epithelium cultures (HAE) were generated by provision of an air-liquid interface for 6 to 8 weeks to form well-differentiated, polarized cultures that resembled in vivo pseudostratified mucociliary epithelium (*59*).· At 48 hours prior to infection the apical surface of the culture was washed with 500 μL PBS for 1.5 hours at 37°C and the cultures moved into fresh air liquid interface (ALI) media. Immediately prior to infection, apical surfaces were washed twice to remove accumulated mucus with 500 μL of PBS with each wash lasting 30 min at 37°C and HAE cultures were moved into ALI media containing various concentrations of NHC ranging from 10 μM to 0.0016 μM as indicated for each experiment (final % DMSO < 0.05%). Upon removing the second PBS wash, 200 μL of viral inoculum (SARS-GFP, MERS-RFP or 2019-nCoV/USA-WA1/2020 strain) at an MOI of 0.5 was added to the apical surface and HAE cultures were incubated for 2 hours at 37°C. Viral inoculum was then removed, and the apical surface of the cultures were washed three times with 500μL PBS and then incubated at 37°C until 48 hours post infection (hpi). For all HAE cultures, infectious virus produced was collected by washing the apical surface of the culture with 100 μL PBS. Apical washes were stored at -80°C until analysis and titered by plaque assay as previously described (*19*).

qRT-PCR approach to assess cytotoxicity

Total RNA was isolated using the Zymo Direct-zol RNA MiniPrep Kit (Zymo Research Corp.) according to the manufacturer's directions. Cells were treated with 1μM staurosporine (Sigma-Aldrich) as a positive control. First-strand cDNA was generated using Superscript III reverse transcriptase (Life Technologies). For quantification of cellular markers of toxicity/apoptosis, real-time PCR was performed using commercially validated TaqMan-based primer-probe sets (**table S1**) and TaqMan Universal PCR Mix (Life Technologies). Results were then normalized as described above.

MERS-CoV genomic RNA qRT-PCR

Mouse lungs were stored in RNAlater (ThermoFisher) at -80°C until processed via homogenization in TRIzol (Invitrogen). Total RNA was isolated using Direct-zol RNA MiniPrep kit (Zymo Research). Previously published TaqMan primers were synthesized by Integrated DNA Technologies (IDT) to quantify MERS genomic RNA (targeting orf1a: Forward: 5′-GCACATCTGTGGTTCTCCTCTCT-3′, Probe (6-FAM/ZEN/IBFQ): 5′- TGCTCCAACAGTTACAC-3′, Reverse: 5′-AAGCCCAGGCCCTACTATTAGC)(*60*). qRT-PCR was performed using 100ng total RNA compared to an RNA standard curve using TaqMan Fast Virus 1-Step Master Mix (ThermoFisher) on a Quant Studio 3 (Applied Biosystems).

Quantification of SARS-CoV-2 viral RNA genome copy number by qRT-PCR

Cell supernatants were harvested in TRIzol LS reagent (Invitrogen), and RNA was purified following phase separation by chloroform as recommended by the manufacturer. The RNA in the aqueous phase was collected and further purified using PureLink RNA Mini Kits (Invitrogen) according to the manufacturer's protocol. Viral RNA was quantified using one-step quantitative reverse transcription PCR (qRT-PCR) on a StepOnePlus Real-Time PCR system (Applied Biosystems) by TaqMan Fast Virus 1-Step Master Mix chemistry (Applied Biosystems). SARS-CoV-2 N gene RNA was amplified using forward (5′-GACCCCAAAATCAGCGAAAT) and reverse (5′-TCTGGTTACTGCCAGTTGAATCTG) primers and probe (5′-FAM-ACCCCGCATTACGTTTGGTGGACC-BHQ1) designed by the United States Centers for Disease Control and Prevention (oligonucleotides produced by IDT, cat# 10006606). Copy numbers were interpolated from a standard curve produced with dilutions of N gene RNA. Briefly, SARS-CoV-2-N positive control plasmid DNA (IDT, cat# 10006625) was amplified using forward (5′-TAATACGACTCACTATAGGGATGTCTGATAATGGACCCCA) and reverse (5′- TTAGGCCTGAGTTGAGTCAG) primers, resulting in a 1280 nucleotide fragment containing a T7 promoter. The PCR product was purified by column (Promega) and in vitro transcribed using the mMESSAGE mMACHINE T7 Transcription Kit (Invitrogen) according to the manufacturer's protocol. Transcribed RNA was purified using RNeasy mini kit (Qiagen) according to the manufacturer's protocol, and serial 10-fold dilutions were quantified as described above.

Primer ID and deep sequencing

Primer ID NGS is designed to specifically identify and remove RT-PCR mutations, while facilitating highly accurate sequence determination of single RNA molecules, because each cDNA is created with a barcoded degenerate primer (N10, 4^{10} combinations) from which Illumina indexed libraries are made. We used a multiplexed Primer ID library prep approach and MiSeq sequencing to investigate the presence of mutations in the viral genomes and murine mRNA. We designed cDNA primers targeting multiple regions on the viral genome and murine mRNA, each with a block of random

nucleotides (11 bp long) as the Primer ID (*25, 61*) (**table S2**). Viral RNA was extracted using QIAamp viral RNA kit. A pre-amplification titration of templates was performed to estimate the amount of template to use. We used SuperScript III to make cDNA with multiplexed cDNA primers based on the regions to be sequenced. We used 41R_PID11 for the pilot sequencing and titration determination. For the MERS-CoV sequencing, we multiplexed nsp10_PID11, nsp12_PID11 and nsp14_PID11 for the cDNA reaction; for the murine mRNA sequencing, we used mixed primers of nsp10_PID11, ifit3_PID11, isg15_PID11. After bead purification, we amplified the cDNA with a mixture of forward primers (based on the described schemes) and a universal reverse primer, followed by another round of PCR to incorporate Illumina sequencing adaptors and barcodes in the amplicons. After gel-purification and quantification, we pooled 24 libraries for MiSeq 300 base paired-end sequencing. The TCS pipeline version 1.38 (https://github.com/SwanstromLab/PID) was used to process the Primer ID sequencing data and construct template consensus sequences (TCSs) to represent each individual input templates, and the sequences of each region in the pool was de-multiplexed. The RUBY package viral_seq version 1.0.6 (https://rubygems.org/gems/viral_seq) was used to calculate the mutation rate at each position. NCBI SRA Accession numbers for sequence data are as follows: PRJNA613261 (Fig. 5) and PRJNA613454 (Fig. 7).

In vivo experiments

We performed 4 mouse studies to evaluate the in vivo efficacy of the NHC prodrug (EIDD-2801). First, we performed prophylactic dose escalation studies for both SARS- and MERS-CoV to determine the most efficacious dose of EIDD-2801 per virus. For SARS-CoV, in cohorts of equivalent numbers of male and female 20-29 week old SPF C57BL/6J (Stock 000664 Jackson Labs) mice (n = 10/dose group), we administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or 50, 150 or 500 mg/kg EIDD-2801 by oral gavage 2 hours prior to intranasal infection with 1E+04 PFU mouse-adapted SARS-CoV strain MA15 in 50μl. Mice were anaesthetized with a mixture of ketamine/xylazine prior to intranasal infection. Vehicle or drug was administered every 12hr for the remainder of the study. Body weight and pulmonary function by whole body plethysmography were measured daily. On 5 dpi, animals were sacrificed by isoflurane overdose, lungs were scored for lung hemorrhage, and the inferior right lobe was frozen at −80°C for viral titration via plaque assay. Briefly, 500,000 Vero E6 cells/well were seeded in 6-well plates. The following day, medium was removed and serial dilutions of clarified lung homogenate were added per plate (10^{-1} to 10^{-6} dilutions) and incubated at 37°C for 1hr after which wells were overlaid with 1X DMEM, 5% Fetal Clone 2 serum, 1X antibiotic/antimycotic, 0.8% agarose. Two days after, plaques were enumerated to generate a plaque/ml value. Lung hemorrhage is a gross pathological phenotype readily observed by the naked eye driven by the degree of virus replication where the coloration of the lung changes from pink to dark red (*62, 63*). The large left lobe was placed in 10% buffered formalin and stored at 4°C for 1-3 weeks until histological sectioning and analysis. For MERS-CoV, the prophylactic dose escalation studies we performed similarly as done for SARS-CoV with our recently developed a mouse model for MERS-CoV, which has a humanized DPP4 receptor (hDPP4) (*28*). We performed all in vivo studies with EIDD-2801 in equivalent numbers of 10-14 week old female and male C57BL/6J hDPP4 mice. Second, we intranasally infected mice with 5E+04 PFU mouse-adapted MERS-CoV strain M35C4 in 50μl. Third, to titer lungs by plaque assay, Vero CCL81 cells were used and plaques were enumerated 3 dpi.

To determine the time at which therapeutic administration of EIDD-2801 would fail to improve outcomes with SARS-CoV or MERS-CoV infection, we performed therapeutic efficacy studies in mice where we initiated treatment 2 hours prior to infection or 12, 24 or 48 hours after infection. As 500 mg/kg provided the most complete protection from disease in prophylactic SARS-CoV studies, this dose was used for both therapeutic efficacy studies. Vehicle or EIDD-2801 was given via oral gavage twice daily following initiation of treatment. For both SARS-CoV and MERS-CoV, the infectious dose for the therapeutic studies and the mouse strains were the same as that used in the prophylactic studies. The numbers of mice per group for the SARS-CoV studies were as follows: Vehicle (n = 10), -2 hours (n = 10), +12 hours (n = 10), +24 hours (n = 10), +48 hours (n = 10). The numbers of mice per group for the MERS-CoV therapeutic studies were as follows: Vehicle (n = 9), -2 hours (n = 9), +12 hours (n = 9), +24 hours (n = 7), +48 hours (n = 10). As described above, each day mouse body weight and pulmonary function were quantitated. On 5 dpi for SARS-CoV and 6 dpi for MERS-CoV, animals were humanely sacrificed and tissues were harvested and analyzed as described above. In addition, for the MERS-CoV study, lung tissue was harvested and stored in RNAlater (Thermo Fisher) at -80°C and then thawed, homogenized in Trizol reagent (Invitrogen) and total RNA was isolated using a Direct-zol RNA MiniPrep kit (Zymo Research). This total RNA was then used for Primer ID and qRT-PCR.

Whole body plethysmography

Pulmonary function was monitored once daily via whole-body plethysmography (Buxco Respiratory Solutions, DSI Inc.). Mice intended for this analysis were randomly chosen prior to the initiation of the study. Briefly, after a 30-min acclimation time in the plethysmograph, data for 11 parameters was recorded every 2 s for 5 min.

Acute lung injury histological assessment tools

Two different and complementary quantitative histologic tools were used to determine if antiviral treatments

diminished the histopathologic features associated with lung injury. Both analyses and scoring were performed by a Board Certified Veterinary Pathologist who was blinded to the treatment groups.

American Thoracic Society lung injury scoring tool. In order to help quantitate histological features of ALI observed in mouse models and increase their translation to the human condition, we used the ATS scoring tool (*63*). In a blinded manner, we chose three random diseased fields of lung tissue at high power (60 ×), which were scored for the following: (A) neutrophils in the alveolar space (none = 0, 1–5 cells = 1, > 5 cells = 2), (B) neutrophils in the interstitial space/ septae (none = 0, 1–5 cells = 1, > 5 cells = 2), (C) hyaline membranes (none = 0, one membrane = 1, > 1 membrane = 2), (D) Proteinaceous debris in air spaces (none = 0, one instance = 1, > 1 instance = 2), (E) alveolar septal thickening (< 2× mock thickness = 0, 2–4× mock thickness = 1, > 4× mock thickness = 2). To obtain a lung injury score per field, the scores for A–E were then put into the following formula, which contains multipliers that assign varying levels of importance for each phenotype of the disease state.: score = [(20x A) + (14 x B) + (7 x C) + (7 x D) + (2 x E)]/100. The scores for the three fields per mouse were averaged to obtain a final score ranging from 0 to and including 1.

Diffuse Alveolar Damage (DAD) tool. The second histological tool to quantitate lung injury was reported by Schmidt *et al.*(*64*). DAD is the pathological hallmark of ALI (*63, 64*). Three random diseased fields of lung tissue were scored at high power (60 ×) for the following in a blinded manner: 1 = absence of cellular sloughing and necrosis, 2 = Uncommon solitary cell sloughing and necrosis (1–2 foci/field), 3 = multifocal (3 + foci) cellular sloughing and necrosis with uncommon septal wall hyalinization, or 4 = multifocal (>75% of field) cellular sloughing and necrosis with common and/or prominent hyaline membranes. The scores for the three fields per mouse were averaged to get a final DAD score per mouse.

nsp12 phylogenetic analysis and conservation modeling

Coronavirus RdRp (nsp12) protein sequence alignments and phylogenetic trees were generated using Geneious Tree Builder in Geneious Prime (version 2020.0.5) and visualized using Evolview (https://www.evolgenius.info/evolview/). Protein similarity scores were calculated using Blosom62 matrix. The accession numbers used were: PDCoV (KR265858), AIBV (NC_001451), HCoV-229E (JX503060), PEDV (NC_003436), MHV (AY700211), HCoV-HKU1 (DQ415904), HCoV-NL63 (JX504050), HCOV-OC43 (AY903460), HKU5-1 (NC_009020), MERS-CoV (JX869059), HKU9-4 (EF065516), 2019-nCoV (MN996528), HKU3-1 (DQ022305), SHC014 (KC881005), WIV1 (KF367457), SARS-CoV (AY278741). Amino acid conservation scores of coronavirus RdRp were generated using ConSurf Server (https://consurf.tau.ac.il/) using the protein alignment described above and visualized on the SARS-CoV RdRp structure (PDB: 6NUR) in PyMol (version 1.8.6.0)(*20, 65*).

Statistical analysis

All statistical data analyses were performed in Graphpad Prism 8. Statistical significance for each endpoint was determined with specific statistical tests. In general, for metrics with multiple treatment groups with longitudinal data (e.g., mouse weight loss or pulmonary function over time), two-way ANOVA was performed with the suggested multiple comparison test as advised by Prism. For comparative data with for a single timepoint (e.g., lung titer) Kruskal-Wallis or one-way ANOVA was performed with the suggested multiple comparison test. For each test, a p-value <0.05 was considered significant. Specific tests are noted in each figure legend.

Acknowledgments: Funding: We would like to acknowledge the following funding sources, Antiviral Drug Discovery and Development Center (5U19AI109680 and (1U19AI142759) awarded to M.D. and R.S.B, a partnership grant from the National Institutes of Allergy and Infectious Disease (NIAID, 5R01AI132178) awarded to T.P.S. and R.S.B. and an NIAID R01 grant (AI108197) awarded to M.D. and R.S.B.. NIAID contract, HHSN272201500008C, was awarded to G.P. and The Emory institute for Drug Development and a subcontract from this was awarded to R.S.B. and M.R.D. M.L.A. was funded through training grants F31AI133952 and T32AI112541. The Marsico lung Institute Tissue Procurement and Cell Culture Core is supported by NIH grant DK065988 and Cystic Fibrosis Foundation grant BOUCHE15RO. **Author contributions:** A.C.S., T.P.S, A.J.P. and M.L.A. designed in vitro efficacy studies. A.C.S., A.J.B., T.P.S., R.L.G. A.J.P., L.J.S., and M.L.A. executed and/or analyzed in vitro efficacy studies. X.L., T.M.H. and A.S.G. designed, optimized and/or executed the SARS-CoV-2 qRT-PCR studies. J.H., A.T. and N.J.T. providing the clinical isolate of SARS-CoV-2. T.P.S., A.A.K., M.G.N., G.P. and R.S.B. designed in vivo efficacy studies. T.P.S., A.C.S., S.Z., C.S.H, and R.S. designed, executed and/or analyzed the Primer ID NGS data. K.H.D 3rd performed structural modeling and phylogenetics and sequence alignments. M.L.A., A.J.P., J.D.C. and M.R.D. designed, performed and/or executed the construction of RDV resistant MHV and performed cross-resistance studies. T.P.S., A.S. and S.R.L. executed and analyzed in vivo efficacy studies. A.S. and S.R.L. performed whole body plethysmography for in vivo studies. S.A.M. assessed all lung pathology. G.R.B., and M.S., were responsible for synthesis, and scale-up of small molecules. T.P.S., A.C.S., S.Z., S.R.L, A.S., K.H.D. 3rd, M.L.A., A.J.P., J.D.C, G.R.B., A.A.K., G.P., R.S., M.R.D., and R.S.B., wrote the manuscript. **Disclaimers:** The findings and conclusions in this report are those of the author(s) and do not necessarily represent the official position of the Centers for Disease Control and Prevention. Fig. 1. NHC potently inhibits MERS-CoV and newly emerging SARS-CoV-2 replication. (A) Percent inhibition of MERS-CoV replication and NHC cytotoxicity in Calu-3 cells. Calu-3 cells were infected in triplicate with MERS-CoV nanoluciferase (nLUC) at a multiplicity of infection (MOI) of 0.08 in the presence of a range of drug for 48 hours, after which replication was measured through quantitation of MERS-CoV–expressed nLUC. Cytotoxicity was measured in similarly treated but uninfected cultures via Cell-Titer-Glo assay. Data are combined from 3 independent experiments. **(B)** NHC antiviral activity and cytotoxicity in Vero E6 cells infected with SARS-CoV-2. Vero E6 cells were infected in duplicate with SARS-CoV-2 clinical isolate 2019-nCoV/USA-WA1/2020 virus at an MOI of 0.05 in the presence of a range of drug for 48 hours, after which replication was measured through quantitation of cell viability by Cell-Titer-Glo assay. Cytotoxicity was measured as in **A**. Data are combined from 2 independent experiments. **(C)** SARS-CoV-2 titer reduction (left) and percent inhibition (right) in Calu-3 cells. Cells were infected with at an MOI of 0.1 for 30 min, washed and exposed to a dose response of NHC in triplicate per condition. 72 hours post infection, virus production was measured by plaque assay. **(D)** SARS-CoV-2 genomic RNA reduction (left) and percent inhibition (right) in Calu-3 cells. Viral RNA was isolated from clarified supernatants from the study in panel **C**. Genome copy numbers were quantitated by qRT-PCR with primer/probes targeting the N gene. For **A-D**, the symbol is at the mean and the error bars represent the standard deviation.

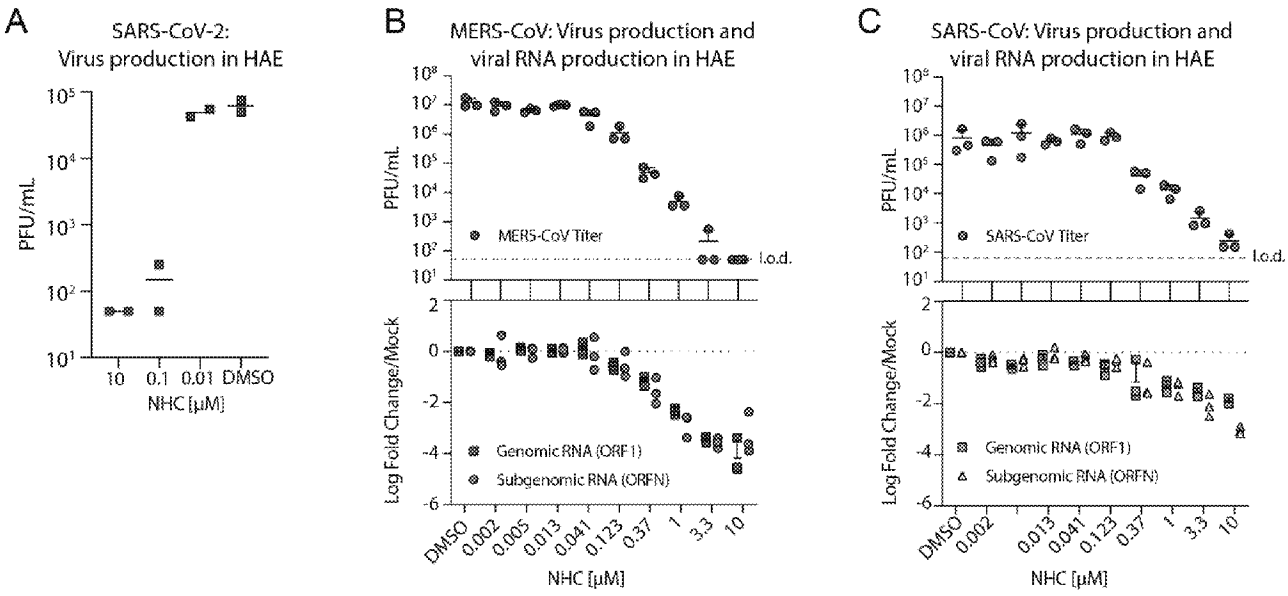

Fig. 2. NHC is highly active against SARS-CoV-2, MERS-CoV, and SARS-CoV in primary human airway epithelial cell cultures. (A) HAE were infected at an MOI of 0.5 with clinical isolate SARS-CoV-2 for 2 hours in the presence of NHC in duplicate after which virus was removed and cultures were washed in incubated in NHC for 48 hours when apical washes were collected for virus titration by plaque assay. The line is at the mean. Each symbol represents the titer from a single well. **(B)** HAE cells were infected with MERS-CoV red fluorescent protein (RFP) at an MOI of 0.5 in triplicate and treated similarly to **A**. qRT-PCR for MERS-CoV ORF1 and ORFN mRNA. Total RNA was isolated from cultures in **C** for qRT-PCR analysis. Representative data from three separate experiments with three different cell donors are displayed. PFU, plaque-forming units. **(C)** Studies performed as in **A** but with SARS-CoV green fluorescent protein (GFP). Representative data from two separate experiments with two different cell donors are displayed. Each symbol represents the data from one HAE culture, the line is at the mean and the error bars represent the standard deviation.

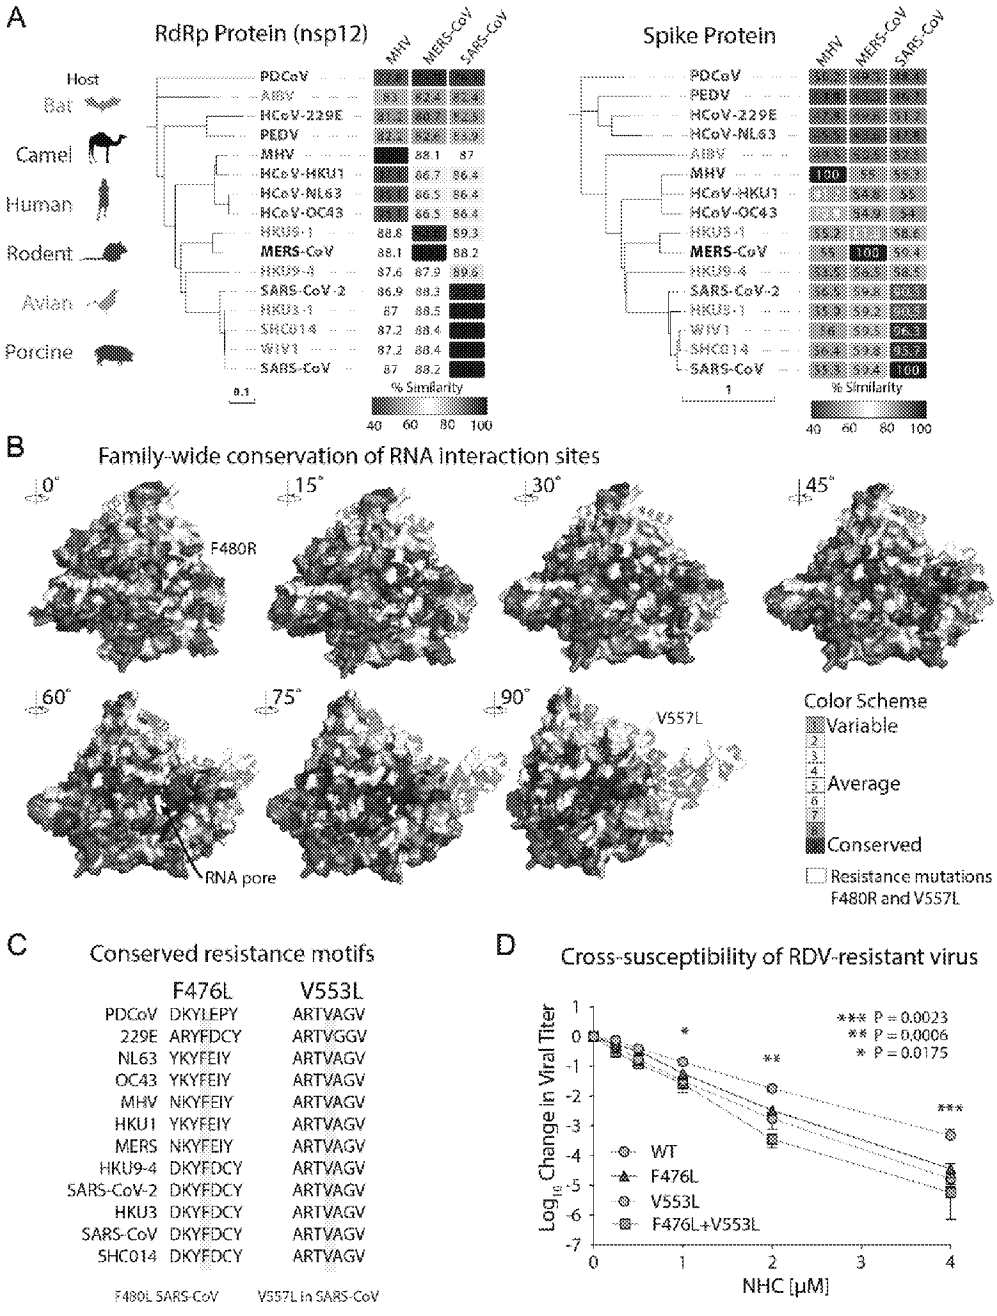

Fig. 3. Remdesivir (RDV) resistance mutations in the highly conserved RNA-dependent RNA polymerase increase susceptibility to NHC. (A) Neighbor-joining trees created with representatives from all four CoV genogroups showing the genetic similarity of CoV nsp12 (RdRp) and CoV spike glycoprotein, which mediates host tropism and entry into cells. Text color of the virus strain label corresponds to virus host species on the left. The heatmap adjacent to each neighbor-joining tree depicts percent amino acid identity (% A.A. similarity) against mouse hepatitis virus (MHV), SARS-CoV, or MERS-CoV. **(B)** The variation encompassed in panel **A** was modeled onto the RdRp structure of the SARS-CoV RdRp. **(C)** Amino acid sequence of CoV in panel **A** at known resistance alleles to antiviral drug RDV. **(D)** Virus titer reduction assay in DBT cells across a range of NHC with recombinant MHV bearing resistance mutations to RDV. Data shown are combined from three independent experiments performed with biological duplicates or triplicates per condition. Asterisks indicate statistically significant differences by Mann-Whitney test as indicated on the graph.

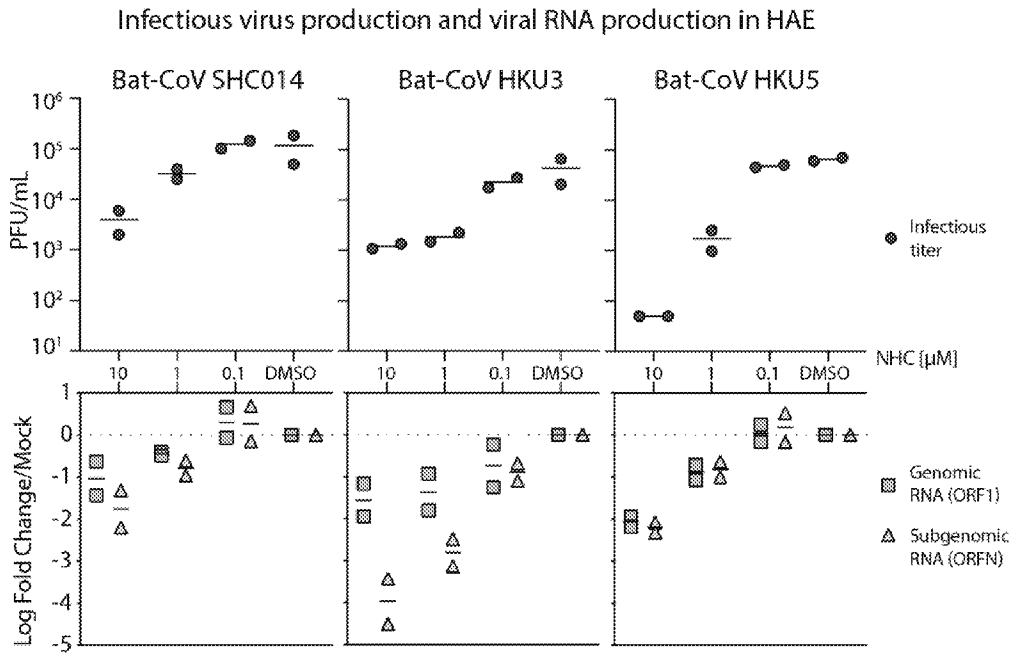

Fig. 4. NHC is effective against multiple genetically distinct Bat-CoV. Top: Antiviral efficacy of NHC in HAE cells against SARS-like (HKU3, SHC014, group 2b) and MERS-like (HKU5, group 2c) bat-CoV. HAE cells were infected at an MOI of 0.5 in the presence of NHC in duplicate. After 48 hours, virus produced was titrated via plaque assay. Each data point represents the titer per culture. Bottom: qRT-PCR for CoV ORF1 and ORFN mRNA in total RNA from cultures in the top panel. Mock, mock-treated. Representative data from two separate experiments with two different cell donors are displayed.

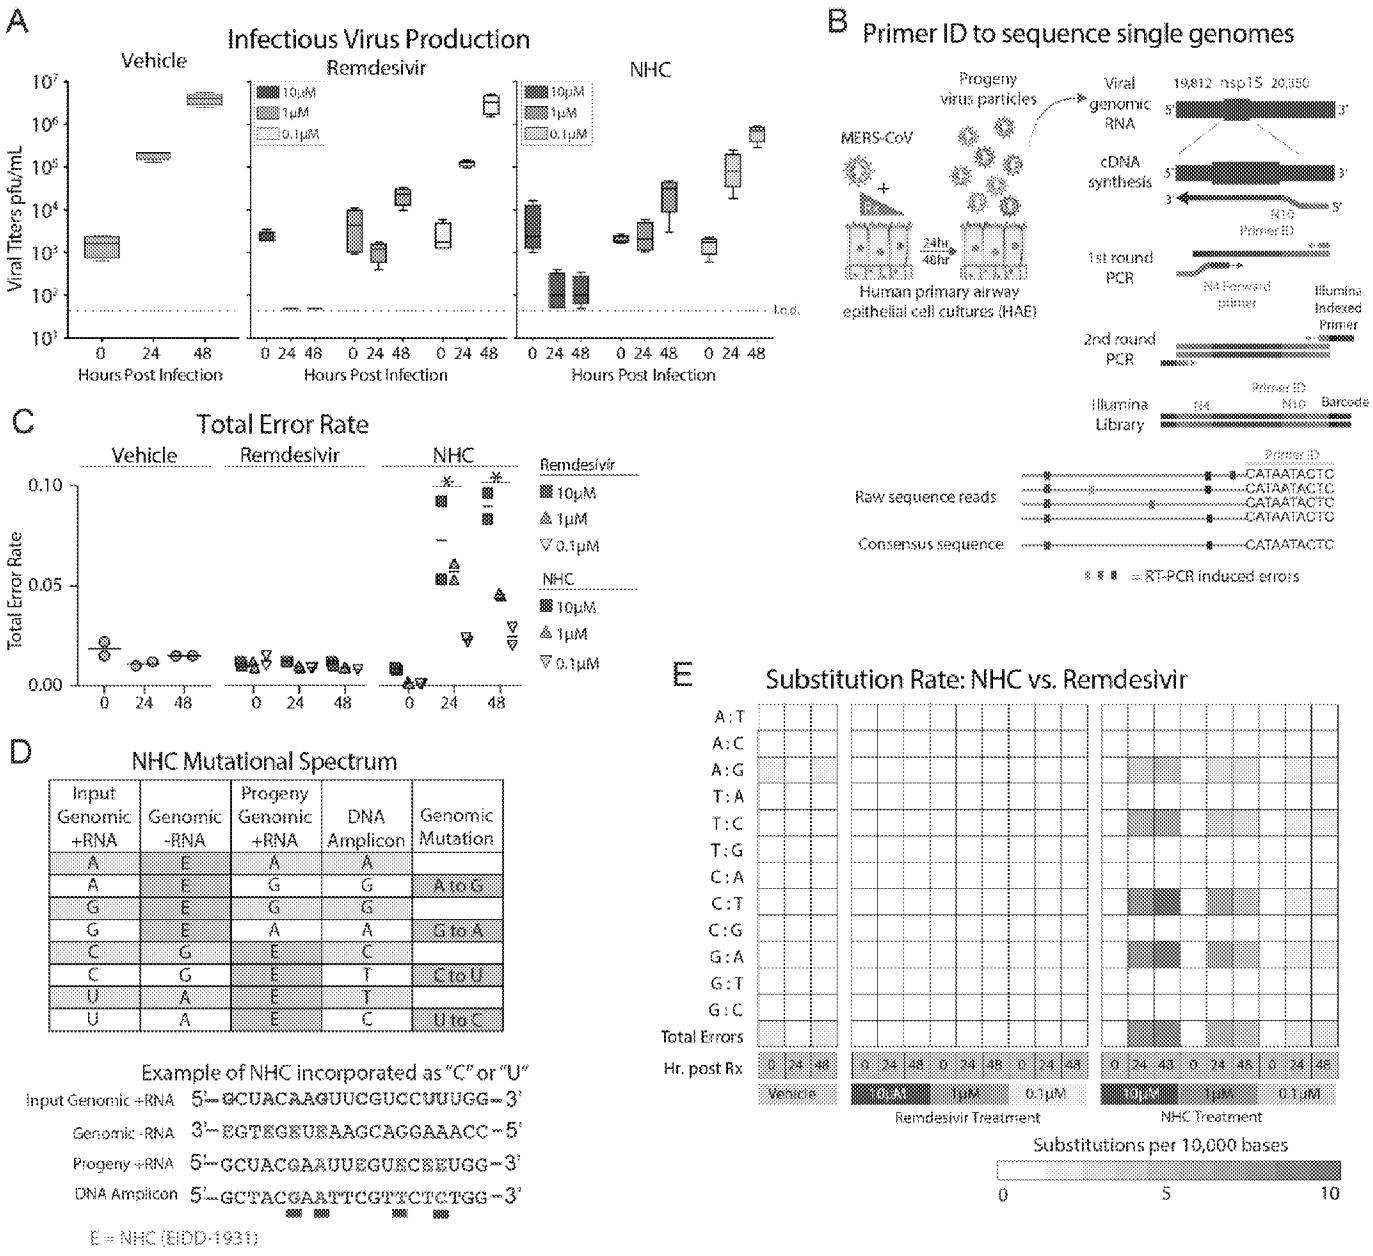

Fig. 5. NHC antiviral activity is associated with increased viral mutation rates. (**A**) HAE cultures were infected with MERS-CoV red fluorescent protein (RFP) at an MOI of 0.5 in duplicate in the presence of vehicle, RDV, or NHC for 48 hours, after which apical washes were collected for virus titration. Data are combined from two independent studies. The boxes encompass the 25th to 75th percentile, the line is at the median, while the whiskers represent the range. **(B)** Schematic of Primer ID deep sequencing for single RNA genomes of MERS-CoV. **(C)** The total error rate for MERS-CoV RNA isolated from cultures in panel **A** as determined by Primer ID. Error rate values are # mutations per 10,000 bases. Asterisks indicate significant differences as compared to untreated group by two-way ANOVA with a Dunnett's multiple comparison test. **(D)** Description of potential NHC mutational spectra on both positive and negative sense viral RNA. **(E)** Nucleotide transitions in cDNA derived from MERS-CoV genomic RNA.

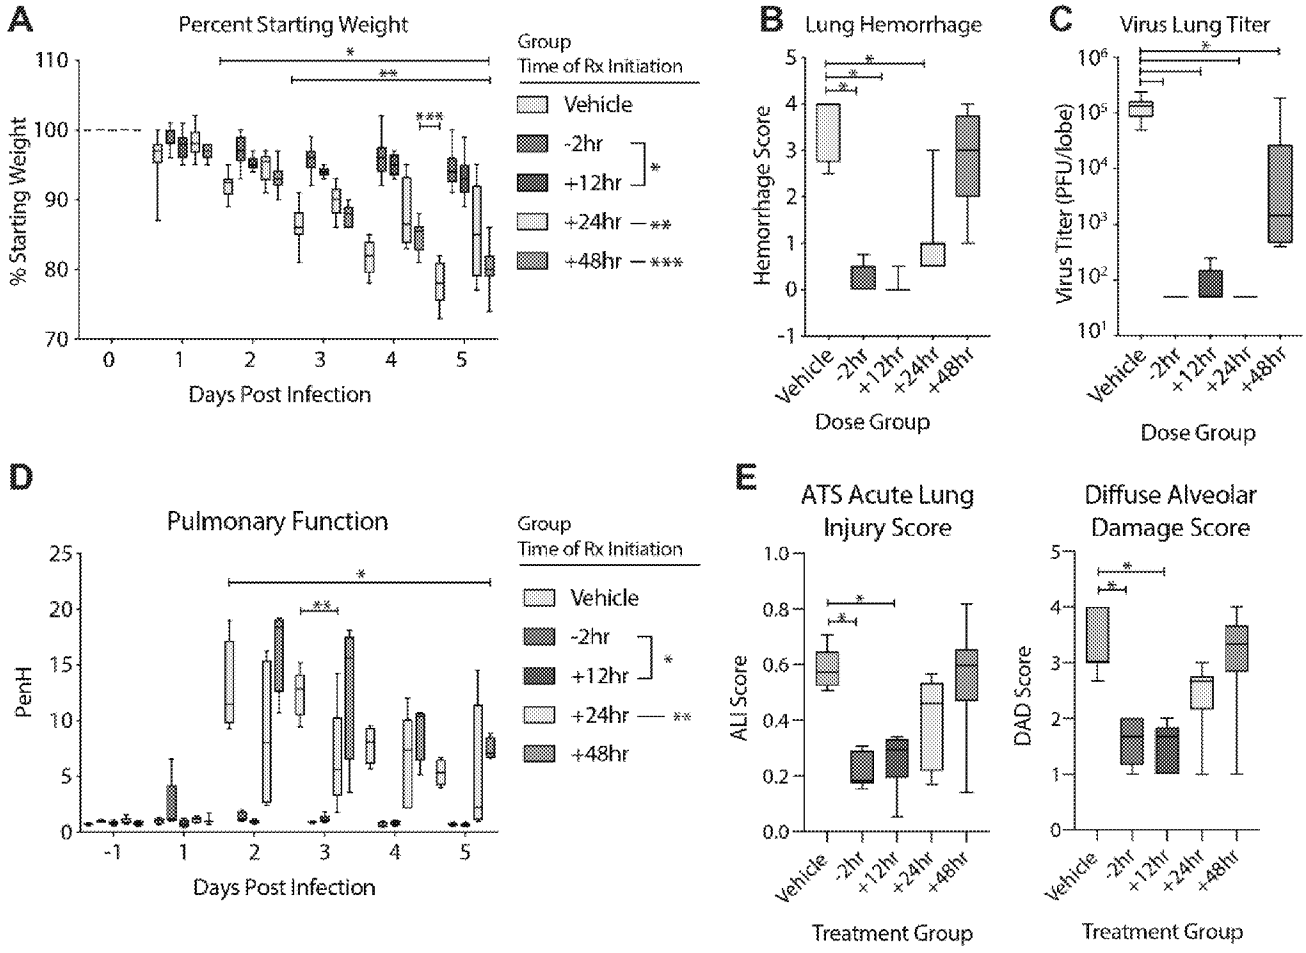

Fig. 6. Prophylactic and therapeutic EIDD-2801 reduces SARS-CoV replication and pathogenesis. Equivalent numbers of 25-29 week old male and female C57BL/6 mice were administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or NHC prodrug EIDD-2801 beginning at -2 hours, +12, +24 or +48 hours post infection and every 12 hours thereafter by oral gavage (n = 10/group). Mice were intranasally infected with 1E+04 PFU mouse-adapted SARS-CoV MA15 strain. **(A)** Percent starting weight. Asterisks indicate differences from vehicle treated by two-way ANOVA with Tukey's multiple comparison test. **(B)** Lung hemorrhage in mice from panel **A** scored on a scale of 0-4 where 0 is a normal pink healthy lung and 4 is a diffusely discolored dark red lung. **(C)** Virus lung titer in mice from panel **A** as determined by plaque assay. Asterisks in both panel **B** and **C** indicate differences from vehicle by one-way ANOVA with a Dunnett's multiple comparison test. **(D)** Pulmonary function by whole body plethysmography was performed daily on five animals per group. Asterisks indicate differences from vehicle by two-way ANOVA with a Dunnett's multiple comparison test. **(E)** The histological features of acute lung injury (ALI) were blindly scored using the American Thoracic Society Lung Injury Scoring system and a Diffuse Alveolar Damage Scoring System. Three randomly chosen high power (60X) fields of diseased lung were assessed per mouse. The numbers of mice scored per group: Vehicle N = 7, -2 hours N = 9, +12 hours N = 9, +24 hours N = 10, +48 hours N = 9. Asterisks indicate statistical significance compared to vehicle by Kruskal-Wallis with a Dunn's multiple comparison test. For all panels, the boxes encompass the 25th to 75th percentile, the line is at the median, while the whiskers represent the range. *, -2 hours and +12 hours compared to vehicle; **, +24 hours compared to vehicle; ***, +48 hours compared to vehicle.

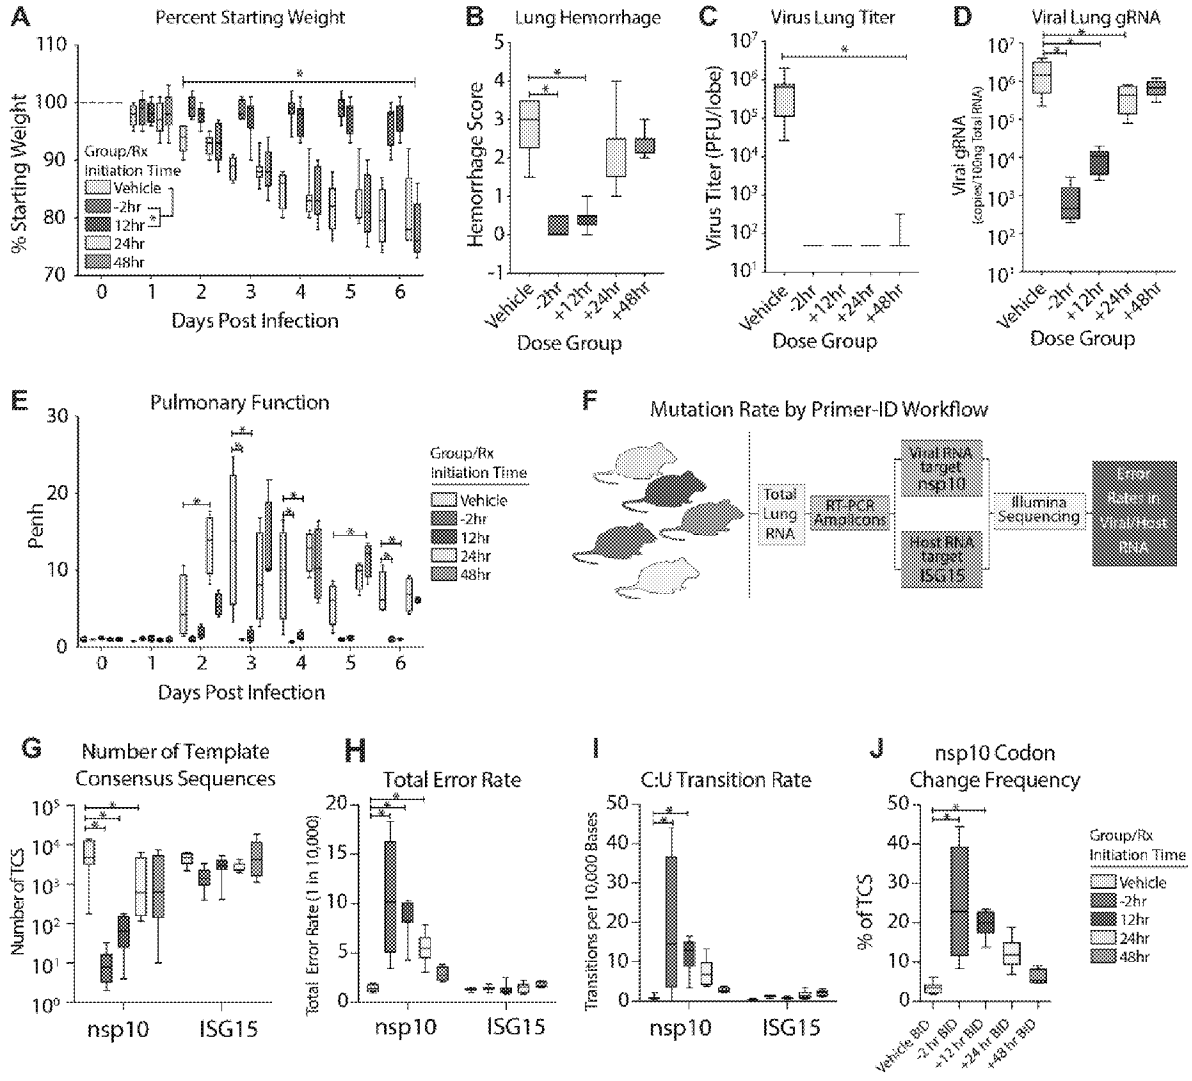

Fig. 7. Prophylactic and therapeutic EIDD-2801 reduces MERS-CoV replication and pathogenesis coincident with increased viral mutation rates. Equivalent numbers of 10-14 week old male and female C57BL/6 hDPP4 mice were administered vehicle (10% PEG, 2.5% Cremophor RH40 in water) or NHC prodrug EIDD-2801 beginning at -2 hours, +12, +24 or +48 hours post infection and every 12 hours thereafter by oral gavage (n = 10/group). Mice were intranasally infected with 5E+04 PFU mouse-adapted MERS-CoV M35C4 strain. (**A**) Percent starting weight. Asterisks indicate differences between -2 hours and +12 hours group from vehicle by two-way ANOVA with Tukey's multiple comparison test. (**B**) Lung hemorrhage in mice from panel **A** scored on a scale of 0-4 where 0 is a normal pink healthy lung and 4 is a diffusely discolored dark red lung. (**C**) Virus lung titer in mice from panel **A** as determined by plaque assay. Asterisks in both panel **B** and **C** indicate differences from vehicle by Kruskal-Wallis with Dunn's multiple comparison test. (**D**) MERS-CoV genomic RNA in lung tissue by qRT-PCR. Asterisks indicate differences by one-way ANOVA with a Dunnett's multiple comparison test. (**E**) Pulmonary function by whole body plethysmography was performed daily on four animals per group. Asterisks indicate differences from vehicle by two-way ANOVA with Tukey's multiple comparison test. (**F**) Workflow to measure mutation rate in MERS-CoV RNA and host transcript ISG15 by Primer ID in mouse lung tissue. (**G**) Number of template consensus sequences (TCS) for MERS-CoV nsp10 and ISG15. (**H**) Total error rate in MERS-CoV nsp10 and ISG15. (**I**) The cytosine to uridine transition rate in MERS-CoV nsp10 and ISG15. In panels **G-I,** asterisks indicate differences from vehicle by two-way ANOVA with Tukey's multiple comparison test. (**J**) Codon change frequency in MERS-CoV nsp10. Asterisks indicate differences from vehicle by Kruskal-Wallis with Dunn's multiple comparison test. For all panels, the boxes encompass the 25th to 75th percentile, the line is at the median, while the whiskers represent the range.

Subject: Re: WIV questions

A few of the questions are about the WIV facility. Since I have never been there, I didn't want to comment. I know you interacted with them in the planning stages.

I'll forward those requests to Raul and Connie.

Thanks

VDM

Subject: WIV questions

Hey Jim,

I have been getting more questions about the Wuhan Institute of Virology and my interactions with them. I am not particularly interested in talking about them and have only had limited interactions. I have been sending a few to you. I just wanted to make sure you are ok with me deflecting those questions to you.

Thanks

VDM

Interesting. But snakes are very commonly found in wet-markets throughout China and Southeast Asia though.

Subject: New CoV

Hey,

I chatted with Anne over email. I told her I'd send her my comments and suggestions and she can work on the paper further. She said it might take awhile since she has to work on it in the evenings.

Do you have info on the new virus in Wuhan? I heard that it's a CoV and maybe even a 2B virus. Nothing concrete or that I trust. I assume we'll read about it in a George Gao paper shortly.

I am going to gauge the UTMB funding structure to see if there is money to rapidly respond. Generally, they've been able to shake free money for NHP and other animal models for emerging virus outbreaks. I imagine Kent would be lead on that, but I am sure I'd be included.

We got your Christmas card. Congrats on the new grand child. Everyone looks great.

Subject: Inquiry of your Nature Medicine paper on CoronaVirus
Attachments: nm.3985.pdf

Dear Prof. Baric and Prof. Menachery,

I am writing to kindly seek some clarification about the paper you published at Nature Medicine as attached. In particular, I was hoping to know if the CoronaVirus now widely spreading in China and worldwide is the same or any format of mutation of the virus studied in the paper. This information would be extremely important for the development of efficient strategy to control or eventual stop the spreading and also for the development of medical treatment . I would truly appreciate your response for the well being of billions of people in China whose are suffering tremendous mental and physical pain even loss of life.

Many thanks,

Linyou

A SARS-like cluster of circulating bat coronaviruses shows potential for human emergence

Vineet D Menachery[1], Boyd L Yount Jr[1], Kari Debbink[1,2], Sudhakar Agnihothram[3], Lisa E Gralinski[1], Jessica A Plante[1], Rachel L Graham[1], Trevor Scobey[1], Xing-Yi Ge[4], Eric F Donaldson[1], Scott H Randell[5,6], Antonio Lanzavecchia[7], Wayne A Marasco[8,9], Zhengli-Li Shi[4] & Ralph S Baric[1,2]

The emergence of severe acute respiratory syndrome coronavirus (SARS-CoV) and Middle East respiratory syndrome (MERS)-CoV underscores the threat of cross-species transmission events leading to outbreaks in humans. Here we examine the disease potential of a SARS-like virus, SHC014-CoV, which is currently circulating in Chinese horseshoe bat populations[1]. Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve *in vitro* titers equivalent to epidemic strains of SARS-CoV. Additionally, *in vivo* experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis. Evaluation of available SARS-based immune-therapeutic and prophylactic modalities revealed poor efficacy; both monoclonal antibody and vaccine approaches failed to neutralize and protect from infection with CoVs using the novel spike protein. On the basis of these findings, we synthetically re-derived an infectious full-length SHC014 recombinant virus and demonstrate robust viral replication both *in vitro* and *in vivo*. Our work suggests a potential risk of SARS-CoV re-emergence from viruses currently circulating in bat populations.

The emergence of SARS-CoV heralded a new era in the cross-species transmission of severe respiratory illness with globalization leading to rapid spread around the world and massive economic impact[3,4]. Since then, several strains—including influenza A strains H5N1, H1N1 and H7N9 and MERS-CoV—have emerged from animal populations, causing considerable disease, mortality and economic hardship for the afflicted regions[5]. Although public health measures were able to stop the SARS-CoV outbreak[4], recent metagenomics studies have identified sequences of closely related SARS-like viruses circulating in Chinese bat populations that may pose a future threat[1,6]. However, sequence data alone provides minimal insights to identify and prepare for future prepandemic viruses. Therefore, to examine the emergence potential (that is, the potential to infect humans) of circulating bat CoVs, we built a chimeric virus encoding a novel, zoonotic CoV spike protein—from the RsSHC014-CoV sequence that was isolated from Chinese horseshoe bats[1]—in the context of the SARS-CoV mouse-adapted backbone. The hybrid virus allowed us to evaluate the ability of the novel spike protein to cause disease independently of other necessary adaptive mutations in its natural backbone. Using this approach, we characterized CoV infection mediated by the SHC014 spike protein in primary human airway cells and *in vivo*, and tested the efficacy of available immune therapeutics against SHC014-CoV. Together, the strategy translates metagenomics data to help predict and prepare for future emergent viruses.

The sequences of SHC014 and the related RsWIV1-CoV show that these CoVs are the closest relatives to the epidemic SARS-CoV strains (**Fig. 1a,b**); however, there are important differences in the 14 residues that bind human ACE2, the receptor for SARS-CoV, including the five that are critical for host range: Y442, L472, N479, T487 and Y491 (ref. 7). In WIV1, three of these residues vary from the epidemic SARS-CoV Urbani strain, but they were not expected to alter binding to ACE2 (**Supplementary Fig. 1a,b** and **Supplementary Table 1**). This fact is confirmed by both pseudotyping experiments that measured the ability of lentiviruses encoding WIV1 spike proteins to enter cells expressing human ACE2 (**Supplementary Fig. 1**) and by *in vitro* replication assays of WIV1-CoV (ref. 1). In contrast, 7 of 14 ACE2-interaction residues in SHC014 are different from those in SARS-CoV, including all five residues critical for host range (**Supplementary Fig. 1c** and **Supplementary Table 1**). These changes, coupled with

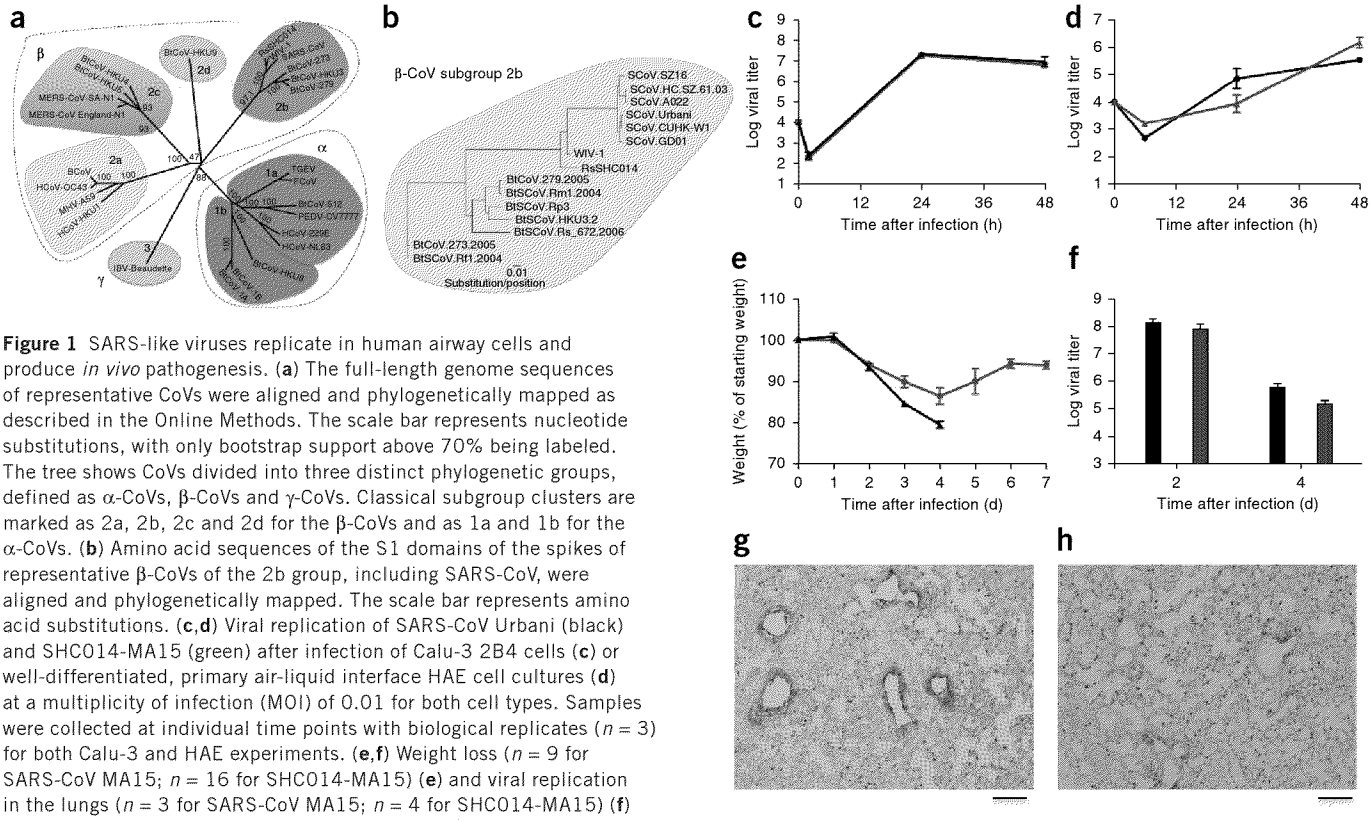

Figure 1 SARS-like viruses replicate in human airway cells and produce *in vivo* pathogenesis. (**a**) The full-length genome sequences of representative CoVs were aligned and phylogenetically mapped as described in the Online Methods. The scale bar represents nucleotide substitutions, with only bootstrap support above 70% being labeled. The tree shows CoVs divided into three distinct phylogenetic groups, defined as α-CoVs, β-CoVs and γ-CoVs. Classical subgroup clusters are marked as 2a, 2b, 2c and 2d for the β-CoVs and as 1a and 1b for the α-CoVs. (**b**) Amino acid sequences of the S1 domains of the spikes of representative β-CoVs of the 2b group, including SARS-CoV, were aligned and phylogenetically mapped. The scale bar represents amino acid substitutions. (**c**,**d**) Viral replication of SARS-CoV Urbani (black) and SHC014-MA15 (green) after infection of Calu-3 2B4 cells (**c**) or well-differentiated, primary air-liquid interface HAE cell cultures (**d**) at a multiplicity of infection (MOI) of 0.01 for both cell types. Samples were collected at individual time points with biological replicates ($n = 3$) for both Calu-3 and HAE experiments. (**e**,**f**) Weight loss ($n = 9$ for SARS-CoV MA15; $n = 16$ for SHC014-MA15) (**e**) and viral replication in the lungs ($n = 3$ for SARS-CoV MA15; $n = 4$ for SHC014-MA15) (**f**) of 10-week-old BALB/c mice infected with 1×10^4 p.f.u. of mouse-adapted SARS-CoV MA15 (black) or SHC014-MA15 (green) via the intranasal (i.n.) route. (**g**,**h**) Representative images of lung sections stained for SARS-CoV N antigen from mice infected with SARS-CoV MA15 ($n = 3$ mice) (**g**) or SHC014-MA15 ($n = 4$ mice) (**h**) are shown. For each graph, the center value represents the group mean, and the error bars define the s.e.m. Scale bars, 1 mm.

the failure of pseudotyped lentiviruses expressing the SHC014 spike to enter cells (**Supplementary Fig. 1d**), suggested that the SHC014 spike is unable to bind human ACE2. However, similar changes in related SARS-CoV strains had been reported to allow ACE2 binding[7,8], suggesting that additional functional testing was required for verification. Therefore, we synthesized the SHC014 spike in the context of the replication-competent, mouse-adapted SARS-CoV backbone (we hereafter refer to the chimeric CoV as SHC014-MA15) to maximize the opportunity for pathogenesis and vaccine studies in mice (**Supplementary Fig. 2a**). Despite predictions from both structure-based modeling and pseudotyping experiments, SHC014-MA15 was viable and replicated to high titers in Vero cells (**Supplementary Fig. 2b**). Similarly to SARS, SHC014-MA15 also required a functional ACE2 molecule for entry and could use human, civet and bat ACE2 orthologs (**Supplementary Fig. 2c,d**). To test the ability of the SHC014 spike to mediate infection of the human airway, we examined the sensitivity of the human epithelial airway cell line Calu-3 2B4 (ref. 9) to infection and found robust SHC014-MA15 replication, comparable to that of SARS-CoV Urbani (**Fig. 1c**). To extend these findings, primary human airway epithelial (HAE) cultures were infected and showed robust replication of both viruses (**Fig. 1d**). Together, the data confirm the ability of viruses with the SHC014 spike to infect human airway cells and underscore the potential threat of cross-species transmission of SHC014-CoV.

To evaluate the role of the SHC014 spike in mediating infection *in vivo*, we infected 10-week-old BALB/c mice with 10^4 plaque-forming units (p.f.u.) of either SARS-MA15 or SHC014-MA15 (**Fig. 1e–h**). Animals infected with SARS-MA15 experienced rapid weight loss and lethality by 4 d post infection (d.p.i.); in contrast, SHC014-MA15 infection produced substantial weight loss (10%) but no lethality in mice (**Fig. 1e**). Examination of viral replication revealed nearly equivalent viral titers from the lungs of mice infected with SARS-MA15 or SHC014-MA15 (**Fig. 1f**). Whereas lungs from the SARS-MA15–infected mice showed robust staining in both the terminal bronchioles and the lung parenchyma 2 d.p.i. (**Fig. 1g**), those of SHC014-MA15–infected mice showed reduced airway antigen staining (**Fig. 1h**); in contrast, no deficit in antigen staining was observed in the parenchyma or in the overall histology scoring, suggesting differential infection of lung tissue for SHC014-MA15 (**Supplementary Table 2**). We next analyzed infection in more susceptible, aged (12-month-old) animals. SARS-MA15–infected animals rapidly lost weight and succumbed to infection (**Supplementary Fig. 3a,b**). SHC014-MA15 infection induced robust and sustained weight loss, but had minimal lethality. Trends in the histology and antigen staining patterns that we observed in young mice were conserved in the older animals (**Supplementary Table 3**). We excluded the possibility that SHC014-MA15 was mediating infection through an alternative receptor on the basis of experiments using *Ace2*$^{-/-}$ mice, which did not show weight loss or antigen staining after SHC014-MA15 infection (**Supplementary Fig. 4a,b** and **Supplementary Table 2**). Together, the data indicate that viruses with the SHC014 spike are capable of inducing weight loss in mice in the context of a virulent CoV backbone.

Given the preclinical efficacy of Ebola monoclonal antibody therapies, such as ZMApp[10], we next sought to determine the efficacy of SARS-CoV monoclonal antibodies against infection with

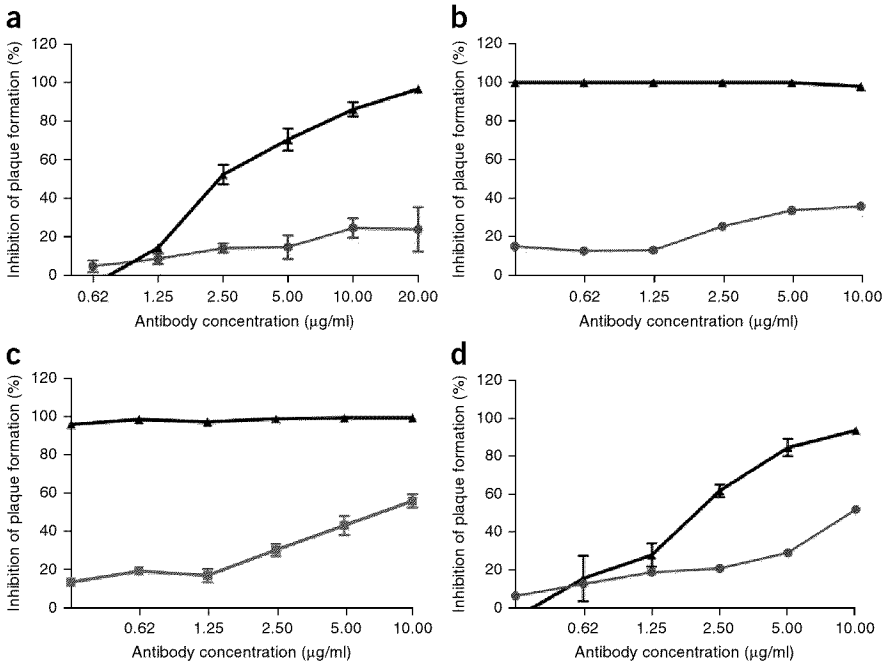

Figure 2 SARS-CoV monoclonal antibodies have marginal efficacy against SARS-like CoVs. (**a**–**d**) Neutralization assays evaluating efficacy (measured as reduction in the number of plaques) of a panel of monoclonal antibodies, which were all originally generated against epidemic SARS-CoV, against infection of Vero cells with SARS-CoV Urbani (black) or SHC014-MA15 (green). The antibodies tested were fm6 ($n = 3$ for Urbani; $n = 5$ for SHC014-MA15)[11,12] (**a**), 230.15 ($n = 3$ for Urbani; $n = 2$ for SHC014-MA15) (**b**), 227.15 ($n = 3$ for Urbani; $n = 5$ for SHC014-MA15) (**c**) and 109.8 ($n = 3$ for Urbani; $n = 2$ for SHC014-MA15)[13] (**d**). Each data point represents the group mean and error bars define the s.e.m. Note that the error bars in SARS-CoV Urbani–infected Vero cells in **b**,**c** are overlapped by the symbols and are not visible.

SHC014-MA15. Four broadly neutralizing human monoclonal antibodies targeting SARS-CoV spike protein had been previously reported and are probable reagents for immunotherapy[11–13]. We examined the effect of these antibodies on viral replication (expressed as percentage inhibition of viral replication) and found that whereas wild-type SARS-CoV Urbani was strongly neutralized by all four antibodies at relatively low antibody concentrations (**Fig. 2a–d**), neutralization varied for SHC014-MA15. Fm6, an antibody generated by phage display and escape mutants[11,12], achieved only background levels of inhibition of SHC014-MA15 replication (**Fig. 2a**). Similarly, antibodies 230.15 and 227.14, which were derived from memory B cells of SARS-CoV–infected patients[13], also failed to block SHC014-MA15 replication (**Fig. 2b,c**). For all three antibodies, differences between the SARS and SHC014 spike amino acid sequences corresponded to direct or adjacent residue changes found in SARS-CoV escape mutants (fm6 N479R; 230.15 L443V; 227.14 K390Q/E), which probably explains the absence of the antibodies' neutralizing activity against SHC014. Finally, monoclonal antibody 109.8 was able to achieve 50% neutralization of SHC014-MA15, but only at high concentrations (10 μg/ml) (**Fig. 2d**). Together, the results demonstrate that broadly neutralizing antibodies against SARS-CoV may only have marginal efficacy against emergent SARS-like CoV strains such as SHC014.

To evaluate the efficacy of existing vaccines against infection with SHC014-MA15, we vaccinated aged mice with double-inactivated whole SARS-CoV (DIV). Previous work showed that DIV could neutralize and protect young mice from challenge with a homologous virus[14]; however, the vaccine failed to protect aged animals in which augmented immune pathology was also observed, indicating the possibility of the animals being harmed because of the vaccination[15]. Here we found that DIV did not provide protection from challenge with SHC014-MA15 with regards to weight loss or viral titer (**Supplementary Fig. 5a,b**). Consistent with a previous report with other heterologous group 2b CoVs[15], serum from DIV-vaccinated, aged mice also failed to neutralize SHC014-MA15 (**Supplementary Fig. 5c**). Notably, DIV vaccination resulted in robust immune pathology (**Supplementary Table 4**) and eosinophilia (**Supplementary Fig. 5d–f**). Together, these results confirm that the DIV vaccine would not be protective against infection with SHC014 and could possibly augment disease in the aged vaccinated group.

In contrast to vaccination of mice with DIV, the use of SHC014-MA15 as a live, attenuated vaccine showed potential cross-protection against challenge with SARS-CoV, but the results have important caveats. We infected young mice with 10^4 p.f.u. of SHC014-MA15 and observed them for 28 d. We then challenged the mice with SARS-MA15 at day 29 (**Supplementary Fig. 6a**). The prior infection of the mice with the high dose of SHC014-MA15 conferred protection against challenge with a lethal dose of SARS-MA15, although there was only a minimal SARS-CoV neutralization response from the antisera elicited 28 d after SHC014-MA15 infection (**Supplementary Fig. 6b**, 1:200). In the absence of a secondary antigen boost, 28 d.p.i. represents the expected peak of antibody titers and implies that there will be diminished protection against SARS-CoV over time[16,17]. Similar results showing protection against challenge with a lethal dose of SARS-CoV were observed in aged BALB/c mice with respect to weight loss and viral replication (**Supplementary Fig. 6c,d**). However, the SHC014-MA15 infection dose of 10^4 p.f.u. induced >10% weight loss and lethality in some aged animals (**Fig. 1** and **Supplementary Fig. 3**). We found that vaccination with a lower dose of SHC014-MA15 (100 p.f.u.), did not induce weight loss, but it also failed to protect aged animals from a SARS-MA15 lethal dose challenge (**Supplementary Fig. 6e,f**). Together, the data suggest that SHC014-MA15 challenge may confer cross-protection against SARS-CoV through conserved epitopes, but the required dose induces pathogenesis and precludes use as an attenuated vaccine.

Having established that the SHC014 spike has the ability to mediate infection of human cells and cause disease in mice, we next synthesized a full-length SHC014-CoV infectious clone based on the approach used for SARS-CoV (**Fig. 3a**)[2]. Replication in Vero cells revealed no deficit for SHC014-CoV relative to that for SARS-CoV (**Fig. 3b**); however, SHC014-CoV was significantly ($P < 0.01$) attenuated in primary HAE cultures at both 24 and 48 h after infection (**Fig. 3c**). *In vivo* infection of mice demonstrated no significant weight loss but showed reduced viral replication in lungs of full-length SHC014-CoV infection, as compared to SARS-CoV Urbani (**Fig. 3d,e**). Together, the results establish the viability of full-length

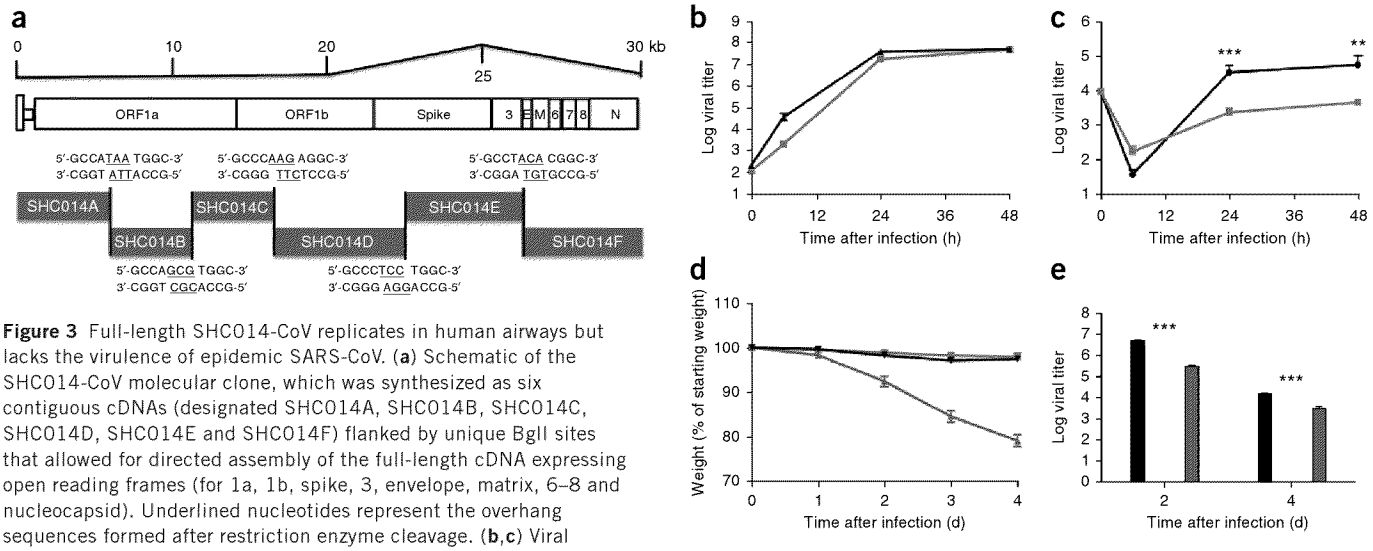

Figure 3 Full-length SHC014-CoV replicates in human airways but lacks the virulence of epidemic SARS-CoV. (**a**) Schematic of the SHC014-CoV molecular clone, which was synthesized as six contiguous cDNAs (designated SHC014A, SHC014B, SHC014C, SHC014D, SHC014E and SHC014F) flanked by unique BglI sites that allowed for directed assembly of the full-length cDNA expressing open reading frames (for 1a, 1b, spike, 3, envelope, matrix, 6–8 and nucleocapsid). Underlined nucleotides represent the overhang sequences formed after restriction enzyme cleavage. (**b**,**c**) Viral replication of SARS-CoV Urbani (black) or SHC014-CoV (green) after infection of Vero cells (**b**) or well-differentiated, primary air-liquid interface HAE cell cultures (**c**) at an MOI of 0.01. Samples were collected at individual time points with biological replicates ($n = 3$) for each group. Data represent one experiment for both Vero and HAE cells. (**d**,**e**) Weight loss ($n = 3$ for SARS-CoV MA15, $n = 7$ for SHC014-CoV; $n = 6$ for SARS-Urbani) (**d**) and viral replication in the lungs ($n = 3$ for SARS-Urbani and SHC014-CoV) (**e**) of 10-week-old BALB/c mice infected with 1×10^5 p.f.u. of SARS-CoV MA15 (gray), SHC014-CoV (green) or SARS-CoV Urbani (black) via the i.n. route. Each data point represents the group mean, and error bars define the s.e.m. $^{**}P < 0.01$ and $^{***}P < 0.001$ using two-tailed Student's *t*-test of individual time points.

SHC014-CoV, but suggest that further adaptation is required for its replication to be equivalent to that of epidemic SARS-CoV in human respiratory cells and in mice.

