Colleagues – quick turnaround and **approval** for the JID antiviral summit article. Will keep you posted on when a link appears for the article (we pre-requested a fast posting to their 'just accepted' section), and the final formatted article. Thanks,
Matt

On 6/3/21, 10:28 AM, "em.jid.0.73bb1a.070efb16@editorialmanager.com on behalf of The Journal of Infectious Diseases" <em.jid.0.73bb1a.070efb16@editorialmanager.com on behalf of em@editorialmanager.com> wrote:

CC: mshirsch@partners.org

Dear Dr. Hall,

We are pleased to inform you that your revised manuscript has been accepted for publication in a supplement to The Journal of Infectious Diseases.

In order to publish your article, our publisher, Oxford University Press (OUP), requires that you complete a license agreement online. A link to the online licensing system, and instructions on how to select and complete a license, will be provided to you by the Production Editor at Oxford University Press after your manuscript has been sent to the publisher for production.

You will receive an e-mail from OUP when your proofs are ready to be downloaded from the Internet. On return of your proofs to OUP, your paper will be scheduled for publication.

PLEASE NOTE: All articles are available to JID subscribers upon Advance Access online publication. Any article that is clearly identified by the authors as funded by the NIH will be sent by Oxford University Press to the National Library of Medicine's PubMed Central, and free access to the article will be available 12 months after issue publication. Authors who choose the Oxford Open Initiative will also have their published articles sent directly to PubMed Central and will have open access available upon Advance Access online publication.

You will receive your official acceptance date from Oxford University Press once you have signed your license to publish. (Please note: If you are a UK-based author and are looking to comply with the HEFCE policy on open access in the Research Excellence Framework, you should use the official acceptance date when depositing in your repository.)

Press Releases: Authors or institutional press offices planning to publicize a JID article with a press release should contact the

journal at jid@jidoffice.org as soon as possible and review the related guidelines at https://academic.oup.com/jid/pages/for_press_offices_. Authors and their institutions are expected to respect any press embargoes set for their manuscript.

Sincerely,

Martin Hirsch, MD
Editor

Subject: FW: MS #JID-73083R1, Report of the National Institutes of Health SARS-CoV-2 Antiviral Therapeutics Summit

Colleagues – quick turnaround and **approval** for the JID antiviral summit article. Will keep you posted on when a link appears for the article (we pre-requested a fast posting to their 'just accepted' section), and the final formatted article. Thanks,
Matt

On 6/3/21, 10:28 AM, "em.jid.0.73bb1a.070efb16@editorialmanager.com on behalf of The Journal of Infectious Diseases" <em.jid.0.73bb1a.070efb16@editorialmanager.com on behalf of em@editorialmanager.com> wrote:

CC: mshirsch@partners.org

Dear Dr. Hall,

We are pleased to inform you that your revised manuscript has been accepted for publication in a supplement to The Journal of Infectious Diseases.

In order to publish your article, our publisher, Oxford University Press (OUP), requires that you complete a license agreement online. A link to the online licensing system, and instructions on how to select and complete a license, will be provided to you by the Production Editor at Oxford University Press after your manuscript has been sent to the publisher for production.

You will receive an e-mail from OUP when your proofs are ready to be downloaded from the Internet. On return of your proofs to OUP, your paper will be scheduled for publication.

PLEASE NOTE: All articles are available to JID subscribers upon Advance Access online publication. Any article that is clearly identified by the authors as funded by the NIH will be sent by Oxford University Press to the National Library of Medicine's PubMed Central, and free access to the article will be available 12 months after issue publication. Authors who choose the Oxford Open Initiative will also have their published articles sent directly to PubMed Central and will have open access available upon Advance Access online publication.

You will receive your official acceptance date from Oxford University Press once you have signed your license to publish. (Please

note: If you are a UK-based author and are looking to comply with the HEFCE policy on open access in the Research Excellence Framework, you should use the official acceptance date when depositing in your repository.)

Press Releases: Authors or institutional press offices planning to publicize a JID article with a press release should contact the journal at jid@jidoffice.org as soon as possible and review the related guidelines at https://academic.oup.com/jid/pages/for_press_offices_. Authors and their institutions are expected to respect any press embargoes set for their manuscript.

Sincerely,

Martin Hirsch, MD
Editor

Subject: RE: NYTimes: Coronavirus Antibody Tests: Can You Trust the Results?

Want to weigh something large? Put it on one end of a teeter-totter (a seesaw). Then balance that with a large rock on the other end. Now all you need do is weight the rock.

One way to determine the quality of these newly developed assays is to (a) find someone who knows what the hell they are doing and have them (b) test by MACELISA and IgGelisa, then (c) test by NEUTRALIZATION. Without the latter, I ain't buying it. In the current situation, who cares whether a person has antibody, to SARS-CoV-2, unless that antibody is helpful in determining protection. Jordi Casals and Bob Shope must be turning in their graves.

Now W.H.O. is saying that the presence of antibody is not indicative of protection from a second exposure to SARS-CoV-2. No shit, Sherlock.

Charlie

Dear Massoud,

It was nice to finally speak with you today. Please find attached:

- A Quantum GX2 lung imaging slide deck
- A bibliography of all the Quantum lung imaging papers

Also, On Sunday April 12th 2020, Prof. Kawaoka's (University of Tokyo) research was highlighted on Japanese TV. Prof. Kawaoka is a virologist who used the Quantum to image COVID-19 in hamster lungs. He has also imaged ferrets. Find some screenshots below.

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

Subject: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

As we discussed during our meeting on Monday we hope to hold a third virtual dialogue meeting with CAS and CCDC experts to discuss what is known about COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

We have proposed to CAS that this meeting take place on~~**Tuesday evening, May 26 from 9:00 -11:00 PM ET for the Americans**(and the morning of Wednesday, May 27 for the Chinese).~~ I have attached the list of questions on these topics we sent to CAS for your information. **Please let me know if you are interested and available to participate in the 3rd virtual dialogue meeting.**

Kind regards,

Ben

Importance: High

Greetings,

Thought it would be helpful to send you a basic outline for the follow up call (**at 11:30 ET today**).

1) Intro
2) Comments on the Day 1 and Day 2 discussion
3) Ideas for topics (and additional American experts) for future virtual dialogue sessions
4) Discussion of George Gao's joint statement idea
5) CAS idea to post a blurb about the meetings on the CAS website
6) Other issues, concerns

I have attached the dialogue agenda (American version) for reference along with Jim's summaries of future collaboration ideas from the sessions.

I know a few people can't make it but I would be happy to follow up with you individually over the phone or email.

I look forward to talking to the group soon.

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

As we discussed during our meeting on Monday we hope to hold a third virtual dialogue meeting with CAS and CCDC experts to discuss what is known about COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

We have proposed to CAS that this meeting take place on~~**Tuesday evening, May 26 from 9:00 -11:00 PM ET for the Americans**(and the morning of Wednesday, May 27 for the Chinese).~~ I have attached the list of questions on these topics we sent to CAS for your information. **Please let me know if you are interested and available to participate in the 3rd virtual dialogue meeting.**

Kind regards,

Ben

Importance: High

Greetings,

Thought it would be helpful to send you a basic outline for the follow up call (**at 11:30 ET today**).

1) Intro
2) Comments on the Day 1 and Day 2 discussion
3) Ideas for topics (and additional American experts) for future virtual dialogue sessions
4) Discussion of George Gao's joint statement idea
5) CAS idea to post a blurb about the meetings on the CAS website
6) Other issues, concerns

I have attached the dialogue agenda (American version) for reference along with Jim's summaries of future collaboration ideas from the sessions.

I know a few people can't make it but I would be happy to follow up with you individually over the phone or email.

I look forward to talking to the group soon.

Ben has asked me to contact you to schedule a time for the follow up call. We need to do this early next week, as there was not a time

that worked well for everyone this week. Please send me your availability for a one hour Zoom meeting between 9AM - 6PM ET, Monday - Wednesday next week.

Thank you and best wishes,

Hope Hare

Immunity topics plus Gao for 3rd China U.S. Dialogue v2.docx

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

3rd U.S.-China Virtual Dialogue Conference Call

COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

Questions:

Immune Response and Immunotherapy

- Use of antibody assays in diagnosis of acute disease and as an indicator of protection (Le Duc)
  - How is immune response being measured?
  - Was there standardization of testing tools?
- **What is the overall situation of serologic investigation in the US? (Fineberg)**
- What can be said about the characterization of the (Perlman)
  - Innate immune responses?
  - humoral immune response?
  - cellular immune response?
- What is China's experience in using immune plasma or other antibody-based therapies for COVID-19 patients and for prevention of infection? (Hamburg)
  - Is the use of immune plasma effective?
  - Have there been any complications?
- What has been China's experience with human monoclonal antibodies for treatment and prevention? (Hamburg)
  - Do a majority of the monoclonal antibodies isolated from patient B cells produce neutralizing antibodies?
- What immunopathologies are evident in the patients with COVID-19? (Relman)
  - Are there any biomarkers in patients who develop systemic inflammation?
  - What is the most effective treatment for patients who develop a cytokine storm?

Immunity

- After recovery, what types of antiviral immune responses are present? (Saif)
  - Do these immune responses protect from re-infection?
    - What is known about the durability of neutralizing antibody and longevity of protective immunity?

  Did recovery from SARS provide any protection from infection with SARS-CoV-2?
- **Progress in the development of vaccine in the U.S. especially mRNA vaccine? (Baric)**

Reactivation or Reinfection of Recovered Patients/Fall resurgence

- Has reactivation of latent virus or re-infection been seen among survivors? (Shi)
- Is reactivation/reinfection a concern with respect to a fall resurgence?
- What steps should be taken in anticipation of a fall resurgence in transmission? (Fineberg)

- **What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the U.S.? (Fineberg)**

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

Greetings,

I have attached the list of Chinese participants for the meeting tomorrow (that I just received). There will be fewer people on their side this time (at our request). **Please let me know if you are not planning to participate.**

I have also attached the **American version** of the agenda / list of questions. Recall that their version lists Harvey Fineberg and Ralph Baric as discussants to answer Dr. Gao's questions but not the other names.

FYI the Zoom link for the meeting is:
https://nasem.zoom.us/j/95921551654?pwd= **552.136**

Please let me know if you have any questions or concerns. Thanks again for taking the time to participate in these meetings.

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS

without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: U.S. China Gene Editing Technologies to Detect and Respond to Viral Pathogens - workshop - July 14 and July 16

Greetings,

I wanted to let you all know that as a follow on to our bio dialogue discussions NASEM is holding a small invitation only virtual workshop on ***Opportunities and Best Practices for Using Gene Editing Technologies to Detect and Respond to Viral Pathogens***. The virtual workshop will take place over Zoom on the evenings on **Tuesday, July 14 and Thursday, July 16 for U.S. participants (6-8 PM U.S. PT / 9-11 PM U.S. ET on both evenings)** and the mornings of Wednesday July 15 and Friday July 17 for Chinese participants (9-11 AM Beijing time)**.**

The workshop will explore the use of genome editing technologies, such as those based on CRISPR-Cas systems, to understand and combat viral pathogens. Issues to be discussed include the use of genome editing as a research tool to better understand the basic biology of viral infection and interactions with the immune system; the development of rapid CRISPR-based diagnostic systems to detect viral pathogens; and the potential to use genome editing as an innovative anti-viral strategy as well as best practices for biosafety and biosecurity. Diane Griffin and George Gao will co-chair and Nancy Connell is organizing with help from Katie Bowman, Fran Sharples and Hui Sun from CAS. We expect that the workshop will include approximately 6 or 7 invited speakers with about 30 total participants split between the U.S. and China. The preliminary agenda is below. The first day will focus on the development of CRISPR-based diagnostic systems to detect viral pathogens such as SARS-CoV2. The second day will focus on the potential to use genome editing as an innovative anti-viral strategy, as well as best practices for biosafety and biosecurity.

We hope that you can participate in some or all of the workshop. If you plan to participate please RSVP, and we will send the Zoom link to you before the call.

Happy to answer any questions that you have. Hope you have a great July 4th.

PS as we discussed at the end of the 3rd bio dialogue Zoom meeting last month we plan to hold another bio dialogue meeting in August. I will be back in touch to start planning that meeting after the gene editing workshop.

Kind regards,

Ben

Virtual Workshop on Opportunities and Best Practices for Using Gene Editing Technologies to Detect and Respond to Viral Pathogens
Agenda

Day 1: **Evening of July 14 in US (Tuesday) and Morning of July 15 in Beijing (Wednesday)**

- Welcome
  - US welcome and focus of the 2 sessions and how they extend the topics of the 3 bio dialogue meetings held in May/June *[5min]* – **Diane Griffin**, NASEM
  - China welcome *[5 min]* – **George Gao**, China CDC

- Opening Presentation: Introduction to how CRISPR-based technologies can be applied to diagnosis and treatment of disease *[10 min]*
  Nancy Connell, Johns Hopkins University

- Detecting Viral Pathogens *[75 min] – 3 presentations x 15 min each followed by panel discussion*
  Session moderator: **David Walt**, Harvard University
  - **Feng Zhang** [invited], Massachusetts Institute of Technology*: Development of CRISPR/Cas-based systems to detect viral pathogens)*
  - **Chunbo Lou** [invited]**,** Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences: *Paired Design of dCas9 as a Systematic Platform for the Detection of Featured Nucleic Acid Sequences in Pathogenic Strains*
  - **Charles Chiu** [invited]*,* University of California San Francisco: *Detection of SARS-CoV-2 using CRISPR/Cas-based systems)*
  - Moderated Discussion *[30 min]*

- Looking ahead to session 2 – **Nancy Connell**, Johns Hopkins University *[5 min]*
- Adjourn until second session

Day 2: **Evening of July 16 in US (Thursday) and Morning of July 17 in Beijing (Friday)**

- Welcome – **Nancy Connell**, Johns Hopkins University [*5min]*

- Responding to viral pathogens [60 min] - *3 presentations x 15 min each followed by panel discussion.*
  Session moderator: **Nancy Connell**, Johns Hopkins University
  - **Deyin Guo** [invited], School of Medicine (Shenzhen), Sun Yat-sen University: *CRISPR-Cas Targeting of Host Genes as an Antiviral Strategy*
  - **Xin Zhao** [invited]**,** Institute of Microbiology, Chinese Academy of Sciences: *Receptor hunting of Enterovirus B by CRISPR screening*
  - **Stanley Qi** [invited, recommended colleague]*,* Stanford University: *Development of CRISPR as an Antiviral Strategy to Combat SARS-CoV-2 and Influenza")*
  - Moderated Discussion *[30 min]*

- Capturing the opportunities through responsible development *[30 min]*
  - **Weiwen Zhang** [invited], Tianjin University: The importance of promoting responsible development around technologies such as gene editing, including following good biosafety/biosecurity practices) [15 min]
  - Discussion among all participants *[20 min]*

- Thanks to all speakers and participants and adjourn virtual workshop

Benjamin Rusek

Dear colleagues,

This is to invite you to submit manuscripts to a (very) special issue of PATHOGENS (IF 3.018, ISSN 2076-0817) [Diagnostics and Surveillance of Arboviral Diseases]. This special number will be edited by Prof. José Mauro Peralta from Federal University of Rio de Janeiro and Pedro Fernando Vasconcelos. In the attached files you can find additional information. The deadline will be in April 2021, but we think that the issue can be complete before, perhaps by December/2020 or January/2021. I hope you can contribute. All the best,

José Mauro Peralta (peralta@micro.ufrj.br)
Pedro Fernando Vasconcelos (pedrovasconcelos@iec.gov.br); (pedrofc.vasconcelos@gmail.com)

Date: Mon, Jul 20, 2020 at 5:19 AM
Subject: [Pathogens] (IF 3.018, ISSN 2076-0817) [Diagnostics and Surveillance of Arboviral Diseases] Website is Ready
To: Jose Mauro Peralta <peralta@micro.ufrj.br>, <pedrofcvasconcelos@gmail.com>
Cc: <pathogens@mdpi.com>

Dear Colleagues,

Thank you for your summary. The website of this special issue is ready now. Please check following link to see if any modifications needed:
https://www.mdpi.com/journal/pathogens/special_issues/arboviral_diseases

At this point, I would like to explain more details about the Special Issue:
1) Regarding the number of published papers

We expect to publish around 10 papers in this Special Issue; however, we do not have a limit for the number of papers, but encourage authors to publish high-quality papers in the Special Issue.

As guest editor, we hope you could help to invite some colleagues and experts in this field to contribute from your side. At the same time, we will also prepare a regular call for paper list, and once it is ready, we will ask you to check it. After receiving your approval, we will organize public call for papers from our official account.

For guest editor, you could publish one review paper and one article paper free of charge. For the feature papers invited by you, we could give a special discount (30-50%). Meanwhile, to attract more scholars with high reputation to publish with us, the editorial office would like to waive the charges of 3 papers invited by you. However, please send us the author list in advance as the editorial office needs to approve it before granting the waivers.

2) Promotion
I suggest promoting this Special Issue within your scientific network and reaching out to your collaborators to ask for submissions.

Enclosed are the banner and flyer we prepared for issue promotions, which you can publicize via social media, such as through Twitter and LinkedIn; we also encourage you to add the Special Issue as a project to your institute homepage or ResearchGate homepage.

I would be pleased to discuss more if you have any plans or suggestions for attractive more submissions for our special issue.

Hope we could have an enjoyable cooperation.

Best regards,

We look forward to hearing from you.

Best regards,
Mejoe Wang

Deadline for manuscript submissions:
30 April 2021

Message from the Guest Editors

Dear Colleagues

Arboviruses are a diverse group of viruses that are transmitted by bites of hematophagous insects to humans, many of which can cause diseases associated with significant human morbidity and mortality worldwide, while some are apparently restricted to certain geographic areas.

In this Special Issue, we invite the arboviral diseases community to submit research articles, reviews, or short communications highlighting critical advancements in our understanding of diagnostic approaches and surveillance of arboviruses. The development of new assays that can discriminate between different arboviral infections is of particular interest. Timely and accurate diagnosis is crucial for patient management, prevention of unnecessary therapies, rapid adoption of vector control measures, and collection of epidemiological data. Finally, considering the importance and global impact of arboviruses as public health threats and the emergence/re-emergence of such viruses we look forward to your submissions.

pathogens

IMPACT FACTOR 3.018

an Open Access Journal by MDPI

Message from the Editor-in-Chief

The worldwide impact of infectious disease is incalculable. The consequences for human health in terms of morbidity and mortality are obvious and vast but, when infections of animals and plants are also taken into account, it is hard to imagine any other disease that has such a significant impact on our lives—on healthcare systems, on agriculture and on world economics. *Pathogens* is proud to continue to serve the international community by publishing high quality studies that further our understanding of infection and have meaningful consequences for disease intervention.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.
High Visibility: Indexed in the Science Citation Index Expanded (SCIE) - Web of Science, BIOSIS Previews and Scopus. Ctations available in PubMed, full-text archived in PubMed Central.
CiteScore 2019 (Scopus): **3.1**, which equals rank 138/283 (Q2) in the 'Infectious Diseases' category, rank 26/45 (Q3) in 'General Immunology and Microbiology' and rank 61/115 (Q3) in 'Microbiology (medical).'

Subject: CREID Network Working Groups

Hello working group members,

I hope this finds you well. You have all been invited to the CREID Coordinating Center team in Microsoft Teams, as well as the CREID Working Groups channel within the team. This will be used as an information sharing and collaboration space for the CREID Network Working Groups. Please follow the link to access the team and channel, and let me know if you have any issues. Feel free to reach out to myself and Nefer Batsuli (nbatsuli@rti.org) with any questions or concerns.

Thank you,

Aaron

Subject: CREID Network Working Group materials

Dear CREID Network Working Group members,

We are looking forward to the NIAID-hosted CREID Network Kickoff meeting next week, September 16-18, 2020. The opportunity to officially move forward on establishing the CREID Network is exciting. My apologies for the long email!

We will be convening four of the CREID Working Groups for the first time next week on Days 2 and 3 of the Kickoff meeting. We will be convening the 5th Working Group, Capacity Building and Sustainability in December. At the Kickoff meeting, these Working Groups will meet:

- Data Capture and Harmonization
- Laboratory Assay Oversight and Quality
- Biorepository Oversight and Quality
- Outbreak Research Response

The Working Group facilitators from the Coordinating Center and DMID have crafted an agenda for the two days. These meetings will be an opportunity to get to know each other and define the purpose and goals of each Working Group.

Below is information we would like you to review ahead of the meeting to ensure a robust discussion.

Homework to prepare for the CREID Working Group meetings:

1. **Using Microsoft Teams**
   a. We will be collaborating and sharing materials via Microsoft Teams (until the CREID portal is established) and you have each been added to the CREID Network Working Groups Teams channel.
   b. Please make sure you can access the Teams site. If you have any issues, please contact Aaron Macoubray at amacoubray@rti.org to problem solve access issues.

2. **Please review the Working Group materials on the Working Group Teams channel:**
   a. In the Governance, Administration, and Membership folder:

      i. CREID Network Governance Guidelines
      ii. Membership lists for all Working Groups
      iii. NIAID Kickoff meeting agenda. *Please do not share this agenda as there are Zoom links for the closed meetings on Days 2 and 3.*

   b. In the WG specific folders

      i. Agenda for your Working Group
      ii. Draft charter for your Working Group

3. **We need a Research Center co-facilitator for each Working Group**
   a. Each Working Group is co-facilitated by DMID, the Coordinating Center, and a Research Center representative. *Please email me by September 15 if you are interested in self-nominating yourself to serve in this role.*
   b. We will have a voting process to select the Research Center facilitator following the first Working Group meeting on Day 2 of the Kickoff meeting.
   c. Role of Facilitators: The WG facilitators will be responsible for planning and leading meetings. During each meeting facilitators will guide the group through the agenda, catalyzing group discussion, and moving the group through the decision-making process. Facilitators will communicate with the CC and DMID about duplication of activities identified during the course of the WG and should communicate with other WG facilitator(s) to invite additional technical inputs as needed from other groups.

Please note that the primary representatives for the Research Centers on each Working Group will be unmuted during the meetings. All other secondary representatives, participants, and observers in the meetings will be muted. If others from your Research Center want to provide inputs during the meeting, please have them channel their inputs through you as the primary representative.

You will be receiving additional information about the Kickoff meeting from the DMID team in the next few days.

Have a good week and please let me know if you have any questions.

Subject: Virtual U.S. China dialogue meeting October 13 and 14

Greetings,

I hope you all had a good summer and are staying safe and healthy. The Chinese Academy of Sciences has agreed to hold another (4th) virtual bio dialogue meeting with NASEM on **1) vaccine development and delivery** and **2) immunity, testing and diagnostics.** The agreed topics for the session are below. **We have reserved Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT**) to discuss the topics on the agenda.

We hope you are able to participate. Please let me know if you are available and if so save the dates and times on your calendar. We will get back to you with more information and a detailed agenda for the sessions soon.

Kind regards,

Ben

Benjamin Rusek

***

Vaccine development and delivery

Human

1) **Current status of CoVID-19 vaccine development in China and the U.S.**
2) **Chinse vaccination of military personnel and other Chinese populations**
3) **Vaccination of pediatric populations**
4) **Active surveillance strategies for monitoring adverse events observed after vaccination (as well as immunogenicity)**
5) **Adapting current vaccine platforms to novel mass vax strategies and other mass vaccination strategic issues**
6) **Progress on a universal influenza vaccines**
7) **Vaccine for enterovirus D68**

Animal

1) **Status of corona virus vaccination for animals - kinds of vaccine, efficacy, complications, etc**
2) **ASF in China and ASF vaccine progress**
3) **New swine coronavirus**
4) **Vaccination strategy for H5N1 avian influenza and domestic poultry**

Immunity, testing and diagnostics

1) **Correlates of immunity including the possibility of background immunity from circulating "common cold" coronaviruses**
2) **Chinese diagnostic testing strategies for testing large populations quickly**
3) **Antibody and antibody testing topics, importance of T-cell responses**
4) **Long-term sequela following COVID-19 infection—lung function, neurologic issues, others**

Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Happy to take part and look forward to the discussions. I know that the WHO team are planning their deeper dive into the animal reservoir question for COVID-19 origins, and it might be good to ask a couple of questions on animal infections that are not controversial, e.g.:

1. We have heard that there are policy measures under review to significantly reduce the wildlife trade, including closing down wildlife farms. Are there plans to test animals before they are killed, e.g. civets, raccoon dogs, bamboo rats, to see if they have had exposure to SARS-CoV-2?

2. We realize that the bat coronaviruses with the closest relationship to SARS-CoV-2 are not the parental strain, but more like fairly distant relatives. Are there plans to do more bat sampling, and try to identify viruses that are closer to SARS-CoV-2 than those nearest viruses (RaTG13 and RmYN02)?

Cheers,

Peter

Subject: Virtual U.S. China dialogue meeting October 13 and 14

Greetings,

I hope you all had a good summer and are staying safe and healthy. The Chinese Academy of Sciences has agreed to hold another (4th) virtual bio dialogue meeting with NASEM on **1) vaccine development and delivery** and **2) immunity, testing and diagnostics.** The agreed topics for the session are below. **We have reserved Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT**) to discuss the topics on the agenda.

We hope you are able to participate. Please let me know if you are available and if so save the dates and times on your calendar. We will get back to you with more information and a detailed agenda for the sessions soon.

Kind regards,

Ben

Benjamin Rusek
The U.S. National Academy of Sciences
1-202-334-3975

***

Vaccine development and delivery

Human

1) **Current status of CoVID-19 vaccine development in China and the U.S.**
2) **Chinse vaccination of military personnel and other Chinese populations**
3) **Vaccination of pediatric populations**
4) **Active surveillance strategies for monitoring adverse events observed after vaccination (as well as immunogenicity)**
5) **Adapting current vaccine platforms to novel mass vax strategies and other mass vaccination strategic issues**
6) **Progress on a universal influenza vaccines**
7) **Vaccine for enterovirus D68**

Animal

1) **Status of corona virus vaccination for animals - kinds of vaccine, efficacy, complications, etc**
2) **ASF in China and ASF vaccine progress**
3) **New swine coronavirus**
4) **Vaccination strategy for H5N1 avian influenza and domestic poultry**

Immunity, testing and diagnostics

1) **Correlates of immunity including the possibility of background immunity from circulating "common cold" coronaviruses**
2) **Chinese diagnostic testing strategies for testing large populations quickly**
3) **Antibody and antibody testing topics, importance of T-cell responses**
4) **Long-term sequela following COVID-19 infection—lung function, neurologic issues, others**

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

Subject: RE: Virtual U.S. China dialogue meeting October 13 and 14 - agenda with zoom links
October 2020 U.S.-China Bio Dialogue v3.docx

Greetings,

We are looking forward to the two virtual bio dialogue sessions set to take place on Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT) next week. Like in previous sessions we expect that the Chinese expert participants will lead the discussion on the majority of the topics and that the format will be more of a discussion among the participants instead of a series of formal presentations. I have attached an agenda that includes the Zoom connection links for both days along with the U.S. participant list. If I get the Chinese participant list before the session I will send that out to you all.

Feel free to respond to this email with any thoughts, points of emphasis or issues that you would like to discuss among the U.S. group before the sessions. Also let me know if you have any questions or concerns.

Kind regards,

Ben

October Bio Dialogue Virtual Sessions

Session 1: Tuesday, October 13, 9-11 PM ET / 6-8 PM PT in U.S.
Wednesday, October 14, 9-11 AM in China

Session 1 Meeting Link: [HYPERLINK "https://nasem.zoom.us/j/92754903815?pwd= **552.136**
Password **552.136**

Welcome and Introduction — Diane Griffin and George Gao

Overview of current status of CoVID-19 vaccine development in China — George Gao
Overview of current status of CoVID-19 vaccine development in the U.S. — Nancy Connell

Topic 1: Human vaccine development and delivery
Moderator: Diane Griffin

- Vaccination programs in China: How are vaccine programs for particular subpopulations being implemented?
  - Pediatric populations
  - First responders
  - Military personnel
  - Elderly population

- Post-vaccination surveillance and monitoring strategies
  - Immunogenicity
  - Monitoring Immunity
  - Vaccine-associated adverse events

- Adapting current vaccine platforms to novel mass vaccination: strategies and issues

- Progress on other vaccines
  - Universal influenza vaccines
  - Enterovirus D68

Topic 2: Animal vaccine development and delivery
Moderator: Linda Saif

- Status of corona virus vaccination for animals
  - Vaccine types
  - Efficacy
  - Complications and other issues?

