Location: https://rtiorg.zoom.us/j/98355183025?pwd= **552.136**

Importance: Normal

Subject: CREID EBOV Discussion

Start Time: Fri 4/23/2021 2:00:00 PM (UTC-05:00)

End Time: Fri 4/23/2021 3:00:00 PM (UTC-05:00)

Required Attendees: Macoubray, Aaronrfgarry@tulane.edu; Cross, Robert W.; Weaver, Scott; MacDonald, Pia; pardis@broadinstitute.org; Kristian Andersen; bronwyn@broadinstitute.org; mmgraw; olival@ecohealthalliance.org; daszak@ecohealthalliance.org; Quiner, Claire; jean.patterson@nih.gov; sara.woodson@nih.gov; Beaubien, Candice (NIH/NIAID) [E; Linde, Amber (NIH/NIAID) [E; julie.dyall@nih.gov; Weldon, Caroline; li@ecohealthalliance.org; firth@ecohealthalliance.org; linfa.wang@duke-nus.edu.sg; eric.laing@usuhs.edu; rbaric@email.unc.edu; christopher.broder@usuhs.edu; chmura@ecohealthalliance.org; hagan@ecohealthalliance.org; peshi@UTMB.EDU; sumclell@UTMB.EDU; SLPAESSL@utmb.edu; Megan Averill; Vasilakis, Nikolaos

Optional Attendees: kga1978@gmail.com; Dyall, Julie (NIH/NIAID) [E]; Florese, Ruth (NIH/NIAID) [E]

Hi all,

I've added others from your Research Centers to this invite. Please feel free to forward this invitation to the most appropriate representative on the topic from your RC, and to other CREID Network members as you see fit.

Thank you very much,

Aaron

Required Attendees: Macoubray, Aaronrfgarry@tulane.edu; Cross, Robert W.; Weaver, Scott; MacDonald, Pia; pardis@broadinstitute.org; Kristian Andersen; bronwyn@broadinstitute.org; mmgraw; olival@ecohealthalliance.org; daszak@ecohealthalliance.org; Quiner, Claire; jean.patterson@nih.gov; sara.woodson@nih.gov; Beaubien, Candice (NIH/NIAID) [E; Linde, Amber (NIH/NIAID) [E; julie.dyall@nih.gov; Weldon, Caroline; li@ecohealthalliance.org; firth@ecohealthalliance.org; linfa.wang@duke-nus.edu.sg; eric.laing@usuhs.edu; rbaric@email.unc.edu; christopher.broder@usuhs.edu; chmura@ecohealthalliance.org; hagan@ecohealthalliance.org; peshi@UTMB.EDU; sumclell@UTMB.EDU; SLPAESSL@utmb.edu; Megan Averill; Vasilakis, Nikolaos

Optional Attendees: kga1978@gmail.com; Dyall, Julie (NIH/NIAID) [E]; Florese, Ruth (NIH/NIAID) [E]

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea

From: Lane, Chelsea (NIH/NIAID) [E][mary.lane@nih.gov]
Location: GoToMeeting
Importance: Normal
Subject: GoToMeeting Invitation - A38 Task Order Kickoff Meeting
Start Time: Fri 3/27/2020 12:00:00 PM (UTC-05:00)
End Time: Fri 3/27/2020 2:00:00 PM (UTC-05:00)
Required Attendees: Lane, Chelsea (NIH/NIAID) [E]; Tseng, Chien-Te K.; Menachery, Vineet; Massey, Christopher; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C

Hello gents,

Please see below for details of the A38 kickoff teleconference on Friday afternoon. Please plan on joining for as much of the meeting as you are able to. I think we will all be connecting from remote locations so I will not reserve a conference room.

David B.

-----Original Appointment-----
From: Lane, Chelsea (NIH/NIAID) [E] <mary.lane@nih.gov>
Sent: Wednesday, March 25, 2020 2:18 PM
To: Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C
Subject: GoToMeeting Invitation - A38 Task Order Kickoff Meeting
When: Friday, March 27, 2020 1:00 PM-3:00 PM (UTC-05:00) Eastern Time (US & Canada).
Where: GoToMeeting

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

Importance: Normal

Start Time: Fri 5/22/2020 2:30:00 PM (UTC)

End Time: Fri 5/22/2020 4:00:00 PM (UTC)

Required Attendees: Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]

Optional Attendees: Richard Bowen

- **Timelines for availability of MCM studies**
- **Any resources needed? Any hurdles/challenges?**

2. **Alternating bi-weekly email updates [due on: 5/8/2020, 6/5/2020, etc.] – please see attached template**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

Importance:	Normal
Start Time:	Fri 5/22/2020 2:30:00 PM (UTC)
End Time:	Fri 5/22/2020 4:00:00 PM (UTC)
Required Attendees:	Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]
Optional Attendees:	Richard Bowen

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

Importance:	Normal
Start Time:	Fri 6/19/2020 2:30:00 PM (UTC)
End Time:	Fri 6/19/2020 4:00:00 PM (UTC)
Required Attendees:	Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]
Optional Attendees:	Richard Bowen; Bouvier, Nicole

Importance:	Normal
Start Time:	Fri 7/17/2020 2:30:00 PM (UTC)
End Time:	Fri 7/17/2020 4:00:00 PM (UTC)
Required Attendees:	Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]; Massey, Christopher; Raul.Andino@ucsf.edu
Optional Attendees:	Richard Bowen; Bouvier, Nicole; Eakin, Ann (NIH/NIAID) [E]; Deye, Greg (NIH/NIAID) [E]; Wolfraim, Larry (NIH/NIAID) [E]; Hewitt, Judith (NIH/NIAID) [E]; Challberg, Mark (NIH/NIAID) [E]; Elia Brodsky; Young, Jennifer (AE); Dang, Que (NIH/NIAID) [E]

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea

Subject: A38 Task Order Monthly Call
A38 Task Order Update_Template.docx

Hi All,

Thanks again for joining the A38 call this morning. As mentioned during the call, please email your site's update to Erik Stemmy (erik.stemmy@nih.gov), me (mary.lane@nih.gov), and Thames Pickett (pickettte@niaid.nih.gov) by **COB, Tuesday 4/28**. Please use the attached template, and as mentioned, for those of you further along in the model development process, please include a one pager/descriptor of the model as discussed.

Lastly, for those that are having issues with obtaining PPE, please reach out to Charles Jackson (Charles.Jackson@nih.gov) and Miranda Adams (miranda.adams@nih.gov).

Hope you all have a lovely weekend,
Chelsea

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status (including any new data)
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Study capacity
- Any resources needed? Any hurdles/challenges?

Also, as model development nears completion – please send us a one pager/description of the model including animal background (e.g. mouse background & any information on promoters, etc., route of inoculum & dose, days post inoculation for determining viral loads & histopathology, etc...)

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

To: Beasley, David W.[dwbeasle@UTMB.EDU]; Pickett, Thames (NIH/NIAID) [E][pickettte@niaid.nih.gov]; Liz.grinstead@colostate.edu[Liz.grinstead@colostate.edu]; Julie Harvey[Julie.harvey@colostate.edu]; Bowen, Richard[richard.bowen@colostate.edu]; Chandra Caldwell[ccaldwel@email.unc.edu]; Victoria Moore[victoria_moore@unc.edu]; Baric, Ralph[rbaric@email.unc.edu]; Taylor Bray, Christy J.[cjtaylor@utmb.edu]; Viner, Rebekah L.[rlviner@UTMB.EDU]; Devin Hansen[devin.hansen@usu.edu]; Jennipher Hulse[jennipher.hulse@usu.edu]; Bart Tarbet[bart.tarbet@usu.edu]; Katie Dana[katie.dana@usu.edu]; Adams, Miranda (NIH/NIAID) [E][miranda.adams@nih.gov]; Stemmy, Erik (NIH/NIAID) [E][erik.stemmy@nih.gov]; Baric, Toni C[antoinette_baric@med.unc.edu]; Graham, Rachel[rlgraham@ad.unc.edu]; Menachery, Vineet[vimenach@UTMB.EDU]; Brett Hurst[brett.hurst@usu.edu]; LeGros, Erika[erlegros@UTMB.EDU]; Schilling, Beth A.[baschill@UTMB.EDU]; Tseng, Chien-Te K.[sktseng@UTMB.EDU]; McNees, Andrew G.[amcnees@UTMB.EDU]; Florence, Clint (NIH/NIAID) [E][clint.florence@nih.gov]; Bryan, Jonathan (NIH/NIAID) [E][jonathan.bryan@nih.gov]; Jackson, Charles (NIH/NIAID) [E][charles.jackson@nih.gov]; Bouvier, Nicole[Nicole.Bouvier@mountsinai.org]; Zhongde Wang[zonda.wang@usu.edu]; Morrey, John[john.morrey@usu.edu]; Richard Bowen[rbowen@rams.colostate.edu]

A38 Task Order Update_Template.docx

Hi All,

Hope you are all doing well! As mentioned during our last call, please email your site's bi-weekly update to Erik Stemmy (erik.stemmy@nih.gov), me (mary.lane@nih.gov), and Thames Pickett (pickettte@niaid.nih.gov) by **COB, Friday 5/8**. Please use the attached template, and as mentioned, for those of you further along in the model development process, please include a one pager/descriptor of the model as discussed. If you have any updates to your one pager/descriptor, please feel free to send us an update.

Lastly, if any of you are still having issues with obtaining PPE, please reach out to Charles Jackson (Charles.Jackson@nih.gov) and Miranda Adams (miranda.adams@nih.gov).

Hope you all have a lovely week,
Chelsea

A38 Task Order Update_Template.docx

Hi All,

Just a friendly reminder that this biweekly email update is due by **tomorrow COB**.

For CSU and UNC: please also indicate the following: How many MCM candidates can you test at one time (and how many animals can you run per study)? How often can you initiate a study (e.g. every two weeks?).

Thanks all!
Chelsea

Subject: DUE Friday, 6/5: A38 biweekly email update

Hi All,
Hope you are all doing well! I wanted to send you a reminder re: our next biweekly email update for the A38 task order, which is this **Friday, June 5th**. As a reminder, please use the attached template outlining the updates on your site's SARS2 animal model(s) that are in development. Please email your site's update to Erik Stemmy (erik.stemmy@nih.gov), Chelsea Lane (mary.lane@nih.gov), and Thames Pickett (pickettte@niaid.nih.gov).
Thanks, and have a great week!

Chelsea & Erik

A38 Task Order Update_Template.docx

Dear Colleagues,
Hope this message finds you well! I wanted to send you a reminder re: our next biweekly email update for the A38 task order. Given the holiday this upcoming weekend (and that we have all been working extremely hard), I figured we could extend the email update deadline to **COB, Monday, July 6th**. As a reminder, please use the attached template outlining the updates on your site's SARS2 animal model(s) that are in development. Please email your site's update to Erik Stemmy (erik.stemmy@nih.gov), Chelsea Lane (mary.lane@nih.gov), and Thames Pickett (pickettte@niaid.nih.gov).
Thanks, and have a great week!

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current animal model development study status
- Timelines for availability of MCM studies. Should **emphasize** earliest possible date for study start and numbers of animals able to test per vaccine or therapeutic study (i.e. study capacity).
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

Subject: A38 Task Order Bi-weekly Call

Dear A38 Sites,

You should all have received an updated meeting invitation for Friday, July 16th. Please note the shift in time by 30 minutes – and that the meeting will start at 11am EST.

We have been asked by NIAID SARS-CoV-2 leadership to take another big picture view of where we are with all of our SARS2 small animal models. Hence, the update to our standard agenda for the 7/16 meeting (as shown at the bottom of this email). Many of our NIAID SARS-CoV-2 team members (from the Vaccine, mAb, and Therapeutics team) will be attending, so I'd like to keep these slides as a high level overview – similar to the 1 pager or information sheets that we asked you to develop. The goal will be that we (NIAID) can then utilize these slides as well and send them to External Requestors interested in testing their medical countermeasure of interest. I'd like to make sure that we are clear with the caveats/limitations of each model – i.e. if you think that the given model at your site is not best for testing of anti-inflammatory agents, please be sure to note that.

At the end of your presentation, please be sure to include 2-3 slides capturing final data on the pilot dexamethasone study conducted at your site. I know that many of you are still awaiting histopathology analyses, but I'm hoping that we can have all these final data (and cytokine data if applicable) in by July 16th.

Should you have any questions, please let me or Erik know ☺
Chelsea

7/16/2021 Agenda:

- General Updates (Erik)
- Brief slide deck (~6-10 slides) on models developed at each A38 site. Please include:
  - Model kinetics & pathology phenotypes (as noted in your 1-pager/info sheets);
  - Whether your model is suitable for testing of vaccines, antivirals, anti-inflammatory agents, mAbs, etc., and what controls can be utilized in your model (and the optimal timing and routes for dosing, etc.);
  - What assays/reagents are available for testing of immune responses in your model (and please include any relevant cytokine data if available);
- Another 2-3 slides with your Site's final data for testing of dexamethasone. Please ensure that histopathology analyses (and any additional analyses, e.g. cytokine if appropriate) can be completed by this date.

Subject: PPE shortages & scheduling for monthly update teleconferences

Dear A38 Task Order Team (Colleagues),

It has come to the attention of Erik Stemmy and me that certain labs are having issues with ordering PPE and/or critical reagents from Fisher and VWR for conducting essential research under the A38 task order. In an effort to determine how widespread this issue is (and to help find potential solutions), we are assembling a list of PPE/reagents that are in short supply per contractor site. If possible, please let me and Erik know by noon tomorrow, whether your site has had any issues in obtaining necessary PPE or reagents for your task order studies.

Also, as per the instructions from the kickoff meeting, big thanks to the contractor sites that have already emailed Erik and me updates on your site's model development efforts. Again, we do not need a detailed update at this point in time – just a high level update on the availability of the animals that you are testing (e.g. if you are breeding animals, how that is coming along) and any updates on SARS-CoV-2 testing if that work has commenced. For those that have not provided updates, please send Erik and me (with a Cc to Thames and Miranda) your updates by noon tomorrow as well.

Last but not least, I wanted to begin polling for days/times during the week for our monthly update teleconferences. Based on Erik's and my calendars – the best day/time windows during the week are: Mondays (after 1pm EST); Friday mornings (between 10am-12pm EST); and Friday afternoons (after 1pm). For each contractor site, please let me know whether any of these day/time windows does not work for your team (by Friday COB if possible). If you could first consult with your specific site and reply to me in a single email, that would be most helpful.

Thanks all, and I hope that you are all staying healthy and safe. Should you have any additional questions, please let me or Erik know.

Sincerely,
Chelsea

M. Chelsea Lane, Ph.D.

Required Attendees:	Beasley, David W.; Pickett, Thames (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]
Optional Attendees:	Bouvier, Nicole; Richard Bowen

AGENDA for 4/24/2020:

1. **Updates from each site [CSU, UNC, USU, UTMB]:**

- **Current animal status**
- **Current study status**
- **Timelines for availability of MCM studies**
- **Any resources needed? Any hurdles/challenges?**

2. **Alternating bi-weekly email updates [due on: 5/8/2020, 6/5/2020, etc.]**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

From: Lane, Chelsea (NIH/NIAID) [E][mary.lane@nih.gov]

Attendees: Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; bart.tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; antoinette_baric; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]; Massey, Christopher; Davis, Mindy (NIH/NIAID) [E]; Richard Bowen; Bouvier, Nicole; Eakin, Ann (NIH/NIAID) [E]; Wolfraim, Larry (NIH/NIAID) [E]; Hewitt, Judith (NIH/NIAID) [E]; Challberg, Mark (NIH/NIAID) [E]; Young, Jennifer (AE); Vily, Aytaj (NIH/NIAID) [E]; Palin, Amy (NIH/NIAID) [E]; Sciotti, Rick (NIH/NIAID) [E]; Venkatraman Siddharthan

From: Lane, Chelsea (NIH/NIAID) [E][mary.lane@nih.gov]

Attendees: Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]; Richard Bowen; Bouvier, Nicole

Location: Zoom meeting

Importance: Normal

Subject: A38 Task Order Monthly Call

Start Time: Fri 6/19/2020 9:30:00 AM (UTC-05:00)

End Time: Fri 6/19/2020 11:00:00 AM (UTC-05:00)

Required Attendees: Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]

Optional Attendees: Richard Bowen; Bouvier, Nicole

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

Dear Colleagues,

I wanted to send you a reminder for our upcoming A38 task order monthly call, to be held virtually this **Friday, August 14th from 10:30am-12pm EST**. As a reminder, please be prepared to share a brief slide presentation outlining the updates on your site's SARS-CoV-2 animal model(s) that are in development.

Thanks so much!
Chelsea & Erik

Subject: A38 Task Order Monthly Call_Friday September 11th

Dear Colleagues,

I wanted to send you a reminder for our upcoming A38 task order monthly call, to be held virtually this **Friday, September 11th from 10:30am-12pm EST**. As a reminder, please be prepared to share a brief slide presentation outlining the updates on your site's SARS-CoV-2 animal model(s) that are in development.

Also, we have received a number of questions from external requestors regarding the capacity for performing immune assays. It would be great if you could present a couple general slides on your site's assay capabilities this Friday as well.

Thanks so much – looking forward to seeing your updates on Friday!
Chelsea & Erik

Optional Attendees: Richard Bowen; Bouvier, Nicole; Eakin, Ann (NIH/NIAID) [E]; Wolfraim, Larry (NIH/NIAID) [E]; Hewitt, Judith (NIH/NIAID) [E]; Challberg, Mark (NIH/NIAID) [E]; Young, Jennifer (AE); Vily, Aytaj (NIH/NIAID) [E]; Palin, Amy (NIH/NIAID) [E]; Embry, Alan (NIH/NIAID) [E]

Hi all,

On December 4th, we will go more in depth into the hamster models at USU and CSU. Please see the updated agenda below.

12/4/2020 Agenda:

- **General Updates (Erik)**
- **In depth A38 Site Updates for USU and CSU (hamster models)**
- **If there is time – we will go through brief updates for UNC and UTMB**
- **Rotating check-in with individual sites (~~11/20: UNC~~; 12/4: UTMB; 12/18: USU; 1/15: CSU)**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the biweekly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Best,
Erik & Chelsea

A38 Task Order Update_Template.docx

AGENDA for 4/24/2020:

1. **Updates from each site [CSU, UNC, USU, UTMB]:**

- **Current animal status**
- **Current study status**
- **Timelines for availability of MCM studies**
- **Any resources needed? Any hurdles/challenges?**

2. **Alternating bi-weekly email updates [due on: 5/8/2020, 6/5/2020, etc.] – please see attached template**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the monthly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Erik and I will be updating the agenda shortly, so please stay tuned.

Best,
Erik & Chelsea

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

Importance: Normal

Start Time: Fri 5/22/2020 2:30:00 PM (UTC)

End Time: Fri 5/22/2020 4:00:00 PM (UTC)

Required Attendees: Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]

Optional Attendees: Richard Bowen

Hi all,
Just to let you all know in advance, we are expecting NIAID leadership to be joining this call on Friday. Please be prepared to present all the work you have completed thus far for model development and any MCM studies (if applicable). Please also be prepared to mention your capacity for MCM studies starting in January 2021.

11/20/2020 Agenda:

- General Updates (Erik)
- A38 Sites Updates (UNC, UTMB, USU, CSU)
- Rotating check-in with individual sites (11/20: UNC; 12/4: UTMB; 12/18: USU; 1/15: CSU)

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the biweekly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Best,
Erik & Chelsea

A38 Task Order Update

Establishment of Small Animal Models for Screening MCMs for the 2019 Novel Coronavirus (SARS-CoV-2)

Please include updates on the following:

- Current animal status (animal availability, colony expansion, actual numbers of animals available, etc.)
- Current study status
- Timelines for availability of MCM studies (should **emphasize** earliest possible date for study start)
- Any resources needed? Any hurdles/challenges?

Updates are required bi-weekly and will alternate between teleconference or email updates. The next alternating bi-weekly email updates are due by close of business on 5/8/2020, 6/5/2020, ... etc. Please email your site's update to Erik Stemmy ([HYPERLINK "mailto:erik.stemmy@nih.gov"]), Chelsea Lane ([HYPERLINK "mailto:mary.lane@nih.gov"]), and Thames Pickett ([HYPERLINK "mailto:pickettte@niaid.nih.gov"]).

Importance: Normal

Start Time: Fri 5/22/2020 2:30:00 PM (UTC)

End Time: Fri 5/22/2020 4:00:00 PM (UTC)

Required Attendees: Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]

Optional Attendees: Richard Bowen

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea

Hi all,
Just to let you all know in advance, we are expecting NIAID leadership to be joining this call on Friday. Please be prepared to present all the work you have completed thus far for model development and any MCM studies (if applicable). Please also be prepared to mention your capacity for MCM studies starting in January 2021.

11/20/2020 Agenda:

- General Updates (Erik)
- A38 Sites Updates (UNC, UTMB, USU, CSU)
- Rotating check-in with individual sites (11/20: UNC; 12/4: UTMB; 12/18: USU; 1/15: CSU)

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the biweekly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Best,
Erik & Chelsea

Hi all,

On December 4th, we will go more in depth into the hamster models at USU and CSU. Please see the updated agenda below.

12/4/2020 Agenda:

- **General Updates (Erik)**
- **In depth A38 Site Updates for USU and CSU (hamster models)**
- **If there is time – we will go through brief updates for UNC and UTMB**
- **Rotating check-in with individual sites (~~11/20: UNC~~; 12/4: UTMB; 12/18: USU; 1/15: CSU)**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the biweekly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Best,

Hi Ralph,

Sounds good, do you guys have any availability on Thursday or Friday? Other than the Marty genetics I should be able to have all of your comments incorporated by then.

Thanks again,
Jessica

Hi Vineet and Jess, Hope you are having a nice new year. Nice job on the paper. I have appended my comments on the paper. I think marty needs to discuss genotyping in the methods section. Be glad to chat. Ralph

From: Lane, Chelsea (NIH/NIAID) [E][mary.lane@nih.gov]
Importance: Normal
Subject: A38 Task Order Monthly Call
Start Time: Fri 7/17/2020 9:30:00 AM (UTC-05:00)
End Time: Fri 7/17/2020 11:00:00 AM (UTC-05:00)
Required Attendees: Lane, Chelsea (NIH/NIAID) [E]; Julie Harvey; Bowen, Richard; Chandra Caldwell; Victoria Moore; Baric, Ralph; Taylor Bray, Christy J.; Viner, Rebekah L.; Beasley, David W.; Devin Hansen; Jennipher Hulse; Bart Tarbet; Katie Dana; Adams, Miranda (NIH/NIAID) [E]; Pickett, Thames (NIH/NIAID) [E]; Stemmy, Erik (NIH/NIAID) [E]; Baric, Toni C; Liz.grinstead@colostate.edu; Graham, Rachel; Menachery, Vineet; Brett Hurst; LeGros, Erika; Schilling, Beth A.; Tseng, Chien-Te K.; McNees, Andrew G.; Florence, Clint (NIH/NIAID) [E]; Bryan, Jonathan (NIH/NIAID) [E]; Jackson, Charles (NIH/NIAID) [E]; Zhongde Wang; Lampley, Rebecca (NIH/NIAID) [C]; Massey, Christopher; Raul.Andino@ucsf.edu
Optional Attendees: Richard Bowen; Bouvier, Nicole; Eakin, Ann (NIH/NIAID) [E]; Deye, Greg (NIH/NIAID) [E]; Wolfraim, Larry (NIH/NIAID) [E]; Hewitt, Judith (NIH/NIAID) [E]; Challberg, Mark (NIH/NIAID) [E]; Elia Brodsky; Young, Jennifer (AE); Dang, Que (NIH/NIAID) [E]

Update for 7/17:
In addition to the A38 contractor updates, Dr. Raul Andino from UCSF will also provide a brief presentation on a new camera system that his laboratory is developing to measure non-traditional endpoints for SARS-CoV-2 in mice. We will follow Dr. Andio's presentation with updates from each A38 contractor.
Best,
Chelsea

Hi all,
Just to let you all know in advance, we are expecting NIAID leadership to be joining this call on Friday. Please be prepared to present all the work you have completed thus far for model development and any MCM studies (if applicable). Please also be prepared to mention your capacity for MCM studies starting in January 2021.

11/20/2020 Agenda:

- General Updates (Erik)
- A38 Sites Updates (UNC, UTMB, USU, CSU)
- Rotating check-in with individual sites (11/20: UNC; 12/4: UTMB; 12/18: USU; 1/15: CSU)

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the biweekly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Optional Attendees: Richard Bowen; Bouvier, Nicole; Eakin, Ann (NIH/NIAID) [E]; Wolfraim, Larry (NIH/NIAID) [E]; Hewitt, Judith (NIH/NIAID) [E]; Challberg, Mark (NIH/NIAID) [E]; Young, Jennifer (AE); Vily, Aytaj (NIH/NIAID) [E]; Palin, Amy (NIH/NIAID) [E]; Embry, Alan (NIH/NIAID) [E]

Hi all,

On December 4th, we will go more in depth into the hamster models at USU and CSU. Please see the updated agenda below.

12/4/2020 Agenda:

- **General Updates (Erik)**
- **In depth A38 Site Updates for USU and CSU (hamster models)**
- **If there is time – we will go through brief updates for UNC and UTMB**
- **Rotating check-in with individual sites (~~11/20: UNC~~; 12/4: UTMB; 12/18: USU; 1/15: CSU)**

Dear A38 Task Order Team,

Please find below the GoToMeeting information for the biweekly A38 task order teleconferences. Please forward the meeting to those on your team that you wish to attend (should they not be on this meeting invite).

Best,
Erik & Chelsea

Subject: Introductions and collaborations

Vineet,

I am sorry that we are not able to meet in person given the current circumstances.

I am an MD, PhD, and I did my PhD in Shinji Makino's lab at UTMB when Kumari was still in the lab. Since then, I have moved to UCSD to do my Internal Medicine and Infectious Disease clinical training, and I recently joined Shane Crotty's lab at La Jolla Institute (LJI).

Congratulations on the recent manuscript regarding type I interferon pre-treatment and SARS-CoV-2 vs SARS-CoV. It was posted to our lab's Slack #coronavirus thread.

As you can imagine, there are a number of excellent scientists with diverse backgrounds eager to study SARS-CoV-2. However, there are not many coronavirologists around. Given your lab's expertise in the area, including your own expertise from your time in the Baric lab and your time as an independent investigator, it would be great to be able to put you in touch with a number of PIs here in San Diego.

Shane and multiple other PIs at LJI are focused on understanding the immune response (mainly T and B cell responses) to SARS-CoV-2. We are also collaborating with a number of PIs at UCSD.

Aaron Carlin is one of our collaborators at UCSD. He is an MD, PhD Infectious Diseases physician scientist who did his postdoc in Chris Glass' lab and has gone on to start his own lab, studying innate immunity and pathogen-host interactions with flaviviruses (among other things). He is hoping to study pathogen-host interactions with SARS-CoV-2, and ultimately hopes to do so in a lung organoid model. However, he does not have experience culturing CoV.

Would you be willing/able to share your SOPs for making SARS-CoV-2 stock virus? I think that it would be useful for him to have an SOP for plaque assays in Vero E6 as well.

I have copied Aaron and Kumari on this email to try to help facilitate this. Aaron can correct me or add details as needed.

Thank you.

Best,

Sydney

Sent: Thur 2/18/2021 2:02:02 PM (UTC-06:00)
Subject: SARS-CoV-2 Weekly Investigators Meeting - February 23rd

Hi Everyone!

Apologies for the last minute cancelation last week.

Dr. Laura Hughes saved me from disappointing you all two weeks in a row. She will be giving a presentation titled "**Real-time surveillance of SARS-CoV-2 mutations and variants**".

As a reminder, if you are interested in presenting, please reach out to me so I can get you on the schedule.

Best,
Rebecca

Subject: UPDATE: SARS-CoV-2 Weekly Investigators Meeting - February 23rd

Hi Everyone!

SURPRISE! We will now have TWO presenters on Tuesday, February 23rd to make up for the last minute cancellation last week.

Presenter 1:

Dr. Laura Hughes
"**Real-time surveillance of SARS-CoV-2 mutations and variants**"

Presenter 2:

Dr. Richard Scheuermann
"Toward an Early warning system for SARS-CoV-2 Variants of Concern"

As a reminder, if you are interested in presenting, please reach out to me so I can get you on the schedule.

Have a great weekend,
Rebecca

Rebecca M. Lampley M.S. [C]
Program Manager
Respiratory Diseases Branch

Subject: SARS-CoV-2 Weekly Investigators Meeting - March 2nd

Hi Everyone,

On Tuesday, February 23rd, we had two wonderful presentations given by the presenters below:
Presenter 1:

Dr. Laura Hughes
"**Real-time surveillance of SARS-CoV-2 mutations and variants**"

Presenter 2:

Dr. Richard Scheuermann
"Toward an Early warning system for SARS-CoV-2 Variants of Concern"

Next week, Dr. Robert "Rob" Schwartz will be giving a presentation titled "**The landscape of host responses and disease pathology in SARS-CoV-2 infection**" on Tuesday, March 2nd.

As a reminder, if you are interested in presenting, please reach out to me so I can get you on the schedule.

Have a great weekend,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - March 9th

Hi Everyone,

On Tuesday, **March 2nd,** Dr. Robert "Rob" Schwartz gave a wonderful presentation titled "**The landscape of host responses and disease pathology in SARS-CoV-2 infection**". Thank you to our presenter and those that were able to join.

Next up, we have Dr. Rory de Vries who will be giving a presentation on how "**Intranasal fusion inhibitory lipopeptide prevents**

direct-contact SARS-CoV-2 transmission in ferrets" on Tuesday, March 9th.

Presenter needed: March 23rd! Please let me know if you'd like to claim that spot. ☺

Have a great rest of the week,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - March 30th

Hi Everyone,

On March 23rd, Dr. Ben tenOever presented data on "**Aging and the immune response to SARS-CoV-2 in the golden hamster**".

Thank you to our presenter for his time and to those that were able to join.
Our last March presenter will be Dr. Christopher Brooke who will be presenting on the "**Substantial person-to-person heterogeneity in viral dynamics during acute SARS-CoV-2 infection".**

Hope you all have a wonderful rest of the week!

Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - April 20th

Hi Everyone!

I hope you all had a great weekend!

Dr. Liz Thompson gave us all an overview on the "**Metabolic programs define dysfunctional immune responses in severe COVID-19 patients".** Thank you to our presenter and to everyone who was able to join.

Tomorrow, Dr. Santosh Dhakal will be presenting on the "**Sex differences in lung imaging and SARS-CoV-2 antibody responses in a COVID-19 golden Syrian hamster model**". Hope you all are able to join!

If you are interested in presenting in the future or would like to add someone to this call, please feel free to reach out.

Best,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - April 27th

Happy Friday, Everyone!

Thank you all who attended the presentation given by Dr. Santosh Dhakal on the "**Sex differences in lung imaging and SARS-CoV-2 antibody responses in a COVID-19 golden Syrian hamster model**" and thank you to the presenter.

On Tuesday, April 27th, Dr. Jennifer Gribble-Bowser will be giving a presentation on "**Defining the determinants and products of coronavirus recombination**".

Hope you all have a great weekend! Look forward to seeing your names on Tuesday!

Rebecca

Subject: 4/6 CANCELLED: SARS-CoV-2 Weekly Investigators Meeting

Hi Everyone,

We had a last minute cancelation and will NOT be having the SARS-CoV-2 Investigators meeting this morning.

However, we will resume next week with Dr. Liz Thompson who will be presenting on the "**Metabolic programs define dysfunctional immune responses in severe COVID-19 patients**".

Best,
Rebecca

Subject: Co-authored manuscript - conflict of interest forms required
coi_disclosure.pdf

Dear Co-authors,

Our manuscript, "Immune predictors of mortality following RNA virus infection", has been reviewed at a couple of places – Cell Reports wanted additional experiments that we aren't willing to do (requiring a lot more mice), so we submitted to the Journal of Infectious Diseases, where it was quite favorably reviewed. We're preparing our revision, and in the meantime, they require each author to complete the attached conflict of interest form.

Could you each fill this out and return to me ASAP?

Thanks!
Jenny

Subject: Co-authored manuscript - conflict of interest forms required

Dear Co-authors,

Our manuscript, "Immune predictors of mortality following RNA virus infection", has been reviewed at a couple of places – Cell Reports wanted additional experiments that we aren't willing to do (requiring a lot more mice), so we submitted to the Journal of Infectious Diseases, where it was quite favorably reviewed. We're preparing our revision, and in the meantime, they require each author to complete the attached conflict of interest form.

Could you each fill this out and return to me ASAP?

Thanks!
Jenny

Dear Dr. Heise,

I am pleased to let you know that, based on your revisions and the reviewer comments below, your manuscript has now been "accepted in principle" as a Research Article at Cell Reports.

Before we can formally accept your manuscript, we require that the final files are uploaded according to our production guidelines as outlined in our Final Files Checklist. We would like to have your final materials within 10 days, but please let us know if you think that you may need more time. Once we receive your final files, we can move forward with accepting your manuscript and scheduling it for publication.

Please note that our article length guidelines have been recently adjusted to reflect that references are no longer counted towards the overall character count of the manuscript. The revised manuscript should conform to the general length restriction for a Research Article, which is **45,000 characters** (including spaces and figure legends) and no more than **7 figures and/or tables**. This count does not include STAR Methods or any supplemental legends, or the reference list. There is some flexibility here, so please contact us to discuss this further.

Please pay attention to the following points when preparing your revised paper:

- To avoid errata, you should **double check all files carefully and ensure that all figure panels are accurate.**
- **Author names cannot be corrected later, thus you should ask all co-authors to carefully check the spelling of their names.**
- I have a few suggestions for the eTOC blurb to trim this to within our guidelines as the eTOC blurb can be up to 50 words. I will email these to you separately I will email these to you separately. Please feel free to modify my suggestions while keeping within these length limits.
- Please submit the main-text figures in individual high resolution files (TIF or high resolution PDF) and ensure that gel and microscopy images are at least 300 pixels per inch at final print size. For clear and accurate presentation of your data, we strongly recommend a vector graphics program (such as Adobe Illustrator or Inkscape) to assemble the figures and verify that at final print size, each displayed image is at least 300 pixels per inch. Note that programs such as Word or Powerpoint often reduce the resolution of primary data images and this should be checked carefully before resubmission.
- Figure legends should include information on biological and technical replicates.
- We routinely implement post-accept figure checks for papers at Cell Press. Thus, we may need to see the original data (uncropped, unlabeled images) for your figures. If so, I'll be in touch with specific instructions. Please ensure you have all raw data underlying the figures quickly accessible in case this is necessary.
- When you split up your single PDF for final file submission, please ensure that the Supplemental information (figures, tables, and legends) is uploaded as a single PDF file.
- The supplemental section should be organized so that the relevant figure legend is placed beneath each Supplementary figure. The text should be Times New Roman (10 point) with single (left) justification of all text in the Supplemental document.
- Each Supplemental figure or table should be linked to at least one main-text figure or table, and/or to STAR Methods. This is indicated in the legend for the Supplemental figure; for example, "Figure S1. Flies lacking YFG do not exhibit changes in grooming behavior. Related to Figures 1 and 3." Every Supplemental figure must be cited at least once in the main text.

STAR Methods

Thank you for including the STAR Methods and Key Resources Table with your revised manuscript. I am including a few further suggestions, particularly as our guidelines are currently changing.

- GENERAL:STAR Methods follows a standardized structure. Please include these specific headings in the following order: RESOURCE AVAILABILITY; EXPERIMENTAL MODEL AND SUBJECT DETAILS; METHOD DETAILS; QUANTIFICATION AND STATISTICAL ANALYSIS; ADDITIONAL RESOURCES. The list below details the information that should be reported in each section. Please see the STAR Methods guide for more information or contact me for help.
- RESOURCE AVAILABILITY: We have just changed our guidelines for this section to require three subsections: Lead Contact, Materials Availability, and Data and Code Availability.
- In the Lead Contact subsection, we require identification and contact information for a Lead Contact, who is the main point of contact for responding to material and resource requests. Please provide the full name and email address for the author taking responsibility for the Lead Contact role. Sample text to include: Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Jane Doe (janedoe@qwerty.com).
- Under the Materials Availability subheading in the Resource Availability section, we require a "Materials

Availability Statement" even if no reagents were generated in the study.

- Examples of the types of appropriate "Materials Availability Statements" are below and the Information for Authors provides further details on the Cell Press Materials Sharing policy. A combination of these Statements may be appropriate:
    - Plasmids generated in this study have been deposited to [Addgene, name and catalog number or unique identifier].
    - Mouse lines generated in this study have been deposited to [the Knockout Mouse Project (KOMP), name and catalog number or unique identifier].
    - This study did not generate new unique reagents.
    - There are restrictions to the availability of [reagent] due to the lack of an external centralized repository for its distribution and our need to maintain the stock. We are glad to share [reagent] with reasonable compensation by requestor for its processing and shipping.
    - [Reagent] generated in this study will be made available on request, but we may require a payment and/or a completed Materials Transfer Agreement if there is potential for commercial application.
    - All unique/stable reagents generated in this study are available from the Lead Contact without restriction.
    - All unique/stable reagents generated in this study are available from the Lead Contact with a completed Materials Transfer Agreement.
- Under the Data and Code Availability subheading in the Resource Availability section, we require a Data and Code Availability Statement.
- Examples of "Data and Code Availability Statements" are below. Statements with multiple types of datasets may use a combination of statements.
    - The [datasets/code] generated during this study are available at [NAME OF REPOSITORY] [ACCESSION CODE/WEB LINK]
    - The published article includes all [datasets/code] generated or analyzed during this study.
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC], but are available from the corresponding author on request.
    - There are restrictions to the availability of [dataset/code] due to [REASON WHY RESTRICTIONS EXIST]
    - Original/source data for [figures/datatype] in the paper is available [i.e. Mendeley Data DOI]
    - Original/source data for [figures/datatype] in the paper is available in supplemental figure X
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC] but are available from the corresponding author on request.
- If the paper does not generate any new data or code, it is appropriate to state the following:
    - This study did not generate any unique datasets or code.
- KEY RESOURCES TABLE (KRT): Some citations also include journal name and this can be removed so that the citations use author name and year as in the main text. Please add the DOIs for the Mendeley Data datasets

Please be sure that the STAR Methods section is in the main Word document and appears after the figure legends. Note that there should be no Supplemental Experimental Procedures or supplemental references section. You can consult the STAR Methods website for further details and for the Key Resources Table template. You may also create the Key Resources Table using this interactive webform. The following are specific issues that need to be addressed in your STAR Methods. **Please email me with any questions (**gteitzel@cell.com**).**

The Final Files Checklist is provided to make sure your paper complies with our guidelines and everything is in order. We suggest having multiple authors review the checklist and revised materials to ensure that all items are complete. If you have any questions about any of the points in the final file checklist, please email us at reports@cell.com.