During the SARS-CoV epidemic, links were quickly established between palm civets and the CoV strains that were detected in humans[4]. Building on this finding, the common emergence paradigm argues that epidemic SARS-CoV originated as a bat virus, jumped to civets and incorporated changes within the receptor-binding domain (RBD) to improve binding to civet Ace2 (ref. 18). Subsequent exposure to people in live-animal markets permitted human infection with the civet strain, which, in turn, adapted to become the epidemic strain (**Fig. 4a**). However, phylogenetic analysis suggests that early human SARS strains appear more closely related to bat strains than to civet strains[18]. Therefore, a second paradigm argues that direct bat-human transmission initiated SARS-CoV emergence and that palm civets served as a secondary host and reservoir for continued infection (**Fig. 4b**)[19]. For both paradigms, spike adaptation in a secondary host is seen as a necessity, with most mutations expected to occur within the RBD, thereby facilitating improved infection. Both theories imply that pools of bat CoVs are limited and that host-range mutations are

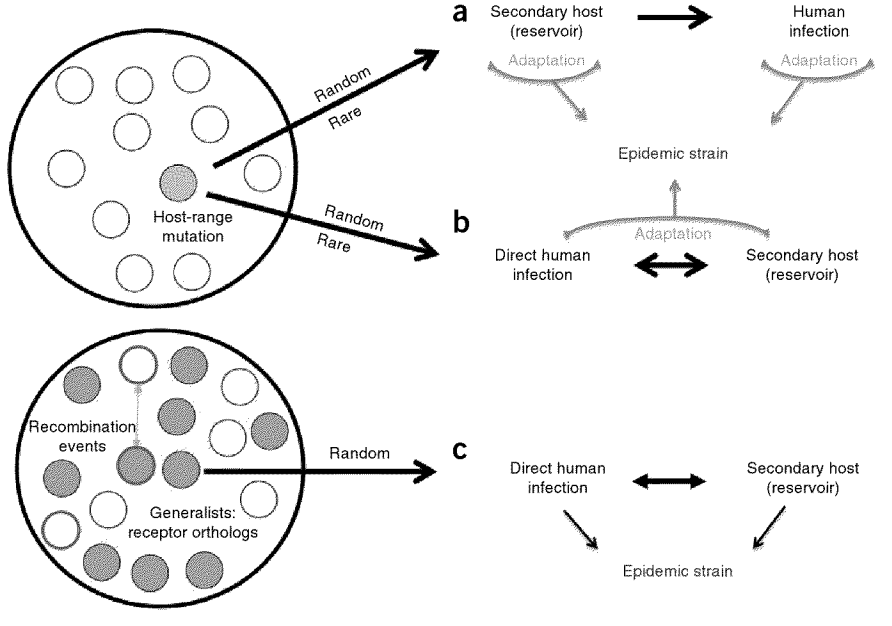

Figure 4 Emergence paradigms for coronaviruses. Coronavirus strains are maintained in quasi-species pools circulating in bat populations. (**a**,**b**) Traditional SARS-CoV emergence theories posit that host-range mutants (red circle) represent random and rare occurrences that permit infection of alternative hosts. The secondary-host paradigm (**a**) argues that a nonhuman host is infected by a bat progenitor virus and, through adaptation, facilitates transmission to humans; subsequent replication in humans leads to the epidemic viral strain. The direct paradigm (**b**) suggests that transmission occurs between bats and humans without the requirement of an intermediate host; selection then occurs in the human population with closely related viruses replicating in a secondary host, permitting continued viral persistence and adaptation in both. (**c**) The data from chimeric SARS-like viruses argue that the quasi-species pools maintain multiple viruses capable of infecting human cells without the need for mutations (red circles). Although adaptations in secondary or human hosts may be required for epidemic emergence, if SHC014 spike–containing viruses recombined with virulent CoV backbones (circles with green outlines), then epidemic disease may be the result in humans. Existing data support elements of all three paradigms.

both random and rare, reducing the likelihood of future emergence events in humans.

Although our study does not invalidate the other emergence routes, it does argue for a third paradigm in which circulating bat CoV pools maintain 'poised' spike proteins that are capable of infecting humans without mutation or adaptation (**Fig. 4c**). This hypothesis is illustrated by the ability of a chimeric virus containing the SHC014 spike in a SARS-CoV backbone to cause robust infection in both human airway cultures and in mice without RBD adaptation. Coupled with the observation of previously identified pathogenic CoV backbones[3,20], our results suggest that the starting materials required for SARS-like emergent strains are currently circulating in animal reservoirs. Notably, although full-length SHC014-CoV probably requires additional backbone adaption to mediate human disease, the documented high-frequency recombination events in CoV families underscores the possibility of future emergence and the need for further preparation.

To date, genomics screens of animal populations have primarily been used to identify novel viruses in outbreak settings[21]. The approach here extends these data sets to examine questions of viral emergence and therapeutic efficacy. We consider viruses with the SHC014 spike a potential threat owing to their ability to replicate in primary human airway cultures, the best available model for human disease. In addition, the observed pathogenesis in mice indicates a capacity for SHC014-containing viruses to cause disease in mammalian models, without RBD adaptation. Notably, differential tropism in the lung as compared to that with SARS-MA15 and attenuation of full-length SHC014-CoV in HAE cultures relative to SARS-CoV Urbani suggest that factors beyond ACE2 binding—including spike processivity, receptor bio-availability or antagonism of the host immune responses—may contribute to emergence. However, further testing in nonhuman primates is required to translate these finding into pathogenic potential in humans. Importantly, the failure of available therapeutics defines a critical need for further study and for the development of treatments. With this knowledge, surveillance programs, diagnostic reagents and effective treatments can be produced that are protective against the emergence of group 2b–specific CoVs, such as SHC014, and these can be applied to other CoV branches that maintain similarly heterogeneous pools.

In addition to offering preparation against future emerging viruses, this approach must be considered in the context of the US government–mandated pause on gain-of-function (GOF) studies[22]. On the basis of previous models of emergence (**Fig. 4a,b**), the creation of chimeric viruses such as SHC014-MA15 was not expected to increase pathogenicity. Although SHC014-MA15 is attenuated relative to its parental mouse-adapted SARS-CoV, similar studies examining the pathogenicity of CoVs with the wild-type Urbani spike within the MA15 backbone showed no weight loss in mice and reduced viral replication[23]. Thus, relative to the Urbani spike–MA15 CoV, SHC014-MA15 shows a gain in pathogenesis (**Fig. 1**). On the basis of these findings, scientific review panels may deem similar studies building chimeric viruses based on circulating strains too risky to pursue, as increased pathogenicity in mammalian models cannot be excluded. Coupled with restrictions on mouse-adapted strains and the development of monoclonal antibodies using escape mutants, research into CoV emergence and therapeutic efficacy may be severely limited moving forward. Together, these data and restrictions represent a crossroads of GOF research concerns; the potential to prepare for and mitigate future outbreaks must be weighed against the risk of creating more dangerous pathogens. In developing policies moving forward, it is important to consider the value of the data generated by these studies and whether these types of chimeric virus studies warrant further investigation versus the inherent risks involved.

Overall, our approach has used metagenomics data to identify a potential threat posed by the circulating bat SARS-like CoV SHC014. Because of the ability of chimeric SHC014 viruses to replicate in human airway cultures, cause pathogenesis *in vivo* and escape current therapeutics, there is a need for both surveillance and improved therapeutics against circulating SARS-like viruses. Our approach also unlocks the use of metagenomics data to predict viral emergence and to apply this knowledge in preparing to treat future emerging virus infections.

ACKNOWLEDGMENTS

Research in this manuscript was supported by grants from the National Institute of Allergy & Infectious Disease and the National Institute of Aging of the US National Institutes of Health (NIH) under awards U19AI109761 (R.S.B.), U19AI107810 (R.S.B.), AI085524 (W.A.M.), F32AI102561 (V.D.M.) and K99AG049092 (V.D.M.), and by the National Natural Science Foundation of China awards 81290341 (Z.-L.S.) and 31470260 (X.-Y.G.), and by USAID-EPT-PREDICT funding from EcoHealth Alliance (Z.-L.S.). Human airway epithelial cultures were supported by the National Institute of Diabetes and Digestive and Kidney Disease of the NIH under award NIH DK065988 (S.H.R.). We also thank M.T. Ferris (Dept. of Genetics, University of North Carolina) for the reviewing of statistical approaches and C.T. Tseng (Dept. of Microbiology and Immunology, University of Texas Medical Branch) for providing Calu-3 cells. Experiments with the full-length and chimeric SHC014 recombinant viruses were initiated and performed before the GOF research funding pause and have since been reviewed and approved for continued study by the NIH. The content is solely the responsibility of the authors and does not necessarily represent the official views of the NIH.

AUTHOR CONTRIBUTIONS

V.D.M. designed, coordinated and performed experiments, completed analysis and wrote the manuscript. B.L.Y. designed the infectious clone and recovered chimeric viruses; S.A. completed neutralization assays; L.E.G. helped perform mouse experiments; T.S. and J.A.P. completed mouse experiments and plaque assays; X.-Y.G. performed pseudotyping experiments; K.D. generated structural figures and predictions; E.F.D. generated phylogenetic analysis; R.L.G. completed RNA analysis; S.H.R. provided primary HAE cultures; A.L. and W.A.M. provided critical monoclonal antibody reagents; and Z.-L.S. provided SHC014 spike sequences and plasmids. R.S.B. designed experiments and wrote manuscript.

ONLINE METHODS

Viruses, cells, *in vitro* infection and plaque assays. Wild-type SARS-CoV (Urbani), mouse-adapted SARS-CoV (MA15) and chimeric SARS-like CoVs were cultured on Vero E6 cells (obtained from United States Army Medical Research Institute of Infectious Diseases), grown in Dulbecco's modified Eagle's medium (DMEM) (Gibco, CA) and 5% fetal clone serum (FCS) (Hyclone, South Logan, UT) along with antibiotic/antimycotic (Gibco, Carlsbad, CA). DBT cells (Baric laboratory, source unknown) expressing *ACE2* orthologs have been previously described for both human and civet; bat *Ace2* sequence was based on that from *Rhinolophus leschenaulti*, and DBT cells expressing bat *Ace2* were established as described previously[8]. Pseudotyping experiments were similar to those using an HIV-based pseudovirus, prepared as previously described[10], and examined on HeLa cells (Wuhan Institute of Virology) that expressed *ACE2* orthologs. HeLa cells were grown in minimal essential medium (MEM) (Gibco, CA) supplemented with 10% FCS (Gibco, CA) as previously described[24]. Growth curves in Vero E6, DBT, Calu-3 2B4 and primary human airway epithelial cells were performed as previously described[8,25]. None of the working cell line stocks were authenticated or tested for mycoplasma recently, although the original seed stocks used to create the working stocks are free from contamination. Human lungs for HAE cultures were procured under University of North Carolina at Chapel Hill Institutional Review Board–approved protocols. HAE cultures represent highly differentiated human airway epithelium containing ciliated and non-ciliated epithelial cells as well as goblet cells. The cultures are also grown on an air-liquid interface for several weeks before use, as previously described[26]. Briefly, cells were washed with PBS and inoculated with virus or mock-diluted in PBS for 40 min at 37 °C. After inoculation, cells were washed three times and fresh medium was added to signify time '0'. Three or more biological replicates were harvested at each described time point. No blinding was used in any sample collections nor were samples randomized. All virus cultivation was performed in a biosafety level (BSL) 3 laboratory with redundant fans in the biosafety cabinets, as described previously by our group[2]. All personnel wore powered air purifying respirators (Breathe Easy, 3M) with Tyvek suits, aprons and booties and were double-gloved.

Sequence clustering and structural modeling. The full-length genomic sequences and the amino acid sequences of the S1 domains of the spike of representative CoVs were downloaded from Genbank or Pathosystems Resource Integration Center (PATRIC), aligned with ClustalX and phylogenetically compared by using maximum likelihood estimation using 100 bootstraps or by using the PhyML (https://code.google.com/p/phyml/) package, respectively. The tree was generated using maximum likelihood with the PhyML package. The scale bar represents nucleotide substitutions. Only nodes with bootstrap support above 70% are labeled. The tree shows that CoVs are divided into three distinct phylogenetic groups defined as α-CoVs, β-CoVs and γ-CoVs. Classical subgroup clusters are marked as 2a, 2b, 2c and 2d for β-CoVs, and 1a and 1b for the α-CoVs. Structural models were generated using Modeller (Max Planck Institute Bioinformatics Toolkit) to generate homology models for SHC014 and Rs3367 of the SARS RBD in complex with ACE2 based on crystal structure 2AJF (Protein Data Bank). Homology models were visualized and manipulated in MacPyMol (version 1.3).

Construction of SARS-like chimeric viruses. Both wild-type and chimeric viruses were derived from either SARS-CoV Urbani or the corresponding mouse-adapted (SARS-CoV MA15) infectious clone (ic) as previously described[27]. Plasmids containing spike sequences for SHC014 were extracted by restriction digest and ligated into the E and F plasmid of the MA15 infectious clone. The clone was designed and purchased from Bio Basic as six contiguous cDNAs using published sequences flanked by unique class II restriction endonuclease sites (BglI). Thereafter, plasmids containing wild-type, chimeric SARS-CoV and SHC014-CoV genome fragments were amplified, excised, ligated and purified. *In vitro* transcription reactions were then preformed to synthesize full-length genomic RNA, which was transfected into Vero E6 cells as previously described[2]. The medium from transfected cells was harvested and served as seed stocks for subsequent experiments. Chimeric and full-length viruses were confirmed by sequence analysis before use in these studies. Synthetic construction of chimeric mutant and full-length SHC014-CoV was approved by the University of North Carolina Institutional Biosafety Committee and the Dual Use Research of Concern committee.

Ethics statement. This study was carried out in accordance with the recommendations for the care and use of animals by the Office of Laboratory Animal Welfare (OLAW), NIH. The Institutional Animal Care and Use Committee (IACUC) of The University of North Carolina at Chapel Hill (UNC, Permit Number A-3410-01) approved the animal study protocol (IACUC #13-033) used in these studies.

Mice and *in vivo* infection. Female, 10-week-old and 12-month-old BALB/cAnNHsD mice were ordered from Harlan Laboratories. Mouse infections were done as previously described[20]. Briefly, animals were brought into a BSL3 laboratory and allowed to acclimate for 1 week before infection. For infection and live-attenuated virus vaccination, mice were anesthetized with a mixture of ketamine and xylazine and infected intranasally, when challenged, with 50 μl of phosphate-buffered saline (PBS) or diluted virus with three or four mice per time point, per infection group per dose as described in the figure legends. For individual mice, notations for infection including failure to inhale the entire dose, bubbling of inoculum from the nose, or infection through the mouth may have led to exclusion of mouse data at the discretion of the researcher; post-infection, no other pre-established exclusion or inclusion criteria are defined. No blinding was used in any animal experiments, and animals were not randomized. For vaccination, young and aged mice were vaccinated by footpad injection with a 20-μl volume of either 0.2 μg of double-inactivated SARS-CoV vaccine with alum or mock PBS; mice were then boosted with the same regimen 22 d later and challenged 21 d thereafter. For all groups, as per protocol, animals were monitored daily for clinical signs of disease (hunching, ruffled fur and reduced activity) for the duration of the experiment. Weight loss was monitored daily for the first 7 d, after which weight monitoring continued until the animals recovered to their initial starting weight or displayed weight gain continuously for 3 d. All mice that lost greater than 20% of their starting body weight were ground-fed and further monitored multiple times per day as long as they were under the 20% cutoff. Mice that lost greater than 30% of their starting body weight were immediately sacrificed as per protocol. Any mouse deemed to be moribund or unlikely to recover was also humanely sacrificed at the discretion of the researcher. Euthanasia was performed using an isoflurane overdose and death was confirmed by cervical dislocation. All mouse studies were performed at the University of North Carolina (Animal Welfare Assurance #A3410-01) using protocols approved by the UNC Institutional Animal Care and Use Committee (IACUC).

Histological analysis. The left lung was removed and submerged in 10% buffered formalin (Fisher) without inflation for 1 week. Tissues were embedded in paraffin and 5-μm sections were prepared by the UNC Lineberger Comprehensive Cancer Center histopathology core facility. To determine the extent of antigen staining, sections were stained for viral antigen using a commercially available polyclonal SARS-CoV anti-nucleocapsid antibody (Imgenex) and scored in a blinded manner by for staining of the airway and parenchyma as previously described[20]. Images were captured using an Olympus BX41 microscope with an Olympus DP71 camera.

Virus neutralization assays. Plaque reduction neutralization titer assays were performed with previously characterized antibodies against SARS-CoV, as previously described[11–13]. Briefly, neutralizing antibodies or serum was serially diluted twofold and incubated with 100 p.f.u. of the different infectious clone SARS-CoV strains for 1 h at 37 °C. The virus and antibodies were then added to a 6-well plate with 5×10^5 Vero E6 cells/well with multiple replicates ($n \geq 2$). After a 1-h incubation at 37 °C, cells were overlaid with 3 ml of 0.8% agarose in medium. Plates were incubated for 2 d at 37 °C, stained with neutral red for 3 h and plaques were counted. The percentage of plaque reduction was calculated as (1 − (no. of plaques with antibody/no. of plaques without antibody)) × 100.

Subject: New CoV

Hey,

I chatted with Anne over email. I told her I'd send her my comments and suggestions and she can work on the paper further. She said it might take awhile since she has to work on it in the evenings.

Do you have info on the new virus in Wuhan? I heard that it's a CoV and maybe even a 2B virus. Nothing concrete or that I trust. I assume we'll read about it in a George Gao paper shortly.

I am going to gauge the UTMB funding structure to see if there is money to rapidly respond. Generally, they've been able to shake free money for NHP and other animal models for emerging virus outbreaks. I imagine Kent would be lead on that, but I am sure I'd be included.

We got your Christmas card. Congrats on the new grand child. Everyone looks great.

VDM

Subject: Happy Thanksgiving and meeting next year, June 12-13, 2020
Attachments: Meeting report_ACVA_SCBA-virology_Kunming.pdf; Junming_1.JPG; Kunming_2.JPG;
Kunming_3.JPG; Kunming_4.JPG

Dear friends and colleagues,

I wish you all a great Thanksgiving holiday!

A few updates:

1. We will have our first scientific meeting on June 12-13, 2020, right before the ASV annual meeting (June 13-17) in Fort Collins, Colorado State University. Organizing and scientific committees will be formed soon.
2. I am excited to share that Dr. Xiang-Jin (XJ) Meng of Virginia Tech, a distinguished virology and a member of the US National Academy of Science, will be the keynote speaker of this meeting. Details will follow.
3. In addition to scientific programs, we will also hold an election; a new leadership team will be elected to serve our community for the next two years.
4. Attached please find a brief report of our Kunming meeting, along with a few photos.

Please let me know if you have comments and suggestions.

All best wishes, and happy holidays!

Shan-Lu

SCBA-Virology Division Workshop Held in Kunming

The SCBA-Virology Division held a scientific workshop on July 28, 2019 after the 17th SCBA International Symposium in Kunming, China. The workshop was co-organized by Drs. Genhong Cheng, Haitao Guo, Shan-Lu Liu and Tongqing Zhou of the SCBA-virology Division and by Dr. Qihan Li at the Institute of Medical Biology (IMB), Chinese Academy of Medical Sciences (CAMS).

The meeting was opened by an introductory speech by Prof. Qihan Li, Director of IMB, followed by scientific presentations. The workshop had three sessions, which covered the topics of "Immunity to Viral Infection", "Viral Pathogenesis", and "Vaccine and Primate Models". More than 50 people attended the workshop, many from IMB. Speakers, session chairs, and panelists include: Tian Wang, Shan-Lu Liu, Haitao Hu, Jie Sun, Wenzhe Ho, Lishan Su, Wei Jiang, Xuefeng Liu, Hongyu Deng, Yuntao Wu, Jianming Hu, Genhong Cheng, Lanying Du, Yuan Yan, Kui Li, Shou-Wei Ding, Qi Huang, etc.

Before the scientific sessions, meeting attendees were given a guided tour of the National Medical Primate Research Center located in IMB, CAMS, which hosts the largest P4 primate research facility in China and plays a leading role in breeding, reproduction, disease control, genetic studies of primates in the world. In addition to IMB of CAMS, the workshop was also supported by Drs. Yuelong Shu and Musheng Zeng at Sun Yat-sen University (SYSU), China, Dr. Yuntao Wu at Virongy, LLC and George Mason University, as well as Immune Technology Corp.

This is the first scientific event after the official establishment of the SCBA-Virology Division in 2018. During the 2019 SCBA international symposium and the SCBA-Virology satellite workshop, we also organized opportunities for social networking.

Subject: ACVA/SCBA-Virology Division: 2019 Year in Review
Attachments: ACVASCBA-Virology 2019 year in review.pdf

Dear Colleagues and Friends:

Happy new year! I wish you all a healthy and productive 2020!

I would like to share the below summary on our major activities in 2019.

ACVA/SCBA-Virology Division: 2019 Year in Review (chronologically)

1. Continuous and focused discussion on the Science letter "Racial Profiling Harms Science" (original title "Racial Profiling Harms American Science and Innovation").

2. Seven Chinese or Chinese American scientists, including 5 members of ACVA/SCBA-Virology Division, elected to the American Academy of Microbiology (AAM) - Genhong Cheng（程根宏）, Pinghui Feng （冯平辉）, Guangping Gao (高光坪）, Jake T Liang （連展阳）, Zhengli Shi （石正丽）, Yumei Wen (闻玉梅), Richard Zhao （赵玉琪）.

3. Themed discussion on the universal influenza vaccine, vectored ImmunoProphylaxis, and attenuated influenza vaccine.

4. Themed discussion of Open Access journal publishing.

5. Debate and discussion on the definition of "racial profiling": Chinese translations, differences between "racial profiling" and "racial discrimination", and differences in Chinese translations: " 种族标签，种族偏见，种族歧视".

6. Themed discussion on virus-host evolutionary arms races: HIV and others.

7. Ultimate publication of the Science letter on March 21, 2019 (online) – sagas and stories behind the scenes.

8. Responses to the Science letter and media reports – "The Scientist", "知识分子", and others.

9. Discussion and responses to US institution's statements, Emory/MD Anderson faculty firing, and NIH's foreign influences and FBI investigations.

10. Establishment of the ACVA/SCBA-Virology Division website (https://sites.google.com/view/scba-virology/home), as well as collection and distribution of membership list (https://sites.google.com/view/scba-virology/members).

11. Dr. George F. Gao elected to the US National Academy of Sciences as International Member (formerly called Foreign Associate).

12. Dr. Zongdi Feng (冯枞棣) won the 2019 ASV's Ann Palmenberg Junior Investigator's award.

13. ACVA/SCBA-Virology participation in the 17th SCBA International Symposium, Kunming, July 24-28, 2019, and scientific workshop and social gathering at the 2nd ACVA/SCBA-virology meeting in Kunming, July 28, 2019.

14. Response and discussion on the role of $\alpha 4\beta 7$ antibody in the control of HIV/SIV infection: 3 Science papers with all negative results - what has gone wrong and what is next?

15. Dr. Feng Shao won the 2019 Future Scientific Prize in Biological Sciences: congratulations and discussions on the scientific evaluation systems in China – ideas and solutions.

16. Three members among the 2019 Journal of Virology top 25 reviewers: Drs. Dongdi Feng (冯枞棣), Bin He (何斌), and Dong-Yan Jin (金冬雁); note that Dr. Bin He is PhD advisor of Dr. Feng, and both have been on the list multiple times, including 2018 (Drs. Ju-tao Guo and Jianming Hu were among the 2018's JVI top 25 reviewers)

17. Response and discussion about the 2019 Lasker award for the discovery of T and B development.

18. Overwhelming responses to Dr. Xuetao Cao's publication issues raised by Pubpeer.com, and heated discussion on scientific misconduct in general.

19. Heated discussion on publishing in CNS (Cell, Nature and Science), selection of conference speakers, and scientific community networking.

20. Themed discussion on self-plagiarism and direct feedback from Editor in Chiefs of Journal of Virology (Roz Sandri-Goldin), Journal of Immunology (Gene Oltz), Viruses (Eric Freed), Emerging Microbes and Infections (Shan Lu), etc.

21. Themed discussion on publications of structural biology studies in CNS - a scientific favor or true advance in biology?

22. Themed discussion on US patents and institution royalties - why are they different?

23. Themed discussion on viral entry: definition of viral receptors – requirements and pitfalls.

Shan-Lu Liu, MD, PhD
President of ACVA/SCBA-Virology
The Ohio State University

Subject: [EXTERNAL] Happy Thanksgiving and meeting next year, June 12-13, 2020

Dear friends and colleagues,

I wish you all a great Thanksgiving holiday!

A few updates:

1. We will have our first scientific meeting on June 12-13, 2020, right before the ASV annual meeting (June 13-17) in Fort Collins, Colorado State University. Organizing and scientific committees will be formed soon.
2. I am excited to share that Dr. Xiang-Jin (XJ) Meng of Virginia Tech, a distinguished virology and a member of the US National Academy of Science, will be the keynote speaker of this meeting. Details will follow.
3. In addition to scientific programs, we will also hold an election; a new leadership team will be elected to serve our community for the next two years.
4. Attached please find a brief report of our Kunming meeting, along with a few photos.

Please let me know if you have comments and suggestions.

All best wishes, and happy holidays!

Subject: How did covid-19 begin? Its initial origin story is shaky. from The Washington Post

https://www.washingtonpost.com/opinions/global-opinions/how-did-covid-19-begin-its-initial-origin-story-is-shaky/2020/04/02/1475d488-7521-11ea-87da-77a8136c1a6d_story.html

Please see link to article that appeared today in the Washington Post. I've has inquiries already. Any information you might have to address the work done in the Wuhan CDC would be helpful. BSL2 work there on coronaviruses? True?

Thanks, and I hope you are all well. Things are heating up here but so far everyone is well.

Best wishes, Jim

Dear Prof Wang,
Noted with thanks.

Dear Pei Yong,
Many thanks for accepting our invitation. We will send you a letter of invite for your visit from 16 March to 21 March and follow up with you with more information.

Thank you and we look forward to seeing you in March.

Regards,
Yih-Shin

Dear Linfa,

Happy 2020!

Many thanks for the kind invitation. I am excited about the visit and the retreat. I could arrive on Monday and give a seminar on Tuesday and leave on Saturday.

I'm glad you are helping with the "Wuhan pneumonia" investigation. Please let me know if there is anything I could help.

All the best from Galveston!

Dear Pei Yong,

Happy 2020!

We are planning a BIG retreat for EID on 19-20 March 2020, first time to have a 2-day retreat.

We are going to invite all past PIs (Duane, Veronika, etc) and will officially farewell Mariano.

We thought it will be a good idea to give Mariano a surprise by inviting you as a guest speaker.

Duke-NUS will of course cover the return business class airfare and all associated costs.

Do let me know if you are available and able to do that.

Thanks in advance.

Cheers,

LF

Subject: 3rd Virtual U.S. China dialogue meeting on COVID-19
Attachments: Immunity topics for 3rd China U.S. Dialogue.docx

Greetings,

As we discussed during our meeting on Monday we hope to hold a third virtual dialogue meeting with CAS and CCDC experts to discuss what is known about COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

We have proposed to CAS that this meeting take place on **Tuesday evening, May 26 from 9:00 -11:00 PM ET for the Americans** (and the morning of Wednesday, May 27 for the Chinese). I have attached the list of questions on these topics we sent to CAS for your information. **Please let me know if you are interested and available to participate in the 3rd virtual dialogue meeting.**

Kind regards,

Ben

Subject: RE: Follow up Meeting to Discuss Results of the Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Thought it would be helpful to send you a basic outline for the follow up call (**at 11:30 ET today**).

1) Intro
2) Comments on the Day 1 and Day 2 discussion
3) Ideas for topics (and additional American experts) for future virtual dialogue sessions
4) Discussion of George Gao's joint statement idea
5) CAS idea to post a blurb about the meetings on the CAS website
6) Other issues, concerns

I have attached the dialogue agenda (American version) for reference along with Jim's summaries of future collaboration ideas from the sessions.

I know a few people can't make it but I would be happy to follow up with you individually over the phone or email.

I look forward to talking to the group soon.

3rd U.S.-China Virtual Dialogue Conference Call

COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

Questions:

Immune Response and Immunotherapy

- Use of antibody assays in diagnosis of acute disease and as an indicator of protection
  - How is immune response being measured?
  - Was there standardization of testing tools?
- What can be said about the characterization of the
  - Innate immune responses?
  - humoral immune response?
  - cellular immune response?
- What is China's experience in using immune plasma or other antibody-based therapies for COVID-19 patients and for prevention of infection?
  - Is the use of immune plasma effective?
  - Have there been any complications?
- What has been China's experience with human monoclonal antibodies for treatment and prevention?
  - Do a majority of the monoclonal antibodies isolated from patient B cells produce neutralizing antibodies?
- What immunopathologies are evident in the patients with COVID-19?
  - Are there any biomarkers in patients who develop systemic inflammation?
  - What is the most effective treatment for patients who develop a cytokine storm?

Immunity

- After recovery, what types of antiviral immune responses are present?
- Do these immune responses protect from re-infection?
- What is known about the durability of neutralizing antibody and longevity of protective immunity?
  Did recovery from SARS provide any protection from infection with SARS-CoV-2?

Reactivation or Reinfection of Recovered Patients

- Has reactivation of latent virus or re-infection been seen among survivors?
- Is reactivation/reinfection a concern with respect to a fall resurgence?
- What steps should be taken in anticipation of a fall resurgence in transmission?

Subject: Requesting for reference letter - Eng Eong Ooi (Nomination for National Medical Excellence Awards)

~ Sent on behalf of Professor Linfa Wang, Programme Director, Programme in EID, Duke-NUS Medical School ~

Dear Prof Shi,

The National Medical Excellence Awards (NMEA), organised by Singapore's National Medical Research Council (NMRC), is a series of awards that aims to recognise and celebrate healthcare professionals who have made significant contributions to medical excellence in Singapore, be it in the fields of research, knowledge translation, clinical practice or healthcare delivery.

The Core Leaders of Singhealth Duke-NUS Academic Medical Center has proposed for Professor Eng Eong Ooi to be nominated for the NMEA Outstanding Clinician Scientist Award for his contributions in translation research. Prof Ooi is a three-time recipient of the NMRC Clinician-Scientist Senior Investigator Award and led several investigator-initiated clinical trials.

We will be grateful if you could provide a reference letter for Prof Ooi's nomination for this prestigious national award. It would be helpful if you would comment on the following:

1. Prof Ooi's contributions towards healthcare research resulting or will result in healthcare benefits for the Singapore community;
2. His involvement in the translational and/or clinical research and how his basic research impacts the clinical and commercialisation outcomes;
3. The impact of his contributions and recognition on the international level;
4. Any additional ins insights that may be helpful in strengthening this nomination

Attached is a copy of his CV for your reference. We would appreciate a reply by 7 Feb 2020, if at all possible. Please send your letter to me (linfa.wang@duke-nus.edu.sg) and our programme manager (yihshin.lai@duke-nus.edu.sg). Thank you in advance for taking time to do this. Your response will be maintained in confidence.

Yours sincerely,

Subject: RE: Singapore visit in March

Dear Pei-Yong,

You beat me by 3 hours! We have made the decision to postpone the retreat, but I will first announce it at our PI meeting in one hr's time. I was going to then send the postpone notice to all guests!

Extremely busy, but a lot to chat about. So I will try to give you a call on the weekend. Let me know what is a good time and your number.

Thanks

Hi Linfa,

Congratulations for the very nice commentary at Lancet!

I'm writing to see if we should postpone the trip to Singapore. If so, Yih Shin needs to help me cancel the flight and hotel reservations.

Hope all well in Singapore. We could catch up over phone when you get a chance.

Best wishes from Galveston!

Pei-Yong

Here it is.

I am sure that you are watching closely the WIV saga being played out in the highest US political level and it is now in Australia as well!

Very sad indeed! I am worried that this will be another WMD scandal: found "evidence" at any cost, even if fabrication is required!

- External Email -

Dear Linfa,

I'm writing for a support letter for an NIH grant I'm participating. The grant is to support the World Reference Center for Emerging Viruses and Arboviruses (WRCEVA) at UTMB. The WRCEVA collects more than 7,000 viruses and distribute to global research on emerging viruses, particularly arboviruses. We are asking a few prominent scientists who have been collaborators of WRCEVA faculty or major customers of our repositories to write letters of support to include in the application. It is critical for us to demonstrate the impact of the WRCEVA to the virology community, so these letters will be important components of the application,

If you are willing to write a letter, feel free to use the attached template or guide you, or of course you may choose to write something more personal.

If possible, please send your letter electronically on letterhead by May 5th.

Many thanks for your support.

Best regards,
Pei-Yong

RE: Support Letter for the World Reference Center for Emerging Viruses and Arboviruses (WRCEVA)

Dear Scott,

I am writing to express my enthusiastic support for your NIH R24 renewal application in support of the World Reference Center for Emerging Viruses and Arboviruses (WRCEVA). As you know, the Duke-NUS Medical School has been a major beneficiary of the WRCEVA for many years as the recipient of critical virus strains, antibodies, and other reagents for our research programs. Your unique collection of viruses and associated reagents has been essential to many aspects of our work, including our rapid response to the Zika virus outbreak in Singapore. We have benefitted from several highly productive scientific collaborations leading to our world class findings about the virus structure and rapid development of Zika vaccine candidates. I also want to confirm that my institution will continue to rely on the WRCEVA for assistance with the identification and characterization of new viruses and strains as needed, and we will contribute samples to your collection in order to help maintain its unique value to the scientific community.

Yours sincerely,

Subject: Requesting for reference letter - Eng Eong Ooi (Nomination for National Medical Excellence Awards)

~ Sent on behalf of Professor Linfa Wang, Programme Director, Programme in EID, Duke-NUS Medical School ~

Dear Prof Shi,

The National Medical Excellence Awards (NMEA), organised by Singapore's National Medical Research Council (NMRC), is a series of awards that aims to recognise and celebrate healthcare professionals who have made significant contributions to medical excellence in Singapore, be it in the fields of research, knowledge translation, clinical practice or healthcare delivery.

The Core Leaders of Singhealth Duke-NUS Academic Medical Center has proposed for Professor Eng Eong Ooi to be nominated for the NMEA Outstanding Clinician Scientist Award for his contributions in translation research. Prof Ooi is a three-time recipient of the NMRC Clinician-Scientist Senior Investigator Award and led several investigator-initiated clinical trials.

We will be grateful if you could provide a reference letter for Prof Ooi's nomination for this prestigious national award. It would be helpful if you would comment on the following:

1. Prof Ooi's contributions towards healthcare research resulting or will result in healthcare benefits for the Singapore community;
2. His involvement in the translational and/or clinical research and how his basic research impacts the clinical and commercialisation outcomes;
3. The impact of his contributions and recognition on the international level;

4. Any additional ins insights that may be helpful in strengthening this nomination

Attached is a copy of his CV for your reference. We would appreciate a reply by 7 Feb 2020, if at all possible. Please send your letter to me (linfa.wang@duke-nus.edu.sg) and our programme manager (yihshin.lai@duke-nus.edu.sg). Thank you in advance for taking time to do this. Your response will be maintained in confidence.

Yours sincerely,

Linfa (Lin-Fa) WANG, PhD FTSE

Curriculum vitae

Name: Ooi Eng Eong
Title: Professor
Email: [HYPERLINK "mailto:engeong.ooi@duke-nus.edu.sg"] **Contact No**: 6516 8594
Office Mailing Address: Duke-NUS Medical School, 8 College Road, Singapore 169857
Current Position: Professor & Deputy Director, Programme in Emerging Infectious Diseases, Duke-NUS Medical School

Joint Positions:
Professor, SingHealth Duke-NUS Global Health Institute
Professor, Saw Swee Hock School of Public Health, National University of Singapore
Professor, Department of Microbiology & Immunology, National University of Singapore
Co-Director, Viral Research and Experimental Medicine Centre, SingHealth Duke-NUS Academic Medical Centre
Co-Founder, Tychan Pte Ltd

Academic qualifications (Indicate the degree's title, year of award and name of the institution that conferred the degree)

B.M., B.S.	University of Nottingham (1993)
Ph.D.	National University of Singapore (1998)
FRCPath.	Royal College of Pathologists, UK. (2013)

Research interests
The global emergence of epidemic dengue is fuelled partly by an incomplete understanding of the determinants of both dengue immunity and pathogenesis. My background in clinical medicine and molecular biology enables me to position my research at the interface between clinical epidemiology and trials with basic virology and immunology. Specifically, my research interests are to define how antibodies either protect against or enhance dengue virus infection and the molecular determinants of clinical and epidemiological fitness of dengue viruses. By understanding these mechanisms, I hope to contribute to the development of effective vaccines and therapeutics against dengue and other flaviviruses.

I am also interested in translational research. I co-founded Tychan Private Limited, a Singapore-based Temasek owned clinical-stage biotechnology company that develops therapeutic antibodies for emerging viruses. I have also co-founded the Viral Research and Experimental Medicine Centre at SingHealth Duke-NUS Academic Medical Centre (ViREMiCS), which aims to develop molecular endpoints to accelerate therapeutic and vaccine trials for both academia and industry.

Selected Professional Memberships and Contributions

1994-	Singapore Medical Council – full registration
2003-	Fellow of the Royal Society of Tropical Medicine and Hygiene
2006-	Member, American Society of Tropical Medicine and Hygiene
2006	WHO Temporary Adviser, UNICEF/UNDP/World Bank/WHO Special Programme for Research and Training in Tropical Diseases Scientific Working Group on Dengue
2009-2020	Member, Local Review Panel, National Medical Research Council, Singapore
2013-	Fellow of the Royal College of Pathologists, UK
2014-2016	Member of the Dengue Vaccine Scientific Advisory Board for Sanofi Pasteur
2015	Co-founder of Tychan Pte Ltd (a clinical stage biotechnology company in Singapore)
2017-2022	Editor, Journal of General Virology
2019	Director, Global Dengue and Aedes-transmitted Diseases Consortium
2019	Member, Dengue Vaccine Immunology Advisory Board, Takeda Vaccines Inc.
2019	Chair, Dengue Vaccine Efficacy Advisory Board, Takeda Vaccines Inc.
2019-2020	Co-Chair, Lancet Commission on *Aedes*-Transmitted Diseases

Honours

2010 NMRC Clinician-Scientist Award (Senior Investigator)
2013 Fellow of the Royal College of Pathologists, UK (by published works)
2014 NMRC Clinician-Scientist Award (Senior Investigator)
2016 1st Prize in SingHealth- Duke-NUS Research Team Award
2017 Fellow of the Academy of Medicine, Singapore
2019 NMRC Clinician-Scientist Award (Senior Investigator)
2019 1st Prize in SingHealth- Duke-NUS Research Team Award
2019 National Healthcare Group Research Impact Award

Patents held (related or unrelated to the study)

1) US Patent Application No 10/564,617, 2004. Diagnostics for SARS virus. Inventors: Kwang J, Ling A, Ooi EE, Chng H.

2) US Patent Application No PCT/SG2007/000310. Hemagglutinin antibody and uses thereof. Inventors: Hanson BJ, Lim AP, Ooi EE, Boon AC, Webby RJ. Filing date: 03 Jan 2010.
3) International Patent Application No PCT/SG2013/000455. Assay for the parallel detection of biological material based on PCR. Inventors: Wang L, Ooi EE, Sessions OM, Anderson DE. Filing date: 22 Oct 2013.
4) International Patent Publication No. WO2014/143907 A1. Novel dosing regimens of celgosivir for the treatment of dengue. Dow GS, Morrish G, Reid M, Vasudevan SG, Sung C, Rathore A, Watanabe S, Low J, Ooi EE. Publication date: 18 Sep 2014.
5) Singapore Patent Application 10201602980W. Rapid method of generating live attenuated vaccines. Ooi EE, Goh KC, Kwek SS, Tang CK. Filing date: 04 May 2016.
6) US Patent Serial No. 62/408020. Antibodies that bind zika virus envelope protein and uses thereof. Sasisekharan R, Tharakaraman K, Chan KR, Watanabe S, Vasudevan SG, Ooi EE. Filing date: 13 October 2016.

Summary of research outcomes from NMRC grants

Various grants from NMRC have enabled my laboratory to investigate the mechanistic basis of antibody-dependent dengue virus infection, including demonstration of this hypothesis in an experimental medicine trial. My laboratory has also led the way in showing how a small number of genetic differences can have profound effects on the epidemiological fitness of dengue virus. The latter understanding has now enabled us to develop a rapid approach to deriving attenuated flaviviruses for further exploration as vaccine candidates. These studies that mostly interface clinical and laboratory approaches have been published in well-respected journals. Several patents based on these findings have also either been granted or are at the national phase.

The translational focus of my research has also enabled me to play leading roles in several investigator-initiated clinical trials. One was a phase 2 trial that tested the efficacy of cholorquine as a prophylactic drug for influenza (published in *Lancet Infectious Diseases* in 2011). This trial was motivated by my laboratory's bench-based research findings. The second was to test the efficacy of celgosivir as an anti-dengue drug (published in *Lancet Infectious Diseases* in 2014) and the third was a phase I trial on a virus-like particle-based influenza vaccine (published in *Vaccine* in 2015). The final one was to test the effect of cross-reactive antibodies on the immunogenicity of live attenuated yellow fever vaccination. Primary and exploratory findings from this trial, which for the first time tested a long-standing hypothesis on antibody-dependent enhancement of virus infection through a proof-of-concept clinical trial, were published in *Nature Microbiology*, *JCI Insight* and *Nature Medicine*. Notably, of these 4 clinical trials, 3 were directly as a consequence of the basic virologic and immunologic investigations in my laboratory. My laboratory has also supported industry-sponsored therapeutic and vaccine development, including a pan-dengue therapeutic antibody against dengue (Visterra Inc, now licensed to Serum Institute of India), Zika and yellow fever (developed by Tychan Pte Ltd). We are currently in discussions with Takeda Vaccines and Janssen Pharmaceutica on collaborative clinical trials to evaluate their dengue vaccine and antiviral drug candidates using the laboratory tools that we have developed.

Dear Pei Yong,

Happy 2020!

We are planning a BIG retreat for EID on 19-20 March 2020, first time to have a 2-day retreat.

We are going to invite all past PIs (Duane, Veronika, etc) and will officially farewell Mariano.

We thought it will be a good idea to give Mariano a surprise by inviting you as a guest speaker.

Duke-NUS will of course cover the return business class airfare and all associated costs.

Do let me know if you are available and able to do that.

Thanks in advance.

Cheers,

Review Template.docx

Good afternoon all,
As promised this morning, I am sending you the 2020 Pilot projects. Please return your reviews by April 1 at the latest. I have also attached the review template.
Thank you,

Toni Baric

A. Personal Statement

My research career has involved investigating numerous and diverse phenomena related to innate immunity, molecular biology, and viral disease. This includes exploring the biology of pattern recognition receptor signaling, the type I interferon response, and the mechanistic roles of innately activated transcription factors. Early in my career I focused on these topics largely in the context of virus-mediated activation, direct antiviral responses, and viral immune evasion. Recently my efforts have shifted to investigating the function and roles of innate immune processes for establishment of adaptive immunity. This includes examination of the specific signaling pathways and factors that potentiate antigen presentation and T cell activity but also the harnessing of these responses for beneficial clinical outcomes. In light of this my work now commonly employs techniques of drug discovery and development to identify and characterize novel compounds that elicit precisely targeted innate immune reactions useful in the contexts of vaccine enhancement, anti-tumor immunity, and broad-spectrum antiviral activity. This has led to the identification and characterization of novel IRF-activating molecules and a multi-investigator effort to understand how these can be employed in the context of immunotherapeutics. Experimentally I have employed and adapted a broad range of model types including *in vitro* and *ex vivo* culture of mammalian cells, mice, and nonhuman primates. I have also utilized and mastered a range of investigative and high content exploratory platforms including transcriptomics (RNAseq and hybridization array), proteomics, and high throughput chemical screening. I also routinely employ and customize numerous cutting-edge molecular methodologies such as viral expression vectors, transposon-mediated transgenics, cell reporters, CRISPR/Cas9-driven genome editing, protein techniques, and viral mutagenesis. My work has integrated these approaches with *in vivo* examination of adaptive immune responses including antibody and T lymphocyte activities. This scientific background has allowed me to accumulate a valuable infrastructure of reagents, equipment, and intellectual resources. As such, I am well positioned to lead the studies outlined in this proposal.

B. Positions and Honors

Positions and Employment

1993-1995	Research Asst., Dept. of Biological Sciences, Wayne State University, Detroit, MI
1995-1996	Teaching Asst., Dept. of Ecology & Evolutionary Biology, University of California, Irvine
1997-2001	Research Asst., Dept. of Ecology & Evolutionary Biology, University of California, Irvine
2001-2005	Postdoctoral Fellow, OHSU Vaccine and Gene Therapy Institute, Beaverton, OR
2005-2011	Research Assistant Professor, OHSU Vaccine and Gene Therapy Institute, Beaverton, OR
2011-2016	Assistant Scientist, OHSU Vaccine and Gene Therapy Institute, Beaverton, OR
2013-Present	Adjunct Faculty, OHSU Dept. of Molecular Microbiology and Immunology, Portland, OR

2016-2019 Assistant Professor, OHSU Vaccine and Gene Therapy Institute, Beaverton, OR
2019-Present Assistant Professor, Division of Pathobiology and Immunology, Oregon National Primate Research Center, Beaverton, OR
2019-Present Associate Professor, OHSU Vaccine and Gene Therapy Institute, Beaverton, OR

Professional Activities

2010-2011 Faculty of 1000 Associate Member
2012 NIAID Scientific Review Program for RFA-AI-12-020 "Partnerships for Interventions to Treat Chronic, Persistent and Latent Infections"
2014 Reviewer, California National Primate Research Center Pilot Research Program
2016 NIAID Scientific Review Program for PAR-16-106 "Rapid Assessment of Zika Virus (ZIKV) Complications"
2016 NIAID Scientific Review Program for RFP-NIAID-DMID-NIHAI2016059 "Pre-clinical Models of Infectious Diseases"
2018 Reviewer, Wellcome Trust DBT Fellowship
2018 Reviewer, Israeli Science Foundation
2020 NIAID Scientific Review Program for PHS-2020-1 "Adjuvant Development for Vaccines against Infectious or Immune-mediated Diseases"
2011-2013 Board of Directors, Buck Buck Foundation for Cytomegalovirus Awareness
2014-2019 Scientific Consultant, Tomegavax, Inc.
2015-2019 Scientific Advisor, NeuraLexo, Inc.
2013-Present Editorial Board Member, Journal of Virology
2017-Present Associate Editor, Frontiers in Cellular and Infection Microbiology
2019-Present Editorial Board Member, Cytokines

C. Contributions to Science (***Corresponding Author***)

1. Discovery and Characterization of Novel Innate Immune Stimulating Compounds.
Targeted activation of innate immune responses by small molecules has proven to be a powerful strategy for achieving beneficial clinical outcomes related to anti-cancer therapeutics, vaccine adjuvanticity, and broad-spectrum antiviral activity. My work has focused on leveraging these responses for immunotherapeutic purposes while identifying new molecular entities that may function as potential drug leads or research tools to facilitate dissection of associated innate immune processes. For this my group has employed high throughput screening that utilizes custom reporter cell lines constructed in our laboratory using sophisticated transgenic tools. Novel compounds discovered in this way are then characterized with respect to the transcriptional profiles they generate, phenotypes they elicit, and host targets required for their effects. To achieve these ends my group has pioneered the use of CRISPR/Cas9-mediated genome editing to construct a library of cells lacking targeted innate immune signaling and effector proteins that is used to identify essential cellular factors via loss of function assays. This technology also allows us to quickly dissect the molecular mechanistic bases of innate immune phenotypes. Additionally, we use medicinal and computational chemistry approaches to construct compound analogs and understand structure-activity relationships. This work has led to the identification and molecular characterization of the first novel small molecule agonists of the STING pathway as well as a novel TRIF-activating molecule. I served as the senior investigator for these relevant studies:

2. Innate Detection of Cytoplasmic DNA in the Context of Viral Infection.
Human cytomegalovirus is a ubiquitous beta-herpesvirus that infects hosts for life. While generally asymptomatic in immunologically healthy people, it can be a dangerous opportunistic infection during immunocompromise and represents a leading infectious cause of birth defects. The innate immune response to cytomegalovirus is a poorly understood phenomenon but involves induction of the type I interferon and inflammasome systems and, prominently, is fundamentally triggered by the sensing of cytoplasmic DNA. My work has led to characterization of processes and host factors involved in this response including the first demonstration that STING is required for cytomegalovirus innate immune recognition. This has involved the use of reverse genetics and functional genomics to allow an understanding of the importance of innate signaling pathways during infection. I served as a primary investigator for these relevant studies:

1. Botto S, Abraham J, Mizuno N, Pryke K, Gall B, Landais I, Streblow DN, Früh KJ, *DeFilippis VR. 2019. Human Cytomegalovirus Immediate Early 86-kDa Protein Blocks Transcription and Induces Degradation of the Immature Interleukin-1β Protein during Virion-Mediated Activation of the AIM2 Inflammasome. mBio **10**:257. 3. Biology and Evolution of DNA Tumor Viruses.
DNA viruses such as Kaposi Sarcoma virus and papillomaviruses represent significant etiological sources of human cancers. Understanding the fundamental biology and evolution of these pathogens is not only crucial to our efforts to treat and eradicate them but also brings to light important phenomena regarding tumor biology and their co-evolution with human hosts. I have made contributions to studies that examine both virus-host biology of these agents but also their epidemiological and evolutionary histories, which has required the use of sophisticated techniques of computational molecular data analysis. I served as a primary or co-investigator for these relevant studies:

1. Xi LF, Schiffman M, Koutsky LA, Hulbert A, Lee S-K, DeFilippis VR, Shen Z, Kiviat NB. 2012. Association of human papillomavirus type 31 variants with risk of cervical intraepithelial neoplasia grades 2-3. Int J Cancer 131:2300–2307. PMID: 22396129

4. Development and Utilization of Nonhuman Primate Models of Viral Disease and Immunity.
Nonhuman primates (NHP) represent a unique and powerful model for understanding the impacts of and responses to viral infection. I have been pivotally involved in multiple studies that have led to establishment of new research models that employ NHP, revealed novel phenomena regarding emerging Zika ang Chikungunya virus biology, and led to unexpected discoveries in cytomegalovirus replication. Ultimately, this work has served to mold my skills and direct my ability to leverage NHP models for acquiring impactful research outcomes. I served as a co-investigator for these relevant studies:

5. Infection by and Immunity to Emerging Alpha- and Flaviviruses.
Mosquito-transmitted viruses that are currently undergoing widespread and explosive outbreaks throughout equatorial regions of the world include members of the flavivirus (e.g. Dengue, West Nile, and Zika) and alphavirus (e.g. Chikungunya) clades. Unfortunately, a deficiency of knowledge exists regarding the immunobiology, pathogenesis, and antiviral strategies to which these viruses are susceptible. This includes an understanding of how the viruses activate and evade innate immunity and what factors control tissue dissemination and control. My work has made multiple contributions to these fields including description of an unusual nearly global host transcription and translational shutoff mechanism exhibited by the Chikungunya virus in human cells. In addition, I was involved in characterization of a novel RIG-I agonist that confers broad-spectrum antiviral efficacy. Ultimately this work will facilitate identification of immune-based strategies that can be used to combat viral disease and spread. I served as a primary or co-investigator for these relevant studies:

NIH/NIAID
Mechanistic Exploration of cGAS-STING-Mediated Vaccine Enhancement
cGAS and STING comprise a cellular signaling pathway crucial to generating innate and adaptive immune responses against microbe-infected cells that can elicit beneficial vaccine outcomes when stimulated by adjuvants. The goals of this work include detailed characterization of the molecular and immunological effects of STING activation using a combination of biochemical, murine, and nonhuman primate experimental models. Results we generate will have a transformative impact on our understanding of the biological role of STING and its immunotherapeutic potential as a pharmacologic target.
Role: Principal Investigator

HHSN272201400055C (Nelson, PI) 10/01/2019 – 09/30/2024
NIH/NIAID
Adjuvant Discovery Program
The goal of this work is to identify novel small molecules capable of stimulating activation of STING that can be used to enhance immunogenicity of flavivirus and alphavirus vaccines. This is undertaken in a partnership with Inimmune, Inc. and focuses on high throughput screening of chemical libraries to reveal and ultimately develop new innate activating compounds to enhance vaccine immunogenicity. There is no overlap with the current proposal.
Role: Co-Investigator

HHSN272201400055C (Nelson, PI) 09/30/2014 – 09/29/2020
NIH/NIAID
Adjuvant Discovery Program
The goal of this work is to identify novel small molecules capable of stimulating activation of IRF1, IRF3, or IRF5 that can be used to enhance immunogenicity of flavivirus vaccines. This is undertaken in a partnership with Inimmune, Inc. and focuses on high throughput screening of chemical libraries to reveal and ultimately develop new innate activating compounds to enhance vaccine immunogenicity. There is no overlap with the current proposal.
Role: Co-Investigator

NIH/NIAID
Antiviral Drug Discovery and Development Center: Project 2: Novel Therapeutic Strategies Targeting Re-emerging Alphaviruses
The main goal of this project is to develop novel nucleoside and nucleotide inhibitors directed against alphaviruses including Chikungunya virus and Venezuelan Equine Encephalitis virus. This work involves identifying antiviral molecules in a high throughput in vitro virus replication screen, validating their efficacy and nontoxicity in vitro, and optimizing their utility to clear virus replication in mouse models of infection. There is no overlap with the current proposal.
Role: Co-Investigator

Scope of Work

The goal of the work outlined in this pilot proposal is development of a powerful *in vivo* tool to mechanistically explore innate immune correlates of and genotype-associated variation in vaccine-mediated immune responses. Vaccination represents the most efficient tactic for combating infectious disease. Unfortunately, the immune activity elicited by vaccines can vary greatly between individuals and surprising gaps exist in our knowledge regarding how they work to enhance immunogenicity. The Collaborative Cross (CC) mouse model was devised to enable systems genetics and predictive biology approaches in an *in vivo* platform that recapitulates the phenotypic diversity of human populations. Preliminary work from our group utilized a panel of CC-derived lines to demonstrate striking variation in response to an adjuvanted protein vaccine against Zika virus. Based on this we predict that the CC model will be highly valuable as a tool for characterizing molecular and immunological correlates of vaccine efficacy. This pilot proposal aims to acquire experimental observations that serve as an important proof of principle supporting this idea. We therefore plan to undertake an investigation of the CC lines used in our previous study to characterize innate immune processes associated with diversity of vaccine-induced reactivity. Innate immune function is closely linked with the establishment of protective adaptive immune responses, especially those elicited by vaccination. Moreover, genotypic and phenotypic variation in innate immune genes and processes is evident in human populations. We aim to characterize vaccine-induced secretion of cyto/chemokines as well as innate cell trafficking to understand how they correlate with particular immune outcomes. These data can then be used to devise mechanistic models and allow novel hypotheses to be formed about their functional importance in vaccine efficacy. This will also facilitate further development of the CC model for dissecting genotype-associated vaccine responses.

Specific Aims

The goal of the work outlined in this pilot proposal is development of a powerful *in vivo* tool to mechanistically explore innate immune correlates of and genotype-associated variation in vaccine-mediated immune responses. Ultimately this will allow hypothesis-driven and clinically impactful investigation of causal links between vaccination outcomes and organism-specific attributes such as gene loci and immunological processes. Vaccination represents the most efficient and adaptable tactic for combating infectious disease. Vaccine platforms comprised of non-replicating immunogenic microbial antigens are extremely safe but elicit weaker immunity, a condition mitigated through co-administration of immune-enhancing molecules termed adjuvants. *Importantly, the immune activity elicited by vaccines can vary greatly between individuals with non-responsiveness to or reactogenicity associated with vaccination being demonstrable in patient populations*. While this diversity is influenced by numerous parameters (e.g. age, race, and socioeconomic conditions), genetic makeup contributes substantially to vaccine efficacy. However, basic and surprising gaps exist in our knowledge regarding how adjuvanted vaccines work to enhance immunogenicity. Obtaining a functional understanding of the relationship between the response to vaccination and underlying variables associated with genetic variability will require a model that is experimentally tractable, recapitulates key aspects of human outcomes, and can be used to probe cellular and molecular correlates. Examination of immune-related phenomena using human tissues and populations can be informative but these are not ideal for mechanistic characterization of vaccine success or operation. Contrastingly, laboratory mice are desirable to investigate immune function since they are easy to handle, can be maintained in a controlled setting, and allow for large sample sizes. Moreover, mice and humans share >90% of the same genes and thus successful genetic discovery efforts in humans often originate in murine studies. However, efforts that employ individual inbred mouse strains (e.g. C57BL/6) fail to recapitulate the phenotypic diversity exhibited by human populations, greatly reducing translatability of acquired results. In response to this insufficiency, the Collaborative Cross (CC) mouse model was devised to enable systems genetics and predictive biology approaches in an *in vivo* platform. CC mice comprise a panel of recombinant inbred (RI) lines derived from sequential breeding of eight founder strains chosen to maximize genetic and thus phenotypic variability, resulting in representation of millions of uniformly distributed polymorphisms. This gives rise to a reproducible set of genetic clones that can be exploited as both a powerful forward genetics tool as well as a generator of phenotypic diversity mimicking that displayed by outbred populations such as humans. Preliminary work from our group has utilized a set of eleven CC-derived RI lines to demonstrate striking variation in response to an adjuvanted protein-based vaccine against Zika virus. *Based on this we predict that the CC model will be highly valuable as a tool for characterizing molecular and immunological correlates of vaccine efficacy.* This pilot proposal aims to acquire experimental observations that serve as an important proof of principle supporting this idea. Our ultimate hope is that a straightforward and cost-effective model of vaccine response diversity in CC mice can be developed that will allow: 1) detailed characterization of the associated innate and adaptive mechanisms; and 2) identification of genes pivotal for establishment of protective immunity. We plan to accomplish this in the following specific aim:

***Specific Aim*: Characterize innate processes associated with vaccine response diversity**

Our preliminary data indicate that CC-RI lines exist that exhibit a phenotypic range with respect to vaccine-mediated antibody titers. As such, these represent a distinct and potentially highly informative set of models that are likely to yield valuable information about the physiological mechanisms responsible for this disparity. We therefore plan to undertake a comparative characterization of molecular and immunological processes associated with substantial differences in vaccine-induced reactivity. We aim to identify secreted cyto/chemokines and or innate immune processes that correlate with particular outcomes that can then be used to devise models and allow novel hypotheses to be formed about their functional importance in vaccine efficacy.

Background and Significance

Vaccines are essential for diminishing pathogen-mediated illness. Yet the potency of protective responses they elicit varies greatly between individuals. While these responses are influenced by many parameters, genetic makeup contributes substantially[1-7]. Genome-wide association studies have identified many polymorphisms in protein coding regions that link innate and adaptive immune functions crucial to vaccine efficacy[4,7,13,14]. This includes receptors, cytokines, and antimicrobial effectors as well as proteins involved in antigen presentation. Vaccines comprised of inert antigen are the safest immunization platform since no microbial growth occurs. However, since their administration and exposure are localized and transient, these do not activate as many facets of the immune response and can lead to weaker, shorter-lived immunity. This is mitigated through the co-administration of molecules termed adjuvants that augment immunogenicity by stimulating innate immune processes, often mimicking those triggered by infection. As such, innate immunity is essential to adjuvant-dependent elicitation of protective immunity[8]. In addition, innate immune genes exhibit high diversity as a result of host-pathogen co-evolution[9]. Moreover, reactogenic and adverse effects of vaccination often involve dysfunctional innate responses to vaccine components, for which evidence of a genetic link also exists[10]. *Unfortunately, a large knowledge deficit exists regarding the mechanistic link between polymorphism in immune-related genes, their molecular phenotypes, and vaccine responsiveness*[11]. Furthermore, models are lacking that both recapitulate the diversity of vaccine effects in humans and are tractable for hypothesis-based study. Mice reproduce key aspects of the human immune system (including innate reactivity[12]) and allow great flexibility of experimental parameters. However, inbred strains do not display the diversity of phenotypes present in human populations. The CC model is a set of recombinant inbred (RI) mouse lines developed to enable systems genetics and predictive biology *in vivo*[13,14]. These were derived through breeding of eight diverse founder strains, and, as such, up to eight variant alleles may be present at any locus. Individual CC-RI lines, like other inbred strains, comprise a population of genetic clones, allowing for repeat measures and comparative studies across the model. In addition to facilitating discovery of genetic factors associated with phenotypes, the CC model can also be harnessed to explore the mechanistic bases of vaccine response variation. *We hypothesize that this will be applicable as an impactful model to study variability in immune responses to vaccination, especially with respect to: 1) innate immune activation by characterized adjuvants; and 2) potentially adverse reactions to vaccines.* This will enable development of an innovative rational approach to vaccinology and ultimately facilitate strategies that are safer, more effective, and personalized to patient biology.

Preliminary Data

We utilized a replication-defective virus-like particle (VLP) antigen from Zika virus (ZIKVLP) to explore vaccine responses in CC-RI mice[15,16]. This was chosen based on its clinical importance and well-described patterns of replication and immunity in mice[17,18]. We screened the genotype-associated range of antibody (Ab) responses using eleven genetically diverse CC-RI lines in the absence or presence of immunologically dissimilar adjuvants. Mice were vaccinated with ZIKVLP alone, ZIKVLP + cyclic di-AMP (CDA; agonist of the STING pathway[19]), or ZIKVLP + Pam3CSK4 (TLR2 agonist[20]) using intramuscular (IM) prime/boost. Zika-specific total IgG was examined by ELISA using sera (currently banked) collected from mice at 3w post boost (6w post prime). *In all CC-RI lines, ZIKVLP alone led to significantly lower Ab responses than when administered with an adjuvant* (**Figure 1**). Intriguingly, while CDA improved Ab titers to a statistically significant degree in all CC-RI lines, Pam3CSK4 only did so in five of eleven lines. Moreover, mean IgG titers per vaccine type also varied *between CC-RI lines by nearly three logs*, with lines CC040 and CC031 displaying the extremes. Finally, the degree to which adjuvants enhanced IgG titers also varied greatly between lines. *Given the crucial role of innate responses in the establishment of adaptive immunity, we hypothesize that the CC model as utilized here represents a powerful tool for understanding adjuvant-associated processes that correlate with elicitation of protective immunity and perhaps reactogenicity.*

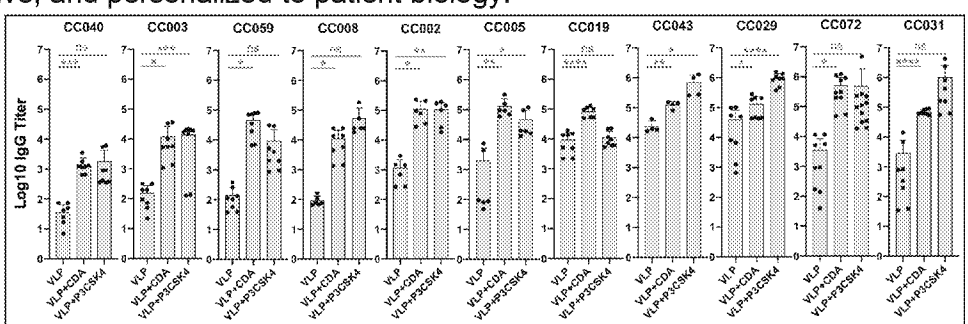

Figure 1. Zika-specific total IgG elicited by ZIKVLP in the absence or presence of CDA or Pam3CSK4 across CC-RI lines. CC-RI lines (as indicated) were vaccinated by a prime-boost strategy as described in the text and harvested at 6w post prime. Sandwich ELISA was then used to quantify antibodies reactive to Zika virus particles in duplicate. Data presented are average geometric mean titers ±SD for each vaccine cohort (n = 4 in most cases). Students T-test was then used to compare results from animals vaccinated with and without adjuvant (*p<0.05; **p<0.01; ***p<0.001; ****p<0.0001).

Specific Aim: Characterize innate processes associated with vaccine response diversity

Hypothesis: We hypothesize that innate immunological processes induced by adjuvanted vaccines are identifiable as dissimilar between CC-RI lines that display differences in induced Ab levels (**Fig. 1**). This is likely to include disparities in cytokine secretion profiles and localized immune cell recruitment and migration.

Rationale: Ab responses to adjuvanted vaccination in CC-RI lines are diverse and adjuvant-specific (**Fig. 1**). As such, these constitute a unique model from which exceptionally informative data regarding the underlying

physiological mechanisms can be retrieved. Adjuvant function correlates with transcriptomic patterns specific to tissue type as well as cytokine secretion and immune cell infiltration[21-23]. We plan to undertake an unbiased characterization of innate immunological processes associated with the differences seen in vaccine-induced reactivity. Findings can then be used in future work to test novel hypotheses about their functional importance.

Approach: We will utilize CC-RI lines described above (**Fig. 1**). First, secretion of local and systemic cytokines will be measured following vaccination with ZIKVLP with or without CDA or Pam3CSK4. Second, we will compare migration of immune cells to the vaccine site of injection (SOI). Our goal is to characterize the immediate innate immune changes that occur as a reaction to vaccine administration between CC-RI lines to identify distinguishing phenotypes that can investigated for their mechanistic roles in follow on studies.

1) Vaccine-induced cytokine profiling. Vaccines adjuvanted with innate inducers elicit secretion of immunomodulatory cytokines systemically as well as at the SOI[17-22]. Evidence indicates this facilitates transient inflammatory processes that attract antigen presenting cells (APC), enable antigen loading and delivery, and polarize adaptive immune responses. We hypothesize that the vaccine response variation observed between CC-RI lines will be reflected in levels of CDA- and Pam3CSK4-induced cytokines in injected muscle between the CC-RI lines. For this, we will vaccinate mice from each of the eleven CC-RI lines (n = 4/treatment; 2 of each sex) with PBS vehicle, ZIKVLP, ZIKVLP + Alum, or ZIKVLP + Pam3CSK4 and euthanize at 6h post vaccination (timepoint shown to represent peak induction over a time course[17,22]). Sera will be harvested and injected and contralateral (control) quadriceps will be homogenized and treated with protease inhibitor[24]. An aliquot of homogenate will also be saved for RNA isolation to allow mRNA quantitation. Next, we will use a Luminex multiplex assay to measure levels of Eotaxin, VEGF, TNF-α, RANTES, MIP-2, MIP-1β, MIP-1α, MIG, M-CSF, MCP-1, LIX, LIF, KC-like, IP-10, IL-17, IL-15, IL-13, IL-12 (p70), IL-12 (p40), IL-10, IL-9, IL-7, IL-6, IL-5, IL-4, IL-3, IL-2, IL-1β, IL-1α, IFN-γ, GM-CSF, and G-CSF in these tissues. Induction of each will be compared between vaccines and CC-RI lines using standard statistical methods. We aim to identify individual or classes of cytokines that are differentially secreted in response to specific vaccinations within and between CC-RI lines.

2) Injection site immune cell migration. Innate reactions to adjuvanted IM vaccines drive localized recruitment of immune cells to the SOI[25-28]. The magnitude and quality of recruited cells dictates antigen loading, trafficking, and presentation in draining lymph node (dLN) and correlates with establishment of adaptive immunity. To assess vaccine- and CC-RI-associated differences in this innate process, we will use flow cytometry to quantify accumulation of macrophages ($F4/80^{high}CD11b^{+}SSC^{high}$), monocytes ($CD11b^{+}Ly6C^{high}Ly6G\text{-}F4/80^{int}$), myeloid DCs ($MHCII^{high}CD11c^{+}F4/80^{low}$), plasmacytoid DCs ($120G8^{+}CD11b^{dim}CD11c^{int}$), granulocytes ($CD11b^{+}GR1^{+}$), neutrophils ($CD11b^{+}Ly6C^{+}Ly6G^{high}F4/80^{-}$), and eosinophils ($CD11b^{+}Ly6C^{int}Ly6G^{int}F4/80^{int}$) in injected muscles at 72h post-vaccination[24,25,27,28]. For this we will select a subset of CC-RI lines to examine that represent phenotypic extremes in terms of Ab response and cytokine secretion (maximum of eight lines). For instance, we will include two lines that exhibit the largest (i.e. CC059, CC008) and smallest (i.e. CC019, CC029) disparity in IgG titers between adjuvanted and nonadjuvanted VLP. We will also select four lines that display the most disparate collective patterns of cytokine secretion as determined above. Mice will be treated as described for cytokine experiments. Injected and contralateral muscle tissue will be excised and digested in IMDM containing collagenase, DNAseI, and BSA and filtered through 70 μm nylon mesh. Cells will be stained with monoclonal Ab listed above and sorted on a BD LSR-II. Data analysis and visualization will be performed using FlowJo. Contralateral muscles and those injected with PBS or VLP alone will serve as controls that will allow determination of adjuvant- and VLP-associated changes. We will then statistically compare absolute numbers of each cell type between CC-RI lines to establish whether significant differences are detectable.

Analysis of Results and Future Work: Our goal is to demonstrate that genotype-associated differences in adjuvanted vaccine immunogenicity (**Fig. 1**) correlate with innate phenotypes. This will establish CC mice as a unique platform for both: 1) discovery of immunological and genetic traits associated with vaccine efficacy; and 2) directly testing hypotheses regarding mechanistic relationships. As a proof of principle, we propose to examine cytokine induction and immune cell trafficking, two innate processes that are simple to evaluate yet fundamental to vaccine function. Given the diversity in IgG titers between CC-RI lines and vaccine types we anticipate detecting associated differences in innate immune processes. In addition to the rapid and direct induction of cytokine synthesis by STING and TLR2 activity, signaling proteins in both pathways are known to exhibit polymorphisms that affect function. We thus predict that differences will be evident in the cytokine profiles between vaccine types and CC-RI lines. Profiles will likely differ in overall magnitude of detection or predicted immune impact (e.g. Th polarization, chemotactic properties, etc.). These will also constitute important targets for follow up study. Moreover, the concurrent collection of tissue RNA will allow follow up transcriptomic work on target genes of interest. By focusing on CC-RI lines that exhibit the most dissimilar responses for immune cell assessment, we maximize the probability that differences in the underlying variables are detectable. We also expect that these results will reveal differences in cells that link innate and adaptive immune processes and thus reveal potential functional targets for follow up studies. Our long-term goal is the maturation of the CC model as a unique system for investigating processes, factors, and genes associated with vaccine reactivity. Work completed here will be both an important proof of concept and a source of targets for future hypothesis testing.

BUDGET JUSTIFICATION

KEY PERSONNEL:

Victor DeFilippis, Ph.D., Principal Investigator, 1% effort (0.12 calendar months). Dr. DeFilippis will provide the oversight to ensure proper coordination and efficient execution of research activities. Dr. DeFilippis will hold the primary role in promoting scientific direction, ensuring research progress, and facilitating communication. Dr. DeFilippis will be responsible for maintaining compliance with all institutional, federal, and NIH regulations as well as the safety and security of data, and managing materials, facilities and resources of the program.

NON-KEY PERSONNEL:

Dylan Boehm, Ph.D., Postdoctoral Researcher, 15% effort (1.8 calendar months). Dr. Boehm is a postdoctoral scientist in the DeFilippis laboratory. He is an accomplished mouse immunologist with skills and experience related to all in vivo portions of the proposal. He will be working in consultation with Dr. DeFilippis regarding the design, execution, and analysis of all mouse experiments. This includes mouse handling and vaccination, tissue processing and storage, analysis of cytokine induction, and cell infiltration assays.

Supplies and Reagents
We are requesting funds for 228 CC-RI mice ($215 each = $49,020) as well as necessary per diems. Additional procurement of Luminex multiplex cytokine kits, antibodies for flow staining, and plasticware will also be required.

A. Personal Statement

I am a graduate student at the University of Tennessee Health Science Center. I began graduate school in the Fall of 2017 where I joined Dr. Colleen Jonsson's lab that next year. Over the past few years, my studies have been focused on the study of hantaviruses (now genus *Orthohantavirus*, family *Hantaviridae*). Our lab conducts *in vitro* and field-based studies on the biology, ecology and evolution of hantavirus and I was fascinated by how these rodent-borne viruses cause disease in human however establish persistence in their reservoir hosts without causing disease. In reviewing the literature, I realized that there were fundamental gaps in our understanding of the pathogenesis of these viruses in rodent and human host. First, studies on human pathogenesis were limited to *in vitro* and clinical findings as there are no animal models that fully recapitulate human disease outcomes. Secondly, there is limited research on rodent-reservoir hosts because of the lack of genetic and immunological tools for these wild rodent species, the lack of rodent colonies and the requirements to have an ABSL-4 facility for New World Rodents. Therefore, my thesis research is focused on developing mouse models to study hantavirus pathogenesis and persistence. The dichotomous infection outcomes observed in rodents and humans provides a unique opportunity to examine the mechanisms mediating disease or persistence. Moreover, these models will be useful for preclinical testing of antivirals or vaccines.

I have the motivation and resources necessary to successfully carry out the proposed research project. My previous undergraduate research experience has enabled me to develop analytical, technical, and communication skills which has benefited my progression throughout the graduate program. Additionally, Dr. Colleen Jonsson's expertise, leadership, and guidance will greatly aid in these efforts.

