Describe the nominee's outstanding contributions to the microbial sciences. Please be as specific as possible, with particular focus on why the nominee is deserving of this specific award (*no more than 4000 characters*). For more information regarding specific awards descriptions, please visit: https://www.asm.org/Academy/ASM-Awards.

If you are willing, the nomination is due by July 9th. If you don't have time, I can ask Scott Weaver or another person to nominate me. Let me know and I will send you and updated CV.ThanksVDM

RESEARCH INTERESTS

Utilizing severe coronavirus infections, the Menachery Lab seeks to define virus-host interactions that dictate disease outcomes taking advantage of three cutting edge platforms: 1) reverse genetic systems for virus generation, 2) a refined systems biology approach, and 3) diverse model systems for infection. Described below, the current projects provide insight into our approach and explore areas with implications for understanding infection and disease.

- **Examine the dynamics of host-virus interactions within and between diverse viral families.** Employing uniform experimental platforms, these systems based studies seek to identify common host pathways induced and/or antagonized by various pathogenic viruses. The approach also leverages differences between wild-type and mutant viruses to identify key processes that drive pathogenic outcomes. The overall goal is to derive mechanistic insight and develop novel avenues for antiviral treatment.
- **Explore the pathogenic and emergence potential of novel CoVs.** The outbreaks of both SARS and MERS-CoV underscore the need for continued surveillance of zoonotic viruses. While CoV sequences have been identified, minimal translational work has been undertaken. These studies evaluate the likelihood of emergence, pathogenic potential, and efficacy of current therapeutic platforms against existing coronavirus strains.
- **Define age dependent changes to host immunity via viral infection**. Infectious disease in the context of aging represents an opportunity to explore changes to immunity as well as gain insights into a leading cause of death among the elderly. Importantly, both SARS and MERS-CoV induce more severe infection and increased mortality in aged human patients. This phenotype is recapitulated in young and aged mouse models, allowing exploration of host virus interaction that change as a product of aging. These studies seek to identify, confirm, and validate changes in pathway activation as well as develop treatments to mitigate disease in the aged hosts.
- **Examine the role of host diversity in susceptibility to infection.** In addition to aging, host genetic diversity plays a critical role in the response to respiratory virus infection. Employing the Collaborative Cross (CC), a panel of recombinant inbred mice that captures genetic diversity similar to the human population, we observe a wide spectrum of phenotypes. These readouts can be dysregulated from each other, allowing fine mapping to define specific genetic components that drive phenotypic responses.

EDUCATION

University of North Carolina at Chapel Hill — May 2017
Post-doctoral Fellowship — Chapel Hill, North Carolina

Washington University in Saint Louis — May 2010
Doctorate of Philosophy in Biological Sciences, concentration in Immunology — Saint Louis, Missouri

Clemson University — May 2004
Bachelors of Science in Microbiology, *Minor* in Business Administration — Clemson, South Carolina

LABORATORY POSITIONS

Menachery Laboratory
Dept. of Microbiology and Immunology, University of Texas Medical Branch — Galveston, TX
Assistant Professor — May 2017- Present

Laboratory of Dr. Ralph S. Baric
Dept. of Epidemiology, University of North Carolina — Chapel Hill, NC
Post-doctoral fellow — August 2010- May 2017

Laboratory of Dr. David Leib
Dept. of Ophthalmology and Vision Sciences, Washington University — Saint Louis, MO
Graduate Student — May 2005- May 2010

Laboratory of Dr. Timothy Sparer
Microbiology Dept., University of Tennessee — Knoxville, TN
Research Technician — June 2003 – August 2003

AWARDS & HONORS

- American Association of Immunologist Early Career Faculty Travel Grant (2019)
- UTMB Nominee, Pew Scholars Program (2019)
- University of Texas System Rising STARs Award (2017)
- Pathway to Independence Award (K99/R00, NIA) (2015-2020)
- Ruth L. Kirschstein National Research Service Award (F32, NIAID) (2013-2015)
- Postdoctoral Award for Research Excellence, University of North Carolina (2014)
- Millstein Young Investigator Award, International Society of Interferon and Cytokine Research (2016)
- UTMB Nominee, Searle Scholar Program (2017, 2018)
- Best Talk, UNC Microbiology & Immunology Postdoc Symposium (2016)
- Selection to Virus and Cell, Gordon Research Conference (2013, 2015, 2017)
- Milstein Travel Award, International Society of Interferon and Cytokine Research (2012)
- National Eye Institute Research Training Grant in the Visual Sciences (2008-2010)
- American Society of Virology Travel Award (2009, 2011, 2015)
- Selection to 4th Annual NIH National Graduate Student Research Festival (2009)
- Magna Cum Laude, Clemson University (2004)
- Prince Alumni Scholar, Clemons University (2000-2004)
- Campbell Young Leader Scholar, Clemson University (2000-2002)
- Eagle Scout, Boy Scouts of America

PROFESSIONAL SERVICE

Session Chair

- Annual Meeting, American Society of Virology, College Park, Maryland (2018)
- Positive Sense RNA Virus Meeting, Keystone Symposia, Killarney, Ireland (2019)
- Annual Meeting, American Society of Virology, Minneapolis, Minnesota (2019)
- Biology of Acute Respiratory Infection, Gordon Research Conference, Galveston, Texas (2020)

Journal Reviewer

- *Virus Research* (2014 – present)
- *Virology* (2014 – present)
- *Viruses* (2019 – present)
- *Journal of Virology* (2016 – present)
- *PlosPathogen* (2016 – present)
- *Cell Host Microbe* (2018 – present)
- *Clinical Microbiology Reviews* (2014 – present)

Grant Reviewer
- Hong Kong Research Grants Council (2015 – present)
- Systems Immunogenetics Pilot Program (2018 – present)

Panel & Committee Membership
- Oliver Smithies Nobel Symposium Committee (2014)
- Panelist K-Series Information Session (2015, 2016)
- Poster Judge, McLaughlin Symposia (2018, 2019)

Science Communication
- Guest, *This Week In Virology* Podcast Episode 364: "It's not SARS 2.0" (2015).
- Research Featured, STAT News, "SARS-like virus in bats shows potential to infect humans, study finds" (2015).
- Interview, Infectious Disease Hub, "Emerging technologies to investigate coronavirus emergence" (2019).

RESEARCH SUPPORT

Ongoing Research Support

4R00AG049092-03 (PI- Menachery) June 2017- May 2020
Pathway to Independence Award (K99/R00), National Institute of Aging
Title: Systems Based Analysis of Host Factors that Contribute to Aging Pathogenesis
This grant utilizes systems biology and the SARS-CoV mouse model to identify target host pathways that contribute to differential disease outcomes in the aged host compared to young.
Role: PI

University of Texas Rising STARs Award (PI- Menachery) May 2017- April 2020
Award granted for recruitment of promising faculty members for the purposes of equipment and renovation expenditures for establishment of their new laboratory.
Role: PI

U19AI100625 (PI- Baric/Heise) May 2017 – April 2022
Title: Systems Immunogenetics of SARS-CoV Infection
This program uses the Collaborative Cross to study complex genetic interactions in diverse populations, to identify novel polymorphic genes regulating immune responses to SARS and gain insights into genetic interactions that shape immune phenotypes in mice and humans.
Role: Project 1 Co-I

Claude Pepper Pilot Award (PI- Menachery) September 2018 – August 2019
Claude D. Pepper Older American Independence Center
Title: Parabiosis and Age-dependent Viral Pathogenesis
Goal: Project explores feasibility of using parabiosis to study aging in the context of SARS-CoV infection.
Role: PI

Completed Research Support

Pilot Award Oklahoma Nathan Shock Center (PI- Menachery) July 2017- June 2018
Award by an NIA Center of Excellence in Biology of Aging to analyze aging systems biology data in the context of infection; funds support collaboration with the with the Discovery Bioinfomatics Core housed within the Oklahoma Nathan Shock Center.
Role: PI

1K99AG049092-01A1 (PI- Menachery) June 2015- May 2017
Pathway to Independence Award (K99/R00), National Institute of Aging
Title: Systems Based Analysis of Host Factors that Contribute to Aging Pathogenesis
This grant utilizes systems biology and the SARS-CoV mouse model to identify target host pathways that contribute to differential disease outcomes in the aged host compared to young.
Role: PI

5F32AI102561-02-09 (PI- Menachery) January 2013- June 2015
Ruth L. Kirschstein National Research Service Award, National Institute of Allergy and Infectious Disease, NIH
Title: Evaluation of SARS-CoV 2'O Methyltransferase Mutants
The major goal is to examine the role of NSP16 in the context of infection, host responses, and therapeutics.
Role: PI

Postdoctoral Awards for Research Excellence (PI- Menachery) September 2014- July 2015
Office of Postdoctoral Affairs, University of North Carolina at Chapel Hill
The award recognizes research excellence and provides support for materials or further training opportunities.
Role: Awardee

T32EY013360-09 (PI- Beebe) September 2008- May 2010
National Eye Institute Research Training Grant in Visual Science
Title: The Impact of Interferon Regulatory Factor 3 on the Immune Response to Herpes Simplex Virus-1 Infection
This project examined the role of interferon regulatory factor 3 in controlling HSV-1 infection in vitro and in vivo.
Role: Trainee

INVITED SEMINARS

2019

Seminar Speaker

Infection and Immunity Seminar Series 2019 — Imperial College London
London, UK — June 2019

Plenary Speaker

Annual Conference 2019 — UK Microbiology Society
Belfast, Northern Ireland, UK — April 2019

2018

Seminar Speaker

Infectious Disease Division — Washington University School of Medicine
St. Louis, MO — June 2018

Microbiology Department Seminar — Ichan School of Medicine, Mount Sinai Hospital
New York, NY — March 2018

Center for Infection and Immunity — Mailman School of Public Health, Columbia University
New York, NY — March 2018

Plenary Speaker

4th Medical Conference — Instituto de Medicina Tropical Pedro Kouri
Havanna, Cuba — December 2018

2016

Seminar Speaker

Microbiology Department — University of Pennsylvania
Philadelphia, PA — March 2016

Microbiology Department — Columbia University
New York, NY — March 2016

Biochemistry and Molecular Biology Department — Penn State University
State College, PA — February 2016

Microbiology, Immunology, and Cancer Department — University of Virginia
Charlottesville, VA — February 2016

Laboratory of Infectious Disease — National Institute of Health
Bethesda, MD — February 2016

Microbiology and Immunology — University of Iowa
Iowa City, IA — January 2016

PROFESSIONAL DEVELOPMENT

- Positive-Strand RNA Virus Keystone Meeting (2016, 2019)
- Virus and Cell Gordon Conference (2013, 2015, 2017)

- American Society of Virology Annual Meeting (2006, 2008, 2009, 2011-2019)
- American Association of Immunologist Annual Meeting (2018, 2019)
- Aging and Immunity Symposium (2017)
- International Nidovirales Symposium (2014, 2017)
- Cytokines Meeting (2016, 2018)
- Biology of Acute Respiratory Infection Gordon Conference (2016)
- NIH Systems Biology U19 Annual Meeting (2015, 2016, 2017, 2019)
- "Omics" Systems Biology Program Meeting (2015)
- Responsible Conduct & Human Subjects Research Training, Collaborative Institutional Training Initiative (2014)
- Pathogenesis of Respiratory Viruses, Keystone Symposia (2014)
- Systems Immunogenetics Bi-Annual Meeting, Chapel Hill, NC (2013, 2014, 2015, 2016)
- Systems Genetics Workshop, Chapel Hill, NC (2013)
- North Carolina State 2nd Annual Postdoctoral Research Symposium (2013)
- Microbiology and Immunology Reunion, University of North Carolina (2013)
- Annual Oliver Smithies Nobel Symposium (2013, 2014)
- Virology in Progress, UNC (2011- 2017)
- 3rd Annual Systems Biology Programmatic and Systems Biology Working Group Meeting (2011)
- Systems Biology Approaches to Virus-Host Interaction Conference, Chapel Hill (2011, 2012)
- University of North Carolina Virology Colloquium (2010, 2011, 2012, 2015)
- Responsible Conduct of Research Training (2010)
- Triangle Immunology Interest Group (2010- Present)
- Immunology Program Retreat (2004 – 2008)
- International Herpes Workshop (2007)

TEACHING AND MENTORING EXPERIENCE

Microbial Pathogenesis: Viruses
Biological and Biomedical Sciences Program, University of North Carolina Chapel Hill, NC
Guest Lecturer April 2014

- Senior level graduate course exploring microbial pathogenesis of viruses.
- Delivered lecture on host-virus interactions as well as providing and grading final exam questions.

Preparing for the Postdoctoral Process
The Graduate School, University of North Carolina Chapel Hill, NC
Panelist September 2013

- Served as contributor for panel to prepare graduate students for researching, finding, and getting a post-doctoral opportunity in their area of interest.

Undergraduate Research
Dept. of Biology, University of North Carolina Chapel Hill, NC
Research Mentor August 2011- May 2012

- Senior level undergraduate course in biology that seeks to provide students with research experience while working on a relevant question of current biological interest to a UNC research laboratory.
- Responsibilities included direct training and supervision of a senior undergraduate, Jordan Best. Provided guidance for projects that included construction of over expression vectors, stable cell lines, and chimeric mutant viruses. Reviewed lab notebook, aided final summary report, and provided context and recommendations for final grade.

Principles of Biology III: Physiology
Dept. of Biology, Washington University in St. Louis Saint Louis, MO
Teaching Assistant January 2007- May 2007

- Sophomore undergraduate class of 360-390 students with strong interest in biology; subject matter focuses on molecular and cellular bases of systems physiology.
- Responsibilities included leading 3 one-hour discussion sections per week; writing and grading weekly quizzes; attending lectures and holding office hours; leading final exam preparation sessions; and proctoring all exams.

JVI Spotlight Text.docx

Here is the draft of the spotlight text. I'd like to have it sent to JV by the end of the day if possible.

Also, with Amy gone, who is handling the publication bills.

Thanks

Subject: Congratulations! Your Article Has Been Chosen as a JVI Spotlight!

Dear Vineet,

Congratulations! Your article, "Trypsin Treatment Unlocks Barrier to Zoonotic Bat Coronaviruses Infection " (JVI01774-19) has been selected by the editors of the Journal of Virology for inclusion in "Spotlight," a feature in the Journal that highlights research articles of significant interest from the current issue. This section follows the table of contents and includes short descriptions of five especially meritorious articles.

If you wish your article to be included in this section, please draft a short, declarative title and a brief summary of your manuscript (between 50-100 words) and forward these to me. The summary should be composed in general terms, highlighting the broad biological significance of the work. Also, please select a panel of one figure from your paper to display alongside the text in the Spotlight section. Please crop the figure file so that it includes only the portion of the figure to be published in the Spotlight, and send the resulting high-resolution (300dpi) TIF (preferred), EPS, or PPT file to me. The figure can convey the most important experimental result of your study or an interesting image. Do not send a multi-panel figure. We only have space for a single panel. Please include a short descriptive title for the figure. The title used in the legend for the chosen figure may suffice. You will find an example of what we are aiming for in this section, attached.

As our printing deadlines are very tight, we must receive your material – the headline, paragraph of text,

cropped figure file, and brief figure legend by 5 pm (Eastern Standard Time) on Tuesday the 17th of December. Please let me know if I can help you with any questions. Thank you for contributing to the Journal of Virology Spotlight.

Sincerely,
Becky Dutch

JVI Spotlight
Menachery, Dinnon et al.

Reconsidering the Primary Barriers to Coronavirus Emergence

Traditionally, the emergence of coronaviruses (CoVs) has been attributed to a gain in receptor binding in a new host. In this study, we rescued replication of two MERS-like bat viruses through the addition of exogenous trypsin. Our results argue that proteolytic cleavage of the spike, not receptor binding, is the primary replication barrier for these CoVs. Importantly, the majority of zoonotic virus sequences are isolated from guano, suggesting an enteric replication cycle in bats. Thus, the presence of exogenous protease may be required for the replication of bat viruses and a key barrier to emergence in a new host.

Spotlight Figure: **Absence of compatible host proteases restricts bat CoV infection.**

November 25, 2019

To the Editors,

Please find our revised manuscript, "Trypsin treatment unlocks barrier for zoonotic bat coronaviruses infection" by Menachery, Dinnon, et al.

We take this opportunity to thank the reviewer for the comments and suggestions. We have responded to all the comments of the reviewer and feel that the improved manuscript is now appropriate for publication. Detailed modifications have been highlighted in the manuscript, and the significant changes are described in the response to reviewers.

Both reviewers recognized the significance and importance of our findings. However, both reviewers asked for clarification and elaboration on specific points and additional experiments to support our conclusions. Specifically, Reviewer 1 requested modification of the text and expansion on several points of interest. In addition, we revised our description of the HAE infections to more clearly describe the experiments. Reviewer 2 requested documentation of spike cleavage and examination of the proteolytic cleavage site sequences. Each has been added to the manuscript and figures have been modified as outlined in the response to reviews.

Overall, we believe that these responses have improved the quality of the manuscript and made it more appropriate for publication in Journal of Virology. Thank you for your consideration of this revised manuscript..

Sincerely,

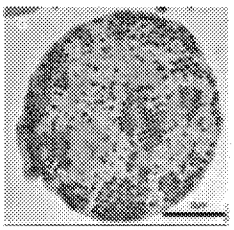
Faustovirus, a Virus of Amoebae Closely Related to the Mammalian Pathogen, Asfarvirus
(Reteno et al.)

African swine fever virus (ASFV) is the unique mammalian pathogen among the nucleocytoplasmic large DNA viruses (NCLDVs). Reteno et al. (#0115-15) report the isolation of Faustovirus, a new lineage of NCLDV phylogenetically close to ASFV. Faustovirus encodes about three times more mosaic gene complements than ASFV, of which two-thirds do not show significant similarity to known proteins. The isolation of this new giant virus provides a blueprint for finding new pathogenic or commensal viruses and for deciphering the dark matter in metagenomic databases.

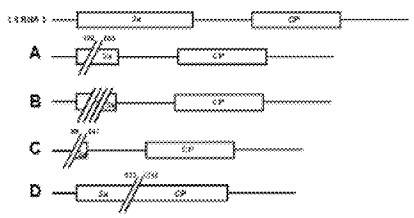
Electron microscopy imaging of the faustovirus.



Mutation and Recombination, Opposing Properties of a Viral Polymerase
(Pita et al.)

RNA virus polymerases display high mutation rates and have a tendency to generate recombinant viruses. In this study, Pita et al (#0040-15) show that cucumber mosaic virus strains with high levels of mutation frequency have low levels of recombination frequency, whereas those with low levels of mutation frequency have high levels of recombination frequency. These findings may reflect different effects of the capacity of the polymerase to remain associated with its template.

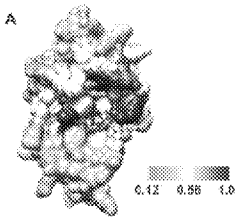
Structure of RNA 3 deletion mutants.



Structural Basis of Rotavirus RNase L Antagonism
(Ogden, Hu, et al.)

Some rotaviruses and coronaviruses encode a phosphodiesterase that cleaves 2',5'-oligoadenylates, which activate cellular RNase L, thereby shutting down a potent innate antiviral pathway. Ogden, Hu, et al. (#0701-15) present crystal structures of the rotavirus phosphodiesterase domain alone and in complex with 2',5'-oligoadenylate. This new structure enabled identification of the ligand-binding site, which is conserved among phosphodiesterases that cleave this substrate. This work points the way forward in the design of small-molecule inhibitors of viral RNase L antagonists.

Surface representation of the rotavirus VP3 C-terminal domain with bound substrate.



Insights into Ebola Virus Lethality in an Animal Model
(Alfson et al.)

Ebola virus (EBOV) plaque-forming-units (PFUs) are usually quantified by plaque assay using Vero E6 cells. Alfson et al. (#0649-15) infected cynomolgus macaques with equivalent doses of two EBOV stocks possessing different particle-to-PFU ratios. A dose of 0.01 PFU from a high particle-to-PFU ratio stock was 100% lethal, while the same dose from a low particle-to-PFU ratio stock exhibited no lethality. This finding suggests that viral particles not quantified by plaque assay retain the capacity to cause lethal disease and should be considered when modelling EBOV disease and testing EBOV countermeasures.

Hypothesized composition of EBOV stocks with different particle:PFU ratios.

Hey Jake and Ralph,

Happy new year to you both. Congrats on the baby. Hopefully you are adjusting well. You have so much to look forward to.

In regards to the paper, I have read through it, skimming and looking through the figures. I still think that the manuscript needs a lot of work. Anne did not address the reviewer comments and I still find the paper confusing and sloppy.

Based on what is here, I do not think it can go back to JVI. It still needs to be cleaned up quite a bit in the text for clarity. I would recommend dropping figure 3 altogether, as the point is lost and not especially clear. Similarly, I would take the HELMET data out of figure 4 and have it on its own as figure 5. FInally, figure 5-6 should be combined. The text needs to be modified here too to be much more careful in the discussion.

Overall, there is good data here and a clear story. Unfortunately, in the current form, it is very difficult to get to that conclusion.

U19 Progress Report UTMB 060520.docx

Hey Ralph,

Sorry, I lost track of time with the progress report. See attached with some of the progress with the PARP9 story my student Craig is working on. We had a fundable score on my aging CC R21 but NOA. If it is funded, I was going to do a F2 with CC032XCC072. This will help resolve the SARS titer qtl. I will plan on doing it with SARS2 if the MA virus also causes age dependent disease; otherwise I'll do SARS1.

I added the publications that cited U19 funding which might not already overlap with what you have. Let me know if I need anything else. Again, sorry it is late.

Subject: Re: CoV question

HKU1 and OC43 don't have a known ORF3b or ORF8. The accessory ORFs don't have much homology across families.

I do question if there is sufficient abundance of those proteins to generate ab response against them. Dont' know much about it or if anyone has really looked. I'd think 8 before 3B.

Subject: CoV question

Ralph/Matt/Vineet

Reviewing a paper (what else is new). Quick question....

Do OC43 and HKU1 (other betacoronaviruses) have ORF3b and ORF8 proteins?

I don't think so, but I want to be sure

This is about potential X-reactivity of these antigens to anti-SARS-CoV-2 sera....if the OC43 and HKU1 don't have these proteins, the SARS-2 proteins might be useful for SARS-CoV-2 diagnostics (apart from MERS-CoV and SARS-CoV)

Yes?

Mike

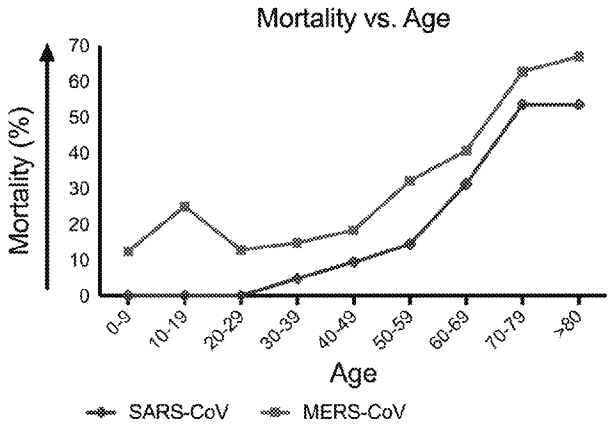
Aging CC for RSB 100820.pptx
PARP9 summary for RSB 100820.pptx

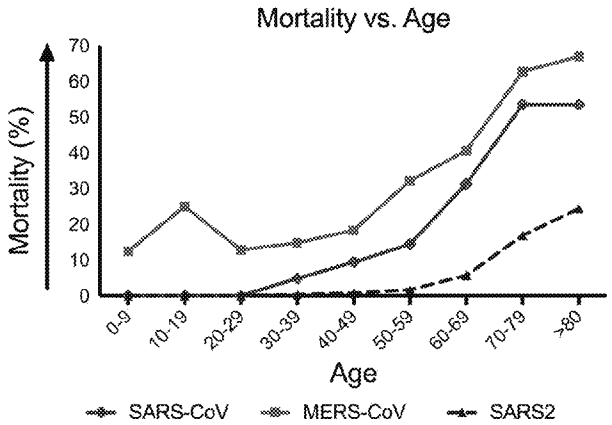
Aging, Genetic Diversity, and CoVs

Aging & Infection



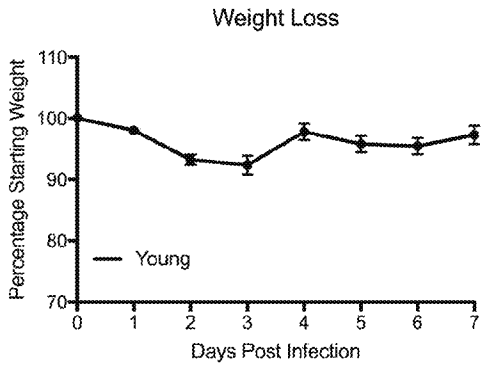
- Major age dependent disease with CoVs in humans

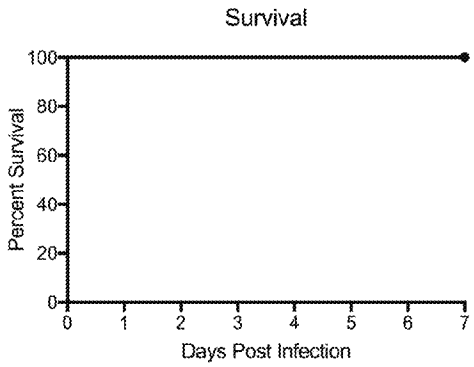
Aging & Infection



- Major age dependent disease with CoVs in humans

Age Related Pathogenesis to SARS





- SARS-CoV age-dependent disease conserved in mice

Genetic Diversity and Aging

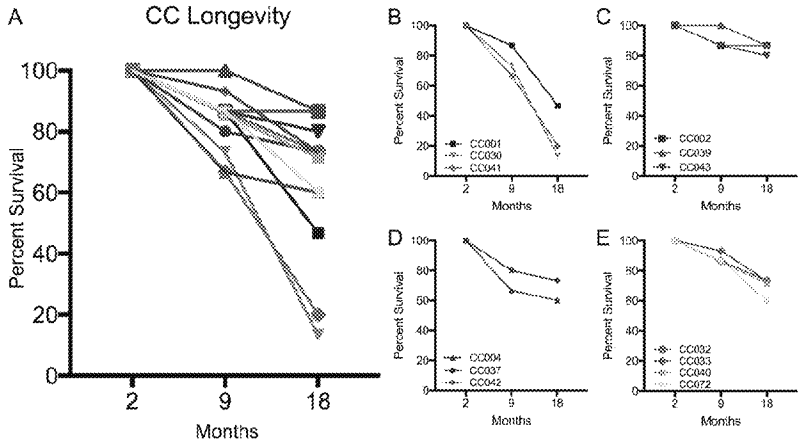
- How does genetic diversity impact the aging process?

- Is age dependent susceptibility to CoVs driven by genetic correlates?

Premise

- 8-12 mice from 13 CC lines were aged to >18 months
- Mice were challenged with SARS-CoV and compared to young (2.5 months)

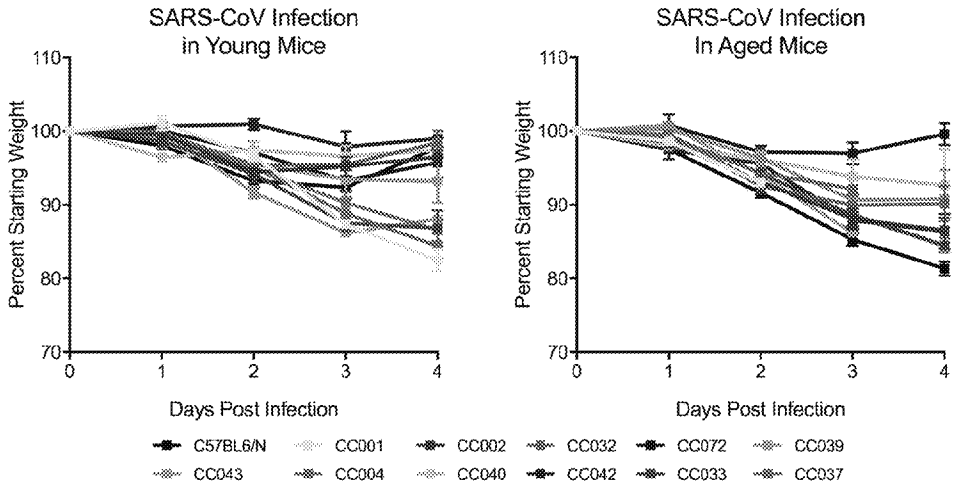
Longevity



- Range of survival for CC to 18 months of age

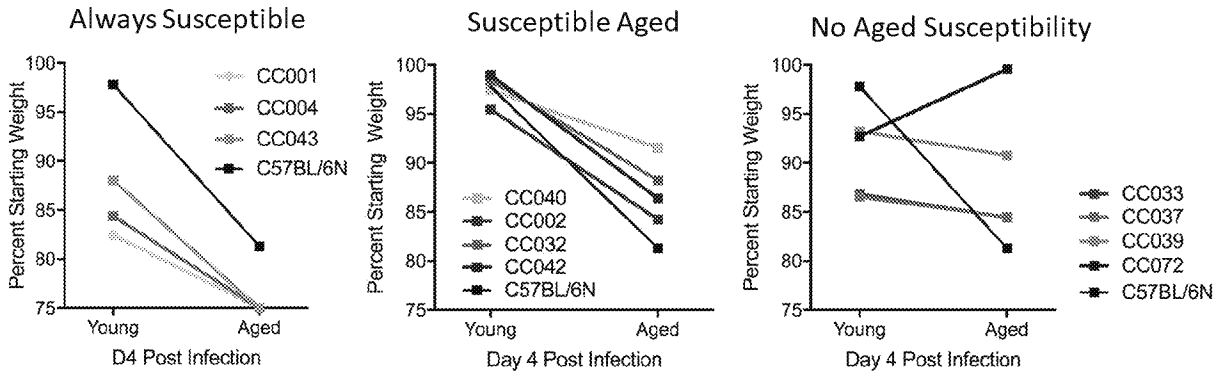
All the B6 mice survived to this point with no lethality.
No cause of deaths noted, mice surveyed for prseence at 9 and 18 months

Age-dependent Susceptibility



- Range of disease observed in young and aged

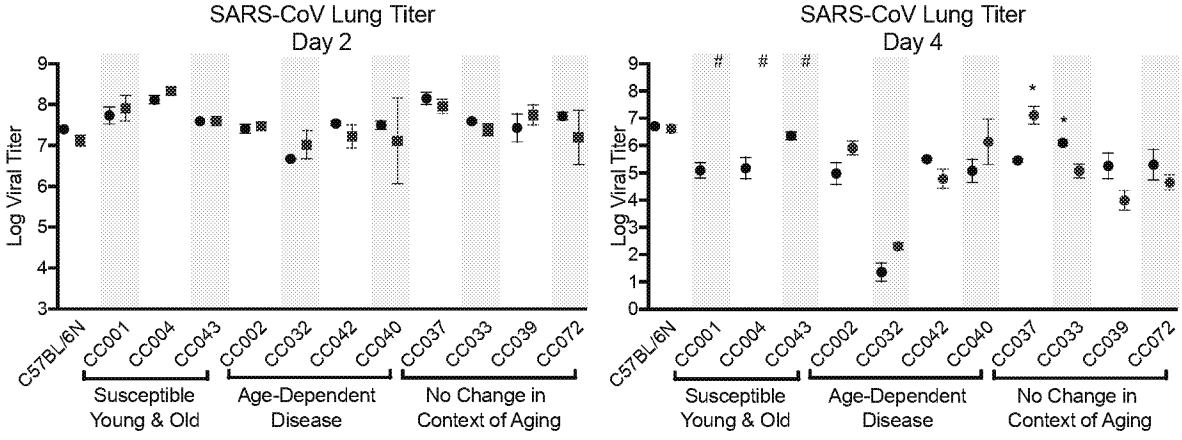
Age-dependent Susceptibility



- Age dependent CoV susceptibility conserved in most CC lines

Lines susceptible young and old
Lines susceptible just aged
Lines indifferent or resistant as they age

Age-dependent Susceptibility



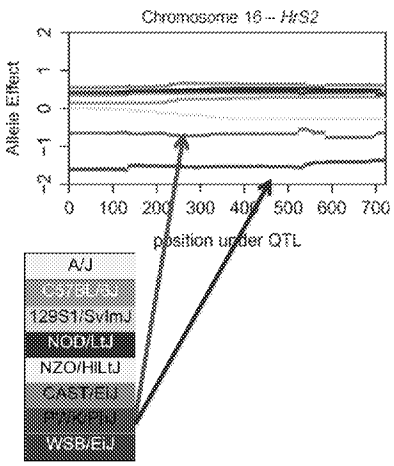
- Age dependent CoV susceptibility not driven by change in viral loads

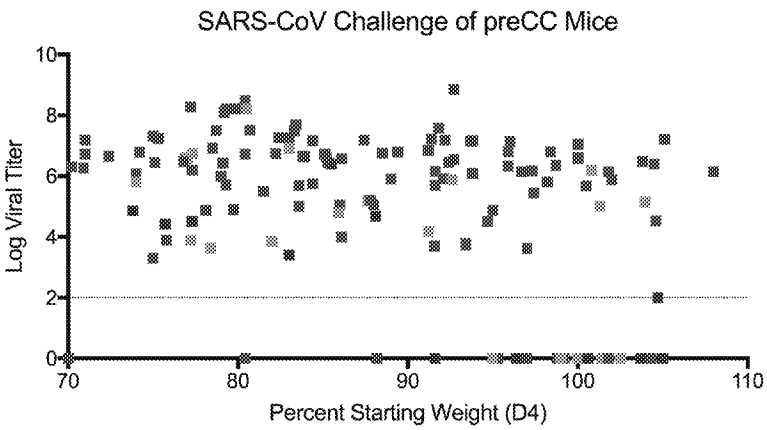
No significant changes in D2 titers between young and old
Day 4 has only CC037 with higher load in old;
represent animals groups that did not survive to the the d4 time point or did not have enough animals to graph

Mapping Age-Dependent Susceptibly

- Work on defining age-dependent QTL alleles
  - F2 cross
    - CC032 (susceptible aged) vs CC072 (resistant aged)
    - Examine young and aged F2 mice in screen
  - Funded on R21AI145400

SARS Viral Titer QTL: Chr. 16 (26%)





- Low titer phenotype driven by PWK/PhJ allele
- Cast/EiJ allele also had lower viral loads

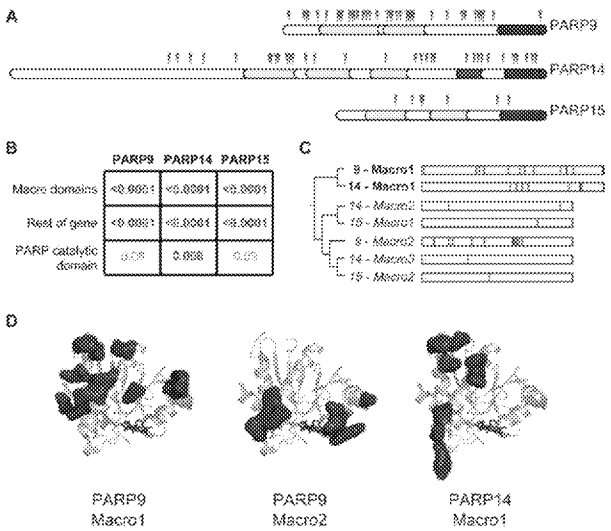
Gralinski et al. PLoS Genet. 2015 Oct 9;11(10):e1005504.

SARS Viral Titer QTL: Chr. 16

- 5.4Mb QTL region contains
  - 92 total coding genes
  - 30 non-coding RNA
- Narrowing to the PWK allele
  - 48 candidate genes with impactful mutation
  - Apoptosis, T-cell activation, mucins
  - Also include Parp9 and Parp14

PARP Proteins

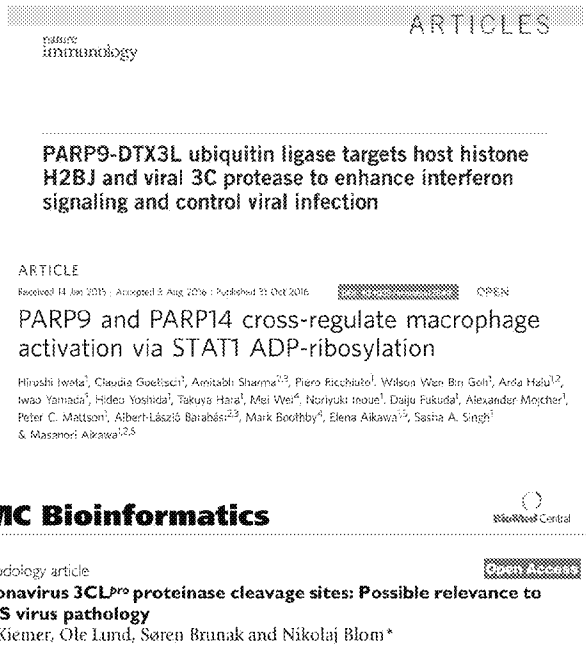
- Family of proteins associated with ADP ribosylation
- PARP genes found to be under heavy positive selection in primates and rodents



Daugherty et al. PLoS Genet. 2014 May; 10 (5):e1004403.

PARP Proteins

- PARP9 found to play role in interferon stimulated gene induction via STAT1
- PARP9 and PARP14 co-regulate each other in macrophage activation
- Prediction software suggest that CoV 3CL-protease may cleave PARP9 or PARP14



ARTICLES

nature immunology

PARP9-DTX3L ubiquitin ligase targets host histone H2BJ and viral 3C protease to enhance interferon signaling and control viral infection

Sent: Wed 12/9/2020 1:28:33 PM (UTC-06:00)
Subject: FW: Conversation with CDC's Dr. Redfield

Hi Everyone!

Dr. Scott Strome sent this along thinking some of you might be interest. Please keep in mind that all times are CST.

[redacted]

[redacted]

Please join the UT Health Science Center College of Medicine and Faculty Senate for a virtual conversation with Dr. Robert Redfield, director of the Centers for Disease Control and Prevention (CDC).

Monday, December 14

11:00 am – 12:00 pm CST

Zoom link: *https://zoom.us/j/91716864333*

Passcode: 901901

Dr. Scott Strome, Dean of the College of Medicine, has arranged this conversation so that the campus and community can hear Dr. Redfield's perspectives on COVID-19 – perspectives that will be directly applicable to health care providers, patients, businesses, and our community.

Dr. Redfield has more than 30 years of experience in research and clinical care of viral infections and infectious diseases, particularly HIV. He was a member of the President's Advisory Council on HIV/AIDS from 2005 to 2009, chair of the International Subcommittee, and past member of the Office of AIDS Research Advisory Council at the National Institutes of Health.

Our mailing address is:

Subject: SARS-CoV-2 Weekly Investigators Meeting - December 15th
nCoV PI call attendee list.xlsx

Hi Everyone,

On Tuesday, December 8th, Dr. Ben Tenoever gave a wonderful seminar on **"Single virion tracking of SARS-CoV-2 in vivo to better understand systemic inflammation associated with COVID-19".** Thank you to Dr. Tenoever for presenting and to those that attended.

Next up, Dr. Ivan Marazzi will be giving a presentation on "**A potential cure for severe COVID-19, in animal models, thus far**." Hope everyone is able to tune in! Please let me know if you know of anyone who would like to attend or present in future meetings.

Speaking of future meetings, the holidays are quickly approaching. Please complete the poll as to whether you are planning to attend the webinar on Tuesday, December 22nd so we have an idea of the number of attendees. If you want to email me your answer instead, that's ok too. Keep in mind, we will be canceling this meeting on December 29th (holiday vacation) and January 12th (CEIRS Annual Meeting).

Subject: SARS-CoV-2 Weekly Investigators Meeting

nCoV PI call attendee list.xlsx

Hi Everyone!

On Tuesday, December 15th, Dr. Ivan Marazzi gave a presentation on "**A potential cure for severe COVID-19, in animal models, thus far**." Thank you, Ivan, for presenting and those that were able to join.

As a reminder, this call will be cancelled December 22nd and 29th. I will send an email closer to the new year with the presentation details for the January 4th meeting.

Hope everyone has a safe and joyful holiday season.

Rebecca

CANCELLING for the holidays

Hi Everyone,

We will be incorporating COVID-19 Cohort presentations to our arsenal of talks. As a reminder, the goal for the weekly SARS-CoV-2 Investigators meeting is to provide a platform that is informative and encourages collaboration.

If you would like to present your research, please let me know. *

Subject: Change in date for SIG U19 call

Hi All,
The time that works for most is the 4th Thursday of every month, 1:30 pm ET/10:30 PT. I will cancel the old invitation and send a new one.
Thanks for your cooperation.

Toni Baric

Dept of Microbiology & Immunology

To: Liu, Joy (NIH/NIAID) [E]; Arlene Sharpe; Jonathan Kagan; Baric, Ralph S; Heise, Mark T; Ulevitch, Richard; Diercks, Alan; Bruce Beutler; Leitner, Wolfgang (NIH/NIAID) [E]
Subject: Second Webinar for Systems Immunology Program
When: Tuesday, March 23, 2021 4:00 PM-5:00 PM (UTC-05:00) Eastern Time (US & Canada).
Where: Zoom meeting

Dear All,

According to your availability, our second webinar will be held from 4:00 to 5:00 PM EDT on March 23th. **Ralph Baric's group will give us a 45-min presentation. We will have 15 minutes for Q&A after that. Ideally, the topic would be COVID-19 related. Please forward the invitation to the laboratories in your group**. Please use the following information to access the meeting. Please let me know if you have any questions.

Best regards,
Joy Liu

Subject: SARS-CoV-2 Weekly Investigators Meeting - February 2nd
nCoV PI call attendee list.xlsx

TGIF Everyone!

What a great discussion we had on Tuesday, January 26th following the presentation given by Drs. Dave O'Connor and Thomas Friedrich titled "**SARS-CoV-2 variants in Wisconsin**". Thank you to our presenters and to those who were able to join.

Next Tuesday, February 2nd, we will have a double feature from the following investigators:

Drs. Dave O'Connor and Thomas Friedrich
"COVID on campus: investigating links between SARS-CoV-2 transmission among college students and the broader community"

And

Dr. Denis Nash
"Serologic outcomes in a national, community-based cohort of U.S. adults: the CHASING COVID Cohort Study"

Hope you all are able to join!
Rebecca

Subject: final official acceptance!

Hi all,

Over the past two weeks I worked with the BMC Bioinformatics editorial system to get the right headings and order of sections. I just received the final official acceptance! From the journal email:

“I am pleased to inform you that your manuscript "Hypergraph Models of Biological Networks to Identify Genes Critical to Pathogenic Viral Response" (BINF-D-20-01029R3) has been accepted for publication in BMC Bioinformatics.”

Thank you all for the work to carry out the experiments, gather and process data, and complete the hypergraph analysis. I think we can now officially list this one as “In Press” :).

Subject: final official acceptance!

Hi all,

Over the past two weeks I worked with the BMC Bioinformatics editorial system to get the right headings and order of sections. I just received the final official acceptance! From the journal email:

“I am pleased to inform you that your manuscript "Hypergraph Models of Biological Networks to Identify Genes Critical to Pathogenic Viral Response" (BINF-D-20-01029R3) has been accepted for publication in BMC Bioinformatics.”

Thank you all for the work to carry out the experiments, gather and process data, and complete the hypergraph analysis. I think we can now officially list this one as “In Press” :).

DEGs_Human_MG_SYD_141020.pdf

Dear all,
I thought that you might find this useful for your candidate gene analysis. Mark mention it a few times during our presentation at the NIAID meeting.
Enclosed is a list of differentially expressed genes from a comparison of patients with severe to moderate influenza disease. You can use it directly to check your candidate genes to see whether they are regulated in severely infected patients. The list contains differentially expressed genes with a fold change abs>0.5849 (log2 of 1.5) and an adj.p-value<0.01.
If you have any questions concerning the list or particular genes, do not hesitate to contact me.
With best regards,
Klaus

Subject: Third Webinar for Systems Immunology Program
When: Thursday, April 1, 2021 2:00 PM-3:00 PM (UTC-05:00) Eastern Time (US & Canada).
Where: Zoom meeting

Dear All,

According to your availability, our third webinar will be held from 2:00 to 3:00 PM EDT on April 1st. **Richard Ulevitch's group will give us a 45-min presentation. We will have 15 minutes for Q&A after that. Ideally, the topic would be COVID-19 related. Please forward the invitation to the laboratories in your group**. Please use the following information to access the meeting. Please let me know if you have any questions.

Best regards,
Joy Liu

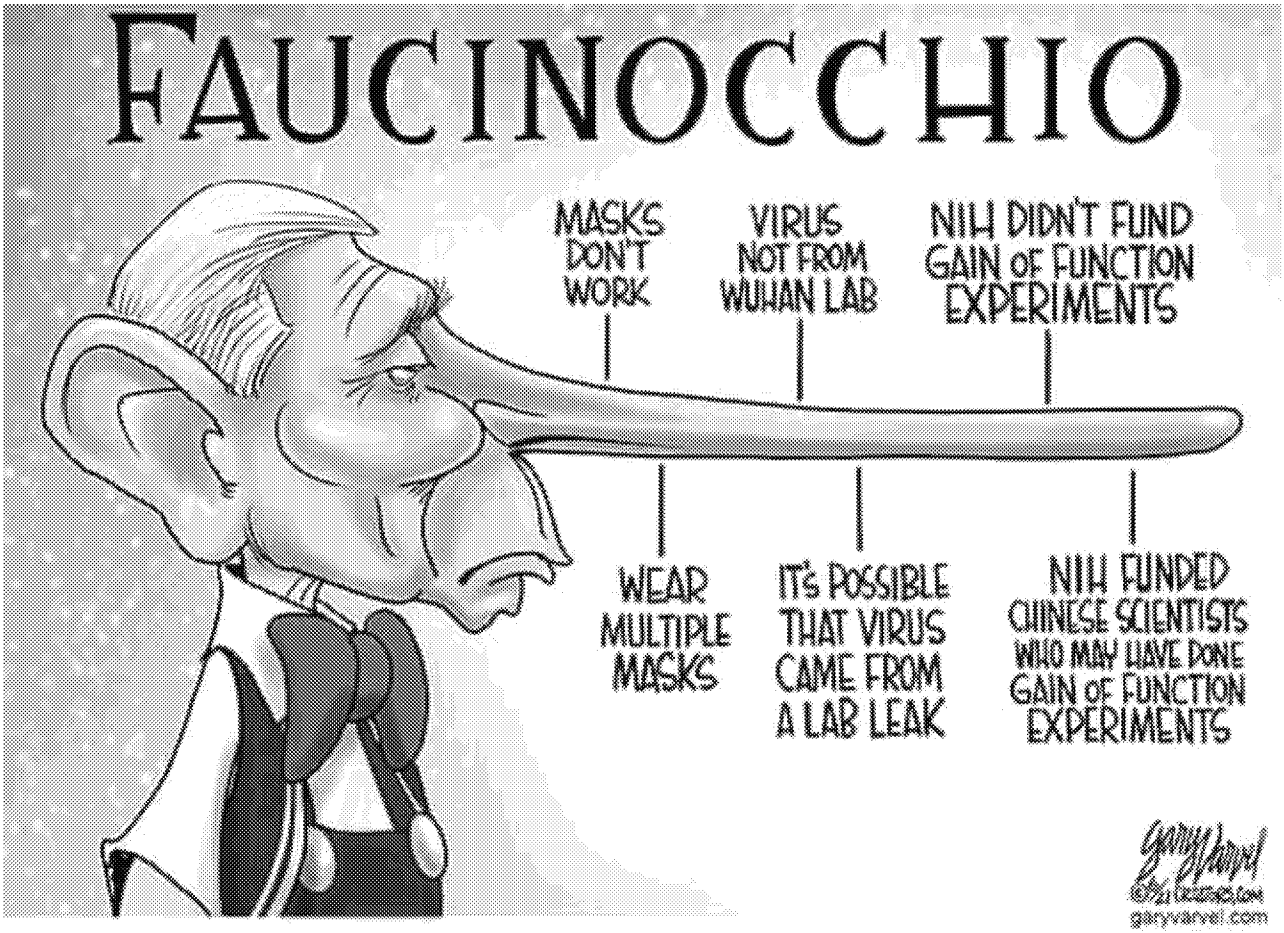
Subject:	Contaminated vaccines killed 3.5 million; It's a US funded Chinese lab virus; Regulation failure: Formal FDA petitions/lawsuit to withdraw ALL vaccines

Government "scientists", "top virologists", "top medical journals", Big Tech social media, mainstream media, "fact-check" criminals, 77 mad Nobel "scientists", colluded, conspired, lied and censored to cover up the lab origin of the SARS-CoV-2 virus. Only the incredibly stupid would still believe that these same lying criminals are magically telling us the truth about vaccine dangers.

Now that the SARS-CoV-2 cover up has failed spectacularly, the criminals at Facebook have graciously decided to allow people to have discussions on the matter.

Fauci wrote in 2012 that the benefits of gain-of-function (GOF) experiments outweigh the risk. He killed 3.5 million people in 15 months by funding a sloppy lab in China performing GOF research, which created the SARS-CoV-2 virus. This mass murderer pushes killer quackccines lying again that the benefits outweigh the risks. He maimed and killed millions more. This mass murderer is the Chief Medical Adviser to POTUS.



Vaccines killed 3.5 million in 15 months

3.5 million people died of COVID-19 disease because they were injured by quackccines such as the flu shot, Tdap, etc. Dirty quackccines contaminated with proteins that are similar to SARS-CoV-2 proteins, induced allergy against the SARS-CoV-2 virus.

Severe COVID-19 is therefore a severe allergic reaction suffered upon infection. Predicted in Jan 2020, confirmed in Aug 2020:

"Some cytokines not associated with antiviral responses, such as IL-5, which aids defence against parasitic worms and is released during **allergic reactions**, were, surprisingly, upregulated as people developed severe disease."

COVID-19 poses a riddle for the immune system
https://www.nature.com/articles/d41586-020-02379-1

OTC antihistamines famotidine/cetirizine could have prevented all these deaths. Corrupted criminals in the medical establishment, actively suppressed use of these proven, cheap medicines, killed millions while pushing for new, unnecessary, lucrative SARS-CoV-2 quackccines. These quackccines have maimed and killed thousands. At least 4000 deaths have been reported to VAERS. Clueless FDA does not understand a thing about modmRNA quackccines but they have magically determined that these deaths are unrelated to the quackccines?

https://www.foxnews.com/opinion/tucker-carlson-how-many-americans-have-died-after-taking-the-covid-vaccine

My email to Fauci/Collins/Redfield sent **Feb 1 2020** on using antihistamines to treat COVID-19 (see pg. 97-98 of FOIA doc. below):

https://www.judicialwatch.org/wp-content/uploads/2021/02/DCNF-v-HHS-Nov-2020-00149.pdf

The biggest lie ever told: "the doctor has determined the benefits outweigh the risks"

After billions and decades wasted on "research", doctors (make that quacks) admit they are clueless about the root cause of food allergy, autism, asthma, leukemia, countless autoimmune disorders or even COVID-19 severity. All immunological disorders. Even vaccinologists admit they are clueless about the immunological mechanisms involved in how vaccines work/fail/hurt the body. But these quacks have magically determined that immunological interventions - vaccines are safe? The benefits outweigh the risks? Who are they trying to fool?

Corrupt Pharma criminals hiding behind liability protection for their vaccines, tells you EVERYTHING you need to know about vaccine safety. If vaccines were safe, why can't these criminals put their money where their mouth is? Instead these organized criminals have raked in billions for their killer quackccines.