Please upload your final files to our https://www.editorialmanager.com/cell-reports/ as a revision of CELL-REPORTS-D-19-04583R1. When you submit your revised files, our team will check them and will contact you if there are any remaining formatting issues that need to be resolved. We will also share any editorial comments on the revised files at this point.

OPEN ACCESS LICENSES AND FEES

Cell Reports is a fully Gold Open Access journal. To provide open access, expenses are offset by an author publication fee that allows the journal to support itself and the research community in a fully sustainable way. Cell Reports has a small budget for reducing Open Access charges for authors in developing countries and others in genuine financial hardship. Please note that funds for other reductions are limited.

COVER SUBMISSIONS
If you would like to submit a cover image, please see our cover submission guidelines. Here, you will find guidelines and a cover template that contains the journal logo and crop lines. A striking image on the cover attracts more attention to the paper, so please do consider sending us an image! If desired, please include a statement granting permission to possibly feature your cover submission in a slide show at the top of our homepage.

STAR PROTOCOLS
Consider submitting one of your protocols to STAR Protocols, the new protocols journal from Cell Press. STAR Protocols aims to make the daily work of the scientific researcher easier by providing complete, authoritative, and consistent instructions on how to conduct experiments. STAR Protocols gives scientists the space they need to explain what worked and, perhaps more importantly, what didn't. The primary criteria for publication in STAR Protocols is usability and reproducibility. You can check out their most recent protocols here. If would like to submit your Protocol, please visit their submissions site. If you have any questions, please email starprotocols@cell.com.

Please note that your paper is not formally accepted at this stage and cannot be until we receive the materials listed above. Please let me know if you have any questions, and I look forward to hearing from you.

Sincerely,
Gail

Gail Teitzel, Ph.D.
Deputy Editor, Cell Reports

Reviewer comments:

Reviewer #1: (Comments for the author)
The authors have addressed my concerns and the concerns of the other reviewer and have significantly strengthened what was already a strong manuscript.

Reviewer #2: Author's were responsive to previous reviewer concerns. No further comments.

Complex genetic architecture underlies regulation of influenza A virus-specific antibody responses in the Collaborative Cross
CELL-REPORTS-D-19-04583R1

Mar 16, 2020

Dear Dr. Heise,

I am pleased to let you know that, based on your revisions and the reviewer comments below, your manuscript has now been "accepted in principle" as a Research Article at Cell Reports.

Before we can formally accept your manuscript, we require that the final files are uploaded according to our production guidelines as outlined in our Final Files Checklist. We would like to have your final materials within 10 days, but please let us know if you think that you may need more time. Once we receive your final files, we can move forward with accepting your manuscript and scheduling it for publication.

Please note that our article length guidelines have been recently adjusted to reflect that references are no longer counted towards the overall character count of the manuscript. The revised manuscript should conform to the general length restriction for a Research Article, which is **45,000 characters** (including spaces and figure legends) and no more than **7 figures and/or tables**. This count does not include STAR Methods or any supplemental legends, or the reference list. There is some flexibility here, so please contact us to discuss this further.

Please pay attention to the following points when preparing your revised paper:

• To avoid errata, you should **double check all files carefully and ensure that all figure panels are accurate.**
• **Author names cannot be corrected later, thus you should ask all co-authors to carefully check the spelling of their names.**
• I have a few suggestions for the eTOC blurb to trim this to within our guidelines as the eTOC blurb can be up to 50 words. I will email these to you separately I will email these to you separately. Please feel free to modify my suggestions while keeping within these length limits.
• Please submit the main-text figures in individual high resolution files (TIF or high resolution PDF) and ensure that gel and microscopy images are at least 300 pixels per inch at final print size. For clear and accurate presentation of your data, we strongly recommend a vector graphics program (such as Adobe Illustrator or Inkscape) to assemble the figures and verify that at final print size, each displayed image is at least 300 pixels per inch. Note that programs such as Word or Powerpoint often reduce the resolution of primary data images and this should be checked carefully before resubmission.
• Figure legends should include information on biological and technical replicates.
• We routinely implement post-accept figure checks for papers at Cell Press. Thus, we may need to see the original data (uncropped, unlabeled images) for your figures. If so, I'll be in touch with specific instructions. Please ensure you have all raw data underlying the figures quickly accessible in case this is necessary.
• When you split up your single PDF for final file submission, please ensure that the Supplemental information (figures, tables, and legends) is uploaded as a single PDF file.
• The supplemental section should be organized so that the relevant figure legend is placed beneath each Supplementary figure. The text should be Times New Roman (10 point) with single (left) justification of all text in the Supplemental document.
• Each Supplemental figure or table should be linked to at least one main-text figure or table, and/or to STAR Methods. This is indicated in the legend for the Supplemental figure; for example, "Figure S1. Flies lacking YFG do not exhibit changes in grooming behavior. Related to Figures 1 and 3." Every Supplemental figure must be cited at least once in the main text.

STAR Methods

Thank you for including the STAR Methods and Key Resources Table with your revised manuscript. I am including a few further suggestions, particularly as our guidelines are currently changing.

• GENERAL:STAR Methods follows a standardized structure. Please include these specific headings in the following order: RESOURCE AVAILABILITY; EXPERIMENTAL MODEL AND SUBJECT DETAILS; METHOD DETAILS; QUANTIFICATION AND STATISTICAL ANALYSIS; ADDITIONAL RESOURCES. The list below details the information that should be reported in each section. Please see the STAR Methods guide for more information or contact me for help.
• RESOURCE AVAILABILITY: We have just changed our guidelines for this section to require three subsections: Lead Contact, Materials Availability, and Data and Code Availability.
• In the Lead Contact subsection, we require identification and contact information for a Lead Contact, who is the main point of contact for responding to material and resource requests. Please provide the full name and email address for the author taking responsibility for the Lead Contact role. Sample text to include: Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Jane Doe (janedoe@qwerty.com).
• Under the Materials Availability subheading in the Resource Availability section, we require a "Materials Availability Statement" even if no reagents were generated in the study.
• Examples of the types of appropriate "Materials Availability Statements" are below and the Information for Authors provides further details on the Cell Press Materials Sharing policy. A combination of these Statements may be appropriate:
    - Plasmids generated in this study have been deposited to [Addgene, name and catalog number or unique identifier].
    - Mouse lines generated in this study have been deposited to [the Knockout Mouse Project (KOMP), name and catalog number or unique identifier].
    - This study did not generate new unique reagents.
    - There are restrictions to the availability of [reagent] due to the lack of an external centralized repository for

its distribution and our need to maintain the stock. We are glad to share [reagent] with reasonable compensation by requestor for its processing and shipping.
    - [Reagent] generated in this study will be made available on request, but we may require a payment and/or a completed Materials Transfer Agreement if there is potential for commercial application.
    - All unique/stable reagents generated in this study are available from the Lead Contact without restriction.
    - All unique/stable reagents generated in this study are available from the Lead Contact with a completed Materials Transfer Agreement.
- Under the Data and Code Availability subheading in the Resource Availability section, we require a Data and Code Availability Statement.
- Examples of "Data and Code Availability Statements" are below. Statements with multiple types of datasets may use a combination of statements.
    - The [datasets/code] generated during this study are available at [NAME OF REPOSITORY] [ACCESSION CODE/WEB LINK]
    - The published article includes all [datasets/code] generated or analyzed during this study.
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC], but are available from the corresponding author on request.
    - There are restrictions to the availability of [dataset/code] due to [REASON WHY RESTRICTIONS EXIST]
    - Original/source data for [figures/datatype] in the paper is available [i.e. Mendeley Data DOI]
    - Original/source data for [figures/datatype] in the paper is available in supplemental figure X
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC] but are available from the corresponding author on request.
- If the paper does not generate any new data or code, it is appropriate to state the following:
    - This study did not generate any unique datasets or code.
- KEY RESOURCES TABLE (KRT): Some citations also include journal name and this can be removed so that the citations use author name and year as in the main text. Please add the DOIs for the Mendeley Data datasets

Please be sure that the STAR Methods section is in the main Word document and appears after the figure legends. Note that there should be no Supplemental Experimental Procedures or supplemental references section. You can consult the STAR Methods website for further details and for the Key Resources Table template. You may also create the Key Resources Table using this interactive webform. The following are specific issues that need to be addressed in your STAR Methods. **Please email me with any questions (**gteitzel@cell.com**).**

The Final Files Checklist is provided to make sure your paper complies with our guidelines and everything is in order. We suggest having multiple authors review the checklist and revised materials to ensure that all items are complete. If you have any questions about any of the points in the final file checklist, please email us at reports@cell.com.

Please upload your final files to our https://www.editorialmanager.com/cell-reports/ as a revision of CELL-REPORTS-D-19-04583R1. When you submit your revised files, our team will check them and will contact you if there are any remaining formatting issues that need to be resolved. We will also share any editorial comments on the revised files at this point.

OPEN ACCESS LICENSES AND FEES

Cell Reports is a fully Gold Open Access journal. To provide open access, expenses are offset by an author publication fee that allows the journal to support itself and the research community in a fully sustainable way. Cell Reports has a small budget for reducing Open Access charges for authors in developing countries and others in genuine financial hardship. Complex genetic architecture underlies regulation of influenza A virus-specific antibody responses in the Collaborative Cross
CELL-REPORTS-D-19-04583R1

Mar 16, 2020

Dear Dr. Heise,

I am pleased to let you know that, based on your revisions and the reviewer comments below, your manuscript has now been "accepted in principle" as a Research Article at Cell Reports.

Before we can formally accept your manuscript, we require that the final files are uploaded according to our production guidelines as outlined in our Final Files Checklist. We would like to have your final materials within 10 days, but please let

us know if you think that you may need more time. Once we receive your final files, we can move forward with accepting your manuscript and scheduling it for publication.

Please note that our article length guidelines have been recently adjusted to reflect that references are no longer counted towards the overall character count of the manuscript. The revised manuscript should conform to the general length restriction for a Research Article, which is **45,000 characters** (including spaces and figure legends) and no more than **7 figures and/or tables**. This count does not include STAR Methods or any supplemental legends, or the reference list. There is some flexibility here, so please contact us to discuss this further.

Please pay attention to the following points when preparing your revised paper:

- To avoid errata, you should **double check all files carefully and ensure that all figure panels are accurate.**
- **Author names cannot be corrected later, thus you should ask all co-authors to carefully check the spelling of their names.**
- I have a few suggestions for the eTOC blurb to trim this to within our guidelines as the eTOC blurb can be up to 50 words. I will email these to you separately I will email these to you separately. Please feel free to modify my suggestions while keeping within these length limits.
- Please submit the main-text figures in individual high resolution files (TIF or high resolution PDF) and ensure that gel and microscopy images are at least 300 pixels per inch at final print size. For clear and accurate presentation of your data, we strongly recommend a vector graphics program (such as Adobe Illustrator or Inkscape) to assemble the figures and verify that at final print size, each displayed image is at least 300 pixels per inch. Note that programs such as Word or Powerpoint often reduce the resolution of primary data images and this should be checked carefully before resubmission.
- Figure legends should include information on biological and technical replicates.
- We routinely implement post-accept figure checks for papers at Cell Press. Thus, we may need to see the original data (uncropped, unlabeled images) for your figures. If so, I'll be in touch with specific instructions. Please ensure you have all raw data underlying the figures quickly accessible in case this is necessary.
- When you split up your single PDF for final file submission, please ensure that the Supplemental information (figures, tables, and legends) is uploaded as a single PDF file.
- The supplemental section should be organized so that the relevant figure legend is placed beneath each Supplementary figure. The text should be Times New Roman (10 point) with single (left) justification of all text in the Supplemental document.
- Each Supplemental figure or table should be linked to at least one main-text figure or table, and/or to STAR Methods. This is indicated in the legend for the Supplemental figure; for example, "Figure S1. Flies lacking YFG do not exhibit changes in grooming behavior. Related to Figures 1 and 3." Every Supplemental figure must be cited at least once in the main text.

STAR Methods

Thank you for including the STAR Methods and Key Resources Table with your revised manuscript. I am including a few further suggestions, particularly as our guidelines are currently changing.

- GENERAL:STAR Methods follows a standardized structure. Please include these specific headings in the following order: RESOURCE AVAILABILITY; EXPERIMENTAL MODEL AND SUBJECT DETAILS; METHOD DETAILS; QUANTIFICATION AND STATISTICAL ANALYSIS; ADDITIONAL RESOURCES. The list below details the information that should be reported in each section. Please see the STAR Methods guide for more information or contact me for help.
- RESOURCE AVAILABILITY: We have just changed our guidelines for this section to require three subsections: Lead Contact, Materials Availability, and Data and Code Availability.
- In the Lead Contact subsection, we require identification and contact information for a Lead Contact, who is the main point of contact for responding to material and resource requests. Please provide the full name and email address for the author taking responsibility for the Lead Contact role. Sample text to include: Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Jane Doe

(janedoe@qwerty.com).

- Under the Materials Availability subheading in the Resource Availability section, we require a "Materials Availability Statement" even if no reagents were generated in the study.
- Examples of the types of appropriate "Materials Availability Statements" are below and the Information for Authors provides further details on the Cell Press Materials Sharing policy. A combination of these Statements may be appropriate:
    - Plasmids generated in this study have been deposited to [Addgene, name and catalog number or unique identifier].
    - Mouse lines generated in this study have been deposited to [the Knockout Mouse Project (KOMP), name and catalog number or unique identifier].
    - This study did not generate new unique reagents.
    - There are restrictions to the availability of [reagent] due to the lack of an external centralized repository for its distribution and our need to maintain the stock. We are glad to share [reagent] with reasonable compensation by requestor for its processing and shipping.
    - [Reagent] generated in this study will be made available on request, but we may require a payment and/or a completed Materials Transfer Agreement if there is potential for commercial application.
    - All unique/stable reagents generated in this study are available from the Lead Contact without restriction.
    - All unique/stable reagents generated in this study are available from the Lead Contact with a completed Materials Transfer Agreement.
- Under the Data and Code Availability subheading in the Resource Availability section, we require a Data and Code Availability Statement.
- Examples of "Data and Code Availability Statements" are below. Statements with multiple types of datasets may use a combination of statements.
    - The [datasets/code] generated during this study are available at [NAME OF REPOSITORY] [ACCESSION CODE/WEB LINK]
    - The published article includes all [datasets/code] generated or analyzed during this study.
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC], but are available from the corresponding author on request.
    - There are restrictions to the availability of [dataset/code] due to [REASON WHY RESTRICTIONS EXIST]
    - Original/source data for [figures/datatype] in the paper is available [i.e. Mendeley Data DOI]
    - Original/source data for [figures/datatype] in the paper is available in supplemental figure X
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC] but are available from the corresponding author on request.
- If the paper does not generate any new data or code, it is appropriate to state the following:
    - This study did not generate any unique datasets or code.
- KEY RESOURCES TABLE (KRT): Some citations also include journal name and this can be removed so that the citations use author name and year as in the main text. Please add the DOIs for the Mendeley Data datasets

Please be sure that the STAR Methods section is in the main Word document and appears after the figure legends. Note that there should be no Supplemental Experimental Procedures or supplemental references section. You can consult the STAR Methods website for further details and for the Key Resources Table template. You may also create the Key Resources Table using this interactive webform. The following are specific issues that need to be addressed in your STAR Methods. **Please email me with any questions (**gteitzel@cell.com**).**

The Final Files Checklist is provided to make sure your paper complies with our guidelines and everything is in order. We suggest having multiple authors review the checklist and revised materials to ensure that all items are complete. If you have any questions about any of the points in the final file checklist, please email us at reports@cell.com.

Please upload your final files to our https://www.editorialmanager.com/cell-reports/ as a revision of CELL-REPORTS-D-19-04583R1. When you submit your revised files, our team will check them and will contact you if there are any remaining formatting issues that need to be resolved. We will also share any editorial comments on the revised files at this point.

OPEN ACCESS LICENSES AND FEES

Cell Reports is a fully Gold Open Access journal. To provide open access, expenses are offset by an author publication fee that allows the journal to support itself and the research community in a fully sustainable way. Cell Reports has a small

budget for reducing Open Access charges for authors in developing countries and others in genuine financial hardship. Please note that funds for other reductions are limited.

COVER SUBMISSIONS
If you would like to submit a cover image, please see our cover submission guidelines. Here, you will find guidelines and a cover template that contains the journal logo and crop lines. A striking image on the cover attracts more attention to the paper, so please do consider sending us an image! If desired, please include a statement granting permission to possibly feature your cover submission in a slide show at the top of our homepage.

STAR PROTOCOLS
Consider submitting one of your protocols to STAR Protocols, the new protocols journal from Cell Press. STAR Protocols aims to make the daily work of the scientific researcher easier by providing complete, authoritative, and consistent instructions on how to conduct experiments. STAR Protocols gives scientists the space they need to explain what worked and, perhaps more importantly, what didn't. The primary criteria for publication in STAR Protocols is usability and reproducibility. You can check out their most recent protocols here. If would like to submit your Protocol, please visit their submissions site. If you have any questions, please email starprotocols@cell.com.

Please note that your paper is not formally accepted at this stage and cannot be until we receive the materials listed above. Please let me know if you have any questions, and I look forward to hearing from you.

Sincerely,
Gail

Gail Teitzel, Ph.D.
Deputy Editor, Cell Reports

Reviewer comments:

Reviewer #1: (Comments for the author)
The authors have addressed my concerns and the concerns of the other reviewer and have significantly strengthened what was already a strong manuscript.

Reviewer #2: Author's were responsive to previous reviewer concerns. No further comments.

CELL-REPORTS-D-19-04583R1

Mar 16, 2020

Dear Dr. Heise,

I am pleased to let you know that, based on your revisions and the reviewer comments below, your manuscript has now been "accepted in principle" as a Research Article at Cell Reports.

Before we can formally accept your manuscript, we require that the final files are uploaded according to our production guidelines as outlined in our Final Files Checklist. We would like to have your final materials within 10 days, but please let us know if you think that you may need more time. Once we receive your final files, we can move forward with accepting your manuscript and scheduling it for publication.

Please note that our article length guidelines have been recently adjusted to reflect that references are no longer counted towards the overall character count of the manuscript. The revised manuscript should conform to the general length restriction for a Research Article, which is **45,000 characters** (including spaces and figure legends) and no more than **7 figures and/or tables**. This count does not include STAR Methods or any supplemental legends, or the reference list. There is some flexibility here, so please contact us to discuss this further.

Please pay attention to the following points when preparing your revised paper:

- To avoid errata, you should **double check all files carefully and ensure that all figure panels are accurate.**
- **Author names cannot be corrected later, thus you should ask all co-authors to carefully check the spelling of their names.**
- I have a few suggestions for the eTOC blurb to trim this to within our guidelines as the eTOC blurb can be up to 50 words. I will email these to you separately I will email these to you separately. Please feel free to modify my suggestions while keeping within these length limits.
- Please submit the main-text figures in individual high resolution files (TIF or high resolution PDF) and ensure that gel and microscopy images are at least 300 pixels per inch at final print size. For clear and accurate presentation of your data, we strongly recommend a vector graphics program (such as Adobe Illustrator or Inkscape) to assemble the figures and verify that at final print size, each displayed image is at least 300 pixels per inch. Note that programs such as Word or Powerpoint often reduce the resolution of primary data images and this should be checked carefully before resubmission.
- Figure legends should include information on biological and technical replicates.
- We routinely implement post-accept figure checks for papers at Cell Press. Thus, we may need to see the original data (uncropped, unlabeled images) for your figures. If so, I'll be in touch with specific instructions. Please ensure you have all raw data underlying the figures quickly accessible in case this is necessary.
- When you split up your single PDF for final file submission, please ensure that the Supplemental information (figures, tables, and legends) is uploaded as a single PDF file.
- The supplemental section should be organized so that the relevant figure legend is placed beneath each Supplementary figure. The text should be Times New Roman (10 point) with single (left) justification of all text in the Supplemental document.
- Each Supplemental figure or table should be linked to at least one main-text figure or table, and/or to STAR Methods. This is indicated in the legend for the Supplemental figure; for example, "Figure S1. Flies lacking YFG do not exhibit changes in grooming behavior. Related to Figures 1 and 3." Every Supplemental figure must be cited at least once in the main text.

STAR Methods

Thank you for including the STAR Methods and Key Resources Table with your revised manuscript. I am including a few further suggestions, particularly as our guidelines are currently changing.

- GENERAL:STAR Methods follows a standardized structure. Please include these specific headings in the following order: RESOURCE AVAILABILITY; EXPERIMENTAL MODEL AND SUBJECT DETAILS; METHOD DETAILS; QUANTIFICATION AND STATISTICAL ANALYSIS; ADDITIONAL RESOURCES. The list below details the information that should be reported in each section. Please see the STAR Methods guide for more information or contact me for help.
- RESOURCE AVAILABILITY: We have just changed our guidelines for this section to require three subsections: Lead Contact, Materials Availability, and Data and Code Availability.
- In the Lead Contact subsection, we require identification and contact information for a Lead Contact, who is the main point of contact for responding to material and resource requests. Please provide the full name and email address for the author taking responsibility for the Lead Contact role. Sample text to include: Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Jane Doe (janedoe@qwerty.com).
- Under the Materials Availability subheading in the Resource Availability section, we require a "Materials Availability Statement" even if no reagents were generated in the study.
- Examples of the types of appropriate "Materials Availability Statements" are below and the Information for Authors provides further details on the Cell Press Materials Sharing policy. A combination of these Statements may be appropriate:
    - Plasmids generated in this study have been deposited to [Addgene, name and catalog number or unique identifier].
    - Mouse lines generated in this study have been deposited to [the Knockout Mouse Project (KOMP), name and catalog number or unique identifier].
    - This study did not generate new unique reagents.
    - There are restrictions to the availability of [reagent] due to the lack of an external centralized repository for its distribution and our need to maintain the stock. We are glad to share [reagent] with reasonable compensation by requestor for its processing and shipping.
    - [Reagent] generated in this study will be made available on request, but we may require a payment and/or a completed Materials Transfer Agreement if there is potential for commercial application.
    - All unique/stable reagents generated in this study are available from the Lead Contact without restriction.
    - All unique/stable reagents generated in this study are available from the Lead Contact with a completed Materials Transfer Agreement.
- Under the Data and Code Availability subheading in the Resource Availability section, we require a Data and Code Availability Statement.
- Examples of "Data and Code Availability Statements" are below. Statements with multiple types of datasets may use a combination of statements.
    - The [datasets/code] generated during this study are available at [NAME OF REPOSITORY] [ACCESSION CODE/WEB LINK]
    - The published article includes all [datasets/code] generated or analyzed during this study.
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC], but are available from the corresponding author on request.
    - There are restrictions to the availability of [dataset/code] due to [REASON WHY RESTRICTIONS EXIST]
    - Original/source data for [figures/datatype] in the paper is available [i.e. Mendeley Data DOI]
    - Original/source data for [figures/datatype] in the paper is available in supplemental figure X
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC] but are available from the corresponding author on request.
- If the paper does not generate any new data or code, it is appropriate to state the following:
    - This study did not generate any unique datasets or code.
- KEY RESOURCES TABLE (KRT): Some citations also include journal name and this can be removed so that the citations use author name and year as in the main text. Please add the DOIs for the Mendeley Data datasets

Please be sure that the STAR Methods section is in the main Word document and appears after the figure legends. Note that there should be no Supplemental Experimental Procedures or supplemental references section. You can consult the STAR Methods website for further details and for the Key Resources Table template. You may also create the Key Resources Table using this interactive webform. The following are specific issues that need to be addressed in your STAR Methods. **Please email me with any questions (**gteitzel@cell.com**).**

The Final Files Checklist is provided to make sure your paper complies with our guidelines and everything is in order. We suggest having multiple authors review the checklist and revised materials to ensure that all items are complete. If you have any questions about any of the points in the final file checklist, please email us at reports@cell.com.

Please upload your final files to our https://www.editorialmanager.com/cell-reports/ as a revision of CELL-REPORTS-D-19-04583R1. When you submit your revised files, our team will check them and will contact you if there are any remaining formatting issues that need to be resolved. We will also share any editorial comments on the revised files at this point.

OPEN ACCESS LICENSES AND FEES
Cell Reports is a fully Gold Open Access journal. To provide open access, expenses are offset by an author publication fee that allows the journal to support itself and the research community in a fully sustainable way. Cell Reports has a small budget for reducing Open Access charges for authors in developing countries and others in genuine financial hardship. Please note that funds for other reductions are limited.

COVER SUBMISSIONS
If you would like to submit a cover image, please see our cover submission guidelines. Here, you will find guidelines and a cover template that contains the journal logo and crop lines. A striking image on the cover attracts more attention to the paper, so please do consider sending us an image! If desired, please include a statement granting permission to possibly feature your cover submission in a slide show at the top of our homepage.

STAR PROTOCOLS
Consider submitting one of your protocols to STAR Protocols, the new protocols journal from Cell Press. STAR Protocols aims to make the daily work of the scientific researcher easier by providing complete, authoritative, and consistent instructions on how to conduct experiments. STAR Protocols gives scientists the space they need to explain what worked and, perhaps more importantly, what didn't. The primary criteria for publication in STAR Protocols is usability and reproducibility. You can check out their most recent protocols here. If would like to submit your Protocol, please visit their submissions site. If you have any questions, please email starprotocols@cell.com.

Please note that your paper is not formally accepted at this stage and cannot be until we receive the materials listed above. Please let me know if you have any questions, and I look forward to hearing from you.

Sincerely,
Gail

Dear Dr. Heise,

I am pleased to let you know that, based on your revisions and the reviewer comments below, your manuscript has now been "accepted in principle" as a Research Article at Cell Reports.

Before we can formally accept your manuscript, we require that the final files are uploaded according to our production guidelines as outlined in our Final Files Checklist. We would like to have your final materials within 10 days, but please let us know if you think that you may need more time. Once we receive your final files, we can move forward with accepting your manuscript and scheduling it for publication.

Please note that our article length guidelines have been recently adjusted to reflect that references are no longer counted towards the overall character count of the manuscript. The revised manuscript should conform to the general length restriction for a Research Article, which is **45,000 characters** (including spaces and figure legends) and no more than **7 figures and/or tables**. This count does not include STAR Methods or any supplemental legends, or the reference list. There is some flexibility here, so please contact us to discuss this further.

Please pay attention to the following points when preparing your revised paper:

- To avoid errata, you should **double check all files carefully and ensure that all figure panels are accurate.**
- **Author names cannot be corrected later, thus you should ask all co-authors to carefully check the spelling of their names.**
- I have a few suggestions for the eTOC blurb to trim this to within our guidelines as the eTOC blurb can be up to 50 words. I will email these to you separately I will email these to you separately. Please feel free to modify my suggestions while keeping within these length limits.
- Please submit the main-text figures in individual high resolution files (TIF or high resolution PDF) and ensure that gel and microscopy images are at least 300 pixels per inch at final print size. For clear and accurate presentation of your data, we strongly recommend a vector graphics program (such as Adobe Illustrator or Inkscape) to assemble the figures and verify that at final print size, each displayed image is at least 300 pixels per inch. Note that programs such as Word or Powerpoint often reduce the resolution of primary data images and this should be checked carefully before resubmission.
- Figure legends should include information on biological and technical replicates.
- We routinely implement post-accept figure checks for papers at Cell Press. Thus, we may need to see the original data (uncropped, unlabeled images) for your figures. If so, I'll be in touch with specific instructions. Please ensure you have all raw data underlying the figures quickly accessible in case this is necessary.
- When you split up your single PDF for final file submission, please ensure that the Supplemental information (figures, tables, and legends) is uploaded as a single PDF file.
- The supplemental section should be organized so that the relevant figure legend is placed beneath each Supplementary figure. The text should be Times New Roman (10 point) with single (left) justification of all text in the Supplemental document.
- Each Supplemental figure or table should be linked to at least one main-text figure or table, and/or to STAR Methods. This is indicated in the legend for the Supplemental figure; for example, "Figure S1. Flies lacking YFG do not exhibit changes in grooming behavior. Related to Figures 1 and 3." Every Supplemental figure must be cited at least once in the main text.

STAR Methods

Thank you for including the STAR Methods and Key Resources Table with your revised manuscript. I am including a few further suggestions, particularly as our guidelines are currently changing.

- GENERAL:STAR Methods follows a standardized structure. Please include these specific headings in the following order: RESOURCE AVAILABILITY; EXPERIMENTAL MODEL AND SUBJECT DETAILS; METHOD DETAILS; QUANTIFICATION AND STATISTICAL ANALYSIS; ADDITIONAL RESOURCES. The list below details the information that should be reported in each section. Please see the STAR Methods guide for more information or contact me for help.
- RESOURCE AVAILABILITY: We have just changed our guidelines for this section to require three subsections: Lead Contact, Materials Availability, and Data and Code Availability.
- In the Lead Contact subsection, we require identification and contact information for a Lead Contact, who is the main point of contact for responding to material and resource requests. Please provide the full name and email address for the author taking responsibility for the Lead Contact role. Sample text to include: Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Jane Doe (janedoe@qwerty.com).
- Under the Materials Availability subheading in the Resource Availability section, we require a "Materials Availability Statement" even if no reagents were generated in the study.
- Examples of the types of appropriate "Materials Availability Statements" are below and the Information for Authors provides further details on the Cell Press Materials Sharing policy. A combination of these Statements may be appropriate:
    - Plasmids generated in this study have been deposited to [Addgene, name and catalog number or unique identifier].

Mar 16, 2020

Dear Dr. Heise,

I am pleased to let you know that, based on your revisions and the reviewer comments below, your manuscript has now been "accepted in principle" as a Research Article at Cell Reports.

Before we can formally accept your manuscript, we require that the final files are uploaded according to our production guidelines as outlined in our Final Files Checklist. We would like to have your final materials within 10 days, but please let us know if you think that you may need more time. Once we receive your final files, we can move forward with accepting your manuscript and scheduling it for publication.

Please note that our article length guidelines have been recently adjusted to reflect that references are no longer counted towards the overall character count of the manuscript. The revised manuscript should conform to the general length restriction for a Research Article, which is **45,000 characters** (including spaces and figure legends) and no more than **7 figures and/or tables**. This count does not include STAR Methods or any supplemental legends, or the reference list. There is some flexibility here, so please contact us to discuss this further.

Please pay attention to the following points when preparing your revised paper:

- To avoid errata, you should **double check all files carefully and ensure that all figure panels are accurate.**
- **Author names cannot be corrected later, thus you should ask all co-authors to carefully check the spelling of their names.**
- I have a few suggestions for the eTOC blurb to trim this to within our guidelines as the eTOC blurb can be up to 50 words. I will email these to you separately I will email these to you separately. Please feel free to modify my suggestions while keeping within these length limits.
- Please submit the main-text figures in individual high resolution files (TIF or high resolution PDF) and ensure that gel and microscopy images are at least 300 pixels per inch at final print size. For clear and accurate presentation of your data, we strongly recommend a vector graphics program (such as Adobe Illustrator or Inkscape) to assemble the figures and verify that at final print size, each displayed image is at least 300 pixels per inch. Note that programs such as Word or Powerpoint often reduce the resolution of primary data images and this should be checked carefully before resubmission.
- Figure legends should include information on biological and technical replicates.
- We routinely implement post-accept figure checks for papers at Cell Press. Thus, we may need to see the original data (uncropped, unlabeled images) for your figures. If so, I'll be in touch with specific instructions. Please ensure you have all raw data underlying the figures quickly accessible in case this is necessary.
- When you split up your single PDF for final file submission, please ensure that the Supplemental information (figures, tables, and legends) is uploaded as a single PDF file.
- The supplemental section should be organized so that the relevant figure legend is placed beneath each Supplementary figure. The text should be Times New Roman (10 point) with single (left) justification of all text in the Supplemental document.
- Each Supplemental figure or table should be linked to at least one main-text figure or table, and/or to STAR Methods. This is indicated in the legend for the Supplemental figure; for example, "Figure S1. Flies lacking YFG do not exhibit changes in grooming behavior. Related to Figures 1 and 3." Every Supplemental figure must be cited at least once in the main text.

STAR Methods

Thank you for including the STAR Methods and Key Resources Table with your revised manuscript. I am including a few further suggestions, particularly as our guidelines are currently changing.

- GENERAL:STAR Methods follows a standardized structure. Please include these specific headings in the following order: RESOURCE AVAILABILITY; EXPERIMENTAL MODEL AND SUBJECT DETAILS; METHOD DETAILS; QUANTIFICATION AND STATISTICAL ANALYSIS; ADDITIONAL RESOURCES. The list below details the information that should be reported in each section. Please see the STAR Methods guide

for more information or contact me for help.

- RESOURCE AVAILABILITY: We have just changed our guidelines for this section to require three subsections: Lead Contact, Materials Availability, and Data and Code Availability.
- In the Lead Contact subsection, we require identification and contact information for a Lead Contact, who is the main point of contact for responding to material and resource requests. Please provide the full name and email address for the author taking responsibility for the Lead Contact role. Sample text to include: Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Jane Doe (janedoe@qwerty.com).
- Under the Materials Availability subheading in the Resource Availability section, we require a "Materials Availability Statement" even if no reagents were generated in the study.
- Examples of the types of appropriate "Materials Availability Statements" are below and the Information for Authors provides further details on the Cell Press Materials Sharing policy. A combination of these Statements may be appropriate:
    - Plasmids generated in this study have been deposited to [Addgene, name and catalog number or unique identifier].
    - Mouse lines generated in this study have been deposited to [the Knockout Mouse Project (KOMP), name and catalog number or unique identifier].
    - This study did not generate new unique reagents.
    - There are restrictions to the availability of [reagent] due to the lack of an external centralized repository for its distribution and our need to maintain the stock. We are glad to share [reagent] with reasonable compensation by requestor for its processing and shipping.
    - [Reagent] generated in this study will be made available on request, but we may require a payment and/or a completed Materials Transfer Agreement if there is potential for commercial application.
    - All unique/stable reagents generated in this study are available from the Lead Contact without restriction.
    - All unique/stable reagents generated in this study are available from the Lead Contact with a completed Materials Transfer Agreement.
- Under the Data and Code Availability subheading in the Resource Availability section, we require a Data and Code Availability Statement.
- Examples of "Data and Code Availability Statements" are below. Statements with multiple types of datasets may use a combination of statements.
    - The [datasets/code] generated during this study are available at [NAME OF REPOSITORY] [ACCESSION CODE/WEB LINK]
    - The published article includes all [datasets/code] generated or analyzed during this study.
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC], but are available from the corresponding author on request.
    - There are restrictions to the availability of [dataset/code] due to [REASON WHY RESTRICTIONS EXIST]
    - Original/source data for [figures/datatype] in the paper is available [i.e. Mendeley Data DOI]
    - Original/source data for [figures/datatype] in the paper is available in supplemental figure X
    - The [datasets/code] supporting the current study have not been deposited in a public repository because [REASON WHY DATA ARE NOT PUBLIC] but are available from the corresponding author on request.
- If the paper does not generate any new data or code, it is appropriate to state the following:
    - This study did not generate any unique datasets or code.
- KEY RESOURCES TABLE (KRT): Some citations also include journal name and this can be removed so that the citations use author name and year as in the main text. Please add the DOIs for the Mendeley Data datasets

Please be sure that the STAR Methods section is in the main Word document and appears after the figure legends. Note that there should be no Supplemental Experimental Procedures or supplemental references section. You can consult the STAR Methods website for further details and for the Key Resources Table template. You may also create the Key Resources Table using this interactive webform. The following are specific issues that need to be addressed in your STAR Methods. **Please email me with any questions (**gteitzel@cell.com**).**

The Final Files Checklist is provided to make sure your paper complies with our guidelines and everything is in order. We suggest having multiple authors review the checklist and revised materials to ensure that all items are complete. If you have any questions about any of the points in the final file checklist, please email us at reports@cell.com.

Please upload your final files to our https://www.editorialmanager.com/cell-reports/ as a revision of CELL-REPORTS-D-19-04583R1. When you submit your revised files, our team will check them and will contact you if there are any remaining formatting issues that need to be resolved. We will also share any editorial comments on the revised files at this point.

OPEN ACCESS LICENSES AND FEES
Cell Reports is a fully Gold Open Access journal. To provide open access, expenses are offset by an author publication fee that allows the journal to support itself and the research community in a fully sustainable way. Cell Reports has a small budget for reducing Open Access charges for authors in developing countries and others in genuine financial hardship. Please note that funds for other reductions are limited.

COVER SUBMISSIONS
If you would like to submit a cover image, please see our cover submission guidelines. Here, you will find guidelines and a cover template that contains the journal logo and crop lines. A striking image on the cover attracts more attention to the paper, so please do consider sending us an image! If desired, please include a statement granting permission to possibly feature your cover submission in a slide show at the top of our homepage.

STAR PROTOCOLS
Consider submitting one of your protocols to STAR Protocols, the new protocols journal from Cell Press. STAR Protocols aims to make the daily work of the scientific researcher easier by providing complete, authoritative, and consistent instructions on how to conduct experiments. STAR Protocols gives scientists the space they need to explain what worked and, perhaps more importantly, what didn't. The primary criteria for publication in STAR Protocols is usability and reproducibility. You can check out their most recent protocols here. If would like to submit your Protocol, please visit their submissions site. If you have any questions, please email starprotocols@cell.com.