B. Positions and Honors

2014	Summer Research Intern with Dr. Regina Oyesanya, Norfolk State University, Department of Biology.
2015-17	Undergraduate Researcher with Dr. Regina Oyesanya, Norfolk State University, Department of Biology.
2016	Defense Intelligence Agency Student Intern; Office of Advance Technologies Intelligence Biological Sciences Branch with Major Tracy Clinton, Charlottesville, VA
2017-present	Member, Graduate Program in Immunology, Biochemistry and Molecular Biology, UTHSC
2019-present	Member, American Society for Virology

Honors and Awards

2013-17	Dozoretz National Institute for Mathematics and Applied Science (DNIMAS) Scholar
2013-17	Dean's List, Norfolk State University
2014	Annual Biomedical Research Conference for Minority Students Travel Award
2014	Norfolk State University Special Recognition Award for Poster Presentation
2015	Intelligence Community Centers of Academic Excellence (IC-CAE) National Security Certificate Award

C. Contributions to Science

Topic 1. **Ecology and Evolution of Hantaviruses.** As a Ph.D. student in Dr. Colleen Jonsson's lab, I learned and optimized an indirect immunofluorescence assay for screening hantaviral IgG antibodies. My experience with this technique allowed me to screen blood samples collected from wild rodents captured in the Interior Atlantic Forest of Paraguay. Previously, an experimental field study was conducted by our group to test whether food resources and/or landscape composition promote the emergence of hantaviruses harbored by rodent reservoirs within their native ecosystem. For our pending manuscript, I provided data showing rodent population dynamics, rodent demographics and viral prevalence. I also assisted with statistical analysis. We found that the addition of food resources increased rodent species diversity but did not affect hantaviral prevalence. For *Akodon montensis* species, the rodent reservoirs of *Jabora Orthohantavirus*, we detected a strong statistical association between antibody-positive animals and habitat degradation. From these studies, we found that the relationship between rodent biodiversity and hantaviral prevalence depends upon the specific host-pathogen ecology. I presented this work at the 2019 American Society for Virology conference and am listed as second author. The skills obtained from this project will be useful for the development of my research project, as outlined in the Research Strategy.

A. Personal Statement

I am a Professor in the Department of Microbiology, Immunology and Biochemistry, Director of the Institute for Study of Host-Pathogen Interactions, Director of the Regional Biocontainment Laboratory at the University of Tennessee Health Science Center. During the early years of my academic career, I focused on studies to elucidate that structure-function activities of retroviral and hantaviral proteins using a combination of biochemical, virology, cell biology approaches and techniques. Over the years, these efforts have segued into a much broader, multidisciplinary research program that include laboratory and field-based efforts in the biology, ecology and evolution of hantaviruses, and drug discovery research into several emerging RNA viruses. Additionally, I have worked on the development of various small animal models for the testing of therapeutics. Lastly, I have engaged in scientific capacity building in the area of infectious disease diagnostics in several developing countries; Paraguay, Honduras, Brazil and most recently, Ukraine.

My research in the study of hantaviruses (now genus *Orthohantavirus*, family *Hantaviridae*) began in 1995 as a new Assistant Professor at New Mexico State University. I started this position during the 1993 outbreak of hantavirus pulmonary syndrome in the Four Corners region of the USA. I found the sudden appearance of this new, rodent-borne virus fascinating. In review of the literature, I quickly realized fundamental gaps in our understanding of these viruses. First, there were (and still are) no therapeutics for treatment of hantaviruses and their diseases in humans; second, there was little known regarding the structure-function of virion proteins; and third, we knew little of the dynamics of virus populations in the reservoir rodent species or during the course of infection in humans. I describe briefly our accomplishments and then summarize the current focus of my lab in international research.

Our structure-function studies of the hantaviral N protein showed the protein recognized the viral genomic RNA with fairly high affinity and we mapped the RNA binding domain to a central conserved region. Subsequent research focused on cellular trafficking on N and we were the first to show the virus trafficked to the ERGIC and required microtubules, specifically dynein. We also discovered that hantaviruses differ in their cellular components required for cellular entry/trafficking. Finally, we have worked with Rossman's group at Purdue to define the structure of the Hantaan virion by cryoelectron microscopy and we have continued these efforts with Jason Lanman at Purdue for several of the New World hantaviruses (publications in progress).

The intensive efforts of my lab in structure-function studies enabled my transition into field work. I was able to establish both ELISA and strip-based tests for hantaviruses that were used in surveys of human and animal populations. While much of the published research has been focused in Paraguay and Brazil, I led several workshops in Paraguay, Honduras, El Salvador to enable participants to conduct sero-surveillance of hantaviruses. This type of work has recently expanded to Ukraine.

Our research into therapeutics has primarily focused on defining the mechanism of action of ribavirin for HTNV. The motivation to address this question was that ribavirin is the only antiviral for treatment of hantaviral infection (open label); and we hypothesized that if we understood why it was so effective (an potent) that understanding its mechanism would open the door to better antivirals for treatment. Our studies revealed that ribavirin increased the mutation frequency (Mf) of HTNV. We learned that HTNV has a lethal threshold of Mf, past which it no longer can survive *in vitro*. We tested this in vivo in a lethal mouse model and observed that ribavirin increased Mf, but this correlates with persistence in the host, and an increase in positively-selected amino acids. In contrast, the untreated, HTNV-infected mice, showed a decrease in Mf (as compared to preexisting standing genetic variation suggesting negative selection of the virus. These findings motivated the question, how do hantaviruses spill over and adapt to new hosts? This is one of the main questions being addressed now in the lab and field studies and will be discussed in the next paragraph. Important to this effort are the approaches and techniques we have developed to sequence hantaviruses and map genetic diversity. These techniques represent our studies of the "population" structure of viruses within host. In our current efforts these techniques have been replaced by Nexgen approaches. We have now applied our approaches, not only hantaviruses, but to New World alphaviruses as part of a drug discovery effort.

As mentioned above, a third area of research in the lab is in the ecology and evolution of hantaviruses using a combination of field- and lab-based research approaches. My R01 lab-based efforts seeks to further the understanding of the evolution and host restriction mechanisms of hantaviruses in their natural rodent reservoir and spillover rodents. Secondly, we are studying the epidemiology and phylodynamics of hantaviruses in their natural hosts within populations in their natural rodent reservoir that are endemic in the Interior Atlantic Forest of Paraguay. As these are longitudinal collection studies, we are only just beginning to write manuscripts based on three years of collection efforts and several years of screening of rodent tissues for hantaviruses. Additionally, we have developed tiling techniques to obtain full length genomes by nexgen sequencing. Lastly, we have funding from NSF to model these relationships in collaboration with Dr. Linda Allen to understand the relationships of these viruses with their rodent reservoir. My current funding presents a valuable opportunity for understanding standing genetic diversity and plasticity of RNA viruses in wildlife in rapidly changing environments and genetic determinants driving its epidemiology.

Finally, I have a unique blend of professional experience and leadership skills gained from my positions over 30 years in industry, academics and not-for-profit institutes that would benefit the goals of the US-Brazil collaboration as the PI. I have led three major cross-institutional efforts that demonstrate my scientific and administrative leadership experience. In each of the major efforts in which I have engaged, I have built collaborative programs with other research institutions and developed cooperative programs with industry. My role as a leader in these programs has been to actively establish and communicate policy, mission, goals, and accomplishments, and foster collaborative networks among leadership, faculty, students and staff. I have been successful in fostering interdisciplinary research relationships and leading scientific studies focused on virology questions that bridge expertise across mathematics, ecology, medicinal chemistry and/or new technologies.

B. Positions and Honors

1981-1983 Monsanto- Summer Research Intern with Drs. Kishore, Castanho, Yoshikawa
08/83-08/85 Research Biologist, Monsanto- St. Louis, Mo. Molecular Biology Division
09/85-09/90 USDA Predoctoral Fellow with Dr. David Kuhn, Purdue University, Department of Biochemistry.
09/90-08/93 NRSA (F32) Postdoctoral Fellow with Dr. Monica Roth, UMDNJ, Department of Biochemistry
08/93-06/99 Assistant Professor, Department of Chemistry and Biochemistry
New Mexico State University (NMSU), Las Cruces, NM
7/99-6/2000 ORISE Sabbatical Fellow, United States Army Medical Institute of Infectious Disease, Virology Division with Dr. Connie Schmaljohn
08/99-08/03 Associate Professor (tenured), Department of Chemistry and Biochemistry, NMSU
08/03-10/04 Senior Research Scientist, Department of Biochemistry and Molecular Biology, Drug Discovery Division, Southern Research Institute (SRI), Birmingham, AL
08/03-08/08 Associate Professor, Department of Biochemistry and Molecular Genetics, University of Alabama, Birmingham, secondary appointment
08/03-08/08 Member, Graduate Program in Biochemistry and Molecular Genetics, UAB
10/04-01/06 Director, Emerging Pathogens, Drug Development Division, SRI
01/06-01/11 Program Leader, Emerging Infectious Disease Research, SRI
09/08-12/14 Professor, Department of Microbiology and Immunology, University of Louisville (UofL), KY
09/08-12/14 Director, Center for Predictive Medicine for Biodefense and Emerging Infectious Diseases, UofL, KY
08/11—12/14 Associate Faculty Member, Department of Pharmacology and Toxicology, University of Louisville, KY

12/15—	To present: Adjunct Professor, Department of Microbiology and Immunology, UofL, KY
12/14—6/17	Professor, Department of Microbiology, University of Tennessee, Knoxville, TN
12/14—6/17	Director, National Institute for Mathematical and Biological Synthesis (NIMBioS), University of Tennessee, Knoxville, TN
7/17-	To present: Van Vleet Chair of Excellence in Virology, Professor, Department of Microbiology, University of Tennessee Health Science Center (UTHSC), Memphis, TN
7/17	To present: Director, UTHSC Regional Biocontainment Laboratory, Memphis, TN

Other Experience and Professional Memberships (Selected) Study Sections: 1997-8, NIH, Structural AIDS Special Emphasis Panel; NSF Graduate Fellowship Panel; 2002-6, NIH, RCMI Study Section; 1998-2001,03, National Institutes of Health, Biodefense, Vaccine; 2003-4, NIH, Biodefense, Bioterrorism & Emerging Infectious Diseases; 2006, *Chair,* NIH, National Biocontainment Laboratories- BSL3 and BSL4; 2010-14: NIH, Drug Discovery and Resistance Study Section; Consultant: Pan American Health Organization in Tegucigulpa, Honduras, San Salvador, El Salvador, Mexico City, Mexico, Panama City, Panama; *Antiviral Research,* Editorial Board

Honors and Awards1985-1988, USDA National Needs Predoctoral Fellowship in Plant Biotechnology; 1992-93, Individual National Research Service Award, National Institutes of Health; 1992-93, University of Medicine and Dentistry, NJ Postdoctoral Fellowship; 1994, New Mexico State University Summer Research Award; 1996, McArthur Foundation Training Fellowship – Vector Borne Disease Workshop; 1997/1998, Battelle Summer Research Fellowship in the Division of Virology, United States Army Research Institute of Infectious Disease; 1997, Certificate of Recognition and Appreciation by the State of New Mexico for Service to the Community and New Mexico State University; 1999/2000, ORISE Sabbatical Fellow at USAMRIID; 2000, American Society of Microbiology International Professorship to Honduras; 2007, Distinguished Alumni Award, Purdue University College of Agriculture

B. Contributions to Science

Topic 1: Mapping the progression of inflammation and influenza virus infection in ferret lung. During the H1N1 2009 pandemic, I began a collaboration with Dr. Daniel Mollura at NIH to determine if we could use a commonly used clinical PET imaging probe, FDG, to follow the progression of inflammation in real-time in ferret. Building on our prior NIH funded work with the ferret models of influenza infection, we evaluated the virology, pathogenesis, immune/local gene responses of clinical isolates of H1N1pdm09 with radiological imaging. These studies taught us a great deal about the progression of inflammation in the lung. Surprisingly, and counter to our hypothesis, the FDG probe detected cellular regeneration during infection, and not immune infiltration as shown in cancer studies (Camp et al).

Topic 2: High Throughput Screening (HTS) to Accelerate the Discovery and Translation of Potential Antivirals for RNA Viruses. During the SARS CoV outbreak in 2003, I was working to improve the technology and processes to accelerate small molecule screening in BSL3 containment. I led the successful implementation of this for a number of RNA viruses. In 2008, I was awarded a U54 grant to lead a screening center focused on BSL3 pathogens from the NIH Molecular Libraries Screening Program. This program, and my other collaborative research programs over the years, have led to patents for hantaviruses, influenza virus, and respiratory syncytial virus as well as interesting hits for SARS CoV and West Nile virus. One of the most exciting small molecules that has emerged from my HTS collaborations is with Drs. Chung and Golden that is focused on Venezuelen equine encephalitis. My role in this effort is the testing of the molecules in small animal models of VEEV and to lead the way toward translation in preclinical testing.

PMID: 21059874

Topic 3: Structure-function, intracellular trafficking and intracellular signaling of the hantaviral N protein. My lab showed the N protein preferentially recognizes its viral RNA with fairly high affinity and we mapped this to a central conserved domain. Subsequent research focused on cellular trafficking on N and we were the first to show the virus trafficked to the ERGIC and required microtubules, specifically dynein. Our studies also show that hantaviruses differ in the cellular components required for cellular entry/trafficking.

Topic 4: Mechanism of action of ribavirin against hantaviruses. We found that ribavirin increased the mutation frequency (Mf) of HTNV *in vitro* that resulted in error catastrophe/extinction of the virus. Given this result, we asked whether Mf would similarly increase *in vivo* in the mouse model of lethal HTNV-infection, treated with ribavirin, which it did. Our mechanistic studies yielded insight into the genetic robustness and evolution of the virus. We have learned that HTNV has a window of Mf as well as a lethal threshold, past which it no longer can survive *in vitro*. We observed that the increased Mf actually correlates with persistence in the host, and an increase in positively-selected amino acids. In contrast, the untreated, HTNV-infected mice, showed a decrease in Mf (as compared to preexisting standing genetic variation suggesting negative selection of the virus. We have also shown that ribavirin is effective in clearing Andes virus in the hamster model in collaboration with Dr. Jay Hooper (USAMRIID).

PMID: 23903835

Topic 5: Modeling the ecology, evolution and immune responses of hantaviruses. My current R01 seeks to further the understanding of the epidemiology and evolution of hantaviruses within populations in their natural rodent reservoir that are endemic in the Interior Atlantic Forest of Paraguay. These studies build upon our efforts (with Robert Owen) and the research of others, that suggest that host-virus relationships may not be exclusive, and that host-switching and adaptation to new hosts may account for much of the observed geographic diversity of hantaviruses. Our current funding presents a valuable opportunity for understanding standing genetic diversity and plasticity of RNA viruses in wildlife in rapidly changing environments and genetic determinants driving its epidemiology. Dr. Owen and I have endeavored to mathematically model these relationships in collaboration with Dr. Linda Allen. The modeling revealed many aspects in the ecology of the rodent-virus relationship that are not presently understood and led us to develop a theoretical biological model of these relationships based on the immune response of the rodent (reservoir versus nonreservoir). Our recent efforts funded by NSF seek to model immune regulatory mechanisms in reservoir, nonreservoir and humans which is important to interpretation of systemic and localized immune responses in human disease. Finally my prior NIH R01

hosted an R03 to build BSL3 capacity and discovery of viruses in rodents with Dr. L. Figueiredo in Brazil. This has resulted in the discovery of hantaviruses in bats.

D. Additional Information: Research Support and/or Scholastic Performance

Ongoing Research Support

NIH 1R01AI103053 - 01 Jonsson (PI) 03/31/14-03/30/18 NCE
Title: Evolutionary mechanisms of RNA virus host switching
Scope: To define the ecology and evolution of hantaviruses in their reservoir and nonreservoir hosts in wildlife populations in Paraguay and in in vitro cell culture models.

NIH 1 R01 AI118814-01 Jonsson (Multi-PI with Chung and Golden) 04/01/15-03/31/20
Title: Lead Optimization of ML336, a Potent VEEV Inhibitor
Scope: Drs. Hoon Chung, Jennifer Golden, and Jonsson have teamed together for the proposed drug discovery efforts in the evaluation of the antiviral candidates in efficacy, pharmaco -kinetic and -dynamic studies for VEEV.

NSF Mathematical Biology PD 12-7334 Jonsson (Co-PI, Dr. Linda Allen) 09/01/15-08/31/18 (NCE8/31/19)
Title: Collaborative Research: Modeling Immune Dynamics of RNA Viruses In Reservoir and Nonreservoir Species
Scope: In support of the mathematical modeling by Dr. Allen (Texas Tech U), the dynamics of the viral RNA levels, infectious virus and immune responses will be measured for Sin Nombre virus (SNV) in its host rodent reservoir, the deer mouse, (HR) in vitro. All viruses will be compared to infection in human cells. 4

Metabiota (DoD BTRP). Jonsson(PI) 10/02/17-10/01/18 (Year 1) and 2/18/19-2/17/20 (Year 2)
Title: Prevalence of Crimean Congo hemorrhagic fever virus and hantaviruses in Ukraine and the potential requirement for differential diagnosis of suspect leptospirosis patients
Scope: Training and surveillance of hantaviruses and CCHFV in environmental and human populations.

U19 AI142762-01 (PI: Jonsson) 03/2019-02/2024
Title: Center of Excellence for Encephalitic Alphavirus Therapeutics
Scope: This proposed research efforts of the Center aim to develop broad spectrum, medical countermeasures (MCM) against multiple pathogens (VEEV, EEEV, and WEEV) thereby enabling a "rapid response" capability to an outbreak or an intentional exposure scenario. The proposed Center of Excellence will facilitate all aspects that enable the progress toward safe and effective therapeutics for encephalitic alphaviruses and will advance the development of a broad-spectrum approach that has the capacity to address many of the performance attributes desired in the field of biodefense, namely a readily manufactured, safe antiviral with sufficient potency to provide protective efficacy against multiple pathogens once exposure is identified.

BUDGET JUSTIFICATION – University of Tennessee Health Science Center

Key Personnel

Colleen Jonsson, Ph.D. (5% effort, Year 1) – Dr. Jonsson from the UTHSC Department of Microbiology, Immunology and Biochemistry will provide scientific guidance of Briana Spruill-Harrell for the proposed studies. She will provide support for compliance of all recombinant DNA and the animal studies by obtaining the appropriate approvals. She will work with Briana each week in their one on one meeting to review the progress toward the proposed research and engage in the research as needed. She will provide oversight of the manuscript resulting from this research.

Other Personnel

Briana Spruill-Harrell (graduate student; 12 CMs Y1). Ms. Spruill-Harrell will oversee all of the lab work. She will lead the mouse studies and in vitro studies. Briana has been working with hantaviruses for over two years and has mastered all of the pertinent virology for this project. She has been trained for the mouse studies and has approval to work in ABSL3 in the Regional Biocontainment Lab. Dr. Jonsson will provide mentors from the RBL to provide specific instruction and mentoring unique to her studies. Briana will lead the writing of research resulting from her efforts.

Equipment

None

Supplies

The consumables are based on these estimates for standard virology, histology, and molecular biology supplies. Supplies include culture flasks and plates for growing and assaying virus, materials for collection of lung and kidney for downstream pathology and IHC, and molecular reagents for detection of virus, host genes (RNASeq) specific genes. We also include costs for housing of the mice at ABSL-3.

Travel (Domestic)

Scientific Meetings: Travel is budgeted for the graduate student to attend the annual American Society of Virology Meeting or similar in the USA to present research findings in summer 2021.

Hotel, airfare and ground transportation are calculated using rates from previous travel records. Per diem rates are calculated using UTHSC guidelines and the State of TN Accounting Manual.

Publication Costs $2,500/year

We request support for publications estimated at $2500. This is based on prior publication costs with color figures which will be an essential output of the work.

I. SPECIFIC AIMS

Hantaan virus (HTNV) is an emerging RNA virus belonging to the family *Hantaviridae*, genus *Orthohantavirus*. that causes hemorrhagic fever with renal syndrome (HFRS) in humans throughout Europe and Asia [1]. The global incidence of reported HFRS cases can be as high as 100,000 per year with a majority of cases occurring in geographically focused outbreaks that can results in hundreds to thousands of cases [1]. Hallmark features of HFRS include fever, hemorrhage, thrombocytopenia, and kidney dysfunction. Disease severity differs individually, as infection can range from mild to lethal with a case fatality reaching up to 15% in some outbreaks [4,5]. There are no FDA-approved vaccines or antivirals for treatment. In Europe and Asia, two closely-related hantaviruses, HTNV and Dobrava-Belgrade virus (DOBV) are the primary causative agents of severe HFRS. HTNV is carried by the rodent species *Apodemus agrarius*, belonging to the family *Muridae*, and is transmitted to humans through inhalation of virus contained in excrements [1-3]. Remarkably, no disease has been shown to be present in the rodent reservoir, which may persist over the lifetime of the rodent.

The current mouse models used to study HFRS have been developed on single inbred backgrounds and are predominantly models of infection or arguably irrelevant models of lethality. Mouse models of infection have been primarily conducted in adult mice which become infected but do not cause serious disease or lethality [6]. The primary lethal model has been achieved by intracranial injection of the virus into the brain of suckling mice [7-9]. Neither of these models recapitulates the pathophysiology of the disease in humans. Moreover, these models are not appropriate for preclinical testing of antivirals or vaccines or the study of pathogenesis. Therefore, we propose to identify and then develop a translationally relevant mouse model system of hantaviral infection and disease using the Collaborative Cross (CC) R1 mouse strains. Upon development of this model, we plan to investigate the underlying mechanisms of pathogenesis.

There are a few reports in the published literature that suggest the Collaborative Cross could be used to identify a relevant model of HFRS [10-11]. Wichmann et al. demonstrated that several adult laboratory mice strains including C57BL/6, BALB/c, AKR/J, and SJL/J mice, are susceptible to intraperitoneal (IP) infection of 10^5 pfu of HTNV (strain 76-118), but phenotypically differ in clinical course (i.e. time to death) [12]. Although these mice did not develop hallmarks of HFRS, this study suggests that host genetic variation likely influences infection outcome. The lack the genetic diversity seen in current mouse models make it difficult to recapitulate HFRS disease in humans. Therefore, we propose to use the Collaborative Cross which captures over 90% of diversity across three *Mus musculus* subspecies (*M. m. musculus, M. m. domesticus,* and *M. m. castaneus*), to test the hypothesis that host immune gene variation influences infection outcome [10-11].

The primary goals of the proposed project are to 1) Develop a translationally relevant mouse model system to study HTNV infection and disease, and 2) Identify genes that influence HTNV pathogenicity. Our strategy to accomplish these two goals are:

Aim 1. Evaluate susceptibility of the Collaborative Cross to HTNV virus infection. In this aim, we plan to test the hypothesis that inherent genetic variation in the Collaborative Cross will influence susceptibility to HTNV infection. To test this hypothesis, we propose to infect up to 80 strains of the CC that are readily available with HTNV 76-118 and we will monitor weight loss, clinical signs and survival over 14 days. We will screen the CC panel in groups of five across 20 strains. From this screen, we will select two mouse strains that show a greater level of symptoms of disease relevant to HFRS and two that show resistance to infection (for future follow on studies). For the two pairs of mouse strains selected, we will perform a serial sacrifice to obtain a preliminary understanding of the dynamics of infection and pathology with a focus on the kidney and lung; the two primary sites of viral replication. From this second study, we will choose one lethal mouse strain for the studies in Aim 2.

Aim 2. Identify host transcriptional responses associated with HTNV disease outcome. In this aim, we plan to test the hypothesis that the susceptibility in strains of mice with higher lethality is due to genes regulating innate and/or adaptive immunity. While we cannot predict apriori what genes may influence outcome, we hypothesize that an uncontrolled immune response to infection (in humans) will result in a greater degree of HTNV pathogenesis. We propose to test this hypothesis by infecting one of the two mouse strains showing greater pathogenesis with HTNV 76-118 and examining transcriptional response of the lungs and kidneys at 1, 3, 5, and 7 days post-infection and examining the gene expression profiles by RNASeq.

The proposed one-year pilot will provide the basis for future studies follow-on studies in collaboration with Dr. Klaus Schughart to use F2 crosses of the lethal and resistant mice strains to define what genes are critical for disease severity and the underlying biological mechanisms of pathogenesis.

II. RESEARCH STRATEGY

A. Significance

The proposed Collaborative Cross studies will advance the field of hantavirology by providing a novel, *in vivo* model to characterize virus-host interactions of an important human pathogen, HTNV, which is responsible for up to 50,000 cases of HFRS each year in Asia [14]. Development of the HFRS rodent model will set the foundation for follow-up studies to examine the underlying mechanisms of pathogenesis which will also be important for other Old World hantaviruses that cause disease in Europe. Further, a relevant model of HFRS will advance the identification and characterization of host factors contributing to hantavirus infection and disease outcome that may serve as targets for future drug and vaccine discovery. Laslty, the development of a relevant model for HFRS would be a tremendous resource to those involved in testing of drugs and vaccines for Old World hantaviruses.

B. Innovation

The innovation of the proposed research is two-fold. First, our research will result in a translationally relevant rodent model system of HFRS. Secondly, this model, once realized, will reveal genes that influence pathogenicity. Several groups have used the Collaborative Cross to model human variability to viral infections including studies with Ebola virus (EBOV), Influenza virus, SARS-Coronavirus, and West Nile virus [10-11]. Our studies will complement these efforts and may also provide additional insights into hemorrhagic viruses like EBOV.

C. Approach

Aim 1. Evaluate susceptibility of Collaborative Cross Mouse (CC) Strains to HTNV virus infection.

Rationale. Wichmann et al. showed that intraperitoneal (IP) injection of 10^5 pfu of HTNV 76-118 in 8-week-old C57BL/6 resulted in uniform lethality [12]. C57BL/6J mice are one of several founder strains of the Collaborative Cross therefore, we will use this age, route, and dose in the proposed experiments. Hence, we will use this dose and route to infect mice in the UTHSC Regional Biocontainment Laboratory ABSL-3 facilities. We will use male mice in the Aim 1 since male mice show a greater susceptibility than females. However in Aim 2, we will use males and females and include sex as a variable in our hypothesis. Dr. Jonsson has 24 years of experience in working in biocontainment with hantaviruses *in vitro* and *in vivo*; she has approved protocols in place from the IBC and IACUC for *in vitro* and *in vivo* study with HTNV. We hypothesize that inherent genetic variation in the CC strains will influence susceptibility to HTNV infection.

Experimental Design and Methods.

We propose two experiments; (Aim 1A) a survival study of the CC panel using up to 80 strains, and (Aim 1B) a serial sacrifice of the two CC strains that show the greatest signs of disease. **Aim 1A**: We will infect each 8-week old CC strain (n=4) by IP with 10^5 pfu of HTNV 76-118. We will screen in groups of 20 strains. We will monitor weight each day and clinical signs. Differences in survival will be compared using the Log-Rank (Mantel-Cox) Test in GraphPad Prism 8 (Graph Pad Software, Inc). P values generated by the Log-Rank test will be evaluated by comparison to a Bonferroni corrected threshold of 0.0125 (p=0.05) to determine statistical significance. **Aim 1B**: We will conduct a serial sacrifice of the two strains that show the most disease; we will include mock-infected controls for all groups. Using groups sizes of four, we will sacrifice mice on days 1, 3, 5 and 7. Weight loss and clinical signs will be monitored twice daily for 14 days. On 1 ,3, 5, and 7, tissues (i.e. brain, kidneys, heart, liver, lungs, and spleen) will be harvested following perfusion with PBS. Tissues will be divided into two equally sized portions. One portion will be fixed in 4% paraformaldehyde for histopathology. One portion will be homogenized in 0.5 mL of PBS for virus infectivity by plaque assay.

Anticipated Results, Potential Pitfalls and Alternative Approaches. Several studies suggest that genetic variation influences host susceptibility to HTNV infection. For example, in China, human leukocyte antigen (HLA) haplotypes such as HLA-DRB1*09 and HLA-B*46-DRB1*09 are common among HFRS patients compared to healthy controls and are correlated with disease severity [20]. If our hypothesis is correct, we expect that susceptibility measures (i.e. survival, weight loss, viral load, and pathology) will differ in the Collaborative Cross. We predict that viral load will be associated with weight loss, clinical signs, and pathology score. Adult males (20-60 years old) have a higher risk of HTNV infection [4, 25]. Therefore, we predict that there may be sex-dependent differences in infection outcome. The overall goal of this study is to identify a mouse model of HFRS with renal involvement. Particularly, we anticipate observing acute tubulointerstitial nephritis with mononuclear

cells and CD8+ T cell infiltration in the kidneys which is characteristic of HFRS [2,15]. If we get these results, we will characterize this model in future studies. If we do not observe renal pathology, this would suggest that other target sites are involved in HTNV-induced disease in the Collaborative Cross. Wichmann et al. demonstrated that IP infection in 8-week-old laboratory mice strains resulted in encephalitis [12]. If this happens, we will optimize viral dose and infection route to improve our model.

Aim 2. Identify host transcriptional responses associated with HTNV disease outcome.

Rationale. HFRS is a systemic inflammatory disease that cause vascular leakage and coagulation disorders. Kidney involvement occurs in up to 40% of cases and the most prominent pathological finding is acute tubulointerstitial nephritis with immune cell infiltration [15]. HTNV is non-cytopathic therefore, pathogenesis is suggested to involve an overwhelming inflammatory response. It is been demonstrated that the magnitude of the inflammatory response and HTNV load correlates with disease severity [16-19]. To begin identifying the immune genes and associated pathways that shape anti-HTNV immune responses and/or disease, we propose to examine lung and kidney transcriptional responses using RNA sequencing. We hypothesize that genetic variation in the Collaborative Cross at loci regulating innate and/or adaptive immunity influence HTNV pathogenesis.

Methods. Using the CC mouse strain with the greatest degree of HFRS relevant pathology and clinical signs, we will challenge groups of 8-week-old mice of both sexes by IP with 10^5 pfu of HTNV 76-118. Mock-infected mice will receive PBS. Weight loss and clinical signs will be monitored twice daily for 14 days. Mice will serially be sacrificed at 1, 3, 5, and 7 days post-infection at which time the lungs and kidneys will be harvested following perfusion with PBS. Tissues will be divided into two equally sized portions as described in Aim 1. We will perform TRIzol RNA isolation from homogenized lungs or kidneys collected from infected and mock-infected mice according to the manufacture's protocol (Thermo Fisher Scientific). RNASeq libraries will be prepared for paired-end (150 bp) sequencing on Illumina HiSeq. Differential expression analysis will be performed using the *Mus musculus* reference genome making use of nf-core's RNA seq pipeline and DESeq2 [26, 27]. Differentially expressed genes will be based upon a fold change > |2| and FDR corrected p-value <0.05. Gene Ontology Enrichment Analysis and KEGG Pathway Enrichment Analysis will be used to determine the biological functions and associated pathways of these genes.

Anticipated Results, Potential Pitfalls and Alternative Approaches. HTNV evades the early host immune response by delaying induction of the antiviral gene expression *in vitro* to establish infection [21-23]. Our preliminary results and other published *in vitro* studies show than HTNV infection results in elevated, prolonged expression of tumor necrosis factor alpha (TNF- α), interferon-γ (IFN-γ), interleukin-1β (IL-1β), interleukin-6 (IL-6), interleukin-8 (IL-8), interferon regulatory factor 7 (IRF7), chemokine (C-C motif) ligand-5 (CCL-5), and C-X-C motif ligand-10 (CXCL-10) in human endothelial cells [21-23]. These inflammatory mediators are also elevated in the serum and/or kidneys of HFRS patients [17-19]. In contrast, early induction of antiviral gene expression is observed with hantaviruses that do not cause human disease [21]. Based upon these findings, we expect to observe delayed induction but elevated, prolonged immune gene expression in the lungs and/or kidneys of mice susceptible to HTNV infection in a time-dependent manner compared to resistant mice. We anticipate that peak gene expression will correlate with viral load and replication [23]. If we do not detect any significant differences in gene expression between males and females, we will search for other potential factors such as age. We will also examine gene expression in other organs such as the brain and spleen in future efforts. Neurological complications have been reported in HFRS patient although, viral antigen has not been detected in the brain [1-2; 24]. Moreover, infection of several different laboratory mice strains with HTNV results in encephalitis [6-9;12]. We do not anticipate any potential problems in screening of the CC strains as Dr. Jonsson has over 15 years of experience in working with HTNV in mouse models.

Conclusions. At the end of the first year, we expect to identify at least two CC strains with relevant clinical signs. Our future efforts will endeavor to leverage our findings to develop a translationally relevant rodent model system of HFRS and to identify genes that influence pathogenicity. In the first year, we only proposed to examine one of the CC mice strains with the greatest clinical signs. If there are more strains that show clinical signs, these will be useful for identifying gene-phenotype relationships of disease severity in future efforts. Long term, these studies could be used to understand the underlying mechanisms of pathogenicity of other hantaviruses and help identify novel therapeutic targets to treat HFRS. We hold that our findings will complement and contribute to the overall understanding of host-pathogen interactions in the context of the other studies on-going within The Center for Systems Immunogenetics of Biodefense Pathogens in the Collaborative Cross at the University of North Carolina.

SCOPE OF WORK

We propose to use the Collaborative Cross which captures over 90% of diversity across three Mus musculus subspecies (M. m. musculus, M. m. domesticus, and M. m. castaneus), to test the hypothesis that host immune gene variation influences infection outcome of the Old World hantavirus, Hantaan virus.

The primary goals of the proposed project are to 1) Develop a translationally relevant mouse model system to study HTNV infection and disease, and 2) Identify genes that influence HTNV pathogenicity.

Our strategy to accomplish these two goals are to:

(1) screen available collaborative cross strains with HTNV across the available strains in groups of 20. We will monitor weight loss, clinical signs and survival over 14 days.
(2) From this screen, we will select two mouse strains that show a greater level of symptoms of disease relevant to HFRS and two that show resistance to infection (for future follow on studies).
(3) For the two pairs of mouse strains selected, we will perform a serial sacrifice to obtain a preliminary understanding of the dynamics of infection and pathology with a focus on the kidney and lung; the two primary sites of viral replication.
(4) From the serial sacrifice study, we will choose one lethal mouse stain with both sexes in advance molecular studies.
(5) In the advanced molecular studies, we will infect one of the two mouse strains showing greater pathogenesis with HTNV 76-118 and examining transcriptional response of the lungs and kidneys at 1, 3, 5, and 7 days post-infection and examining the gene expression profiles by RNASeq.

Perform an unbiased screen of the Collaborative Cross resource to identify new loci influencing the immune response to malaria

Overall hypothesis: Identifying the genetic variants that link to improved immune responses to blood-stage malarial parasites will inform novel therapeutic designs.

Despite remarkable efforts toward eradicating malaria, this infectious disease remains a major global health problem. In 2018, there were 228 million cases worldwide and an estimated 405,000 deaths with >90% of the mortalities occurring in sub-Saharan Africa[1]. Malaria is caused by *Plasmodium* parasites. *P. falciparum* is the most virulent and deadly of the 5 human plasmodia species and accounts for close to 100% of malaria cases in sub-Saharan Africa[1]. In this region, children under the age of 5 years and pregnant women are the most vulnerable, developing serious and often deadly complications, namely, severe malarial anemia and cerebral malaria. Drug resistance in the malaria parasite, insecticide resistance in the mosquito vector, and climate change contribute to the lack of progress in malaria control. Liver stage infection is asymptomatic while the blood-stage causes disease[2]. Yet, the protective host immune response to blood-stage infection remains poorly understood and an effective vaccine that provides long-term protection is still not available. Although hemoglobinopathies have long been associated with resistance to malaria, there is growing evidence that variability in immune response genes contribute to susceptibility in individuals residing in endemic areas[3-5].

Identification of genetic variants that contribute to malarial susceptibility in humans presents considerable challenges[6]. *P. chabaudi* AS (PcAS) infection in mice mirrors many of the immunological and pathological features of *P. falciparum* infection making this parasite an important experimental tool to study the immunology of human malaria and to identify new targets for vaccine development and therapeutic intervention[7,8]. Similar to genetic variation among humans in susceptibility to *P. falciparum*, genetically-determined differences to PcAS infection occur among inbred mouse strains[7,9-12]. Using various classical genetic approaches, namely backcross mice, recombinant inbred strains, recombinant congenic strains, and ENU strains, we and our colleagues have shown that susceptibility to PcAS is a complex trait[9,11,13-15]. In addition to sex differences[9-11,16], eleven loci termed *Char* for chabaudi resistance have been identified[17]. Notably, these loci were identified based on peak parasitemia level and survival, with little to no investigation of the immune response. Consequently, most of these loci are linked to erythroid-specific traits that limit parasite replication in red blood cells (RBC). To design an effective vaccine or immune-based therapeutic approach, it would be most informative to identify the genetic variants linked to the immune response to PcAS.

Hypothesis: The CC strains will provide an unbiased means to identify new candidate genes regulating the immune response to blood-stage malaria.

Specific Aim 1 To determine the intra-strain variation and quantify the experimental variability for detecting immune responses to blood-stage PcAS infection in the eight CC founder strains.

Specific Aim 2 To identify genetic variants linked to the immune parameters for response to PcAS in the CC strains.

This research program builds on a budding collaboration between Dr. Mary Stevenson, expert on mouse models of malaria, and Dr. Sylvie Lesage, an immunogeneticist. It harbours outstanding potential to uncover novel genetic variants contributing to the immune response to blood-stage malaria. Identification of these genetic variants will inform us on the molecular pathways that have been naturally selected to modulate these immune traits, which may help to design better vaccines to prevent malaria or identify novel immunotherapy to treat malaria.

Perform an unbiased screen of the Collaborative Cross resource to identify new loci influencing the immune response to malaria

RESEARCH APPROACH

Rationale: Genetic studies in mice typically exploit two parental inbred strains with limited genetic diversity. To circumvent this limitation, hundreds of recombinant inbred mouse strains derived from eight diverse founder strains were produced[18,19]. This project was termed the Collaborative Cross (CC) and has emerged as a powerful genetic resource[18,19]. In our most recent work[20], we took advantage of the Australian CC cohort to characterize basal immunological traits in non-infected mice. Building on our expertise, we now wish to exploit the North American CC strains to study the immune response to blood-stage malaria using the mouse model of PcAS infection.

Specific Aim 1 To determine the intra-strain variation and quantify the experimental variability for detecting immune responses to blood-stage PcAS infection in the eight CC founder strains.

Prior to testing the CC strains, we will assess the intra-strain variation and quantify the experimental variability for detecting immune responses to PcAS in the 8 founder inbred strains, namely, A/J, B6, 129S, NOD, NZO, CAST, PWK, and WSB mice. We will infect 5-6 male and female mice per strain intraperitoneally with 10^6 PcAS-parasitized RBC (pRBC) and quantify peak blood parasitemia and survival. Blood smears will be prepared from individual mice, and the percentage of pRBC determined by microscopy every day beginning on day 4 post infection (p.i.) until resolution of infection, which is usually around day 28 p.i. in resistant B6 mice. Body weight and survival will be monitored daily. Separate groups of male and female mice of the founder strains will be infected with PcAS. Blood samples will be collected from individual mice to determine the total number of RBC and percentage of reticulocytes as a measure of anemia and erythropoietic response, respectively.

More importantly, a detailed characterization of parameters that correlate with immunity to PcAS will be performed on days 0, 2, 5, 10, 14, 21, and 28 p.i. in surviving mice. Blood samples will be collected. Sera will be used to quantify multiple cytokines, including but not limited to IL-1β, IL-2, IL-4, IL-6, IL-10, IL-12, IL-17A, IL-23, IFN-γ, MCP-1, GM-CSF and TNF-α, by multiplex ELISAs and to monitor PcAS-specific antibodies by ELISA. Blood cells will be prepared, total cell numbers determined, and flow cytometry used to phenotype the immune cell populations during infection. Specifically, we will quantify the proportion and activation status of various subsets of dendritic cells, macrophages, natural killer cells, T cells, and B cells, at the different time points during infection. At sacrifice (day 28 p.i. or earlier), spleens will be harvested, and size and weights determined as a measure of splenomegaly. Complete immune characterization of spleen cells will be performed by flow cytometry. PcAS-specific antibody ELISAs, multiplex ELISAs, and polychromatic flow cytometry are standard methods well established in our laboratories. A strength of this approach is to quantify intra-strain variability that is greater than experimental variability among the founder strains, allowing to select for the relevant parameters to investigate within the CC strains. Together, the detailed immune characterization along with the monitoring of blood parasitemia will provide a framework to reveal new traits as well as a complete picture of the immune response to PcAS in the founder strains.

Specific Aim 2 To identify genetic variants linked to the immune parameters for response to PcAS in the CC strains.

Once we have established the extent of intra-strain variation and quantified the experimental variability for detecting immune parameters indicative of a response to malaria in the eight

founder strains, we will investigate the responses in all CC strains available at the University of North Carolina at Chapel Hill (> 60 strains; analysis of 30 strains are budgeted in this pilot grant). Again, we will include 5-6 male and female mice per strain to account for biological and experimental variability inherent to *in vivo* and *ex vivo* experiments. At least three PcAS resistant B6 and susceptible A/J mice (founder strains) will be included as controls for each new infection cohort. This will allow data standardization over time. If the data from the B6 and A/J mice fall outside of the pre-established experimental range, the data from the CC strains tested on the same day will be discarded and additional mice from these CC strains will be re-tested. CC strains will first be examined for resistance/susceptibility to PcAS infection based on peak blood parasitemia and survival as described above. Separate groups of CC strain mice will be infected with PcAS and peripheral blood counts, splenomegaly, serum cytokine and antibody levels, and the number and proportion of immune cells will be determined as described in Aim 1.

After data collection, genetic associations will be plotted as logarithm of the odds (LOD) scores[20-25]. Sets of 1,000 permutations will be applied. Candidate genes contributing to the immune response to malaria will be extracted from the combined analyses of the founder coefficients at the loci linked to immune response to malaria together with analysis of the founder gene sequences at these loci. The degree of heritability of immune responses to malaria will also be quantified by taking into account genetic, phenotypic and environmental variance[20].

Expected results and interpretations: As we previously showed susceptibility to PcAS is a complex trait[10,12-14], we expect the eight founder strains will exhibit different levels of immune responses that influence disease outcomes to malaria. Based on our previous study examining 18 different basal immunological traits in CC strains[20], we expect that immune phenotypes in the CC strains will fall well outside of the variation range established by the founder strains. For example, we expect that most of the CC strains will exhibit either higher or lower phenotypes related to the response to malaria of any of the eight founder strains. This observation would agree with transgressive segregation suggesting the immune response to malaria results from interaction among multiple genetic variants that have been inherited independently by the CC strains. We also expect that the detailed characterization of the immune response to malaria will reveal distinct, associated genetic loci. As the CC has already proven useful in identifying genetic variants mediating different phenotypes[26-45], we fully expect that this approach will reveal novel genetic variants contributing to different aspects of the immune response to malaria.

Timeline and Personnel: In our recent work, we immunophenotyped 60 strains in 6 weeks[20]. The current proposed protocol is admittedly more time-consuming than our past immunophenotyping design. Still, we expect to complete the characterization of the eight founder strains within four months. We also expect that we will complete the typing for resistance/susceptibility to PcAS in thirty of CC strain mice, within the remaining eight months. An experienced research technician will maintain the mice, carry out the infection studies and immunophenotyping of the founder strains. An MSc student currently studying immune phenotypes in the eight founders, will also participate in the phenotypic analysis of the CC strains.

Future directions and impact: Following from this pilot study, the remainder of the CC strains will need to be analyzed. To improve mapping resolution, additional CC strains from the European and Australian cohorts will also be included. Subsequently, the impact of genetic variants linked to immune response to malaria will be validated by using knock-out or floxed-mice for key candidate genes. The information gained will identify loci linked to protective immune responses to blood-stage malaria, which will guide the design of novel therapies.

Perform an unbiased screen of the Collaborative Cross resource to identify new loci influencing the immune response to malaria

POSITION TITLE: Professor

EDUCATION/TRAINING *(Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.)*

INSTITUTION AND LOCATION	DEGREE *(if applicable)*	Completion Date MM/YYYY	FIELD OF STUDY
McGill University, Canada	BSc	04/1995	Immunology
McGill University, Canada	PhD	10/1999	Immunology
Australian National University, Australia	Post-doc	10/2002	Immunogenetics
Université de Montréal, Canada	Post-doc	09/2005	Immunology

A. Personal Statement

The immune system is comprised of many cell types that work together to fight cancer and infection. In some circumstances, immune cells can also turn against self and cause autoimmune diseases. Each individual's potential to combat infections, fight cancer and develop autoimmune diseases is in part controlled by genetic factors that impose variations in the composition and function of their immune system. I have established an original research program that aims to characterize these variations in immune homeostasis by taking advantage of various genetic mouse models. Specifically, we characterize dysregulation in immune cell types linked to disease development. The data acquired from the study of both the immunological function and the immunogenetic regulation of these cell types, feeds into our translational platform, wherein we aim to develop means to effectively restore immune function and prevent the onset of immunopathologies.

B. Positions and honors

Professional Experience:

2005-present Head, Cellular Immunogenetics Unit, Maisonneuve-Rosemont Hopsital
2005-2010 Assistant Professor, Dept. Microbiologie, infectiologie et immunologie, Université de Montréal
2010-2016 Associate Professor, Dept. Microbiologie, infectiologie et immunologie, Université de Montréal
2016-2017 Full Research Professor, Dept. Microbiologie, infectiologie et immunologie, Université de Montréal
2013-present Adjunct Professor, Dept. Microbiology and Immunology, McGill University
2017-present Full Professor, Dept. Microbiologie, infectiologie et immunologie, Université de Montréal

Selected Professional Services and Memberships

2006-Present Member, Canadian Society for Immunology
2006-Present Member, Conseil Professionnel de Diabète Québec
2008-2011 Member, MSc scholarship selection committee, Fonds de recherche Québec – Santé
2009-2013 Research Grant External Reviewer, Natural Sciences and Engineering Research Council
2009-Present Member, American Association of Immunologists
2009-Present Research Grant Review Panel, Canadian Diabetes Association (Co-Chair since 2013)

2010-2013	Board Member, Immunology Montreal
2010-Present	Review editor, Frontiers in Immunology
2011-Present	Member, ThéCell FRQS network
2012	Research Grant External Reviewer, Association Française contre les Myopathies
2012	Member, Post-doc scholarship selection committee, MITACS Elevate
2012-2013	Research Grant Review Panel, Arthritis Society
2012-2016	Associate Editor, Journal of Immunology
2013-2016	Member, MSc scholarship selection committee, Canadian Institutes of Health Research
2013-Present	Member, Montreal Diabetes Research Center
2013-Present	Member, National Research Council, Canadian Diabetes Association/Diabetes Canada
2014-Present	Member, McGill Center of Complex Traits
2014-2015	Research Grant Review Panel, Fondation des pompiers du Québec
2014-Present	Co-Chair, Montreal Immunology Meetings
2015	Research Grant External Reviewer, KU Leuven grant program, Belgium
2015	Member, Post-doc scholarship selection committee, Fonds Wetenschappelijk Onderzoek
2015-2019	Council member, Canadian Society for Immunology
2016	Research Grant Review Panel, NIH/NIDDK-JDRF
2016-2019	Member, Mid-career Investigator Salary Award selection committee, Fonds de recherche Québec - Santé
2016-Present	Review editor, Frontiers in Oncology
2017	Research Grant External Reviewer, European Research Council
2017	Research Grant External Reviewer, Agence National de la recherche, France
2017-2019	Research Grant Reviewer, Cancer Research Society
2017-Present	Scholarship Reviewer, Fondation le Grand Défi Pierre Lavoie
2018	Research Grant Reviewer, Canadian Institutes for Health Research – DOL committee
2018-2019	Research Grant Reviewer, Canadian Institutes for Health Research – IT committee
2019	Research Grant Reviewer, Canadian Institutes for Health Research – CIB committee
2019	Research Grant Reviewer, NIH/NIAID, Collaborative Cross R21
2019-Present	Chair, Scholarship and Grant Reviews, Diabète Québec
2020	Research Grant Reviewer, Fonds de recherche Québec – Santé, FCI-FLJE
2020	Local Organizing Committee, Canadian Society for Immunology Annual Conference
2020-Present	Scientific Officer, Canadian Institutes for Health Research – IT committee

Honors and Awards

1995	Excellence scholarship, Dean's Honours list, BSc
1995-1997	Fonds de recherche en santé du Québec, MSc scholarship
1997-1999	Fonds de recherche en santé du Québec, PhD scholarship
1999-2002	Canadian Institutes for Health Research, Postdoctoral fellowship
2002-2007	Canadian Institutes for Health Research, Senior Research Fellowship
2006	ThymOz, New Investigator Award
2007-2011	Fonds de recherche Québec - Santé, Junior Investigator Level 1
2010	AAI Junior Faculty Award
2010-2015	Canadian Institutes for Health Research, New Investigator Award
2015-2018	Fonds de recherche Québec - Santé, Senior
2019-2023	Fonds de recherche Québec - Santé, Research Scholars Emeritus

C. Contribution to Science

1. A key publication of relevance to this application presents our expertise in immunophenotyping mice of the CC strains. We examined 18 phenotypes in more than 60 CC strains.

   - Collin, R., Balmer, L., Morahan, G., Lesage, S. Common heritable immunological variations revealed in genetically diverse inbred mouse strains of the Collaborative Cross. 2019. J. Immunol. 202: 777-786.

2. In the past ten years, we focused our attention towards $CD4^{-}CD8^{-}$ (double negative, DN) T cells, as DN T cells had been shown to inhibit immune responses in a unique antigen-specific manner. We demonstrated

that DN T cells decrease serum auto-antibody levels, likely through the elimination of activated B cells. We also find that DN T cells are found in lower proportion in autoimmune prone mice and that a single intravenous injection of DN T cells is sufficient to protect from autoimmune disease progression. We performed phenotypic, functional and immunogenetic studies to characterize immunoregulatory DN T cells. Together, these findings highlight the biological relevance of defining the homeostatic regulation of DN T cell and the role of this cell subset in conferring immune tolerance of autoimmune diseases. Listed here, are a few selected articles on the topic of DN T cells, in both mice and humans.

- Dugas, V., Beauchamp, C., Chabot-Roy, G., Hillhouse, E.E., Lesage, S. Implication of the CD47 pathway in autoimmune diabetes. 2010. J Autoimmun. 35: 23-32.
- Hillhouse, E.E., Beauchamp, C., Chabot-Roy, G., Dugas, V., Lesage S. IL-10 limits the expansion of immunoregulatory CD4-CD8- T cells in autoimmune-prone NOD mice. 2010. Immuno Cell Biol. 88:771-780. **Highlighted as "Outstanding Observation"**. See also: News and Commentary, Pierson, W. & Liston, A. Immunol Cell Biol 88, 769-770 (2010).

- Collin, R., Doyon, K., Mullins-Dansereault, V., Karam, M., Chabot-Roy, G., Hillhouse, E.E., Orthwein, A., Lesage, S. Genetic interaction between two insulin-dependent diabetes susceptibility loci, Idd2 and Idd13, in determining immunoregulatory DN T cell proportion. 2018. Immunogenetics. 70: 495-509.
- Hillhouse, E.E., Thiant, S., Moutuou, M.M., Lombard-Vadnais, F., Parat, R., Delisle, J.S., Ahmad, I., Roy, D.C., Guimond, M., Roy, J., Lesage, S. Double negative T cells levels predict chronic graft-versus-host disease severity. 2019. Biol. Blood Marrow Transplant. 25: 19-25.

3. Dendritic cells play a key role in maintaining immune tolerance. In addition to studying immunoregulatory DN T cells, we thus investigated the immunogenetic regulation of DC subset and their link in various pathologies. Our work supports a strong role for non-conventional DC subsets in type 1 diabetes.

   - Pham, T., Meziane., O., Miah, M., Volodina, O., Colas, C., Béland, K., Li. Y., Dallaire, F., Keler, T., Guimond, J., Lesage, S., Cheong, C., Haddad, E., Cohen, E. Flt3L-mediated expansion of plasmacytoid dendritic cells controls HIV infection in humanized mice. 2019. Cell Reports. 29: 2770-2782.
   - Audiger, C., Fois, A., Lesage, S. Merocytic dendritic cells compose a conventional dendritic cell subset with low glucose uptake potential. 2019. J Immunol. Revisions requested.

4. While characterizing variations in immune cell subsets in mice predisposed to type 1 diabetes, we found that a novel cell type, namely Interferon-producing killer dendritic cells (IKDC), was linked to diabetes susceptibility. In line with recent work by others, we demonstrate that the both the proportion and number of IKDC is strongly defined by genetic polymorphism. We importantly demonstrated that IKDC are immediate precursors to mature NK cells, closing the debate on their lineage origin. As such, we have proposed to

rename IKDC as pre-mNK cells. Our work contributed to defining a new cell type linked to diabetes and cancer susceptibility, and our ongoing work continues to define the immunogenetics of NK cell subsets.

- Guimont-Desrochers, F., Cappello, Z.J., Chagnon, M., McDuffie, M.J., Lesage, S. Genetic characterization of interferon-producing killer dendritic cells. 2009. J. Immunol. 182: 5193-5197

D. Research Support

Ongoing Peer-Reviewed Research Support (**Amounts are in CAD; 1$ CAD is approximately 0.75$ USD**)

April 2017 – April 2022 Canadian Institutes of Health Research – 841 500$
Title: A subset-based model for defining NK cell differentiation and function: focus on pre-mNK cells
PI: Sylvie Lesage
Description: To study murine NK cell differentiation and subset function.

July 2018 – July 2021 Fonds québécois de la recherche sur la nature et les technologies (FQRNT) – 162 000$
Title : Novel parameter for optimized, fast, and precise cell characterization: definition and implementation
PI : Yves-Alain Peter, Co-PI : Sylvie Lesage, Jean-Sébastien Delisle
Description: To develop and integrate a device in flow cytometers that quantifies the cellular refractive index

July 2018 – July 2023 Canadian Institutes of Health Research – 1 500 000$
Title: Canadian Autoimmunity Standardization Core (CAN-ASC)
PI: Megan Levings, Co-PI: J Bramson, C Des Rosiers, J Dutz, E Haddad, S Ivison, J Kimmelman, S Lesage, A Prat, JD Rioux, S Ritz, S Turvey, S Vercauteren, J Wither
Description: To design and implement standardized protocols for nationwide analysis of human samples.

October 2018 – October 2023 Canadian Institutes of Health Research – 960 076$
Title: Thymic differentiation of immunoregulatory DN T cells
PI: Sylvie Lesage
Description: To study DN T cell differentiation in mouse models

October 2018 – October 2023 Canadian Institutes of Health Research – 749 700$
Title: Roles of CLCF1 and CRLF1 in IL-23-driven autoimmune pathologies
PI: Jean-François Gauchat, Co-PI: Sylvie Lesage
Description: To investigate the role of new cytokine complexes in mouse models of autoimmunity

Sept 2018 – Sept 2020 Cancer Research Society – 120 000$
Title: Evaluating the impact of immunosuppressive drugs on the therapeutic efficacy of human DN T cells
PI: Sylvie Lesage, Co-PI: Jean-Sébastien Delisle
Description: A preclinical study for the use of DN T cells in graft-vs-host disease

Sept 2018 – Sept 2020 Cancer Research Society – 120 000$
Title: p53 mutations in NK cells impede the anti-tumour immune response
PI: Sylvie Lesage
Description: To define the NK cell immune response in Li-Fraumeni patients

April 2019 – April 2024 Natural Sciences and Engineering Research Council of Canada – 210 000$
Title: Immunogenetics of antibody affinity
PI: Sylvie Lesage
Description: To identify genetic loci linked to antibody affinity maturation using the CC strains.

January 2019 – January 2022 EuroNanoMed III, Joint Transnational Competition – 900 000$
Title: A liquid corneal glue-filler as an alternative to transplantation in high-risk patients; LIQD-CORNEA
PI: May Griffith, Illimar Altosaar, Olivier Zelphati, Virginiija Bukelskiene, Co-PI: Sylvie Lesage, Rimvydas Asoklis, Evelin Loit.
Description: To design a safe, cost-effective, therapeutic approach for healing corneal lesions.

April 2020 – April 2025 Canadian Institutes of Health Research – 851 290$
Title: Control of metabolic inflammaging by traffic of B lymphocytes in adipose tissues
PI: Frédéric Picard, Co-PI: Sylvie Lesage, Mathieu Ferron
Description: To study the impact of B cells on adipose tissue biology during aging in mice.

A. Personal Statement

A shared evolutionary history between parasites and their hosts has shaped a unique relationship reflected in their interactions at the immunologic and genetic interfaces. Malaria parasites especially *Plasmodium falciparum* has dramatically shaped the human genome, most notably human red cell traits. Pathogens have also shaped the human genome to favor their survival by their effects on immune response genes. My research focuses on defining the cellular mechanisms essential for protective immunity to blood-stage malaria and identifying the underlying causes of severe malarial anemia (SMA) responsible for high morbidity and mortality in vulnerable populations. In collaboration with McGill colleagues with expertise in genetic analysis of complex traits, my laboratory has contributed significantly to identifying previously unrecognized erythroid-specific traits regulating susceptibility to blood-stage malaria. Altogether, our findings provide important evidence directly translatable to the development of novel and effective therapeutic and vaccine strategies against blood-stage malaria.

B. Positions and Honors

Professional Experience

1982-1988	Assistant Professor, Department of Medicine, McGill University, Montreal, QC
1984-Present	Associate Member, Department of Physiology, McGill University, Montreal, QC
1988-1996	Associate Professor, Department of Medicine, McGill University, Montreal, QC
1988-Present	Associate Member, Institute of Parasitology, McGill University, Ste-Anne-de-Bellevue, QC
1996-2015	Professor, Department of Medicine, McGill University, Montreal, QC
2015-Present	Professor, Department of Microbiology and Immunology and Department of Medicine (Joint Appointment), McGill University, Montreal, QC

Selected Contributions to the Scientific Community

1998-Present	Founding Member and Canadian Representative, International Board, Malaria Foundation International, Inc., Atlanta, GA
1998-2000	Editorial Board, Infection and Immunity
2000-2004	Associate Editor, Journal of Immunology

2000	Special Study Section, NIAID/NIH, Tropical Medicine Research Center Program
2001	Special Study Section, NIAID/NIH, Malarial Anemia Research and Training Program
2001-2004	Panel Member, CIHR Operating Grants, Experimental Medicine Committee
2005	Special Study Section, NHLBI/NIH/Program Project Review, Malaria Anemia
2007-2009	Member, Post Doctoral Fellowship Review Committee, Fonds de recherche du Québec-Santé (FRQ-S)
2010	Member, FRQ-S-INSERM Exchange Program Review Committee, FRQ-S
2010-Present	Member, American Society of Tropical Medicine and Hygiene, Travel Awards Committee
2016	NSERC Studentship Selection Committee, Faculty of Medicine, McGill University
2017	Member, Vanier-CIHR Studentship Selection Committee, Faculty of Medicine, McGill University
2017	Member, Pathogens Program Review Panel, Francis Crick Institute, London, UK
2019-Present	Member, Research Scholars Emeritus Selection Committee, FRQ-S

Honors and Awards

1979-80	Post-Doctoral Fellowship	Cancer Research Society (Montreal)
1980	Travel Award, International Congress of Immunology, Paris, France	Canadian Society for Immunology and International Union of Immunological Societies
1981-82	New Investigator Award	The Montreal General Hospital Foundation
1982-87	New Investigator Award	Medical Research Council of Canada
1982-87	New Investigator Award (Declined)	Fonds de la Recherche en Santé du Québec
1985	Outstanding Young Alumnae Award	Hood College, Frederick, MD
1990	Visiting Lecturer, University of Alberta	Alberta Heritage Foundation for Medical Research (AHFMR)
1998-2002	New Initiatives in Malaria Research Award	Burroughs-Wellcome Fund
2002	Jay Keystone International Lectureship	University of Toronto, Toronto, ON
2003	International Travel Lectureship	Australian Society for Parasitology
2006	Visiting Lecturer, University of Calgary	AHFMR
2016	Fellow of the American Society of Tropical Medicine and Hygiene	American Society of Tropical Medicine and Hygiene

C. Contribution to Science (For a complete list of my publications, please see https://www.ncbi.nlm.nih.gov/myncbi/1H1aayuecivcyq/bibliography/public/)

1. The mouse model of *P. chabaudi* AS (PcAS) in resistant C57BL/6 (B6) and susceptible A/J mice is well established in my laboratory. I am recognized internationally for my expertise in this model and other mouse malaria models. We previously phenotyped a panel of inbred mouse strains and B6- and A/J-derived F1, backcross, recombinant inbred and recombinant congenic inbred (RCI) mice as well as B6-derived ENU strains as resistant or susceptible to PcAS based on peak blood parasitemia level and survival. The publications below demonstrate susceptibility to PcAS is a complex trait and that female mice are more resistant than male mice. This body of work is directly relevant to the studies to identify genetically-regulated immune responses to malaria in the Collaborative Cross mice proposed in the present application.

2. Efforts to develop a protective vaccine against blood-stage malaria are hampered by the lack of a clear understanding of the immune response to the Plasmodium parasite. Earlier studies identified candidate antigens based on their ability to stimulate high titers of antibodies. Yet, recombinant vaccines based on these antigens are not protective. My work to understand the immune response to malaria is focused on identifying the cellular mechanisms involved, in particular, the contributions of cells and cytokines important in innate and adaptive immunity. Based on this approach, we have identified critical roles for dendritic cells, NK cells, macrophages, $CD4^+$ Th1 cells, regulatory $Foxp3^+$ T cells, and the cytokines IL-12, IFN-γ and TNF-α in protective immunity to PcAS. These cells and cytokines have been confirmed to be essential for protective immunity to *P. falciparum* in humans supporting the validity of the PcAS model in mice as a robust experimental tool.

3. Malarial anemia is complex and multifactorial and ranges from mild to severe in *P. falciparum*-infected children. Both host- and parasite-derived molecules contribute but their exact roles are unclear. During PcAS infection in mice, anemia occurs and like varies from mild to severe among inbred strains. We investigated erythropoiesis, reticulocytosis, erythropoietin (Epo) production, and the role of cytokines in regulating erythropoiesis in PcAS-infected mice. We provided the first evidence that late-stage erythropoiesis is suppressed during malaria despite adequate increases in Epo. Importantly, our findings were confirmed in vivo and in vitro in *P. falciparum*-infected children with SMA. We also demonstrated that *Plasmodium*-derived products directly contribute to suppression of erythropoiesis during malaria.

4. Based on findings of our studies on the immune response to malaria, we developed novel immunotherapy and a protective vaccine against blood-stage malaria using IL-12. The findings of our previous genetic analyses in RCI mice derived from PcAS-resistant B6 and susceptible A/J mice that identified loci associated with erythroid-specific traits provided the rationale to test cysteamine, a drug used to treat nephropathic cystinosis, alone or in combination with artemisinin as chemotherapy against malaria.

Perform an unbiased screen of the Collaborative Cross resource to identify new loci influencing the immune response to malaria

SCOPE: Malaria continues to be a major global health problem despite efforts to eradicate this disease. Mosquito-borne *Plasmodium* parasites cause high morbidity and mortality in sub-Saharan Africa. In this region, *P. falciparum*, the deadliest species of human malaria, is endemic. Replication of the parasite in host red blood cells during blood-stage infection is responsible for severe malarial anemia and cerebral malaria which frequently result in death in children under the age of 5 and pregnant women. Yet, the protective immune response to blood-stage infection remains poorly understood and an effective vaccine that provides long-term protection is still not available. Although there is growing evidence that variability in immune response genes contributes to susceptibility in individuals residing in endemic areas, identification of genetic variants that contribute to malarial susceptibility in humans presents considerable challenges. A more viable approach is to perform genetic analyses in a robust experimental model in mice. To this end, we propose to perform an unbiased screen of the Collaborative Cross (CC) resource available from the University of North Carolina in Chapel Hill to identify new loci influencing the immune response to malaria using the mouse model of blood-stage *P. chabaudi* AS (PcAS). PcAS infection in mice mirrors many of the immunological and pathological features of *P. falciparum* infection making this parasite an important experimental tool to study the immunology of human malaria and identify new targets for vaccine development and immunotherapeutic interventions. We hypothesize that the CC strains will provide an unbiased means to identify new candidate genes regulating the immune response to blood-stage malaria. Parasitological and immunological approaches well established in our laboratories will be used in **Aim 1** to determine the intra-strain variation and quantify the experimental variability for detecting immune responses to PcAS infection in the eight CC founder strains and identify parameters that correlate with immunity to blood-stage malaria. Studies in **Aim 2** will identify genetic variants linked to the immune parameters identified for response to PcAS in the CC strains. This research program builds on a budding collaboration between Dr. Mary Stevenson, expert on mouse models of malaria, and Dr. Sylvie Lesage, an immunogeneticist. It harbours outstanding potential to uncover novel genetic variants contributing to the immune response to malaria. Identification of these genetic variants will inform us on the molecular pathways that have been naturally selected to modulate these immune traits, which may help design better vaccines to prevent malaria or to identify novel immunotherapy to treat malaria.

"Per" signature not acceptable.)*	DATE

Specific Aims

Mammalian immune systems often effectively control exogenous mobile genetic elements (MGEs) i.e. viruses, preventing them from causing mortality or significant morbidity. Similarly, endogenous MGEs—including transposons and endogenous retroviruses (ERVs)—comprise ~50% of mammalian genomes and are generally controlled via diverse silencing mechanisms. The mechanisms controlling endogenous and exogenous MGEs are intertwined (e.g. 1-7). Moreover, control of both exogenous and endogenous MGEs is incomplete. Whereas incomplete viral control results in disease, incomplete silencing of endogenous MGEs in the germline results in mutation.

In humans, several classes of MGEs have been documented to cause mutations by *de novo* insertion, often discovered in the context of genetic disorders (8). Moreover, some human ERVs have been active in the recent past, as can be inferred based on population-specific insertions of these elements (9). Throughout evolution, mutations caused by MGEs have led to phenotypic changes important for organismal function, which is referred to as exaptation. For example, some human ERVs contain transcription factor (TF) binding sites which enable them to act as interferon-responsive enhancers, and these ERVs are critical for transcriptional regulation of the interferon pathway (4).

MGEs are even more active as mutagens of mouse genomes than in human (10). A high number of spontaneously-arising mutations on the B6J background are due to ERV insertions (11). In humans, large population cohorts have now been sequenced, allowing comprehensive genotyping of the polymorphic MGE insertions (12). Initial attempts to understand the phenotypic correlates, at the level of gene transcription, of polymorphic MGE genotypes in the human population have been undertaken (13). However, it remains unknown how polymorphic MGE insertions drive variation in physiologically-relevant immune phenotypes in humans and mice. In this proposal, we will use a newly-developed computational pipeline to genotype MGE insertions in collaborative cross (CC) mouse strains, then perform association testing between these insertions and phenotypes collected by other projects in the Center for Systems Immunogenetics of Biodefense Pathogens. This will allow us to map new immune regulatory genes and genetic variants important for defense against pathogens.

Aim 1. Map MGE insertion genotypes in CC recombinant inbred (CC-RI) F1 cross strains used in SARS-CoV, IAV, and WNV infection screens. A) We will first apply our MGE insertion detection pipeline to short-read datasets from the 8 founder strains, then will use existing haplotype data for CC-RI strains to partition MGE insertion genotypes to each strain based on the known recombination breakpoints and genetic contributions from the founder strains. B) We will also obtain long-read sequencing of select CC-RI strains in order to confirm genotypes and identify *de novo* MGE insertions arising during CC breeding.

Aim 2. Associate MGE insertion genotypes with immune system phenotypes to identify novel immune regulatory genes and new mechanisms of immune gene regulation. A) We will first perform genome-wide association studies of MGE insertion genotypes with immune phenotypes. B) To understand the transcriptional impact of polymorphic MGEs on the genes they regulate, we will perform RNAseq of immune cells from selected CC lines with MGE-dependent differences in viral outcomes.

BIOGRAPHICAL SKETCH

A. Personal Statement

My research focuses on virus-host symbioses established upon integration of viral sequence information into the genome of the host. As over 50% of the human genome is derived from endogenous retroviruses and other retro-transposable elements, this has been a significant driver of human genome evolution. My team is currently studying host-integrated viral sequences derived from two human pathogens which do not encode integration enzymes; thus host, rather than viral, machinery was necessary for integration of these viral sequences into our genome: Borna disease virus, a recently emerging cause of human encephalitis, human herpesvirus 6, a ubiquitous human pathogen responsible for roseola in infants. The goal of this research is to understand and harness existing mechanisms of “natural” human genome editing to enable human resistance to disease. I am also a medical doctor with specialty training in general surgery and interest in translating basic science advances to surgical care, especially in the field of transplantation. I have been focusing exclusively on basic science research since 2018, when I started an independent research group at RIKEN in Japan.

B. Positions and Honors

Positions and Employment

2014	Japan Society for the Promotion of Science Postdoctoral Fellow, Kyoto University Institute for Virus Research
2015-2018	Resident Physician, Vanderbilt University Medical Center, Section of Surgical Sciences, General Surgery
2018-present	Hakubi Team Leader, RIKEN Center for Integrative Medical Sciences, Genome Immunobiology RIKEN Hakubi Research Team

Other Experience and Professional Memberships

2014-	Candidate Member, Association for Academic Surgery
2015-	Junior Fellow, International College of Surgeons
2015-	Resident Member, American College of Surgeons
2015-	Member, American Society for Transplantation Trainee and Young Faculty Community of Practice
2015-	Member, The RNA Society
2018-	Member, The Japanese Society for Virology
2019-	Member, The Molecular Biology Society of Japan

Honors

2007	Phi Beta Kappa, Gamma of Georgia
2009	Conference on Retrovirology and Opportunistic Infections (CROI) Young Investigator Award
2011	CROI Young Investigator Award
2011	Centers for HIV-1/AIDS Vaccine Immunology (CHAVI) Young Investigator Award
2012	CHAVI Immunogen Design Pre-Doctoral Student Award
2014	Richard K. Root Prize, Perelman School of Medicine
2018	American College of Surgeons International Exchange Scholarship
2018	J. Kenneth Jacobs Research Scholarship Award, Vanderbilt University
2019	Outstanding Abstract, 11th International Conference on Human Herpesvirus 6 & 7

1. I am currently studying the role of genomic sequences derived from non-retrotranscribing viruses on host immune function. I reported the first example of production of piRNAs, a class of interfering small RNA, from nonretroviral endogenous viral elements, specifically from endogenous bornavirus-like Nucleoprotein elements (EBLNs) in the mouse and human genome. I proposed that these piRNAs could be involved in sequence-specific antiviral immunity, a concept that has subsequently been demonstrated in chickens, mosquitos, and koalas. Currently, a major effort of my group is to test this concept using genome-engineered mice. This research highlights the remarkable ability of the host genome to integrate virus-specific nucleic acid information, potentially as immune memory.

2. I have used whole genome sequencing to study virus genome-human genome interactions and the evolution of genomic novelty in general. As a member of the 1,000 Genome Structural Variation working group, I characterized the contribution of a novel RNA-templated DNA insertion mutation mechanism to genetic differences across individuals and human populations. I have continued this work to analyze the human "integrated virome" in non-reference genome-mapping reads from whole genome sequencing projects. In doing so, we have found evidence of relatively frequent integration of HHV-6 into certain telomeres. The existence of common HHV-6 integrations events which are identical by descent and linked to human haplotypes is an unexpected new finding. We consider it a scientific imperative to test the possibility that these integrated viruses act as a reservoir to generate infectious viruses or are otherwise capable of influencing human health.

3. My graduate work focused on HIV-1 molecular virology in the laboratory of Dr. Beatrice Hahn. I was able to connect viral genotypes of interest, across the entire viral genome, to medically relevant phenotypes. This was made possible using chemically-synthesized molecular clones of large panels of HIV-1. We were able to, for the first time, define the virus phenotypes that are associated with mucosal transmission, and link these phenotypes back to the diverse genotypes responsible for the HIV-1 pandemic.

D. Additional Information: Research Support and/or Scholastic Performance

Current Support: My laboratory is funded by an internal RIKEN program, the "Hakubi" program which aims to recruit exceptionally talented individuals to develop the next generation of leading researchers with a global outlook. My team's budget is ~40 million JPY (~360,000 USD) annually for 5-7 years. I am fully eligible for additional external funds and internal funds, of which I was able to compete for 6.8 million JPY in the previous fiscal year.

Research Approach

The goals of this pilot project are to identify MGE insertions that are polymorphic in different CC lines and characterize them as novel immune regulatory genes. To this end, we will use a new computational method to discover MGE insertions using short-read sequencing data. We developed a new pipeline that uses the BLAST homology search algorithm to "explain" unmapped reads or reads that map partially to a reference genome with non-reference MGE insertions. BLAST has previously been too computationally costly for this purpose, however we have implemented our pipeline using supercomputing resources available at RIKEN and the University of Tokyo. This pipeline outperforms "Mobile Element Locator Tool," the pipeline used to genotype mobile element insertions in the 1000 Genomes Project (14 and unpublished data). Critically, it is also applicable to mouse, not only human, genomes and allows detection of polymorphic ERVs, not only transposons. To demonstrate the feasibility of our pipeline to achieve this aim, we have already applied it to sequencing data from *Mus musculus castaneus* (CAST/EiJ, Cast). In this preliminary work, we identified over 15,000 MGE insertions present in either the Cast or mouse reference (C57BL/6J, B6J) genome, but not both, including over 5,000 ERVs. If funded, we will implement this pipeline using publically-available short-read whole-genome sequencing (WGS) data from 8 CC founder strains. Next, we will use the available haplotype data from the CC-RI strains, as well as WGS data available for 75 CC strains, to generate inferred MGE insertion genotypes, genome-wide, for all CC-RI strains used in the infection screens performed by the Center for Systems Immunogenetics of Biodefense Pathogens (15).

MGE can quickly generate genetic novelty, potentially influencing immune regulation. However the rapid evolution of MGEs complicates their genotyping based on reference datasets, because new insertions can arise in the generations that separate the individual(s) sequenced to produce a reference dataset and the actual individuals of interest (in this case, the CC-RI cross lines that were actually experimented on). In humans, *de novo* MGE insertions have been detected in 6% of live births (16), and the MGE insertion rate in mice is higher than that of humans (10). Moreover, because human data addressing this point is based only on short-read sequencing from pedigrees, which has limited sensitivity for detecting *de novo* MGE insertions, it is likely an underestimation. To address this point, we will obtain approximately 30x coverage long-read WGS data of six selected CC-RI lines. We will coordinate this with the University of Washington PacBio Sequencing Service in consultation with members of the Center for Systems Immunogenetics of Biodefense Pathogens. This dataset will allow us to genotype *de novo* MGE insertions arising during the CC breeding process, and will also generate a "ground truth" MGE insertion dataset to validate our genotyping pipeline in mice, as we have previously done using human long-read sequencing results (unpublished data).