Why are the anti-vaxxers winning, and how do you stop them in their tracks?

How do I argue against anti vaxxers?

https://www.quora.com/How-do-I-argue-against-anti-vaxxers/answers/131896199

Allogeneic and xenogeneic antigens in vaccines/biologics cause the explosion of autoimmune diseases

One protein contaminating the AstraZeneca and Janssen vaccines causes the autoimmune disease that leads to clotting in the brain. The German team found almost 2000 such contaminating proteins in the AstraZeneca vaccine. The Janssen vaccine is manufactured using human embryonic retinal cells (PER.C6) while the AstraZeneca vaccine used human embryonic kidney cells. So they can be expected to have the same contamination profile. This autoimmune clotting problem is just the first of 2000 more to come.

Towards Understanding ChAdOx1 nCov-19 Vaccine-induced Immune Thrombotic Thrombocytopenia (VITT)

https://assets.researchsquare.com/files/rs-440461/v1/8eabf306-6fd4-4a89-a7a3-8f4d06c89a55.pdf

"In this regard, we identied (sic) an array of cell-culture derived human proteins in the vaccine, potentially predisposing to immune reactions against these antigens. If such proteins express a structures (sic), e.g. by a genetic polymorphism not found in the corresponding endogenous protein of the vaccinated individual, **a possible strong alloimmune response (with potential for autoreactivity) in a susceptible vaccine recipient should be considered**"

https://assets.researchsquare.com/files/rs-440461/v1/dadfb0d76a7a31650e518d70.pdf

"This proteome analysis revealed a surprisingly large number of proteins of 1856 – 1939 proteins per LOT"

These are just the latest quackccine induced autoimmune diseases.

5 to 7% of blood donors have detectable PF4–heparin antibodies induced by quackccines.

It's a US funded, Chinese lab virus

"Top virologists" are lying criminals. How can you trust them to create safe vaccines?

http://thebulletin.org/2021/05/the-origin-of-covid-did-people-or-nature-open-pandoras-box-at-wuhan/

Root cause of COVID-19? Biotechnology's dirty secret: Contamination. Bioinformatics evidence demonstrates that SARS-CoV-2 was created in a laboratory, unlikely to be a bioweapon but most likely a result of sloppy experiments

Fauci Emails: How Top Public Health Officials Spun Tangled Web of Lies Around COVID Origin, Treatments

https://childrenshealthdefense.org/defender/fauci-emails-top-public-health-officials-lies-covid-origin-treatments/

Bell's palsy observed in mRNA vaccine trials but not in the real world? Means VAERS reports undercount 12X or trials were cooked.

From the clinical trials, it was obvious that the mRNA quackccines cause Bell's palsy. There was only a 1 in 7000 chance that the trial outcome was a result of random chance. Looking at Bell's palsy cases reported to the VAERS, it means either only 8% of adverse events are being captured in VAERS or if VAERS is representing reality then the trials were cooked. It is unlikely that both vendors would have observed spikes in Bell's palsy cases in the trial.

Assume SARS-CoV-2 vaccines DO NOT cause Bell's palsy

40,000 cases of Bell's palsy occur in the US per year. So 40,000 cases for 330,000,000 person-years. 40,000/12=3333 cases for 330,000,000 person-months.

Due to CDC mandated reporting to VAERS, assume all cases of Bell's palsy occurring within a month of the SARS-CoV-2 vaccine administration are reported. That is 260,000,000 person-months.

So for 260M doses administered, we have 260*3333/330 = 2626 background cases unrelated to the vaccine, are expected in VAERS.

With only ~1500 reports, it means they are only reporting 1500*100/2626 = 57%, at best.

Assume SARS-CoV-2 vaccines cause Bell's palsy at the same rate observed in the trial

There were 7 times more cases in the vaccine arms than the placebo arms.

So the number of Bell's palsy cases expected in the VAERS is 2626*7= 18382. This suggests reporting rate may be as low as 1500*100/18382=~8%. Closer to Harvard Pilgrim 2010 VAERS study.

Possible conclusions from above

Even under CDC mandated VAERS reporting, only ~8% of adverse events are being reported.

OR

VAERS reporting is closer to ~57% but vaccine batch/lot characteristics used during Phase 3 trial were not representative of what is being administered to the general public. This invalidates trial and EUA.

However, if this is true, it is unlikely that batch/lot deviation will happen to both vendors - Pfizer and Moderna, by random chance.

Raises the possibility that Pfizer/Moderna may have carefully selected batch/lot with desirable characteristics for trial use? For example, 30% of the modmRNA is truncated/modified in the vaccine. They could have screened for batch/lots that have say 10% truncation/modification to improve efficacy observed in the trial? Then the spike in Bell's palsy cases observed only in the trials may be the smoking gun showing the trials were cooked ...

Ethics of vaccine refusal

https://jme.bmj.com/content/early/2021/02/25/medethics-2020-107026

"In practical terms, mandatory vaccination amounts to discrimination against healthy, innate biological characteristics, which goes against the established ethical norms and is also defeasible a priori."

Universities mandating COVID-19 quackccines is an admission of their abject failure

If universities succeeded in imparting thinking skills to students, why can students not be trusted to make the right decision regarding the vaccines? Why is a mandate needed? This shows that our universities are an abject failure. Alternately, the universities are lying about the "safety and efficacy" of the vaccines hence they expect vaccine refusal.

Referring to investigational quackccines under EUA as "safe and effective" violates 21 U.S.C. § 360bbb-3.

FDA/NIH employees refuse to eat their own dog food. Only 50-60% of FDA/NIH employees are vaccinated.

https://www.rev.com/blog/transcripts/dr-fauci-cdc-director-testify-before-senate-on-covid-19-guidelines-transcript

Perhaps they learned the lessons I taught them. Dirty quackccines cause autism, autoimmune diseases and allergies:

https://list.nih.gov/cgi-bin/wa.exe?A2=IMMUNI-L;65e1e89d.1811

Please add your comment on petition calling for **revocation of EUA** for these unnecessary and unsafe quackccines:

Oregon Health Authority Condemned by Scientists For Scrubbing Report on Wireless Hazards in Schools

http://washingtonspectator.org/oregon-health-authority-forbes/

In a quackccine, anything goes. Vaccine regulation is an oxymoron thus turning them into quackccines.

Aluminum content in vaccines vary, wildly exceeding levels documented in package insert or fall significantly below documented levels. So these quackccines are neither safe nor effective.

https://www.regulations.gov/document/FDA-2021-P-0433-0001

The measurement and full statistical analysis including Bayesian methods of the aluminium content of infant vaccines

https://www.sciencedirect.com/science/article/pii/S0946672X21000523

https://www.regulations.gov/comment/FDA-2021-P-0433-0040

Regulators fail to regulate vaccine content, mislead and thus invalidate all vaccine trials and studies

There are three points to be raised here.

No regulation/control of vaccine ingredients

Prof. Exley and his team have done excellent work revealing the lack of control/regulation of aluminum content in the vaccines (Shardlow et al. 2021). This problem of course is not limited to aluminum. There are no controls or specifications for thousands of other ingredients either. Egg protein content has been shown to vary a 100-fold in the influenza vaccines (Goldis et al. 2010). Bovine casein varied 2-fold in just 8 samples of the DTap/Tdap vaccines (Kattan et al. 2011). Yeast protein content among the Hep B vaccines vary 5-fold per the

package insert itself. I describe the details in my comments (two of them) posted in the Annals of Internal Medicine (please see comments section).

https://www.acpjournals.org/doi/10.7326/m18-2101

All vaccine safety, efficacy trials/studies are therefore invalid and must be withdrawn

This invalidates all vaccine trials and epidemiological studies because no one characterized/controlled the products that were the subject of these studies. We don't know if the results of such studies apply to vaccines with high or low levels of any of the ingredients. All these studies must therefore be withdrawn. The Pandemrix vaccines made in Europe contained more H1N1 nucleoprotein compared to Arepanrix made by the same vendor in Canada. Pandemrix caused way more cases of narcolepsy compared to Arepanrix. We have many examples of vaccine studies done in Denmark that are then interpreted as being applicable anywhere in the world. The above information shows that notion is absurd.

As many as 7 times the number of Bell's palsy cases were observed in the vaccine arms of the Phase III clinical trials of the Pfizer and Moderna modmRNA SARS-CoV-2 vaccines (Ozonoff et al. 2021), compared to the placebo arms. However, now the CDC claims no excess Bell's palsy cases are being observed in the general population. This is evidence that the product used in the trials were not representative of what is being administered to the public. This invalidates the trial and the emergency use authorization (EUA) that relied on that trial.

Regulatory agencies repeatedly mislead the public regarding vaccine content and the damage they cause

The FDA/CDC, UK's MHRA and EMA have continued to repeatedly mislead the public regarding vaccine content.

Human protein contamination of vaccines

One protein contaminating the AstraZeneca and Janssen vaccines causes the autoimmune disease that leads to clotting in the brain (Arumugham 2021). The German team found almost 2000 such contaminating proteins in the AstraZeneca vaccine. The Janssen vaccine is manufactured using human embryonic retinal cells (PER.C6) while the AstraZeneca vaccine used human embryonic kidney cells. So they can be expected to have the same contamination profile. This autoimmune clotting problem is therefore just the first of 2000 more to come.

Towards Understanding ChAdOx1 nCov-19 Vaccine-induced Immune Thrombotic Thrombocytopenia (VITT)

https://assets.researchsquare.com/files/rs-440461/v1/8eabf306-6fd4-4a89-a7a3-8f4d06c89a55.pdf

"In this regard, we identied (sic) an array of cell-culture derived human proteins in the vaccine, potentially predisposing to immune reactions against these antigens. If such proteins express a structures (sic), e.g. by a genetic polymorphism not found in the corresponding endogenous protein of the vaccinated individual, **a possible strong alloimmune response (with potential for autoreactivity) in a susceptible vaccine recipient should be considered**"

https://assets.researchsquare.com/files/rs-440461/v1/dadfb0d76a7a31650e518d70.pdf

"This proteome analysis revealed a **surprisingly** large number of proteins of 1856 – 1939 proteins per LOT"

So in the case of human protein contamination, a genetic polymorphism is needed for the immune system to recognize the antigen as a neoantigen, thus leading to autoimmune disease. But vaccines are contaminated with numerous plant/animal/fungal proteins (homologous xenogeneic antigens) that are similar to human proteins. Here no genetic polymorphism is needed as xenogeneic antigens already have numerous single amino acid residue differences compared to self antigens thus making them ideal neoantigens (Arumugham 2020a). In fact, oncologists use xenogeneic antigens in cancer vaccines to break immune tolerance and induce autoimmunity to treat cancer (Strioga et al. 2014). So the probability of vaccine induced autoimmune responses are much higher with xenogeneic antigens (Arumugham 2020a) than with human antigens in vaccines. VITT that was observed

so quickly with the AstraZeneca and Janssen vaccines shows that vaccine induced autoimmunity is extremely common. 5-7% of blood donors test positive for such vaccine induced anti-PF4 antibodies (Schultz et al. 2021).

The AstraZeneca vaccine package insert fails to document the 2000 proteins discovered above.

List of ingredients in the Janssen vaccine from the fact sheet for vaccination providers:

FACT SHEET FOR HEALTHCARE PROVIDERS ADMINISTERING VACCINE (VACCINATION PROVIDERS)

https://www.fda.gov/media/146304/download

"Each 0.5 mL dose of Janssen COVID-19 Vaccine is formulated to contain 5×10^{10} virus particles (VP) and the following inactive ingredients: citric acid monohydrate (0.14 mg), trisodium citrate dihydrate (2.02 mg), ethanol (2.04 mg), 2-hydroxypropyl-β-cyclodextrin (HBCD) (25.50 mg), polysorbate-80 (0.16 mg), sodium chloride (2.19 mg). **Each dose may also contain residual amounts of host cell proteins (≤0.15 mcg) and/or host cell DNA (≤3 ng).**"

But the fact sheet for recipients and care givers says:

FACT SHEET FOR RECIPIENTS AND CAREGIVERS

https://www.fda.gov/media/146305/download

"The Janssen COVID-19 Vaccine includes the following ingredients: recombinant, replication-incompetent adenovirus type 26 expressing the SARS-CoV-2 spike protein, citric acid monohydrate, trisodium citrate dihydrate, ethanol, 2-hydroxypropyl-β-cyclodextrin (HBCD), polysorbate-80, sodium chloride."

Why are the highlighted items missing from the list provided to the vaccine recipient? Why is the FDA misleading consumers?

Ovalbumin

Ovalbumin is the only egg protein listed for some influenza vaccines (CDC 2020). But 293 chicken proteins were identified in the influenza vaccine (Jacob et al. 2015).

Deoxycholate

Deoxycholate is listed as an ingredient in some vaccines (CDC 2020). Deoxycholate is derived from bovine gall bladders and is thus contaminated with bovine proteins (Jacob et al. 2015). The CDC fails to document those contaminants.

Casein

Bovine casein contaminates the DTaP/TdaP vaccines. Children with milk allergy react to the DTaP/Tdap shots. 8-18ng/ml of casein have been measured in the DTaP/TdaP vaccines (Kattan et al. 2011). The CDC fails to document that (CDC 2020).

Food proteins

Numerous food proteins contaminate vaccines per the National Academy of Medicine (2017).

Allergens in **Vaccines**, Medications, and Dietary Supplements

Physicians and patients with food allergy must consider potential **food allergen exposures in vaccines**, medications, and dietary supplement products (e.g., vitamins, probiotics), which are not regulated by labeling laws. Also, excipients (i.e., substances added to medications to improve various characteristics) may be **food or derived from foods** (Kelso, 2014). These include **milk proteins; soy derivatives; oils from sesame, peanut, fish or soy; and beef or fish gelatin.** The medications involved include **vaccines**; anesthetics; and oral, topical, and injected medications. With perhaps the exception of gelatin, reactions appear to be rare overall, likely because little residual protein is included in the final preparation of these items. The specific risk for each medication is not known.

Vaccines also may contain food allergens, such as egg protein or gelatin.

The FDA/CDC fail to document these contaminants. Polysorbate 80 used in many vaccines is derived from wheat/corn and is contaminated with wheat/corn proteins. The FDA/CDC fail to disclose that (Arumugham and Trushin 2019).

As a result, vaccines predictably cause the development of food allergies, asthma, autism, numerous autoimmune disorders, cancers (Arumugham 2020b) and the FDA/CDC deny it by ignoring the science and evidence.

All these vaccines must be immediately withdrawn. All these studies published based on these uncharacterized products must be immediately withdrawn. Safety specifications for vaccine ingredients based on safety research (not based just on vaccine maker's manufacturing capability) must be created and independently verified before these vaccines can be improved and reintroduced.

All,

Regarding:

Immunology Is Where Intuition Goes to Die
https://www.theatlantic.com/health/archive/2020/08/covid-19-immunity-is-the-pandemics-central-mystery/614956/

Says: "Normally, the immune system mobilizes different groups of cells and molecules when fighting three broad groups of pathogens: viruses and microbes that invade cells, bacteria and fungi that stay outside cells, and parasitic worms. Only the first of these programs should activate during a viral infection. But Iwasaki's team recently showed that all three activate in severe COVID-19 cases. "It seems completely random," she says. In the worst cases, "the immune system almost seems confused as to what it's supposed to be making.""

You refer to Iwasaki's paper:

Longitudinal analyses reveal immunological misfiring in severe COVID-19

https://www.nature.com/articles/s41586-020-2588-y

It says: "Moreover, severe COVID-19 was accompanied by an increase in multiple type 2 (anti-helminths) effectors, including interleukin-5 (IL-5), IL-13, immunoglobulin E and eosinophils."

I predicted the above in **Jan 2020** (please see forwarded email below) and explained **WHY** it occurs and how to treat it. Basically, vaccines contaminated with coronavirus-like proteins, program the immune system to attack those proteins as if they were parasitic worms/helminths (technically, immunoglobulin E or IgE mediated

sensitization). Upon SARS-CoV-2 infection, due to cross-reaction, part of the immune system recognizes the virus as a parasite thus resulting in an inappropriate and dangerous anti-parasite immune response. But it is important to recognize that allergy/anaphylaxis is an anti-parasite immune response. So we know how to treat it. Use antihistamines and mast cell stabilizers. That is why antihistamines work in COVID-19. **No clinical trials needed.**

Antihistamines May Help Calm COVID-19 Cytokine Storm

https://www.medscape.com/viewarticle/937178

We have known for years that the influenza vaccine causes the development of an anti-parasite (IgE) immune response against the influenza virus.

Long Term Persistence of IgE Anti-Influenza Virus Antibodies in Pediatric and Adult Serum Post Vaccination with Influenza Virus Vaccine
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3065793/

Seasonal split influenza vaccine induced IgE sensitization against influenza vaccine
https://pubmed.ncbi.nlm.nih.gov/26188254/

Influenza specific serum IgE is present in non-allergic subjects
https://pubmed.ncbi.nlm.nih.gov/16316424/

Highly increased levels of IgE antibodies to vaccine components in children with influenza vaccine–associated anaphylaxis
https://www.sciencedirect.com/science/article/pii/S0091674915010957

Severe influenza is caused by the same misdirected anti-parasite immune response we observe in COVID-19. I described the process in the BMJ back in 2018:

Influenza vaccines and dengue-like disease

https://www.bmj.com/content/360/bmj.k1378/rr-15

So I was able quickly confirm that the same mechanism was occurring in COVID-19 when the SARS-CoV-2 proteome became available in Jan 2020.

The Atlantic says: "No one yet knows why this happens, and only in some people."

Now you do. Coronavirus-like protein contaminants by definition means no one knows which batch of vaccine contains how much. So it happens only in some people because it is a game of Russian roulette.

Please see details here:

Immunological mechanisms explaining the role of IgE, mast cells, histamine, elevating ferritin, IL-6, D-dimer, VEGF levels in COVID-19 and dengue, potential treatments such as mast cell stabilizers, antihistamines, Vitamin C, hydroxychloroquine, ivermectin and azithromycin
https://doi.org/10.5281/zenodo.3748303

It might seem intuitive to get a flu shot during the COVID-19 pandemic. But think again because Immunology Is Where Intuition Goes to Die.

Proteins that contaminate influenza vaccines have high homology to SARS-CoV-2 proteins thus increasing risk of severe COVID-19 disease and mortality
https://doi.org/10.5281/zenodo.3996984

The Atlantic says:

"For some diseases, like dengue, an antibody response to one infection can counterintuitively make the next infection more severe. So far, there's no evidence this happens with SARS-CoV-2, says Krammer,"

No, that is incorrect. As explained before, severe COVID-19 is in fact the "next infection". The "first infection" was the contaminated vaccine. So exactly as in dengue, the immune response that develops following first infection, results in severe disease the next time.

"Such immune overreactions also happen in extreme cases of influenza,"

We already covered that:

Influenza vaccines and dengue-like disease

https://www.bmj.com/content/360/bmj.k1378/rr-15

Immunology Is Where Intuition Goes to Die, but there is a method to the madness. Unfortunately, as we can see, vaccinating without understanding the full immunological impact, is extremely dangerous.

Prof. Kounis' team and I, describe the common immunological mechanisms involved in cardiac injury in COVID-19, severe dengue infection and allergic reactions/anaphylaxis (Kounis syndrome). The medications for prevention/treatment include antihistamines such as famotidine/cetirizine.

The passepartout wayfares of Covid-19, Cytokine storm and Kounis syndrome

https://doi.org/10.5281/zenodo.3977923

Here's the bigger picture of the damage caused by contaminants, and non-target antigens in vaccines:

Vaccines and Biologics injury table based on mechanistic evidence – Feb 2020 Covering over 125 conditions
https://zenodo.org/record/3647593/files/vbitr2_final.pdf?download=1

IgE mediated sensitization to peptides that have homology to 2019-nCoV peptides may contribute to disease severity. In that case, antihistamines and other allergy treatments such as mast cell stabilizers may help reduce infection severity.

A BLASTP analysis of 2019-nCoV proteome against common vaccine antigens was performed. Preliminary results suggest that IgE mediated sensitization to common vaccine antigens can result in cross reactive immune responses to 2019-nCoV.

Please see details of the mechanisms here:

Lay summary

Proteins are a chain of amino acids. Proteins can have up to several hundred amino acids. Snippets of proteins (peptides), 7-15 amino acids in length are important in immunology. There are 20 types of amino acids. Each is assigned a letter (1 letter code).

Antibodies are proteins that can bind to peptides that have a specific amino acid sequence. Such a target peptide is known as an epitope.?? When an antibody binds to a peptide (which is part of a protein, which in turn may be part of a cell surface), it can trigger an immune attack on the cell. If the cell were a bacterium, the bacterium would be killed.

Humans (like all organisms) are made of numerous proteins (self proteins). So we have self-proteins, self-peptides and self-epitopes. In a healthy person, the body will not make antibodies that bind strongly to self-peptides (self-tolerance).

DNA is a chain of base-pairs. The DNA base-pair sequence determines the amino acid sequence in the protein produced. If there is a mutation that alters a single base-pair, the resulting protein will have a single amino acid that is altered. To prevent cancer, the immune system is capable of making antibodies against such altered peptides. Such antibodies can also weakly bind (cross react) to the unaltered normal peptide thus resulting in destruction of some healthy cells.

Say a normal protein has the following peptide (10 amino acids, each represented by its 1 letter code):

ALSTLVVNKI

Say DNA in a cell mutates due to a carcinogen exposure and it alters the protein thus resulting in this peptide with a single amino acid change:

ALSTLVV**S**KI

When the immune system makes antibodies targeted at ALSTLVV**S**KI (to attack the cell with the DNA mutation), the same antibodies can weakly bind to the normal ALSTLVVNKI peptide.

ALSTLVVNKI is an epitope associated with rheumatoid arthritis (RA).

So as a result of the immune system defending against cancer, the person can develop RA.

Now consider vaccines containing animal proteins. Animal proteins are very similar to human proteins, containing only occasional amino acid differences. An animal peptide could therefore have the ALSTLVV**S**KI sequence. Such a vaccine would fool the immune system into creating an anti-cancer immune response, creating antibodies targeted at ALSTLVV**S**KI. The result is vaccine induced RA.

Therefore one can predict that analyzing epitopes associated with autoimmune diseases, such single amino acid difference compared to animal peptides present in vaccines, would occur more frequently than can be expected merely by chance. The analysis confirms that this prediction is valid.

Abstract

The National Institute of Allergy and Infectious Diseases (NIAID) sponsors the Immune Epitope Data Base (IEDB). IEDB contains epitopes identified from the medical literature and organized by diseases and categories of diseases. All epitopes (23000+) associated with 82 autoimmune diseases in humans were analyzed.

The role of animal, plant, fungal proteins contained in vaccines in the etiology of autoimmune diseases have been described in humans and animals. BLASTP was used to analyze IEDB derived epitopes for sequence alignment to animal, plant, fungal (APF) proteins present in vaccines and biologics. Specifically, the search was performed against bovine, chicken, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes.

The results show that 57% of epitopes differed by exactly one amino acid residue from an APF peptide. 78% of the epitopes differed by up to two amino acid residues from an APF peptide. The rest of the epitopes were either identical or differed by more than two amino acid residues.

A majority of IEDB epitopes analyzed were 9-mer peptides. Comparing randomly selected 9-mer human peptides with APF proteomes, the probability of single amino acid residue difference (SAARD) outcomes was derived. This was used to estimate the probability that actual IEDB SAARD alignments to APF peptides were

merely a chance outcome. The estimates show that the probability that the observed IEDB alignments to APF being merely a chance outcome are vanishingly small. So the results make it absolutely clear that APF proteins in vaccines cause all these autoimmune diseases.

Introduction

Vaccines contain thousands of residual animal, plant and fungal (APF) proteins from the manufacturing process (1???6)???. 293 chicken proteins were identified in the influenza vaccine (7)???, for example. Actin and vimentin proteins were detected in the Priorix Tetra vaccine (8)???. Immunization with homologous xenogeneic antigens resulting in autoimmune diseases has been known for at least 40 years (9)???. Vaccines that contain bovine proteins caused autoimmunity in dogs (10)???. We previously described the immunological mechanism involved in autoimmunity induction by immunization with homologous xenogeneic antigens (11)???.

Cancer cells have minor differences when compared to healthy cells. Due to mutation of the DNA encoding the proteins, cancer cells can display altered proteins on their surface. Healthy cancer defense mechanisms include immune responses directed at such altered proteins. Therefore an immune response directed against cancer cells always carries a risk of cross reactive immune responses against healthy cells displaying the unaltered protein. Therefore, cancer induced autoimmune responses are a consequence of normal, healthy immune system behavior.

Animal proteins have minor differences compared to human proteins. Peptides that are identical between humans and animals are unlikely to cause any problem due to strong self tolerance. However, peptides with one amino acid residue difference produce the strongest cross reactive immune responses (11)???. They are ideally suited to induce autoimmune diseases. Injecting animal proteins results in anti-cancer immune responses because the immune system perceives animal proteins as altered human proteins. Adjuvants in the vaccine boost this anti-cancer immune response. This artificial anti-cancer response directed at thousands of APF proteins in vaccines or biologics, therefore cross react and cause numerous autoimmune disorders.

For this reason, one can predict that single amino acid residue difference (SAARD) between autoimmune disease related epitopes in the IEDB and homologous APF peptides in vaccines, would occur at a higher probability than by mere chance. We perform a BLASTP analysis to verify.

Methods

Basic local alignment search tool for proteins (BLASTP) (12)???, Universal Protein Resource (UniProt)(13)??? and the Immune Epitope Database (IEDB) (14)??? were used for bioinformatics analysis.

Specifically, the BLASTP sequence alignment of IEDB peptides was performed against bovine, chick, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes. Vaccines and biologics contain residual proteins from all these organism due to media used to grow viruses or bacteria, recombinant cells/organisms used for protein expression or as excipients.

Results

57% of IEDB peptides have a SAARD and 78% have up to two amino acid differences compared to animal, fungal or plant peptides present in vaccines.

Discussion

Could this result be a chance occurrence?

A majority of IEDB epitopes analyzed were 9-mer peptides. Five thousand 9-mer peptides were chosen at random from the human proteome. BLASTP was run using these peptides to compare against each

organism???s proteome or a subset. This provides us the probability that randomly selected human peptides have an alignment providing a SAARD compared to peptides from these organisms. These are listed in table 1 under ??? Random SAARD alignment???. Given this, we can compute the probability of the actual SAARD alignment to IEDB epitopes, occurring by chance. This is listed in table 1 under ???Estimated probability of actual SAARD outcome occurring just by chance???.

For a simple coin toss example, we would perform the calculation as follows:

Computing probability of say a 7 heads, 3 tails outcome of 10 trials of a fair coin:

Probability = (0.5^7) x (0.5^3) x 10! / (7! x 3!)

Where:

0.5 is the probability of a head or tail outcome of a fair coin.

For an unfair coin, say probability of head outcome = 0.4 and tail outcome 0.6, we would have:

Probability = (0.4^7) x (0.6^3) x 10! / (7! x 3!)

For the IEDB peptide probability analysis, the outcome is for 23192 trials (peptides).

The ???head outcome??? is the ???Random SAARD alignment ??? entries in table 1. The ???tail outcome??? probability is 1-???head outcome???.

Sample calculation for Chinese Hamster:

Probability = ((889/5000)^4574) x ((4111/5000)^18618) x 23192! / (4574! x 18618!)

Probability = 1.488e-15

Where: 889*100/5000 = 17.8% is the entry in Table 1 for Chinese Hamster. BLASTP analysis shows 889 SAARD out of 5000 peptides analyzed.

And, 4574*100/23192=19.7% is the IEDB entry in Table 1 for Chinese Hamster. BLASTP analysis shows 4574 SAARD out of 23192 peptides analyzed.

So the 1.488e-15 value is the probability that we will have exactly 4574 SAARD alignments out of 23192 peptides. The probability goes down for all values > 4574. Conservatively, applying the same probability as for 4574, to all values >4574, we can calculate the probability of the chance occurrence of 4574 or greater number of SAARD alignments as 1.488e15 * 18618 = 27e-12, entry in table.

The Gnome calculator was used to perform these calculations and the results were verified using the Qalculate! calculator and WolframAlpha (15)??? since spreadsheets are unable to perform these calculations.

Table 1

Organism	Random SAARD alignment Number of Peptides(%)	Actual (IEDB) SAARD alignment Number of Peptides (%)	Estimated probability of actual SAARD outcome occurring just by chance	Remarks
African green monkey (*Chlorocebus aethiops*)	26 (0.5)	420 (1.8)	~1.7e-96	Probability of this outcome occurring just by chance is vanishingly small. So these animal proteins in vaccines, caused these diseases.
Cow (*Bos taurus*)	936 (18.7)	4385 (18.9)	~1	There are two possibilities. (1) This outcome occurred just by chance. (2) The assumption that all cow proteins are

Organism	Random SAARD alignment Number of Peptides(%)	Actual (IEDB) SAARD alignment Number of Peptides (%)	Estimated probability of actual SAARD outcome occurring just by chance	Remarks
				present in the vaccines in equal amount is not true. We know that cow???s milk, bovine gelatin, bovine serum albumin are used in vaccines. So these proteins and proteins present in tissues in the vicinity, are included in vaccines but other cow proteins may not be present. This is the more likely explanation. Please see Cow???s milk entry below.
Cow???s Milk (*Bos taurus*)	0 (0)	12 (0.05)	0	Probability of this outcome occurring just by chance is 0. So these animal proteins in vaccines, caused these diseases.
Chinese Hamster (*Cricetulus griseus*)	889 (17.8)	4574 (19.7)	~27e-12	Probability of this outcome occurring just by chance is vanishingly small. So these animal proteins in vaccines, biologics caused these diseases.
Chicken (*Gallus gallus*)	536 (10.7)	3901 (16.8)	<1e-100	Probability of this outcome occurring just by chance is vanishingly small. So these animal proteins in vaccines, caused these diseases. Unlike bovine, porcine and murine proteins, since chicken egg or embryo is used for vaccine manufacture, all chicken proteins can be present in vaccines.
Guinea Pig (*Cavia porcellus*)	837 (16.7)	4439 (19.1)	~1e-18	Probability of this outcome occurring just by chance is vanishingly small. So these animal proteins in vaccines, caused these diseases.
Mice (*Mus musculus*)	940 (18.8)	4467 (19.3)	~1	There are two possibilities. (1) This outcome occurred just by chance. (2) The assumption that all mice proteins are present in biologics in equal amount is not true. We know that mice myeloma cells are used in biologics. So these proteins and proteins present in tissues in the vicinity, are present in biologics but other mice proteins may not be present. This is the more likely explanation.
Maize (*Zea mays*)	303 (6.1)	1667 (7.2)	~5e-9	Probability of this outcome occurring just by chance is vanishingly small. So these plant proteins in vaccines, caused these diseases.
Peanut (*Arachis*	223 (4.5)	1697 (7.3)	~79e-81	Probability of this outcome occurring just by chance is vanishingly small. So these

Organism	Random SAARD alignment Number of Peptides(%)	Actual (IEDB) SAARD alignment Number of Peptides (%)	Estimated probability of actual SAARD outcome occurring just by chance	Remarks
hypogaea)				plant proteins in vaccines, caused these diseases.
Yeast *(Saccharomyces cerevisiae)*	64 (1.3)	828 (3.6)	<1e-100	Probability of this outcome occurring just by chance is vanishingly small. So these fungal proteins in vaccines, biologics caused these diseases.
Sesame (*Sesamum indicum*)	155 (3.1)	1398 (6.0)	<1e-100	Probability of this outcome occurring just by chance is vanishingly small. So these plant proteins in vaccines, caused these diseases.
Soy (*Glycine max)*	215 (4.3)	1548 (6.7)	~86e-59	Probability of this outcome occurring just by chance is vanishingly small. So these plant proteins in vaccines, caused these diseases.
Pig (*Sus scrofa*)	963 (19.3)	4407 (19.0)	~1	There are two possibilities. (1) This outcome occurred just by chance. (2) The assumption that all porcine proteins are present in the vaccines in equal amount is not true. We know that porcine gelatin is used in vaccines. So these proteins and proteins present in tissues in the vicinity are included in vaccines but other porcine proteins may not be present. This is the more likely explanation.
Wheat (*Triticum aestivum*)	138 (2.8)	977 (4.2)	~18e-33	Probability of this outcome occurring just by chance is vanishingly small. So these plant proteins in vaccines, caused these diseases.

The calculations make it clear that the findings cannot be merely a chance outcome and that immunization against animal/plant/fungal antigens in the vaccines do cause these autoimmune diseases in the IEDB.

Conclusion

Vaccines containing animal, plant or fungal proteins are extremely dangerous and cause numerous autoimmune diseases and cancer (16???19)???. All non-target proteins in vaccines must be immediately removed using processes such affinity chromatography (20)???.

Dear Dr. Shi,

It is my pleasure to present you the Special Issue on SARS-CoV-2 and COVID-19 recently published in *Virologica Sinica*. This issue collectively includes original reports on virus characterization, clinical features, inflammatory responses, infection models, detection methods, drugs and treatments, etc., and we hope you will find this issue useful and informative.

Zheng-Li Shi, Ph.D.
Editor-in-Chief, *Virologica Sinica*

Virologica Sinica is an academic journal which aims at presenting the cutting-edge research on viruses. The journal publishes peer-reviewed original research articles, reviews, and letters to the editor, to encompass the latest developments in all branches of virology, including research on animal, plant and microbe viruses. The journal welcomes articles on virus discovery and characterization, viral epidemiology, viral pathogenesis, virus-host interaction, vaccine development, antiviral agents and therapies, and virus related biotechniques. *Virologica Sinica*, the official journal of the Chinese Society for Microbiology, will serve as a platform for the communication and exchange of academic information and ideas in an international context.

The journal is indexed by: Science Citation Index (SCI), Journal Citation Reports (JCR), PubMed/Medline, Pubmed Central, Scopus, BIOSIS, Google Scholar.

About the Special Issue on SARS-CoV-2 and COVID-19

Issue Editor: Prof. Zheng-Li Shi, Ph.D., Wuhan Institute of Virology, Chinese Academy of Sciences
The ongoing outbreak of Coronavirus Disease 2019 (COVID-19) has become a global public health emergency. The causative pathogen of COVID-19, severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), hits the humankind so sudden and brings tremendous challenges to the world. In combating against the COVID-19 pandemic, *Virologica Sinica* delicates this focused issue to timely present the latest scientific progress. Original reports on virus characterization, clinical features, inflammatory responses, infection models, detection methods, drugs and treatments, etc. are collectively included in the issue. The cover depicts the SARS-CoV-2 virus particle, surrounded by human blood cells.

Old Weapon for New Enemy: Drug Repurposing for Treatment of Newly Emerging Viral Diseases
Free Full Text (HTML) *Free* Full Text (PDF)
Deyin Guo

In December 2019, a dozen of patients with unusual pneumonia were hospitalized in Wuhan in central China, and the causative agent was identified as a new type of coronavirus (Zhu et al. 2020; Huang et al. 2020). The new virus was temporarily named as 2019 novel coronavirus (2019-nCoV) by the World Health Organization (WHO). As of January 29, 2020, 7736 confirmed cases of 2019-nCoV infection with 170 deaths were reported in China, and additional 77 cases in other 16 countries (National Health Commission of the People's Republic of China 2020; WHO 2020c). Since the emerging viruses are previously unknown pathogens, there are no specific and effective drugs available. Therefore, there is an urgent need for antiviral treatment in fighting the emerging viral diseases. However, the development of antiviral drugs is time- and resource-consuming, and thus repurposing of existing drugs to treat emerging viral diseases represents one of efficient strategies for drug development.

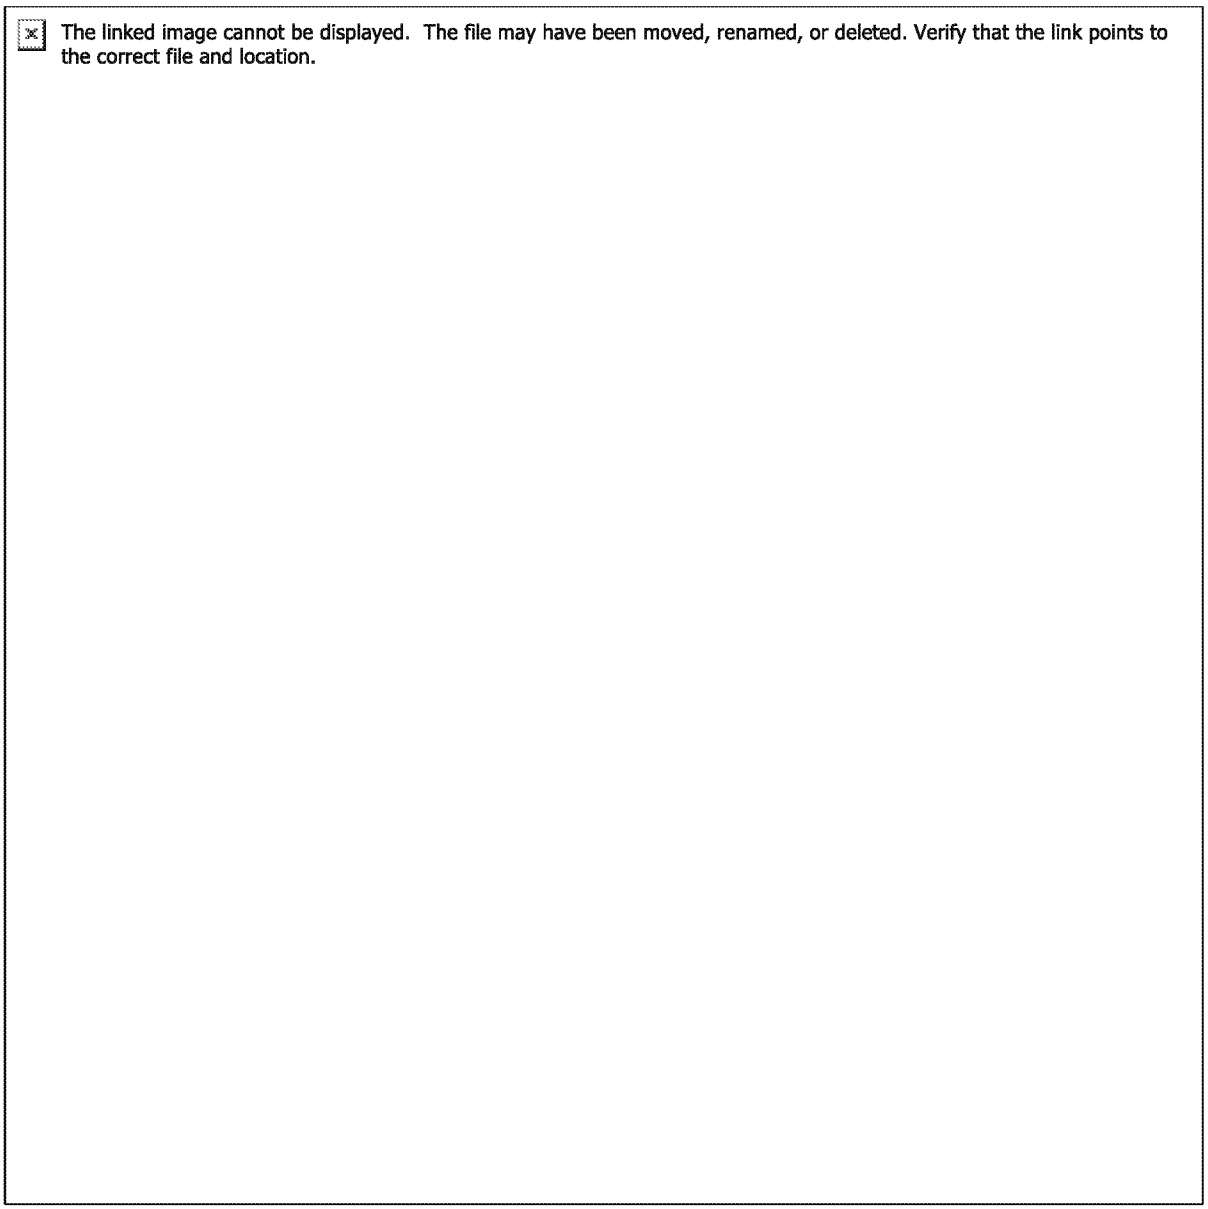
Perspective

Compensation of ACE2 Function for Possible Clinical Management of 2019-nCoV-Induced Acute Lung Injury

Free Full Text (HTML) *Free* Full Text (PDF)

Yuntao Wu

This perspective is intended to stimulate discussions about possible pathogenic mechanisms, based on the interaction of the virus with its receptor ACE2, so that rational therapies can be developed. Although ACE is regarded as the primary Ang II-converting enzyme, another enzyme, chymase, is also involved in converting Ang II in certain pathological conditions that may need attention (Fyhrquist and Saijonmaa 2008; Lindberg et al. 1997). In addition, coronavirus pathogenesis is a highly complex process (Lo et al. 2006), and much of the needed detail in host–pathogen interaction in 2019-nCoV infection awaits investigation. It also remains to be clinically tested whether some of these potential treatments, as proposed here, can be effective or beneficial in the management of 2019-nCoV-induced lung injury.



Perspective

mRNA Vaccines: Possible Tools to Combat SARS-CoV-2

Free Full Text (HTML) *Free* Full Text (PDF)

Changhua Yi, Yongxiang Yi, Junwei Li

Since December 2019, a novel coronavirus pneumonia outbreak has been reported in 212 countries and territories, with over 5, 000, 000 infections and over 300, 000 deaths on May 22, 2020. To date, except some repurposed drugs have been shown inhibitory effect on the so-called severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), no drugs have been licensed to be effective and safe in treating COVID-19. Inspite of emergent need, no authorized vaccines have been approved for clinical use against this new virus currently. After the genetic map of SARS-CoV-2 was shared, scientists and biotech and vaccine companies promptly launched a race to pursue different types of vaccines to prevent illness from this novel virus. Among these vaccine projects, mRNA vaccines are showing a promising future with their feature of fast development.

The First Disease X is Caused by a Highly Transmissible Acute Respiratory Syndrome Coronavirus

Free Full Text (HTML) *Free* Full Text (PDF)

Shibo Jiang, Zheng-Li Shi

Based on the announcement of the World Health Organization (WHO) in 2018, the Wuhan pneumonia caused by an unknown etiology should be recognized as the first Disease X. Later, the pathogen was identified to be a novel coronavirus denoted 2019-nCoV, which has 79.5% and 96% whole genome sequence identify to SARS-CoV and bat SARS-related coronavirus (SARSr-CoV-RaTG13), respectively, suggesting its potential bat origin. With high human-to-human transmission rate (R0), 2019-nCoV has quickly spread in China and other countries, resulting in 34, 953 confirmed cases and 725 deaths as of 8 February 2020, thus calling for urgent development of therapeutics and prophylactics. Here we suggest renaming 2019-nCoV as "transmissible acute respiratory syndrome coronavirus (TARS-CoV)" and briefly review the advancement of research and development of neutralizing antibodies and vaccines targeting the receptor-binding domain (RBD) and viral fusion inhibitors targeting the heptad repeat 1 (HR1) domain in spike protein of 2019-nCoV.

Understanding SARS-CoV-2-Mediated Inflammatory Responses: From Mechanisms to Potential Therapeutic Tools

Free Full Text (HTML) *Free* Full Text (PDF)

Yajing Fu, Yuanxiong Cheng, Yuntao Wu

Currently there is no effective antiviral therapy for SARS-CoV-2 infection, which frequently leads to fatal inflammatory responses and acute lung injury. Here, we discuss the various mechanisms of SARS-CoV-mediated inflammation. We also assume that SARS-CoV-2 likely shares similar inflammatory responses. Potential therapeutic tools to reduce SARS-CoV-2-induced inflammatory responses include various methods to block FcR activation. In the absence of a proven clinical FcR blocker, the use of intravenous immunoglobulin to block FcR activation may be a viable option for the urgent treatment of pulmonary inflammation to prevent severe lung injury. Such treatment may also be combined with systemic anti-inflammatory drugs or corticosteroids. However, these strategies, as proposed here, remain to be clinically tested for effectiveness.

The Rapid Assessment and Early Warning Models for COVID-19

Free Full Text (HTML) *Free* Full Text (PDF)

Zhihua Bai, Yue Gong, Xiaodong Tian, Ying Cao, Wenjun Liu, Jing Li

Human beings have experienced a serious public health event as the new pneumonia (COVID-19), caused by the severe acute respiratory syndrome coronavirus has killed more than 3000 people in China, most of them elderly or people with underlying chronic diseases or immunosuppressed states. Rapid assessment and early warning are essential for outbreak analysis in response to serious public health events. This paper reviews the current model analysis methods and conclusions from both micro and macro perspectives. The establishment of a comprehensive assessment model, and the use of model analysis prediction, is very efficient for the early warning of infectious diseases. This would significantly improve global surveillance capacity, particularly in developing regions, and improve basic training in infectious diseases and molecular epidemiology.

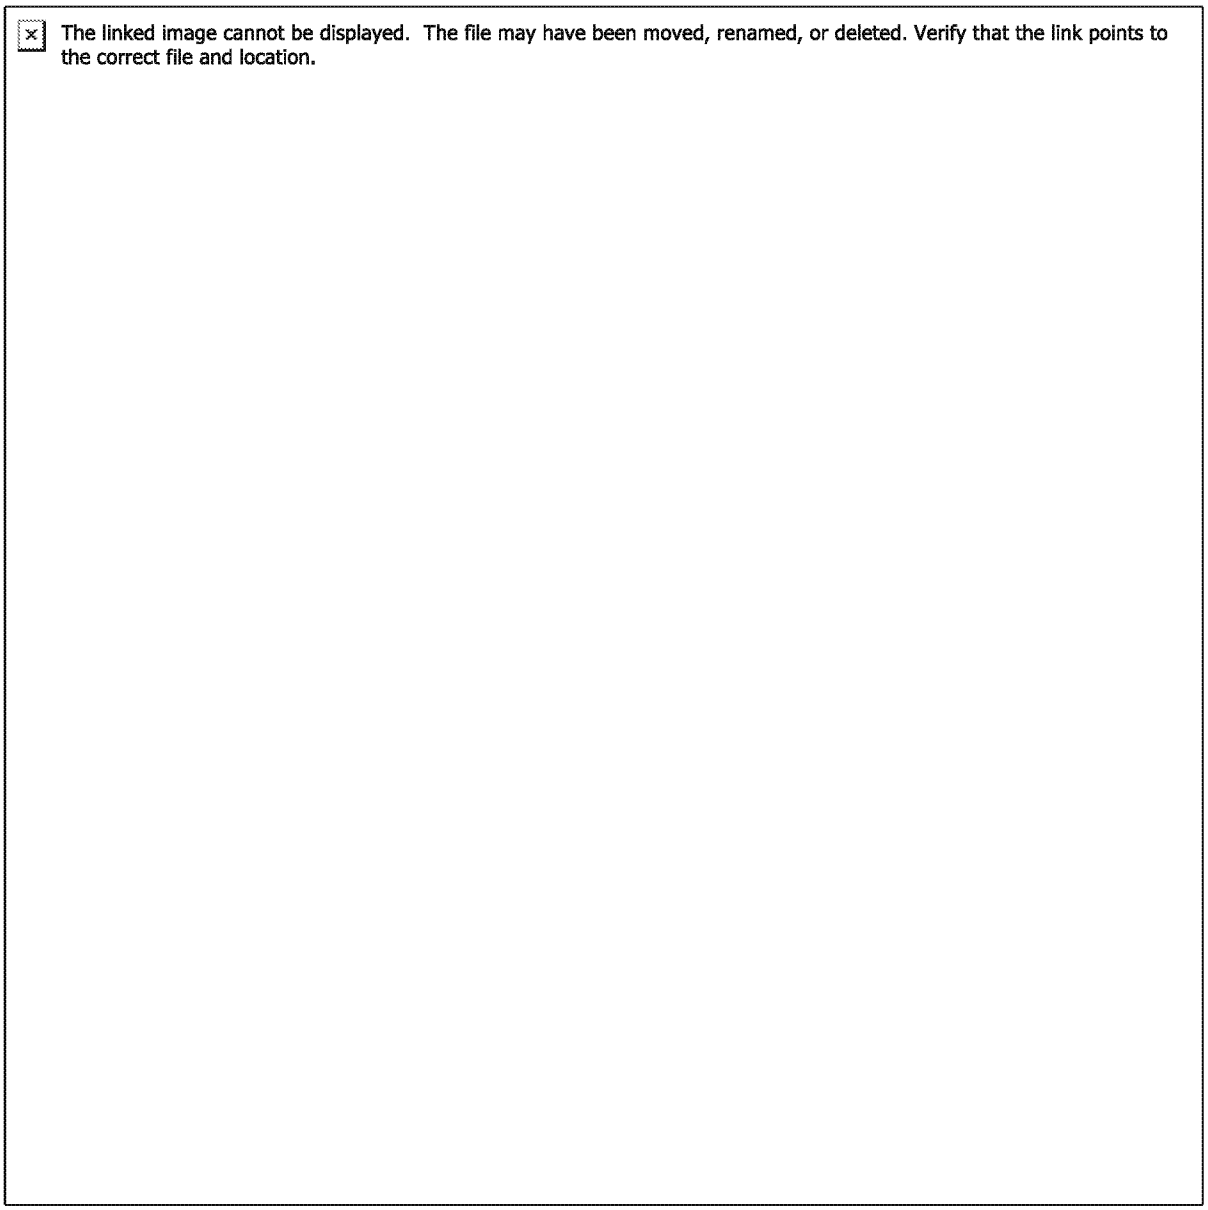
Conditionally Reprogrammed Human Normal Airway Epithelial Cells at ALI: A Physiological Model for Emerging Viruses

Free Full Text (HTML) *Free* Full Text (PDF)

Xuefeng Liu, Yuntao Wu, Lijun Rong

Cancer cell lines have been used widely in cancer biology, and as biological or functional cell systems in many biomedical research fields. These cells are usually defective for many normal activities or functions due to significant genetic and epigenetic changes. Normal primary cell yields and viability from any original tissue specimens are usually relatively low or highly variable. These normal cells cease after a few passages or population doublings due to very limited proliferative capacity. Animal models (ferret, mouse, etc.) are often used to study virus-host interaction. However, viruses usually need to be adapted to the animals by several passages due to tropism restrictions including viral receptors and intracellular restrictions. Here we summarize applications of conditionally reprogrammed cells (CRCs), long-term cultures of normal airway epithelial cells from human nose to lung generated by conditional cell reprogramming (CR) technology, as an ex vivo model in studies of emerging viruses. CR allows to robustly propagate cells from non-invasive or minimally invasive specimens, for example, nasal or endobronchial brushing. This process is rapid (2 days)

and conditional. The CRCs maintain their differentiation potential and lineage functions, and have been used for studies of adenovirus, rhinovirus, respiratory syncytial virus, influenza viruses, parvovirus, and SARS-CoV. The CRCs can be easily used for air-liquid interface (ALI) polarized 3D cultures, and these coupled CRC/ALI cultures mimic physiological conditions and are suitable for studies of viral entry including receptor binding and internalization, innate immune responses, viral replications, and drug discovery as an ex vivo model for emerging viruses.