Please note that your paper is not formally accepted at this stage and cannot be until we receive the materials listed above. Please let me know if you have any questions, and I look forward to hearing from you.

Sincerely,
Gail

Gail Teitzel, Ph.D.
Deputy Editor, Cell Reports

Reviewer comments:

Reviewer #1: (Comments for the author)
The authors have addressed my concerns and the concerns of the other reviewer and have significantly strengthened what was already a strong manuscript.

Reviewer #2: Author's were responsive to previous reviewer concerns. No further comments.

Subject: SARS-CoV-2 Weekly Investigators Meeting

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Hi Everyone,

We will be incorporating COVID-19 Cohort presentations to our arsenal of talks. As a reminder, the goal for the weekly SARS-CoV-2 Investigators meeting is to provide a platform that is informative and encourages collaboration.

If you would like to present your research, please let me know. *

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

CANCELING to give you all time to catch up from the long weekend

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Optional Attendees: David Montefiori, Ph.D.; Michael, Nelson; Zhou, Bin (CDC/DDID/NCIRD/ID); Peter Halfmann; Holbrook, Michael (NIH/NIAID) [C]; Hensley, Lisa (NIH/NIAID) [E]; Gardner, Meredith Elizabeth Davis; Weaver, Scott

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Marciela DeGrace is inviting you to a scheduled ZoomGov meeting.

Hi Everyone,

We will be incorporating COVID-19 Cohort presentations to our arsenal of talks. As a reminder, the goal for the weekly SARS-CoV-2 Investigators meeting is to provide a platform that is informative and encourages collaboration.

If you would like to present your research, please let me know. *

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Sent: Sun 2/7/2021 1:27:14 PM (UTC-06:00)

Subject: WHO Working Group on COVID-19 Assays

From: Antiviral Drug Discovery and Development Center-AD3C[ad3c@peds.uab.edu]

Importance: Normal

Subject: Canceled: Monthly AD3C Project/Core Teleconference Call

Start Time: Thur 1/23/2020 4:30:00 PM (UTC-05:00)

End Time: Thur 1/23/2020 6:00:00 PM (UTC-05:00)

Required Attendees: 'Alana Centilli'; 'Alec Hirsch'; 'Ardina Pruijssers'; 'Ashish Pathak'; 'Babu Tekwani'; 'Bob Bostwick'; 'Carrie Evans'; Chad Petit; 'Clare O'Regan'; 'Corinne Augelli-Szafran'; 'Daniel Streblow'; 'Erica Bitten'; 'Fahim Ahmad'; 'George Painter'; 'Greg Bluemling'; 'Hope Angel'; 'Jay Nelson'; 'Jessica Smith'; 'Jim Chappell'; 'Lynn Rasmussen'; 'Maria Agostini'; 'Mark Denison'; 'Mark Heise'; 'Mark Suto'; Mary Wyatt Bowers; 'Mason Wu'; 'Michael Diamond'; 'Miranda Nebane'; 'Nichole Tower'; 'Omar Moukha-Chafiq'; Shi, Pei yong; 'Rachel Graham'; 'Ralph Baric'; Richard Whitley, M.D.; 'Ron Swanstrom'; 'Shuntai Zhou'; Stephanie Moore; 'Thomas Morrison'; 'Tim Sheahan'; 'Toni Baric'; 'Victor DeFilippis'; 'Amelia.s.george@vumc.org'; 'Hughes, Tia M'; 'kak@uab.edu'; Tameca Winston; 'Nicole Haese'

Optional Attendees: 'Suto, Mark J.'; 'Rasmussen, Lynn'; 'Swanstrom, Ronald I'; 'Morrison, Thomas'; 'Sides, Kate'

Hello To Everyone:

Just to be safe, I am sending a second message to confirm the cancellation of the monthly AD3C Project/Core Zoom Meeting call at this time. I may have cancelled the Zoom meeting, but not removed this entry from your calendars. This message should accomplish the latter, and remove it from your Outlook calendar. At this time, because many of our institutions are not operating at full capacity, there isn't a lot of monthly progress to report at this time. When we are back to normal operations, we will send a new meeting notice.

However, if anyone would like to discuss anything during this time, please reach out to our Admin Core group and we can arrange a call as needed.

Thank you!

Sara Davis | Program Coordinator II
UAB Research and Pediatric Virology/Pediatrics/Infectious Diseases
UAB | The University of Alabama at Birmingham
CHB Room 303| 1600 7th Avenue S | Birmingham, AL 35233-1711

Subject: NIAID Location tomorrow
Fishers Lane map[1].pptx

Hello all,
Just figured I'd send these details below out again for quick reference. Attached is the map for the meeting location too.

See you in the morning!
-Steph

Meeting Location:
NIAID
5601 Fishers Lane
Rockville MD 20852

Building Access: It is very important that you arrive at the building by **8:30 am Eastern Time** to allow sufficient time to get through security. Domestic travelers will need a government issued ID (i.e. driver's license) to enter the building. We plan to meet as a group in the lobby, but if you are early/late, please call Maureen Beanan at 301-339-4753 when you arrive at the lobby security station and she or one of her colleagues will come down to escort you.

Parking: Parking is available in the garage at 5635 Fishers Lane, Rockville, MD 20852 – the road to the garage is the first left after turning on to Fisher's Lane. The garage will be at the end of a road. Walk back out to Fisher's Lane, turn left and walk one block, cross the street to reach our building, about a 3 minute walk.

Meeting schedule: 9:00 to 11:00 am Part I: (~2.0 hours, including time for questions)
(Audience: This part of the meeting is open to all NIAID staff, including CETR Program Staff and all other interested NIAID staff)

9:00 am NIAID CETR staff welcome participants and Introductions (5 minutes)

9:05 am CETR presentations:

- Brief overview of the Center including the goals, administrative structure, projects, and cores – please include a slide summarizing the progress of depositing the genome sequences into NCBI in this part of the presentation;
- Report on Year 1 activities for each project (~15-20 minutes per project)
- Summarize the status of the project at the end of Year 1 (1 slide)
- Describe the progress on each project during year 1 and plans for remaining 4 years

11:00 am to 12:00 pm Part II: Discussion with CETR Program staff (~0.5 - 1 hour)
Possible topics:

- Senior NIAID staff questions
- Issues that have arisen during year and proposed options
- CETR Program updates
- Annual Progress Report questions

Subject: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda and zoom information for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday June 9 2:30PM CET (Geneva Time)

1. Theodora Hatziioannou (Rockefeller) - *Evolution of neutralizing antibody responses to SARS-CoV-2*
2. Larry Dumont (Vitalant Research)- *SARS-CoV-2 Antibody persistence in COVID-19 convalescent plasma donors: Dependency on assay format and applicability to serosurveillance*

Hello all,

Thank you for your attendance at the reverse site visit. Please don't forget to send your signed form to us for reimbursement. Let us know if you have any question. It was so great to see you and I will be in touch!

Thank you,

Steph

Subject: IMPORTANT: Logistics and Presentation Items for the AD3C Reverse Site Visit on February 11, 2020 in Rockville, MD

Greetings and Happy New Year:

It is time to move forward with final plans for the AD3C Reverse Site Visit, scheduled for **Tuesday, February 11, 2020** at the NIAID Building, 5601 Fishers Lane. Rockville, MD. **In preparation for this visit, please read the following instructions carefully:**

- At this time, **please purchase a plane ticket using a domestic carrier and select a seat in economy class**, so your ticket can be reimbursed. For those who will be staying overnight, we suggest that you stay at the Hilton Washington DC/Rockville Hotel, 1750 Rockville Pike, Rockville, MD 20852, Phone is 301-468-1100 and the website link is https://www3.hilton.com/en/hotels/maryland/hilton-washington-dc-rockville-hotel-and-executive-meeting-ctr-IADMRHF/index.html. It is a short walk to the NIAID or a quick cab/Uber ride.

- Please use the attached form to keep track of your travel expenses and speed up reimbursement after the trip. It is important for you to sign the form before sending it to us with your receipts.

- If you will be arriving in the area on the evening of Monday, February 10 and would like to have dinner, **please let us know** so we will have a head count for making a group reservation at a nice local restaurant.

- In order to produce a presentation that contains uniform content for each project, please send the following items to Stephanie Moore at smoore@peds.uab.edu no later than **February 3, 2020** to be compiled into one presentation. There can be **10 slides** maximum per project that will take 20-25 minutes at most to cover. I have attached a blank AD3C slide if you would like to use it. Below are the areas that Maureen Beanan has requested that we cover:

  a. Status (1-2 slides - utilize timeline structure perhaps?)
  b. Accomplishments (2-3 slides)
  c. Proposed for upcoming year(s) (1-2 slides)
  d. Significant publications (1 slide)

Here are additional details on the meeting location, and the meeting agenda provided by NIH for your use, shown below:

Meeting Location:
NIAID
5601 Fishers Lane
Rockville MD 20852

Building Access: It is very important that you arrive at the building by **8:30 am Eastern Time** to allow sufficient time to get through security. Domestic travelers will need a government issued ID (i.e. driver's license) to enter the building. We plan to meet as a group in the lobby, but if you are early/late, please call Maureen Beanan at 301-339-4753 when you arrive at the lobby security station and she or one of her colleagues will come down to escort you.

Parking: Parking is available in the garage at 5635 Fishers Lane, Rockville, MD 20852 – the road to the garage is the first left after turning on to Fisher's Lane. The garage will be at the end of a road. Walk back out to Fisher's Lane, turn left and walk one block, cross the street to reach our building, about a 3 minute walk.

Meeting schedule: 9:00 to 11:00 am Part I: (~2.0 hours, including time for questions)
(Audience: This part of the meeting is open to all NIAID staff, including CETR Program Staff and all other interested NIAID staff)

9:00 am NIAID CETR staff welcome participants and Introductions (5 minutes)

9:05 am CETR presentations:

- Brief overview of the Center including the goals, administrative structure, projects, and cores – please include a slide summarizing the progress of depositing the genome sequences into NCBI in this part of the presentation;
- Report on Year 1 activities for each project (~15-20 minutes per project)
- Summarize the status of the project at the end of Year 1 (1 slide)
- Describe the progress on each project during year 1 and plans for remaining 4 years

11:00 am to 12:00 pm Part II: Discussion with CETR Program staff (~0.5 - 1 hour)
Possible topics:

- Senior NIAID staff questions
- Issues that have arisen during year and proposed options

- CETR Program updates
- Annual Progress Report questions

Thank you for agreeing to participate in the AD3C Reverse Site Visit. If you need any additional items or information, please contact any of our Administrative Core group members and we will be happy to assist you.

With kind regards,

Sara Davis | Program Coordinator II

Subject: Timelines (Microsoft Project, Gantt Chart)
Timeline worksheet.xlsx
Example Timeline.pdf

Dear AD3C Team,

As a follow up to our last AD3C team meeting, I have attached a spreadsheet which will capture all of the information I need to assist you with your Microsoft Project timeline. If you would like my assistance with drafting your timeline, please fill out the attached spreadsheet with all of your tasks, durations and dependencies. Once you return the attached to me, I will draft your timeline and sent it back to you for review. I have also attached an example timeline to give you an idea of the sort of information that we typically capture in a Gantt chart. For the purposes of this specific timeline, the milestone tasks should be Go/No Go decision points.

If you are going to draft your own Gantt Chart, I would greatly appreciate it if you would send me the Microsoft Project file once you have finalized your Gantt. I will need all Gantt Charts in order to compile them into a single file with all projects.

Please let me know if you need any additional information and/or if I can be of assistance!

Thanks,

Carrie

Subject: Timelines (Microsoft Project, Gantt Chart)

Dear AD3C Team,

As a follow up to our last AD3C team meeting, I have attached a spreadsheet which will capture all of the information I need to assist you with your Microsoft Project timeline. If you would like my assistance with drafting your timeline, please fill out the attached spreadsheet with all of your tasks, durations and dependencies. Once you return the attached to me, I will draft your timeline and sent it back to you for review. I have also attached an example timeline to give you an idea of the sort of information that we typically capture in a Gantt chart. For the purposes of this specific timeline, the milestone tasks should be Go/No Go decision points.

If you are going to draft your own Gantt Chart, I would greatly appreciate it if you would send me the Microsoft Project file once you have finalized your Gantt. I will need all Gantt Charts in order to compile them into a single file with all projects.

Please let me know if you need any additional information and/or if I can be of assistance!

Thanks,

Carrie

SARS JVi 8-05.pdf

Hi Guys,
Just wondering if any of you have any suggestions for us regarding a research lab, preferably based in US, that may be interested to pursue testing of PPMO targeted against SARS2_CoV RNA. Of course, it would be necessary that the lab have BSL 3+ facilities.

From the attached paper you can see that PPMO worked well vs SARS1 in cell cultures (never got to try it in vivo). We make PPMO in our lab at OSU. PPMO are not available commercially.

We already have some testing of PPMO vs SARS2 in the works, but are interested to find a reserach lab that may wish to join in and possibly write a grant with us to pursue various project/possibilities. If you would like to discuss please let me know and perhaps we can have a quick phone call.

With Regards,
Dave

Received 10 November 2004/Accepted 4 April 2005

The recently emerged severe acute respiratory syndrome coronavirus (SARS-CoV) is a potent pathogen of humans and is capable of rapid global spread. Peptide-conjugated antisense morpholino oligomers (P-PMO) were designed to bind by base pairing to specific sequences in the SARS-CoV (Tor2 strain) genome. The P-PMO were tested for their capacity to inhibit production of infectious virus as well as to probe the function of conserved viral RNA motifs and secondary structures. Several virus-targeted P-PMO and a random-sequence control P-PMO showed low inhibitory activity against SARS coronavirus. Certain other virus-targeted P-PMO reduced virus-induced cytopathology and cell-to-cell spread as a consequence of decreasing viral amplification. Active P-PMO were effective when administered at any time prior to peak viral synthesis and exerted sustained antiviral effects while present in culture medium. P-PMO showed low nonspecific inhibitory activity against translation of nontargeted RNA or growth of the arenavirus lymphocytic choriomeningitis virus. Two P-PMO targeting the viral transcription-regulatory sequence (TRS) region in the 5′ untranslated region were the most effective inhibitors tested. After several viral passages in the presence of a TRS-targeted P-PMO, partially drug-resistant SARS-CoV mutants arose which contained three contiguous base point mutations at the binding site of a TRS-targeted P-PMO. Those partially resistant viruses grew more slowly and formed smaller plaques than wild-type SARS-CoV. These results suggest PMO compounds have powerful therapeutic and investigative potential toward coronavirus infection.

The perception of coronaviruses as harmless seasonal pathogens was indelibly changed in 2002, with the emergence of severe acute respiratory syndrome, a severe, sometimes fatal respiratory disease. Thanks in part to the availability of severe acute respiratory syndrome coronavirus (SARS-CoV) bioinformatics and structural data, identification of potential SARS-CoV antiviral compounds has moved rapidly. For example, antiviral compounds which target the SARS-CoV superfamily 1 helicase and the 3C-related serine proteinase with 50% effective concentration (EC_{50}) values in the low micromolar range have been reported (1, 19, 20, 44). However, the second SARS-CoV-encoded proteinase, a papain-related cysteine proteinase, may prove to be a less suitable drug target, as a coronavirus molecular clone lacking one of the two known cleavage sites for this enzyme displayed only minor growth defects in cell culture (7).

Other confirmed and putative viral enzymes, including the polymerase, poly(U)-specific endoribonuclease homolog, *S*-adenosylmethionine-dependent ribose 2′-*O*-methyltransferase, and cyclic phosphodiesterase, are potential anti-SARS drug targets (34). Furthermore, not all proposed SARS-CoV inhibitors act by inhibiting viral enzymes. Compounds targeting the interaction of the viral spike protein with the ACE-2 receptor (20, 44, 45) or with the spike-mediated fusion event (3, 14, 22, 47) and showing micromolar-scale efficiency in cell culture have been reported. Several groups have also reported in vitro efficacy with small interfering RNAs (42, 48) targeted at suppression of viral gene expression.

Compounds designed to function by base pairing to specific nucleic acid sequences, collectively known as antisense agents, offer a potentially powerful and selective tool for manipulating host and pathogen gene expression. Antisense agents directed against single-stranded RNA are known to act by two general mechanisms: by causing damage to an RNA strand containing the complementary "target" sequence through priming of endogenous RNase H activity, or by steric interference with targeted RNA function. Phosphorodiamidate morpholino oligomers (PMO) act by the latter mechanism, duplexing to specific RNA sequence by Watson-Crick base-pairing and forming a steric block (37).

The most frequently successful strategies for PMO-based gene knockdown are inhibiting translation initiation (28) and mRNA splicing (9). We recently demonstrated the antiviral effects of one peptide-conjugated PMO (P-PMO) complemen-

tary to the AUG translation start site region of a murine coronavirus replicase polyprotein in vitro (29). We reasoned that the activity of P-PMO against coronaviruses might be improved by the rational targeting of RNA sequence elements and secondary structures critical for replication, transcription, and host factor interaction.

In this report, we demonstrate that antisense-mediated suppression of viral replication can be achieved by binding to conserved RNA elements implicated in viral RNA synthesis and translation. Nine P-PMO with sequences complementary to coding and noncoding regions of the SARS-CoV genome were used to probe the function of conserved RNA features during infection in cell culture. The most effective anti-SARS CoV P-PMO described in this report are over 100-fold more active than the anti-murine hepatitis virus coronavirus P-PMO described previously (26). Inhibition of viral yield exceeded 10^4-fold for compounds designed to bind the transcription regulatory sequence (TRS) region present in the viral genomic 5′ untranslated region (UTR). Corresponding effects on viral RNA level, cell-to-cell spread, and cytopathology were observed. Virus clones partially resistant to P-PMO were selected by multiple rounds of growth in the presence of P-PMO. Partially resistant clones selected with a TRS-directed P-PMO developed clustered point mutations at the P-PMO binding site proximal to the leader TRS and grew more slowly in cell culture than wild-type SARS-CoV. We conclude that P-PMO offer a highly specific antisense-based method for probing the function of specific RNA elements in intact RNA virus genomes in addition to their considerable therapeutic potential.

MATERIALS AND METHODS

Cells and viruses. Vero-E6 cells were cultured in Dulbecco's modified Eagle's medium containing 10% fetal bovine serum, 0.01 M HEPES, penicillin, and streptomycin for general growth and maintenance or in serum-free medium (VP-SFM; Invitrogen) supplemented with L-glutamine, penicillin, and streptomycin during P-PMO studies. SARS-CoV-Tor2 (24) was cultured on Vero-E6 cells. Arenavirus lymphocytic choriomeningitis virus-Armstrong was grown and titrated as previously described (4).

Plaque assay. For the SARS-CoV plaque assay, Vero-E6 cells were seeded in 12-well tissue culture plates at 2×10^5 cells per well and allowed to adhere overnight at 37°C and 5% CO_2. The culture medium was removed and replaced with 0.5 ml of inoculum. Cells were treated as specified, and a 2% fetal bovine serum, 0.7% agarose overlay was applied 1 h after inoculation. After 72 h, cells were fixed by immersion in 10% formaldehyde in phosphate-buffered saline for 24 h, agarose plugs were removed, and cells were stained with 0.1% crystal violet. Plaque size reduction assays were cultured and inoculated as above except that individual 0.7% agarose overlays were prepared for each treatment group. Agarose overlays for plaque size reduction assays were prepared with serum-free VP-SFM and P-PMO.

Virus growth and titer reduction assays. Vero-E6 cells were seeded at a density of 5×10^5 cells per 25-cm^2 tissue culture flask and allowed to adhere overnight at 37°C and 5% CO_2. Cells were pretreated with 1 ml VP-SFM containing treatment for 6 h, except where stated, as in time-of-addition and time-of-removal experiments. Cells were inoculated with SARS-CoV or lymphocytic choriomeningitis virus Armstrong at a multiplicity of ≈0.1 or ≈10 PFU/cell and placed at 37°C for 1 h. The inoculum was removed and replaced with fresh VP-SFM with or without P-PMO treatment. Cell culture medium was collected, stored, and replaced with fresh medium at the designated time points. The virus in cell culture supernatants was titrated by 50% tissue culture infectious dose

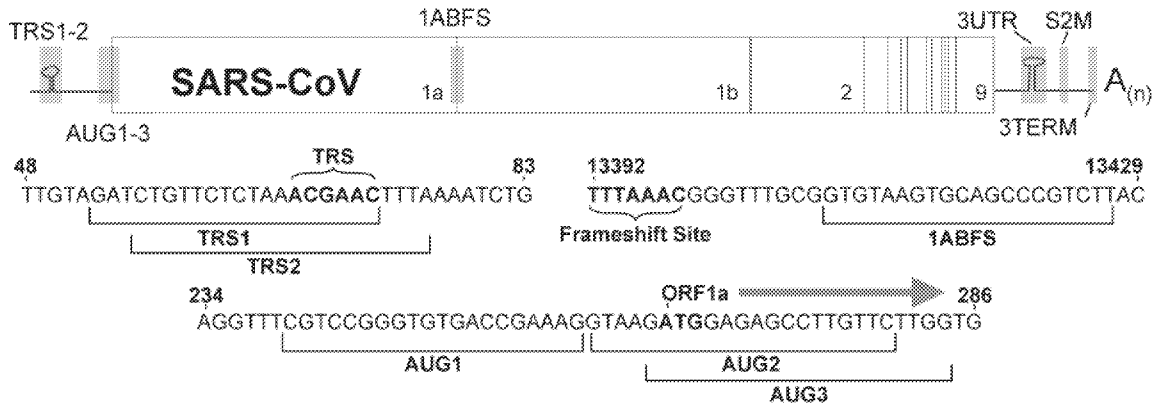

FIG. 1. P-PMO targeting schematic. Relative positions of P-PMO targets on the genomic plus-strand of SARS CoV are indicated by grey boxes. Enlarged regions of the genome indicate the specific target sequences of P-PMO directed against the TRS and AUG regions and the relative proximity of the 1ABFS P-PMO to the ribosomal frameshift site. Nucleotide positions refer to the published sequence of the SARS-CoV-Tor2 strain.

($TCID_{50}$) with threefold dilution steps analyzed according to the method of Reed and Muench or by plaque assay as described above.

PMO design, synthesis, and quality control. PMO were designed to be complementary to the viral plus-strand in several regions showing no sequence variation among sequenced SARS-CoV isolates. Table 1 describes all PMO and DNA oligonucleotide sequences. PMO were synthesized complementary to overlapping sequences in the vicinity of the replicase open reading frame (ORF) 1a initiation codon (AUG1; AUG2; and AUG3), the ORF 1a/1b frameshift signal pseudoknot (1ABFS), the consensus body and leader TRS (TRS1), leader TRS (TRS2), the S2M motif (S2M), the 3′-UTR pseudoknot (3UTR), and the 3′ genomic terminus (3TERM; Fig. 1). Random-sequence "nonsense" PMO (DSCR and FT) were included as controls.

PMO targets were screened with BLAST (http://www.ncbi.nlm.nih.gov/BLAST/) against known human mRNA sequences in order to preclude unintentional gene-silencing effects. PMO were covalently linked to peptide NH_2-RRRRRRRRRFFC-$CONH_2$ or NH_2-RRRRRFFRRRRC-$CONH_2$ designated R_9F_2 or $R_5F_2R_4$, respectively. Both types of peptide-conjugated PMO are henceforth referred to as P-PMO. PMO were synthesized at AVI BioPharma Inc. (Corvallis, OR) by a method described previously (38). The conjugation, purification, and analysis of P-PMO compounds were carried out at AVI BioPharma according to methods described elsewhere (25).

Coiled-coil design, synthesis, and quality control. We identified a 28-mer peptide from the S2 region of the SARS-CoV spike protein with the highest probability to form a coiled coil using the software program Coils 2.2 (by A. N. Lupas and J. M. Lupas). This peptide, designated SARS-HR2, was synthesized as previously described (18). Circular dichroism (CD) was performed on an Aviv 203-02 spectropolarimeter. Samples for CD contained 10 μM peptide in 5 mM sodium phosphate at pH 5, 6, and 7. Spectra were collected between 200 and 265 nm at 25°C in a 2-mm quartz cell; three spectra were acquired and averaged per sample before subtracting the background spectra.

Nonviral assays. The protein-coding sequence for firefly luciferase, without the ATG initiator-Met codon, was subcloned into the multiple cloning site of plasmid pCiNeo (Promega) at the SalI and NotI sites. The pCiNeo expression vector includes both cytomegalovirus and T7 promoters (for mammalian cellular and cell-free transcription of cloned inserts, respectively). Subsequently, complementary oligonucleotides SARSL+ and SARSL− were duplexed and subcloned into the NheI and SalI sites. This effectively replaced the start codon of the luciferase gene with sequence encoding bases −31 to +22 relative to the A of the AUG translation start-site codon of the SARS-CoV polyprotein (identical to the region shown in Fig. 1). This leader sequence includes the complete target sites for the AUG1, AUG2, and AUG3 antisense P-PMO. The −31 to +22 target region corresponds to genomic plus-strand nucleotides 235 to 287, as depicted in Fig. 1.

Three other constructs were made in a similar manner by inserting immediately upstream of the intact luciferase gene the DSCR P-PMO target sequence (5′-AGTCTCGACTTGCTACCTCATG-3′), the SARS TRS target sequence that corresponds to nucleotides 51 to 80 of the genomic plus-strand (5′-CTAG ATAGATCTGTT*CTC*TAAACGAACTTTAAAATG-3′), and the same SARS TRS target sequence that incorporates the three observed nucleotide polymorphisms described in the text (5′-CTAGATAGATCTGTT*AAA*TAAACGAACT TTAAAATG-3′). The luciferase gene for each of these three constructs contains a functional ATG initiator-Met codon. A final construct was made by performing PCR with oligonucleotides 5UTR-PCRF (including an NheI site and bases 2 to 30 of genomic plus-strand) and 5UTR-PCRR (including a SalI site and bases 290 to 262 of genomic plus-strand). The resulting 289-bp fragment was restricted with NheI and SalI and subcloned into pCiNeoluc. This construct utilizes the intact ATG initiator-Met codon within the subcloned SARS sequence (genomic plus-strand bases 266 to 268), as the ATG within the luciferase gene has been deleted.

For the luciferase-fusion constructs that include the TRS sequence, the TRS sequence with three mutations, and the SARS 5′UTR (genomic plus-strand bases 2 to 290), in vitro-transcribed 5′-capped RNA was produced with the mMESSAGE mMACHINE kit (Ambion) after plasmid linearization with NotI. For the SARS AUG and DSCR luciferase fusion constructs, the MegaScript T7 kit (Ambion) was used as described previously (29). In vitro translations were carried out on all constructs as described previously (29). Luciferase-induced light emission was read on a FLx800 microplate luminometer as described previously (29). Cellular efficacy studies were carried out using confluent Vero-E6 cells transiently transfected with target-leader/luciferase plasmids using Lipofectamine (Gibco BRL) according to the manufacturer's directions and assayed as above. The 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide (MTT) assay was used to measure cell viability as described previously (29).

Resistance studies. Virus was passaged 11 times on fresh Vero-E6 cells pretreated with 2 to 10 μM P-PMO. Biologically cloned viruses were cultured from individual, well-spaced plaques. Viral RNA was prepared from infected cells by Trizol lysis followed by an additional chloroform extraction. Reverse transcription-PCR was carried out according to the enzyme manufacturer's specifications (Invitrogen). The 5′-terminal region of the SARS-CoV genome was amplified using primers SEQ-F1 and SEQ-R2. PCR products were sequenced using primer SEQ-R2. Relative RNA load was determined by 25-cycle PCR of cDNA primed with oligonucleotides RVS1 through RVS4. PCR was primed with FN-F1 and the appropriate FN-R oligonucleotide to generate products of 104, 127, 156, 188, 212, 259, 299, and 353 bp, corresponding to viral subgenomic RNAs 2 through 9, respectively.

RESULTS

Design of antivirals. P-PMO were designed to target conserved viral sequences implicated in SARS-CoV RNA synthesis, translation, and/or host factor interaction (Fig. 1). The expression of the coronavirus replicase polyprotein is controlled at two points: the initiation of translation at open reading frame 1a, and the ribosomal frameshift which results in translation of the extended open reading frame 1ab. Three sequences were selected in the immediate vicinity of the AUG translation-initiation codon of the viral replicase polyprotein

open reading frame 1a (AUG1, AUG2, and AUG3) such that AUG2 and AUG3 overlapped the initiation codon and AUG1 was located in the 5′ untranslated region proximal to the translation start site. P-PMO 1ABFS was designed to disrupt the RNA secondary structure at the −1 ribosomal frameshift site that mediates translation of the remainder of the replicase polyprotein. The untranslated 5′-terminal 263 nucleotides of the SARS-CoV RNA also contain the ≈80-nucleotide leader sequence found at one terminus of each of the 5′- and 3′-coterminal subgenomic viral RNA species produced in the infected cell.

The transcription regulatory sequence (TRS) located in the 5′-UTR of the genome is believed to participate in discontinuous RNA synthesis (30–32, 39). The leader TRS was targeted with two P-PMO, each designed to mask the consensus TRS (5′-CGAAC-3′) and disrupt the stem-loop predicted to form in this region (40). TRS1 is complementary to the TRS in the leader RNA present on both genomic and subgenomic RNA species. TRS2 spans the junction between the leader and a portion of the 5′-UTR not present on subgenomic RNAs (39).

Studies of coronavirus defective-interfering RNAs have shown the genomic termini contain several conserved motifs, some of which act as discrete signals for RNA replication (6, 15). P-PMO compounds designed against targets in the 3′-untranslated region included 3UTR, targeting a portion of the conserved RNA stem-loop/pseudoknot found in most coronavirus genomes (10–13); S2M, targeting the stem-loop 2 motif region related to sequences in astroviruses and equine rhinovirus (17); and 3TERM, targeting the 3′ terminus of the genomic RNA, including the first five bases of the polyadenosine tail. Two nonsense P-PMO, DSCR and FT, were included to control for nonspecific P-PMO effects. The 5′ termini of P-PMO were conjugated to an arginine-rich delivery peptide (R_9F_2; 26, 29) or to a rearranged $R_5F_2R_4$ peptide, which confers equivalent delivery and efficacy properties (Moulton et al., unpublished data). The R_9F_2 and $R_5F_2R_4$ peptide conjugates were used interchangeably in the antiviral studies presented here. We did not observe detectable differences in sequence-specific or nonspecific effects between PMO conjugated to one or the other of the two delivery peptides.

Non-antisense antiviral compounds which targeted different stages of the viral growth cycle were included in some assays to provide a bridge for comparison of the results reported here with other studies reported in the literature. Among the control antivirals tested was a peptide identical to the carboxyl-terminal heptad repeat region of the SARS-CoV spike (HR2), which was designed to bind the spike protein during virus-cell fusion and arrest fusion at an intermediate stage. Amphipathic helices of the SARS and murine hepatitis virus coronaviruses form six-helix bundles that are believed to mimic the postfusion state of the spike glycoprotein. Several reports have demonstrated the antiviral properties of peptides based on amphipathic helices of coronavirus spike protein (3, 14, 22, 47).

We synthesized and purified a heptad repeat peptide derived from residues 1158 to 1185 of the SARS-CoV-Tor2 spike protein, designated SARS-HR2. The SARS-HR2 protein was selected to allow comparison of direct inhibition of SARS-CoV growth by different methods, e.g., fusion arrest versus antisense. The circular dichroism spectrum of SARS-HR2 (data not shown) displayed an equilibrium between disordered and helical structure, as previously reported for similar peptides (14).

P-PMO are effective and specific. As we have reported previously, the conjugated "delivery" peptides increase both the efficacy and toxicity of PMO in cell culture (29). $R_5F_2R_4$-conjugated PMO were tested for cytotoxicity by the MTT assay under the serum-free culture conditions used throughout this report. $R_5F_2R_4$-PMOs were nontoxic (defined as ≥90% cell viability after 24 h) at concentrations as high as 20 μM on Vero-E6 cells (data not shown). The level of toxicity of $R_5F_2R_4$-PMO was similar to that reported for R_9F_2-PMO previously (29). Based on this finding, treatment doses of P-PMO were limited to 20 μM. Hygromycin B, a broad-spectrum translation inhibitor active against most coronaviruses, was nontoxic to ≥80 μM (data not shown), in agreement with other published results (2).

P-PMO designed to inhibit initiation of translation of the SARS-CoV replicase polyprotein were tested in a rabbit reticulocyte lysate cell-free translation assay to determine which compound was most effective at inhibiting expression of a luciferase reporter. P-PMO were added to reticulocyte lysates programmed with in vitro-transcribed RNA in which translation of the luciferase gene was initiated at a small region derived from the SARS-CoV 5′-UTR containing the AUG1-3 P-PMO target sites. AUG1, AUG2, and AUG3 P-PMO generated comparable nanomolar-scale dose-dependent reduction of luciferase expression in this cell-free translation system (Fig. 2A). The FT P-PMO, described in our previous studies (29), was included here as a negative control.

DSCR P-PMO consistently generated low nonspecific activity in a variety of assays in this study. In order to demonstrate that the ineffectiveness of DSCR was not due to some innate defect in the compound itself, we compared the effects of DSCR and AUG1 P-PMO on inhibition of luciferase expression from a DSCR-target/luciferase construct (Fig. 2B). As expected, DSCR P-PMO specifically suppressed translation from the DSCR/luciferase transcripts. Nonspecific effects of AUG1 P-PMO against the DSCR/luciferase RNA were comparable to those of DSCR P-PMO against the SARS AUG-target/luciferase RNA described above. We therefore concluded that the DSCR and P-PMO AUG1 to AUG3 acted solely through antisense activity and displayed low nonspecific effects.

The three AUG P-PMO also displayed equivalent micromolar-scale effects on translation of the reporter gene in Vero cell cultures transiently transfected with the SARS/luciferase reporter plasmid used in the previous experiment (Fig. 2C). Synergistic effects can potentially be obtained when antiviral compounds with different targets are administered in combination (41). Nonoverlapping combinations of P-PMO were tested in the cell-free translation system in order to screen for additive synergy or anergy. The effects of combinations of AUG1 to AUG3 at a given total molarity did not differ significantly from the effects of an individual AUG P-PMO at the same total molarity (Fig. 2C), as might be expected for compounds targeting essentially identical targets by the same mechanism.

Reduction of SARS-CoV CPE and growth. In order to characterize the nine SARS-CoV-specific P-PMO, we tested them for several correlates of antiviral efficacy: prevention of cyto-

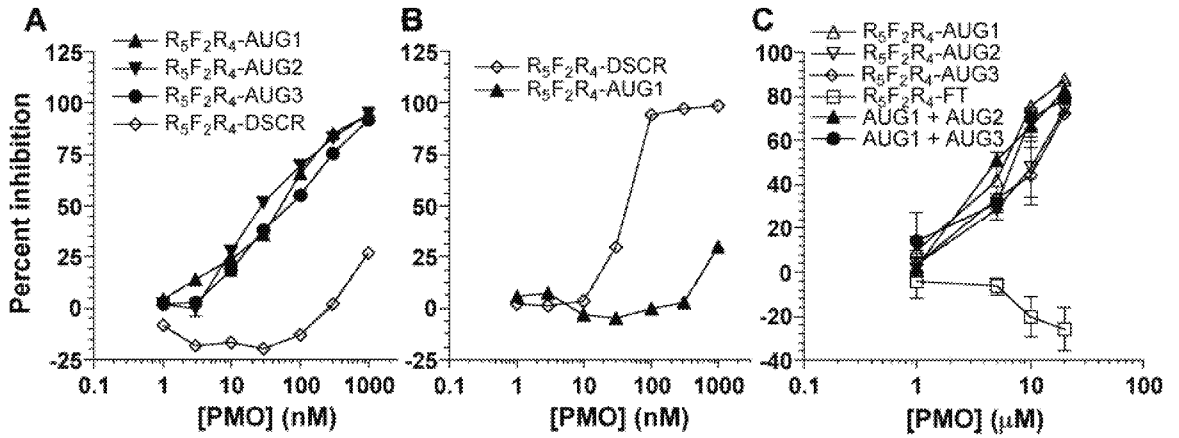

FIG. 2. Peptide-conjugated PMO specifically reduce cell-free and cell culture expression of plasmid-generated target sequences. (A) Cell-free translation assay demonstrates the inhibition of SARS AUG region/luciferase translation by AUG P-PMO relative to nonspecific activity of the DSCR control P-PMO. Data are expressed as percent inhibition relative to 12 untreated control values. (B) The converse assay, inhibiting translation from DSCR target/luciferase RNA specifically with the DSCR P-PMO demonstrates the lack of cross-reactivity of DSCR and AUG P-PMO in this system. (C) Luciferase expression from AUG region/luciferase mRNA generated from a transiently transfected plasmid in cell culture was inhibited by single-AUG P-PMO and combination AUG PMO treatments. Concentrations of combined P-PMO are expressed as the molarity of a 1:1 mixture of two nonoverlapping compounds. Error bars indicate standard error of the mean.

pathic effects, reduction of viral titer, and reduction of the spread of an established infection. SARS-CoV cytopathic effects (CPE) on Vero-E6 include vacuolation and extensive cell rounding by 24 h postinoculation in the case of high-multiplicity inoculation. We chose to compare cytopathic effects 72 h after high-multiplicity (≥10 PFU/cell) inoculation, by which time cells in untreated controls and those receiving ineffective treatments had displayed severe CPE for 24 to 48 h (Fig. 3A). Typical SARS-CoV-induced CPE was observed in infected cells treated with vehicle (water) only, DSCR, S2M, and 3TERM-P-PMO. The AUG1, AUG2, AUG3, 1ABFS, and 3UTR P-PMO consistently reduced CPE only after 20 μM treatment (AUG1 results are presented in Fig. 3A; the remaining data are not shown). Treatment with lower doses of AUG1 to AUG3 P-PMO appeared to reduce the severity of CPE in some experiments, as in the case shown in Fig. 3A. However, the protective effect of lower doses of the three AUG-targeted P-PMO was not observed consistently, and when present was always less pronounced than the protective effect of either TRS-targeted P-PMO. TRS1 and TRS2 strongly reduced CPE after ≥6 μM treatment (results for TRS1 are presented in Fig. 3A; TRS2 data are not shown). We thus concluded that TRS1 and TRS2 had at least a threefold greater antiviral activity compared to the AUG1 to AUG3, 1ABFS, or 3UTR P-PMO. The AUG3 P-PMO was not studied further since it was not found to differ from AUG2 or AUG1 in efficacy, toxicity, or CPE reduction.