Next, we will perform association studies using the new genotypes obtained above with the rich phenotypic data collected during the previously-performed infection screens, in collaboration with current investigators in this project. To demonstrate the feasibility of MGE insertions to act as immune regulatory variants and influence viral infection outcomes, we analyzed the location of MGE insertions in the Cast genome, relative to the B6J genome, in relation to Ensembl gene transcriptional start sites (TSS). We found 1220 MGE insertions within 10 kilobases upstream of all genes' TSS, which represents a significant enrichment relative to random distribution throughout the mouse genome ($p<0.0001$). There were 402 MGE insertions absent in Cast, but present in B6J, which also represents a statistical enrichment ($p=0.01$). Downstream insertions were not enriched. Considering only TSS of immune genes, we detected 50 MGEs polymorphic between B6J and Cast; there are reasonable candidate loci to be involved in regulating immune responses differently between these

lines. The diverse CC strains used in the infection studies will be a powerful resource to allow us to discover which, if any, of these genetic variants associate with viral infection phenotypes of interest. It is important to note that these MGE insertions are not genotyped using existing approaches, so these MGE insertions may explain "missing heritability" of already-studied phenotypes, or may represent the "hidden" causative variants at loci already known to be associated with traits of interest. This subaim adresses a major open question in the genomics of immune regulation. While we thus cannot guarantee that MGEs will indeed be revealed as immune regulatory variants, there are a number known overlaps between the immune genes and mechanisms that control ERVs and other MGEs with those that control exogenous viruses (e.g. 3, 17,18). Thus it is reasonable to anticipate that some of the genetic variation contributed by the activity of MGEs in recent mouse diversification evolved under selective pressure from viruses and ERVs, and will thus influence variation in immune phenotype.

In the final aspect of this pilot project, we will perform RNA sequencing of immune cells sorted from different CC-RI lines. This will be performed in collaboration with Dr. Hideyuki Yoshida, an expert in single cell sequencing and immune transcriptomics (19, 20). We will choose 6 CC-RI lines which have highly divergent responses to SARS-CoV, IAV, and WNV, as well as candidate MGE insertions which may influence these responses. In the event that we cannot find suitable lines that differ based on MGE insertions putatively influencing antiviral immune function, we will choose any six diverse CC-RI lines for this purpose. We will first use flow sorting to quantify and separate immune cells into the 11 basic cell types characterized in the Immgen consortium (20). In all lines, we will minimally sequence bulk splenic native CD4 T cells, CD8 T cells, and natural killer T cells. To limit cost, we will employ a pooled single cell RNAseq approach followed by de-multiplexing of single cells based on the known genotypes of the CC-RI lines (21). Based on the MGE insertions we identify, we will tailor additional sequenced populations (e.g. if MGEs are identified near TFs known to regulate development of immune cell types) and whether or not they are sequenced after stimulus (e.g. if MGEs are identified near interferon-stimulated genes). To preliminarily validate that this approach can identify MGE insertions as immune regulatory variants, we used single cell RNA sequencing data from B6J and Cast naive CD4 T cells (22). 51 genes with a MGE insertion within 10kb of the TSS were differentially expressed in naive CD4 T cells from these two lines. Notably, one of these genes is a known antiviral gene which is highly upregulated (>20 fold) in CD4 T cells from Cast relative to B6J (Figure 1). In the Cast genome, but not the B6J genome, an ERV has inserted 1.8 kilobases downstream of the gene's TSS (Figure 2). We thus anticipate that the deep genetic resource of the CC, along with existing phenotypic datasets from viral infections, coupled with unique genotypic and transcriptomic data we will generate on a pilot scale if funded, will enable us to identify MGE insertion as a genetic mechanism underlying variation in immune responses and their regulation.

Scope of Work

Nicholas Parrish, MD PhD, will oversee this project. He will spend approximately 15% of his time on this pilot project during the grant period. He will direct the implementation of the described mobile genetic element genotyping pipeline. Funds are requested to support supercomputer usage time in order to implement genotyping. He will coordinate a service agreement with the University of Washington PacBio sequencing service (https://pacbio.gs.washington.edu/) or another service provider to perform long-read resequencing of 6 CC-RI lines. Dr. Parrish will act as liaison with other Systems Immunogenetics Project members. He will oversee association testing between mobile genetic element insertions as genotyped by his group and existing and future phenotypic data collected by Systems Immunogenetics Project members.

Dr. KOJIMA Shohei (postdoctoral researcher, RIKEN IMS) will assist with implementation of the pipeline and will perform association testing. GWAS implementation and statistical genetics is available through our laboratories existing collaboration with the RIKEN IMS Laboratory for Statistical and Translational Genetics (PI Dr. TERAO Chikashi). Dr, KOJIMA will analyze PacBio sequencing data.

Ms. Erica Parrish will perform animal care for the requested CC-RI lines.

Dr. YOSHIDA Hideyuki will perform FACS sorting of various immune cell subsets from CC-RI lines. He will generate RNA sequencing libraries from these cells. We will contract with Macrogen Japan company (https://www.macrogen-japan.co.jp/) to sequence the resulting libraries. Dr. Yoshida will collaborate with Dr. Parrish and Dr. KOJIMA to perform association testing between gene expression levels, polymorphic mobile genetic element genotypes, and phenotype data collected by Systems Immunogenetics Project members.

Indirect costs are calculated at 8%

Budget Justification:

Personnel: No personnel costs are requested. Dr. PARRISH, Dr. YOSHIDA and one postdoctoral researcher (KOJIMA Shohei) will be the personnel involved, however salary support for the grant period is already covered.

Equipment/Travel/Participant fees: Dr. Parrish requests funds to travel once to UNC from Japan to present the outcome of the pilot project: $5,400

Direct costs:

Materials and supplies:

Animal costs and embryo/sperm frozen shipping fees: $2,500

RIKEN animal facility fees for mouse clean-up: $76 x 6 strains: $460

Animal care costs: 24 cages x 180 days x $0.65: $2,800

Antibodies for flow sorting: $5,240

RNA sequencing library preparation reagents: $12,000

Hard drives for data transfer and shipping: $1,000

ADP/ computer services:

"D4" course with 1024 cores x 12 months at Shirokane supercomputer, University of Tokyo: $3,600

Contract costs:

University of Washington PacBio sequencing service (four 30-hour sequel II runs, with 3 samples multiplexed per run, each sample in duplicate): $19,600

Macrogen HiSeqX sequencing service, 18 lanes total: $23,400

Facility User fees:

RIKEN IMS FACS core user fees: $2,000

Indirect costs: RIKEN indirect costs at 8%

DATE 02/27/20

SPECIFIC AIMS

The survival of a host infected with a chronic pathogen is ultimately determined by the host response that must include both resistance and disease tolerance mechanisms. "Resistance" involves antimicrobial pathways that directly control bacterial burden, while disease "tolerance" comprises of mechanisms to withstand the cumulative damage of tissue damage that chronic infection entails. In the context of tuberculosis (TB), resistance pathways eventually breakdown and *Mycobacterium tuberculosis (Mtb)* is able to persist in tissues long-term. At that point, disease tolerance is vital for regulating the immune response to prevent overt damage and ensure ultimate survival of the host. With the failure of current therapies that focus on directly targeting microbial pathways, **this proposal instead focuses on identifying the mediators of host tolerance** that may be leveraged to design new host-directed strategies.

From preliminary studies, we found that the Collaborative Cross panel models the broad phenotypic spectrum of TB disease traits observed in human cohorts. We identified resistant CC genotypes able to control bacterial burden through to highly susceptible CC genotypes that succumbed to disease within one month of infection. While we found many disease traits were generally correlated, we also identified several "outlier" genotypes where typical disease metrics were broken. For example, bacterial burden and weight loss are correlated in the standard C57BL/6J model of infection, however among CC strains harboring 10_7 CFU in their lungs, we identified genotypes with a wide variation in weight loss and survival. Several genotypes showed limited pathology and could tolerate disease at that burden, while other CC genotypes exhibited weight loss and succumbed to disease at the same CFU. These data suggest that distinct genetic mechanisms underlie disease tolerance. In the current proposal we will **leverage these CC "outlier" strains as new models of disease tolerance to define the immunological and genetic mechanisms** underpinning this essential and understudied component of protective immunity to pathogens.

We will pursue the following aims:

Aim 1: Define the immunological hallmarks and kinetics of disease tolerance in outlier CC genotypes. In our previous study, we identified disease tolerant and non-tolerant CC genotypes, however the cellular players and timing mediating this protective state is yet unknown. We hypothesize that specific immunological profiles can distinguish tolerant and non-tolerant responses. Here, we will profile the innate and adaptive immune responses in two tolerant and two non-tolerant CC genotypes during the course of infection with *Mtb*. Overall, this aim will Identify the immunological biomarkers that distinguish disease tolerance from non-tolerance in diverse hosts.

Aim 2: Elucidate the genetic determinants that underlie disease tolerance. The identification of outlier CC strains that maintain the same bacterial burden, yet show vastly different disease outcomes implies that these traits are under distinct genetic control. In this aim, we will identify the genetic loci underlying disease tolerance in an F2 mapping population created between the two most extreme tolerant and non-tolerant CC strains that we identified in the initial CC infection study. F2 mice will be genotyped, infected with *Mtb* and phenotyped for bacterial burden and disease tolerance traits. QTL mapping will identify novel host loci that underlie disease tolerance in these CC outlier strains.

Impact: Overall, this work will provide new insights into disease tolerance that is relevant to genetically diverse hosts. Understanding the immunological and genetic mediators of disease tolerance will allow the rationale design of novel host-directed strategies that may be applied to tuberculosis and other chronic infections.

A. SIGNIFICANCE

Infection with *Mycobacterium tuberculosis* (*Mtb*) results in highly variable disease progression and clinical outcomes. Most individuals exposed to *Mtb* have latent infection and remain asymptomatic for a lifetime. However, about 10% of those infected develop active tuberculosis (TB), and even amongst these patients the timing, location and presentation of pathology is remarkably diverse. Two major questions facing the field include: predicting which people are most at risk for disease, and determining the optimal immune response a vaccine or intervention should elicit. Thus, **understanding the cellular and genetic determinants of the host response to infection** is a fundamental challenge in developing more effective strategies in TB prevention, diagnosis and treatment.

A challenge in understanding the mechanisms underpinning protective immunity is the lack of adequate diverse animal model systems. In contrast to the genetic and phenotypic diversity observed in natural outbred populations, the vast majority of small animal models for TB utilize single strains of genetically identical animals. *The lack of a tractable small animal model that incorporates relevant genetic diversity limits our ability to rationally design interventions that are likely to be effective in natural outbred and variable populations (*Smith *et al. 2018;* https://doi.org/10.1016/j.tim.2018.08.002). The Collaborative Cross (CC) mouse panel is unique in its genetic diversity that allows for the generation of new models that replicate diverse disease states. Importantly, this variability can be generated reproducibly, creating tractable models in which to interrogate mechanisms of protection (Smith *et al.* 2016; https://mbio.asm.org/content/7/5/e01516-16).

From preliminary studies in the 8 parental strains and ~55 recombinant inbred Collaborative Cross (CC) lines, we found that the CC panel encompassed a broad response to infection with *Mtb*. In particular, we identified several CC genotypes that maintained relatively high bacterial burden (10_6 to 10_7 CFU), yet showed no typical disease traits including weight loss or pathological sequelae. This ability to withstand inflammation and disease at high bacterial burden is known as "disease tolerance", and may be an important arm of the host response needed to survive chronic infections. We also identified "non-tolerant" strains that at that same bacterial burden succumbed to infection, reminiscent of the classical "wasting" disease associated with TB in susceptible human cohorts. In this project, **we will leverage outlier CC strains to define the immunological and genetic basis of disease tolerance**. This work will provide new models and genetic loci underlying disease tolerance that will inform novel host-directed strategies to augment host tolerance to infection.

B. INNOVATION

This proposal is conceptually innovative in 3 main ways:

(i) Incorporating genetic variability in a reproducible manner using the CC is critical to produce a more accurate model of **diverse TB disease**. Here, we will identify immune responses associated with disease tolerance in the genetically diverse but reproducible CC strains.

(ii) **Disease tolerance** is a critical, yet understudied aspect of protective immunity to chronic infections. Thus, our identification of new models of disease tolerance within the CC panel will enable mechanistic studies to dissect disease tolerance that may also be applicable to other chronic infections

(iii) The F2 intercross approach between two phenotypic outlier CC strains is an effective method to **map and identify casual variants** underlying distinct disease states. We have successfully leveraged this approach to identify a causal variant underlying susceptibility to TB (Smith *et al.* 2019; https://doi.org/10.1128/mBio.02791-19) and will now leverage the extreme phenotypic difference between a CC tolerant strain and non-tolerant strain to map the genetic loci and associated pathways underlying disease tolerance. These pathways and mechanisms may be widely applicable to other chronic infections.

C. APPROACH

In this project, we will select strains from the CC panel that demonstrate the extremes of disease tolerance to TB (Fig1). We will leverage the tractable CC model to functionally characterize these responses at the immunological and genetic level, to discover new pathways of protective immunity and disease tolerance that can be leveraged for new host-directed interventions. We will do this by 1) Defining the characteristics and kinetics of immunity and pathology in tolerant and non-tolerant CC lines and 2) Identifying the genetic loci that underly disease tolerance to *Mtb* infection.

Overall approach: We will profile the adaptive immune responses and histopathological progression during infection with *Mtb* in two tolerant CC strains and two non-tolerant CC strains. Profiling several independent CC strains of each category enables the identification of multiple tolerance pathways. After defining the traits and timepoint that distinguish disease tolerance between these extreme tolerance outliers, we will map the genetic loci driving the divergent disease tolerance response, as described:

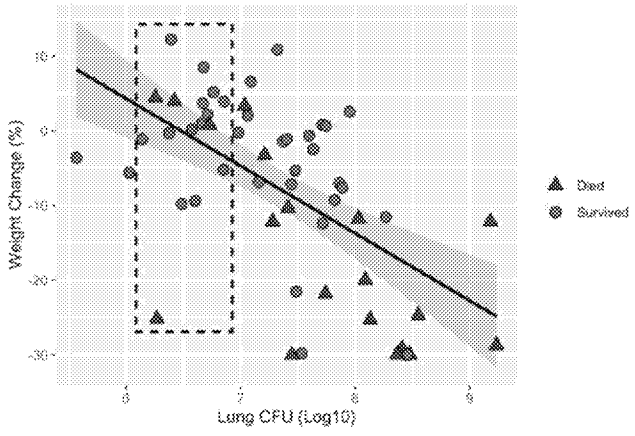

Fig1. Identifying disease tolerant vs non-tolerant CC strains. Bacterial burden (CFU) vs weight loss across ~55 CC strains. Strains within the box have similar burden but vastly different disease, based on weight loss. Each point represents a CC genotype (the average of n=3-5 mice/genotype). Triangles indicate genotypes that were moribund at 4wks post-Mtb infection.

Aim 1: Determine the immune and histopathological characteristics of tolerance to tuberculosis in tolerant and non-tolerant CC lines.

Choice of tolerance outlier lines: Based on our ongoing studies, we have chosen to focus on 4 CC strains; 2 tolerant lines (high bacterial burden but do not lose weight) and 2 non-tolerant strains (that at the same bacterial burden, succumb to disease after four weeks of *Mtb* infection) (Fig1). These genotypes represent the phenotypic extremes of TB tolerance.
Infection: Mice will be infected by the aerosol route with *Mtb* reference strain H37Rv. Groups of 5 mice per genotype will be sacrificed at 2 weeks (prior to the onset of adaptive immunity), 3 weeks (onset of adaptive immunity) and 4 weeks (plateau of bacterial burden and adaptive immunity) after *Mtb* challenge. Lungs and spleen will be collected for i) immune profiling by flow cytometry and ii) fixation for histopathological analysis of cellular infiltrate location and lesion formation. Mice will be monitored for weight loss, and one anatomic lung lobe homogenized / plated for bacterial counts.

We will perform the following set of functional assays and unbiased immune profiling strategies by flow cytometry:
T-cell subsets: We will enumerate the proportion of $CD4_+$, $CD8_+$, $TCR\gamma\partial_+$, and invariant (iNKT and MAIT) T cells.
T helper subtypes: We will compare transcription factor expression (t-bet, RORγT, Foxp3, and GATA-3), surface receptor expression (CXCR3, CCR6, CCR4, and CD25), and intracellular cytokine production (IFNγ, IL-17, IL-22, IL-10, and IL-4) after stimulation with Mtb purified protein derivative (PPD) to evaluate the contribution of each T helper (Th) subset (Th1, Th17, Treg, and Th2, respectively) of Mtb-specific T helper cells.
T cell function: Without ex vivo stimulation, we will directly estimate the proportion of cells secreting several effector cytokines that contribute to antimicrobial function during TB by direct intracellular cytokine staining / flow cytometry of T cell subsets, including: IFNγ, TNF, IL-2, IL-17, IL-21, and GM-CSF. CTL function will be estimated by measuring intracellular granzyme B and perforin by antibody staining and flow cytometry. Surface receptors associated with T cell exhaustion (PD-1, 2B4, Tim-3, CTLA-4, Lag-3), terminal effector differentiation (KLRG1), and T cell activation (CD69 and CD25 expression, intracellular Nur-77, IRF-4 expression, and CD27 and CD127 down-regulation) will also be compared. Each assay has been already tested in the parental strains of the CCs to ensure validity of antibodies.
Total organ cytokines will also be measured by multiplex ELISA assays, to correlate inflammatory profiles that separate tolerant from non-tolerant CC responses to *Mtb*.

Together, this data will distinguish the cellular and histopathological changes that ***separate disease tolerance and non-tolerance in the selected CC outlier strains*** during the innate and adaptive host response to TB. The deep profiling of these CC strains will ensure their implementation as new models in which future studies can test host-directed strategies to augment tolerance to TB and other chronic infections.

Aim 2: Elucidate underlying genetic drivers of disease tolerance to TB.

The identification of outlier lines that at the same bacterial burden have vastly different inflammatory sequalae, implies that bacterial burden and pathological disease traits are under independent genetic control. We aim to *identify the underlying host loci driving the extreme disease tolerance responses by a genetic mapping approach*.

In collaboration with Dr Martin Ferris and Dr Fernando Pardo-Manuel de Villena at UNC Chapel Hill, the two most extreme disease tolerance CC genotypes will be intercrossed to make F1s; F1 progeny will then be intercrossed to create an F2 mapping cohort. Tail snips will be taken and genomic DNA extracted for genotyping on the miniMUGA array (~10,000 markers), developed by our UNC collaborators and that we have extensively used. We will infect ~200 F2 mice with *Mtb*, collect lungs and spleen for bacterial counts and multi-immunological phenotyping (determined by the informative phenotypes that distinguish tolerance from non-tolerance as determined in aim 1 above). The QTL associated with disease tolerance traits will be mapped using RQTL2. Additionally, analysis in RQTL2 can explicitly identify sex-specific genetic effects and 2-gene epistatic interactions.

This extreme CCxCC F2 approach will identify **host loci that underlie disease tolerance.** Future studies can verify candidate loci through further crosses (congenics) and swapping of alleles between tolerant/non-tolerant strains and/or knock-out strians using Crispr/Cas9 technology.

Future directions:

This proposal will identify and define new models of disease tolerance and is the first step in identifying the genetic determinants that underly this vital arm of protective immunity to pathogens. Findings from this work will form the preliminary data to setup an R01 application, that will aim to identify the causal drivers of disease tolerance and how these pathways may be targeted as novel host-directed therapeutic interventions.

A. Personal Statement. Throughout my scientific career I have focused on understanding the genetic determinants underlying infectious disease, successfully translating these insights into human clinical settings. My honors thesis and PhD work in the laboratory of Dr. Simon Foote focused on understanding the contribution of host and *Plasmodium* enzymes to malarial infection in the red blood cell. I discovered that several host heme enzymes are required for parasite growth in the red cell and I validated these enzymes as novel host-directed therapeutic targets using a range of *in vitro*, *in vivo* mouse and *ex vivo* human studies. I stayed in the Foote laboratory immediately after my PhD defense to test the target and compound I discovered during my PhD in a human malarial challenge phase IIb trial. My PhD training under a renowned mouse and human geneticist gave me the skills to tackle host aspects of the longstanding evolutionary battle between host and pathogen but left me with the feeling that this was truly only half of the answer. To truly understand the genetic basis of susceptibility to infection, we needed a way to incorporate pathogen diversity.

The quest to understand the host-pathogen interaction at a genome-wide level subsequently led me to postdoc with Dr. Chris Sassetti at UMASS, who developed tools to understand bacterial genetic requirements during tuberculosis infection. This was a productive collaboration, where I mastered new bacterial genetic technologies and applied my background in mammalian genetics to **create a tractable new model to understand the contribution of both host and pathogen variation underlying infection**. This "dual-genome" model leverages genetically diverse mice (including Collaborative Cross (CC) and Diversity Outbred mouse panels) and libraries of bacterial mutants to define the host-pathogen genetic interactions that allow *Mycobacterium tuberculosis* to survive in diverse environments. I have also leveraged the CC to understand protective immunity and vaccine protection across genetically diverse hosts. My postdoctoral work has established the use of the CC in the tuberculosis and pathogenesis fields as a way to incorporate genetically diverse but tractable models to understand mechanisms of protective immunity observed in human cohorts.

Having established novel Systems Genetics approaches to define the host-pathogen interactions underlying tuberculosis disease and treatment, I am now poised to launch my own group in the Molecular Genetics and Microbiology (MGM) Department as Duke University. Here, I am in a unique position to lead the effort to incorporate genetically diverse models including the CC into the broader pathogenesis field. As a leader in Mammalian Genetics and an expert in the CC and wild-derived mouse resources, I have established collaborations within Duke, the NC research triangle and to the broader pathogenesis and tuberculosis research fields. Here, my lab's "dual genome" systems genetics approaches can be broadly applied to understand disease pathogenesis in the context of genetically diverse hosts.

B. Positions and Honors

Positions and employment

2006	Undergraduate thesis research. Advisor: Dr John Ross, University of Tasmania, Australia. "Genetic regulators of gibberellin synthesis and root growth in *Pisum sativum*"
2007	Honors thesis research. Advisor: Dr Simon Foote, University of Tasmania, Australia. "A bioinformatic approach to dissecting host vs parasite metabolic genes"
2008-2012	Graduate student, Laboratory of Dr. Simon Foote, Menzies Research Institute, Australia. "An investigation of novel host-directed antimalarial therapeutics"
2009	Summer research fellow, Laboratory of Dr. Odile Puijalon, The Pasteur Institute, Paris.
2012	Visiting research fellow, Laboratory of Dr. Maria Mota, Institute of Molecular Medicine, Lisbon, Portugal
2013-2019	Postdoctoral Research Fellow. University of Massachusetts Medical School, MA. Advisor: Professor Christopher Sassetti. "Systems Genetics of Tuberculosis"
12/2019-	Assistant Professor, Molecular Genetics and Microbiology Department; Member of Duke Human Vaccine Institute, Duke University, NC.

Honors and awards:

2008 – Awarded GlaxoSmithKline Postgraduate Fellowship

2009 – Awarded best talk at the Australian Society for Parasitology National Conference, Sydney, Australia

2010 – Awarded best poster at Lorne Genome National Conference, Lorne, Australia

2011 – Awarded Bede Morris Fellowship from the Australian Academy of Science

2012 – Awarded OzEMalaR (Australia-Europe Malaria Cooperation) Fellowship for researcher exchange

2013 – Young Australian of the Year award; Tasmanian State winner and National finalist

2014 - Awarded Verne Chapman Young Investigator for best talk at the International Mammalian Genome Conference, Bar Harbor, ME. This award resulted in election to the Secretariat of the International Mammalian Genome Society

2014 – Lorraine Flaherty Award, International Mammalian Genome Conference, Bar Harbor, ME

2015 – Judged Best Overall Talk at the Complex Traits Consortium Meeting, Portland, OR

2016 – University of Tasmania Foundation Award, awarded in recognition of professional achievement

2016 – Session chair for plenary session on human disease models, TAGC, Orlando, FL

2017 – Charles A. King Postdoctoral Fellowship

2020 – Whitehead Research Scholar, Duke University

Editorial and Review Activities

Ad hoc reviewer for eLife, Trends in Genetics, Trends in Microbiology and Mammalian Genome
Editor of Mammalian Genome Journal Special Edition on genetics of Infectious Disease

C. Contributions to Science

1. Identified new host resistance genes in response to malarial infection and successfully translated these insights into human clinical settings. During my honor's year in the Foote lab, I took a bioinformatics approach to identify biochemical pathways in the both the host and the malarial parasite *Plasmodium falciparum* during red blood cell infection. I identified enzymes present in the mature red cell that were lacking in the parasite, and hypothesized that these would be scavenged from the host cell and thereby offer a point of interference in the host-parasite interaction. I discovered that many enzymes from the heme pathway were absent in the parasite during this stage of their life-cycle. I functionally demonstrated that each of these enzymes was required for parasite growth, as parasites were unable to grow in blood from individuals with genetic mutations in the uroporphyrinogen-III synthase or ferrochelatase genes (ie. blood from patients with porphyria). This was also the case in mice with ENU-induced mutations in these same enzymes. I subsequently showed that chemical inhibition of these red blood cell enzymes also blocked the growth of the parasite *in vitro*. As one of these compounds was FDA approved for human use as an antifungal, I subsequently showed the compound had *ex vivo* anti-parasitic activity in human patients taking the drug. My honors and PhD work hence identified an Achilles heel of the malarial parasite and my results led to an experimental human infection clinical study, a patent application, two accepted first-author manuscripts, a funded NHMRC project grant and a funded Gates grant.

2. Created a new model system to understand the contribution of host and pathogen to outcome of tuberculosis (TB). The outcome to TB is remarkably diverse and current models are insufficient to dissect the roles of host genetics, bacterial variation and environment factors that contribute to the progression and outcome of disease. I have addressed the shortcomings of existing animal models by leveraging new mammalian and bacterial genetic resources to create a novel, tractable model to understand host and bacterial determinants of susceptibility to TB. Host diversity is modeled using diverse mice (including wild-derived, single-gene knockout and the BXD and Collaborative Cross recombinant inbred panels) and bacterial variation is incorporated using *Mtb* clinical isolates and large-scale bacterial genetic techniques including transposon mutagenesis (TnSeq). Here I have I have demonstrated that the CCs have wide phenotypic diversity in susceptibility and resistance traits that are relevant to human disease. Through the coordinated use of mammalian and bacterial genetics, I have associated different underlying disease states with more than 10 distinct host loci that influence disease progression and outcome to TB (host-interacting with pathogen QTL; hipQTL). I have additionally leveraged F2 crosses between phenodeviant CC strains to further resolve and map new TB susceptibility loci. Individual genetic variants I have identified from these studies are being tested in human clinical cohorts.

b. **Smith CM**, Long J, Mishra B, Proulx M, Williams R, de Villena FP, Ferris MT, Baker R and Sassetti CM, "The genetic landscape of host-pathogen interactions underlies *Mtb* pathogenesis". Expected submission March 2020

3. Dissected host resistance from vaccine protection in genetically diverse mice. The efficacy of the currently used TB vaccine, *M. bovis* BCG, is highly variable. The design of more broadly-efficacious vaccines depends on understanding the factors that limit the protection imparted by BCG. While these complex factors are difficult to disentangle in natural populations, I leveraged the CC parental strains and several CC RI lines to understand the basis of vaccine efficacy in protection against tuberculosis. Using this new preclinical model, I discovered that natural host genetic diversity is a major determinant of TB vaccine efficacy. I am now using this system to identify immunological correlates of effective vaccination and screen new vaccines that may protect host backgrounds that are unresponsive to standard intervention.

Completed

Systems Genetics of Tuberculosis
Charles A. King Trust Postdoctoral Fellowship 09/01/2017 – 08/30/2019
Role: Principal Investigator
This postdoctoral fellowship was to investigate the molecular and biological basis of TB-associated host polymorphisms that underly susceptibility to disease.

Investigating immunological outliers to understand protective adaptive immunity during tuberculosis
Innovation grant from the Broad Institute 09/01/2017 – 12/01/2018
Role: Principal Investigator
The major goal of this gift grant from the Broad Institute was to identify and characterize new host models of non-canonical immunity to tuberculosis.

Understanding the contribution of host genetics to BCG efficacy
AERAS Biotechnology 09/01/2015-05/31/2016
Role: Co-Principal Investigator with Dr Christopher Sassetti.
In this project, we leveraged strains from the Collaborative Cross to define the contribution of host genetics in vaccine protection against infection with Mycobacterium tuberculosis.

New models to dissect the genetic determinants of disease tolerance

9/1/2020 – 8/31/21

Dr. Clare M Smith

In this project, we will leverage the genetic diversity of the Collaborative Cross (CC) in conjunction with immunophenotyping and genetic mapping approaches to examine disease tolerance to tuberculosis. In order to understand the immunological hallmarks of disease tolerance during infection with *Mycobacterium tuberculosis*, we will define the cellular players and kinetics of disease tolerance in several tolerant vs. non-tolerant CC strains. Concurrently, we will take a CCxCC intercross approach between a tolerant and non-tolerant CC line to generate an F2 mapping population to identify the genetic loci underlying disease tolerance during the chronic infection of tuberculosis. Overall, this work will define new models of disease tolerance and map novel genetic loci driving protective immunity that may be directly applied to other chronic infectious diseases.

Determination of the Host Genetic Determinants of Cytomegalovirus Infection and Immunity

Specific Aims

Human cytomegalovirus (HCMV) is a ubiquitous β-herpes virus that continues to be an important human health concern. Although HCMV infection is largely asymptomatic in individuals with intact immune systems, HCMV has been implicated in the development of a number of diseases including: vascular disease, solid organ and bone marrow transplant rejection, pneumonia, retinitis and certain cancers. In addition, HCMV is transmitted vertically and is the leading viral cause of congenital disease in neonates where it causes a syndrome of sequelae that include neurological malformations, deafness, blindness, and mental retardation. However, the viral and cellular mechanisms involved in these diseases are still largely unknown.

CMV infections are life-long, and the virus alters host immunity through the induction of chronic inflammation, infection and persistence in myeloid lineage antigen presenting cells, escaping T and B cell responses to a large extent, while altering T cell phenotypes and frequencies [1]. However, the latter ability of the virus has ignited a recent area of vaccine development through the use of CMV as a vaccine platform to elicit long lasting, broadly active T cell responses against genome-incorporated foreign antigens. The Streblow lab recently used murine CMV (MCMV)-based vaccines against Chikungunya virus (CHIKV) to induce protective CD8 T cell immunity that reshaped the inflammatory environment following CHIKV footpad challenge. Similarly, our RhCMV vaccine vectors containing Simian immunodeficiency virus (SIV) antigens have been used to vaccinate rhesus macaques. Data from these studies have also challenged dogma by uncovering unique aspects of T cell biology. While the RhCMV vaccine vectors elicit broadly reactive, potent, antigen-specific effector T cells in all vaccinated animals, an important caveat that has emerged is the finding that only approximately half of the vaccinated animals are protected against SIV acquisition upon repeated challenge [2]. Because the induction of T cell responses is fairly uniform across these vaccinated animals, this finding is highly suggestive that host genetics play an important role in how a host responds to CMV infection and to the induction of protective vaccine efficacy, which we feel are most likely functionally linked.

Host genetics dictate responses to CMV infections and may predispose some individuals to CMV infection and disease. This effect has been shown for MCMV in different mouse strains wherein BALB/C mice are more sensitive to virus infection whereas C57BL/6 are more resistant. This difference has been partially linked to the Ly49H gene [3, 4]. The important point is that the inability to clear virus in BALB/C mice also enhances and prolongs immune activation [5]. Thus, genetic susceptibility to HCMV infections may also manifest through: 1) higher tissue viral loads due to an increased viral replication; 2) a decreased ability to control the virus through modified immune mechanisms; as well as 3) an increased susceptibility to heightened inflammation, change in inflammatory profiles or the lack of controls that limit inflammatory processes. Deciphering the host genetic networks that control CMV infection and disease may impact whether we can identify susceptible patients, how we monitor their CMV infection and potential disease manifestations and when to intervene. In addition, if CMV-vectored vaccines become FDA approved, host genetics could be used to predict genetic susceptibility to vaccine failure. Most mouse studies are performed in highly inbred mice with limited genetic diversity, which hampers the ability to identify traits associated with CMV infection. Human studies or those performed in outbred nonhuman primates are limited by feasibility and resources. Therefore, we intend to use the genetically diverse Collaborative Cross (CC) mouse population to determine the genetic networks involved in MCMV infection and disease. We propose the following aims:

SA1. Determine host gene networks control MCMV *in vivo* replication and tissue distribution.
We will quantify viral loads and tissue distribution during acute and persistent infection times to identify QTL associated with MCMV replication *in vivo*.

SA2. Identify host immunological gene networks that regulate anti-MCMV induced immunity
We will quantify and characterize antiviral adaptive immune responses following MCMV infection and correlate these data with viral loads/distribution (SA1) to QTL that affect antiviral immunity.

SA3. Determine host gene networks involved in CMV-induced inflammation
We will quantify inflammatory cytokine levels as well as lung and spleen immunopathogenesis to identify QTL that predict acute and chronic inflammatory disease following MCMV infection.

Translation of our findings could be applied to identify populations of humans that are susceptible to CMV infection and disease, which would be especially important in newborns and patients undergoing immune suppression.

Determination of the Host Genetic Determinants of Cytomegalovirus Infection and Immunity

Significance: Infection with HCMV is linked to the development of a number of human diseases including vascular disease, pneumonia, fetal neurological syndrome, solid organ and bone marrow transplant rejection, as well as, cancer. Studies have indicated that there exists a genetic predisposition to CMV infection and disease, but the susceptibility or resistance gene networks that govern CMV infection are not known. Mice and MCMV are the most commonly used *in vivo* models of CMV infection and disease. We propose to identify the gene networks associated with *in vivo* MCMV replication, anti-viral immunity and virus-mediated inflammation.

Innovation: The Collaborative Cross (CC) is a genetic reference population of mice specifically designed to support Systems-wide Genetics Studies to identify complex phenotypes governed by diverse gene networks. Our pilot project is highly innovative because we do not yet understand the host genetic networks that control increased host susceptibility to CMV infection and disease. We anticipate to identify gene networks associated with susceptibility to infection, antiviral immunity and inflammation. Our CC analysis of MCMV infection could lead to the identification of additional unique mouse models of CMV infection and disease, a process that would benefit the entire MCMV field. Our results could be applied to the analysis of the herpes simplex viruses and MHV-68, prototypic α and γ herpesviruses. Our genetic data could be used to modify CMV treatments.

Research Team: This proposal represents an ongoing collaboration between Drs. Nathaniel Moorman (UNC) and Daniel Streblow (OHSU). Dr. Moorman provides expertise in CMV biology and using the CC to map and study polymorphic immune response genes. Dr. Streblow has expertise in CMV pathogenesis, immunity and inflammation as well as the development of rat, mouse, and rhesus animal models of CMV. The Team will be assisted by the Center for Systems Immunogenetics CC Animal Core and Genetics Analysis Team (UNC). The team will have monthly videoconferences to share and interpret data and plan experiments, with additional calls as needed to discuss new results or experimental issues.

Overall Study Design: Sets of 10 mice (4-6 weeks of age) from each of the 65 currently available CC lines will be infected with $1x10^5$ pfu of wild type MCMV Smith strain by intraperitoneal injection. The virus establishes local infection that becomes distributed throughout the body by trafficking myeloid lineage cells (e.g. macrophages and dendritic cells). During the acute phase (day 0-7 post infection), MCMV rapidly spreads and infects nearly all tissues. The acute phase is followed by lifelong salivary gland persistence and latency in myeloid lineage precursors. We plan to perform our analysis at two different times post infection. One cohort (n=5) will be harvested at 5 days post infection (dpi) due to the high tissue distribution of virus and activation of host innate immunity. The second cohort (n=5) will be harvested at 14 dpi because this is the beginning of viral persistence and the adaptive immune responses will be fully activated at this time. The dysregulation of inflammation will be assessed for both acute (d5) and persistence (d14) times post infection as we would predict that gene networks modify control of these pathways and this could be associated with disease. All animals will be bled prior to infection to assess baseline levels of antibodies, cytokines, and immune cell profiles. At the time of harvest, the animals will be bled by heart puncture and bone marrow, brain, heart, kidneys, lungs, liver, intestines, spleen, salivary glands, and mesenteric lymph nodes will be collected from each animal. A portion of each tissue will be bead beaten in 1ml of PBS, which will be used to detect infectious virus by plaque assay and DNA isolation for viral load determination by Taqman. This sample can also be used to quantify tissue cytokines levels. A second portion of tissue will be collected in RNA later for future host & viral transcriptomics analyses. A third portion of spleen, lung, and salivary gland tissues will be collected in formalin for histological analyses to assess inflammation. Blood will be separated into plasma and cell fractions. The plasma will be analyzed by: 1) cytokine multiplex assays to quantify cytokine and chemokine levels; 2) virus-specific ELISA to identify antibody binding titers and Ig isotypes; and 3) $PRNT_{50}$ to quantify the presence of neutralizing antibodies against MCMV. A phenotypic analysis of mouse T and B cell markers will be performed on the PBMC fraction to characterize perturbations in T cells profiles. The specific methods for each SA are listed below:

SA1. Determine host gene networks control MCMV *in vivo* replication and tissue distribution

Viral loads and tissue distribution will be determined using plaque assays and vDNA Taqman. The results represent a quantitative amount per tissue and the number of positive tissues per animal can be calculated.

Plaque assay. Tissue homogenates will be serially diluted in culture medium and added to confluent monolayers of NIH3T3 cells in 48-well dishes. After 2 hours incubation, the cells will be overlaid with medium containing carboxymethylcellulose. At 5 dpi, the plates will be fixed with 3% formalin and then stained with methylene blue dye, and washed. Plaques will be visualized by microscopy and titers will be calculated.

vDNA Taqman. Total DNA will be isolated from 100µl of the tissue homogenates using our modified DNAzol method that contains extra wash steps. A total of 1µg of DNA will be analyzed by quantitative real-time PCR (Taqman) utilizing a MCMV-specific primers and probe set targeting the viral polymerase M54 and Taqman reagents from ABI. Samples will be analyzed using an ABI QuantStudio7. A stock of BAC derived DNA containing

the entire MCMV genome will be used as a standard to calculate relative copy numbers of viral genome using ABI software.

SA2. Identify host immunological gene networks that regulate anti-MCMV induced immunity

Binding and neutralizing antibody titers will be calculated per ml of plasma. Flow cytometry results are can be quantitative and the level of activated cells or those expressing specific sub-type markers can be used to identify phenotypes driving QTL.

Analysis of Ab responses: (a) ELISA. Purified MCMV virions or infected cell lysates will be bound onto high binding ELISA plates. Plates will be blocked and then serially diluted heat-inactivated serum (day 0, 5, and 14) will be added. Anti-MCMV Ab isotypes will be determined using anti-mouse IgM, IgG, IgG1, IgG2b, IgG2a/c, or IgG3 secondary Abs. Ab levels will be determined by calculating a variety of metrics, including area under the curve, last positive dilution, or saturation dilutions. **(b) Neutralization assays.** $PRNT_{50}$ analysis will be used to quantify neutralization capacity of the serum samples.

PBMC Immunophenotyping. Two panels of antibodies directed against PBMC cell surface markers and cytokines will help determine the frequency, phenotype, and activation status of immune cells. Panel 1: Innate Immune Cell: CD3, CD8a, CD45, CD11b, CD11c, Ly6G/C, I-A/I-E, NK1.1, CD80, CD83, CD19, and CD138; Panel 2: T cell and B cell: CD3, CD4, CD8, CD44, CD62L, CD25, CD223, GITR, IL-17a and Ki67.

SA3. Determine host gene networks involved in CMV-induced inflammation

We will quantify host cytokines and chemokines associated with inflammation and the generation of specific immune responses. The results from this analysis are typically expressed in pg/ml. Histological evaluation will be performed to assess immune infiltration in the lungs and rearrangement of splenic architecture (these results might be best expressed as a binary factor, although a grading scale could be applied).

Analysis of cytokines: Serum cytokines will be evaluated by multiplex assays for the following mouse cytokines: Eotaxin, G-CSF, GM-CSF, IFN-γ, IL-1α, IL-1β, IL-2, IL-4, IL-5, IL-6, IL-7, IL-9, IL-10, IL-12p70, IL-15, IL-17, IP-10, KC/GRO, LIF, LIX, MCP-1, M-CSF, MIG, MIP-1α, MIP-1β, MIP-2, RANTES, TNF-α, and VEGF.

Histology: Lung, spleen and salivary gland tissues will be analyzed by histology for the presence of inflammation. We will stain tissue sections with H&E for microscopic analysis and grading of tissues using our inflammation scoring system.

Evaluation of Correlations Between Phenotypes. We can take advantage of the diversity in the CC population to test the relationship between different virus replication and immune phenotypes. Therefore, we will perform correlation testing to determine whether the viral loads or tissue distribution correlate with the magnitude of specific immune phenotypes (e.g., specific cytokines), Ab response over time, composition (Ab subtype composition), or neutralizing activity Ab response, the frequency and activation status of immune cells, or markers of inflammation.

QTL Mapping. We will identify QTL for all phenotypes assessed within the CC RI screen by linkage disequilibrium mapping. We will conduct *de novo* QTL mapping of all collected traits within the CC population. Phenotypes at both time points will be mapped as continuous traits (viral loads, tissue distribution, antibody levels, cytokines, etc.) although some of the results (such as histology) may need to be mapped as binary traits. However, we have utilized a histology grading scale in the past and this could be applied to our analysis, which would allow for the QTL to be mapped as continuous traits as well. We will perform genome-wide linkage analysis using an additive haplotype model, with parametric bootstrapping for significance. QTL intervals will be defined as the region associated with a 1.5 LOD drop from the peak LOD score. For QTL that reach genome wide significance ($p<0.05$) we will determine both the effect size (percent of heritable and total variation in the trait explained by the QTL) and the haplotype effects associated with high, low, or intermediate QTL effects using our established methods available through the consortium.

Expected Results: We would predict that we will be able to identify QTL for multiple phenotypes. We would expect that there could be traits that limit virus replication in all or specific subsets of tissues. These effects on replication could be validated using *in vitro* cultures of cells (fibroblasts, SMC, EC, DC, Macs, Epithelial cells) derived from specific mouse strains. We would also predict to identify unique QTL that determine adaptive immunity and inflammatory responses. Depending on the specific phenotype these QTL could also be validated in cells isolated from individual mouse strains from the CC.

**The results from this CC mouse screen will be a springboard for the identification of host factors that determine susceptibility to CMV infection and immunity against the virus. Our results will be *directly compared* to the genetic factors that govern infection susceptibility and disease manifestations that have been identified using the CC mouse resource following challenge with other viruses. Future R01-type funding will be made possible to validate specific QTL involved in MCMV infection and to identify specific genes and mechanisms that drive the phenotype.

A. Personal Statement

My graduate and post-doctoral training have made me well suited to conduct research and mentor graduate students. My graduate training at the University of Wisconsin-Madison was in the field of HIV pathogenesis and involved work at both the molecular and whole animal (rhesus macaque) levels. During my post-doctoral training I shifted my focus to the large DNA virus, human cytomegalovirus (CMV). We developed a model of MCMV-accelerated atherosclerosis and worked to define chemokines and chemokine receptors across CMV species including MCMV, RCMV and HCMV. Since then my lab has developed a number of *in vitro* and *in vivo* models to determine the mechanisms of CMV-accelerated allograft rejection. In addition, we have been involved in the development of CMV vaccine vectors in rhesus-CMV wherein we are identifying viral and host factors involved CMV infection and vaccine efficacy. My laboratory, generated both mouse and rhesus macaque chikungunya virus (CHIKV) infection animal models to identify age-related defects in the response to CHIKV infection. We have utilized these models to characterize CHIKV infection and define the immune responses to the virus infection and efficacy test therapeutic antibodies, small molecule inhibitors, and vaccines against CHIKV. We have developed protocols and reagents for the identification and quantification of virus as well as to characterize both innate and adaptive (T and B cell) responses directed against CHIKV. Utilizing MCMV- and Adenovirus-vectored vaccines we discovered that CD8 T cell specific vaccines against CHIKV modulate inflammation following challenge in mice, which acts to prevent CHIKV-mediated joint disease (Broeckel et al. 2019). We have applied these virological and immunological assays to develop an NHP model of Zika virus infection and pathogenesis and assess anti-Zika virus immunity in adult and neonatal NHP (Hirsch et al. 2017, PLOS Pathogens & Dudley et al. 2018, Nature Medicine). We have found that ZIKV infection during pregnancy causes placental damage and inflammation which affects placental function having important ramifications on fetal development, viral transmission and disease (Hirsch et al. 2018, Nature Communications). Overall, we have utilized animal models and to identify key host and viral factors that are involved viral pathogenesis in order to develop novel therapeutics to prevent and treat viral disease.

B. Positions and Honors

Positions and Employment

1997-2001 Postdoctoral Fellow, Oregon Health Sciences University, Portland, OR

C. Contribution to Science

1. Development of a Non-human Primate Model of Zika Virus Infection and Disease.

Zika virus (ZIKV) is an emerging Flavivirus that spread explosively through the Western hemisphere in 2014-2016. Infection has been associated with dengue-like symptoms, including fever, rash, arthralgia, and conjunctivitis, and also Guillain-Barré syndrome. The most significant finding to date is that ZIKV infection of pregnant women has been associated microcephaly, other developmental abnormalities or death of the fetus. We have developed a rhesus macaque model of ZIKV infection in pregnant and non-pregnant rhesus macaques and characterized clinical features, viral replication, tropism, and immune response. We are currently characterizing the impact of ZIKV on placental biology and the developing fetus in order to identify novel therapeutics and assess the efficacy of antivirals and vaccines directed against the virus.

PMCID: PMC6781003

2. Development of a Non-human Primate Model of CHIKV Infection and Disease.

CHIKV is a NIAID Category C Biodefense priority mosquito-transmitted Alphavirus that causes a febrile, sometimes-fatal disease that involves incapacitating myalgia and arthralgia that can persist for years. FDA approved anti-CHIKV therapeutics and vaccines are currently not available. Therefore, in order to reduce the impact of this virus and devastating arthralgia that it causes, we must develop new therapies and vaccines to treat persistent CHIKV infections. We have developed a non-human primate model that parallels CHIKV infection and disease in humans; and we are characterizing CHIKV infection and antiviral immunity in this model using both adult and aged Rhesus monkeys. Using our NHP-CHIKV infection model, we have demonstrated that aged animals exhibit higher susceptibility to persistent CHIKV infection as a result of defects in the development of T cell responses directed against the virus. A safe and effective vaccine that can protect

vulnerable populations from CHIKV infection is clearly warranted. In addition, we are currently determining whether there exist differences in joint disease, viral load, distribution and/or immune infiltrates between CHIKV infected adult and aged animals at early times post infection in an effort to lay the foundation for the design of successful vaccine strategies to prevent CHIKV-associated morbidities in vulnerable populations. Lastly, we have tested the efficacy of neutralizing antibody therapy has on pre-existing CHIKV infection of NHP joint tissues. This model will be extremely useful for the pre-clinical efficacy testing of antiviral therapies and vaccines directed against CHIKV. I served as primary or co-investigator for these studies:

1. Chikungunya virus infection results in higher and persistent viral replication in aged rhesus macaques due to defects in anti-viral immunity.Messaoudi I, Vomaske J, Totonchy T, Kreklywich CN, Haberthur K, Springgay L, Brien JD, Diamond MS, Defilippis VR, and **Streblow DN**. PMCID: PMC5491320

3. Characterization of the Role of Cytomegalovirus in the Development of Vascular Disease and Chronic Allograft Rejection.

We are studying the role of human cytomegalovirus (HCMV) in the development of chronic diseases including vascular disease and chronic rejection (CR) of solid organ transplants. The precise role of CMV in these diseases is still uncharacterized, and as such my lab has been studying the mechanisms of HCMV-accelerated vascular disease through: 1) identification of viral and cellular genes expressed during these diseases and determining their function using *in vitro* and *in vivo* models of CMV-accelerated vascular disease; 2) determination of the immunological mechanisms of viral acceleration of chronic allograft rejection from latently infected donors, which is the most common cause of HCMV-associated disease in transplant patients; 3) determination of the function of CMV-encoded chemokines and chemokine receptors; and 4) generation of vaccine strategies to prevent CMV reactivation and disease in transplant patients.

The major goal of this project is to develop novel small molecule therapeutics targeting emerging Alphaviruses
Role: Project 2 Leader

Global Health Proposal OPP1107409 Picker (PI) 07/28/2014 – 08/31/2020
Bill & Melinda Gates Foundation
Development of Attenuated CMV Vectors for an HIV/AIDS Vaccine
The overall goal of this project is the development of an HCMV vector-based HIV/AIDS vaccine (composed of one or more HIV insert-expressing HCMV vectors) that is optimized for safety, efficacy and manufacturability.
Role: Project Leader, Activity 2.3

1 U19 AI128741-03 (Picker) 03/02/2017 – 02/28/2022
NIH/NIAID
Development of Immunogenicity- and Efficacy-Optimized CMV Vectors for an HIV/AIDS Vaccine: Project 4: Optimization of CMV Vector CD8+ T Cell Response Programming by Modification of CMV-Encoded Molecular Mechanisms That Interfere with Unconventional CD8+ T Cell Response Priming
In Project 4 we first seek to identify the specific motifs in the UL128 and UL130 proteins which block MHC-E-restricted CD8+ T cell priming with the goal of mutating these regions to abrogate their MHC-E-response inhibition while retaining PRC function. Utilizing a deletion strategy we will ascertain whether any non-essential HCMV genes have this activity. Finally, utilizing the data from Projects 2-4, Project 4 will construct the 2nd generation "response and safety" optimized HCMV/HIV vector for manufacture and clinical testing in Project 5.
Role: PI, Project 4

1 P01 AI127335-02 (Nelson/Yurochko) 08/15/2017 – 07/31/2022
NIH/NIAID
Human Cytomegalovirus Dysregulation of Host Hematopoietic Progenitor Cell Signaling Pathways to Modulate Latency, Reactivation and Hematopoiesis during Transplantation: Project 3: HCMV US28 regulation of host cell signaling in viral latency and hematopoiesis
In this project we will examine UL7 signaling in CD34+ HPCs and identify the cellular pathways necessary for viral reactivation and hematopoiesis in the context of infection. We will also determine whether these UL7 pathways cross-talk with pathways modulated by UL133/8 (Project 1), HCMV miRNAs (Project 2), US28 (Project 3) and wild-type HCMV infection (Project 5).
Role: Project Leader, Project 3

1 R01 AI143660-02 (DeFilippis) 01/23/2019 – 12/31/2023
NIH/NIAID
Mechanistic Exploration of cGAS-STING-Mediated Vaccine Enhancement
The major goals of this project are to characterize the molecular, cellular, and immunological bases of adaptive immune responses augmented by the innate protein STING.
Role: Co-Investigator

Completed Research Support
Global Health Proposal OPP1108533 Picker (PI) 09/22/2014 – 09/30/2017
Bill & Melinda Gates Foundation
MHC II- and MHC E-restricted CD8+ T Cells and Control of HIV
The goal of this project is to provide fundamental research on a new type of vaccine-elicited CD8+ T cell immunity with the potential to control and clear HIV. Role: Project Manager; Outcome 8 Activity 4.3

BIOGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors.
Follow this format for each person. **DO NOT EXCEED FIVE PAGES.**

NAME: Moorman, Nathaniel J.

eRA COMMONS USER NAME (credential, e.g., agency login): nmoorman

POSITION TITLE: Associate Professor of Microbiology & Immunology

EDUCATION/TRAINING *(Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.)*

INSTITUTION AND LOCATION	DEGREE *(if applicable)*	Completion Date MM/YYYY	FIELD OF STUDY
University of Illinois, Urbana-Champaign	B.S.	1991-1995	Microbiology
Washington University, St. Louis, MO	Ph.D.	1998-2004	Molecular Virology
Princeton University	Postdoctoral	2004-2010	Molecular Virology

A. Personal Statement

My research is focused on understanding the complex interaction between pathogens and their hosts at the molecular level. My research expertise lies in the broad area of viral pathogenesis. Throughout my career, I have studied how viruses manipulate host cell biology to maximize their replication. My work uses a combination of cell biology, biochemistry and viral genetics to reveal novel interactions between viral proteins and the host, and how these interactions contribute to viral disease. In addition I have extensive experience studying viral determinants of herpesvirus pathogenesis in mice. Together these experiences provide me with the necessary expertise to study mechanisms driving herpesvirus disease in the complex genetic backgrounds of Collaborative Cross mice.

My prior research experiences have also provided me with extensive experience with collaborative studies, such as the multi-group effort proposed herein. An important aspect of collaborative science is the ability of the investigators to work together effectively. Throughout my career I have been a strong proponent of integrating new techniques and approaches into my research, as demonstrated by my track record of successful collaborative science. As a postdoc I worked closely with two other fellows as part of a multi-disciplinary program project grant, providing me with the ability to communicate effectively and approach problems from unique perspectives. My lab currently has funding as part of a U19 grant that involves 6 investigators from 3 different institutions, an additional funded multi-PI R01 proposal, and several multi-PI R21 awards. These experiences have taught me to effectively shared resources toward common group goals. Thus my current and previous experiences with collaborative studies and my firm commitment to collaborative science provide me with the needed experience to work productively in multi-group projects.

B. Positions and Honors

Positions and Employment

1995-1998 Lead Research Technician, lab of Dr. David Leib, Washington University
1998-2004 Graduate Student, Drs. Sam Speck & Skip Virgin, co-mentors, Washington University

2004-2010 Postdoctoral Fellow, lab of Dr. Tom Shenk, Princeton University
2010-2017 Assistant Professor, University of North Carolina at Chapel Hill
2017-present Associate Professor, University of North Carolina at Chapel Hill

Other Experience and Professional Memberships

2006-2009 American Cancer Society Postdoctoral Fellow
2009 American Cancer Society Postdoctoral Conference Organizer
2010-present Member, American Society for Microbiology
2014 Organizing Committee, NIH workshop "Roseoloviruses: Clinical Impact, Interventions & Research Needs"
2015-17 MRC Research grant reviewer, ad hoc
2017-18 NIH Peer Review Committee; ZRG1 IDM S (02), ad hoc
2017-present Editorial Board, Journal of Virology

C. Contribution to Science

1. Understanding manipulation of the AMPK/mTOR signaling during HCMV infection. Viruses manipulate host signaling pathways to facilitate their replication. I have used multiple approaches to decipher how viruses manipulate the AMPK and mTORC1 kinases to promote their replication. Using a proteomics approach, I found that HCMV pUL38 maintains mTORC1 signaling by inhibiting the tumor suppressor TSC2, an mTORC1 antagonist (a). Building on this work I found that potent and specific mTOR inhibitors inhibit the replication of representative α, β and γ-herpesviruses (b). We found that elevated mTORC1 signaling is necessary to promote the synthesis of fatty acids needed for infectious virion production (c). However we also found that virus infection activates AMPK, which inhibits mTORC1 by activating TSC2, and that AMPK activity is also required for virus replication (d). Together this work uncovers a novel strategy used by HCMV to manipulate the host AMPK/mTOR pathway to its advantage. While active AMPK typically inhibits mTORC1, HCMV uses the UL38 protein to "short circuit" this pathway, allowing for simultaneous AMPK and mTORC1 activity. Dysregulation of the AMPK/mTORC1 signaling axis allows the virus to harness the increased metabolites arising from both AMPK and mTORC1 activation, while also maintaining mTORC1-dependent expression of host proteins needed for virus replication.

2. Defining HCMV strategies to regulate mRNA translation. Like host mRNAs, all viral mRNAs must associate with host ribosomes for their translation, as no virus encodes its own ribosome. As a result all viruses must co-opt the host translation machinery for their replication. My group has developed a number of approaches to determine how viruses regulate the translation of host and viral mRNAs during infection. We recently demonstrated that HCMV stimulates the translation of host pro-survival factors to prolong the survival of HCMV-infected monocytes (a). By measuring the association of host and viral mRNAs with polysomes, we found that inhibiting or disrupting the host eIF4F translation initiation complex limits the translation of host mRNAs without impacting the translation of HCMV mRNAs (b). Thus host and viral mRNAs differ in their requirement for key translation initiation factors. To define host or viral factors that might facilitate ribosome recruitment to viral mRNAs, we used a proteomic analysis to identify proteins that bind the mRNA cap in HCMV-infected cells. We identified a novel role for the HCMV TRS1 protein as an mRNA cap-binding protein that was independent of the eIF4F complex, and that TRS1 expression alone was sufficient to increase the rate of protein synthesis

(c). The TRS1 protein also regulates the antiviral kinase PKR, which potently limits protein synthesis when activated by viral RNA ligands. We identified TRS1 binding to PKR as a critical step in maintaining protein synthesis during HCMV infection (d). However we also found that TRS1 increased protein synthesis in cells lacking PKR. Thus our work uncovers a new role for an HCMV protein in the regulation of protein synthesis during infection. The TRS1 protein both suppresses the host antiviral response, and also stimulating protein synthesis in a PKR-independent manner.

3. Development of proteomic approaches to identify critical virus:host interactions during viral infection. The identification of protein binding partners for viral proteins is often used to identify new functions for viral proteins. Until recently this strategy relied on genetic approaches such as yeast two hybrid assays, or multi-step biochemical purification of viral proteins and their binding partners. While informative, these approaches limited in their usefulness for identifying interactions in the context of HCMV infection. In collaboration with two other postdoctoral fellows, I helped devise an improved strategy for the rapid proteomic identification of binding partners for HCMV proteins in the context of viral infection. We developed a system to epitope-tag specific viral proteins in their native location in the viral genome under the control of their normal promoter, resulting in endogenous levels of expression. The tagged viral protein and its binding partners captured by immunoaffinity purification, and identified by mass spectrometry. We systematized the mutagenesis, virus production and mass spectrometry steps to generate a collection of over 100 viral mutants. Using this collection I helped define novel activities for multiple HCMV proteins including interactions that: regulate the innate immune response to infection (a), novel interactions between a viral protein and a host histone deacteylase complex that facilitates transcription of viral genes (b) and systematically defined interactions driving the assembly and egress of HCMV particles (c). Most relevant for this application, we also recently developed methods to identify host and viral proteins that associate with the mRNA cap (d) and mRNAs in general (e) in virally infected cells. Together these approaches provide a significant advance in our ability to define virus:host interactions that regulate virus replication.

BUDGET JUSTIFICATION – OREGON HEALTH & SCIENCE UNIVERSITY / UNC

KEY PERSONNEL:
Daniel N. Streblow, Ph.D., PI, (0.12 calendar months). Dr. Streblow is a Professor in the Vaccine and Gene Therapy Institute (VGTI) at OHSU, with an adjunct position in the Division of Pathobiology and Immunology at the ONPRC. Dr. Streblow will be the PI and provide the oversight and organizational structure to ensure clear lines of authority and oversight of research activities, including those of all key personnel and technical staff. Dr. Streblow will have responsibility for planning and maintaining communication with UNC. Dr. Streblow will be responsible for helping to ensure compliance with all federal and NIH regulations as well as the safety and security of data, materials, facilities and resources of the program. Dr. Streblow has extensive experience with *in vitro* and *in vivo* animal models of CMV infection and disease. Dr. Streblow will be responsible for data analysis and preparation of reports and publications derived from the project.

NON-KEY PERSONNEL:
Nicole Haese, Ph.D., Postdoctoral Scholar (1.2 calendar months). Dr. Haese is a postdoctoral scientist in the Streblow lab. Dr. Haese was trained in viral pathogenesis and immunology, and she has a strong background in immunology. She will devote much of her time to characterizing the immune responses in the infected animals. Dr. Haese's previous work experience makes her an important addition to the group for completion of the proposed experiments.

OTHER COSTS (Fee for service)
The UNC Genomics Core will perform mouse experiments as a fee for service. A total of $34,500 direct costs is budgeted to perform the screen in 65 currently available CC mouse strains.

MATERIALS AND SUPPLIES
Tissue Culture Supplies: These will be required for all cell growth and maintenance as well as virus growth and titration and isolation from tissues. This includes cell culture growth media, animal serum, PBS, trypsin, sucrose, sorbitol, disposable sterilizing filters, antibiotics, and syringes. This also includes Disposable plasticware required for cell and virus culture, virus titration and virus isolation, and molecular biological work. ($830)

Antibodies: Antibodies will be required for numerous assays including flow cytometry to monitor changes in host lymphocyte phenotype and activation status. ($2,000)

Luminex Cytokine Assays: For quantitative analysis of cytokine and chemokine levels, we are requesting $7,000 for the purchase of Luminex assay kits.

Flow Cytometry Core Services: T cell and B cell and innate/adaptive immune cell phenotypic characterization and activation will be assessed using flow cytometry in the VGTI core facilities, which employs a fee-for-service operational model. ($1,000)

BUDGET JUSTIFICATION – UNIVERSITY OF NORTH CAROLINA AT CHAPEL HILL
KEY PERSONNEL:
Nathaniel Moorman, PhD, Principal Investigator, (2% effort, 0.24 cal. months). Dr. Moorman will design and lead all aspects of the proposed studies. He will supervise Mr. Sanders during the completion of the proposed work. Dr. Moorman will supervise all aspects of the proposed studies, including analyzing the data, designing experiments, and overseeing the publication of manuscripts describing the results.

NON-KEY PERSONNEL:
Wes Sander, M.S., Research Technician, (10% effort, 1.2 cal. months). Mr. Sanders will perform experiments to measure virus replication in tissues of Collaborative Cross mice under the direct supervision of Dr. Moorman.

SUPPLIES:
Tissue culture: ($8,847) These funds will be used to purchase plasticware, consumables, growth media and supplements needed to culture cells and virus, and measure virus load in tissues of Collaborative Cross mice.

SCOPE OF WORK

Cytomegalovirus infections are lifelong and associated with a number of diseases. However, the impact of host genetics on viral replication, host immunity and inflammation are relatively unknown. Mouse cytomegalovirus is an important animal model of human infections and has been used to identify a number of key features of host immunity following CMV infection and immune evasion. There is a pressing need to identify the host gene networks that are involved in CMV infection and disease. However, the reliance on the limited genetic diversity present in inbred mouse strains has restricted a genome-wide identification of these disease gene networks. In collaboration with Dr. Nathaniel Moorman (UNC), we will utilize the genetically diverse mouse collaborative cross line to identify host genes involved in MCMV replication and immunity. For this pilot project proposal, we will characterize antibody and T cell immunity and our collaborator at UNC will quantify viral loads and tissue distribution following MCMV infection of the CC. Our labs have considerable experience with all facets of the proposed studies, including MCMV infections in mice, processing of samples for viral load and dissemination, and characterization of the host innate and adaptive immune responses to virus challenge.

Title

Genetic Regulation of Host Proteome in Response to Influenza A in Collaborative Cross (CC) Mice

Specific Aims

The overarching goal of the proposal is to understand genetic regulation of host protein expression in response to influenza A in collaborative cross (CC) mice. The CC mice for genetic regulation studies are greatly enhanced by the availability of complete genome sequences and massive transcriptomic profiling. A comprehensive dissection of the regulation of molecular composition (e.g. DNAs, RNAs, proteins, and metabolites) in CC mice is critical for understanding molecular mechanisms underlying complex diseases (e.g., infectious diseases). Genetic regulation at transcript level from 44 influenza-infected pre-CC lines has identified putative regulatory regions potentially controlling their expression in response to influenza A infection. However, transcripts are usually not a direct proxy for proteins and genetic regulation at the protein level has not yet been defined in response to influenza A infection in CC mice.

Recently, liquid chromatography coupled with tandem mass spectrometry (LC-MS/MS) has proven to be a powerful technology for large-scale identification of peptides and quantification of protein abundance. Both PI groups (i.e., Wang and Yang) have profiled proteomics data for immune systems (e.g., molecular and metabolic regulation of T cell activation) and human diseases (e.g., Alzheimer's disease). The Wang Lab has been working on the development of computational algorithms and tools for MS-based proteomics, and on the application of systems genetics approaches to study genetic regulation of expression at transcript and protein levels. The Yang Lab focuses on understanding fundamental mechanisms involved in the regulation of T cell metabolism and function in autoimmune and infectious diseases. In this proposal, we will combine our expertise in proteomics, systems genetics, and immunology, to systematically understand the genetic architecture of the regulation of protein expression in host response to influenza A in CC mice. Two specific aims are:

Aim 1. Generate and analyze lung T cell proteome of 69 CC lines after influenza A infection using 16-plex tandem mass tag (TMT) LC/LC-MS/MS.

Aim 1a. We will first generate CC lines with influenza A infection. Female mice (8−16 weeks of age) from the 69 CC lines will be obtained from the UNC CC consortium. At 14 days post infection, mice will be euthanized, and the lung for subsequent proteome profiling. **Aim 1b.** We will profile deep lung proteome of 69 CC lines after influenza A infection using 16-plex TMT LC-MS/MS technology. In this pilot proposal, we will use 69 CC lines whose genome sequences are available. **Aim 1c.** We will identify peptides and quantify proteins using JUMP, a comprehensive proteomic analysis pipeline developed by the PI. Our goal is to identify and quantify ~10,000 proteins at false discovery rate (FDR) of 1% from all 69 CC lines. The generated raw MS data will be submitted to the PRIDE database (https://www.ebi.ac.uk/pride/), and protein quantification and mapping results will be released to the research community via the UNC Systems Genetics portal (https://csbio.unc.edu/CCstatus/index.py).

Aim 2. Integrate multi-omics data to understand the genetic regulation of protein expression.

Aim 2a. We will identify variant peptides from the mouse lung T cell proteome using the proteogenomics approach, which combines genomic and proteomic data. The whole genome sequences of 69 CC lines will be obtained from the UNC Systems Genetics portal. Variants from the genome of 69 CC lines will be used to curate a customized proteomic database for the identification of variant peptides. **Aim 2b.** We will determine quantitative trait loci for protein expression (pQTLs) in response to influenza A infection using genotype and acquired lung proteome of the 69 CC lines. We will also compare commonality and differences in genetic loci that are defined at transcript (i.e. eQTLs) and protein (i.e. pQTLs) levels. The goal of this aim is to detect ~500 variant peptides that are confirmed at both transcript and protein levels and to detect ~800 genetic loci for protein expression including *cis*- and *trans*-regulations.

The successful outcome of the project will produce a deep lung T cell proteome dataset for CC mice, which will be a valuable resource for the research community. The project will also address a fundamental question essential to genetic regulation of protein expression influenza A infection and characterize commonalities and differences in genetic regulation at transcript and protein levels.

Background and Significance

Recombinant inbred (RI) strains are a useful resource for identifying genetic variation in phenotype [1]. The Collaborative Cross (CC) panel of multi-parental RI mice, derived from eight founder strains, exhibits high and uniform levels of genetic and phenotypic variation than other currently available animal models [2], especially in response to virus infection, such as Ebola [3], SARS-CoV [4], and influenza A [5]. In recent years, expression quantitative trait locus (eQTL) mapping has emerged as an important approach to understand genetic modulation of gene expression and to facilitate the identification of causal variants and/or genes for traits in the CC RI strains. For example, genetic regulation at transcript level from 44 influenza-infected pre-CC lines has identified putative regulatory regions potentially controlling their expression in host response to influenza A infection [6]. However, the transcript level is often not accurate indicators of the protein abundance [7, 8] and the regulation of protein expression is not well defined in response to influenza A infection in CC mice.

Dr. Wang has extensive experience in developing computational algorithms and tools for MS-based proteomics [9-11] and applying the tools to understanding biological systems and human diseases [12-14]. I also have long interest in studying genetic regulation of gene expression [15-17]. With the combination of molecular, genetics, and systems biology approaches, Dr. Yang has been to investigate regulatory mechanisms coordinating immune signals and cellular metabolism to control T cell immune responses in the context of autoimmune [18, 19], inflammatory [20, 21], and infectious diseases [14, 19, 22]. In addition, he has extensive experience in studying molecular mechanisms governing the innate response to viral infection [23-25]. In this pilot grant, we propose: (1) to generate and analyze lung proteome of 69 CC lines in response to influenza A infection using 16-plex tandem mass tag (TMT) LC/LC-MS/MS; (2) to integrate multi-omics data to understand the genetic regulation of protein expression in response to influenza A infection.

Research Strategy

Aim 1. Generate and analyze spleen proteome of 69 CC lines in response to influenza A infection using 16-plex tandem mass tag (TMT) LC/LC-MS/MS

Aim 1a. Generate CC lines with influenza A infection. Female mice (8−16 weeks of age) from the 69 CC lines will be obtained from the UNC CC consortium. Influenza A strain A/PR/8/34 (H1N1)(ATCC® VR-95) used for all infection experiments will be grown in allantoic cavities from 10-11-day old embryonated chicken eggs for 2 days at 37°C. The viral titer will be determined by a standard plaque assay using Madin-Darby canine kidney (MDCK) cells grown in high glucose Dulbecco's minimal eagle's medium (10% fetal bovine serum, 1% penicillin/streptomycin). For intranasal infection, mice will be fully anesthetized via inhalation with Attane Isoflurane (Minrad Inc, Orchard Park, NY), and then injected by intranasal application of 20 μL of virus suspension (10 PFU in PBS). Mice will be assayed daily for morbidity (determined as % weight loss), mortality, and clinical disease scores. At 14 days post infection, we will collect lungs, serum, and bronchoalveolar lavage (BALF) for various assays. To obtain single lung cell suspensions, lungs will be perfused with 10 ml PBS through the right ventricle, minced using razor blades, and incubated in RPMI containing 5% FBS, 1 mM $CaCl_2$, 1mM $MgCl_2$, 2.5 mM HEPES, and 0.5 mg/ml collagenase D 37°C for 60 min. Twenty percent of single-cell suspension will be stained with anti-B220, anti-CD3, anti-CD4, anti-CD8a, anti-MHC class II, anti-CD19, anti-F4/80, anti-DX5, anti-CD11c, anti-Siglec-F, anti-CD11b, or anti-CD45.2 antibodie to examine immune cell subsets. The remaining single-cell suspension will be used to purify $CD4^+$ and $CD8^+$ T cells. Serum and BALF will be used for measurement of virus titers and production of the cytokines IL-1β and IFNγ.

Aim 1b. Profile deep lung proteome of 69 CC lines using TMT LC-MS/MS technology. We will profile lung $CD4^+$ and $CD8^+$ T cell proteome of 69 CC strains. By using 16-plex tandem mass tag (TMT)-based LC/LC-MS/MS, we will perform proteome profiling for 69 CC strains with 5 TMT batches. Each batch includes 15 biological samples and two internal standards (i.e., a mixed 69 samples). The internal standards will be used for batch normalization. For each batch, 14 CC samples are lysed. The samples are weighed and homogenized in lysis buffer, and protein concentration is measured by the BCA assay (Thermo Fisher) and confirmed by Coomassie-stained short SDS gels. Quantified protein samples (~1 mg in the lysis

buffer with 8 M urea) for each TMT channel are proteolyzed with Lys-C (Wako, 1:100 w/w) at 21° C for 2 h, diluted 4-fold to reduce urea to 2 M, and digest by trypsin (Promega, 1:50 w/w) at 21°C overnight. The digestion is terminated by the addition of 1% trifluoroacetic acid, followed by centrifugation. Each sample is resuspended in 50 mM HEPES, pH 8.5, labels with TMT reagents, mix equally, and desalt again. The TMT labeled samples are fractionated by offline basic pH reverse phase LC followed by acidic pH reverse phase LC-MS/MS analysis. We performed two offline LC runs (~2-3 h gradient, ~40-120 concatenated fractions) on an XBridge C18 column. In the acidic pH LC-MS/MS analysis, each fraction is run sequentially on a column interfaced with Q Exactive HF Orbitrap MS (Thermo Fisher). Peptides are eluted by a 2-3 h gradient. MS settings include MS1 scans (60,000 resolution, 1 x 10^6 AGC and 100 ms maximal ion time) and 20 data-dependent MS2 scans.

Aim 1c. Perform in-depth identification and quantification of peptides and proteins

Data analysis and interpretation are crucial in proteomic studies. We developed JUMP software for better peptide identification, a novel tag-based database search engine [11]. JUMP shows a significant improvement compared to SEQUEST or MASCOT, two widely used commercial peptide identification tools (~30% increase in identification). We propose to use JUMP to process the proteomic data generated in **Aim 1a**. Below are detailed steps for protein identification and quantification:

- **Perform database search using JUMP program** [11]. To increase the sensitivity, our developed TMT spectral library will be used for low-quality spectra [9].
- **Evaluate false discovery rate (FDR) of peptide identification**. We will use the concatenated target-decoy strategy [26, 27] to filter the PSMs to achieve ~1% FDR.
- **Quantify protein using JUMPq** [28]. We recently developed JUMPq program to remove the effects of ion suppression.
- **Control batch effect.** We control the batch effect by two methods: (1) the control channel, which is a mixed sample; (2) the function of "Remove Batch Effect" in the LIMMA software, which employs a linear correction to account for the batch effect.

Aim 2. Integration of multi-omics data to understand genetic regulation of protein expression

Aim 2a. Identify variant peptides using proteogenomics approach

We will download the whole genome sequences of 69 CC mice from the UNC Systems Genetics portal and use JUMPg [29], a proteogenomics program that we developed for variant peptides detection.

- **Call variants from BAM files.** We will use GATK-HC and SAMtools to call genetic variants from the genomic data. In this pilot study, we will only use single nucleotide variants.
- **Extract 100bp flanking sequences** (50 bp each side) for each genetic variant, and translate the nucleotide sequences into protein sequences and serve as potential variant peptides.
- **Combine all potential variant peptides with a mouse reference protein database**. The mouse reference protein database will be downloaded from the UniProt database. The reference protein database will be combined with all potential variant peptides.
- **Detect and annotate coding genetic variants** using our recently developed JUMPg, which is a proteogenomic program to detect variant peptides from MS data.