Review

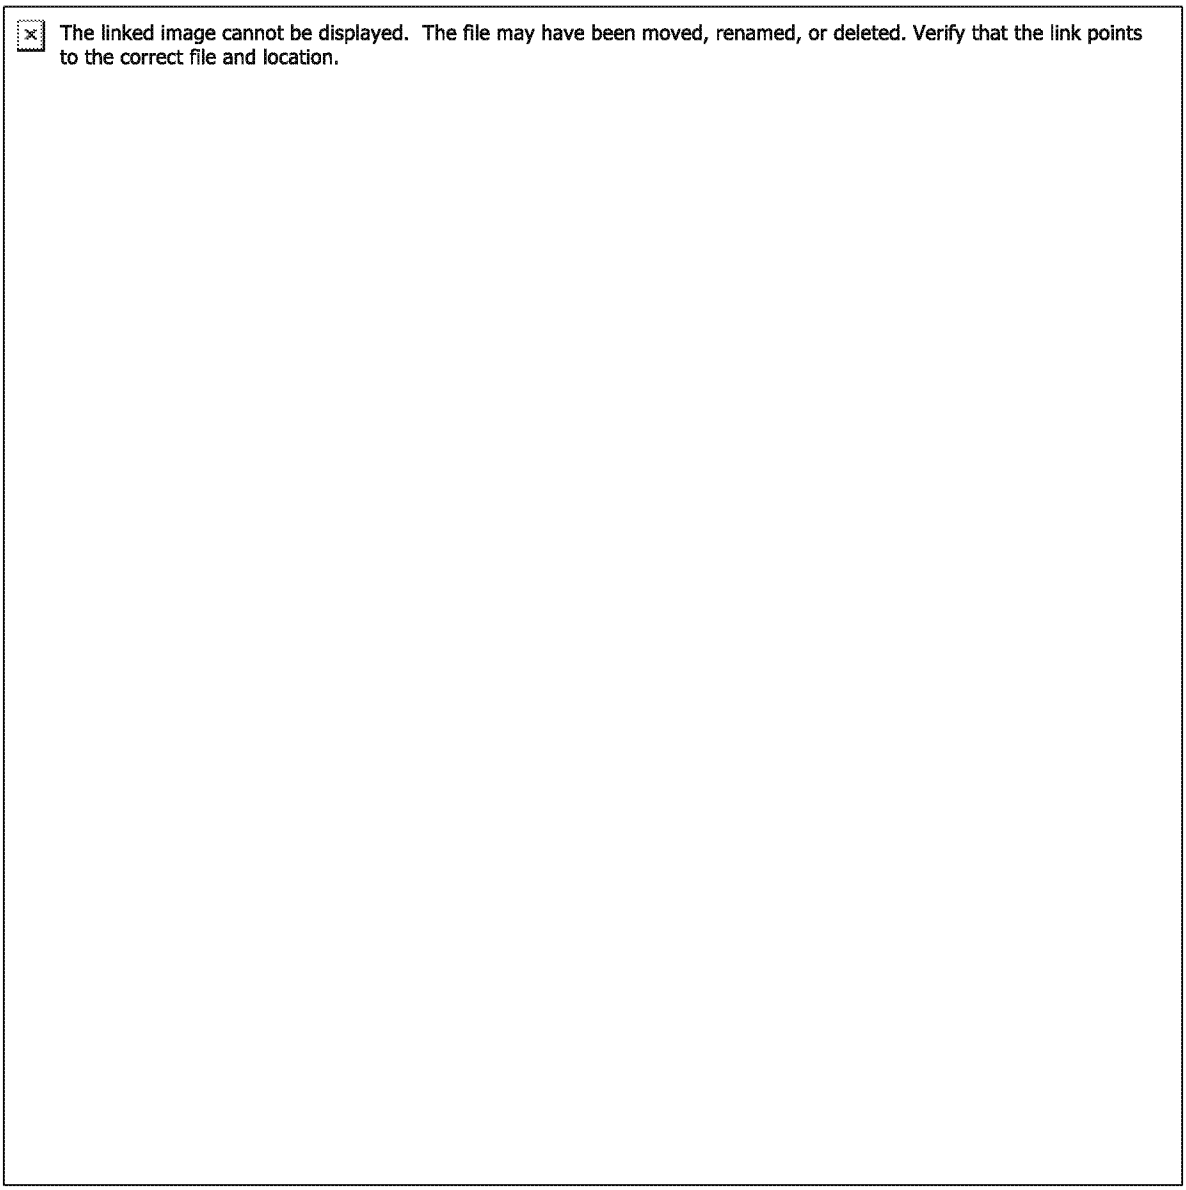
A Comprehensive Review of Animal Models for Coronaviruses: SARS-CoV-2, SARS-CoV, and MERS-CoV

Free Full Text (HTML) *Free* Full Text (PDF)

Ashutosh Singh, Rahul Soloman Singh, Phulen Sarma, Gitika Batra, Rupa Joshi, Hardeep Kaur, Amit Raj Sharma, Ajay Prakash, Bikash Medhi

The recent outbreak of coronavirus disease (COVID-19) caused by the novel severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) has already affected a large population of the world. SARS-CoV-2 belongs to the same family of severe acute respiratory syndrome coronavirus (SARS-CoV) and Middle East respiratory syndrome coronavirus (MERS-CoV). COVID-19 has a complex pathology involving severe acute

respiratory infection, hyper-immune response, and coagulopathy. At present, there is no therapeutic drug or vaccine approved for the disease. There is an urgent need for an ideal animal model that can reflect clinical symptoms and underlying etiopathogenesis similar to COVID-19 patients which can be further used for evaluation of underlying mechanisms, potential vaccines, and therapeutic strategies. The current review provides a paramount insight into the available animal models of SARS-CoV-2, SARS-CoV, and MERS-CoV for the management of the diseases.



Research Article

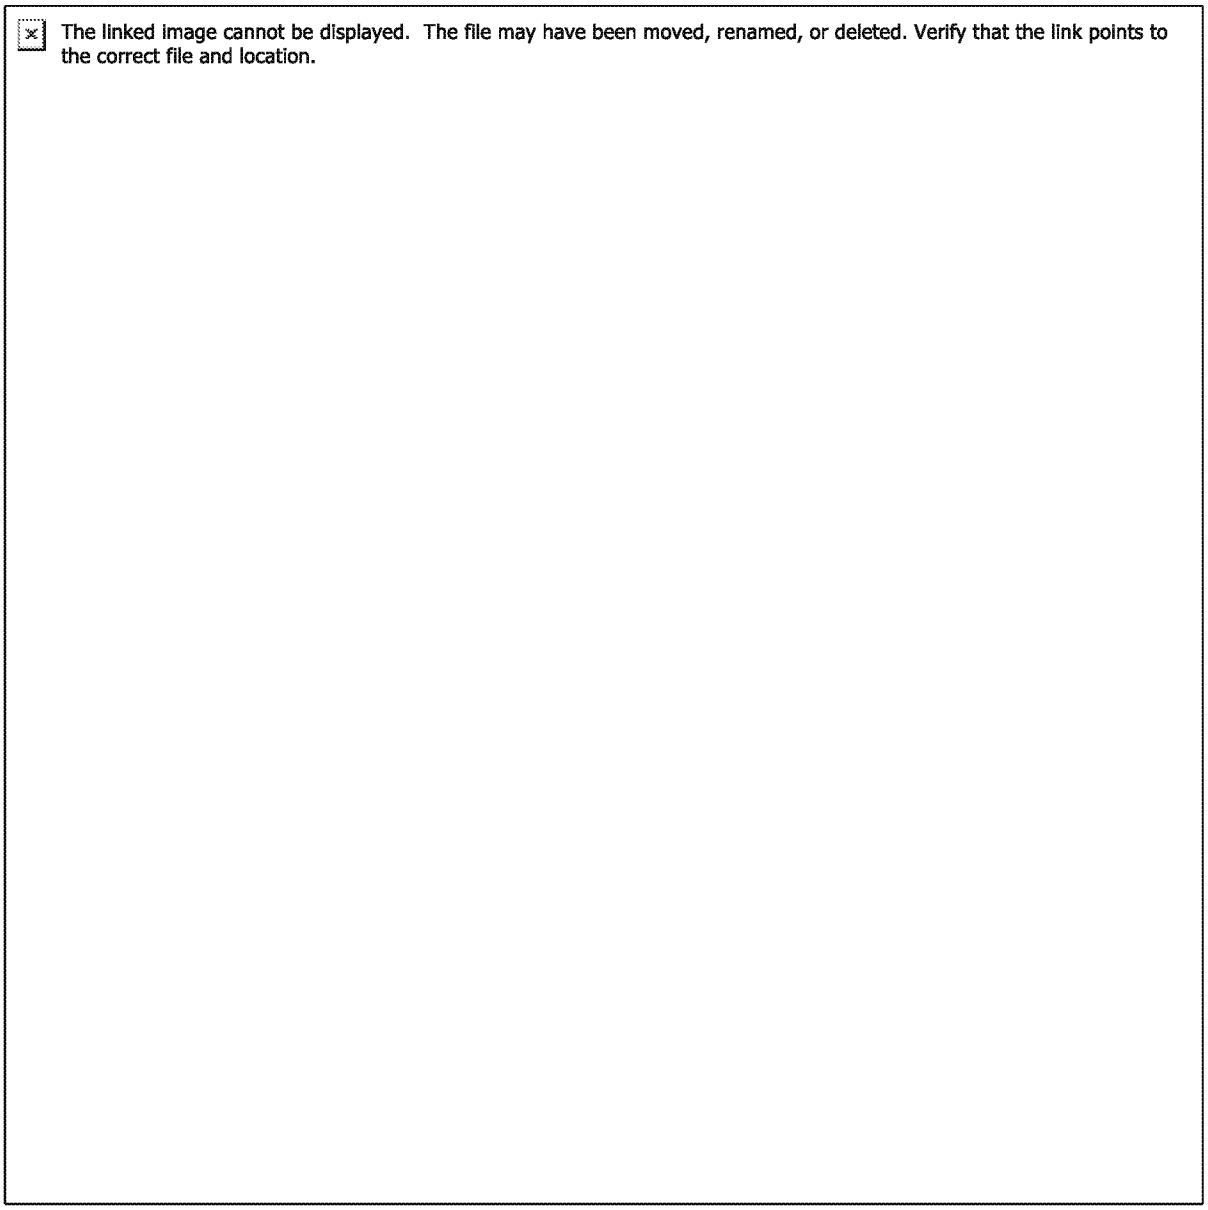
Clinical Manifestation and Laboratory Characteristics of SARS-CoV-2 Infection in Pregnant Women

Free Full Text (HTML) *Free* Full Text (PDF)

Chunchen Wu, Wenzhong Yang, Xiaoxue Wu, Tianzhu Zhang, Yaoyao Zhao, Wei Ren, Jianbo Xia

The severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) epidemic has become a major challenge to public health in China and other countries, considering its pathogenicity across all age groups. Pregnancy is a unique physiological condition, and is characterized by altered immunity and elevated hormone levels to actively tolerate the semi-allogeneic fetus, which undergoes a sudden and substantial fluctuation during the immediate postpartum period. Changes in clinical features, laboratory characteristics, and imaging features of pregnant women during the pre-partum and post-partum periods require further

elucidation. Here, we retrospectively analyzed the clinical features, laboratory characteristics, and imaging features of eight pregnant cases of SARS-CoV-2 infection during the pre-partum and post-partum periods. Our results showed that four of the eight pregnant women were asymptomatic before delivery but became symptomatic post-partum. Correspondingly, white blood cell (WBC) counts increased and lymphocyte (LYMPH) counts decreased. C-reactive protein (CRP) levels in the serum also increased to a higher level than those in general pregnancy. Therefore, it is imperative to closely monitor laboratory parameters including the WBC count, LYMPH count, and CRP, along with other imaging features in chest CT scans, to promptly prevent, diagnose, and treat a SARS-CoV-2 infection during pregnancy.



Research Article

Long Term Culture of Human Kidney Proximal Tubule Epithelial Cells Maintains Lineage Functions and Serves as an Ex vivo Model for Coronavirus Associated Kidney Injury

Free Full Text (HTML) *Free* Full Text (PDF)

Siyu Xia, Ming Wu, Si Chen, Tao Zhang, Lina Ye, Jun Liu, Hui Li

The mechanism of how SARS-CoV-2 causes severe multi-organ failure is largely unknown. Acute kidney injury (AKI) is one of the frequent organ damage in severe COVID-19 patients. Previous studies have shown that human renal tubule cells could be the potential host cells targeted by SARS-CoV-2. Traditional cancer

cell lines or immortalized cell lines are genetically and phenotypically different from host cells. Animal models are widely used, but often fail to reflect a physiological and pathogenic status because of species tropisms. There is an unmet need for normal human epithelial cells for disease modeling. In this study, we successfully established long term cultures of normal human kidney proximal tubule epithelial cells (KPTECs) in 2D and 3D culture systems using conditional reprogramming (CR) and organoids techniques. These cells had the ability to differentiate and repair DNA damage, and showed no transforming property. Importantly, the CR KPTECs maintained lineage function with expression of specific transporters ($SLC_{34}A_3$ and cubilin). They also expressed angiotensin-converting enzyme 2 (ACE2), a receptor for SARS-CoV and SARS-CoV-2. In contrast, cancer cell line did not express endogenous $SLC_{34}A_3$, cubilin and ACE2. Very interestingly, ACE2 expression was around twofold higher in 3D organoids culture compared to that in 2D CR culture condition. Pseudovirion assays demonstrated that SARS-CoV spike (S) protein was able to enter CR cells with luciferase reporter. This integrated 2D CR and 3D organoid cultures provide a physiological ex vivo model to study kidney functions, innate immune response of kidney cells to viruses, and a novel platform for drug discovery and safety evaluation.

Research Article

SARS-Coronavirus-2 Nsp13 Possesses NTPase and RNA Helicase Activities That Can Be Inhibited by Bismuth Salts

Free Full Text (HTML) *Free* Full Text (PDF)

Ting Shu, Muhan Huang, Di Wu, Yujie Ren, Xueyi Zhang, Yang Han, Jingfang Mu, Ruibing Wang, Yang Qiu, Ding-Yu Zhang, Xi Zhou

The ongoing outbreak of Coronavirus Disease 2019 (COVID-19) has become a global public health emergency. SARS-coronavirus-2 (SARS-CoV-2), the causative pathogen of COVID-19, is a positive-sense single-stranded RNA virus belonging to the family Coronaviridae. For RNA viruses, virus-encoded RNA helicases have long been recognized to play pivotal roles during viral life cycles by facilitating the correct folding and replication of viral RNAs. Here, our studies show that SARS-CoV-2-encoded nonstructural protein 13 (nsp13) possesses the nucleoside triphosphate hydrolase (NTPase) and RNA helicase activities that can hydrolyze all types of NTPs and unwind RNA helices dependently of the presence of NTP, and further characterize the biochemical characteristics of these two enzymatic activities associated with SARS-CoV-2 nsp13. Moreover, we found that some bismuth salts could effectively inhibit both the NTPase and RNA helicase activities of SARS-CoV-2 nsp13 in a dose-dependent manner. Thus, our findings demonstrate the NTPase and helicase activities of SARS-CoV-2 nsp13, which may play an important role in SARS-CoV-2 replication and serve as a target for antivirals.

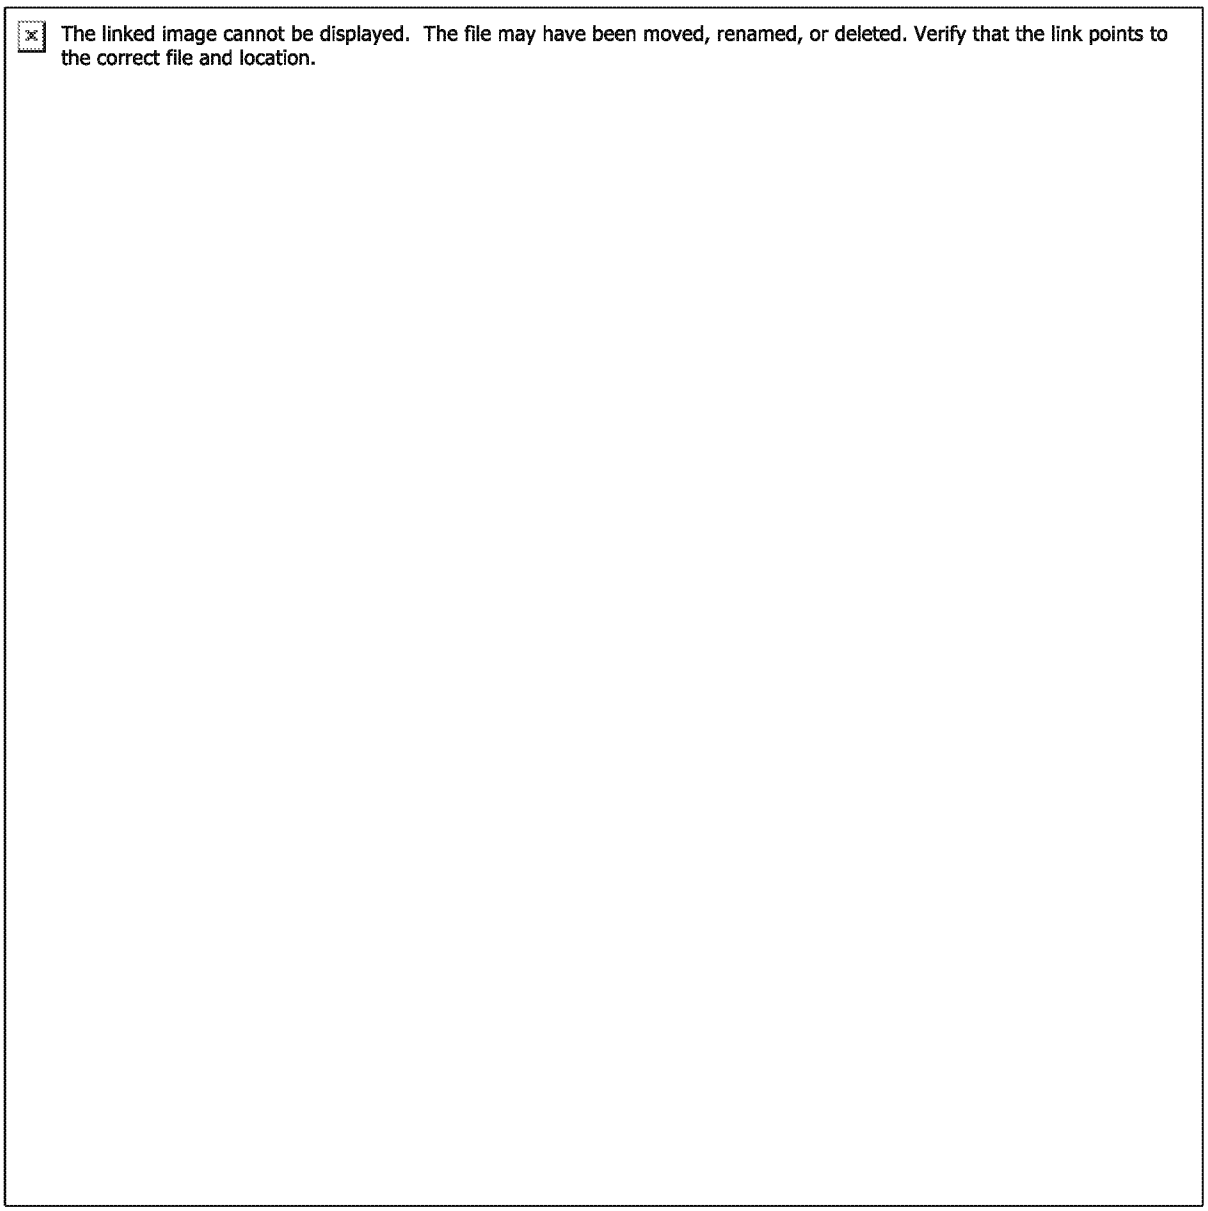
Clinical Features and Treatment of 2019-nCov Pneumonia Patients in Wuhan: Report of A Couple Cases

Free Full Text (HTML) *Free* Full Text (PDF)

Zhan Zhang, Xiaochen Li, Wei Zhang, Zheng-Li Shi, Zhishui Zheng, Tao Wang

Till January 20, 2020, the 2019-new coronavirus (2019-nCoV) has caused more than one hundred cases in Wuhan (WMHC 2020). During a retrospective study of recent pneumonia patients in our department, we found two patients who are likely being infected with the 2019-nCoV. During the hospitalization, those two patients were appropriately treated, and both were discharged within two weeks. Thus, we are reporting the clinical features and treatment regiment, and hope the information and experience can be shared.



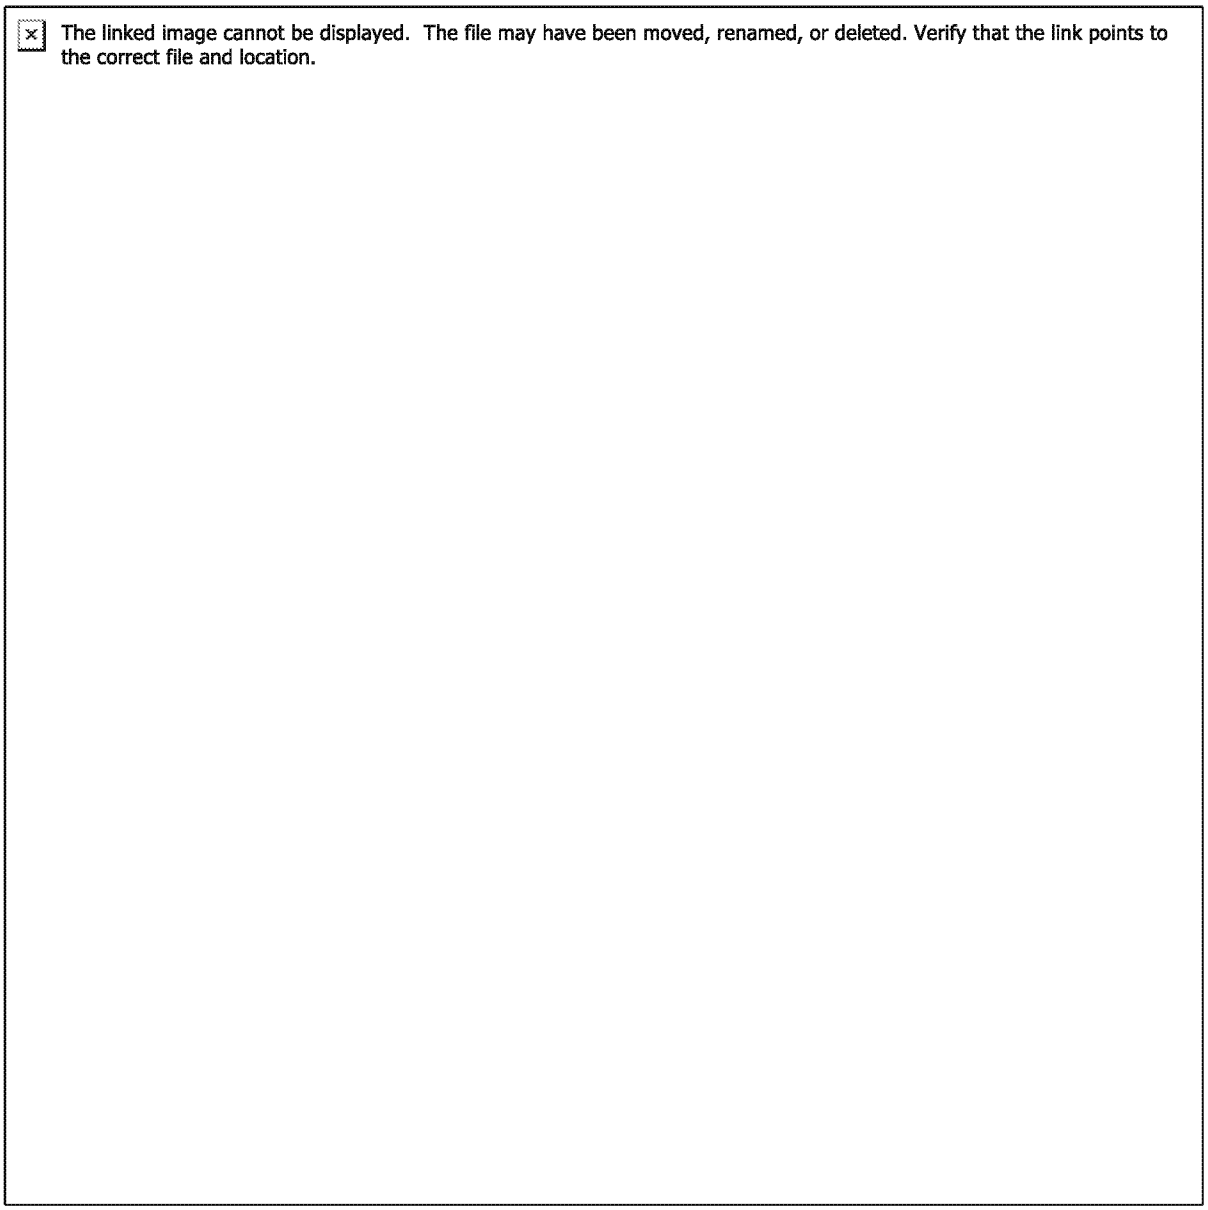
Letter

A Unique Protease Cleavage Site Predicted in the Spike Protein of the Novel Pneumonia Coronavirus (2019-nCoV) Potentially Related to Viral Transmissibility

Free Full Text (HTML) *Free* Full Text (PDF)

Qiong Wang, Ye Qiu, Jin-Yan Li, Zhi-Jian Zhou, Ce-Heng Liao, Xing-Yi Ge

In summary, our sequence analysis on the S protein of 2019-nCoV has predicted a novel furin cleavage site at S1/S2 linkage. The ubiquitous expression of furin in different organs and tissues may be a reason for the high transmissibility and pathogenicity of 2019-nCoV observed in the current epidemic. However, since our findings were mainly based on bioinformatic analysis, more laboratory studies on 2019-nCoV in cell and animal models are required to verify our speculations and to avoid any bias.



Letter

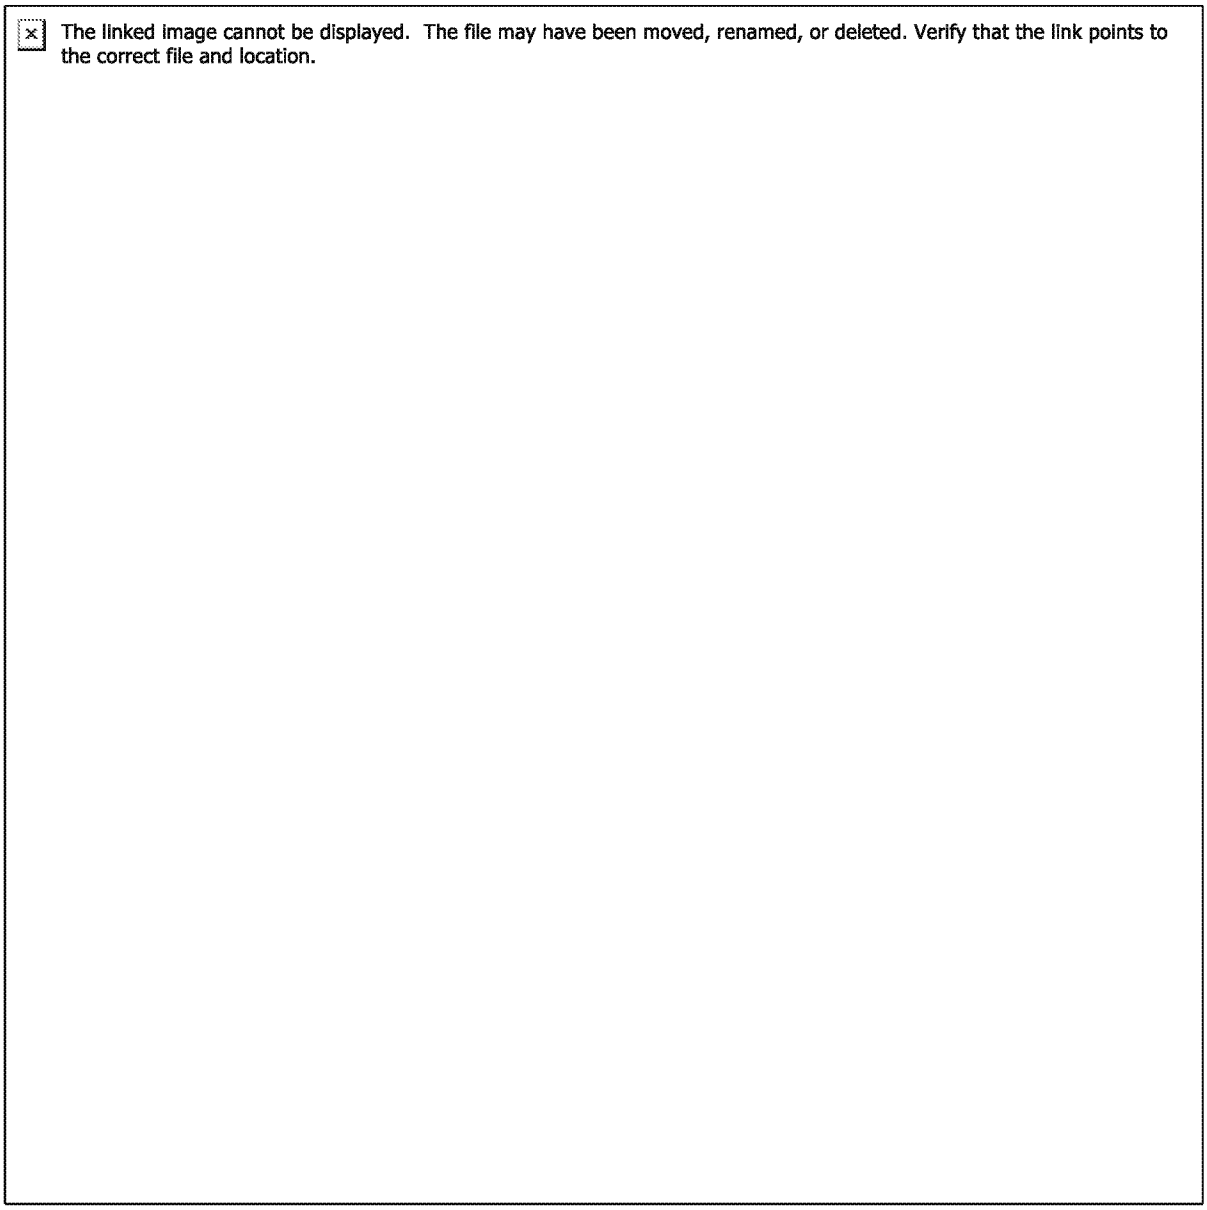
Inefficiency of Sera from Mice Treated with Pseudotyped SARS-CoV to Neutralize 2019-nCoV Infection

Free Full Text (HTML) *Free* Full Text (PDF)

Zezhong Liu, Shuai Xia, Xinling Wang, Qiaoshuai Lan, Wei Xu, Qian Wang, Shibo Jiang, Lu Lu

The novel coronavirus 2019-nCoV has caused the pandemic of Wuhan pneumonia recently, posing a serious threat to global public health, and thus calling for the development of therapeutics and prophylactics. Here we showed that high titer anti-SARS-CoV spike protein serum cannot effectively neutralize 2019-nCoV infection. Based on our previous research, we developed SARS pseudovirus (SARS-PsV) and MERS pseudovirus (MERS-PsV) as immunogens to immunize mice. We found sera from mice treated with SARS-CoV S protein

could potently cross-neutralize infection by SARS-CoV (50% neutralizing antibody titers, NT_{50} > 40, 000) and SARS-related coronavirus (NT_{50} > 7, 000), but weakly for 2019-nCoV infection NT_{50} < 100), implying that it may not be practical to treat 2019-nCoV infection with anti-SARS-CoV antibodies and that people with history of SARS-CoV infection many years ago may not be resistant to 2019-nCoV infection.



Letter

Development of a Novel Reverse Transcription Loop-Mediated Isothermal Amplification Method for Rapid Detection of SARS-CoV-2

Free Full Text (HTML) *Free* Full Text (PDF)

Renfei Lu, Xiuming Wu, Zhenzhou Wan, Yingxue Li, Lulu Zuo, Jianru Qin, Xia Jin, Chiyu Zhang

In conclusion, the novel visual RT-LAMP assay is a simple, rapid, and sensitive approach for detection of SARS-CoV-2, and it is ready for application in primary care and community hospitals or health care centers, and even patients' own houses in response to the current SARS-CoV-2 epidemic because the assay does not require sophisticated equipment and skilled personnel. Furthermore, it is also ready to be used in fields for screening samples from wild animals and environments to facilitate the identification of potential intermediate hosts that mediate the cross-species transmission of SARS-CoV-2 from bats to humans.

Isolation and Growth Characteristics of SARS-CoV-2 in Vero Cell

Free Full Text (HTML) *Free* Full Text (PDF)

Pingping Yao, Yachun Zhang, Yisheng Sun, Yulin Gu, Fang Xu, Bo Su, Chen Chen, Hangjing Lu, Dehui Wang, Zhangnv Yang, Biao Niu, Jiancai Chen, Lixia Xie, Lei Chen, Yajing Zhang, Hui Wang, Yuying Zhao, Yue Guo, Juncheng Ruan, Zhiyong Zhu, Zhenfang Fu, Dayong Tian, Qi An, Jianmin Jiang, Hanping Zhu

The coronavirus disease 2019 (COVID-19) broke out in early December 2019 in Wuhan, China and escalated into a global pandemic. There is an urgent need to understand the biology of SARS-CoV-2. In this letter, we report the isolation and characterization of seven isolates of SARS-CoV-2. Results show that our viruses have 99% sequence identity with published virus sequences. In addition, all viruses grew well in Vero cells, and one of the viruses had a deletion mutation after short passage. These results shall facilitate the understanding of the characteristics of SARS-CoV-2 *in vitro*.

Zhiqiang Chen, Qihan Wu, Jing Chen, Xiaohua Ni, Jianfeng Dai

Altogether, we have identified a novel method for the detection of SRAS-CoV-2 N protein using DNA based aptamers. Although the aptamers used in this study were designed based on an aptamer previously selected for SARS-CoV N protein, they bind to SRAS-CoV-2 N protein with a high affinity. Most importantly, SARS-CoV-2 N protein shares very low similarity (16%–38%) with N protein from other five known human coronaviruses except for SARS-CoV. Because there are no SARS-CoV cases reported since 2004, our aptamer-based method can be used as a supplementation to the current diagnosis of SARS-CoV-2.

SARS-CoV-2 Does Not Replicate in Aedes Mosquito Cells nor Present in Field-Caught Mosquitoes from Wuhan

Free Full Text (HTML) *Free* Full Text (PDF)

Han Xia, Evans Atoni, Lu Zhao, Nanjie Ren, Doudou Huang, Rongjuan Pei, Zhen Chen, Jin Xiong, Raphael Nyaruaba, Shuqi Xiao, Bo Zhang, Zhiming Yuan

With the rapid spread of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) and growing fear, people have become very concerned about whether this novel coronavirus could be transmitted by mosquitoes. We evaluate the infectivity of SARS-CoV-2 in *Aedes albopictus* and *Aedes aegypti* derived cell lines. The results indicated that SARS-CoV-2 could not replicate in both C6/36, Sf9 and Aag2 cells. Further, no SARS-CoV-2 RNA was detected in the field collected *Culex*, and *Anopheles* mosquitoes during the months of April and May in Wuhan in 2020. Our findings highlight the restricted replication of SARS-CoV-2 in mosquito cells and field-caught mosquitoes.

Computational Identification of Small Interfering RNA Targets in SARS-CoV-2

Free Full Text (HTML) *Free* Full Text (PDF)

Wei Chen, Pengmian Feng, Kewei Liu, Meng Wu, Hao Lin

With the epidemic of Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2) worldwide and in the absence of any effective vaccine, there is an urgent need to find a specific anti- SARS-CoV-2 agent. In this study, by analyzing the secondary structures of the SARS-CoV-2 genome (MN908947), several 21~25 base-long segments were obtained and selected as the potential targets of small interfering RNA duplexes. Moreover, it was also found that these targets are conserved among different strains. We hope the results will contribute to the pharmaceutical research and therapy of the SARS-CoV-2.

Hi Xuejie,
Thanks for the invitation. I will be happy to be on the editorial board and help the journal.
Hope all well on your side.
Best wishes,
Pei-Yong

Subject: Editoral board member

Hi Pei-yong,

I am writing to you to ask you to help me on a new journal, Infectious Medicine. I am the Editor-in-Chief for Infectious Medicine, a new journal on infectious diseases, which will be launched in the summer of 2021 by Tsinghua University and Tsinghua University Press. I hope you will be an editoral board member or an associate editor of the journal. I also hope you can recommend internationally well-known infectious disease and immunology experts and scholars to the jouranl to form an editorial board to participate in the peer review of manuscripts. With your outstanding academic status in the field of infectious diseases, I feel confident to make the journal successful!

Infectious Medicine is a comprehensive English-language journal in the field of infection and infectious diseases. It is dedicated to reporting on the intersection of emerging infectious diseases and animal-borne infectious diseases, and strives to become an integrated platform for One Health on studying human infectious diseases and animal infectious diseases. Our mission is to promote academic exchanges, advance scientific and technological progress, and improve the scientific level of infectious disease research. The scope of this journal includes all aspects of infectious diseases especially emerging infectious diseases, including but not limited to the following areas: (1) epidemiology, prevention and control of infectious diseases and nosocomial infections; (2) pathogenesis, immunology, diagnosis and

treatments of infection diseases; (3) Research and development of vaccines; (4) Public health policies and epidemic prevention measures for infectious diseases. The journal will have the following columns: Editorial, Original article, Commentary, Reviews, Short report & Case report, Research letter and Perspective. In order to increase the speed and breadth of dissemination, Infectious Medicine will adopt open access and ahead of print methods to publish, and all articles can be read for free online. Once the article is received, it will be retrieved, read and downloaded by readers worldwide as soon as possible.
The main responsibilities of the editorial board include:
1. Participate in the peer review of submissions; 2. Write manuscripts for the journal; 3. Recommend manuscripts to the journal; 4. When participating in international and domestic academic meetings, the editorial board members will actively publicize and recommend this journal to colleagues; 5. Provide feedback and suggestions for the development of the journal.

I know you are very busy and I promise there will not be too much work on you. I sincerely hope that you can accept my invitation. Please let me know whether you would like to be an associate editor or an editoral board memeber for the Infectious Medicine. Thank you.

主题: RE: paper-2020526

Hi Xinwen,

I quickly went through the manuscript. Let's have a call to (i) go through the data and (ii) discuss the way forward. Please let me know when you have time to call.

Best,

- Pei-Yong

佩勇，

附件是文章的结果。文章很初步，整体结构也需要大的调整。我想这是第一次请教，请你审核数据（文章的主体部分和图表），期待意见和建议，特别是：

1）需要补充的其他实验；

2）文章写作思路和整体布局

另外， 我们正在补充的数据包括：

1）GLP2R蛋白的ECL1结构域和E蛋白DIII直接相互作用证据（合成多肽，SPR分析），

2）缺陷小鼠感染实验（已经构建成功，正在繁殖）。

将在你意见和建议的基础上重新架构文章。

非常感谢！

祝好！

Subject: cell paper about very potent highly stable human domain

Hi Bill,

I put it on the chat in the last second, here it is
https://www.cell.com/cell/fulltext/S0092-8674(20)31148-X

also attached the file just in case.

It is human domain fused to Fc and every stable – for 3 months at 37C no change in activity.
Was thinking even could be used as reference reagent, you mentioned there is also another candidate.

Best
Mitko
(Dimiter Dimitrov)

Key words: Human V_H antibody domain, virus neutralization, electron microscopy, SARS-CoV-2, mouse and hamster models

Abstract

Novel COVID-19 therapeutics are urgently needed. We generated a phage-displayed human antibody V_H domain library from which we identified a high-affinity V_H binder ab8. Bivalent V_H, V_H-Fc ab8 bound with high avidity to membrane-associated S glycoprotein and to mutants found in patients. It potently neutralized mouse adapted SARS-CoV-2 in wild type mice at a dose as low as 2 mg/kg and exhibited high prophylactic and therapeutic efficacy in a hamster model of SARS-CoV-2 infection, possibly enhanced by its relatively small size. Electron microscopy combined with scanning mutagenesis identified ab8 interactions with all three S protomers and showed how ab8 neutralized the virus by directly interfering with ACE2 binding. V_H-Fc ab8 did not aggregate and did not bind to 5300 human membrane-associated proteins. The potent neutralization activity of V_H-Fc ab8 combined with good developability properties and cross-reactivity to SARS-CoV-2 mutants provide a strong rationale for its evaluation as a COVID-19 therapeutic.

Introduction

The global outbreak of a severe acute respiratory distress (SARS) coronavirus 2 (SARS-CoV-2) associated disease 2019 (COVID-19) requires rapid identification of therapeutics and vaccines. While many vaccines are in clinical development, the time to market can be relatively long and immunogenicity can be limited for high-risk groups (Amanat and Krammer, 2020). Alternatively and complementarily, antibodies can be used as safe and effective prophylactics and therapeutics (Pelegrin et al., 2015). Convalescent plasma from COVID-19 patients inhibited SARS-CoV-2 infection and alleviated symptoms of newly infected patients (Casadevall and Pirofski, 2020; Rojas et al., 2020) suggesting that potent neutralizing monoclonal antibodies (mAbs) may be even more effective.

SARS-CoV-2 genome shares more than 80% homology to the SARS-CoV (Li et al., 2020b). Similar to SARS-CoV, SARS-CoV-2 uses the spike (S) envelope glycoprotein to enter into host cells. The viral entry is initiated by the receptor binding domain (RBD) of the S protein binding to its receptor, angiotensin-converting enzyme 2 (ACE2), leading to conformational change of the S2 subunit and formation of six helical-bundle resulting in membrane fusion between viral and host cells (Jiang et al., 2020; Yan et al., 2020). The SARS-CoV RBD contains immune-dominant epitopes that can elicit neutralizing antibodies conferring protection to SARS-CoV infection (He et al., 2005). A recent bioinformatics study showed that SARS-CoV-2 RBD has several B cell epitopes (Grifoni et al., 2020). SARS-CoV-2 RBD based immunogens were able to elicit neutralizing sera in animals (Quinlan et al., 2020). Thus, SARS-CoV-2 RBD is a good target for developing potent neutralizing mAbs. We and others have identified such potent neutralizing human mAbs targeting the RBD of SARS-CoV (Zhu et al., 2007) and the middle east respiratory syndrome coronavirus (MERS-CoV) (Ying et al., 2014a). Recently, several groups have reported the isolation of potent neutralizing antibodies from convalescent human donors but all are in an Immunoglobulin G1 (IgG1) format with a molecular mass of about 150 kDa (Cao et al., 2020; Ju et al., 2020; Rogers et al., 2020; Shi et al., 2020; Zost et al., 2020).

Antibody domains and fragments such as Fab (fragment antigen binding, molecular weight of 50 kDa), scFv (singe-chain variable fragment, 30 kDa) and V_H (heavy chain variable domain, 15 kDa) are attractive antibody formats as candidate therapeutics (Nelson, 2010). For example, isotope labeled antibody fragments are more suitable for bio-imaging due to their better tissue penetration and faster clearance compared to full-size antibodies (Freise and Wu, 2015). Single antibody domains (sAbd), e.g., camelid V_HH (15 kDa) exhibit strong antigen binding and high stability (Harmsen and De Haard, 2007). We and others have demonstrated that human IgG1 heavy chain variable domain (V_H) can be engineered to achieve high stability and affinity to antigens (Nilvebrant et al., 2016), as exemplified by the V_H, m36.4, targeting the human immunodeficiency virus type 1 (HIV-1) envelope glycoprotein co-receptor binding site (Chen et al., 2008a). The V_H domains small size could improve therapeutic efficacy for infectious diseases, such as COVID-19 because of greater penetration to sites of infection. The conformation of the SARS-CoV-2 S trimer is dynamic with only one RBD in the "up" conformation presenting neutralizing epitopes while epitopes in the other two RBDs may be masked (Yan et al., 2020). Small V_Hs may achieve binding to the cryptic RBD epitopes during the dynamic "breathing" of the S trimer (Liu et al., 2020). In addition, V_Hs may have

an advantage for treatment of respiratory virus infections because V_HS could efficiently penetrate tissue, especially when using direct delivery through inhalation (Detalle et al., 2016).

To identify potent neutralizing V_HS against SARS-CoV-2, we panned our large (10^{11} clones) and diverse phage-displayed human V_H antibody library against recombinant RBD. Several V_H binders were isolated and screened for their affinities, ACE2 competition and stabilities. One of those V_HS, ab8, in an Fc (human IgG1, crystallizable fragment) fusion format, showed potent neutralization activity and specificity against SARS-CoV-2 both in vitro and in two animal models. To our knowledge, this is the first report for high potency of a human antibody domain (V_H) in two animal models of infection.

Results

Selection of a high-affinity V_H, ab8, and its conversion to a V_H-Fc

We generated a large phage-displayed human V_H library where heavy chain complementarity-determining regions (HCDR1, 2, 3s) were grafted into their cognate positions of a stable scaffold based on the germline V_H3-23 (**Figure S1A).** It was panned against recombinant RBD antigens with two different tags (avi-his and human IgG1 Fc tag) which were sequentially used to avoid phage enrichment to tags and related epitopes. The quality of the RBD used for panning was confirmed by ACE2 binding (**Figure S1B and C**). After three rounds of panning, a panel of V_H binders was obtained. Among the highest affinity binders, we selected one, V_H ab8, which did not aggregate during a six-days incubation at 37℃ as tested by dynamic light scattering (DLS) (**Figure S1D**). To increase the V_H ab8 avidity and extend its in vivo half-life, it was converted to a bivalent antibody domain by fusion to the human IgG1 Fc (V_H-Fc ab8) (**Figure S1E**).

High-avidity specific binding of V_H-Fc ab8 to RBD and cell surface associated native S protein

V_H ab8 bound to SARS-CoV-2 RBD and S1 with half-maximal binding concentrations (EC_{50}s) of 10 nM as measured by ELISA (**Figure 1A and D**) and an equilibrium dissociation constant (K_D) of 19 nM as measured by the biolayer interferometry (Blitz system) (**Figure 1B**). The relatively fast dissociation rate constant ($k_d = 4.1\times 10^{-3}$ S^{-1}) was significantly (23-fold) decreased by the conversion to a bivalent Fc fusion format ($k_d = 1.8\times 10^{-4}$ S^{-1}) (**Figure 1E)** resulting in high avidity. V_H-Fc ab8 bound to SARS-CoV-2 RBD and S1 subunit of S protein with EC_{50}s of 0.40 nM and 0.20 nM, respectively, and a K_D of 0.54 nM (**Figure 1E**). It specifically bound to 293T cells expressing S, but not to control 293T cells **(Figure 1C and Figure S2A)**. The binding of V_H-Fc ab8 was higher than that of IgG1 CR3022, an anti-SARS-CoV antibody cross-reactive with SARS-CoV-2 (Tian et al., 2020). The V_H-Fc ab8's half-maximal FACS measured binding concentration (FC_{50}) of 0.07 nM was higher than that of recombinant human ACE2-Fc (FC_{50} = 0.52 nM) (**Figure 1F**). These data demonstrate that ab8 selected by an isolated RBD can bind to cell surface associated native S trimer. The binding of V_H-Fc ab8 to the S protein was significantly improved compared to that of the V_H ab8 through avidity effect.

V_H-Fc ab8 and V_H ab8 outcompete human ACE2-Fc for binding to RBD

Competition with human ACE2 for binding to RBD is a surrogate indicator for antibody neutralization activity. V_H-Fc ab8 outcompeted human ACE2-Fc with a half-maximal inhibitory concentration (IC_{50}) of 1.0 nM **(Figure 2A)**. Note that the V_H-Fc ab8 was much more effective in outcompeting ACE2-Fc than V_H ab8, consistent with its enhanced binding. ACE2 can also block V_H ab8 for binding to RBD (**Figure S2B**) and cell surface associated S (**Figure S2C**). V_H-Fc ab8 also significantly decreased the kinetics of ACE2 binding as measured by Blitz (**Figure 2B**). V_H-Fc ab8 did not bind to the SARS-CoV RBD **(Figure 2C)** and did not compete with CR3022 for binding to RBD **(Figure 2D)**. The CR3022 epitope is located in a conserved region on the RBD core domain distal from the ACE2 binding interface, as seen in the crystal structure of the Fab CR3022-RBD complex (Yuan et al., 2020). These results indicate that the ab8 epitope may overlap with the ACE2 binding site on RBD.

V_H-Fc ab8 binds to SARS-CoV-2 RBD mutants found in patients; an alanine scanning mutation in the distal loop tip of the receptor binding motif (RBM) decreases its binding

Currently, nine prevalent RBD mutants were found in COVID-19 patients (Priyanka et al., 2020). Six of these mutations (F342L, N354D. N354D/D364Y, V367F, R408I, W436R) are located in the RBD core domain and three, K458R, G476S and V483A are in the receptor binding motif (RBM) (**Figure 3A**). V_H-Fc ab8 bound to all mutants similarly to wild type RBD as measured by ELISA (**Figure 3B**). To map the ab8 epitope, we also generated several mutations in non-conserved positions compared to SARS-CoV spanning the footprint of ACE2 on RBM (N439A, G446L, L455A, F456A, A475I, F486A, Q493A, Q498A, N501A, Y505A) (**Figure 3C**). Most of these mutants retained V_H-Fc ab8 binding except F486A, F456A and A475I **(Figure 3D and 3E)**. The F486A significantly decreased binding without affecting the overall RBD conformation (**Figure S2C and S2D**) indicating that F486 directly interacts with ab8. The F456A and A475I mutations decreased the binding by 15% and 40%, respectively, but they also affected the RBD conformation (**Figure S2C and S2D**). These results suggest that a portion of the V_H ab8 epitope could be in the RBM distal loop tip where the F486 is located at (**Figure 3F**).

Electron microscopic analysis of the SARS-CoV-2 S protein ectodomain bound to V_H ab8

To explore structural aspects of SARS-CoV-2 neutralization by V_H ab8, we performed negative stain electron microscopic analysis of the complex formed between the S protein ectodomain and V_H ab8 or soluble ACE2 (**Figure 4**). The density maps showed that both V_H ab8 and ACE2 were in a quaternary conformation in which two of the protomers in the trimer are in the "down" conformation with the third one in the "up" conformation (**Figures 4A and 4B**), similar to the quaternary conformation of the reported ACE2-bound S ectodomain (PDB ID: 6VYB) (Walls et al., 2020). One molecule of the V_H ab8 was observed bound to each RBD domain (**Figure 4A**). In the ACE2-S complex, one molecule of ACE2 was bound to the S protein trimer, straddling one "up" and one "down" RBD region **(Figure 4B)**. There appears to be a noticeable shift of the "up" RBD domain when it is bound to V_H ab8 (**Figure 4A**). This shift is not observed when ACE2 is bound to the trimer (**Figure 4B**). Superposition of the two density maps reveals that the binding site of V_H ab8 directly overlaps with the ACE2 one, precluding simultaneous occupancy on the S protein ectodomain **(Figure 4C).** We also found that when ACE2 was added subsequent to the

addition of V_H ab8, only the V_H ab8 bound state was observed, further confirming the ACE2 competition with V_H ab8. To better understand the spatial relationship between the site of V_H ab8 binding and that of ACE2 binding, we created a molecular model for ACE2 bound S trimer by aligning the RBD region of the crystal structure of SARS-CoV-2 RBD bound ACE2 (PDB ID: 6M0J) (Lan et al., 2020) to the "up" RBD region in the cryo-EM structure of the trimer (PDB ID: 6YVB) (Wrapp et al., 2020). Superposition of this chimeric structure with the density map of V_H ab8-bound S protein trimers reveals that the bound ACE2 has extensive overlap with the space occupied by bound V_H ab8 (**Figure 4D**). The direct spatial overlap between bound V_H ab8 and ACE2 provides a structural mechanism for the observed effect of ab8 on blocking ACE2 binding. The structural findings also showed that the RBM distal loop, which has F486 at its tip, is directly covered by the footprint of the bound V_H ab8, consistent with the epitope mapping results showing that F486 is a direct contacting residue for ab8.