- African Swine Fever: vaccine progress in China

- New "swine flu" (G4) in China

- H5N1 avian influenza and domestic poultry

Session 2: Wednesday October 14, 9-11 PM ET / 6-8 PM PT in U.S.
Thursday, October 15, 9-11 AM in China

Session 2 Meeting Link: [HYPERLINK "https://nasem.zoom.us/j/98420889232?pwd=552.136
Password: 552.136

Topic 1: Immunity
Moderator: Diane Griffin

- Correlates of immunity – biomarkers predicting susceptibility or progression to severe disease
- Background immunity from circulating "common cold" coronaviruses
- How long will immunity last?

Topic 2: Testing and diagnostics
Moderator: Peggy Hamburg

- Chinese testing strategies for rapid, frequent population-level testing
- Antibody testing
- Importance of T-cell responses
- Long-term sequelae following COVID-19 infection—lung function, neurologic issues, other issues

NASEM Participants

Dr. Ralph Baric, PhD, is a Professor in the Department of Epidemiology at the University of North Carolina's School of Public Health.

Dr. Nancy Connell, PhD, is a Professor at the Johns Hopkins Center for Health Security in Baltimore, MD

Dr. Peter Daszak, PhD, is currently president of EcoHealth Alliance, a nonprofit non-governmental organization that supports various programs on global health.

Dr. Victor Dzau, is the current President of the U.S. National Academy of Medicine in Washington, D.C.

Dr. David R. Franz, DVM, PhD, is currently retired, but served in the U.S. Army Medical Research and Materiel Command for 23 of 27 years on active duty and as Commander of the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID).

Dr. Harvey Fineberg, MD, is currently president of the Gordon and Betty Moore Foundation, immediately prior to which he was President of the Institute of Medicine (now the National Academy of Medicine).

Dr. Diane Griffin, PhD, is University Distinguished Service Professor and Alfred and Jill Sommer Chair of the W. Harry Feinstone Department of Molecular Microbiology and Immunology at Johns Hopkins Bloomberg School of Public Health and the current vice-president of the U.S. National Academy of Sciences.

Dr. Margaret (Peggy) Hamburg, MD, is an American physician and public health administrator. She served as the 21st Commissioner of the U.S. Food and Drug Administration from May 2009 to April 2015 and is currently Foreign Secretary for the U.S. National Academy of Medicine.

Ben - ok, thanks. I think that last night's session went well - clearly value in having these sessions relatively small and with people who now "know" each other.

See you tonight.

No major updates before we get started.

FYI Bu Zhigao from CAAS will not make it tonight and since Zhiming can't make the scheduled planning session next week we need to reschedule. I let CAS know that we would like at least Zhiming, George Gao, Zhengli Shi and maybe Mifang Liang as well as others who value and are interested in the dialogue and possible future topics to join the now to be scheduled planning call.

Kind regards,

Ben

Greetings,

I have attached what should be the final agenda for the U.S. China dialogue meeting sessions on Tuesday, October 13 and Wednesday October 14. It includes the Chinese participant list at the end. Links to join the Zooms are also below.

Looking forward to seeing/talking to you all on Tuesday and Wednesday evening.

Kind regards,

Ben

Importance: High

Greetings,

We are looking forward to the two virtual bio dialogue sessions set to take place on Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT) next week. Like in previous sessions we expect that the Chinese expert participants will lead the discussion on the majority of the topics and that the format will be more of a discussion among the participants instead of a series of formal presentations. I have attached an agenda that includes the Zoom connection links for both days along with the U.S. participant list. If I get the Chinese participant list before the session I will send that out to you all.

Feel free to respond to this email with any thoughts, points of emphasis or issues that you would like to discuss among the U.S. group before the sessions. Also let me know if you have any questions or concerns.

Kind regards,

Ben

Subject: Virtual U.S. China dialogue meeting October 13 and 14

Importance: High

Greetings,

I hope you all had a good summer and are staying safe and healthy. The Chinese Academy of Sciences has agreed to hold another (4th) virtual bio dialogue meeting with NASEM on **1) vaccine development and delivery** and **2) immunity, testing and diagnostics.** The agreed topics for the session are below. **We have reserved Tuesday, October 13 (9-11 PM ET / 6-8 PM PT) and Wednesday, October 14 (9-11 PM ET / 6-8 PM PT**) to discuss the topics on the agenda.

We hope you are able to participate. Please let me know if you are available and if so save the dates and times on your calendar. We will get back to you with more information and a detailed agenda for the sessions soon.

Kind regards,

Ben

Benjamin Rusek
The U.S. National Academy of Sciences
1-202-334-3975

***

Vaccine development and delivery

Human

1) **Current status of CoVID-19 vaccine development in China and the U.S.**
2) **Chinse vaccination of military personnel and other Chinese populations**
3) **Vaccination of pediatric populations**
4) **Active surveillance strategies for monitoring adverse events observed after vaccination (as well as immunogenicity)**
5) **Adapting current vaccine platforms to novel mass vax strategies and other mass vaccination strategic issues**
6) **Progress on a universal influenza vaccines**
7) **Vaccine for enterovirus D68**

Animal

1) **Status of corona virus vaccination for animals - kinds of vaccine, efficacy, complications, etc**
2) **ASF in China and ASF vaccine progress**
3) **New swine coronavirus**
4) **Vaccination strategy for H5N1 avian influenza and domestic poultry**

Immunity, testing and diagnostics

1) **Correlates of immunity including the possibility of background immunity from circulating "common cold" coronaviruses**
2) **Chinese diagnostic testing strategies for testing large populations quickly**
3) **Antibody and antibody testing topics, importance of T-cell responses**
4) **Long-term sequela following COVID-19 infection—lung function, neurologic issues, others**

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

Benjamin Rusek
The U.S. National Academy of Sciences
1-202-334-3975

Summary of Discussions between NASEM and CAS on COVID-19, 13Oct 2020

1. CAS (George Gao) provided an overview of the COVID-19 vaccine efforts underway in China. Key points were as follows:
    a. 7 different vaccine approaches are underway (list was shared)
    b. Range from classic inactivated vaccines to live, attenuated candidates
    c. Vaccine underdeveloped based on modified "cold adapted" influenza vaccine as a live, attenuated vaccine for COVID-19 following nasal administration.
    d. Several candidates are in Phase 3 clinical trials (Brazil, Argentina and UAE mentioned, but perhaps other locations as well)
2. Human monoclonal antibody candidates are being developed for clinical use
    a. Multiple candidates are under study
    b. Collaborations with Lilly to create a 2 monoclonal antibody cocktail was mentioned. This product is in clinical trials (now on hold) in the USA.
    c. Several questions were raised:
        i. Protective efficacy of candidates
        ii. Impact on/activity in lungs
        iii. Duration of maby protection
        iv. Possibility of antibody dependent enhancement
        v. Possible impact on vaccination
3. A general discussion of the value and challenges associated with the creation of a universal coronavirus vaccine similar to ongoing discussions about a possible universal vaccine for influenza.
    a. Comment (Stanley Perlman) about the possibility of including T cell epitopes as a component of a universal coronavirus vaccine given demonstrated cross-reactivity among recognized coronaviruses.
4. NAS (Nancy Connell) shared an overview of the USA "Warp Speed" vaccine development efforts underway.
    a. 4 vaccine platforms are being developed with 2 candidates supported in each platform technology (list shared)
    b. Most candidates will require a prime/boost administration
    c. mRNA candidates will require an ultralow temperature cold chain that will be demanding to implement
    d. Many are in Phase 3 clinical trials with the mRNA candidates most advanced
    e. Selection of technologies was based in part on ease of production
    f. Results of clinical studies may be available incrementally with the mRNA candidates farthest along; results known perhaps by Nov-Dec 2020; others at roughly 2 month intervals with the replicating live vaccine results available in late 2021.
    g. Vaccine production is underway concurrent with clinical trials, with approximately 100 M doses of mRNA vaccine available around the end of 2020. Manufacturing costs provided by USG (BARDA).
5. Discussion of challenges associated with USA vaccine development and roll-out strategy.
    a. Key questions: is the candidate safe, is it effective in preventing infection/disease, and what is the duration of protection (Harvey's comments)

b. How to manage multiple "successful" candidates with differing vaccination schedules and other requirements
c. How to detect adverse events
d. If EUA is granted early, those receiving placebo with receive the vaccine, leading to challenges in interpretation late onset adverse events (Ralph's comment)
e. For all candidate vaccines (USA and China), what is the strategy for select segments of the population—children, elderly, high risk occupations, others—still being addressed in China; Just released NASEM report on equitable distribution of vaccine discussed by Nancy and slide of 4 tiers of those to be vaccinated shared.

6. Review of vaccination efforts for animal diseases caused by coronaviruses (Linda Saif)
    a. Linda gave a comprehensive review of several vaccine development efforts, especially those associated with swine (list provided)
    b. Challenges encountered in producing protective vaccines for piglets
    c. Difficulties in generating mucosal immunity/IgA
7. Discussion of lessons learned from animal coronaviruses and how they might foretell problems with COVID-19 vaccination
    a. Relevance of past infection versus naïve populations on response to vaccines
    b. Mention of evidence of naturally occurring recombination of coronaviruses infecting swine in Europe.

NIH SARS-CoV-2 Antiviral Therapeutics Summit Agenda _27 Oct 2020.pdf

Colleagues,

Thank you for agreeing to participate in our NIH SARS-CoV-2 Antiviral Therapeutics Summit, to be held next Friday 6th November. We look forward to getting together with each panel group over the next two days, to discuss Q&A topics and enable the moderators to wrap up their introductory slides for each session (due at the end of the week).

We're excited to share that the **web site** for the summit is now live : https://www.nih.gov/antiviralcov2summit
Attached are two digital posters (PDF and JPG) and the agenda. Note that registration is not required, but a calendar invite can be downloaded from the summit web site.

Please forward and share information on the event with your colleagues. We recognize that the meeting has been organized at a rapid pace and are making an effort to ensure as many people are aware of the meeting as possible. The webcast will also be recorded and available for playback at videocast.nih.gov .

While I have your attention, please do pass along your **photo** and check your **affiliation** and **bio** on the web site 'Hosts & Presenters' section of the site (if you have not already). The organizing group will reach out again as we strive to fill out this page.

On behalf of my fellow organizers:

James Anderson, NIH OD
Anthony Conley, NIAID
Mindy Davis, NIAID
Kyle Brimacombe, NCATS
Stephanie Ford-Scheimer, NCATS
Abigail Grossman, NCATS

NIH VIRTUAL SARS-COV-2 ANTIVIRAL THERAPEUTICS SUMMIT

An overview of the current state of direct anti-coronaviral targets and therapeutics, available tools, and challenges

FRIDAY NOVEMBER 6, 2020

Session Topics

Viral Replication Machinery

Proteases (Viral and Host)

Emerging Targets and Modalities

Preclinical Tools

Lessons from Other Viruses and Preparation for the Future

WWW.NIH.GOV/ANTIVIRALCOV2SUMMIT

NIH National Institutes of Health

Sponsored by
National Institute of Allergy and Infectious Diseases

NIH SARS-CoV-2 Antiviral Therapeutics Summit

Date: November 6, 2020 **Virtual Meeting**

Purpose: This summit will provide an overview of the current state of direct anti-coronaviral targets and therapeutics, available tools and challenges.

Agenda

11:00 AM – 11:20 AM **Introductory Comments**

- Dr. Francis Collins – Director, National Institutes of Health
- Dr. Anthony Fauci – Director, National Institute of Allergy and Infectious Diseases
- Dr. Christopher Austin – Director, National Center for Advancing Translational Sciences

11:20 AM – 11:40 AM **Overview of the Virus and Therapeutics Approaches**

- Dr. Mark Dennison, Vanderbilt University

11:40 AM – 12:15 PM **Viral Replication Machinery. Moderator: Dr. Tomas Cihlar, Gilead Sciences**

- Dr. Elizabeth Campbell, Rockefeller University
- Dr. Matthias Götte, University of Alberta
- Dr. George Painter, Emory University
- Dr. Michael Sofia, Arbutus Biopharma, Inc.
- Dr. Sandra Weller, University of Connecticut

12:15 PM – 12:25 PM **Highlight on Status of Vaccines and Neutralizing Antibodies to Prevent and Treat SARS-CoV-2 Infection**

- Dr. Kizzmekia Corbett, Vaccine Research Center, National Institute of Allergy and Infectious Diseases

12:25 PM – 1:00 PM **Proteases (Viral and Host). Moderator: Dr. Annaliesa Anderson, Pfizer**

- LTC Charlotte Lanteri, Walter Reed Army Institute of Research
- Dr. Andrew Mesecar, Purdue University
- Dr. Jen Nwankwo, 1910 Genetics
- Dr. Celia Schiffer, UMass Medical School

1:00 PM – 1:35 PM **Emerging Targets, Emerging Modalities. Moderator: Dr. Kara Carter, Evotec**

- Dr. David Baker, University of Washington
- Dr. Lillian Chiang, Evrys Bio
- Dr. Matthew Disney, Scripps Research
- Dr. Kumar Saikatendu, Takeda Pharmaceuticals
- Dr. Marla Weetall, PTC Therapeutics, Inc.

1:35 PM – 2:10 PM **Preclinical Tools. Moderator: Dr. Pei-Yong Shi, University of Texas Medical Branch**

- Dr. Sara Cherry, University of Pennsylvania
- Dr. Emmie de Wit, NIAID/Rocky Mountain Laboratories
- Dr. Jules O'Rear, Food and Drug Administration
- Dr. Timothy Sheahan, University of North Carolina
- Dr. Hugh Smyth, University of Texas at Austin

2:10 PM – 2:45 PM **Lessons from Other Viruses and Preparation for the Future. Moderator: Dr. Daria Hazuda, Merck**

- Dr. Jay Bradner, Novartis
- Dr. Courtney Fletcher, University of Nebraska Medical Center
- Dr. Frederick Hayden, University of Virginia
- Dr. Hilary Marston, National Institute of Allergy and Infectious Diseases

2:45 PM – 3:05 PM **Summary of Discussions and Perspectives on the Challenges Ahead**

- Dr. Richard Whitley, University of Alabama at Birmingham

3:05 PM – 3:25 PM **Closing Statement**

- Dr. Francis Collins, Director, National Institutes of Health

Subject: COVID-19 assays review
State of the Art paper outline.docx

Dear colleagues,

Similar to what was done recently with the WHO COVID-19 models working group, we would like to publish a short review about the state-of-the-art regarding COVID-19 assays. Based on your expertise and the data you have generated and presented to the WHO assays group, we would like to ask you to contribute to this paper. As you can see in the attached outline, we have suggested subgroups for different topics. Please take this only as a suggestion and feel free to contribute to other parts of the review as you deem fit. Also, feel free to suggest additional authors as needed. Florian Krammer has graciously agreed to help coordinate and submit this to a high quality journal. We would like to have a draft by the end of the year if possible. Please confirm that you wish to participate in this endeavor.

Thank you all in advance for your support.

Best regards
Bill Dowling ,
Co-Chair WHO COVID-19 assays working group

Introduction
This will include a discussion of assay use cases/purposes

ELISA and Spike proteins (Natalie Thornburg, Barney Graham, Jason McClellan, Marion Koopmans, Mary Matheson)

Multiplex assays (David Goldblatt)

Viral Neutralization (David Montefiori, Lin-fa Wang, Pei-Yong Shi, Sylvie van der Werf, William Lee, Miao Xu)

Antibody function (Galit Alter)

T-Cells (Alex Sette, Shane Crotty, Julie McElrath)

Duration of immunity (Florian Krammer, Katie Doors, Anita Iyer, Paul Bieniasz)

Performance evaluations (Jilian Sacks, Douglas Lowy)

Assay harmonization/ International Standards Mark Page

Correlates of Protection

Conclusions and Lessons Learned

Subject: COVID-19 assays review

Dear colleagues,

Similar to what was done recently with the WHO COVID-19 models working group, we would like to publish a short review about the state-of-the-art regarding COVID-19 assays. Based on your expertise and the data you have generated and presented to the WHO assays group, we would like to ask you to contribute to this paper. As you can see in the attached outline, we have suggested subgroups for different topics. Please take this only as a suggestion and feel free to contribute to other parts of the review as you deem fit. Also, feel free to suggest additional authors as needed. Florian Krammer has graciously agreed to help coordinate and submit this to a high quality journal. We would like to have a draft by the end of the year if possible. Please confirm that you wish to participate in this endeavor.

Thank you all in advance for your support.

Best regards
Bill Dowling ,
Co-Chair WHO COVID-19 assays working group

Subject: WHO working group on COVID-19 assays

Dear All,

Please find below the agenda for our group call on Wednesday December 2, 2020 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays

1. Jilian Sacks, FIND – Assessment of serologic assays
2. Paul Bieniasz, Rockefeller – Coronavirus neutralizing antibodies before and after SARS-CoV-2 infection

Subject: Email to Bob Tesh

Dear Pei Yong,

Hope this email finds you well!

I recently send an email to Bob (at rtesh@utmb.edu) with no reply so far. Can you confirm this is the correct email address? If he is around, can you ask him to check to see whether he has received my email?

I am not sure whether you are in the loop for Ping's submission to Scientific Reports. Both she and I have tried so many times with no reply at all from the editorial office. This $-making journals are cray! We have now written to the EiC and hope we can get some progress soon!

Cheers,

LF

Subject: Invitation as a guest speaker for the EID retreat 2020

Dear Pei Yong,

Happy 2020!

We are planning a BIG retreat for EID on 19-20 March 2020, first time to have a 2-day retreat.

We are going to invite all past PIs (Duane, Veronika, etc) and will officially farewell Mariano.

We thought it will be a good idea to give Mariano a surprise by inviting you as a guest speaker.

Duke-NUS will of course cover the return business class airfare and all associated costs.

Do let me know if you are available and able to do that.

Thanks in advance.

Cheers,

LF

Director

Programme in Emerging Infectious Diseases

Duke-NUS Medical School (Duke-NUS), Singapore's only graduate-entry medical school was established as a landmark collaboration between two world-ranking institutions of higher education – Duke University and National University of Singapore. Duke-NUS provides innovative education and impactful research to enhance the practice of medicine in Singapore and beyond. Through its strategic partnership with Singapore Health Services (SingHealth) which includes Singapore General Hospital, the School is able to leverage its joint capabilities and infrastructure to develop outstanding clinical education programmes and cutting edge research collaborations that translate fundamental science into better health. Duke-NUS and its partners have created an academically-based Programme in Emerging Infectious Diseases (EID) designed to serve as a national and international resource of excellence in emerging infectious diseases. The mission of the Programme faculty is to conduct high-level basic and applied research, and to train graduate students, postdoctoral fellows and clinician-scientists in the disciplines relevant to emerging infectious diseases. Duke-NUS and its partners provide state-of-the-art research facilities, including a standalone ABSL3 unit.

We are seeking an individual with exceptional scientific credentials and leadership skills to head the EID Programme. The Programme Director will provide leadership, including engagement with the broader biomedical community in Singapore and with Duke University; strategic hiring and programme development; medical school and graduate education; faculty mentoring; budgetary and space planning. The School will provide the new Programme Director with the resources to support the highest level of research.

Interested candidates should send a CV and the names of three references to: **Chair, Search Committee on Emerging Infectious Diseases, Duke-NUS Medical School, Singapore by email to: hr@duke-nus.edu.sg**

Applications will be accepted until the position is filled. We anticipate to begin interviewing candidates in early April 2020.

More information on the Programme can be found at www.duke-nus.edu.sg.

MATERIAL TRANSFER AGREEMENT

This Material Transfer Agreement ("**Agreement**") is made between The University of Texas Medical Branch at Galveston, d/b/a UTMB Health ("**UTMB**"), a health institution of The University of Texas System ("System"), an agency of the State of Texas, located at 301 University Blvd., Galveston, TX 77555-0926, and Duke-NUS Medical School, ("**Recipient"),** located at 8 College Road, Singapore 169857 ("**Recipient**").

From the laboratory of Dr. Pei-Yong Shi, ("**Provider Scientist**"), UTMB agrees to provide Recipient with certain materials for the purpose stated herein under the following conditions:

Material and Research. The Materials covered by this Agreement are as follows:
Reagents

- mNeonGreen SARS-CoV-2 reporter virus
- Nano luciferase SARS-CoV-2 reporter virus
- RFP SARS-CoV-2 reporter virus
- Other recombinant SARS-CoV-2 Viruses

("**Material**"). The Material shall be used by Recipient in research ("**Research**"), as defined in **Attachment A**, and the Research will be conducted by Recipient under the supervision of Linfa Wang PhD FTSE, ("**Recipient Scientist**"). Materials shall be shipped separately. Recipient shall provide Provider with a FedEx account number for shipping of the materials requested.

1. **Use of Material.** This Material is made available for internal research use only in laboratory animals or in vitro experiments. The Material shall not be used in humans. The Material is considered proprietary to UTMB. UTMB shall be free, in its sole discretion, to distribute the Material to others and to use it for its own purposes. Except as provided for by this Agreement, Recipient shall not distribute, transfer, or release the Material to any person or entity other than laboratory personnel under Recipient Scientist's direct supervision, unless written permission is obtained from UTMB. Recipient agrees that all of its Recipient Scientist(s) involved in the Research will have read the terms and conditions of this Agreement and abide by the terms and conditions of this Agreement.
2. **Rights.** Subject to Section 6. Intellectual Property of this Agreement, Recipient agrees that nothing herein shall be deemed to grant to Recipient or Recipient Scientist any rights under any UTMB patents or any rights to use the Material for any products or processes for any purpose other than performing the Research. Recipient will not use Material for any commercial purposes. Recipient understands that UTMB shall have no obligation to grant a license to Recipient to use Material for commercial purposes, and may grant exclusive or non-exclusive commercial licenses to others, or sell or assign all or part of the rights in the Material to any third party(ies), subject to any pre-existing rights held by others and obligations to the Federal Government.
3. **Confidentiality**. All Material and information relating to the Material that is disclosed by UTMB to Recipient shall be considered to be confidential, subject to Section 5. Publication of this Agreement. Recipient will use reasonable efforts to prevent the disclosure of UTMB's confidential information to third parties for a period of three (3) years from receipt, provided that the Recipient party's obligation shall not apply to information that:
   a) is already in the Recipient's possession at the time of disclosure;
   b) is or later becomes part of the public domain through no fault of the Recipient;
   c) is received from a third party having no obligations of confidentiality to UTMB;
   d) is independently developed by the Recipient; or
   e) is required by law or regulation to be disclosed.

In the event that information is required to be disclosed pursuant to subsection (e), Recipient shall notify the UTMB, in order to allow UTMB to assert whatever exclusions or exemptions may be available to it under such law or regulation.

4. **Publication.** Recipient will inform UTMB of Results of the Research performed in confidence, related to the Material. The Parties understand and agree that any initial Publication related to the Research performed utilizing the Material provided hereunder, shall be a Joint Publication, for which the Parties shall collaborate in good faith regarding timing and content of any such Publication. Notwithstanding the foregoing, in any such publication or presentation of Research results, Recipient agrees to acknowledge UTMB scientist as provider of the Material.
5. **Intellectual Property.** If the Research involving the Material results in an invention, Recipient Scientist will promptly disclose the invention Recipient's Patent Administrator and will notify the Patent Administrator of UTMB's role as a supplier of the Material used. Recipient, in cooperation with Scientist, will promptly supply UTMB with a copy of the disclosure, in confidence for UTMB's research and evaluation purposes only. Inventorship of any invention will be determined based on U.S. patent law. Ownership shall follow inventorship. Recipient recognizes the property rights of UTMB in the Material.
6. **Warranty.** The Material is experimental in nature and it is provided "AS IS" WITHOUT WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR SAFETY OR ANY OTHER WARRANTY, EXPRESS OR IMPLIED. UTMB MAKES NO REPRESENTATION OR WARRANTY THAT THE USE OF THE MATERIAL WILL NOT INFRINGE ANY PATENT OR OTHER PROPRIETARY RIGHT.
7. **Liability.** In no event shall UTMB be liable for any use by Recipient Scientist or Recipient of the Material or any loss, claim, damage or liability, of whatsoever kind or nature, which may arise from or in connection with Recipient's breach of this Agreement or Recipient's use, handling or storage of the Material, unless such loss, claim, damage or liability results from the negligence or willful malfeasance of UTMB, System, their Regents, officers, agents and employees.
   a) **State Entities:** To the extent authorized by the Recipient's state law, Recipient agrees to indemnify and hold harmless UTMB, System, their Regents, officers, agents and employees, from any liability, loss or damage they may suffer as a result of claims, demands, costs or judgments against them arising out of the Recipient's activities to be carried out pursuant to this Agreement and the use by Recipient of the results obtained from Research, excluding claims, loss, or damage that arise from the negligence or willful malfeasance of any Regent, officer, agent or employee of UTMB or System.
   b) **Federal Entities**: Recipient assumes the liability for any claims, damages, injury, or expenses arising from the use, storage, handling, and disposal of the Material by the Recipient, but only to the extent provided under the Federal Tort Claims Act (28 U.S.C. Chapter 171).
   c) **All other entities**: Recipient shall indemnify and hold UTMB, System, their Regents, officers, agents, and employees harmless against any and all claims, demands, damages, liabilities and costs which directly or indirectly result from, or arise in connection with, any negligent act or omission of Recipient, its agents, or employees, pertaining to its activities and obligations under this Agreement.
8. **Compliance.** Recipient will use the Material in compliance with all laws, governmental regulations and guidelines applicable to the Material. Moreover, if the Material is used in the United States, then Recipient will comply with current United States NIH guidelines.
9. **Export Control.** Recipient further agrees that if the U.S. export laws are or become applicable, it will not export any Materials received under this Agreement to any countries for which the United States government requires an export license or other supporting documentation at the time of export or transfer, unless Recipient has obtained prior written authorization from the appropriate authority responsible for such matters.

10. **Assignment.** This Agreement is not assignable, whether by operation of law or otherwise, without the prior written consent of UTMB.
11. **Publicity.** Recipient may not use the name of UTMB, System or their Regents without express written consent, subject to Section 5. Publication of this Agreement.
12. **Term and Termination.** This Agreement shall be effective as of the date of the last signature and terminate one (1) year from that date. Upon termination, Recipient will immediately destroy all the Material then in its possession.

Subject: SARS-CoV-2 Antiviral summit report available
2020_NIH_Antiviral_Summit_Report_508.pdf

Colleagues,

The SARS-CoV-2 Antiviral Summit report was completed just prior to the holiday break, was reviewed and cleared by NIH Director Dr. Collins, along with NIAID (Dr.Fauci's office) and NCATS (Dr. Austin) leadership, and underwent final formatting to ensure it is accessible ('508 compliant').

The Summit report has now been posted at the following link, and is also attached to this email:
https://www.nih.gov/research-training/medical-research-initiatives/activ/events
At the link, you can also access the agenda for the meeting, and a link to the recording of the meeting. Note that the equivalent information on the previous neutralizing antibody summit

Please circulate this report among your colleagues, and consider citing this report when publishing.

On behalf of my fellow organizers (Mindy Davis, Tony Conley, Jim Anderson, Abigail Grossman, Kyle Brimacombe, and Stephanie Ford-Scheimer), thank you again for your participation and contributions to create a very successful Summit and report. This report has already been helpful in planning to meet challenges in developing antiviral drugs. We aim to create an amended version of the report for publication at some point in the very near future.

Any questions, please let me know.