Aim 2b. Determine pQTL in response to influenza A infection

We will perform pQTL mapping for proteomic data. Although our preliminary data consist of a small number of (i.e. n = 69) CC strains, the result will provide insights into the genetic regulation of protein expression and genetic regulatory difference at transcript and protein levels in response to influenza A infection in CC mice.

- **Genotype of CC lines** will be downloaded from the UNC Systems Genetics portal.
- **Composite interval QTL map for protein expression** will be performed with the Bagpipe package [30]. We will categorize all *cis*-pQTLs and *trans*-pQTL.
- **Genome-wide significance** will be defined using the permutation method. A significance level of 0.05 will be applied.
- **Comparison of eQTLs and pQTLs.** Previous published eQTL results will be compared with our pQTL to determine the commonalities and differences of the regulation at transcript and protein levels.

A. Personal Statement

I am currently working as an Assistant Professor in the Department of Biology at the University of North Dakota (UND) and I will serve as a principal investigator on this project. I received my PhD training in Bioinformatics from Zhejiang University under a joined program with University of California, Davis. Following my postdoctoral training in Dr. Williams lab at the University of Tennessee Health Science Center (UTHSC), and I became a Bioinformatics Group Leader in the Center for Proteomics and Metabolomics at St. Jude Children's Research Hospital until I move to UND this August. My research focuses on developing computational algorithms and tools for integrating large-scale omics data and applying developed tools for understanding molecular mechanisms underlying human complex diseases. Recently, I have been collaborating locally and regionally with several research groups to discover the molecular mechanisms involved in various diseases, such as cancer. I have unique and extensive interdisciplinary expertise in fields, including Bioinformatics, Genomics, Proteomics, and Metabolomics. Over the past ten years, my research has led to 60 scholarly publications in academic journals. I have developed several computational algorithms and tools, including JUMP for peptide identification, JUMPg for proteogenomic analysis, tandem mass tag (TMT) spectral library, and a target-decoy strategy for metabolomics. I have been collaborating locally and regionally with several research groups to apply these developed MS-based computational tools to discover molecular mechanisms involved in various diseases, including rhabdomyosarcoma and Alzheimer disease. During the four-year research at the University of Tennessee Health Science Center (UTHSC), my research focused on systems genetics that are closely relevant to the study of genetic regulations using BXD recombinant inbred (RI) mice. I had implemented many advanced bioinformatics approaches to assembly the genome of DBA/2J, performed transcriptome and genome linkage analyses, and developed novel phenome-wide association study (PheWAS) in mouse. The goal of this proposal is to understand genetic regulation of host proteins in response to influenza A by profiling proteome of the collaborative cross (CC) mice. I believe that my academic training and research experience have prepared me to be an effective investigator in this proposed project.

2018–present	Editor, PLoS One

Honors

2002–2003	Rockefeller scholarship, International Rice Research Institute

C. Contribution to Science

1. **Development of novel computational frameworks for mass spectrometry–based proteomics and metabolomics.** One of the cornerstones of mass spectrometry–based proteomics is peptide identification. As a group leader in the Center for Proteomics and Metabolomics at St. Jude Children's Research Hospital since 2011, I have developed several computational algorithms and tools for mass spectrometry–based proteomics and metabolomics to increase the sensitivity and specificity of peptide identification. These tools include the JUMP program for peptide identification, the JUMPg program for proteogenomics, and a tandem mass tag (TMT) spectral library. JUMP, for example, increases the sensitivity of the identification at the peptide-spectrum match level by 30% when compared to other commercially available tools, and the sensitivity for TMT data can be further improved by 30% with our recently developed TMT spectral library.

2. **Understanding the genetic basis of complex diseases.** As a postdoctoral and research associate at the University of Tennessee Health Science Center (UTHSC), my research was focused on elucidating genetic mechanisms of complex diseases using a systems genetics approach, linking genetic variants to phenotype traits. One of my major projects was to characterize sequence variants in two parental strains of the BXD family and to analyze genome-to-phenome relations in mice and humans using the PheWAS approach. Other projects included studies of genetic regulation of the variation in gene expression and linking it to classic phenotypes, such as alcohol and stress responses.

3. **Application of our proteomics tools to understanding human diseases.** I have been collaborating locally and regionally with several research groups to apply our novel MS-based proteomics tools to discovering molecular mechanisms involved in various diseases, including rhabdomyosarcoma and Alzheimer disease, as well as mechanisms of T-cell activation.

PubMed PMID: 24023061; PubMed Central PMCID: PMC3799305.

4. **Development of genetic markers in plants.** During my graduate studies, I developed a novel type of genetic marker—intron length polymorphisms (ILPs)—in rice (Wang et al., 2006; DNA Res). Owing to its ease of use, this new type of marker has been widely adopted for other plant species, such as maize, millet, and *Brassica* species, and has become a powerful resource for genetic linkage analysis and evolutionary studies. Because of this innovative development, I received an award from the National Natural Science Foundation of China (Project No. 30700517). In addition, I developed several new algorithms and computational tools. For example, I developed a deep learning (i.e., artificial neural network) method to predict infections in tomatoes.

A. Personal Statement

My doctoral studies focused on understanding regulatory mechanisms involved in the control of the IRF3 signaling pathway that induces innate immune responses to viral infection. To investigate physiological relevance of immune signaling in T cell immunity, I received postdoctoral training with Dr. Hongbo Chi at St. Jude Children's Research Hospital. Using various genetic and disease models, I have been to elucidate fundamental mechanisms by which T cells coordinate immune signals and reprogramming of cellular metabolism in the regulation of T cell homeostasis, differentiation and function at steady state and during immune responses. I have demonstrated that LKB1- and PTEN-dependent signaling networks in Tregs orchestrate functional specification and metabolic fitness to enforce their suppressive function in maintaining immune tolerance and preventing the pathogenesis of immune-mediated diseases. In addition, I have demonstrated that mTOR signaling and cellular metabolism play pivotal roles in dictating T cell activation and differentiation. The intimate interplay of mTOR signaling and metabolic programs not only contributes to T cell survival and expansion, but also shapes T cell differentiation and function. By integrative analyses of proteome and phosphoproteome profiling in naïve and activated T cells, I have shown that the temporal interactions of signaling networks and bioenergetics pathways underpin T cell activation and differentiation via mTOR-dependent and –independent mechanisms. Better understanding the interaction of immune signaling and metabolic pathways in the physiologic setting could provide significant insights into the development of new therapeutic strategies for the treatment of immune-mediated diseases.

B. Positions and Honors

Positions and Employment

2008-2009	Research Associate, Institute of Biochemistry and Cell Biology, Chinese Academy of Sciences, Shanghai, China
2014-2017	Staff Scientist, Department of Immunology, St. Jude Children's Research Hospital, Memphis, TN
2017-present	Assistant Professor, Wells Center for Pediatric Research, Department of Pediatrics, Indiana University School of Medicine, Indianapolis, IN

Honors

2011-2014	Postdoctoral Fellowship, the Arthritis Foundation
2016-2017	ANRF Scholar, Arthritis National Research Foundation
2018-2019	Showalter Young Investigator Award

C. Contributions to Science

My research has been to understand fundamental mechanisms coordinating immune signals and reprogramming of cellular metabolism in T cell immunity. With a combination of various genetic and disease models and systems biology approaches, I have highlighted that regulation of mTOR signaling and metabolic programs plays a central role in regulating T cell homeostasis, differentiation and function. In addition, I also investigated the regulatory mechanism governing the activation of the IRF3 signaling pathway in response to viral infection. My major scientific contributions have included:

1) *Demonstration of functions of mTOR signaling and cellular metabolism in T cell differentiation and development.* mTOR signaling regulates cell growth and metabolism. Our studies indicate that mTOR signaling integrates distinct microenvironmental cues and cellular metabolism in dictating T cell fate decisions. We have uncovered that sphingosine-1–phosphate receptor 1 (S1PR1) reciprocally regulates the differentiation of T_H1 and T_{reg} cells and the outcome of immune responses through control of mTOR activation. We went on to understand the functions of distinct mTOR complexes in the development of thymocytes, including αβ T cells, γδ T cells and invariant natural killer T (iNKT) cells. Key publications included: *Identification of new regulators of IRF3 signaling pathway in response to viral infection.* Viruses can activate IRF3 signaling pathway that induces innate immune responses to suppress viral replication. I identified various regulators that control virus-induced activation of IRF3 signaling pathway through distinct mechanisms. Key publications included:
    a. Liu G*, **Yang K***, Burns S, Shrestha S, Huang G and Chi H (* equal contribution). The S1P1-mTOR axis directs the reciprocal differentiation of T_H1 and T_{reg} cells. ***Nat Immunol.*** 11: 1047-56, 2010.
    b. Wei J*, **Yang K*** and Chi H (* equal contribution). Cutting edge: Discrete functions of mTOR signaling in invariant NKT cell development and NKT17 fate decision. ***J Immunol.*** 193: 4297-301, 2014.
    c. **Yang K** and Chi H. Metabolic control of Th17 cell generation and CNS inflammation. ***J Neurol Neurophysiol.*** S12: 004, 2014.
    d. **Yang K***, Blanco DB*, Chen X*, Dash P, Neale G, Rosencrance C, Easton J, Chen W, Dhungana Y, KC A, Awad W, Guo X, Thomas P and Chi H (* equal contribution). Metabolic signaling directs the reciprocal lineage decisions of αβ and γδ T cells. ***Sci Immunol.*** 565: 101-105, 2018.

2) *Elucidation of molecular and metabolic mechanisms involved in the control of T cell quiescence.* Before our studies there was lack of information about central regulatory mechanisms in maintaining quiescence of naïve T cells. Using various genetic models, we have provided evidence that mTOR signaling and cellular metabolism are key players that coordinate immune signals and transcriptional programs to control quiescence status of naïve and memory T cells. By integrative analysis of proteomics and phosphoproteomics profiling in T cells, we have recently revealed that the temporal interactions of signaling networks and bioenergetics pathways underpin T cell quiescence exit and differentiation. Key publications included:
    a. **Yang K**, Neale G, Green DR, He W and Chi H. The tumor suppressor Tsc1 enforces quiescence of naive T cells to promote immune homeostasis and function. ***Nat Immunol.*** 12: 888-97, 2011.
    b. **Yang K**, Shrestha S, Zeng H, Karmaus PW, Neale G, Vogel P, Guertin DA, Lamb RF and Chi H. T cell exit from quiescence and differentiation into T_H2 cells depend on Raptor-mTORC1-mediated metabolic reprogramming. ***Immunity.*** 39: 1043-56, 2013.
    c. Shrestha S*, **Yang K***, Wei J, Karmaus PW, Neale G, and Chi H (* equal contribution). Tsc1 promotes the differentiation of memory $CD8^+$ T cells via orchestrating the transcriptional and metabolic programs. ***Proc Natl Acad Sci U S A.*** 111: 14858-63, 2014.
    d. Tan H*, **Yang K***, Li Y*, Shaw T*, Wang Y, Blanco DB, Wang X, Cho J, Wang H, Rankin S, Guy C, Peng J, and Chi H (* equal contribution). Integrative proteomics and phosphoproteomics profiling reveals dynamic signaling networks and bioenergetics pathways underlying T cell activation. ***Immunity*** 46: 488-503, 2017.

3) *Elucidation of regulatory mechanisms governing cellular metabolism and functional integrity of T_{reg} cells.* Before our studies there was lack of evidence about the interaction of immune signaling and cellular metabolism in regulating T_{reg} cell homeostasis and function. In trying to understand physiological functions of immune signaling in T_{reg} cells, we unexpectedly found mTORC1 signaling and metabolic reprogramming are essential for T_{reg} cell activation and function. We went on to examine the roles of various regulators of mTOR

signaling, demonstrating that these regulators enforce functional fitness of T_{reg} cells through coordinating distinct immune signals and metabolic programs. Key publications included:

a. Zeng H, **Yang K**, Cloer C, Neale G, Vogel P, and Chi H. (2013). mTORC1 couples immune signals and metabolic programming to establish Treg-cell function. ***Nature***. 499: 485-90, 2013.
b. Shrestha S*, **Yang K***, Guy C, Neale G, Vogel P, and Chi H (* equal contribution). Treg cells require the phosphatase PTEN to restrain TH1 and TFH cell responses. ***Nat Immunol.*** 16: 178-87, 2015.
c. Wei J, Long L, **Yang K**, Guy C, Shrestha S, Chen Z, Wu C, Vogel P, Neale G, Green DR, and Chi H. Autophagy enforces functional integrity of regulatory T cells by coupling environmental cues and metabolic homeostasis. ***Nat Immunol.*** 17: 277-85, 2016.
d. **Yang K**, Blanco DB, Neale G, Vogel P, Avila J, Clish CB, Wu C, Shrestha S, and Chi H. Homeostatic control of metabolic and functional fitness of T_{reg} cells by LKB1 signaling. ***Nature*** 548: 602-606, 2017.

4) *Identification of new regulators of IRF3 signaling pathway in response to viral infection.* Viruses can activate IRF3 signaling pathway that induces innate immune responses to suppress viral replication. I identified various regulators that control virus-induced activation of IRF3 signaling pathway through distinct mechanisms. Key publications included:

a. **Yang K**, Shi HX, Qi R, Sun SG, Tang YJ, Zhang BH and Wang C. Hsp90 Regulates Activation of Interferon Regulatory Factor 3 and TBK-1 Stabilization in Sendai Virus-infected Cells. ***Mol Biol Cell.*** 17:1461-71, 2006.
b. **Yang K**, Shi HX, Liu XY, Shan YF, Wei B, Chen S and Wang C. TRIM21 is essential to sustain IRF3 activation during antiviral response. ***J Immunol.*** 182: 3782-92, 2009.

BUDGET JUSTIFICATION

A. PERSONNEL

Xusheng Wang, Ph.D., Principal Investigator (effort = 0.5 calendar months). Dr. Wang will be responsible for the overall coordination and supervision of all aspects of the project. This includes hiring, training, and supervising staff/students; recruiting study participants; scheduling and staff assignments; and data management. In addition, He will conduct proteomics data collection and analyses, and be responsible for reporting the study's findings. His time is not budgeted in the grant and will be covered by his department as part of the research allocation for his 9-month academic year contract.

Kai Yang, Ph.D., Co-Investigator (effort = 0.5 calendar months). Dr. Yang will be responsible for performing influenza A infection in CC mice and tissue collection. He will also assist in manuscript preparation. His time is not budgeted in the grant and will be covered by his department as part of the research allocation for his 9-month academic year contract.

B. OTHER PERSONNEL

TBA Graduate Student (effort = 12 Calendar Months effort). One graduate student will work with Dr. Wang to perform proteomics data collection and analyses. His/her 12-month base salary is $26,040, with a 1% fringe benefit rate.

C. Equipment

None.

D. TRAVEL - $1,950 is requested for travel to professional conferences (i.e., 18th Annual Meeting of the Complex Trait Community in collaboration with the Rat Genomics Community. Manchester UK. September 2-4, 2020) to present findings associated with the investigation.

F. OTHER DIRECT COSTS

F.1 Materials and Supplies
General research supplies - We request for $6,000 for TMT reagent and mass spectrometry proteome profiling, and office supplies ($1,000).

PUBLICATION COSTS: An amount of $1,000 is budget for publications.

F.2 Subawards/Consortium/Contractual Costs
One subaward for $52,000 will be made to the Indiana University (Dr. Kai Yang), including $19,192 (58.5%) indirect costs.

Saogang Sun; Technician (effort = 3 Calendar Months effort). He will work with Dr. Yang to perform influenza A infection in CC mice and tissue collection. His/her 12-month base salary is $38,000, with a 40% fringe benefit rate. Thus, a total of $15,985 is requested.

A total of $9,822 is requested for lab supplies and $7,000 for mouse work.

Applicant Principal Investigator(s):

OVERALL IMPACT

Reviewers will provide an overall impact score to reflect their assessment of the likelihood for the project to exert a sustained, powerful influence on the research field(s) involved, in consideration of the following five scored review criteria, and additional review criteria. An application does not need to be strong in all categories to be judged likely to have major scientific impact.

Overall Impact *Write a paragraph summarizing the factors that informed your Overall Impact score.*
OVERALL IMPACT SCORE:

SCORED REVIEW CRITERIA

Reviewers will consider each of the five review criteria below in the determination of scientific and technical merit and give a separate score for each.

1. Significance Score:
Strengths • **Weaknesses** •

2. Investigator(s) Score:
Strengths • **Weaknesses** •

3. Innovation Score:
Strengths • **Weaknesses** •

4. Approach Score:
Strengths

-

Weaknesses

-

5. Potential for Fit/Collaboration with SIG-U19 Program Score:

Subject: Potentially highly potent drugs for 2019-nCoV
Attachments: 2019-nCoV-Reposition_13.pdf; Anti-2019-nCoV.docx

Dear Researchers,
There is a pressing need to find effective medications for 2019-nCoV. Therefore, I would like to bring your attention to a class of potentially highly potent drugs for 2019-nCoV. Sorry for disturbing your weekend!

We use deep learning to screen 1465 drugs in the DrugBank that have been approved by the U.S. Food and Drug Administration (FDA), based on the inhibition of 2019-nCoV 3CL protease. We found a few market drugs that might be effective for curing 2019-nCoV, ranked by their binding affinities in inhibiting the 2019-nCoV 3CL protease.

Table 1: A summary of potentially highly potent anti2019-nCoV drugs with predicted binding free energies (unit: kcal/mol) and
corresponding trade names.

Drug ID	Type	Trade Name	Predicted Binding Affinity
DB00188	Bortezomib	Velcade, Chemobort, Bortecad	-12.15
DB00690	Flurazepam	Dalmane, Dalmadorm, Fluzepam	-10.38
DB08901	Ponatinib	Iclusig	-10.25
DB00398	Sorafenib	Nexavar	-10.01
DB01254	Dasatinib	Sprycel, Dasanix	-9.87
DB01384	Paramethasone	Cortidene Depot, Dilar, Dilarmine	-9.71
DB00838	Clocortolone	Victrelis	-9.58
DB00301	Flucloxacillin	Flora, Flox, Floxapen	-9.57
DB06144	Sertindole	Serdolect and Serlect	-9.54
DB04920	Clevidipine	Cleviprex	-9.52
DB00673	Aprepitant	Emend	-9.49
DB01076	Atorvastatin	Lipitor, Sortis	-9.49
DB01594	Cinolazepam	Gerodorm	-9.47
DB00845	Clofazimine	Lamprene	-9.43
DB06717	Fosaprepitant	Emend, Ivemend	-9.39

Among FDA approved protease-based antiviral drugs, the most possible one is Boceprevir (binding affinity -9.36 kcal/mol), see Table of the attached manuscript. A brief summary is also given in Chinese.

Abstract

The World Health Organization (WHO) has declared the 2019 novel coronavirus (2019-nCoV) infection outbreak a global health emergency. Currently, there is no effective anti-2019-nCoV medication. The sequence identity of the 3CL proteases of 2019-nCoV and SARS is 96%, which provides a sound foundation for structural-based drug repositioning (SBDR). Based on a SARS 3CL protease X-ray crystal structure, we construct a 3D homology structure of 2019-nCoV 3CL protease. Based on this structure and existing experimental datasets for SARS 3CL protease inhibitors, we develop an SBDR model based on machine learning and mathematics to screen 1465 drugs in the DrugBank that have been approved by the U.S. Food and Drug Administration (FDA). We found that many FDA approved drugs are potentially highly potent to 2019-nCoV.

Key words: 2019-nCoV, Drug repositioning, DrugBank, deep learning, algebraic topology.

1 Introduction

The 2019 novel coronavirus (2019-nCoV) caused the pneumonia outbreak in Wuhan, China, in late December 2019 and has rapidly spread around the world. By Feb 5, 2020, more than 24000 individuals were infected and more than 490 fatalities had been reported. The World Health Organization (WHO) has declared this novel coronavirus outbreak a global health emergency. Currently, there is no specific antiviral drug for this epidemic. Considering the severity of this widespread dissemination and health threats, panic patients misled by media flocked to the pharmacies for Chinese Medicine herbs which were reported to "inhibit" the 2019-nCoV, despite no clinical evidence supporting the claim. Many researchers are engaged in developing anti-2019-nCoV drug s [1, 2]. However, new drug discovery and development is a long, costly and rigorous scientific process. A more effective approach is to search for anti-2019-nCoV therapies from the existing FDA-approved drug database.

Drug repositioning (also known as drug repurposing), which concerns the investigation of existing drugs for new therapeutic target indications, has emerged as a successful strategy for drug discovery due to the reduced costs and expedited approval procedures [3–5]. Several successful examples unveil its great values in practice: Nelfinavir, initially developed to treat the human immunodeficiency virus (HIV), is now being used for cancer treatments. Amantadine was firstly designed to treat influenza caused by type A influenza viral infection and is being used for Parkinson's disease later on [6]. In recent years, the rapid growth of drug-related datasets, as well as open data initiatives, has led to new developments for computational drug repositioning, particularly, structural-based drug repositioning (SBDR). Machine learning, network analysis, and text mining and semantic inference are three major computational approaches commonly applied in drug repositioning [7]. The rapid accumulation of genetic and structural databases [8], the development of low-dimensional mathematical representations of complex biomolecular structures [9, 10], and the availability of advanced deep learning algorithms have made machine learning-based drug reposition a promising approach [7]. Considering the urgent need for anti-2019-nCoV drugs, a computational drug repositioning is one of the most feasible strategies for discovering 2019-nCoV drugs.

In SBDR, one needs to select one or a few effective targets. Study shows that 2019-nCoV genome is very close to that of the severe acute respiratory syndrome (SARS)-CoV [11]. The sequence identities of 2019-nCoV 3CL protease, RNA polymerase, and the spike protein with corresponding SARS-CoV proteins are 96.08%, 96%, and 76%, respectively [12]. We, therefore, hypothesize that a potent SARS 3CL protease inhibitor is also a potent 2019-nCoV 3CL protease inhibitor. Unfortunately, there is no effective SARS therapy at present. Nevertheless, the X-ray crystal structure of SARS 3CL protease has been reported [13] and the binding affinities of 115 potential SARS 3CL protease inhibitors are available in ChEMBL database [14]. Additionally, there are 15,843 protein-ligand complexes in PDBbind 2018 general set with binding affinities and X-ray crystal structures [15]. Moreover, the DrugBank contains about 1600 drugs approved by the U.S. Food and Drug Administration (FDA) [16]. The aforementioned information provides a sound foundation to develop an SBDR machine learning model for 2019-nCoV 3CL protease inhibition.

Recently, we have developed low-dimensional mathematical representations [9, 10] to reduce the structural complexity of macromolecules based on abstract mathematics, such as algebraic topology [17–20], differential geometry, and spectral graph theory [10, 21]. We exploit these representations to extract critical chemical and biological information for protein-ligand pose selection, binding affinity ranking, prediction, ranking, scoring, and screening [9, 10]. Paired with various machine learning, including deep algorithms, these approaches are the top competitor for D3R Grand Challenges, a worldwide competition series in computer-aided drug design in the past few years [22, 23].

In responding to the pressing need for anti-2019-nCoV medications, we develop mathematics-based deep learning models to systematically eventuate FDA approved drugs in the DrugBank for 2019-nCoV 3CL protease inhibition. With the consensus of two deep learning models based on convolutional neural

networks and multitask deep learning, we report the top 15 potentially highly potent anti-2019-nCoV 3CL inhibitors, which provide timely guidance for the further development of anti-2019nCoV drugs.

2 Results

2.1 Sequence identity analysis

The sequence identity is defined as the percentage of characters that match exactly between two different sequences. The sequence identities between 2019-nCoV protease and the protease of SARS-CoV, MERS-CoV, HKU-1, OC43, HCoVNL63, 229E, and HIV are 96.1%, 52.0%, 49.0%, 48.4%, 45.2%, 41.9%, and 23.7%, respectively. It is seen that 2019-nCoV protease is very close to SARS-CoV protease, but is distinguished from other proteases. Clearly, 2019-nCoV has a strong genetic relationship with SARS-CoV, the sequence alignment in Figure 1 further confirms their relationship. Additionally, the available experimental data of SARS-CoV protease inhibitors can be used as the training set to generate new inhibitors of 2019-nCoV protease.

2.2 Structure similarity analysis

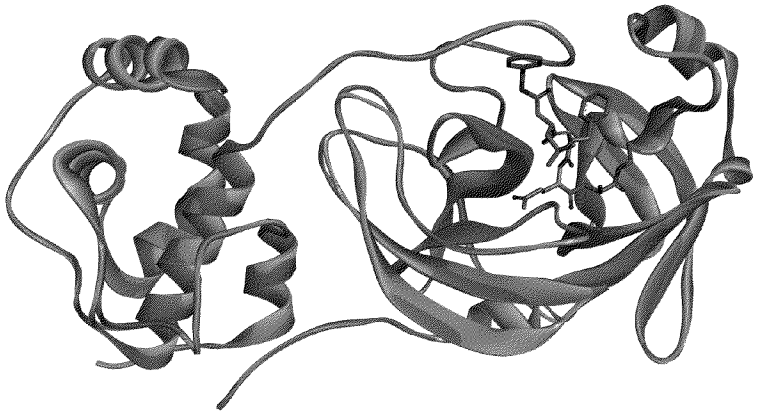

Figure 2: Illustration of the similarity and difference between protease structures of 2019-nCoV 3CL protease (in gold) and SARS-CoV 3CL protease (PDB ID: 2A5I, in green). The anti-SARS inhibitor in dark color indicates the binding site.

Since the sequences are highly identical, the 2019-nCoV protease structure can be built by homology modeling with the SARS-CoV 3CL protease (PDB ID: 2A5I) [13] as a template. It turns out, as shown in Fig. 2, the homology structure of the 2019-nCoV protease is essentially identical to the X-ray structure of SARS-CoV 3CL protease. Particularly, the RMSD of two structures at the binding site is 0.21 Å. The high structural similarity between the two proteases suggests that anti-SARS-CoV chemicals can be equally effective for the treatment of 2019-nCoV.

2.3 Binding analysis

We predict the binding affinities of 1465 3D FDA-approved drugs and 2019-nCoV protease complexes using two models, 3DALL and 3DMT. 3DALL is built with deep convolutional neural networks (CNNs) using the algebraic topology-based representation of protein-ligand complexes, with 84 SARS-CoV protease inhibitors and 15843 complexes from the PDBbind 2018 general set as the training set. 3DMT, a deep

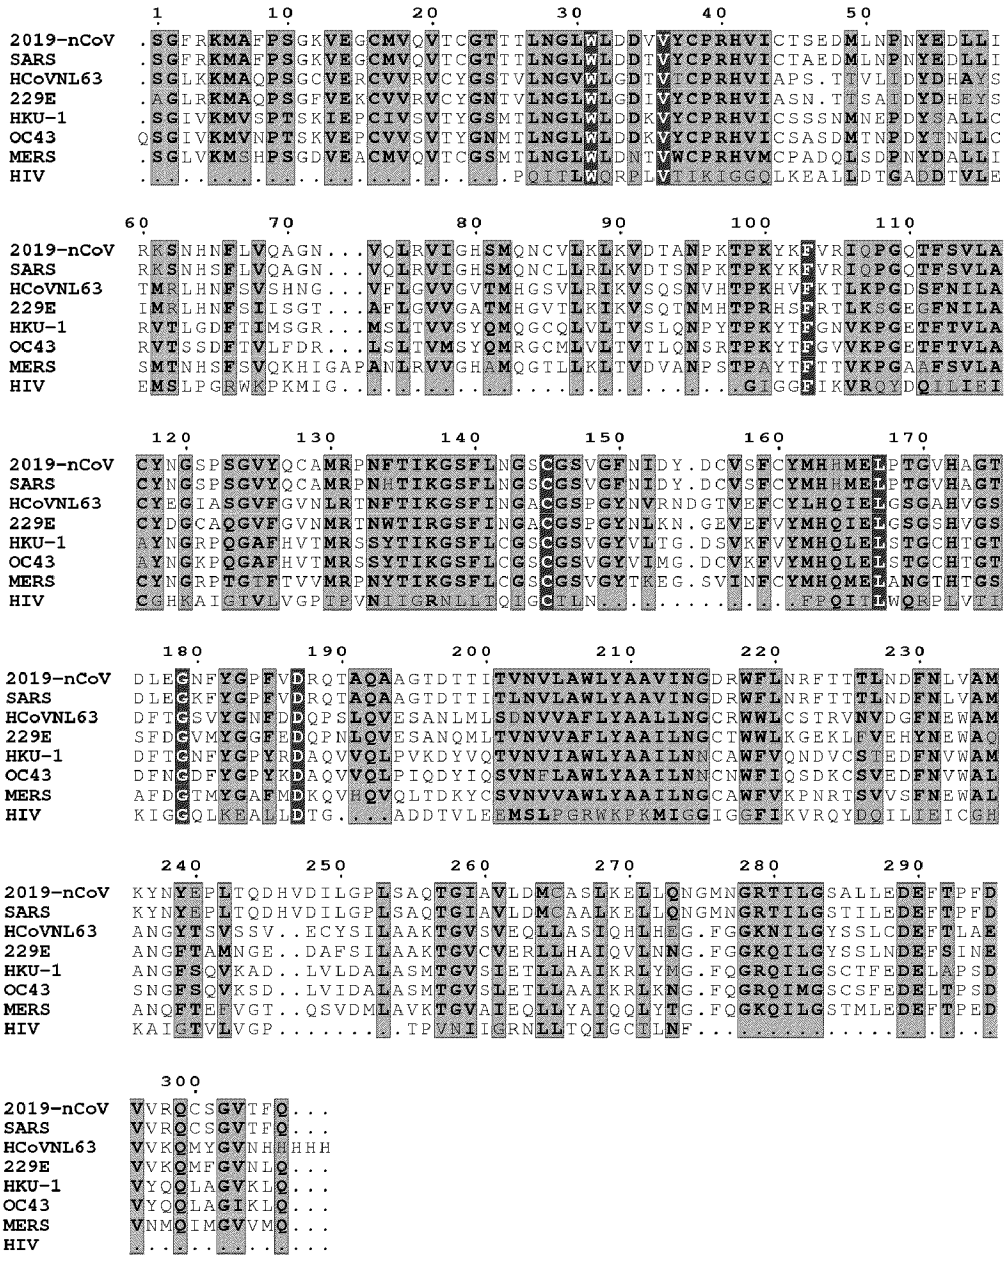

Figure 1: The protease sequence alignment between 2019-nCoV, SARS, MERS, OC43, HCoVNL63, HKU-1, 229E, and HIV.

multitask CNN model based on the algebraic topology representation of protein-ligand complexes is the second model. In the current work, two tasks were developed in the 3DMT. The first task involves 1465 2019-nCoV protease complexes as the test set and 84 SARS-CoV protease inhibitors as the training set. The second task is trained with the PDBbind 2018 general set of 15843 protein-ligand complexes. Our top 15 potential 2019-nCoV inhibitors based on consensus binding affinities of the aforementioned two models are listed in Table 1. A complete list of predicted binding affinities of 1465 FDA-approved drugs is given in the Supplementary Material.

We briefly describe the predicted potentially highly potent anti-2019-nCoV drugs. The most potent one is Bortezomib, an anti-cancer medication, which is known as proteasome inhibitor and can be used to treat multiple myeloma and mantle cell lymphoma. The second drug is Flurazepam, which is a benzodiazepine derivative that possesses anxiolytic, anticonvulsant, hypnotic, sedative, and skeletal muscle

Table 1: A summary of potentially highly potent anti2019-nCoV drugs with predicted binding free energies (unit: kcal/mol) and corresponding trade names.

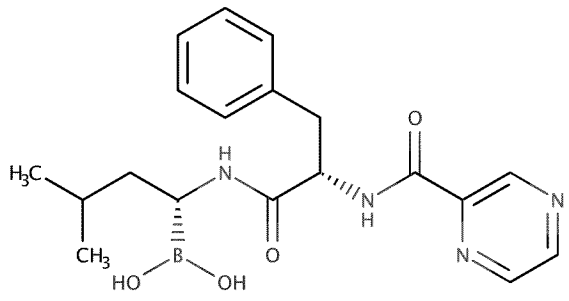
DrugID	Type	Trade Name	Predicted Binding Affinity
DB00188	Bortezomib	Velcade, Chemobort, Bortecad	-12.15
DB00690	Flurazepam	Dalmane, Dalmadorm, Fluzepam	-10.38
DB08901	Ponatinib	Iclusig	-10.25
DB00398	Sorafenib	Nexavar	-10.01
DB01254	Dasatinib	Sprycel, Dasanix	-9.87
DB01384	Paramethasone	Cortidene Depot, Dilar, Dilarmine	-9.71
DB00838	Clocortolone	Victrelis	-9.58
DB00301	Flucloxacillin	Flora, Flox, Floxapen	-9.57
DB06144	Sertindole	Serdolect and Serlect	-9.54
DB04920	Clevidipine	Cleviprex	-9.52
DB00673	Aprepitant	Emend	-9.49
DB01076	Atorvastatin	Lipitor, Sortis	-9.49
DB01594	Cinolazepam	Gerodorm	-9.47
DB00845	Clofazimine	Lamprene	-9.43
DB06717	Fosaprepitant	Emend, Ivemend	-9.39

relaxant properties. The third one, Ponatinib, an oral drug for the treatment of chronic myeloid leukemia and Philadelphia chromosome-positive acute lymphoblastic leukemia, which is a multi-targeted tyrosine kinase inhibitor. It is important to notice that this drug has the risk of life-threatening blood clots and severe narrowing of blood vessels. The next one is Sorafenib, a kinase inhibitor for the treatment of primary kidney cancer and liver cancer. The fifth drug, Dasatinib, is a therapy for treating certain cases of chronic myelogenous leukemia and acute lymphoblastic leukemia. The next one, Paramethasone, is a glucocorticoid with the general properties of corticosteroids. The seventh drug is Clocortolone, a topical steroid that is used in the form of an ester, clocortolone pivalate. It is interesting to note that this drug is always applied as a cream for the treatment of dermatitis. It is considered a medium-strength corticosteroid. Therefore, this drug might be used to clean 2019-nCoV contaminated materials, offering an extra layer of protection. The number eight drug, Flucloxacillin, is a narrow-spectrum beta-lactam antibiotic of the penicillin class. It is used to treat infections caused by susceptible Gram-positive bacteria. The next one, Sertindole, is an antipsychotic medication. The number ten drug, Clevidipine, is a dihydropyridine calcium channel blocker that used for the reduction of blood pressure when oral therapy is not feasible or not desirable. The eleventh drug, Aprepitant, is used to prevent chemotherapy-induced nausea and vomiting, as well as postoperative nausea and vomiting. The number twelve, Atorvastatin, is a statin drug used to prevent cardiovascular disease in those at high risk and treat abnormal lipid levels. The next drug is Cinolazepam, a benzodiazepine derivative. It possesses anxiolytic, anticonvulsant, sedative, and skeletal muscle relaxant properties. The number fourteen drug, Clofazimine, is used together with rifampicin and dapsone to treat leprosy. The fifteenth number drug, Fosaprepitant, is an antiemetic medication used in the prevention of acute and delayed nausea and vomiting associated with chemotherapy treatment.

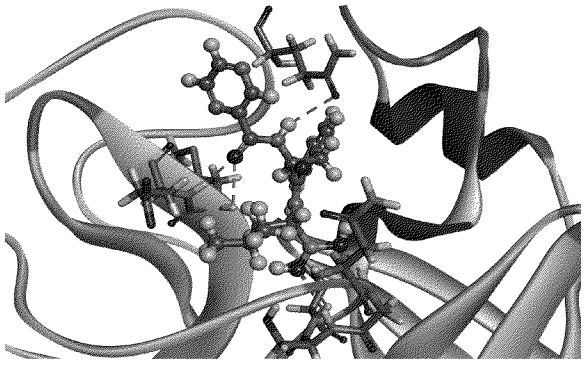
3 Discussion

3.1 The structural analysis of top 3 potent drug candidates

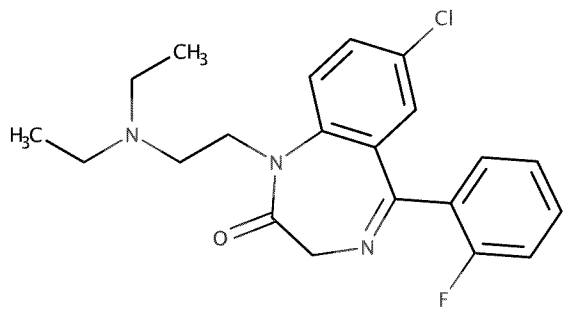
The top-ranking candidate of the existing drugs is Bortezomib (see Figure 3(b)). Its predicted binding affinity to the nCoV-2019 protease is -12.29 kcal/mol. The high binding affinity is due to the strong hydrogen bond network formed between the drug and the nCoV-2019 protease. For example, the strongest hydrogen



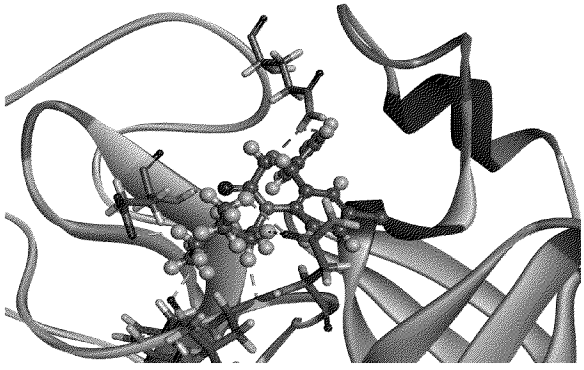
(a) Bortezomib, -12.15 kcal/mol



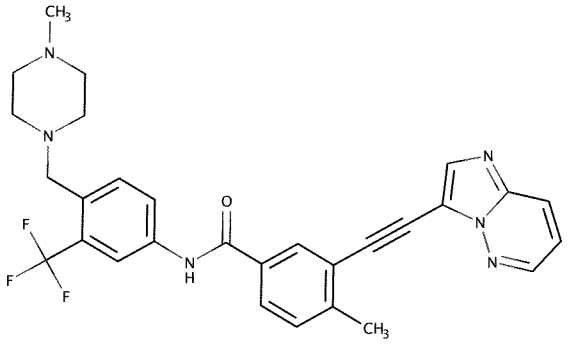
(b) 2019-nCoV protease and Bortezomib complex



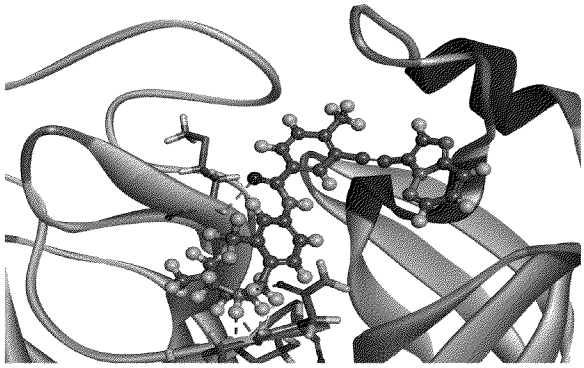
(c) Flurazepam, -10.38 kcal/mol



(d) 2019-nCoV protease and Flurazepam complex



(e) Ponatinib, -10.25 kcal/mol



(f) 2019-nCoV protease and Ponatinib complex

Figure 3: Bortezomib, Flurazepam, Ponatinib and their complexes with 2019-nCoV protease.

bonds are formed by two O atoms in two hydroxyls on the head of Bortezomib and three different aminos in the main chains of residues Gly143, Ser144, and Cys145 of nCoV-2019 protease. Therefore, the head bonds tightly with the side chains of the aforementioned residues. The other two important hydrogen bonds are located at the tail of the drug molecule. The first one is between the O atom in the Hydroxyl on the tail and the two H atoms in the amino acid of the main chain of Glu166 and the methyl of the main chain of Met165. The second one is the H atom in the amino on the tail and the O atom in the side chain of Gln189. As a result, the head, body, and tail of Bortezomib interact firmly with the protease binding site.

The second-best drug is Flurazepam (see Figure 3(d)) with a binding affinity of -10.37 kcal/mol. The strong hydrogen bonds between this molecule and the protease are formed by five different H atoms on the head of the drug with four different O atoms in the main chains of Phe140 , Leu141, as well as the side

chains of Asn142 and Glu166. Another important bond is formed by the H atom in the amino of the side chain of Gln189 with the F atom of the fluorobenzene and one N atom of the 1,4-diazepane in the drug. Additionally, the O atom in the drug adjacent to the 1,4-diazepane is bonded with the amino H atom of the side chain of Glu166. Therefore, the head, tail, and body of the molecule are firmly fixed to the binding site, which promises a strong binding to the 2019-nCoV protease.

The third one, Ponatinib (see Figure 3(f)), has a binding affinity -10.29 kcal/mol. The strong hydrogen bonds between this molecule and the protease are formed by two H atoms of the piperazine with the O atom in the side chain of Ser144 and the main chain of Leu141. Additionally, a bond exists between the O atom in the main chain of the drug and the H atom in the methyl of the main chain of Met165. These hydrogen bonds lead to a high binding affinity with 2019-nCoV protease.

The 3D complexes of 2019-nCoV protease and other 12 potential drugs are given in Supplementary Material.

3.2 Binding affinities of anti-virus protease drugs

It is interesting to analyze the predicted binding affinities of existing antiviral drugs developed as protease inhibitors. Their binding affinities are listed in Table 2. It is interesting to see that except for Boceprevir, which is a protease inhibitor used to treat hepatitis caused by the hepatitis C virus (HCV), the rest of protease inhibitors do not have a strong effect on 2019-nCoV. The predicted values by a recent study [24] are given in the parenthesis. It appears that these values are overestimated.

Table 2: A summary of predicted binding affinities (unit: kcal/mol) of antiviral protease inhibitors. Numbers in parenthesis are results from the literature [24].

DrugID	Predicted Binding Energy	DrugID	Predicted Binding Affinity
Boceprevir	-9.36	Atazanavir	-7.28 (-9.57)
Tipranavir	-8.87	Ritonavir	-7.19 (-8.47)
Fosamprenavir	-7.82	Lopinavir	-7.12
Saquinavir	-7.75	Darunavir	-7.05
Simeprevir	-7.52 (-8.29)	Nelfinavir	-6.74
Telaprevir	-7.50	Amprenavir	-6.73
Indinavir	-7.46		

4 Material and methods

Our deep learning-based drug repositioning models employ mathematical pose (MathPose) and mathematical deep learning (MathDL) to predict 3D poses and protein-ligand binding affinities. The latter is used as a major criterion for searching anti-2019-nCoV therapies from the existing FDA-approved drugs. We first build a 3D 2019-nCoV 3CL protease structure by using homology modeling. A set of SARS-CoV protease inhibitors are docked to the 3D 2019-nCoV 3CL protease structure using our MathPose. The resulting complexes are used as a set of machine learning training. Additionally, a set of protein-ligand complexes from the PDBBind database is collected as another machine learning training set. Our training accuracy in terms of the Pearson correlation coefficient is higher than 0.99 in all deep learning models.

4.1 3D 2019-nCoV protease structure

Homology modeling, a procedure that constructs an atomic-resolution model of a protein from its amino acid sequence and experimental 3D structure of the related homologous protein, i.e., the "template," is used to generate the 3D structure of 2019-nCoV 3CL protease. The SWISS model (https://swissmodel.expasy.org/) is employed with the protease structure of SARS-CoV (PDB ID: 2A5I [13]) as a template. The sequence identity between the 3CL proteases of SARS-CoV and 2019-nCoV is 96.08%.

4.2 SARS-CoV protease inhibitor dataset

ChEMBL [14], an open database that brings chemical, bioactivity, and genomic data together to translate genomic information into effective new drugs, is employed to construct our 2019-nCoV training set. Considering the high sequence identity between viral proteases of 2019-nCoV and SARS-CoV, we take the protease of SARS-CoV as the input target in ChEMBL and a total 115 ChEMBL IDs of the target can be found. The experimental ΔG values of 2019-nCoV 115 SARS-CoV protease inhibition compounds range from -10.0 kcal/mol to 7.5 kcal/mol. We exclude compounds with positive values, resulting in a total of 84 SARS-nCoV protease inhibition compounds for our machine learning training. A collection of these 84 compounds is given in the Supplementary Materials.

4.3 Binding affinity training set

The PDBbind database is a yearly updated collection of experimentally measured binding affinity data (Kd, Ki, and IC50) for the protein-ligand complexes deposited in the Protein Data Bank (PDB). The PDBbind general set, instead of the high-quality refined set, is chosen as our training set because of the FDA approved drugs involve a wide range of protein targets. In the current work, we use a set of 15,843 X-ray crystal structures of protein-ligand complexes and associated binding affinities from the PDBbind v2018 general set [15]. The information of these complexes is provided in the Supplementary Materials.

4.4 FDA approved drugs

DrugBank (www.drugbank.ca) is a richly annotated, freely accessible online database that integrates massive drug, drug target, drug action, and drug interaction information about FDA-approved drugs with the experimental drugs which are going through the FDA approval process [16]. Due to the high quality and sufficient information contained in, the DrugBank has become one of the most popular reference drug resources used all over the world. A total of 1553 FDA-approved drugs are contained in the DrugBank. However, in the present work, a number of FDA-approved drugs encountered difficulties in docking with the target molecule. Therefore, the MathPose successfully created 3D protein-ligand complex structures for 1465 FDA-approved drugs and 2019-nCoV protease.

4.5 MathDL

MathDL, designed for predicting various druggable properties of 3D molecules [23], is capable of efficiently and accurately encoding the high-dimensional biomolecular interactions into low-dimensional representations. Algebraic graph theory-based algorithms [25], differential geometry, and algebraic topology methods [23] are applied to generate three mathematical representations of data in MathDL. These data

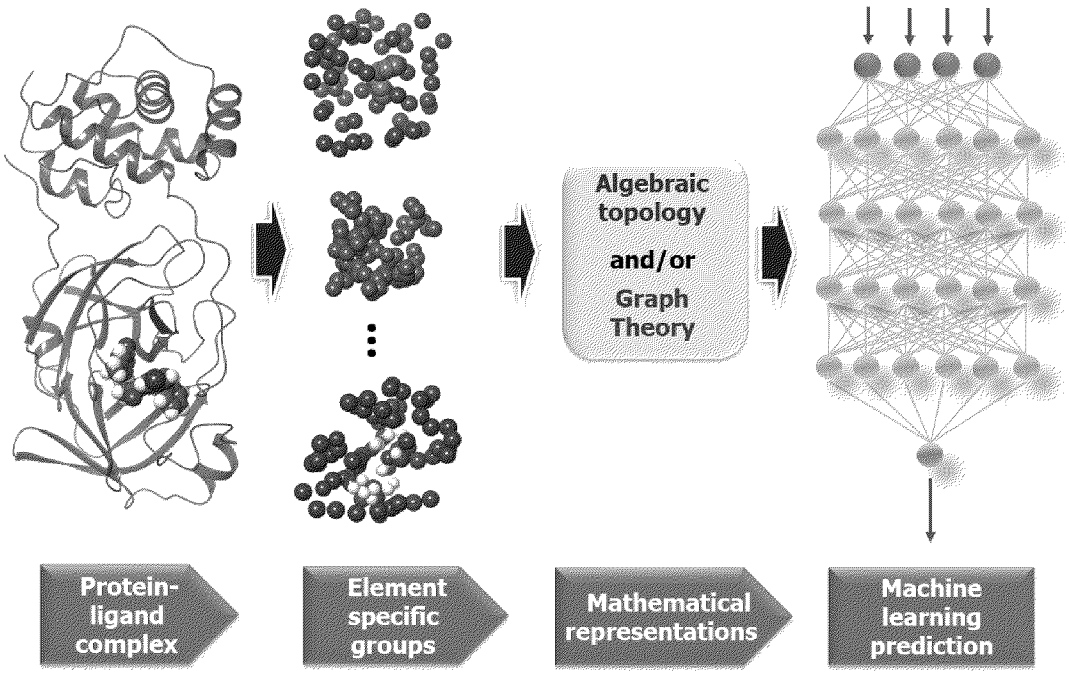


Figure 4: A framework of MathDL energy prediction model which integrates advanced mathematical representations with sophisticated CNN architectures

representations can be integrated with well-designed deep learning models, such as gradient-boosted trees (GBTs) and convolutional neural networks (CNNs), for pose ranking and binding affinity predictions. In D3R Grand Challenges (https://drugdesigndata.org/about/grand-challenge), a worldwide competition series in computer-aided drug design, MathDL had been proved as the top performer in free energy prediction and ranking [22, 23]. Figure 4 illustrates the framework of the MathDL model, which combined the aforementioned mathematical representations with the CNN architecture for druggable properties predictions. The PDBbind 2018 general set [15], along with the SARS 3CL protease related dataset is used in our training process. In this section, we briefly describe the algebraic topology representation used in the present work. Details can be found in the literature [23].

4.5.1 Algebraic topology-based representation

Even with a glimpse of topology, one can realize it dramatically simplifies geometric complexity [9, 17–20]. The study of topology reveals characterizes of different dimensions. As a type of algebraic topology, simplicial homology studies complexes on discrete datasets under various settings, such as the Vietoris-Rips (VR) complex, Čech complex or alpha complex, and identifies the topological invariants of a point-cloud dataset such as atomic coordinates in a protein [26]. Separated components, rings, and cavities can be classified for a given configuration and their numbers are referred to as Betti-0, Betti-1, and Betti-2, respectively. In this topological analysis process, the metrics or coordinates are fully abandoned. Instead, geometric and topological information is captured as data representation. Moreover, as a new development branch of algebraic topology, persistent homology which combines multiscale geometric information and topological invariants to achieve a geometry-enriched topological characteristic, e.g., barcodes. Therefore, the "birth" and "death" of separated components, circles, rings, voids or cavities can be indicated at all spatial scales by topological measurements. Key concepts are briefly shown as following.

In algebraic topology, simplices are the essential building blocks. Let $v_0, v_1, v_2, \cdots, v_k$ be $k+1$ affinely independent points. A (geometric) k-simplex σ^k is the linear combinations of these points in $\mathbb{R}^n$ ($n \geq k$),

whose coefficients are positive and satisfy that their summation equals to 1. For example, a 0, 1, 2, or 3-simplex is considered as a vertex, an edge, a triangle, or a tetrahedron, respectively. A simplicial complex K is a topological space composed of simplices which satisfies that every face of a simplex $\sigma_k \in K$ is also in K and the non-empty intersection of any two simplices is a face for both. To identify the homology group, a k-chain $[\sigma^k]$ is a summation $\sum_i \alpha_i \sigma_i^k$ of k-simplices σ_i^k, and the set of all k-chains of the simplicial complex K equipped with an algebraic field (typically, $\mathbb{Z}_2$) forms an abelian group $C_k(K, \mathbb{Z}_2)$. The homology defined on a series of abelian groups is used to analyze topological invariants which requires boundary operators to connect these chain spaces. The boundary operators $\partial_k : C_k \to C_{k-1}$ for a k-simplex $\sigma^k = \{v_0, v_1, v_2, \cdots, v_k\}$ are homomorphisms defined as $\partial_k \sigma^k = \sum_{i=0}^{k} (-1)^i \{v_0, v_1, \cdots, \hat{v_i}, \cdots, v_k\}$, where $\{v_0, v_1, \cdots, \hat{v_i}, \cdots, v_k\}$ is a $(k-1)$-simplex excluding v_i from the vertex set. Consequently, a important property of boundary operator, $\partial_{k-1}\partial_k = \emptyset$, follows from that boundaries are boundaryless. The algebraic construction to connect a sequence of complexes by boundary maps is called a chain complex

$$\cdots \xrightarrow{\partial_{i+1}} C_i(X) \xrightarrow{\partial_i} C_{i-1}(X) \xrightarrow{\partial_{i-1}} \cdots \xrightarrow{\partial_2} C_1(X) \xrightarrow{\partial_1} C_0(X) \xrightarrow{\partial_0} 0$$

and the kth homology group is the quotient group defined by

$$H_k = Z_k / B_k, \tag{1}$$

where the k-cycle group Z_k and the k-boundary group B_k are the subgroups of C_k defined as, $Z_k = \ker \partial_k = \{c \in C_k \mid \partial_k c = \emptyset\}$, $B_k = \text{im } \partial_{k+1} = \{\partial_{k+1} c \mid c \in C_{k+1}\}$. The aforementioned property implies $B_k \subseteq Z_k \subseteq C_k$. The Betti numbers are defined by the ranks of kth homology group H_k which counts k-dimensional holes, especially, $\beta_0 = \text{rank}(H_0)$ reflects the number of connected components, $\beta_1 = \text{rank}(H_1)$ reflects the number of loops, and $\beta_2 = \text{rank}(H_2)$ reveals the number of voids or cavities. Together, the set of Betti numbers $\{\beta_0, \beta_1, \beta_2, \cdots\}$ indicates the intrinsic topological property of a system.

Persistent homology [18] is devised to track the multiscale topological information over different scales along a filtration. A filtration of a topology space K is a nested sequence of subspaces $\{K^t\}_{t=0,\ldots,m}$ of K such that $\emptyset = K^0 \subseteq K^1 \subseteq K^2 \subseteq \cdots \subseteq K^m = K$. Moreover, on this complex sequence, we obtain a sequence of chain complexes by homomorphisms: $C_*(K^0) \to C_*(K^1) \to \cdots \to C_*(K^m)$ and a homology sequence: $H_*(K^0) \to H_*(K^1) \to \cdots \to H_*(K^m)$, correspondingly. The p-persistent kth homology group of K^t is defined as

$$H_k^{t,p} = Z_k^t / (B_k^{t+p} \bigcap Z_k^t), \tag{2}$$

where $B_k^{t+p} = \text{im}\partial_{k+1}(K^{t+p})$. Intuitively, this homology group records the homology classes of K^t that are persistent at least until K^{t+p}. Under the filtration process, the persistent homology barcodes can be generated. To make use of advanced deep learning algorithms, we vectorize persistent homology barcodes by dividing them into bins and calculating persistence, birth, and death incidents in each bin. Furthermore, the statistics of element-specific persistent homology barcodes are taken into consideration as well in fixed-length features.

4.6 MathPose

MathPose, a 3D pose predictor which converts SMILES strings into 3D poses with references of target molecules, was the top performer in D3R Grand Challenge 4 in predicting the poses of 24 beta-secretase 1 (BACE) binders [23]. For one SMILES string, around 1000 3D structures can be generated by a common docking software tool, i.e., GLIDE [27]. Moreover, a selected set of known complexes is re-docked by the three docking software packages mentioned above to generate at 100 decoy complexes per input ligand as a machine learning training set. The machine learning labels will be the calculated root mean squared deviations (RMSDs) between the decoy and native structures for this training set. Furthermore, MathDL models will be set up and applied to select the top-ranked pose for the given ligand. Additionally, the top poses will be fed into the MathDL for druggable proprieties evaluation.

5 Conclusion

The current pneumonia outbreak caused by a new coronavirus (CoV), called 2019-nCoV in China, has evolved into a global health emergency declared by the World Health Organization. Although there is no effective anti-viral medicine for the 2019-nCoV, the 3CL proteases of 2019-nCoV and SARS-CoV have a sequence identity of 96%, which provides a foundation for us to hypothesize that all potential anti-SARS-CoV chemotherapies are also effective anti-2019-CoV molecules. We build a three-dimensional (3D) 2019-nCoV 3CL protease structure using a SARS-CoV 3CL protease crystal structure as a template and collect a set of 84 SARS-CoV inhibition experimental data. The molecules of this set are docked to the 3D 2019-nCoV 3CL protease structure to form a machine learning training set. Additionally, the PDBbind 2018 general set of 15,843 protein-ligand complexes is also included as an additional machine learning training set. Using these training sets, we develop two deep learning models based on low-dimensional algebraic topology representations of macromolecular complexes. A total of 1465 FDA-approved drugs is evaluated by their binding affinities predicted by the consensus of two models built with 1) a combination of algebraic topology and deep convolutional neural networks (CNNs), and 2) a combination of algebraic topology and deep multitask CNNs. According to the predicted binding affinities, we recommend many FDA-approved drugs as potentially highly potent medications to 2019-nCoV, which serve as a crucial step for the development of anti-2019-nCoV drugs.

Supplementary Materials

Supplementary Materials are available online for 3D structure information and affinities of SARS-CoV inhibitors, FDA-approved drugs, and PDBbind data set.

(A brief summary in Chinese)

潜在的高效抗新冠状病毒药

运用分子生物学, 结构生物学, 药物设计原理, 扑拓学, 大数据, 以及深度学习, 从联邦食品及药物管理局已经批准的1465种药物中筛选出了以下潜在的高效抗新冠病毒药 (按照预测的药物与病毒剪切酶的结合能, i.e, predicted drug-2019-nCoV 3CL protease binding affinity, 由强到弱排列):

1. Bortezomib 万珂, 在台湾的正式商品名为萬科（原用途: 延缓、停止及治疗多发性骨髓瘤和被套细胞淋巴瘤恶化的情况, 属于标靶治疗的新型抗癌药. 潜在抗新冠病毒效果极强. 预测结合能: -12.2 kcal/mol）

2. Flurazepam 盐酸氟西泮（原用途: 抗焦虑药、镇痉剂、镇静剂及肌肉松弛剂. 预测结合能: -10.4 kcal/mol）

3. Ponatinib 普纳替尼（原用途: 白血病治疗药物. 预测结合能: -10.3 kcal/mol）

4. Sorafenib 蕾莎瓦（原用途: 治疗肾细胞癌及肝癌. 预测结合能: -10.0 kcal/mol）

5. Dasatinib 达沙替尼（原用途: 慢性粒细胞性白血病，费城染色体呈阳性的急性髓性白血病该药，前列腺癌等. 预测结合能: -9.9 kcal/mol）

6. Paramethasone 帕拉米松（原用途: 严重的细菌感染和严重的过敏性疾病、各种各种血小板减少性紫癜、粒细胞减少症、严重皮肤病、器官移植的免疫排斥反应、肿瘤的治疗及对糖皮质激素敏感的眼部炎症等. 预测结合能: -9.7 kcal/mol）

7. Clocortolone 氯可托龙（原用途: 各种皮肤病, 例如，湿疹，皮炎，过敏，皮疹. 预测结合能: -9.6 kcal/mol）

8. Flucloxacillin 氟氯西林（原用途: 半合成的耐青霉素酶的青霉素. 预测结合能: -9.6 kcal/mol）

9. Sertindole 舍吲哚（原用途: 非典型抗精神病药物. 预测结合能: -9.5 kcal/mol）

10. Clevidipine 氯维地平（原用途: 治疗高血压. 预测结合能: -9.5 kcal/mol）

11. Aprepitant 阿瑞吡坦胶囊（原用途:止吐. 预测结合能: -9.5 kcal/mol）

12. Atorvastatin 立普妥（原用途: 降低血液胆固醇水平的常见药物. 预测结合能: -9.5 kcal/mol）

13. Cinolazepam 西诺西泮（原用途: 抗焦虑镇静催眠药. 预测结合能: -9.5 kcal/mol）

14. Clofazimine 氯法齐（原用途: 治疗结核病 (TB)、麻风病和其它相关传染病的抗生素. 预测结合能: -9.4 kcal/mol）

15. Fosaprepitant 福沙匹坦（原用途: 一种肿瘤辅助用药. 预测结合能: -9.4 kcal/mol）

另外, 联邦食品及药物管理局已经批准的抗病毒剪切酶的药物中, 分析表明唯有 Boceprevir 博赛泼维（原用途:丙型肝炎蛋白酶抑制剂）可能有一定的效果 (排名18. 预测结合能: -9.3 kcal/mol). 顺便提一下, 以前传的抗艾滋病药, 洛匹那韦/利托那韦片 (Lopinavir/ Ritonavir), 排名很靠后 (预测结合能: -7.1/-7.2 kcal/mol). 达芦那韦 (Darunavir) 排名也很靠后 (预测结合能: -7.1 kcal/mol).

Subject: NASEM Standing Committee on EIDs and 21st Century Health Threats
Standing Committee on EIDs and 21st C Health Threats. Details.pdf
SC on EID and 21st Century Threats - One Pager.pdf

Alan, Erik

Here are some details on the NASEM "Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats" – the charge to the committee, and the agenda and membership details from the first call last week. There is a draft doc on research agenda being finalized and sent to OSTP Director also.

This Committee was set up at the request of the OSTP Director, who joined the first call as well as NSC staff, and I'm sure they'll be involved heavily in future calls/reports.

I hope NIH/NIAID can be involved and so you're aware, all of the above info is public domain, and there was a session open to the public for the first meeting.

Cheers,

Peter

Subject: RE: nCoV weekly investigators meeting

Hello everyone,

As we discussed on the last call, it could be useful to share information certain experimental results, especially animal model work, in as close to real time as possible enable better planning of experiments by the entire group.

During the Zika response, the portal that was used for this was LabKey's Open Research Portal: https://openresearch.labkey.com/project/home/begin.view. This is a fully public portal.

Please consider if this platform might work, and we can discuss on our next call including any logistics and support needed for setting up accounts.

Thank you!

Marciela

Subject: nCoV weekly investigators meeting
When: Tuesday, February 18, 2020 9:00 AM-10:00 AM (UTC-05:00) Eastern Time (US & Canada).
Where: GoToWebinar

Hi everyone,

Please see updated webinar links below. Hopefully this resolves any issues people had last time with sound.

Hello everyone,

Below please find the registration link for our weekly investigators meeting regarding the nCoV. **Please do not forward**. If you would like anyone else to be added to the invitation, please let me (Marciela.degrace@nih.gov) or Erik (erik.stemmy@nih.gov) know.

Our tentative agendas will be:

- Epi Updates
- NIAID Updates
- Other HHS partner Updates, if applicable
- Investigator research updates
- Discussion and Action Items
-

updated webinar link

Agenda and Remote Participation Information

First Meeting of the Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats

Final Agenda

Wednesday, March 11, 2020, 12:00 p.m. – 5:30 p.m. ET
Virtual Zoom Meeting/Keck 201 for Local Participants

Background:
In response to a request from the Office of Science and Technology Policy (OSTP) and the Office of the Assistant Secretary for Preparedness and Response (ASPR), the National Academies of Sciences, Engineering, and Medicine will convene a standing committee of experts to help inform the federal government on critical science and policy issues related to emerging infectious diseases and other 21st century health threats. The standing committee will include members with expertise in emerging infectious diseases, public health, public health preparedness and response, biological sciences, clinical care and crisis standards of care, risk communication, epidemiology, and regulatory issues, as well as veterinary science, One Health, ethics, and community engagement. The standing committee will provide a venue for the exchange of ideas among federal government agencies, the private sector, and the academic community, as well as other relevant stakeholders.

Meeting Objectives

- Discuss the statement of task (SOT) and role of the standing committee
- Conduct the bias and conflict of interest discussion
- Discuss relevant context and key issues
- Explore potential research priorities arising as a result of the emergence of COVID-19 in the U.S. and globally
- Discuss next steps to move forward on key issues; plan second meeting and identify speakers and topics

Wednesday, March 11, 2020

CLOSED SESSION (COMMITTEE MEMBERS ONLY)

12:00 p.m. **Welcome and Introductions**

- Brief introductions
- Discussion of meeting objectives

Harvey Fineberg, *Committee Chair*
President
Gordon and Betty Moore Foundation

Andrew Pope
Director, Board on Health Sciences Policy
Health and Medicine Division

Julie Pavlin
Director, Board on Global Health
Health and Medicine Division

12:10 p.m. **Role of National Academies Standing Committees**

Andrew Pope
Director, Board on Health Sciences Policy
Health and Medicine Division

12:15 p.m. **Discussion of Bias and Conflict of Interest**

Lauren Shern
Associate Executive Director
Health and Medicine Division

12:30 p.m. **Committee Discussion with Sponsor to Inform Open Session**

Kelvin Droegemeier
Director
White House Office of Science and Technology Policy

Harvey Fineberg, *Committee Chair*
President
Gordon and Betty Moore Foundation

OPEN SESSION

SESSION I **Welcoming Remarks, Introductions, and Sponsors' Charge to the Committee**

1:30 p.m. **Welcome and Introductions**

Harvey Fineberg, *Committee Chair*
President
Gordon and Betty Moore Foundation

Marcia McNutt
President
National Academy of Sciences

Victor Dzau
President
National Academy of Medicine

Gregory Symmes
Chief Program Officer
The National Academies of Sciences, Engineering, and Medicine

1:45 p.m. **Sponsors' Charge to the Committee**

- Discuss the context/purpose for the standing committee
- Review the statement of task

Kelvin Droegemeier
Director
White House Office of Science and Technology Policy

David (Chris) Hassell
Senior Science Advisor
Assistant Secretary for Preparedness and Response
U.S. Department of Health and Human Services

2:00 p.m. **Committee Discussion with the Sponsor**

Harvey Fineberg, *Committee Chair*
President
Gordon and Betty Moore Foundation

2:30 p.m. *BREAK*

SESSION II **Diagnostics and Viral Characterization**

2:45 p.m. **Presentation of the Issues**

Ian Watson
Assistant Director for Biotechnology & Biosecurity
Office of Science & Technology Policy

Paige Waterman
Assistant Director for Biological Threat Defense
Office of Science & Technology Policy

David (Chris) Hassell
Senior Science Advisor
Assistant Secretary for Preparedness and Response
U.S. Department of Health and Human Services

3:00 p.m. **Committee Discussion of the Issues**

Harvey Fineberg, *Committee Chair*
President
Gordon and Betty Moore Foundation

SESSION III **Other Selected Topics and Issues**

4:00 p.m. **Discussion of Committee's Selected Topics and Issues**

Harvey Fineberg, *Committee Chair*
President
Gordon and Betty Moore Foundation

CLOSED SESSION (COMMITTEE ONLY)

5:00 p.m. **Committee Debrief, Next Steps, and Potential Future Meeting Topics**

Harvey Fineberg, *Committee Chair*
President
Gordon and Betty Moore Foundation

5:30 p.m. ***ADJOURN MEETING***

Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats

COMMITTEE MEMBER BIOSKETCHES

Harvey Fineberg, M.D., Ph.D. ***(Chair)***
President
Gordon and Betty Moore Foundation

Harvey Fineberg is president of the Gordon and Betty Moore Foundation. He previously served as president of the Institute of Medicine from 2002 to 2014 and as provost of Harvard University from 1997 to 2001, following 13 years as dean of the Harvard School of Public Health. Fineberg devoted most of his academic career to the fields of health policy and medical decision-making. His past research has focused on the process of policy development and implementation, assessment of medical technology, evaluation and use of vaccines, and dissemination of medical innovations. Fineberg serves on the boards of the Carnegie Endowment for International Peace and the China Medical Board. He helped found and served as president of the Society for Medical Decision Making, previously served on and chaired the board of the William and Flora Hewlett Foundation, and chaired the committee to review the performance of the World Health Organization and the functioning of the International Health Regulations (2005) during the 2009 H1N1 influenza pandemic. Fineberg is co-author of the books *Clinical Decision Analysis*, *Innovators in Physician Education* and *The Epidemic That Never Was*, an analysis of the controversial federal immunization program against swine flu in 1976. He has co-edited several books on such diverse topics as AIDS prevention, vaccine safety, understanding risk in society and global health. He has also authored numerous articles published in professional journals. Fineberg chaired the National Academies committee that produced the 2019 report on *Reproducibility and Replicability in Science*. He earned his bachelor's and doctoral degrees at Harvard and is the recipient of several honorary degrees.

Kristian Andersen, Ph.D.
Associate Professor and Director of Infectious Disease Genomics, Scripps Research Translational Institute
The Scripps Research Institute

Kristian Andersen is an associate professor in the Department of Immunology and Microbiology at Scripps Research, with joint appointments in the Department of Integrative Structural and Computational Biology, and at the Scripps Research Translational Institute. Over the past decade, his research has focused on the complex relationship between host and pathogen. Using a combination of next-generation sequencing, field work, experimentation, and computational biology he has spearheaded large international collaborations investigating the emergence, spread and evolution of deadly pathogens, including SARS-CoV-2, Zika virus, Ebola virus, West Nile virus, and Lassa virus. His work is highly cross-disciplinary and exceptionally collaborative. Kristian earned his doctoral degree from the University of Cambridge and performed postdoctoral work in Pardis Sabeti's group at Harvard University and the Broad Institute.

Mary Bassett, M.D., M.P.H.
Director of the François-Xavier Bagnoud Center for Health and Human Rights
Harvard School of Public Health

Mary Bassett is the Director of the FXB Center for Health and Human Rights at Harvard University, as well as the FXB Professor of the Practice of Health and Human Rights at the Harvard School of Public Health. With more than 30 years of experience in public health, Dr. Mary Travis Bassett has dedicated her career to advancing health equity. Prior to her directorship at the FXB Center, Dr. Bassett served for four years as commissioner of Health for New York City. As commissioner, she worked to ensure that every New York City neighborhood supported the health of its residents, with the goal of closing gaps in population health across the city. Originally from New York City, Dr. Bassett lived in Zimbabwe for nearly 20 years. Previously, she was the Program Director for the African Health Initiative and the Child Well-being Program at the Doris Duke Charitable Foundation. She received her B.A. in History and Science from Harvard University and her M.D. from Columbia University's College of Physicians and Surgeons. She served her medical residency at Harlem Hospital Center, and has a master's degree in Public Health from the University of Washington, where she was a Robert Wood Johnson Clinical Scholar.

Trevor Bedford, Ph.D.
Associate Faculty Member, Vaccine and Infectious Disease Division, Public Health Sciences Division, and Human Biology Division
Fred Hutchinson Cancer Research Center

Trevor Bedford is currently Associate Member of the Vaccine and Infectious Disease Division, the Public Health Sciences Division, and the Human Biology Division at the Fred Hutchinson Cancer Research Center. Dr. Bedford uses powerful computers and complex statistical methods to study the rapid spread and evolution of viruses. Data gathered from these processes help researchers develop successful strategies for monitoring and controlling infectious diseases. His visual representations of viral family trees are used to show how the fate of dangerous outbreaks is often determined by the genetics of the infectious agent, human behavior and geography. Dr. Bedford has applied these techniques to document the worldwide spread of seasonal flu viruses. He is developing models to predict which strains of influenza are likely to be most challenging to humans — data that help inform the crucial early decisions about which strains to include in annual flu shots. He specializes in tracking the evolutionary changes of viruses such as HIV and influenza that use RNA, rather than DNA, to carry their genetic information. RNA viruses are much more prone to rapid mutation, which makes many of them particularly nimble at escaping the human immune system and difficult to stop with vaccines. He is a leading advocate for the immediate release of research analyzing viral evolution during epidemics, fresh information that could make a lifesaving difference. He received his Ph.D. in biology from Harvard University.

Georges Benjamin, M.D.
Executive Director
American Public Health Association

Georges Benjamin is well-known as a health leader, practitioner, and administrator. Dr. Benjamin has served as the executive director of the American Public Health Association, the nation's oldest and largest organization of public health professionals, since December 2002. He is a former secretary of Health for the state of Maryland. Dr. Benjamin is a graduate of the Illinois Institute of Technology and the University Of Illinois College Of Medicine. He is board-certified in internal medicine, a Master of the American College of Physicians, a fellow of the National Academy of Public Administration and a fellow emeritus of the American College of Emergency Physicians. He serves on several nonprofit boards such as Research!America, the University of Maryland Medical System and, the Reagan-Udall Foundation. He is a member of the National Academy of Medicine. In April 2016, President Obama appointed Benjamin

to the National Infrastructure Advisory Council, a council that advises the president on how best to assure the security of the nation's critical infrastructure.

Richard Besser, M.D.
President and CEO
Robert Wood Johnson Foundation

Richard Besser is president and CEO of the Robert Wood Johnson Foundation (RWJF), a position he assumed in April 2017. Dr. Besser is the former acting director for the Centers for Disease Control and Prevention (CDC), and ABC News' former chief health and medical editor. At RWJF, Dr. Besser leads the largest private foundation in the country devoted solely to improving the nation's health. RWJF's work is focused on building a comprehensive Culture of Health that provides everyone in America with a fair and just opportunity to live the healthiest life possible. In Dr. Besser's role at ABC News, he provided medical analysis and reports for all ABC News programs and platforms. His weekly health chats on social media reached millions. Before joining ABC News in 2009, Dr. Besser worked as director of the Coordinating Office for Terrorism Preparedness and Emergency Response at the CDC. In that role, he was responsible for all the CDC's public health emergency preparedness and emergency response activities. He also served as acting director of the CDC from January to June 2009, during which time he led the CDC's response to the H1N1 influenza pandemic. He is a member of the National Academy of Medicine. He received the Surgeon General's Medallion for his leadership during the H1N1 response, and in 2011 he accepted the Dean's Medal for his contributions to public health from the Johns Hopkins Bloomberg School of Public Health. Dr. Besser received his Bachelor of Arts degree in economics from Williams College and medical degree from the University of Pennsylvania. He completed a residency and chief residency in pediatrics at Johns Hopkins University Hospital in Baltimore.

Peter Daszak, Ph.D.
President and CEO
EcoHealth Alliance

Peter Daszak is President of EcoHealth Alliance, a US-based organization that conducts research and outreach programs on global health, conservation, and international development. Dr. Daszak's research has been instrumental in identifying and predicting the origins and impact of emerging diseases across the globe. He is one of the founders of the field of Conservation Medicine and has been instrumental in the growth of EcoHealth, One Health, and now Planetary Health. Dr. Daszak is a member of the National Academy of Medicine and Chair of the NASEM's Forum on Microbial Threats. He is a member of the NRC Advisory Committee to the US Global Change Research Program, the Supervisory Board of the One Health Platform, the One Health Commission Council of Advisors, the CEEZAD External Advisory Board, the Cosmos Club, and the Advisory Council of the Bridge Collaborative. He has served on the IOM Committee on global surveillance for emerging zoonoses, the NRC committee on the future of veterinary research, the International Standing Advisory Board of the Australian Biosecurity CRC; and has advised the Director for Medical Preparedness Policy on the White House National Security Staff on global health issues. Dr. Daszak is a regular advisor to WHO on pathogen prioritization for R&D. He received his Ph.D. in parasitic infectious disease from the University of East London.