Next, P-PMO were tested for the ability to reduce virus yield in pretreated cells. It is our observation that SARS-CoV growth plateaus by 24 h and remains high through 48 h following high-multiplicity inoculation (≥3 PFU/cell) or peaks ≈24 h later following low-multiplicity inoculation (≤0.1 PFU/cell). In order to compare P-PMO effects on log-phase viral growth, we compared infectious titers 24 h after low-multiplicity inoculation (Fig. 3B). The viral titer results were generally consistent with the cytoprotection results (Fig. 3A). The most effective P-PMO decreased viral titers to below the threshold of detection, 100 PFU/ml in the experiment shown in Fig. 3B. The 3UTR P-PMO had slight antiviral effects, while 1ABFS, AUG1, and AUG2 displayed equivalent moderate antiviral activity. TRS1 and TRS2 clearly exhibited robust antiviral activity in the low micromolar range. In repeated experiments, titers were consistently reduced by over 100-fold by treatment with ≥6 μM AUG1, AUG,2 and 1ABFS P-PMO or by ≥2 μM TRS1 and TRS2 PMO.

We next sought to further characterize the highly effective TRS2 P-PMO by performing time course studies in which this compound was added or removed at different times. Antivirals affecting a particular stage of the viral growth cycle, such as entry (early) or assembly (late), would likely be effective on different time scales, whereas inhibitors of ongoing processes such as replication and translation could be active at any point prior to the peak of viral growth. In order to investigate this hypothesis, we tested the effects of time of addition on the control heptad repeat peptide SARS-HR2, designed to inhibit virus-cell fusion after receptor binding and some conformational changes have occurred. SARS-HR2 was active when administered 1 h before inoculation or in combination with the inoculum. SARS-HR2 did not alter the titer of infectious virus present in the supernatant 24 h postinoculation when SARS-HR2 was administered 1 h postinoculation or later, indicating that an early event was targeted, and consistent with the predicted target of the membrane fusion process (data not shown). The TRS2 P-PMO significantly reduced viral titer when added up to 4 h after high-multiplicity infection and 8 h after low-multiplicity infection (data not shown), consistent with the effects expected from inhibition at a later stage in the viral life cycle. However, this result also indicated a requirement that TRS2 P-PMO be present early in the infection process for maximal antiviral effect.

In order to determine the duration and reversibility of TRS2 P-PMO-mediated antiviral effects, the TRS2 P-PMO was removed from the cell culture medium at various intervals and viral titer was assessed at several time points (Fig. 3C). Re-

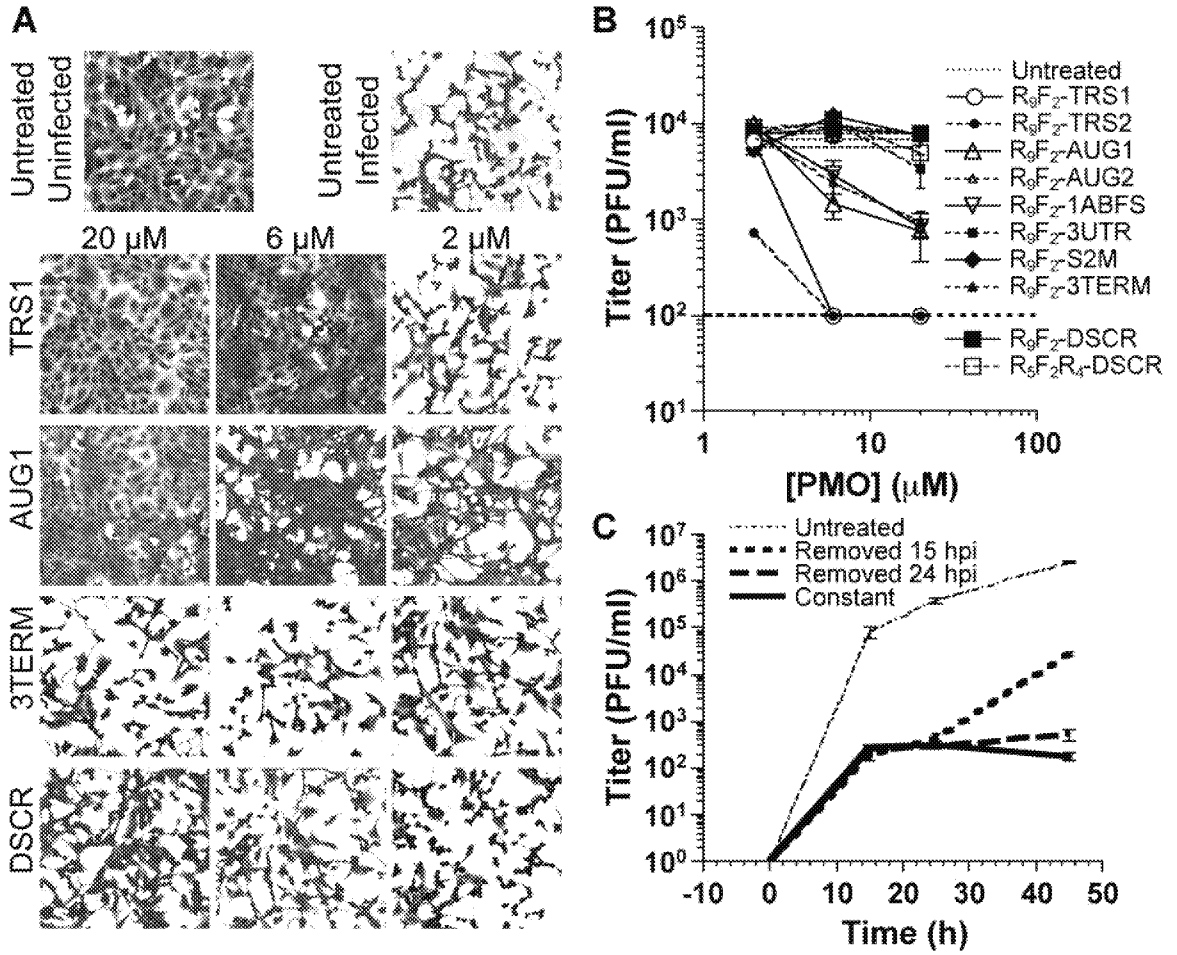

FIG. 3. Peptide-conjugated PMO reduce SARS-CoV cytopathology and titer. Qualitative changes in cell morphology and density were gauged against untreated infected (upper right) and untreated uninfected (upper left) controls. (A) Representative images of cells pretreated for 6 h with selected R_9F_2-conjugated PMO and fixed 72 h after inoculation. (B) Dose-response of titer reduction. Triplicate wells of Vero-E6 cells were pretreated with P-PMO or vehicle-only at 6 h before inoculation with SARS-CoV at a multiplicity of 0.1 PFU/cell. Virus yield was quantified 24 h after. The limit of detection for the assay shown was 100 PFU/ml. Error bars indicate standard error of the mean. (C) Cells were pretreated with 20 μM TRS2 R_9F_2-PMO or mock treated 6 h before inoculation. Culture medium was collected at 15 h and 24 h and replaced with medium containing P-PMO or medium alone as indicated. Virus yield was measured at 15 h, 24 h, and 48 h.

moval of TRS2 P-PMO as late as 15 h after infection resulted in increased viral amplification as measured at 24 and 48 h. This result suggests either rapid neutralization of the P-PMO or saturation of the TRS2 P-PMO molecules at the site of activity for a period of time. Taken together, these results demonstrate that the constant presence of TRS2 P-PMO is required to maintain maximum antiviral activity.

Preventing spread of an existing infection. Pathways leading to the establishment or spread of an infection can differ for some viruses. In murine hepatitis virus, initial cell entry of virus has rigorous receptor specificity requirements, but infection can subsequently be spread to receptor-null cells by contact with infected cells (8). Consequently, despite the positive results for the AUG1 to AUG3, 1ABFS, and TRS1 and TRS2 P-PMO, we hypothesized that successful inhibition of SARS-CoV-induced CPE and infectious titer might not necessarily predict effective treatment of an existing infection. The effects on viral persistence and spread of an existing infection were measured in a plaque size reduction assay. In this assay, cells were treated with P-PMO 1 h after inoculation with a standardized amount of SARS-CoV. The progress of the initial infection was quantified by measuring the diameter of the resulting viral plaques 72 h after inoculation.

The observed effects on viral spread (Fig. 4A-C) closely resembled the titer reduction results (Fig. 3B). DSCR, 3UTR, S2M, and 3TERM P-PMO were ineffective. The dose-response curves of the AUG1 and AUG2 P-PMO were essentially equivalent and showed slightly more potency than the 1ABFS P-PMO. The TRS1 and TRS2 P-PMO were again the most effective. Treatment with ≥6 μM TRS1 or TRS2 P-PMO completely prevented the formation of visible plaques.

We compared the effects of the AUG1 P-PMO against DSCR P-PMO, SARS-HR2 peptide, and hygromycin B on the spread of SARS-CoV infection (Fig. 4C). The slopes of the dose-response curves for hygromycin B and the AUG1 P-PMO were similar, indicating similar kinetics of activity, although the AUG1 P-PMO was approximately 10-fold more potent than hygromycin B. The slope of the dose-response curve for SARS-

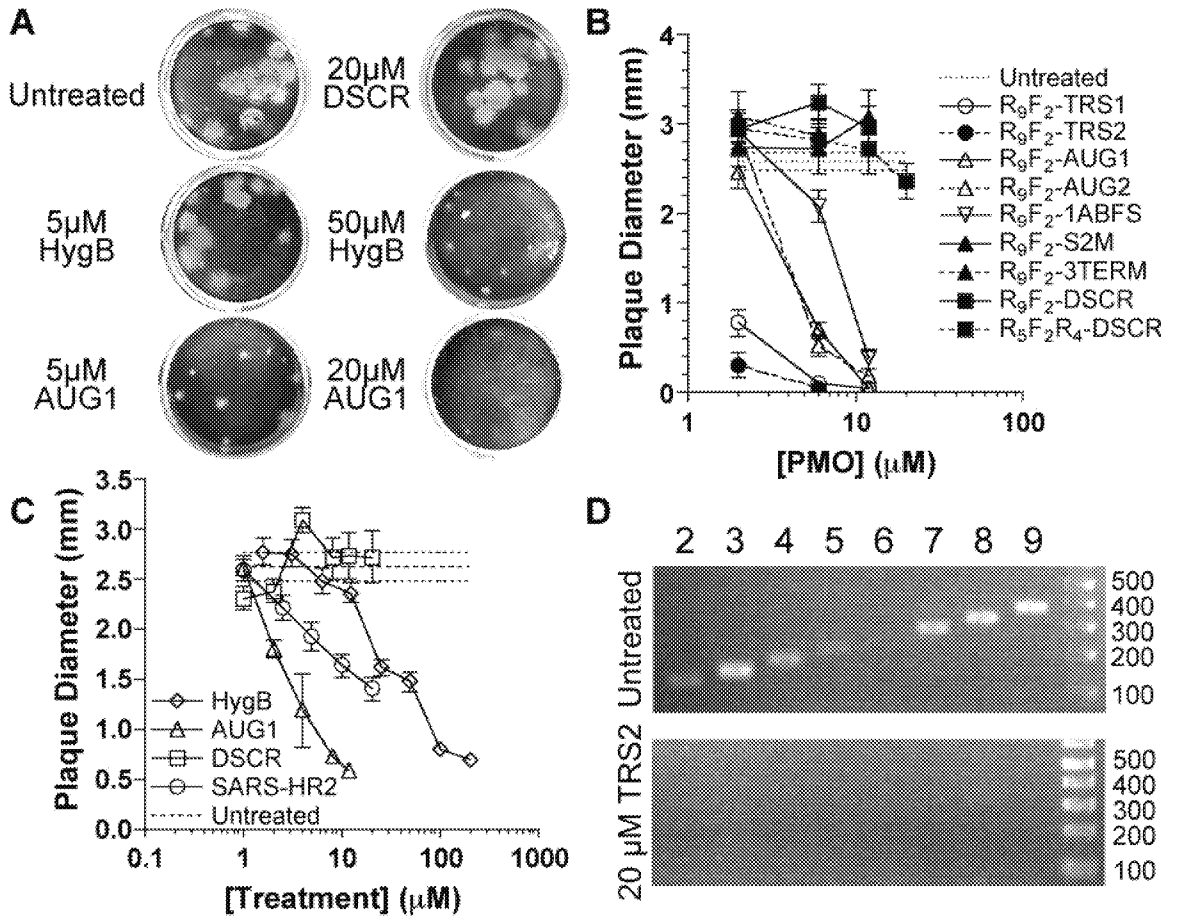

FIG. 4. Peptide-conjugated PMO and coiled-coil peptides inhibit the propagation of SARS-CoV infection. Plaque diameter on treated and mock-treated cells was visualized (A) and measured (B) 72 h after inoculation under the same experimental conditions as described for Fig. 3A. (C) Comparison of 72-h plaque diameter on cells treated with $R_5F_2R_4$-AUG1 P-PMO, $R_5F_2R_4$-DSCR P-PMO, hygromycin B (HygB), or coiled-coil SARS-HR2 and on mock-treated cells (untreated). Error bars indicate standard error of the mean. (D) Reverse transcription-25-cycle PCR comparison of viral subgenomic RNA 2 to 9 levels in an equivalent number of mock-treated or 20 μM TRS2 P-PMO-treated cells 24 h after inoculation. Sizes in bp are indicated to the right. Amplicons of 104, 127, 156, 188, 212, 259, 299, and 353 bp were expected, corresponding to viral subgenomic RNAs 2 through 9, respectively.

HR2 was less steep, indicating that relatively more SARS-HR2 was required to produce incremental inhibitory effects compared to P-PMO or hygromycin B. Possible explanations for this difference in dose-response ratio include peptide lability, the brief availability of the transition state amenable to competitive SARS-HR2 binding during the fusion process compared to continuous inhibition by hygromycin B or P-PMO, and the potential for up to three SARS-HR2 peptides to bind each prefusion intermediate of the spike homotrimer compared to the presumed binding of one P-PMO molecule per viral RNA molecule.

We reasoned that the observed inhibition of viral growth and propagation might correspond to a decrease in the viral RNA level, whether through inhibition of replicase expression, interference with discontinuous RNA synthesis at the leader TRS, or an alternatiove mechanism. Coronaviruses produce a nested set of subgenome-length RNA species in infected cells. Most coronavirus subgenomic RNAs are produced in molar excess of the genomic RNA, though genomic RNA and trace amounts of subgenomic RNAs are typically packaged in the virion (reviewed in reference 33). Therefore, we investigated genomic and subgenomic RNA production 24 h after low-multiplicity inoculation, as an indicator of ongoing infection. The 24-h time point was selected as a time when several rounds of replication would have occurred but virus-induced cell lysis would be negligible.

Reverse transcription-PCR products specific for each of eight subgenomic RNA species were strongly amplified from mock-treated cells and cells treated with mildly effective P-PMO (Fig. 4D and data not shown). Equal volumes of reverse transcription-PCR products from an equivalent number of 20 μM TRS2 P-PMO-treated cells were faint (i.e., subgenomic RNA 8 and possibly 9) or undetectable (subgenomic RNAs 2 to 7; Fig. 4D). Genomic RNA synthesis was likewise qualitatively reduced by 20 μM TRS2 P-PMO (data not shown), though whether this resulted directly from steric hindrance of target RNA or indirectly through inhibition of replicase polyprotein expression was not determined. This result suggests P-PMO effects on SARS-CoV growth, CPE, and spread correlate with a qualitative decrease of viral RNA level.

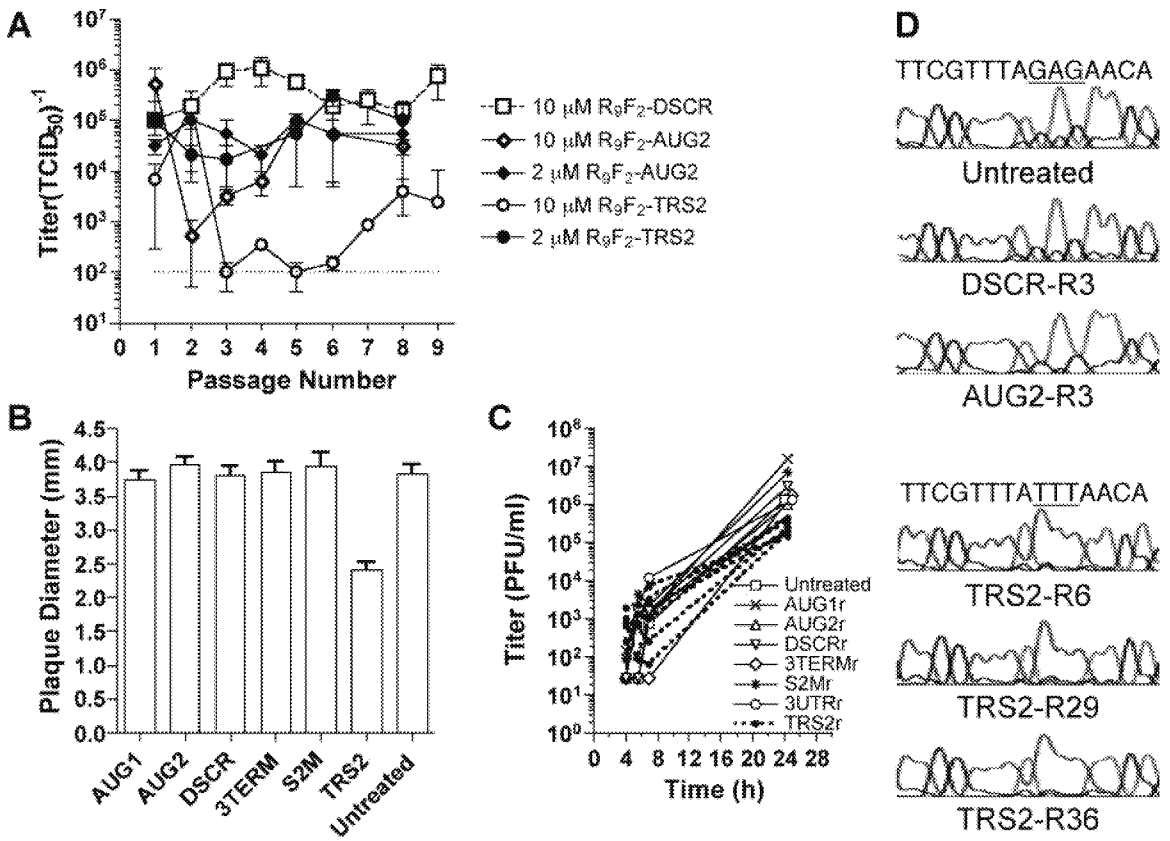

FIG. 5. Characterization of P-PMO-resistant SARS-CoV. SARS-CoV was serially passaged on cells pretreated with 2 μM or 10 μM R_9F_2-PMO or mock-treated cells. (A) Virus yield over the first nine passages was quantified 24 h after inoculation at an initial multiplicity of ≈10 PFU/cell. (B) The diameters of 50 plaques were measured after 11 viral passages on untreated or 10 μM P-PMO-treated cells. (C) Growth kinetics of P-PMO-resistant plaque-purified SARS-CoV on untreated Vero-E6 cells are shown. Biologically cloned virus was cultured from plaque-purified stocks selected after 11 passages on untreated cells or cells treated with AUG1, AUG2, S2M, 3TERM, 3UTR, TRS2, or DSCR P-PMO. Growth curves for five median-growth partially TRS2-resistant SARS-CoV biological clones are shown. $TCID_{50}$ titrations were calculated for four fourfold replicates. Error bars indicate standard error of the mean. (D) The 5′-terminal regions of P-PMO-resistant and mock-treated clones were amplified and sequenced in the antigenomic orientation. A portion of the TRS2 P-PMO target region is shown, with the mutations in TRS2-resistant clones underlined.

Specificity of P-PMO. The most effective anti-SARS-CoV P-PMO was found to be TRS2. Therefore TRS2 was tested for effects on an unrelated virus, the arenavirus lymphocytic choriomeningitis virus, that grows well in Vero-E6 cells under the same culture conditions under which the SARS-CoV experiments were carried out. Cells treated with 2 to 20 μM TRS2 were inoculated at a multiplicity of about 0.1 PFU/cell, and cell culture supernatants were harvested and titrated by plaque assay. Virus amplification at 24 h was not significantly altered in cells treated for 6 h with TRS2 P-PMO at any concentration compared to untreated controls (data not shown). Although the cellular functions required for arenavirus and coronavirus replication are likely not identical, we interpret this result as a further confirmation that the effectiveness of P-PMO against SARS-CoV was antisense mediated.

Partial resistance to P-PMO. The error-prone replication of RNA viruses presents a rapid model for viral evolution and drug resistance studies. In order to assess the propensity for SARS-CoV to develop resistance to antisense P-PMO, a stock cultured from a plaque-purified biological clone of SARS-CoV was serially passaged on cells treated with 0.5, 2, or 10 μM P-PMO. The term biological clone as used here designates an isolate derived from a single viral plaque. We chose to administer submaximal doses of P-PMO in order to allow the generation of P-PMO-resistant mutant strains. SARS-CoV was passaged blindly 11 times in cells pretreated with P-PMO. Viral growth was assessed, as an indicator of resistance, after each of the first nine passages (Fig. 5A).

The 3TERM and DSCR P-PMO did not inhibit SARS-CoV growth at any concentration or passage number. The AUG1, AUG2, and 3UTR P-PMO inhibited SARS-CoV growth for one to three passages after 10 μM treatment only. Treatment with 10 μM TRS2 P-PMO strongly inhibited SARS-CoV growth in each of the 11 passages tested. However, an increase in titer indicative of partial resistance was observed by passage 7. The peak titer of the TRS2 P-PMO-resistant virus population, during the 11 passages performed, was at least 100-fold below the titer of mock-treated cells, indicating acquisition of partial but not total resistance.

Viral plaques reflect the progress of a single infected cell's progression through multiple waves of viral entry, replication, and spread, and altered plaque diameter or morphology can be

indicative of perturbation to some stage of the virus replication cycle. To determine whether partially or totally P-PMO-resistant virus clones displayed altered amplification characteristics in the absence of P-PMO selection, plaque morphology and size were examined (Fig. 5B). Plaque morphology was found to be unaffected, though TRS2-selected biological clones displayed a smaller plaque morphology compared to that of wild-type SARS-CoV. Eight to 41 plaque-purified viruses were selected from each treatment pool. All AUG1, AUG2, DSCR, 3UTR, S2M, and 3TERM P-PMO-selected viruses caused typical CPE on Vero-E6 cells. Sixteen of 41 TRS2 P-PMO-selected clones caused negligible CPE on cells 72 h after inoculation, while the remaining clones caused reduced CPE.

One-step growth curves were performed for a selection of the P-PMO-selected SARS-CoV biological clones. TRS2 P-PMO-selected clones displayed delayed growth kinetics compared to untreated SARS-CoV and other P-PMO-selected clones (Fig. 5C). The titers of untreated and non-TRS P-PMO-treated SARS-CoV biological clones displayed in Fig. 5C represent typical titers observed 24 h after high-multiplicity inoculation. Continuous TRS2 P-PMO treatment, as shown in Fig. 3C, suppressed viral titers to approximately 100 PFU/ml, a decrease of ≈4 to 5 $\log_{10}$ from peak titers of ≈6 to 7 $\log_{10}$ observed in Fig. 3C, 5A, and 5C.

Reverse transcription-PCR amplicons from 14 TRS2-P-PMO-resistant SARS-CoV clones and one each of AUG1, AUG2, DSCR, 3UTR, S2M, and 3TERM and mock-treated clones were sequenced to determine whether the observed phenotypes correlated with specific genetic variations (Fig. 5D). Three consensus sequences were obtained for each biological clone, reflecting the dominant genotype over the first ≈600 bases proximal to the 5′ terminus of the genomic plus-strand. The sequences fell into two categories: TRS2-resistant clones each carried an identical set of mutations. Clones resulting from selection with the other P-PMO and mock treatment-selected clones were all identical. The 21 sequences that were obtained differed at three points: a silent mutation, C543T, and a block of three contiguous base changes of CTC to AAA at positions 62 to 64 proximal to the leader TRS (within the target region of TRS2-P-PMO) appeared in only the 14 TRS2-resistant clones, whereas a mutation, T281C, resulting in a leucine-to-proline shift at the sixth codon of ORF1a was present in only the AUG1, AUG2, DSCR, 3UTR, S2M, and 3TERM P-PMO-selected and vehicle-treated clones. Since the point mutation at position 281 relative to the original SARS-Tor2 sequence was found in both selected and mock-selected clones, we interpret this change as having likely evolved during serial passage in Vero-E6 cells prior to P-PMO selection. All TRS2-resistant clones identified likely derived from a single escape mutant. Mutations were not observed in the AUG1 or AUG2 P-PMO target regions of clones resistant to either of these P-PMO. We cannot at present rule out the possibility of compensating downstream mutations in AUG P-PMO-resistant biological clones.

Thermal melting curve data for peptide-conjugated PMO/RNA duplexes with variable mismatches led us to speculate that the three mutations at the TRS2-P-PMO target site reduce the effective binding affinity as measured by melting temperature (T_m) by ≈25 to 30°C (H. Moulton et al., manuscript in preparation) (36). We are unable at present to predict the precise number of mutations required to completely abrogate P-PMO efficacy. However, we tested the hypothesis that decreased affinity of the TRS2 P-PMO for the mutated target site could explain the decreased sensitivity of TRS2-selected SARS-CoV biological clones to TRS2 P-PMO.

P-PMO binding affinity was compared using a reporter construct in which the luciferase reporter gene was placed immediately downstream of either the wild-type SARS-CoV TRS region or the same region with the CTC→AAA mutations observed in TRS2 P-PMO-selected SARS-CoV clones (Fig. 6A). TRS2 P-PMO was approximately 10-fold less active against the three-mismatch TRS target compared to the wild-type target (EC_{50} of 500 nM and 50 nM, respectively). EC_{50}, as used here, refers to the amount of compound required to reduce luciferase luminescence by 50% compared to untreated controls. The decreased TRS2 P-PMO sensitivity of TRS2-selected strains was therefore consistent with the apparent reduction in stability of the P-PMO/target RNA duplex in TRS2-resistant biological clones. A similar observation was recently reported for human immunodeficiency virus type 1 escape variants resistant to small interfering RNAs (43).

While the experiments described above addressed the specificity and efficacy of P-PMO, we also wished to explore which molecular events of the viral life cycle the TRS2 P-PMO was affecting. In order to examine the effects of TRS2 PMO on inhibition of viral translation, a luciferase reporter construct was designed in which the entire SARS-CoV 5′-UTR was placed upstream of the reporter. The new reporter construct was designed so that luciferase expression would be initiated at the authentic SARS-CoV ORF 1a AUG codon. Contrary to our expectation, the TRS2 P-PMO outperformed AUG1 P-PMO by severalfold in translation inhibition (EC_{50}s of 35 nM and 185 nM, respectively; Fig. 6B). The TRS2 target site (bases 55 to 75) is sufficiently distant from both the 5′ terminus and the site of translation initiation to make it unlikely that interference with any of the discrete events of preinitiation at the terminus (e.g., 43S complex loading onto mRNA) or initiation at the initiator AUG (e.g., 48S-complex formation and/or joining of 48S and 60S ribosomal subunits) forms the basis for the observed effect. We therefore concluded, pending further testing, that TRS2 P-PMO inhibits SARS-CoV amplification primarily by interfering with the 43S preinitiation complex scanning process.

DISCUSSION

The results of this study demonstrate that P-PMO specific to the SARS-CoV genome can reduce production of infectious virus and thereby protect cells from virus-induced CPE as well as slow the cell-to-cell spread of infection. P-PMO acted by a sequence-specific mechanism, with low nonspecific activity on off-target cellular and viral functions. SARS-CoV overcame the antiviral activity of P-PMO directed against a number of sites on the viral genome, while resistance to P-PMO targeting the leader TRS element developed only after several host cell passages. The precise mechanism and timing of TRS2-associated nucleotide changes is unclear. We note, however, that the 5′-UTR typically displays relatively low sequence variability among coronaviruses of one species (one notable exception being a TRS-proximal polymorphism in murine hepatitis virus

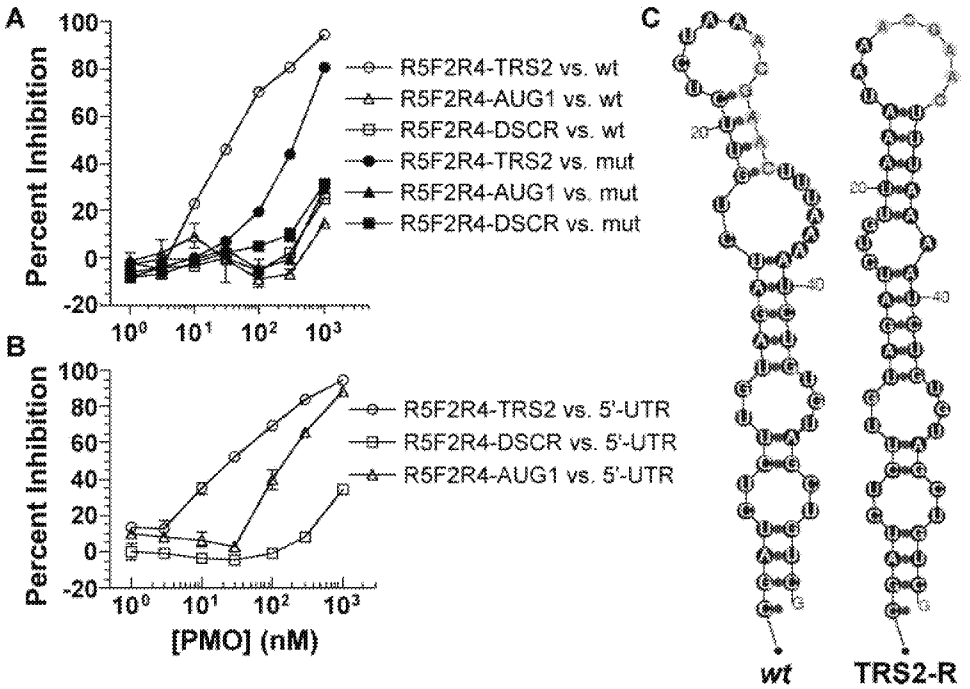

FIG. 6. Mechanisms of P-PMO efficacy and partial resistance. (A) Binding of P-PMO to the TRS region (nucleotide positions 51 to 79) was assessed in a cell-free translation inhibition assay. The relative binding strength of P-PMO to the wild-type SARS-CoV target (wt) and the three-mispair target (mut) is expressed as percent inhibition of luciferase expression. Zero percent inhibition was determined by the average level of luciferase expression from untreated control translations programmed with both wild-type and mutant mRNAs. (B) Comparison of inhibition of luciferase expression downstream of the entire SARS-CoV 5′-UTR sequence by three P-PMO. Error bars indicate standard error of the mean. (C) Low-energy secondary structures of the TRS hairpin of wild-type SARS-CoV (wt) and TRS2 P-PMO-selected SARS-CoV (TRS2-R) were generated using Mfold (49). The core TRS is near the top of the stem and shown in white circles; flanking sequences are depicted inside black circles. Nucleotides are numbered from the beginning of the predicted stem-loop.

JHM) (46), and the observed TRS2-associated polymorphism is not represented among SARS-CoV sequences currently available in the GenBank database. SARS-CoV resistant to TRS P-PMO displayed reduced cytopathology and cell-to-cell spread. Mutations at the TRS 2 P-PMO target site confirm that P-PMO act directly on the viral RNA, as similarly shown for in situ-generated RNA complementary to human immunodeficiency virus type 1 *env* (23) and small interfering RNAs directed against human immunodeficiency virus type 1 (43). Decreased P-PMO-target affinity to altered target sequence almost certainly explains the observed loss of P-PMO sensitivity in resistant isolates.

The CTC→AAA mutations found in all TRS2-P-PMO-resistant SARS-CoV clones occur outside the region occupied by the consensus TRS (5′-CGAAC-3′) (Fig. 6C), but within the TRS2 P-PMO target region. No mutations were observed in resistant isolates cloned from cultures treated with other P-PMO. The presence of short complementary regions surrounding the TRS is a conserved feature among the *Nidovirales* and is called stem-loop II (5) or the leader TRS hairpin (40). Mfold secondary-structure predictions (49) indicate that the TRS2-resistant SARS-CoV could form a destabilized alternate hairpin conformation (boldface), **TTAAA**-TAA*ACGAAC*-**TTTAA**, surrounding the TRS (italic). The lowest-energy fold of the TRS hairpin with the AAA mutation has a calculated ΔG of −4.1 kcal/mol, compared to −7.0 kcal/mol for the wild-type CTC sequence.

Our analysis yields no compelling rationale that would favor the incorporation of the particular set of mutations observed. Finding a clustered three-nucleotide substitution in a coronavirus after 11 passages would generally be considered a rare event, and further study will be required to clarify the mechanism involved. Moreover, it is unclear whether these point mutations arose from a low-probability chance event or whether the particular set of mutations observed represent a preferred solution to the selective pressures toward optimal replication and drug resistance. So, while it would appear that antisense may designate a site for mutation, the present data are insufficient to suggest the type of mutation most likely to be incorporated.

Levels of P-PMO efficacy appeared to group with respect to the nature of the viral target sequence. This was most striking in the case of the AUG1 P-PMO, targeted to the 3′ end of the 5′-UTR, the AUG2 and AUG3 P-PMO, which directly masked the ORF 1a translation initiation codon, and the 1ABFS P-PMO, targeted over 13 kb downstream. All four of these P-PMO were conceived as inhibitors of replicase translation, with targets designed to interfere with ribosome scanning, translation initiation, or the ribosomal frameshift event by which the coronaviruses produce the enzymatic products of ORFs 1a and 1b. Results for the 3UTR P-PMO, though modest, were interesting because the effects of 3UTR cannot be readily attributed to inhibition of translation and therefore likely derive from some effect on viral RNA synthesis. The selection of the 3UTR

P-PMO target was perhaps unfortunate, as a study from the Masters group that appeared during the course of our studies showed that the loop and upper stem regions of the stem-loop/pseudoknot structure in the 3′-UTR targeted by the 3UTR P-PMO were tolerant of extensive mutations and deletions (10). Our results appear to confirm that result. The relative lack of activity of the three compounds targeted near the 3′ terminus of the genome may indicate that the processing minus-strand polymerase complex displaces bound P-PMO or that P-PMO compete inefficiently with viral and host proteins for binding in this region (16, 21, 27, 35).

The most effective P-PMO targeted the transcription regulatory sequence. Two different P-PMO, TRS1 and TRS2, showed the highest levels of antiviral activity compared to all other P-PMO used in this study. The 20-mer TRS1 and 21-mer TRS2 vary by only a few nucleotides, as shown in Fig. 1, but are predicted to vary considerably in the targets to which they can bind. The TRS1 target includes the consensus TRS core sequence ACGAAC and 14 bases in the viral 5′ direction. TRS2 covers the TRS core, four bases in the 3′ direction, and 11 bases on the 5′ side. This difference is predicted to allow binding of TRS1 to full-length genomic RNA and all eight of the subgenomic mRNAs (27). Out of the eight SARS subgenomic RNAs, five have start codons either adjacent to or within two bases of the TRS core (27). The 3′ end of the TRS core is also the 3′ end of the TRS1 target. TRS1 was therefore expected to have a more profound antiviral effect due to its potential for translational inhibition via duplexing to a region immediately upstream of the AUG translation start sites of at least five discrete viral RNAs combined with its potential ability to block discontinuous transcription of all subgenomic minus-strand RNAs. The TRS2 P-PMO spans the flanking sequence on both sides of the TRS core more extensively than TRS1 P-PMO and may therefore be more effective at inhibiting discontinuous transcription. The observation that TRS2 is more efficacious than TRS1 suggests that targeting the genomic RNA exclusively is a more efficient antiviral strategy with this class of antisense compound.

The SARS-CoV was able to partially escape inhibition by the TRS2 P-PMO within four viral passages. The forced generation of resistance suggests antisense agents as a powerful means of investigating virus structure and function and as a complement to traditional reverse-genetic studies. Furthermore, the observation that the TRS2-resistant SARS-CoV showed a reduced level of cytopathology opens the possibility for a new approach to the generation of attenuated viral strains. The results presented here indicate that the selection of therapeutic antisense antiviral targets will present the greatest opportunity for success when informed by detailed molecular understanding of the physical and temporal requirements for virus amplification.

Subject: AD3C Project/Core Teleconference Call
SARS_COVID19_VS_selected_hits_v1-2[1].xlsx
Modeling SARS v6[1].pptx

Hello all AD3C members,

Hoping this email finds you safe and well. Although we did cancel last week's call, we would like to follow up with everyone and have a check-in. Further, we would like to update and obtain feedback from everyone on some of the COVID-19 work. Attached please find the virtual screens that we received from SR's Med Chem group:
1. Virtual screen of 102K library against exonuclease site of SARS nsP14 crystal structure.
2. Virtual screen of 122K library against conserved binding site of SARS/COVID-19 main protease crystal structures
3. Repurposing of drugs/compounds from literature according to cheminformatics analysis (not included in current HTS library).