Potent neutralization of SARS-CoV-2 by V_H-Fc ab8 in vitro

We used four different assays to evaluate V_H-Fc ab8 mediated inhibition of SARS-CoV-2 infection *in vitro*: a β-galactosidase (β-Gal) reporter gene-based quantitative cell-cell fusion assay (Xiao et al., 2003); an HIV-1 backbone-based SARS-CoV-2 pseudovirus assay (Zhao et al., 2013); and two different replication-competent virus neutralization assays (a luciferase reporter gene assay and a microneutralization (MN)-based assay) (Scobey et al., 2013; Yount et al., 2003). V_H-Fc ab8 inhibited cell-cell fusion much more potently than V_H ab8 **(Figure 5A)**. The inhibitory activity of V_H-Fc ab8 was also higher than that of ACE2-Fc. The control anti MERS-CoV antibody IgG1 m336 did not show any inhibitory activity. V_H-Fc ab8 neutralized pseudotyped SARS-CoV-2 virus (IC_{50} = 0.03 μg/ml) more potently than ACE2-Fc (IC_{50} = 0.40 μg/ml) and V_H ab8 (IC_{50} = 0.65 μg/ml) (**Figure 5B**). The pseudovirus neutralization IC_{50} for ACE2-Fc in our assay is comparable to the one reported by Changhai Lei *et al.* (0.03-0.1 μg/ml) (Lei et al., 2020). Interestingly, the maximum neutralization by V_H ab8 was only 50% compared to the 100% by V_H-Fc ab8 and ACE2-Fc, which was also observed for another antibody S309 (Pinto et al., 2020). The complete neutralization by V_H-Fc ab8/ACE2-Fc emphasizes the role of bivalency and related avidity in neutralization (Klasse and Sattentau, 2002). Furthermore, in the reporter gene assay V_H-Fc ab8 neutralized live SARS-CoV-2 with an IC_{50} of 0.04 μg/ml (**Figure 5C**), which is much lower than that for ACE2-Fc (IC_{50} of 6.1 μg/ml) and V_H ab8 (IC_{50} = 29 μg/ml). ACE2-Fc seemed to be much less potent against the live virus compared to the pseudovirus, which is also observed by others (IC_{50} = 12.6 μg/ml) (Case et al., 2020) and may relate to the S expression levels and RBD/S conformation on the virus surface. We also confirmed the high V_H-Fc ab8 live virus neutralization potency by a microneutralization (MN) assay-100% neutralization (NT_{100}) at 0.1 μg/ml (**Figure 5D**). The NT_{100} from the MN assay (0.1 μg/ml) was close to the IC_{100} (0.2 μg/ml) from the reporter gene assay suggesting consistency in the live virus neutralizing activity of V_H-Fc ab8 obtained with two independent assays at two different laboratories. These results suggest that V_H-Fc ab8 is a potent neutralizer of SARS-CoV-2, which correlates with its strong competition with ACE2 for binding to RBD.

High prophylactic efficacy of V_H-Fc ab8 in a mouse ACE2 adapted SARS-CoV-2 infection model

To evaluate the prophylactic efficacy of V_H-Fc ab8 *in vivo*, we used a recently developed mouse ACE2 adapted SARS-CoV-2 infection model, in which wild type BALB/c mice are challenged with SARS-CoV-2 carrying two

mutations Q498T/P499Y at the ACE2 binding interface in the RBD (Dinnon et al., 2020). It was shown that in this model, the aged BALB/c mice exhibited more clinically relevant phenotypes than those seen in hACE2 transgenic mice (Dinnon et al., 2020). Groups of 5 mice each were administered 36, 8, 2 mg/kg V_H-Fc ab8 prior to high titer (10^5 pfu) SARS-CoV-2 challenge followed by measurement of virus titer in lung tissue 2 days post infection. V_H-Fc ab8 effectively inhibited SARS-CoV-2 in the mouse lung tissue in a dose dependent manner (**Figure 6A**). There was complete neutralization of infectious virus at the highest dose of 36 mg/kg, and statistically significant reduction by 1000-fold at 8 mg/kg. Remarkably, even at the lowest dose of 2 mg/kg it significantly decreased virus titer by 10-fold (two tailed, unpaired *t* test, $p = 0.0075$). To exclude possible effects of residual ab8 on viral titration, we performed another experiment in which mouse lungs were perfused with 10 ml of PBS before harvesting for titration. The perfusion did not affect to any significant degree the infectious virus in the lungs **(Figure 6B)**. The V_H-Fc ab8 completely neutralized the virus in the lungs at 36 mg/kg and significantly reduced infectious virus at 8 mg/kg. V_H-Fc ab8 also reduced viral RNA in the lungs **(Figure 6C).** These results demonstrate the neutralization potency of V_H-Fc ab8 *in vivo*. They also suggest that the double mutations Q498T/P499Y on RBD did not influence V_H-Fc ab8 binding and contribute to the validation of the mouse adapted SARS-CoV-2 model for evaluation of neutralizing antibody efficacy.

V_H-Fc ab8 exhibited both prophylactic and therapeutic efficacy in a hamster model of SARS-CoV-2 infection

Recently hamsters were demonstrated to recapitulate clinical features of SARS-CoV-2 infection (Chan et al., 2020) (Imai et al., 2020). To evaluate the V_H-Fc ab8 efficacy in hamsters, it was intraperitoneally administered either 24 hours before (prophylaxis) or 6 hours after (therapy) intranasal 10^5 $TCID_{50}$ virus challenge. In the therapeutic group, the rationale for administration of the antibody six hours post viral infection is based on the replication cycle length of 5-6 hours after initial infection for SARS-CoV in VeroE6 cells (Keyaerts et al., 2005). Six hours after challenge with a high dose of 10^5 $TCID_{50}$, approximately the same number of susceptible cells could become infected and likely produce much more infectious virus, which would need to be neutralized by the antibody to prevent subsequent cycles of infection. Nasal washes and oral swab at 1, 3, 5 days post infection (dpi) and different lung lobes at 5 dpi were collected. V_H-Fc ab8 decreased viral RNA by 1.7 log in the lung when administered prophylactically. The lung viral RNA decrease in the therapeutic groups was slightly lower (by 1.2 log) (**Figure 6D**). Interestingly, the viral RNA load in the therapeutic groups was to some extent tissue location dependent (**Figure 6F**). The variation of the viral load in different lung lobes may relate to nonuniform antibody transport and viral spread inside the lung. Remarkably, V_H-Fc ab8 alleviated hamster pneumonia and reduced the viral antigen in the lung (H&E staining, **Figure 7A** and **C** and immunohistochemistry **Figure 7B** and **D**). The control hamsters exhibited severe interstitial pneumonia characterized by extensive inflammatory cell infiltration, presence of type II pneumocytes, alveolar septal thickening and alveolar hemorrhage. Both prophylactic and therapeutic treatment of V_H-Fc ab8 reduced the lesions of alveolar epithelial cells, focal hemorrhage and inflammatory cells infiltration. V_H-Fc ab8 also reduced the shedding from mucosal membranes including in nasal washes and oral swabs (**Figure S4**). The decrease in viral RNA in nasal washes and oral swabs were not as large as the decrease observed in the lung tissue, similar to a recent finding in hamsters (Imai et al., 2020). Overall, the

prophylactic treatment was more effective than the therapeutic treatment in decreasing viral load in nasal washes and oral swabs. Notably, prophylactic administration of V_H-Fc ab8 effectively reduced the infectious virus in the oral swab at 1 dpi, while the post-exposure treatment did not (**Figure S4C** and **G**). Interestingly, viral reduction (except the viral titer in the oral swab at 1 dpi) was more effective at 3 and 5 dpi compared to that at 1 dpi, likely due to the infection peak occurring before day 3 as reported in hamsters (Sia et al., 2020). A striking finding is that V_H-Fc ab8 given therapeutically at as low dose as 3 mg/kg can still decrease viral loads in the lung, nasal washes and oral swabs (**Figure S5**).

We measured the V_H-Fc ab8 concentrations at both doses (10 and 3 mg/kg) in the sera at 1 dpi and 5 dpi in the post-exposure treatment groups (**Figure S5C**). The higher dose (10 mg/kg) resulted in higher antibody concentration and better inhibitory activity than the lower dose (3 mg/kg). The relatively high concentration of V_H-Fc ab8 five days after administration also indicates good pharmacokinetics. Furthermore, we also compared the V_H-Fc ab8 concentration in both the sera and lung with that of IgG1 ab1, which has a similar affinity to SARS-CoV-2 and similar degree of competition with the receptor ACE2 as V_H-Fc ab8 (Li et al., 2020a). We found that the concentration of V_H-Fc ab8 in hamster sera is significantly higher than that of IgG1 ab1 at 1 and 5 dpi after post-exposure administration of the same dose of 10 mg/kg (**Figure 7E**), possibly indicating more effective delivery of V_H-Fc ab8 from the peritoneal cavity to the blood than that of IgG1 ab1. We also found that the V_H-Fc ab8 concentration in all hamster lung lobes was higher than that of the IgG1 ab1 (**Figure 7F**), suggesting that V_H-Fc ab8 appears to penetrate the lung tissue more effectively than IgG1 ab1. These results indicate that the in vivo delivery of V_H-Fc ab8 may be more effective than that of full-size antibodies in an IgG1 format.

V_H-Fc ab8 does not aggregate and does not bind to 5300 human membrane proteins

The V_H-Fc ab8 propensity for aggregation was measured at 37°C by dynamic light scattering (DLS), which detects particle size distributions in the nanometer range (Stetefeld et al., 2016). It displayed a single peak at 11.5 nm which is the size of a monomeric V_H-Fc protein **(Figure S6A)**. The absence of large-size peaks corresponding to large molecular weight species (aggregates) in solution, indicates that V_H-Fc ab8 is highly resistant to aggregation at high concentration (4 mg/ml) and relatively long times of incubation (6 days) at 37°C. The V_H-Fc ab8 propensity for aggregation was also evaluated by size exclusion chromatography (SEC), which showed that >96% of V_H-Fc ab8 was eluted in a peak at a position corresponding to a monomeric state with a molecular weight of 80 kDa (**Figure S6B)**.

Antibody nonspecificity and polyreactivity can be an obstacle for developing an antibody into a clinically useful therapeutic. Polyreactivity may not only cause off-target toxicities and interfere with normal cellular functions, but may also reduce antibody half□life (Chuang et al., 2015). To test for potential polyreactivity of V_H-Fc ab8, a Membrane Proteome Array (MPA) platform was used, in which 5,300 different human membrane protein clones were separately overexpressed in 293T cells in a matrix array achieving a high-throughput detection of binding by FACS. V_H-Fc ab8 did not bind to any of those proteins (**Figure S6C**), demonstrating its lack of polyreactivity and nonspecificity. Interestingly, we did not detect V_H-Fc ab8 binding to the human FcγRIA, which is probably due to the relatively low expression level of FcγRIA on HEK-293T cell surface without concomitant

expression of the common γ chain (Van Vugt et al., 1996). In addition, we found that V_H-Fc ab8 bound to the FcγRs much weaker than IgG1 (**Figure S7**), likely due to the different conformation in the lower hinge region for Fc fusion proteins compared to that of IgG1s (Ying et al., 2014b). For the Fc fusion proteins (even with the same hinge sequence as IgG1), binding to FcγRs may be different from that of IgG1, and can be affected by the fusion partners (Lagassé et al., 2019). The importance of antibody binding to FcγRs for therapeutic or prophylactic efficacy or toxicity in SARS-CoV-2 infection is unknown.

Discussion

Neutralizing mAbs are promising for prophylaxis and therapy of SARS-CoV-2 infections. Recently, many potent neutralizing antibodies from COVID19 patients were identified that neutralize pseudovirus with IC_{50}s ranging from 1 to 300 ng/ml, and replication-competent SARS-CoV-2 with IC_{50}s from 15 to 500 ng/ml (Cao et al., 2020; Ju et al., 2020; Rogers et al., 2020; Shi et al., 2020; Zost et al., 2020). By comparison, the V_H-Fcab8 reported here exhibited comparable or better neutralizing potency against SARS-CoV-2 pseudovirus and live virus (IC_{50}s of 30 ng/ml and 40 ng/ml respectively). Of note, IC_{50}s can vary widely between different assays and laboratories because there is no generally accepted standardized assay. In addition, there are many factors that contribute to potency and efficacy in vivo. Animal models are a more comprehensive and likely more reliable predictor of potential efficacy in humans than in vitro neutralization assays.

To our knowledge V_H-Fc ab8 is the first human antibody domain whose activity was validated in two animal models. In the mouse ACE2 adapted SARS-CoV-2 infection model, V_H-Fc ab8 significantly decreased infectious virus by 10-fold at 2 days post infection even at a very low dose of 2 mg/kg **(Figure 6A)**. It also exhibited both prophylactic and therapeutic efficacy in a hamster model. It not only reduced the viral load in the lung and alleviated pneumonia; but it also reduced shedding in the upper airway (nasal washes and oral swab), which could potentially reduce transmission of SARS-CoV-2. Impressively, V_H-Fc ab8 was active therapeutically even at 3 mg/kg. The finding that V_H-Fc ab8 persisted for 4 days post administration at significant levels indicates that the pharmacokinetics of V_H-Fc ab8 is comparable to that of a full size antibody; the half-lives of Fc fusion proteins were reported to vary from those of IgG1s and can range from hours to days (Unverdorben et al., 2016). The molecular weight of V_H-Fc ab8 (80 kDa) is half of that of full-size IgG1 which suggests an advantage in terms of smaller quantities needed to be produced compared to those for IgG1s to reach similar number of molecules and efficacy. In addition, it was shown that decreasing binder's size exponentially increases its diffusion through normal and tumor tissues (Jain, 1990). Thus, decreasing the size two-fold can increase diffusion through tissues by four-fold. We found that after administration at the same dose, the concentration of V_H-Fc ab8 was higher than that of IgG1 ab1 in both hamster sera and lung tissue. This result might suggest that the V_H-Fc ab8 diffusion from the peritoneal cavity to the blood and penetration of lung may be faster than that of IgG1 ab1. This may further explain its efficacy at low doses in animals. Although the low dose showed efficacy in the small animal models, it should be noted that in humans higher doses could be required to achieve comparable degree of efficacy. Another caveat is that in the

hamster post-exposure experiment, the V_H-Fc ab8 was administered at a time (six hours) when the first round of virus replication was likely completed (Keyaerts et al., 2005), but before the infection peak at 1-2 days (Sia et al., 2020). Because it inhibits infection of new cells, its administration at around the infection peak or after may not be as effective unless it also kills infected cells in vivo which is under investigation.

Recently antibody domains including human V_H and camelid V_HH were reported having varying neutralization potency (Chi et al., 2020; Sun et al., 2020; Wrapp et al., 2020; Wu et al., 2020a). Compared to those domains, V_H-Fc ab8 is unique in terms of potency, aggregation resistance and specificity. V_H-Fc ab8 exhibited good developability properties including stability at high concentrations and long incubation at 37°C, as well as absence or very low aggregation. In addition, V_H-Fc ab8 did not bind to the human cell line 293T even at high concentration (1 μM) which is about 1754-fold higher than its K_d indicating absence of non-specific binding to many membrane-associated human proteins. A similar result was obtained by the membrane protein array assay showing that V_H-Fc ab8 did not bind to any of 5,300 human membrane-associated proteins, indicating its lack of non-specificity and thus low potential for off-target toxicity when used *in vivo*. Besides, unlike camel V_HHs, the V_H ab8 sequence is fully human and therefore likely less immunogenic than that of camelid V_HHs.

Multiple structures are now available for the SARS-CoV-2 S protein trimer in complex with various neutralizing antibodies, offering insight into antigenic epitopes and inhibitory mechanisms critical for S protein neutralization. Epitopes on the SARS-CoV-2 S protein RBD have emerged as effective targets, as evidenced by the action of several RBD binding antibodies including CR3022, B38, C105, CB6, H014, and S309 (Barnes et al., 2020; Lv et al., 2020; Pinto et al., 2020; Shi et al., 2020; Wu et al., 2020b). While B38, C105, and CB6 directly compete with ACE2 for binding sites on the RBD surface, H014 occupies a position distinct from these binding sites, precluding ACE2 binding *via* steric inhibition (Lv et al., 2020). S309 targets the RBD of the S protein both in closed and open S protein conformations, exhibiting a different mechanism of neutralization (Pinto et al., 2020). A recent study of the structure of the S protein trimer in complex with the nanobody H11-D4 (PDB ID: 6Z43) revealed full occupancy of the nanobody on all three RBDs in a "one up and two down" conformation (Huo et al., 2020), similar to what we report here. Our structural analysis demonstrates that the location of the V_H ab8 bound to the trimeric S ectodomain directly overlaps the region that would be occupied by ACE2 when bound to the S protein. The ACE2 blocking is likely the major mechanism of the V_H-Fc ab8 neutralizing activity, which is significantly augmented by avidity effects due to its bivalency. The narrow neutralization concentration range in the live virus neutralization (10-200 ng/ml for 0%-100% neutralization) (**Figure 5D**) indicates a plausible cooperative neutralization mechanism, probably due to the synergistic binding of V_H molecules in V_H-Fc ab8 to RBDs. Due to its small size, V_H may facilitate targeting occluded epitopes on RBD that are otherwise inaccessible to full-length IgGs, which is important because the SARS-CoV-2 S protein is conformationally heterogenous, exposing neutralizing epitopes to varying degrees (Yan et al., 2020). The structural analysis shows that V_H ab8 is able to simultaneously target all three RBD epitopes in both "up" and "down" conformations, which may provide a structural basis for a unique cooperative neutralization mechanism for V_H-Fc ab8. V_H-Fc ab8 with a long flexible linker between V_H and Fc may allow two

V_H molecules to bind simultaneously two protomers in the same S trimer or cross-link two different protomers from different S trimers.

The ab8 epitope is distal to the CR3022 epitope, explaining its lack of competition with CR3022. The ab8 contact residue F486 (L472 in SARS-CoV) is not conserved which likely explains its lack of cross-reactivity to SARS-CoV. From the GISAID and NCBI databases, we found nine mutations in RBD with relatively high frequencies in current circulating SARS-COV-2. Six of them are in the core domain (F342L, N354D, N354D/D364Y, V367F, R408I and W436R) and three in the RBM (K458R, G476S, V483A). The core domain mutations are far away from the ab8 epitope, thus these mutations do not affect V_H-Fc ab8 binding to RBD. Those three RBM mutations also did not affect ab8 binding although they are close to the ab8 epitope, suggesting that these mutations may not affect ab8 neutralizing activity although neutralization of whole virus carrying these mutations is needed to definitely demonstrate this possibility. Interestingly, V_H-Fc ab8 effectively inhibited the mouse ACE2 adapted SARS-CoV-2 with a Q498T/P499Y mutation in RBD, indicating that this double mutation also does not affect V_H-Fc ab8 binding to RBD. These results suggest that V_H-Fc ab8 may be a broadly cross-reactive SARS-CoV-2 neutralizing antibody.

In conclusion, we identified a fully human antibody V_H domain that shows strong competition with ACE2 for binding to RBD and potent neutralization of SARS-CoV-2 in vitro and in two animal models. This potent neutralizing activity combined with its specificity and good developability properties warrants its further evaluation for prophylaxis and therapy of SARS-CoV-2 infection. Our elucidation of its unique epitope and mechanism of neutralization could also help in the discovery of more potent inhibitors and vaccines.

ACKNOWLEDGMENTS. We would like to thank the members of our group, Dontcho Jelev, Megan Shi, Cynthia Adams, Du-San Baek, Yae-Jin Kim and Xiaojie Chu for their helpful discussions. We thank Dr. Kevin McCormick from the University of Pittsburgh, Rui Gong from the Institute of Virology in Wuhan and Rachel Fong from Integral Molecular for helpful suggestions. This work was supported by the University of Pittsburgh Medical Center. We would like to thank Jocelyne Lew and Vinoth Manoharan for technical assistance and the members of the Clinical Research and Animal Care team at VIDO-InterVac, as well as Yanyun Huang and Dale Godson (Prairie Diagnostic Services Inc.). David R. Martinez is funded by an NIH F32 AI152296, a Burroughs Wellcome Fund Postdoctoral Enrichment Program Award, and was supported by an NIH NIAID T32 AI007151. RSB is supported by grants from the NIH AI132178 and AI108197. Work in the Subramaniam laboratory is supported by a Canada Excellence Research Chair Award and a grant from Genome BC, Canada. Some monoclonal antibodies were generated by the UNC Protein Expression and Purification (PEP) core facility, which is funded by NIH grant P30CA016086.

AUTHOR CONTRIBUTIONS. DSD, RSB, CTT, JWM, SS, DF and WL conceived and designed the research; WL identified and characterized antibodies; XL and ZS helped to make libraries, characterized antibodies and performed the cell fusion pseudovirus assays. CC made the RBD, ACE2; LZ made and characterized reagents; MU and EP characterized proteins and helped with the proteome assay; DM and AD performed the live virus

neutralization assays; AS, SSK, DF and SL performed the animal studies; AB, SC, KL, DM, SS, XZ and SS produced and purified the S trimer, carried out the EM experiments and analyzed the structure-related results; DSD and WL wrote the first draft of the article, and all authors discussed the results and contributed to the manuscript.

DECLARATION OF INTERESTS. Wei Li, Chuan Chen, Zehua Sun, John W. Mellors and Dimiter S. Dimitrov are co-inventors of a patent, filed on March 12 by the University of Pittsburgh, related to ab8 described in this paper.

FIGURE LEGENDS

Figure 1. Binding of V_H ab8 and V_H-Fc ab8 to recombinant SARS-CoV-2 RBD and S1 proteins and cell membrane associated S. (A and **D)** V_H and V_H-Fc ab8 binding to recombinant RBD and S1 proteins measured by ELISA. The MERS-CoV antibody IgG1 m336 was used as a negative control. Experiments were performed in duplicate and the error bars denote ± SD, n =2. **(B** and **E)** Kinetics of V_H ab8 (**B**) and V_H-Fc ab8 (**E**) binding to RBD. **(C)** Binding of V_H-Fc ab8, ACE2-Fc and IgG1 CR3022 to S transiently transfected 293T cells (293T-S). The 293T cells without transfection serve as a control. Antibodies or proteins were evaluated at a concentration of 1 μM. (**D**) Concentration-dependent binding of V_H-Fc ab8 and ACE2-Fc to 293T-S cells. See also **Figure S2, panel A**.

Figure 2. Competition of V_H-Fc ab8 and V_H ab8 with ACE2, CR3022 for binding to SARS-CoV-2 RBD and lack of binding of V_H-Fc ab8 to SARS-CoV S1. (A) Competition of V_H-Fc ab8 and V_H ab8 with ACE2 for binding to SARS-CoV-2 RBD. RBD was coated and incubated with 5-fold serially diluted V_H-Fc ab8 and V_H ab8 in the presence of 2 nM ACE2-mFc (mouse Fc). **(B)** Inhibition of ACE2 binding to RBD by V_H-Fc ab8 as measured by Blitz. **(C)** Lack of binding to SARS-CoV S1 as tested by ELISA. SARS-CoV S1 was coated and incubated with V_H-Fc ab8. (**D**) Competition between V_H-Fc ab8 and CR3022 measured by Blitz. ELISA Experiments were performed in duplicate and the error bars denote ± SD. **See also Figure S2, panel B and C**.

Figure 3. Epitope mapping for V_H-Fc ab8 by using naturally occurring RBD mutants from circulating SARS-CoV-2 isolates and by alanine scanning. (**A**) Mapping of natural RBD mutants to RBD/ACE2 3D structure (PDB ID: 6M0J). RBD and ACE2 are represented as cyan and green cartoons with RBM highlighted by red color. The RBD mutants are represented by cyan (core domain mutants) and red (RBM) spheres. (**B**) Binding of V_H-Fc ab8 to those RBD mutant as measured by ELISA. (**C**) Design of Ala scanning mutants to explore the ab8 epitope. RBD/ACE2 structure is based the same PDB as panel **A**. Non-conservative residues spanning ACE2 footprint on RBD compared to SARS-CoV are selected and depicted by stick and sphere representations. (**D**) V_H-Fc ab8 binding to SARS-CoV-2 RBD alanine mutants as tested by ELISA. ELISA procedure is similar to the above described. (**E**) Normalized signals of V_H-Fc ab8 binding to those RBD mutants compared to the WT RBD at the concentration of 1.6 nM derived from the panel **D**. (**F**) Representation of portions of ab8 binding region on RBD based on the epitope mapping ELISA results. F486 in the distal RBM loop is the plausible direct contact residue for ab8. **See also Figure S2, panel D and E.**

Figure 4. Electron microscopic analysis of the SARS-CoV-2 S protein ectodomain complexed with V_H ab8. (A) Side and top views of the density map of S protein ectodomain (shown in gray) in complex with V_H ab8. The density that we associate with the bound V_H domain is colored red. The open-state structure of the SARS-CoV-2 S protein ectodomain (PDB ID: 6VYB, blue color ribbon) fits well into the map with the exception of the tip of the RBD from the "up" protomer. There appears to be a slight outward shift in the V_H ab8 complex. **(B)** Side and top views of the density map of S protein ectodomain in complex with soluble human ACE2 domain, with density for bound ACE2 shown in blue. **(C)** Superposition of the density maps from (**A**) and (**B**). **(D)** A closer view of the binding site that incorporates the known atomic model for the structure of the ACE2 complex with the RBD in the "up" conformation, delineating the regions of contact with the V_H density. A ribbon representation of the RBM distal loop and the F486 side chain are highlighted in yellow. **See also Figure S3.**

Figure 5. Inhibition of cell-cell fusion and neutralization of pseudotyped and authentic SARS-CoV-2 by V_H-Fc ab8 and V_H ab8. (**A**) Inhibition of cell fusion between 293T-S and 293T-ACE2 cells by V_H ab8, V_H-Fc ab8 and ACE2-Fc. **(B)** Neutralization of SARS-CoV-2 pseudovirus by V_H ab8, V_H-Fc ab8 and ACE2-Fc. **(C)** Neutralization of live SARS-CoV-2 tested in the nLuc reporter assay. **(D)** Neutralization of live virus by a microneutralization assay. Experiments were performed in duplicate and the error bars denote ± SD, n =2.

Figure 6. Evaluation of the prophylactic efficacy of V_H-Fc ab8 in a mouse ACE2 adapted model; and both prophylactic and therapeutic efficacy in a hamster model of SARS-CoV-2 infection. (**A**) V_H-Fc ab8 inhibited mouse ACE2 adapted SARS-CoV-2 in wild type BALB/c mice (two-tailed, unpaired *t* test, ** $p < 0.01$). (**B**) The same experiments as panel **A** except that the mice lung was perfused before viral titration (Mann-Whitney *U* test, **$p < 0.01$). (**C**) The viral RNA level change in the lung in the same mice of panel **B** as quantified by RT-qPCR and presented as $TCID_{50}$ equivalents (Mann-Whitney *U* test, **$p < 0.01$). (**D-F**) Evaluation of the prophylactic and therapeutic efficacy of V_H-Fc ab8 in the hamster model. Hamsters were injected intraperitoneally with 10 mg/kg of V_H-Fc ab8 antibody either one day before (prophylaxis) or six hours after (therapy) intranasal challenge of 1×10^5 $TCID_{50}$ of SARS-CoV-2. (**D**) The decrease of viral RNA in the hamster lung after averaging all lung lobes. (**E** and **F**) The decrease of viral RNA in hamster lung lobes: prophylaxis and therapy, respectively. (Mann-Whitney *U* test, ns: $p > 0.05$, *$p < 0.05$, **$p < 0.01$, ***$p < 0.001$). **See also Figure S4 and S5.**

Figure 7. Histopathology of hamster lung stained by hematoxylin and eosin stain (H&E) and immunohistochemistry (IHC); comparison of antibody concentrations in the hamster lung and sera between V_H-Fc ab8 and IgG1 ab1. (**A** and **C**) **Reduced pathological changes in lung tissue lobe with V_H-Fc ab8 treatment.** H&E staining of treated and control lung lobes in hamsters challenged with SARS-CoV-2. Arrows showed inflammatory cells and arrow head for alveolar hemorrhages. (**B** and **D**) **Prophylaxis and post-infection treatment with V_H-Fc ab8 decreased SARS-CoV-2 antigen staining in lung lobes of hamsters.** Immunohistochemistry detection of the nucleocapsid antigen of V_H-Fc ab8 prophylactically treated (**B**) and post-exposure treatment (**D**) and control hamster lungs following SARS-CoV-2 challenge. Arrow indicates nucleocapsid positive cells (brown) in lungs lobes of hamsters at day 5 post-infection. (**E** and **F**) Comparison of V_H-Fc ab8 and IgG1 ab1 concentration in the lung and sera of hamsters receiving post-exposure treatment of a dose of 10 mg/kg

(Two-way ANOVA analysis followed by Tukey test, ns, $p > 0.05$, *$p < 0.05$, **$p < 0.01$, ***$p < 0.001$, ****$p <$ 0.0001).

SUPPLEMENTARY FIGURE LEGENDS

Figure S1. Schematic representation of V_H library construction strategy, characterization of the RBD-his-biotin as an antigen for panning and evaluation the aggregation propensity of V_H ab8. Related to Star Methods "Generation of a human V_H library, Selection of Binders and Conversion of V_H to V_H-Fc Fusion Protein". **(A)** Schematic representation of HCDRs grafting into their cognate positions on a stable scaffold. **(B)** ELISA of biotinylated $RBD_{330-532}$ binding to streptavidin-HRP. **(C)** ELISA measurement of binding of biotinylated RBD-his to ACE2. ~100 ng ACE2-Fc was coated on plate with incubation of serially diluted RBD-his-biotin. Binding was detected by using HRP conjugated streptavidin. Experiments were performed in duplicate and the error bars denote ± SD, n =2. (**D**) Evaluation of aggregation of V_H ab8 by DLS. V_H ab8 (4 mg/ml) in PBS was incubated at 37°C. On day 0, day 1 and day 6, samples were taken out for DLS measurement. All measurements were repeated by three times. (**F**) Scheme of conversion of V_H ab8 into V_H-Fc ab8 by fusing IgG1 Fc. The linker between V_H and Fc is the natural human IgG1 upper and lower hinge (DKTHTCPPCPAPELL). V_H ab8 and V_H-Fc ab8 structure is modeled by the online SWISS-MODEL sever (https://swissmodel.expasy.org/).

Figure S2. Concentration dependent binding of V_H-Fc ab8 and ACE2-Fc to cell surface associated SARS-CoV-2 S; evaluation of competition of ACE2 and V_H ab8 by ELISA and FACS; test of the conformation integrity of RBD mutants by using a polyclonal antibody and monoclonal antibody CR3022. Related to Figure 1, 2 and 3. (A) Cells were incubated with serially diluted antibodies or ACE2-Fc and subsequently with PE conjugated anti-human Fc antibody for flow cytometry analysis. Percentage of PE-A+ cells were defined by the above gate strategy in FlowJ, representing the percentage of V_H-Fc ab8 and ACE2-Fc bound 293T-S cells. (**B**) ACE2 blocking V_H ab8 for binding to RBD by ELISA. RBD was coated to plate and 10 nM of V_H ab8 in the presence of gradient concentration of ACE2 was added. Binding was detected by HRP conjugated anti FLAG tag antibody. (**C**) ACE2 blocking V_H ab8 for binding to cell surface associated S. S transiently transfected 293T was incubated with 1 μM V_H ab8 in the presence of various concentration of ACE2 (his tag). Binding of V_H ab8 was detected by the PE conjugated anti FLAG tag antibody. (**D** and **E**) Binding of a mouse polyclonal anti-SARS-CoV-2 RBD antibody and IgG1 CR3022 to the RBD mutants. RBD mutants were coated to plate and two concentrations of polyclonal anti-RBD antibody and CR3022 were added. Binding was detected by HRP conjugated anti mouse (Fc) antibody and anti-human (Fc) antibody. Experiments were performed in duplicate and the error bars denote ± SD, n =2.

Figure S3. Collection and analysis of electron microscopic data. Related to Figure 4. (A) Representative raw micrograph of the SARS-CoV-2 S protein ectodomain complex with V_H ab8. Scale bar 50 nm. **(B)** Selected 2D class averages. Scale bar 10 nm. **(C)** Plot of Fourier Shell Correlation (FSC) between maps constructed from two randomly selected halves of the particle projection images.

Figure S4. Detection of infectious virus and viral RNA in hamster nasal washes and oral swabs. Related to Figure 6. Hamsters were injected intraperitoneally with 10 mg/kg of V_H-Fc ab8 antibody either one day before (prophylaxis) or six hours after (therapy) intranasal challenge of 1×10^5 $TCID_{50}$ of SARS-CoV-2. Untreated hamsters were kept as a control. Nasal washes and oral swabs were collected at day one, three and five post infection (dpi) for virus titer titration by viral $TCID_{50}$ assays and viral RNA quantification by RT-qPCR. **(A** and **E).** Nasal washes viral titer in un-treated (control), pre-infection (prophylaxis) treatment and post-infection (therapy) treatment hamsters. **(B** and **F).** Nasal washes viral RNA levels in un-treated, pre-treated and post- treated hamsters. (**C** and **G**) Oral swab viral titer in un-treated, pre-treated and post-treated hamsters. Note that the prophylactic treatment of V_H-Fc ab8 largely decreased the viral tier in the oral swabs at one dpi, while there is almost no effect for the post-infection treatment. **(D** and **H)** Oral swab viral RNA levels in un-treated, pre-treated and post-treated hamsters.

Figure S5. Post-exposure treatment efficacy of V_H-Fc ab8 at two different doses in the hamster model. Related to Figure 6. V_H-Fc ab8 at doses of 10 mg/kg or 3 mg/kg was administered i.p. 6 h after virus intranasal challenge. The hamster shedding including nasal washes and oral swabs were collected at 1, 3, 5 dpi. All hamsters were euthanized on 5 dpi. At the euthanasia, lungs (different lobes) were collected viral RNA quantification by RT-qPCR. (**A** and **D**) Nasal washes viral titer and viral RNA in un-treated (control), 3 mg/kg and 10 mg/kg post-infection treated hamsters. (**B** and **E**) Oral swab viral titer and viral RNA in un-treated (control), 3 mg/kg and 10 mg/kg post-infection treated hamsters. (**C**) Comparison of antibody concentrations in hamster sera for those two doses. Hamsters were bled at one and five dpi for measuring antibody concentrations in sera by SARS-CoV-2 S1 ELISA. Sera was diluted 1:100 and binding was detected by using the goat anti human IgG-HRP. (**F**). Viral RNA levels in different lung lobes. RNA quantity was presented as the $TCID_{50}$ equivalence.

Figure S6. Absent or very low aggregation and high specificity of binding of V_H-Fc ab8. Related to Star Methods "Dynamic Light Scattering, Size Exclusion Chromatography and Membrane Proteome Array Assay". (A) Evaluation of the aggregation of V_H-Fc ab8 by DLS. V_H-Fc ab8 (4 mg/ml) buffered in PBS was incubated at 37°C. On day 0, day 1 and day 6, samples were taken out for DLS measurement on Zetasizer Nano ZS ZEN3600 (Malvern Instruments Limited, Westborough, MA) to determine the size distribution. All measurements were repeated by three times. **(B)** Evaluation of V_H-Fc ab8 aggregation by SEC. Size exclusion was performed by loading 0.22 μm membrane-filtered proteins (150 ul, 1.5 mg/mL) onto the Superdex 200 increase 10/300 GL column. Protein was eluted by PBS buffer in a flow rate of 1.5 mL/min. The arrows indicate the peaks of the MW standards in PBS. **(C)** Lack of non-specific binding measured by a Membrane Proteome Array (MPA). Specificity testing of V_H-Fc ab8 (20 μg/ml) was performed using the MPA platform which comprises 5,300 different human membrane proteins, each overexpressed in live cells. To ensure data validity, each array plate contained positive (SARS-CoV-2 S) and negative (empty vector) controls.

Figure S7. Binding of V_H-Fc ab8 to human FcγRs measured by ELISA. Related to Star Methods "ELISA for detection of the binding of V_H-Fc ab8 and IgG1 ab1 to human FcγRs". Recombinant FcγRs ectodomains (100 ng) were coated, and biotinylated V_H-Fc ab8 or IgG1 ab1 was added. Binding was detected by Streptavidin HRP. Experiments were performed in duplicate and the error bars denote ± SD, n =2.

KEY RESOURCES TABLE

RESOURCE AVAILABLITY

Lead Contact

Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Dimiter Dimitrov (mit666666@pitt.edu).

Materials Availability

All requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact author. This includes antibodies, viruses, plasmids and proteins. All reagents will be made available on request after completion of a Material Transfer Agreement.

Data and Code Availability

Antibody nucleotide sequence has been deposited to GenBank with an accession number of MT943599. The antibody is only allowed for non-commercial use. All data supporting the findings of this study are available within the paper and are available from the corresponding author upon request.

EXPERIMENTAL MODEL AND SUBJECT DETAILS

Cells and virus

Vero E6 (CRL-1586, American Type Culture Collection (ATCC) and 293T (ATCC) were cultured at 37°C in Dulbecco's Modified Eagle medium (DMEM) supplemented with 10% fetal bovine serum (FBS), 10 mM HEPES pH 7.3, 1 mM sodium pyruvate, and 100 U/mL of penicillin–streptomycin. 293T stably expressing SARS-CoV-2 and human ACE2 was cultured in DMEM medium containing 200 μg/ml Zeocin. HEK293F and expi293F were cultured in FreeStyle 293 serum free medium (ThermoFisher, Cat#12338018) and Expi293™ Expression Medium

(ThermoFisher, Cat# A1435103), respectively. The SARS-CoV-2 spike pseudotyped HIV-1 backboned virus is packaged in 293T cells after transfecting pNL4-3.luc.RE and pcDNA3.1 S plasmids. The SARS-CoV-2 (US_WA-1/2020) and SARS-CoV2/Canada/ON/VIDO-01/2020 obtained from Centers for Disease Control and Prevention were propagated in Vero E6 cells. The recombinant SARS-CoV-2-SeattlenLuc virus and the mouse ACE2 adapted SAR-CoV-2 virus (carrying a Q498T/P499Y mutation in RBD) recovered by the reverse genetics was produced in VeroE6 cells. All work with infectious SARS-CoV-2 was performed in Institutional Biosafety Committee approved BSL3 facilities using appropriate positive pressure air respirators and protective equipment.

Recombinant proteins

The recombinant proteins SARS-CoV-2 RBD-his, RBD mutants, RBD-Fc, ACE2-hFc were subcloned into pcDNA3.1 expression plasmids, and expressed in expi293F cells. Proteins with his tag were purified by Ni-NTA affinity chromatography and protein with Fc tag purified by protein A chromatography. Protein purity was estimated as >95% by SDS-PAGE and protein concentration was measured spectrophotometrically (NanoVue, GE Healthcare).

Monoclonal antibodies

V_H ab8 antibody was identified by panning of the phage library. V_H-Fc ab8 were constructed by fusing V_H to human IgG1 Fc with the native IgG1 hinge. IgG1 ab1 was obtained by our lab through panning of a Fab phage library. MERS-CoV-specific IgG1 m336 and SARS-CoV antibody IgG1 CR3022 sequences from other groups were subcloned into the pDR12 plasmid for expression. V_H ab8 (in a phagemid pComb3x with a Flag tag) was expressed in HB2151 *E. coli* and purified by Ni-NTA affinity chromatography. All other IgG1 were expressed in expi293 cells and purified with protein A chromatography.

Mouse and hamster experiments

For the mouse model, BALB/c mice purchased from Envigo (BALB/cAnNHsd, stock# 047, immunocompetent, 11-12 months of age, female) were used for all experiments. They are drug/test naïve and negative for pathogens. Animals were not involved in any previous studies. Animals were housed in groups of 5 animals per cage and fed standard chow diet. The study was carried out in accordance with the recommendations for care and use of animals by the Office of Laboratory Animal Welfare (OLAW), National Institutes of Health and the Institutional Animal Care. All mouse studies were performed at the University of North Carolina (Animal Welfare Assurance #A3410-01) using protocols (19-168) approved by the UNC Institutional Animal Care and Use Committee (IACUC) and all virus studies were performed in ABSL3 facilities at UNC. Virus inoculations were performed under anesthesia and all efforts were made to minimize animal suffering. For evaluating prophylactic efficacy of V_H-Fc ab8, mice were intraperitoneally treated (12 hours before infection) with different doses of V_H-Fc ab8 followed by intranasal challenge with 10^5 PFU of mouse-adapted SARS-CoV-2. Two days post infection, mice were sacrificed and perfused with 10 ml PBS. Then lung was harvested for viral titer as determined by the plaque assay. For the hamster model, studies were approved by the University Animal Care Committee (UACC) of the University of

Saskatchewan according to the guidelines of the Canadian Council on Animal Care (CCAC). Hamsters were purchased from Charles River (male, immunocompetent, healthy, drug/test naïve, free of pathogens). Hamsters were not involved in previous procedures. Hamsters are housed in microisolater cages, typically 3-7/cage. The cages have BioFresh bedding with Crinkle bedding added. Hamsters have access to food and water ab libitum. Food is Lab Diet 5P00 ProLab RMH300. Cages are changed weekly or as needed and spot cleaned. For experiment, hamsters were intraperitoneally treated with V_H-Fc ab8 either 24 hrs before (prophylaxis) or 6 hrs (therapy) after intranasal challenge of 1×10^5 $TCID_{50}$ of SARS-CoV-2. Nasal washes and oral swabs were collected at day 1, 3 and 5 post infection (dpi). Hamsters were bled at 1 and 5 dpi. All hamsters were euthanized on 5 dpi. At euthanasia, lungs were collected for RNA isolation. For viral titer determination, VeroE6 cells $TCID_{50}$ assay was used. For testing viral RNA, viral RNA RT-qPCR was used. For testing antibody concentration at sera and lung, SARS-CoV-2 S1 ELISA was used. For histopathology, 10% formalin fixed and paraffin embedded tissues were processed with either hematoxylin and eosin stain (H&E) or immunohistochemistry (IHC). Lung lobes were scored based on pathology using microscopy.

METHOD DETAILS

Generation, Expression and Characterization of SARS-CoV-2 RBD, S1-Fc, ACE2-Fc, IgG1 m336, and Fab CR3022. The SARS-CoV-2 S and the anti-SARS-CoV antibody IgG1 CR3022 and genes were synthesized by IDT (Coralville, Iowa). MERS-CoV-specific IgG1 m336 antibody was expressed in human mammalian cell as described previously (Ying et al., 2014a). Briefly, IgG1 m336 light chain and heavy chain Fd were subcloned into the pDR12 vector containing dual promoters and a IgG1 Fc cassette. The recombinant plasmid was sequenced and transfected into expi293 cells for expression. The human angiotensin converting enzyme 2 (ACE2) gene was ordered from OriGene (Rockville, MD). The RBD domain (residues 330-532) and S1 domain (residues 14-675) and ACE2 (residues 18-740) genes were cloned in frame to human IgG1 Fc in the mammalian cell expression plasmid pcDNA3.1. The RBD protein with an AviTag followed by a 6×His tag at C-terminal was subcloned similarly. These proteins were expressed with Expi293 expression system (Thermo Fisher Scientific) and purified with protein A resin (GenScript) and by nickel- nitrilotriacetic acid (Ni-NTA) resin (Thermo Fisher Scientific). The Fab CR3022 antibody gene with a His tag was cloned into pCAT2 plasmid (developed in house) for expression in HB2151 bacteria and purified with Ni-NTA resin. Protein purity was estimated as >95% by sodium dodecyl sulfate–polyacrylamide gel electrophoresis (SDS-PAGE) and protein concentration was measured spectrophotometrically (NanoVue, GE Healthcare).

Generation of a human V_H library, Selection of Binders and Conversion of V_H to V_H-Fc Fusion Protein. Unlike camel V_HHs, which naturally evolved to be autonomously stable, human V_H is usually unstable and easy to aggregate in the absence of V_L (Li et al., 2016; Nguyen et al., 2000). However, human V_H can be selected or engineered with high stability and solubility. To facilitate identification of stable V_H binders, we chose engineered germline V_H3-23 as our library scaffold (Chen et al., 2008b). Our human V_H phage display library was made by grafting heavy chain CDR1, 2, 3 genes derived from 12 healthy donors' peripheral blood monocytes (PBMCs) and

splenocytes (Takara, Cat. No. 636525) into their cognate positions of a stable scaffold (based on the germline V_H3-23) in a manner similar to the method we previously described but without mutagenesis of CDR1 (Chen et al., 2008a). Briefly, CDRs were PCR-amplified by using primers with degenerated adaptors covering CDRs edge regions from diverse V_H families in one end, and with sequences annealing to the V_H3-23 framework (FR) regions in the other end. The PCR products were then assembled by overlapping extension PCR by using primers with homologous ending. The whole V_H was assembled by overlapping FR1-CDR1-FR2-CDR2 and FR3-CDR3-FR4 fragments. After assembly, the V_H fragment was Sfi I digested followed by ligated into Sfi I linearized pComb3x phagemid. The recombinant phagemid was then purified, desalted and concentrated for electroporation of bacteria TG1, from which the V_H phage particles were rescued and produced. The library size was determined by tittering transformants. The library quality (diversity) was checked by randomly Sanger sequencing hundreds of V_H clones and also evaluated by panning of diverse antigens. This library contains very large number of clones (10^{11}). For panning, the V_H library was alternatively panned against biotinylated RBD-his and RBD-Fc proteins. RBD biotinylation occurred through biotin ligase (BirA) mediated enzymatic conjugation of a single biotin on AviTag (GLNDIFEAQKIEWHE) (Fairhead and Howarth, 2015). The panning was for 3 rounds with input antigens of 10 μg RBD-his, 2 μg RBD-Fc and 0.5 μg RBD-his for the 1st, 2nd and 3rd round, respectively. The panning process begun with incubation of antigens with 10^{12} V_H phage particles followed by washing with phosphate-buffered saline (PBS) containing 0.1% Tween-20. Bound phage pulled down by streptavidin-M280-Dynabeads were rescued by log-phase TG1 cells with the M13KO7 helper phage. After the 3rd round panning, positive clones were selected by soluble expression monoclonal (SEM) ELISA followed by sequencing (Chen et al., 2008b). V_H binders were further screened for their binding affinity, stability and ACE2 competition. For conversion to Fc-fusion, the V_H gene was subcloned into pSecTag B vector containing human IgG1 Fc fragment. V_H-Fc ab8 was expressed as described above.

Enzyme-Linked Immunosorbent Assays (ELISAs). For detection of RBD biotinylation efficacy, horseradish peroxidase (HRP) conjugated streptavidin was used. For conformation of function of RBD-his after biotinylation, 100 ng ACE2-Fc was coated into the plates followed by addition of serially diluted biotinylated RBD-his. HRP conjugated streptavidin was used for detection. For other ELISAs, the SARS-CoV-2 RBD (residues 330-532) protein was coated on 96-well plates (Costar) at 100 ng/well in PBS overnight at 4°C. For screening SEM ELISA, clones randomly picked from the infected TG1 cells were incubated with immobilized antigen. Bound phages were detected with HRP-conjugated mouse anti-FLAG tag Ab (Sigma-Aldrich). For the V_H-Fc binding assay, HRP-conjugated goat anti-human IgG Fc (Sigma-Aldrich) was used for detection. For the competition ELISA with hACE2, 2 nM of human ACE2-mouse Fc was incubated with serially diluted V_H, or V_H-Fc, and the mixtures were added to RBD coated wells. After washing, bound ACE2-mouse Fc was detected by HRP-conjugated anti mouse IgG (Fc specific) (Sigma-Aldrich). For evaluation of ACE2 blocking of V_H ab8 binding to RBD, 10 nM V_H ab8 was incubated with coated RBD in the presence of various concentration of ACE2-His (Sino Biological), and the bound V_H ab8 was detected by HRP conjugated anti FLAG antibody. For evaluation of conformational changes of the epitope mapping RBD mutants, we used a mouse polyclonal anti SARS-CoV-2 RBD antibody (Sino biological, Cat. No. 40592-MP01) and the human IgG1 CR3022 antibody. For measuring the binding of V_H-Fc ab8 to RBD mutants, 100 ng RBD mutant was coated on 96-wells plates and incubated with V_H-Fc ab8 with binding detected by using

HRP conjugated anti human Fc antibody. To evaluate the binding of V_H-Fc ab8 and IgG1 ab1 to human FcγRs, recombinant human FcγRIA, IIA, IIIA were coated on 96-wells plates followed by addition of biotinylated V_H-Fc ab8 and IgG1 ab1. Binding was detected by the streptavidin-HRP. All colors were developed by 3,3′,5,5′-tetramethylbenzidine (TMB, Sigma) and stopped by 1 M H_2SO_4 followed by recording absorbance at 450 nm. Experiments were performed in duplicate and the error bars denote ± 1 SD.

BLItz. Antibody affinities and avidities were analyzed by the biolayer interferometry BLItz (ForteBio, Menlo Park, CA). For measuring V_H ab8 affinity, the RBD-Fc was mounted on the protein A sensor (ForteBio: 18-5010). 125 nM, 250 nM and 500 nM V_H ab8 were used for association. For measuring avidity of V_H-Fc ab8, biotinylated RBD-Fc was immobilized on streptavidin biosensors (ForteBio: 18–5019) for 2 min and equilibrated with Dulbecco's phosphate-buffered saline (DPBS) (pH = 7.4) to establish baselines. 50 nM, 100 nM and 200 nM V_H-Fc ab8 were chosen for association. The association was monitored for 2 min and then the antibody was allowed to dissociate in DPBS for 4 min. The k_a and k_d were derived from sensorgrams fittings and used for K_d calculation. For the competitive Blitz, 500 nM V_H-Fc ab8 was loaded onto the RBD-Fc coated sensor for 300 s to reach saturation followed by dipping the sensor into a 100 nM ACE2-Fc or Fab CR3022 solution in the presence of 500 nM V_H-Fc ab8. The association was monitored for 300 s. The signals from100 nM hACE2 or CR3022 binding to the RBD-Fc coated sensor in the absence of V_H-Fc ab8 was independently recorded in parallel. Competition was determined by the percentage of signal in the presence of V_H-Fc ab8 to signal in the absence of V_H-Fc ab8 (< 0.7 is considered to be competitive) (Wu et al., 2020a).

SARS-CoV-2 RBD Mutants and Epitope Mapping by Ala Scanning. RBD mutants, N354D, N354D/D364Y, V367F, R408I, W436R were purchased from Acro Biosystems. F342L and K458R were bought from Sino Biological. RBD mutants G476S and V483A, plus the alanine (Ala) scanning mutants N439A, G446L, L455A, F456A, A475I, F486A, Q493A, Q498A, N501A, Y505A were constructed by site-directed mutagenesis using QuikChange II XL Site-Directed Mutagenesis Kit (Agilent, cat. no. 200521). Mutants were expressed and purified according to the abovementioned RBD purification procedures. ELISA was used to evaluate the binding of these mutants compared to the wild type RBD.

Electron Microscopy for SARS-CoV-2 S Trimer Complexed with V_H ab8.