Matt

INTRODUCTION

NIH SARS-COV-2 ANTIVIRAL THERAPEUTICS SUMMIT

Presenters:
Dr. Francis Collins (NIH)
Dr. Anthony Fauci (NIAID)
Dr. Christopher Austin (NCATS)

The NIH Virtual SARS-CoV-2 Antiviral Summit was held on November 6, 2020. The virtual Summit was organized to provide an overview on the status and remaining challenges in developing antiviral therapeutics for COVID-19, including combinations of antivirals, and streamed live to allow broad public access while maintaining social distancing. Scientific experts from the public and private sectors were brought together to discuss SARS-CoV-2 targets for drug development, and the preclinical tools needed to evaluate and develop effective small molecule antivirals. The goal of the Summit was to review the current state of the science, identify unmet research needs, share insights and lessons learned from treating other infectious diseases, identify opportunities for public-private partnerships, and assist the research community in designing and developing antiviral therapeutics.

The Summit was jointly organized by NIAID, NCATS, and the NIH Office of the Director (NIH OD), and hosted by the respective Directors: Dr. Francis Collins (NIH), Dr. Anthony Fauci (NIAID), and Dr. Christopher Austin (NCATS). The meeting moderators and panelists were from academia, industry (pharma/biotech), NIH Institutes and Centers, and Federal agencies working in the COVID-19 therapeutics space.

The Summit itself was comprised of introductory remarks, an overview of the virus and therapeutic opportunities, followed by five scientific panels. In each panel, the session moderator provided an overview of the topic (slides are included in the Appendix) and facilitated discussion with panelists. An update on vaccines and neutralizing antibodies was provided, and a final summary session was held to identify key points from the Summit. The sessions were:

- Viral Replication Machinery
- Proteases (Viral and Host)
- Emerging Targets, Emerging Modalities
- Preclinical Tools
- Lessons from Other Viruses and Preparation for the Future

This Summit report is structured to reflect the meeting itself, providing an overview of the virus and therapeutics approaches, individual panel summaries, and a summary of the discussions and perspectives on the challenges ahead. The report was written utilizing the meeting transcript and recorded notes, and it was prepared by the Summit organizers with contributions and input from session moderators and panelists.

OVERVIEW OF THE VIRUS AND THERAPEUTICS APPROACHES

Speaker:
Dr. Mark Denison, Vanderbilt University

Coronaviruses are enveloped positive-sense single-stranded RNA viruses enclosed by capsid comprised of multiple proteins, most notably the spike proteins that are responsible for the virus's crown-like appearance. Cellular entry of coronaviruses, such as SARS-CoV-2 (Severe Acute Respiratory Syndrome-Coronavirus-2), can occur in a number of ways, primarily via the spike (S) proteins of SARS-CoV-2 binding to the host ACE2 (Angiotensin-converting enzyme 2) receptor[1]. Two-thirds of the SARS-CoV-2 genome is dedicated to the synthesis of two replicase polyproteins called polyprotein 1a and polyprotein 1ab. Within the polyprotein are two proteases, the papain-like protease (PL^{pro}) and $3CL^{pro}$ (also known as nsp5 or M^{pro}, short for main protease). In general, any inactivation of these proteases leads to a loss of RNA synthesis, and it is well established that disruption of viral RNA replication or viral protease functions are vulnerable to intervention[2,3]. The next step after the formation of replicase proteins is the modification of host cell membranes, probably occurring in parallel to replication processes. A multiprotein complex formed by coronaviruses termed the replication transcription complex (RTC) is responsible for RNA replication and proof-reading. Nonstructural proteins nsp7 through nsp16 form the core of the RTC and represent a prime target for antiviral drug development, as the function of the core replicase is highly conserved. A detailed outline of the viral replication process, and druggable targets, is displayed in Figure 1.

Importantly in the context of antiviral drugs, when the SARS-CoV-2 epidemic (now a pandemic) emerged, there were no approved treatments or vaccines for treating any betacoronavirus infection. The endemic common cold betacoronaviruses OC42-CoV and HKU1-CoV generally cause mild symptoms, and have not stimulated significant therapeutic or vaccine development investigation. The SARS (caused by SARS-CoV-1) and MERS (Middle East Respiratory Syndrome, caused by MERS-CoV) epidemics were resolved using public health measures, though the translational science response to the SARS-CoV-2 pandemic has benefited from the intensive research efforts that took place to understand the SARS and MERS viruses[4,5].

From a therapeutic perspective, there are multiple windows of opportunity for preventing and managing COVID-19, which include the prophylactic pre-infection stage, early post-infection pre- or asymptomatic stage (antiviral window), and the symptomatic stages during which antiviral efficacy wanes and treatment strategy shifts towards immunomodulatory and anticoagulant therapies. As antiviral drugs are developed, some principles for SARS-CoV-2 antiviral development to be considered include:

- Antivirals should be broadly active for coronaviruses in both in vitro and in vivo models.
- Bioavailability of antivirals should be sought for multiple routes of administration: IV, oral, inhalational, intranasal, etc.

- Antivirals should have limited or no toxicity, especially for outpatient use, have a high barrier to resistance, and a large therapeutic window.
- Combinations of antivirals should be a priority in order to maximize potency and prevent resistance emergence. Combinations of antivirals and immunomodulatory therapies will be needed for treatment in later stages of illness.
- Vulnerable populations should be considered when designing new therapeutics as well as designing clinical trials.

Antiviral drug development for SARS-CoV-2 should take place with the recognition that unlike SARS and MERS (that sporadically re-emerges), the pandemic may continue for a long time, and the virus itself will likely be with us forever (endemic). There is also the high likelihood for another novel coronavirus(-es) to emerge from animal reservoirs. Given these realities, irrespective of vaccine effectiveness, there will be a need for antivirals. Teams working together across industry, academia, and government can drive fundamental discovery for this virus, and create the "playbook" for responding to the next zoonotic coronavirus. In the context of future pandemics, antivirals with broad-spectrum activity against betacoronaviruses would be positioned to enable rapid pre-clinical testing and clinical trials if and when a new zoonotic coronavirus appears (and for sporadic MERS outbreaks)[6].

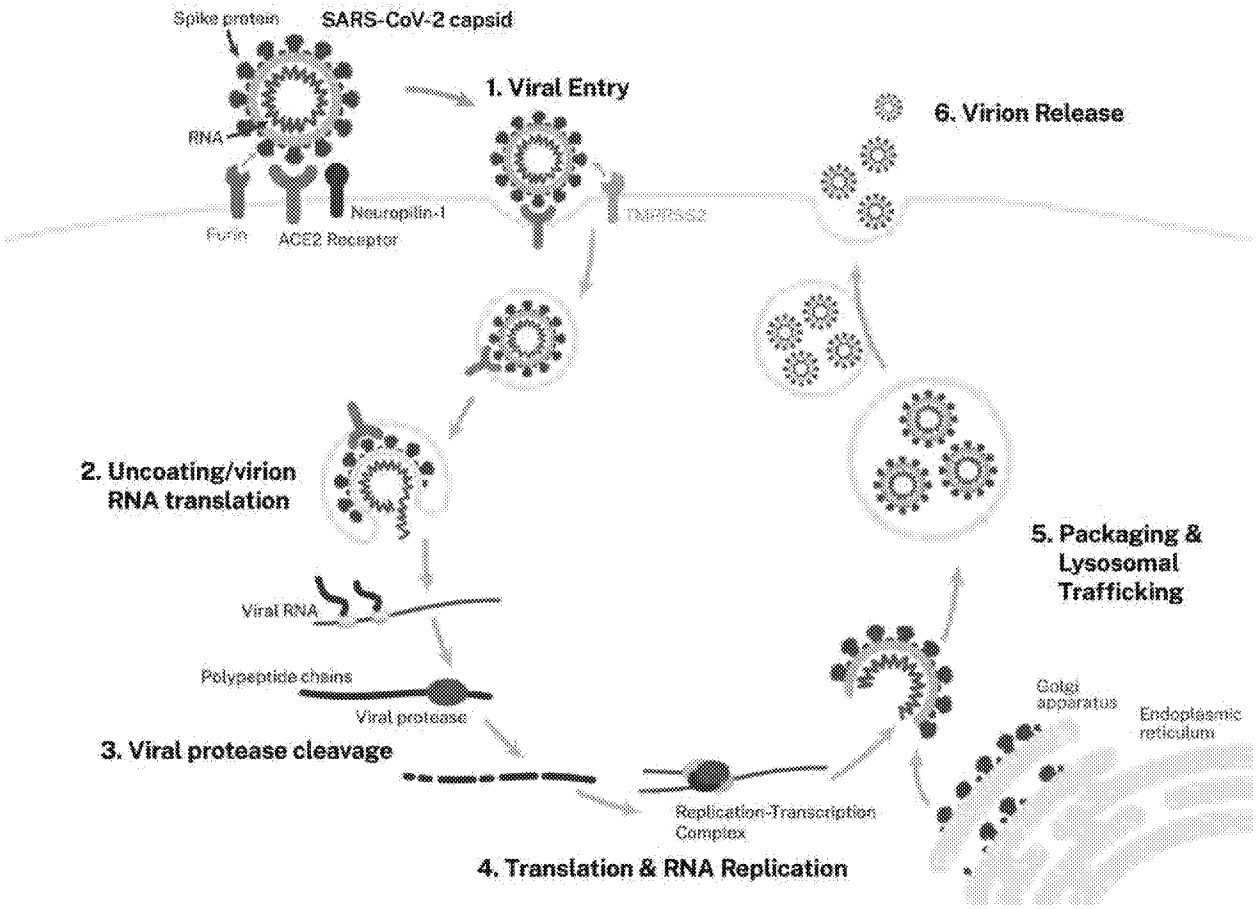

Figure 1. Scheme showing the SARS-CoV-2 viral replication cycle and highlighting "druggable" events. The SARS-CoV-2 virion is composed of a capsid protein coat, with an internal core of the viral genetic material (RNA). **1. Viral entry.** The SARS-CoV-2 virion in the extracellular space presents Spike (S) protein on the capsid surface. The S protein contains a number of protease cleavage sites, as well as the receptor binding domain (RBD). Engagement of spike protein at the extracellular surface involves engagement of multiple host cell proteins including (but may not be limited to) cleavage of S by the protease furin (gene FURIN), binding of the S RBD to ACE2 (ACE2), engagement of a liberated S terminal peptide to neuropilin-1 (Nrp-1, NRP1), and cleavage of S by the serine protease TMPRSS2 (TMPRSS2). **2.** Following endocytosis, the virion is uncoated, and the viral RNA translated into polypeptide chains. **3.** Two **viral proteases** cleave the viral polypeptide chains to produce up to 29 mature protein products. These proteases are the main protease (M^{pro}) and the papain-like protease (PL^{pro}). **4. Viral RNA replication** follows, with the formation of a replication-transcription complex, incorporating the RNA-dependent RNA polymerase (RdRp). **5.** The arising viral RNA (genetic material) is then packaged into capsid formed by viral protein including envelope (E), membrane (M), nucleocapsid (N) and aforementioned spike. Mature packaged virion is then trafficked via lysosomes, and **6. virion is released** via exocytosis. For other viruses, the time from viral entry to emergence of first progeny (the "eclipse time") can be as little as 15 minute or as long as 7-8 hours[7]. Schematic prepared by Kyle R. Brimacombe (NCATS).

SESSION 1

VIRAL REPLICATION MACHINERY

Moderator:
Dr. Tomas Cihlar, Gilead Sciences

Panelists:
Dr. Elizabeth Campbell, Rockefeller University
Dr. Matthias Götte, University of Alberta
Dr. George Painter, Emory University
Dr. Michael Sofia, Arbutus Biopharma, Inc.
Dr. Sandra Weller, University of Connecticut

Summary of Current Status

Since the emergence of SARS-CoV-2 at the beginning of 2020, considerable progress over a very short period of time has been made in the development of antivirals for the treatment of COVID-19, in part because of ongoing studies for inhibitors of MERS-CoV. The identified agents include small molecule antivirals and biologics targeting both viral and host functions critical for SARS-CoV-2 infection and replication. Multiple potent neutralizing antibodies targeting independent epitopes on viral spike protein alongside a battery of direct acting small molecule antivirals interfering with various steps of viral replication have been quickly identified and brought to clinical testing. Across these efforts viral RNA synthesis stands out as one of the most critical functions for selective targeting by antiviral therapies[8].

SARS-CoV-2 and other coronaviruses contain a ~30kb positive-sense non-segmented single strand RNA genome. Their RNA synthesis is a complex process consisting of two independent parts:

1. Viral genomic RNA replication through synthesis of a full-length negative (-) strand copy of the viral RNA genome that serves as a template for subsequent amplification of the genomic positive strand (+) RNA.
2. RNA transcription progressing via synthesis of subgenomic (sg) (-)RNA intermediates that are subsequently transcribed into mRNA. Some of the (-)sgRNA species are made through discontinuous processes that include template shifting. Once synthesized, the viral mRNAs are 5′-capped and 3′-polyadenylated to enable efficient translation of viral proteins.

All steps of the coronavirus RNA synthesis are carried out by the viral RTC encoded by approximately one third of the viral genome[9,10]. The RTC is an assembly of at least nine viral nonstructural proteins (nsp) known as nsp7 through nsp16, as well as some less characterized host factors. Core catalytic function of the RNA synthesis is performed by RNA-dependent RNA polymerase (RdRp; nsp12) and two of its co-factors (nsp7 and 8). Coronaviruses also encode for RNA proofreading 3′-5′ exonuclease function, carried out by nsp14, that increases the fidelity of replication and maintains genetic stability of the large coronavirus genome. The 5′-capping of RNA is performed by two methyl-transferases (nps14 and nsp16). Table 1 summarizes the viral RTC proteins and their functions.

Table 1. Virally encoded components of coronavirus RTC

Coronavirus protein	Function in RTC
Nsp7	RdRp cofactor
Nsp8	RdRp cofactor
Nsp9	RNA binding protein, capping regulator
Nsp10	Cofactor of Nsp14 and Nsp16
Nsp12	RNA-dependent RNA polymerase, capping
Nsp13	Zn-binding RNA helicase/RNA 5'-phosphatase
Nsp14	3'-5' exonuclease; N7-methyltransferase
Nsp15	Uridylate-specific endoribonuclease
Nsp16	2'-O-methyltransferase

Viral nucleic acid synthesis has been successfully targeted by a wide range of small molecule direct-acting antivirals, many of which have been developed into commercial drug products and are widely used in clinical practice[11]. Examples include inhibitors of HIV reverse transcriptase (a DNA polymerase), hepatitis C virus (HCV), hepatitis B virus (HBV), and herpesvirus DNA polymerases. While some of these enzymes can be targeted effectively by non-nucleoside allosteric inhibitors (e.g., non-nucleoside reverse transcriptase inhibitors for HIV), nucleoside and nucleotide analogs mimicking the natural nucleic acid building blocks remain the most abundant class of viral replication inhibitors[12].

Potent and selective antiviral inhibitors of coronaviruses including SARS-CoV-2 have been identified among nucleoside and nucleotide analogs with known broad-spectrum antiviral activity, several of which quickly progressed into clinical testing for the treatment of COVID-19 (Figure 2). Table 2 lists a summary of profiles of these agents. Each candidate is a pro-drug that requires intracellular activation to a triphosphate form that is incorporated into viral RNA, resulting in effects including delayed RNA termination, RNA mutagenesis, and/or second RNA strand synthesis stalling.

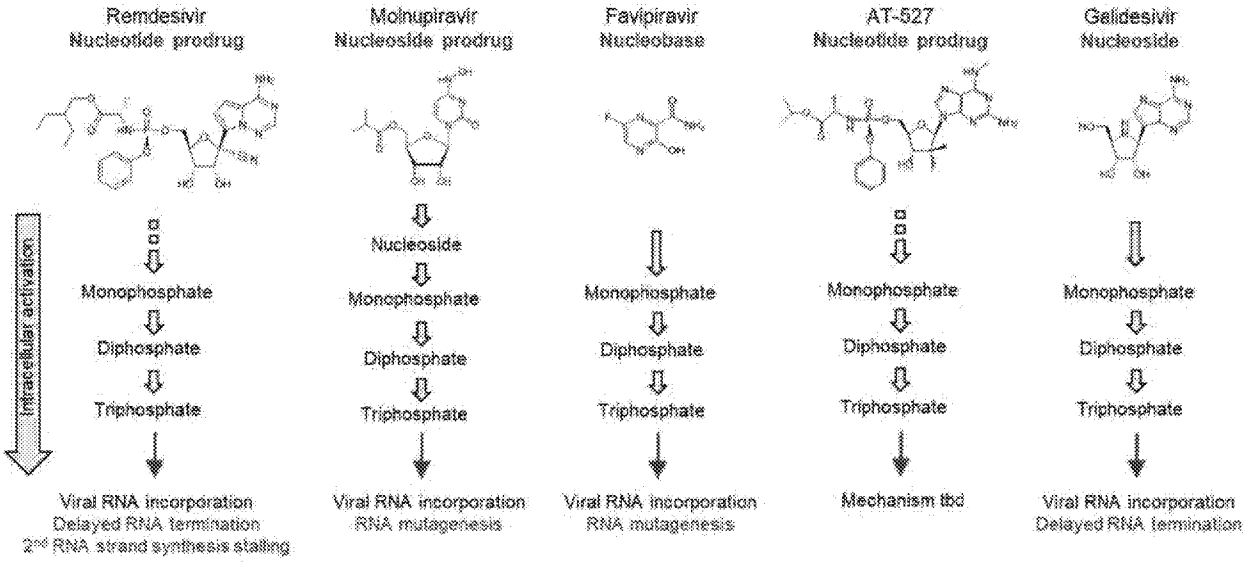

Figure 2. Structures of nucleoside analogs for the treatment of COVID-19, and their metabolic activation.

Table 2. Nucleoside analogs for the treatment of COVID-19. Status as of November 2020.

Nucleoside drug	**Form**	**Mechanism of action**	**In vitro activity** EC50 [μM]	**Animal model efficacy**	**Clinical dosing**	**Development status** (Target population)
Remdesivir (GS-5734)	Nucleoside monophosphate prodrug	Delayed RNA chain termination	0.01 - 1.5	NHP, mouse	IV QD 200/100 mg	Approved in US & 50+ countries (Hospitalized); Phase 3 (Outpatient)
Molnupiravir (EIDD-2801; MK-4482)	Nucleoside prodrug	Viral RNA mutagenesis	0.05 - 0.3	Mouse	Oral BID 200-800 mg	Phase 2/3 (Outpatient and Hospitalized)
Favipiravir (T-705)	Nucleobase	Viral RNA mutagenesis	60 - 250	Hamster	Oral BID 1800/800 mg	Approved in Russia; under review in Japan
AT-527	Nucleoside monophosphate prodrug	tbd	0.5 (EC_{90})	tbd	Oral BID 550 mg	Phase 2 (Hospitalized)
Galidesivir (BCX-4430)	Nucleoside	Delayed RNA chain termination	58 - 68*	tbd	IV	Phase1b

* In vitro activity against SARS- and MERS-CoVs. TBD = to be disclosed.

Remdesivir is a phosphoramidate prodrug that liberates an adenosine nucleotide analog within cells (the core nucleoside being GS-441524)[13]. Remdesivir was developed by Gilead Sciences with support from several U.S. Government organizations. Remdesivir was shown to be active against Ebola virus, and its safety profile was demonstrated in Ebola clinical trials. In several randomized clinical trials, remdesivir has demonstrated efficacy in hospitalized COVID-19 patients by reducing disease progression and accelerating time to recovery. In October 2020, remdesivir was approved by FDA as the first treatment for COVID-19[14,15].

Molnupiravir (EIDD-2801) is an orally bioavailable prodrug of N6-hydroxycytidine. It was developed at Emory (University) Institute for Drug Discovery (EIDD) as part of a program against Venezuelan equine encephalitis virus, and a Phase I trial was planned against influenza in 2019. As SARS-CoV-2 emerged, molnupiravir showed potent anti-SARS-CoV-2 activity both in vitro and in animal models[16]. It is currently in Phase 2-3 testing both in out-patient settings and in hospitalized COVID-19 patients.

Favipiravir, a guanine base analog, is a drug product approved in Japan (2014) for the treatment of influenza infections due to novel strains not responsive to other available agents[17]. It is also under regulatory review for the treatment of COVID-19 in Japan and has recently been approved for the same indication in Russia. It is active against SARS-CoV-2 in models, and is being tested in several advanced clinical studies around the world[18]. While it can be administered orally, it is substantially less potent than molnupiravir and remdesivir in vitro, which is reflected in a much higher dose required for favipiravir.

AT-527 is a prodrug of a guanosine nucleotide analog, developed by Atea Pharmaceuticals[19]. AT-527 was developed against the HCV RdRp, and safety was demonstrated in an HCV Phase 1-2 clinical trials in healthy and HCV-infected subjects. AT-527 was recently found to be active in vitro against SARS-CoV-2, and is currently being tested in Phase 2 in patients hospitalized with moderate COVID-19 disease[20].

Galidesivir is an adenine nucleoside analog developed by BioCryst for HCV, but it has broad-spectrum activity against RNA viruses and has been in development for treating deadly filoviruses (e.g., Ebola, Marburg)[21]. It has shown relatively weak activity in vitro against SARS- and MERS-CoVs and is slated for testing in a small proof-of-concept Phase 2 study in Brazil. It is the least characterized molecule among the SARS-CoV-2 nucleoside inhibitors.

It is worth noting that all the drug candidates described above existed before the COVID-19 pandemic, and novel chemical matter developed specifically for the SARS-CoV-2 replication

machinery has not yet been disclosed. While diverse in structures as well as formulations administered (see Figure 1 and Table 2), all SARS-CoV-2 nucleoside inhibitors require intracellular activation to their nucleoside triphosphate (NTP) metabolites, which then interact with the active site of coronavirus RdRp and are incorporated into viral RNA. The metabolic pathways leading to the respective NTP metabolites are cell-type dependent and differ for each molecule, as do their molecular mechanisms of viral RNA synthesis inhibition. Once incorporated into viral RNA, the metabolites of remdesivir and galidesivir cause delayed RNA chain termination, in the case of remdesivir template-dependent inhibition has also been shown, while those of molnupiravir and favipiravir act as specific viral RNA mutagens due to their capability of promiscuous base-pairing[22]. The mechanism of action for AT-527 is less well characterized and structural as well as biochemical data suggest that it might not interact very effectively with SARS-CoV-2 RdRp.

Challenges and Opportunities

Nucleoside and nucleotide analogs represent the most extensively explored class of antivirals with well understood advantages and limitations that both are related primarily to their function as mimetics of natural nucleotide molecules. Because the active sites of viral RNA polymerases to which the active NTP metabolites bind are often highly conserved within as well as across multiple viral families, many nucleosides exhibit broad-spectrum antiviral activity. Remdesivir, favipiravir, and molnupiravir are good examples of broad-spectrum antivirals with pan-coronavirus activity that may be leveraged as a part of future pandemic preparedness not only for the treatment of COVID-19, but likely also for other existing and newly emerging coronaviruses. The similarity of antiviral nucleoside analogs with natural substrates can also represent a significant liability, mainly because of their potential for off-target effects, such as impairment of mitochondrial functions through the inhibition of (host) mitochondrial RNA polymerase. Some nucleoside analogs might require prodrug strategies using established principles of medicinal chemistry to optimize oral delivery (bioavailability). In the case of SARS-CoV-2, the primary target tissue is the lung, and effective distribution into target cells irrespective of administration route is required.

Besides the inhibition of nsp12 (RdRp) by nucleoside analogs, the highly dynamic and multi-functional coronavirus RTC offers variety of other opportunities to interfere with viral RNA synthesis, including the other critical catalytic enzymatic functions present in RTC, such as the nsp13 helicase, nsp14 and nsp16 methyltransferases, or nsp14 exonuclease. In addition, the concerted function of this multiprotein complex relies on a multitude of specific protein-protein interactions, many of which have been mapped across the spectrum of coronaviruses including SARS-CoV-2. These efforts can be greatly facilitated by structural information generated by X-ray crystallography and cryo-electron microscopy studies conducted with many of the RTC proteins

and their complexes, including the nsp15 endonuclease, nsp14/10 and nsp16/10 methyltransferases, and particularly the multiprotein RdRp complex of nsp12/nsp7/nsp8 together with a dimer of nsp13 helicase. This wealth of structural information can facilitate the identification of critical interfaces and conserved pockets that might be amenable to targeting with small molecule inhibitors.

These alternative RTC targets offer the opportunity for non-nucleoside drug-like molecules, with the potential for candidates with desirable pharmacokinetic properties, like oral bioavailability, low protein binding, and adequate delivery to the respiratory tract. Unfortunately, the current state of the field underscores a complete absence of any validated small molecule inhibitors targeting some of these critical replicative functions, which in turn hinders advancement towards optimization of any new class of RTC inhibitors and their rapid progression into clinical testing. Therefore, the drug discovery process will rely on de novo high throughput screening approaches of suitable small molecule libraries (either pooled or arrayed). To that end, a number of recombinant RTC proteins have been cloned, expressed, and functionally characterized. Several options for functional biochemical assays exist depending on the desired format and preferred mode of read-out particularly for the catalytic complex of nsp12/nsp7/nsp8 RdRp. Similarly, functional assays have been established for coronavirus exonuclease as well as methyltransferases.

To effectively target some of the critical protein-protein interfaces, the field can employ a wide array of screening techniques for small molecule ligand binding, some of which are quite suitable for large compound libraries. Options include high-throughput affinity selection mass spectrometry (ASMS) DNA-encoded libraries (DELs), or surface plasmon resonance (SPR) assays. Alternatively, computational docking algorithms for putative binding sites can be employed for screening of vast virtual small molecule libraries. The major advantage of these approaches is speed and the number of potential candidate molecules identified, but these techniques need to be always coupled with relevant functional testing assays to triage the hits and validate their functional relevance. Newly-developed cell-based replicon assays for SARS-CoV-2 should be valuable to characterize activity of candidate compounds and certify cell-based activity and activation of candidate pro-drugs[23,24].

As will be discussed elsewhere, work remains to identify optimal target combinations with RdRp/RTC inhibitors (both small molecule antivirals and other modalities/approaches), and the patient populations most likely to benefit depending on individual drug product profiles, to maximize clinical effectiveness in the treatment and/or prevention of COVID-19.

SESSION 2

PROTEASES (VIRAL AND HOST)

Moderator:
Dr. Annaliesa Anderson, Pfizer

Panelists:
LTC Charlotte Lanteri, Walter Reed Army Institute of Research
Dr. Andrew Mesecar, Purdue University
Dr. Jennifer Nwankwo, 1910 Genetics
Dr. Celia Schiffer, University of Massachusetts Medical School

The SARS-CoV-2 Infection Cycle Requires Host and Viral Proteases

SARS-CoV-2 uses both host and viral proteases in its replication cycle (see Figure 1 in Overview). The generalizability of host proteases makes them a good target for many distinct coronaviruses that tend to use similar host factors. The spike proteins of SARS-CoV and SARS-CoV-2 have commonalities, such as sequence similarities and multi-basic proteolytic cleavage sites at both the S1 and S2 residue site as well as the S2 prime residue sites where host proteases (such as furin and TMPRSS2) cleave to facilitate viral entry. Host proteases do not mutate as easily as the viral proteases.

Host proteases TMPRSS2 and furin have a role in cleaving spike protein between S1 and S2 to reveal the fusion peptide and helical repeat domains that are necessary for viral entry[25,26]. Currently two compounds are being investigated that potentially inhibit the host proteases and could be used as COVID-19 treatments: camostat and nafamostat. Both are repurposed drugs that are approved in Japan for the treatment of several conditions including pancreatitis[27]. Since these compounds have existing human safety data, late-stage clinical studies for COVID-19 treatment are underway.

Drug discovery efforts to identify new host and viral proteases are actively being pursued. These include two efforts being led by the panelists in this session. The group at 1910 Genetics (founder Dr. Jen Nwankwo) is using machine learning design to screen millions of compounds to identify a suitable chemical substrate for host TMPRSS2 inhibitors. A second AI approach to identify viral protease inhibitors, led by LTC Lanteri at Walter Reed Army Institute of Research (WRAIR), combines X-ray crystallographic data with high performance machine learning.