A presentation is attached for further details. In total, 52 compounds were sorted and initially 38 compounds will be accessed for SARS/COVID-19 SAR assays (See excel file for details). Some of these will be purchased from commercial sources in coming days.

A doodle poll may be found here in order to schedule in such a tight turn around:
https://doodle.com/poll/emrk69gb327hqa9a
Please do this at your earliest convenience. Hope you all have a nice weekend and stay safe and well.

Thank you all,

Stephanie
Cell: 205-563-8565

Southern Research Engineering

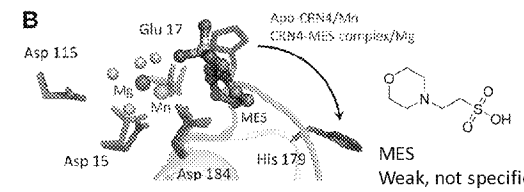
Outline

- Virtual screen of SARS nsP14
- Virtual screen of SARS/COVID-19 main protease
- Other strategies for virtual screen

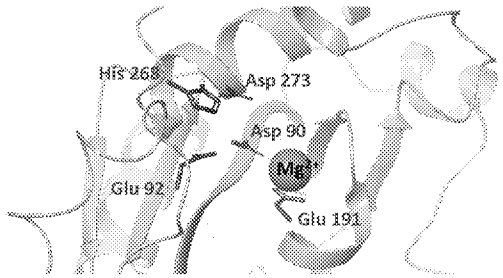
9/27/2021

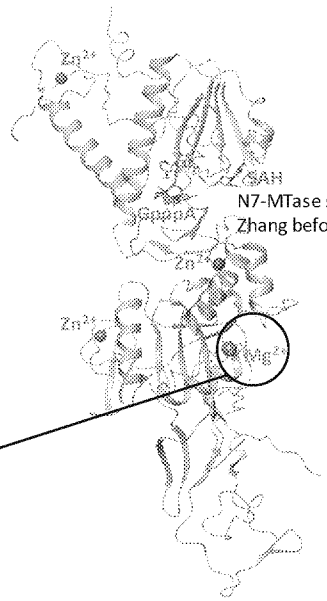
Southern Research Engineering

Virtual Screen (VS) Site at SARS nsP14



Inhibitor MES co-crystalized at DEDDh exonuclease site of *C. elegans* CRN-4 (Figure 6B, Huang, KW; *et. al. J. Med. Chem.* 2016, 59: 8019)





N7-MTase site (VS by Dr. Wei Zhang before)

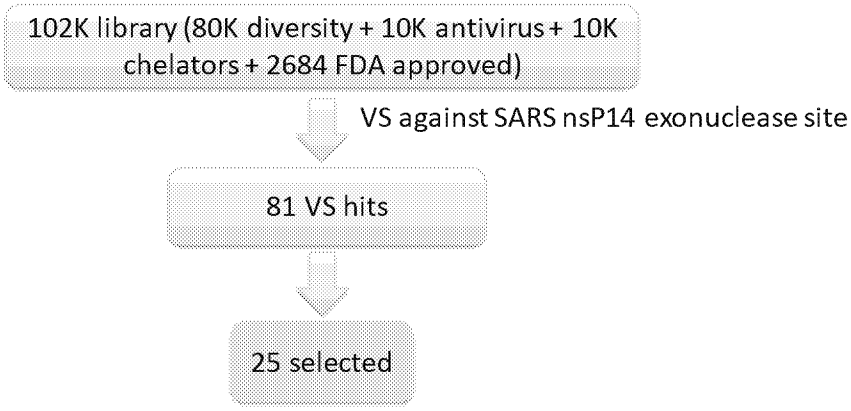
SARS nsP14 crystal (PDB ID 5C8S)

❖ DEEDh exonuclease site in SARS nsP14 (equivalent to DEDDh family) is used for new VS

9/27/2021

Southern Research Engineering

Summary of VS Result of nsP14

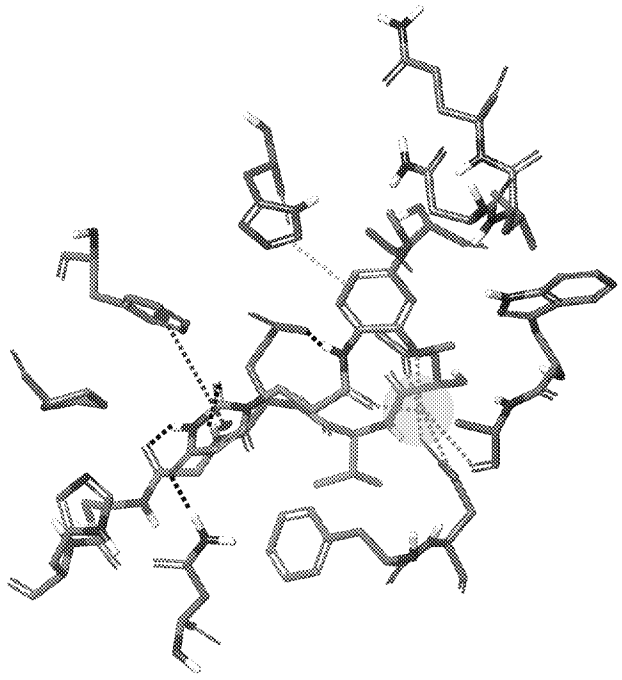


- Challenge: bring specificity at the metal ion binding site

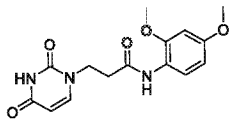
9/27/2021

Southern Research Engineering

Examples From Diversity Set for nsP14



VS pose at SARS nsP14 exonuclease site



ChemDiv D459-0057 (left figure)
Score: -8.3

- Hydrogen bond
- Coordinate bond
- Hydrophobic contact
- π-π stacking

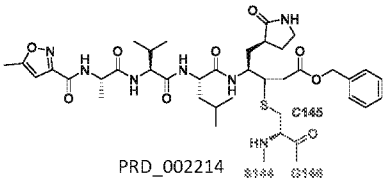
Purple residues: DEEDh motif
Pink sphere: Mg^{2+}

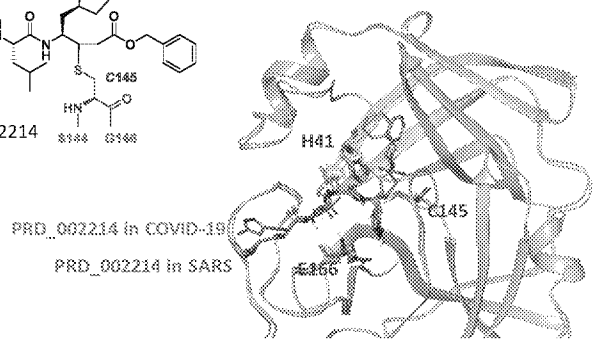
*Score in kcal/mol, more negative, the better

9/27/2021

Southern Research Engineering

SARS & COVID-19 Main Protease





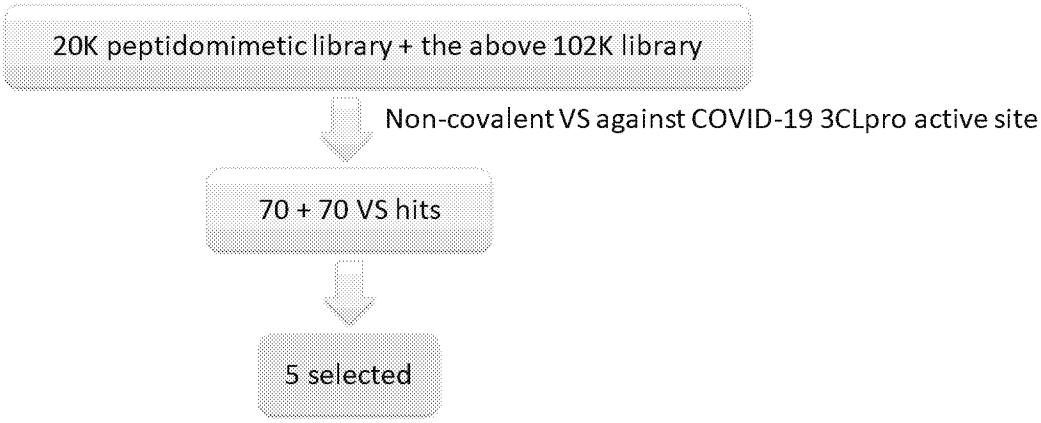
Overlay of SARS and COVID-19 co-crystals of 3CLpro/PRD_002214

- **SARS main protease (nsP5 3CLpro) crystal structure** (PDB ID 2AMQ) and COVID-19 3CLpro crystal structure (PDB ID 6LU7, published in Feb.) has 97% sequence similarity and identical active site
- Since active sites are identical, VS results of COVID-19 protease will be applicable to SARS protease

9/27/2021

Southern Research Engineering

Summary of VS Result of 3CLpro

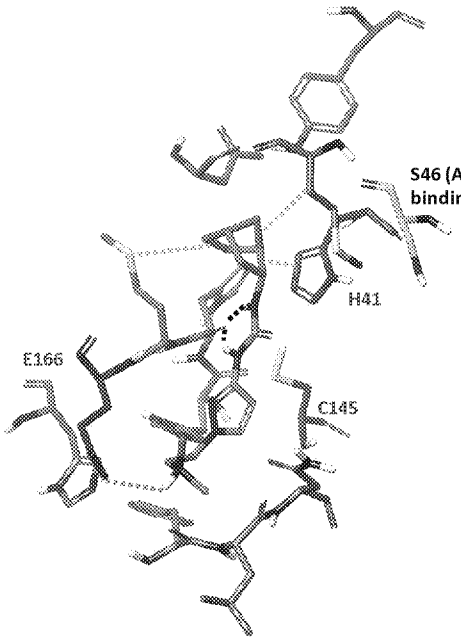


- Challenge: non-covalent inhibitors may not be as potent as covalent inhibitors

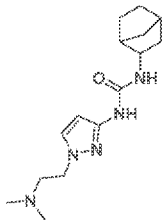
9/27/2021

Southern Research Engineering

Example Hit for SARS/COVID-19 3CLpro



VS pose at COVID-19 protease active site



Enamine antivirus library Z1278200544
Score: -9.3

- Hydrogen bond
- Salt bridge
- Hydrophobic contact
- π-π stacking

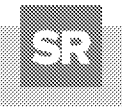
Purple residues: active site
Cyan residue: variant in SARS

9/27/2021

Southern Research Engineering

Other VS Strategies

- ❖ Receptor-based VS
  - Protease inhibitor library against SARS/COVID-19 nsP5 3CLpro crystal
  - SARS nsP3 papain-like protease crystal
  - SARS nsP3 macrodomain crystal
  - Other crystal structures of interest
- ❖ Ligand-based VS
  - Machine learning model built on in-house SARS HTS data and literature COVID-19 data



Solving the world's hardest problems.

Additional Details of VS Strategies

- VS protease inhibitor library against SARS/COVID-19 nsP5 3CLpro crystal
  - 227 cmpds from Selleckchem and 108 cmpds from TargetMol
- VS against SARS nsP3 papain-like protease crystal (not macrodomain)
  - COVID-19 has 91% sequence similarity and identical binding site according to homology model
- VS against SARS nsP3 macrodomain crystal
  - COVID-19 has 83% sequence similarity and identical binding site according to homology model
  - An conserved ribose binding site across alphaviruses and coronaviruses
  - Knowledge gained from in-house CHIKV nsP3 fragment VS/co-crystalization can be applied here
- Ligand-based VS of 775K in-house compounds against an in-house built COVID-19 pharmacophore model
  - A.I./machine learning model built with COVID-19 actives in literature and SARS data from SR HTS
  - As a pilot run, 8 in-house compounds have been selected for re-purpose

Subject: AD3C Project/Core Teleconference Call

Hello all AD3C members,

Hoping this email finds you safe and well. Although we did cancel last week's call, we would like to follow up with everyone and have a check-in. Further, we would like to update and obtain feedback from everyone on some of the COVID-19 work. Attached please find the virtual screens that we received from SR's Med Chem group:
1. Virtual screen of 102K library against exonuclease site of SARS nsP14 crystal structure.
2. Virtual screen of 122K library against conserved binding site of SARS/COVID-19 main protease crystal structures
3. Repurposing of drugs/compounds from literature according to cheminformatics analysis (not included in current HTS library).

A presentation is attached for further details. In total, 52 compounds were sorted and initially 38 compounds will be accessed for SARS/COVID-19 SAR assays (See excel file for details). Some of these will be purchased from commercial sources in coming days.

A doodle poll may be found here in order to schedule in such a tight turn around:
https://doodle.com/poll/emrk69gb327hqa9a
Please do this at your earliest convenience. Hope you all have a nice weekend and stay safe and well.

Thank you all,

Stephanie

When: Thursday, August 15, 2019 3:30 PM-5:00 PM (UTC-06:00) Central Time (US & Canada).
Where: Call in at 1-888-806-5025 and use the passcode of **552.136**

Hello to Everyone:

Due to several scheduling issues, we are moving the August 2019 AD3C monthly call from August 22nd to Thursday, August 15th at 3:30 pm Central Time. We hope you are able to join the call. If you have slides to share, please send them to me by 12:00 pm Central Time on that day and I will distribute to the group.

With kind regards,

Sara Davis

Subject: IMPORTANT: AD3C Monthly Meeting Date Change for July Meeting
7.30.20 AD3C Agenda.pdf

Hello to Everyone:

I am writing to you today to let you know that the Administrative Group needs to change the date of the July monthly AD3C Zoom call from July 23 to **Thursday, July 30 at the same time, 3:30 pm Central Time.** We apologize for any difficulties that this change might cause for you, and hope that you will be able to join us. The agenda for the call is attached, and I will send an Outlook Calendar notice with the new date this morning. Thank you.

With kind regards,

Sara Davis
Program Coordinator II
Collaborative Antiviral Study Group/Pediatrics/Infectious Diseases
sadavis@peds.uab.edu
Direct Line Telephone: 205-638-2536

Dear all,
Here is the paper mentioned by Dimiter on our call today. I tried to send an email with the file , but the email bounced back from most due to the file size. Please just use the link.
Thanks
Bill

Subject: cell paper about very potent highly stable human domain

Hi Bill,

I put it on the chat in the last second, here it is
https://www.cell.com/cell/fulltext/S0092-8674(20)31148-X

also attached the file just in case.

It is human domain fused to Fc and every stable – for 3 months at 37C no change in activity.
Was thinking even could be used as reference reagent, you mentioned there is also another candidate.

Best
Mitko
(Dimiter Dimitrov)

Subject: Agenda for WHO working group on COVID-19 assays

Hello all

Here is the agenda for tomorrow's meeting of the WHO working group on COVID-19 assays:

1. David Eyre form Oxford University will talk about the paper "Antibodies to SARS-CoV-2 are associated with protection against reinfection " doi: https://doi.org/10.1101/2020.11.18.20234369
2. Updates:
    a. Simon Funnell - update on the working group on SARS-COV-2 propagation
    b. Mark page- update on the work towards an International Standard
    c. Any other updates from the group
3. Discussion on future topics

Best regards
Bill

Subject: Scheduling Dr. Whitley's AD3C Year 1 Reverse Site Visit in February 2020

Hello To Everyone:

You are receiving this message because you are either a member of the Antiviral Drug Discovery and Development Center External Advisory Board, or you are a Project Leader for this CETR grant. It is time to reach out and schedule the Reverse Site Visit for **Year 1** of the grant.

Dr. Maureen Beanan, our NIH/NIAID Program Officer for the grant, has written to Dr. Whitley and shared possible dates for this meeting. Because our group is holding our Annual Meeting later than usual this year (November 15-16), I have created a Doodle Poll with possible dates for the Reverse Site Visit in February of 2020. The January dates have already been scheduled by other CETR groups.

The meeting will be held in Rockville, MD at the NIAID Building on Fishers Lane, from 9 am to around 12 noon Eastern Time on the selected day.

Here is the link to the Doodle Poll: https://doodle.com/poll/eviskabvb2576e2k

Please take a moment and indicate which dates might work for your schedule, and I will be back in touch as soon as we have found the best date for all.

Thank you very much for your assistance and your attention to my request.

With kind regards,

Sara Davis | Program Coordinator II

Subject: Cross Virus Data

Hi AD3C Team,

I have uploaded the AD3C cross virus data spreadsheet to ShareFile at the link below. This spreadsheet shows the data that has been generated for compounds across multiple viruses to date. The Chemistry Core will continue to submit active compounds for screening against other viruses, and we will update this spreadsheet as we generate additional data.

https://southernresearch.sharefile.com/d-s3d089a933d6843dda6d8d3e80db15f97

Please let me know if you need any additional information and/or have any problems accessing ShareFile!

Thanks,

Carrie

Subject: RE: Scheduling Dr. Whitley's AD3C Year 1 Reverse Site Visit in February 2020

A quick note of correction: The 2019 AD3C Annual Meeting will be held on November 13-14, 2019 (Wednesday and Thursday), not November 15-16 as I wrote in the message that you just received. I apologize if I created any confusion for you.

Subject: Scheduling Dr. Whitley's AD3C Year 1 Reverse Site Visit in February 2020

Hello To Everyone:

You are receiving this message because you are either a member of the Antiviral Drug Discovery and Development Center External Advisory Board, or you are a Project Leader for this CETR grant. It is time to reach out and schedule the Reverse Site Visit for **Year 1** of the grant.

Dr. Maureen Beanan, our NIH/NIAID Program Officer for the grant, has written to Dr. Whitley and shared possible dates for this meeting. Because our group is holding our Annual Meeting later than usual this year (November 15-16), I have created a Doodle Poll with possible dates for the Reverse Site Visit in February of 2020. The January dates have already been scheduled by other CETR groups.

The meeting will be held in Rockville, MD at the NIAID Building on Fishers Lane, from 9 am to around 12 noon Eastern Time on the selected day.

Here is the link to the Doodle Poll: https://doodle.com/poll/eviskabvb2576e2k

Please take a moment and indicate which dates might work for your schedule, and I will be back in touch as soon as we have found the best date for all.

Thank you very much for your assistance and your attention to my request.

With kind regards,

Sara Davis | Program Coordinator II

Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for our group call on Wednesday December 9, 2020 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays

1. Drs. Galit Alter and Dan Barouch from the Ragon Institute of MGH, MIT and Harvard, "T cell and antibody functional correlates of severe COVID-19"
2. Dr. Qiang Pan-Hammarström from the Karolinska Institutet, "Persistence of SARS-CoV-2 specific B- and T-cell responses in convalescent COVID-19 patients 6-8 months after the infection"

Sent: Tue 12/15/2020 10:01:28 AM (UTC-06:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for our group call on Wednesday December 16, 2020 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays

1. Remarks from Ana María Henao Restrepo
2. Mark Page and Giada Mattiuzzo NIBSC - *Harmonisation and increased comparability of SARS-COV-2 serological assays by WHO International standard*

Subject: RE: Scheduling Dr. Whitley's AD3C Year 1 Reverse Site Visit in February 2020

Greetings!

First, a huge thank you to everyone for replying to the scheduling poll in such a speedy fashion! Before your schedules fill up, I am going to have you lock in **Tuesday, February 11, 2020** on your calendars. That date works for Maureen Beanan and the NIH/NIAID stuff as well. That will require travel on Monday, February 10, because the meeting will take place on Tuesday morning.

Additional details and instructions on crafting the presentation for the site visit will be discussed at the Annual Meeting on November 13-14 here in Birmingham, AL.

We appreciate your participation and look forward to seeing you soon.

With kind regards,

Sara Davis | Program Coordinator II

Subject: Scheduling Dr. Whitley's AD3C Year 1 Reverse Site Visit in February 2020

Hello To Everyone:

You are receiving this message because you are either a member of the Antiviral Drug Discovery and Development Center External Advisory Board, or you are a Project Leader for this CETR grant. It is time to reach out and schedule the Reverse Site Visit for **Year 1** of the grant.

Dr. Maureen Beanan, our NIH/NIAID Program Officer for the grant, has written to Dr. Whitley and shared possible dates for this meeting. Because our group is holding our Annual Meeting later than usual this year (November 15-16), I have created a Doodle Poll with possible dates for the Reverse Site Visit in February of 2020. The January dates have already been scheduled by other CETR groups.

The meeting will be held in Rockville, MD at the NIAID Building on Fishers Lane, from 9 am to around 12 noon Eastern Time on the selected day.

Here is the link to the Doodle Poll: https://doodle.com/poll/eviskabvb2576e2k

Please take a moment and indicate which dates might work for your schedule, and I will be back in touch as soon as we have found the best date for all.

Thank you very much for your assistance and your attention to my request.

With kind regards,

Sara Davis | Program Coordinator II

From: SCHWARTZ, Lauren[schwartzl@who.int]
Sent: Mon 1/11/2021 5:43:28 PM (UTC-06:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for our group call on Wednesday January 13, 2021 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays

1. Alessandro Sette (LJI) - *Comprehensive analysis of T cell immunodominance and immunoprevalence of SARS-CoV-2 epitopes in COVID-19 cases*
2. Joe Campo (Antigen Discovery Inc) - *A Multi-Coronavirus Protein Microarray for Mapping SARS-CoV-2 Antibody Epitopes and Characterizing Immune Responses to Infection and Vaccination*

Subject: RE: WHO Working Group on COVID-19 Assays with Vaccine Developers

Dear All,

Please find below the agenda for our group call with vaccine developers on Wednesday January 20, 2021 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays with vaccine developers

1. WHO standards for COVID-19 - I. Knezevic (WHO)
2. Roles and Importance of Standards in Assays – G. Mattiuzzo (NIBSC)
3. Calibration of secondary standards to WHO International Standards – P. Rigsby (NIBSC)
4. Discussion on standards
5. Update on 501Y.V2 variants – Alex Sigal (AHRI)

Sent: Mon 1/18/2021 4:51:31 PM (UTC-06:00)
Subject: RE: WHO Working Group on COVID-19 Assays with Vaccine Developers

Hi All,

Before the call on Wednesday, if you have specific questions you can email Bill Dowling, Mark Page, and myself (click here for email). We will try and address these questions on the call.

Best,
Lauren

Subject: RE: WHO Working Group on COVID-19 Assays with Vaccine Developers

Dear All,

Please find below the agenda for our group call with vaccine developers on Wednesday January 20, 2021 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays with vaccine developers

1. WHO standards for COVID-19 - I. Knezevic (WHO)
2. Roles and Importance of Standards in Assays – G. Mattiuzzo (NIBSC)
3. Calibration of secondary standards to WHO International Standards – P. Rigsby (NIBSC)
4. Discussion on standards
5. Update on 501Y.V2 variants – Alex Sigal (AHRI)

Chat_Assays Call with Vaccine Developers_20Jan2021.docx

Dear All,

Many thanks for joining the discussion on Wednesday. See attached the presentations on standards, a summary of some of the questions from the zoom chat, and the pre-print from Alex Sigal.

Best,
Lauren

Subject: RE: WHO Working Group on COVID-19 Assays with Vaccine Developers

Hi All,

Before the call on Wednesday, if you have specific questions you can email Bill Dowling, Mark Page, and myself (click here for email). We will try and address these questions on the call.

Best,
Lauren

Subject: RE: WHO Working Group on COVID-19 Assays with Vaccine Developers

Dear All,

Please find below the agenda for our group call with vaccine developers on Wednesday January 20, 2021 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays with vaccine developers

1. WHO standards for COVID-19 - I. Knezevic (WHO)
2. Roles and Importance of Standards in Assays – G. Mattiuzzo (NIBSC)
3. Calibration of secondary standards to WHO International Standards – P. Rigsby (NIBSC)
4. Discussion on standards
5. Update on 501Y.V2 variants – Alex Sigal (AHRI)

Abstract

New SARS-CoV-2 variants with mutations in the spike glycoprotein have arisen independently at multiple locations and may have functional significance. The combination of mutations in the 501Y.V2 variant first detected in South Africa include the N501Y, K417N, and E484K mutations in the receptor binding domain (RBD) as well as mutations in the N-terminal domain (NTD). Here we address whether the 501Y.V2 variant could escape the neutralizing antibody response elicited by natural infection with earlier variants. We were the first to outgrow two variants of 501Y.V2 from South Africa, designated 501Y.V2.HV001 and 501Y.V2.HVdF002. We examined the neutralizing effect of convalescent plasma collected from six adults hospitalized with COVID-19 using a microneutralization assay with live (authentic) virus. Whole genome sequencing of the infecting virus of the plasma donors confirmed the absence of the spike mutations which characterize 501Y.V2. We infected with 501Y.V2.HV001 and 501Y.V2.HVdF002 and compared plasma neutralization to first wave virus which contained the D614G mutation but no RBD or NTD mutations. We observed that neutralization of the 501Y.V2 variants was strongly attenuated, with IC_{50} 6 to 200-fold higher relative to first wave virus. The degree of attenuation varied between participants and included a knockout of neutralization activity. This observation indicates that 501Y.V2 may escape the neutralizing antibody response elicited by prior natural infection. It raises a concern of potential reduced protection against re-infection and by vaccines designed to target the spike protein of earlier SARS-CoV-2 variants.

Through genomic surveillance of the severe acute respiratory syndrome-related coronavirus 2 (SARS-CoV-2), a number of new variants have recently been identified with multiple mutations in the spike glycoprotein [1, 2, 3]. We recently described the emergence of the N501Y.V2 variant in South Africa, characterised by the K417N, E484K, and N501Y mutations in the spike receptor binding domain (RBD) as well as four substitutions and a deletion in the N-terminal domain (NTD) [1]. This variant was first detected in October 2020, and has rapidly become the dominant variant in several parts of the country at a time of a rapid resurgence in infections.

The RBD is the main target of neutralizing antibodies (NAbs) elicited by SARS-CoV-2 infection, with the remaining activity directed at the NTD [4, 5, 6]. All three amino acid residues in the RBD that carry mutations in 501Y.V2 interact directly with the human angiotensin-converting enzyme 2 (hACE2) receptor and form part of the epitopes for hACE2-blocking NAbs [7]. The E484 residue specifically is a hotspot for binding of highly potent NAbs [7]. In a number of separate *in vitro* studies using monoclonal antibodies (mAbs), mutations at E484 have emerged as immune escape mutations, often conferring broad cross-resistance to panels of mAbs [8, 9, 10, 11]. E484K also emerged during passage with convalescent plasma, leading to substantial drops in neutralization with convalescent plasma samples [12, 13]. Using a deep mutation scanning approach to determine the effect of individual mutations on neutralization by polyclonal serum, mutations at E484 were associated with the largest drops in neutralization [14].

Here, using a microneutralization assay with authentic virus, we address the question of whether 501Y.V2 variants can escape the neutralizing response elicited by natural infection with previous variants. We outgrew and compared the neutralization of two SARS-CoV-2 501Y.V2 variants to a previously circulating variant derived from South Africa which does not have the 501Y.V2 defining mutations.

For neutralization, we used plasma samples from our ongoing longitudinal cohort study that tracks COVID-19 cases enrolled at two hospitals in Durban, South Africa [15]. We sampled participants weekly for the first month post-enrollment, and at each timepoint a blood draw and combined nasopharyngeal/oropharyngeal swab was performed to obtain both the plasma and the infecting virus.

Figure 1: Study design and sequences of SARS-CoV-2 variants. (A) We obtained convalescent plasma and detected the matching infecting variant in the first SARS-CoV-2 infection wave in South Africa. A blood draw and nasopharyngeal/oropharyngeal was performed on study participants. First wave virus was outgrown from one of the participants and compared to two viruses outgrown from the second wave, which were 501Y.V2 variants. A focus forming microneutralization assay was used to quantify neutralization. (B) Phylogenetic tree and mutations of variant sequences. Variants which infected the study participants who were plasma donors only for this study are marked in blue. Sequences of variants which were outgrown are marked in yellow. Participant 039-13-0013 was both a plasma donor and the donor from whom the first wave virus was outgrown. Y-axis denotes time of sampling for viral sequencing. Table shows mutations present in Spike for the 501Y.V2 variants and the first wave virus used in the study. See Table S2 for a complete list of mutations in the viral genomes.

We chose plasma from participants from the first infection wave where the infecting virus was successfully sequenced (Table S1) and where RBD binding was detected by ELISA. These viruses were from a variety of B.1 lineages circulating in South Africa and contained the D614G mutation but none of the spike mutations defining 501Y.V2 (Figure 1, see Table S2 for whole genome mutations). Plasma samples were from blood drawn approximately 1 month post-symptom onset (Table S1), shown to be close to the antibody response peak [16, 17].

We outgrew first wave virus (Materials and methods) from a sample obtained from a cohort participant (039-13-0013) in July 2020, and second wave 501Y.V2 virus from two samples obtained in November 2020 through our genomic surveillance program. We used a microneutralization live virus focus forming assay (FFA) [18]. This relies on a methylcellulose overlay to limit cell-free viral spread, resulting in a local infection focus then detected by an anti-SARS-CoV-2 Spike antibody (Materials and methods). Re-sequencing of the first 501Y.V2 variant after outgrowth revealed no changes in the RBD or NTD but a deletion in the furin cleavage site (Table S3) commonly observed after *in vitro* culture in Vero E6 cells [19, 20]. We designated this variant 501Y.V2.HVdF002. HV represents the outgrowth protocol which included initial outgrowth in a human H1299 cell line derivative overexpressing the ACE2 receptor, followed by a cell-to-cell infection of Vero E6 cells (Materials and methods). dF represents the deletion of the furin cleavage site. Deletion of the furin cleavage site may not affect neutralization [19]. However, we proceeded to test an additional 501Y.V2 variant. This variant, which we designated 501Y.V2.HV001, had an additional mutation, L18F, in the NTD prior to outgrowth and showed no changes in spike sequence after outgrowth.

We mixed the virus with serially diluted participant plasma, then added the mixture to Vero E6 cells and counted infection foci after 28 hours (Figure 2A, Materials and methods). There was a clear visual difference in the number of foci as a function of plasma dilution. 501Y.V2.HV001 also showed dramatically larger foci (Figure 2A).

We normalized the number of foci to the number of foci in the absence of plasma on the same plate to obtain the transmission index (Tx, [21]). In this context, it is the number of foci in the presence of plasma inhibition divided by the number of foci in the absence of plasma. This controls for experiment variability between plates and experiments. The data from the FFA approximated a normal distribution (Figure S1) and we therefore used parametric statistics to describe it. We observed neutralization of the first wave virus which varied between plasma samples (Figure 2B). To obtain the IC_{50}, we fitted the data for each participant to a sigmoidal function [22] with IC_{50} as the only free parameter (Materials and methods). Fitted IC_{50} values (Figure 2D) varied between 4×10^{-3} for participant 039-13-0013 to 1×10^{-4} for participants 039-13-0033 and 039-02-0015, consistent with the previously observed heterogeneity in neutralization between individuals [16, 17].

We next determined neutralization of 501Y.V2. A decline in plasma neutralization was clearly observed (Figure 2A). T501Y.V2.HV001 also showed attenuated neutralization likely greater than that of 501Y.V2.HVdF002 (Figure S2), ruling out the *in vitro* generated deletion in the furin cleavage site as being responsible for escape. We combined the data for both 501Y.V2 variants. Fitted IC_{50} values varied between 1×10^{-3} (1:100 dilution) for plasma from participant 039-13-0033 to a complete knock-out of activity for plasma from participant 039-13-0013 (Figure 2D). The 501Y.V2 to first wave IC_{50} ratio ranged from 6 to 200-fold (Figure 2D). Averaging across all participants highlighted the dramatic decrease in sensitivity to neutralization of authentic 501Y.V2 variants (Figure 2E).

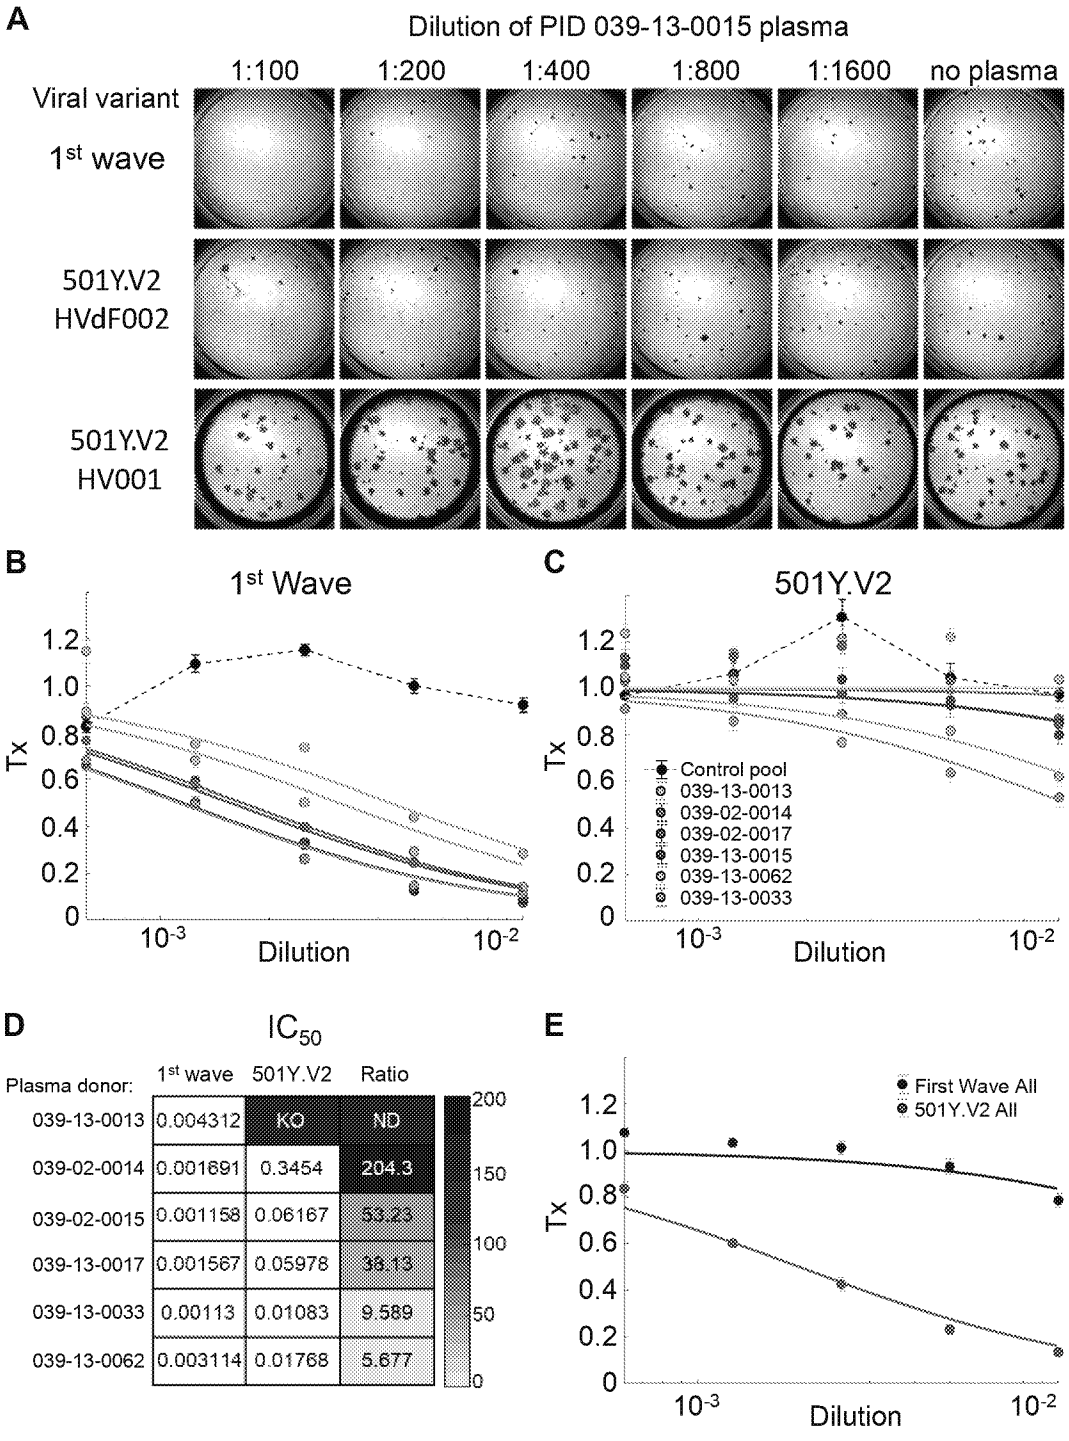

Figure 2: Neutralization of first wave and 501Y.V2 variants by convalescent plasma from first wave infections. (A) A representative focus forming assay using plasma from participant 039-13-0015. Plasma neutralization of (B) first wave virus and (C) the combined results from the two 501Y.V2 variants. Colored circles represent means and standard errors from 8 independent neutralization experiments using plasma from 6 convalescent participants who were infected by first wave variants in the first peak of the pandemic in South Africa. Correspondingly colored lines are fits of the sigmoidal equation with IC_{50} as the fitted parameter. Black points represent a pool of plasma from three uninfected controls. The transmission index (Tx) is the number of foci in the presence of the plasma dilution normalized by the number of foci in the absence of plasma. (D) Plasma IC_{50} values and ratios for first wave and 501Y.V2 variants. Knockout (KO) was scored as $IC_{50} > 1$. ND, not defined. (E) Mean and standard error across all plasma donors.

As we have entered the second year of the SARS-CoV-2 pandemic with high levels of transmission in many parts of the world, variants with mutations at key residues in the spike glycoprotein have emerged. Here we present clear evidence using authentic SARS-CoV-2 that the 501Y.V2 variant first detected in South Africa is associated with reduced neutralization by plasma collected from patients infected in the first wave with SARS-CoV-2 variants without the 501Y.V2 defining RBD and NTD mutations. While our findings are based on plasma samples from six convalescent study participants, the relative consistency of the effect argues that the potential to escape neutralizing antibodies elicited by prior SARS-CoV-2 infection may be widespread.