A. Expression and Purification. The codon optimized SARS-CoV-2 2P S protein ectodomain construct (GenBank: YP_009724390.1) was C-terminally tagged with 8xHis and a twin Strep tag and cloned into the mammalian expression vector pcDNA 3.1 (Synbio). HEK293F cells were grown in suspension culture using FreeStyle media (ThermoFisher) at 37 °C in a humidified CO_2 incubator (8% CO_2). Cells were transiently transfected at a density of 1 x 10^6 cells/ml using branched polyethylenimine (PEI) (Sigma) (Portolano et al., 2014). Media was exchanged after 24 h and supplemented with 2.2 mM valproic acid. Supernatant was harvested by centrifugation after 4 days, filtered and loaded onto a 5 ml HisTrap HP column (Cytiva). The column was washed with buffer (20 mM Tris pH 8.0, 500 mM NaCl, 20 mM imidazole) and the protein was eluted with buffer (20 mM Tris pH 8.0, 500 mM NaCl, 500 mM imidazole). Purified protein was concentrated (Amicon Ultra 100 kDa cut off, Millipore Sigma) and loaded onto a

Superose 6 column (Cytiva) equilibrated with GF buffer (20 mM Tris pH 8.0 and 150 mM NaCl). Peak fractions were pooled and concentrated to 1.3 mg/ml (Amicon Ultra 100 kDa cut off, Millipore Sigma).

B. Electron Microscopy Specimen Preparation and Data Collection. Purified S protein ectodomain (0.04 mg/ml) was mixed with V_H ab8 (0.02 mg/ml) or soluble ACE2 (0.02 mg/mL) and incubated on ice for 10 mins. For the competition experiment, the S protein (0.04 mg/ml) was first incubated on ice with V_H ab8 (0.02 mg/ml) for 10 mins then followed by addition of ACE2 (0.02 mg/mL) for another 10 mins. The mixtures (4.8 µl) were applied to 300-mesh copper grids coated with continuous ultrathin carbon. Grids were plasma cleaned using an H_2/O_2 gas mixture for 15 s in a Solarus plasma cleaner (Gatan Inc.) prior to adding the sample. Samples were allowed to adsorb for 30 s before blotting away excess liquid, followed by a brief wash with MilliQ H_2O. Grids were stained by three successive applications of 2% (w/v) uranyl formate (20 s, 20 s, 60 s). Grids containing S protein ectodomain with V_H ab8, and S protein ectodomain mixed with both V_H ab8 and soluble ACE2 were imaged using a 200 kV Glacios transmission electron microscope (ThermoFisher Scientific) equipped with a Falcon3 camera operated in linear mode. Using EPU automated acquisition software (ThermoFisher Scientific), 15-frame movies were collected at 92,000x magnification (corresponding to a physical pixel size of 1.6 □) over a defocus range of -0.5 to -3.0 µm with an accumulated total dose of 40 $e^-/Å^2$/movie. Grids containing purified S protein ectodomain (0.04 mg/mL) with soluble ACE2 (0.02 mg/mL) were imaged using a 200kV Glacios transmission electron microscope equipped with a Ceta 16M CMOS camera (ThermoFisher Scientific). Micrographs were collected at 92,000x magnification (physical pixel 1.6 □) over a defocus range of -0.5 to -3.0 µm with a total dose of 50 $e^-/Å^2$ using EPU automated acquisition software.

C. Image Processing. Motion correction and CTF estimation were performed in RELION (3.1) (Scheres, 2012). Particles were picked by crYOLO (1.7.4) (Wagner et al., 2019) with pre-trained model for negative stain data. After extraction, particles were imported to cryoSPARC live (v2.15.1) (Punjani et al., 2017) and subjected to 2D classification and 3D heterogeneous classification. Final density maps were obtained by 3D homogeneous refinement. Figures were prepared using UCSF Chimera (Pettersen et al., 2004).

Flow Cytometry Analysis (FACS). Full-length S protein of SARS-CoV-2 with native signal peptide replaced by the CD5 signal peptide were codon-optimized and synthesized by IDT. The S gene was subcloned into our in-house mammalian cell expression plasmid, which were used to transiently transfect 293T cells cultured in Dulbecco's Modified Eagle's Medium (DMEM) with 10% FBS, 1% penicillin-streptomycin (P/S). The comparisons of ACE2-Fc, IgG1 CR3022 and V_H-Fc ab8 binding to both blank 293T and 293T overexpressing S (293T-S) were performed. For the determination of binding avidity of V_H-Fc ab8 and ACE2-Fc to the cell surface S, serially diluted antibodies or ACE2-Fc with highest concentration of 1 µM were incubated with cells, and after washing, bound antibodies were detected by phycoerythrin (PE) conjugated anti-human Fc antibody (Sigma-Aldrich). PE-A+ cells were detected by flow cytometry using BD LSR II (San Jose, CA). The gating of PE-A+ population was performed by the FlowJo software, which was plotted against the concentrations of proteins to calculate FC_{50} by non-linear fitting in Graphpad Prism 7 (San Diego, CA). To evaluate ACE2 blocking of V_H ab8 binding to cell surface associated S,

gradient concentrations of ACE2-his in the presence of 1 μM V_H ab8 (Flag tag) were incubated with 293-S cells. After washing, V_H ab8 binding was detected by PE conjugated anti FLAG tag antibody.

Cell-Cell Fusion Inhibition Assay. To test antibody mediated inhibition of cell fusion, the β-galactosidase (β-gal) reporter gene based quantitative cell fusion assay was used (Xiao et al., 2003). In this assay, 293T-S cell expression of T7 RNA polymerase was achieved by infection with vaccinia virus VTF7.3, while 293T-ACE2 cell expression of T7 promoter controlled β-Gal was obtained by infection with vaccinia virus VCB21R. β-Gal will be expressed only after fusion of the two types of cells, which can be monitored by chromogenic reactions using β-Gal substrate. To assay cell-cell fusion, 293T cells stably expressing SARS-CoV-2 S (293T-S) cells were infected with T7 polymerase-expressing vaccinia virus (vTF7-3), and 293T cells stably expressing ACE2 (293T-ACE2) were infected with vaccinia virus (vCB21R Lac-Z) encoding T7 promotor controlled β-gal. Two hours after infection, cells were incubated with fresh medium and transferred to 37 °C for overnight incubation. The next day, 293T-S cells were pre-mixed with serially diluted antibodies or ACE2-Fc at 37 °C for 1 h followed by incubation with 293T-ACE2 cells at a 1:1 ratio for 3 h at 37°C. Then cells were then lysed, and the β-gal activity was measured using β□ galactosidase assay kit (substrate CPRG, G-Biosciences, St. Louis, MO) following the manufacturer's protocol. Fusion inhibition percentage (sample reading, F) was normalized by maximal fusion (reading, F_{max}) of 293T-S and 293T-ACE2 cells in the absence of antibodies using this formula: Fusion inhibition % = $[(F_{max}-F)/(F_{max} - F_{blank})] \times 100\%$, in which F_{blank} refers to the OD reading of 293T-S and 293T incubation wells. Fusion inhibition percentage was plotted against antibody concentrations. Experiments were performed in duplicate and the error bars denote ± 1 SD.

Pseudovirus Neutralization Assay. Pseudovirus neutralization assay was performed based on previous protocols (Zhao et al., 2013). Briefly, HIV-1 backbone based pseudovirus was produced in 293T cells by co-transfection with plasmid encoding SARS-CoV-2 S protein and plasmid encoding luciferase expressing HIV-1 genome (pNL4-3.luc.RE) using PEI. Pseudovirus-containing supernatants were collected 48 h later and concentrated using Lenti-X™ concentrator kit (Takara, CA). Pseudovirus neutralization assay was then performed by incubation of SARS-CoV-2 pseudovirus with serially diluted antibodies or ACE2-Fc for 1 h at 37 °C, followed by addition of the mixture into pre-seeded 293T-ACE2 cells. The mixture was then centrifuged at 1000 × g for 1 hour at room temperature. The medium was replaced 4 hrs later. After 24 h, luciferase expression was determined by Bright-Glo kits (Promega, Madison, WI) using BioTek synergy multi-mode reader (Winooski, VT). Cells only and virus only wells were included and used for normalization. The 50% pseudovirus neutralizing antibody titer (IC_{50}) was calculated using Graphpad Prism 7. Experiments were performed in duplicate and the error bars denote ± 1 SD.

SARS-CoV and SARS-CoV-2 Microneutralization Assay. The standard live virus-based microneutralization (MN) assay was used as previously described (Agrawal et al., 2016a; Agrawal et al., 2016b; Du et al., 2013; Du et al., 2014). Briefly, serially three-fold and duplicate dilutions of individual monoclonal antibodies (mAbs) were incubated with 120 pfu of SARS-CoV or SARS-CoV-2 at room temperature for 2 h before transferring into designated wells of confluent Vero E6 cells grown in 96-well microtiter plates. Vero E6 cells cultured with medium with or without virus were included as positive and negative controls, respectively. MERS-CoV RBD-specific

neutralizing m336 mAb (Ying et al., 2014a) were used as additional controls. After incubation at 37 °C for 4 days, individual wells were observed under the microcopy for the status of virus-induced formation of cytopathic effect. The efficacy of individual mAbs was expressed as the lowest concentration capable of completely preventing virus-induced cytopathic effect in 100% of the wells.

SARS-CoV and SARS-CoV-2 Reporter Gene Neutralization Assay. Full-length viruses expressing luciferase were designed and recovered via reverse genetics as described previously (Scobey et al., 2013; Yount et al., 2003). Briefly, the SARS-CoV-2 RNA from infected cell culture was reverse-transcribled and constructed into the seven contiguous genomic cDNA subclones with interconnecting junctions, which were then BsaI/BsmBI digested and ligated into a full-length SARS-CoV-2 genome cDNA through the cohesive ends. A silent mutation of T15102A was introduced into a conserved region in nsp12 to differentiate our recombinant viruses from the circulating SARS-CoV-2 strains through Sanger sequencing. The reporter viruse was synthesized by replacing a 276-bp region in ORF7 with a GFP-fused nanoluciferase (nLuc) gene. After assembly into full-length cDNA, full-length RNA was in vitro transcribed and was electroporated into Vero E6 cells. Virus stocks were propagated on Vero E6 cells in minimal essential medium containing 10% fetal bovine serum (HyClone) and supplemented with penicillin/kanamycin (Gibico). Viruses were tittered in Vero E6 USAMRID cells to obtain a relative light units (RLU) signal of at least 20× the cell only control background. Ab or ACE2-Fc were serially diluted 4-fold up to eight dilution spots with at a starting dilution 100 ∝g/ml, and were incubated with SARS-CoV-UrbaninLuc and SARS-CoV-2-SeattlenLuc viruses at 37℃ with 5% CO_2 for 1 hour. Then virus-antibody dilution complexes were added to the pre-seeding E6 USAMRID cells (20,000) in duplicate. Virus-only controls and cell-only controls were included in each neutralization assay plate. Following infection, plates were incubated at 37 ℃ with 5% CO_2 for 48 hours. Then cells were lysed and luciferase activity was measured via Nano-Glo Luciferase Assay System (Promega) according to the manufacturer specifications. SARS-CoV and SARS-CoV-2 neutralization IC_{50} were defined as the sample concentration at which a 50% reduction in RLU was observed relative to the average of the virus control wells. Experiments were performed in duplicate and IC_{50} was obtained by the non-linear fitting of neutralization curves in Graphpad Prism 7.

Evaluation of the V_H-Fc ab8 Protective Efficacy in a Mouse Adapted SARS-CoV-2 Model. A recombinant mouse ACE2 adapt SARS-CoV-2 variant was constructed by introduction of two amino acid changes (Q498T/P499Y) at the ACE2 binding pocket in RBD. Virus stocks were grown on Vero E6 cells and viral titer was determined by plaque assay (Dinnon et al., 2020). Groups of 5 each of 10 to 12-month old female BALB/c mice (Envigo, #047) were treated prophylactically (12 hours before infection) by intraperitoneal injection with 36, 8, or 2 mg/kg of V_H-Fc ab8, respectively. Mice were challenged intranasally with 10^5 PFU of mouse-adapted SARS-CoV-2. Two days post infection, mice were sacrificed and lung viral titer was determined by the plaque assay. To exclude the residual lung antibody impact on viral titration, mice were euthanized and perfused with 10 ml of PBS via cardiac puncture before lung harvest for viral titration. For virus titration, the caudal lobe of the right lung was homogenized in PBS. The resulting homogenate was serial-diluted and inoculated onto confluent monolayers of Vero E6 cells, followed by agarose overlay. Plaques were visualized via staining with Neutral Red on day 2 post

infection. To measure the viral RNA in the lung, tissue homogenate lysed in Trizol LS (Thermofischer) was then processed with Thermofischer Trizol RNA isolation protocol followed by RT-qPCR using the QuantiFast Probe RT-PCR kit (Qiagen) to amplify a portion of upE gene. The 50% tissue culture infectious doses ($TCID_{50}$) equivalence were estimated by running serial dilutions of known $TCID_{50}$ standards.

Evaluation of the V_H-Fc ab8 Prophylactic and Therapeutic Efficacy in a Hamster Model of SARS-CoV-2 Infection. SARS-CoV2/Canada/ON/VIDO-01/2020 was propagated on Vero'76 cells using DMEM with 2% FBS and 1μg/ml L-(tosylamido-2-phenyl) ethyl chloromethyl ketone (TCPK) trypsin. Infectious work with SARS-CoV-2 was approved by the Biosafety Protocol Approval Committee (BPAC) at the University of Saskatchewan and performed in the high containment laboratories at VIDO-InterVac. Male hamsters (9-week-old) were obtained from Charles River (Montreal, QC). For evaluations of prophylactic efficacy, all hamsters (n=7) were injected intraperitoneally with 10 mg/kg of V_H-Fc ab8 24 hours prior to intranasal challenge of 50 μl/nare containing a total of 1×10^5 $TCID_{50}$ of SARS-CoV-2. For the therapeutic group, hamsters were infected as above and treated intraperitoneally with 10 mg/kg (n=3) or 3 mg/kg (n=4) of V_H-Fc ab8 6 hours post-infection. Untreated hamsters were kept as a control. Nasal washes and oral swabs were collected at day 1, 3 and 5 post infection (dpi). Hamsters were bled at 1 and 5 dpi. All hamsters were euthanized on 5 dpi. At euthanasia, lung lobes were collected for virus titration and RNA isolation. For viral titer determination, nasal washes were diluted in a 10-fold dilution series and absorbed on Vero'76 cells in triplicates for 1 hour at 37°C. Inoculum was removed and replaced with fresh DMEM containing 2% FBS, penn/strep and 1μg/ml TPCK. Cytopathic effect was scored on day 3 and day 5 post infection. The limit of detection is 13.6 $TCID_{50}$. For testing viral RNA, viral RNA isolated from nasal and oral swabs using the QiaAmp Viral RNA mini kit (Qiagen) and the QuantiFast Probe RT-PCR kit (Qiagen) to amplify a portion of upE gene. For RNA levels in tissues, 30 mg of tissue homogenate in buffer RLT were processed with the RNeasy kit (Qiagen) followed by RT-qPCR as above. $TCID_{50}$ equivalence were estimated by running serial dilutions of known $TCID_{50}$ standards. For testing Ab8 concentrations post injection at hamster sera and lung tissue, SARS-CoV-2 spike-1 ELISA was used. S1 protein was coated at 1 μg/ml overnight at 4°C in PBS onto MaxiSorp plates (Nunc). The following day plates were blocked with 5% skim milk and 0.05%Tween20. Serum collected on day 1 and day 5 post-challenge was diluted 1:100 and absorbed for 1 hour at 37 °C. Plates were washed and goat anti human IgG-HRP was added. Plates were washed and subsequently developed with OPD (o-phenylenediamine dihydrochloride) substrate. Optical density was measured at 450 nm after 30 mins of incubation. For lung tissues, after blocking homogenates were diluted 1:10 and absorbed overnight at 4°C followed by detection with anti-human IgG-HRP and substrate as stated above. The control hamster lung homogenate was used for background correction. For histopathology on day 5 p.i., 10% formalin fixed and paraffin embedded tissues were processed with either hematoxylin and eosin stain (H&E) or immunohistochemistry (IHC) for detection of SARS-CoV2 antigen; in IHC after blocking tissue slides were treated with anti-nucleocapsid rabbit polyclonal antibodies followed with anti-rabbit HRP antibody.

Dynamic Light Scattering (DLS). For evaluation of aggregation propensity, V_H ab8 and V_H-Fc ab8 were buffer-changed to DPBS and filtered through a 0.22 μm filter. The concentration was adjusted to 4 mg/mL; 500 μL samples

were incubated at 37 °C. On day 0, day 1 and day 6, samples were taken out for DLS measurement on Zetasizer Nano ZS ZEN3600 (Malvern Instruments Limited, Westborough, MA) to determine the size distributions of protein particles.

Size Exclusion Chromatography (SEC). The Superdex 200 Increase 10/300 GL chromatography (GE Healthcare, Cat. No. 28990944) was used. The column was calibrated with protein molecular mass standards of Ferritin (Mr 440 000 kDa), Aldolase (Mr 158 000 kDa), Conalbumin (Mr 75 000 kDa), Ovalbumin (Mr 44 000 kDa), Carbonic anhydrase (Mr 29 000 kDa), Ribonuclease A (Mr 13 700 kDa). 150 µl filtered proteins (1.5 mg/ml) in PBS were used for analysis. Protein was eluted by DPBS buffer at a flow rate of 0.5 ml/min.

Membrane Proteome Array Assay. Integral Molecular, Inc. (Philadelphia, PA) performed specificity testing of V_H-Fc ab8 using the Membrane Proteome Array (MPA) platform. The MPA comprises 5,300 different human membrane protein clones, each overexpressed in live cells from expression plasmids that are individually transfected in separate wells of a 384-well plate (Tucker et al., 2018). The entire library of plasmids is arrayed in duplicate in a matrix format and transfected into HEK-293T cells, followed by incubation for 36 h to allow protein expression. Before specificity testing, optimal antibody concentrations for screening were determined by using cells expressing positive (membrane-tethered Protein A) and negative (mock-transfected) binding controls, followed by flow cytometric detection with an Alexa Fluor-conjugated secondary antibody (Jackson ImmunoResearch Laboratories). Based on the assay setup results, V_H-Fc ab8 (20 µg/ml) was added to the MPA. Binding across the protein library was measured on an iQue3 (Ann Arbor, MI) using the same fluorescently labeled secondary antibody. To ensure data validity, each array plate contained positive (Fc-binding; SARS-CoV-2 S protein) and negative (empty vector) controls. Identified targets were confirmed in a second flow cytometric experiment by using serial dilutions of the test antibody. The identity of each target was also confirmed by sequencing.

QUANTIFICATION AND STATISTICAL ANALYSIS

For the mouse model, the statistical significance of difference between V_H-Fc ab8 treated and control mice lung virus titers was determined by the two-tailed, unpaired, student *t* test calculated using GraphPad Prism 7.0. A p value < 0.05 was considered significant. ** $p < 0.01$. For the mice lung viral titer after perfusion, viral RNA and hamster lung viral RNA, statistical significance was determined by the Mann-Whitney *U* test. A p value < 0.05 was considered significant. ns: $p > 0.05$, *$p < 0.05$, **$p < 0.01$, ***$p < 0.001$. For comparing V_H-Fc ab8 and IgG1 ab1 concentration, significance analysis was determined by the two-way ANOVA followed by Tukey test in GraphPad Prism 7.0. A p value < 0.05 was considered significant. ns: $p > 0.05$, *$p < 0.05$, **$p < 0.01$, ***$p < 0.001$, ****$p < 0.0001$.

- A high-affinity human antibody domain, V_H ab8, specific for SARS-CoV-2 was selected
- V_H ab8 bound to all three S protomers competing with ACE2
- Bivalent V_H, V_H-Fc ab8, potently neutralized SARS-CoV-2 in vitro and in animals
- Small size and bivalency contribute to the high ab8 SARS-CoV-2 neutralizing potency

In brief summary:

A high-affinity human antibody domain, V_H ab8, specific for SARS-CoV-2 bound to all three S protomers competing with ACE2. The relatively small size and bivalency of V_H-Fc ab8 contributed to its high potency in two animal models of infection.

Subject: ACVA/SCBA-Virology 2020 meeting

Dear colleagues,

As you know, our ACVA/SCAB-Virology 2020 annual meeting originally scheduled in July was cancelled due to the pandemic. Now the Advisory Board has decided to have a virtual meeting on **December 30-31, 2020**. The date is chosen to specially mark the first public revelation of COVID-19 outbreak in Wuhan, which is December 30, 2019. The current board members will serve as organizing and also scientific program committees to facilitate the process.

The meeting will be held in the morning of December 30 and 31 (9-12 pm) and in the afternoon of December 30 (1:30-4:30 pm). Six scientific sessions focusing on the molecular virology, viral pathogenesis, and viral therapeutics and vaccines, etc. will be dedicated to this day-and-half event. Three focused panel discussions will also be arranged.

We are pleased that Drs. Susan Weiss and X.J. Meng have agreed to deliver keynote address during the meeting.

Xiang-Jin (X.J.) Meng, MD, PhD
Virginia Tech
"Expanding host range and extrahepatic manifestation of hepatitis E virus infection"

Susan R. Weiss, PhD
University of Pennsylvania
"Coronaviruses: Old and New"

Please submit your abstract to Dr. Tongqing Zhou (tzhou@mail.nih.gov) by Nov 30, 2020 for full consideration of selected talks. We especially encourage young investigators to submit abstracts and participate in this meeting. As we wish to cover as many topics as possible, the talk will be limited to 12 min of presentation plus 3 min of questions.

Please let me know if you have questions or suggestions.

P.S. This meeting will be open to all SCBA members (not restricted to the Virology Division). Will update.

Thank you.

Shan-Lu Liu, MD, PhD
ACVA/SCBA-Virology President
The Ohio State University

Subject: Invitation letter of the 9th International Symposium on Emerging Viral Diseases
Attachments: Invitation letter of 9th ISEVD_Prof Shi.pdf

Dear Prof. Shi,

The 9th International Symposium on Emerging Viral Diseases, organized by Wuhan Institute of Virology, Chinese Academy of Sciences, will be held in November 27th and 28th 2020 in Wuhan, China. This biennial symposium covers a variety of topics on emerging viruses, including virus discovery, pathogenesis, immunity, antivirals and vaccines, etc. It has become an event for Chinese and international virologists to discuss cutting-edge science on emerging viruses, as well as to foster international collaborations. This year, the meeting will focus on but not limited to SARS-CoV-2 and COVID-19. It will build an opportunity for global researchers to present their important research findings on SARS-CoV-2, and to exchange the latest understanding of this pandemic coronavirus and other emerging viruses.

You are one of the leading scientists on emerging viruses and have made distinguished research advance in SARS-CoV-2. It is our great pleasure to invite you to give a keynote speech about your outstanding research work at this symposium. For speakers outside China, the presentation will be given on-line via Zoom. Please find enclosed the formal invitation letter from the chairmen of the meeting, Prof.Zhengli Shi and Prof.Xi Zhou from Wuhan Institute of Virology.

If you accept this invitation, please reply to us by 8th November, and please let us know the available date and time of your talk.

We look forward to hearing from you.

Thank you!

Best regards

Ben Hu PhD
Wuhan Institute of Virology, CAS
Secretary of the 9th ISEVD

WUHAN INSTITUTE OF VIROLOGY
THE CHINESE ACADEMY OF SCIENCES

November 2, 2020

Prof. Pei-Yong Shi
Department of Biochemistry and Molecular Biology, University of Texas Medical Branch, Galveston, TX, USA

Dear Prof. Shi,

The 9th International Symposium on Emerging Viral Diseases, organized by Wuhan Institute of Virology, Chinese Academy of Sciences, will be held in November 27th and 28th 2020 in Wuhan, China. This biennial symposium covers a variety of topics on emerging viruses, including virus discovery, pathogenesis, immunity, antivirals and vaccines, etc. It has become an event for Chinese and international virologists to discuss cutting-edge science on emerging viruses, as well as to foster international collaborations. This year, the meeting will focus on but not limited to SARS-CoV-2 and COVID-19. It will build an opportunity for global researchers to present their important research findings on SARS-CoV-2, and to exchange the latest understanding of this pandemic coronavirus and other emerging viruses.

It is our great pleasure to invite you to give a keynote speech about your outstanding research work at this symposium. The presentation will be given on-line via Zoom.

If you accept this invitation, please reply to the meeting secretary Dr. Ben Hu (huben@wh.iov.cn) by 8th November, and please let us know the available date and time of your talk. We look forward to hearing from you.

Sincerely Yours,

Zheng-Li SHI, PhD

Dear Prof Shi,

Thanks a lot for your quick response.

We are very glad to know that you accept to participate in the meeting. We will contact you later when we make the meeting agenda.

Sincerely

Ben

Subject: Invitation letter of the 9th International Symposium on Emerging Viral Diseases

Dear Prof. Shi,

The 9th International Symposium on Emerging Viral Diseases, organized by Wuhan Institute of Virology, Chinese Academy of Sciences, will be held in November 27th and 28th 2020 in Wuhan, China. This biennial symposium covers a variety of topics on emerging viruses, including virus discovery, pathogenesis, immunity, antivirals and vaccines, etc. It has become an event for Chinese and international virologists to discuss cutting-edge science on emerging viruses, as well as to foster international collaborations. This year, the meeting will focus on but not limited to SARS-CoV-2 and COVID-19. It will build an opportunity for global researchers to present their important research findings on SARS-CoV-2, and to exchange the latest understanding of this pandemic coronavirus and other emerging viruses.

You are one of the leading scientists on emerging viruses and have made distinguished research advance in SARS-CoV-2. It is our great pleasure to invite you to give a keynote speech about your outstanding research work at this symposium. For speakers outside China, the presentation will be given on-line via Zoom. Please find enclosed the formal invitation letter from the chairmen of the meeting, Prof.Zhengli Shi and Prof.Xi Zhou from Wuhan Institute of Virology.

If you accept this invitation, please reply to us by 8th November, and please let us know the available date and time of your talk.

We look forward to hearing from you.

Thank you!

Best regards

Ben Hu PhD
Wuhan Institute of Virology, CAS
Secretary of the 9th ISEVD

Subject: 9th ISEVD on-line speaker instruction
Attachments: 9th ISEVD meeting brochure.pdf

Dear speaker:

The 9th International Symposium on Emerging Viral Diseases will start in the morning of 27th November (Beijing time).

Please find enclosed the brochure of the two-day symposium, which include the final program, the information needed for zoom meeting log-in, and the biosketch collection of all speakers.

Please note that the time indicated in the program are generally in Beijing time (GMT +8). But for our speakers in other time zones, the scheduled time of your presentation in your local time zone are shown in bold.

Please use following information to join in our meeting by Zoom:

Zoom Meeting link:
https://us02web.zoom.us/j/3120552792?pwd= **552.136**

Meeting Topic: 9th ISEVD Day 1 / Day 2

Meeting ID: 3120552792

Password: **552.136**

All presentations are given in English. On-line speakers are welcome to join in the meeting throughout the symposium.

Please make sure that you have entered the zoom meeting at least 10 min before your presentation starts.

If you are afraid that some networking problem may happen when you give the talk and affect the quality of the live presentation, you can also make a video recording of your speech in advance, and send it to us at least 24 hours before the scheduled time of your talk.

Thank you for your support to the symposium!

We are looking forward to hearing your talks.

Best regards

Day 2, Afternoon Session /第二天下午	
14:00-17:50	**Session 4: Pathogen biology** **Session Chair: Prof. Zhengli SHI**
14:00-14:30 Keynote Speech S-21	**Title:** Bats and viruses – in the context of COVID-19 **Speaker: Lin-Fa Wang (on-line presentation)** Programme in Emerging Infectious Diseases at Duke-NUS Medical School, Singapore
14:30-14:55 S-22	**Title:** When could we predict the emergence of the infectious diseases like weather forecast? **Speaker: Yongzhen Zhang** Shanghai Public Health Clinical Center, Fudan University, Shanghai
14:55-15:20 S-23	**Title:** Co-infection of SARS-CoV-2 and influenza virus **Speaker: Ke Xu** College of Life Sciences, Wuhan University
15:20-15:45 S-24	**Title:** Persistence of SARS-CoV-2 *in vivo* and *in vitro* **Speaker: Peng Zhou** Wuhan Institute of Virology, Chinese Academy of Sciences
15:45-16:00	Tea Break/茶歇
16:00-16:30 Keynote Speech S-25	**Title:** From SARS, 2003, to COVID-19, 2020 – Insight into SARS-CoV-2 replication and transcription machinery **Speaker: Zihe Rao** **Academician of CAS** School of Life Sciences and School of Medicine, Tsinghua University, Beijing
16:30-16:55 S-26	**Title:** SARS-CoV-2 and its transmission **Speaker: Leo Poon (on-line presentation)** School of Public Health, The University of Hong Kong
16:55-17:20 **(GMT +1** **9:55-10:20)** S-27	**Title:** Development of an RNA replicon vaccine for highly pathogenic human Coronaviruses **Speaker: Luis Enjuanes (on-line presentation)** Department of Molecular and Cell Biology. National Center of Biotechnology (CNB-CSIC), Madrid, Spain

17:20-17:45 **(GMT +1 10:20-10:45)** S-28	**Title:** SARS-CoV-2 entry into cells and its inhibition **Speaker: Stefan Pöhlmann (on-line presentation)** Infection Biology Unit, German Primate Center - Leibniz Institute for Primate Research, Göttingen, Germany
17:45-17:50	**Closing Remarks/闭幕致词** **By Xi Zhou** Wuhan Institute of Virology, Chinese Academy of Sciences Chair of the 9th International Symposium on Emerging Viral Diseases
18:00-19:00	Dinner/晚餐

For our on-line speakers

- Please use following information to join in our meeting by Zoom:

Zoom Meeting link:

https://us02web.zoom.us/j/3120552792?pwd=552.136

552.136

Meeting Topic: 9th ISEVD Day 1 / Day 2

Meeting ID: 3120552792

Password: 552.136

- All presentations are given in English. On-line speakers are welcome to join in the meeting throughout the 2-day symposium.
- Please make sure that you have entered the zoom meeting at least 10 min before your presentation starts.

Biosketches of Speakers (In order of presentations)

报告专家简介（按照报告顺序）

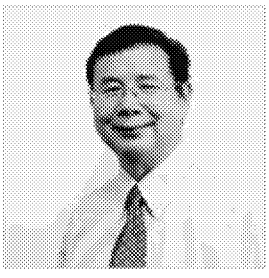
Dr. Hualiang Jiang, CAS Academician

Dr. Hualiang Jiang is a pharmaceutical scientist. He was conferred a bachelor's degree in Chemistry from the Nanjing University in 1987. He received his master's degree in Physical Chemistry (Quantum Chemistry) from East China Normal University in 1992. In 1995, he obtained his Ph.D. degree in Medicinal Chemistry from Shanghai Institute of Materia Medica (SIMM), Chinese Academy of Sciences (CAS). In 2004, he was appointed as Deputy Director of SIMM followed by his directorship from 2012 up to now. He was a chief scientist of two 973 National Basic Research Projects in drug discovery. He was a member of scientific committees of several major research programs in China, such as 863 National High Technology Program, National Basic Research Program, and Major Research Project of National Natural Science Foundation of China. He also served as Associate Editor of *Journal of Medicinal Chemistry* and editorial board members of several journals such as *The Journal of Biological Chemistry*. Over the years, Dr. Jiang has received numerous awards including the Natural Science Award of China, the 5th Prize of Yong Scientist Award of China, the Science and Technology Progress Prize from Ho Leung Ho Lee Foundation, etc. He was elected as Member of the Chinese Academy of Sciences in 2017.

Dr. Jiang's research is mainly focused on developing new computational methods for target identification and drug design and their applications in drug discovery. He has devised and developed a series of new computational methods for target identification and function predication. These methods have been widely used by big pharmaceutical companies and academic community at large. Employing the strategy of computational prediction combined with experimental validation, Dr. Jiang and his team have discovered and studied the druggable properties of a series of proteins. Targeting several diseases such as pulmonary hypertension, schizophrenia, type 2 diabetes, erectile disorder and Alzheimer's disease, Dr. Jiang and his co-workers obtained a number of drug candidates by using computational drug design, organic synthesis and drug development technologies. One compound has entered into phase II clinical trial, three are undergoing phase I clinical trial. Dr. Jiang has published more than 200 corresponding/co-corresponding author papers, 260 non-corresponding author papers, and 13 review articles in international journals and these papers have been cited more than 20,000 times. He was invited to write chapters for 4 books.

Shibo Jiang, M.D.

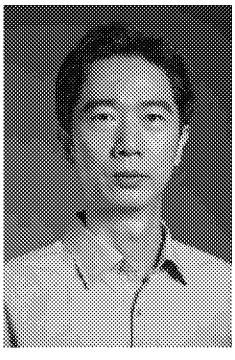
Professor, College of Basic Medical Science,
Fudan University, Shanghai, China
Email: shibojiang@fudan.edu.cn



Shibo Jiang was educated in China for getting M.S. and M.D. degrees. He received his postdoctoral training in the Rockefeller University in New York from 1987 to 1990, worked in the LFK Research Institute of the New York Blood Center as Member and Laboratory Head from 1990 to 2010, and joined Fudan University as a professor in late 2010. His major research interest is to research and develop antiviral therapeutics and vaccines against HIV, HPV, coronaviruses, and influenza viruses. So far, he has published 490 peer-reviewed papers, which have been cited 24,322 times, with an h-index of 82 (Google Scholar). He has obtained 25 US patents and 16 Chinese and PCT patents, 11 of which have been licensed out. Since the beginning of 2020, he has published 50 peer-reviewed papers in *The Lancet*, *Science* (x2), *Nature, Nat Rev Microbiol, Sci Transl Med.,* etc., making contribution in studying coronavirus fusion and entry mechanism and developing broad-spectrum anti-coronavirus therapeutic and vaccine candidates.

Prof. Peng GONG

Wuhan Institute of Virology, Center for Biosafety Mega-Science, Chinese Academy of Sciences, faculty member



B.S. 1998/M.S. 2001, Tsinghua University
PhD 2006, University of Massachusetts Amherst
Postdoctoral research associate, 2006-2007, University of Massachusetts Amherst
Postdoctoral research fellow/research scientist, 2007-2011, Colorado State University

Principal research interests:

Catalysis and regulation of viral RNA-dependent RNA polymerases (RdRPs); Intervention mechanisms of nucleotide analog targeting viral RdRPs.

Representative publications:

1. Structural basis for RNA replication by the SARS-CoV-2 polymerase. Wang et al., ***Cell*** 2020, 182(2):417-28.

2. Stringent control of the RNA-dependent RNA polymerase translocation revealed by multiple intermediate structures. Wang et al., ***Nat Commun*** 2020, 11:2605.

3. A conformation-based intra-molecular initiation factor identified in the flavivirus RNA-dependent RNA polymerase. Wu et al., ***PLoS Pathog*** 2020, 16(5):e1008484.

4. A unique intra-molecular fidelity-modulating mechanism identified in a viral RNA-dependent RNA polymerase. Liu et al., ***Nucleic Acids Res*** 2018, 46(20):10840-54.

5. Structural basis of viral RNA-dependent RNA polymerase catalysis and translocation. Shu and Gong, ***Proc Natl Acad Sci USA*** 2016, 113(28):E4005-4014.

6. Crystal structure of the full-length Japanese encephalitis virus NS5 reveals a conserved methyltransferase-polymerase interface. Lu and Gong, ***PLoS Pathog*** 2013, 9(8):e1003549.

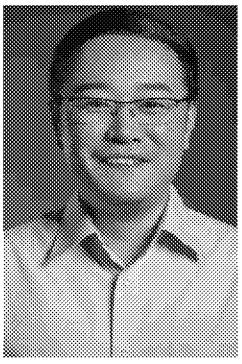
Hongping Wei, Dr., Professor

Principle Investigator of Diagnostic Microbiology
Director of African Swine Fever Regional Laboratory of China (Wuhan)
Vice-Director of Center for Emerging Infectious Diseases,
Wuhan Institute of Virology, Chinese Academy of Sciences
Email: hpwei@wh.iov.cn

Prof Wei's main research interests are developing rapid methods for infectious pathogens and bacteriophage therapy. His group has developed RT-PCR kits for viruses, such as SARS-CoV-2 and African Swine fever virus and rapid drug susceptibility tests for bacteria such as *Mycobacterium Tuberculosis*. In order to find new treatments for drug-resistant bacteria, his group has found a few highly active lysins from bacteriophages. Prof Wei has published about 40 research papers and commercialized a few products such as RT-PCR kit for detection of SARS-CoV-2 by cooperation with companies.

Rui Gong

Professor, Head of Antibody Engineering Group
Wuhan Institute of Virology, Chinese Academy of Sciences
No.44 Xiao Hong Shan, Wuhan, Hubei 430071, P. R. China
Tel: +86-27-87199331, +86-27-87806108
Fax: +86-27-87806108
E-mail: gongr@wh.iov.cn



Education:

9/2002 – 6/2007 Ph.D. (Microbiology), College of Life Sciences, Wuhan University, China
9/1998 – 6/2002 B.S. (Biomedicine), College of Life Sciences, Wuhan University, China

Brief Chronology of Employment:

9/2012 – Date Professor, Head of Antibody Engineering Group
9/2007 – 8/2012 Postdoctoral Fellow, National Cancer Institute (NCI), National Institute of Health (NIH), Frederick, MD, USA

Honors & Other Special Scientific Recognition:

1. Rui Gong, Federal Technology Transfer Award, NCI, NIH, USA, 2011.
2. Rui Gong, Federal Technology Transfer Award, NCI, NIH, USA, 2012.

Biography

Rui Gong, Ph.D., Head of Antibody Engineering Group, Professor, Ph.D. Supervisor. Dr. Gong graduated from Wuhan University in 2002 and received his Ph.D. also in Wuhan University in 2007. He went to National Cancer Institute, National Institute of Health, USA in 2007 for his training as a postdoctoral fellow, and joined Wuhan Institute of Virology, Chinese Academy of Sciences and established Antibody Engineering Group for antibody engineering-related research in 2012. Dr. Gong won Federal Technology Transfer Award (NIH, USA) in 2011 and 2012. He has more than thirty publications and several patents. He is hosting or hosted the grants of the Strategic Priority, Research Program of the Chinese Academy of Sciences, Young Scientist Subject of the National High Technology Research and Development Program of China (863 Project), and National Natural Science Foundation of China, etc.

Research Interests:

The long-term goal is to develop therapeutic antibodies and vaccines against virus. Our work includes selection of full-length antibodies and antibody fragments against important and emerging viruses by phage display, yeast display, and other high throughput screening technologies; identification of the epitopes for vaccine design; development of novel C-based single domain antibodies (C-sdAbs) based on scaffolds derived from antibody constant CH2 domains in antibody Fc fragments; and improvement of biological activities of Fc fragments. We try to elucidate the basic questions in virology, and solve several difficulties for improvement of efficacy of therapeutic antibodies and vaccines.

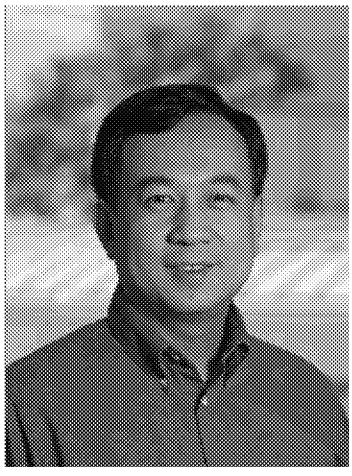
Prof. Dr. Ke Peng, principle investigator of the State Key Laboratory of Virology, Wuhan Institute of Virology, Chinese Academy of Sciences. Ke Peng received his PhD training through the Chinese Academy of Sciences and the Dutch Royal Academy of Sciences joint-PhD program in the Wuhan Institute of Virology and Wageningen University in the Netherlands, after which he did post-doctoral research in the field of HIV-1 replication and pathogenesis in the Medical School of Heidelberg University in Germany. Since 2016.10 he set up the research group of Virus-Host Interactions to study the pathogenesis mechanisms of pathogenic RNA viruses including bunyavirus, SARS-CoV-2 and HIV-1. The recent research progresses in his group focused on: 1) pathogenesis and inflammatory mechanisms of bunyavirus infection and antiviral drug development (*Cell Research* **2019**, *Cell Reports* **2020**, *Cell Discovery* **2020**, *ACS Infectious Diseases* **2020**); 2) mechanisms of SARS-CoV-2 triggered inflammatory responses (*Signal Transduction Targeted Therapy* **2020**); and 3) mechanisms of HIV-1 nuclear entry and integration (*eLife* **2019**). The mechanisms of RNA virus triggered inflammatory responses and anti-viral drug development would be the two long-term pursued research topics in his group.

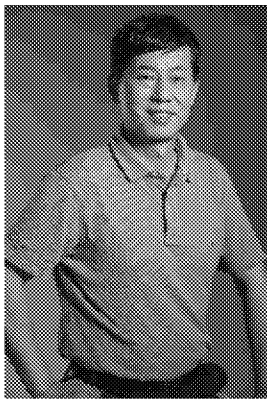
Chen Dong, Ph.D, CAS Academician



Dr. Dong is Professor and Director of the Institute for Immunology at Tsinghua University, Beijing, China. He is a member of the Chinese Academy of Sciences. Dr. Dong was Dean of the School of Medicine at Tsinghua University, he also served as a Professor of Immunology and the Director of the Center for inflammation and Cancer at the University of Texas MD Anderson Cancer Center before his move to Tsinghua University. Dr. Dong's research is to understand the molecular mechanisms whereby immune and inflammatory responses are normally regulated, and to apply this knowledge to the understanding and treatment of autoimmunity and allergy disorders as well as cancer. The work from Dr. Dong's group has led to the discoveries of Th17 and T follicular helper (Tfh) cell subsets in the immune system and elucidation of their biological and pathological functions. Dr. Dong has over 200 publications and was rated highly cited researcher for six years from 2014 to 2019. The honors he has received include the 2009 American Association of Immunologists-BD Bioscience Investigator Award and 2019 International Cytokine and Interferon Society Biolegend-William E. Paul Award. He is a fellow of the American Association for the advancement of Science and a member of the Chinese Academy of Sciences. He is currently an Editor for Immunity, Editor-in-chief for Frontiers in Immunology- T Cell Biology and Associate Editor for China Sciences- Life Sciences.

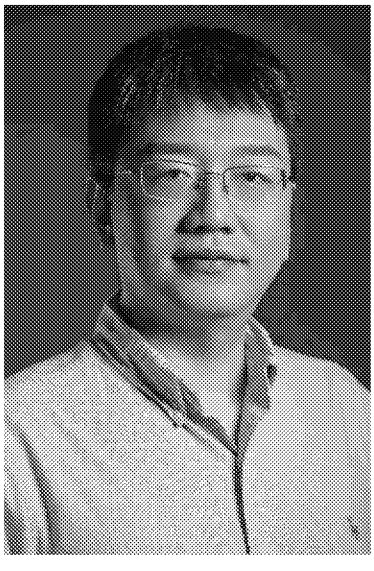
Zhiming Yuan

Ph.D., Principle Investigator
Wuhan Institute of Virology, CAS



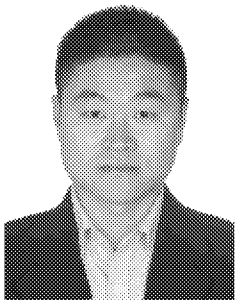
Yuan Zhiming got his PhD on microbiology and biotechnology at Sun Yat-sen University, and then trained and worked in France, Denmark, and United States for several years. He has been working as a Professor in Wuhan Institute of Virology, the President of Wuhan Branch, Chinese Academy of Sciences since year 2000. As a principal investigator, his research group works on the diagnosis and drug discovery of aborviruses, genomics, insecticidal proteins and their mode of action, genetically modification of entomopathogenic bacteria (Bacillus spp), as well as the production, standardization and application of bio-pesticide and other microbial agents. Since 2003, he was appointed the Chairman of Institutional Biosafety Committee, member of National Laboratory Biosafety Committee, advisor of different national technical committees on biosafety management, general manager of National High-Level Biosafety Laboratory in Wuhan. He also works as a group leader on Sino-French biosafety legislation cooperation. In addition, he was elected as President of Hubei Society for Microbiology in 2008. Along providing expertise and consultative services to both private companies and government institutions on matters of biotechnology and biosafety, he has given many lectures to national and international audiences. He published more than 150 scientific papers on Bacillus spp and aborviruses during his career.

Dr. Xi Zhou



Dr. Xi Zhou got his Ph.D. degree and postdoctoral training in the University of Texas GSBS at Houston, and the University of Texas, M.D. Anderson Cancer Center. He is currently a professor and the deputy director of State Key Laboratory of Virology, Wuhan Institute of Virology, Chinese Academy of Sciences (CAS). Before this current position, Dr. Zhou was the Luojia Distinguished Professor and Deputy Chair, Dept. of Virology, Wuhan University, China. Dr. Zhou's research interest is focused on RNA viruses, antiviral immunity and antiviral therapy. His group uses important human and vector-borne pathogenic RNA viruses (such as coronavirus, enterovirus, flavivirus, etc.) to study many aspects of RNA virology and immunology. Since the outbreak of COVID-19, his group is also working on the virus-host interactions and pathogenesis of SARS-CoV-2 and COVID-19. After establishing his own group in 2011, he has authored more than 50 papers in peer reviewed journals, including Immunity, Cell Host Microbe, Cell Research, National Science Review, Science Advances, eLife, PLOS Pathogens, Nucleic Acids Res., Cell Mol Immunol., J. Virol. etc., as corresponding author. Dr. Zhou is the recipient of the National Excellent Young Scientist Fund of China, the Young Scientist Fund of National High-Tech R&D (863) Project of China, and the Newton Advanced Fellowship of the Royal Society/Academy of Medical Sciences (UK), and the Christopher Mérieux Award for Young Virologist of Chinese Society for Virology and Mérieux Institut. He is currently serving as the Vice President of Hubei Society for Microbiology, and the Vice President of Wuhan Society for Microbiology, and editorial member of Viruses and Virological Sinica.

Weifeng Shi



PhD in Bioinformatics and Professor in Basic Medicine

Research interests: i. Origin, transmission and evolution of emerging virus diseases; ii. Molecular epidemiology and pathogenic mechanisms of human enteroviruses; iii. Virome and novel virus discovery

Honors:

1. 2020 "Chang Jiang Scholars program" – Special Position for SARS-CoV-2
2. 2019 "Chang Jiang Scholars program" – Young Scholars
3. 2019 Natural Science Prize of Shandong Province (Second class)
4. 2018 Young Scientist Prize of Shandong Province
5. 2015 Taishan Scholars program of Shandong Province

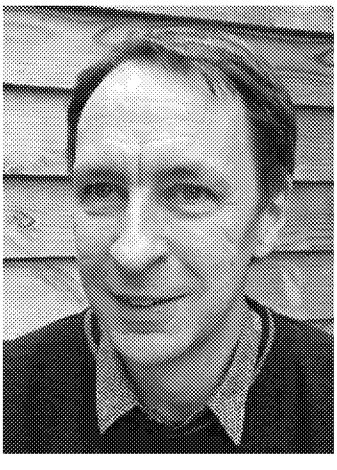
Academic achievements:

As of November 2020, I have published >120 publications in peer-reviewed journals, including Lancet, Nature, Nature Reviews Microbiology, Nature Communications, Cell Host & Microbe, and Current Biology, with a total of > 15000 citations.

Selected publications on SARS-CoV-2:

1. Roujian Lu#, Xiang Zhao#, Juan Li#, Peihua Niu#, Bo Yang#, Honglong Wu#, Wenling Wang, Hao Song, Baoying Huang, Na Zhu, Yuhai Bi, Xuejun Ma, Faxian Zhan, Liang Wang, Tao Hu, Hong Zhou, Zhenhong Hu, Weimin Zhou, Li Zhao, Jing Chen, Yao Meng, Ji Wang, Yang Lin, Jianying Yuan, Zhihao Xie, Jinmin Ma, William J. Liu, Dayan Wang, Wenbo Xu, Edward C. Holmes, George F. Gao, Guizhen Wu*, Weijun Chen*, **Weifeng Shi***, Wenjie Tan*. Genomic characterisation and epidemiology of 2019 novel coronavirus: implications for virus origins and receptor binding. ***Lancet***, 2020, 395(10224): 565-574.
2. Hong Zhou#, Xing Chen#, Tao Hu#, Juan Li#, Hao Song, Yanran Liu, Peihan Wang, Di Liu, Jing Yang, Edward C. Holmes, Alice C. Hughes*, Yuhai Bi*, **Weifeng Shi***. A novel bat coronavirus closely related to SARS-CoV-2 contains natural insertions at the S1/S2 cleavage site of the spike protein. ***Curr Biol***, 2020, 30: 2196-2203.
3. Jing Yang#, Juan Li#, Shengjie Lai#*, Corrine W. Ruktanonchai, Weijia Xing, Alessandra Carioli, Peihan Wang, Nick W. Ruktanonchai, Ruiyun Li, Jessica R. Floyd, Liang Wang, Yuhai Bi*, **Weifeng Shi***, Andrew J. Tatem. Uncovering intercontinental COVID-19 transmission dynamics using global travel network and phylogenetic analyses. ***Journal of Travel Medicine***, in press.
4. Na Zhu#, Dingyu Zhang#, Wenling Wang#, Xinwang Li#, Bo Yang#, Jingdong Song, Xiang Zhao, Baoying Huang, **Weifeng Shi**, Roujian Lu, PeihuaNiu, Faxian Zhan, Xuejun Ma, Dayan Wang, Wenbo Xu, Guizhen Wu*, George F. Gao*, Wenjie Tan*. A Novel Coronavirus from Patients with Pneumonia in China, 2019. ***N Engl J Med***, 2020, 382(8): 727-733.

Prof. Bart Haagmans



Bart Haagmans is a workgroup leader at the department of Viroscience of the Erasmus Medical Center in Rotterdam. He did his training at the Utrecht University and holds a PhD from the same university. His main interest is the pathogenesis of emerging viral infections including SARS and MERS coronavirus. Receptor usage and zoonotic transmission are studied with the aim to further understand the biology of coronaviruses and to develop candidate vaccines.

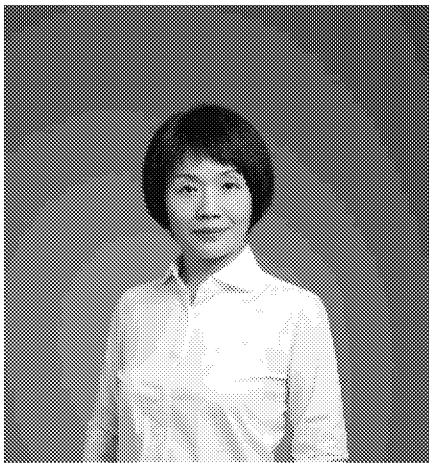
Understanding virus-host interactions in the era of organoid

Department of Microbiology, The University of Hong Kong, Hong Kong, China

Recent advances in stem cell biology allow the *in vitro* growth of 3-dimensional organoids that recapitulate essential attributes of their counterpart-organs *in vivo*. Organoids can be grown from pluripotent stem cells or tissue-resident adult stem cells (ASC). ASC-derived organoids consist exclusively of epithelial cells and can be generated from a variety of human organs. Our study published in 2018 has ushered in a brand-new long-term expandable culture model of human respiratory epithelium to the world, the human airway organoids. These human airway organoids can faithfully simulate the multicellular complexity and functionality of human airway epithelium to a near-physiological level. We demonstrated that these human airway organoids can predict the infectivity of emerging influenza viruses, which has been a long-standing challenge for influenza research and public health worldwide. Leveraging human intestinal organoids, we reported that human intestinal tract is an alternative route to acquire MERS-CoV infection (Science Advances, 2017).