Viral Protease Inhibitors (PIs) Have Been Used to Treat HIV and HCV Successfully

The first viral protease inhibitors were identified in the search for HIV cures[28]. The HIV protease inhibitors are some of the first examples of structural based design, a move away from the traditional high throughput screening approaches that had been previously deployed for drug discovery efforts. A similar approach was also used for HCV and was so successful it was able to provide a cure for what was previously a chronic disease.

Structural design was first applied to coronaviruses in 2003 during the SARS epidemic caused by SARS-CoV-1 with the discovery of the first protease inhibitors specifically designed for coronaviruses. Both the public health measures that led to control of SARS-CoV-1 and the resulting lack of patients for clinical studies meant that that these drugs were never developed; it is not yet known if this approach will work for SARS-CoV-2, though there is promising in vivo data of these compounds against coronaviruses with similar proteases.

Two SARS-CoV-2 Cysteine Proteases can be Targeted for Potential COVID-19 Treatment

There are two SARS-CoV-2 encoded cysteine proteases that are potential antiviral targets: a papain-like protease and a 3C-like protease. These proteases are responsible for cleaving the polypeptide that is translated after the viral RNA enters the host cell. The single polypeptide makes up the machinery that the virus needs for replication. If it is not cleaved into the 16 individual non-structural proteins, the virus cannot replicate. The papain-like protease is a multifunctional enzyme that is also associated with pore formation and immune modulation[29]. The 3C-like protease, which is also known as the main protease, functions as a dimer and has a single role that is to cleave the polypeptide at 11 sites[30].

HCV and HIV Drugs Have Limited Utility for COVID-19 Treatment, Current Potential Antiviral Inhibitor Candidates

Early in the pandemic, steps were taken to investigate whether existing HIV and HCV protease inhibitors could be redeployed to treat COVID-19 patients. There are considerable differences in the structure of the different proteases, so this approach led to little success, although some inhibition had been observed. Clinical studies are still in progress with the HIV drug ritonavir-boosted lopinavir, but an early controlled trial in COVID-19 patients in China failed to find evidence of antiviral effects or clinical benefits, and subsequent trials have confirmed the lack of therapeutic efficacy in hospitalized COVID-19 patients. Also, it is unclear what is its mechanism of action. Lopinavir and isotretinoin are examples of drugs repurposed for potential antiviral therapy. A Phase 1 study of PF-07304814 (termed PF-'814) is ongoing. This drug was specifically designed to inhibit coronavirus proteases. Several preclinical protease inhibitors are also under investigation and extensive screening for additional protease inhibitors is ongoing.

Example of 3-CL PI Development: Pivoting to a Pro-Drug Candidate PF-007304814 to Enable Clinical Dosing of Therapeutic Concentrations of Active Drug Candidate PF-0835231

In January 2020, as the potential force of the COVID-19 pandemic became apparent, Pfizer restarted its coronavirus PI development program that had been conducted in response to the SARS epidemic more than 15 years earlier. After comparing sequences of the two coronaviruses, a high degree of similarity was observed between the 3CL proteases, suggesting that Pfizer's lead compound PF-0835231 (termed PF-'231) could be developed and then potentially be deployed against SARS-CoV-2.

The following 8 months (to October 2020) saw the usual long development program dramatically compressed with the help of many coronavirus experts in the field to generate data for evidence that the candidate drug was highly potent and specific for the inhibition of coronavirus 3CL proteases including that from SARS-CoV-2. When it was recognized that the compound's potential pharmacokinetic exposure was suboptimal, teams of chemists quickly developed the phosphate

prodrug PF-'814[31]. This prodrug increased the exposure of the drug to allow for effective dosing in clinical studies, the first of which was initiated in September 2020 (NCT04535167).

PF-0835231 SARS-CoV-2 Protease Inhibitor has Additive Activity with Remdesivir In Vitro Due to Differentiated Mechanism of Action and Has the Potential to be Broadly Cross Reactive Across Coronaviruses

Remdesivir and Pfizer's PF-'814 have distinct antiviral mechanisms of action. Since antiviral treatment has benefitted from combination therapy, the antiviral activity of combinations was explored in vitro. The PF-'231 starting point showed potent single agent EC_{90} in a SARS-CoV-2 antiviral assay, indicating potential clinical efficacy for viral protease inhibitors. Combining PF-'231 with remdesivir increased the observed in vitro potency. These in vitro data suggest that a combination may result in control over the virus with reduced amounts of each compound.

Collectively these in vitro data suggest Pfizer's prodrug has the potential to be effective as a single or a combination agent against SARS-CoV-2. In addition, it appears the compound has the potential to be a pan-coronavirus drug that can be deployed in the event of potential future coronaviruses that emerge as a result of additional species crossover events. The data generated suggests that this potential first-in-class protease inhibitor may provide the best opportunity to show meaningful antiviral activity to help treat COVID-19 patients. Two clinical studies are ongoing: one is a Phase 1 single ascending dose (SAD) study in healthy volunteers (NCT04627532), and a second is a Phase 1b in patients (NCT04535167). A pivotal Phase 2/3 study is planned to start in early 2021, with a projected approval in the second half of 2021.

PL^{pro} Has Other Functions in Addition to Protease Activity that PL^{pro} Inhibitors May Also Prevent

Coronavirus PL protease inhibitor development is not as advanced as the $3CL^{pro}$ inhibitors. Inhibitors targeted to this protease may provide a unique opportunity to not only inhibit viral replication via inhibition of cleaving the nsp3, but also inhibit nsp3 from antagonizing the NF-κB and IRF3 host innate pathways via deubiquitination and deISGylation as well as removing ISG15 from proteins in the Jak/Stat pathway. The dysregulation of these pathways may contribute to excessive cytokine release from infected cells. In addition, Nsp3 has recently been shown to be part of a molecular pore in double-membrane vesicles (DMVs). The DMVs form after viral infection as a result of nsp3, nsp4 and nsp6 embedding in the rough endoplasmic reticulum and reshaping it.

Challenges and Opportunities

The challenges and opportunities for the discovery and development of SARS-CoV-2 protease

inhibitor treatments were discussed by the panel, with a focus on how advanced screening methodologies are being used to accelerate screening and the importance of structural analysis to identify potential resistance challenges and facilitate compound discovery. Current research into protease inhibitors has been enhanced by consortia and collaborations. For example, work conducted by the Center for Structural Genomics enables the acceleration of drug design and validation programs.

With each new mechanistic insight come new targets, including host factors. These targets provide an opportunity for rational drug design accelerated by artificial intelligence (AI) that can be deployed at all stages of the early drug discovery process, from novel hit discovery to identification and optimization. For example, a 1910 Genetics AI platform allows the rapid screening of a billion-chemical library in less than 6 hours to identify hit compounds. Hit compounds are synthesized to ensure that they are not cytotoxic and then confirmed as actively inhibiting viral entry into Vero E6 cells engineered to overexpress TMPRSS2.

With the arrival of the COVID-19 pandemic, WRAIR scientists initiated a discovery program in small molecules therapeutics directed at SARS-CoV-2, with the goal of developing a small molecule therapeutic that can treat or prevent SARS-CoV-2 and other circulating coronaviruses in anticipation of the next emerging virus. LTC Charlotte Lanteri explained that this involved a significant pivot for the WRAIR Experimental Therapeutics (ET) Branch, the Department of Defense's (DoD's) sole drug development group, into a new therapeutic area of developing antivirals. The WRAIR ET team leveraged their inherent drug discovery and development capabilities and expertise for developing malaria and antibacterial drugs to address COVID-19.

WRAIR partnered with the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID) scientists who established a high throughput in vitro SARS-CoV-2 Vero cell-based test system at their biosafety level-3 (BSL-3) labs. As part of this DoD COVID-19 Small Molecule Therapeutics effort, collaborators at the Southwest Research Institute in San Antonio, TX, in conjunction with the DoD's High Performance Computing Modernization Center, applied a proprietary AI/machine learning algorithm to screen >41 million compounds against two SARS-CoV-2 targets: the main protease and Spike protein Receptor Domain. The virtual screens were built based on published crystal and cryo-electron structures, as well as X-ray structures of the virus produced by the WRAIR Emerging Infectious Diseases Branch. The DoD group screened a library of >41 million compound structures in a matter of weeks. Compound structures came from a diversity of sources, some of them were existing drugs that may be repurposed for SARS CoV-2 and other coronaviruses. Others were novel chemical matter from a large repository of compounds that had already been analyzed for drug like properties. In contrast to traditional in silico

method introduces the ligand to the target with no pre-conceived notions of binding pose. Their ultimate goal is to develop a pan-coronavirus drug; as such, virtual screen hits were also screened against an analogous target (RBD) from SARS-CoV-1 and MERS to select compounds with the greatest overlap in predicted binding. From this large scale initial screen, they rapidly down-selected approximately 800 compounds within a few weeks, dramatically shortening the traditional years-long discovery phase. To date, testing of in silico hits resulted in a 9% hit rate in USAMRIID's SARS2 antiviral Vero cell screen. This outcome is orders of magnitude better than more traditional high throughput put methods. The combination of AI and then high-throughput screening using an invitro assay has been key for accelerating the discovery of potential new coronavirus treatments. The molecules are currently being studied from a medicinal chemistry perspective including determination of their metabolic properties, safety evaluation and pharmacokinetics in mouse models.

PL^{pro} Has Other Functions in Addition to Protease Activity that PL^{pro} Inhibitors May Also Prevent

Dr. Mesecar of Purdue University described working on PL^{pro} and M^{pro} after the SARS-CoV-1 pandemic in 2003-2004 with a collaborative team[32–35]. At that time, the papain-like protease was an overlooked protease with no established structure. Cleavage of ubiquitin off host cell proteins was also identified as another potential role for the PL^{pro}. Dr. Mesecar and his group confirmed that PL^{pro} was capable of utilizing ubiquitin substrates. He evaluated interferon-stimulated gene 15 (ISG15) and determined it is also capable of hydrolyzing 7-amino-4-methylcoumarin (AMC) of ISG15 causing its removal from ubiquitin in host cells. Understanding the complete role of PL^{pro} antagonism of an aspect of host innate immune response will be important to the successful use of PIs of this protease.

Dr. Mesecar and colleagues elucidated the structure of PL^{pro} and found that it was indeed a ubiquitin-specific protease (USP). They then conducted a high-throughput screen of 50,000 compounds, identifying two potential compound templates for anti-viral drug development. These non-covalent inhibitors had the ability to target only a certain subclass of coronaviral papain-like proteases selectively, making it possible to target papain-like proteases selectively. To date these compounds have shown efficacy in a non-SARS-CoV-2 coronavirus animal model.

Design of protease inhibitors to pre-emptively avoid Drug Resistance:

Viral proteases are key drug targets and have been one of the most successful structure-based drug designs. However, drug resistance can come from mutations in the active site, or remote changes that alter the flexibility of the protease[36–38]. The necessity of the protease to cut a series of cleavage sites is a key evolutionary constraint. Dr. Celia Schiffer's laboratory at University of

Massachusetts Medical School, for example, have focused on this evolutionary constraint of substrate recognition and processing and how to combine that evolutionary constraint to preemptively avoid drug resistance. Inhibitors that fit within the substrate envelope are less likely to produce resistant strains because the mutation impacting these inhibitors will simultaneously impact the recognition and processing of the majority of the substrates. Dr Schiffer's team has previously demonstrated this approach with HIV and HCV proteases[39,40]. Similar to other viruses, SARS-CoV-2 has already evolved during the current pandemic. As the SARS-CoV-2 viral proteases both recognize multiple substrates, the substrate envelope approach is being pursued as a way to pre-emptively avoid resistance. Combining protein crystallography, medicinal chemistry, and computational methods to SARS-CoV-2 $3CL^{pro}$ and PL^{pro} with a collaborative team at University of Massachusetts Medical School, the aim is not only to have inhibitors that retain effectiveness during the current pandemic but are potent against any future coronaviral outbreaks.

SESSION 3

EMERGING TARGETS, EMERGING MODALITIES

Moderator:
Dr. Kara Carter, Evotec*
**Current affiliation: Dewpoint Therapeutics*

Panelists:
Dr. David Baker, University of Washington
Dr. Lillian Chiang, Evrys Bio, LLC
Dr. Matthew Disney, Scripps Research Institute
Dr. Kumar Saikatendu, Takeda Pharmaceuticals
Dr. Marla Weetall, PTC Therapeutics, Inc

As discussed above, small molecule inhibitors of essential viral enzymes, such as polymerases and proteases, are well validated approaches for antivirals. However, as with all complex viral diseases, multiple therapeutics to address different aspects of the SARS-CoV-2 viral life cycle and in different COVID-19 patient populations are needed to have the ability to effectively treat patients. Several new modalities have arisen for therapeutics in general over the last several years including RNAi, CRISPR/Cas9 and other targeted nucleases, bifunctional molecules, and others. Dr. Matt Disney of Scripps Research Institute described how sections of viral genomes in general, and SARS-CoV-2 in particular, form constrained secondary structures that are specifically targetable by small molecules. Such regions of the SARS-CoV-2 genome include the 5' untranslated region and the frame shift motif. Small molecule screens have been conducted and identified binders to these elements[41]. These binders have been used as the basis of a chimeric compound that can target a host ribonuclease to the viral genome and ultimately lead to its degradation. Such a mechanism has demonstrated potent antiviral activity. In addition, Dr. David Baker of the University of Washington described his work generating mini-proteins that specifically bind to the receptor binding domain of the viral spike protein with potent nanomolar antiviral activity[42]. These mini-proteins were computationally designed and are able to be produced in large quantities that could lead to minimal cost of goods. In vivo, these mini-proteins delivered either intranasally to hamsters or as Fc-fusions by injection to mice, had protective effects when the animals were challenged with virus.

Both of these newer modalities have potential significant advantages. First, drug discovery can begin as soon as a new genome is sequenced (a parallel with vaccine development). For mini-proteins, computational methods lead to the synthesis of small numbers of molecules for testing. For RNA binders, analysis and comparison to sequences of related viruses can accurately predict genome sequences/structures to start screening for small molecule binders. The mini-proteins, as mentioned above, can be developed with different formulations for different routes of administration and have good potential for low cost. Additionally, at least in the case of the mini-protein generated against SARS-CoV-2 spike, the molecule is thermostable and can be stored at room temperature. The RNA targeting small molecules may have a lower incidence of mutation given there are only three options of nucleotides to be incorporated into the RNA for such mutations, and to maintain functional structure of the RNA, even substitution by those three options may not be tolerated by the virus. Both of these modalities, though, lead to molecules that will likely have activity limited to viruses with close sequence homology in the viral target.

Complementing the advances in new modalities is the identification of novel targets for antivirals beyond the traditional viral enzymes such as polymerases and proteases. Both systems biology studies[43,44] and compound repurposing screens[32,45–49] have identified a number of potential

host cell targets to be explored for validation and ultimately drug discovery and development. One example is dihydroorotate dehydrogenase (DHODH), an essential host enzyme in de novo pyrimidine biosynthesis. Studies to identify pathways and/or targets can vary in their methodology, including use of different cell types and tagging or knock-out of proteins, which can lead to conflicting results. The public visibility and combination of large data sets may allow identification of potential targets. These targets become actionable as they are verified with the use of probe molecules to test the therapeutic hypothesis, and demonstration of activity in multiple orthogonal assay systems.

Drug discovery focused on host cell targets is anticipated to present multiple opportunities that will require verification. As opposed to direct acting antivirals that may have a less risky developmental path, drugging host proteins or processes presents less potential for resistance emergence and should be effective irrespective of the viral load. Additionally, such molecules tend to be more refractory to drug block release, meaning that after removal of the drug, the changes that the drug induced in the host cell are maintained by extending the antiviral effect. Particularly compelling cellular targets are those engaged in stress activated signal transduction and the dysregulated metabolism induced upon viral infection[50,51]. For example, Evrys Bio, LLC is developing inhibitors of host SIRT2, which have demonstrated potent and durable antiviral activity across a number of viruses[52,53].

As host genes are nominated as druggable candidates, rigorous validation of the target and modality, translating active molecules to drugs and ultimately to medicines requires focus on physical properties, pharmacokinetics, formulation, and other key pillars of drug development. These new modalities and targets do not replace small molecule drug discovery against traditional, validated targets like polymerases and proteases. Rather, they are expected to complement those efforts and increase the diversity of agents that can be used to treat COVID-19 patients. In some cases, these approaches may provide more rapid discovery and development of drugs in a pandemic setting. Additionally, the breadth of activity and potency, even in the face of high viral load, of drugs targeting cellular proteins can complement more traditional antivirals. These new modalities and targets should certainly be explored as part of the SARS-CoV-2 response.

SESSION 4

PRECLINICAL TOOLS

Moderator:
Dr. Pei-Yong Shi, University of Texas Medical Branch

Panelists:
Dr. Sara Cherry, University of Pennsylvania
Dr. Emmie de Wit, NIAID/Rocky Mountain Laboratories, NIH
Dr. Jules O'Rear, US Food and Drug Administration
Dr. Timothy Sheahan, University of North Carolina
Dr. Hugh Smyth, University of Texas at Austin

Biologically and clinically relevant models are required for the evaluation of antiviral drug candidates in order to obtain the most meaningful and informative preclinical data. Both in vitro (cell-based) and in vivo (animal) models of SARS-CoV-2 infection have been developed to evaluate antiviral activity and therapeutic efficacy of candidate drugs. Various in vitro systems have been used to identify potential COVID-19 therapeutics in the screening of drug libraries comprised of approved drugs with the hope of repurposing in addition to the screening of compound libraries to identify new antiviral compounds to then be optimized into a more drug-like form through medicinal chemistry. Animal models of SARS-CoV-2 infection that recapitulate viral tropism and COVID-19 disease pathology are required to ensure that pre-clinical candidates are active at the target site (e.g. lung) and to assess antiviral combinations. As SARS-CoV-2 is a respiratory virus, formulation of oral or intranasal delivery of therapeutics will be most impactful as dosing would not require assistance from a medical professional. Preclinical animal models are essential to determine if therapeutic candidates have antiviral activity, optimal pharmacokinetic profiles, and mitigate SARS-CoV-2 pathogenesis.

In vitro Models

For cell-based antiviral testing, both wild-type virus and those engineered to express reporter genes like luciferase or fluorescent proteins have been used to screen compounds for antiviral activity[54]. Antiviral activity and potency have been determined by multiple techniques including through the measurement of reporter gene products, direct measure of infectious virus by classical virological techniques, measurement of viral cytopathic effect in cell monolayers, and immunostaining-based measurement of viral proteins via high-content imaging which can also monitor cytotoxicity[45]. To most efficiently triage compounds, early removal of toxic compounds is preferable. Compared with wild-type virus, reporter virus assays typically have a higher dynamic range and potentially higher throughput capacity. High-throughput assay formats also allow the screening and assessment of antiviral combinations in cell culture, which require a large number of experimental conditions to be evaluated[55].

The target cell type employed is also critical to accurately predict antiviral activity of candidates in humans. A number of seemingly simple considerations, including the species of origin of a given cell line (e.g., human versus other animal-derived cell lines), and the tissue of origin (e.g., respiratory epithelial versus kidney or colon) significantly impact the relevance of antiviral candidate potency. For example, the FDA-approved RdRp inhibitor remdesivir IC_{50} values differed by 1,000-fold when remdesivir was tested in Vero cells (African green monkey kidney epithelial cell line, weak activity) compared with primary human airway culture (potent activity)[56]. This is likely due to differences in cellular enzymes that transport and/or metabolize the prodrug into its pharmacologically active triphosphate form. Conversely, chloroquine and its derivatives

showed anti-SARS-CoV-2 activity in Vero cells, but not on primary human airway cultures or animals[57]. These results underline the importance of selecting the right cell types for antiviral testing, and primary or multicellular airway models should be considered to confirm antiviral activity.

Reverse Genetic Systems

Reverse genetic systems have been developed for SARS-CoV-2, leading to the generation of both fluorescent and luminescent reporter viruses that can increase the throughput of screening assays with authentic virus particles at BSL-3[58,59]. In addition, reverse genetics enables the phenotypic confirmation of drug resistance mutations derived through passage in cell culture or those that naturally arise in humans and drug target deconvolution in mechanism of action studies with newly discovered drug candidates. Functional genomics screening approaches such as CRISPRi can enable the identification of human (host) genes that play a cooperative role in mediation the viral replication cycle and may be druggable.

In vivo Models

Several animal models have been developed for SARS-CoV-2, including mouse, hamster, ferret, and non-human primates. A detailed list of SARS-CoV-2 animal models is maintained by the NIH ACTIV Preclincal Working Group at the NCATS OpenData Portal[60,61]. For both small animal and non-human primate models, information on background, primary references, and viral model endpoints are provided.

The establishment of any animal model relies on that species being susceptible to infection by SARS-CoV-2[62], and a secondary consideration is the species being amenable to maintenance in a vivarium setting. Although mice are typically used widely to study viral pathogenesis and antiviral efficacy due to their size, ease of use, available genetic models, and experimental tools, due to differences in the murine ortholog of the human receptor, angiotensin converting enzyme 2 (ACE2), SARS-CoV-2 spike cannot bind mouse ACE2 and cannot infect standard laboratory mice. To circumvent this issue, approaches have been taken to enable SARS-CoV-2 infection in mice. First, transgenic mice have been made that express human ACE2[54]. Second, viral vectors have been used to deliver and overexpress human ACE2 in the mouse lung[63]. Lastly, SARS-CoV-2 has been genetically adapted to utilize mouse ACE2 for entry resulting in a virus with high titer replication in the lungs of standard laboratory mice (i.e. BALB/c), loss of pulmonary function, severe end stage lung disease like ARDS and death[64]. In general, any of these mouse models can be useful for antiviral testing. In addition, because the mouse-adapted infection model recapitulates multiple aspects of the human disease, this model may be more useful to study viral pathogenesis and genetically dissect host immune responses driving disease.

Hamster models have been developed to study viral replication, pathogenesis, and transmission[65,66]. Unlike mice, wild-type SARS-CoV-2 robustly infects hamster respiratory tract, causing weight loss and lung pathology. The hamster model also recapitulates age-dependent disease severity. The kinetics of viral replication in young hamsters is faster than that in aged hamsters, whereas the immune response in aged animals lasts longer, leading to somewhat more severe disease. Moreover, hamsters can transmit the virus allowing for the study of SARS-CoV-2 transmission. Ferret models have also been established to study viral transmission. Compared with other animal models, the viral replication level and disease severity are milder in ferrets.

Several non-human primate models of SARS-CoV-2 have been reported, including rhesus macaque, cynomolgus macaque, and African green monkey[67–69]. In the rhesus macaque model, the infected animals develop mild to moderate clinical signs of disease, develop pulmonary infiltrates on radiographs, and virus shedding in nose and throat swabs is similar to that observed in COVID-19 patients. Although no non-human primate models have been established that recapitulate severe COVID-19, these models have been used successfully to show the efficacy of several direct-acting antivirals and antibody treatments.

In summary, antiviral models have been developed to support in vitro and in vivo drug discovery. However, limitations remain, in large part due to the biosafety considerations, to enable more efficient therapeutic development.

Challenges and opportunities

Data reproducibility and assay comparisons

One challenge to SARS-CoV-2 drug discovery and development is that different research teams have reported different activity, or lack of activity, for the same compound. One "side effect" of so many research groups converging on SARS-CoV-2 research has been the use of differing models and assays (described above). The adoption of common reference assays and criteria would set standards for the field. This would include recommendations on appropriate cell lines and reagents and making sure these are readily available to qualified investigators. For example, HIV repositories exist for small molecules, viruses and cell lines promoting standardization which has been beneficial to drug development (though this was implemented over a longer timeline, see for a general example the Biodefense and Emerging Infections Research Resources Repository, BEI Resources). Importantly, the reliance on a single assay model for demonstrating activity is not adequate, and orthogonal assays are essential. In addition, testing against standardized positive and negative controls in assays is also important.

Combination antiviral therapy

Combination antiviral therapy is expected to be critical to effectively treating infections and minimizing the development of resistant strains. Screening approaches can be used to identify potent synergism of antiviral candidates, and functional/genetic approaches can be used to predict drugged target combinations that should be effective. Moreover, any new therapeutic, especially other RdRp inhibitors, must be tested for antagonism against approved therapies, such as remdesivir, to ensure that unwanted impedance of antiviral activity does not occur in combination. Also initial clinical studies of potential drug-drug interactions with respect to human pharmacokinetics and tolerability are necessary.

In vivo models

Before the SARS-CoV and MERS-CoV outbreaks, very few models of coronavirus pathogenesis existed, but researchers responding to the SARS-CoV-2 pandemic rapidly took advantage of previous approaches and models developed for other emerging coronaviruses (e.g., human ACE2 transgenic mice). However, the numbers of researchers able to engage in research with an authentic emerging coronavirus is limited by the need to perform this work in a BSL-3 laboratory of which there are only a handful in the United States. Another major gap is that it remains difficult to study long-term effects of either treatment or disease in animal models. From an antiviral candidate perspective, "direct-acting" compounds against viral proteins can be applied to many animal models, but host-target antiviral candidates (for example, host proteases described earlier) rely on an understanding of the species homolog of the human gene. Current animal models are not adequate for studying extrapulmonary manifestations of disease. Studying comorbidities is also difficult in animal models, which is a major weakness given the pathology of COVID-19 in humans, and the anticipation that newly developed antivirals will be effective in reducing mortality in patients with such complicating comorbidities.

To date, the FDA has not been requiring animal model data for some clinical trials using agents with known activity during viral infections, and well-defined safety based on prior in-human use. However, antiviral activity information remains essential in instances when other data, on topics such as the mechanism of action or toxicity, are lacking. Mechanism of action and resistance data is of vital importance. In this context, the designation of a standard accepted in vivo model with gold standard positive and negative controls for assessing and comparing antiviral activity of a new therapeutic has not been designated.

SESSION 5

LESSONS FROM OTHER VIRUSES AND PREPARATION FOR THE FUTURE

Moderator:
Dr. Daria Hazuda, Merck & Co.

Panelists:
Dr. Jay Bradner, Novartis
Dr. Courtney Fletcher, University of Nebraska Medical Center
Dr. Frederick Hayden, University of Virginia
Dr. Hilary Marston, NIAID

There is a long history of antiviral drug discovery and development dating back to the 1960s. While these earliest efforts were largely empiric, the tremendous effort against HIV in the 1980s and 1990s was pivotal in the shifting emphasis to more target-based drug discovery and some of the earliest successes in structure-based and rational drug design. The success of antiretroviral therapy for HIV illustrated the critical importance of combination therapy and adherence in treating chronic infections and highlighted the value of fixed dose combinations, convenience, and tolerability. These fundamental lessons were subsequently relearnt in the discovery and development of direct acting antiviral drugs for HCV.

HCV drug discovery also emphasized a target-based approach for the development of protease and polymerase inhibitors, but in the end, empiricism was also critical to this amazing success story. The HCV NS5a inhibitors, which became pivotal to most successful combination therapies, were discovered from agnostic cell-based screens that were only made possible by the development of replicon assays. The development of replicons for multiple diverse HCV genotypes was fundamental to achieving the breadth of activity needed to address both spectrum and resistance, also illustrating the critical value of having the right in vitro models to drive the drug discovery process.

Throughout the 1980s, 1990s, and 2000s, advances were also made in therapeutics for HBV, influenza, and various herpesviruses. Today there are more than 90 approved antiviral agents to treat a variety of both acute and chronic viral infections. While there are successful antiviral drugs across multiple distinct target classes, the largest number and broadest class of approved antiviral drugs are those which target viral polymerases. Polymerase inhibitors have been approved to treat infections across both RNA and DNA viruses as well as retroviruses and comprise a myriad of mechanisms, including substrate mimetics such as nucleoside and pyrophosphate analogs but also non-nucleoside or allosteric inhibitors. It is worth noting even nucleosides can exhibit distinct mechanisms of action, including chain termination, inhibition of translocation, and error catastrophe with unique implications for pharmacology and resistance.