Ellen Embrey
Managing Partner
Stratitia, Inc.

Ellen Embrey is Managing Partner of Stratitia, Inc., a consulting firm focused on developing meaningful and innovative strategies, and delivering supporting tools and partnerships to bring them successfully to life. Ms. Embrey brings deep expertise in health and medical issues, as well as a wealth of other experience gained during her extensive federal service. In her last federal role, she performed the duties of

the Assistant Secretary of Defense for Health Affairs and the Director, TRICARE Management Activity during the presidential transition period in 2009-2010. From 2002 to 2009, Ms. Embrey was the Deputy Assistant Secretary of Defense for Force Health Protection and Readiness, leading significant changes in Department of Defense policies and programs affecting deployment and combat casualty medicine, health promotion and preventive medicine, medical readiness and public health emergency preparedness and response. For 9 months in 2001, Ms. Embrey performed the duties of Assistant Secretary of Defense for Reserve Affairs, shaping policies affecting the readiness and use of the National Guard and Reserve in both federal and state status. From 2000 to 2001, she served as Chief of Staff of that office, and from 1998 to 2001, as Deputy Assistant Secretary of Defense for Military Assistance to Civil Authorities, developing policies that shaped the role of the National Guard and Reserve components in supporting homeland security, disaster preparedness, and national disaster response capabilities, including advising the president on such matters in the days and weeks following September 11, 2001. Between 1978 and 1997, Ms. Embrey served in senior-level policy analyst, budget analyst, program analyst, management analyst, and systems analyst positions in the Office of the Assistant Secretary of Defense for Reserve Affairs, the Defense Contract Audit Agency, and the Office of Personnel Management. Ms. Embrey was recognized with the Secretary of Defense's Distinguished Civilian Service Award in 2001 and 2004, and twice received the Meritorious Executive Presidential Rank Award in 2006 and 2009.

Diane Griffin, M.D., Ph.D.
Professor, Department of Molecular Microbiology and Immunology
Johns Hopkins Bloomberg School of Public Health

Diane Griffin is University Distinguished Service Professor and Alfred and Jill Sommer Chair of the W. Harry Feinstone Department of Molecular Microbiology and Immunology at Johns Hopkins Bloomberg School of Public Health. Dr. Griffin is a virologist recognized for her work on the pathogenesis of viral infections. She is known particularly for her studies on measles and alphavirus encephalomyelitis that have delineated the role of the immune response in virus clearance, vaccine-induced protection from infection, tissue damage and immune suppression. Dr. Griffin was born in Iowa City, Iowa, and grew up in Oklahoma City. She graduated from Augustana College, Rock Island, Illinois with a degree in biology and from Stanford University School of Medicine in 1968 with a Ph.D. in immunology and M.D., followed by a residency in internal medicine. She was a postdoctoral fellow in virology and infectious diseases at Johns Hopkins University School of Medicine and joined the faculty in 1974. She has been president of the American Society for Virology and of the American Society for Microbiology and is a member of both the National Academy of Sciences and the National Academy of Medicine.

Margaret Hamburg, M.D.
Foreign Secretary
National Academy of Medicine

Margaret Hamburg is an internationally recognized leader in public health and medicine, and currently serves as foreign secretary of the National Academy of Medicine and chair of the NTI | bio Advisory Group. She is a former Commissioner of the U.S. Food and Drug Administration (FDA), having served for almost six years. As FDA Commissioner she was known for advancing regulatory science, streamlining and modernizing FDA's regulatory pathways, and globalization of the agency. Before joining FDA, Hamburg was founding vice president and senior scientist at the Nuclear Threat Initiative. Previous government positions include Assistant Secretary for Planning and Evaluation, U.S. Department of Health and Human Services, Health Commissioner for New York City, and Assistant Director of the National Institute of Allergy and Infectious Diseases, National Institutes of Health. She is President-elect of the American Association for the Advancement of Science (AAAS), as well as an elected member of the Council on Foreign Relations and the National Academy of Medicine. Hamburg currently sits on the boards of the Commonwealth Fund, the Simons Foundation, the Urban Institute, the Global Alliance for Vaccines and Immunization, the Parker Institute for Cancer Immunotherapy and the American Museum

of Natural History. She is chair of the Joint Coordinating Group for the Coalition for Epidemic Preparedness and Innovation, and a member of the Harvard University Global Advisory Council, the Global Health Scientific Advisory Committee for the Gates Foundation, the Harvard Medical School Board of Fellows, and the World Dementia Council. Dr. Hamburg earned her B.A. from Harvard College, her M.D. from Harvard Medical School and completed her medical residency at Weill Cornell Medical Center. She is the recipient of multiple honorary degrees and numerous awards.

John Hick, M.D.
Associate Medical Director for EMS
Medical Director of Emergency Medicine
Hennepin County Medical Center

John L. Hick is a faculty emergency physician at Hennepin Healthcare and a Professor of Emergency Medicine at the University of Minnesota. Dr. Hick serves as the deputy medical director for Hennepin County Emergency Medical Services and Medical Director for Emergency Preparedness at HCMC. He is also the Vice-Chair of the Clinical Council for Life Link III helicopter service and medical director for MN TF-1 state US&R team. He served the Minnesota Department of Health as the medical director for the Office of Emergency Preparedness until becoming an Advisor to the Director of OEM at ASPR/HHS where he is the lead editor for the TRACIE healthcare disaster preparedness website. He is the founder and past chair of the Minneapolis/St. Paul Metropolitan Hospital Compact, a 32-hospital mutual aid and planning group active since 2002. He is a national speaker on hospital preparedness issues and has published numerous papers dealing with hospital preparedness for contaminated casualties, personal protective equipment, crisis standards of care, and surge capacity and was honored to serve the Institute of Medicine on their Crisis Standards of Care projects as well as the Forum on Medical and Public Health Preparedness for Disasters and Emergencies. Dr. Hick holds an M.D. from the Mayo Medical School.

Kent E. Kester, M.D.
Vice President and Head, Translational Science and Biomarkers
Sanofi Pasteur

Kent Kester is currently Vice President and Head, Translational Science and Biomarkers at Sanofi Pasteur. In this capacity, Dr. Kester leads a team of over 200 research and clinical professionals in the US and France focused on the translational development of new vaccines. During a 24-year career in the US Army, he worked extensively in clinical vaccine development and led multiple research platforms at the Walter Reed Army Institute of Research, the U.S. Department of Defense's largest and most diverse biomedical research laboratory with a major emphasis on emerging infectious diseases, an institution he later led as its Commander/Director. His final military assignment was as the Associate Dean for Clinical Research in the School of Medicine at the Uniformed Services University of the Health Sciences (USUHS). During his military service, Dr. Kester was appointed as the lead policy advisor to the US Army Surgeon General in both Infectious Diseases and in Medical Research & Development. In these capacities, he worked extensively in the interagency environment and developed a variety of Army and DoD medical policies related to infectious diseases, both clinical and research aspects. Dr. Kester holds an undergraduate degree from Bucknell University and an M.D. from Jefferson Medical College, completing his internship and residency in internal medicine at the University of Maryland and a research fellowship in infectious diseases at the Walter Reed Army Medical Center. Currently a member of the US Government Presidential Advisory Council on Combating Antibiotic-Resistant Bacteria (PACCARB) and the Department of Veterans Affairs Health Services Research & Development Service Merit Review Board, he previously chaired the Steering Committee of the NIAID/USUHS Infectious Disease Clinical Research Program, and has served as a member of the FDA Vaccines & Related Biologics Products Advisory Committee (VRBPAC), the NIAID Advisory Council, and the CDC Office of Infectious Diseases Board of Scientific Counselors. He is the Vice Chair of the National Academy of Medicine Forum on Microbial Threats. Board-certified in both internal medicine and infectious diseases, Dr. Kester

holds faculty appointments at USUHS and the University of Maryland; and is a fellow of the American College of Physicians, the Royal College of Physicians of Edinburgh, the Infectious Disease Society of America, and the American Society of Tropical Medicine and Hygiene. He is a member of the clinical faculty at the University of Maryland Shock Trauma Center in Baltimore.

Patricia King, J.D.
Professor Emerita
Georgetown University Law Center

Patricia King is Professor of Law emeritus at Georgetown University Law Center and an Adjunct Professor in the Department of Health Policy and Management, School of Hygiene and Public Health at Johns Hopkins University. She is the co-author of Cases and Materials on Law, Science and Medicine. She is a member of the National Academy of Medicine, a member of the American Law Institute, a fellow of the Hastings Center and a faculty affiliate of Georgetown's Kennedy Institute of Ethics. Her scholarship focuses on race and genomics, racial disparities in health and reproductive health. Professor King has served on numerous national advisory bodies formed to address the ethical issues generated by developments in science and technology, including the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research (1974-78), which produced the seminal "Belmont Report," the President's Advisory Committee on Human Radiation Experiments (1994-95), the National Institutes of Health's Embryo Research Panel (co-chair for policy, 1994), the Ethics, Legal and Social Issues Working Group of the NIH's Human Genome Project (1989-95), and the NIH's Recombinant DNA Advisory Committee (1979-81). She has served on numerous boards and Institute of Medicine committees and is currently a member of the Board of Health Sciences Policy of the National Academies. She is also a Director of Mathematica an employee-owned company.She is a graduate of Wheaton College (Massachusetts) and has served as a Trustee and Chair of the Wheaton College Board of Trustees. In 2018 she was designated a Life Trustee by the Wheaton College Board. She graduated from Harvard Law School and is a past member of the Harvard Corporation the governing board of Harvard University. She has received honorary degrees from Wheaton College, Old Dominion University, and Harvard University.

Jonna Mazet, D.V.M., M.P.V.M., Ph.D.
Executive Director, One Health Institute
UC Davis School of Veterinary Medicine

Jonna Mazet is a Professor of Epidemiology and Disease Ecology and Executive Director of the One Health Institute in the UC Davis School of Veterinary Medicine, where she focuses on global health problem solving, especially for emerging infectious disease and conservation challenges. Dr. Mazet is active in international One Health research programs, most notably in relation to disease transmission among wildlife, domestic animals, and people and the ecological drivers of disease emergence. Currently, she is the Global Director of a $175 million viral emergence early warning project, named PREDICT, that has been developed with the US Agency for International Development's (USAID) Emerging Pandemic Threats Program. She was elected to the National Academy of Medicine in 2013 in recognition of her successful and innovative approach to emerging environmental and global health threats and serves on the National Academies' Forum on Microbial Threats, as well as chairs the Academies' One Health Work Group. Jonna joined the UC Global Health Institute Board of Directors as co-vice chair in April 2019. She holds a D.V.M., M.P.V.M., and Ph.D. from UC Davis.

Phyllis Meadows, Ph.D., M.S.N., R.N.
Senior Fellow, Health
The Kresge Foundation

Phyllis Meadows currently serves as the Senior Fellow and Program Advisor for the Kresge Foundation Health Team. In this role, she is responsible for supporting the health team in the development and implementation of investment opportunities within and across the Foundation's various programming areas. Her professional career includes leadership roles in philanthropy, academia, community health and governmental public health. She has previously served in the role of Associate Dean for Public Health Practice and Clinical Professor - Health, Management and Policy with the University of Michigan School of Public Health. She has led several initiatives to expand multi-disciplinary practice in communities, designing the University's first certification program on population health and health equity for medical residents. She is currently a Distinguished Towsley Policy Maker in Residence with the University of Michigan's Gerald Ford School of Public Policy. She has taught and developed graduate level and professional continuing education courses to address emerging health issues, including topics on health policy and public health leadership. Dr. Meadows has extensive experience in public health practice having served in various leadership roles in public health. She has held several official appointments in public health leadership at the state, county and local levels. In her most recent appointment, she served as the Chief Health Officer and Director of Health for the City of Detroit, providing leadership for the department of health, environmental health, infectious diseases, child health, clinical and dental services for the residents of Detroit. Her philanthropic experience includes positions as Program Director for the W.K. Kellogg Foundation - Youth, Education and Higher Education; and advisor for several national initiatives of the Robert Wood Johnson Foundation including the Nurse Executive Leadership Program, Partners in Nursing, and the County Roadmaps project. As a registered nurse, she has worked in both community-based health and hospitals. She currently serves as a Board Member and Advisor for several state level organizations and private foundations focusing on health.

Tara O'Toole, M.D., M.P.H.
Executive Vice President
In-Q-Tel

Tara O'Toole currently serves as Executive Vice President at In-Q-Tel. Dr. O'Toole was confirmed as the Under Secretary for Science and Technology (S&T) at the U.S. Department of Homeland Security (DHS) and served from November 4, 2009 to September 23, 2013. From 2003 to November 2009, Dr. O'Toole was the CEO and Director of the Center for Biosecurity at the University of Pittsburgh Medical Center (UPMC), and Professor of Medicine and of Public Health at the University of Pittsburgh. The Center for Biosecurity of UPMC is an independent organization dedicated to improving the country's resilience to major biological threats. Dr. O'Toole is internationally known for her work on biosecurity and on health and safety issues related to the U.S. nuclear weapons complex. Her publications in the biodefense field include articles on the response to anthrax, smallpox, and plague biological attacks; containment of contagious disease epidemics; biodefense research and development strategies; and hospital preparedness. She is the founding editor of the journal Biosecurity and Bioterrorism: Biodefense Strategy, Practice, and Science. She was a principal author and producer of Dark Winter, an influential exercise conducted in June 2001 to alert national leaders to the dangers of bioterrorist attacks. She was also a principal writer and producer of Atlantic Storm, an international ministerial-level biosecurity exercise held in January 2005. Prior to founding the UPMC in 2003, Dr. O'Toole was one of the original members of the Johns Hopkins Center for Civilian Biodefense Strategies and served as its director from 2001 to 2003. She has served on numerous government and expert advisory committees dealing with biodefense, including panels of the Defense Science Board; the National Academy of Engineering Committee on Combating Terrorism; and the National Academy of Sciences Working Group on Biological Weapons. She served as chair of the Board of the Federation of American Scientists from 2006 to 2007, and in 2006 she was appointed to the board of Google Foundation's International Networked System for Total Early Disease

Detection. From 1993 to 1997, Dr. O'Toole served as Assistant Secretary of Energy for Environment Safety and Health. In this position, she was the principal advisor to the Secretary of Energy on environmental protection and on the health and safety of the approximately 100,000 workers in the U.S. nuclear weapons complex and Department of Energy (DOE) laboratories. She developed the first overall management and safety plan for dealing with the highly enriched uranium, plutonium, spent fuel, and radioactive waste left in place when nuclear weapons production was stopped in the early 1990s. She ran the multi-agency, multimillion-dollar task force that oversaw the government's investigations into human radiation experiments conducted during the Cold War and led the U.S. delegation to Russia to establish the U.S./Russia cooperative effort to study radiationexposure and environmental hazards of the Russian nuclear weapons complex. Prior to her work at DOE, Dr. O'Toole was a senior analyst at the Congressional Office of Technology Assessment, where she directed several projects and studies, including the health impact of pollution resulting from nuclear weapons production. She also served as a consultant to industry and government in matters related to occupational and environmental health; worker participation in workplace safety protection; and organizational change. Dr. O'Toole practiced general internal medicine in community health centers in Baltimore from 1984 to 1988. She is board certified in internal medicine and occupational and environmental health. She has a bachelor's degree from Vassar College, an M.D. from the George Washington University, and a Master of Public Health degree from Johns Hopkins University. She completed internal medicine residency training at Yale University and a fellowship in Occupational and Environmental Medicine at Johns Hopkins University.

Alexandra Phelan, S.J.D., LL.M., LL.B.
Faculty Research Instructor
Center for Global Health Science and Security
Georgetown University

Alexandra Phelan is a member of the Center for Global Health Science and Security and a Faculty Research Instructor in the Department of Microbiology and Immunology at Georgetown University. Dr. Phelan also holds an appointment as Adjunct Professor of Law at Georgetown University Law Center. Dr. Phelan works on legal and policy issues related to infectious diseases, with a particular focus on emerging and reemerging infectious disease outbreaks and international law. She has worked as a consultant for the World Health Organization, the World Bank, and Gavi: the vaccine alliance, and has advised on matters including international law and pathogen sharing, human rights law and Zika, intellectual property law, and contract law. She previously worked for a number of years as a solicitor at a firm in Melbourne, Australia and was admitted to practice to the Supreme Court of Victoria and High Court of Australia in 2010. Dr. Phelan's doctorate examined how overlap between fields of international law – in particular, global health law, international human rights law, and international environmental law – can serve as the catalyst to progressively develop international law to prevent and respond to infectious diseases. She also holds a Master of Laws, specializing in international law, from the Australian National University and a Bachelor of Biomedical Science/Bachelor of Laws (Honours) double degree from Monash University. She also holds a Diploma of Languages (Mandarin Chinese). Dr. Phelan is a General Sir John Monash Scholar and was recognized as an Associate Fellow of the Royal Commonwealth Society in 2015 for her human rights advocacy during the 2013-16 Ebola outbreak.

David Relman, M.D.
Thomas C. and Joan M. Merigan Professor in Medicine, and Chief of Infectious Diseases
Stanford University; VA Palo Alto Health Care System

David Relman is the Thomas C. and Joan M. Merigan Professor in Medicine, and Microbiology and Immunology at Stanford University, and Chief of Infectious Diseases at the Veterans Affairs Palo Alto Health Care System. Dr. Relman is also Senior Fellow at the Freeman Spogli Institute for International Studies (FSI), and served as Science Co-Director at the Center for International Security and Cooperation (2013-2017), at Stanford. He is currently director of a new Biosecurity Initiative at FSI. Relman trained at

MIT and then Harvard Medical School, followed by clinical training in internal medicine and infectious diseases at the Massachusetts General Hospital in Boston, and then a postdoctoral fellowship in microbiology at Stanford. His early research focused on molecular methods for pathogen discovery and over the past 20 years, on the human microbiome. He was elected to the National Academy of Medicine in 2011. Dr. Relman served as vice-chair of the National Research Council Committee that reviewed the science performed for the FBI 2001 Anthrax Letters investigation, chair of the Forum on Microbial Threats (2007-2017), and is currently a member of the Intelligence Community Studies Board (2016-) as well as Chair of a Standing Committee tasked with examining the health-related problems of US embassy personnel stationed overseas, all at the U.S. National Academies of Science. He was a founding member of the National Science Advisory Board on Biosecurity (2005-2014), a member of the Working Group on Biodefense for the President's Council of Advisors on Science and Technology (The White House) (2016), and served as President of the Infectious Diseases Society of America (2012-2013). He holds an M.D. from Harvard Medical School.

Mark Smolinski, M.D., M.P.H.
President
Ending Pandemics

Mark Smolinski currently serves as President of Ending Pandemics. Dr. Smolinksi brings 25 years of experience in applying innovative solutions to improve disease prevention, response, and control across the globe. Mark is leading a well-knit team—bringing together technologists; human, animal, and environmental health experts; and key community stakeholders to co-create tools for early detection, advanced warning, and prevention of pandemic threats. Since 2009, Mark has served as the Chief Medical Officer and Director of Global Health at the Skoll Global Threats Fund (SGTF), where he developed the Ending Pandemics in Our Lifetime Initiative in 2012. His work at SGTF created a solid foundation for the work of Ending Pandemics, which branched out as an independent entity on January 1, 2018. Prior to SGTF, Mark developed the Predict and Prevent Initiative at Google.org, as part of the starting team at Google's philanthropic arm. Working with a team of engineers, Google Flu Trends (a project that had tremendous impact on the use of big data for disease surveillance) was created in partnership with the U.S. Centers for Disease Control. Mark has served as Vice President for Biological Programs at the Nuclear Threat Initiative, a public charity directed by CNN founder Ted Turner and former U.S. Senator Sam Nunn. Before NTI, he led an 18-member expert committee of the National Academy of Medicine on the 2003 landmark report "Microbial Threats to Health: Emergence, Detection, and Response." Mark served as the sixth Luther Terry Fellow in Washington, D.C., in the Office of the U.S. Surgeon General and as an Epidemic Intelligence Officer with the U.S. Centers for Disease Control and Prevention. Mark received his B.S. in Biology and M.D. from the University of Michigan in Ann Arbor. He is board-certified in preventive medicine and public health and holds an M.P.H. from the University of Arizona.

David Walt, Ph.D.
Hansjörg Wyss Professor of Biologically Inspired Engineering
Harvard Medical School

David Walt is a member of the faculty at Harvard Medical School in the Department of Pathology, and a Howard Hughes Medical Institute Professor. Dr. Walt pioneered the use of microwell arrays for single-molecule detection and analysis, which has revolutionized the process of genetic and proteomic sequencing, enabling the cost of DNA sequencing and genotyping to plummet nearly a millionfold in the last decade. His current research employs optical fiber microarrays for the detection and analysis of single enzyme molecules to provide mechanistic insight into enzyme mechanisms. In another project, hhe is also investigating the limits of creating high-density sensing arrays containing thousands of microsensors and nanosensors, and are preparing arrays to perform high-density nucleic acid and protein analysis. Dr. Walt is the Scientific Founder of Illumina, Inc. and Quanterix Corp, and has co-founded several other life sciences startups. Previously, he was a University Professor, Professor of Neuroscience, and Professor of

Oral Medicine at Tufts University. He is a member of the National Academy of Engineering, the National Academy of Medicine, a Fellow of the American Academy of Arts and Sciences, a Fellow of the American Institute for Medical and Biological Engineering, and a Fellow of the National Academy of Inventors. He has received numerous awards and honors, including the 2017 American Chemical Society Kathryn C. Hach Award for Entrepreneurial Success, the 2016 Ralph Adams Award in Bioanalytical Chemistry, the 2014 American Chemical Society Gustavus John Esselen Award, the 2013 Analytical Chemistry Spectrochemical Analysis Award, the 2013 Pittsburgh Analytical Chemistry Award, and the 2010 ACS National Award for Creative Invention. He received a B.S. in chemistry from the University of Michigan and a Ph.D. in chemical biology from SUNY at Stony Brook, and did postdoctoral studies at MIT.

Statement of Task

The National Academies of

SCIENCES • ENGINEERING • MEDICINE

Health and Medicine Division

Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats

In response to a request from the Office of Science and Technology Policy (OSTP) and the Office of the Assistant Secretary for Preparedness and Response (ASPR), the National Academies of Sciences, Engineering, and Medicine will convene a standing committee of experts to help inform the federal government on critical science and policy issues related to emerging infectious diseases and other 21st century health threats. The standing committee will include members with expertise in emerging infectious diseases, public health, public health preparedness and response, biological sciences, clinical care and crisis standards of care, risk communication, epidemiology, and regulatory issues, as well as veterinary science, One Health, ethics, and community engagement. The standing committee will provide a venue for the exchange of ideas among federal government agencies, the private sector, and the academic community, as well as other relevant stakeholders.

The standing committee will:

- Stand ready to respond on short notice to requests from the federal government to assess and consider the science and policy implications of an emerging infectious disease or significant public health threat;
- Provide a venue to enable science and policy discussions relevant to the federal government on emerging issues, research, and activities through in-depth knowledge of the sponsor's programs, goals, and objectives;
- Identify opportunities to integrate science into national preparedness and response decision making;
- Explore lessons learned and best practices from previous preparedness and response efforts, and identify opportunities to disseminate that information to a variety of stakeholders;
- Serve as a focal point for national policy discussions by experts and other leaders in the field;
- Consider, identify, and discuss strategies for addressing misinformation; and
- Respond to the federal government's needs for continuing dialog related to strategic planning and program development to address emerging infectious diseases, biosecurity, and public health and medical preparedness.

At the request of the sponsors, the standing committee will be involved in the planning, development, and oversight of related ad hoc activities undertaken by separately appointed committees operating under its auspices.

The standing committee will serve as a focal point for the discussion of scientific, technical, and policy issues relevant to emerging infectious diseases and public health preparedness and response that warrant detailed examination. Topics for discussion with the standing committee may include:

- Technical assistance and/or assessment of response to emerging infectious diseases;
- Availability of and access to information, samples, and other materials to determine the origin and evolution of emerging infectious diseases;
- International coordination and engagement;
- Technical assessment of ecological and evolutionary drivers of disease emergence;
- Approaches to proactive public messaging and strategies to address misinformation;
- Other science and policy issues relevant to emerging infectious diseases and 21st century health threats.

The committee will carry out its charge at its in-person and virtual meetings by gathering evidence from experts, deliberating, and, when necessary, by preparing short reports.

Standing Committees: What They Do

Standing committees provide sponsors with an ongoing mechanism to engage the National Academies of Sciences, Engineering, and Medicine, stakeholders, and committee members on specific issues in a variety of ways. They are designed to serve sponsors by helping them address their needs on a continuing basis for short and long-term strategic planning and program development.

Standing committees:

1) Stand ready to respond on short notice to requests and other needs from the sponsor(s);
2) Provide high-level strategic guidance to sponsor(s) on emerging issues, research, and activities through in-depth knowledge of the sponsor's programs, goals, and activities;
3) Serve as a focal point for national policy discussions by experts and other leaders in the field; and
4) Respond to sponsor(s) needs for continuing advice through planning, strategic thinking, and program development.

As part of the ongoing nature of the activity, the standing committee becomes very familiar with the sponsor(s) program/agency. This understanding and familiarity with the sponsor(s) programs facilitates the standing committee's ability to respond quickly and effectively with in-depth knowledge and insight about the sponsor(s) program.

Standing committee activities may include:

- Meeting periodically with the sponsor(s) and others in information-gathering sessions;
- Inviting experts/guests to provide input on the issues that will serve to inform the sponsor and the standing committee in its strategic planning and program development roles; and
- Conducting public outreach, such as through the development of websites and newsletters from the Academies that provides general information about the standing committee's activities or other related initiatives of the Academies.

Standing committee outputs may include:

Type	Product	Source/Origin	Recipient	Process
1	Immediate, **informal verbal feedback and guidance** provided to sponsors at public meetings	Individual Committee Members during meetings	Sponsors	Public meeting discussions

2	**Meeting "Recap,"** which is a high-level summary of issues discussed at a committee meeting	Staff prepares the recap/summary	Sponsors (and Committee Members)	Internal review by HMD staff
3	**Letter Report,** which is a formal report from the committee, based primarily on information presented and discussed at a committee meeting, that may include findings, conclusions, and recommendations on a specific topic	Committee (with Staff support)	Sponsors and the Public	Formal institutional review process
4	**Consensus Report,** which is a separate Academies report (or workshop) prepared by an ad hoc committee appointed specifically for the identified task	The Standing Committee can identify the need for, and recommend to the Academies that they conduct a study	Sponsors and the Public	Standing committees may also develop 'spin off' ideas for workshops and studies that are conducted via separate ad hoc committees (standing committee members may serve on the committees for these ad hoc workshops and studies along with additional members recruited to address the specific workshop or study charge).

EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF SCIENCE AND TECHNOLOGY POLICY
WASHINGTON, D.C. 20502

February 3, 2020

Dr. Marcia McNutt
President, National Academy of Sciences
2101 Constitution Ave, N.W.
Washington, D.C., U.S. 20418

SUBJECT: Rapid Response Assessment of 2019-nCoV Data Needs

In support of the Office of Science and Technology's (OSTP) National Science and Technology Committee (NSTC) rapid research response work for the 2019-nCoV response, and the Administration's efforts to characterize and provide evidence-based assessments for outbreak response efforts, I am writing to ask the National Academies of Sciences, Engineering, and Medicine (NASEM) to rapidly examine information and identify data requirements that would help determine the origins of 2019-nCoV, specifically from an evolutionary/structural biology standpoint. I also ask NASEM to consider whether this should include more temporally and geographically diverse clinical isolates, sequences, etc.

Although a widely-disputed paper, "Uncanny similarity of unique inserts in the 2019-nCoV spike protein to HIV-1 gp120 and Hag," posted on the pre-print server bioRxiv last week has been withdrawn, the response to that manuscript highlights the need to determine information and data requirements as quickly as possible to better perform and validate such analyses of origin. These questions are important not only for this current situation, but to inform future outbreak preparation and better understand animal/human and environmental transmission aspects of coronaviruses. As part of a broader deliberative process, this review will aid preparedness for future events by establishing a process that quickly assembles subject matter experts for evaluating other potentially threatening organisms.

OSTP requests NASEM convene a meeting of experts, particularly world class geneticists, coronavirus experts, and evolutionary biologists, to assess what data, information, and samples are needed to address the unknowns, in order to understand the evolutionary origins of 2019-nCoV and more effectively respond to both the outbreak and any resulting misinformation. I request a letter statement from the National Academies be prepared and provided in response to this solicitation. A more in-depth examination of the issues will be established as a follow up as needed.

Sincerely,

Kelvin K. Droegemeier
Director

February 6, 2020

Kelvin Droegemeier
Director
White House Office of Science and Technology Policy
1650 Pennsylvania Avenue, NW
Washington, D.C. 20504

Dear Dr. Droegemeier:

Thank you for your letter regarding the current outbreak of a new respiratory virus, the 2019 Novel Coronavirus, or 2019-nCoV, which was first detected in Wuhan, China, and has now been reported in a growing number of locations worldwide, including the United States.[1] The request from OSTP is timely given the declaration of a public health emergency and potential for misinformation to confound the response.

In response to your request, we consulted leading experts[2] in the fields of virology, infectious disease genomics, genome sciences, epidemiology, microbiology, immunobiology, coronaviruses, emerging infections, biosecurity, and global health. We wanted their views about the data needs that could help elucidate the origin and evolution of 2019-nCoV.

Research studies to better understand the origin of 2019-nCoV and how it relates to viruses found in bats and other species are already underway.[3] The closest known relative of 2019-nCoV appears to be a coronavirus identified from bat-derived samples collected in China.[4] The experts informed us that additional genomic sequence data from geographically- and temporally-diverse viral samples are needed to determine the origin and evolution of the virus. Samples collected as early as possible in the outbreak in Wuhan and samples from wildlife would be particularly valuable. Understanding the driving forces behind viral evolution would help facilitate the development of more effective strategies for managing the 2019-nCoV outbreak and for preventing future outbreaks. In this regard, we understand from Chunli Bai, President, Chinese Academy of Sciences, and the Alliance of International Science Organizations (ANSO), that the Wuhan National Biosafety Laboratory of the Chinese Academy of Sciences is willing to share isolates of the 2019-nCoV with the international community and is working with the University of Texas Medical Branch and other international research institutions on the specifics for the sharing and distribution of the isolates. International collaboration of this kind is more important than ever to overcome these types of global challenges.

---

EXECUTIVE OFFICE OF THE PRESIDENT

OFFICE OF SCIENCE AND TECHNOLOGY POLICY

WASHINGTON, D.C. 20502

February 26, 2020

Dr. Marcia McNutt
President, National Academy of Sciences
2101 Constitution Ave, N.W.
Washington, D.C., U.S. 20418

SUBJECT: National Academies Standing Committee for Emerging Infectious Disease and 21st Century Health Threats

Dear Dr. McNutt, Marcia

Given the complexities of assessing and responding to emerging infectious diseases and other 21st Century health threats, as demonstrated by the present situation with COVID-19, a need exists to establish an ongoing activity to facilitate rapid access to expert, independent perspectives and insights. A neutral venue is needed through which the U.S. Government can engage subject matter experts from the private sector, non-governmental organizations, the academic community, and other relevant stakeholders involved in topics of emerging infectious disease, biosecurity, and public health and medical preparedness. The purpose is to provide a means for examining critical issues in depth and providing strategic input and guidance, based on the best available information and expertise.

To address this need, and stemming from the offer you extended in your letter to me dated February 6, 2020, the Office of Science and Technology Policy (OSTP) and the Department of Health and Human Services (HHS) have been working with Dr. Andy Pope, and his colleagues from your organization, on a request for the National Academies of Sciences, Engineering, and Medicine (NASEM) to establish a Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats. This committee would:

- Stand ready to respond on short notice to requests from the Federal government to assess and consider the science and policy implications of an emerging infectious disease or other significant public health threat;
- Provide a venue to enable science and policy discussions relevant to the Federal government on emerging issues, research, and activities through in-depth knowledge of the sponsor's programs, goals, and objectives;
- Identify opportunities to integrate science into national preparedness and response decision making;
- Explore lessons learned and best practices from previous preparedness and response efforts, and identify opportunities to disseminate that information to a variety of stakeholders;
- Serve as a focal point for national policy discussions with experts and other leaders in the field;
- Consider, identify and discuss strategies for addressing misinformation; and

- Respond to the Federal government's needs for continuing dialog related to strategic planning and program development to address emerging infectious diseases, biosecurity, and public health and medical preparedness.

I would request that the standing committee serve as a focal point for the discussion of scientific, technical, and policy issues relevant to emerging infectious diseases and public health preparedness and response that warrant detailed examination.

The committee members should include experts in emerging infectious diseases, epidemiology, disease modeling and forecasting, genomics, public health, public health preparedness and response, clinical care and crisis standards of care, risk communication, and regulatory issues. The committee would provide a venue for the exchange of ideas among Federal government agencies, the private sector, and the academic community, as well as other relevant stakeholders such as non-profit/philanthropic organizations.

Topics for discussion with the Committee may include:

- Technical assistance and/or assessment of response to emerging infectious diseases;
- Availability of and access to information, samples, and other materials to determine the origin and evolution of emerging infectious diseases;
- International coordination and engagement;
- Technical assessment of ecological and evolutionary drivers of disease emergence
- Approaches to proactive public messaging and strategies to address misinformation;
- Other science and policy issues relevant to emerging infectious diseases and 21st century health threats.

Thank you for your partnership and willingness to bring scientific expertise to bear on this important issue.

Sincerely,

Kelvin K. Droegemeier
Director

Thank you, Marcia!

– Kelvin

Health and Medicine Division

Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats

In response to a request from the Office of Science and Technology Policy (OSTP) and the Office of the Assistant Secretary for Preparedness and Response (ASPR), the National Academies of Sciences, Engineering, and Medicine will convene a standing committee of experts to help inform the federal government on critical science and policy issues related to emerging infectious diseases and other 21st century health threats. The standing committee will include approximately 15 members with expertise in emerging infectious diseases, public health, public health preparedness and response, biological sciences, clinical care and crisis standards of care, risk communication, epidemiology, and regulatory issues, as well as veterinary science, One Health, ethics, and community engagement. The standing committee will provide a venue for the exchange of ideas among federal government agencies, the private sector, and the academic community, as well as other relevant stakeholders.

The standing committee will:

- Stand ready to respond on short notice to requests from the federal government to assess and consider the science and policy implications of an emerging infectious disease or significant public health threat;
- Provide a venue to enable science and policy discussions relevant to the federal government on emerging issues, research, and activities through in-depth knowledge of the sponsor's programs, goals, and objectives;
- Identify opportunities to integrate science into national preparedness and response decision making;
- Explore lessons learned and best practices from previous preparedness and response efforts, and identify opportunities to disseminate that information to a variety of stakeholders;
- Serve as a focal point for national policy discussions by experts and other leaders in the field;
- Consider, identify, and discuss strategies for addressing misinformation; and
- Respond to the federal government's needs for continuing dialog related to strategic planning and program development to address emerging infectious diseases, biosecurity, and public health and medical preparedness.

At the request of the sponsors, the standing committee will be involved in the planning, development, and oversight of related ad hoc activities undertaken by separately appointed committees operating under its auspices.

The standing committee will serve as a focal point for the discussion of scientific, technical, and policy issues relevant to emerging infectious diseases and public health preparedness and response that warrant detailed examination. Topics for discussion with the standing committee may include:

- Technical assistance and/or assessment of response to emerging infectious diseases;
- Availability of and access to information, samples, and other materials to determine the origin and evolution of emerging infectious diseases;
- International coordination and engagement;
- Technical assessment of ecological and evolutionary drivers of disease emergence;
- Approaches to proactive public messaging and strategies to address misinformation;
- Other science and policy issues relevant to emerging infectious diseases and 21st century health threats.

The committee will carry out its charge at its in-person and virtual meetings by gathering evidence from experts, deliberating, and, when necessary, by preparing short reports.

Subject: Nature publication on coronaviruses

Dear Professor Baric and Menachery,

You may have already received inquiries about your nature paper published in 2015
"A SARS-like cluster of circulating bat coronaviruses shows potential for human emergence"

A "rumor" or "speculation" is being reported in the news, that the current novel coronaviruses outbreak in Wuhan China was originated from laboratory. Owing to the fact that hundreds of people have died and tens of thousands people are infected, I dare to ask the questions below.

1. Could you please kindly clarify where the in vitro and in vivo experiments were performed, Wuhan China or North Carolina, USA? Particularly, the generation/production and recovery of chimeric viruses, in vitro virus replication in primary human airway cells and mouse model.

2. At the end of your study, what has been done with the samples containing coronaviruses? Were those samples destroyed safely or stored away? If stored away, again, in China or USA?

3. At any point of time, were any of the coronaviruses, in vitro or in vivo experiment samples ever shipped to China, if the critical and bulk of experiments were done in North Carolina USA?

I'm looking forward to your clarification.

Many thanks for your help,

Mike

Subject: Cooperation wanted

Dear Scientist,

I want to cooperate with you on "Selecting plants (grass, herbs) for Inhalated Theraputic Treatment of Coronovirus infected humans to stop the spread".

Goal of this online resarch : to find plants (grass, herbs) that will stop the demonic Virus spread.

Base and mechanism of action:

Lord Allah Sky Father planted herbs (or minerals like salt) that release bioprotectors to help humans in difficult times of demon attacks.We need to find the exatle plant mixture on the Planet to help people. We will work like bees, who select flowers and lets show like ants - how cooperative scientists can be worldwide.

How to join: send your email with idias to everybody and start applying.

Financing required: to pay all scientists for their work use Financial Department who can request officially for an additional emission of currency from local Central Banks in your country.

Equipment o be used: any inhalator can be loaded in your region.

Inhaled therapeutics for prevention and treatment of pneumonia

Amar Safdar, MD,† Samuel A. Shelburne, Scott E. Evans, and Burton F. Dickey

Author information Copyright and License information Disclaimer

Abstract

Go to:

The lungs are the most common site of serious infection owing to their large surface area exposed to the external environment and minimum barrier defense. However, this architecture makes the lungs readily available for topical therapy. Therapeutic aerosols include those directed towards improving mucociliary clearance of pathogens, stimulation of innate resistance to microbial infection, cytokine stimulation of immune function and delivery of antibiotics. In our opinion inhaled antimicrobials are underused, especially in patients with difficult-to-treat lung infections. The use of inhaled antimicrobial therapy has become an important part of the treatment of airway infection with *Pseudomonas aeruginosa* in cystic fibrosis and the prevention of invasive fungal infection in patients undergoing heart and lung transplantation. Cytokine inhaled therapy has also been explored in the treatment of neoplastic and infectious disease. The choice of pulmonary drug delivery systems remains critical as air-jet and ultrasonic nebulizer may deliver sub-optimum drug concentration if not used properly. In future development of this field, we recommend an emphasis on the study of the use of aerosolized hypertonic saline solution to reduce pathogen burden in the airways of subjects infected with microbes of low virulence, stimulation of innate resistance to prevent pneumonia in immunocompromised subjects using cytokines or synthetic pathogen-associated molecular pattern analogues and more opportunities for the use of inhaled antimicrobials. These therapeutics are still in their infancy but show great promise.

Keywords: amikacin, antifungal, antiviral, aspergillosis, cancer, colistin, cytokine, inhaled tobramycin, innate immunity, pneumonia, Pseudomonas, transplantation, vancomycin, ventilator-associated pneumonia, zygomycosis

1. Introduction

Go to:

тельных и хронических болезнях (туберкулез, нагноения, новообразования, системные болезни крови, алкоголизм и др.) или при длительном применении иммунодепрессивных препаратов.

Симптомы, течение. Выделяют 4 формы бронхолегочного аспергиллеза. Легкая форма протекает как быстропреходящий острый трахеобронхит. Для аллергического бронхиального аспергиллеза характерны транзиторные легочные инфильтраты, эозинофилия, лихорадка, бронхоспазм; мокрота может иметь коричневый оттенок, иногда откашливаются слепки бронхов; течение может быть длительным с повторными обострениями и развитием тяжелой бронхиальной астмы; в ряде случаев наступает выздоровление. Аспергиллома (колонии из мицелия гриба, свободно лежащие в туберкулезной каверне, в полости абсцесса, бронхоэктазах, участке медленно рассасывающейся пневмонии, инфаркта легкого, в области опухоли) может протекать бессимптомно, но чаще наблюдаются кашель с выделением мокроты без запаха, кровохарканье, потеря массы тела (вплоть до кахексии), высокая температура, боль в груди, прогрессирующее ухудшение состояния. Некротическая форма легочного аспергиллеза протекает с выраженной интоксикацией, лихорадкой.

В диагностике используют данные рентгенологического исследования, посевов мокроты, серологических методов.

Лечение. Эффективен амфотерицин В. Суточную дозу (250 ЕД/кг) вводят в 450 мл 5% раствора стерильной глюкозы в/в капельно в течение 4—6 ч через день или 2 раза в неделю в течение 4—8 нед; ингаляции 50 000 ЕД амфотерицина В в 10 мл воды для инъекций производят 1—2 раза в день в течение 10—14 дней. Противогрибковое действие препарата усиливается при сочетании с рифампицином. Амфотерицин В обладает способностью к кумулированию, нейро-нефро- и гепатотоксичен.

БРОНХИАЛЬНАЯ АСТМА — хроническое рецили-

мый по 300—500 мл 0,1% раствора [illegible] капельно в течение 3—4 ч ежедневно или через день.

Эффективность сульфаниламидов и антибиотиков при пневмониях, как правило, выявляется к концу первых суток лечения, но не позже 3 дней их применения; после этого срока при отсутствии терапевтического эффекта назначенный препарат следует заменить другим. Но и в случаях положительного эффекта желательна смена препарата (препаратов) через каждые 5—6 дней. Антибактериальная терапия контролируется клиническими и параклиническими методами как для оценки ее эффективности, так и для выявления непереносимости (особенно лекарственной аллергии и гемоцитодепрессивного действия).

При тяжелых вирусно-бактериальных пневмониях, нередко возникающих вследствие взаимодействия вируса гриппа и стафилококка, наряду с внутривенно вводимыми антибиотиками широкого спектра действия показано введение специфического донорского противогриппозного γ-глобулина по 3—6 мл, при необходимости повторно каждые 4—6 ч, в первые 2 дня болезни. Применяют также дезинтоксикационные средства (гемодез и др.).

При выраженной тахикардии, снижении систолического давления до 100 мм рт. ст. и ниже больным пневмониями назначают строфантин (0,05% раствор по 0,25—0,5 мл в/в 1 раз в день), кордиамин (по 2 мл в/м или в/в 3—4 раза в день), сульфокамфокаин (по 2 мл в/м 10% раствора 2—4 раза в день). При выраженной одышке и цианозе назначают длительные ингаляции увлажненного кислорода. При пневмонии, развившейся на фоне хронического обструктивного бронхита, эмфиземы легких, концентрации кислорода не должны превышать 30%, а ингаляции его контролируют исследованием кислотно-щелочного баланса. Используют безаппаратную физиотерапию (круговые банки, аппликации парафина, озокерита, лечебной грязи), после нормализации температуры тела можно назначить ко-

ротковолновую диатермию, электрическое поле УВЧ и др. При тяжелом течении острых и обострении хронических пневмоний, осложненных острой или хронической дыхательной недостаточностью, больных помещают в палаты интенсивной терапии; может быть проведен бронхоскопический дренаж, при артериальной гиперкапнии — вспомогательная искусственная вентиляция легких. При развитии отека легких, инфекционно-токсического шока и других тяжелых осложнений лечение больных пневмонией ведут совместно с реаниматологом.

Выписанные из стационара в период клинического выздоровления или ремиссии лица, перенесшие пневмонию, должны быть взяты под диспансерное наблюдение. Для проведения реабилитации их можно направлять в местные санатории. Больные хронической пневмонией без выраженного нагноительного процесса и легочно-сердечной недостаточности II — III стадии в фазе ремиссии могут быть направлены на лечение на курорты Южного берега Крыма, горные климатические курорты Кавказа, Алтая, в санатории Подмосковья, Приморья, Сибири и др.

Прогноз при пневмониях значительно улучшился с начала применения антибактериальных средств. Но он остается серьезным при стафилококковых и «фридлендеровских» пневмониях, при часто рецидивирующих хронических пневмониях, осложненных обструктивным процессом, дыхательной и легочно-сердечной недостаточностью, а также при возникновении пневмонии у лиц с тяжелыми болезнями сердечно-сосудистой и других систем. Летальность от пневмонии в этих случаях остается высокой.

ПНЕВМОСКЛЕРОЗ — развитие в легких соединительной ткани как исход неспецифического (пневмонии, бронхиты) или специфического (туберкулез, сифилис) воспалительного процесса, а также пневмокониозов, длительного застоя в малом круге кровообращения

Subject: Wuhan CCHFV application

Dear All,

Here is the application I wrote with help from Han for Wuhan collaboration. Please take a look and let me know if anything needs to be changed.

Thanks very much for all the supports from you.

Best,

Chao

Weekly Roundup of COVID-19 Articles

Journal Editor-in-Chief Philip Rosenthal, Managing Editor Cathi Siegel, and Editorial Assistant Alison Jaeb are giving high priority to all COVID-19 manuscripts. Accepted manuscripts are posted to the Journal website almost immediately and are open to all. To keep you apprised of the latest research, we are sending a weekly roundup of the newly published articles on Friday.

We extend our deep thanks to the *Journal*'s Editors and staff who are working together to review and publish all accepted articles as quickly as possible.

► **Keep Politics out of Funding Decisions for Medical Research and Public Health**
Philip J. Rosenthal, Daniel G. Bausch, Karen A. Goraleski, David R. Hill, Julie A. Jacobson, Chandy C. John and Joel G. Breman

► **The Origin of COVID-19 and Why It Matters**
David M. Morens, Joel G. Breman, Charles H. Calisher, Peter C. Doherty, Beatrice H. Hahn, Gerald T. Keusch, Laura D. Kramer, James W. LeDuc, Thomas P. Monath and Jeffery K. Taubenberger

► **More Studies are Needed on the Link between Metformin and Decreased Mortality in Diabetic COVID-19 Patients**
Marinos Fysekidis, Régis Cohen and Abdallah Al-Salameh

► **Artemisia Spp. Derivatives for COVID-19 Treatment: Anecdotal Use, Political Hype, Treatment Potential, Challenges, and Road Map to Randomized Clinical Trials**

Subject: RE: RE: sharing of isolates of 2019nCoV

Thanks, Fei
Although US CDC has already shared the virus isolate with a number of US institutions (including UTMB) last week, it is still important to successfully transfer and share the isolate(s) from China.
Best,

- Pei-Yong

Diane E. Griffin, Vice President, NAS,
Margaret Hamburg, Foreign Secretary, NAM

Dear Prof. Griffin and Prof. Hamburg,

Thank you for your concerns on the recent outbreak of the 2019 novo-coronavirus epidemic. Upon receiving your letter dated January 28, my colleagues have discussed with Dr. George Fu Gao and other experts and we are willing to share isolates of the 2019 nCoV with the international community. We believe this is critical to engaging joint international efforts to contain the spread of the virus.

The National Biosafety Laboratory Wuhan of the Chinese Academy of Sciences is prepared and willing to work with The University of Texas Medical Branch and

other international research institutions on the specifics for the sharing and distribution of the isolates. We are in the process of getting it ready.

I look forward to hearing your further advice on this matter.

With best regards,

Chunli Bai

Hi professors,

I apologize if you are bothered by this email. I am helping my friend, Ed Seto to advertise his recruiting post-doc:

Postdoctoral Position

Applications are invited for a postdoctoral fellowship to study the structures, functions, and mechanisms of histone deacetylases. Candidates with experiences in biochemical, molecular, and cell biological approaches are preferred.

Recent selected articles from our lab:
PMID: 32540961
PMID: 32457045
PMID: 31162605
PMID: 30517871
PMID: 30456376
PMID: 29958910

Please send a CV and names of three references to:

Ed Seto, Ph.D.
Email: seto@gwu.edu

Dear friends and colleagues,

I wish you all a great Thanksgiving holiday!

A few updates:

1. We will have our first scientific meeting on June 12-13, 2020, right before the ASV annual meeting (June 13-17) in Fort Collins, Colorado State University. Organizing and scientific committees will be formed soon.
2. I am excited to share that Dr. Xiang-Jin (XJ) Meng of Virginia Tech, a distinguished virology and a member of the US National Academy of Science, will be the keynote speaker of this meeting. Details will follow.
3. In addition to scientific programs, we will also hold an election; a new leadership team will be elected to serve our community for the next two years.
4. Attached please find a brief report of our Kunming meeting, along with a few photos.

Please let me know if you have comments and suggestions.

All best wishes, and happy holidays!

Shan-Lu

SCBA-Virology Division Workshop Held in Kunming

The SCBA-Virology Division held a scientific workshop on July 28, 2019 after the 17th SCBA International Symposium in Kunming, China. The workshop was co-organized by Drs. Genhong Cheng, Haitao Guo, Shan-Lu Liu and Tongqing Zhou of the SCBA-virology Division and by Dr. Qihan Li at the Institute of Medical Biology (IMB), Chinese Academy of Medical Sciences (CAMS).

The meeting was opened by an introductory speech by Prof. Qihan Li, Director of IMB, followed by scientific presentations. The workshop had three sessions, which covered the topics of "Immunity to Viral Infection", "Viral Pathogenesis", and "Vaccine and Primate Models". More than 50 people attended the workshop, many from IMB. Speakers, session chairs, and panelists include: Tian Wang, Shan-Lu Liu, Haitao Hu, Jie Sun, Wenzhe Ho, Lishan Su, Wei Jiang, Xuefeng Liu, Hongyu Deng, Yuntao Wu, Jianming Hu, Genhong Cheng, Lanying Du, Yuan Yan, Kui Li, Shou-Wei Ding, Qi Huang, etc.

Before the scientific sessions, meeting attendees were given a guided tour of the National Medical Primate Research Center located in IMB, CAMS, which hosts the largest P4 primate research facility in China and plays a leading role in breeding, reproduction, disease control, genetic studies of primates in the world. In addition to IMB of CAMS, the workshop was also supported by Drs. Yuelong Shu and Musheng Zeng at Sun Yat-sen University (SYSU), China, Dr. Yuntao Wu at Virongy, LLC and George Mason University, as well as Immune Technology Corp.

This is the first scientific event after the official establishment of the SCBA-Virology Division in 2018. During the 2019 SCBA international symposium and the SCBA-Virology satellite workshop, we also organized opportunities for social networking.

佩勇,

附件是文章的结果。文章很初步，整体结构也需要大的调整。我想这是第一次请教，请你审核数据（文章的主体部分和图表），期待意见和建议，特别是：

1）需要补充的其他实验；

2）文章写作思路和整体布局

另外， 我们正在补充的数据包括：

1）GLP2R蛋白的ECL1结构域和E蛋白DIII直接相互作用证据（合成多肽，SPR分析），

2）缺陷小鼠感染实验（已经构建成功，正在繁殖）。

将在你意见和建议的基础上重新架构文章。

非常感谢！

祝好！

Dear Professors,

Please find attached your APC invoice.

This invoice was sent to you on **03/25/2019** and payment is now required. We would appreciate an update as to when the money could be expected in.

If you are having problems paying this invoice, or if you are currently working with co-authors, funders or your institution to arrange payment please do update us so that we are able to provide assistance or update your invoice where necessary.

Alternatively, if you have paid this invoice, please could you provide us with proof of payment so we can check our records?

If you wish to pay by credit card, please use our online payment link:
https://secure.taylorandfrancis.com/payment#/?product=tandf.

We look forward to hearing from you with an update.

Kind Regards

Erica Veasey

Credit Control Specialist | Taylor & Francis Books | European Shared Services | Global Support

Taylor & Francis are now offering an online payment service to all of our customers, if you wish to pay by debit or credit card please use our online payment link:

You can now pay by Credit or Debit Card the following secure online system:
https://secure.taylorandfrancis.com/payment#/tandf

When paying for more than one invoice please only provide **one** of the invoice numbers. Please email a list of all invoices (and any credit notes used) to us by **email** with the payment reference.
Thank you!

Subject: Potentially highly potent drugs for 2019-nCoV
Attachments: 2019-nCoV-Reposition_13.pdf; Anti-2019-nCoV.docx

Dear Researchers,
There is a pressing need to find effective medications for 2019-nCoV. Therefore, I would like to bring your attention to a class of potentially highly potent drugs for 2019-nCoV. Sorry for disturbing your weekend!

We use deep learning to screen 1465 drugs in the DrugBank that have been approved by the U.S. Food and Drug Administration (FDA), based on the inhibition of 2019-nCoV 3CL protease. We found a few market drugs that might be effective for curing 2019-nCoV, ranked by their binding affinities in inhibiting the 2019-nCoV 3CL protease.

Table 1: A summary of potentially highly potent anti2019-nCoV drugs with predicted binding free energies (unit: kcal/mol) and
corresponding trade names.

Drug ID	Type	Trade Name	Predicted Binding Affinity
DB00188	Bortezomib	Velcade, Chemobort, Bortecad	-12.15
DB00690	Flurazepam	Dalmane, Dalmadorm, Fluzepam	-10.38
DB08901	Ponatinib	Iclusig	-10.25
DB00398	Sorafenib	Nexavar	-10.01
DB01254	Dasatinib	Sprycel, Dasanix	-9.87
DB01384	Paramethasone	Cortidene Depot, Dilar, Dilarmine	-9.71
DB00838	Clocortolone	Victrelis	-9.58
DB00301	Flucloxacillin	Flora, Flox, Floxapen	-9.57
DB06144	Sertindole	Serdolect and Serlect	-9.54
DB04920	Clevidipine	Cleviprex	-9.52
DB00673	Aprepitant	Emend	-9.49
DB01076	Atorvastatin	Lipitor, Sortis	-9.49
DB01594	Cinolazepam	Gerodorm	-9.47
DB00845	Clofazimine	Lamprene	-9.43
DB06717	Fosaprepitant	Emend, Ivemend	-9.39

Among FDA approved protease-based antiviral drugs, the most possible one is Boceprevir (binding affinity -9.36 kcal/mol), see Table of the attached manuscript. A brief summary is also given in Chinese.

Abstract

The World Health Organization (WHO) has declared the 2019 novel coronavirus (2019-nCoV) infection outbreak a global health emergency. Currently, there is no effective anti-2019-nCoV medication. The sequence identity of the 3CL proteases of 2019-nCoV and SARS is 96%, which provides a sound foundation for structural-based drug repositioning (SBDR). Based on a SARS 3CL protease X-ray crystal structure, we construct a 3D homology structure of 2019-nCoV 3CL protease. Based on this structure and existing experimental datasets for SARS 3CL protease inhibitors, we develop an SBDR model based on machine learning and mathematics to screen 1465 drugs in the DrugBank that have been approved by the U.S. Food and Drug Administration (FDA). We found that many FDA approved drugs are potentially highly potent to 2019-nCoV.

Key words: 2019-nCoV, Drug repositioning, DrugBank, deep learning, algebraic topology.

*Address correspondences to Guo-Wei Wei. E-mail:wei@math.msu.edu

1 Introduction

The 2019 novel coronavirus (2019-nCoV) caused the pneumonia outbreak in Wuhan, China, in late December 2019 and has rapidly spread around the world. By Feb 5, 2020, more than 24000 individuals were infected and more than 490 fatalities had been reported. The World Health Organization (WHO) has declared this novel coronavirus outbreak a global health emergency. Currently, there is no specific antiviral drug for this epidemic. Considering the severity of this widespread dissemination and health threats, panic patients misled by media flocked to the pharmacies for Chinese Medicine herbs which were reported to "inhibit" the 2019-nCoV, despite no clinical evidence supporting the claim. Many researchers are engaged in developing anti-2019-nCoV drug s [1, 2]. However, new drug discovery and development is a long, costly and rigorous scientific process. A more effective approach is to search for anti-2019-nCoV therapies from the existing FDA-approved drug database.

Drug repositioning (also known as drug repurposing), which concerns the investigation of existing drugs for new therapeutic target indications, has emerged as a successful strategy for drug discovery due to the reduced costs and expedited approval procedures [3–5]. Several successful examples unveil its great values in practice: Nelfinavir, initially developed to treat the human immunodeficiency virus (HIV), is now being used for cancer treatments. Amantadine was firstly designed to treat influenza caused by type A influenza viral infection and is being used for Parkinson's disease later on [6]. In recent years, the rapid growth of drug-related datasets, as well as open data initiatives, has led to new developments for computational drug repositioning, particularly, structural-based drug repositioning (SBDR). Machine learning, network analysis, and text mining and semantic inference are three major computational approaches commonly applied in drug repositioning [7]. The rapid accumulation of genetic and structural databases [8], the development of low-dimensional mathematical representations of complex biomolecular structures [9, 10], and the availability of advanced deep learning algorithms have made machine learning-based drug reposition a promising approach [7]. Considering the urgent need for anti-2019-nCoV drugs, a computational drug repositioning is one of the most feasible strategies for discovering 2019-nCoV drugs.

In SBDR, one needs to select one or a few effective targets. Study shows that 2019-nCoV genome is very close to that of the severe acute respiratory syndrome (SARS)-CoV [11]. The sequence identities of 2019-nCoV 3CL protease, RNA polymerase, and the spike protein with corresponding SARS-CoV proteins are 96.08%, 96%, and 76%, respectively [12]. We, therefore, hypothesize that a potent SARS 3CL protease inhibitor is also a potent 2019-nCoV 3CL protease inhibitor. Unfortunately, there is no effective SARS therapy at present. Nevertheless, the X-ray crystal structure of SARS 3CL protease has been reported [13] and the binding affinities of 115 potential SARS 3CL protease inhibitors are available in ChEMBL database [14]. Additionally, there are 15,843 protein-ligand complexes in PDBbind 2018 general set with binding affinities and X-ray crystal structures [15]. Moreover, the DrugBank contains about 1600 drugs approved by the U.S. Food and Drug Administration (FDA) [16]. The aforementioned information provides a sound foundation to develop an SBDR machine learning model for 2019-nCoV 3CL protease inhibition.

Recently, we have developed low-dimensional mathematical representations [9, 10] to reduce the structural complexity of macromolecules based on abstract mathematics, such as algebraic topology [17–20], differential geometry, and spectral graph theory [10, 21]. We exploit these representations to extract critical chemical and biological information for protein-ligand pose selection, binding affinity ranking, prediction, ranking, scoring, and screening [9, 10]. Paired with various machine learning, including deep algorithms, these approaches are the top competitor for D3R Grand Challenges, a worldwide competition series in computer-aided drug design in the past few years [22, 23].

In responding to the pressing need for anti-2019-nCoV medications, we develop mathematics-based deep learning models to systematically eventuate FDA approved drugs in the DrugBank for 2019-nCoV 3CL protease inhibition. With the consensus of two deep learning models based on convolutional neural

networks and multitask deep learning, we report the top 15 potentially highly potent anti-2019-nCoV 3CL inhibitors, which provide timely guidance for the further development of anti-2019nCoV drugs.

2 Results

2.1 Sequence identity analysis

The sequence identity is defined as the percentage of characters that match exactly between two different sequences. The sequence identities between 2019-nCoV protease and the protease of SARS-CoV, MERS-CoV, HKU-1, OC43, HCoVNL63, 229E, and HIV are 96.1%, 52.0%, 49.0%, 48.4%, 45.2%, 41.9%, and 23.7%, respectively. It is seen that 2019-nCoV protease is very close to SARS-CoV protease, but is distinguished from other proteases. Clearly, 2019-nCoV has a strong genetic relationship with SARS-CoV, the sequence alignment in Figure 1 further confirms their relationship. Additionally, the available experimental data of SARS-CoV protease inhibitors can be used as the training set to generate new inhibitors of 2019-nCoV protease.

2.2 Structure similarity analysis

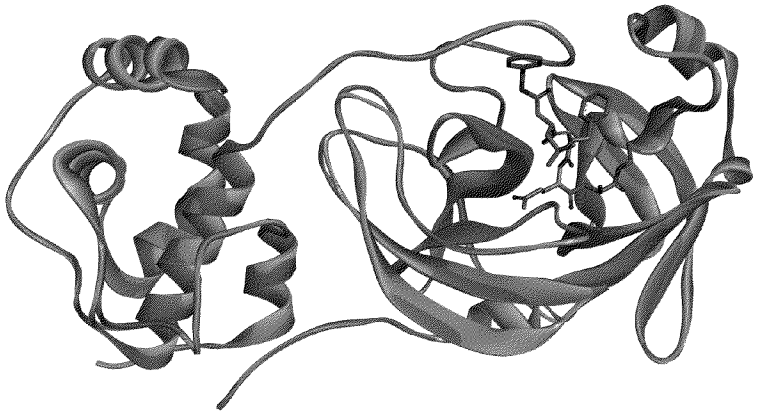

Figure 2: Illustration of the similarity and difference between protease structures of 2019-nCoV 3CL protease (in gold) and SARS-CoV 3CL protease (PDB ID: 2A5I, in green). The anti-SARS inhibitor in dark color indicates the binding site.

Since the sequences are highly identical, the 2019-nCoV protease structure can be built by homology modeling with the SARS-CoV 3CL protease (PDB ID: 2A5I) [13] as a template. It turns out, as shown in Fig. 2, the homology structure of the 2019-nCoV protease is essentially identical to the X-ray structure of SARS-CoV 3CL protease. Particularly, the RMSD of two structures at the binding site is 0.21 Å. The high structural similarity between the two proteases suggests that anti-SARS-CoV chemicals can be equally effective for the treatment of 2019-nCoV.

2.3 Binding analysis

We predict the binding affinities of 1465 3D FDA-approved drugs and 2019-nCoV protease complexes using two models, 3DALL and 3DMT. 3DALL is built with deep convolutional neural networks (CNNs) using the algebraic topology-based representation of protein-ligand complexes, with 84 SARS-CoV protease inhibitors and 15843 complexes from the PDBbind 2018 general set as the training set. 3DMT, a deep

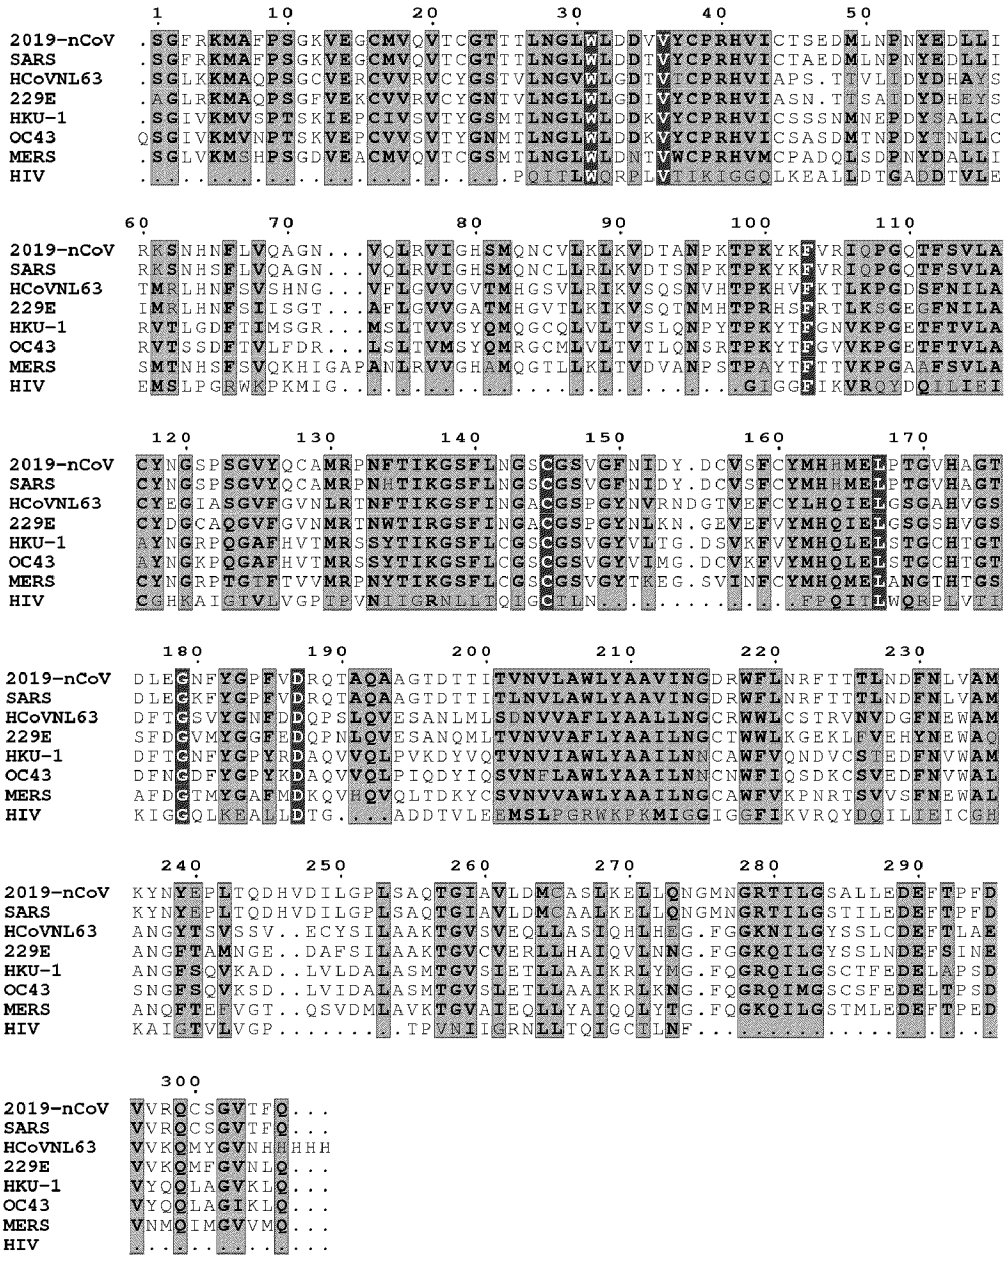

Figure 1: The protease sequence alignment between 2019-nCoV, SARS, MERS, OC43, HCoVNL63, HKU-1, 229E, and HIV.

multitask CNN model based on the algebraic topology representation of protein-ligand complexes is the second model. In the current work, two tasks were developed in the 3DMT. The first task involves 1465 2019-nCoV protease complexes as the test set and 84 SARS-CoV protease inhibitors as the training set. The second task is trained with the PDBbind 2018 general set of 15843 protein-ligand complexes. Our top 15 potential 2019-nCoV inhibitors based on consensus binding affinities of the aforementioned two models are listed in Table 1. A complete list of predicted binding affinities of 1465 FDA-approved drugs is given in the Supplementary Material.

We briefly describe the predicted potentially highly potent anti-2019-nCoV drugs. The most potent one is Bortezomib, an anti-cancer medication, which is known as proteasome inhibitor and can be used to treat multiple myeloma and mantle cell lymphoma. The second drug is Flurazepam, which is a benzodiazepine derivative that possesses anxiolytic, anticonvulsant, hypnotic, sedative, and skeletal muscle

Table 1: A summary of potentially highly potent anti2019-nCoV drugs with predicted binding free energies (unit: kcal/mol) and corresponding trade names.

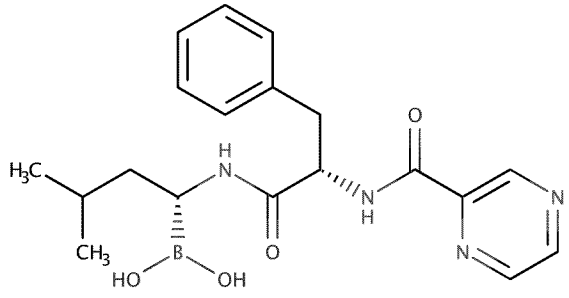
DrugID	Type	Trade Name	Predicted Binding Affinity
DB00188	Bortezomib	Velcade, Chemobort, Bortecad	-12.15
DB00690	Flurazepam	Dalmane, Dalmadorm, Fluzepam	-10.38
DB08901	Ponatinib	Iclusig	-10.25
DB00398	Sorafenib	Nexavar	-10.01
DB01254	Dasatinib	Sprycel, Dasanix	-9.87
DB01384	Paramethasone	Cortidene Depot, Dilar, Dilarmine	-9.71
DB00838	Clocortolone	Victrelis	-9.58
DB00301	Flucloxacillin	Flora, Flox, Floxapen	-9.57
DB06144	Sertindole	Serdolect and Serlect	-9.54
DB04920	Clevidipine	Cleviprex	-9.52
DB00673	Aprepitant	Emend	-9.49
DB01076	Atorvastatin	Lipitor, Sortis	-9.49
DB01594	Cinolazepam	Gerodorm	-9.47
DB00845	Clofazimine	Lamprene	-9.43
DB06717	Fosaprepitant	Emend, Ivemend	-9.39

relaxant properties. The third one, Ponatinib, an oral drug for the treatment of chronic myeloid leukemia and Philadelphia chromosome-positive acute lymphoblastic leukemia, which is a multi-targeted tyrosine kinase inhibitor. It is important to notice that this drug has the risk of life-threatening blood clots and severe narrowing of blood vessels. The next one is Sorafenib, a kinase inhibitor for the treatment of primary kidney cancer and liver cancer. The fifth drug, Dasatinib, is a therapy for treating certain cases of chronic myelogenous leukemia and acute lymphoblastic leukemia. The next one, Paramethasone, is a glucocorticoid with the general properties of corticosteroids. The seventh drug is Clocortolone, a topical steroid that is used in the form of an ester, clocortolone pivalate. It is interesting to note that this drug is always applied as a cream for the treatment of dermatitis. It is considered a medium-strength corticosteroid. Therefore, this drug might be used to clean 2019-nCoV contaminated materials, offering an extra layer of protection. The number eight drug, Flucloxacillin, is a narrow-spectrum beta-lactam antibiotic of the penicillin class. It is used to treat infections caused by susceptible Gram-positive bacteria. The next one, Sertindole, is an antipsychotic medication. The number ten drug, Clevidipine, is a dihydropyridine calcium channel blocker that used for the reduction of blood pressure when oral therapy is not feasible or not desirable. The eleventh drug, Aprepitant, is used to prevent chemotherapy-induced nausea and vomiting, as well as postoperative nausea and vomiting. The number twelve, Atorvastatin, is a statin drug used to prevent cardiovascular disease in those at high risk and treat abnormal lipid levels. The next drug is Cinolazepam, a benzodiazepine derivative. It possesses anxiolytic, anticonvulsant, sedative, and skeletal muscle relaxant properties. The number fourteen drug, Clofazimine, is used together with rifampicin and dapsone to treat leprosy. The fifteenth number drug, Fosaprepitant, is an antiemetic medication used in the prevention of acute and delayed nausea and vomiting associated with chemotherapy treatment.

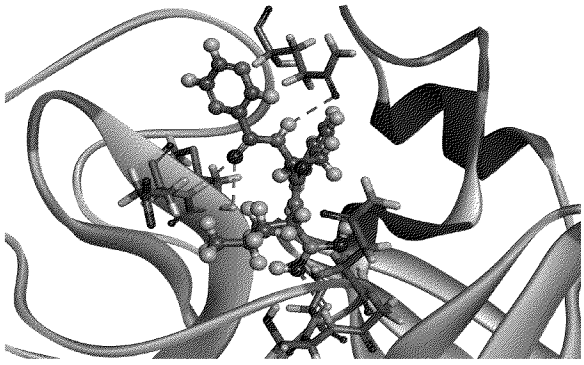
3 Discussion

3.1 The structural analysis of top 3 potent drug candidates

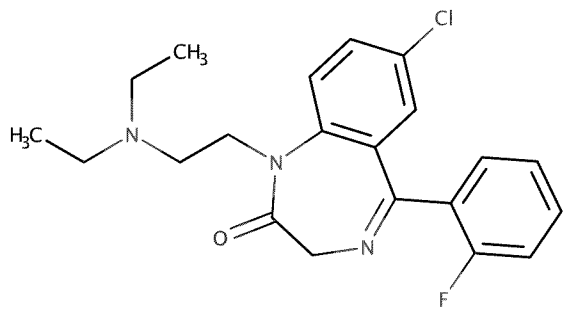
The top-ranking candidate of the existing drugs is Bortezomib (see Figure 3(b)). Its predicted binding affinity to the nCoV-2019 protease is -12.29 kcal/mol. The high binding affinity is due to the strong hydrogen bond network formed between the drug and the nCoV-2019 protease. For example, the strongest hydrogen



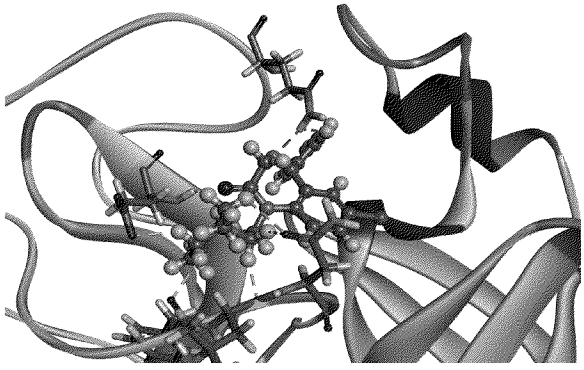
(a) Bortezomib, -12.15 kcal/mol



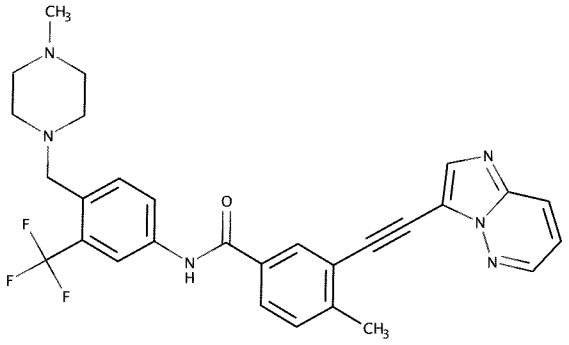
(b) 2019-nCoV protease and Bortezomib complex



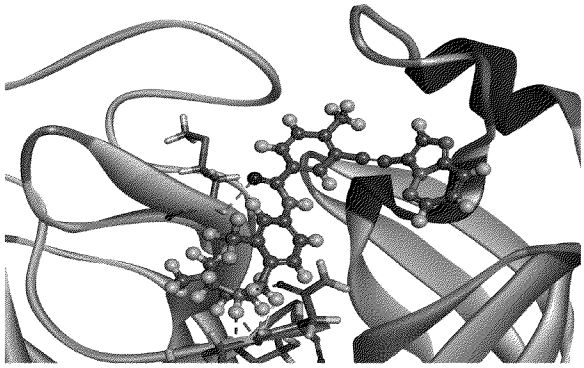
(c) Flurazepam, -10.38 kcal/mol



(d) 2019-nCoV protease and Flurazepam complex



(e) Ponatinib, -10.25 kcal/mol



(f) 2019-nCoV protease and Ponatinib complex

Figure 3: Bortezomib, Flurazepam, Ponatinib and their complexes with 2019-nCoV protease.

bonds are formed by two O atoms in two hydroxyls on the head of Bortezomib and three different aminos in the main chains of residues Gly143, Ser144, and Cys145 of nCoV-2019 protease. Therefore, the head bonds tightly with the side chains of the aforementioned residues. The other two important hydrogen bonds are located at the tail of the drug molecule. The first one is between the O atom in the Hydroxyl on the tail and the two H atoms in the amino acid of the main chain of Glu166 and the methyl of the main chain of Met165. The second one is the H atom in the amino on the tail and the O atom in the side chain of Gln189. As a result, the head, body, and tail of Bortezomib interact firmly with the protease binding site.