In the early outbreak of COVID-19, we tested the infectivity of SARS-CoV-2 in human intestinal organoids since some COVID-19 patients developed gastrointestinal symptoms. We demonstrate robust replication of SARS-CoV-2 in both large and small intestinal organoids, suggesting enteric infection in COVID-19 patients (Nature Medicine 2020). The human lung organoids and intestinal organoids in our lab have become powerful and versatile technical platforms, which can be applied to various applications including assessing pathogenicity of human pathogens, understanding pathogenesis, and evaluating therapeutic efficacy.

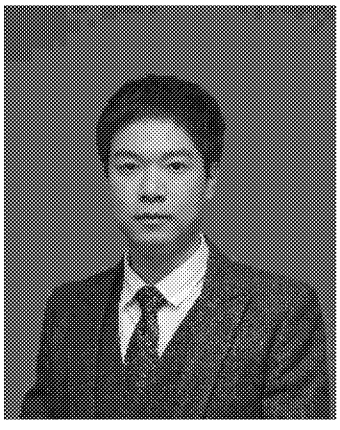
In addition, we established bat intestinal organoids which can simulate the native intestinal epithelium of bats. The intestinal organoids derived from Chinese horseshoe bat are highly susceptible to SARS-CoV-2 and sustain active viral replication, implicating that bat intestinal cells may support the natural infection by SARS-CoV-2 and its progenitor(s). Importantly, these bat intestinal organoids open up a new avenue for isolating and cultivating other bat viruses, which has been a long-standing challenge for studying numerous bat viruses of high zoonotic potential.



Jie Zhou, PhD

Biography

Dr. Jie Zhou graduated from Xi'An Medical University and served as a clinical pathologist in the affiliated hospitals in Peking University. She started her PhD training of Virology in The University of Hong Kong in 2003. After her postdoctoral training in UC San Francisco, she moved back to HKU. Now she is an assistant professor in HKU Microbiology. Her research interests are virus-host interaction and pathogenesis of human viral infections. In the past few years, her team have been working on establishing human organoids for virus research.



陈 宇

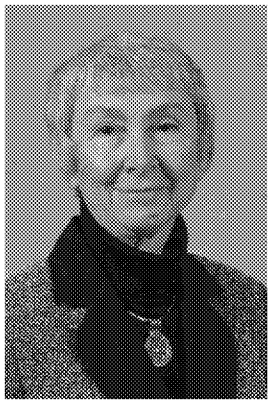
武汉大学病毒学国家重点实验室

chenyu@whu.edu.cn

陈宇，博士，教授，武汉大学病毒学国家重点实验室 PI，生命科学学院病毒系副主任，长江学者奖励计划特岗教授，中央高校拔尖创新人才，湖北省自然科学基金杰出青年基金获得者；2009 年毕业于武汉大学生命科学学院病毒学专业，获博士学位；赫尔辛基大学访问学者。从事冠状病毒复制与致病机制及病毒防治研究，承担、参与国家自然科学基金重大项目、科技部“973”、“十二五”、“十三五”传染病重大专项、科技部病毒与免疫创新团队等项目。解析了 SARS 冠状病毒 RNA 甲基转移酶、主蛋白酶、N 蛋白等的功能、结构及其作用机制，开发了 4 种靶向抗冠状病毒抑制剂；系统研究了 SARS 及新冠病毒亚基因组复制转录机制，解析新冠病毒亚基因组新特性，发现其不连续转录复制新机制；合作完成了新冠病毒病原鉴定；鉴定了气溶胶新冠病毒载量及传播特性；发展了高灵敏度的新冠病毒核酸检测方法；发表了新冠患者 BALF 和 PBMC 转录组数据。在 *Nature, Nature Immunology, PNAS, PLoS Pathog, Emerg Microbe Infect, J Virol* 等期刊发表论文 30 余篇，引用 1700 余次，申请发明专利 10 项，实现成果转化 1 项。

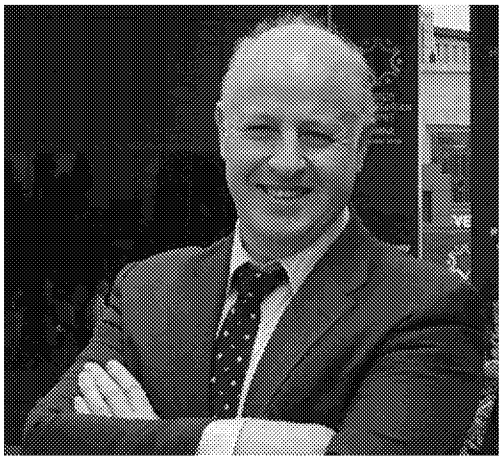
Prof. Manli Wang got her doctoral degree from Wuhan Institute of Virology, CAS in 2009 and has been working there since then. She has been focusing on the mechanism of virus entry and antiviral research by taking several important viruses as models. A serials of important scientific findings have been achieved, including **(1)** Thoroughly disclosed the evelope fusion protein-mediated baculovirus entry mechanism, revealed the roadblocks to mammalian cell entry of baculovirus, thus providing new strategies for improving baculovirus-based gene delivery and therapy. **(2)** Disclosed the multistep entry process and the dynamic virus-host interactions of the severe fever with thrombocytopenia syndrome virus (SFTSV) by using single-particle trafficking and quantitative proteomic technologies, providing potential targets for SFTS prevention and control. **(3)** Recently, she focuses on drug screening and virus pathogenesis of SARS-CoV-2. Her team reported several drugs, including remdesivir (GS-5734), chloroquine (CQ), hydroxychloroquine (HCQ) and arbidol, could efficiently inhibit SARS-CoV-2 infection *in vitro*. In addition, her team systematically analyzed the organotropism and cell tropism of SARS-CoV-2 by using human and animal samples. Dr. Wang has published 40 (co-)first/(co-)corresponding authored papers in SCI journals, including Cell Res (1), Small (1), Small Methods (1), Cell Discovery (3), Journal of Virology (10), et al. Her PhD thesis has won "Top 50 Excellent PhD Thesis Award of Chinese Academy of Sciences" (year 2010).

Linda J. Saif



Dr. Linda Saif is a Distinguished University Professor at The Ohio State University (OSU) in the Food Animal Health Research Program (College of Food, Agriculture and Environmental Sciences) and the Veterinary Preventive Medicine Department (College of Veterinary Medicine). She is Co-Director of the Viruses and Emerging Pathogens Program of the OSU Infectious Diseases Institute. She is a virologist and mucosal immunologist, whose coronavirus research spans 4 decades, focusing on pathogenesis, immunity and vaccines for animal coronaviruses. Her team's discovery of the gut-mammary secretory IgA axis (initial description of a common mucosal immune system) in swine was a breakthrough for development of maternal coronavirus vaccines to passively protect neonatal animals. Her lab also investigates the interrelationships among animal coronaviruses, and their human counterparts to assess their zoonotic potential and mechanisms of interspecies transmission. Besides research on enteric viruses (rotaviruses noroviruses), her lab investigates the impacts of probiotics and the gut microbiota on the neonatal immune system and vaccines. Dr. Saif worked with WHO and CDC during the Severe Acute Respiratory Syndrome (SARS) outbreak and with the Ministry of Agriculture in Saudi Arabia on the Middle East Respiratory Syndrome (MERS) coronavirus in camels. Her laboratory is a WHO International Reference Lab for Animal coronaviruses in the SARS/BEI network and was an International Reference Lab for TGEV porcine coronavirus for the Office International des Epizooties (OIE), Paris, France. She is a member of the U.S. National Academy of Sciences and the National Academy of Inventors. She is an elected Fellow of the American College of Veterinary Microbiologists, the AAAS, and the American Academy of Microbiology. In 2015, she was the first woman to receive the Wolf Prize in Agriculture. She has authored or coauthored over 390 journal publications and 77 book chapters.

Dr. Peter Daszak, Ph.D



Dr. Peter Daszak is President of EcoHealth Alliance, a US-based organization that conducts research and outreach on global health and conservation. Dr. Daszak's research is focused on the origins and impact of emerging diseases, and includes identifying the bat origin of SARS-CoV, the drivers of Nipah virus emergence, publishing the first global emerging disease 'hotspots' map, discovering SADS coronavirus, launching the Global Virome Project, identifying the first case of a disease causing species extinction, and discovering chytridiomycosis as the cause global amphibian declines. Dr. Daszak is a member of the National Academy of Medicine, Chair of the NASEM's Forum on Microbial Threats, a member of the NRC Advisory Committee to the US Global Change Research Program, and a member of the NASEM Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats that advises HHS ASPR and the US White House COVID Taskforce. He serves on the Supervisory Board of the One Health Platform, the One Health Commission Council of Advisors, *The Lancet* One Health Commission, *The Lancet* COVID-19 Commission, the Future Earth Health KAN Steering Committee, the CEEZAD External Advisory Board, and is a member of the Cosmos Club. He has served on the IOM Committee on global surveillance for emerging zoonoses, the NRC committee on the future of veterinary research, the International Standing Advisory Board of the Australian Biosecurity CRC; and has advised the Director for Medical Preparedness Policy in the White House National Security Staff, and is a member of the WHO R&D Blueprint program for pathogen prioritization. Dr. Daszak won the 2000 CSIRO medal for collaborative research on the discovery of amphibian chytridiomycosis, and is Editor-in-Chief of the journal *Ecohealth*. He has authored over 300 scientific papers, is a Web of Science *Highly Cited Researcher* for 2018 & 2019, and his work has been the focus of extensive media coverage.

Dr. Stanley Perlman

The University of Iowa
Professor of Microbiology and Immunology, and of Pediatrics
USA

Dr. Perlman received his Ph.D. in Biophysics from M.I.T., Cambridge, Massachusetts and his M.D. from the University of Miami, Miami, Florida. He was trained in Pediatrics and Pediatric Infectious Diseases at Boston Children's Hospital, Boston, Massachusetts. His current research efforts are focused on coronavirus pathogenesis, including virus-induced demyelination and the Severe Acute Respiratory Syndrome (SARS), the Middle East Respiratory Syndrome (MERS) and COVID-19.

His laboratory has developed several novel animal models useful for studying pathogenesis and evaluating vaccines and anti-viral therapies. His studies are directed at understanding why aged patients and mice developed more severe disease than younger individuals after infection with SARS-CoV or SARS-CoV-2 and also on why there is a male predominance in patients with more severe disease after infection with SARS-CoV, MERS-CoV or SARS-CoV-2. He and his colleagues demonstrated that transduction of mice with an adenovirus expressing the human receptor for MERS-CoV, DPP4, rendered them sensitive to infection, providing the first rodent model useful for studying MERS. Similar approaches have been used to develop a mouse model for COVID-19. He has also developed models for the loss of sense of smell (anosmia) observed in patients with COVID-19.

Pei-Yong Shi, Ph.D.

John Sealy Distinguished Chair in Innovations in Molecular Biology
University of Texas Medical Branch at Galveston, Texas, USA

Pei-Yong Shi is John Sealy Distinguished Chair in Innovations in Molecular Biology at University of Texas Medical Branch and Fellow of American Academy of Microbiology. He works on RNA virus replication, antiviral drug discovery, and vaccine research. His unique expertise in public health laboratory (Wadsworth Center, New York State Department of Health; 8 years), pharmaceutical companies (Novartis and Bristol-Myers Squibb; total 10 years), and academia (University of Texas Medical Branch, Yale, and other universities; total 11 years) allows him to work on both basic and translational research. He has published over 300 peer-reviewed papers in leading journals, including *Nature*, *Science*, *Cell*, and *Nature Medicine*. His work has generated bodies of knowledge that has significantly advanced the fields of RNA viral replication, diagnostics, drug discovery, and vaccine development. His group developed the first reverse genetic systems for the epidemic West Nile virus and Zika virus, and discovered flavivirus N7 and 2'O methyltransferase activities. In response to the recent COVID pandemic, his team published the first peer-reviewed infectious clone and reporter virus for SARS-CoV-2; these reagents have been shared around world to fight the COVID pandemic. Besides academic excellence, he also has a stellar track record of senior leadership role at major pharmaceutical companies (*e.g.*, Executive Director at Novartis Institute for Tropical Diseases) where he set up antiviral strategies and executed drug discovery and development. He contributed to the development of Fostemsavir, an FDA-approved HIV drug. Many of his technologies have been licensed to leading pharmaceutical companies for diagnostic and countermeasure development. A recent example is his reporter neutralization assay that has enabled the rapid development of Pfizer's COVID-19 vaccine, the first vaccine with >90% efficacy in humans.

Dr. Lijun Rong

Professor of Microbiology and Immunology
Director of High-Throughput Screening Facility
University of Illinois, Chicago

Positions and Employment

1998-2004	Assistant Professor, Dept. of Microbiology & Immunology, School of Medicine, University of Illinois, Chicago, Illinois.
2004-2015	Associate Professor, Dept. of Microbiology & Immunology, School of Medicine, University of Illinois, Chicago, Illinois.
2015-	Professor, Dept. of Microbiology & Immunology, School of Medicine, University of Illinois, Chicago, Illinois.
2010-	Director of High-throughput Screening Facility. University of Illinois, Chicago, Illinois
2019-	Visiting Professor of Shandong University of Chinese Traditional Medicine, Jinan, Shandong, China
2019-	Visiting Professor of Institute of Pathogen Biology, Chinese Academy of Medical Sciences and &Peking Union Medical College, Beijing, China

Selected publications on antiviral drug discovery in 2020

Epub 2020 Mar 2. PubMed PMID: 32069052.

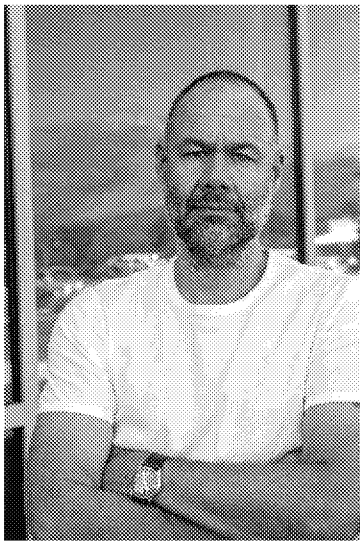
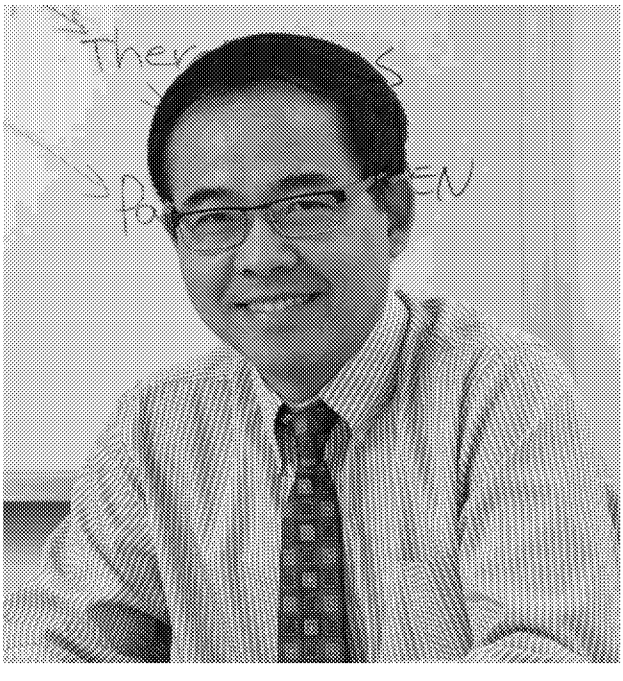
Dr. Vincent Munster



Dr. Vincent Munster is the chief of the Virus Ecology Section at NIAIDs Rocky Mountain Laboratories. He received his Ph.D. in virology from Erasmus University, Rotterdam, the Netherlands, in 2006. During his Ph.D. studies, Dr. Munster studied the ecology, evolution, and pathogenesis of avian influenza viruses. He continued his training at the Erasmus Medical Center from 2006 to 2009, where he worked within the Center for Research on Influenza Pathogenesis and Surveillance (CRIPS) focusing on pathogenicity and human-to-human transmission of influenza A viruses. Dr. Munster joined the NIAIDs Laboratory of Virology as a visiting fellow in 2009 to study the ecology of emerging viruses such as Ebola virus. In 2013, Dr. Munster established the Virus Ecology Unit as an independent tenure-track investigator. His lab is working to elucidate the ecology of emerging viruses and drivers of zoonotic and cross-species transmission. The lab uses a combined field and experimental research approach and conducts research at the state-of-the-art high- and maximum-containment facilities of the Rocky Mountain Laboratories, as well as at field study sites in Africa (the Republic of the Congo, Mali, Ghana, Liberia) and the Middle East (Jordan). Dr. Munster has been actively involved in the response to MERS-CoV, Ebola virus and COVID19 outbreaks. With the current COVID19 pandemic he is actively involved in the development of medical countermeasures and providing critical experimental data supporting direct public health decisions and interventions.

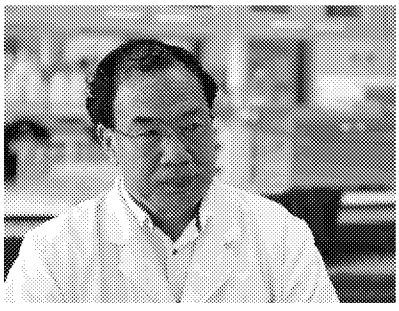
Prof Linfa Wang



Prof Linfa Wang is a professor in the Programme in Emerging Infectious Diseases at Duke-NUS Medical School, Singapore. He is an international leader in the field of emerging zoonotic viruses and virus-host interaction. His current research focuses on why bats are such an important reservoir for emerging viruses and on how we can learn from bats to make us more resilience to infection and diseases in general. He is a member of the WHO SARS Scientific Research Advisory Committee and played a key role in identification of bats as the natural host of SARS-like viruses. Currently, he is serving on multiple WHO committees for COVID-19, including the WHO IHR Emergency Committee. Prof Wang has more than 400 scientific publications, including papers in *Science*, *Nature and Lancet*. He is currently the Editor-in-Chief for the open access Virology Journal. In 2010, Prof Wang was elected to the Australian Academy of Technological Sciences and Engineering.

Yong-Zhen Zhang

Shanghai Public Health Clinic Center & School of Life Sciences, Fudan University, Shanghai



Since the end of 1998 when Zhang finished his PhD course at Kunming Institute of Zoology of the Chinese Academy of Sciences, he had been worked at National Institute for Communicable Disease Control and Prevention of China CDC in Beijing, and have moved to Shanghai in this year. He performed the epidemiologic research and the control and prevention of rabies and hemorrhagic fever with renal syndrome before 2012. Subsequently, he focused on the virus diversity, evolution, ecology, and transmission, as well as the etiologic agents and clinic features of the infectious disease that could not be diagnosed clinically based on a surveillance network including local CDC and hospitals in China.

Ke XU, Ph.D.

Professor
State Key Laboratory of Virology
College of Life Sciences
Wuhan University

Dr. Xu graduated from Shanghai Institutes for Biological Sciences, Chinese Academy of Sciences as Ph.D. in the year 2009, major in Biochemistry and Biomedicine. She was the investigator in Institut Pasteur of Shanghai, Chinese Academy of Sciences 2009-2018. Since 2019, she is a professor in the State Key Laboratory of Virology of Wuhan University. Dr. Xu mainly works on the molecular mechanisms underlying viral-host interplay and identifying drug targets for emerging and re-emerging viruses, such as SARS-CoV and influenza A virus. She reported that NS1 and NP proteins of influenza A viruses are sumoylated which is essential for virus survival to antagonize IFN response (***Journal of Virology 2011***; ***Journal of Virology 2014***). She discovered that epigenetic modifications on influenza A virus NP protein play an important role in RNA virus replication (***Nature Communications 2017; PLoS Pathogens 2017***). She also developed site-targeted antivirals against emerging viruses and identified host DHODH enzyme as an efficient drug target for SARS-CoV-2 and other acute-viral infections ***(Protein & Cell 2020).*** She was also awarded to ESWI young scientist award (2014), Shanghai Rising-Star Talent (2015), and the NSFC excellent young scientist (2019). She served as an advisory board member of Archives of Virology and scientific reviewers for several SCI journals.

Dr. Peng ZHOU

Professor, Center for Emerging Infectious Diseases, Wuhan Institute of Virology, Chinese Academy of Sciences, China

Academic qualifications:
PhD of molecular biology, Wuhan Institute of Virology (WIV), Chinese Academy of Sciences (CAS), Wuhan, China, 2010;
Joint PhD study, Australian Animal Health Laboratory (AAHL), CSIRO, Australia, 2009-2010
Bachelor of bioengineering, Henan University, Kaifeng, China, 2004.

Research interests: Bat innate immunity; virus host interface; pathogens discovery

Publication track record: more than 50-refereed publications in journals including *Nature*, *Science, Cell Host and Microbe, PNAS, Journal of Virology and Journal of Immunology* covering virology and immunology. Publications also include one book chapter on bat immunology

Selected Publications:

1. **Zhou P**, Yang XL, Wang XG, Hu B, Zhang L, Zhang W, Si HR, Zhu Y, Li B, Huang CL, Chen HD, Chen J, Luo Y, Guo H, Jiang RD, Liu MQ, Chen Y, Shen XR, Wang X, Zheng XS, Zhao K, Chen QJ, Deng F, Liu LL, Yan B, Zhan FX, Wang YY, Xiao GF, Shi ZL*. **Nature**. 2020 Feb 3. doi: 10.1038/s41586-020-2012-7.

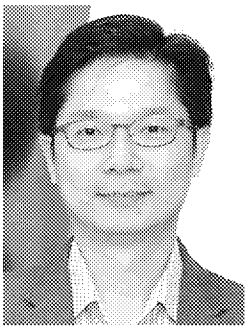
Prof. Zihe Rao, CAS Academician

Prof. Zihe Rao, Head of Laboratory for Structural Biology, Tsinghua University, the member of the Presidium of the CAS Academic Divisions, the member of Standing Committee of the National Committee of the Political Consultative Conference, Founder and Editor-in-Chief of Protein & Cell (IF 10.164 Year 2019), the former President of Nankai University, the former Director-General of Institute of Biophysics (CAS), the former President of the International Union for Pure and Applied Biophysics (IUPAB). Prof. Zihe Rao dedicates in studying the mechanisms underlying pathogenic infectious agents with significant concerns on global public health throughout his academic career. He provides the insight into virus lifecycle and antiviral research on coronaviruses (SARS-CoV and SARS-CoV-2), picornaviruses, flaviviruses, avian influenza virus and retrovirus. He also works to develop the innovative technics to dissect the assembly giant viruses, including Africa swine fever virus and herpesvirus. Amongst his studies on viruses, his recent works provide groundbreaking insights into energy and metabolite transport, drug resistance and cell wall synthesis in M. tuberculosis with invaluable information for anti-TB drug discovery. In the recent global pandemic of COVID-19, he determined the structures of two key targets for antiviral development, main protease and RNA-dependent RNA polymerase, accelerating the global efforts against COVID-19 (Nature 2020, Science 2020). To date, he has published more than 380 peer reviewed research papers, including 22 pieces of research papers in Cell, Nature and Science, with more than 17,500 citations (google scholar 2020 Nov 13) in total.

香 港 大 學
THE UNIVERSITY OF HONG KONG



Professor Leo L. M. POON
School of Public Health, LKS Faculty of Medicine
The University of Hong Kong
E-mail: llmpoon@hku.hk
Website: https://sph.hku.hk/en/about-us/faculty-and-staff/academic-staff/poon,-lit-man-leo
Research interest: Public Health, Infectious Diseases and Virology

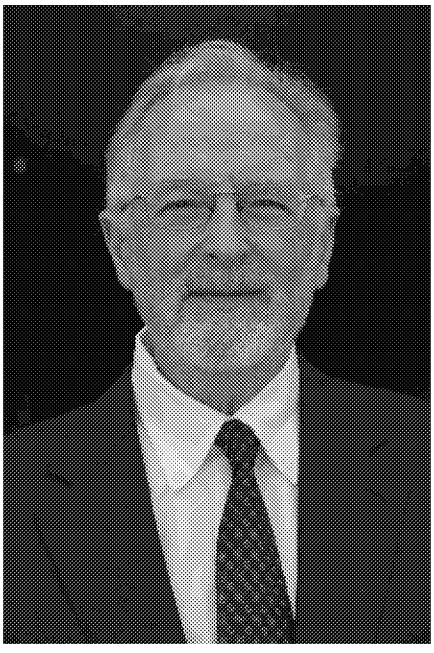
Short Biography

Professor Leo Poon was born and raised in Hong Kong. He received his doctoral training in Sir William Dunn School of Pathology in University of Oxford (1999). He joined HKU in 2001. He is a now a professor in School of Public Health and he is the division head of Public Health Laboratory Sciences in this school.

Leo Poon has strong research interests related to emerging viruses, ranging from basic science to clinical virology. His work primarily focuses on influenza virus and coronavirus (e.g. SARS and MERS, SARS-CoV-2). He has published over 220 publications. He has been ranked as a top 1% most-cited scientist since 2005. He is a founding member of the Hong Kong Young Academy of Sciences.

Apart from serving in his capacity within HKU, he serves as an expert in various international health care organizations (e.g. WHO and OIE). He serves in a number of task force groups in these organizations to develop infectious disease control policy. His division serves as a WHO reference laboratory for H5 influenza virus and COVID-19. He organized workshops to train frontline medical scientists in various regional and international disease control programs. He conducted overseas missions and outbreak investigations for controlling infectious diseases.

Prof Luis Enjuanes



Luis Enjuanes has been working in the virology field for more than 40 years, including 35 years in coronaviruses. His present interest is the study of the mechanism of replication, transcription, virulence and virus-host interaction in coronavirus. He has published more than 220 peer reviewed articles and 65 book chapters. At present, he is Research Professor and Head of the Coronavirus Laboratory at the National Center of Biotechnology of the Spanish National Research Council (CNB-CSIC). He has been an NIH Fogarty Visiting Fellow at Bethesda, MD, and a Visiting Scientist at FCRC, NIH, MD. He is Professor of Virology at the University of Madrid and the Institute Pasteur of Paris. He has been named "Distinguish Senior Virologist" by the Spanish Society of Virology, and a Member of the Royal Academy of Exact, Physical and Natural Sciences. He is also a member of the American Academy of Microbiology. He has been Editor-in-Chief of Virus Research. Enjuanes has received from the Government of Spain the Medal to the Merit for Scientific Research and University Teaching.

Stefan Pöhlmann, Prof. Dr.

Professor, Head of the Infection Biology Unit,
German Primate Center

2000: Ph.D., Friedrich-Alexander-Universität Erlangen-Nürnberg
2000-2003: Postdoctoral Fellow, University of Pennsylvania
2003-2007: Head of a SFB Junior Research Group, Institute of Clinical and Molecular Virology, Friedrich-Alexander-University Erlangen-Nürnberg
2007-2010: Professor for Experimental Virology, Hannover Medical School
2010: Professor for Infection Biology at Georg-August-University Göttingen (Brückenprofessur) and Head of the Infection Biology Unit of the German Primate Center

Major Research Interests

Influenza viruses pose a global health threat. These viruses constantly change and therapeutics may thus cease to be effective. Therefore, we seek to develop novel influenza therapies. One focus of our work is on the host cell protease TMPRSS2 since we obtained evidence that influenza viruses depend on this enzyme for acquisition of infectivity. Moreover, we are investigating how defective interfering particles (DIPs) can be developed as novel therapeutics.

Emerging viruses may cause severe disease. Outbreaks frequently occur abroad but the agents can be imported into Germany via infected travelers. We are investigating how emerging viruses interact with host cells and cause disease. Our focus in on lymphocytic choriomeningitis virus, Ebola virus and SARS coronavirus. One aim of our research is to develop cell culture systems that allow predicting transmissibility and thus pandemic potential of emerging viruses.

Another focus of our research is on primate herpesviruses. The transmission of herpes B virus from macaques to humans can cause serve disease while closely related viruses seem to be apathogenic in humans. We are investigating which viral and host factors determine whether infection will result in severe disease. Moreover, we are developing diagnostics for herpesvirus infections of non-human primates.

Pei-yong,

Here is the update draft of the paper. I would like invite you go through the MS.Thank you very much !

I am looking forward to hearing from you.

All mm regards,

Xinwen

Hi Xinwen,

I quickly went through the manuscript. Let's have a call to (i) go through the data and (ii) discuss the way forward. Please let me know when you have time to call.

Best,

- Pei-Yong

佩勇，

附件是文章的结果。文章很初步，整体结构也需要大的调整。我想这是第一次请教，请你审核数据（文章的主体部分和图表），期待意见和建议，特别是：

1）需要补充的其他实验；

2）文章写作思路和整体布局

另外， 我们正在补充的数据包括：

1）GLP2R蛋白的ECL1结构域和E蛋白DIII直接相互作用证据（合成多肽，SPR分析），

2）缺陷小鼠感染实验（已经构建成功，正在繁殖）。

将在你意见和建议的基础上重新架构文章。

非常感谢！

祝好！

Subject: Thank you and happy new year!

Dear colleagues:

Greetings and happy new year!

I hope that you all have enjoyed our annual meeting last two days, which I consider as a success. There were more than 300 registrations, and in each session, there were at least 100 attendees at various times. Once again, I wish to thank all the speakers, cochairs, panelists and all of you for your participation and discussion. I especially want to thank the organizing committee members, Genhong Cheng, Haitao Guo, Renfeng Li, Yuying Liang, Wenjun Ma, Tongqing Zhou, and hi-Ming Zheng for their help that made this symposium possible. I would hope that our annual meeting next year will happen in person.

As I finish my term as the Founding President of this association, which is effective today, I would like to offer my most sincere appreciation and thanks for your care, trust, understanding, patience, and support. It is all because of you last few years that this association and the WeChat group is so strong, entertaining, and full of fun!

In the meantime, I would like to introduce the new leadership team of SCBA-Virology Division as follows:

President: Haitao Guo, Ph.D, University of Pittsburgh School of Medicine
Secretary: Tongqing Zhou, Ph.D, Vaccine Research Center, NIAID, NIH
Treasurers: Yuying Liang , Ph.D, University of Minnesota, and Wenjun Ma, Ph.D, University of Missouri

I wish you all a happy, healthy, and prosperous 2021!

Shan-Lu

SCBA-Virology Division 2020 Year in Review: Focused Responses to COVID-19

By Shan-Lu Liu

This past year has been unprecedented as we grapple with the COVID-19 pandemic around the globe. The SCBA-Virology Division has had many exciting and intriguing discussions over this year; I have summarized some key highlights below.

Dec 30, 2019: Immediate response and discussion about the first public revelation of mysterious pneumonia in Wuhan, China.

Jan 2-5, 2020: Response and lively discussion about the suspected pathogen for the Wuhan pneumonia and the possibility of human-to-human transmission.

Jan 4, 2020: Focused discussion on endogenous retroviruses and their roles in animal and human physiology, pathology and evolution.

Jan 5, 2020: Focused discussion on Koch's postulates and how to apply them in identifying the suspicious pathogens, including Zhi-Ming Zheng's suggestion to detect IgM within 2 weeks of infection and 4-fold titer increase for specific IgG in paired sera. Overwhelming calls from colleagues, including many in mainland China like Dr. Yuelong Shu, to release the name of the pathogen.

Jan 9, 2020: Overwhelming responses to the Walls Street Journal news on COVID-19.

Jan 10-11, 2020: Debate on naming the new coronavirus, in particular regarding whether "Wuhan" should be included.

Jan 10, 2020: Immediate dissemination and focused discussion on the full genome sequence of SARS-CoV-2 released by Yongzhen Zhang and Edward Holmes.

Jan 19-22, 2020: Response and discussion about the correspondence by Shan-Lu Liu in Nature entitled "New virus in China requires international control effort" that calls for investigation of human-to-human transmission, and commentary in Viruses entitled "Emerging Viruses without Borders: The Wuhan Coronavirus" that appeals for continued US-China scientific collaboration.

Jan 23, 2020: Response and discussion regarding the lockdown of Wuhan.

Jan 23, 2020: Proposal by Shan Lu and members of the society to China CDC and other agencies for effective control of the spreading virus, entitled
"分层管理，集中分筛可疑人群是当前控制新型冠状病毒的关键".

Since Jan 27, 2020, members of this society have actively participated in media interviews, including Shou-Jiang Gao, Haitao Guo, Qi Huang, Shibo Jiang, Dong-Yan Jin, Ke Lan, Shan-Lu Liu, Shan Lu, Lijun Rong, Zhengli Shi, Lishan Su, Jun Wang, Qiuhong Wang, Yan Xiang, Zhi-Ming Zheng, Richard Zhao, and many more.

Jan 27, 2020: Active discussion on a Lancet paper by Kwok-Yung Yuen and colleagues that reported the first family-clustered cases of person-to-person transmission of SARS-CoV-2.

Feb 2, 2020: Lively discussion on a preprint by Indian scientists claiming an association between SARS-CoV-2 and HIV; this led to an article by corresponding author Feng Gao and coauthors Chuan Xiao, Shou-Jiang Gao, Yongming Sang published in Emerging Microbes and Infections (EMI).

Feb 19, 2020: Themed discussion on the role of selective pressure in generating recombinants that may have contributed to the origin of SARS-CoV-2.

Feb 19, 2020: Congratulations to Dong-Yan Jin for election into the American Academy of Microbiology.

Feb 20, 2020: Strong debate on the naming of SARS-CoV-2, resulting in an article entitled "SARS-CoV-2 is an appropriate name for the new coronavirus" by members Yuntao Wu, Wenzhe Ho, Dong-Yan Jin, Shan-Lu Liu, Xuefeng Liu, Jianming Qiu, Yongming Sang, Qiuhong Wang, and Zhi-Ming Zheng, etc.

Feb 23, 2020: Themed discussion on the possible origin of SARS-CoV-2 and RaTG13, specifically on whether or not SARS-CoV-2 is artificially engineered; this led to an article entitled "No credible evidence supporting claims of the laboratory engineering of SARS-CoV-2" by Lishan Su and Shan-Lu Liu and others published in EMI. This paper received 75000 downloads, ranking as the third most downloaded paper among 2500 journals in the Taylor & Francis family.

March 19, 2020: Response, discussion, and support of Dr. Kwok-Yung Yuen's commentary published in a Hong Kong Newspaper regarding the frequent spillover of animal viruses to humans and lessons learned from 2003/SARS and COVID-19.

May 17, 2020: Themed discussion on selective pressure that drives both the SARS-CoV-2 Spike and ACE2 receptor co-evolution.

May - August, 2020: Xuefeng Liu co-organized a series of COVID-19 seminars sponsored by the Wuhan University Alumni Association; speakers include Genhong Cheng, Haitao Guo, Deyin Guo, Jianming Hu, Shibo Jiang, Ke Lan, Xuefeng Liu, Dongfang Liu, Yang Liu, Zheng-Li Shi, Jun Wang, Yuntao Wu, Zhi-Ming Zheng, Tongqing Zhou, Fanxiu Zhu, etc.

August 30, 2020: Themed discussion on antibody-dependent enhancement (ADE) and possible impact on COVID-19 pathogenesis and vaccines.

Sept 1, 2020: Focused discussion on scientific contributions of Dr. Louise Chow and the lack of recognition by Nobel committee and other organizations for her tremendous contribution to RNA splicing.

Sept 8, 2020: Response and discussion about a Xinhua News Agency's report on the timeline of discovery of SARS-CoV-2, particularly on the important contribution of Yongzhen Zhang, who was the first to publicly release the genome sequence of SARS-CoV-2.

Sept 23, 2020: Response and congratulations to Zheng-Li Shi and Yongzhen Zhang as "The 100 Most Influential People of 2020" selected by TIME magazine.

Sept 24, 2020: Response and congratulations to Yang Liu and Pan Zheng's breakthrough on CD24Fc treatment for COVID-19.

Oct 5, 2020: Active discussion regarding the announcement of 2020 Nobel Prize winners, with special congratulations to virology colleagues Drs. Charles Rice, Harvey Alter and Michael Houghton to science and recognition of their connections to the Chinese virology community.

Nov 25, 2025: Response and congratulations to Fanxiu Zhu and Shan-Lu Liu for being elected as fellows of the American Association for the Advancement of Science.

Oct - Dec, 2020: Continuous discussion and debate on COVID-19 vaccines: safety, efficacy and distribution.

Dec 30-31: The 3rd Symposium of SCBA-Virology was held virtually and successfully. Invited speakers were Drs. Susan Weiss and Xiang-Jin (XJ) Meng, who had given outstanding speeches. There were ~320 registrations from at least 7 counties and regions. Three sessions include: (1) COVID-19/SARS-CoV-2, (2) Host response, pathogenesis, and antivirals, and (3) Viral replication and spread. All sessions were followed by a panel discussion, which was informative, interactive, and entertaining

Immunity topics plus Gao for 3rd China U.S. Dialogue v2.docx
Chinese Participants-0610.docx

Greetings,

I have attached the list of Chinese participants for the meeting tomorrow (that I just received). There will be fewer people on their side this time (at our request). **Please let me know if you are not planning to participate.**

I have also attached the **American version** of the agenda / list of questions. Recall that their version lists Harvey Fineberg and Ralph Baric as discussants to answer Dr. Gao's questions but not the other names.

FYI the Zoom link for the meeting is:
https://nasem.zoom.us/j/95921551654?pwd= **552.136**

Please let me know if you have any questions or concerns. Thanks again for taking the time to participate in these meetings.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

3rd U.S.-China Virtual Dialogue Conference Call

COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

Questions:

Immune Response and Immunotherapy

- Use of antibody assays in diagnosis of acute disease and as an indicator of protection (Le Duc)
  - How is immune response being measured?
  - Was there standardization of testing tools?
- **What is the overall situation of serologic investigation in the US? (Fineberg)**
- What can be said about the characterization of the (Perlman)
  - Innate immune responses?
  - humoral immune response?
  - cellular immune response?
- What is China's experience in using immune plasma or other antibody-based therapies for COVID-19 patients and for prevention of infection? (Hamburg)
  - Is the use of immune plasma effective?
  - Have there been any complications?
- What has been China's experience with human monoclonal antibodies for treatment and prevention? (Hamburg)
  - Do a majority of the monoclonal antibodies isolated from patient B cells produce neutralizing antibodies?
- What immunopathologies are evident in the patients with COVID-19? (Relman)
  - Are there any biomarkers in patients who develop systemic inflammation?
  - What is the most effective treatment for patients who develop a cytokine storm?

Immunity

- After recovery, what types of antiviral immune responses are present? (Saif)
  - Do these immune responses protect from re-infection?
  - What is known about the durability of neutralizing antibody and longevity of protective immunity?

  Did recovery from SARS provide any protection from infection with SARS-CoV-2?
- **Progress in the development of vaccine in the U.S. especially mRNA vaccine? (Baric)**

Reactivation or Reinfection of Recovered Patients/Fall resurgence

- Has reactivation of latent virus or re-infection been seen among survivors? (Shi)
- Is reactivation/reinfection a concern with respect to a fall resurgence?
- What steps should be taken in anticipation of a fall resurgence in transmission? (Fineberg)

- **What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the U.S.? (Fineberg)**

Chinese Participants

Ling Chen: Dr. Ling Chen is a professor and founding director of CAS Guangzhou Institute of Biomedicine and Health, former deputy director of State Key Lab of Respiratory Disease.

Chen Dong: Dr. Chen Dong is Director and a professor of the Institute for Immunology, Dean of the School of Medicine at Tsinghua University, CAS member.

George F. Gao: Dr. George F. Gao is Director-General of CCDC, a professor at the CAS Institute of Microbiology, CAS member.

Qihan Li: Dr. Qihan Li is a professor of the Institute of Medical Biology, Chinese Academy of Medical Science, Peking Union Medical College. His research focuses on viral vaccine and viral immunology.

Wenjie Tan: Dr. Wenjie Tan is Chief and a professor of the Biotech Center for Viral Disease Emergency, National Institute for Viral Disease Control and Prevention, CCDC.

Jianqing Xu: Dr. Jianqing Xu is a professor of the Institutes of Biomedical Sciences, Fudan University.

Zhiming Yuan: Dr. Zhiming Yuan is a professor of CAS Wuhan Institute of Virology, Director of Wuhan P4 lab.

Dr Menachery and Professor Baric

I've just read this article:

https://nam03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2Fnm.3985%23ref-CR2&data=02%7C01%7Cvimenach%40utmb.edu%7C3e9682604d1b4dd4576c08d800a46f62%7C7bef256d85db4526a72d31aea2546852%7C0%7C0%7C637260053589056828&sdata=MT2x0NrVZ0s36xv1ZYOiCc6nFzke74WdSvIQ9tOW9bE%3D&reserved=0

which says:

"Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve in vitro titers equivalent to epidemic strains of SARS-CoV. Additionally, in vivo experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis."

Did you and your group, deliberately or inadvertantly, create the virus now known as COVID-19?

Was that virus then somehow released into the environment in Wuhan, deliberately or accidentally, by one or more of your co-authors, who live and work there?

Please respond openly and honestly, thank you.

Look forward to hearing from you.

best wishes
Marcus Williamson

IgE mediated sensitization to peptides that have homology to 2019-nCoV peptides may contribute to disease severity. In that case, antihistamines and other allergy treatments such as mast cell stabilizers may help reduce infection severity.

A BLASTP analysis of 2019-nCoV proteome against common vaccine antigens was performed. Preliminary results suggest that IgE mediated sensitization to common vaccine antigens can result in cross reactive immune responses to 2019-nCoV.

Please see details of the mechanisms here:

Lay summary

Proteins are a chain of amino acids. Proteins can have up to several hundred amino acids. Snippets of proteins (peptides), 7-15 amino acids in length are important in immunology. There are 20 types of amino acids. Each is assigned a letter (1 letter code).

Antibodies are proteins that can bind to peptides that have a specific amino acid sequence. Such a target peptide is known as an epitope. When an antibody binds to a peptide (which is part of a protein, which in turn may be part of a cell surface), it can trigger an immune attack on the cell. If the cell were a bacterium, the bacterium would be killed.

Humans (like all organisms) are made of numerous proteins (self proteins). So we have self-proteins, self-peptides and self-epitopes. In a healthy person, the body will not make antibodies that bind strongly to self-peptides (self-tolerance).

DNA is a chain of base-pairs. The DNA base-pair sequence determines the amino acid sequence in the protein produced. If there is a mutation that alters a single base-pair, the resulting protein will have a single amino acid that is altered. To prevent cancer, the immune system is capable of making antibodies against such altered peptides. Such antibodies can also weakly bind (cross react) to the unaltered normal peptide thus resulting in destruction of some healthy cells.

Say a normal protein has the following peptide (10 amino acids, each represented by its 1 letter code):

ALSTLVVNKI

Say DNA in a cell mutates due to a carcinogen exposure and it alters the protein thus resulting in this peptide with a single amino acid change:

ALSTLVV**S**KI

When the immune system makes antibodies targeted at ALSTLVV**S**KI (to attack the cell with the DNA mutation), the same antibodies can weakly bind to the normal ALSTLVVNKI peptide.

ALSTLVVNKI is an epitope associated with rheumatoid arthritis (RA).

So as a result of the immune system defending against cancer, the person can develop RA.

Now consider vaccines containing animal proteins. Animal proteins are very similar to human proteins, containing only occasional amino acid differences. An animal peptide could therefore have the ALSTLVV**S**KI sequence. Such a vaccine would fool the immune system into creating an anti-cancer immune response, creating antibodies targeted at ALSTLVV**S**KI. The result is vaccine induced RA.

Therefore one can predict that analyzing epitopes associated with autoimmune diseases, such single amino acid difference compared to animal peptides present in vaccines, would occur more frequently than can be expected merely by chance. The analysis confirms that this prediction is valid.

Abstract

The National Institute of Allergy and Infectious Diseases (NIAID) sponsors the Immune Epitope Data Base (IEDB). IEDB contains epitopes identified from the medical literature and organized by diseases and categories of diseases. All epitopes (23000+) associated with 82 autoimmune diseases in humans were analyzed.

The role of animal, plant, fungal proteins contained in vaccines in the etiology of autoimmune diseases have been described in humans and animals. BLASTP was used to analyze IEDB derived epitopes for sequence alignment to animal, plant, fungal (APF) proteins present in vaccines and biologics. Specifically, the search was performed against bovine, chicken, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes.

The results show that 57% of epitopes differed by exactly one amino acid residue from an APF peptide. 78% of the epitopes differed by up to two amino acid residues from an APF peptide. The rest of the epitopes were either identical or differed by more than two amino acid residues.

A majority of IEDB epitopes analyzed were 9-mer peptides. Comparing randomly selected 9-mer human peptides with APF proteomes, the probability of single amino acid residue difference (SAARD) outcomes was derived. This was used to

estimate the probability that actual IEDB SAARD alignments to APF peptides were merely a chance outcome. The estimates show that the probability that the observed IEDB alignments to APF being merely a chance outcome are vanishingly small. So the results make it absolutely clear that APF proteins in vaccines cause all these autoimmune diseases.

Introduction

Vaccines contain thousands of residual animal, plant and fungal (APF) proteins from the manufacturing process (1–6). 293 chicken proteins were identified in the influenza vaccine (7), for example. Actin and vimentin proteins were detected in the Priorix Tetra vaccine (8). Immunization with homologous xenogeneic antigens resulting in autoimmune diseases has been known for at least 40 years (9). Vaccines that contain bovine proteins caused autoimmunity in dogs (10). We previously described the immunological mechanism involved in autoimmunity induction by immunization with homologous xenogeneic antigens (11).

Cancer cells have minor differences when compared to healthy cells. Due to mutation of the DNA encoding the proteins, cancer cells can display altered proteins on their surface. Healthy cancer defense mechanisms include immune responses directed at such altered proteins. Therefore an immune response directed against cancer cells always carries a risk of cross reactive immune responses against healthy cells displaying the unaltered protein. Therefore, cancer induced autoimmune responses are a consequence of normal, healthy immune system behavior.

Animal proteins have minor differences compared to human proteins. Peptides that are identical between humans and animals are unlikely to cause any problem due to strong self tolerance. However, peptides with one amino acid residue difference produce the strongest cross reactive immune responses (11). They are ideally suited to induce autoimmune diseases. Injecting animal proteins results in anti-cancer immune responses because the immune system perceives animal proteins as altered human proteins. Adjuvants in the vaccine boost this anti-cancer immune response. This artificial anti-cancer response directed at thousands of APF proteins in vaccines or biologics, therefore cross react and cause numerous autoimmune disorders.

For this reason, one can predict that single amino acid residue difference (SAARD) between autoimmune disease related epitopes in the IEDB and homologous APF peptides in vaccines, would occur at a higher probability than by mere chance. We perform a BLASTP analysis to verify.

Methods

Basic local alignment search tool for proteins (BLASTP) (12), Universal Protein Resource (UniProt)(13) and the Immune Epitope Database (IEDB) (14) were used for bioinformatics analysis.

Specifically, the BLASTP sequence alignment of IEDB peptides was performed against bovine, chick, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes. Vaccines and biologics contain residual proteins from all these organism due to media used to grow viruses or bacteria, recombinant cells/organisms used for protein expression or as excipients.

Results

57% of IEDB peptides have a SAARD and 78% have up to two amino acid differences compared to animal, fungal or plant peptides present in vaccines.

Discussion

Could this result be a chance occurrence?

A majority of IEDB epitopes analyzed were 9-mer peptides. Five thousand 9-mer peptides were chosen at random from the human proteome. BLASTP was run using these peptides to compare against each organism's proteome or a subset. This provides us the probability that randomly selected human peptides have an alignment providing a SAARD compared to peptides from these organisms. These are listed in table 1 under " Random SAARD alignment". Given this, we can compute the probability of the actual SAARD alignment to IEDB epitopes, occurring by chance. This is listed in table 1 under "Estimated probability of actual SAARD outcome occurring just by chance".

For a simple coin toss example, we would perform the calculation as follows:

Computing probability of say a 7 heads, 3 tails outcome of 10 trials of a fair coin:

Probability = (0.5^7) x (0.5^3) x 10! / (7! x 3!)

Where:

0.5 is the probability of a head or tail outcome of a fair coin.

For an unfair coin, say probability of head outcome = 0.4 and tail outcome 0.6, we would have:

Probability = (0.4^7) x (0.6^3) x 10! / (7! x 3!)

For the IEDB peptide probability analysis, the outcome is for 23192 trials (peptides).

The "head outcome" is the "Random SAARD alignment " entries in table 1. The "tail outcome" probability is 1-"head

outcome".

Sample calculation for Chinese Hamster:

Probability = ((889/5000)^4574) x ((4111/5000)^18618) x 23192! / (4574! x 18618!)

Probability = 1.488e-15

Where: 889*100/5000 = 17.8% is the entry in Table 1 for Chinese Hamster. BLASTP analysis shows 889 SAARD out of 5000 peptides analyzed.

And, 4574*100/23192=19.7% is the IEDB entry in Table 1 for Chinese Hamster. BLASTP analysis shows 4574 SAARD out of 23192 peptides analyzed.

So the 1.488e-15 value is the probability that we will have exactly 4574 SAARD alignments out of 23192 peptides. The probability goes down for all values > 4574. Conservatively, applying the same probability as for 4574, to all values >4574, we can calculate the probability of the chance occurrence of 4574 or greater number of SAARD alignments as 1.488e15 * 18618 = 27e-12, entry in table.

The Gnome calculator was used to perform these calculations and the results were verified using the Qalculate! calculator and WolframAlpha (15) since spreadsheets are unable to perform these calculations.

Table 1

Organism	Random SAARD alignment Number of Peptides(%)	Actual (IEDB) SAARD alignment Number of Peptides (%)	Estimated probability of actual SAARD outcome occurring just by chance	Remarks
African green monkey (*Chlorocebus aethiops*)	26 (0.5)	420 (1.8)	~1.7e-96	Probabilit is vanishi vaccines,

Chinese Hamster (*Cricetulus griseus*)	889 (17.8)	4574 (19.7)	~27e-12	Probabilit is vanishi vaccines,
Chicken (*Gallus gallus*)	536 (10.7)	3901 (16.8)	<1e-100	Probabilit is vanishi vaccines, porcine an embryo is proteins ca
Guinea Pig (*Cavia porcellus*)	837 (16.7)	4439 (19.1)	~1e-18	Probabilit is vanishi vaccines,
Mice (*Mus musculus*)	940 (18.8)	4467 (19.3)	~1	There are occurred j

				mice prote amount is cells are u proteins pr present in be present
Maize (*Zea mays*)	303 (6.1)	1667 (7.2)	~5e-9	Probability is vanishin vaccines,
Peanut (*Arachis hypogaea)*	223 (4.5)	1697 (7.3)	~79e-81	Probability is vanishin vaccines,
Yeast *(Saccharomyces cerevisiae)*	64 (1.3)	828 (3.6)	<1e-100	Probability is vanishin vaccines,
Sesame (*Sesamum indicum*)	155 (3.1)	1398 (6.0)	<1e-100	Probability is vanishin vaccines,
Soy (*Glycine max)*	215 (4.3)	1548 (6.7)	~86e-59	Probability is vanishin vaccines,
Pig (*Sus scrofa*)	963 (19.3)	4407 (19.0)	~1	There are occurred ju porcine pr amount is used in va present in vaccines b present. T
Wheat (*Triticum aestivum*)	138 (2.8)	977 (4.2)	~18e-33	Probability is vanishin vaccines,

The calculations make it clear that the findings cannot be merely a chance outcome and that immunization against animal/plant/fungal antigens in the vaccines do cause these autoimmune diseases in the IEDB.