In general, enzyme targets dominate the list of approved antiviral agents, but after polymerase, other enzyme targets are generally unique to different virus families making it challenging to find drugs that work broadly. The challenge of finding approaches that are effective across a virus or virus family is particularly true for viral entry targets, which can often vary even for a specific virus in cases where multiple receptors or modes of entry are observed. The best clinical illustration of this challenge is the development of CCR5 inhibitors for HIV, where having a diagnostic to differentiate CCR5 vs CXCR4 tropism was critical and became an impediment for the use of such

agents in the real world. CCR5 inhibitors are also one of the only examples of a successful antiviral development against a host target, another challenge for antiviral development generally.

Despite a tremendous track record of success, there are lessons from notable disappointments in antiviral drug development. There is always the potential for failure due to toxicity or pharmacology that plague drug development more generally, but in the case of antivirals, in some cases poor efficacy can be attributed to a drug's inability to address either inherent diversity or easily acquired resistance. One such example is the first generation HCV protease inhibitors that were obsolete by the time they launched, being replaced by agents with improved resistance profiles and spectrum. While in many cases, learnings from the initial clinical disappointments resulted in improved agents, an earlier understanding of diversity and resistance could have avoided many of these early mistakes. Therefore, understanding the impact of genetic diversity and resistance is important even at the earliest stages of target and lead selection.

While it is certainly preferable to develop agents which have a high barrier to the development of resistance, as seen in HIV and HCV, even agents with a low barrier to resistance development can work when combined if there is adequate pharmacologic coverage. The importance of combinations appears to be more important in treating chronic infections, where there is ongoing replication and a larger more diverse population as compared to prevention where dual and even monotherapy is highly effective. But even in chronic infection, monotherapy can sometimes work, as is the case in HBV, likely a consequence of both the biology of the virus and the specific agents.

It is important to note that resistance and antiviral efficacy are intrinsically linked to pharmacology. The following characteristics have been found to decrease the probability of the development of resistance: high bioavailability, high plasma and/or organ/tissue/site-of-action distribution, long elimination half-life, low intra- and interpatient variability, low probability as a victim or perpetrator of drug-drug interactions, and convenient dosing regimens (which promote high adherence and are forgivable of missed doses). To maximize the potential for broad impact and global use, oral agents with low cost of goods that are easy to formulate and also suitable for pediatric formulations are critical. For chronic therapy and prevention, drugs which are amenable to long-acting formulations are highly desirable. In addition, understanding where the agent needs to be delivered to treat or prevent infection is key. In respiratory infection for example, intranasal administration may not be sufficient to treat or prevent lower respiratory tract disease but may be useful for prophylaxis.

For both acute and chronic infections, timing is key. As has been shown in HIV, early treatment and prophylaxis lead to profound patient, public health, and economic benefit. The same has been

observed in the setting of preemptive therapy or post exposure prophylaxis. How soon post-exposure prophylaxis needs to be administered may vary between different viral infections and antiviral mode of action, but in all preclinical models and clinical studies of respiratory viral infections, sooner is better. In a pandemic setting, this is especially critical. For influenza, insufficient and delayed use of neuraminidase inhibitor treatment resulted in these drugs having a diminished impact on patient mortality during the 2009 pandemic despite their known effectiveness. The exceptions included countries like Japan that had high levels of antiviral coverage, including children and pregnant women.

A number of potential SARS-CoV-2 inhibitors are being considered for topical administration (e.g. intranasal, inhaled) to the respiratory tract. One issue for topically delivered respiratory virus antivirals is whether intranasal administration is sufficient, which in turn, depends on the principal site(s) of initial acquisition. Intranasal interferons (IFNs) protect against rhinovirus and likely common respiratory coronavirus illness. However, neither intranasal IFN nor intranasal zanamivir prevent natural influenza illness. In contrast, inhaled zanamivir is highly effective for prevention of influenza illness (75-80% in household contacts). It remains to be determined whether antivirals administered intranasally (i.e. protecting only the nose) might prevent some SARS-CoV-2 infections. Inhaled investigational agents like IFN-beta, which has shown some efficacy in hospitalized COVID-19 patients, and when available, inhaled remdesivir may prove effective in prevention and early treatment.

It is well established that antiviral drugs are highly effective in both treating and preventing infections, if they have the right pharmacologic properties, can be easily accessed, and administered to at risk populations. Having the appropriate in vitro tools and in vivo models to develop antivirals are key. Investing in the basic biology to develop these tools, assays, and models, understand the implications of resistance and overcoming the barriers which impede rapid access to the use of such drugs once developed, are critical for limiting future pandemics and outbreaks and requires a collaborative effort which crosses public, private, and governmental boundaries.

Preclinical Pharmacokinetics and Formulation

As with any preclinical drug development program, it is essential to understand the physicochemical properties of the drug compound and the resulting pharmacokinetic profile in order to improve chances of success in demonstrating in vivo efficacy. For example, Remdesivir is given intravenously due to poor oral bioavailability. Moreover, remdesivir required solubility enhancement using cyclodextrins due to its limited solubility[70] Preclinical formulation development should take into account drug solubility, stability, and absorption. In the case of

alternative routes of administration may also be considered. Notably, intranasal and pulmonary administration appears a promising strategy for SARS-CoV-2 antiviral delivery where ACE2 receptor distribution is implicated in initial infection and subsequent pathology[71].

SUMMARY OF DISCUSSIONS AND PERSPECTIVES ON THE CHALLENGES AHEAD

Speakers:
Dr. George Painter, Emory University
Dr. Richard Whitley, University of Alabama at Birmingham

Overview of the Virus and Therapeutic Approaches

An overarching goal for the coronavirus antiviral program is the discovery of broadly active compounds that act at multiple sites in the virus replication cycle, and that target diverse coronaviruses (CoV) both in vitro and in animal models. The ability to administer drug by multiple routes (IV, oral, inhalation, and nasal) is highly desirable. A toxicity profile that supports prophylactic as well as therapeutic use is key. As the current pandemic emerged, the problems associated with clinical development in the absence of a clear understanding of the virologic and immunologic course of disease became apparent. Important considerations moving forward include determining acute viral burden, establishing the effective therapeutic window, and identifying potent combination therapies designed to improve efficacy and prevent resistance. Even with the availability of effective vaccines, antiviral drugs will be required to protect highly vulnerable populations with diminished immune function or who cannot take vaccines due to allergic reactions.

Targeting Viral Replication Machinery of SARS-CoV-2

Therapeutics against SARS-CoV-2 consist of many subtypes: antibodies, early inhibitors of entry, fusion inhibitors, RNA polymerase inhibitors, protease inhibitors, and virus release inhibitors, among others. These can be either host or viral targeted therapeutics. One of the most successful methods to mitigate SARS-CoV-2 replication is by direct acting antivirals; currently, those that target the replication machinery are of high interest. To date, progress has been made in the development of nucleoside analogs, as these are the only class of antivirals that have been approved clinically for COVID-19 (e.g., remdesivir)[14]. There are pros and cons of developing nucleosides. Those nucleosides in which the sugar is ribose, called "ribonucleosides," have had the advantage in that they had been jump started from other viral indications. Advantages include: 1. they mimic natural substances; 2. in vitro work has suggested a high threshold of viral resistance; 3. the development pathway is well understood; and 4. tests are in place to detect off target toxicities. The fact that ribonucleosides tend to be broadly active make this family of therapeutics desirable for interrogation (both for now, and off-the-shelf for future pandemics)[72–74].

It has proven difficult to establish structure-activity relationships for nucleoside/nucleotide analogs, consequently nucleoside discovery generally is a trial and error process. The current approach is to simply introduce modification on the base or ribosugar, and then test each derivative for activity. In addition, nucleosides require multistep metabolic activation for conversion to the 5'-triphosphate derivative in order to be inhibitory. This effort can be a challenge as metabolic activation varies between different cell types, which makes selection of assay types and cell types a challenge for downstream evaluation. Further, the delivery of nucleosides to the target tissue of interest can be a challenge. However, there is a wealth of historical data that

informs the selection of those nucleosides that provide a starting place for synthetic efforts. Nevertheless, chemistry can be challenging working through the many variations of modifications that are possible on base versus ribosugar. Nucleosides, because they mimic natural factors, also can act through different mechanisms, targeting aspects of the replication machinery of either host or virus (selectivity). While tools have improved the design of antiviral nucleosides, these compounds must be tested in whole cell screens and must be evaluated for the potential off-target effects (mitochondrial or host cell compartment interactions). Lastly, the design of alternative delivery options, e.g. such as oral delivery - can be challenging. Tactics to make all the information surrounding the work in nucleoside therapeutics more widely known across disciplines including the assays to determine antiviral effect must be made more generally available.

Proteases (Viral and Hosts)

An obvious target is viral and host proteases, as these proteins are important for viral entry and processing. Of benefit is that libraries of HIV and HCV protease inhibitors provide a logical starting point for synthesis. Repurposing protease inhibitors provides an invaluable and rich resource especially for combination therapies. Proteases have been demonstrated to be broadly druggable, and new pre-clinical candidates will emerge. Currently, success has been extremely limited in contrast to that which has been achieved with HIV and HCV infections

Emerging Targets and Emerging Modalities

Nucleosides are of interest because they function as directly interacting with replication processes within either the virus or host. However, there are numerous proteins that are part of the replication machinery, providing opportunities for other target strategies. Efforts to selectively target downstream proteins are now becoming well advanced. In addition, through the application of AI computational oversight to identify properties of likely drug candidates would be expected to be a major step forward, including helicase, endoribonuclease, exonucleases, and methyltransferase.

Knowledge of the lifecycle of SARS-CoV-2 virus indicates that there are numerous other targets of the viral or host genome or proteome that are largely unexplored and could be suitable for drug discovery. The fact that these targets are unexplored makes this route of therapeutic discovery and development more contingent on unknown factors. These unknown risks and benefits must be recognized, but it should not be a factor that impedes progress.

Preclinical Tools

When choosing the preclinical tools to test compounds in vitro and in vivo, the choice of cell type is crucial for cell assays. Orthogonal assays as well as AI are necessary tools to complement discovery efforts[75]. In vivo models can be problematic but are ultimately helpful for therapeutic development. In vivo models can help determine if a drug is capable of engaging a target tissue. In particular, animal models provide a critical true tool for the assessment of drug distribution, e.g. site of viral replication is essential. Further, the half-life, oral bioavailability, metabolism, distribution, microsomal stability, etc. can all be evaluated in animal systems[76]. However, animal models may fail to determine if metabolic differences can drastically alter the way a drug is metabolized. Further, it should be emphasized that a drop in viral burden is not a validated endpoint for efficacy. Each animal model has its own set of peculiarities and other models could be considered. Especially for SARS-CoV-2 (and other respiratory viruses), the air-liquid interface human airway cell model may provide insight into tissue site needs better than an animal model[77].

Clinical Trials and Lessons from Other Viruses and Preparation for the Future

When considering lessons from previous antiviral drug development, clinical trial design and execution should be carefully reviewed. Decrease in viral burden is not a traditionally validated endpoint with the exception of HIV, HCV, and cytomegalovirus (CMV) after hematopoietic stem cell transplantation (HSCT). However, for SARS-CoV-2 antiviral candidates, the lack of antiviral efficacy in early clinical studies of prevention or treatment of mild illnesses should raise concerns about advancing such candidates further. For agents demonstrating antiviral efficacy, what should antiviral clinical trial endpoints be? For SARS-CoV-2 the answer is dependent on the indication (e.g., pre-exposure or post-exposure prophylaxis, treatment) and target population (e.g., early treatment in outpatients to ameliorate illness, prevent disease progression, and/or reduce transmission; treatment in seriously or critically ill hospitalized patients). The logistical issues are many, such as defining diverse patient populations or, often forgotten, the staffing and supply needs to accommodate the appropriate trial. Standardization of platforms for each stage of development, including the clinical trials, would be a helpful step for all. This has been achieved in the pandemic response in part through creation of large pragmatic, adaptive trials in hospitalized COVID-19 patients like RECOVERY in the UK, WHO's Solidarity Trial, and ACTT and ACTIV in the US. These platforms have provided key outcomes data on therapeutics that helped (i.e., dexamethasone, baricitinib), those that did not (hydroxychloroquine, lopinavir-ritonavir, azithromycin) and those with inconsistent results (e.g., remdesivir). Availability of databases and algorithms for AI to provide computational oversite for in vitro and in vivo models and clinical trial design as well as openly sharing negative data among all research groups is useful to avoid rabbit holes that are a waste of time and money. Standardized endpoints would also enable "basket antiviral trials" that test multiple antivirals (or combinations) with a single placebo arm.

Ultimately, for the development of any drug, the most important factor is to guarantee that the lead is safe for human administration[78]. As emphasized, the early stages of the drug discovery and development process should include considerations regarding what the final product insert will recommend as the indication. Considerations would include: will a compound be used for prophylaxis? What formulation options are required according to the route of delivery? Drug delivery to the site of viral replication/disease must be included in the development pathway and crucial treatment paradigm. Establishing these goals at the outset ensures the appropriate design, particularly outpatient or inpatient, with or without multiorgan involvement. In the medicinal chemistry field these are referred to as "target product profiles." The breadth of knowledge critical for drug discovery and development is vast. A translational science approach with a combination of skill sets from virologic and immunologic backgrounds as well as chemistry, toxicology, and other fields are important factors of success.

Forming Partnerships

Forming product development partnerships (PDPs) around direct acting antivirals is a powerful means of rapidly discovering and developing antiviral therapeutics. PDPs are synergistic initiatives between academic innovators at the cutting edge of their discipline and biotechnology/pharma-based drug developers, who can rapidly move clinical development candidates forward through preclinical and into clinical development[79]. Formation of these partnerships is absolutely necessary to maximize the possibility of success in a time and cost-efficient manner. Working with regulators during a pandemic is also important. Defining the resources that are needed and are already available is key. Both NCATS and NIAID have preclinical development resources that are readily accessible.

RESOURCES

National Institutes of Health Accelerating COVID-19 Therapeutic Interventions and Vaccines (NIH ACTIV)

- In response to the emergence and rapid spread of the SARS-CoV-2 virus and of the Coronavirus Disease 2019 (COVID-19), NIH ACTIV brought together senior members of the National Institutes of Health (NIH), the biopharmaceutical industry, the U.S. Food and Drug Administration (FDA), the European Medicines Agency (EMA), and academic researchers to establish a new biomedical research PPP to coordinate respond to COVID-19 and to plan for future pandemics.

- ACTIV working groups have been evaluating potential new therapeutics for preclinical and clinical development. Sponsors are encouraged to submitted agents to the therapeutic agent survey portal for expert review, guidance, and potential support for further efforts (e.g., inclusion in one of the ACTIV managed master protocols). (https://redcap.ncats.nih.gov/redcap/surveys/index.php?s=DAE87WPTE7)

- Description of the ACTIV clinical trial master protocols and additional resources to guide preclinical and clinical research on SARS-CoV2 can be found at the following link (https://fnih.org/what-we-do/programs/activ-partnership)

National Institute of Allergy and Infectious Diseases (NIAID)

- NIAID has a comprehensive suite of preclinical services available to the infectious disease research community to facilitate research in various stages in the product development pathway (www.niaid.nih.gov/research/microbiology-and-infectious-diseases-resources), including assays for testing candidate products against the SARS-CoV-2 in vitro and in animal models. Note that the purpose of these resources is not to assist researchers in developing a product from start to finish, but rather to lower the financial risk to product developers by providing limited, but critical, information to fill specific gaps in the product development pipeline.

- NIAID has many research resources available that may be of interest to you (https://www.niaid.nih.gov/research/resources), including SARS-CoV-2 reagents available from the BEI Resources Repository (https://www.beiresources.org/).

National Institute of Allergy and Infectious Diseases (NIAID, continued)

- In addition to grants and contracts, NIAID also offers a range of basic, preclinical, and clinical resources for the scientific community to advance product development. Information on these services can be found at (https://www.niaid.nih.gov/research/resources). You do not need NIH funding to utilize these resources.

- The National Biocontainment Laboratories (NBLs) and Regional Biocontainment Laboratories (RBLs) provide BSL-4/3/2 and BSL-3/2 biocontainment facilities, respectively, for research on biodefense and emerging infectious disease agents. Investigators in academia, not-for-profit organizations, industry, and government studying biodefense and emerging infectious diseases may request the use of biocontainment laboratories. Please contact the NBLs and RBLs directly for further information.

National Center for Advancing Translational Sciences (NCATS)

- NCATS aims to address scientific and operational challenges that slow the development of new interventions to improve human health. Experts in NCATS's Division of Preclinical Innovation actively seek collaborators on various research projects, including SARS-CoV-2-related targets:
  - NCATS's early stage collaborative programs include 3-D Tissue model development, assay development (Assay Development and Screening Technology), high-throughput screening and hit-to-lead medicinal chemistry (Early Translation Branch), and informatics, as well as many others (https://ncats.nih.gov/about/center/org/dpi/collaborate).

  - NCATS staff can also provide expertise that enables and accelerates Investigational New Drug (IND) applications. Investigators or companies who have identified promising small molecules, biologics or gene therapies can form joint project teams with NCATS' Therapeutic Development Branch staff — including Bridging Interventional Development Gaps (BrIDGs) and Therapeutics for Rare and Neglected Diseases (TRND) scientists — to develop IND-ready therapies for consideration by the Food and Drug Administration for clinical testing.

National Center for Advancing Translational Sciences (NCATS, continued)

- The NCATS COVID-19 OpenData Portal: NCATS has been generating a collection of datasets by screening a panel of SARS-CoV-2-related assays against ~10,000 annotated small molecules (including all approved drugs). These complete datasets, as well as the assay protocols used to generate them, are being made immediately available to the scientific community on the OpenData Portal as the screens are completed (https://opendata.ncats.nih.gov/covid19).

- In coordination with NCATS, and with support from the Foundation for the National Institutes of Health (FNIH), the National Institutes of Health (NIH) Accelerating COVID-19 Therapeutic Interventions and Vaccines (ACTIV) Preclinical Working Group has been collecting and maintaining up-to-date summaries of COVID-19-related animal models, in both small animals and non-human primates (https://opendata.ncats.nih.gov/covid19/animal).

Subject: WHO Working Group on COVID-19 Assays

Dear All,

Please find below the agenda and call-in information for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday February 10 2:30PM CET (Geneva Time)

1. Alain Townsend (University of Oxford)- *A haemagglutination test for rapid detection of antibodies to SARS-CoV-2*
2. David Montefiori (Duke) - *SARS-CoV-2 variant B.1.1.7 is susceptible to neutralizing antibodies elicited by ancestral Spike vaccines*

Subject: Dengue NS2A Protein Orchestrates Virus Assembly

尊敬的老师：

您好！我是武汉大学的钟有权，最近在阅读您发表的文章"Dengue NS2A Protein Orchestrates Virus Assembly"发现，文末提供的补充材料链接是原文PDF的链接，并不是补充材料的链接。所以我想问问您方便提供补充材料的链接吗？

冒昧致信，恳请海涵，感谢老师能在百忙之中阅读我的邮件。

敬颂

时安

学生：钟有权

Subject: RE: Transfer of SARS-CoV-2 reporter virus

Hello Xin Mei,

I just wanted to point out that these materials have to be shipped with a CITES permit due to the fact that the virus is grown on Vero cells. I already have the permit on my end, but you might also have to apply for this permit to be able to receive.

Can you please check with your customs office to verify?

The package will be picked up at my office location:

David Blakeman
1302 Mechanic Street
Galveston TX, 77555
552.117

Thanks,
David

Dear Dr Plante,

Kindly find attached fully executed MTA for the transfer.

Thank you.

Best regards,
Xin Mei

- External Email -

Ok then, that is a little easier. We are likely 10 or so days from a production lot of virus being ready as we have to amplify up our cells.

Thanks

Ken

Hi Ken,
The MTA for this request has already been executed. Sorry I should have mentioned to you earlier.

Hi Xin Mei,
Could you email Ken the fully executed MTA? Thanks!

Cheers,

- Pei-Yong

I can start the MTA process and wait until I have Nano-luc ready to go before I ship.

Let me know.

Dear Ken and Pei-Yong,

0.5 ml is sufficient.

For Nano luciferase reporter, any chance to send us a small aliquot as well? I know that you are in the process of setting up a formal depository, but for us to get two import shipments, there is a lot more effort involved. So it will be greatly appreciated if we can have both shipped at your earliest convenience.

Thanks

Subject: Re: Transfer of SARS-CoV-2 reporter virus

Hello,

A couple of things,

we can send you the SARS-CoV-2mNG, but we will only be able to send you (2) 0.5ml aliquots. This should be more then enough for you to grow massive working stocks. We use 100ul these stocks to infect a t-850 rolling bottle and produce 220ml of virus.

We are in the process of depositing the Nano luciferase reporter currently.

The RFP is still in development and will be unavailable for some time.

Do you want me to start that process now?

Ken

Dear David and Dr Plante,

May we also get your assistance to confirm the details and insert the institution's letterhead for the declaration letter attached?

We will be submitting this to apply for import permit from relevant authorities.

Thank you.

Best regards,
Xin Mei

Subject: RE: Transfer of SARS-CoV-2 reporter virus

Hi David,
We are shipping the SARS-CoV-2 reporter viruses from UTMB to Duke-NUS BSL3 facility through Ken's World Reference Centre. The Singapore receiver is arranging courier for the shipment. Could you help them with the question?

Hi Xin Mei,
Dr. Ken Plante (cc'd) from the World Reference will lead the shipment arrangement from UTMB side.

Thanks!

- Pei-Yong

Dear Prof Shi,

This is Xin Mei from Prof Wang Linfa's lab at Duke-NUS Medical School.

We are currently arranging for the transfer of the SARS-CoV-2 reporter viruses from UTMB to Duke-NUS BSL3 facility. May we confirm that the following is the full address for pick up by the courier company and if there is a contact person we can liaise with for the transfer?

Pick up address for courier company:
Department of Biochemistry & Molecular Biology
University of Texas Medical Branch
Galveston, Texas 77555

Thank you.

Best regards,
Xin Mei

Thanks Xin Mei.

Dear Pei-Yong,
Sorry it took much longer than I wanted, but that is the "norm" we all face.
It will be appreciated if you (or your lab manager) can assist us to speed up the shipment.

Thanks

Hello Xin Mei,

I just wanted to point out that these materials have to be shipped with a CITES permit due to the fact that the virus is grown on Vero cells. I already have the permit on my end, but you might also have to apply for this permit to be able to receive.

Can you please check with your customs office to verify?

The package will be picked up at my office location:

David Blakeman
1302 Mechanic Street
Galveston TX, 77555
409 682 2874

Thanks,
David

Ok then, that is a little easier. We are likely 10 or so days from a production lot of virus being ready as we have to amplify up our cells.

Thanks

Dear Ken and Pei-Yong,

0.5 ml is sufficient.

For Nano luciferase reporter, any chance to send us a small aliquot as well? I know that you are in the process of setting up a formal depository, but for us to get two import shipments, there is a lot more effort involved. So it will be greatly appreciated if we can have both shipped at your earliest convenience.

Thanks

Hello,

A couple of things,

we can send you the SARS-CoV-2mNG, but we will only be able to send you (2) 0.5ml aliquots. This should be more then enough for you to grow massive working stocks. We use 100ul these stocks to infect a t-850 rolling bottle and produce 220ml of virus.

We are in the process of depositing the Nano luciferase reporter currently.

The RFP is still in development and will be unavailable for some time.

Do you want me to start that process now?

Ken

Subject: BNT162b1 vaccine development is fundamentally flawed, the trials are invalid and the safety claims are laughable

BNT162b1 vaccine development is fundamentally flawed, the trials are invalid and the safety claims are laughable

Lack of Design for Safety

Vaccines must be designed not developed using trial and error as is the case for BNT162b1. Among the first steps during design is publishing design FMEA (Failure Modes and Effects Analysis). This team has **utterly failed** since there is no FMEA published before going into trial. Without FMEA, a proper trial cannot be designed. All failure modes need to be identified. Only then we can test in the trial if the design has successfully avoided the failure modes.

U.S. Consumer Product Safety Commission (CPSC) says:
"**Design** is the dominant influence on product safety. **Product safety starts in the mind of the product designers.** If all the elements of manufacturing were ranked in order of their potential effect on consumer product safety, **the design function would lead the list**. Additionally, **design importantly affects subsequent decisions** and practices related to materials, production, **testing**, processes, labeling, packaging and distribution."
Vaccine safety: Learning from the Boeing 737 MAX disasters
https://doi.org/10.5281/zenodo.2648251

Lack of testing for de novo IgE synthesis directed against vaccine antigens

The vaccination can result in IgE mediated sensitization to the RBD antigen. The Moderna mRNA vaccine failed by doing exactly that. Causing IgE mediated sensitization directed against the vaccine antigen. 3 of 45 recipients therefore predictably suffered severe allergic reaction following the second dose. A textbook case of sensitization followed by elicitation - a type 1 hypersensitivity reaction. You cannot escape by talking about vaccine antigen dose. Vaccine-induced protection is usually short term. IgE is long-term persistent. So recipients can develop severe COVID-19 due to the allergic reaction since vaccine-induced protection has waned. Exactly same failure as the Dengvaxia disaster. You cannot control the RBD antigen dose during a SARS-CoV-2 infection.

www.statnews.com/2020/05/26/moderna-vaccine-candidate-trial-participant-severe-reaction/

Lack of autoimmune serology

You have not performed autoimmune serology to check for vaccine-induced de novo autoimmune disorders.

You excluded individuals with autoimmune disease (AD)? How did you do that? Obesity is AD. Heart disease is AD. Type 2 diabetes is AD. How did you detect subclinical AD?

Vaccines and Biologics injury table based on mechanistic evidence – Feb 2020 Covering over 125 conditions
https://doi.org/10.5281/zenodo.2582634

The insanity of completely relying on testing

You are insanely relying on testing alone to check for safety problems. You follow-up for 2 months, you MAY catch problems that show up in two months. You test for 2 years, you MAY catch problem for that duration. How do you catch say vaccine-induced type 1 diabetes that shows up after 15 years? Run a trial for 15 years? You should stop this insanity.

The Biontech/Pfizer vaccine development process is fundamentally flawed, the trials are invalid and the safety claims are laughable.
You need to go back to the drawing board. Per CPSC, your vaccine is **UNSAFE BY DEFINITION** because you lacked a design process.
Obviously, having learned **NOTHING** from the Pandemrix induced narcolepsy disaster, you are proceeding at warp speed to create the next humongous disaster.

Pandemrix and Arepanrix vaccine safety analysis and scrutiny fell short

Ok then, that is a little easier. We are likely 10 or so days from a production lot of virus being ready as we have to amplify up our cells.

Thanks

Dear Ken and Pei-Yong,

0.5 ml is sufficient.

For Nano luciferase reporter, any chance to send us a small aliquot as well? I know that you are in the process of setting up a formal depository, but for us to get two import shipments, there is a lot more effort involved. So it will be greatly appreciated if we

can have both shipped at your earliest convenience.

Thanks

Subject: Re: Transfer of SARS-CoV-2 reporter virus

Hello,

A couple of things,

we can send you the SARS-CoV-2mNG, but we will only be able to send you (2) 0.5ml aliquots. This should be more then enough for you to grow massive working stocks. We use 100ul these stocks to infect a t-850 rolling bottle and produce 220ml of virus.

We are in the process of depositing the Nano luciferase reporter currently.

The RFP is still in development and will be unavailable for some time.

Do you want me to start that process now?

MATERIAL TRANSFER AGREEMENT

This Material Transfer Agreement **("Agreement")** is made between The University of Texas Medical Branch at Galveston, d/b/a UTMB Health ("UTMB"), a health institution of The University of Texas System ("System"), an agency of the State of Texas, located at 301 University Blvd., Galveston, TX 77555-0926, and National University of Singapore, a public company limited by guarantee incorporated in Singapore, located at 21 Lower Kent Ridge Road, Singapore 119077, acting through Duke-NUS Medical School (**"Recipient"**).