The second-best drug is Flurazepam (see Figure 3(d)) with a binding affinity of -10.37 kcal/mol. The strong hydrogen bonds between this molecule and the protease are formed by five different H atoms on the head of the drug with four different O atoms in the main chains of Phe140 , Leu141, as well as the side

chains of Asn142 and Glu166. Another important bond is formed by the H atom in the amino of the side chain of Gln189 with the F atom of the fluorobenzene and one N atom of the 1,4-diazepane in the drug. Additionally, the O atom in the drug adjacent to the 1,4-diazepane is bonded with the amino H atom of the side chain of Glu166. Therefore, the head, tail, and body of the molecule are firmly fixed to the binding site, which promises a strong binding to the 2019-nCoV protease.

The third one, Ponatinib (see Figure 3(f)), has a binding affinity -10.29 kcal/mol. The strong hydrogen bonds between this molecule and the protease are formed by two H atoms of the piperazine with the O atom in the side chain of Ser144 and the main chain of Leu141. Additionally, a bond exists between the O atom in the main chain of the drug and the H atom in the methyl of the main chain of Met165. These hydrogen bonds lead to a high binding affinity with 2019-nCoV protease.

The 3D complexes of 2019-nCoV protease and other 12 potential drugs are given in Supplementary Material.

3.2 Binding affinities of anti-virus protease drugs

It is interesting to analyze the predicted binding affinities of existing antiviral drugs developed as protease inhibitors. Their binding affinities are listed in Table 2. It is interesting to see that except for Boceprevir, which is a protease inhibitor used to treat hepatitis caused by the hepatitis C virus (HCV), the rest of protease inhibitors do not have a strong effect on 2019-nCoV. The predicted values by a recent study [24] are given in the parenthesis. It appears that these values are overestimated.

Table 2: A summary of predicted binding affinities (unit: kcal/mol) of antiviral protease inhibitors. Numbers in parenthesis are results from the literature [24].

DrugID	Predicted Binding Energy	DrugID	Predicted Binding Affinity
Boceprevir	-9.36	Atazanavir	-7.28 (-9.57)
Tipranavir	-8.87	Ritonavir	-7.19 (-8.47)
Fosamprenavir	-7.82	Lopinavir	-7.12
Saquinavir	-7.75	Darunavir	-7.05
Simeprevir	-7.52 (-8.29)	Nelfinavir	-6.74
Telaprevir	-7.50	Amprenavir	-6.73
Indinavir	-7.46		

4 Material and methods

Our deep learning-based drug repositioning models employ mathematical pose (MathPose) and mathematical deep learning (MathDL) to predict 3D poses and protein-ligand binding affinities. The latter is used as a major criterion for searching anti-2019-nCoV therapies from the existing FDA-approved drugs. We first build a 3D 2019-nCoV 3CL protease structure by using homology modeling. A set of SARS-CoV protease inhibitors are docked to the 3D 2019-nCoV 3CL protease structure using our MathPose. The resulting complexes are used as a set of machine learning training. Additionally, a set of protein-ligand complexes from the PDBBind database is collected as another machine learning training set. Our training accuracy in terms of the Pearson correlation coefficient is higher than 0.99 in all deep learning models.

4.1 3D 2019-nCoV protease structure

Homology modeling, a procedure that constructs an atomic-resolution model of a protein from its amino acid sequence and experimental 3D structure of the related homologous protein, i.e., the "template," is used to generate the 3D structure of 2019-nCoV 3CL protease. The SWISS model (https://swissmodel.expasy.org/) is employed with the protease structure of SARS-CoV (PDB ID: 2A5I [13]) as a template. The sequence identity between the 3CL proteases of SARS-CoV and 2019-nCoV is 96.08%.

4.2 SARS-CoV protease inhibitor dataset

ChEMBL [14], an open database that brings chemical, bioactivity, and genomic data together to translate genomic information into effective new drugs, is employed to construct our 2019-nCoV training set. Considering the high sequence identity between viral proteases of 2019-nCoV and SARS-CoV, we take the protease of SARS-CoV as the input target in ChEMBL and a total 115 ChEMBL IDs of the target can be found. The experimental ΔG values of 2019-nCoV 115 SARS-CoV protease inhibition compounds range from -10.0 kcal/mol to 7.5 kcal/mol. We exclude compounds with positive values, resulting in a total of 84 SARS-nCoV protease inhibition compounds for our machine learning training. A collection of these 84 compounds is given in the Supplementary Materials.

4.3 Binding affinity training set

The PDBbind database is a yearly updated collection of experimentally measured binding affinity data (Kd, Ki, and IC50) for the protein-ligand complexes deposited in the Protein Data Bank (PDB). The PDBbind general set, instead of the high-quality refined set, is chosen as our training set because of the FDA approved drugs involve a wide range of protein targets. In the current work, we use a set of 15,843 X-ray crystal structures of protein-ligand complexes and associated binding affinities from the PDBbind v2018 general set [15]. The information of these complexes is provided in the Supplementary Materials.

4.4 FDA approved drugs

DrugBank (www.drugbank.ca) is a richly annotated, freely accessible online database that integrates massive drug, drug target, drug action, and drug interaction information about FDA-approved drugs with the experimental drugs which are going through the FDA approval process [16]. Due to the high quality and sufficient information contained in, the DrugBank has become one of the most popular reference drug resources used all over the world. A total of 1553 FDA-approved drugs are contained in the DrugBank. However, in the present work, a number of FDA-approved drugs encountered difficulties in docking with the target molecule. Therefore, the MathPose successfully created 3D protein-ligand complex structures for 1465 FDA-approved drugs and 2019-nCoV protease.

4.5 MathDL

MathDL, designed for predicting various druggable properties of 3D molecules [23], is capable of efficiently and accurately encoding the high-dimensional biomolecular interactions into low-dimensional representations. Algebraic graph theory-based algorithms [25], differential geometry, and algebraic topology methods [23] are applied to generate three mathematical representations of data in MathDL. These data

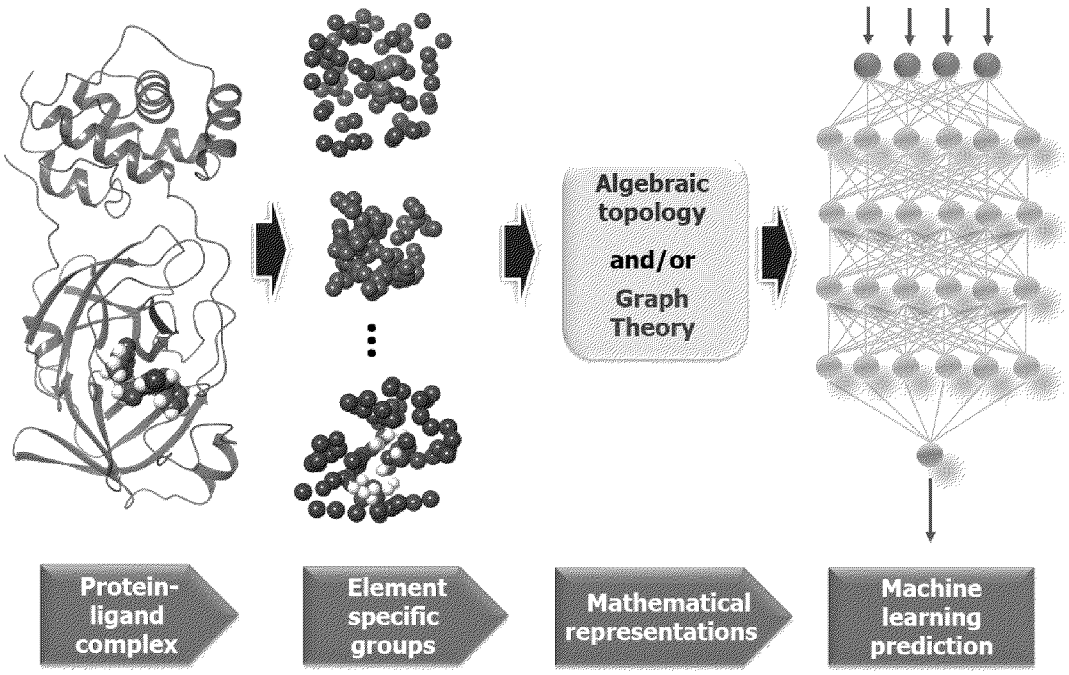


Figure 4: A framework of MathDL energy prediction model which integrates advanced mathematical representations with sophisticated CNN architectures

representations can be integrated with well-designed deep learning models, such as gradient-boosted trees (GBTs) and convolutional neural networks (CNNs), for pose ranking and binding affinity predictions. In D3R Grand Challenges (https://drugdesigndata.org/about/grand-challenge), a worldwide competition series in computer-aided drug design, MathDL had been proved as the top performer in free energy prediction and ranking [22, 23]. Figure 4 illustrates the framework of the MathDL model, which combined the aforementioned mathematical representations with the CNN architecture for druggable properties predictions. The PDBbind 2018 general set [15], along with the SARS 3CL protease related dataset is used in our training process. In this section, we briefly describe the algebraic topology representation used in the present work. Details can be found in the literature [23].

4.5.1 Algebraic topology-based representation

Even with a glimpse of topology, one can realize it dramatically simplifies geometric complexity [9, 17–20]. The study of topology reveals characterizes of different dimensions. As a type of algebraic topology, simplicial homology studies complexes on discrete datasets under various settings, such as the Vietoris-Rips (VR) complex, Čech complex or alpha complex, and identifies the topological invariants of a point-cloud dataset such as atomic coordinates in a protein [26]. Separated components, rings, and cavities can be classified for a given configuration and their numbers are referred to as Betti-0, Betti-1, and Betti-2, respectively. In this topological analysis process, the metrics or coordinates are fully abandoned. Instead, geometric and topological information is captured as data representation. Moreover, as a new development branch of algebraic topology, persistent homology which combines multiscale geometric information and topological invariants to achieve a geometry-enriched topological characteristic, e.g., barcodes. Therefore, the "birth" and "death" of separated components, circles, rings, voids or cavities can be indicated at all spatial scales by topological measurements. Key concepts are briefly shown as following.

In algebraic topology, simplices are the essential building blocks. Let $v_0, v_1, v_2, \cdots, v_k$ be $k+1$ affinely independent points. A (geometric) k-simplex σ^k is the linear combinations of these points in $\mathbb{R}^n$ ($n \geq k$),

whose coefficients are positive and satisfy that their summation equals to 1. For example, a 0, 1, 2, or 3-simplex is considered as a vertex, an edge, a triangle, or a tetrahedron, respectively. A simplicial complex K is a topological space composed of simplices which satisfies that every face of a simplex $\sigma_k \in K$ is also in K and the non-empty intersection of any two simplices is a face for both. To identify the homology group, a k-chain $[\sigma^k]$ is a summation $\sum_i \alpha_i \sigma_i^k$ of k-simplices σ_i^k, and the set of all k-chains of the simplicial complex K equipped with an algebraic field (typically, $\mathbb{Z}_2$) forms an abelian group $C_k(K, \mathbb{Z}_2)$. The homology defined on a series of abelian groups is used to analyze topological invariants which requires boundary operators to connect these chain spaces. The boundary operators $\partial_k : C_k \to C_{k-1}$ for a k-simplex $\sigma^k = \{v_0, v_1, v_2, \cdots, v_k\}$ are homomorphisms defined as $\partial_k \sigma^k = \sum_{i=0}^{k} (-1)^i \{v_0, v_1, \cdots, \hat{v_i}, \cdots, v_k\}$, where $\{v_0, v_1, \cdots, \hat{v_i}, \cdots, v_k\}$ is a $(k-1)$-simplex excluding v_i from the vertex set. Consequently, a important property of boundary operator, $\partial_{k-1}\partial_k = \emptyset$, follows from that boundaries are boundaryless. The algebraic construction to connect a sequence of complexes by boundary maps is called a chain complex

$$\cdots \xrightarrow{\partial_{i+1}} C_i(X) \xrightarrow{\partial_i} C_{i-1}(X) \xrightarrow{\partial_{i-1}} \cdots \xrightarrow{\partial_2} C_1(X) \xrightarrow{\partial_1} C_0(X) \xrightarrow{\partial_0} 0$$

and the kth homology group is the quotient group defined by

$$H_k = Z_k / B_k, \tag{1}$$

where the k-cycle group Z_k and the k-boundary group B_k are the subgroups of C_k defined as, $Z_k = \ker \partial_k = \{c \in C_k \mid \partial_k c = \emptyset\}$, $B_k = \text{im } \partial_{k+1} = \{\partial_{k+1} c \mid c \in C_{k+1}\}$. The aforementioned property implies $B_k \subseteq Z_k \subseteq C_k$. The Betti numbers are defined by the ranks of kth homology group H_k which counts k-dimensional holes, especially, $\beta_0 = \text{rank}(H_0)$ reflects the number of connected components, $\beta_1 = \text{rank}(H_1)$ reflects the number of loops, and $\beta_2 = \text{rank}(H_2)$ reveals the number of voids or cavities. Together, the set of Betti numbers $\{\beta_0, \beta_1, \beta_2, \cdots\}$ indicates the intrinsic topological property of a system.

Persistent homology [18] is devised to track the multiscale topological information over different scales along a filtration. A filtration of a topology space K is a nested sequence of subspaces $\{K^t\}_{t=0,\ldots,m}$ of K such that $\emptyset = K^0 \subseteq K^1 \subseteq K^2 \subseteq \cdots \subseteq K^m = K$. Moreover, on this complex sequence, we obtain a sequence of chain complexes by homomorphisms: $C_*(K^0) \to C_*(K^1) \to \cdots \to C_*(K^m)$ and a homology sequence: $H_*(K^0) \to H_*(K^1) \to \cdots \to H_*(K^m)$, correspondingly. The p-persistent kth homology group of K^t is defined as

$$H_k^{t,p} = Z_k^t / (B_k^{t+p} \bigcap Z_k^t), \tag{2}$$

where $B_k^{t+p} = \text{im}\partial_{k+1}(K^{t+p})$. Intuitively, this homology group records the homology classes of K^t that are persistent at least until K^{t+p}. Under the filtration process, the persistent homology barcodes can be generated. To make use of advanced deep learning algorithms, we vectorize persistent homology barcodes by dividing them into bins and calculating persistence, birth, and death incidents in each bin. Furthermore, the statistics of element-specific persistent homology barcodes are taken into consideration as well in fixed-length features.

4.6 MathPose

MathPose, a 3D pose predictor which converts SMILES strings into 3D poses with references of target molecules, was the top performer in D3R Grand Challenge 4 in predicting the poses of 24 beta-secretase 1 (BACE) binders [23]. For one SMILES string, around 1000 3D structures can be generated by a common docking software tool, i.e., GLIDE [27]. Moreover, a selected set of known complexes is re-docked by the three docking software packages mentioned above to generate at 100 decoy complexes per input ligand as a machine learning training set. The machine learning labels will be the calculated root mean squared deviations (RMSDs) between the decoy and native structures for this training set. Furthermore, MathDL models will be set up and applied to select the top-ranked pose for the given ligand. Additionally, the top poses will be fed into the MathDL for druggable proprieties evaluation.

5 Conclusion

The current pneumonia outbreak caused by a new coronavirus (CoV), called 2019-nCoV in China, has evolved into a global health emergency declared by the World Health Organization. Although there is no effective anti-viral medicine for the 2019-nCoV, the 3CL proteases of 2019-nCoV and SARS-CoV have a sequence identity of 96%, which provides a foundation for us to hypothesize that all potential anti-SARS-CoV chemotherapies are also effective anti-2019-CoV molecules. We build a three-dimensional (3D) 2019-nCoV 3CL protease structure using a SARS-CoV 3CL protease crystal structure as a template and collect a set of 84 SARS-CoV inhibition experimental data. The molecules of this set are docked to the 3D 2019-nCoV 3CL protease structure to form a machine learning training set. Additionally, the PDBbind 2018 general set of 15,843 protein-ligand complexes is also included as an additional machine learning training set. Using these training sets, we develop two deep learning models based on low-dimensional algebraic topology representations of macromolecular complexes. A total of 1465 FDA-approved drugs is evaluated by their binding affinities predicted by the consensus of two models built with 1) a combination of algebraic topology and deep convolutional neural networks (CNNs), and 2) a combination of algebraic topology and deep multitask CNNs. According to the predicted binding affinities, we recommend many FDA-approved drugs as potentially highly potent medications to 2019-nCoV, which serve as a crucial step for the development of anti-2019-nCoV drugs.

Supplementary Materials

Supplementary Materials are available online for 3D structure information and affinities of SARS-CoV inhibitors, FDA-approved drugs, and PDBbind data set.

(A brief summary in Chinese)

潜在的高效抗新冠状病毒药

运用分子生物学, 结构生物学, 药物设计原理, 扑拓学, 大数据, 以及深度学习, 从联邦食品及药物管理局已经批准的1465种药物中筛选出了以下潜在的高效抗新冠病毒药 (按照预测的药物与病毒剪切酶的结合能, i.e, predicted drug-2019-nCoV 3CL protease binding affinity, 由强到弱排列):

1. Bortezomib 万珂, 在台湾的正式商品名为萬科（原用途: 延缓、停止及治疗多发性骨髓瘤和被套细胞淋巴瘤恶化的情况, 属于标靶治疗的新型抗癌药. 潜在抗新冠病毒效果极强. 预测结合能: -12.2 kcal/mol）

2. Flurazepam 盐酸氟西泮（原用途: 抗焦虑药、镇痉剂、镇静剂及肌肉松弛剂. 预测结合能: -10.4 kcal/mol）

3. Ponatinib 普纳替尼（原用途: 白血病治疗药物. 预测结合能: -10.3 kcal/mol）

4. Sorafenib 蕾莎瓦（原用途: 治疗肾细胞癌及肝癌. 预测结合能: -10.0 kcal/mol）

5. Dasatinib 达沙替尼（原用途: 慢性粒细胞性白血病，费城染色体呈阳性的急性髓性白血病该药，前列腺癌等. 预测结合能: -9.9 kcal/mol）

6. Paramethasone 帕拉米松（原用途: 严重的细菌感染和严重的过敏性疾病、各种各种血小板减少性紫癜、粒细胞减少症、严重皮肤病、器官移植的免疫排斥反应、肿瘤的治疗及对糖皮质激素敏感的眼部炎症等. 预测结合能: -9.7 kcal/mol）

7. Clocortolone 氯可托龙（原用途: 各种皮肤病, 例如，湿疹，皮炎，过敏，皮疹. 预测结合能: -9.6 kcal/mol）

8. Flucloxacillin 氟氯西林（原用途: 半合成的耐青霉素酶的青霉素. 预测结合能: -9.6 kcal/mol）

9. Sertindole 舍吲哚（原用途: 非典型抗精神病药物. 预测结合能: -9.5 kcal/mol）

10. Clevidipine 氯维地平（原用途: 治疗高血压. 预测结合能: -9.5 kcal/mol）

11. Aprepitant 阿瑞吡坦胶囊（原用途:止吐. 预测结合能: -9.5 kcal/mol）

12. Atorvastatin 立普妥（原用途: 降低血液胆固醇水平的常见药物. 预测结合能: -9.5 kcal/mol）

13. Cinolazepam 西诺西泮（原用途: 抗焦虑镇静催眠药. 预测结合能: -9.5 kcal/mol）

14. Clofazimine 氯法齐（原用途: 治疗结核病 (TB)、麻风病和其它相关传染病的抗生素. 预测结合能: -9.4 kcal/mol）

15. Fosaprepitant 福沙匹坦（原用途: 一种肿瘤辅助用药. 预测结合能: -9.4 kcal/mol）

另外, 联邦食品及药物管理局已经批准的抗病毒剪切酶的药物中, 分析表明唯有 Boceprevir 博赛泼维（原用途:丙型肝炎蛋白酶抑制剂）可能有一定的效果 (排名18. 预测结合能: -9.3 kcal/mol). 顺便提一下, 以前传的抗艾滋病药, 洛匹那韦/利托那韦片 (Lopinavir/ Ritonavir), 排名很靠后 (预测结合能: -7.1/-7.2 kcal/mol). 达芦那韦 (Darunavir) 排名也很靠后 (预测结合能: -7.1 kcal/mol).

Subject: Fwd: Re: Confirmation of my predictions on the role of mast cells, histamine in COVID-19

COVID-19 severity is caused by an allergic reaction to the coronavirus involving mast cell degranulation and histamine release (elicitation). The development of this allergy (sensitization) was caused by vaccine components that are similar to coronavirus proteins.

Sharing with permission.

To: Lawrence Steinman <steiny@stanford.edu>
Subject: Confirmation of my predictions on the role of mast cells, histamine in COVID-19
ï¿½
Prof. Steinman,

Thought this may be of interest:

I have been predicting for 4 months now that mast cell stabilizers and antihistamines (like H1/H2 blockers) can help in COVID-19.

I described the details, connecting mast cells, histamine, COVID-19 and dengue in my article below (uploaded Apr 11'20):

Immunological mechanisms explaining the role of IgE, mast cells, histamine, elevating ferritin, IL-6, D-dimer, VEGF levels in COVID-19 and dengue, potential treatments such as mast cell stabilizers, antihistamines, Vitamin C, hydroxychloroquine, ivermectin and azithromycin
https://doi.org/10.5281/zenodo.3748303

As you may have read, famotidine (an antihistamine, H2 blocker) has been found to help in COVID-19, just like I predicted.

A large group of experts with expertise covering drug discovery, vaccines, pathology etc. recently (May 24'20 report) hypothesized and investigated numerous potential mechanisms involved in famotidine's beneficial effect in COVID-19. The study was funded by the "Department of Defense (DoD), Defense Threat Reduction Agency (DTRA), and the Joint Science and Technology Office (JSTO) of the Chemical and Biological Defense Program (CBDP) for funding under the Discovery of Medical countermeasures Against Novel Entities (DOMANE) initiative."

COVID-19: Famotidine, Histamine, Mast Cells, and Mechanisms
www.researchsquare.com/article/rs-30934/v1

They conclude: "We propose that the principal famotidine mechanism of action for COVID-19 involves on-target histamine receptor H2 activity, and that development of clinical COVID-19 involves dysfunctional mast cell activation and histamine release."

They write: " ... COVID-19 disease progression could share an immunologic basis with Dengue hemorrhagic fever" and

"This model is also supported by the significant overlap in the clinical signs and symptoms of the initial phase of COVID-19 disease and those of mast cell activation syndrome (MCAS) 89-92 as well similarities to Dengue hemorrhagic fever and shock syndrome (including T cell depletion) during the later phase of COVID-19"

"If COVID-19 is partially driven by dysfunctional mast cell degranulation, then a variety of medical interventions employing marketed drugs useful for treating mast cell-related disorders may help to reduce death and disease associated with SARS-CoV-2 infection. Examples include drugs with mast cell stabilizing activity, other histamine antagonists (for example H1 and H4 types), leukotriene antagonists and leukotriene receptor antagonists"

In other words, their findings are in perfect agreement with my prediction and analysis.

Thanks,
Vinu

Subject: about the publishingfee of mBio , ms. mBio02375-19

Dear all ;

I have already paid the membership fee of $90 , and saved the publishing fee for $900！(happy!haha...) I completed the payment of thepublishing.There were some problems logging into the U.S. website those days ,so delayed some time.

By the way,I have changed the invoice information (organization) of publishing fees. But I can't find the invoice about the membership fee. I need to change the organization.

Subject: Payment for your upcoming article in mBio , ms. mBio02375-19

Dear Dr. Pei-Yong Shi,

Your article, Zika virus NS2A-mediated virion assembly (Manuscript # mBio02375-19), is scheduled to be published in issue 6 of mBio.

To facilitate prompt publication of your article, please use this link to the Author Services system to do any of the following:

- Pay publication fees
- Pay additional fees (Open Access, supplemental materials, etc.)
- Order reprints or eprints

https://authorservices.cadmus.com/Shibboleth.sso/Login?entityID=https://login.asm.org/idp/shibboleth&target=/DRIPShopperWeb%2Foffer.do%3FarticleID%3D3087836%26emailAddress%3Dpeshi%40utmb.edu

You may pay by credit card, or purchase order. Doing so will create a printable invoice that you can include with your payment, or submit to your funding institution as a pro-forma invoice. The invoice you create will contain information about payment by credit card, bank wire, or check. You must use this system to create an accurate invoice for payment.

ASM Members receive substantial discounts on publication fees and when ordering reprints and eprints. If you are a current ASM member, these discounts are applied automatically when you log in. If you are just now joining or renewing, we must first receive your payment for the membership discounts to be available.

To join or renew your ASM membership, go to: www.asm.org/join.

If you experience problems with your fees or with the Author Services website, please email ASM.AuthorServicesSupport@cenveo.com.

Thank you,

ASM Reprint/Billing Account Manager.

Subject: Payment for your upcoming article in mBio , ms. mBio02375-19

Dear Dr. Pei-Yong Shi,

Your article, Zika virus NS2A-mediated virion assembly (Manuscript # mBio02375-19), is scheduled to be published in issue 6 of mBio.

To facilitate prompt publication of your article, please use this link to the Author Services system to do any of the following:

- Pay publication fees
- Pay additional fees (Open Access, supplemental materials, etc.)
- Order reprints or eprints

https://authorservices.cadmus.com/Shibboleth.sso/Login?entityID=https://login.asm.org/idp/shibboleth&target=/DRIPShopperWeb%2Foffer.do%3FarticleID%3D3087836%26emailAddress%3Dpeshi%40utmb.edu

You may pay by credit card, or purchase order. Doing so will create a printable invoice that you can include with your payment, or submit to your funding institution as a pro-forma invoice. The invoice you create will contain information about payment by credit card, bank wire, or check. You must use this system to create an accurate invoice for payment.

ASM Members receive substantial discounts on publication fees and when ordering reprints and eprints. If you are a current ASM member, these discounts are applied automatically when you log in. If you are just now joining or renewing, we must first receive your payment for the membership discounts to be available.

To join or renew your ASM membership, go to: www.asm.org/join.

If you experience problems with your fees or with the Author Services website, please email ASM.AuthorServicesSupport@cenveo.com.

Thank you,

ASM Reprint/Billing Account Manager.

Dear all ,How are you?

I need a writer's member name (should be a email) and password on ASM, because members can discount the page fee. I'm not one of the authors,so I can't get a discount even if I pay the membership fee. It's a little expensive(3300 dollars),Please see the picture below.

Subject: RE: Virtual U.S. China dialogue meeting October 13 and 14 - agenda with zoom links

Greetings,

Thank you for participating in the China bio dialogue sessions on Tuesday and Wednesday this week. We have scheduled a short hotwash session so the American participants can discuss the virtual dialogue discussions (from this week and earlier this year) and your get your ideas on future topics and other issues.

The session will take place tomorrow from 5:30-6:30 PM, Zoom link is below. Sorry for the short notice, if you can't make it tomorrow feel free to weigh in by email.

Topic: China Bio Post Dialogue Meeting Discussion
Time: Oct 16, 2020 5:30 PM ET / 4:30 PM CT / 2:30 PM PT
Meeting Link: https://nasem.zoom.us/j/92476126782?pwd= **552.136**
Password: **552.136**

PS I have asked CAS for the ppts from last night, will send those out as soon as I get them.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting October 13 and 14 - agenda with zoom links
Importance: High

Greetings,

We are looking forward to the two virtual bio dialogue sessions set to take place on Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT) next week. Like in previous sessions we expect that the Chinese expert participants will lead the discussion on the majority of the topics and that the format will be more of a discussion among the participants instead of a series of formal presentations. I have attached an agenda that includes the Zoom connection links for both days along with the U.S. participant list. If I get the Chinese participant list before the session I will send that out to you all.

Feel free to respond to this email with any thoughts, points of emphasis or issues that you would like to discuss among the U.S. group before the sessions. Also let me know if you have any questions or concerns.

Kind regards,

Ben

Subject: Virtual U.S. China dialogue meeting October 13 and 14
Importance: High

Greetings,

I hope you all had a good summer and are staying safe and healthy. The Chinese Academy of Sciences has agreed to hold another

(4th) virtual bio dialogue meeting with NASEM on **1) vaccine development and delivery** and **2) immunity, testing and diagnostics.** The agreed topics for the session are below. **We have reserved Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT**) to discuss the topics on the agenda.

We hope you are able to participate. Please let me know if you are available and if so save the dates and times on your calendar. We will get back to you with more information and a detailed agenda for the sessions soon.

Kind regards,

Ben

Benjamin Rusek
The U.S. National Academy of Sciences
1-202-334-3975

***

Vaccine development and delivery

Human

1) **Current status of CoVID-19 vaccine development in China and the U.S.**
2) **Chinse vaccination of military personnel and other Chinese populations**
3) **Vaccination of pediatric populations**
4) **Active surveillance strategies for monitoring adverse events observed after vaccination (as well as immunogenicity)**
5) **Adapting current vaccine platforms to novel mass vax strategies and other mass vaccination strategic issues**
6) **Progress on a universal influenza vaccines**
7) **Vaccine for enterovirus D68**

Animal

1) **Status of corona virus vaccination for animals - kinds of vaccine, efficacy, complications, etc**
2) **ASF in China and ASF vaccine progress**
3) **New swine coronavirus**
4) **Vaccination strategy for H5N1 avian influenza and domestic poultry**

Immunity, testing and diagnostics

1) **Correlates of immunity including the possibility of background immunity from circulating "common cold" coronaviruses**
2) **Chinese diagnostic testing strategies for testing large populations quickly**
3) **Antibody and antibody testing topics, importance of T-cell responses**
4) **Long-term sequela following COVID-19 infection—lung function, neurologic issues, others**

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

Benjamin Rusek

October Bio Dialogue Virtual Sessions

Session 1: Tuesday, October 13, 9-11 PM ET / 6-8 PM PT in U.S.
Wednesday, October 14, 9-11 AM in China

Session 1 Meeting Link: [HYPERLINK "https://nasem.zoom.us/j/92754903815?pwd=
Password: 552.136

552.136

Welcome and Introduction — Diane Griffin and George Gao

Overview of current status of CoVID-19 vaccine development in China — George Gao
Overview of current status of CoVID-19 vaccine development in the U.S. — Nancy Connell

Topic 1: Human vaccine development and delivery
Moderator: Diane Griffin

- Vaccination programs in China: How are vaccine programs for particular subpopulations being implemented?
  - Pediatric populations
  - First responders
  - Elderly population

- Post-vaccination surveillance and monitoring strategies
  - Immunogenicity
  - Monitoring Immunity
  - Vaccine-associated adverse events

- Adapting current vaccine platforms to novel mass vaccination: strategies and issues

- Progress on other vaccines
  - Universal influenza vaccines
  - Enterovirus D68

Topic 2: Animal vaccine development and delivery
Moderator: Linda Saif

- Status of corona virus vaccination for animals
  - Vaccine types
  - Efficacy
  - Complications and other issues?

- African Swine Fever: vaccine progress in China

- New "swine flu" (G4) in China

- H5N1 avian influenza and domestic poultry

Session 2: Wednesday October 14, 9-11 PM ET / 6-8 PM PT in U.S.
Thursday, October 15, 9-11 AM in China

Session 2 Meeting Link: [HYPERLINK "https://nasem.zoom.us/j/98420889232?pwd=552.136
Password: 552.136

Topic 1: Immunity
Moderator: Diane Griffin

- Correlates of immunity – biomarkers predicting susceptibility or progression to severe disease
- Background immunity from circulating "common cold" coronaviruses
- How long will immunity last?

Topic 2: Testing and diagnostics
Moderator: Peggy Hamburg

- Chinese testing strategies for rapid, frequent population-level testing
- Antibody testing
- Importance of T-cell responses
- Long-term sequelae following COVID-19 infection—lung function, neurologic issues, other issues

NASEM Participants

Dr. Ralph Baric, PhD, is a Professor in the Department of Epidemiology at the University of North Carolina's School of Public Health.

Dr. Nancy Connell, PhD, is a Professor at the Johns Hopkins Center for Health Security in Baltimore, MD

Dr. Peter Daszak, PhD, is currently president of EcoHealth Alliance, a nonprofit non-governmental organization that supports various programs on global health.

Dr. Victor Dzau, is the current President of the U.S. National Academy of Medicine in Washington, D.C.

Dr. David R. Franz, DVM, PhD, is currently retired, but served in the U.S. Army Medical Research and Materiel Command for 23 of 27 years on active duty and as Commander of the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID).

Dr. Harvey Fineberg, MD, is currently president of the Gordon and Betty Moore Foundation, immediately prior to which he was President of the Institute of Medicine (now the National Academy of Medicine).

Dr. Diane Griffin, PhD, is University Distinguished Service Professor and Alfred and Jill Sommer Chair of the W. Harry Feinstone Department of Molecular Microbiology and Immunology at Johns Hopkins Bloomberg School of Public Health and the current vice-president of the U.S. National Academy of Sciences.

Dr. Margaret (Peggy) Hamburg, MD, is an American physician and public health administrator. She served as the 21st Commissioner of the U.S. Food and Drug Administration from May 2009 to April 2015 and is currently Foreign Secretary for the U.S. National Academy of Medicine.

Dr. James Le Duc, PhD, is the director of the Galveston National Laboratory, one of the largest active biocontainment facilities on a U.S. academic campus.

Dr. Stanley Perlman, MD, PhD, is Professor of Microbiology and Immunology and of Pediatrics at the University of Iowa Health Care.

Dr. David Relman is a microbiologist and the Thomas C. and Joan M. Merigan Professor in Medicine and in Microbiology & Immunology at the Stanford University School of Medicine.

Dr. Linda J. Saif, PhD,[HYPERLINK "https://en.wikipedia.org/wiki/Linda_Saif" \l "cite_note-:0-3"] is Distinguished University Professor, [HYPERLINK "http://vet.osu.edu/preventive-medicine" \o "Preventive Medicine"], [HYPERLINK "http://www.oardc.ohio-state.edu/fahrp/" \t "_blank"], Ohio Agricultural Research and Development Center of the Ohio State University.

Dr. Pei Yong Shi, PhD, is I.H. Kempner Professor of Human Genetics, University of Texas Medical Branch, Galveston Texas.

Chinese Participants

George F. Gao, Director-General, Chinese Center for Disease Control and Prevention, Member of Chinese Academy of Sciences

Zhiming Yuan, Professor, Director of Wuhan P4 Lab, Wuhan Institute of Virology, Chinese Academy of Sciences

Zhigao Bu, Director, Harbin Veterinary Research Institute, Chinese Academy of Agricultural Sciences (To be confirmed)

Jianping Weng, Executive Director, Division of Life Sciences and Medicine, University of Science and Technology of China

Xian-En Zhang, Professor, Institute of Biophysics, Chinese Academy of Sciences

Jinhua Liu, Professor, China Agricultural University

Aihua Zheng, Professor, Institute of Zoology, Chinese Academy of Sciences

Xi Zhou, Professor, Wuhan Institute of Virology, Chinese Academy of Sciences

Hongping Wei, Professor, Wuhan Institute of Virology, Chinese Academy of Sciences

Dong Men, Professor, Wuhan Institute of Virology, Chinese Academy of Sciences

Daming Wang, Suzhou Institute of Biomedical Engineering and Technology, Chinese Academy of Sciences

Lianpan Dai, Associate Professor, Institute of Microbiology, Chinese Academy of Sciences

Yong Hu, Associate Professor, Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences

Subject: RE: Some bullets following our US-China dialogue discussion on Friday
3-month follow-up-JP Weng.pdf

Greetings,

Thanks again for participating in the China bio dialogue sessions last week. And thank you Peter and others who sent me feedback and thoughts on the future of the dialogue. Additional thoughts and comments are welcome.

Re next steps: The general plan is to try and hold another two night session in 2-3 months, when we have more information to share on vaccines, durability of immunity and the evaluation and uses of different types of tests. More discussion on the origin or "natural history" of the virus focused on preventing future outbreaks (since George Gao seems to be open to it) might be possible as well.

PS I have attached the ppt on learning from Covid patients from the dialogue.

Kind regards,

Ben

Subject: Some bullets following our US-China dialogue discussion on Friday
Importance: High

Thanks for a good discussion on Friday Ben,

I fully support a continued dialog and noted, as did some of those on the call, that George Gao and others were more open in their discussion of investigations into animal reservoirs of SARS-CoV-2 – i.e. discussion about the origin. We discussed ways we could frame a future topic that would allow us to talk about some important issues around the 'natural history' of SARS-CoV-2, that might also be comfortable for our Chinese colleagues. Here are a couple of bullets along the lines you asked me for:

1. Summary of recent findings re. the ability of SARS-CoV-2 to infect other species of animals in the lab, and in the wild, around the world (e.g. mink farm infections Europe and US, experimental infections of ferrets & raccoon dogs, risk assessments of SARS-CoV-2 infecting bats in other countries)

2. From the natural history of the virus, what do we know about the diversity of alpha and beta CoVs in wildlife reservoirs, and in potential intermediate hosts in various countries in Asia.

3. What information can we identify from the receptor binding domain of SARS-related CoVs that might help us predict future potential for emergence of CoVs from other countries

I think a good strategy would be to have the US side give the opening slide deck so that we sort of set the parameters and open up some of the discussion that I'm sure would lead to interesting information. I'd be happy to help on the first 2 points, and I'm sure Ralph could talk to the 3rd point. Linda and Stanley have a great deal of knowledge and could provide supporting comments…

Cheers,

Peter

Subject: RE: Virtual U.S. China dialogue meeting October 13 and 14 - agenda with zoom links

Greetings,

Thank you for participating in the China bio dialogue sessions on Tuesday and Wednesday this week. We have scheduled a short hotwash session so the American participants can discuss the virtual dialogue discussions (from this week and earlier this year) and your get your ideas on future topics and other issues.

The session will take place tomorrow from 5:30-6:30 PM, Zoom link is below. Sorry for the short notice, if you can't make it tomorrow feel free to weigh in by email.

Topic: China Bio Post Dialogue Meeting Discussion
Time: Oct 16, 2020 5:30 PM ET / 4:30 PM CT / 2:30 PM PT
Meeting Link: https://nasem.zoom.us/j/92476126782?pwd= **552.136**
Password: **552.136**

PS I have asked CAS for the ppts from last night, will send those out as soon as I get them.

Kind regards,

Ben

Greetings,

Thank you for joining the dialogue session last night. I have attached the slides from the three presentations.

FYI CAS has invited two additional CCDC experts to the session tonight.

Dr. Huaqing Wang, PI, Immunization program, Chinese Center for Disease Control and Prevention
Dr. Zundong Yin, Director of National Immunization Program, Chinese Center for Disease Control and Prevention

Looking forward seeing and hearing from you all in a few hours.

Importance: High

Greetings,

We are looking forward to the two virtual bio dialogue sessions set to take place on Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT) next week. Like in previous sessions we expect that the Chinese expert participants will lead the discussion on the majority of the topics and that the format will be more of a discussion among the participants instead of a series of formal presentations. I have attached an agenda that includes the Zoom connection links for both days along with the U.S. participant list. If I get the Chinese participant list before the session I will send that out to you all.

Feel free to respond to this email with any thoughts, points of emphasis or issues that you would like to discuss among the U.S. group before the sessions. Also let me know if you have any questions or concerns.

Kind regards,

Ben

Importance: High

Greetings,

I hope you all had a good summer and are staying safe and healthy. The Chinese Academy of Sciences has agreed to hold another (4th) virtual bio dialogue meeting with NASEM on **1) vaccine development and delivery** and **2) immunity, testing and diagnostics.** The agreed topics for the session are below. **We have reserved Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT**) to discuss the topics on the agenda.

We hope you are able to participate. Please let me know if you are available and if so save the dates and times on your calendar. We will get back to you with more information and a detailed agenda for the sessions soon.

Kind regards,

Ben

Benjamin Rusek
The U.S. National Academy of Sciences

***

Vaccine development and delivery

Human

1) **Current status of CoVID-19 vaccine development in China and the U.S.**
2) **Chinse vaccination of military personnel and other Chinese populations**
3) **Vaccination of pediatric populations**
4) **Active surveillance strategies for monitoring adverse events observed after vaccination (as well as immunogenicity)**

5) **Adapting current vaccine platforms to novel mass vax strategies and other mass vaccination strategic issues**
6) **Progress on a universal influenza vaccines**
7) **Vaccine for enterovirus D68**

Animal

1) **Status of corona virus vaccination for animals - kinds of vaccine, efficacy, complications, etc**
2) **ASF in China and ASF vaccine progress**
3) **New swine coronavirus**
4) **Vaccination strategy for H5N1 avian influenza and domestic poultry**

Immunity, testing and diagnostics

1) **Correlates of immunity including the possibility of background immunity from circulating "common cold" coronaviruses**
2) **Chinese diagnostic testing strategies for testing large populations quickly**
3) **Antibody and antibody testing topics, importance of T-cell responses**
4) **Long-term sequela following COVID-19 infection—lung function, neurologic issues, others**

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

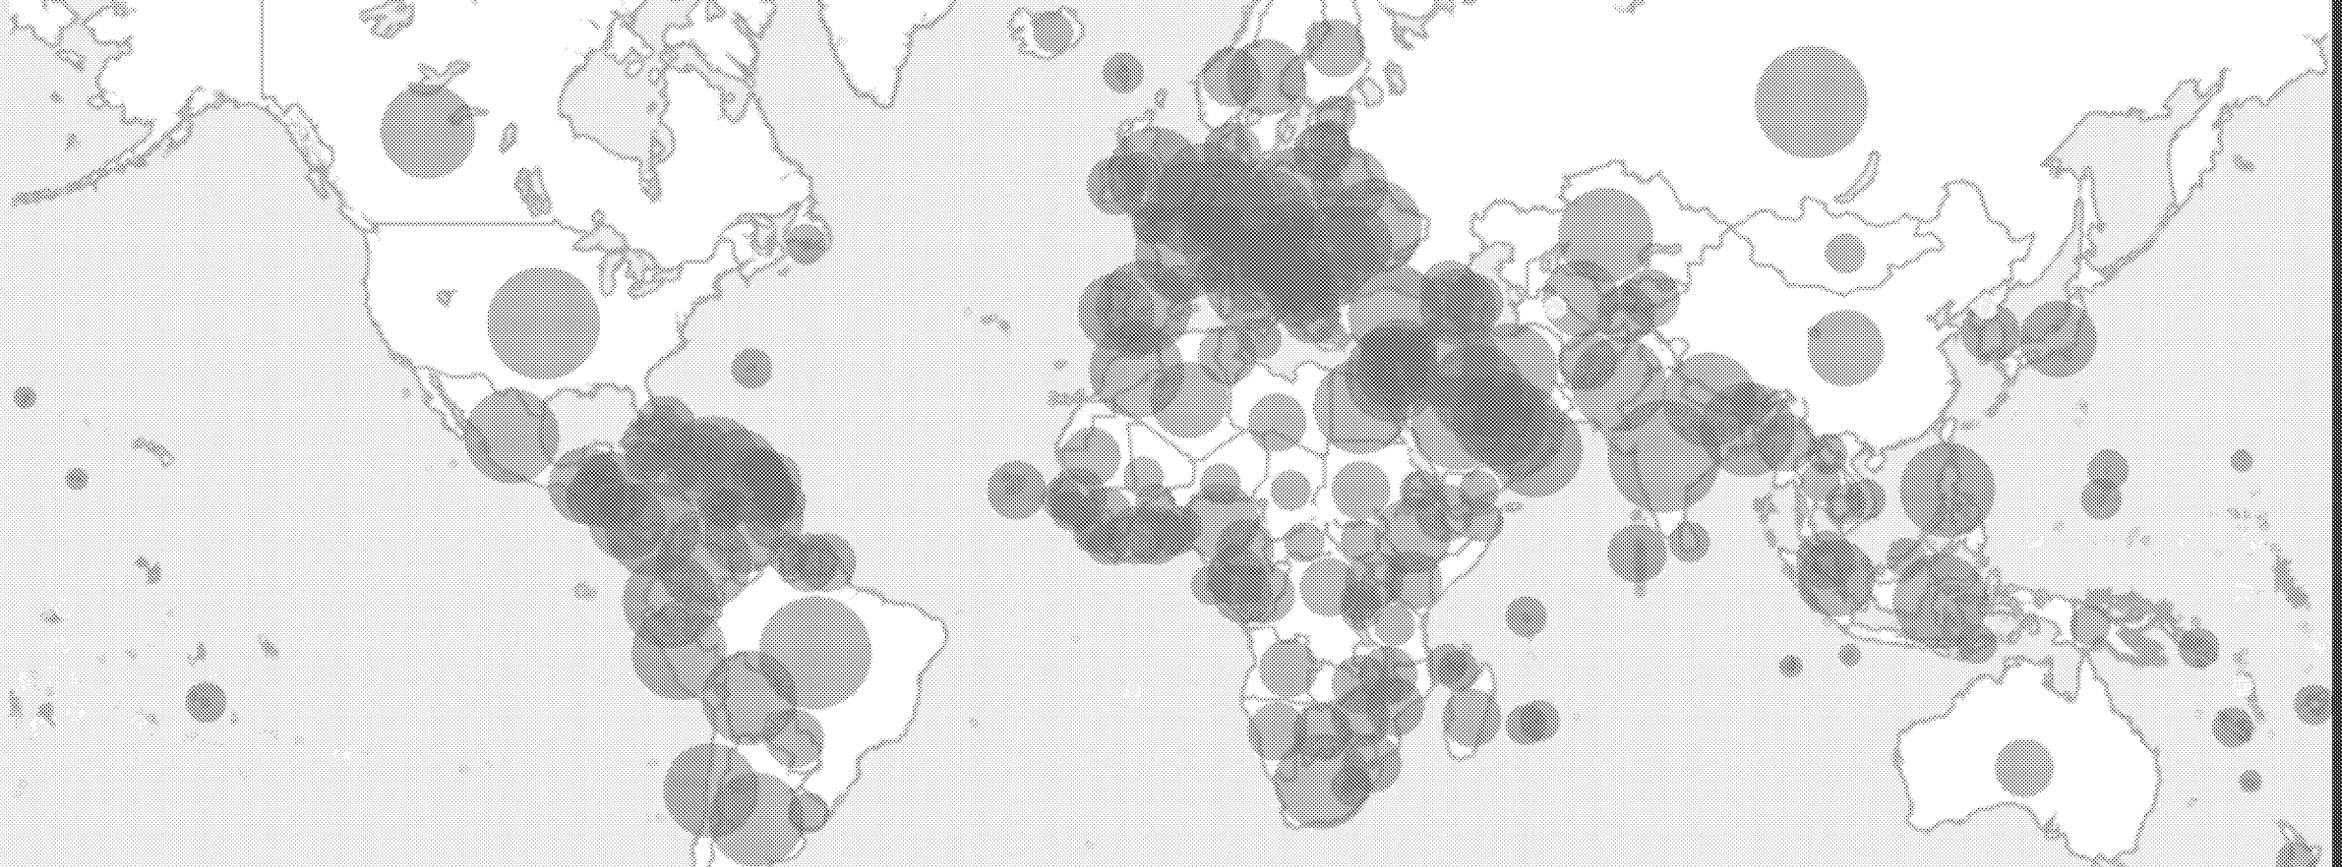
Learning from following up of COVID-19 patients

Jianping Weng October 15, 2020

中国科学技术大学
University of Science and Technology of China



COVID-19 global pandemic: a historical challenge

- Globally, as of 5:06pm CEST, 13 October 2020
- **37,704,153** confirmed cases
- Causing **1,079,029** deaths

1. https://covid19.who.int/ (accessed October 14, 2020)

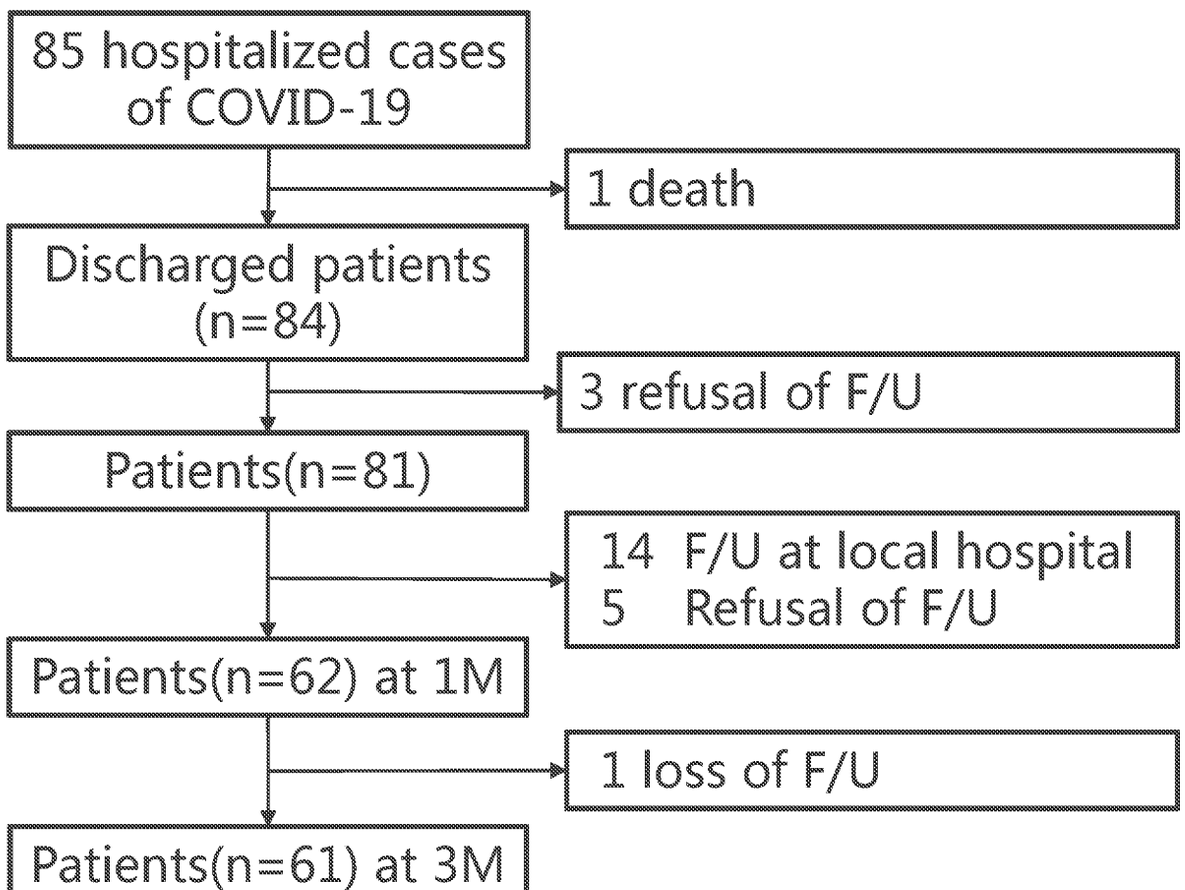
Epidemiology of COVID-19 among Infant and Children in China

- Pediatric cases accounted for approx. 1% of all cases (728/80,000, estimated via China CDC case series)
- Communicability of infection amongst children has been tracked and, as expected, infected children shed virus although, as noted above, they are frequently asymptomatic or only mildly symptomatic.
- Negative breast milk, Amniotic fluid, cord blood, and neonatal throat swab samples by RT-PCR from mothers with COVID-19 reported.
- Cases series of babies breastfed by mothers with overt COVID-19 – not infected

1. Dong Y, et al. Pediatrics. 2020 Jun;145(6):e20200702. 2. Chen H, et al. Lancet. 2020;395(10226):809–815.
3. Liu W, et al. J Hum Lact. In press. 4. Zhu H, et al. Transl Pediatr. 2020;9(1):51–60.
5. Bi Q, et al. Lancet Infect Dis. 2020;20(8):911–919.

Clinical follow-up of COIVD-19 patients after discharge

- A single-center, prospective observational follow-up study to characterize the outcomes in patients with COVID-19 at 1, 3 and 6 months after discharge
- Currently, analysis has finished with the 1- and 3-month data



Manuscript under review

At 3-month COVID-19 patients were not fully recovered

- Baseline characteristics: 58% male; median age 45 years, IQR(34-55) ; 11% had smoking history; 37% had chronic disorders;
- At 3-month (n=61)
  - 1 re-activated virus RT-PCR on D100
  - 38% symptoms persisted: dyspnea(18%), coughing(15%), fatigue(8%)
  - 54% CT scans abnormalities: GGOs (15%), fibrosis (5%)
  - pulmonary ventilating function & physical activity (6MWD) gradually recovering

Potentially more prompt recovery at 3-month compared to SARS

- Compared with SARS, COVID-19 appears to be associated with a prompter resolution on chest CT during the recovery phase.
- Our findings indicate potentially more prompt recovery of COVID-19 patients at 3M in 6MWD compared to those with SARS.
- Preferable to combine FEV1 with DLCO in identifying pulmonary function impairment with higher sensitivity
- No significant difference among the discharged survivors with different severity pneumonia regarding other pulmonary function measures

1. Ng CK, et al.. Thorax. 2004;59(10):889-891.
2. Hui DS, et al. Chest. 2005;128(4):2247-2261.
3. Mo X, et al. Eur Respir J. 2020:2001217.

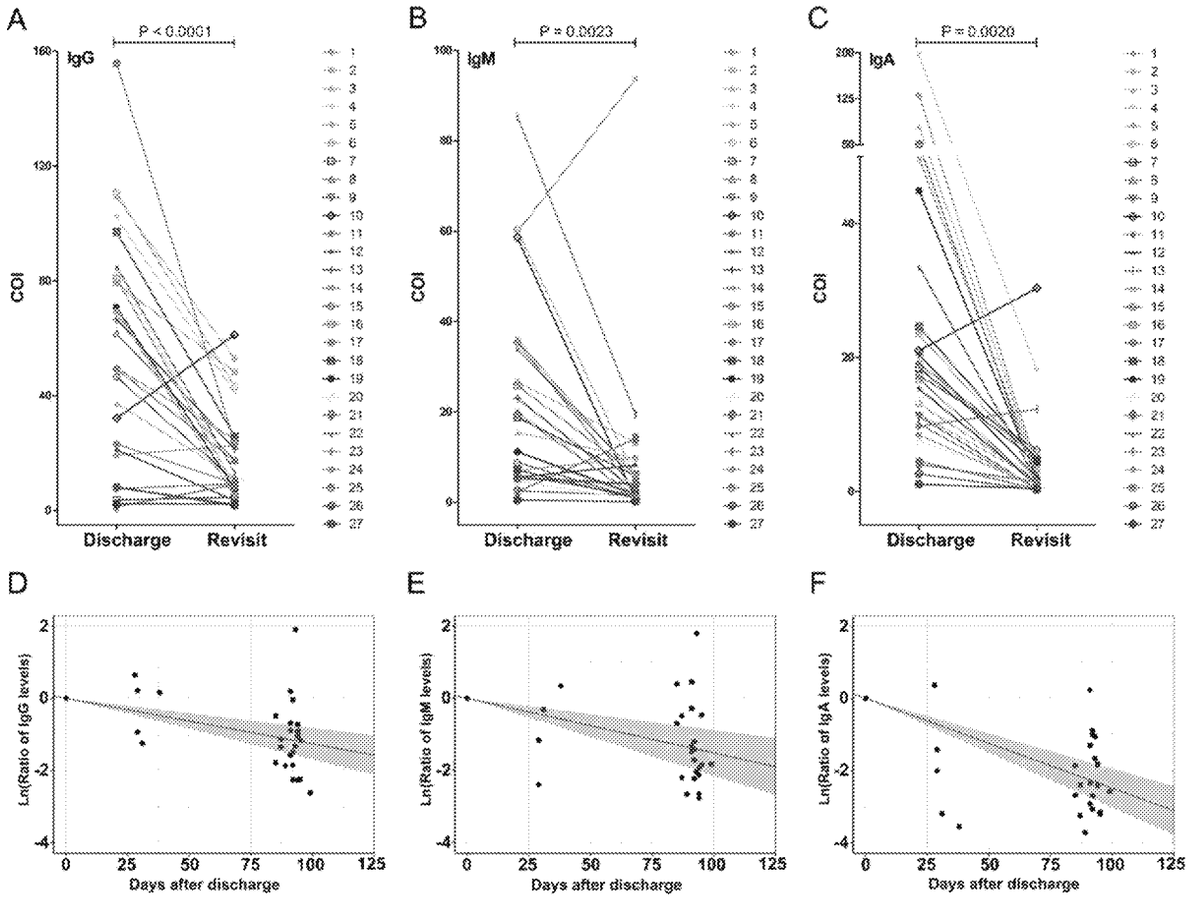
Serological study of COVID-19 patients after recovery

- Previous studies suggest that there is a significant reduction of neutralizing antibodies in the serum of COVID-19 patients in their early convalescent stage.
- Patients recovered from COVID-19 might not have protection against re-infection

1. Robbiani DF, et al. Nature. 2020 Aug;584(7821):437-442. doi: 10.1038/s41586-020-2456-9.
2. Long Q-X, et al. Nat Med. 2020 Aug;26(8):1200-1204. doi: 10.1038/s41591-020-0965-6.

Decline of SARS-CoV-2 specific antibodies in convalescent patients

- Serological study based on 27 patients followed-up after discharge
  - 100% IgG (COI 1.67-61.26) remains positive, 81.5% (COI 0.15-93.73) for IgM and 77.78% (COI 0.25-30.36) for IgA
  - Substantial decline of antibodies level at 3 months



1. Ma et al. Sci China Life Sci, 2020, doi: 10.1007/s11427-020-1805-0

Decline of SARS-CoV-2 specific antibodies in convalescent patients

- IgG antibody would become undetectable after discharge for 273 days
- IgM and IgA would be 150 and 108 days
- Our result suggests humoral immunity diminish in short period, losing the protection for the virus
- Together with previous studies, triggering strong cellular immune response and immune memory is the key for SARS-CoV-2 vaccine development.

Greetings,

Thank you for joining the dialogue session last night. I have attached the slides from the three presentations.

FYI CAS has invited two additional CCDC experts to the session tonight.

Dr. Huaqing Wang, PI, Immunization program, Chinese Center for Disease Control and Prevention
Dr. Zundong Yin, Director of National Immunization Program, Chinese Center for Disease Control and Prevention

Looking forward seeing and hearing from you all in a few hours.
Session 2: Wednesday October 14, **9-11 PM ET / 6-8 PM PT in U.S.**

Importance: High

Greetings,

We are looking forward to the two virtual bio dialogue sessions set to take place on Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT) next week. Like in previous sessions we expect that the Chinese expert participants will lead the discussion on the majority of the topics and that the format will be more of a discussion among the participants instead of a series of formal presentations. I have attached an agenda that includes the Zoom connection links for both days along with the U.S. participant list. If I get the Chinese participant list before the session I will send that out to you all.

Feel free to respond to this email with any thoughts, points of emphasis or issues that you would like to discuss among the U.S. group before the sessions. Also let me know if you have any questions or concerns.

Kind regards,

Ben

Greetings,

I hope you all had a good summer and are staying safe and healthy. The Chinese Academy of Sciences has agreed to hold another (4th) virtual bio dialogue meeting with NASEM on **1) vaccine development and delivery** and **2) immunity, testing and diagnostics.** The agreed topics for the session are below. **We have reserved Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT**) to discuss the topics on the agenda.

We hope you are able to participate. Please let me know if you are available and if so save the dates and times on your calendar. We will get back to you with more information and a detailed agenda for the sessions soon.

Kind regards,

Ben

***

Vaccine development and delivery

Human

1) **Current status of CoVID-19 vaccine development in China and the U.S.**
2) **Chinse vaccination of military personnel and other Chinese populations**
3) **Vaccination of pediatric populations**
4) **Active surveillance strategies for monitoring adverse events observed after vaccination (as well as immunogenicity)**
5) **Adapting current vaccine platforms to novel mass vax strategies and other mass vaccination strategic issues**
6) **Progress on a universal influenza vaccines**
7) **Vaccine for enterovirus D68**

Animal

1) **Status of corona virus vaccination for animals - kinds of vaccine, efficacy, complications, etc**
2) **ASF in China and ASF vaccine progress**
3) **New swine coronavirus**
4) **Vaccination strategy for H5N1 avian influenza and domestic poultry**

Immunity, testing and diagnostics

1) **Correlates of immunity including the possibility of background immunity from circulating "common cold" coronaviruses**
2) **Chinese diagnostic testing strategies for testing large populations quickly**
3) **Antibody and antibody testing topics, importance of T-cell responses**
4) **Long-term sequela following COVID-19 infection—lung function, neurologic issues, others**

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

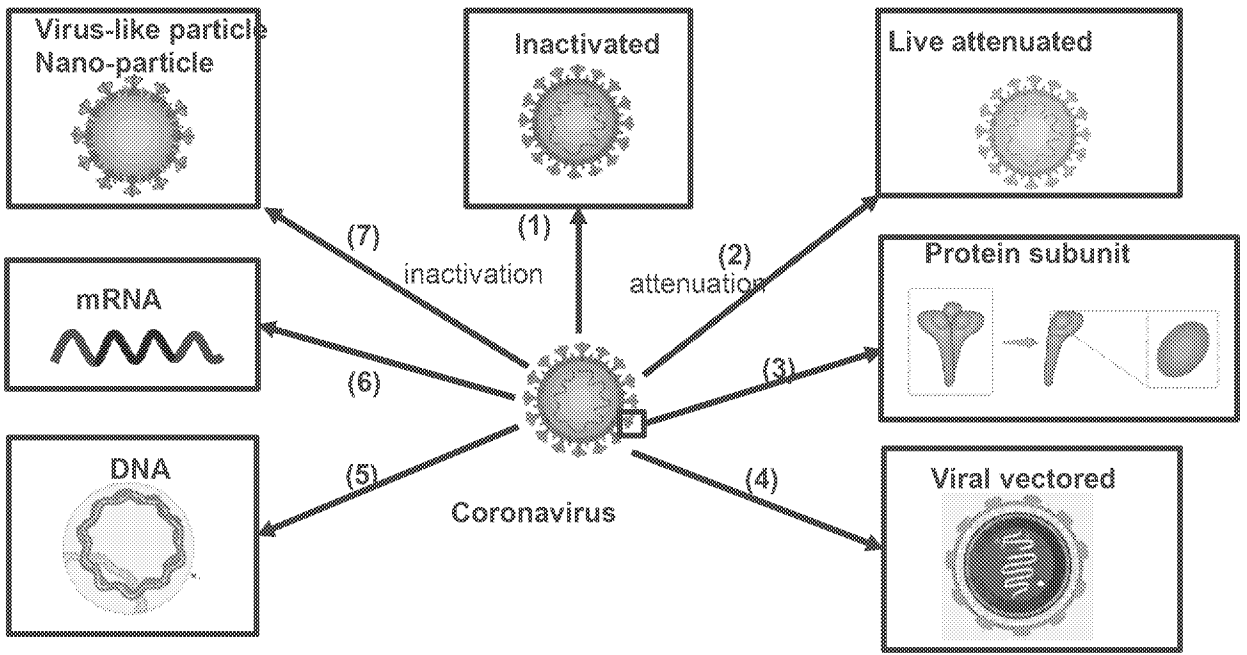
Vaccine development

Future hope

Major forms of coronavirus vaccine



全球新冠疫苗研发现况（截至2020年9月9日，全球有180种候选疫苗）

- 35种进入人体临床试验，9种进入临床Ⅲ期
  - 非复制病毒载体（4）：Ad5 、ChAdOx1、 Ad5+ Ad26、 Ad26
  - RNA（2）：mRNA-1273、mRNA-BNT162b
  - 灭活疫苗（3）：中生北京所、中生武汉所、科兴
  - DNA：INO-4800等
  - 蛋白亚单位：NVX CoV2373等
- 145种在临床前研究阶段，主要技术路线：
  - 蛋白亚单位（51）
  - 非复制病毒载体（19）
  - 复制型病毒载体（19）
  - RNA（17），DNA（12）
  - 病毒样颗粒（12），灭活（9）
  - 减毒（3）

Hot Spot：ChAdOx1腺病毒载体疫苗（AZD1222）

➢ 由牛津大学与阿斯利康合作开发

- 腺病毒载体疫苗
- 以复制缺陷型猿猴腺病毒为载体，包含SARS-CoV-2的全长结构表面糖蛋白（S蛋白）的腺病毒载体疫苗
- 该平台尚未用于已批准的疫苗，但已在针对其他病毒（包括埃博拉病毒）的实验性疫苗中进行了测试。

➢ 临床试验分期：Ⅲ期临床试验

- 美国、英国、巴西、南非
- 18-55岁健康成人

※阿斯利康与深圳康泰公司签署了技术转让的合作协议

Folegatti et al., (2020). Safety and immunogenicity of the ChAdOx1 nCoV-19 vaccine against SARS-CoV-2: a preliminary report of a phase 1/2, single-blind, randomised controlled trial. The Lancet, https://doi.org/10.1016/S0140-6736(20)31604-4

AZD1222因疑似不良反应暂停临床试验

- 9月8日，阿斯利康表示一个英国受试者出现一种无法解释的疾病
  - 该公司该疫苗在全球临床试验都暂停，旨在确保受试者安全，
- 9月10日，阿斯利康CEO Pascal Soriot 在电话会议中表示
  - 患上无法解释疾病的受试者是否为**横贯性脊髓炎**仍正在检查
  - 今年7月也曾发现一名疫苗接种者出现了神经系统症状，也一度暂停临床试验，后被诊断患有多发性硬化症，独立审查小组结论为**多发性硬化症**与疫苗接种无关

9月12日，英国恢复了阿斯利康牛津冠状病毒疫苗AZD1222的临床试验

AstraZeneca

阿 斯 利 康

Pascal Soriot 阿斯利康CEO

横贯性脊髓炎

- 脊髓局限性炎性病变过程，导致运动、感觉和自主神经功能障碍
  - 疼痛、肌肉无力、瘫痪、感觉问题或膀胱和肠道功能障碍
- 横贯性脊髓炎的确切病因不清楚
  - 一些影响脊髓的病毒、细菌和真菌感染可能导致横断性脊髓炎

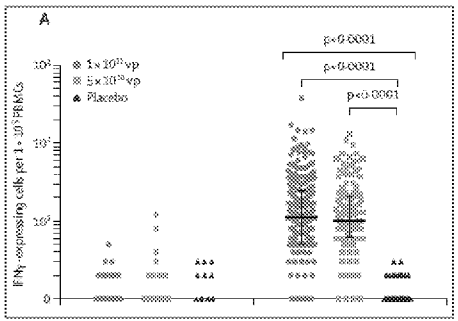
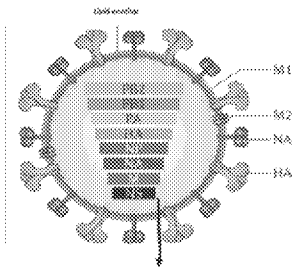
Currently under Phase III overseas multi-center clinical trials



Safety and immunogenic for both humoral and cellular responses

鼻喷流感载体新冠肺炎疫苗

- 由厦门大学、香港大学和北京万泰生物药业股份有限公司共同研发
- 核心技术是CA4-DelNS1，是将California/04/2009(H1N1)流感病毒株的NS1基因敲除后再经低温适应获得的减毒且温度敏感的双重减毒流感载体，缺失NS1可显著增强T细胞免疫应答
- 该疫苗是在CA4-DelNS1内插入新冠病毒RBD基因片段研制而成的活病毒载体疫苗，是目前已获准开展临床试验的新冠肺炎候选疫苗中唯一采用鼻腔喷雾接种方式的疫苗



DelNS1-nCoV-RBD-OPT1

1月27日启动研发　　8月27日获批临床　　9月1日启动一期临床[2]

鼻喷流感载体新冠肺炎疫苗

- 该疫苗在动物模型中呈现出对流感病毒和新冠病毒的双重保护效果：
  - ✓ 小鼠实验显示：对甲型H1N1流感病毒的致死性感染保护率为100%。
  - ✓ hACE2小鼠和仓鼠实验显示：攻毒对照组肺组织出现中至重度病理损伤且体重明显下降，疫苗免疫可明显减轻肺组织病理损伤，体重无明显下降。
- 该疫苗通过模拟呼吸道病毒天然感染途径激活局部和全身性免疫应答，在动物体内可诱导出较强的RBD特异性细胞应答，尤其以肺组织局部T细胞应答为突出特征，同时可检测到RBD特异性抗体应答，包括粘膜局部的IgA。
- 该疫苗于9月1日启动一期临床试验，已完成63名受试者接种，显示出良好安全性：
  - ✓ 正常年龄组 (18-59岁) 不良反应发生率为28.13% (9/32)，其中2级2人，1级7人。

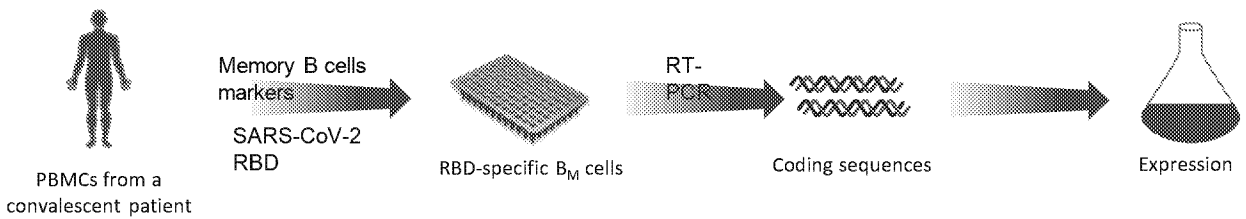
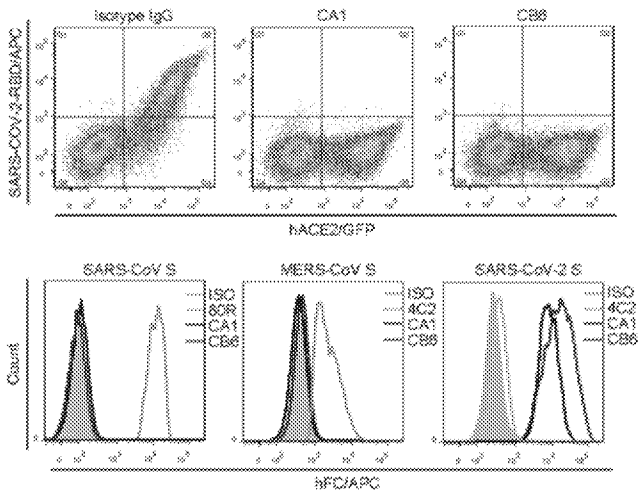
Isolation of RBD-specific memory B cells in a convalescent patient

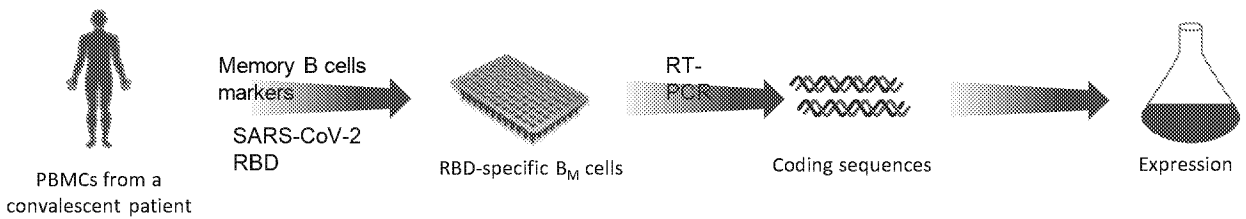


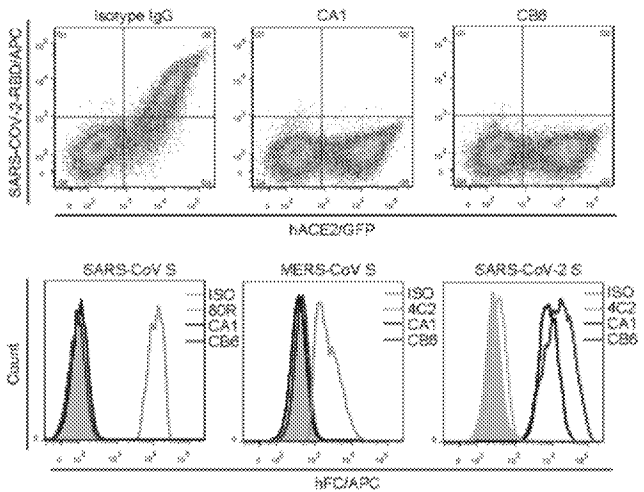


- Two mAbs-containing supernatant blocks the interaction between soluble COVID-19 virus RBD and 293T-hACE2 cells, respectively.
- Both CA1 and CB6 are specific to interact with COVID-19 virus S protein

Shi et al., 2020, Nature

Isolation of RBD-specific memory B cells in a convalescent patient



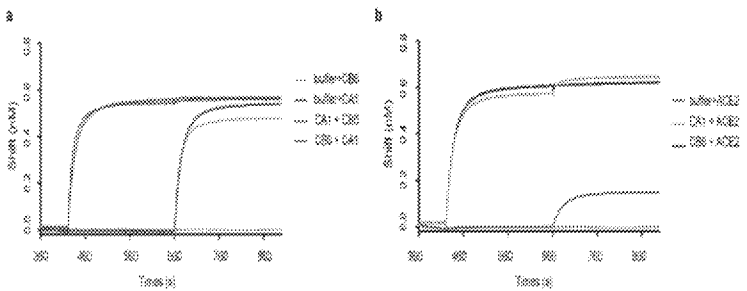


- Two mAbs-containing supernatant blocks the interaction between soluble COVID-19 virus RBD and 293T-hACE2 cells, respectively.
- Both CA1 and CB6 are specific to interact with COVID-19 virus S protein

Shi et al., 2020, Nature

Binding affinity between mAbs and RBD

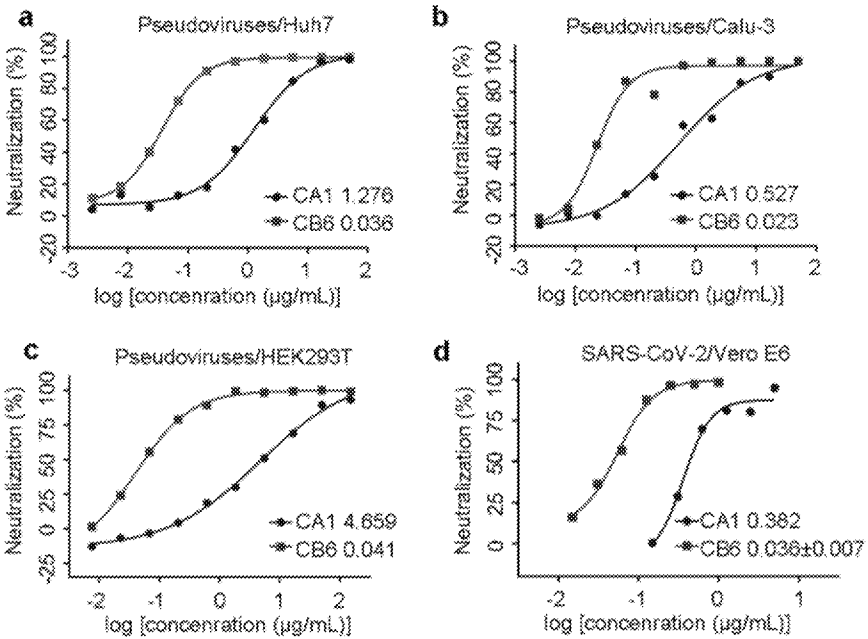
	ka (1/Ms)	kd (1/s)	K_D (M)
CA1/RBD	3.98E+06	1.16E-02	2.92E-09
CB6/RBD	8.95E+05	7.29E-04	0.82E-09
ACE2/RBD	3.82E+04	5.15E-03	133.3E-09



- The binding affinity between mAbs and RBD are stronger than that between the receptor and RBD
- CA1 and CB6 bind to the overlapped epitopes

Shi et al., 2020, Nature

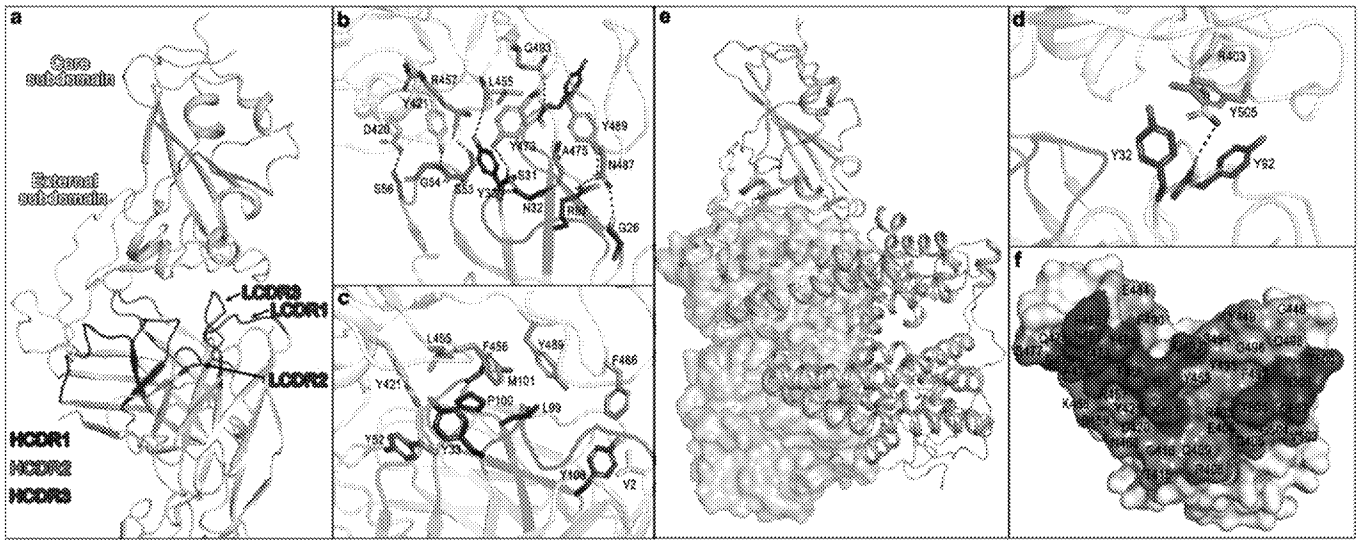
CB6 and CA1 can effectively neutralize COVID-19 virus



- CB6 and CA1 can effectively neutralize COVID-19 virus pseudovirus and live COVID-19 virus *in vitro*.