Conclusion

Vaccines containing animal, plant or fungal proteins are extremely dangerous and cause numerous autoimmune diseases and cancer (16–19). All non-target proteins in vaccines must be immediately removed using processes such affinity chromatography (20).

Subject: Flu shot makes COVID-19 worse, confirmed by Cleveland Clinic; Make Famotidine/Cetirizine SOC for COVID-19; COVID-19 vaccines are unsafe

Mechanistic evidence (prediction)

Proteins that contaminate influenza vaccines have high homology to SARS-CoV-2 proteins thus increasing risk of severe COVID-19 disease and mortality
https://doi.org/10.5281/zenodo.3996984

Epidemiological evidence (confirmation)

Flu shot increases risk of COVID-19 Hospitalization **240%**, ICU admission **204%**, Hospital mortality **232%**.

Safety of Influenza Vaccine during COVID-19

https://doi.org/10.1017/cts.2020.543

"Among individuals with a positive SARS-CoV-2 test, patients previously vaccinated for influenza in 2019 were more likely to be hospitalized. Once hospitalized, they were more likely to be admitted to the ICU and die during hospitalization."

From Table 1:

	Never Vaccinated (N=1,125)	Vaccinated in 2019 (N=309)
Hospitalization - no.(%)	192 (17.1)	127 (41.1)
ICU Admission - no.(%)	77 (6.8)	43 (13.9)
Hospital Mortality - no.(%)	32 (2.8)	20 (6.5)

I predicted in **JANUARY 2020** (email below) that mast cell stabilizers and antihistamines can help in COVID-19. I notified health authorities and thousands of doctors/researchers, worldwide. Hundreds of thousands of lives could have been saved.

The **key is to understand that COVID-19 severity is a result of an allergic reaction to the virus**, a "slow rolling anaphylaxis". **WE HAVE PROVEN TREATMENTS FOR ANAPHYLAXIS. NO CLINICAL TRIALS NEEDED.**

The diagnosis and management of anaphylaxis: An updated practice parameter

https://www.jacionline.org/article/S0091-6749(05)00115-6/fulltext

"These protocols have recommended the administration of **H1 and H2 antagonists, ??-agonists, antileukotrienes, and corticosteroids**."

Cetirizine is an histamine H1 blocker or antagonist. Famotidine is an histamine H2 blocker or antagonist.

These safe, OTC drugs above can be used immediately upon COVID-19 symptoms (or even a low dose if exposure is suspected). Mast cell stabilizers, ??-agonists, antileukotrienes, and corticosteroids can be prescribed as standard of care. Hundreds of thousands of lives can be saved.

As I wrote in my comment posted in the Annals of Internal Medicine:

Please see comments section:

IgE mediated sensitization to peptides that have homology to 2019-nCoV peptides may contribute to disease severity. In that case, antihistamines and other allergy treatments such as mast cell stabilizers may help reduce infection severity.

A BLASTP analysis of 2019-nCoV proteome against common vaccine antigens was performed. Preliminary results suggest that IgE mediated sensitization to common vaccine antigens can result in cross reactive immune responses to 2019-nCoV.

Lay summary

Proteins are a chain of amino acids. Proteins can have up to several hundred amino acids. Snippets of proteins (peptides), 7-15 amino acids in length are important in immunology. There are 20 types of amino acids. Each is assigned a letter (1 letter

code).

Antibodies are proteins that can bind to peptides that have a specific amino acid sequence. Such a target peptide is known as an epitope.?? When an antibody binds to a peptide (which is part of a protein, which in turn may be part of a cell surface), it can trigger an immune attack on the cell. If the cell were a bacterium, the bacterium would be killed.

Humans (like all organisms) are made of numerous proteins (self proteins). So we have self-proteins, self-peptides and self-epitopes. In a healthy person, the body will not make antibodies that bind strongly to self-peptides (self-tolerance).

DNA is a chain of base-pairs. The DNA base-pair sequence determines the amino acid sequence in the protein produced. If there is a mutation that alters a single base-pair, the resulting protein will have a single amino acid that is altered. To prevent cancer, the immune system is capable of making antibodies against such altered peptides. Such antibodies can also weakly bind (cross react) to the unaltered normal peptide thus resulting in destruction of some healthy cells.

Say a normal protein has the following peptide (10 amino acids, each represented by its 1 letter code):

ALSTLVVNKI

Say DNA in a cell mutates due to a carcinogen exposure and it alters the protein thus resulting in this peptide with a single amino acid change:

ALSTLVV**S**KI

When the immune system makes antibodies targeted at ALSTLVV**S**KI (to attack the cell with the DNA mutation), the same antibodies can weakly bind to the normal ALSTLVVNKI peptide.

ALSTLVVNKI is an epitope associated with rheumatoid arthritis (RA).

So as a result of the immune system defending against cancer, the person can develop RA.

Now consider vaccines containing animal proteins. Animal proteins are very similar to human proteins, containing only occasional amino acid differences. An animal peptide could therefore have the ALSTLVV**S**KI sequence. Such a vaccine would fool the immune system into creating an anti-cancer immune response, creating antibodies targeted at ALSTLVV**S**KI. The result is vaccine induced RA.

Therefore one can predict that analyzing epitopes associated with autoimmune diseases, such single amino acid difference compared to animal peptides present in vaccines, would occur more frequently than can be expected merely by chance. The analysis confirms that this prediction is valid.

Abstract

The National Institute of Allergy and Infectious Diseases (NIAID) sponsors the Immune Epitope Data Base (IEDB). IEDB contains epitopes identified from the medical literature and organized by diseases and categories of diseases. All epitopes (23000+) associated with 82 autoimmune diseases in humans were analyzed.

The role of animal, plant, fungal proteins contained in vaccines in the etiology of autoimmune diseases have been described in humans and animals. BLASTP was used to analyze IEDB derived epitopes for sequence alignment to animal, plant, fungal (APF) proteins present in vaccines and biologics. Specifically, the search was performed against bovine, chicken, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes.

The results show that 57% of epitopes differed by exactly one amino acid residue from an APF peptide. 78% of the epitopes differed by up to two amino acid residues from an APF peptide. The rest of the epitopes were either identical or differed by more than two amino acid residues.

A majority of IEDB epitopes analyzed were 9-mer peptides. Comparing randomly selected 9-mer human peptides with APF proteomes, the probability of single amino acid residue difference (SAARD) outcomes was derived. This was used to estimate the probability that actual IEDB SAARD alignments to APF peptides were merely a chance outcome. The estimates show that the probability that the observed IEDB alignments to APF being merely a chance outcome are

vanishingly small. So the results make it absolutely clear that APF proteins in vaccines cause all these autoimmune diseases.

Introduction

Vaccines contain thousands of residual animal, plant and fungal (APF) proteins from the manufacturing process (1???6)???. 293 chicken proteins were identified in the influenza vaccine (7)???, for example. Actin and vimentin proteins were detected in the Priorix Tetra vaccine (8)???. Immunization with homologous xenogeneic antigens resulting in autoimmune diseases has been known for at least 40 years (9)???. Vaccines that contain bovine proteins caused autoimmunity in dogs (10)???. We previously described the immunological mechanism involved in autoimmunity induction by immunization with homologous xenogeneic antigens (11)???.

Cancer cells have minor differences when compared to healthy cells. Due to mutation of the DNA encoding the proteins, cancer cells can display altered proteins on their surface. Healthy cancer defense mechanisms include immune responses directed at such altered proteins. Therefore an immune response directed against cancer cells always carries a risk of cross reactive immune responses against healthy cells displaying the unaltered protein. Therefore, cancer induced autoimmune responses are a consequence of normal, healthy immune system behavior.

Animal proteins have minor differences compared to human proteins. Peptides that are identical between humans and animals are unlikely to cause any problem due to strong self tolerance. However, peptides with one amino acid residue difference produce the strongest cross reactive immune responses (11)???. They are ideally suited to induce autoimmune diseases. Injecting animal proteins results in anti-cancer immune responses because the immune system perceives animal proteins as altered human proteins. Adjuvants in the vaccine boost this anti-cancer immune response. This artificial anti-cancer response directed at thousands of APF proteins in vaccines or biologics, therefore cross react and cause numerous autoimmune disorders.

For this reason, one can predict that single amino acid residue difference (SAARD) between autoimmune disease related epitopes in the IEDB and homologous APF peptides in vaccines, would occur at a higher probability than by mere chance. We perform a BLASTP analysis to verify.

Methods

Basic local alignment search tool for proteins (BLASTP) (12)???, Universal Protein Resource (UniProt)(13)??? and the Immune Epitope Database (IEDB) (14)??? were used for bioinformatics analysis.

Specifically, the BLASTP sequence alignment of IEDB peptides was performed against bovine, chick, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes. Vaccines and biologics contain residual proteins from all these organism due to media used to grow viruses or bacteria, recombinant cells/organisms used for protein expression or as excipients.

Results

57% of IEDB peptides have a SAARD and 78% have up to two amino acid differences compared to animal, fungal or plant peptides present in vaccines.

Discussion

Could this result be a chance occurrence?

A majority of IEDB epitopes analyzed were 9-mer peptides. Five thousand 9-mer peptides were chosen at random from the human proteome. BLASTP was run using these peptides to compare against each organism???s proteome or a subset. This provides us the probability that randomly selected human peptides have an alignment providing a SAARD compared to peptides from these organisms. These are listed in table 1 under ??? Random SAARD alignment???. Given this, we can compute the probability of the actual SAARD alignment to IEDB epitopes, occurring by chance. This is listed in table 1 under ???Estimated probability of actual SAARD outcome occurring just by chance???.

For a simple coin toss example, we would perform the calculation as follows:

Computing probability of say a 7 heads, 3 tails outcome of 10 trials of a fair coin:

Probability = (0.5^7) x (0.5^3) x 10! / (7! x 3!)

Where:

0.5 is the probability of a head or tail outcome of a fair coin.

For an unfair coin, say probability of head outcome = 0.4 and tail outcome 0.6, we would have:

Probability = (0.4^7) x (0.6^3) x 10! / (7! x 3!)

For the IEDB peptide probability analysis, the outcome is for 23192 trials (peptides).

The ???head outcome??? is the ???Random SAARD alignment ??? entries in table 1. The ???tail outcome??? probability is 1-???head outcome???.

Sample calculation for Chinese Hamster:

Probability = ((889/5000)^4574) x ((4111/5000)^18618) x 23192! / (4574! x 18618!)

Probability = 1.488e-15

Where: 889*100/5000 = 17.8% is the entry in Table 1 for Chinese Hamster. BLASTP analysis shows 889 SAARD out of 5000 peptides analyzed.

And, 4574*100/23192=19.7% is the IEDB entry in Table 1 for Chinese Hamster. BLASTP analysis shows 4574 SAARD out of 23192 peptides analyzed.

So the 1.488e-15 value is the probability that we will have exactly 4574 SAARD alignments out of 23192 peptides. The probability goes down for all values > 4574. Conservatively, applying the same probability as for 4574, to all values >4574, we can calculate the probability of the chance occurrence of 4574 or greater number of SAARD alignments as 1.488e15 * 18618 = 27e-12, entry in table.

The Gnome calculator was used to perform these calculations and the results were verified using the Qalculate! calculator and WolframAlpha (15)??? since spreadsheets are unable to perform these calculations.

Table 1

Organism	Random SAARD alignment Number of Peptides(%)	Actual (IEDB) SAARD alignment Number of Peptides (%)	Estimated probability of actual SAARD outcome occurring just by chance	Remarks
African green monkey (*Chlorocebus aethiops*)	26 (0.5)	420 (1.8)	~1.7e-96	Probabilit is vanishi vaccines,
Cow (*Bos taurus*)	936 (18.7)	4385 (18.9)	~1	There are occurred j cow protei amount is bovine gel vaccines. tissues in other cow more likel entry belo
Cow???s Milk (*Bos taurus*)	0 (0)	12 (0.05)	0	Probabilit is 0. So th these disea
Chinese Hamster (*Cricetulus griseus*)	889 (17.8)	4574 (19.7)	~27e-12	Probabilit is vanishi vaccines,
Chicken (*Gallus gallus*)	536 (10.7)	3901 (16.8)	<1e-100	Probabilit is vanishi vaccines, porcine an embryo is proteins ca
Guinea Pig (*Cavia porcellus*)	837 (16.7)	4439 (19.1)	~1e-18	Probabilit is vanishi vaccines,
Mice (*Mus musculus*)	940 (18.8)	4467 (19.3)	~1	There are occurred j mice prote amount is

				cells are u proteins pr present in be present
Maize (*Zea mays*)	303 (6.1)	1667 (7.2)	~5e-9	Probability is vanishir vaccines,
Peanut (*Arachis hypogaea)*	223 (4.5)	1697 (7.3)	~79e-81	Probability is vanishir vaccines,
Yeast *(Saccharomyces cerevisiae)*	64 (1.3)	828 (3.6)	<1e-100	Probability is vanishir vaccines,
Sesame (*Sesamum indicum*)	155 (3.1)	1398 (6.0)	<1e-100	Probability is vanishir vaccines,
Soy (*Glycine max)*	215 (4.3)	1548 (6.7)	~86e-59	Probability is vanishir vaccines,
Pig (*Sus scrofa*)	963 (19.3)	4407 (19.0)	~1	There are occurred ju porcine pr amount is used in va present in vaccines b present. T
Wheat (*Triticum aestivum*)	138 (2.8)	977 (4.2)	~18e-33	Probability is vanishir vaccines,

The calculations make it clear that the findings cannot be merely a chance outcome and that immunization against animal/plant/fungal antigens in the vaccines do cause these autoimmune diseases in the IEDB.

Conclusion

Vaccines containing animal, plant or fungal proteins are extremely dangerous and cause numerous autoimmune diseases and cancer (16???19)???. All non-target proteins in vaccines must be immediately removed using processes such affinity chromatography (20)???.

IgE mediated sensitization to peptides that have homology to 2019-nCoV peptides may contribute to disease severity. In that case, antihistamines and other allergy treatments such as mast cell stabilizers may help reduce infection severity.

A BLASTP analysis of 2019-nCoV proteome against common vaccine antigens was performed. Preliminary results suggest that IgE mediated sensitization to common vaccine antigens can result in cross reactive immune responses to 2019-nCoV.

Lay summary

Proteins are a chain of amino acids. Proteins can have up to several hundred amino acids. Snippets of proteins (peptides), 7-15 amino acids in length are important in immunology. There are 20 types of amino acids. Each is assigned a letter (1 letter code).

Antibodies are proteins that can bind to peptides that have a specific amino acid sequence. Such a target peptide is known as an epitope.?? When an antibody binds to a peptide (which is part of a protein, which in turn may be part of a cell surface), it can trigger an immune attack on the cell. If the cell were a bacterium, the bacterium would be killed.

Humans (like all organisms) are made of numerous proteins (self proteins). So we have self-proteins, self-peptides and self-epitopes. In a healthy person, the body will not make antibodies that bind strongly to self-peptides (self-tolerance).

DNA is a chain of base-pairs. The DNA base-pair sequence determines the amino acid sequence in the protein produced. If there is a mutation that alters a single base-pair, the resulting protein will have a single amino acid that is altered. To prevent

cancer, the immune system is capable of making antibodies against such altered peptides. Such antibodies can also weakly bind (cross react) to the unaltered normal peptide thus resulting in destruction of some healthy cells.

Say a normal protein has the following peptide (10 amino acids, each represented by its 1 letter code):

ALSTLVVNKI

Say DNA in a cell mutates due to a carcinogen exposure and it alters the protein thus resulting in this peptide with a single amino acid change:

ALSTLVV**S**KI

When the immune system makes antibodies targeted at ALSTLVV**S**KI (to attack the cell with the DNA mutation), the same antibodies can weakly bind to the normal ALSTLVVNKI peptide.

ALSTLVVNKI is an epitope associated with rheumatoid arthritis (RA).

So as a result of the immune system defending against cancer, the person can develop RA.

Now consider vaccines containing animal proteins. Animal proteins are very similar to human proteins, containing only occasional amino acid differences. An animal peptide could therefore have the ALSTLVV**S**KI sequence. Such a vaccine would fool the immune system into creating an anti-cancer immune response, creating antibodies targeted at ALSTLVV**S**KI. The result is vaccine induced RA.

Therefore one can predict that analyzing epitopes associated with autoimmune diseases, such single amino acid difference compared to animal peptides present in vaccines, would occur more frequently than can be expected merely by chance. The analysis confirms that this prediction is valid.

Abstract

The National Institute of Allergy and Infectious Diseases (NIAID) sponsors the Immune Epitope Data Base (IEDB). IEDB contains epitopes identified from the medical literature and organized by diseases and categories of diseases. All epitopes (23000+) associated with 82 autoimmune diseases in humans were analyzed.

The role of animal, plant, fungal proteins contained in vaccines in the etiology of autoimmune diseases have been described in humans and animals. BLASTP was used to analyze IEDB derived epitopes for sequence alignment to animal, plant, fungal (APF) proteins present in vaccines and biologics. Specifically, the search was performed against bovine, chicken, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes.

The results show that 57% of epitopes differed by exactly one amino acid residue from an APF peptide. 78% of the epitopes differed by up to two amino acid residues from an APF peptide. The rest of the epitopes were either identical or differed by more than two amino acid residues.

A majority of IEDB epitopes analyzed were 9-mer peptides. Comparing randomly selected 9-mer human peptides with APF proteomes, the probability of single amino acid residue difference (SAARD) outcomes was derived. This was used to estimate the probability that actual IEDB SAARD alignments to APF peptides were merely a chance outcome. The estimates show that the probability that the observed IEDB alignments to APF being merely a chance outcome are vanishingly small. So the results make it absolutely clear that APF proteins in vaccines cause all these autoimmune diseases.

Introduction

Vaccines contain thousands of residual animal, plant and fungal (APF) proteins from the manufacturing process (1???6)???. 293 chicken proteins were identified in the influenza vaccine (7)???, for example. Actin and vimentin proteins were detected in the Priorix Tetra vaccine (8)???. Immunization with homologous xenogeneic antigens resulting in autoimmune diseases has been known for at least 40 years (9)???. Vaccines that contain bovine proteins caused autoimmunity in dogs (10)???. We previously described the immunological mechanism involved in autoimmunity induction by immunization with homologous xenogeneic antigens (11)???.

Cancer cells have minor differences when compared to healthy cells. Due to mutation of the DNA encoding the proteins, cancer cells can display altered proteins on their surface. Healthy cancer defense mechanisms include immune responses directed at such altered proteins. Therefore an immune response directed against cancer cells always carries a risk of cross

reactive immune responses against healthy cells displaying the unaltered protein. Therefore, cancer induced autoimmune responses are a consequence of normal, healthy immune system behavior.

Animal proteins have minor differences compared to human proteins. Peptides that are identical between humans and animals are unlikely to cause any problem due to strong self tolerance. However, peptides with one amino acid residue difference produce the strongest cross reactive immune responses (11)???. They are ideally suited to induce autoimmune diseases. Injecting animal proteins results in anti-cancer immune responses because the immune system perceives animal proteins as altered human proteins. Adjuvants in the vaccine boost this anti-cancer immune response. This artificial anti-cancer response directed at thousands of APF proteins in vaccines or biologics, therefore cross react and cause numerous autoimmune disorders.

For this reason, one can predict that single amino acid residue difference (SAARD) between autoimmune disease related epitopes in the IEDB and homologous APF peptides in vaccines, would occur at a higher probability than by mere chance. We perform a BLASTP analysis to verify.

Methods

Basic local alignment search tool for proteins (BLASTP) (12)???, Universal Protein Resource (UniProt)(13)??? and the Immune Epitope Database (IEDB) (14)??? were used for bioinformatics analysis.

Specifically, the BLASTP sequence alignment of IEDB peptides was performed against bovine, chick, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes. Vaccines and biologics contain residual proteins from all these organism due to media used to grow viruses or bacteria, recombinant cells/organisms used for protein expression or as excipients.

Results

57% of IEDB peptides have a SAARD and 78% have up to two amino acid differences compared to animal, fungal or plant peptides present in vaccines.

Discussion

Could this result be a chance occurrence?

A majority of IEDB epitopes analyzed were 9-mer peptides. Five thousand 9-mer peptides were chosen at random from the human proteome. BLASTP was run using these peptides to compare against each organism???s proteome or a subset. This provides us the probability that randomly selected human peptides have an alignment providing a SAARD compared to peptides from these organisms. These are listed in table 1 under ??? Random SAARD alignment???. Given this, we can compute the probability of the actual SAARD alignment to IEDB epitopes, occurring by chance. This is listed in table 1 under ???Estimated probability of actual SAARD outcome occurring just by chance???.

For a simple coin toss example, we would perform the calculation as follows:

Computing probability of say a 7 heads, 3 tails outcome of 10 trials of a fair coin:

Probability = (0.5^7) x (0.5^3) x 10! / (7! x 3!)

Where:

0.5 is the probability of a head or tail outcome of a fair coin.

For an unfair coin, say probability of head outcome = 0.4 and tail outcome 0.6, we would have:

Probability = (0.4^7) x (0.6^3) x 10! / (7! x 3!)

For the IEDB peptide probability analysis, the outcome is for 23192 trials (peptides). The ???head outcome??? is the ???Random SAARD alignment ??? entries in table 1. The ???tail outcome??? probability is 1-???head outcome???.

Sample calculation for Chinese Hamster:

Probability = ((889/5000)^4574) x ((4111/5000)^18618) x 23192! / (4574! x 18618!)

Probability = 1.488e-15

Where: 889*100/5000 = 17.8% is the entry in Table 1 for Chinese Hamster. BLASTP analysis shows 889 SAARD out of 5000 peptides analyzed.

And, 4574*100/23192=19.7% is the IEDB entry in Table 1 for Chinese Hamster. BLASTP analysis shows 4574 SAARD out of 23192 peptides analyzed.

So the 1.488e-15 value is the probability that we will have exactly 4574 SAARD alignments out of 23192 peptides. The probability goes down for all values > 4574. Conservatively, applying the same probability as for 4574, to all values >4574, we can calculate the probability of the chance occurrence of 4574 or greater number of SAARD alignments as 1.488e15 * 18618 = 27e-12, entry in table.

The Gnome calculator was used to perform these calculations and the results were verified using the Qalculate! calculator and WolframAlpha (15)??? since spreadsheets are unable to perform these calculations.

Table 1

Organism	Random SAARD alignment Number of Peptides(%)	Actual (IEDB) SAARD alignment Number of Peptides (%)	Estimated probability of actual SAARD outcome occurring just by chance	Remarks
African green monkey (*Chlorocebus aethiops*)	26 (0.5)	420 (1.8)	~1.7e-96	Probability is vanishir vaccines,
Cow (*Bos taurus*)	936 (18.7)	4385 (18.9)	~1	There are occurred ju cow protei amount is bovine gel vaccines. S tissues in t other cow more likel entry belo
Cow???s Milk (*Bos taurus*)	0 (0)	12 (0.05)	0	Probability is 0. So th these disea
Chinese Hamster (*Cricetulus griseus*)	889 (17.8)	4574 (19.7)	~27e-12	Probability is vanishir vaccines, b
Chicken (*Gallus gallus*)	536 (10.7)	3901 (16.8)	<1e-100	Probability is vanishir vaccines, porcine an embryo is proteins ca
Guinea Pig (*Cavia porcellus*)	837 (16.7)	4439 (19.1)	~1e-18	Probability is vanishir vaccines,
Mice (*Mus musculus*)	940 (18.8)	4467 (19.3)	~1	There are occurred ju mice prote amount is cells are u proteins pr present in be present
Maize (*Zea mays*)	303 (6.1)	1667 (7.2)	~5e-9	Probability is vanishir vaccines,
Peanut (*Arachis hypogaea*)	223 (4.5)	1697 (7.3)	~79e-81	Probability is vanishir vaccines,

Yeast (*Saccharomyces cerevisiae)*	64 (1.3)	828 (3.6)	<1e-100	Probabilit is vanishi vaccines,
Sesame (*Sesamum indicum*)	155 (3.1)	1398 (6.0)	<1e-100	Probabilit is vanishi vaccines,
Soy (*Glycine max)*	215 (4.3)	1548 (6.7)	~86e-59	Probabilit is vanishi vaccines,
Pig (*Sus scrofa*)	963 (19.3)	4407 (19.0)	~1	There are occurred j porcine pr amount is used in va present in vaccines b present. T
Wheat (*Triticum aestivum*)	138 (2.8)	977 (4.2)	~18e-33	Probabilit is vanishi vaccines,

The calculations make it clear that the findings cannot be merely a chance outcome and that immunization against animal/plant/fungal antigens in the vaccines do cause these autoimmune diseases in the IEDB.

Conclusion

Vaccines containing animal, plant or fungal proteins are extremely dangerous and cause numerous autoimmune diseases and cancer (16???19)???. All non-target proteins in vaccines must be immediately removed using processes such affinity chromatography (20)???.

Subject: Verizon is killing my family using 5G cellular radiation. Your family is next.

Verizon is installing 5G antennas on light poles next to my house to kill my family by causing cancer. Your family comes next.

Studies have repeatedly shown that cell phone radiation is unsafe and causes cancer. Big Telecom is corrupting the science to lie and kill for profit.

Google appropriately displays an ad showing a cancer-stricken child at St.Jude hospital, above an article on cell phone antennas on light/telephone poles.

https://www.cdph.ca.gov/Programs/CCDPHP/DEODC/EHIB/CDPH%20Document%20Library/Cell-Phone-Guidance.pdf

Report of final results regarding brain and heart tumors in Sprague-Dawley rats exposed from prenatal life until natural death to mobile phone radio frequency field representative of a 1.8 GHz GSM base station environmental emission.
https://www.ncbi.nlm.nih.gov/pubmed/29530389

CONCLUSIONS:
The RI findings on far field exposure to RFR are consistent with and reinforce the results of the NTP study on near field exposure, as both reported an increase in the incidence of tumors of the brain and heart in RFR-exposed Sprague-Dawley rats. These tumors are of the same histotype of those observed in some epidemiological studies on cell phone users. These experimental studies provide sufficient evidence to call for the re-evaluation of IARC conclusions regarding the carcinogenic potential of RFR in humans.

National Institute of Environmental Health Sciences (NIEHS)/National Toxicology Program (NTP)

High Exposure to Radio Frequency Radiation Associated With Cancer in Male Rats

https://www.niehs.nih.gov/news/newsroom/releases/2018/november1/index.cfm

"We believe that the link between radio frequency radiation and tumors in male rats is real, and the external experts agreed," said Bucher.

The carcinogenic potential of non-ionizing radiations: The cases of S-50 Hz MF and 1.8 GHz GSM radio frequency radiation.

FCC's fake science meets reality

WHO

https://www.iarc.fr/wp-content/uploads/2018/07/pr208_E.pdf

"The WHO/International Agency for Research on Cancer (IARC) has classified radiofrequency electromagnetic fields as possibly carcinogenic to humans (Group 2B),based on an increased risk for glioma, a malignant type of brain cancer, associated with wireless phone use."

FCC

The following FCC site says:

https://www.fcc.gov/engineering-technology/electromagnetic-compatibility-division/radio-frequency-safety/faq/rf-safety#Q5

"It is generally agreed that further research is needed to determine the generality of such effects and their possible relevance, if any, to human health."

"research is continuing"

"The FDA, which has primary jurisdiction for investigating mobile phone safety, has stated that it cannot rule

out the possibility of risk, but if such a risk exists, "it is probably small." "

That's called speculation, not science, from the same corrupted FDA.

"Further, it has stated that, while there is no proof that cellular telephones can be harmful, concerned individuals can take various precautionary actions, including limiting conversations on hand-held cellular telephones and making greater use of telephones with hands-free kits where there is a greater separation distance between the user and the radiating antenna."

"no proof that cellular telephones can be harmful"? That is **UNACCEPTABLE NONSENSE**. We want proof that cellular telephones/antennas **ARE HARMLESS** before **ANY DEPLOYMENT**.

Taking that advise from the FDA we demand that such "small cell" antennas NOT be installed, so we can get a greater separation distance between the user and the radiating antenna.

"The Government Accountability Office (GAO) prepared a report of its investigation into safety concerns related to mobile phones.
The report concluded that further research is needed to confirm whether mobile phones are completely safe for the user."

The **SAFETY SCIENCE SIMPLY DOES NOT EXIST**. Without the science, you CANNOT create a safety specification. So the current "specifications" are ridiculous, arbitrary, PROVEN TO BE DANGEROUS and ABSOLUTELY UNACCEPTABLE.

The corrupted, incompetent FCC should STOP LYING about RF safety. We have to demand that all such cell installations be IMMEDIATELY BANNED AND TORN DOWN until the UNCORRUPTED SCIENCE is completed.

Reality

After several childhood cancer cases at one school, parents question radiation from cell tower

https://www.cbsnews.com/news/cell-tower-shut-down-some-california-parents-link-to-several-cases-of-childhood-cancer/

Firefighters suffer neurological disorders

https://www.iaff.org/om/cell-tower-radiation-health-effects/

How much abuse can the human body take? Pesticide-laden food, rocket fuel in drinking water, polluted air, dirty, contaminated vaccines, carcinogen-laden pharmaceuticals, power line radiation and now 5G on top of 2/3/4G radiation.

FAA/Boeing lied. 346 died due to the 737 MAX. FDA/Pharma lie. Vaccines maim and kill millions. FCC/Telecom lie. Cellular radiation maims and kills millions.

Corruption kills. COVID or not.

Covid-19: politicisation, "corruption," and suppression of science
https://www.bmj.com/content/371/bmj.m4425

Subject: Fwd: Re: Confirmation of my predictions on the role of mast cells, histamine in COVID-19

COVID-19 severity is caused by an allergic reaction to the coronavirus involving mast cell degranulation and histamine release (elicitation). The development of this allergy (sensitization) was caused by vaccine components that are similar to coronavirus proteins.

Sharing with permission.

Subject: Confirmation of my predictions on the role of mast cells, histamine in COVID-19
ï¿½

Prof. Steinman,

Thought this may be of interest:

I have been predicting for 4 months now that mast cell stabilizers and antihistamines (like H1/H2 blockers) can help in COVID-19.

I described the details, connecting mast cells, histamine, COVID-19 and dengue in my article below (uploaded Apr 11'20):

Immunological mechanisms explaining the role of IgE, mast cells, histamine, elevating ferritin, IL-6, D-dimer, VEGF levels in COVID-19 and dengue, potential treatments such as mast cell stabilizers, antihistamines, Vitamin C, hydroxychloroquine, ivermectin and azithromycin
https://doi.org/10.5281/zenodo.3748303

As you may have read, famotidine (an antihistamine, H2 blocker) has been found to help in COVID-19, just like I predicted.

A large group of experts with expertise covering drug discovery, vaccines, pathology etc. recently (May 24'20 report) hypothesized and investigated numerous potential mechanisms involved in famotidine's beneficial effect in COVID-19. The study was funded by the "Department of Defense (DoD), Defense Threat Reduction Agency (DTRA), and the Joint Science and Technology Office (JSTO) of the Chemical and Biological Defense Program (CBDP) for funding under the Discovery of Medical countermeasures Against Novel Entities (DOMANE) initiative."

COVID-19: Famotidine, Histamine, Mast Cells, and Mechanisms
www.researchsquare.com/article/rs-30934/v1

They conclude: "We propose that the principal famotidine mechanism of action for COVID-19 involves on-target histamine receptor H2 activity, and that development of clinical COVID-19 involves dysfunctional mast cell activation and histamine release."

They write: " ... COVID-19 disease progression could share an immunologic basis with Dengue hemorrhagic fever" and

"This model is also supported by the significant overlap in the clinical signs and symptoms of the initial phase of COVID-19 disease and those of mast cell activation syndrome (MCAS) 89-92 as well similarities to Dengue hemorrhagic fever and shock syndrome (including T cell depletion) during the later phase of COVID-19"

"If COVID-19 is partially driven by dysfunctional mast cell degranulation, then a variety of medical interventions employing

marketed drugs useful for treating mast cell-related disorders may help to reduce death and disease associated with SARS-CoV-2 infection. Examples include drugs with mast cell stabilizing activity, other histamine antagonists (for example H1 and H4 types), leukotriene antagonists and leukotriene receptor antagonists"

In other words, their findings are in perfect agreement with my prediction and analysis.

Thanks,

Vinu

Dr Menachery and Professor Baric

I've just read this article:

https://nam03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2Fnm.3985%23ref-CR2&data=02%7C01%7Cvimenach%40utmb.edu%7C5d7f1c89b0a2466dc2d408d810537f59%7C7bef256d85db4526a72d31aea2546852%7C0%7C1%7C637277298089224467&sdata=LKjNwoACjfbifwfhDQtkvbWHHEdw%2F2%2BQMydkOdIGOC0%3D&reserved=0

which says:

"Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve in vitro titers equivalent to epidemic strains of SARS-CoV. Additionally, in vivo experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis."

Did you and your group, deliberately or inadvertantly, create the virus now known as COVID-19?

Was that virus then somehow released into the environment in Wuhan, deliberately or accidentally, by one or more of your co-authors, who live and work there?

Please respond openly and honestly, thank you.

Look forward to hearing from you.

best wishes
Marcus Williamson

SARS_SpleenBaselineMs.docx
Figuresv2.pdf

Hi everyone,

As promised, here is a manuscript describing pre-infection T cell correlates of virologic and clinical outcomes following SARS-CoV infection using data from the screen. I'd love to get everyone's feedback as soon as you can so that we can submit while the field is still hot. I'd also welcome journal suggestions, as I'm not sure of the best place to submit. Oh, and let me know if I've left authors off the list – it wasn't intentional, I just don't always know who worked on the screen!

As usual, even if you don't have any comments, please send me your approval to submit at the very least.

Hope everyone is hanging in there!
Jenny

Subject: How dirty vaccines turned COVID-19 into a killer; Make Famotidine/Cetirizine standard of care for COVID-19; COVID-19 vaccines are unsafe

Immunological mechanisms explaining the role of vaccines, IgE, mast cells, histamine, elevating ferritin, IL-6, D-dimer, VEGF levels in COVID-19 and dengue, potential treatments such as mast cell stabilizers, antihistamines: Predictions and confirmations

https://doi.org/10.5281/zenodo.4100663

"Trump had been administered a Regeneron polyclonal antibody cocktail and has been taking zinc, vitamin D, **famotidine**, melatonin and a daily aspirin."

https://www.cnn.com/2020/10/02/politics/president-donald-trump-walter-reed-coronavirus/index.html

Trump gets **famotidine** for COVID-19 but it is not "standard of care" (SOC) for you and me.

The IDSA is killing hundreds of thousands by **DENYING** them **famotidine**, a cheap, safe and effective over-the-counter drug for COVID-19.

Did the money from vaccine makers and remdesivir maker Gilead, sloshing around at IDSA, influence their decision?

https://www.idsociety.org/practice-guideline/covid-19-guideline-treatment-and-management/

"The guideline panel suggests against famotidine for the sole purpose of treating COVID-19, unless in the context of a clinical trial."

Here's what the authors collected:

KATHRYN M EDWARDS collected ~$150k from vaccine makers.

https://openpaymentsdata.cms.gov/physician/651167

Lindsey Baden collected ~$50k from Janssen Pharma (a vaccine maker).

https://openpaymentsdata.cms.gov/physician/884460

RAJESH TIM GANDHI collected ~$40k from Gilead and Merck.

https://openpaymentsdata.cms.gov/physician/1273478

WILLIAM J MULLER collected ~$140k from Astrazeneca, Merck and Janssen

https://openpaymentsdata.cms.gov/physician/613576

SHUMEL SHOHAM collected $180k from Merck, Gilead, Emergent, Jannsen

https://openpaymentsdata.cms.gov/physician/780712

Mechanistic evidence (prediction)

Proteins that contaminate influenza vaccines have high homology to SARS-CoV-2 proteins thus increasing risk of severe COVID-19 disease and mortality
https://doi.org/10.5281/zenodo.3996984

Epidemiological evidence (confirmation)

Flu shot increases risk of COVID-19 Hospitalization **240%**, ICU admission **204%**, Hospital mortality **232%**.

Safety of Influenza Vaccine during COVID-19

https://doi.org/10.1017/cts.2020.543

"Among individuals with a positive SARS-CoV-2 test, patients previously vaccinated for influenza in 2019 were more likely to be hospitalized. Once hospitalized, they were more likely to be admitted to the ICU and die during hospitalization."

From Table 1:

	Never Vaccinated (N=1,125)	Vaccinated in 2019 (N=309)
Hospitalization - no.(%)	192 (17.1)	127 (41.1)
ICU Admission - no.(%)	77 (6.8)	43 (13.9)

IgE mediated sensitization to peptides that have homology to 2019-nCoV peptides may contribute to disease severity. In that case, antihistamines and other allergy treatments such as mast cell stabilizers may help reduce infection severity.

A BLASTP analysis of 2019-nCoV proteome against common vaccine antigens was performed. Preliminary results suggest that IgE mediated sensitization to common vaccine antigens can result in cross reactive immune responses to 2019-nCoV.

Lay summary

Proteins are a chain of amino acids. Proteins can have up to several hundred amino acids. Snippets of proteins (peptides), 7-15 amino acids in length are important in immunology. There are 20 types of amino acids. Each is assigned a letter (1 letter code).

Antibodies are proteins that can bind to peptides that have a specific amino acid sequence. Such a target peptide is known as an epitope.?? When an antibody binds to a peptide (which is part of a protein, which in turn may be part of a cell surface), it can trigger an immune attack on the cell. If the cell were a bacterium, the bacterium would be killed.

Humans (like all organisms) are made of numerous proteins (self proteins). So we have self-proteins, self-peptides and self-epitopes. In a healthy person, the body will not make antibodies that bind strongly to self-peptides (self-tolerance).

DNA is a chain of base-pairs. The DNA base-pair sequence determines the amino acid sequence in the protein produced. If there is a mutation that alters a single base-pair, the resulting protein will have a single amino acid that is altered. To prevent cancer, the immune system is capable of making antibodies against such altered peptides. Such antibodies can also weakly bind (cross react) to the unaltered normal peptide thus resulting in destruction of some healthy cells.

Say a normal protein has the following peptide (10 amino acids, each represented by its 1 letter code):

ALSTLVVNKI

Say DNA in a cell mutates due to a carcinogen exposure and it alters the protein thus resulting in this peptide with a single amino acid change:

ALSTLVV**S**KI

When the immune system makes antibodies targeted at ALSTLVV**S**KI (to attack the cell with the DNA mutation), the same antibodies can weakly bind to the normal ALSTLVVNKI peptide.

ALSTLVVNKI is an epitope associated with rheumatoid arthritis (RA).

So as a result of the immune system defending against cancer, the person can develop RA.

Now consider vaccines containing animal proteins. Animal proteins are very similar to human proteins, containing only occasional amino acid differences. An animal peptide could therefore have the ALSTLVV**S**KI sequence. Such a vaccine

would fool the immune system into creating an anti-cancer immune response, creating antibodies targeted at ALSTLVV**S**KI. The result is vaccine induced RA.

Therefore one can predict that analyzing epitopes associated with autoimmune diseases, such single amino acid difference compared to animal peptides present in vaccines, would occur more frequently than can be expected merely by chance. The analysis confirms that this prediction is valid.

Abstract

The National Institute of Allergy and Infectious Diseases (NIAID) sponsors the Immune Epitope Data Base (IEDB). IEDB contains epitopes identified from the medical literature and organized by diseases and categories of diseases. All epitopes (23000+) associated with 82 autoimmune diseases in humans were analyzed.

The role of animal, plant, fungal proteins contained in vaccines in the etiology of autoimmune diseases have been described in humans and animals. BLASTP was used to analyze IEDB derived epitopes for sequence alignment to animal, plant, fungal (APF) proteins present in vaccines and biologics. Specifically, the search was performed against bovine, chicken, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes.

The results show that 57% of epitopes differed by exactly one amino acid residue from an APF peptide. 78% of the epitopes differed by up to two amino acid residues from an APF peptide. The rest of the epitopes were either identical or differed by more than two amino acid residues.

A majority of IEDB epitopes analyzed were 9-mer peptides. Comparing randomly selected 9-mer human peptides with APF proteomes, the probability of single amino acid residue difference (SAARD) outcomes was derived. This was used to estimate the probability that actual IEDB SAARD alignments to APF peptides were merely a chance outcome. The estimates show that the probability that the observed IEDB alignments to APF being merely a chance outcome are vanishingly small. So the results make it absolutely clear that APF proteins in vaccines cause all these autoimmune diseases.

Introduction

Vaccines contain thousands of residual animal, plant and fungal (APF) proteins from the manufacturing process (1???6)???. 293 chicken proteins were identified in the influenza vaccine (7)???, for example. Actin and vimentin proteins were detected in the Priorix Tetra vaccine (8)???. Immunization with homologous xenogeneic antigens resulting in autoimmune diseases has been known for at least 40 years (9)???. Vaccines that contain bovine proteins caused autoimmunity in dogs (10)???. We previously described the immunological mechanism involved in autoimmunity induction by immunization with homologous xenogeneic antigens (11)???.

Cancer cells have minor differences when compared to healthy cells. Due to mutation of the DNA encoding the proteins, cancer cells can display altered proteins on their surface. Healthy cancer defense mechanisms include immune responses directed at such altered proteins. Therefore an immune response directed against cancer cells always carries a risk of cross reactive immune responses against healthy cells displaying the unaltered protein. Therefore, cancer induced autoimmune responses are a consequence of normal, healthy immune system behavior.

Animal proteins have minor differences compared to human proteins. Peptides that are identical between humans and animals are unlikely to cause any problem due to strong self tolerance. However, peptides with one amino acid residue difference produce the strongest cross reactive immune responses (11)???. They are ideally suited to induce autoimmune diseases. Injecting animal proteins results in anti-cancer immune responses because the immune system perceives animal proteins as altered human proteins. Adjuvants in the vaccine boost this anti-cancer immune response. This artificial anti-cancer response directed at thousands of APF proteins in vaccines or biologics, therefore cross react and cause numerous autoimmune disorders.

For this reason, one can predict that single amino acid residue difference (SAARD) between autoimmune disease related epitopes in the IEDB and homologous APF peptides in vaccines, would occur at a higher probability than by mere chance. We perform a BLASTP analysis to verify.

Methods

Basic local alignment search tool for proteins (BLASTP) (12)???, Universal Protein Resource (UniProt)(13)??? and the Immune Epitope Database (IEDB) (14)??? were used for bioinformatics analysis.

Specifically, the BLASTP sequence alignment of IEDB peptides was performed against bovine, chick, porcine, guinea pig, African green monkey, Chinese hamster, murine, peanut, soy, wheat, corn, sesame and *Saccharomyces cerevisiae* proteomes. Vaccines and biologics contain residual proteins from all these organism due to media used to grow viruses or bacteria, recombinant cells/organisms used for protein expression or as excipients.

Results

57% of IEDB peptides have a SAARD and 78% have up to two amino acid differences compared to animal, fungal or plant peptides present in vaccines.

Discussion

Could this result be a chance occurrence?

A majority of IEDB epitopes analyzed were 9-mer peptides. Five thousand 9-mer peptides were chosen at random from the human proteome. BLASTP was run using these peptides to compare against each organism???s proteome or a subset. This provides us the probability that randomly selected human peptides have an alignment providing a SAARD compared to peptides from these organisms. These are listed in table 1 under ??? Random SAARD alignment???. Given this, we can compute the probability of the actual SAARD alignment to IEDB epitopes, occurring by chance. This is listed in table 1 under ???Estimated probability of actual SAARD outcome occurring just by chance???.

For a simple coin toss example, we would perform the calculation as follows:

Computing probability of say a 7 heads, 3 tails outcome of 10 trials of a fair coin:

Probability = (0.5^7) x (0.5^3) x 10! / (7! x 3!)

Where:

0.5 is the probability of a head or tail outcome of a fair coin.

For an unfair coin, say probability of head outcome = 0.4 and tail outcome 0.6, we would have:

Probability = (0.4^7) x (0.6^3) x 10! / (7! x 3!)

For the IEDB peptide probability analysis, the outcome is for 23192 trials (peptides).

The ???head outcome??? is the ???Random SAARD alignment ??? entries in table 1. The ???tail outcome??? probability is 1-???head outcome???.

Sample calculation for Chinese Hamster:

Probability = ((889/5000)^4574) x ((4111/5000)^18618) x 23192! / (4574! x 18618!)

Probability = 1.488e-15

Where: 889*100/5000 = 17.8% is the entry in Table 1 for Chinese Hamster. BLASTP analysis shows 889 SAARD out of 5000 peptides analyzed.

And, 4574*100/23192=19.7% is the IEDB entry in Table 1 for Chinese Hamster. BLASTP analysis shows 4574 SAARD out of 23192 peptides analyzed.

So the 1.488e-15 value is the probability that we will have exactly 4574 SAARD alignments out of 23192 peptides. The probability goes down for all values > 4574. Conservatively, applying the same probability as for 4574, to all values >4574, we can calculate the probability of the chance occurrence of 4574 or greater number of SAARD alignments as 1.488e15 * 18618 = 27e-12, entry in table.

The Gnome calculator was used to perform these calculations and the results were verified using the Qalculate! calculator and WolframAlpha (15)??? since spreadsheets are unable to perform these calculations.

Table 1

Organism	Random SAARD alignment Number of Peptides(%)	Actual (IEDB) SAARD alignment Number of Peptides (%)	Estimated probability of actual SAARD outcome occurring just by chance	Remarks
African green monkey (*Chlorocebus aethiops*)	26 (0.5)	420 (1.8)	~1.7e-96	Probabilit is vanishi vaccines,
Cow (*Bos taurus*)	936 (18.7)	4385 (18.9)	~1	There are occurred j cow protei amount is bovine gel vaccines. tissues in other cow more likel

				entry belo
Cow???s Milk (*Bos taurus*)	0 (0)	12 (0.05)	0	Probability is 0. So th these disea
Chinese Hamster (*Cricetulus griseus*)	889 (17.8)	4574 (19.7)	~27e-12	Probability is vanishi vaccines,
Chicken (*Gallus gallus*)	536 (10.7)	3901 (16.8)	<1e-100	Probability is vanishi vaccines, porcine an embryo is proteins ca
Guinea Pig (*Cavia porcellus*)	837 (16.7)	4439 (19.1)	~1e-18	Probability is vanishi vaccines,
Mice (*Mus musculus*)	940 (18.8)	4467 (19.3)	~1	There are occurred j mice prote amount is cells are u proteins p present in be present
Maize (*Zea mays*)	303 (6.1)	1667 (7.2)	~5e-9	Probability is vanishi vaccines,
Peanut (*Arachis hypogaea*)	223 (4.5)	1697 (7.3)	~79e-81	Probability is vanishi vaccines,
Yeast (*Saccharomyces cerevisiae*)	64 (1.3)	828 (3.6)	<1e-100	Probability is vanishi vaccines,
Sesame (*Sesamum indicum*)	155 (3.1)	1398 (6.0)	<1e-100	Probability is vanishi vaccines,

Soy (*Glycine max)*	215 (4.3)	1548 (6.7)	~86e-59	Probability is vanishir vaccines,
Pig (*Sus scrofa*)	963 (19.3)	4407 (19.0)	~1	There are occurred j porcine pr amount is used in va present in vaccines b present. T
Wheat (*Triticum aestivum*)	138 (2.8)	977 (4.2)	~18e-33	Probability is vanishir vaccines,

The calculations make it clear that the findings cannot be merely a chance outcome and that immunization against animal/plant/fungal antigens in the vaccines do cause these autoimmune diseases in the IEDB.

Conclusion

Vaccines containing animal, plant or fungal proteins are extremely dangerous and cause numerous autoimmune diseases and cancer (16???19)???. All non-target proteins in vaccines must be immediately removed using processes such affinity chromatography (20)???.

Dr Menachery and Professor Baric

I've just read this article:

https://nam11.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2Fnm.3985%23ref-CR2&data=04%7C01%7Cvimenach%40utmb.edu%7Cb52e9066a7724d5cb13d08d88a1a4d21%7C7bef256d85db4526a72d31aea2546852%7C0%7C0%7C637411192856738543%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C1000&sdata=5x6Vsf1BLhRL%2B%2BYCI%2FgI7OQTI9CZ23D65Pgk5DFeCxA%3D&reserved=0

which says:

"Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve in vitro titers equivalent to epidemic strains of SARS-CoV. Additionally, in vivo experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis."

Did you and your group, deliberately or inadvertantly, create the virus now known as COVID-19?

Was that virus then somehow released into the environment in Wuhan, deliberately or accidentally, by one or more of your co-authors, who live and work there?

Please respond openly and honestly, thank you.

Look forward to hearing from you.

best wishes
Marcus Williamson

which says:

"Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve in vitro titers equivalent to epidemic strains of SARS-CoV. Additionally, in vivo experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis."

Did you and your group, deliberately or inadvertantly, create the virus now known as COVID-19?

Was that virus then somehow released into the environment in Wuhan, deliberately or accidentally, by one or more of your co-authors, who live and work there?

Please respond openly and honestly, thank you.

Look forward to hearing from you.

best wishes
Marcus Williamson

Dr Menachery and Professor Baric

Can you please reply to this email of 14 April 2020, shown below?

I have copied the UNC Chancellor and UTMB President, so that they can be aware of this apparent lack of responsiveness and openness of their staff.

Please respond openly and honestly to my questions.

I look forward to hearing from you, without further delay.

best wishes
Marcus Williamson

Subject: COVID-19 vaccine dangers; CDC's "Vaccines do not cause autism" lie, taken down; NH commission exposes FCC corruption, cellular radiation dangers

Vaccines absolutely do cause autism

The CDC has flip-flopped twice in ~5 months on the fraudulent claim that "Vaccines do not cause autism", on their website. It suggests that the CDC's vaccine/autism claims are based on the conjunction of Jupiter and Saturn, not science.

They were forced to take the false claim down because ICAN demonstrated there was **ZERO** science behind that claim.

The CDC Finally Capitulated To ICAN's Legal Demands and Removed the Claim that "Vaccines Do Not Cause Autism" From Its Website!

https://www.icandecide.org/ican_press/the-cdc-finally-capitulated-to-icans-legal-demands-and-removed-the-claim-that-vaccines-do-not-cause-autism-from-its-website/

THE CDC JUST SOLIDIFIED THAT ITS DECISIONS ARE NOT DRIVEN BY SCIENCE

https://www.icandecide.org/ican_press/the-cdc-just-solidified-that-its-decisions-are-not-driven-by-science/

FACT: Milk protein contaminated vaccines (DTap/Tdap/Prevnar 13/ActHiB) cause at least 75% of autism cases.

Autism pathogenesis: Piecing it all together, from end to beginning ...
https://doi.org/10.5281/zenodo.1477515

NOTICE!

By authority of the Nuremberg Code on Medical Experimentation, I do hereby exercise my right to refuse to submit to or to administer the Covid-19 vaccine. The United States Government has prosecuted, convicted and executed Medical Doctors who have violated the Nuremberg Code on Medical Experimentation. Aiders and abettors of Nuremberg Crimes are equally guilty and have also been prosecuted, convicted, and executed.

Francis A. Boyle
Professor of Law.

My comment in the Annals of Internal Medicine, against Fauci's "SARS-CoV-2 Vaccines: Much Accomplished, Much to Learn"

https://www.acpjournals.org/doi/10.7326/M21-0111

Vinu Arumugham Independent 18 January 2021
These vaccines are unsafe, unnecessary and must be immediately withdrawn

The vaccine safety claims made by the authors are unsupported by evidence. Vaccines must be designed for safety. These vaccines were not designed at all. So they are unsafe by definition. I predicted the allergic sensitization and autoimmunity risks with these vaccines which have now been confirmed.