From the laboratory of Dr. Pei-Yong Shi, **("Provider Scientist")**, UTMB agrees to provide Recipient with certain materials for the purpose stated herein under the following conditions:

Material and Research. The Materials covered by this Agreement includes reagents (mNeonGreen SARS-CoV-2 reporter virus, Nano luciferase SARS-CoV-2 reporter virus, RFP SARS-CoV-2 reporter virus, and other recombinant SARS-CoV-2 Viruses) **("Material")**. The Material shall be used by Recipient in the scope of research **("Research")**, as defined in **Attachment A,** and the Research will be conducted by Recipient under the supervision of Prof WANG Linfa **("Recipient Scientist")**. Recipient shall provide Provider Scientist with a FedEx account number for shipping of the materials requested.

1. **Use of Material.** This Material is made available solely for use in the Research. The Recipient shall not use the Materials or any substance that is replicated or derived therefrom for any commercial purpose, or in the conduct of research that is subject to legal or commercial obligations to another institution, corporation or business entity, unless UTMB provides its prior written consent. The Material shall be used only in laboratory animals or in vitro experiments. The Material shall not be used in humans. The Material is considered proprietary to UTMB. UTMB shall be free, in its sole discretion, to distribute the Material to others and to use it for its own purposes. Except as provided for by this Agreement, Recipient shall not distribute, transfer, or release the Material to any person or entity other than laboratory personnel under Recipient Scientist's direct supervision, unless written permission is obtained from UTMB. Recipient agrees that all of its Recipient Scientist(s) involved in the Research will have read the terms and conditions of this Agreement and shall abide by the terms and conditions of this Agreement.
2. **Rights.** Subject to Section 5. Intellectual Property of this Agreement, Recipient agrees that nothing herein shall be deemed to grant to Recipient or Recipient Scientist any rights under any UTMB patents or any rights to use the Material for any products or processes for any purpose other than performing the Research. Recipient will not use Material for any commercial purposes. Recipient understands that UTMB shall have no obligation to grant a license to Recipient to use Material for commercial purposes, and may grant exclusive or non-exclusive commercial licenses to others, or sell or assign all or part of the rights in the Material to any third party(ies), subject to any pre-existing rights held by others and obligations to the Federal Government.
3. **Confidentiality**. All Material and information relating to the Material that is disclosed by UTMB to Recipient shall be considered to be confidential, subject to Section 4. Publication of this Agreement. Recipient will use reasonable efforts to prevent the disclosure of UTMB's confidential information to third parties for a period of three (3) years from receipt, provided that the Recipient party's obligation shall not apply to information that:
   a) is already in the Recipient's possession at the time of disclosure;
   b) is or later becomes part of the public domain through no fault of the Recipient;
   c) is received from a third party having no obligations of confidentiality to UTMB;
   d) is independently developed by the Recipient; or
   e) is required by law or regulation to be disclosed.

In the event that information is required to be disclosed pursuant to subsection (e), Recipient shall notify the UTMB, in order to allow UTMB to assert whatever exclusions or exemptions may be available to it under such law or regulation.

4. **Publication.** Recipient will inform UTMB of results of Research, in confidence, related to the Material by providing UTMB with a draft manuscript describing such results. If Recipient's Scientist desires to publish or present such Research results, then, not less than forty-five (45) days prior to submission to a third-party, Recipient will provide UTMB with a copy of any manuscript or abstract disclosing such Research results for the purpose of protecting the Material and intellectual property of UTMB that might be disclosed by such publication. In any such publication or presentation of Research results, Recipient agrees to acknowledge UTMB scientist as provider of the Material.
5. **Intellectual Property.** If the Research involving the Material results in an invention, Recipient Scientist will promptly disclose the invention to Recipient's Patent Administrator and will notify the Patent Administrator of UTMB's role as a supplier of the Material used. Recipient, in cooperation with Recipient Scientist, will promptly supply UTMB with a copy of the disclosure, in confidence for UTMB's research and evaluation purposes only. Inventorship of any invention will be determined based on U.S. patent law. Ownership shall follow inventorship. Recipient recognizes the property rights of UTMB in the Material.
6. **Warranty.** The Material is experimental in nature and it is provided "AS IS" WITHOUT WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR SAFETY OR ANY OTHER WARRANTY, EXPRESS OR IMPLIED. UTMB MAKES NO REPRESENTATION OR WARRANTY THAT THE USE OF THE MATERIAL WILL NOT INFRINGE ANY PATENT OR OTHER PROPRIETARY RIGHT.
7. **Liability.** In no event shall UTMB be liable for any use by Recipient Scientist or Recipient of the Material or any loss, claim, damage or liability, of whatsoever kind or nature, which may arise from or in connection with Recipient's breach of this Agreement or Recipient's use, handling or storage of the Material, unless such loss, claim, damage or liability results from the negligence or willful malfeasance of UTMB, System, their Regents, officers, agents and employees.
   a) **State Entities:** To the extent authorized by the Recipient's state law, Recipient agrees to indemnify and hold harmless UTMB, System, their Regents, officers, agents and employees, from any liability, loss or damage they may suffer as a result of claims, demands, costs or judgments against them arising out of the Recipient's activities to be carried out pursuant to this Agreement and the use by Recipient of the results obtained from Research, excluding claims, loss, or damage that arise from the negligence or willful malfeasance of any Regent, officer, agent or employee of UTMB or System.
   b) **Federal Entities**: Recipient assumes the liability for any claims, damages, injury, or expenses arising from the use, storage, handling, and disposal of the Material by the Recipient, but only to the extent provided under the Federal Tort Claims Act (28 U.S.C. Chapter 171).
   c) **All other entities**: Recipient shall indemnify and hold UTMB, System, their Regents, officers, agents, and employees harmless against any and all claims, demands, damages, liabilities and costs which directly or indirectly result from, or arise in connection with, any negligent act or omission of Recipient, its agents, or employees, pertaining to its activities and obligations under this Agreement.
8. **Compliance.** Recipient will use the Material in compliance with all laws, governmental regulations and guidelines applicable to the Material. Moreover, if the Material is used in the United States, then Recipient will comply with current United States NIH guidelines.
9. **Export Control.** Recipient further agrees that if the U.S. export laws are or become applicable, it will not export any Materials received under this Agreement to any countries for which the United States government requires an export license or other supporting documentation at the time of export or transfer, unless Recipient has obtained prior written authorization from the appropriate authority responsible for such matters.

10. **Assignment.** This Agreement is not assignable, whether by operation of law or otherwise, without the prior written consent of UTMB.
11. **Publicity.** Recipient may not use the name of UTMB, System or their Regents without express written consent, subject to Section 4. Publication of this Agreement.
12. **Term and Termination.** This Agreement shall be effective as of the date of the last signature and terminate one (1) year from that date. Upon termination, Recipient will immediately destroy all the Material then in its possession.

Subject: COVID-19 assays review

Dear colleagues,

Similar to what was done recently with the WHO COVID-19 models working group, we would like to publish a short review about the state-of-the-art regarding COVID-19 assays. Based on your expertise and the data you have generated and presented to the WHO assays group, we would like to ask you to contribute to this paper. As you can see in the attached outline, we have suggested subgroups for different topics. Please take this only as a suggestion and feel free to contribute to other parts of the review as you deem fit. Also, feel free to suggest additional authors as needed. Florian Krammer has graciously agreed to help coordinate and submit this to a high quality journal. We would like to have a draft by the end of the year if possible. Please confirm that you wish to participate in this endeavor.

Thank you all in advance for your support.

Best regards
Bill Dowling ,
Co-Chair WHO COVID-19 assays working group

Subject: COVID-19 assays review

Dear colleagues,

Similar to what was done recently with the WHO COVID-19 models working group, we would like to publish a short review about the state-of-the-art regarding COVID-19 assays. Based on your expertise and the data you have generated and presented to the WHO assays group, we would like to ask you to contribute to this paper. As you can see in the attached outline, we have suggested subgroups for different topics. Please take this only as a suggestion and feel free to contribute to other parts of the review as you deem fit. Also, feel free to suggest additional authors as needed. Florian Krammer has graciously agreed to help coordinate and submit this to a high quality journal. We would like to have a draft by the end of the year if possible. Please confirm that you wish to participate in this endeavor.

Thank you all in advance for your support.

Best regards
Bill Dowling ,
Co-Chair WHO COVID-19 assays working group

Subject: INVITATION TO TELECONFERENCE CUBA-USA COVID-19

Dears Proffesors

Our Minister of Cuban Health organize THE VIDEO CONFERENCE BETWEEN EXPERTS FROM CUBA AND THE UNITED STATES with the objetive to discuss the experience about the management of Covid19. The video-conference will be do next Tuesday, May 5, 2020, TIME: 16:30 hrs (Cuban time).

You coming to the meeting that we organized in 2016 **Exploring Opportunities for Arbovirus Research Collaboration**
and this is the reason that you receive this invitation email.

THIS IS THE PREMILINARY PROGRAM:
Meeting objectives:
- Update globally situation of COVID-19, Americas region and fundamentally in Cuba and the United States.
- To make known to the United States experts how Cuba has faced the COVID-19 pandemic and the available scientific resources.
- Share what both countries have done to obtain understanding and rigor from the American scientific community about what they do in Cuba.
- Arouse interest in the people of the United States in what we do to confront the pandemic.

Introduction: Brief update on the situation of the new coronavirus (COVID-19) in the world, from its surgery and behavior up to now, emphasizing morbidity and mortality. General overview.

Presentation of the Plans to confront the pandemic in Cuba and in the United States. Offer brief information on how Cuba organized its confrontation, management and control plan for Covid-19.
-Epidemiology. Minister of Cuban Health

Brief exposition of the diagnostic models used. Experiences and results.
- Institute of Tropical Medicine Pedro Kouri

Presentation of the clinical management of the disease, in pediatric and adult ages, according to the established protocol.
- Institute of Tropical Medicine Pedro Kouri.

- Minister of Cuban Health

Presentation of the innovative Cuban biotechnology products incorporated into the treatment models used in the different stages of treatment.
- Center for Molecular Immunology (CIM).
- Center for Genetic Engineering and Biotechnology (CIGB)
- Director of Science and Innovation of BioCubaFarma

Exchange of questions and answers between the participants.

If you are agre to participate only tell me in order to send you later on more detail about the video-conference.

Also if you kwon others proffesors that are involve in Covid managemnet we appreciate that you help us to comunicate and invite him.

Best wishes

Subject: M&I Depart.Review - 2014-2020 Publications
Importance: High

Good Morning,
Re: 2014-2020 Micro & Immun Departmental Review
Please send me your publication from 2014-2020 by January 15, 2021.
I have provide below format, citation format, and guidelines.

Please let me know if you have any questions.

NLM Style - Citation Format - ARTICLES

JOURNAL ARTICLES

Sample Article Citations:

Benny BV, Nagpal AS, Singh P, Smuck M. Vascular causes of radiculopathy: a literature review. Spine J. 2011 Jan;11(1):73-85.

Brantingham JW, Bonnefin D, Perle SM, Cassa TK, Globe G, Pribicevic M, Hicks M, Korporaal C. Manipulative therapy for lower extremity conditions: update of a literature review. J Manipulative Physiol Ther. 2012 Feb;35(2):127-66.

Daniels CJ, Morrell AP. Chiropractic management of pediatric plantar fasciitis: a case report. J Chiropr Med. 2012 Mar;11(1):58-63.

Brief Guidelines:

- List all authors, last name first, then first initial and middle initial (if available), separate each author by a comma.
- List full article title, capitalize only first word and any proper nouns.
- Abbreviate journal title according to NLM Catalog of Journals.
- Put year first, followed by month and date, if listed. End with semicolon.
- Put volume and issue (optionally, issue may be omitted if pagination continues for each issue). Do not add space after semicolon. End with colon.
- Indicate page number range. Do not repeat numbers or put a space after colon. i.e. if date range is 1235 through 1237, record as 1235-7.

Thank you
Tina

Subject: Media interview request - Dr. Menachery

Dear Dr. Menachery:

My name is Peter Koper. I am a writer for the arts/essay website SpliceToday (https://www.splicetoday.com/)

I am preparing an article about molecules and their role in humans' lives.

The piece is for a general audience.
Your expertise and communication skills make you an ideal source.

I would like to have a short email interview with you.

I thank you in advance for your reply.

Regards,

Peter Koper

Subject: RE: NYTimes: Coronavirus Antibody Tests: Can You Trust the Results?

Want to weigh something large? Put it on one end of a teeter-totter (a seesaw). Then balance that with a large rock on the other end. Now all you need do is weight the rock.

One way to determine the quality of these newly developed assays is to (a) find someone who knows what the hell they are doing and have them (b) test by MACELISA and IgGelisa, then (c) test by NEUTRALIZATION. Without the latter, I ain't buying it. In the current situation, who cares whether a person has antibody, to SARS-CoV-2, unless that antibody is helpful in determining protection. Jordi Casals and Bob Shope must be turning in their graves.

Now W.H.O. is saying that the presence of antibody is not indicative of protection from a second exposure to SARS-CoV-2. No shit, Sherlock.

Charlie

Subject: COVID-19 mouse models

Dear Dr. Menachery,

First, congratulations on your multiple papers and preprints on SARS-CoV2 including the recent *Science* Perspectives!

I would like to introduce myself. My name is Guru. I am a mouse molecular geneticist and a genome editing technology developer.

I serve as the director of the transgenic core facility at the University of Nebraska. I have developed a couple breakthrough CRISPR genome editing technologies called Easi-CRISPR and i-GONAD. I have included links to a few papers on these contributions below my signature.

I have designed strategies for developing over 20 mouse models for COVID-19. They are various kinds of knock-in models (that can be developed using Easi-CRISPR approach).

I have applied for a supplemental award through my R21 with NIAID for developing 6 of those models, which is currently under review. I have been in communication with the program officer who suggested that I should also consider applying for emergency R21 or R01 to develop these models.

PAR-20-177 https://grants.nih.gov/grants/guide/pa-files/PAR-20-177.html [grants.nih.gov]
PAR-20-178, https://grants.nih.gov/grants/guide/pa-files/PAR-20-178.html [grants.nih.gov]

I am reaching out to you to ask if you would be interested in joining with me in a grant submission. I am planning to submit either R21 (just to develop the models and distribute to the community) or R01 to develop and characterize models, if I can collaborate with experts like yourself who are actively working on SARS-Virology (my PHD in virology was on molecular epidemiology of foot-and-mouth disease virus but I am a genome editor since about 10 years!).

I have written the model generation part (for about 10 models), which is nearly ready for submitting as an R21 grant. If you can join me, we can easily add a few more designs and convert the grant into an R01 as multiple-PIs. I will develop all the models(as a genome editing expert), and as an infectious disease expert you could characterize and evaluate the models.

My list also includes immunocompromised strain background such as NSG, which are likely to develop more severe symptoms suitable for many studies. Some of the models I have designed (such as Cre-LoxP and Tet inducible knock-ins) in C57BL/6J (and NSG backgrounds) could be particularly useful for your aging related studies, where you can turn on the genes at different time points before infecting the mice.

If you are interested I would be happy to share more information. Also, it would great if you are available for a phone call anytime that works for you (weekend is fine). Please feel free to call 402 707 3035.

I look forward to hearing from you.

Best Regards,
Guru

Subject: APT FY 20

Dear Faculty,

APT FY20 blank faculty activity reports have been updated and placed in your S drive faculty folder under **S:\Faculty\Your Name\APT 2020.** (templates attached)

Those faculty who are up for post-tenure review have a 6 year activity report to complete which has been saved to your respective faculty folder on the S drive.

Please update your CV and make sure it's in the UTMB format (template attached).
Also, please turn in teaching evaluations or materials you would like the committee to review.

If you are on the non-tenure track, please request a letter from your supervisor evaluating your FY20 performance to be sent to the administrative office.
For faculty holding administrative titles, please request a letter from your administrative superior to be sent to the administrative office.

Let me know if you have any questions. Please turn in the reports by **August 1st** to the administrative office.

Thank you
Ana Laura Ramos

Good morning,

We are currently working on the departmental review for period 2014-2020.

I'm asking all faculty to send a brief description of your research project in the following format:

- Description should be 12-15 (maximum) lines
- 0.05" margin
- Arial 11 font

Also, please let me know if you have been promoted during this period.

Please submit requested material to me by Friday, January 15th.

Thank you,

I am about to head into the containment lab this morning. Best time would be when I get out, perhaps around 1pm New York time.

My office number is 001-409-772-9713. You can also email me the questions if that is preferable.

Subject: UK LBC Radio Interview request

Dear Dr. Danthi,

I hope you are well. This is Thomas from LBC Radio in the UK.

I was wondering if you might be available to talk about the latest news surrounding the Coronavirus tonight? If not you do you know if any of your colleagues from Indiana or ASV might be able to help?

Would be an over the phone or Facetime Audio interview. It is for our overnight show, so it would be a live interview anytime at 8.30pm, 8.50pm, 9.30pm or 9.50pm.

Hope you you can help!

Many thanks,

Thomas

Subject: Atlas Bio Serum

Vineet,

just left you a voicemail. I AM TRYING TO HELP!

I am one of the Owners of Atlas Biologicals and I am trying to help you. **We have a bovine serum product that works exceptionally well with VERO cells and I am certain it will help you in your COVID Research.**

The product is called **EQUALFETAL** and it is a product that we manufacture and sell mostly to the vaccine and human cell therapy markets. It is also used in large scale Monoclonal antibody production.

I am 100% certain it will work for you and SAVE you a tremendous amount of money compared to your use of traditional FBS. *I believe FBS will start to get harder to find and this is a solution for you if it does.*

Have your lab manager request a sample.

***I will send you a FREE SAMPLE IMMEDIATELY if you want to try it.*

***The serum is only $220.00 per 500mL*

Looking forward to your reply,

ATLAS BIOLOGICALS

An interesting question was brought up in our ID section – could chloroquine, in it's immune mediating capacity, reduce immune response to point where people don't develop neutralizing / protective Ab? So they would be higher risk for getting infected again? Even worse, getting infected with minimal symptoms but able to transmit again? Are we creating a pool of people who will not develop immunity hence increasing our pool of susceptibles for the future?

Subject: Re: (BN) Coronavirus May 'Reactivate' in Cured Patients, Korean CDC

There are many of these reports that have trickled out of patients testing positive again and worthy of follow up and monitoring.

However, I have not seen any reports that live virus was collected from these people who were reactivated/reinfected. The ones I have seen have all been PCR based tests. I can think of a few reasons this could occur.

1) Patients may not have truly cleared virus to begin with. COVID-19 patients have been going through waves of disease symptoms with people seemingly getting better and regressing a few days later. This may be happening in these studies and may be exacerbated in patients with milder disease.
2) PCR positive testing may be a product of clearing cells/debris. As the airway repairs itself, debris from infected cells may still contain the viral RNA and end with a positive test. The stability of small pieces of viral RNA and the abundance of the targets (depending on PCR) make this a potential outcome. Without the PCR data, it is hard to judge and cutoffs will be important.
3) The virus has gone dormant and reactivated in some way like a herpes viruses. This has never been seen before with a coronavirus. I am doubtful that this is what is happening.

My best bet is a combination of 1/2 are occurring. Without the data, it is hard to decipher if this is real. The CT values on the PCR test would be informative here and if they are on the low end (>30CT), my bet is the #2 is what is happening.

Dear Ben

This is a serious concern – I add Vineet Menachery and Shinji Makino since they are our two most expert coronavirologists at UTMB to see if they have an insights from the virus side.

It could very well be a testing problem, however. The PCR test based on nasal or throat swabs alone is spotty at best from day 6 post symptoms onwards – see paper from Germany in Nature attached. Caveat to this paper is that these were all mild cases – nonetheless an important study. I have not looked at the data in great detail but believe one could see whether patients oscillated between negative and positive status.

If useful to you I can check with my friend Dr. Antonio Dajer (Cornell ED) – he was highlighted in the New Yorker recently for his work with COVID-19 patients. He can tell me if they have seen anything like this

Coronavirus May 'Reactivate' in Cured Patients, Korean CDC Says
2020-04-09 04:25:07.356 GMT

By Kyunghee Park
(Bloomberg) -- The coronavirus may be "reactivating" in people who have been cured of the illness, according to Korea's Centers for Disease Control and Prevention.
About 51 patients classed as having been cured in South Korea have tested positive again, the CDC said in a briefing on Monday. Rather than being infected again, the virus may have been reactivated in these people, given they tested positive

again shortly after being released from quarantine, said Jeong Eun-kyeong, director-general of the Korean CDC.

"While we are putting more weight on reactivation as the possible cause, we are conducting a comprehensive study on this," Jeong said. "There have been many cases when a patient during treatment will test negative one day and positive another."

A patient is deemed fully recovered when two tests conducted with a 24-hour interval show negative results.

The Korean CDC will conduct an epidemiological probe into the cases, Jeong said.

South Korea was one of the earliest countries to see a large-scale coronavirus outbreak, but the country has seen just 200 deaths and a falling new case tally since peaking at 1,189 on Feb. 29. One of the world's most expansive testing programs and a tech-driven approach to tracing infections has seen Korea contain its epidemic without lockdowns or shuttering businesses.

Fear of re-infection in recovered patients is also growing in China, where the virus first emerged last December, after reports that some tested positive again -- and even died from the disease -- after supposedly recovering and leaving hospital. There's little understanding of why this happens, although some believe that the problem may lie in inconsistencies in test results.

Read more about Korea's CDC chief: The Virus Hunter Showing the World How to Fight an Epidemic

As of Wednesday, South Korea had 10,384 virus cases, with 6,776 released from hospital, according to data compiled by Johns Hopkins University and Bloomberg News.

Epidemiologists around the world are in a race to find out more about the virus that causes Covid-19. The pathogen's rapid global spread has recently seen the focus shift to patients who contract the virus but display few or atypical symptoms. Korea has been at the forefront of tracking these cases, which are causing particular concern in China, where the epidemic is showing signs of coming under control.

Subject: MEDIA: REQUEST FOR INTERVIEW

Hi Vineet,
This is Vaisakh E. Hari, a journalist with THE WEEK magazine in India, one of the largest circulated English-language news weeklies in the country, published by the Malayala Manorama group. Speaking as someone who has been following your work for some time, it is a pleasure to make your acquaintance.

We were working on a cover story on the ongoing coronavirus pandemic, which has unfortunately hit very close to home for many of us in India, and we would very much appreciate it if you could share your expertise with us on the subject.

Some topics we mean to explore:

1. The feelings of the medical community on the origins of the pandemic, now that both the US President Joe Biden and the UK intelligence agencies have lent credence to the "lab-leak" hypothesis. Does such a theory have legs to stand on?

2. Emergence of the variants of coronavirus, and what does it mean going forward?

3. Are vaccines the only hedge against (what you described in an interview as) "worst-case outcomes"?

4. Evaluation of the situation in India.

Would it be possible to schedule an interview? Our magazine goes to print by 10pm IST Tuesday.

Our website: https://www.theweek.in/home.html

Regards,

Vaisakh E. Hari

Subject: Re: looking for postdoc position

Dear Dr. Vineet,

About a month ago, I sent you an email regarding my interest in your research work. I`m looking for a suitable Postdoc position in the infection biology area and I would love to discuss ongoing projects in your lab if you can find some spare time. I will also send you my CV, I think my experience and expertise would be a good fit for your lab. Thank you so much.
Have a nice day.

Best regards
Inderjeet Kalia, Ph.D.
National Institute of Immunology
Aruna Asif Ali Road, JNU campus
New Delhi - 110067

Subject: Hello from CSC @ WashU/Meeting

Good Afternoon Wendy and Vineet,
I hope this email finds you both well!

I started at the CSC about nine months ago and have been spending a lot of time meeting members of our community. Would both of you be willing to meet via Zoom or phone sometime? It would be great to share a few updates on the CSC and hear about your experiences here.

Please let me know a date or time that works best for you. Aside from Tuesdays, my schedule is flexible. Thank you both for your time!

Blessings,

Brian

Subject: UV rays to inactivate SARS-CoV2.

Greetings Sir.
I am contacting you for further specific information regarding the mention on UV rays to kill the Corona Virus you made for the Washington Post dated 23 March 2020.

I have learned that SARS (2003) could be killed using UV rays of 254nm and I reckon that studies are still happening on what would be the wavelength of UV required to inactivate the SARS-CoV2.

I'm a Bachelor of Engineering in Electrical and Electronics student from Bangalore, India and the scare is on the rise here in India.

Inorder to combat this situation the All India Council for Technical Education (AICTE) has called all the innovators to contribute to flatten the curve.

From the many problem statements given by the event organisers, there is one which mentions about the need for disinfecting the currency notes. So for this need I'd like to know what must be the wavelength of the UV.

From your expertise, can you please clarify that will UV of 254nm be sufficient for the SARS-CoV2 because of the similarities it shares with the SARS (2003). Since there is no studies yet to confirm this, you could potentially tell me if 254nm would work because SARS-CoV2 is a cousin of SARS (2003).

Expecting a reply at the earliest.

Thank you and have a great day.
Abhijith V. Narayan

Dear Vineet Menachery,

Hope this note finds you well.
I am a producer at *CBS This Morning*, the national morning show in the United States co-hosted by Gayle King, Anthony Mason and Tony Dokoupil.

I am researching a piece about whether someone could be infected with COVID-19 more than once, and I would appreciate your insight.

Do you have a few minutes for a quick call on background?

Thanks and best,

Maite Amorebieta

Subject: Strictly confidential invitation to review a manuscript for Nature Reviews Microbiology

Dear Dr. Menachery,

Manuscript number: NRMICRO-20-199V4
Title: COVID-19: Mechanisms of vaccination and immunity
Author(s): Daniel Speiser and Martin Bachmann
Manuscript type: Proposal review

I hope you are well. Nature Reviews Microbiology has recently received this Proposal review article to be considered for publication. The article abstract is included at the end of this email for your information. As you are an expert in this field, I would like to invite you to act as a referee.

We are keen to ensure that the review process is both rigorous and swift, but we understand that the ongoing COVID-19 pandemic is causing severe disruption and are very aware that many researchers will have difficulty in meeting the timelines associated with our peer review process. If you accept this invitation, I would like to receive your comments within 10 working days, but please do contact me if you need additional time, we intend to be highly flexible at this time. If you are unable to review this paper, we would be grateful if you could suggest potential alternative reviewers, keeping in mind that Nature-branded journals strive toward an equitable demographic representation within our reviewer pool, for example, with respect to gender and geography. More information about our commitment to diversity can be found here.

Please respond to this invitation within 2 working days to let me know whether or not you would like to act as a referee for this article. We use an online submission and peer review system, so please reply by clicking on the following link:
https://mts-nrmicro.nature.com/cgi-bin/main.plex?el=A4Z1PiR6D1edX5F5A9ftdULOkyssKLKjdQI7XHTzdAZ

Do you want to involve one of your trainees in the peer-review process?
The Nature Reviews journals are committed to facilitating training in peer review and to ensuring that everyone involved in our peer-review process is appropriately recognised. We have therefore started an initiative to allow and encourage established referees to involve one early-career researcher in our peer-review process. If you participate in this trial, you will remain the primary contact and you will submit the final report, but the review that you compile together will be considered a co-review, meaning that both of you receive recognition for your contributions. We will send instructions to your co-reviewer and ensure that their referee activity is logged on our systems so that they are recognised for their review activity. **If you would like to participate, please reply to this email with the name and contact details of the researcher you'd like to co-review with within 48 hrs of accepting this invitation.** We cannot accept the addition of a co-reviewer after submission of the report and reserve the right to exclude the suggested co-reviewer if a conflict of interest is detected.

You should let us know if, on initial inspection and despite our efforts to avoid it, you realize that you have a competing or financial interest in the article's content. For further guidance, please take a look at our competing interests policy. We ask all referees to inform us of any interest that might be perceived as relevant. The content of this article must be kept in strict confidence, and you should not make use of it in your own research before it is published. In the interest of transparency, we are asking authors to declare any financial and non-financial competing interests. We hope this will aid in your evaluation of the paper.