The reduced neutralization is most likely related to the mutations in the spike RBD and NTD that characterize the 501Y.V2 variant. While the E484K mutation has the clearest association with immune escape, the other mutations in the RBD (K417N, N501Y) are also located within residues targeted by some class 1 and class 2 NAbs [7]. Information about the significance of NTD mutations is also emerging. NAbs targeting this site have been shown to be potent neutralizers of SARS-CoV-2 [5, 6]. The deletion at residues 242-244 is just outside an antigenic supersite loop (residues 245-264) and L18 also falls within the antigenic supersite. Furthermore, mutations at L18 and D80 have been selected during passage with mAbs [5]. Our second variant contains the L18F mutation. This may be associated with the trend to lower neutralization sensitivity relative to the first 501Y.V2 variant (Figure S2). This variant also has strikingly larger foci (Figure 2A).

The reasons for the rapid emergence and fixation of potential immune escape mutations in South Africa remain unclear. The 501Y.V2 variant was first detected in the Eastern Cape Province of South Africa, in Nelson Mandela Bay, an urban municipality with a population of just over one million. While we have no SARS-CoV-2 seroprevalence data from this area, there were 1909 excess natural deaths (approximately 1600 per million population) by the end of the first wave in mid-September (https://www.samrc.ac.za/reports/report-weekly-deaths-south-africa). In the context of a young population (over 80 percent of the population under 50 years), this data would suggest a high attack rate from the first wave. While circumstantial, this provides some support to a hypothesis of high levels of population immunity driving the selection of variants with capacity to evade natural immunity. This area also has high HIV prevalence, and has amongst the lowest proportions of people with HIV who have viral suppression (http://www.hivdata.org.za/). We have not observed evidence of chronic SARS-CoV-2 infection in people living with HIV in our longitudinal cohort [15]. However, most cohort participants had sustained virological suppression with antiretroviral therapy (ART). We did observe altered immune dynamics after SARS-CoV-2 infection in HIV viremic participants relative to those who were virologically suppressed, and we are currently enrolling additional participants to examine SARS-CoV-2 clearance in the HIV viremic subset.

The implications of these results for re-infection and vaccine efficacy are still unclear. Our findings emphasize the need to understand whether the 501Y.V2 variant, and other similar variants, are associated with an increased rate of re-infection. Vaccines such as the Oxford/Astra Zeneca ChAdOx1 [23] and the Pfizer-BioNTech BNT162b2 [24] elicit neutralization titers in a similar range to the convalescent plasma in this study. However, these vaccines may elicit a broader antibody response and protective T cell immunity [25]. Protective T cell immunity also likely occurs following natural infection. Furthermore, it is unclear what degree of neutralization mediates protection, and infection may be particularly sensitive to inhibition at exposure [26].

In conclusion, we present data suggesting that the 501Y.V2 variant first detected in South Africa is able to escape the neutralizing antibody response elicited by natural infection with earlier variants. We expect data in the next weeks from phase 3 vaccine trials being conducted in South Africa. If the variant does have an effect on vaccine efficacy, then there may be a signal in the data from these clinical trials.

Material and methods

Ethical statement

Nasopharyngeal/oropharyngeal swab samples and plasma samples were obtained from six hospitalized adults with PCR-confirmed SARS-CoV-2 infection enrolled in a prospective cohort study approved by the Biomedical Research Ethics Committee (BREC) at the University of KwaZulu-Natal (reference BREC/00001275/2020). The 501Y.V2 variants were obtained from residual nasopharyngeal/oropharyngeal samples used for routine SARS-CoV-2 diagnostic testing by the National Health Laboratory Service, through our SARS-CoV-2 genomic surveillance program (BREC approval reference BREC/00001510/2020).

Whole genome sequencing, genome assembly and phylogenetic analysis

cDNA synthesis was performed on the extracted RNA using random primers followed by gene specific multiplex PCR using the ARTIC V3 protocol. Briefly, extracted RNA was converted to cDNA using the Superscript IV First Strand synthesis system (Life Technologies, Carlsbad, CA) and random hexamer primers. SARS-CoV-2 whole genome amplification was performed by multiplex PCR using primers designed on Primal Scheme (http://primal.zibraproject.org/) to generate 400bp amplicons with an overlap of 70bp that covers the 30Kb SARS-CoV-2 genome. PCR products were cleaned up using AmpureXP purification beads (Beckman Coulter, High Wycombe, UK) and quantified using the Qubit dsDNA High Sensitivity assay on the Qubit 4.0 instrument (Life Technologies Carlsbad, CA). We then used the Illumina® Nextera Flex DNA Library Prep kit according to the manufacturer's protocol to prepare indexed paired end libraries of genomic DNA. Sequencing libraries were normalized to 4nM, pooled and denatured with 0.2N sodium acetate. 12pM sample library was spiked with 1% PhiX (PhiX Control v3 adapter-ligated library used as a control). We sequenced libraries on a 500-cycle v2 MiSeq Reagent Kit on the Illumina MiSeq instrument (Illumina, San Diego, CA). We have previously published full details of the amplification and sequencing protocol [27].

We assembled paired-end fastq reads using Genome Detective 1.126 (https://www.genomedetective.com) and the Coronavirus Typing Tool [28]. We polished the initial assembly obtained from Genome Detective by aligning mapped reads to the references and filtering out low-quality mutations using bcftools 1.7-2 mpileup method. Mutations were confirmed visually with bam files using Geneious software (Biomatters Ltd, Auckland, New Zealand). All of the sequences were deposited in GISAID (https://www.gisaid.org/). We retrieved all South African SARS-CoV-2 genotypes from the GISAID database as of 11 January 2021 (N=2704). We initially analyzed South African genotypes against the global reference dataset (N=2592) using a custom pipeline based on a local version of NextStrain. The pipeline contains several python scripts that manage the analysis workflow. It performs alignment of genotypes in MAFFT [29], phylogenetic tree inference in IQ-Tree20, tree dating and ancestral state construction and annotation (https://github.com/nextstrain/ncov).

Cells

Vero E6 cells (ATCC CRL-1586, obtained from Cellonex) were propagated in complete DMEM with 10% fetal bovine serum (Hylone) containing 1% each of HEPES, sodium pyruvate, L-glutamine, and non-essential amino acids (Sigma-Aldrich). Cells were passaged every 3-4 days. H1299 cells were propagated in complete RPMI with 10% fetal bovine serum containing 1% each of HEPES, sodium pyruvate, L-glutamine, and non-essential amino acids and and passaged every second day.

H1299-E3 cell line for first passage SARS-CoV-2 outgrowth

The H1299-H2AZ clone with nuclear labelled YFP [30] was constructed to overexpress ACE2 as follows: VSVG-pseudotyped lentivirus containing the human ACE2 was generated by co-transfecting 293T cells with the pHAGE2-EF1alnt-ACE2-WT plasmid along with the lentiviral helper plasmids HDM-VSVG,

HDM-Hgpm2, HDM-tat1b and pRC-CMV-Rev1b using TransIT-LT1 (Mirus) transfection reagent. Supernatant containing the lentivirus was harvested two days after infection, filtered through a 0.45μm filter (Corning) and used to spinfect H1299-H2AZ at 1000 rcf for 2 hours at room temperature in the presence of 5 μg/mL polybrene (Sigma-Aldrich). ACE-2 transduced H1299-H2AZ cells were then subcloned at the single cell density in 96-well plates (Eppendorf) in conditioned media derived from confluent cells. After 3 weeks, wells were trypsinized (Sigma-Aldrich) and plated in two replicate plates, where the first plate was used to determine infectivity and the second was stock. The first plate was screened for the fraction of mCherry positive cells per cell clone upon infection with SARS-CoV-2 mCherry expressing Spike pseudotyped lentiviral vector 1610-pHAGE2/EF1a Int-mCherry3-W produced by transfecting as above. Screening was performed using a Metamorph-controlled (Molecular Devices, Sunnyvale, CA) Nikon TiE motorized microscope (Nikon Corporation, Tokyo, Japan) with a 20x, 0.75 NA phase objective, 561 laser line, and 607 nm emission filter (Semrock, Rochester, NY). Images were captured using an 888 EMCCD camera (Andor). Temperature (37°C), humidity and CO2 (5%) were controlled using an environmental chamber (OKO Labs, Naples, Italy). The clone with the highest fraction of mCherry expression was expanded from the stock plate and denoted H1299-E3. This clone was used in the outgrowth.

Viral Outgrowth

All live virus work was performed in Biosafety level 3 containment using AHRI Institutional Biosafety Committee approved protocols for SARS-CoV-2. For first wave virus, a T25 flask (Corning) was seeded with Vero E6 cells at 2×10^5 cells/ml and incubated for 18-20 hours. After 1 DPBS wash, the sub-confluent cell monolayer was inoculated with 500μL universal transport medium (UTM) diluted 1:1 with growth medium and filtered through a 0.45μM filter. Cells were incubated for 1 hour. Flask was then filled with 7mL of complete growth medium and checked daily for cytopathic effect (CPE). Four days post infection, supernatants of the infected culture were collected, centrifuged at 300 rcf for 3 minutes to remove cell debris, and filtered using a 0.45μM filter. Viral supernatant was aliquoted and stored at -80°C. For 501Y.V2 variants, we used H1299-ACE2-E3 cells for initial isolation followed by passage into Vero E6 cells. H1299-ACE2-E3 cells were seeded at 1.5×10^5 cells/ml and incubated for 18-20 hours. After 1 DPBS wash, the sub-confluent cell monolayer was inoculated with 500μL universal transport medium (UTM) diluted 1:1 with growth medium and filtered through a 0.45μM filter. Cells were incubated for 1 hour. Wells were then filled with 3mL of complete growth medium. 8 days post-infection, cells were trypsinized, centrifuged at 300 rcf for 3 minutes and resuspended in 4mL growth medium. 1mL was added to Vero E6 cells that had been seeded at t 2×10^5 cells/ml 18-20 hours earlier in a T25 flask (approximately 1:8 donor-to-target cell dilution ratio) for cell-to-cell infection. Coculture of H1299-ACE2-E3 and Vero E6 cells was incubated for 1 hour and flask was then filled with 7mL of complete growth medium and incubated for 6 days. Viral supernatant was aliquoted and stored at -80°C or further passaged in Vero E6 cells as above.

Microneutralization using focus forming assay

Vero E6 cells were plated in an 96 well plate (Eppendorf) at 30,000 cells per well 1 day pre-infection. Plasma was separated from EDTA-anticoagulated blood by centrifugation at 500 rcf for 10 minutes and stored at -80°C. Aliquots of plasma samples were heat-inactivated at 56°C for 30 minutes, and clarified by centrifugation at 10,000 rcf for 5 minutes, where the clear middle layer was used for experiments. Inactivated plasma was stored in single use aliquots to prevent freeze-thaw cycles. For experiments, plasma was serially diluted two-fold from 1:100 to 1:1600. Virus stocks were used at approximately 50 focus-forming units (FFU) per microwell and added to diluted plasma; antibody-virus mixtures were incubated for 1 hour at 37°C, 5% CO2 . Cells were infected with 100μL of the virus-antibody mixtures, to allow adsorption of virus. Subsequently, 100μL of a 1x RPMI 1640 (Sigma-Aldrich R6504), 1.5% carboxymethylcellulose (Sigma-Aldrich C4888) overlay was added to the wells without removing the inoculum. Cells were fixed at 28 hours post-infection using 4% paraformaldehyde (Sigma-Aldrich) for 20 minutes. For staining of foci, a rabbit anti-Spike monoclonal antibody (mAb BS-R2B12, GenScript

A02058) was used at 0.5μg/mL as the primary detection antibody. Antibody was resuspended in a permiabilization buffer containing 0.1% saponin (Sigma-Aldrich), 0.1% BSA (Sigma-Aldrich), and 0.05% tween (Sigma-Aldrich) in PBS. Plates were incubated with primary antibody overnight at 4°C, then washed with wash buffer containing 0.05% tween in PBS. Secondary goat anti-rabbit horseradish peroxidase (Abcam ab205718) was added at 1 μg/mL and incubated for 2 hours at room temperature with shaking. The TrueBlue peroxidase substrate (SeraCare 5510-0030) was then added at 50μL per well and incubated for 20 minutes at room temperature. Plates were then dried for 2 hours and imaged using a Metamorph-controlled Nikon TiE motorized microscope with a 2x objective. Automated image analysis was performed using a Matlab2019b (Mathworks) custom script, where focus detection was automated and did not involve user curation. Image segmentation steps were stretching the image from minimum to maximum intensity, local Laplacian filtering, image complementation, thresholding and binarization. For the second 501Y.V2 variant, a dilation/erosion step was introduced to prevent the large foci from fragmenting into smaller objects.

Statistics and fitting

All statistics and fitting were performed using Matlab2019b. Neutralization data was fit to

$$Tx = 1/1 + (D/IC_{50}).$$

Here Tx is the number of foci normalized to the number of foci in the absence of plasma on the same plate at dilution D. Fit to a normal distribution using Matlab2019b function normplot, which compared the distribution of the Tx data to the normal distribution (see https://www.mathworks.com/help/stats/normplot.html).

Figure S 1: Fit of combined data for each plasma dilution to a normal distribution. The Matlab2019b function normplot was used to assess the fit of the data (blue crosses) to a normal distribution (solid red line). Lack of pronounced curvature of the data in the range of the solid line indicates that a the data is a reasonably good fit to a normal distribution. see https://www.mathworks.com/help/stats/normplot.html for additional information.

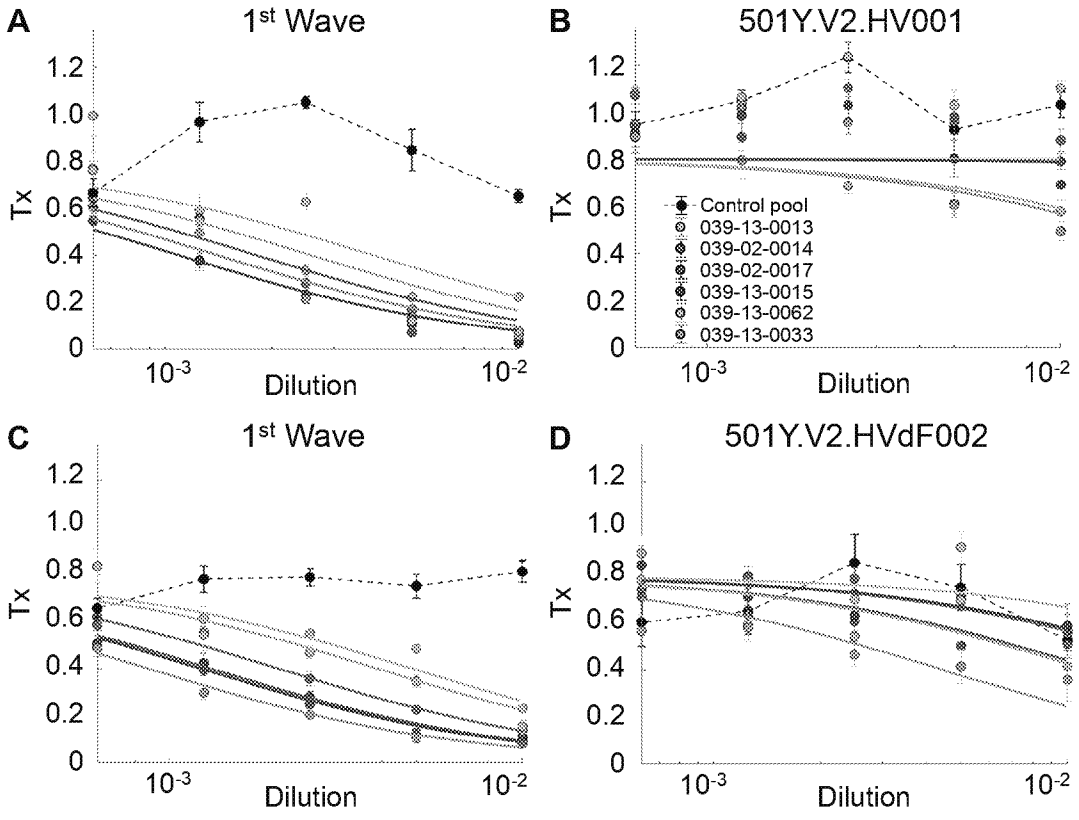

Figure S 2: Neutralization of first wave and 501Y.V2 by convalescent plasma from first wave infections separated by variant. Four sets of independent experiments were performed per 501Y.V2 - first wave pair, where the matched first wave variant results are shown to the left of the 501Y.V2 neutralization results. 501Y.V2 variant 2 contained the L18F mutation in addition to the mutations of variant 1 , and did not have the furin cleavage site deletion from outgrowth in Vero E6 cells. Colored points represent means and standard errors from 4 independent experiments for each 501Y.V2 variant/first wave pair of neutralization activity of plasma from 6 convalescent participants infected by first wave viruses. Corresponding lines are fits of the sigmoidal equation with IC_{50} as the fitted parameter. Black points represent a pool of plasma from three uninfected controls. The transmission index (Tx) is the number of foci in the presence of the plasma dilution normalized by the number of foci in the absence of plasma.

Table S 1: Plasma donor characteristics

Cohort ID	Sex	Age	Supplemental oxygen	Date of symptom onset	Days between symptom onset and diagnostic swab	Days between symptom onset and plasma collection
039-02-0014	F	66	No	01-Jul-2020	13	27
039-02-0017	F	66	Yes	21-Jul-2020	7	28
039-13-0013	F	54	No	29-Jun-2020	3	30
039-13-0015	F	42	No	21-Jun-2020	12	26
039-13-0033	F	37	No	24-Jun-2020	23	30
039-13-0062	M	67	No	06-Aug-2020	12	26

Table S 2: Mutation profile for the genomes of the outgrown viruses and for the infecting viruses of convalescent plasma donors

	Outgrown virus			Infecting virus from plasma donors

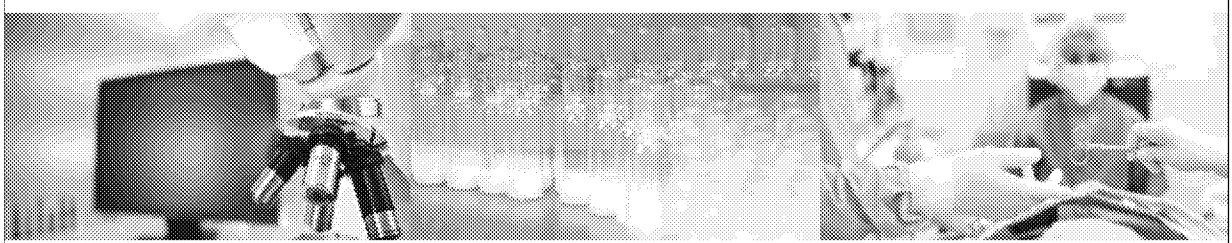
NIBSC

Calibration of secondary standards to WHO International Standards

Peter Rigsby, Analytical & Biological Sciences, NIBSC



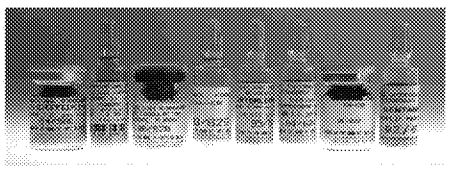
Medicines & Healthcare products Regulatory Agency

WHO International Standards (IS)

- World Health Organization International Standards: highest order standards used to enable biological & immunological assay results to be expressed in the same way worldwide
- WHO Expert Committee on Biological Standardization (ECBS) establishes and assigns a value to an IS
- "An international collaborative study must be carried out before any candidate biological reference standard can be considered for establishment by the WHO ECBS" *(WHO Technical Report Series, No. 932, 2006)*

WHO International Standards (IS)

- Most IS define International Units (IU) of biological activity
  - Arbitrary units representing content of ampoule or vial; no uncertainty assigned
  - Often not dependent on assay method used
- Often lyophilized, giving highly stable preparations



- Not intended for routine use
  - Secondary standards calibrated directly against (and traceable to) the relevant IS are required

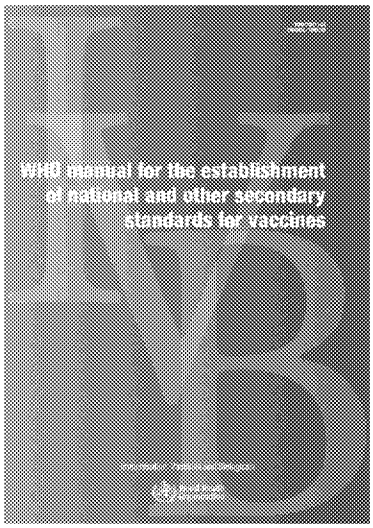
Guidance documents

World Health Organization

Post ECBS version

ENGLISH ONLY

MANUAL FOR THE PREPARATION OF SECONDARY REFERENCE MATERIALS FOR IN VITRO DIAGNOSTIC ASSAYS DESIGNED FOR INFECTIOUS DISEASE NUCLEIC ACID OR ANTIGEN DETECTION: CALIBRATION TO WHO INTERNATIONAL STANDARDS



Key properties of different standards

	WHO International Standard	Secondary standard	Tertiary standard
Alternate names	Highest order, International calibrator	Regional or national working reference materials, working reagents, manufacturer's working calibrator	Working reagents, in-house calibrators, in-house controls, manufacturer's product calibrator
Calibration	Established by WHO international collaborative study	Calibrated against the WHO International Standard	Calibrated against the secondary standard
Unitage	IU/mL	IU/mL	IU/mL
Traceability	N/A	Yes	Yes
Uncertainty of measurement	No	Yes (assay specific)	Yes (assay specific)
Final format	Lyophilised (generally)	Lyophilised or liquid	Liquid (generally)
Usage	Calibration of secondary standards, initial validation of new assay/platform	Calibration of tertiary standards, working reagent, limited use as run control or calibrator	Working reagent, run control, calibrator
Establishment of standard	International agreement through WHO international collaborative study including laboratories worldwide, different assays, different types of test laboratories (approximately 15-30 participants)	May be calibrated in several ways: • In parallel with a study to establish the International Standard • Regional or national collaborative study similar to the WHO collaborative study but with fewer participants from regional laboratories • Small study by a single or limited number of laboratories with a single or limited number of different assays/platforms	Assay-specific study, normally by a single laboratory for use with a specific test/platform Small study by a single or limited number of laboratories with a single or limited number of different assays/platforms

(WHO Technical Report Series, No. 1004, Annex 6, 2017)

Calibration principles

- Test secondary standard multiple times on different occasions in parallel with the WHO IS under exact same test conditions
- Assess validity of individual assays e.g. linearity and parallelism
- Estimate potency (IU/mL) for secondary standard in all valid assays
- Combine estimates and assign combined estimate as potency

Notes on calibration

- Use optimal test system (e.g. commercial assay, validated laboratory test)
- Use only qualified operators, equipment etc.
- No general guidance regarding number of assay runs to perform
  - Decision will depend on various factors
  - E.g. sufficient testing may be performed to give Uncertainty of Measurement (UoM) that is negligible in comparison to the expected precision of the routine assay

7

Assuming appropriate assay conditions, UoM can be expressed as 95% Confidence Interval (CI) for combined estimate. In such cases, this will account for imprecision but not any inherent bias so care should be taken with assay design etc.

Calibration example

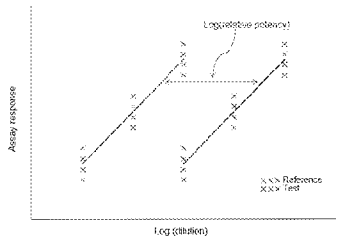
- Samples tested:
  - WHO IS for anti-SARS-CoV-2 immunoglobulin (20/136)
    Potency 250 IU/ampoule for neutralising antibody assays
    Reconstituted to concentration of 1000 IU/mL
  - In-House Standard (IHS)
- Aim: Calibrate IHS in IU/mL using IS
- Samples initially tested in 3 independent assay runs

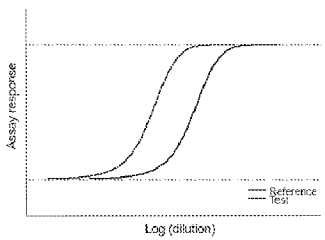
Calibration example – assay 1

IS 20/136 1000 IU/mL				IHS 20 IU/mL (assumed)			
Dilution	Responses			Dilution	Responses		
1/60	30	80	360	1/1	40	30	30
1/180	70800	92400	2510	1/3	580	2730	71600
1/540	142000	280000	64700	1/9	280000	200000	524000
1/1620	465000	844000	581000	1/27	863000	701000	924000
1/4860	953000	941000	843000	1/81	1170000	1490000	971000
1/14580	1060000	1680000	1340000	1/243	1560000	1920000	1600000
1/43740	870000	1480000	1290000	1/729	1210000	1410000	1310000

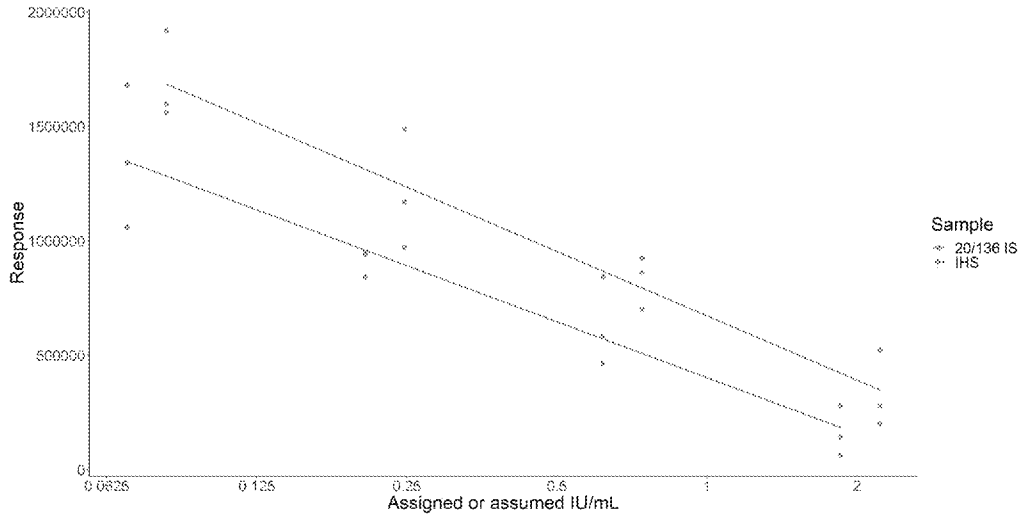
Data analysis

- Objectives of dose-response data analysis:
  - Assess assay validity e.g. linearity/parallelism for linear model
  - Estimate potency of IHS relative to WHO IS
- Various possible analysis methods, including:
  - Parallel line (parallel curve) analysis [recommended]
  - Interpolation from fitted dose-response curve for WHO IS
- Software options will depend on analysis method:
  - Specialised software for bioassay analysis
  - General statistical software packages, Excel





Calibration example – assay 1



Calibration example – assay 1 analysis

- Analysis output for assay 1:

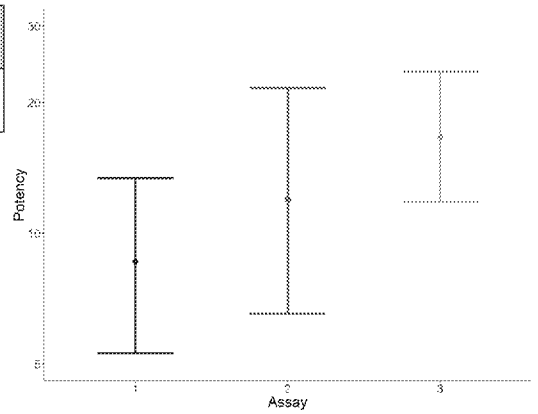
Source	Df	Sum of Sq	Mean Sq	F-ratio	P-Value
Treatments	7	5.63597E+12	8.05139E+11	21.549	<0.001 ***
Preparations	1	3.77329E+11	3.77329E+11	10.099	0.006 **
Regression	1	5.20746E+12	5.20746E+12	139.372	<0.001 ***
Non-parallelism	1	2.53490E+10	2.53490E+10	0.678	0.422
Non-linearity	4	2.58375E+10	6.45937E+09	0.173	0.949
Residual error	16	5.97818E+11	3.73637E+10		
Total	23	6.23379E+12	2.71034E+11		

IHS Potency (IU/mL)		
Estimate	95% LCL	95% UCL
8.60	5.29	13.40

Calibration example – combined estimate

- Combined estimate (IU/mL) from assays 1-3:

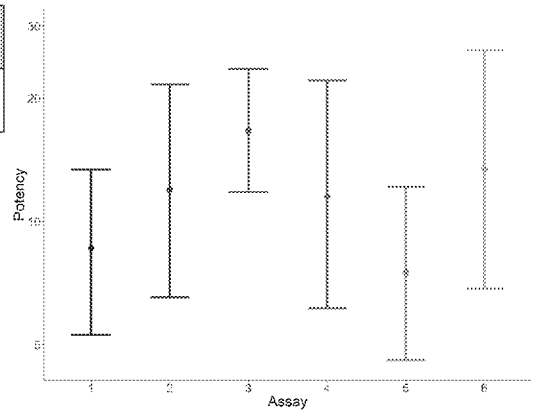
Estimate	95% LCL	95% UCL	LCL as %	UCL as %
12.3	8.5	17.9	68.9%	145.2%



Calibration example – after additional assays

- Combined estimate (IU/mL) from assays 1-6:

Estimate	95% LCL	95% UCL	LCL as %	UCL as %
11.5	9.2	14.4	79.9%	125.1%

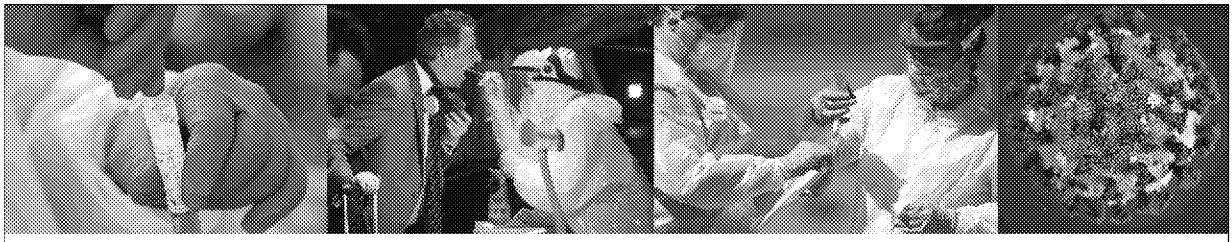


Calibration example – conclusions

- Assigned value to internal standard = 11.5 IU/mL
- Assay currently states µg/mL unitage for internal standard
  - Neat concentration used is 5 µg/mL
  - Calibration exercise estimated neat concentration as 11.5 IU/mL
  - Any existing results reported in µg/mL (from this assay platform, using this internal standard) can now be converted to IU/mL

Summary

- Expression of assay results in International Units (IU) requires use of the WHO International Standard (IS) directly, or the use of a secondary standard calibrated using the IS
- A calibration exercise can be performed to assign an IU value to the secondary standard
- Existing assay results already reported relative to a secondary standard (in µg, EU, relative titre etc.), can then be reported as IU
  - In most cases, existing assay analysis methods are unaffected



WHO standards for COVID-19: update from WHO ECBS

Dr Ivana Knezevic, Norms and Standards for Biologicals (WHO/MHP/HPS)

20 Jan 2021, WG on COVID-19 assays

WHO norms and standards for biologicals

https://www.who.int/groups/expert-committee-on-biological-standardization

Global written standards

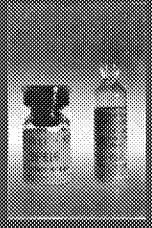
Total 103 docs (Recommendations/ Guidelines)
General docs that apply to vaccines & biologicals: 10
General documents that apply to all vaccines: 12
Vaccine specific: 71
BTP specific: 9

Scientific evidence

1) Standardization of assays
2) Further development and refinement of QC tests
3) Scientific basis for setting specifications

WHO Expert Committee on Biological Standardization

Global measurement standards



Measurement standards: essential elements for development, licensing and lot release

Main outcomes of 73rd ECBS meeting in 2020

World Health Organization

1. ECBS meeting on 9-10 Dec 2020 (focused on COVID-19): published on WHO web site: https://www.who.int/groups/expert-committee-on-biological-standardization

- Executive Summary posted on WHO web site on 16 Dec 2020:

https://www.who.int/groups/expert-committee-on-biological-standardization

3 new WHO International reference preparations established

Standards for use in public health emergencies		
SARS-CoV-2 RNA for NAT-based assays	7.40 $\log_{10}$ IU/ampoule	First WHO International Standard
Anti-SARS-CoV-2 immunoglobulin	250 IU/ampoule (neutralizing antibody activity)	First WHO International Standard
Anti-SARS-CoV-2 immunoglobulin panel	[no assigned units]	First WHO International Reference Panel

- Proposal to develop a standard for SARS-CoV-2 antigens to support the development, assessment and comparability of antigen-based rapid diagnostic tests.

- Update on written standards provided

Measurement standards for COVID-19

World Health Organization

Aim: to facilitate the development, validation and assessment of molecular and antibody assays. This will facilitate the comparability of results from different assays/labs and help harmonize the evaluation of diagnostics, vaccines and other products. Expression of the results of neutralization assays in the International Units would also contribute to the establishment of the correlates of protection.

Timeline: Feb to Dec 2020 is the absolute record for developing and establishing WHO International Standards in 9 months instead of 2-3 years.

Antibody standards during the COVID-19 pandemic: research reagents and WHO International Standards: joint effort by CEPI, NIBSC and WHO

WHO International Antibody Standards:

- **help interpreting results from vaccine CTs by providing the basis for the expression of the antibody titers in the International Units, particularly results from efficacy trials for various vaccine candidates. For instance, correlate of protection can be defined as IU/mL.**
- **IS permits datasets across a range of assays to be compared by reference to the IU. This is especially important with the large number of vaccine candidates**

Uptake of WHO Ab standards – way forward

World Health Organization

1. Why WHO Ab standards have not been used as expected?

- Lack of information on the existence of these standards
- Misunderstandings regarding the intended use
- Labour intense calibration of secondary standards
- Lack of expertise for the use of standards and for the assays in CTs
- Other reasons?

2. Need for secondary standards calibrated against WHO IS

- Several initiatives ongoing
- How many vaccine developers plan to express results of neutralization assays in IU?

How can we help users of standards to express CT results in the International Units?

World Health Organization

1. ECBS – Executive Summary and report in WHO TRS
2. Collaborative study report provides lots of information about the standards but also about the assays
3. Instruction for use
4. WHO EUL: "Considerations for the Assessment of COVID-19 Vaccines for Listing by WHO" (https://extranet.who.int/pqweb/sites/default/files/documents/Considerations_COVID-19_vaccines_for_listing_by_WHO_v1.0.pdf)
   - 4.1. The assays used for immunogenicity evaluation should be validated for their intended purpose and calibrated against WHO international standards, where available (section 3.2)
   - 4.2. Assay results should be reported in international units wherever possible (section 3.3.8)
5. Webinars
6. Case studies with the examples
7. Manual for secondary standards for vaccines – Update and/or specific advice for COVID-19 standards
8. Other opportunities?