Shi et al., 2020, Nature

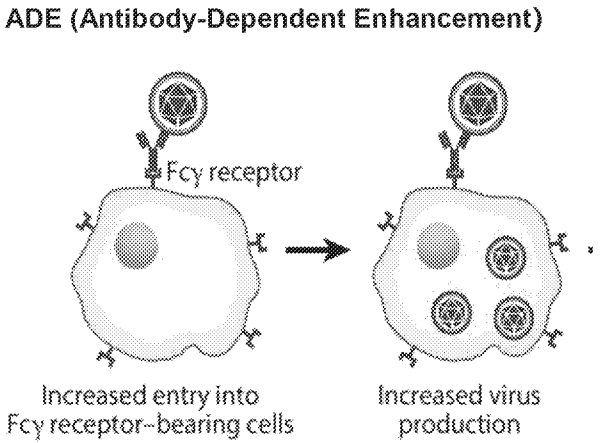
CB6 and CA1 can effectively neutralize COVID-19 virus

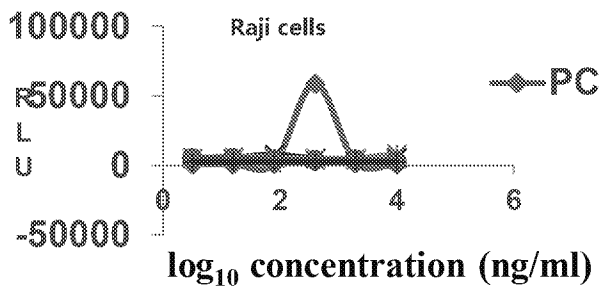


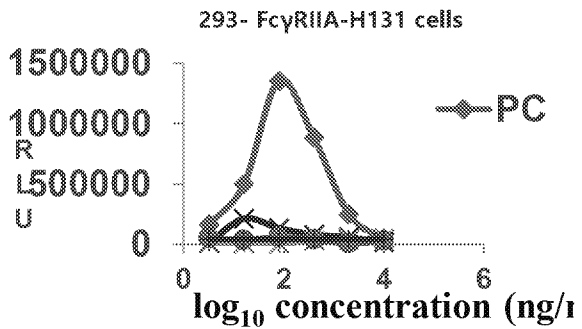
- CB6 competes with the receptor to interact with the same residues of COVID-19 virus RBD
- Both of CB6 heavy chain and light chain sterically hinder the interaction of COVID-19 virus RBD with hACE2

Shi et al., 2020, Nature

CB6-LALA to eliminate the potential ADE effect



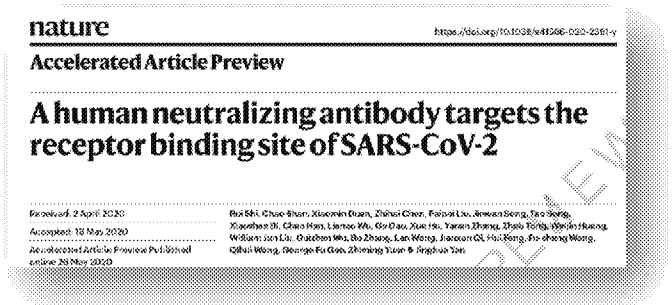


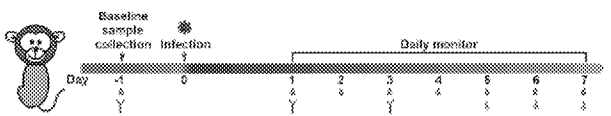


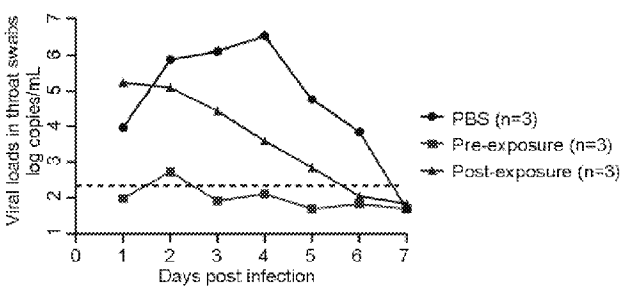
- No detectable ADE effect for CB6-LALA *in vitro*

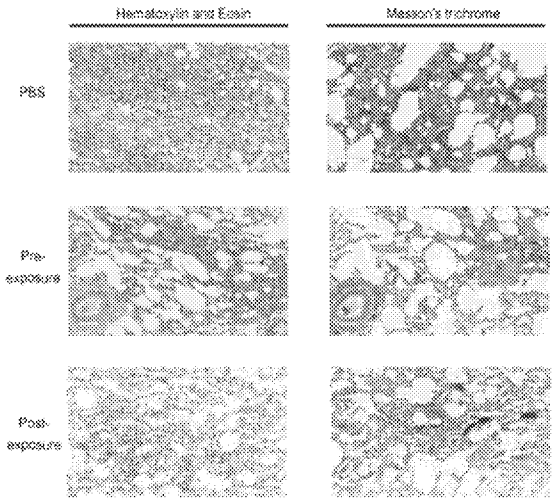
Unpublished data

CB6-LALA protects NHPs from COVID-19 virus infection





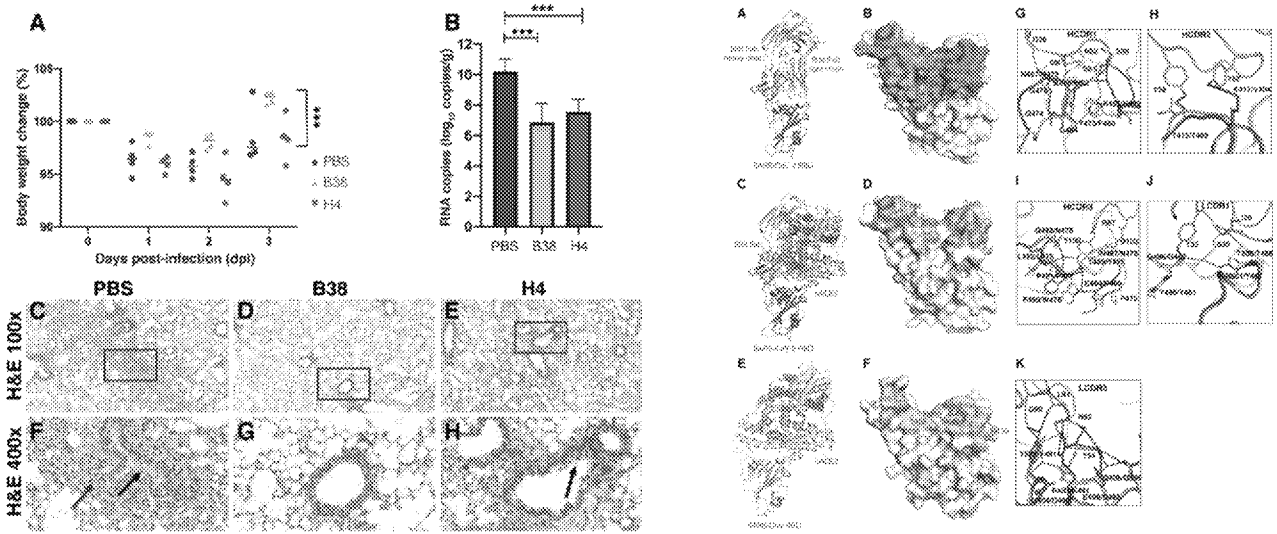




- CB6 decreased the viral loads in the throat swabs in NHPs at both prophylactic and treatment settings
- CB6 reduced the infection-related lung damage of challenged NHPs at both groups

Shi et al., 2020, Nature

Multiple neutralizing MAbs could prevent the escape mutations



- The protection efficiency of MAbs in hACE2 mice model post infection with COVID-19 virus
- Structural analysis of B38 and COVID-19 virus RBD complex and the epitope comparison between B38 and hACE2

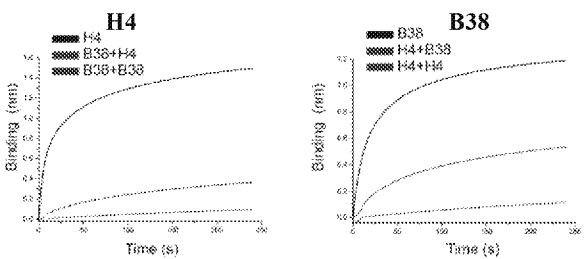
Wu et al., 2020, Science

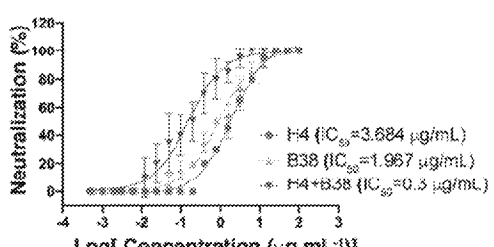
A pair of noncompeting human neutralizing MAbs against COVID-19 virus

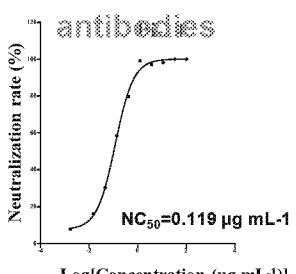
Science

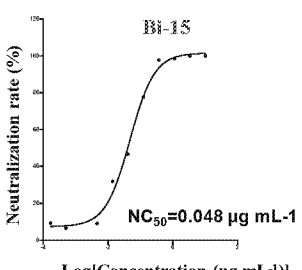
A noncompeting pair of human neutralizing antibodies block COVID-19 virus binding to its receptor ACE2

- H4 and B38, a pair of noncompeting human neutralizing MAbs, synergistically prevent COVID-19 virus infection
- The neutralizing activity of bispecific antibody Bi-15 against COVID-19 pseudovirus is **10 times stronger** than those of parental monoclonal antibodies









Wu et al., 2020, Science

Unpublished data

CB6 advanced into clinical trials in both China and America

- On 5 June 2020, CB6 was approved by the NMPA to enter Phase I clinical trials in China
- On 8 June 2020, CB6 was approved by the FDA to enter Phase I clinical trials in America

Name ▲	Target ▲	Format ▲	Status ▲	Developer/Reseacher ▲
REGN-COV2 (dual mAb cocktail)	SARS-CoV-2 S protein	mAb	Phase 1	Regeneron
LY-CoV555	SARS-CoV-2 S protein	mAb	Phase 1	AbCellera/Eli Lilly
JS016	SARS-CoV-2 S protein	mAb	Phase 1	Junshi Biosciences/Institute of Microbiology, Chinese Academy of Sciences/Eli Lilly
TY027	SARS-CoV-2 S protein	mAb	Phase 1	Tychan

Outstanding questions

- Correlations of neutralizing MAbs with protection
- Reach of neutralizing MAbs to lung
- Lasting time of neutralizing MAbs in vivo
- Antibody-dependent enhancement (ADE) effect
- Best Immunization programs and the pro and con of all the vaccines
- Stratified/prioritized vaccination program

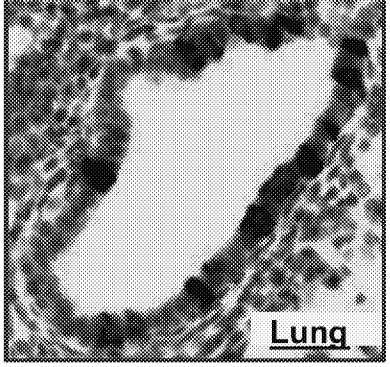
- **Endemic--Encephalomyelitis**
  - Beta-CoV- HEV
- **Epidemic-- Diarrhea** (Naïve population, no immunity)
  - Alpha-CoV- SADS
  - Delta-CoV- PDCoV

Bovine and most human CoVs belong to the *betacoronavirus* genus; most swine CoVs belong to the *alphacoronavirus* genus

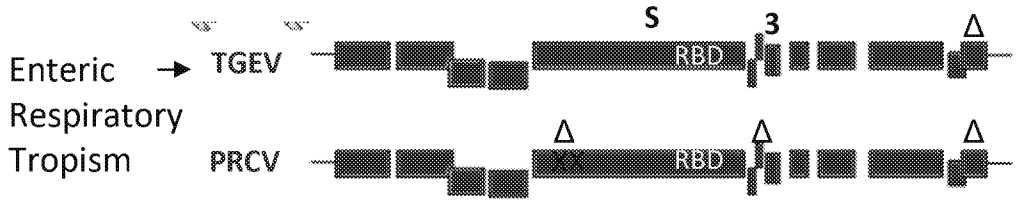
Questions Addressed:
SARS-CoV-2 and Porcine and Bovine CoVs

- How does SARS-CoV-2 cause disease compared with a porcine and bovine respiratory CoV?
- What are the unknowns/gaps for SARS-CoV-2 vaccines and lessons learned based on porcine and bovine CoV vaccines?

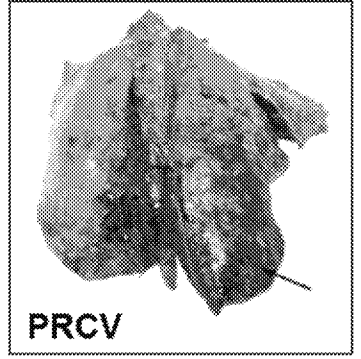
  -- What are the correlates of protection?
  -- What are the lessons for immunity from similar next Gen platform swine experimental CoV vaccines?
  -- What are the correlates of immunity based on immunity to bovine respiratory CoV infections?



Porcine respiratory CoV (PRCV) mutant of TGEV



XX S 681nt Δ
-Loss SA binding
ORF 3 Δ
-Nonfunctional



- TGEV causes fatal diarrhea in baby pigs
- PRCV--S gene deletion mutant of TGEV (621 – 682 bp, N-terminus) emerged in 1980s
- TGEV and PRCV share APN receptor; tissue tropisms differ due to loss of SA binding (gut mucins) by PRCV Spike *(Schultze et al 1996)*
- Lost of enteric tropism and virulence

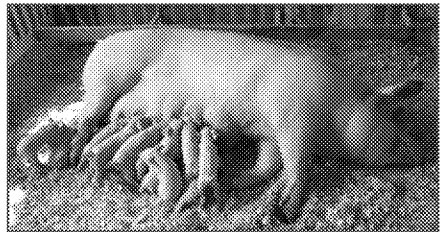
Similarities to SARS CoV-2 respiratory infections

- PRCV infects epithelial cells of upper/lower respiratory tract and type I and 2 pneumoctyes *(Jung/Saif et al 2007 JVI)*
- Most infections mild or subclinical— walking pneumonia like > 50% asymptomatic COVID-19 cases *(Long, QX et al 2020 Nat Med)*
- Atypical pneumonia in most pigs resembles SARS-CoV-2 lesions *(Saif, Jung, 2020 JCM)*: ***PRCV as a BSL2 respiratory CoV model for COVID-19***

Lessons from Swine Coronavirus Veterinary Vaccines

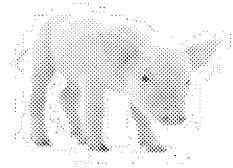
Swine Enteric/Respiratory Coronaviruses: TGEV/PRCV

- Only 2-3X attenuated oral enteric CoV vaccine induced gut/milk IgA Abs: Correlate of immune protection *(Chatta, Roth, Saif 2015 ARAB; Langel/Saif et al 2020 Pathogens)*
  - *GALT-Mammary gland SIgA axis*



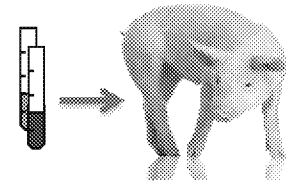
Mother

Gut IgA Ab- Immunity against CoV



Suckling piglet

Milk IgA Abs-Passive immunity



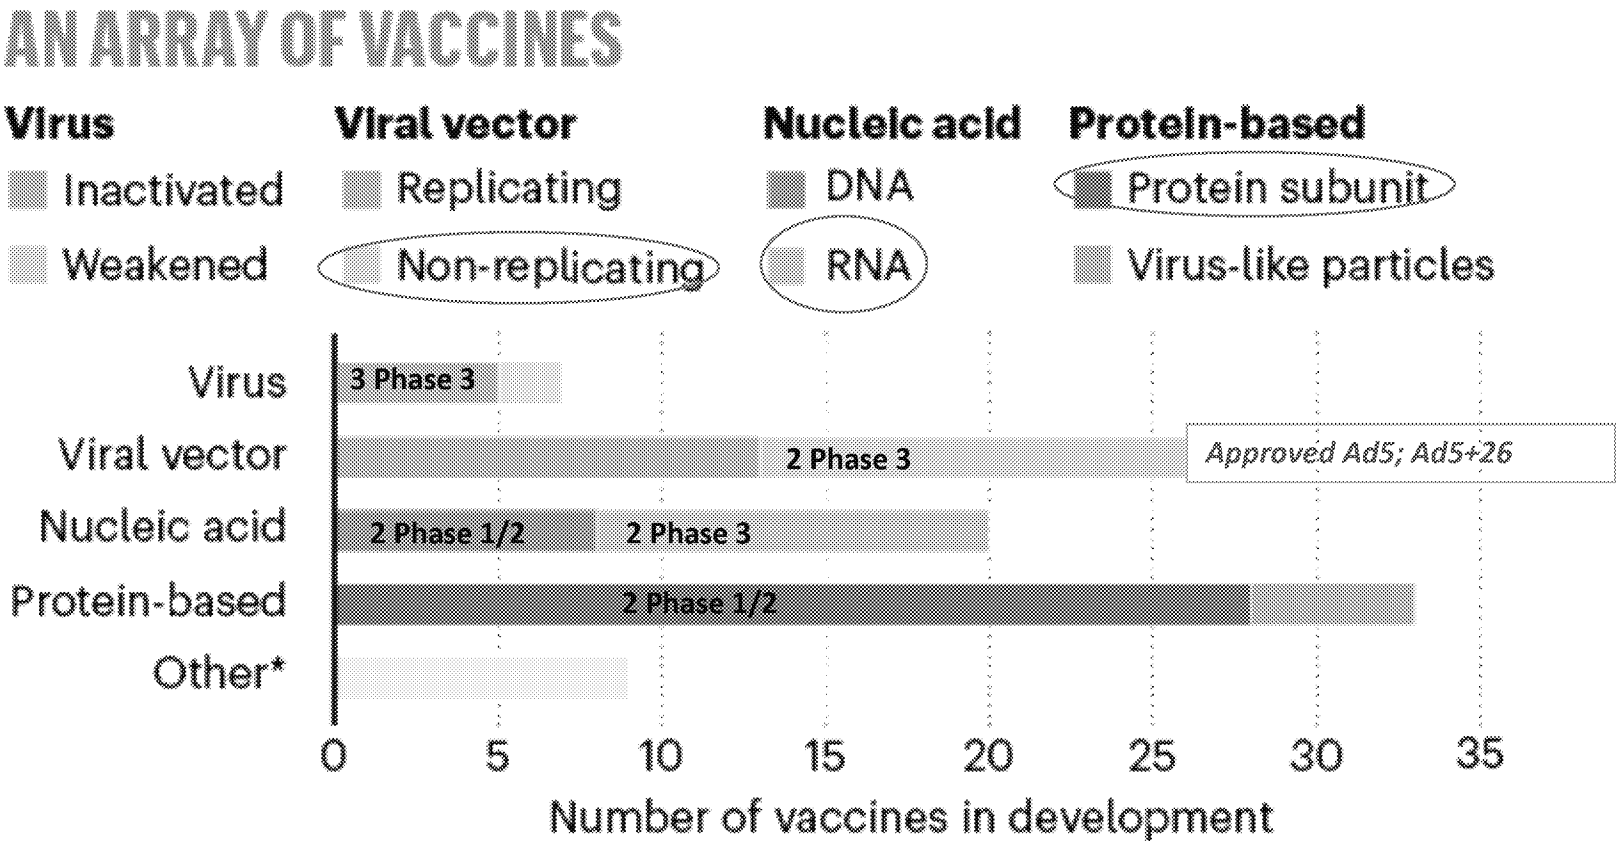
Weaned piglet

Gut IgA Ab-Active immunity: Prevent disease and infection

- Repeated PRCV infections induce IgA Abs and immunity to TGEV *(Sestak/Saif et al 1996 AJVR)*
  - *BALT-Mammary gland SIgA axis*

PRCV as naturally occurring TGEV vaccine

COVID-19 Vaccines



* Other efforts include testing whether existing vaccines against poliovirus or tuberculosis could help to fight SARS-CoV-2 by eliciting a general immune response (rather than specific adaptive immunity), or whether certain immune cells could be genetically modified to target the virus.

(Modified E Callaway Nature 30 April 2020)

Lessons from Molecular Vaccines for Swine CoVs

➢ Molecular next Gen vaccines have advantages (if safe & effective)

-- Provide a platform for rapid production of vaccines for new emerging diseases

-- Backbone constructs to insert key antigens for new viruses with established manufacturing

Will these unproven vaccines be effective to prevent disease and shedding (transmission)?

Recombinant vector vaccines:

PRCV respiratory vaccine

— Recominant experimental human adenovirus (Ad)+PRCV S1

Enteric CoV vaccines — PEDV

— PEDV -Recominant experimental human Ad5+PEDV S1

— PEDV- iPEDV+ (PED RNA)vaccine—Viral Replicon Particle (VRP)= VEEV based replicon vaccine encoding PEDV S replicon RNA

- Non-replicating single cycle RNA in DCs

Recombinant Vector Vaccines: rAd vaccines for porcine CoVs

Antigen/ Vector	Route (dose)	Challenge Inoculum	VN Ab Serum	Protection against Morbidity	Protection against Infection
PRCV respir.			*(Callebaut et al, J Gen Virol 1996;4-wk-old pigs)*		
H Ad5 /S_{A+D} (1220aa) (A+)	**Oronasal 1x**	**PRCV**	**Yes (low)**	**NT**	**Partial (shorter)**
H Ad5 Control	**Oronasal 1x**	**PRCV**	**No**	**NT**	**None**
PEDV enteric			*(Crawford et al, Virus Res 2016; 8 and 20-wk-old pigs)*		
H Ad5/S1 PEDV	**IN 1X**	**PEDV**	**(PreC) No (Post) Yes (3x)**	**Partial**	**No**
Control	**--**	**PEDV**	**No Yes**	**No**	**No**

The human Adeno-S vaccine 1x elicited only partial respiratory immunity to PRCV and marginal enteric immunity to PEDV: multiple doses needed?

Lessons from Molecular Vaccines for Swine CoVs

Recombinant vector/virus and subunit vaccines:

Enteric CoV vaccines — TGEV and PEDV

- TGEV -S recombinant vaccine—ineffective in naïve pigs, but effective as booster vaccine after 1x oral attenuated vaccine *(Shoup/Saif et al, 1997; Park/Saif et al,1998)*

- PEDV -PED RNA (iPEDV+) vaccine—Viral Replicon Particle (VRP) VEEV+ PEDV S replicon RNA
  - 1-3X IM doses in pregnant sows showed low efficacy (only 14-22% less mortality vs controls) in piglet protection in manufacturer's studies *(Crawford et al 2016)* and only 3% less in an independent study *(Greiner et al 2015)*
  - Low milk VN Ab titers (50%+,<80) vs milk (100%,>320) of wt PEDV orally inoculated sows *(Sherba et al 2016)*

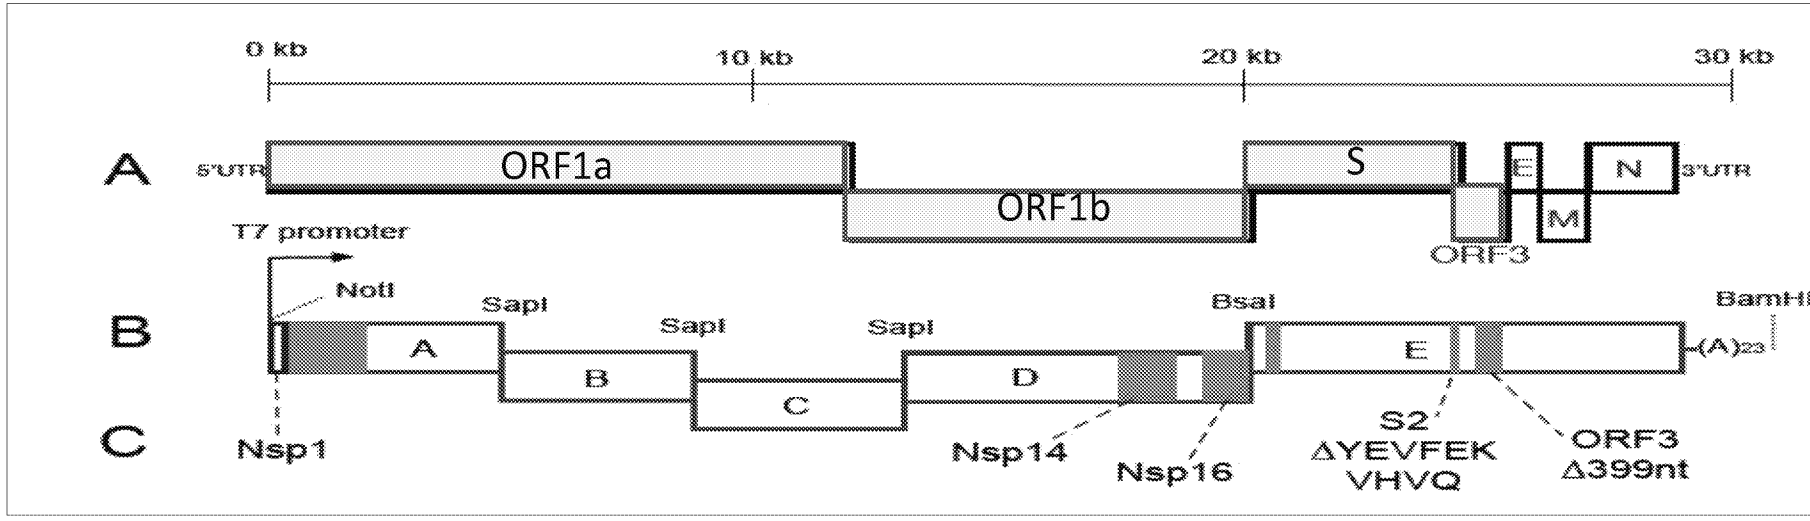
- PEDV -Recominant live attenuated virus vaccine developed by introduction of attenuating mutations into infectious clone (Lead PI: Dr Q. Wang, OSU)

Strategy to generate safe attenuated CoV vaccines using iclones

PEDV

- Target genes that encode innate immune response modulators (nsp1,nsp16) and virus replication (nsp14), non-essential sequences of S protein and the accessory gene ORF3

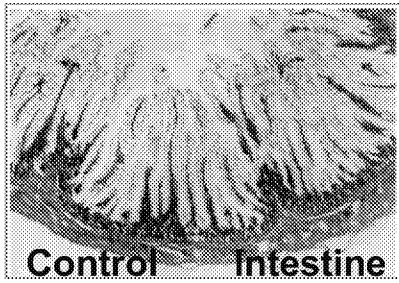
- Introduce at least 2 distinct mutations into separate genes that attenuate the virus to increase genetic stability



(Hou Y, Ke H, Kim J, Yoo D, Su Y, Boley P, Saif LJ, Wang Q. 2019. J Virol)

Saif ©

Three Clinical Syndromes Occur for Bovine Beta-CoV A Infections



Enteric Infections

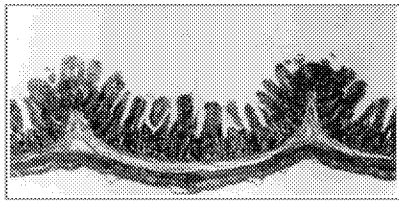
Calf diarrhea

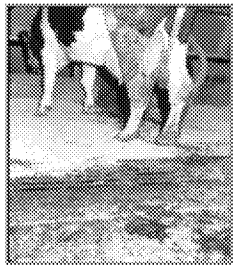
- Diarrhea, dehydration
- Intestinal villous atrophy

Age Groups/Vaccines

Birth to 4 wks of age

IM inact or atten virus vaccine in pregnant cow



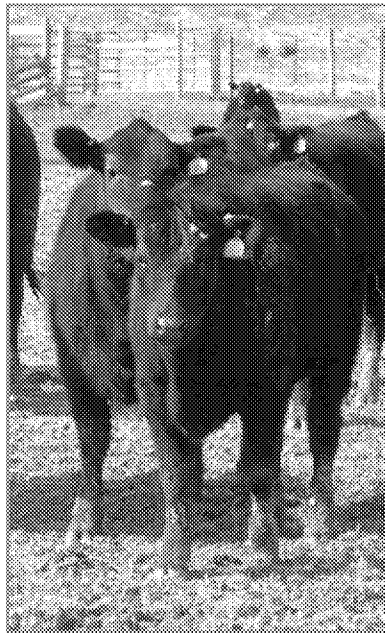


Winter dysentery

- Bloody diarrhea ± upper respiratory infection
- Intestinal villous atrophy

Adults, but not calves

No Vaccine



Respiratory Infections

Calf respiratory disease

Bovine respiratory disease complex (Shipping Fever)

•Cough, nasal discharge, pneumonia

2 wks to 6 months

6-9-mo-old feedlot cattle

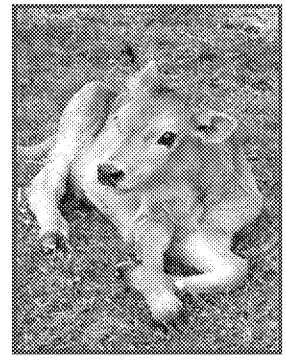
No Vaccine

Saif ©

BCoVs are endemic, pneumoenteric, age effects for clinical syndromes *(Saif, Jung 2020 JCM)*

Some SARS-CoV-2 patients have diarrhea, shed virus in stools

Lessons from BCoV respiratory infection: Correlates of protective immunity in calves



- Strong correlation between serum antibody titers to BCoV and respiratory disease and IgA antibody titers in nasal secretions and nasal shedding in field studies

Calves (Heckert/Saif et al, 1990, 1991)

- *Calves (birth to 20 weeks) shed BCoV repeatedly in nasal secretions, often subclinically (short lived mucosal immunity?)*
- *Calves with IgA antibodies (titer >100) in nasal secretions did not show recurrent BCoV nasal shedding*
- *Correlation between serum antibody titers to BCoV at 24hrs of age and subsequent number of respiratory sick days*

Develop COVID-19 vaccines that elicit both systemic and mucosal immunity?

Lessons from BCoV respiratory infections: Correlates of protective immunity in feedlot cattle

- In Feedlot cattle BCoV serum antibody titers may be a marker for respiratory protection
  - *Antibody isotype (IgG, IgA) and neutralizng titer in serum of cattle at arrival in feedlots were correlated with protection against respiratory disease, pneumonia or BCoV shedding* *(Cho/Saif et al, 2001; Lin et al, 2001; Hasoksuz/Saif et al 2002; Thomas/Saif et al, 2005)*

Strategy: Use vaccines to boost memory antibody responses to BCoV to rapidly increase antibody titers

- *Calves vaccinated IN with an attenuated BCoV vaccine at entry to feedlots had reduced risk for treatment for shipping fever pneumonia* *(Plummer et al, 2004)*

Challenges for COVID-19 Vaccines

- Rapidly deployed nucleic acid or viral vector vaccines may be a 1st generation vaccine to reduce mortality in high risk groups
  - May not prevent nasal shedding (NHP: ChAdOx1, BioRxiv; Inact vaccine, Sci)
  - May require annual booster doses to maintain immunity (common cold CoVs)
- 2nd generation (more potent, efficacious) vaccines (attenuated) may be needed to prevent severe disease and reduce shedding
- Many vaccines have reduced efficacy in elderly (or those with chronic diseases)
  - Require higher dose like flu vaccines, better adjuvants or multiple doses
  - Animal models may not reflect vaccine responses in these high risk groups
- Vaccines will be used in two populations: naïve vs recovered individuals with variable levels of pre-existing immunity
  - Efficacy/adverse effects (ADE?) may vary

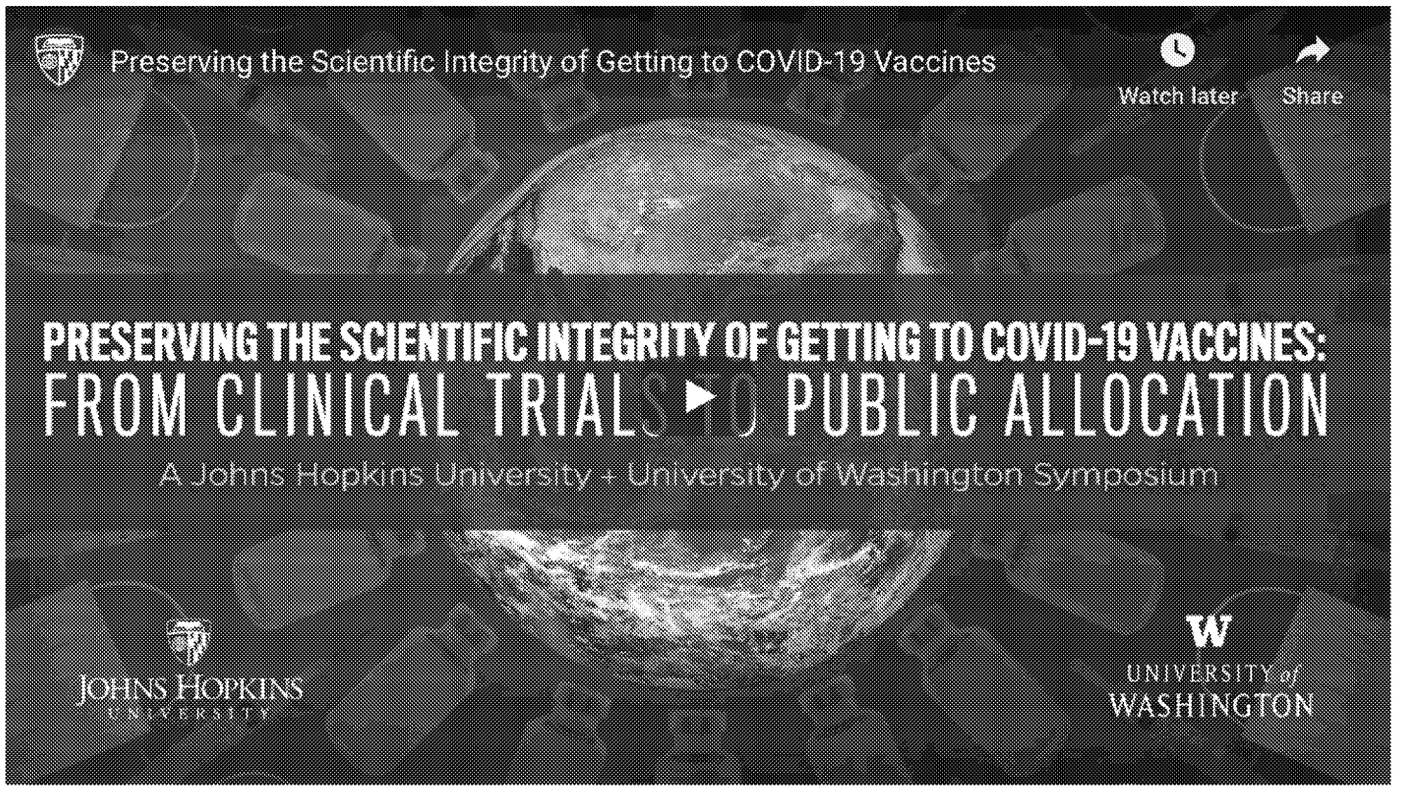
Preserving the Scientific Integrity of Getting to COVID-19 Vaccines: From Clinical Trials to Public Allocation



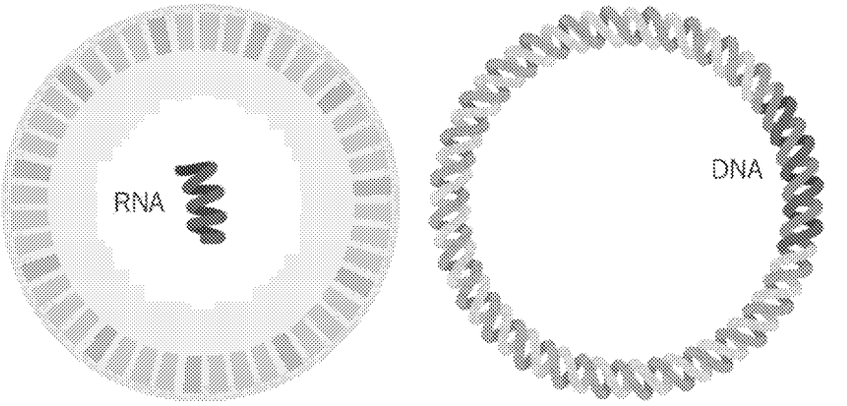
Moncef Slaoui
Chief Advisor

Four platforms, 2 vaccines in each

- Parameters for choice
  - Speed of development
  - Likelihood of efficacy
  - Expected safety profile
  - Scaleup of manufacturing
  - Capacity of owners to execute

- 1. mRNA vaccine
- 2. non-replicating live vectored
- 3. adjuvanted recombinant protein
- 4. live replicating vectored vaccine
  - Oral? Single does?

mRNA vaccines



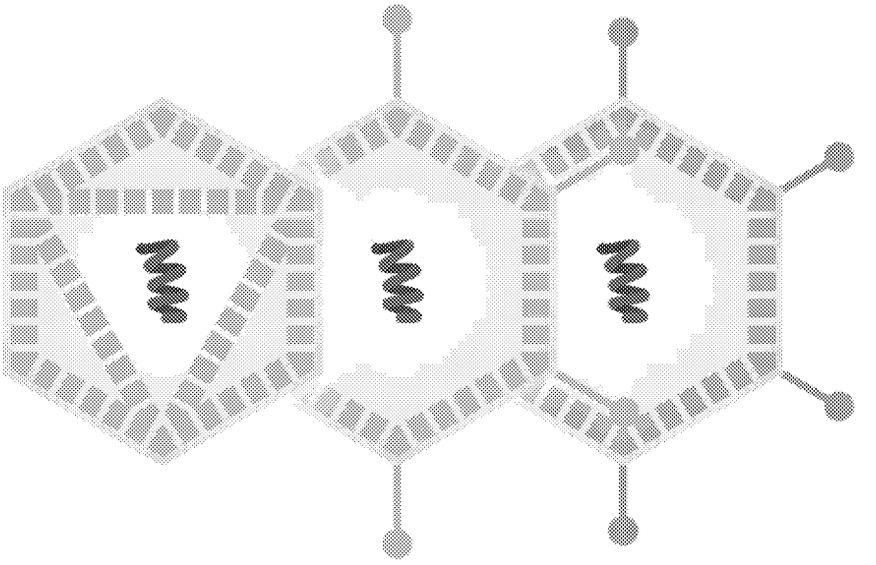
- Who?
  - Moderna
  - BioNtech/Pfizer/Fosun Pharma

Previous uses?
- none

MF and dose availability:
- single digit millions Nov
- 10s millions – Dec
- 100s million - Jan

- Stuctures
  - mRNA encoding Spike protein
  - Encapsulated in lipid nanoparticles – to survive attack by blood cells
  - Pass through cell membranes
  - Chemicals – ease of manufacture
  - Ultracold chain required

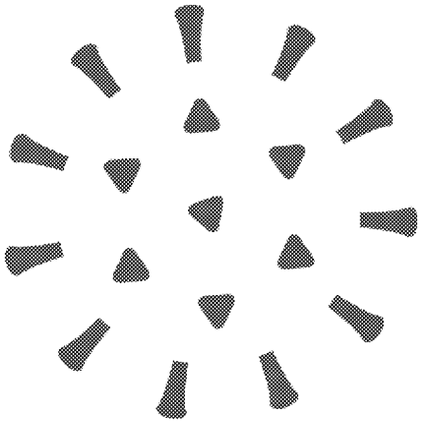
Non-replicative live vector



- Who?
  - Johnson & Johnson
  - Oxford/Astrazeneca
- Previous use?
  - Ebola
- MF and dose availability
  - Oxford 10s millions Jan
  - J&J 6-8 weeks behind

- Mechanism:
  - Virus infects one cell –induced viral immune response
  - Carries S protein gene
  - Immunity to vector?
    - J&J: Adenovirus Ad26 (obscure)
    - Oxford/AZ: (ChAdOx1) (chimp)

Adjuvanted recombinant protein



- Who?

  Novovax

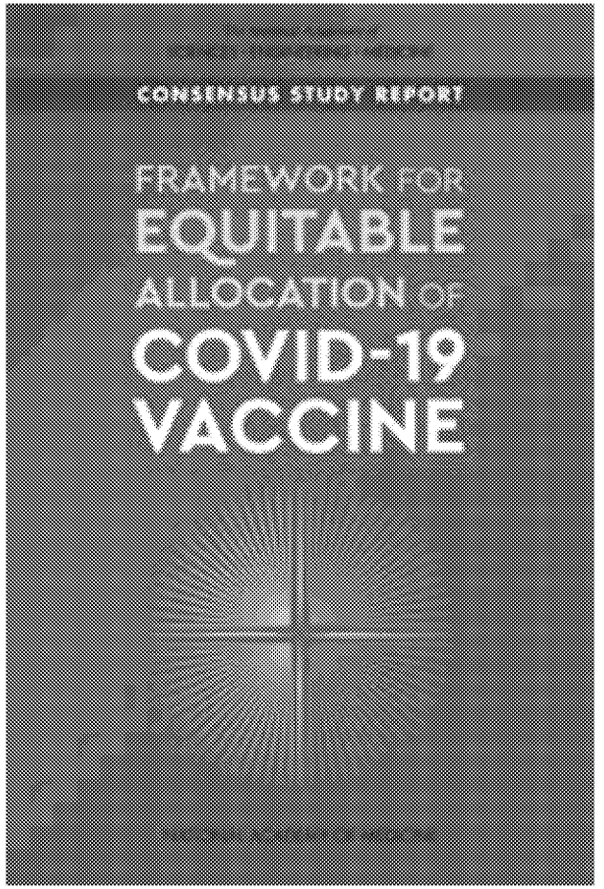
  Sanofi/GSK

- Previous use?
  - multiple
- MF and dose availability:
  - Doses available 1st Q 2021
  - Novovax: NC and TX
  - Sanofi: MA and NJ
- Mechanism
  - Each protein and expression system is different
  - Novovax: nanoparticle with adjuvant
  - Sanofi: based on flu vaccine technology (“FluBlock”)

Four waves of roll-out

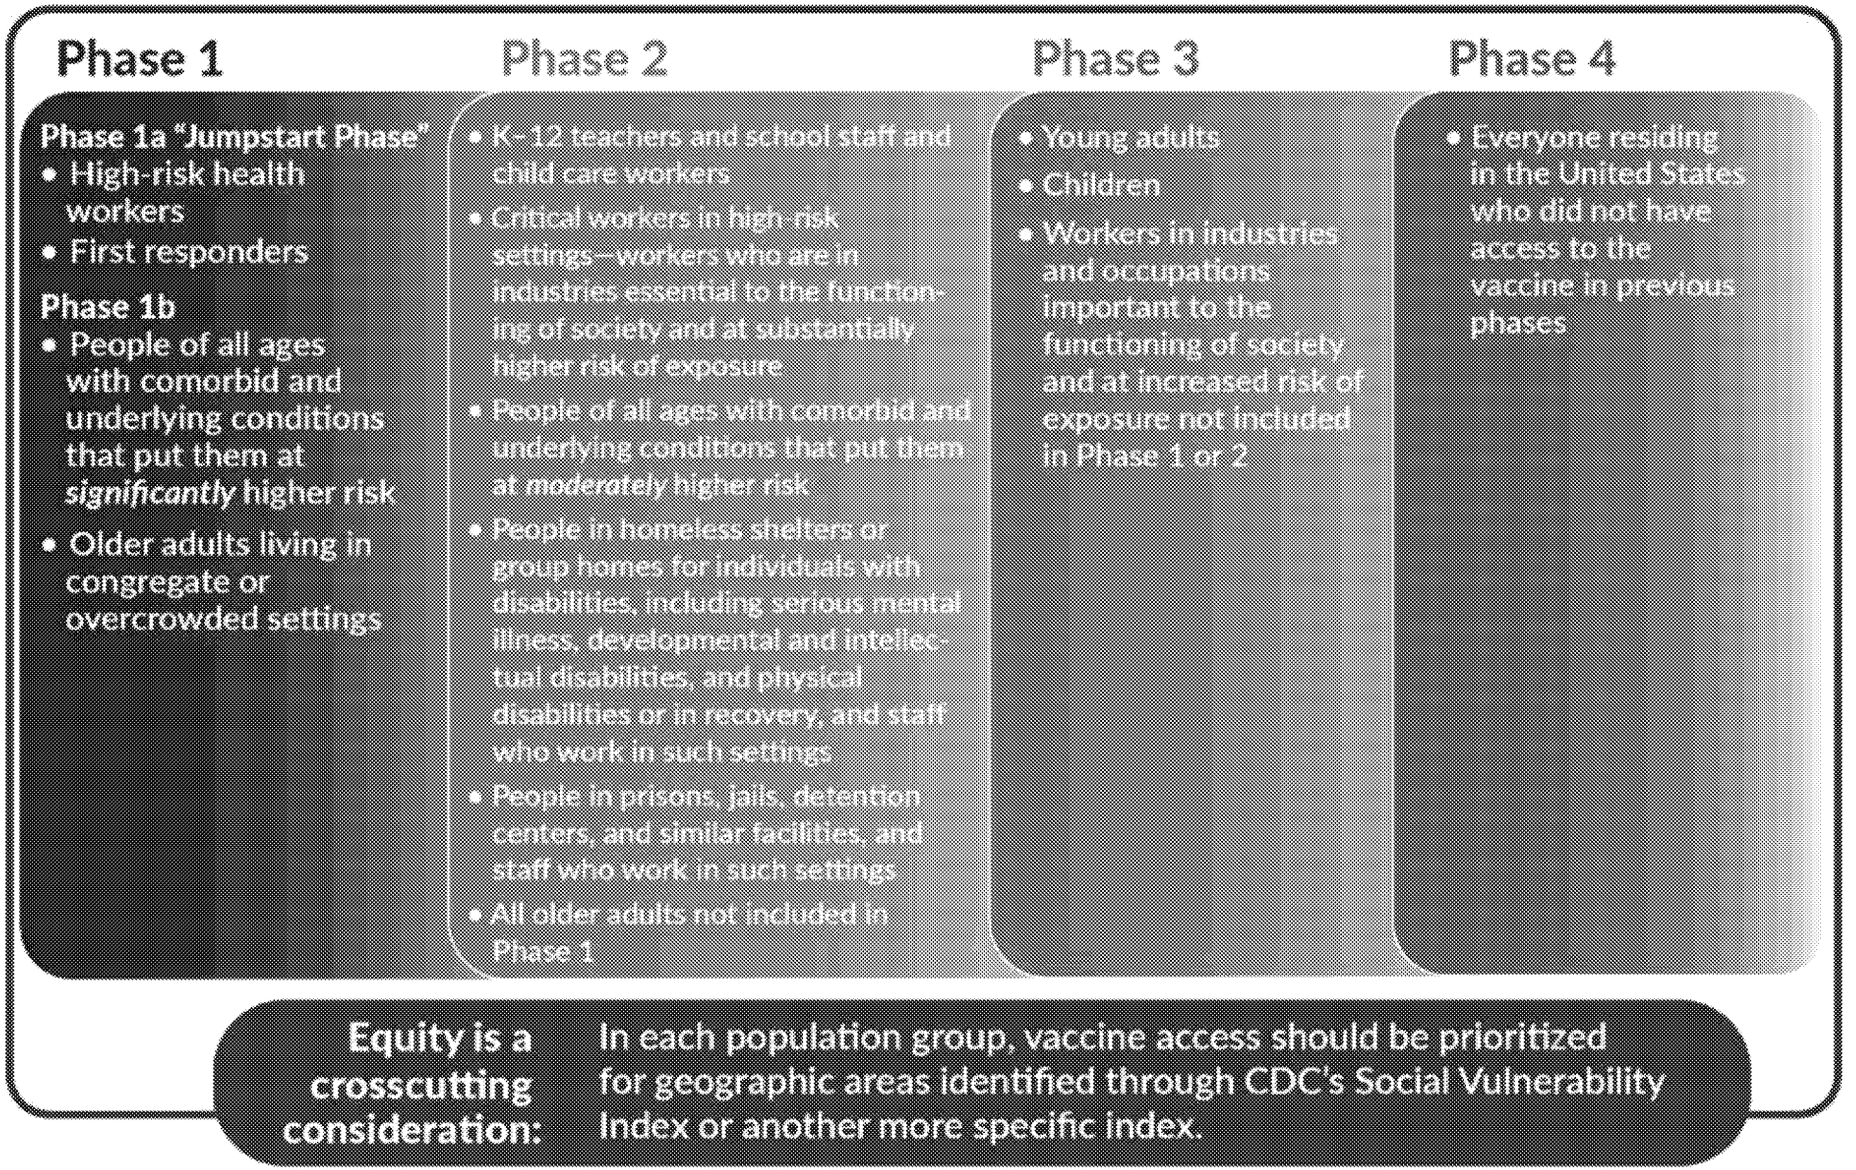
- RNA vaccines — November/December
- Non-replicating live vectors — January/February
- Adjuvanted proteins — March-April
- Replicating live vectors — mid-late 2021

Suryanarayanan2_TPIA_0000000737



Equitable allocation of COVID-19 vaccine

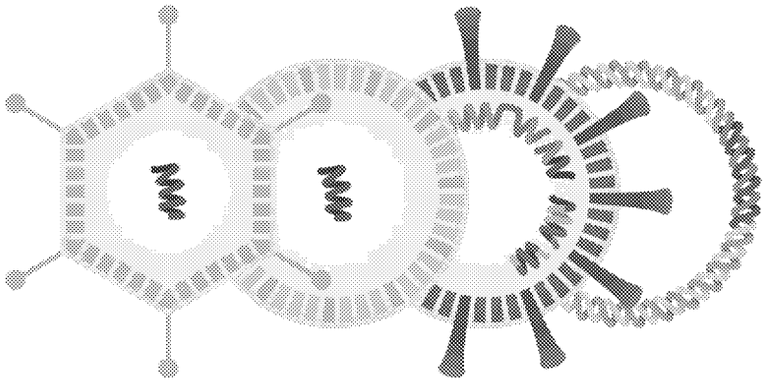
- Four-phased equitable framework, for state, tribal, local and territorial authorities (demand exceeds supply)
- Use existing programs;
- Promotion campaign with risk communication and engagement;
- Support of equitable global allocation



NATIONAL ACADEMY of MEDICINE

FIGURE: A Phased Approach to Vaccine Allocation for COVID-19

The National Academies of SCIENCES ENGINEERING MEDICINE



- *Fauci:* I could say… as a public health person, as a scientist, it will end. We will get through this for absolutely certain. We've already suffered through a lot of pain—a lot of economic and personal pain and inconvenience. But it will end. It will end because the public health efforts will succeed ultimately. And science will get us through this. We will get a vaccine. We will get therapies for early disease and for late disease. So the only message that I think we can jointly tell the American public and the global public is that we will get through this. Hang in there. It will end, we promise you.

Subject: Some bullets following our US-China dialogue discussion on Friday

Thanks for a good discussion on Friday Ben,

I fully support a continued dialog and noted, as did some of those on the call, that George Gao and others were more open in their discussion of investigations into animal reservoirs of SARS-CoV-2 – i.e. discussion about the origin. We discussed ways we could frame a future topic that would allow us to talk about some important issues around the 'natural history' of SARS-CoV-2, that might also be comfortable for our Chinese colleagues. Here are a couple of bullets along the lines you asked me for:

1. Summary of recent findings re. the ability of SARS-CoV-2 to infect other species of animals in the lab, and in the wild, around the world (e.g. mink farm infections Europe and US, experimental infections of ferrets & raccoon dogs, risk assessments of SARS-CoV-2 infecting bats in other countries)

2. From the natural history of the virus, what do we know about the diversity of alpha and beta CoVs in wildlife reservoirs, and in potential intermediate hosts in various countries in Asia.

3. What information can we identify from the receptor binding domain of SARS-related CoVs that might help us predict future potential for emergence of CoVs from other countries

I think a good strategy would be to have the US side give the opening slide deck so that we sort of set the parameters and open up some of the discussion that I'm sure would lead to interesting information. I'd be happy to help on the first 2 points, and I'm sure Ralph could talk to the 3rd point. Linda and Stanley have a great deal of knowledge and could provide supporting comments…

Cheers,

Peter

Subject: RE: Virtual U.S. China dialogue meeting October 13 and 14 - agenda with zoom links

Greetings,

Thank you for participating in the China bio dialogue sessions on Tuesday and Wednesday this week. We have scheduled a short hotwash session so the American participants can discuss the virtual dialogue discussions (from this week and earlier this year) and your get your ideas on future topics and other issues.

The session will take place tomorrow from 5:30-6:30 PM, Zoom link is below. Sorry for the short notice, if you can't make it tomorrow feel free to weigh in by email.

Topic: China Bio Post Dialogue Meeting Discussion
Time: Oct 16, 2020 5:30 PM ET / 4:30 PM CT / 2:30 PM PT
Meeting Link: https://nasem.zoom.us/j/92476126782?pwd= **552.136**
Password: **552.136**

PS I have asked CAS for the ppts from last night, will send those out as soon as I get them.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting October 13 and 14 - agenda with zoom links

Greetings,

Thank you for joining the dialogue session last night. I have attached the slides from the three presentations.

FYI CAS has invited two additional CCDC experts to the session tonight.

Dr. Huaqing Wang, PI, Immunization program, Chinese Center for Disease Control and Prevention
Dr. Zundong Yin, Director of National Immunization Program, Chinese Center for Disease Control and Prevention

Looking forward seeing and hearing from you all in a few hours.
Session 2: Wednesday October 14, **9-11 PM ET / 6-8 PM PT in U.S.**

Importance: High

Greetings,

We are looking forward to the two virtual bio dialogue sessions set to take place on Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT) next week. Like in previous sessions we expect that the Chinese expert participants will lead the discussion on the majority of the topics and that the format will be more of a discussion among the participants instead of a series of formal presentations. I have attached an agenda that includes the Zoom connection links for both days along with the U.S. participant list. If I get the Chinese participant list before the session I will send that out to you all.

Feel free to respond to this email with any thoughts, points of emphasis or issues that you would like to discuss among the U.S. group before the sessions. Also let me know if you have any questions or concerns.

Kind regards,

Ben

Importance: High

Greetings,

I hope you all had a good summer and are staying safe and healthy. The Chinese Academy of Sciences has agreed to hold another (4th) virtual bio dialogue meeting with NASEM on **1) vaccine development and delivery** and **2) immunity, testing and diagnostics.** The agreed topics for the session are below. **We have reserved Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT)** to discuss the topics on the agenda.

We hope you are able to participate. Please let me know if you are available and if so save the dates and times on your calendar. We will get back to you with more information and a detailed agenda for the sessions soon.

Kind regards,

Ben

Vaccine development and delivery

Human

1) **Current status of CoVID-19 vaccine development in China and the U.S.**
2) **Chinse vaccination of military personnel and other Chinese populations**
3) **Vaccination of pediatric populations**
4) **Active surveillance strategies for monitoring adverse events observed after vaccination (as well as immunogenicity)**
5) **Adapting current vaccine platforms to novel mass vax strategies and other mass vaccination strategic issues**
6) **Progress on a universal influenza vaccines**
7) **Vaccine for enterovirus D68**

Animal

1) **Status of corona virus vaccination for animals - kinds of vaccine, efficacy, complications, etc**
2) **ASF in China and ASF vaccine progress**
3) **New swine coronavirus**
4) **Vaccination strategy for H5N1 avian influenza and domestic poultry**

Immunity, testing and diagnostics

1) **Correlates of immunity including the possibility of background immunity from circulating "common cold" coronaviruses**
2) **Chinese diagnostic testing strategies for testing large populations quickly**
3) **Antibody and antibody testing topics, importance of T-cell responses**
4) **Long-term sequela following COVID-19 infection—lung function, neurologic issues, others**

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics

set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

Subject: Save the date COVAX Enabling Sciences Workshop: Global and local approaches to detect and interpret SARS-CoV-2 variants

Dear All

The goal of the workshop is to discuss how to rapidly generate actionable information on the immunological consequences of emerging SARS-CoV-2 variants. This requires connecting local pathogen genomic sequencing and epidemiology with high quality virology and immunology. There will also be a discussion of how immunological knowledge gained in one country or region can feed into, and benefit from, large international efforts and inform global and local decision making.

Agenda and registration link forthcoming.

Thank you.
Karen

Subject: SARS-CoV-2 Weekly Investigators Meeting

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - May 4, 2021

Good morning!

Hope everyone had a wonderful weekend!

On Tuesday, April 27th, Jennifer Gribble-Bowser gave a presentation on "**Defining the determinants and products of coronavirus recombination**". Thank you to the presenter and to everyone who was able to join.

Tomorrow, Tuesday, May the 4th be with you, presentation will be:
Oral Cavity Infection with SARS-CoV-2: Pathology, Transmission Potential, and Symptoms

- Part 1 – Oral Cavity Infection- Blake Warner, PhD
- Part 2 – Symptoms- Paule Joseph, PhD

Best,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - May 11th

Happy Thursday!

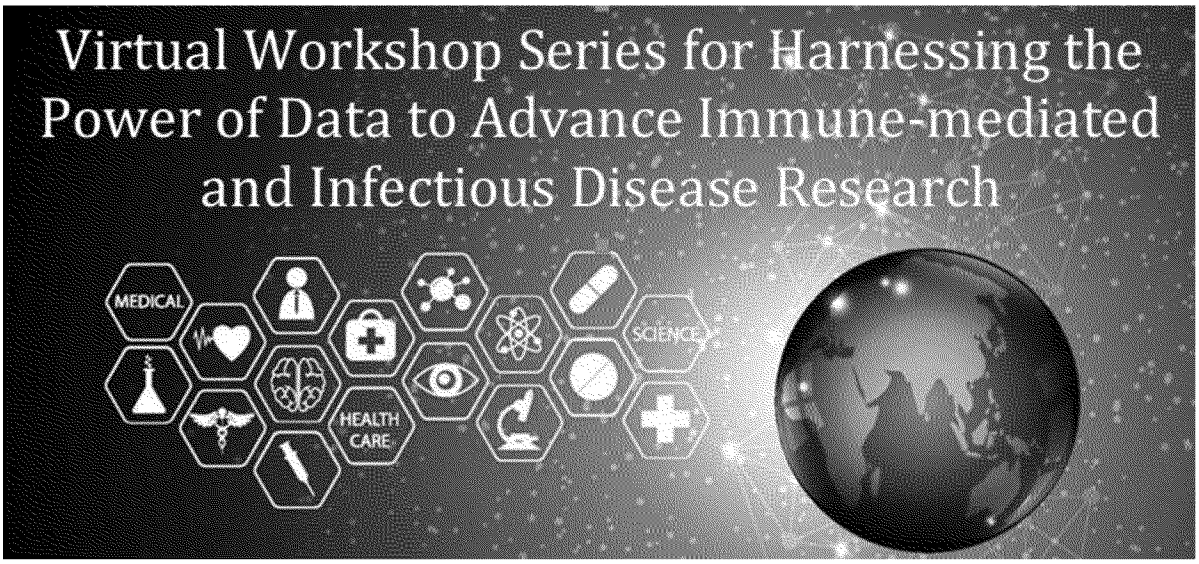
I hope you all enjoyed the presentation on Tuesday, May 4th.
Oral Cavity Infection with SARS-CoV-2: Pathology, Transmission Potential, and Symptoms

- Part 1 – Oral Cavity Infection- Blake Warner, PhD
- Part 2 – Symptoms- Paule Joseph, PhD

Thank you to our presenters and those that joined.

On Tuesday, May 11th, Dr. Pardis Sabeti will be giving a presentation on the "**Outbreak Preemption and Response in the Genomic and Information Age".**

Also….



The National Institute of Allergy and Infectious Diseases (NIAID) is excited to advance discovery and innovation in infectious diseases and immune-mediated disorders research by leveraging data and data science approaches. Towards this end, NIAID will conduct a series of ideas and innovation webinars that bring together experts and stakeholders in data science, infectious diseases, immunology, and immune-mediated disorders.

Through the webinar series, participants will have the opportunity to provide insights into the current landscape of data science research and development, as well as offer ideas that promise to shape the future of data-driven immune-mediated and infectious disease research. The webinar series will serve as a platform for collaboration, idea generation, and networking among participants and generate foundational materials that is expected to inform the prospective role of data science in advancing NIAID's mission.

THIRD EVENT : **Breaking the Silos: Opportunities and Challenges of Harnessing the Power of Data to Advance Immune-Mediated and Infectious Disease Research**

WHEN: May 14th, 2021 2-3:30 pm ET

WHERE: Virtually hosted on Zoom - register to receive meeting link

REGISTRATION : https://zoom.us/webinar/register/WN_jjHo246UQieRTKWtDdSHug
AGENDA : https://apply.hub.ki/datascience4niaid/

WHAT: Our expert panel will engage in a moderated discussion following short talks where they will define the traditional silos that may impede broad data sharing and highlight examples of where breaking those silos facilitated advancement that otherwise could not have been achieved.

WHO: Invited Speakers include Dr. Raphael Gottardo (Fred Hutchinson Cancer Research Center), Dr. Alexa McCray (Harvard Medical School), Dr. Ewan Harrison (University of Cambridge). Moderated by Dr. Stephany Duda (Vanderbilt University) and Dr. Purvesh Khatri (Stanford University).

CONTACTS: Event Organizing Committee (NIAIDODSET@niaid.nih.gov)

Subject: SARS-CoV-2 Weekly Investigators Meeting - May 25th

Hi Everyone,

On Tuesday, May 18th, Dr. Neal Freedman went over "**The COVID-19 SeroHub: a seroprevalence studies resource**". Thank you to our presenter and those that were able to join.

We will have two presentations on Tuesday, May 25th:

1. **SARS-CoV-2 in the Nicaraguan Household Cohort: Spectrum of illness and protection from reinfection**,

   Aubree Gordon, PhD
2. **Four epidemics of chikungunya, Zika, and COVID-19 in Nicaragua reveal bias in case-based mapping**,

   Fausto Bustos Carrillo, PhD

Hope everyone is able to join!

Best,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - May 18th

Happy Monday!
On Tuesday, May 11th, Dr. Pardis Sabeti gave a wonderful presentation on the "**Outbreak Preemption and Response in the Genomic and Information Age".** Thank you to our presenter and to those that were able to join.
Tomorrow, May 18th, Dr. Neal Freedman will be going over "**The COVID-19 SeroHub: a seroprevalence studies resource**". If you or someone you know is interested in listening in, please join. ☺
Best,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - June 8th

Hi All!

I hope your week is going well.

On Tuesday, June 8th, Dr. Sara Cherry will be presenting on "**SARS-CoV-2 and antiviral therapeutics**".

Looking forward to seeing all your names on Zoom next week!

Best,
Rebecca

Rebecca M. Lampley M.S. [C]
Program Manager
Respiratory Diseases Branch
DMID/NIAID/NIH/DHHS
5601 Fishers Lane Desk 8A17
Rockville, MD 20892
Direct: 301.761.6384
Cell: 240.385.2331
E-mail: Rebecca.lampley@nih.gov

From: Lampley, Rebecca (NIH/NIAID) [C][rebecca.lampley@nih.gov]

Location: Zoom; https://www.zoomgov.com/j/1609711373?pwd= 552.136

Importance: Normal

Subject: Canceled: SARS-CoV-2 Weekly Investigators Meeting

Start Time: Tue 6/8/2021 8:00:00 AM (UTC-05:00)

End Time: Tue 6/8/2021 9:00:00 AM (UTC-05:00)

****CANCELING** due to time conflicts with the nidovirus meeting**

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - June 8th

Hi All!

I hope your week is going well.

On Tuesday, June 8th, Dr. Sara Cherry will be presenting on "**SARS-CoV-2 and antiviral therapeutics**".

Looking forward to seeing all your names on Zoom next week!

Best,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - June 15th

Hi Everyone!

Dr. Florian Krammer will help get us back to our regularly scheduled presentation series by presenting on "**Antibody responses to SARS-CoV-2 vaccination**". Looking forward to virtually seeing everyone on Tuesday, June 15th!

Rebecca

CANCELING to give you all time to catch up from the long weekend

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

When: 7:30 AM - 8:30 AM March 12, 2021
Subject: SARS-CoV-2 Variant Testing pipeline
Location: https://www.zoomgov.com/j/1602664950?pwd=MmhuQUE2SUZ6SnZYSG9LU0RPZm5sQT09

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Optional Attendees:	Bouvier, Nicole; Zhongde Wang; Morrey, John; Richard Bowen

AGENDA for 4/24/2020:

1. **Updates from each site [CSU, UNC, USU, UTMB]:**

- **Current animal status**
- **Current study status**
- **Timelines for availability of MCM studies**
- **Any resources needed? Any hurdles/challenges?**

2. **Alternating bi-weekly email updates [due on: 5/8/2020, 6/5/2020, etc.] – please see attached template**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

Importance: Normal

Start Time: Fri 5/22/2020 2:30:00 PM (UTC)

End Time: Fri 5/22/2020 4:00:00 PM (UTC)

Required Attendees: Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]

Optional Attendees: Richard Bowen

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea

Optional Attendees:	Richard Bowen; Bouvier, Nicole; Eakin, Ann (NIH/NIAID) [E]; Deye, Greg (NIH/NIAID) [E]; Wolfraim, Larry (NIH/NIAID) [E]; Hewitt, Judith (NIH/NIAID) [E]; Challberg, Mark (NIH/NIAID) [E]; Elia Brodsky; Young, Jennifer (AE); Dang, Que (NIH/NIAID) [E]

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea
****
Dear A38 Task Order Team,

Please find below the Zoom meeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

Greetings,

This Friday, April 23rd 3-4 pm EDT, we will hold a focused meeting to discuss the EBOV outbreaks in the DRC and Guinea to support Dr. Robert Garry's (and others) outbreak research response to these outbreaks.

Below are two topics that Dr. Garry would like discussed with this group, although we expect other topics to arise during a discussion.

Agenda:

1. Relevance of and most pressing research questions of purported 5 yr recrudescence of EBOV
2. Options/recommendations for enhancing infrastructure including biorepository and inventory system – specifically cold chain power supply. Also, recommendations for inventory software and SOPs

If you are interested in joining this conversation, please reach out to Claire Quiner or Aaron Macoubray and we will forward the invite.

Best,

Claire

A38 Task Order Update_Template.docx

AGENDA for 4/24/2020:

1. **Updates from each site [CSU, UNC, USU, UTMB]:**

- **Current animal status**
- **Current study status**
- **Timelines for availability of MCM studies**
- **Any resources needed? Any hurdles/challenges?**

2. **Alternating bi-weekly email updates [due on: 5/8/2020, 6/5/2020, etc.] – please see attached template**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

Importance: Normal

Start Time: Fri 5/22/2020 2:30:00 PM (UTC)

End Time: Fri 5/22/2020 4:00:00 PM (UTC)

Required Attendees: Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]

Optional Attendees: Richard Bowen

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

Optional Attendees:	Richard Bowen; Bouvier, Nicole; Eakin, Ann (NIH/NIAID) [E]; Deye, Greg (NIH/NIAID) [E]; Wolfraim, Larry (NIH/NIAID) [E]; Hewitt, Judith (NIH/NIAID) [E]; Challberg, Mark (NIH/NIAID) [E]; Elia Brodsky; Young, Jennifer (AE); Dang, Que (NIH/NIAID) [E]

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea

Hi all,
Just to let you all know in advance, we are expecting NIAID leadership to be joining this call on Friday. Please be prepared to present all the work you have completed thus far for model development and any MCM studies (if applicable). Please also be prepared to mention your capacity for MCM studies starting in January 2021.

11/20/2020 Agenda:

- General Updates (Erik)
- A38 Sites Updates (UNC, UTMB, USU, CSU)
- Rotating check-in with individual sites (11/20: UNC; 12/4: UTMB; 12/18: USU; 1/15: CSU)