I hope to hear from you soon.

Best wishes,
Ashley

Vaccines are needed to induce immunity to SARS-CoV-2, the virus causing COVID-19. Vaccines that induce large quantities of high affinity virus-neutralizing antibodies and T helper type 1 responses may optimally prevent infection, and avoid unfavorable effects. Vaccination trials require precise clinical management, complemented with detailed serology testing for protective virus-neutralizing antibodies and unwanted disease enhancing antibodies. Here we review pros and cons of available vaccine platforms, and options to accelerate vaccine development towards rapid immunization of the world's population against SARS-CoV-2. Broad use of carefully selected favorable vaccines may be critical for limiting harm and enabling long-term return to normal public life and economy.

COVID 19 and impact on peer review
As a result of the significant disruption that is being caused by the COVID-19 pandemic we are very aware that many researchers will have difficulty in meeting the timelines associated with our peer review process during normal times. Please do let us know if you need additional time. Our systems will continue to remind you of the original timelines but we intend to be highly flexible at this time.

Subject: Inquiry for the availability for new Ph.D. student in 2021
CV_Yuanfan_2020.pdf

Dear Professor Menachery,

My name is Yuan fan working full-time in the Institute of Preventive Medicine (IPM) in Taiwan, and I am applying to the University of Texas Medical Branch for the Ph.D. program in 2021. I have learned that the research of your lab associates with high-risk, zoonotic viruses, and their pathogenesis by using the cutting edge platforms. One of your aim of the study is to obtain mechanistic information and develop an alternative approach of antiviral treatment, which attract me the most. I have found that you have made a lot of great effort into researching the mechanisms and improving the animal model for investigating the conspiracy of the viruses. Your recent effort in constructing an infectious clone of SARS-CoV-2 and a thorough understanding and reviewing of the virus caught my attention exceedingly.

Furthermore, I am always looking forward to dedicating on the research and work in zoonotic viruses, such as SARS-CoV-2, not just I have gained related experience in the institute, but also, I think it could be one of the most influential studies around the world. It can shed light on the incremental emerging diseases for humans to understand.

Besides, I am interested in virology, emerging viruses, viral evolution, and high containment pathogens. Therefore, *I am writing to ask about that would your laboratory receive new Ph.D. students next year, 2021?* If I could have the fortune to get the admission for this program, I would like to receive the intensive training and leading-edge knowledge under your supervision. Also, the scholarship from my institute would cover my tuition fees and living costs, which means I can fully concentrate on doing research.

In terms of my background, I am a biomedical, military officer dedicated me both in biomedical science and my beloved country, Taiwan, for many years. I have awarded the full scholarship to cover my expenses of studying abroad, including tuition fees and living costs. Therefore, I am planning to apply for the Ph.D. program in the Graduate School of Biomedical Science at the University of Texas Medical Branch.

Here are my brief academic background and research experience. I have earned a master's degree in Microbiology and Immunology. Under the supervise of Prof. Chung in National Defense Medical Center (NDMC) in Taiwan, I studied the pathogenesis of *Streptococcus pneumonia* by using RNA-sequencing to investigate its gene expression profile when exposed to human serum. I have developed a hypothesis that the competence phase could be the critical status for this bacterium to cause invasive disease.

Now, I work as a research assistant at the Institute of Preventive Medicine (IPM), which is an essential facility in Taiwan, responsible for biodefense and biomedical research. I am in the group whose mission is to culture and detect the unknown samples of patients from the hospital or the field. Under the supervision of Dr. Kao and Chang that are our group leaders, I conduct and design the experiments in BSL-4. Recently, I have been working on two projects. One is for studying the essential viral characteristics of SARS-CoV-2, including the replication cycle on different MOI, the growth curve among three different strains, and constructing the viral protein for generating antibodies. Also, the animal model for investigating the pathogenesis of SARS-CoV-2 is under development to ask further questions. The other is for developing platform identifying potential interactive host protein when infected with Enterovirus-D68, EV-D68 by using ascorbate peroxidases, APEX biotin labeling under the supervise of Dr. Kao and Dr. Tsai. Being aware that the zoonotic virus could be the next emerging disease, I have a strong sense of duty for Taiwan and a keen interest in studying virology to become a virologist.

Attachment to this letter is my CV.

I am looking forward to your reply.

Please be feel free to ask me any questions.
Thank you

Best Wishes

Yuanfan

Curriculum Vitae

Education

National Defense Medical Center (NDMC)

Master of Science (MS)

Graduate Institute of Microbiology and Immunology — 2016-2018
Academic ranking: 1st place in the class
GPA 4.0/4.0, 25 credits.

Bachelor of Science (BS)

School of Public Health — 2010-2014
Academic ranking: 1st place in the class
GPA 4.0/4.0, 138 credits.
Emergency Medical Technician level-2 Certification

Work, Research and Teaching Experience

Institute of Preventive Medicine (IPM)

Research Assistant — 2014-2016 & 2018 to date

- Investigated the essential viral characteristics and pathogenesis of SARS-CoV-2, including developing the animal model
- Establishment and Development of the Diagnostic System for RG-4 and the Other Highly Pathogenic Pathogens in the BSL-4 laboratory
- Development of novel recombinant ascorbate peroxidases (APEX) fusion protein as a platform to analyze host-virus protein interaction networks in living cells
- Work experience: being shadowing member in lab of Dr. Holly Shelton for influenza research in the Pirbright Institute in England
- Investigated the role of viral polymerase A (PA) protein in influenza virus-induced apoptosis
- Prepared the anti-influenza serum in the ferret animal model
- Assessed the efficiency of the baculovirus protein expression system in the mosquito cell
- Used gold nanorod to improve the SERS (Surface-Enhanced Raman Scattering) detection method

High Containment lab assistant manager; Department of purchasing supervisor — 2018 to date

- Assisted lab manager in maintaining high containment lab working, managing documents, and setting SOP.
- Conducted regular drills of biological protection, managed equipment and participated in bio-protection training
- Reviewed purchasing documents, handled superior supervision in purchasing materials, and organized procurement cases

National Defense Medical Center (NDMC)

Master of Science, Graduate Institute of Microbiology and Immunology

Human sera induced competence and fratricide in *Streptococcus pneumoniae.* (Thesis, supervised by Prof. Chung) — 2016-2018

Teaching Assistant, *School of Microbiology and Immunology*

Emergency Medical Technician level2 certificate, *School of Public Health* — 2012-2013

The college research project, *School of Public Health*

Subsidy project from Ministry of Science and Technology, Taiwan (ROC)

Using bioinformatics method to Annotate Nitric Oxide Synthase in *Trichomonas Vaginalis* — 2011-2012

Awards and Honors

Institute of Preventive Medicine (IPM) Scholarship — 2020
(Studying Abroad Scholarship)

NDMC Outstanding Student, Mr. Shou Lian Scholarship — 2018
(Academic Excellence Award)

NDMC Alumni association Scholarship — 2017

NDMC Military Medical Research Symposium - Excellent work — 2015
(Poster Presentation)

NDMC Outstanding Student, Liu Yanfeng Scholarship — 2014
(Academic Excellence Award)

NDMC Alumni association Scholarship — 2013

The College Student Research Scholarship — 2011
Ministry of Science and Technology, Taiwan (ROC)

Skills

- Biochemistry and molecular biology skills:
  - RNA-sequencing, PCR.
  - Western blotting, ELISA, protein purification & quantification.
  - DNA quantification & electrophoresis, nucleic acid extraction.
  - IFA, cell culture, flow cytometry, cloning.
- Microbiology skills, including virology and bacteriology.
- Image analysis: TEM, fluorescence microscopy.
- Qualitative analysis: UV, SERS.
- Synthesis and characterization of nanoparticle skills.
- Bioinformatic skills: necessary python coding & using biostatistics software
- Certificate in laboratory animal care & conducting experiments in BSL-3 & 4 laboratories
- Other: Emergency Medical Technician level2.

Greetings Dr. Menachery,

I am an Executive producer with Spectrum News in Austin for our nightly Texas politics and public affairs program 'Capital Tonight' hosted by Karina Kling.

I would like to speak with you about coming on our show via Skype tomorrow Tuesday 6.9 at 130p to discuss the progression of the coronavirus.

Would it be possible to schedule a brief call with you to discuss your work with the coronavirus?

The best way to reach me these days is on my mobile phone 201-417-9413.

Thank you Dr. Menachery.

Hello again Mr. Reyes and Dr. Menachery

I was wondering if you might have some B-Roll of the Menachery Lab. All purpose Lab footage of Dr. Menachery and colleagues at work??

Any chance you could shoot it my way?

Dear Dr. Menachery,

I'm writing to you regarding an outstanding check from The American Association of Immunologists for 2019 AAI Travel Award reimbursement– the check is outstanding as of October20, 2020.
Please confirm if you have or have not received the check matching the information below:

Check #: *41480*
Date: *01/30/2020*
Amount: *$1250*

If you have not received this check, we can reissue it for you. Please confirm the mailing address to ensure that the check is sent to the correct location:

KANEKA Surfactin-COSMOS-160728.pdf

Dr. Menachery,

As per my original email below, we are a manufacturer of Sodium Surfactin produced by fermentation using bacillus subtilis. I wanted to see if you've had a chance to review our information and whether you would be interested in using our Sodium Surfactin in further evaluations particularly in relation to the COVID-19 pandemic.

I am attaching the data sheet here for your information.

I look forward to hearing from you.

Best regards,

Dr. Menachery,

I've sent an email to your utmb account but thought I'd send you one here just in case.

I am a Market Development Manager with Kaneka Americas. We manufacture Sodium Surfactin produced by fermentation using bacillus subtilis. Your article in the Journal of Virology was of keen interest to us and we are looking for partners to assess whether our Sodium Surfactin could be part of a solution to the current Covid-19 Pandemic. I am attaching a data sheet for your information. Is this something that would be of interest to you?

Best regards,

KANEKA Surfactin

Biosurfactant made by fermentation technology of KANEKA

- High performance (CMC:0.0003%) -
  > 3000 times more effective than lecithin
- Low irritation and easy biodegradation -
  > Human and environmental friendly

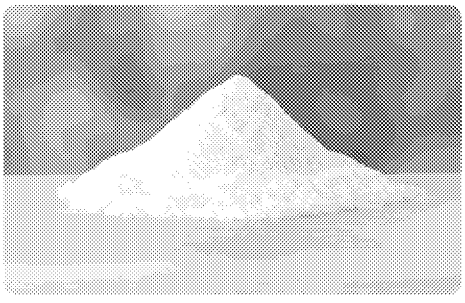
Approved by ECOCERT RAW MATERIAL

COSMOS APPROVED

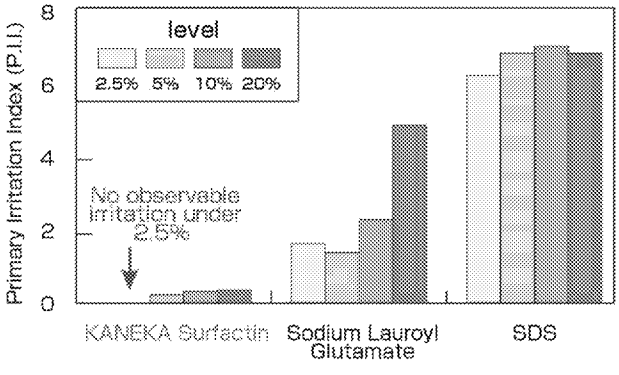
Comparison of Surfactants

Surfactants	Performance	
	Critical Micelle Concentration (CMC) [%]	Vs. SF
KANEKA Surfactin	0.0003	1
Lecithin(Natural Prod.)	1	1/3000
SDS(Synthetic Prod.)	0.1	1/300

KANEKA Surfactin (White powder)

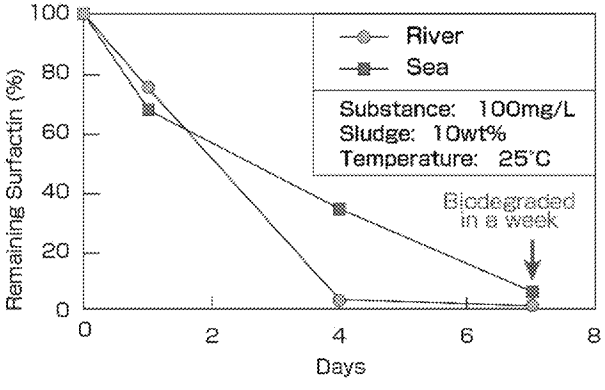


Primary skin irritation test



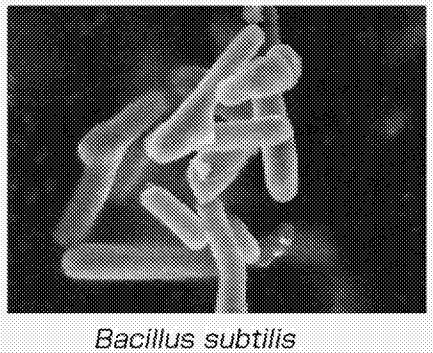
Biodegradation test

(MITI test : easily biodegradable)

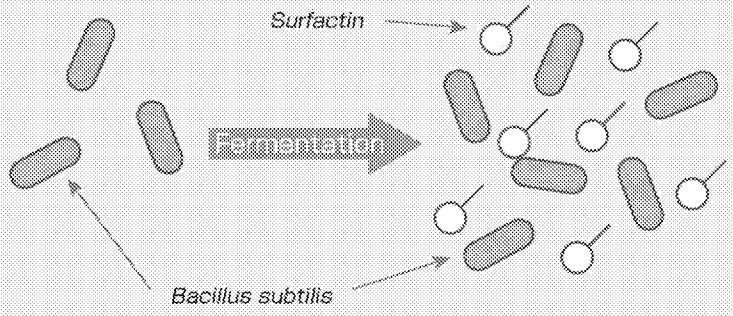


Surfactin is produced by natural fermentation.

- Found in the culture broth of *Bacillus subtilis* in 1968
- Sustainable products by fermentation under mild condition



Bacillus subtilis



★ The data is based on limited test conditions and not guaranteed.

<Data>

Name	KANEKA Surfactin
INCI name	Sodium Surfactin
CAS No.	302933-83-1
Appearance	white powder
Stability	stable: heat treatment; acidic to weak alkaline conditions not stable: strong alkaline conditions (pH > 10)
Solubility	soluble in aqueous solvents. precipitation at acidic pH or with alkaline earth metal ions (Mg^{2+}, Ca^{2+}).
pH	pH 6.5-8.0
Use	a cosmetic ingredient worldwide since 2001
Regulation	Registration complete in Japan, Europe, Unite States and China

<Chemical Structure>

KANEKA Surfactin has an unique structure including a hydrophilic cyclic peptide part constructed by seven amino acids and a hydrophobic hydrocarbon chain.

Sent: Fri 8/21/2020 10:22:59 PM (UTC-05:00)
Subject: Prospective MD/PhD student lab interest

Dear Professor Menachery,
I hope this message finds you well.

My name is Rickey Shah and I am a prospective MD/PhD student at UTMBSOM. I earned my masters degree from Harvard Extension School and did my master thesis research in Pardis Sabeti's Lab. My project focused on high-throughput inactivation and nucleic acid extraction of biosafety level 4 pathogens. I also was appointed as a non-tenured track faculty member at Harvard University to help co-teach an introductory genetics course. In addition to this, I was a co-instructor for a genetics training program offered through the African Centres for Excellence in Genomics of Infectious diseases (ACEGID) hosted at Harvard University.

I grew up in the suburbs of Chicago and went to The University of Illinois at Chicago for my undergraduate studies. I moved back home to help my mom through a liver transplant and fell in love with medicine and became inspired to pursue a career as a physician scientist. I am currently applying to MSTP programs and am extremely interested in learning more about the projects your lab is currently working on and which projects you will be working on in the future.

I look forward to hearing back from you.

Sincerely,
Rickey Shah

P.S. I love your lab logo!

Subject: SARS-CoV-2 and other emerging virus postdoc positions at NIAID
DIR_RML_Postdoc_VEU_08-14-15_cb_ReAd_8-25-20_cc1.docx

Dear colleagues,

Please find attached an advertisement for several postdoctoral positions within the NIAIDs Virus Ecology Section. Feel free to distribute widely.

The research spans from the identification and understanding of the drivers of zoonotic transmission for emerging viruses towards the development of countermeasures. The focus of the lab is largely on emerging coronaviruses, henipaviruses and filoviruses, but recent projects have included work on monkeypox and Lassa virus.

Kind regards,

Vincent Munster, PhD
Chief Virus Ecology Section

Department of Health and Human Services
National Institutes of Health
National Institute of Allergy and Infectious Diseases

With nationwide responsibility for improving health and well-being, the Department of Health and Human Services (HHS) oversees the biomedical research programs of the National Institutes of Health (NIH) and those of NIH's research Institutes. The National Institute of Allergy and Infectious Diseases (NIAID)—a major research component of NIH and HHS—is recruiting for the following positions:

Postdoctoral intramural research training awards (IRTAs)
Rocky Mountain Laboratories (RML), Hamilton, MT

Several postdoctoral IRTA positions are available in the Virus Ecology Unit within the Laboratory of Virology at the RML campus of NIAID in Hamilton, Montana. The laboratory studies the ecology of high- and maximum-containment RNA viruses and is currently focused on the ongoing COVID-19 pandemic.

The [HYPERLINK "https://www.niaid.nih.gov/research/vincent-j-munster-phd"] is interested in the identification and understanding of the drivers of zoonotic transmission for emerging viruses. The laboratory uses a combined field ecological and experimental laboratory approach to understand the emergence of novel viruses and develop successful medical countermeasures against these viruses. Fundamental experimental approaches of the laboratory include molecular-, cellular-, and immunological-based techniques along with animal models of pathogenesis and transmission. Studies are carried out in biosafety level (BSL) 2, BSL-3, and BSL-4 laboratories. The Virus Ecology Section considers diversity and inclusion the centerpiece of the team's culture.

Successful applicants will be part of a diverse and multidisciplinary team focused on understanding the molecular and ecological determinants of spillover from bats to humans and the determinants for onward human-to-human transmission. Candidates are expected to study the underlying molecular and structural determinants involved in zoonotic and human-to-human transmission of COVID-19 and newly identified emerging viruses (including filoviruses and henipaviruses).

An overview of the Virus Ecology Section's most recent SARS-CoV-2/COVID-19 research includes:

Requirements
Highly motivated candidates who have a strong background in molecular biology, genomics, computational biology, disease ecology field research, and infectious disease animal modeling are encouraged to apply. Experience working in high biological containment laboratories (BSL-3 or BSL-4) and experience with molecular biology—particularly reverse genetics or field ecology experience in infectious disease (including mathematical modeling)—would be considered an advantage.

Well-developed oral and written communication skills are essential. Candidates must hold a Ph.D. in virology, molecular biology, or another appropriate discipline and have less than three years of postdoctoral experience. Applicants may be U.S. citizens, permanent residents, or international citizens (for an IRTA, visa requirements apply). Trainees will receive health insurance as well as a stipend (commensurate with experience).

To Apply
Applicants should send their curriculum vitae (CV), a letter expressing career goals and interests, and three letters of reference with contact information no later than December 30, 2020, to Kay Menk, Laboratory Operations Specialist, Laboratory of Virology, Rocky Mountain Laboratories, NIAID, NIH, 903 S 4th Street, Hamilton, MT 59840, 406-375-9624 (phone), 406-375-9620 (fax), or email [HYPERLINK "mailto:menkk@niaid.nih.gov"].

[HYPERLINK "https://www.nytimes.com/2020/05/07/opinion/coronavirus-rocky-mountain-laboratories.html"] is a NIAID campus with excellent genomic, electron microscopic, and veterinary core support that enables scientists to completely focus on their research. Located in the scenic Bitterroot valley of western Montana, RML is surrounded by some of the best hiking, skiing, kayaking, mountain biking, and trout fishing in North America.

Visit [HYPERLINK "https://www.niaid.nih.gov/about/careers-training-opportunities"] for more information about working in NIAID's dynamic atmosphere!

HHS, NIH, and NIAID are equal opportunity employers dedicated to equity, diversity, and inclusion.

Subject: CONFIRMING INTERVIEW WITH NPR's All Things Considered TODAY

Hi Dr. Menachery,

Thanks so much for agreeing to be on the show today. **We are CONFIRMED for a live interview at 5pm Eastern/4pm Central.**

Technical Details:
The folks in the studio will want to connect and test your line 10-15 minutes prior.

For the connection: The ideal connection is a FaceTime audio. Do you have **Facetime** on your computer or phone? If so can you let me know that number so I can relay it to the engineers.

As a back up: since this is a live interview we will also need a back up phone for you. It could be a landline or another cellphone, but it should not be the same phone as the primary, facetime phone, ideally.

I can call you as soon as your meeting is over and talk through any technical questions.

Conversation Notes:
I'm confirming that this will be a live interview of not more than 5 minutes. The director will tell you this when you are on the line before the interview begins, but they can give you a warning in your ear near the end of time if that helps.

I am working to send along an outline of the questions Ari hopes to ask, but it will largely mirror the conversation we had this morning.

One request: since this is for a general audience, please try to limit any overly scientific or technical language, or to define the terms. Ari can also help remind you of this. We are obviously coming to you for your extensive knowledge, but we also want to make sure all listeners can follow the conversation. (I just listened to your conversation with LuLu Garcia-Navarro, so I have no doubt this will be just as great!)

Thank you! Please let me know when you can about the best way to connect with you.

Matt

Dear Dr. Menachery

I'm a producer at NPR's All Things Considered and we're looking to book a guest to speak to Ari Shapiro for this evening's program on the new strain of the virus out of the UK.

This would be on what we know, and what we still hope to learn. This would be a recorded conversation - if you're available for an interview in the next 3 hours can you please let me know.

Thanks!

Subject: RE: CONFIRMING INTERVIEW WITH NPR's All Things Considered TODAY

Hi Dr. Menachery,

As promised, here are a few examples of questions for the interview this afternoon. Ari may remind you of this as well, but please gear your answers to a general population as much as possible: Why does it appear this new variant is more contagious and does that worry you? Is there any reason to believe the vaccines being rolled out are less effective against this variant? Do we know anything about whether the new variant is more deadly? And is there any reason to believe restricting travel out of the UK would be effective at curtailing the spread of this new variant?

Finally, and I'm sorry to be harassing you, but if you can send me a skype ID to reach you at, or (if you have it) the cell number of someone else in your house, that would be great. Just because it's a live interview we try to have as many ways as possible of reaching you.

So YOU have, it the direct studio line/phone number is 202-513-3731. And you can expect a facetime audio call from NPR in a little over an hour now.

Thank you!
Matt

May thanks again for speaking to All Things Considered. The link for sharing is here:
https://www.npr.org/2020/12/21/948873785/new-coronavirus-variant-found-in-u-k-what-does-it-mean-for-the-world

I have one more favor to ask: Could you reply to the following 4 questions? Should take no more than a minute. All Things Considered is trying to do a better job of tracking the demography of our guests we're asking everyone to answer these questions however they please:

How would you describe your gender?

How would you describe your race and your ethnicity/nationality?

How old are you?

Where do you live?

Thank you so much!

Matt

Excellent, thank you!

Here is the Zoom link you can connect on at 4pm CT:
https://theatlantic.zoom.us/j/91085567033

You'll be on with Jim Hamblin and Katherine Wells. And so you have it in mind: the tone of the show is casual. It started essentially as Jim (a preventive medicine doctor / staff writer) fielding worried questions from Katherine. Each episode is basically a phone call between friends that adds expert voices to help answer questions. And, as I'm sure you know, the taping isn't live — if you want to correct or retake something, go right ahead and I can edit accordingly.

Finally, here are the Zoom audio best practices we share with guests so you sound your best:

- Plan to join from a quiet place where you won't be interrupted. A small, carpeted room is best for cutting down on echo and reverb — but any quiet space will do.
- The best Zoom audio actually comes from using the Zoom iPhone app if you have it, especially with wired earbuds. Phones have better mics than computers. A computer works too if you prefer it though, of course.
- Wired earbuds (especially the white ones that came with your phone) make you sound better. And since the call won't be on video, we recommend them. Please don't use Airpods or speakerphone though, as you'll sound distant and there will be echo and reverb.

Thank you again for taking the time! If you have any questions or any trouble reaching me, my cell is 650-492-0728.

- Kevin

Hi Dr. Menachery,

I'm a podcast producer with *The Atlantic* magazine. I help make our coronavirus-era podcast *Social Distance* and I'm reaching out to see if you might be interested in joining this week's episode as an expert guest.

We're hoping to talk about reports of recent SARS-CoV-2 mutations, what those reports mean, and what impacts they could have on transmission, vaccine efficacy, treatment effectiveness, etc. With your work on SARS-like viruses, we thought you could help give us some perspective.

A bit about the show: it's co-hosted by Dr. James Hamblin (a staff writer and preventive medicine doctor) and his friend/producer Katherine Wells. The tone of the show is frank and informative, but also casual and conversational (think: a phone call with some curious but inexpert friends). It would be a half-hour Zoom call tomorrow afternoon or Wednesday morning. Would you be interested?

Many thanks,
Kevin Townsend

Hi Dr. Menachery,

I'm a podcast producer with *The Atlantic* magazine. I help make our coronavirus-era podcast *Social Distance* and I'm reaching out to see if you might be interested in joining this week's episode as an expert guest.

We're hoping to talk about reports of recent SARS-CoV-2 mutations, what those reports mean, and what impacts they could have on transmission, vaccine efficacy, treatment effectiveness, etc. With your work on SARS-like viruses, we thought you could help give us some perspective.

A bit about the show: it's co-hosted by Dr. James Hamblin (a staff writer and preventive medicine doctor) and his friend/producer Katherine Wells. The tone of

the show is frank and informative, but also casual and conversational (think: a phone call with some curious but inexpert friends). It would be a half-hour Zoom call tomorrow afternoon or Wednesday morning. Would you be interested?

Many thanks,
Kevin Townsend

Thank you again for coming on! I thought it was a great conversation.

I can share a link here tomorrow when we post it.

Good luck in your work — I hope you're able to get a vacation away from home some day soon.

All my best,
Kevin

Hi Dr. Menachery,

Would it be okay if we pushed back a half hour to 4:30pm CT?

Kevin

>
> You'll be on with Jim Hamblin and Katherine Wells. And so you have it in mind: the tone of the show is casual. It started essentially as Jim (a preventive medicine doctor / staff writer) fielding worried questions from Katherine. Each episode is basically a phone call between friends that adds expert voices to help answer questions. And, as I'm sure you know, the taping isn't live — if you want to correct or retake something, go right ahead and I can edit accordingly.
>
> Finally, here are the Zoom audio best practices we share with guests so you sound your best:
>
> - Plan to join from a quiet place where you won't be interrupted. A small, carpeted room is best for cutting down on echo and reverb — but any quiet space will do.
> - The best Zoom audio actually comes from using the Zoom iPhone app if you have it, especially with wired earbuds. Phones have better mics than computers. A computer works too if you prefer it though, of course.

• Wired earbuds (especially the white ones that came with your phone) make you sound better. And since the call won't be on video, we recommend them. Please don't use Airpods or speakerphone though, as you'll sound distant and there will be echo and reverb.

Thank you again for taking the time! If you have any questions or any trouble reaching me, my cell is 650-492-0728.

- Kevin

Fantastic, thanks so much for being up for it. How about 4pm CT today?

It'll be a Zoom call, which I'm sure you're no stranger to, but I can send some tips to make sure you sound your best on the recording.
If you have any questions, don't hesitate to ask. Looking forward to the conversation!

Subject: Fwd: Question about antibody concentration in the WIV1 paper

---------- Forwarded message ---------
From: **Matt Frieman** <matt.frieman@gmail.com>
Date: Thu, Apr 11, 2019 at 10:29 PM
Subject: Question about antibody concentration in the WIV1 paper
To: Vineet D Menachery <vineet.menachery@gmail.com>

Vineet

I talked to David Corti, he pointed me in the right direction. He gave them to a company to sell and has them in his lab. Since this is a control for a contract experiment I am going to just buy them.