Medicines & Healthcare products Regulatory Agency

NIBSC

Roles and Importance of Standards in Assays

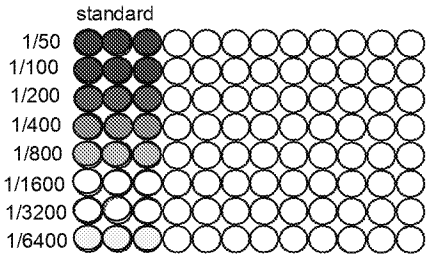
Giada Mattiuzzo

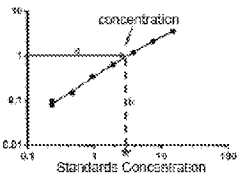
20th January 2021

Standards in assays

- 44 laboratories participated to the CS establishment of WHO IS for anti-SARS-CoV-2 immunoglobulin;
- 8 laboratories did not use an assay internal standard – results reported based on dilution factor
- Difficult to compare with other assays

- Internal calibrator/standard;
- run control;
- working reagent
- Secondary or tertiary reagent





2

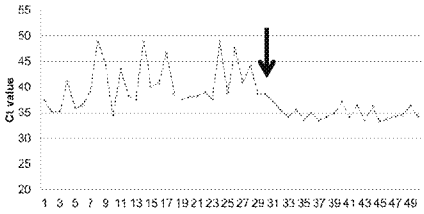
Most commercial assays have a calibrant

External controls

Allow to check for performance drifting of the assay over time/between operators

Monitoring data from diagnostic lab starting using NIBSC Working Reagent for Norovirus GII (↓)

Kindly provided by NIBSC Diagnostics Group, IDD

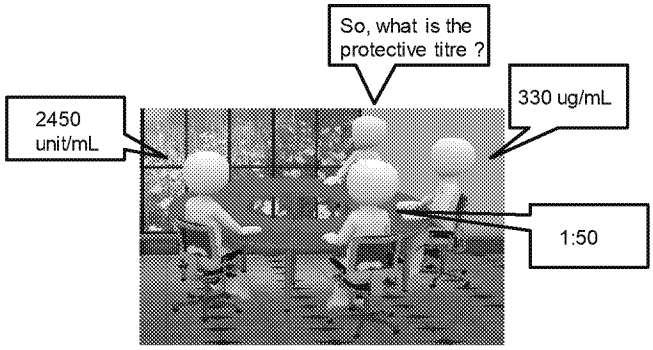


Examples are: national standards, commercially available secondary reagents

Can be used to compare assay between laboratory

Primary calibrant

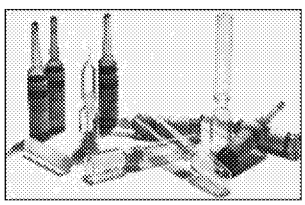
- WHO International Standard – established by the WHO ECBS
- Define the common language to expressed potency of the samples



Common language already reduces the difference between labs

Why International units? A bit of history

- 1890's First Biological: Diphtheria antitoxin
  No reliably produced. Lot to lot variation as biological activity differed from physical property
- Paul Ehrlich: STANDARD ANTITOXIN PREPARATION – calibrated in Units and used to calibrate future batches
- Henry Dale applied concept to insulin and other biologics (1920s) and on International level – appearance of International Units (IUs) as measure of strength or activity of a product

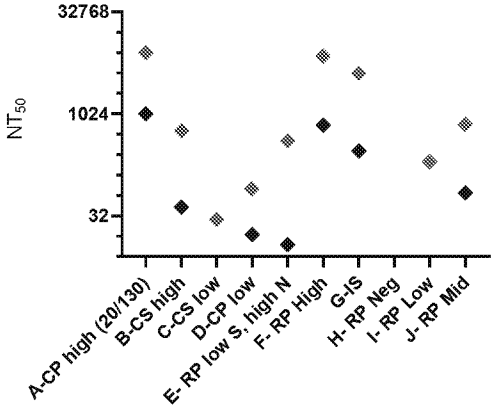


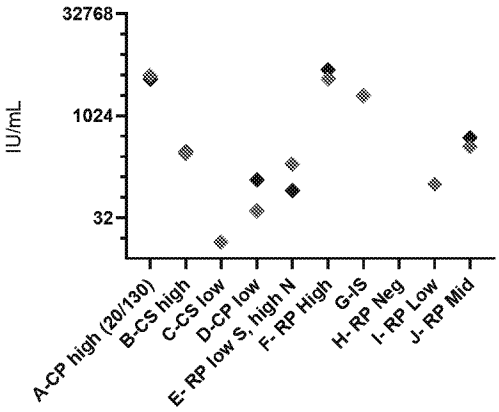
https://www.who.int/bloodproducts/ref_materials/en/

This is to answer the popular question on what's the conversion factor to ng/mL

A recent example: SARS-CoV-2 antibody

Foci reduction neutralisation assay





Binding antibody assay- Spike ELISA

7

2000 fold difference when expressed with different unitage vs less than 5 fold when expressed relative to IU

Unitage assign to the International Standard

- WHO IS established by WHO ECBS on 10th December 2020;
- Available in NIBSC catalogue on 18th December 2020;
- On 18th January 2021, approximately 50 end users have acquired the IS (tot shipped ampoules 162)

Medicines & Healthcare products Regulatory Agency

WHO International Standard
First WHO International Standard for anti-SARS-CoV-2 immunoglobulin (human)
NIBSC code: 20/136
Instructions for use
(Version 2.0, Dated 17/12/2020)

1. INTENDED USE

The First WHO International Standard for anti-SARS-CoV-2 immunoglobulin is the freeze-dried equivalent of 0.25 mL of pooled plasma obtained from eleven individuals recovered from SARS-CoV-2 infection. The preparation has been evaluated in a WHO International Collaborative study (1). The intended use of the International Standard is for the calibration and harmonisation of serological assays detecting anti-SARS-CoV-2 neutralising antibodies. The preparation can also be used as an internal reference reagent for the harmonisation of binding antibody assays. The preparation has been solvent-detergent treated to minimise the risk of the presence of enveloped viruses (2).

2. CAUTION

This preparation is not for administration to humans or animals in the human food chain

The preparation contains material of human origin, and either the final product or the source materials, from which it is derived, have been tested and found negative for HBsAg, anti-HIV and HCV RNA. As with all materials of biological origin, this preparation should be regarded as potentially hazardous to health. It should be used and discarded according to your own laboratory's safety procedures. Such safety procedures should include the wearing of protective gloves and avoiding the generation of aerosols. Care should be exercised in opening ampoules or vials, to avoid cuts.

3. UNITAGE

The assigned potency of the WHO International Standard for SARS-CoV-2 is 250 IU/ampoule for neutralising antibody activity. After reconstitution in 0.25 mL of distilled water, the final concentration of the preparation is 1000 IU/mL.

For binding antibody assays, an arbitrary unitage of 1000 binding antibody units (BAU)/mL can be used to assist the comparison of assays detecting the same class of immunoglobulins with the same specificity (e.g. anti-RBD IgG, anti-N IgM, etc.)

CEPI

First WHO International Reference Panel for anti-SARS-CoV-2 immunoglobulin (20/268)

Reference Panel will comprise 4 pools of COVID-19 convalescent plasma and a negative; freeze-dried equivalent of 0.25 mL

High (NIBSC code 20/150)

Mid (NIBSC code 20/148)

Low S, high N (NIBSC code 20/144)

Low (NIBSC code 20/140)

Negative (NIBSC code 20/142)

Representative data

	High 20/150	Mid 20/148	low S, high N 20/144	low 20/140	
Neut Ab	1473	210	95	44	IU/mL
anti-RBD IgG	817	205	66	45	BAU/mL
anti-S1 IgG	766	246	50	46	BAU/mL
anti-Spike IgG	832	241	86	53	BAU/mL
anti-N IgG	713	295	146	12	BAU/mL

The candidate Reference Panel samples were ranked similarly in almost all the assays used with very few exceptions

No unitage will be assigned for the Reference Panel, but representative data from CS include in IFU

CEPI

Reseach Reagent 20/130

- Made available end April 2020 for the development of assay for the detection of SARS-CoV-2 antibody
- Secondary standard which allows assay to report data in IU/mL, retrospectively
- Calibrated to the WHO IS as part of the CS

	GM	95% CI	
Neut Ab	1300	981-1719	**IU/mL**
anti-RBD IgG	502	382-660	**BAU/mL**
anti-S1 IgG	588	398-870	**BAU/mL**
anti-Spike IgG	476	418-542	**BAU/mL**
anti-N IgG	747	214-2606	**BAU/mL**

Slides available, however this data are also included in the revised Datasheet available in our website; less than 130 vials left- cannot be used as run control

Intended use the standards

- WHO International Standard 20/136 is primary calibrant; distribution restricted to 5 ampoules per end user per year
- Availability of secondary reagents- 20/130 is almost depleted; few example of national standards;
- other secondary standard (?)
- Internal Standard/run control can be calibrated to the IS or to secondary reagents- no need for a CS
- How?

May Chu: We have been promoting the NIBSC Ab reference panel and would be happy to list this through our hub to the users in the network have using the COVID-19 Serology Control Panel (these are dried tube specimens) but sure that some of our users would be keen to have this for their testing regime.

When the standards will be available?

Our CSCP experience from the chat note above is that there are different neutralization assays developed for detecting SARS-CoV2 antibodies, especially the pseudoviral assays that are hard to compare, one test platform to another. What has been WHO/NIBSC solution or guidance?

Mark Page - NIBSC: The materials are available here https://www.nibsc.org/products/brm_product_catalogue/detail_page.aspx?catid=20/136 [HYPERLINK "https://www.nibsc.org/products/brm_product_catalogue/detail_page.aspx?catid=20/268"]
Related materials are listed here too https://www.nibsc.org/science_and_research/idd/cfar/covid-19_reagents.aspx

ZHOU, Tiequn: SARS-CoV-2 standards- related information are also available on WHO website: [HYPERLINK "https://www.who.int/news-room/feature-stories/detail/standardization-of-vaccines-for-coronavirus-disease-covid-19"].

Marc Salit: The Coronavirus Standards Working Group is conducting a study intended to make the International Unit widely and easily available by doing a secondary collaborative study that calibrates a panel of commercially available reference samples against the WHO IS. Our "Harmonization Study" is underway with 14 labs comparing a panel of 8 materials against the WHO IS. This puts all the materials on the same "ruler" — the IU — and will make propagation of the IU easy. Each commercial material will then come with a Certificate of Analysis that includes the value of that material in IU. This can be "leapfrogged" with metrological traceability. Think of it as the *kilogram* of SARS-CoV-2 virus content. Much much more on this work is here: [Coronavirus Standards Working Group — The Joint Initiative for Metrology in Biology](https://jimb.stanford.edu/covid-19-standards) All are welcome to join our open working group. Our results will be published in the open literature, and the manufacturers and distributors of the materials will be promoting the IU as features of their products. Here is a link to the précis for the Coronavirus Standards Working Group 'Harmonization Study': [20201111 CSWG Harmonization Study Description.pdf - Google Drive](https://drive.google.com/file/d/1XrjXsGqt81rilmyRuvMK-qeyn6kK08Re/view?usp=sharing)

How much can developers get IS at once? Is the quantity of IS limited?

Marc Salit: Our study is intended to make the supply of the IU inexhaustible by making it so you don't need the IU, but can buy a commercial material from your preferred vendor. There is a limited supply of the IS, so having commercial materials makes them available to everyone.

Mark Page - NIBSC: We have to limit each requestor to 5 ampoules per lab per year to preserve the standard for many years.

Are the neutralising antibody standards 250IU/ampoule polyclonal? (I see the panel is from pooled so will be polyclonal)

Ligia Pinto: We have a US serology standard available ([HYPERLINK "https://frederick.cancer.gov/seronet/serology-standard"])

Is the international standard tested in assays the include "all isotopes IgG, IgM, IgA" ?

Mark Page - NIBSC: The IS is a pool of convalescent plasma from 11 donors. The IS contains IgG, IgA and IgM

How was the neuralizing activity of the IS assessed?

Any SAF/BRA virus strain available?

We have used anti-SARS-CoV-2 Ab NIBSC code 20/130 standard during the clinical trail and calibrated an In-house standard. How different is the new standard from the already provied NIBSC standard i.e., 20/130?

If there is no regional or national standard, should the secondary standard use NIBSC's reference material(20/130)? Can I use the in-house standard instead of the sencondary standard?

Is the international standard tested with a real SARS-CoV-2 virus?

Giada Mattiuzzo-NIBSC: [HYPERLINK "https://www.who.int/publications/m/item/WHO-BS-2020.2403"] (report of collaborative study). The IS has been characterised in 23 neutralisation assay, 15 of those used live virus covering 9 isolates

Is it possible to use serum from horses immunized with RBD as secondary standards?

How much of a reduction in neutralisation would justify a new standard should a new variant arise with limited cross-neutralisation?

What would be acceptable uncertainty in calibration of secondary standard - if secondary standard was non-parallel uncertainty may be higher and dilution bias could result.

How can this IS approach be applied to "titer-based" neutralizing Ab assays? As in such assay, Ab levels are determined against a "cut-point" instead of a reference standard.

Do you think that the vaccine developers will be willing to make available the vaccine responses from clinical trials converted in IU?

Can we use the standard to standardise sera from experimental animals where we are looking at correlates of protection in animal models?

Is it possible to calibrate in-house pooled covalescent serum material against NIBSC's research reagent (20/130)?

Giada Mattiuzzo-NIBSC: Yes, 20/130 now is considered as a secondary standard and can be used to calibrated your in house pool of convalescent serum

Richard r.tedder@imperial.ac.uk: the use of human plasma/serum does have the confounding effect of IgM which may behave differently and non parallel

Our laboratory is developing a chemiluminescence immunoassay (qualitative). Could we use the IS to standardize the test?

Giada Mattiuzzo-NIBSC: The IS in qualitative assay can be used to express the limit of detection of the assay by serially dilution below endpoint. LOD for qualitative assays.

We also need to validate the test, to PCR (gold standard), Do you have a protocol that we can use?

Can you say more on your interpretation of the very different results seen in FFA with 501.v2 (L18F) ?

Do you have convalescent plasma from the latest wave and have you tested on the 501Y V2 variant?

The large plaque phenotype virus does not have any mutation in the multibasic cleavage site?

How are you evaluating reinfections with the new strain?

Have you tested sera from vaccinees against this variant?

Pfizer published a note claimed that their vaccine sera can neutralize the N501Y isogenic strain, do you think other mutations are important in this reduction in neutralizing the field isolates?

Do you have a comparison of all published IgG and NAb levels from several vaccines finished phase 3 trials?

Celebrate our 50th anniversary with us!

AMENDMENT NO. 1
TO
ANTIVIRAL DRUG DISCOVERY AND DEVELOPMENT CENTER (AD3C) RESEARCH CONSORTIUM AGREEMENT

This Amendment No. 1 to the Antiviral Drug Discovery and Development Center (AD3C) Research Consortium Agreement (the "First Amendment") is entered into as of this March 1, 2019 (the "First Amendment Effective Date") by and between the following institutions:

The Board of Trustees of the University of Alabama for the University of Alabama at Birmingham, a constitutionally created corporation of the State of Alabama and having its principal office at Birmingham, Alabama ("UAB");

The University of North Carolina at Chapel Hill, a nonprofit educational and research institution organized under the laws of North Carolina and having its principal office at Chapel Hill, North Carolina by and through the University of North Carolina School of Medicine ("UNC-CH"); and

The Washington University, a nonprofit educational and research institution, organized under the laws of Missouri and having its principal office at St. Louis, Missouri ("WU-STL");

Oregon Health and Science University, a nonprofit educational and research institution, organized under the laws of Oregon and having its principal office at Portland, Oregon ("OHSU");

Southern Research, a nonprofit research institution, organized under the laws of Alabama and having its principal office at Birmingham, Alabama ("SR");

Vanderbilt University Medical Center, a nonprofit educational and research institution organized under the laws of Tennessee and having its principal office at Nashville, Tennessee by and through the Vanderbilt University School of Medicine ("VANDERBILT");

The University of Texas Medical Branch at Galveston, a state institution of higher education organized under the laws of Texas and having its principal office at Galveston, Texas ("UTMB"); ("UTMB"); and

Emory University, with offices located at 1599 Clifton Road NE, 4th Floor, Mailstop 1599-001-1BA, Atlanta, GA 30322 ("EMORY").

The parties to this First Amendment listed above are singularly and collectively referred to herein as the "First Amendment Parties."

RECITALS

WHEREAS, UAB, UNC-CH, WU-STL, OHSU, SR, and VANDERBILT are parties to that certain Antiviral Drug Discovery and Development Center (AD3C) Research Consortium Agreement dated December 1, 2014, that may be amended from time to time (the "Agreement");

WHEREAS, UAB, UNC-CH, WU-STL, OHSU, SR, and VANDERBILT desire to amend

the Agreement in order to add UTMB and EMORY as parties thereto, and UTMB and EMORY desire to become parties to the Agreement; and

WHEREAS, the First Amendment Parties additionally desire to amend the Agreement to include additional grant funding obtained after the initial effective date of the Agreement, as well as to appropriately allocate the rights of the First Amendment Parties with respect to intellectual property developed prior to the First Amendment Effective Date.

NOW, THEREFORE, THE PARTIES AGREE AS FOLLOWS:

1. As of the First Amendment Effective Date, UTMB and EMORY shall join in the Agreement as parties thereto, and each reference to the "Original Parties," "Members of the Research Group," or "Members" in the Agreement shall refer to all First Amendment Parties, as defined above.

2. As of the First Amendment Effective Date, each reference to the "Prime NIAID Award" shall include both (i) Grant Number U19AI109680-01, awarded by the National Institute of Allergy and Infectious Diseases, National Institutes of Health, and (ii) Grant Number U19AI142759-01, awarded by the National Institute of Allergy and Infectious Diseases, National Institutes of Health.

3. Section 2.2. Compliance with the RFA. Section 2.2 shall be deleted in its entirety and replaced with the following language (revised language is italicized and underlined):

   "The Members of the Research Group each agree that the research program of the AD3C shall in all events be carried out in accordance with the requirements of the terms and conditions for the *Prime NIAID Award* set forth in the NIAID Request for Applications having a release date of November 23, 2012 *(as applicable to Grant Number U19AI109680-01) and the NIAID Request for Applications having a release date of November 30, 2017 (as applicable to Grant Number U19AI142759-01)* (collectively, the "RFA"), a copy of which is attached to this Agreement as **Schedule B** and incorporated herein by reference."

4. Section 4.1. The Principal Investigator. Section 4.1 shall be amended by deleting the phrase "(iv) together with appropriate other investigators of the CETR, attend a CETR Program Annual Meeting to be organized by NIAID staff at or near Bethesda, Maryland or at another NIAID-approved site;" and renumbering item (v) as item (iv).

5. Section 11.4. Acknowledgement of NIH and Collaborator Support. Section 11.4 shall be amended by deleting the first sentence in its entirety and replacing it with the following language:

   "The support of the NIH shall be acknowledged whenever publicizing the work under this Agreement in any media (including, but not limited to, publication of research results of AD3C Research Projects and/or Collaborative AD3C Research Projects in scientific journals) by including an acknowledgment substantially as follows: "This Project has been funded in whole or part with Federal funds from the National Institute of Allergy and Infectious Diseases, National Institutes of Health, under Grant Number [U19AI109680-01

and/or U19AI142759-01, as applicable].""

6. Section 12.10. Licenses to Members and Affiliate Members. Section 12.10 shall be amended by deleting paragraph (b) in its entirety and replacing it with the following language (revised language is italicized and underlined):

   "(b) a non-exclusive, limited, non-sublicensable, royalty-free license of each Invention and Other Invention *that is made during the term of* ***such Member's or Affiliate Member's tenure as a*** *Member or Affiliate Member, as applicable,* and the associated patent rights arising therefrom, for its own non-commercial research, educational, *and* teaching purposes."

   For clarity, certain inventions and associated patent rights developed in connection with the performance of AD3C research under the Agreement prior to the First Amendment Effective Date are listed in attached Exhibit C, which is incorporated herein by reference, and UTMB and EMORY shall not be entitled to any license rights under Section 12.10(b) of the Agreement with respect to such inventions or patent rights.

7. Schedule A. Schedule A shall be amended by appending the document attached to this First Amendment as Exhibit A, the proposal submitted in connection with NIAID Grant Number U19AI142759-01.

8. Schedule B. Schedule B shall be amended by appending the document attached to this First Amendment as Exhibit B, the NIAID Request for Applications having a release date of November 30, 2017

9. Except as provided herein, the Agreement shall remain in full force and effect. If one or more provisions of this First Amendment are held to be unenforceable under applicable law, such provisions shall be excluded from this First Amendment and the balance of this First Amendment shall be interpreted as if such provisions were so excluded and shall be enforceable in accordance with its terms.

10. Capitalized terms used but not defined in this First Amendment have the meanings ascribed to them in the Agreement.

11. This First Amendment may be executed in separate counterparts, each of which shall be deemed an original and all of which together shall constitute one and the same instrument.

[Signature page follows]

IN WITNESS WHEREOF, the parties hereto have executed this First Amendment as of the date first above written.

Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday January 27 2:30PM CET (Geneva Time)

1. Meera Chand & Victoria Hall (PHE) – *The UK SIREN study first interim analysis: Do antibody positive healthcare workers have lower SARS-CoV-2 2 infection rates than antibody negative healthcare workers?*
2. Shane Crotty (LJI) - *Immunological memory to SARS-CoV-2 and COVID-19*
3. Theodora Hatziioannou (Rockefeller) - *Neutralizing antibody responses to SARS-CoV-2 following vaccination*

Subject: SARS-CoV2 variant testing - next steps
Research Update Template.xlsx

Hi everyone,

Thanks for your participation in yesterday's initial meeting. We're looking forward to working with you all to characterize SARS-CoV2 variants and help inform decision making.

Scheduling regular meetings: Please go to the doodle poll here to select times that work for you by **COB Sunday January 31st.** We have people in multiple time zones so be as flexible as you can, and we will choose the best time for most.

Capabilities Template: Attached is a template for general updates on resources you may have. Please fill it out so that we can be aware of what your current capabilities are and send back to me and Leah Vincent (cc'd) by **COB Tuesday February 2nd.** We will use this when deciding who can do different experiments and assays as we move forward.

Group Structure: To maximize productivity, we're going to try a structure of breakout groups by topic so we can dive deeply into data by topic, address critical gaps, and decide next steps. Please look at the 3 breakout groups listed below and decide in advance of our next meeting which one you would like to be involved in.

Agenda:

- Epidemiology, Data and Resource Update (all)
- SARS-CoV2 Interagency Group Update (all)
- **Breakout groups: Early Detection and Analysis (genomics/structure), Assays and *In Vitro* analysis, and *In Vivo* analysis**
- Discuss current data, critical research gaps, priority experiments, and resources needed
- Group discussion of breakout progress
- Next steps – establish timeline for priority experiments, resource acquisition

Data Sharing: We will need to share data in near real-time as we get started. We are looking at options for sharing data directly with us at NIAID or with the larger group. If you have preferred ways to do this, please let me know.

Thank you, and we will speak next week!

Marciela DeGrace Ph.D.
Program Officer, Centers of Excellence for Influenza Research and Surveillance (CEIRS)

Subject: SARS-CoV2 variant testing - next steps
Research Update Template.xlsx

Hi everyone,

I hope you all had a great weekend. A reminder to please fill out the doodle poll so we can confirm a regular time, and the capabilities template (attached), which will help with determining work in the future. We'll look to have our next meeting next week after we've been able to take into account everyone's schedules.

Thank you,

Marciela

From: Degrace, Marciela (NIH/NIAID) [E]
Sent: Friday, January 29, 2021 2:33 PM

Hi everyone,

Thanks for your participation in yesterday's initial meeting. We're looking forward to working with you all to characterize SARS-CoV2 variants and help inform decision making.

Scheduling regular meetings: Please go to the doodle poll here to select times that work for you by **COB Sunday January 31st.** We have people in multiple time zones so be as flexible as you can, and we will choose the best time for most.

Capabilities Template: Attached is a template for general updates on resources you may have. Please fill it out so that we can be aware of what your current capabilities are and send back to me and Leah Vincent (cc'd) by **COB Tuesday February 2nd.** We will use this when deciding who can do different experiments and assays as we move forward.

Group Structure: To maximize productivity, we're going to try a structure of breakout groups by topic so we can dive deeply into data by topic, address critical gaps, and decide next steps. Please look at the 3 breakout groups listed below and decide in advance of our next meeting which one you would like to be involved in.

Agenda:

- Epidemiology, Data and Resource Update (all)
- SARS-CoV2 Interagency Group Update (all)
- **Breakout groups: Early Detection and Analysis (genomics/structure), Assays and *In Vitro* analysis, and *In Vivo* analysis**

- Discuss current data, critical research gaps, priority experiments, and resources needed

- Group discussion of breakout progress
- Next steps – establish timeline for priority experiments, resource acquisition

Data Sharing: We will need to share data in near real-time as we get started. We are looking at options for sharing data directly with us at NIAID or with the larger group. If you have preferred ways to do this, please let me know.

Thank you, and we will speak next week!

Marciela DeGrace Ph.D.
Program Officer, Centers of Excellence for Influenza Research and Surveillance (CEIRS)

Subject: AD3C Scientific Advisory Committee Report
191212_SACnotesAD3C_Final.pdf

Dear AD3C project and core site leaders,

I appreciate your assistance with the RPPR materials. I would like to share with you the scientific advisory committee's report from our annual meeting. They were quite impressed with all of the great work being done. There have been some items pointed out by the committee that will serve as a platform for our presentation at the reverse site visit February 11th, 2020. We will be in communication just after the new year to plan for that.

Additionally, please let me know who will be attending ICAR (March 30th - April 3rd Seattle, Washington) and a night during the conference that might be suitable for me to arrange an AD3C group dinner.

As always please let us know if you have any questions. Have a wonderful holiday!

Most sincerely,
Steph

AD3C External Scientific Advisory Committee
2019 Annual Report

The Annual AD3C investigators meeting was held on November 13-14, 2019 in Birmingham, AL. Four of the five SAC committee members participated either in person (Kara Carter) or via Turbo Meeting webinar/teleconference (Rick Keenan, Tom Shenk and Mike Bray). Following presentations by the four AD3C project investigators, a preliminary project review was completed by external SAC members. Stephanie Moore and Mary Wyatt Bowers were present to lead discussion and record notes.

Overall program review:
Strengths: As a whole, Kara Carter, who served on the external advisory board for the previous grant, noted that all projects had made good progress in this past year. Each seems to have a profile definition of the molecules which had not been achieved in past reviews. All agreed that integrating the cores' presentation into each project presentation was an effective means of highlighting the accomplishments of both. Cores are definitely highly functional and strong. The SAC was very impressed with the collaboration among all projects and cores as well as the caliber of the projects. It was noted that the academic/industry partnership that has been developed should serve as a model for other drug discovery programs.

Weaknesses: As noted in individual projects below, a standard thermal shift assay should be used in all projects to either identify or confirm the molecular target of compounds, but it doesn't appear that anyone is using it now. Also, all teams should include a structural biologist who can collaborate with a computational chemist in developing research plans.

Future Directions:

- Mike Diamond suggested the creation of a 'mega-table' with compound information (ADME) across projects regarding cross-reactivity across viruses with compounds and general screening. This idea was reiterated by the SAC.
- It was also suggested that those in academic groups might benefit from a tutorial on data analysis for assays related to drug development and discovery.

Individual Project Reviews:
Project 1 – Coronaviruses
Strengths: The project, in particular, now has a definition of profile for lead.
Assays are nice and the inclusion of human airway epithelial cells is an important system to keep using.

Weaknesses: The largest issue is the lack of chemical value. There does not appear to be a well-defined future direction for hits, and concerns were expressed about attempting to move compounds forward without relaxing the criteria too much. There was concern that there were few hits to investigate, other than possible remdesivir and β-d-N^4-hydroxycytidine (NHC)

analogs. The *in vivo* studies with NHC required a very high dose (500 mg/kg) to completely block SARS-CoV replication, which is likely not a reasonable path forward.

Future directions:

- As noted above, this project could benefit from analoging remdesivir or NHC – compounds known to have some efficacy against coronaviruses- and work from there.
- Specifically, since the NHC data was intriguing, it was highly recommended that MOA studies be started for RNA polymerase using thermal shift (CETSA). It was suggested that SR might have some resources that could benefit this area – such as their Chemistry Department's Structural Biology Laboratory with Mason Wu. Even if outsourcing is required, the SAC suggested that modeling studies could help to identify better chemical value. Another resource suggested was Project 3's group leader, Pei-Yong Shi; his expertise might be helpful here.
- Project 1 should continue the use of primary cells compared to transformed cell lines as these studies are very important factor for translational application.

Project 2 – Alphaviruses

Strengths: The SAC felt this project was the front runner and was the most advanced project of the four. Members were glad to know that compounds are being considered leads even without activity against VEEV; however, they did note that if there are compounds that have anti-VEEV activity, they should be made a priority. Chemistry is very advanced for this project. It was noted that this project is in very good shape, but should only focus on the most promising compounds with the best overall properties.

Weaknesses: The general concentration in the viral titer reduction assays was 10 micromolar and there is concern that apparent antiviral activity could indicate toxicity and therefore may be an artifact and not actual activity. Also, there was not a clear indication of what the next steps were going to be as the project moves forward (see suggestions below).

Future directions:

- Given its activity in a mouse model of CHIKV infection, compound 42718 deserves top priority. The compound 33001 was thought to be likely a host target and the group liked the suggestion of using biotinylated compounds to identify the host target as well as perhaps RNA-Seq studies. Also, it was suggested that to determine host interaction, the group could perform experiments in which the MOI is varied.
- This group needs to be thinking of what needs to happen for implementation of preclinical trials for lead compounds and do that. There have been no trials for CHIKV thus far, so Kara Carter suggested that it might be good to develop a consortia with other leaders to coordinate such trials. She suggested that George Painter at Emory might be a good resource for helping to define what the first clinical trial would look like. Project 2 leaders need to start attending and being aware of FDA advisory meetings for CHIKV, even if the topic is vaccine-related, because they can shed light on what needs to be defined as far as epi endpoints: acute disease and proof of mechanism with patient population, viremia, acute clinical arthralgia severity post 3 months (clinical

including stiffness scales and pain scales). For all of this to occur, they will need to have a well thought-out clinical trial that includes consideration of drug-drug interactions. Prioritize experiments that are in line with these future goals with the lead compound.

Project 3 – Flaviviruses

Strengths: The addition of Pei-Yong Shi with his structural focus and industry experience has greatly benefitted this project. Several participants noted that the structural analysis was beautiful and was well done. Mike Diamond also brings much to this project and has provided a good approach with mouse models.

Weaknesses: Identification and development of a pan-dengue compound would be useful, but members realize that it is very difficult, due to differences in serotype, structure and mutations that increase resistance. Previously, there has been a push for project leaders to explore commercial partners within these projects, however, for this project, several larger and mid sized pharmas are independently working on Dengue antivirals because there is market for such agents. This results in there being less potential for an industry collaboration for the disease.

Future directions: One member asked if dengue is serotyped when diagnosed. It was suggested that if serotyping is done routinely, this might be a viable approach to develop therapeutics that are serotype specific even if they do not show pan-dengue efficacy.

Project 4 – Influenza

Strengths: Given the challenges that this project has faced during the first 5-year grant period, Kara Carter commented that it had made substantial progress in the past year. The HTS Core, led by Bob Bostwick has done a fantastic job and the quality of screens is very high.

Weaknesses: Even with excellent screens, it is the quality of the compounds emerging from screening that determines progress. Libraries used were limited with few hits to pursue even with a number of approaches being used. Also, IP space wasn't discussed in the presentation.

Future directions:

- Since it is still relatively early days for this project, there was a question as to how the priority to IVB was currently being considered.
- The VX787 compound (used as a positive control in studies) should be looked into further. If it has a patent, the patent information could be very informative.
- *In vivo* models for this project need to be considered. SAC suggested ferret or cotton rat models, not just the mouse models that are being used or planned.
- Because of the focus of hitting RdRp, it would make sense to perform thermal shift assays right away in order to identify hits then utilize the cap-snatch inhibitor.
- One member commented that they would like to see more studies with the EIDD 2838 compound as well as potential combination studies with what is already "out there."

Core A – Administrative
Strengths: The benefit of frequent teleconferences, team meetings and interactions among all projects and cores is clear, and has resulted in good progress for all projects.

Weaknesses: Since this was the first annual meeting under this award, new SAC members noted that clearer direction to the members prior to the meeting would be helpful in future.

Future recommendations:

- The SAC said it would have been helpful to have slide decks provided ahead of time for note taking. For the next meeting, redacted versions of the slides with the final presentations will be requested.
- Although scheduling of the meeting earlier in the year may have benefited the SAC, it was concluded that the same November meeting dates for this year should be followed next year, since they do not overlap with most other major conferences.

Core B – HTS
As noted in individual project reviews, this Core is doing excellent work in providing promising compounds for all projects. (See specific comments in the project sections above.)

Core C – Med Chem
This core is also an obvious strength of the overall program and is doing very good work. (See specific comments in the project sections above.)

Subject: Invitation to a contribution on a special Issue in Cells (IF 4.37) “SARS-CoV-2, Viral Interference and the Antiviral Innate Immune Response: Challenges and Opportunities”

Dear colleagues,

The current pandemic involving SARS-CoV-2, a positive-sense single-stranded RNA virus that was recently showed to target components of the RIG-I like receptor (RLR) and the JAK/STAT pathways, has revealed a defect in the innate type I/III IFN antiviral responses in infected patients that are associated with robust virus replication and severe complications, i.e., inflammation and a “cytokine storm”, notably via the accumulation of monocytes, resulting in lung immunopathology, vascular leakage, and suboptimal T cell response. Thus, viral interference affecting the type I/III IFN antiviral response is likely a culprit here. However, this does not explain why older patients (and sometimes even young individuals) do not mount a proper and efficient innate type I/III IFN antiviral response as compared to others. Whereas autoantibodies against IFNa as well as IRF7 and TLR3 variants represent candidates to consider, other mechanisms are likely involved in the complex interplay that exists between the host, this coronavirus as well as the emerging SARS-CoV-2 variants.

With those considerations in mind, I was invited to act as a Guest Editor for the Special Issue “SARS-CoV-2, Viral Interference and the Antiviral Innate Immune Response: Challenges and Opportunities” in the journal Cells (IF 4.37) (http://www.mdpi.com/journal/cells). This Special Issue will cover the biology of SARS-CoV viruses and their intrinsic ability to antagonize type I/III IFN responses. It will also review our current understanding of the severe complications associated with SARS-CoV-2 infection and address how precision medicine approaches (i.e. high-definition medicine) and medicinal chemistry (direct-acting antiviral drugs, immunomodulators and others) could help in diagnosis, prevention, and treatment.

I would be very pleased if you would agree to contribute a research paper or comprehensive review (more than 5000 words in the main text and include at least two figures or tables) on any aspect related to this thematic. It is our belief that your contribution will significantly strengthen the scope of this special issue and choose to join us.

Looking forward to your positive reply.
Regards,

Prof. Marc Servant
Guest Editor

Below you will find some information that you may find useful when considering this invitation.

(1) For more details of this special issue, please see via the following link: https://www.mdpi.com/journal/cells/special_issues/SARS_immune

(2) The submission deadline is **31 October 2021**. Papers can be submitted anytime before the deadline and will be published online individually soon after they are accepted, as papers are published on an ongoing basis to ensure the fast publication for individual articles.

(3) Currently, the median time from submission to first decision in Cells is 16 days. The median time from submission to publication online is 35 days.

(4) An article processing charge (APC) of 2000 CHF (Swiss Francs) applies to papers accepted after peer review. However, Cells will offer discounts/waivers for scholars who have had a good publication record in the last 3 years. Just make a pre-submission request, providing your tentative title with abstract to Ms. Yvonne Feng of Cells yvonne.feng@mdpi.com for application. The final decision will be made after checking. It is our belief that your contribution will significantly strengthen the scope of this special issue and choose to join us. Look forward to your positive reply.

Manuscript Submission Information
Manuscripts should be submitted online at **www.mdpi.com** by **registering** and **logging in to this website**. Once you are registered, **click here to go to the submission form**. Manuscripts can be submitted until the deadline. All papers will be peer-reviewed. Accepted papers will be published continuously in the journal (as soon as accepted) and will be listed together on the special issue website. Research articles, review articles as well as short communications are invited. For planned papers, a title and short abstract (about 100 words) can be sent to the Editorial Office for announcement on this website.
Submitted manuscripts should not have been published previously, nor be under consideration for publication elsewhere (except conference proceedings papers). All manuscripts are thoroughly refereed through a single-blind peer-review process. A guide for authors and other relevant information for submission of manuscripts is available on the **Instructions for Authors** page. ***Cells*** is an international peer-reviewed open access monthly journal published by MDPI.
Please visit the **Instructions for Authors** page before submitting a manuscript. The **Article Processing Charge (APC)** for publication in this **open access** journal is 2000 CHF (Swiss Francs). Submitted papers should be well formatted and use good English. Authors may use MDPI's **English editing service** prior to publication or during author revisions.

Published Papers
This special issue is now open for submission.

Blank AD3C Slide.pptx

Greetings and Happy New Year:

It is time to move forward with final plans for the AD3C Reverse Site Visit, scheduled for **Tuesday, February 11, 2020** at the NIAID Building, 5601 Fishers Lane. Rockville, MD. **In preparation for this visit, please read the following instructions carefully:**

- At this time, **please purchase a plane ticket using a domestic carrier and select a seat in economy class**, so your ticket can be reimbursed. For those who will be staying overnight, we suggest that you stay at the Hilton Washington DC/Rockville Hotel, 1750 Rockville Pike, Rockville, MD 20852, Phone is 301-468-1100 and the website link is https://www3.hilton.com/en/hotels/maryland/hilton-washington-dc-rockville-hotel-and-executive-meeting-ctr-IADMRHF/index.html. It is a short walk to the NIAID or a quick cab/Uber ride.

- Please use the attached form to keep track of your travel expenses and speed up reimbursement after the trip. It is important for you to sign the form before sending it to us with your receipts.

- If you will be arriving in the area on the evening of Monday, February 10 and would like to have dinner, **please let us know** so we will have a head count for making a group reservation at a nice local restaurant.

- In order to produce a presentation that contains uniform content for each project, please send the following items to Stephanie Moore at smoore@peds.uab.edu no later than **February 3, 2020** to be compiled into one presentation. There can be **10 slides** maximum per project that will take 20-25 minutes at most to cover. I have attached a blank AD3C slide if you would like to use it. Below are the areas that Maureen Beanan has requested that we cover:

    a. Status (1-2 slides - utilize timeline structure perhaps?)
    b. Accomplishments (2-3 slides)
    c. Proposed for upcoming year(s) (1-2 slides)
    d. Significant publications (1 slide)

Here are additional details on the meeting location, and the meeting agenda provided by NIH for your use, shown below:

Meeting Location:
NIAID
5601 Fishers Lane
Rockville MD 20852

Building Access: It is very important that you arrive at the building by **8:30 am Eastern Time** to allow sufficient time to get through security. Domestic travelers will need a government issued ID (i.e. driver's license) to enter the building. We plan to meet as a group in the lobby, but if you are early/late, please call Maureen Beanan at 301-339-4753 when you arrive at the lobby security station and she or one of her colleagues will come down to escort you.

Parking: Parking is available in the garage at 5635 Fishers Lane, Rockville, MD 20852 – the road to the garage is the first left after turning on to Fisher's Lane. The garage will be at the end of a road. Walk back out to Fisher's Lane, turn left and walk one block, cross the street to reach our building, about a 3 minute walk.

Meeting schedule: 9:00 to 11:00 am Part I: (~2.0 hours, including time for questions)
(Audience: This part of the meeting is open to all NIAID staff, including CETR Program Staff and all other interested NIAID staff)

9:00 am NIAID CETR staff welcome participants and Introductions (5 minutes)

9:05 am CETR presentations:

- Brief overview of the Center including the goals, administrative structure, projects, and cores – please include a slide summarizing the progress of depositing the genome sequences into NCBI in this part of the presentation;
- Report on Year 1 activities for each project (~15-20 minutes per project)
- Summarize the status of the project at the end of Year 1 (1 slide)
- Describe the progress on each project during year 1 and plans for remaining 4 years

11:00 am to 12:00 pm Part II: Discussion with CETR Program staff (~0.5 - 1 hour)
Possible topics:

- Senior NIAID staff questions
- Issues that have arisen during year and proposed options
- CETR Program updates
- Annual Progress Report questions

Thank you for agreeing to participate in the AD3C Reverse Site Visit. If you need any additional items or information, please contact any of our Administrative Core group members and we will be happy to assist you.

With kind regards,

Sara Davis | Program Coordinator II
UAB Research and Pediatric Virology/Pediatrics/Infectious Diseases
UAB | The University of Alabama at Birmingham
CHB Room 303| 1600 7th Avenue S | Birmingham, AL 35233-1711
P: 205.996.7804 | sadavis@peds.uab.edu

Celebrate our 50th anniversary with us!

Guest Travel **Date**_____ **Person's Name**_____

Points of Travel

Date	From	To	Mode

Transportation		Private Car, Rental Car, Plane, Train etc.
- Private Car mileage (Not rental cars)	_____ miles @ _____	
- Private Car mileage (Not rental cars)	_____ miles @ _____	
-Airfare/Train fare (Coach class only. Attach ticket stub.)		
-Rental Car (Attach original receipts. Give justification for why rental car was used instead of public transportation)		
-Taxi/Van (Including tips. Attach original receipts for fare where applicable.)		
-Parking (Attach receipt if applicable.)		
	Total Transportation	

Meals (Attach original receipts. Cannot include any alcoholic beverages.)

Date	Breakfast($)	Lunch($)	Dinner($)	Day Total ($)

Total Meals ($) _____

Hotel Room (Attach original receipts. Basic single occupancy room rate only.)

Date(s)	Rate($)	Number of Nights	Total ($)

Total Hotel ($) _____

Miscellaneous

-Baggage Handling Tips (Receipts not required), etc.

Total Miscellaneous	

Total Reimbursement Requested _____

Certification: I hereby request reimbursement of the travel related expenses detailed above and do hereby certify that:
- the travel and expenses indicated hereon were incurred by me
- the expenses were incurred in the performance of official duties and pursuant to the travel authority granted to me by UAB
- I have not been and will not be reimbursed for any of these expenses by any other entity
- there are no alcoholic beverages included in these expenses
- I agree to the rate at which I am being reimbursed
- I have not previously billed UAB for any of these expenses
- this travel voucher has been completed in compliance with UAB policies

Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday February 17 2:30PM CET (Geneva Time)

1. Ellie Barnes and Susie Dunachie (Oxford) - *Vaccine-induced immunity provides more robust heterotypic immunity than natural infection to emerging SARS-CoV-2 variants of concern*
2. Alex Sigal (AHRI) - *Cross-neutralization by plasma antibodies elicited by 501Y.V2 and earlier variants of 501Y.V2 and B.1.1 using live virus*

-----Original Appointment-----

Subject: SARS-CoV-2 Variant Testing pipeline
When: Friday, February 19, 2021 8:00 AM-9:30 AM.
Where: https://www.zoomgov.com/j/1602664950?pwd=MmhuQUE2SUZ6SnZYSG9LU0RPZm5sQT09

USE CAUTION: External Message.

Hello everyone,
Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.
If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.
Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.
Thank you, and looking forward to speaking on Friday February 12th.
Marciela

Summary *In Vitro* Characterization group discussion

2/19/21

What data is needed

1. **Cross-neutralization data**
   - WT to variant
   - Variant to wt
   - Variant to variant
   - Should be a broad panel of pseudoneut (VSV as well as lenti) and neut assays, 2-3 labs per assay?
2. **Growth kinetics in representative cell lines**
   - Organoids/organ systems/air liquid interface cultures?
   - Primary cell lines?
   - Cells overexpressing ACE2/TMPRSS2
3. **Structural information**
   - What impact do NTD loop deletions have?
   - What impact do RBD mutations have?
   - Do heterotrimers present epitopes of wt+variants correctly (important for mRNA/vectored vaccines)
4. **Variant RBD affinity to ACE2**
   - This should include ACE2 binding to animal model ACE2
5. **Characterization of mutations in genes outside of S**
6. **Anticipate mutations (e.g. identified via libraries, escape mutagenesis, also based on variants) and characterize them ahead of time**
7. **Data sharing system?**

Reagents

- Sourcing virus
  - Several isolates from each variant
    - Faster sharing needed – both domestic and international
    - Avoid USDA permits, ship non-cultured clinical isolates or ship extracted RNA!
  - BEI should supply large volumes that are ready to use
  - Molecular clones are needed too
- Benchmarking
  - mAbs (Ellebedy, P. Wilson etc.)
  - Therapeutic mAbs (source??? REGN, Eli Lilly, VIR, AZ etc.)
  - Access to remdesivir or similar
  - Polyclonal serum panel post vaccination for Moderna, Pfizer, J&J, NVX, AZ
  - Polyclonal serum panel post infection (wt, B.1.1.7, B.1.351, P.1, E484K viruses etc.)
- Gene synthesis
  - For molecular clones (wt nt sequence)
  - For pseudotyped entry inhibition assays (codon optimized wt aa sequence)
  - For protein expression (codon optimized 2P/Hexapro ΔCS)

Subject: No call this week - WHO Working Group on COVID-19 Assays

Hi All,

The WHO Working Group on COVID-19 Assays will not be held this week due to a conflict with the 2021 Global Vaccine and Immunization Research Forum (https://gvirf.org/).

Many thanks,
Lauren - Bill, Simon and César

Lauren Schwartz, PhD
Consultant - COVID-19 Response

Subject: Invitation from Marc Servant- Guest Editor- special Issue-"SARS-CoV-2, Viral Interference and the Antiviral Innate Immune Response: Challenges and Opportunities"

Dear colleagues,

The current pandemic involving SARS-CoV-2, a positive-sense single-stranded RNA virus that was recently showed to target components of the RIG-I like receptor (RLR) and the JAK/STAT pathways, has revealed a defect in the innate type I/III IFN antiviral responses in infected patients that are associated with robust virus replication and severe complications, i.e., inflammation and a "cytokine storm", notably via the accumulation of monocytes, resulting in lung immunopathology, vascular leakage, and suboptimal T cell response. Thus, viral interference affecting the type I/III IFN antiviral response is likely a culprit here. However, this does not explain why older patients (and sometimes even young individuals) do not mount a proper and efficient innate type I/III IFN antiviral response as compared to others. Whereas autoantibodies against IFNa as well as IRF7 and TLR3 variants represent candidates to consider, other mechanisms are likely involved in the complex interplay that exists between the host, this coronavirus as well as the emerging SARS-CoV-2 variants.

With those considerations in mind, I was invited to act as a Guest Editor for the Special Issue "SARS-CoV-2, Viral Interference and the Antiviral Innate Immune Response: Challenges and Opportunities" in the journal Cells (IF 4.37) (http://www.mdpi.com/journal/cells). This Special Issue will cover the biology of SARS-CoV viruses and their intrinsic ability to antagonize type I/III IFN responses. It will also review our current understanding of the severe complications associated with SARS-CoV-2 infection and address how precision medicine approaches (i.e. high-definition medicine) and medicinal chemistry (direct-acting antiviral drugs, immunomodulators and others) could help in diagnosis, prevention, and treatment.

I would be very pleased if you would agree to contribute a research paper or comprehensive review (more than 5000 words in the main text and include at least two figures or tables) on any aspect related to this thematic. It is our belief that your contribution will significantly strengthen the scope of this special issue and choose to join us.

Looking forward to your positive reply.
Regards,

Prof. Marc Servant
Guest Editor

Below you will find some information that you may find useful when considering this invitation.

(1) For more details of this special issue, please see via the following link: https://www.mdpi.com/journal/cells/special_issues/SARS_immune

(2) The submission deadline is **31 October 2021**. Papers can be submitted anytime before the deadline and will be published online individually soon after they are accepted, as papers are published on an ongoing basis to ensure the fast publication for individual articles.

(3) Currently, the median time from submission to first decision in Cells is 16 days. The median time from submission to publication online is 35 days.

(4) An article processing charge (APC) of 2000 CHF (Swiss Francs) applies to papers accepted after peer review. However, Cells will offer discounts/waivers for scholars who have had a good publication record in the last 3 years. Just make a pre-submission request, providing your tentative title with abstract to Ms. Yvonne Feng of Cells yvonne.feng@mdpi.com for application. The final decision will be made after checking. It is our belief that your contribution will significantly strengthen the scope of this special issue and choose to join us. Look forward to your positive reply.

Manuscript Submission Information
Manuscripts should be submitted online at **www.mdpi.com** by **registering** and **logging in to this website**. Once you are registered, **click here to go to the submission form**. Manuscripts can be submitted until the deadline. All papers will be peer-reviewed. Accepted papers will be published continuously in the journal (as soon as accepted) and will be listed together on the special issue website. Research articles, review articles as well as short communications are invited. For planned papers, a title and short abstract (about 100 words) can be sent to the Editorial Office for announcement on this website.
Submitted manuscripts should not have been published previously, nor be under consideration for publication elsewhere (except conference proceedings papers). All manuscripts are thoroughly refereed through a single-blind peer-review process. A guide for authors and other relevant information for submission of manuscripts is available on the **Instructions for Authors** page. ***Cells*** is an international peer-reviewed open access monthly journal published by MDPI.
Please visit the **Instructions for Authors** page before submitting a manuscript. The **Article Processing Charge (APC)** for publication in this **open access** journal is 2000 CHF (Swiss Francs). Submitted papers should be well formatted and use good English. Authors may use MDPI's **English editing service** prior to publication or during author revisions.

Published Papers
This special issue is now open for submission.

Subject: No call this week - WHO Working Group on COVID-19 Assays

Hi All,

The WHO Working Group on COVID-19 Assays will not be held this week due to a conflict with the WHO Global consultation on COVID-19 therapeutics. Register with this link if you'd like to attend - https://who-e.zoom.us/webinar/register/WN_CNfywAEiTEWgqA_nEcjeow

Many thanks,
Lauren - Bill, Simon and César

Lauren Schwartz, PhD
Consultant - COVID-19 Response

From: SCHWARTZ, Lauren[schwartzl@who.int]
Sent: Mon 3/8/2021 12:00:43 PM (UTC-06:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday March 10 2:30PM CET (Geneva Time)

1. Alex Sette (LJI) - *Negligible impact of SARS-CoV-2 variants on CD4+ and CD8+ T cell reactivity in COVID-19 exposed donors and vaccinees*
2. Viviana Simon (MSSM) - *Analysis of immune responses to SARS-CoV-2 mRNA vaccination on a serological and monoclonal level*

Subject: AD3C Reverse Site Visit Dinner Reservation on February 10

Hello to Everyone:

Thank you again for your participation in the AD3C Reverse Site Visit on February 11, 2020. Dr. Whitley has made a reservation for dinner at Founding Farmers – Montgomery County at **7:00 pm** Eastern Time for Monday evening, February 10. The address of the restaurant is 12505 Park Potomac Avenue, Potomac, MD 20854 and the phone number is (301) 340-8783. The reservation is confirmed under Dr. Whitley's name.

If I can be of assistance, please let me know.

With kind regards,

Sara Davis | Program Coordinator II
UAB Research and Pediatric Virology/Pediatrics/Infectious Diseases
UAB | The University of Alabama at Birmingham

Subject: SARS-CoV-2 Variant Testing pipeline
When: Friday, April 2, 2021 8:30 AM-9:30 AM.
Where: https://www.zoomgov.com/j/1602664950?pwd=MmhuQUE2SUZ6SnZYSG9LU0RPZm5sQT09

Hello everyone,
Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.
If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.
Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.
Thank you, and looking forward to speaking on Friday February 12th.
Marciela
Marciela DeGrace is inviting you to a scheduled ZoomGov meeting.

Sent: Mon 3/29/2021 6:54:55 PM (UTC-05:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday March 31 2:30PM CET (Geneva Time)

1. Thushan de Silva (U. Sheffield) & Lance Turtle (U. Liverpool)- *T-cell and antibody responses to first BNT162b2 vaccine dose in previously SARS-CoV-2-infected and infection-naive UK healthcare workers: a multicentre, prospective, observational cohort study.*
2. Simon Funnell (PHE) - *An update on the CEPI funded Agility project*

Subject: AD3C Year 3 NOA: Subawards

Dear AD3C Project Leaders,

We are pleased to inform you that UAB has received the NOA for Year 3!

Antiviral Drug Discovery and Development Center (AD3C)
5U19AI142759-03
Year 3: 3/1/2021 – 2/28/2022

NIH has fully funded our Year 3 request, so you can expect your subawards to match the budgets you submitted with the last RPPR. We are now drafting the subaward requests for our OSP.

- IACUC approval: If you have an updated Animal Research IACUC approval, please provide this document to us.
- FINAL INVOICES: You have 60 days to invoice after the end of the period – deadline end of this month. To date, only 1 site has sent me a Final Invoice. Please remind your financial support to submit these.

Thank you for all your hard work!

Sarah M. Dowdy, MPH | Clinical Research Administrator III

From: SCHWARTZ, Lauren[schwartzl@who.int]
Sent: Tue 4/13/2021 10:43:31 AM (UTC-05:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday April 14 2:30PM CET (Geneva Time)

1. Prabuddha Kundu (Premas Biotech) - *SARS CoV2 Antigens and Multiplexed ELISA Platform for Sero surveillance*
2. Julian Hiscox (U. Liverpool) - *Sequence analysis of SARS-CoV-2 in nasopharyngeal samples from patients with COVID-19 illustrates population variation and diverse phenotypes, placing the in vitro growth properties of B.1.1.7 and B.1.351 lineage viruses in context*

Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday April 21 2:30PM CET (Geneva Time)

1. Darin Edwards (Moderna) - *Updated mRNA vaccines to address SARS-CoV-2 variants that drive reduction in neutralization*
2. Eng Eong Ooi (Duke NUS) - *T cells as correlates of protection from Covid-19*

-----Original Appointment-----

Subject: EBOV discussion follow up
CREID_EBOV Discussion_Minutes.docx

Thank you everyone for the robust discussion and knowledge sharing today. See the attached minutes and the items for follow up below:

EBOV Discussion Follow up:

1. Slobodan Paessler (UTMB) will explore his connections from CDC HIV labs which routinely get samples out
    a. One located in Jaws and the other is in Abuja
    b. Will forward contact to Sara W.
2. Jean will follow up with Division of AIDS (DAIDS) colleagues to see if there is any additional local support for this
3. Moody and company will provide general ideas on the cold chain problems, share barcode methods, vendors and SOPs. Will share over email

Have a wonderful weekend.

Best,
Claire

CREID EBOV Discussion Notes

Participants: Bob Garry, Bob Cross, Scott Weaver, Pia MacDonald, Tony Moody, Slobodan Paessler, Jean Patterson, Sara Woodson, Susan McLellan, Candice Beaubien, Ruth Florese, Julie Dyall, Amber Linde, Chris Broder, Claire Quiner, Megan Averill, Hongying Li, Aaron Macoubray

Agenda:

1. Relevance of and most pressing research questions of purported 5 yr recrudescence of EBOV Options/recommendations for enhancing infrastructure including biorepository and inventory system – specifically cold chain power supply.
2. Also, recommendations for inventory software and SOPs

MINUTES

- EBOV Update - DRC
  - 11 confirmed cases, 6 deaths. Mostly in the eastern part of the country
  - Likely recrudescence and sexual transmission
- EBOV Update – Guinea
  - Likely also recrudescence
  - Not quite settled. 23 cases (16 confirmed, 12 deaths)
  - Sequence data suggests this is a case of recrudescence
  - 5000+ people vaccinated
  - 4 new cases reported in April

Discussion –

- Another update re: Sierra Leone
  - Active effort to solidify the borders and limit traffic between countries.
- International help ongoing
  - Molecular reagents and RDTs
  - Brought PPEs
- Suspected cases in Sierra Leone could likely be Lassa
- J&J has donated a large number of vaccines to Sierra Leone
- Bob Cross scheduled to engage field activities (mosquito trapping, bat trapping, etc.) in support of other partners
- Were any of the confirmed cases previously vaccinated?
  - Not sure, but probably not
  - Vaccine rollout has not been particularly robust
- Pia: How has the CREID focused research changed with this outbreak? Did you pivot to do this?
  - Bob: Goal was to look into trapping efforts on the border with Guinea
  - Large deforestation going on. Could be driving bat populations away from Sierra Leone
- Fewer cases of COVID-19 in Sierra Leone. Even before these outbreaks, were planning some of these trips
- Does Sierra Leone have access to enough testing to really understand the COVID situation?
  - They have been doing some sequencing. Maybe not ideal, but don't think there is rampant COVID-19 there
  - There is a network of testing centers around the country including Kenema

- Could be some resistance to beta-coronaviruses in West Africa
    - Need to look into this
- What is currently known about persistence of EBOV in humans?
    - Ebola is an endemic disease that allows it to get into many hosts
    - In monkeys, it can be found in the eyes and the reproductive system, but usually connected to the vasculature.
    - Once the virus gets into the tissues, they are harder to clear with monoclonal antibodies
    - Might be interesting to connect a COVID-19 case to these EBOV cases. May depress the immune system enough to cause some shedding
    - Evidence of the same organs having been affected in humans as shown in monkeys
    - Longitudinal studies will be really important. Need to set up more long-term programs
- Sierra Leone has the most survivors
    - Many are involved in survivor trials
- Sociological questions re: stigma, antisocial behaviors towards survivors
    - Need to get the messaging right about dealing with survivors
    - Real possibility that we could prevent or suppress reemergence of the virus by giving these people vaccinations
- After the last major outbreak was there evidence of spillback into wildlife?
    - It is a possibility, but less likely than it being hosted in humans
    - Not even sure what Ebola does in its natural reservoir
        i. Likely bats have it and are shedding
    - Important to do ecological analysis
- Can you use the molecular clock to determine whether this was recrudescence?
    - Clock was slowed down. Only about 5 mutations of the period of time, compared to 18-20. Unlikely to happen in a reservoir
- Opens the door to Lassa which resides in the rodent population and is persistent
    - Persistence in humans not well understood
    - Hope to be able to treat late cases of Lassa to figure out whether recrudescence is possible
- Need to look at survivors to help understand what is going on in terms of reemergence

What is the sampling availability for these samples?

- Cold chain is an issue.
- Power is an issue
- Would take a couple million dollars to stabilize things
- Logistics of getting samples was not previously an issue. Effective despite power issues. After the Ebola outbreak and other NGOs came in, there were issues around moving samples without approvals, everything was tightened significantly, so it is much more difficult now.
    - High stress to work up samples in country
    - Kenema working towards building up the solar system.
    - Could use assistance to best set this up
    - Battery life is different in that part of the world compared to the US
- Slobodan: In Jos, there is a large HIV center funded by NIH with a robust energy network. Very well set up. They collect Lassa patient samples.
    - Could be useful to connect with who is in charge of that
- Sara: Would the SL government allow samples to be temporarily stored in Nigeria?

    - Bob: Discussed moving samples to another lab with working freezers in Sierra Leone, but shot down
        i. Want their own power systems repaired
        ii. If actively working towards that, could use other temporary solutions
    - Slobodan: Through CDC Nigeria, they can get anything out. Very willing to share
- May want to consider Freetown. They have more stable power
    - Discussed this too, but the focus is getting the power set up in Kenema and self sufficient
- How necessary is a -80 freezer if you have liquid nitrogen?
    - Could be an option to put another nitrogen machine there that's good
    - Might actually be more efficient to run a nitrogen machine vs. consistent power
- Solar could potentially power the hospital with a large enough solar farm
- Key to getting samples out of Nigeria is all through NCDC now. Helped to get everything to NCDC and have them ship samples.
- Can you reconstruct EBOV in the lab?
    - Have reverse genetics in the lab and have been working with CDC. This is in the architecture of the grant as a backup plan

Inventory system

- Old school, paper based.
    - Samples catalogued or aliquoted
    - Not catalogued
- Need something easy, lower tech
    - Not yet moved to a barcoding system
- Tony: Lots of experience barcoding and inventory management systems
    - Inventory systems: everything will be a lift
    - Need to develop a list of all the vendors
        - Are there import export restrictions on any of these?
- Tony and the biorepository can work to pull all of these things together as it will be a value to everyone
    - Can come up with recommendations and options
    - Would recommend barcoding and an electronic system

EBOV Discussion Follow up:

1. Slobodan "Boba" Paessler will explore his connections from CDC HIV labs which routinely get samples out
    a. One located in Jos and the other is in Abuja
    b. Will forward contact to Sara W.
2. Jean will follow up with DAIDS (Division of AIDS) colleagues to see if there is any additional local support for this
3. Moody and company will provide general ideas on the cold chain problems, share barcode methods, vendors and SOPs. Will share over email

From: SCHWARTZ, Lauren[schwartzl@who.int]
Sent: Mon 4/26/2021 6:47:35 PM (UTC-05:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

For this week's meeting, we are deviating from the usual presentation format and will have a panel discussion instead. The

discussion will focus on immune assays for SARS-CoV-2 variants and the use of the WHO International Standard.

Best,
Lauren - Bill, Simon and César

Subject: Faculty Position in Emerging and Re-emerging Viruses at The Ohio State University
Virology Faculty Positions at OSU.pdf

Dear colleagues:

Greetings! I hope you all are doing well.

We have several virology positions opening – see below and attached, and I would very much appreciate it if you could help forward the email to some potentially interested individuals.

Thank you so much!

Shan-Lu

Multiple Faculty Positions in Emerging and Re-emerging Viruses

The Ohio State University College of Veterinary Medicine invites applications for multiple research-intensive tenure-track faculty positions at the Assistant or Associate Professor level in emerging and re-emerging viruses that expand and build upon our programmatic strengths, expertise, assets and impact. Areas of interest include, but are not limited to virus-host interactions, animal models, ecology, immunology, genetics and evolution, structural biology, and zoonotic transmission. Successful candidates will join a highly interactive virology and infectious disease research community on campus that is an integral part of the university's Infectious Disease Institute, including the Center for Retrovirus Research, Center of Microbiome Science, and a newly NIH-funded center, STOP-COVID. These positions are part of the university's new initiatives on research for academic excellence. The College of Veterinary Medicine has a long and outstanding history of research excellence in Signature Programs, including research focus areas in infectious diseases, comparative oncology, neuromusculoskeletal sciences, molecular virology, epidemiology, and vaccine development.

Applicants should have a doctoral degree (PhD, DVM, MD or equivalent) with advanced training in virology, viral immunology or related fields. Academic rank and salary are commensurate with experience. Candidates at the rank of Associate Professor should have demonstrated research productivity and evidence of an independently funded and sustainable research program, as well as experience working with interdisciplinary research teams. Candidates at the rank of Assistant Professor should have training, experience, excellent scholarship, and demonstrated evidence of the likelihood of obtaining and maintaining an independently funded and sustainable research program. All candidates should have interest in programmatic synergy with existing members of the Ohio State faculty.

Columbus, Ohio's capital and largest city and the 14th largest city in the US, offers a wide range of affordable housing, many cultural and recreational opportunities, excellent schools, easy commute and a strong economy with growing industries in biomedical science, finance, insurance, healthcare, retail and e-commerce and information technology. Columbus has consistently been rated as one of the top U.S. cities for quality of life and one of the best places for business and careers in part due to a strong multicultural population and efforts to foster and embrace diversity, equity and inclusion. Residents enjoy the many amenities of the city including professional sports teams, museums, Columbus Zoo and Aquarium, outstanding restaurants, performing arts, metro parks, and more.

Applications should be submitted via email as a single PDF including (1) a cover letter; (2) curriculum vitae; (3) a summary of past research accomplishments; (4) a statement that addresses (i) your future research directions, (ii) your teaching and mentoring philosophy, and (iii) how you foresee integrating diversity and inclusion into your research, teaching and professional service; and (5) the names and contact information of four professional references.

Application materials should be submitted to Casey Hofmann (hofmann.75@osu.edu), or via website: https://www.nature.com/naturecareers/job/open-faculty-search-the-ohio-state-university-osu-739648. Review of applications will begin June 1, 2021 and continue until positions are filled. Inquiries may be directed to the chair of the search committee, Dr. Shan-Lu Liu (liu.6244@osu.edu).

The Ohio State University is committed to establishing a culturally and intellectually diverse environment, encouraging all members of our learning community to reach their full potential. We are responsive to dual-career families and strongly promote work-life balance to support our community members through a suite of institutional policies. To build a diverse workforce, qualified applicants will receive consideration for employment without regard to age, race, color, religion, sex, sexual orientation, gender identity, national origin, disability status, or protected veteran status. EEO/AA employer.

From: SCHWARTZ, Lauren[schwartzl@who.int]
Sent: Mon 5/17/2021 6:58:31 PM (UTC-05:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call. **Please note, you will have to download the most recent version of Zoom to attend the call.**

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday May 17 2:30PM CET (Geneva Time)

1. Galit Alter (Harvard) – *Early cross-coronavirus reactive signatures of protective humoral immunity against COVID-19*
2. Discussion of international standard and variants

-----Original Appointment-----

Subject: No WHO Working Group on COVID-19 Assays this week

Dear All,

There will be no COVID-19 assays call this week because of a conflict with the WHO meeting on correlates of protection (**registration** - https://who-e.zoom.us/webinar/register/WN_V7h9i_1mQbaT7vVAW7RS9A). We will resume next week Wednesday June 2, 2021.

Best,
Lauren - Bill, Simon and César

Lauren Schwartz, PhD
Consultant - COVID-19 Response
R&D Blueprint | Health Emergencies Programme

From: SCHWARTZ, Lauren[schwartzl@who.int]
Sent: Mon 5/31/2021 4:51:30 PM (UTC-05:00)
Subject: RE: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday June 2 2:30PM CET (Geneva Time)

1. Mehul Suthar (Emory) - *The durability of infection- and vaccine-induced antibody responses against SARS-CoV-2 and emerging variants*
2. Simon Funnell (PHE) - Update from the viral propagation subgroup

-----Original Appointment-----

Subject: Reverse Site Final Presentation

Hello all,

Looking forward to seeing everyone tomorrow. The final presentation may be found on the AD3C Sharefile. Please let me know if you can't find it and do share it with your teams.

This link should take you to login and then to the file:
https://southernresearch.sharefile.com/home/shared/foa2e2ec-463a-442e-b104-3c088fc44b73

If the link above doesn't work login and navigate to the presentation in the U19 folder then the "2020 Reverse Site Visit" folder:
https://southernresearch.sharefile.com/Authentication/Login

Thank you and safe travels!

Stephanie

Subject: Global consultation on SARS-CoV-2 variants of concern and their impact on public health interventions, 10 June 2021

Dear all,
WHO will host a virtual global consultation on SARS-CoV-2 Variants of Concern and their Impact on Public Health Interventions scheduled to take place on **Thursday, 10 June 2021** from **13:00-16:30 Geneva time**.

This consultation will be an opportunity for WHO and partners to review and summarize the current evidence of the impact of SARS-CoV-2 variants of concern on public health interventions and outline information needs and decision-making processes. Attached is the concept note and agenda for the webinar.

Please register below to receive your personal connection link.

Description : Global consultation on SARS-CoV-2 Variants of Concern and their Impact on Public Health Interventions.

Please share this with your networks. Should you encounter any problem to register, please contact Ms Josine Umugwaneza at (jumugwaneza@who.int).

Kind regards
Neddy MAFUNGA
on behalf of the WHO R&D Blueprint Secretariat

Sensitivity: CEPI Internal

Global Consultation on SARS-CoV-2 Variants of Concern and their Impact on Public Health Interventions

10 June, 13:00-16:30 CEST

Zoom (Please register in advance here)

Concept Note

Background

On 29 March 2021, WHO convened the Global Consultation on a Decision Framework for Assessing the Impact of SARS-CoV-2 Variants of Concern (VOCs) on Public Health Interventions. This was the first global forum for WHO and stakeholders to outline a global risk monitoring and assessment framework, including critical steps for the detection, monitoring, and assessment of SARS-CoV-2 variants, and to provide an overview of the available evidence on current VOCs and their impact on public health interventions. WHO and partners reviewed potential decision-making processes with respect to analyzing the impact of VOCs, evaluating and modifying vaccines, and issuing policy recommendations. At the time of the consultation, no changes to public health interventions due to the VOCs were recommended.

However, noting the upsurge in COVID-19 cases in parts of the world and the emergence of the B.1.617 VOC, there is an urgent need for the global community to come together again to review and synthesize the available evidence of the impact of VOCs on public health interventions. This will ensure continued coordination and harmonization for interpreting results, issuing recommendations, and communicating to the public.

WHO will convene this second consultation, which is scheduled for 10 June 2021 from 13:00-16:30 CEST, with all stakeholders to continue implementing the global risk monitoring and assessment framework. The consultation will also be an opportunity for WHO to outline decision-making processes for COVID-19 vaccine composition, if needed.[1]

The consultation will be guided by the following key questions:

- How are data on VOCs and evidence of their impact on public health interventions being generated?
- Based on the current VOC data and evidence, what decisions, if any, need to be made by policymakers with respect to COVID-19 prevention and control?
- How can global decision-making processes be further clarified and strengthened?

Objectives:

1. Review and summarize the existing evidence of the impact of VOCs on public health interventions
2. Engage global stakeholders to outline the information needs and decision-making processes for assessing the impact of VOCs on public health interventions
3. Outline decision-making processes for COVID-19 vaccine composition, if needed

Outcomes:

1. Synthesis of the current evidence, challenges, and solutions for VOCs and their impact on public health interventions, including current COVID-19 vaccines
2. Common understanding of the current triggers, roles and responsibilities, and information needs and standards to guide policy recommendations for VOCs

If you have any questions regarding this consultation, please contact Christopher Chadwick, Marie-Ange Wambo, and Josine Umugwaneza.

[1] Please note that the consultation will not be the forum for making evidence-based recommendations on COVID-19 vaccine composition but will address how such a recommendation, if needed, will be made in the future.

Global consultation on SARS-CoV-2 variants of concern and their impact on public health interventions

10 June 2021, 13:00 - 16:30 CEST

Zoom (**Please register in advance here**)

Tentative agenda

TIME	TOPIC	SPEAKERS
13:00-13:05	Opening remarks	Mike Ryan, WHO
13:05-13:10	Updates on the WHO global risk monitoring and assessment framework for SARS-CoV-2 variants	Sylvie Briand, WHO
SESSION 1: FOCUS ON SARS-COV-2 VARIANTS		
13:10-14:10	Update on VOI/VOC designation process and naming system	Lorenzo Subissi, WHO
	Global epidemiological situation with SARS-CoV-2 variants	Brett Archer, WHO
	Risk assessing SARS-CoV-2 variants	Wendy Barclay, Imperial College London
	Moderator: Maria Van Kerkhove, WHO	
SESSION 2: EVIDENCE FRAMEWORK FOR VARIANTS & COVID-19 VACCINES		
14:10-15:20	Topics:	
	• Decision-making process and methods to decide if a modified vaccine or a new vaccine is needed (10 mins)	Philip Krause, Chairperson, WHO research expert group on COVID-19 vaccines
	• Review and critical appraisal of randomized evidence on vaccines and variants (10 mins)	Isabelle Boutron Université de Paris
	• Review and critical appraisal of non-randomized evidence on vaccines and variants (10 mins)	Julian Higgins University of Bristol
	• Developers' corner – current data and plans for evaluation of the effect of variants on vaccine efficacy/effectiveness (20 mins)	Randall N Hyer, Moderna Philip Dormitzer, Pfizer Rabun Mallory, Novavax

		Steven Gong, Clover Biopharmaceuticals Allen Lien, Medigen Vaccine Biologics Corp Raches Ella, Bharat Biotech Robert Coleman, Codagenix Punee Pitisuttithum, Mahidol University Trina Racine, Vaccine and Infectious Disease Org. (VIDO) Luigi Aurisicchio, Takis/Rottapharm Biotech Christine Roberts GeneOne Life Science, Inc
	• Preliminary considerations of other epidemiological data to inform decisions (20 mins)	<u>Panel discussion</u> Helen Rees, Wits RHI, University of Witwatersrand Mary Ramsay, Immunization, Hepatitis, and Blood Safety department, Public Health England | HPA John Peter Figueroa, University of the West Indies, Jamaica
	Moderator: Kanta Subbarao	David Wentworth, Virology surveillance and diagnosis branch, Influenza Division, NCIRD, US CDC

SESSION 3: IMPACT ON PUBLIC HEALTH DECISION-MAKING

15:20-15:50	Perspectives of regulators and developers for variants and COVID-19 vaccines *Moderator: Marco Cavaleri, EMA*	Chang-Joon Bae, MFDS Marco Cavaleri, EMA Adam Hacker, CEPI Philip Krause, FDA
15:50-16:20	Impact of variants on public health decision-making: • Global perspective • Country level perspectives *Moderator: Nyka Alexander, WHO*	Hanna Nohynek, SAGE Christine Carrington, Trinidad & Tobago Nazeem Muhajarine, CoVaRR-Net
16:20-16:30	Concluding remarks	Jaouad Mahjour, WHO

January 22 2019 AD3C Agenda.pdf

Hello To Everyone:

Please be reminded of the AD3C monthly call scheduled for this **Thursday, January 24 at 3:30 pm Central Time.** Attached please find the meeting agenda. If you would like to share any slides with the group, please send them to me by 12:00 pm on the day of the call and I will send them via e-mail to the conference call participants.

With best regards and many thanks,

Sara Davis | Program Coordinator II
Direct Line: 205.996.7804 | sadavis@peds.uab.edu

AD3C Teleconference Agenda
January 22, 2019, 3:30 p.m. CST

Meeting Number: (888) 806-5025 **Participant code: 420976**

1. Admin Core

   - Re-competition info: JIT documents uploaded/received by NIAID
   - Budget status update
   - Final report due June 28, including CETR Final Report Additional Materials
   - Consortium agreement amendment in process
   - Consider abstract ICAR Baltimore (May 12-15 2019, deadline Jan 31; list of speakers https://www.isar-icar.com/page-1075346)

2. Project progress updates

   - Project 1 – Flavi (JNelson, AHirsch, MDiamond; Core B BBostwick; Core C APathak)

   - Project 2 – Corona (MDenison, RBaric; Core B BBostwick; Core C APathak)

   - Project 3 – Alpha (DStreblow, MHeise, TMorrison; Core B BBostwick; Core C APathak)

   - Project 4 – Influenza (RWhitley, MPrichard, JCampos-Gomez; Core B BBostwick; Core C OMoukha-Chafiq)

Subject: SARS-CoV-2 Variant Testing pipeline
When: Friday, February 19, 2021 8:00 AM-9:30 AM.
Where: https://www.zoomgov.com/j/1602664950?pwd=MmhuQUE2SUZ6SnZYSG9LU0RPZm5sQT09

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Summary *In Vitro* Characterization group discussion

2/19/21

What data is needed

1. **Cross-neutralization data**
   - WT to variant
   - Variant to wt
   - Variant to variant
   - Should be a broad panel of pseudoneut (VSV as well as lenti) and neut assays, 2-3 labs per assay?
2. **Growth kinetics in representative cell lines**
   - Organoids/organ systems/air liquid interface cultures?
   - Primary cell lines?
   - Cells overexpressing ACE2/TMPRSS2
3. **Structural information**
   - What impact do NTD loop deletions have?
   - What impact do RBD mutations have?
   - Do heterotrimers present epitopes of wt+variants correctly (important for mRNA/vectored vaccines)
4. **Variant RBD affinity to ACE2**
   - This should include ACE2 binding to animal model ACE2
5. **Characterization of mutations in genes outside of S**
6. **Anticipate mutations (e.g. identified via libraries, escape mutagenesis, also based on variants) and characterize them ahead of time**
7. **Data sharing system?**

Reagents

- Sourcing virus
  - Several isolates from each variant
    - Faster sharing needed – both domestic and international
    - Avoid USDA permits, ship non-cultured clinical isolates or ship extracted RNA!
  - BEI should supply large volumes that are ready to use
  - Molecular clones are needed too
- Benchmarking
  - mAbs (Ellebedy, P. Wilson etc.)
  - Therapeutic mAbs (source??? REGN, Eli Lilly, VIR, AZ etc.)
  - Access to remdesivir or similar
  - Polyclonal serum panel post vaccination for Moderna, Pfizer, J&J, NVX, AZ
  - Polyclonal serum panel post infection (wt, B.1.1.7, B.1.351, P.1, E484K viruses etc.)
- Gene synthesis
  - For molecular clones (wt nt sequence)
  - For pseudotyped entry inhibition assays (codon optimized wt aa sequence)
  - For protein expression (codon optimized 2P/Hexapro ΔCS)

In Vivo group discussion

2/19/21

What to do

1. Characterize variants in three animal models
   - Mouse model
     - K18-hACE2 mice
     - Wild-type immune-competent mice
   - Hamster mode
   - NHP model (limited for prioritized experiments)
   - Share results from the three models and decide which models will be prioritized for variant analysis
2. In vivo variant testing
   - Infect and challenge with homologous and heterologous variant viruses
   - Immunize with vaccines and then challenge with original and variant viruses
   - Test dose range for immunization
   - Shelf infected- or vaccine-immunized animals for later challenge with variant viruses

Notes:

1. Prioritize variants for in vivo testing based on (i) clinical and epidemiological information and (ii) in vitro assay results (e.g., neutralization titers, replication kinetics in human airway culture)

2. Share results from different teams and task groups in real time.

Subject: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda and zoom information for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday June 9 2:30PM CET (Geneva Time)

1. Theodora Hatziioannou (Rockefeller) - *Evolution of neutralizing antibody responses to SARS-CoV-2*
2. Larry Dumont (Vitalant Research)- *SARS-CoV-2 Antibody persistence in COVID-19 convalescent plasma donors: Dependency on assay format and applicability to serosurveillance*

Subject: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda and zoom information for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday June 16 2:30PM CET (Geneva Time)

1. Amy Chung (U. Melbourne) - *Simultaneous evaluation of antibodies that inhibit SARS-CoV-2 RBD variants with a novel competitive multiplex assay*
2. David Goldblatt (UCL) - *Comparing immune responses between SARS-CoV-2 vaccines, correlates of protection and variant immunity*