In your WIV1 paper, you used 200ug of the 227.15 antibody. Did you ever try lower amounts? In the old paper by Barry, he uses 25ug and gets a reasonable couple log drop, but your dose of 200ug really kills the virus. Just wondering if you tried lower doses or if I should just buy enough for the 200ug dose.

thanks

Matt

Subject: frightening reports from Brazil on a virulent new COVID strain--short, live interview today on CBS News Radio LA

Good afternoon Dr. Menachery,

I'm writing from CBS News Radio in Los Angeles, where you've been a fantastic guest for us in the past--I hope you're doing very well and staying healthy. This is admittedly a short notice request, hoping to talk with you in an hour from now, but thought it was worth a shot.

We would be very grateful to talk with you for a short, live Skype or Zoom audio interview--live today at 4:05pm ET on our news magazine program--to discuss what we know about the highly contagious new COVID strain that has sent several parts of Brazil back into lockdown, as infections and deaths are soaring again. We'd like to ask what sets this new Brazil variant of the virus apart from current COVID strains that are circulating and whether we have any idea how the current crop of COVID vaccines will work to slow down the spread.

Would only need you for about 7-minutes live today at 4:05pm ET; let me know what you think and thanks so much for your help and consideration.

Best,
Jonathan

Subject: Interview request

Dear Mr Menachery,

I am a journalist working for the international English language TV channel TRT World and currently working on a segment for our news hour today on the Coronavirus.

I was wondering whether you would be available to join us via Skype this evening at 7pm UK time for an interview on the outbreak. We are expecting a WHO press conference at 6.30pm today in which they may or may not announce the declaration of global public health emergency - so it would be great to get your reaction to this.

If you would like to discuss this further, please feel free to give me a ring on +447568472474.
The interview would be no longer than 4 minutes and would be within the first 15 minutes of the programme.
Please could you let me know if you would be interested in doing this?

Many thanks in advance.

Best wishes

Claudia

Subject: Another Suggestion from Sister Abagail; RE: 2019-nCoV Coronavirus
PleaseRead;Personal Observations/HypothsisOfPotential 2019-nCoV root.eml

Dear Researchers:

This is a new letter I am sending out to all the researchers I have reached out to last week, in hopes of being supportively helpful of your research work, with ideas of new research venues, in finding an effective deterrent & destroyer of the 2019-nCoV Coronavirus.

My Recent New Thoughts, Concerning Fighting the 2019-nCoV Virus:

Every LIVING Thing has required dietary needs in order to live, thrive and survive. On the flip-coin-side of that basic principle of life, is the fact that If and/or When something living is Exposed-To and/or Ingest CERTAIN Specific materials/matter/elements/plants/foods/minerals, it can deplete that living beings life-required-nutrients, potentially cause it to starve to death if it does Not possess the skills to apply the law of adaptation, and/or can cause it to Slowly and/or Quickly Die or Die off!!!!!!!!!

BASED On THIS Rudimentary Biological 2-Coin-Sided Fact, Here are my suggestions, with a HUMBLE Heart:

1. Investigate What Starves&Effects the Virus,from a Nutrutional Aspect:

(a) Study Diet of Family Member of those Effected by the 2019-nCoV Virus, but who did NOT get sick and/or die from family member exposure to the 2019-nCoV Coronavirus.
(b) Study the Diet of Those Who OVERCAME the 2019-nCoV Virus, who were effected, but did NOT Die from it, IF ANY.

2. Connect and WORK WITH Holistic Researchers & Doctors, Nutritional Therapist, AND Integrated Medicine Researchers & Doctors. Reason:
in hopes of finding a way to Starve, Attack & Destroy the 2019-nCoV Coronavirus....and potentially even future new strains of this and other viruses, bacterial infections and/or fungal infections; like the Candida Auris fungal infection that has become so deadly, in need of protection/healing intervention & Functional Medicine treatments.

LIST Of SOME Of the Main Medical Groups I Recommend, for Working WIth, From an Integrative Medicion & Nutrutional Therapy, Research and Treatment Approach:

1. Mount Sinai Integrated Medicine + Nutrition

https://www.mountsinai.org/patient-care/service-areas/community-medicine/integrative-medicine/services

2. Osher Center For Integrative Medicine, Harvard Medical School & Brigham and Women's Hospital

https://oshercenter.org/

3. The George Washington University

(a) Integrative Medicine
(b Laboratory Medicine
(c) Immunohematology & Biotechnology

https://healthsciencesprograms.gwu.edu/program/the-george-washington-university-mshs-in-integrative-medicine-master-1556891118601

4. Duke University Integrative Medicine & Nutrition

https://dukeintegrativemedicine.org/

5. YOUR Preferred Personal References List of Medical Researchers you Know and have worked with, who are Integrative Medicine, Nutritional Therapy, Functional Medicine, Immunology Researchers & Doctors.

I pray this will be of help, for pathways in the direction of Collaborating teams finding cures and helping people to overcome, live and thrive in life with great joy. Huge hugs with much gratitude for what you do to make a difference in life.

Love In ����YESHUA,
�����Sister Abagail

Subject: Potential ROOT Cause Of Mysterious COVID-19 Case in California

Dear Researchers & Scientific Medical Community:

Shalom and Boker Tov! I was reading about the "Mysterious COVID-19 Case" in California, of an infected patient who supposedly did not have Coronavirus exposure, and contracted this virus mysteriously. I have a Hypothesis of the POTENTIAL ROOT CAUSE For this mysterious California case.

According to the follow facts I have pasted below, for you to read for yourself, I believe that the mysterious patient contracted the COVID-19 Coronavirus because they were potentially exposed to marine debris carried by storm winds, that came from & carried across the Pacific Ocean; as in Plastic & Stainless Steel Particle Debris, that was Contaminated with the COVID-19 Virus! That is My Hypothesis.

Gathered Facts, Pasted below, for you to read for yourself. I pray this will be of help. ����May ELOHIM guide you by HIS wisdom, in fighting this deadly virus, and Bless you with all that you need. ⁇ I Love and respect you all, very much, as your Little Sister.

With Much Love In ELOHIM, B'Shem ⁇YESHUA,
⁇Love Sister Abagail

Subject: very concerning findings on the lethality of the UK COVID variant--talking today on CBS News Radio Los Angeles

Good morning Dr. Menachery,

I'm writing from CBS News Radio in Los Angeles, where you've been good enough to talk with us in the past--hope you're doing very well and staying healthy. We'd be grateful to have you back on our newscast for a quick interview this afternoon to discuss new research out of Great Britain on the B.1.1.7 coronavirus variant.

I'm reading about the potential for increased lethality of the so-called "UK variant" of COVID-19 and heightened risks for people who contract this variant of the virus. I'm hoping to talk with you for a brief, live Skype or Zoom audio (no video necessary) interview at 1:25pm Pacific/3:25pm Central. The interview will be quick, just about 7-minutes total, and you'd be in conversation with my two anchors; we have really simple, straight-forward questions about the potential for higher death rates associated with the UK variant of COVID.

Let me know if I can entice one of you to come back to talk with us today at 3:25pm Central and thanks so much for your help and consideration.

Best,

Jonathan

Subject: Media inquiry / coronavirus, your 2015 paper

Vineet D. Menachery, PhD
Assistant Professor
Department of Microbiology & Immunology

Dear Professor Menachery,

I am writing on behalf of my editors at Infobae, the most visited digital media in Latin America, according to ComScore, and the second in the Spanish speaking world, after El País. We currently have 70 million unique users, as per Google Analytics, and more than 550 million page views. We have offices in Buenos Aires (headquarters), Miami and México (CDMX), and correspondents in Colombia, Uruguay, Venezuela and Chile.

We are interested in this paper you and other colleagues published in 2015:
https://www.nature.com/articles/nm.3985

Would it be possible to ask you a few questions, either via e-mail or via phone? Just in case, please let me pose a few:

I would like to understand if five years ago you predicted that something like what we are seeing now with Covid-19 might happen; in fact, the text seems to ask when, nor if. Is that so? What made you focus on coronaviruses from bats?

What is your view on the different countries of the world preparedness for this event we are living, from the perspective of someone who co-wrote that paper?

If there are 5000+ coronaviruses in bats, are there also other risks of new pathogens the human body has no antibodies for that may cause something like we are seeing today?

Thank you so much in advance. All the best,

--

Subject: yet more concern about yet more COVID variants--talking about a Botswana variant that's circulating in Iowa, today on CBS News Radio Los Angeles

Good morning Dr. Menachery,

It's Jonathan at CBS News Radio Los Angeles, where you've been a fantastic guest and resource on our behalf in the past--hope you're doing very well, staying healthy and coming off of a great weekend. We are following reports of several COVID outbreaks in North America, both in the U.S. and Canada, that are being traced to new variants of the virus making the rounds and becoming increasingly prevalent.

So I'm turning to you to get a better understanding about the possible impact of these variants--whether it's the Brazilian strain that's apparently been causing sizable outbreaks in British Colombia, Canada (including among the Vancouver Canucks NHL team) or the Botswana variant that's been detected among people recently infected in Iowa and the Midwest. How aggressively can we expect the novel coronavirus to continue to mutate, and how will the current crop of COVID vaccines stack up against it?

Hoping to talk with you this afternoon for a short, live Skype or Zoom audio interview somewhere within the 4-5pm ET window, depending on what your schedule allows; we'd only need you for about 7-minutes within the 4pm ET hour, where you'll be in conversation with my two anchors.

Let me know what you think and thanks again for your help and consideration.

Best,

Jonathan

Subject: CONFIDENTIAL and very urgent; request to review manuscript NCOMMS-20-47724A

Dear Dr Menachery,

I am writing from Nature Communications with an urgent request for help with the revised version of a manuscript that we currently have under consideration. The manuscript is entitled, Characterization and structural basis of a lethal mouse-adapted SARS-CoV-2' and it has been submitted by Professor Qin and colleagues.

We reviewed the original version of this work and the authors revised according to the comments of four referees. However, two of the referees (who are experts in animal studies and adaptation of viruses to murine hosts) are no longer responding to our requests for comments on the revised version of this work. I am emailing if you would be willing to provide us with comments on how well the authors have responded to the original concerns of Referees 2 and 3. Their comments are provided in the point-by-point response from the authors.

Additionally, we would very much appreciate your comments on the authors' data that are presented in Figures 9a and 9b and

whether there are any concerns with their presentation of growth kinetics of the murine strain in human cells, in particular if you have any concerns relating to dual use of research concern (DURC).

To provide a timely decision for the authors, we would kindly ask you to return your comments within two weeks. We are aware that the current global public health crisis is disrupting the work of many of our authors and reviewers. If you would like to assist, but would need more than 14 days to review the manuscript, please do not hesitate to let me know.

Nature Communications uses a transparent peer review system for new manuscripts submitted from January 2016. If the manuscript is accepted, the authors may agree for the reviewer comments to the authors as well as the author rebuttal letters to be published as a supplementary file associated with the paper. Any confidential comments between you and the editor will not be published. By submitting a reviewer report you agree to the publication of the comments made to the authors. Unless you sign the report with your name in those comments to the authors, we will respect and maintain your full anonymity. For more information, please refer to our FAQ page at http://www.nature.com/article-assets/npg/ncomms/authors/ncomms-transparent-peer-review.pdf

To accept or decline our request, please use the following link:
https://mts-ncomms.nature.com/cgi-bin/main.plex?el=A2S4DNL5A1JHHo7J4A9ftdwES2XWjOPHmxQegPWxrwwZ

Many thanks in advance for your help; I look forward to hearing from you.

Best regards,

Ripudaman Bains
Editor
Nature Communications

Our flexible approach during the COVID-19 pandemic
If you need more time at any stage of the peer-review process, please do let us know. While our systems will continue to remind you of the original timelines, we aim to be as flexible as possible during the current pandemic.

Subject: explaining the Delta COVID variant, back on CBS News Radio L.A. this afternoon

Good afternoon Dr. Menachery,

It's Jonathan at CBS News Radio Los Angeles, where you've been a fantastic guest for us in the past--hope you're doing very well, staying healthy and about to embark on a somewhat, mostly normal summer! Also selfishly hoping that you're around today because we'd be very grateful to have you back on our news magazine program for a short, live interview today at 1:25pm Pacific/3:25pm Central to give us a quick tutorial on the Delta variant of the novel coronavirus.

This is because the CDC has officially labeled the Delta variant a concern, with fears that it's more contagious and likely to become the dominant COVID variant in the months ahead. What does this mean for the vaccinated and unvaccinated alike, what makes this strain more contagious and how much damage has the Delta variant already caused in other countries across the world?

Would keep this to a short and simple 6-minutes at 3:25pm Central, hopefully over a Skype or Zoom audio connection (no video necessary); let me know what's possible and thanks so much for your help and consideration.

Best,

Jonathan

Dear Professor Menachery,

I hope this note finds you well in this challenging time.

I'm a reporter with Chemical & Engineering News, a weekly newsmagazine about chemistry. I am working on a story about the discovery of EIDD-2801, a compound currently in Phase I trials for COVID-19. I've attached a recent Science Translational Medicine paper about this compound. I am looking to speak with someone about the challenges of making antivirals in general and an oral antiviral specifically. Do you have a little time to chat with me this week? I don't think it would take more than 20 minutes. Just let me know when a good time to talk might be and what is the best number to reach you.

Thanks for your help,
Beth

Dear Dr. Shi and UTMB Team

I am reaching out to ask if you were interested in collaborating to make a Codon-pair deoptimized vaccine strain using your infectious clone. We have already designed deoptimized Spike and RdRNP cassettes that could be easily inserted into your WT clone. We could fund the work for the cloning and vaccine strain recovery. We have collaborated in the past with Alan BArret and Nigel Bourne at UTMB, so they are familiar with the success of our approach in Dengue. Looking forward to hearing from you soon, we can send the genes at any time. Have a good day, Regards, Robert Coleman

Subject: Media Request / Spectrum News / Skype Interview Tuesday 6.9

Greetings Dr. Menachery,

I am an Executive producer with Spectrum News in Austin for our nightly Texas politics and public affairs program 'Capital Tonight' hosted by Karina Kling.

I would like to speak with you about coming on our show via Skype tomorrow Tuesday 6.9 at 130p to discuss the progression of the coronavirus.

Would it be possible to schedule a brief call with you to discuss your work with the coronavirus?

The best way to reach me these days is on my mobile phone 201-417-9413.

Thank you Dr. Menachery.

May thanks again for speaking to All Things Considered. The link for sharing is here:
https://www.npr.org/2020/12/21/948873785/new-coronavirus-variant-found-in-u-k-what-does-it-mean-for-the-world

I have one more favor to ask: Could you reply to the following 4 questions? Should take no more than a minute. All Things Considered is trying to do a better job of tracking the demography of our guests we're asking everyone to answer these questions however they please:

How would you describe your gender? ***Male***

How would you describe your race and your ethnicity/nationality? Asian/Indian Subcontient

How old are you? 38

Where do you live? Galveston, Texas

Thank you so much!

Matt

Subject: RE: CONFIRMING INTERVIEW WITH NPR's All Things Considered TODAY

Hi Dr. Menachery,

As promised, here are a few examples of questions for the interview this afternoon. Ari may remind you of this as well, but please gear your answers to a general population as much as possible: Why does it appear this new variant is more contagious and does that worry you? Is there any reason to believe the vaccines being rolled out are less effective against this variant? Do we know anything about whether the new variant is more deadly? And is there any reason to believe restricting travel out of the UK would be effective at curtailing the spread of this new variant?

Finally, and I'm sorry to be harassing you, but if you can send me a skype ID to reach you at, or (if you have it) the cell number of someone else in your house, that would be great. Just because it's a live interview we try to have as many ways as possible of reaching you.

So YOU have, it the direct studio line/phone number is 202-513-3731. And you can expect a facetime audio call from NPR in a little over an hour now.

Thank you!
Matt

Subject: CONFIRMING INTERVIEW WITH NPR's All Things Considered TODAY
Importance: High

Hi Dr. Menachery,

Thanks so much for agreeing to be on the show today. **We are CONFIRMED for a live interview at 5pm Eastern/4pm Central.**

Technical Details:

The folks in the studio will want to connect and test your line 10-15 minutes prior.

For the connection: The ideal connection is a FaceTime audio. Do you have **Facetime** on your computer or phone? If so can you let me know that number so I can relay it to the engineers.

As a back up: since this is a live interview we will also need a back up phone for you. It could be a landline or another cellphone, but it should not be the same phone as the primary, facetime phone, ideally.

I can call you as soon as your meeting is over and talk through any technical questions.

Conversation Notes:
I'm confirming that this will be a live interview of not more than 5 minutes. The director will tell you this when you are on the line before the interview begins, but they can give you a warning in your ear near the end of time if that helps.

I am working to send along an outline of the questions Ari hopes to ask, but it will largely mirror the conversation we had this morning.

One request: since this is for a general audience, please try to limit any overly scientific or technical language, or to define the terms. Ari can also help remind you of this. We are obviously coming to you for your extensive knowledge, but we also want to make sure all listeners can follow the conversation. (I just listened to your conversation with LuLu Garcia-Navarro, so I have no doubt this will be just as great!)

Thank you! Please let me know when you can about the best way to connect with you.

Matt

Dear Dr. Menachery

I'm a producer at NPR's All Things Considered and we're looking to book a guest to speak to Ari Shapiro for this evening's program on the new strain of the virus out of the UK.

This would be on what we know, and what we still hope to learn. This would be a recorded conversation - if you're available for an interview in the next 3 hours can you please let me know.

Thanks!

Subject: eLife review invitation (article from Skjoedt - 03-05-2021-RA-eLife-70002 - confidential)

Dear Vineet,

I'm writing in the hope that you'll be willing to review this article, "The B.1.1.7 SARS-CoV-2 variant exhibits significantly higher affinity for ACE-2 and accelerates disease severity in transgenic hACE-2 mice", for eLife, a selective journal that publishes promising research in all areas of biology and medicine. eLife is now creating public reviews for research that is reviewed by the journal - regardless of the final decision.

What changes for you as a reviewer?
We ask you to structure your review into three parts: (1) a short statement on significance and audience for this paper, (2) the public review with guidance for readers around how to interpret the work, highlighting important findings but also mentioning caveats where they exist, and (3) specific feedback to the authors stating what needs to be changed to make the manuscript acceptable for publication in eLife, or why it falls short as an eLife paper.

The intention is to post the public reviews from each reviewer alongside the preprint (on bioRxiv or medRxiv). At present, authors can opt out from posting a preprint or they can postpone the posting of the public reviews until the paper has been published elsewhere. For papers accepted for publication in eLife, the feedback for authors will be published as part of the decision letter, as before. The "recommendations for the authors" (part 3) will not be posted alongside the preprint.

eLife is taking these steps to help change how publishing works: we believe that clear public reviews should be the central mechanism by which research is evaluated.

Even if you decide to reveal your name to the authors, your name will not appear on the public review. All public reviews are signed by eLife, putting the onus on us as an organization and community to ensure that our reviews are of the highest quality and ethics.

We continue our policy of consultation between the reviewers. If you agree to review this paper, once all the reviews have been received, you will be invited to discuss your comments with the other reviewers in an online consultation session, in which the reviewers will be identified to one another, and you can recommend whether the paper should be revised for publication by eLife or rejected. Additional experiments, analyses, or data collection should only be requested if they are essential.

The abstract and information about the review process are below, and you can read what we have published so far at https://elifesciences.org.

xxxxxxxxxx

If you have competing interests that preclude an objective review, or you cannot otherwise provide a review of the work, you must DECLINE using the link below. Suggestions for alternatives are very welcome. (Where it's appropriate to do so, it would be helpful if you could offer a brief opinion about the work, even if you're declining to review.)

By taking on this assignment, you agree to conduct your review according to the terms in the eLife Reviewer Guide - https://submit.elifesciences.org/html/elife_reviewer_instructions.html - and you agree to our confidentiality notices below*, which help us to protect the personal data of authors, editors, and reviewers.

To respond, please use the link below and select either AGREE or DECLINE:

[https://submit.elifesciences.org/cgi-bin/main.plex?el=A3Hz5irC4A2BiOk1F5A9ftdHKHPgzQ7fBZxEiT7y1AMRwZ]

xxxxxxxxxx

Please note that we work with Publons.com to give you the opportunity to be recognised for your review, so if you agree to provide a review we will let you know how to add the details to a Publons account in the email we send at the conclusion of the review process.

We ask for comments to be returned within 14 days (although we will understand if you will need longer than usual). I'll look forward to hearing from you.

Best wishes,

Kei Sato
Reviewing Editor
eLife

Title: The B.1.1.7 SARS-CoV-2 variant exhibits significantly higher affinity for ACE-2 and accelerates disease severity in transgenic hACE-2 mice

Authors: Rafael Bayarri-Olmos, Laust Johnsen, Manja Idorn, Line Reinert, Anne Rosbjerg, Cecilie Hansen, Charlotte Helgstrand, Jais Bjelke, Theresa Bak-Thomsen, Soren Paludan, Peter Garred, and Mikkel-Ole Skjoedt

Abstract:
Since the emergence of the B.1.1.7 SARS-CoV-2 lineage, it has been transmitting rapidly and accounts for the majority of new COVID-19 cases in Europe. This is likely due to a fitness advantage that could be driven by the RBD residue change (N501Y), which also developed independently in the B.1.351 and B.1.1.248/P.1 "variants-of-concern". Here we present a functional characterisation of the B.1.1.7 variant and show an eight-fold affinity increase towards human ACE-2. In accordance with this, transgenic hACE-2 mice showed a faster disease progression and severity after infection with a low dose of B.1.1.7, compared to a wild-type SARS-CoV-2 isolate. When challenged with sera from convalescent individuals or monoclonal antibodies, the N501Y variant showed a minor, but significant elevated evasion potential of RBD:ACE-2 antibody neutralisation. The data suggest that the N501Y substitution causes a remarkable rise in affinity that could explain the higher transmission rate and severity of the B.1.1.7 variant.

* Confidentiality and Personal Data
We do not release the identities of the reviewers to the authors (unless requested by the reviewers themselves) but in the course of the discussion that forms part of the review process, each reviewer will know the identity of the other reviewer(s).

The review process is strictly confidential and must be treated as such by reviewers during the review process and subsequently:

1. If you agree to provide a review, we will send you the following data: author, editor and reviewer contact information, copies of submitted manuscripts and review comments and discussions arising from the review of those manuscripts, which you will handle only for the duration of the peer-review process.

2. You will only act on our written instructions when handling this personal data, you will keep the personal data secure, and not use the personal data for any other purpose than a review for eLife.

3. You will not ask anyone else to carry out this peer review for you, without our prior agreement.

4. You will assist us in allowing data subjects to exercise their rights under data protection laws, if you hold personal data relevant to them. You will also assist us in meeting our data protection obligations in relation to audits, security, notification of data breaches, and data protection impact assessments.

5. You will delete or return (at our choice) the personal data you hold on our behalf once the decision has been completed.

6. You will report any relevant personal data breaches to us immediately, as well as whether you believe our instructions in connection with the personal data infringes applicable laws.

xxxxxxxxxx

Information about Competing Interests:
Editors, reviewers, and potential reviewers are required to fully declare all potential competing interests that could lead them to be positively or negatively disposed towards an article before they agree to edit or review it. Reviewers must recuse themselves if they feel that they are unable to offer an impartial review. Common reasons for editors and reviewers to recuse themselves from the peer-review process include but are not limited to: Working at the same institution or organization as one or more of the authors, currently or recently; Having collaborated with, or served as a mentor to, one or more of the authors during the past 5 years; Having held grants with one or more of the authors, currently or recently; Having a personal relationship with an author that does not allow you to evaluate the manuscript objectively.

Research Update Template.xlsx

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Subject: RE: NYTimes: Coronavirus Antibody Tests: Can You Trust the Results?

Want to weigh something large? Put it on one end of a teeter-totter (a seesaw). Then balance that with a large rock on the other end. Now all you need do is weight the rock.

One way to determine the quality of these newly developed assays is to (a) find someone who knows what the hell they are doing and have them (b) test by MACELISA and IgGelisa, then (c) test by NEUTRALIZATION. Without the latter, I ain't buying it. In the current situation, who cares whether a person has antibody, to SARS-CoV-2, unless that antibody is helpful in determining protection. Jordi Casals and Bob Shope must be turning in their graves.

Now W.H.O. is saying that the presence of antibody is not indicative of protection from a second exposure to SARS-CoV-2. No shit, Sherlock.

Charlie

Chinese Response to New Virus: Good News/Bad News

By James W. Le Duc

Fast action and open communications by China is helping the world prepare for another potentially devastating infectious disease outbreak. While the situation is rapidly evolving, there is good news that may not make the headlines. Many will recall the dark days in the spring of 2003 when Asia and the world were threatened by the appearance of a new virus disease, Severe Acute Respiratory Syndrome, or SARS, which first appeared in southern China and quickly spread to other countries around the world, ultimately causing over 8000 cases with nearly 10% of those ending in death. SARS was caused by a novel coronavirus then unknown to medical science. There was no known cure, no diagnostic tests and little understanding of where it came from or how it was spread, although person-to-person transmission was obvious as health care workers treating the first cases were themselves among the early victims. Initially, China was reluctant to share information or alert the international community of the magnitude of the epidemic, leading to international criticism and a dangerous global health situation. Fortunately, China reversed its position, opened to collaborations with the WHO, U.S. and others, and the epidemic was eventually controlled.

Today, with another novel coronavirus discovered in China, the start is very different. In quick measure, Chinese health officials recognized that a new disease had emerged, quickly isolated patients, and instituted an impressive set of interventions in attempts to limit disease spread and characterize the new pathogen. Importantly, they have been transparent in sharing their findings with the world, thus allowing other nations to take precautions and be on the lookout for the new disease. Already, the genome of the new virus was sequenced and posted for easy access by international experts, allowing rapid exploration of possible treatments, development of diagnostics and epidemiological investigations.

China's ability to respond quickly and efficiently to this new threat is the result of nearly two decades of investments and collaborations to improve public health in China. The Chinese Centers for Disease Control incorporates many of the strengths of our own CDC, but is designed to meet the needs of a 1.4 billion plus population. In addition, China has invested in building a robust scientific capacity and partnered with containment laboratories such as ours to incorporate best practices when studying dangerous pathogens.

The current outbreak demonstrates a welcome openness to health information sharing with the global community. To diagnose an outbreak early requires astute healthcare providers able to recognize when something new or unusual is occurring; however, clinical recognition alone is meaningless if there is no capacity to investigate cases or characterize the disease-causing agent.

For the last few years, our National Academy of Science, Engineering and Medicine has worked with the Chinese Academy of Sciences to build relationships and share information on emerging diseases and advancements in vaccines and treatments. In Galveston, we welcomed leading Chinese health officials to collaborate on biocontainment facility design, biosafety training and laboratory operations. This dialogue, along with U.S.-based educational opportunities for Chinese students, benefit us all.

China's response to the new coronavirus demonstrates their investments in physical laboratories and scientific collaborations over the past decade are paying dividends, not only to China, but the entire world. Control of a new disease efficiently transmitted person-to-person is nearly impossible as we witnessed during the 2009 novel influenza pandemic and much must still be done together during this quickly evolving situation.

The outbreak is still in the early stages, but it is now clear that the new virus may be transmitted person-to-person, although the efficiency of such transmission remains in question. A few hundred patients have been identified, deaths occurred and the disease has spread from the epicenter in Wuhan to major cities in China and other Asian countries. Our CDC is now screening travelers arriving from Wuhan at U.S. airports, and the WHO is set to consider a global emergency response. With millions about to travel for the Chinese New Year, avoiding a global catastrophe must be the current goal.

The good news is that, at a time when US-China relations are being tested on many fronts, relations within the public health and scientific research arenas remain open and positive, which lays a solid foundation for curtailing this latest threat.

James Le Duc, PhD, is the Director of the Galveston National Laboratory at the University of Texas Medical Branch and a professor in UTMB's Department of Microbiology and Immunology.