The Pfizer/BioNTech vaccine is unnecessary, unsafe and should not be authorized.

https://www.regulations.gov/document?D=FDA-2020-N-1898-0039

Robert F Kennedy Jr. warned the FDA months back about the risk of allergic reactions due to the use of polyethylene glycol (PEG) in the vaccines.
https://childrenshealthdefense.org/defender/pfizer-covid-vaccine-allergic-reactions/

The FDA/VRBPAC ignored us and authorized these horrendously dangerous vaccines.

Recently, Dr. Peter Marks of the FDA admitted that the population was sensitized by PEG-containing pharmaceutical preparations (that include other vaccines/injections).

https://www.wsj.com/articles/scientists-eye-potential-culprit-for-covid-19-vaccine-allergic-reactions-11608901200?mod=hp_lead_pos2

“What we’re learning now is that those **allergic reactions could be somewhat more common** than the highly uncommon that we thought they were **because people do get exposed to polyethylene glycol in various pharmaceutical preparations,**” - Peter Marks, Director, CBER,FDA.

We of course already knew that any vaccine/injection that has enough allergen to cause a reaction, has more than enough allergen to guarantee sensitization/priming (causing the development of new allergy).

Evidence that Food Proteins in Vaccines Cause the Development of Food Allergies and Its Implications for Vaccine Policy

https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3571073

www.sciencemag.org/news/2020/12/suspicions-grow-nanoparticles-pfizer-s-covid-19-vaccine-trigger-rare-allergic-reactions

"he worries anti-PEG antibodies triggered by the first shot could increase the risk of an allergic reaction to the second or to PEGylated drugs."

- Janos Szebeni, an immunologist at Semmelweis University

So now, these vaccines have sensitized millions to PEG. The goal is to sensitize/boost PEG allergy in a 100 million more in the next 100 days.

PEG is contaminated with 1,4-dioxane, a carcinogen.

https://www.fda.gov/cosmetics/potential-contaminants-cosmetics/14-dioxane-cosmetics-manufacturing-byproduct

As predicted, Pfizer COVID-19 vaccine induced autoimmunity (thrombocytopenia) killed a Florida doctor. This is just the tip of the iceberg. Thousands of cases of vaccine induced autoimmune diseases may take months/years to be diagnosed and will be dismissed as unrelated to the vaccine.

https://www.nytimes.com/2021/01/12/health/covid-vaccine-death.html

Only a few lots were tested in the trial. No one has a clue what other lots will do. 100-fold variation of contaminants in vaccines makes trials and epidemiological studies worthless as I detailed in my comments in the Annals of Internal Medicine before. Vaccine safety remains an oxymoron.

https://www.acpjournals.org/doi/10.7326/m18-2101

California calls for pause of 330,000 doses, investigation after allergic reactions to Moderna vaccine batch

https://www.mercurynews.com/2021/01/18/coronavirus-california-calls-for-pause-investigation-after-allergic-reactions-to-moderna-vaccine-batch/

What's worse? Effective, life-saving, cheap, safe medicines such as famotidine/cetirizine/ivermectin are being ignored in this blind race to vaccinate at any cost.

Immunological mechanisms explaining the role of vaccines, IgE, mast cells, histamine, elevating ferritin, IL-6, D-dimer, VEGF levels in COVID-19 and dengue, potential treatments such as mast cell stabilizers, antihistamines: Predictions and confirmations

Dr Menachery and Professor Baric

Can you please reply to this email of 14 April 2020, shown below?

I have copied the UNC Chancellor and UTMB President, so that they can be aware of this apparent lack of responsiveness and openness of their staff.

Please respond openly and honestly to my questions.

I look forward to hearing from you, without further delay.

best wishes
Marcus Williamson

Dr Menachery and Professor Baric

I've just read this article:

https://nam11.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2Fnm.3985%23ref-CR2&data=04%7C01%7Cvimenach%40utmb.edu%7Cecda36bd6e614901bc2308d8d1d9312a%7C7bef256d85db4526a72d31aea2546852%7C0%7C1%7C637490078059902533%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C2000&sdata=VBUI2N5G%2FZFTWqyTydTr8IEZnWDsYUj3IKMIE6pUkMI%3D&reserved=0

which says:

"Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve in vitro titers equivalent to epidemic strains of SARS-CoV. Additionally, in vivo experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis."

Did you and your group, deliberately or inadvertantly, create the virus now known as COVID-19?

Was that virus then somehow released into the environment in Wuhan, deliberately or accidentally, by one or more of your co-authors, who live and work there?

Please respond openly and honestly, thank you.

Look forward to hearing from you.

best wishes
Marcus Williamson

Virologica Sinica is an academic journal which aims at presenting the cutting-edge research on viruses. The journal publishes peer-reviewed original research articles, reviews, and letters to the editor, to encompass the latest developments in all branches of virology, including research on animal, plant and microbe viruses. The journal welcomes articles on virus discovery and characterization, viral epidemiology, viral pathogenesis, virus-host interaction, vaccine development, antiviral agents and therapies, and virus related biotechniques. *Virologica Sinica*, the official journal of the Chinese Society for Microbiology, will serve as a platform for the communication and exchange of academic information and ideas in an international context.

The journal is indexed by: Science Citation Index (SCI), Journal Citation Reports (JCR), PubMed/Medline, Pubmed Central, Scopus, BIOSIS, Google Scholar.

Special Issue: SARS-CoV-2 and COVID-19 (II)
Issue Editor: Zheng-Li Shi, PhD, Wuhan Institute of Virology, Chinese Academy of Sciences

By the end of November 2020, SARS-CoV-2—the new coronavirus behind the disease COVID-19— has infected over 60 million people around the world and caused about one and a half million deaths. Facing the biggest global pandemic of the century, doctors, scientists and the scientific community have been working hard to uncover the pathogenesis and search for effective scientific solutions. *Virologica Sinica* has online published a series of original articles and reviews on SARS-CoV-2 and COVID-19, covering topics on clinical cohorts /cases and disease features, virus characterization and surveillance, diagnosis and improved methods, antiviral agents and therapeutic treatment, and etc, and they are collectively presented in this special issue. Those researches have greatly advanced our understandings of and empowered our strength to combat the disease. The cover depicts the SARS-CoV-2 virus particle, surrounded by human blood cells.

A Crowned Killer's Résumé: Genome, Structure, Receptors, and Origin of SARS-CoV-2

Free Full Text (HTML) *Free* Full Text (PDF)

Shichuan Wang, Mirko Trilling, Kathrin Sutter, Ulf Dittmer, Mengji Lu, Xin Zheng, Dongliang Yang, Jia Liu

The recent emergence and rapid global spread of the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) pose an unprecedented medical and socioeconomic crisis, and the disease caused by it, Coronavirus disease 2019 (COVID-19), was declared a pandemic by the World Health Organization (WHO) on March 11, 2020. Chinese scientists and physicians rapidly identified the causative pathogen, which turned out to be a novel betacoronavirus with high sequence similarities to bat and pangolin coronaviruses. The scientific community has ignited tremendous efforts to unravel the biological underpinning of SARS-CoV-2, which constitutes the foundation for therapy and vaccine development strategies. Here, we summarize the current state of knowledge on the genome, structure, receptor, and origin of SARS-CoV-2.

COVID-19: Antiviral Agents, Antibody Development and Traditional Chinese Medicine

Free Full Text (HTML) *Free* Full Text (PDF)

Wenyi Guan, Wendong Lan, Jing Zhang, Shan Zhao, Junxian Ou, Xiaowei Wu, Yuqian Yan, Jianguo Wu, Qiwei Zhang

The World Health Organization (WHO) has declared coronavirus disease 2019 (COVID-19) is the first pandemic caused by coronavirus named severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). Currently, there is no effective anti-SARS-CoV-2 drug approved worldwide for treatment of patients with COVID-19. Therapeutic options in response to the COVID-19 outbreak are urgently needed. To facilitate the better and faster development of therapeutic COVID-19 drugs, we present an overview of the global promising therapeutic drugs, including repurposing existing antiviral agents, network-based pharmacology research, antibody development and traditional Chinese medicine. Among all these drugs, we focus on the most promising drugs (such as favipiravir, tocilizumab, SARS-CoV-2 convalescent plasma, hydroxychloroquine, Lianhua Qingwen, interferon beta-1a, remdesivir, etc.) that have or will enter the final stage of human testing—phase III–IV clinical trials.

Summary of the Detection Kits for SARS-CoV-2 Approved by the National Medical Products Administration of China and Their Application for Diagnosis of COVID-19

Free Full Text (HTML) *Free* Full Text (PDF)

Ruhan A, Huijuan Wang, Wenling Wang, Wenjie Tan

The on-going global pandemic of coronavirus disease 2019 (COVID-19) caused by a novel coronavirus called severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) has been underway for about 11 months. Through November 20,2020,51 detection kits for SARS-CoV-2 nucleic acids (24 kits), antibodies (25 kits), or antigens (2 kits) have been approved by the National Medical Products Administration of China (NMPA). Convenient and reliable SARS-CoV-2 detection assays are urgently needed worldwide for strategic control of the pandemic. In this review, the detection kits approved in China are summarised and the three types of tests, namely nucleic acid, serological and antigen detection, which are available for the detection of COVID-19 are discussed in detail. The development of novel detection kits will lay the foundation for the control and prevention of the COVID-19 pandemic globally.

Human Monoclonal Antibodies: On the Menu of Targeted Therapeutics Against COVID-19

Free Full Text (HTML) *Free* Full Text (PDF)

Junsen Chen, Rui Huang, Yiwen Nie, Xinyue Wen, Ying Wu

Coronavirus disease 2019 (COVID-19), reminiscent of the severe acute respiratory syndrome (SARS) outbreak in 2003, has been a tragic disaster to people all over the world. As there is no specific drug for COVID-19, neutralizing antibodies are attracting more and more attention as one of the most effective means to combat the pandemic. Here, we introduced the etiological and serological characteristics of COVID-19, discussed the current stage of development of human monoclonal antibodies against SARS-CoV-2 and summarized the antigenic epitopes in the S glycoprotein, which may deepen the understanding of the profile of immune recognition and response against SARS-CoV-2 and provide insight for the design of effective vaccines and antibody-based therapies.

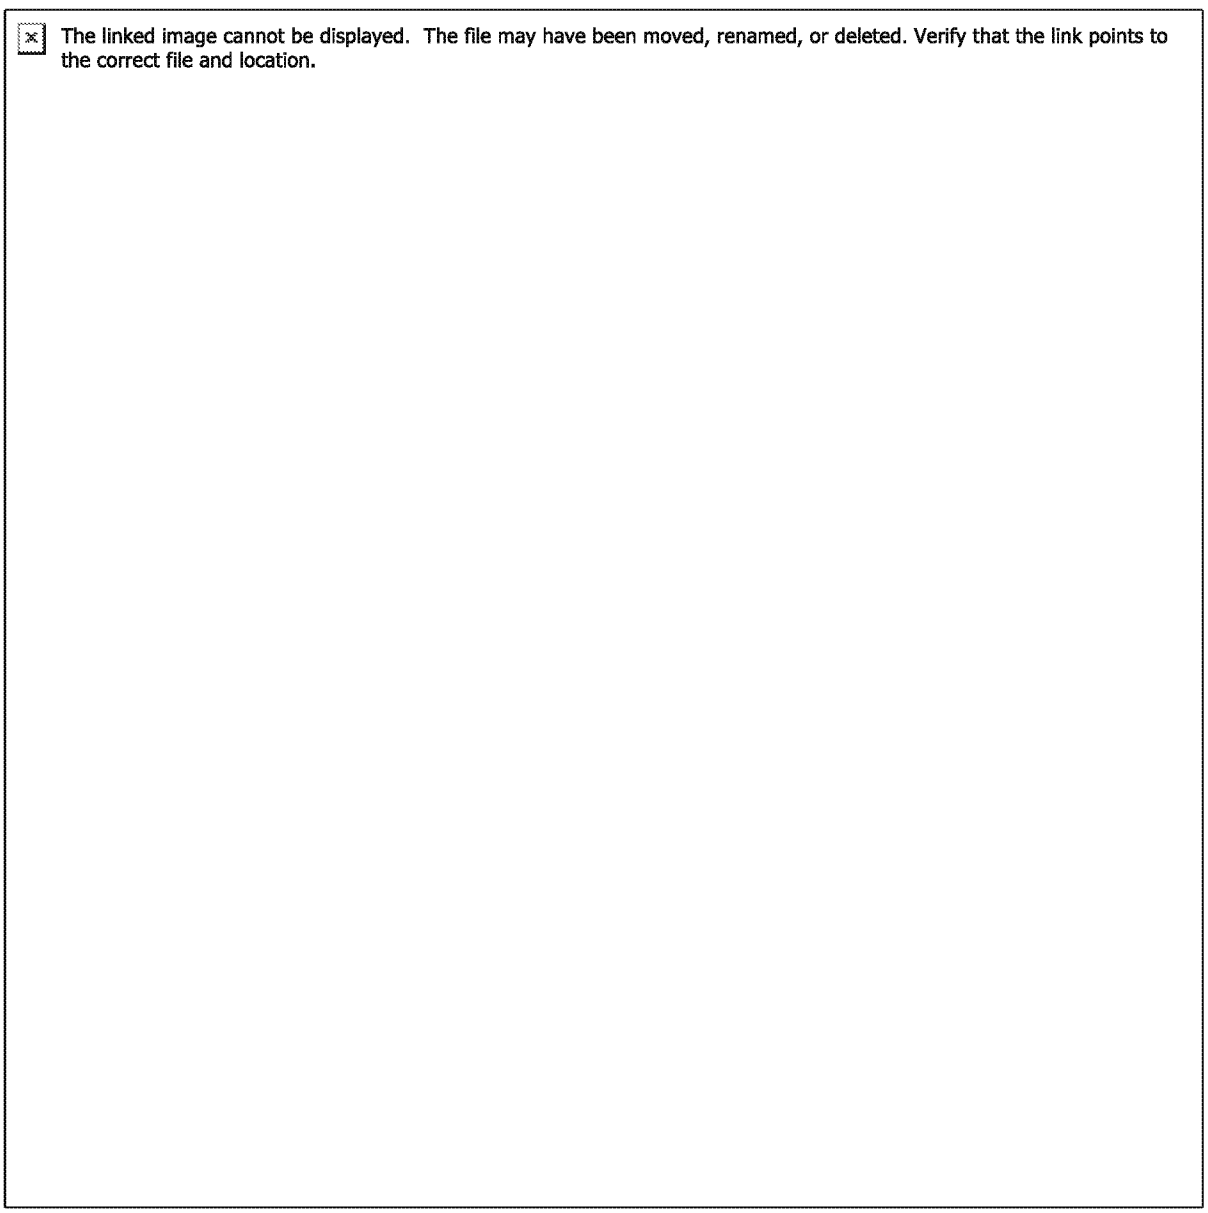
A Small-Scale Medication of Leflunomide as a Treatment of COVID-19 in an Open-Label Blank-Controlled Clinical Trial

Free Full Text (HTML) *Free* Full Text (PDF)

Ke Hu, Mengmei Wang, Yang Zhao, Yunting Zheng, Tao Wang, Zhishui Zheng, Xiaochen Li, Shaolin Zeng, Dong Zhao, Honglin Li, Ke Xu, Ke Lan

We recently reported that inhibitors against human dihydroorotate dehydrogenase (DHODH) have broad-spectrum antiviral activities including their inhibitory efficacies on SARS-CoV-2 replication in infected cells. However, there are limited data from clinical studies to prove the application of DHODH inhibitors in Coronavirus disease 2019 (COVID-19) patients. In the present study, we evaluated Leflunomide, an approved DHODH inhibitor widely used as a modest immune regulator to treat autoimmune diseases, in treating COVID-19 disease with a small-scale of patients. Cases of 10 laboratory-confirmed COVID-19 patients of moderate type with obvious opacity in the lung were included. Five of the patients were treated with Leflunomide, and another five were treated as blank controls without a placebo. All the patients accepted standard supportive treatment for COVID-19. The patients given Leflunomide had a shorter viral shedding time (median of 5 days) than the controls (median of 11 days, P=0.046). The patients given Leflunomide also showed a significant reduction in C-reactive protein levels, indicating that immunopathological inflammation was well controlled. No obvious adverse effects were observed in Leflunomide-treated patients, and they all discharged from the hospital faster than controls. This preliminary study on a small-scale compassionate use of Leflunomide provides clues for further understanding of Leflunomide as a potential antiviral drug against COVID-19.



Research Article

Mild Cytokine Elevation, Moderate $CD4^+$ T Cell Response and Abundant Antibody Production in Children with COVID-19

Free Full Text (HTML) *Free* Full Text (PDF)

Ran Jia, Xiangshi Wang, Pengcheng Liu, Xiaozhen Liang, Yanling Ge, He Tian, Hailing Chang, Hao Zhou, Mei Zeng, Jin Xu

Children with Coronavirus Disease 2019 (COVID-19) were reported to show milder symptoms and better prognosis than their adult counterparts, but the difference of immune response against SARS-CoV-2 between children and adults hasn't been reported. Therefore we initiated this study to figure out the features of immune response in children with COVID-19. Sera and whole blood cells from 19 children with COVID-19 during different phases after disease onset were collected. The cytokine concentrations, SARS-CoV-2 S-RBD or N-specific antibodies and T cell immune responses were detected respectively. In children with COVID-19, only 3 of 12 cytokines were increased in acute sera, including interferon (IFN)-γ-induced protein 10 (IP10), interleukin (IL)-10 and IL-16. We observed an increase in T helper (Th)-2 cells and a suppression in regulatory T cells (Treg) in patients during acute phase, but no significant response was found in the IFN-γ-producing or tumor necrosis factor (TNF)-α-producing $CD8^+$ T cells in patients. S-RBD and N IgM showed an early induction, while S-RBD and N IgG were prominently induced later in convalescent phase. Potent S-RBD IgA response was observed but N IgA seemed to be inconspicuous. Children with COVID-19 displayed an immunophenotype that is less inflammatory than adults, including unremarkable cytokine elevation, moderate $CD4^+$ T cell response and inactive $CD8^+$ T cell response, but their humoral immunity against SARS-CoV-2 were as strong as adults. Our finding presented immunological characteristics of children with COVID-19 and might give some clues as to why children develop less severe disease than adults.

Research Article

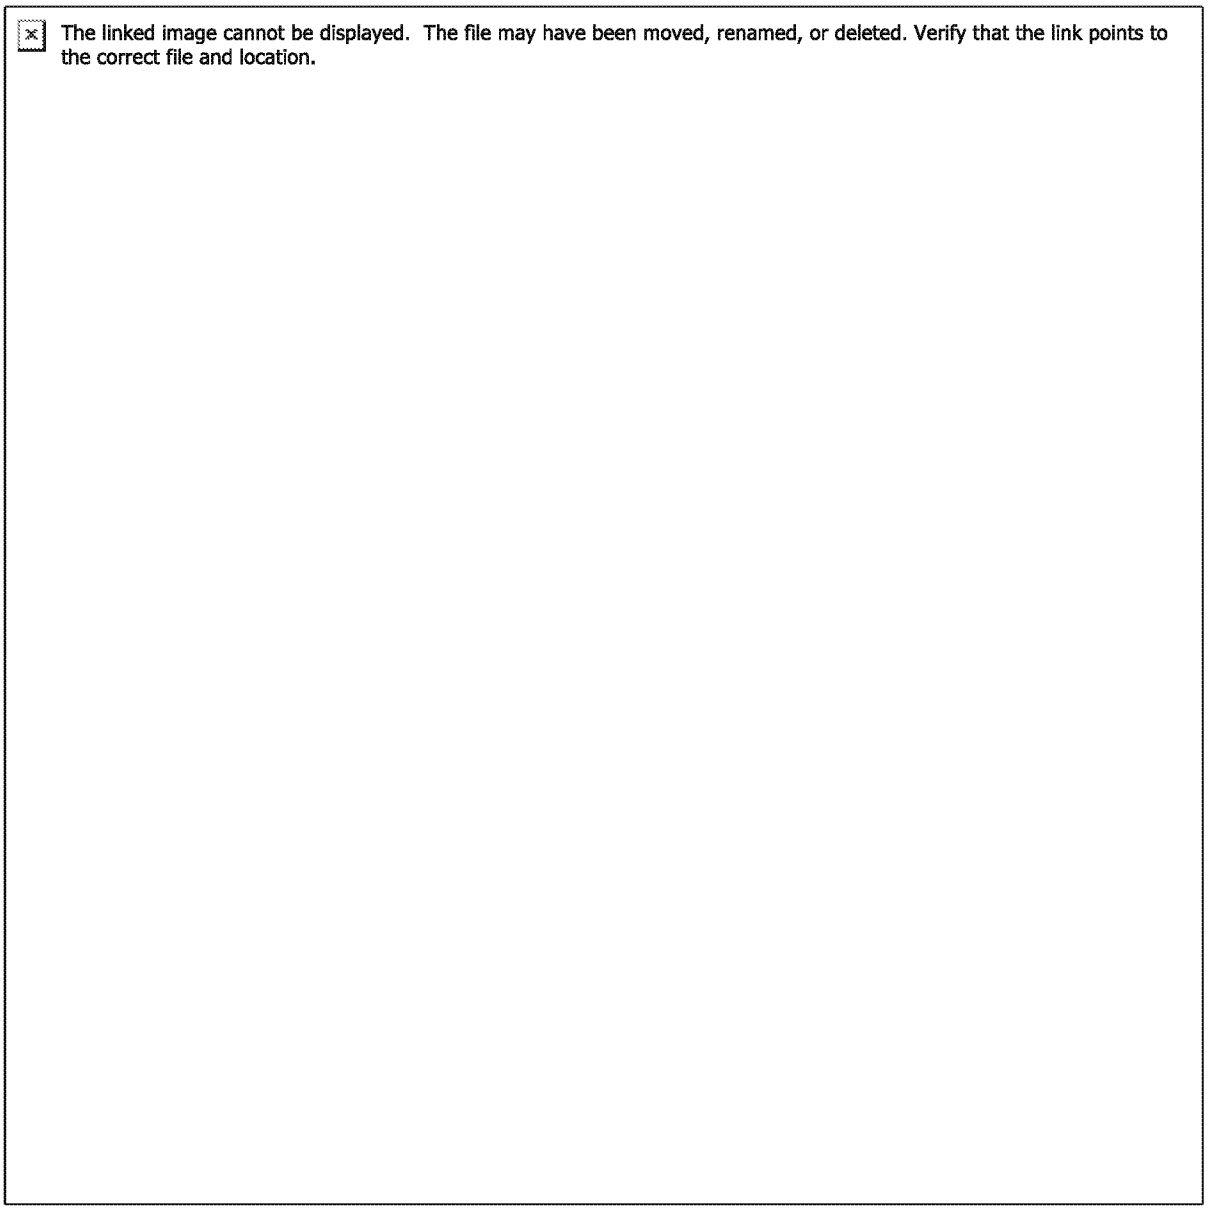
Dynamic Changes of Antibodies to SARS-CoV-2 in COVID-19 Patients at Early Stage of Outbreak

Free Full Text (HTML) *Free* Full Text (PDF)

Huaqing Shu, Shuzhen Wang, Shunan Ruan, Yaxin Wang, Jiancheng Zhang, Yin Yuan, Hong Liu, Yongran Wu, Ruiting Li, Shangwen Pan, Yaqi Ouyang, Shiying Yuan, Peng Zhou, You Shang

The coronavirus disease 2019 (COVID-19), caused by SARS-CoV-2, has spread around the world with high mortality. To diagnose promptly and accurately is the vital step to effectively control its pandemic. Dynamic characteristics of SARS-CoV-2-specific antibodies which are important for diagnosis of infection have not been fully demonstrated. In this retrospective, single-center, observational study, we enrolled the initial 131 confirmed cases of COVID-19 at Jin-Yin-Tan Hospital who had at least one-time antibody tested during their hospitalization. The dynamic changes of IgM and IgG antibodies to SARS-CoV-2 nucleocapsid protein in 226 serum samples were detected by ELISA. The sensitivities of IgM and IgG ELISA detection were analyzed. Result showed that the sensitivity of the IgG ELISA detection (92.5%) was significantly higher than that of the IgM (70.8%) ($P < 0.001$). The meantimes of seroconversion for IgM and IgG were 6 days and 3 days, respectively. The IgM and IgG antibody levels peaked at around 18 days and 23 days, and then IgM fell to below the baseline level at about day 36, whereas IgG maintained at a relatively high level. In conclusion,

antibodies should be detected to aid in diagnosis of COVID-19 infection. IgG could be a sensitive indicator for retrospective diagnosis and contact tracing, while IgM could be an indicator of early infection.



Research Article

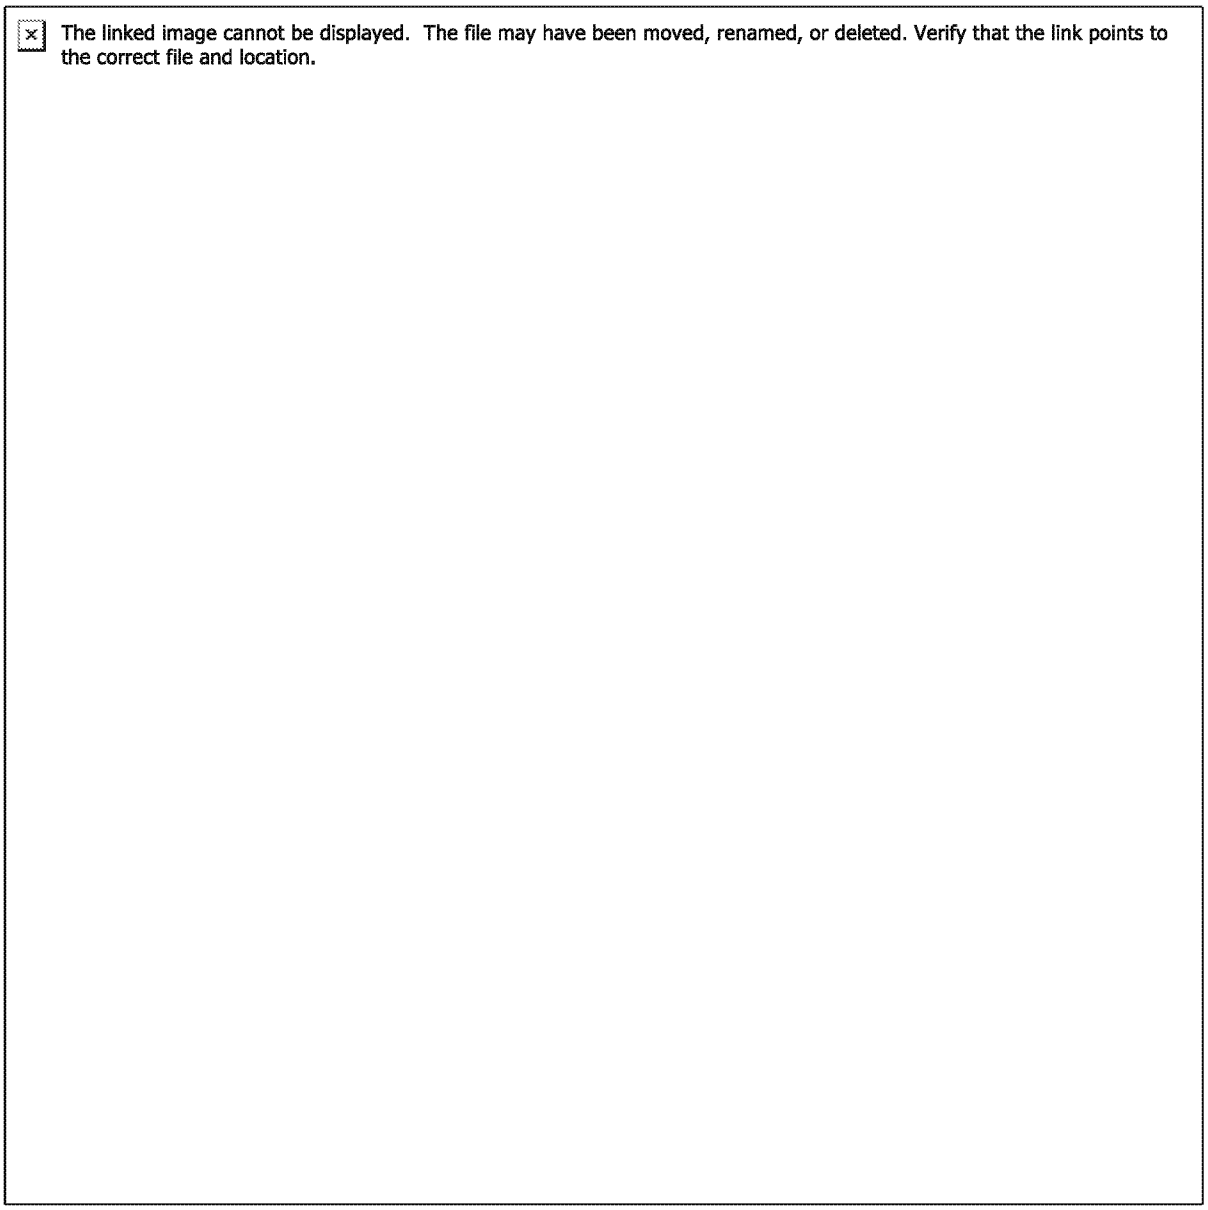
Serologic Response to SARS-CoV-2 in COVID-19 Patients with Different Severity

Free Full Text (HTML) *Free* Full Text (PDF)

Wen-Hua Kong, Rong Zhao, Jun-Bo Zhou, Fang Wang, De-Guang Kong, Jian-Bin Sun, Qiong-Fang Ruan, Man-Qing Liu

The immense patient number caused by coronavirus disease 2019 (COVID-19) global pandemic brings the urge for more knowledge about its immunological features, including the profile of basic immune parameters. In this study, eighty-eight reported COVID-19 patients in Wuhan were recruited from January to February, 2020, including 32 severe/critical cases and 56 mild/moderate cases. Their mean age was 56.43 years (range 17-83) and gender ratio (male/female) was 43:45. We tested SARS-CoV-2 RNA with commercial kits, investigated the level of serologic IgM and IgG antibodies against severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) using magnetic particle chemiluminescence immunoassays, and compared the results of serologic tests and nucleic acid test (NAT). Among 88 patients, 95.45% were confirmed as positive by the combination of NAT and antibody test, which was significantly higher ($P < 0.001$) than by single nucleic

acid test (73.86%) or serologic test (65.91%). Then the correlation between temporal profile and the level of antibody response was analyzed. It showed that seroconversion started on day 5 after disease onset and IgG level was rose earlier than IgM. Comparison between patients with different disease severity suggested early seroconversion and high antibody titer were linked with less severe clinical symptoms. These results supported the combination of serologic testing and NAT in routine COVID-19 diagnosis and provided evidence on the temporal profile of antibody response in patients with different disease severity.



Research Article

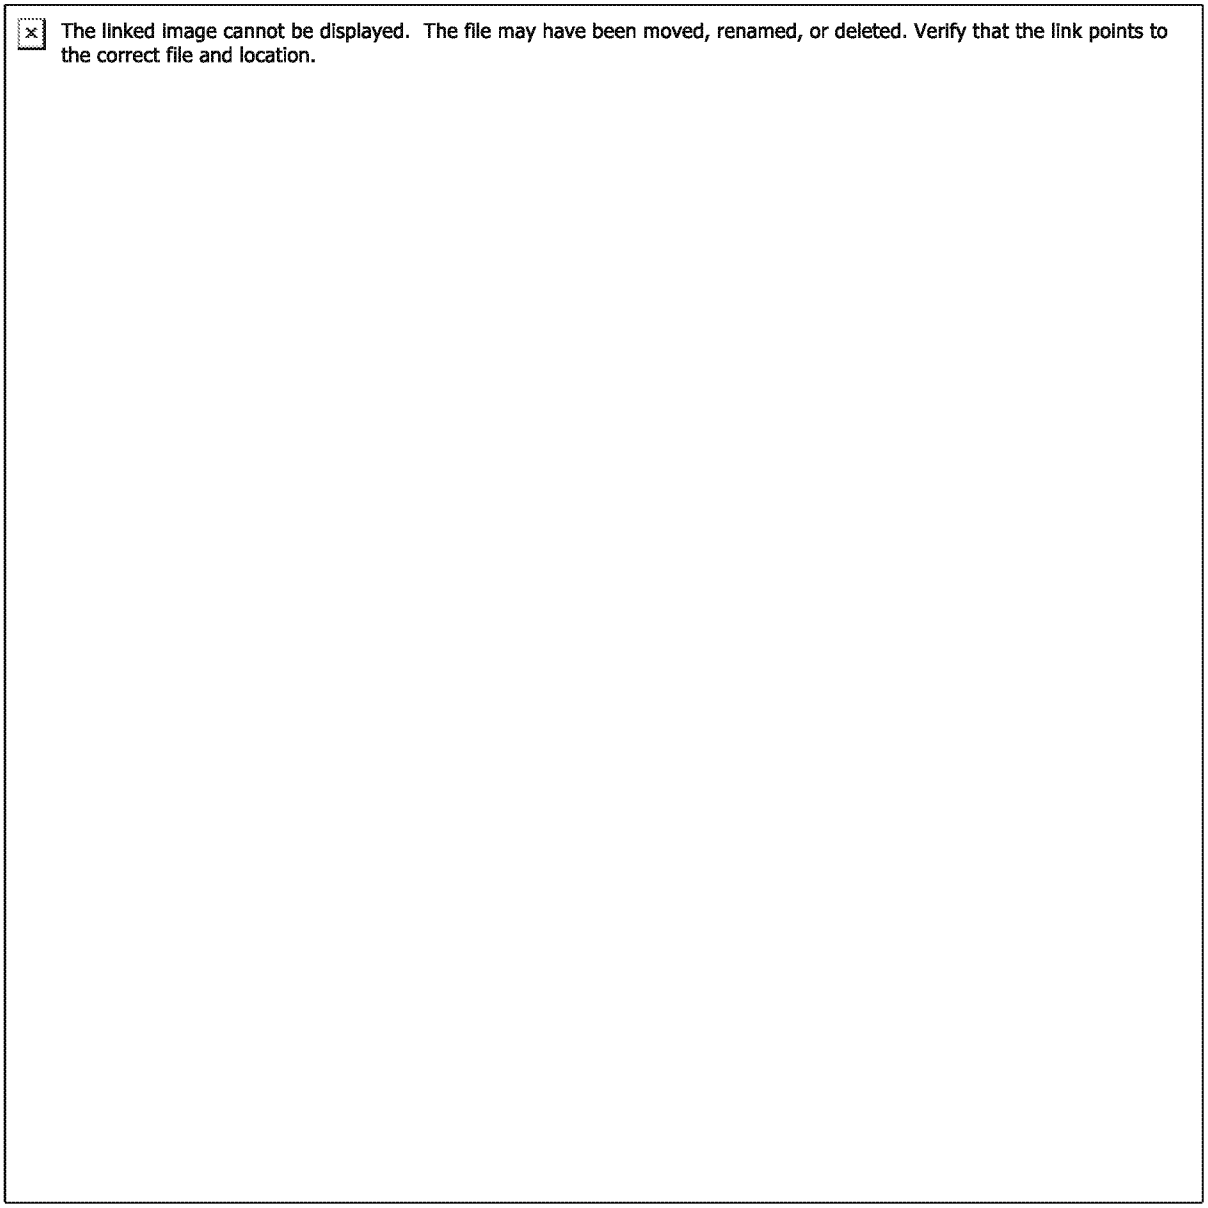
Discrimination of False Negative Results in RT-PCR Detection of SARS-CoV-2 RNAs in Clinical Specimens by Using an Internal Reference

Free Full Text (HTML) *Free* Full Text (PDF)

Yefei Zhang, Changtai Wang, Mingfeng Han, Jun Ye, Yong Gao, Zhongping Liu, Tengfei He, Tuantuan Li, Mengyuan Xu, Luping Zhou, Guizhou Zou, Mengji Lu, Zhenhua Zhang

Reverse transcription-polymerase chain reaction (RT-PCR) is an essential method for specific diagnosis of SARS-CoV-2 infection. Unfortunately, false negative test results are often reported. In this study, we attempted to determine the principal causes leading to false negative results of RT-PCR detection of SARS-CoV-2 RNAs in respiratory tract specimens. Multiple sputum and throat swab specimens from 161 confirmed

COVID-19 patients were tested with a commercial fluorescent RT-PCR kit targeting the *ORF1ab* and *N* regions of SARS-CoV-2 genome. The RNA level of a cellular housekeeping gene ribonuclease P/MRP subunit p30 (*RPP30*) in these specimens was also assessed by RT-PCR. Data for a total of 1052 samples were retrospectively re-analyzed and a strong association between positive results in SARS-CoV-2 RNA tests and high level of *RPP30* RNA in respiratory tract specimens was revealed. By using the ROC-AUC analysis, we identified Ct cutoff values for *RPP30* RT-PCR which predicted false negative results for SARS-CoV-2 RT-PCR with high sensitivity (95.03%–95.26%) and specificity (83.72%–98.55%) for respective combination of specimen type and amplification reaction. Using these Ct cutoff values, false negative results could be reliably identified. Therefore, the presence of cellular materials, likely infected host cells, are essential for correct SARS-CoV-2 RNA detection by RT-PCR in patient specimens. *RPP30* could serve as an indicator for cellular content, or a surrogate indicator for specimen quality. In addition, our results demonstrated that false negativity accounted for a vast majority of contradicting results in SARS-CoV-2 RNA test by RT-PCR.



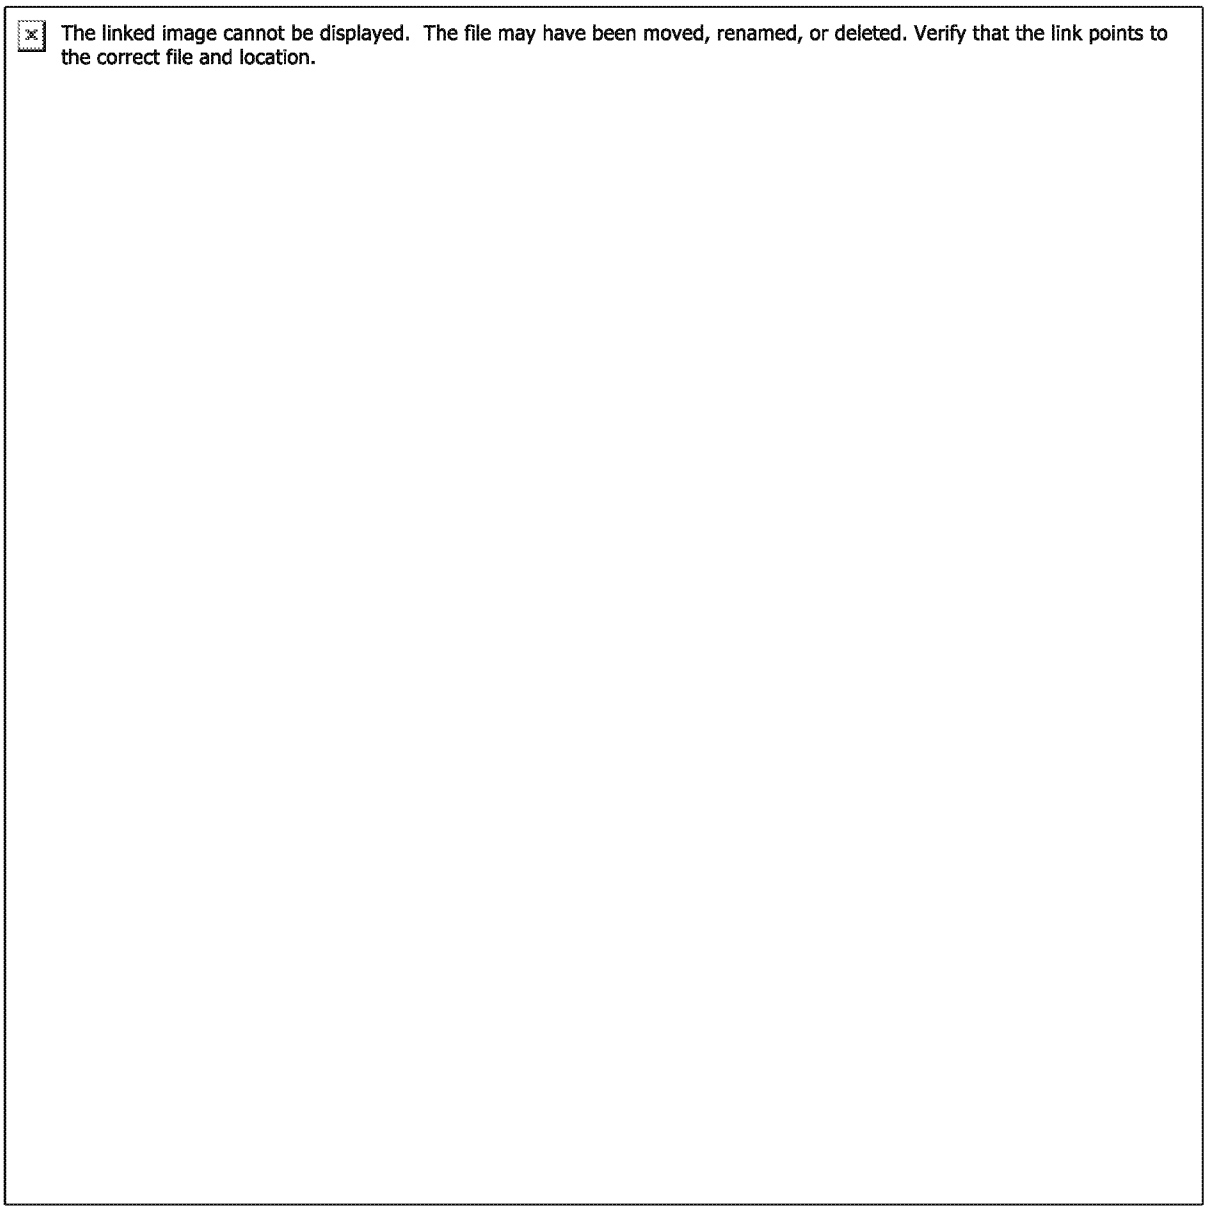
Research Article

Patients with Prolonged Positivity of SARS-CoV-2 RNA Benefit from Convalescent Plasma Therapy: A Retrospective Study

Free Full Text (HTML) *Free* Full Text (PDF)

Yongran Wu, Ke Hong, Lianguo Ruan, Xiaobo Yang, Jiancheng Zhang, Jiqian Xu, Shangwen Pan, Lehao Ren, Lu Chen, Chaolin Huang, You Shang

Convalescent plasma therapy has been implemented in a few cases of severe coronavirus disease 2019. No report about convalescent plasma therapy in treating patients with prolonged positivity of SARS-CoV-2 RNA has been published. In this study, we conducted a retrospective observational study in 27 patients with prolonged positivity of SARS-CoV-2 RNA, the clinical benefit of convalescent plasma therapy were analyzed. qRT-PCR test of SARS-CoV-2 RNA turned negative (≤ 7 days) in a part of patients (early negative group, n = 15) after therapy, others (late negative group, n = 12) turned negative in more than 7 days. Pulmonary imaging improvement was confirmed in 7 patients in early negative group and 8 in late negative group after CP therapy. Viral load decreased in early negative group compared with late negative group at day 3, 5, 7 after implementing convalescent plasma therapy. Patients in early negative group had a shorter median length of hospital stay. In conclusion, convalescent plasma therapy might help eliminate virus and shorten length of hospital stay in patients with prolonged positivity of SARS-CoV-2 RNA.



Research Article

Comparative Antiviral Efficacy of Viral Protease Inhibitors against the Novel SARS-CoV-2 *In Vitro*

Free Full Text (HTML) *Free* Full Text (PDF)

Leike Zhang, Jia Liu, Ruiyuan Cao, Mingyue Xu, Yan Wu, Weijuan Shang, Xi Wang, Huanyu Zhang, Xiaming Jiang, Yuan Sun, Hengrui Hu, Yufeng Li, Gang Zou, Min Zhang, Lei Zhao, Wei Li, Xiaojia Guo, Xiaomei Zhuang, Xing-Lou Yang, Zheng-Li Shi, Fei Deng, Zhihong Hu, Gengfu Xiao, Manli Wang, Wu Zhong

The recent outbreak of novel coronavirus pneumonia (COVID-19) caused by a new coronavirus has posed a great threat to public health. Identifying safe and effective antivirals is of urgent demand to cure the huge number of patients. Virus-encoded proteases are considered potential drug targets. The human immunodeficiency virus protease inhibitors (lopinavir/ritonavir) has been recommended in the global Solidarity Trial in March launched by World Health Organization. However, there is currently no experimental evidence to support or against its clinical use. We evaluated the antiviral efficacy of lopinavir/ritonavir along with other two viral protease inhibitors *in vitro*, and discussed the possible inhibitory mechanism *in silico*. The *in vitro* to *in vivo* extrapolation was carried out to assess whether lopinavir/ritonavir could be effective in clinical. Among the four tested compounds, lopinavir showed the best inhibitory effect against the novel coronavirus infection. However, further *in vitro* to *in vivo* extrapolation of pharmacokinetics suggested that lopinavir/ritonavir could not reach effective concentration under standard dosing regimen [marketed as Kaletra®, contained lopinavir/ritonavir (200 mg/50 mg) tablets, recommended dosage is 400 mg/10 mg (2 tablets) twice daily]. This research concluded that lopinavir/ritonavir should be stopped for clinical use due to the huge gap between *in vitro* IC_{50} and free plasma concentration. Nevertheless, the structure–activity relationship analysis of the four inhibitors provided further information for *de novel* design of future viral protease inhibitors of SARS-CoV-2.

Research Article

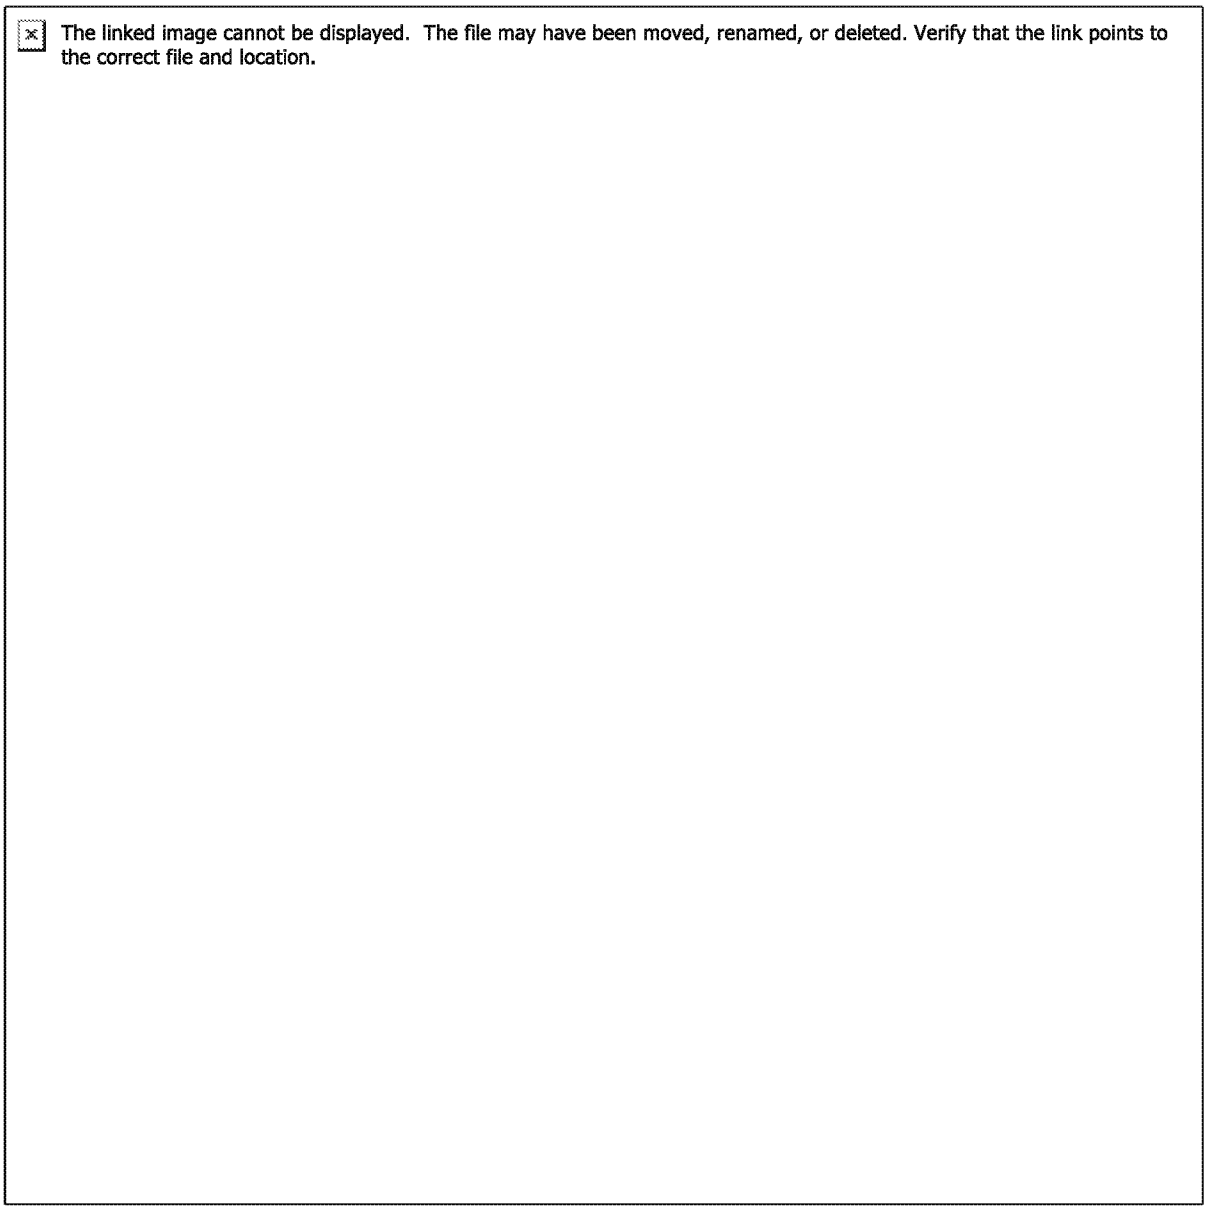
Identifying the Risk of SARS-CoV-2 Infection and Environmental Monitoring in Airborne Infectious Isolation Rooms (AIIRs)

Free Full Text (HTML) *Free* Full Text (PDF)

Zhi-Gang Song, Yan-Mei Chen, Fan Wu, Lin Xu, Bang-Fang Wang, Lei Shi, Xiao Chen, Fa-Hui Dai, Jia-Lei She, Jian-Min Chen, Edward C. Holmes, Tong-Yu Zhu, Yong-Zhen Zhang

Healthcare workers (HCWs) are at high risk of occupational exposure to the new pandemic human coronavirus, SARS-CoV-2, and are a source of nosocomial transmission in airborne infectious isolation rooms (AIIRs). Here, we performed comprehensive environmental contamination surveillance to evaluate the risk of viral transmission in AIIRs with 115 rooms in three buildings at the Shanghai Public Health Clinical Center, Shanghai, during the treatment of 334 patients infected with SARS-CoV-2. The results showed that the risk of airborne transmission of SARS-CoV-2 in AIIRs was low (1.62%, 25/1544) due to the directional airflow and strong environmental hygiene procedures. However, we detected viral RNA on the surface of foot-operated openers and bathroom sinks in AIIRs (viral load: 55.00–3154.50 copies/mL). This might be a source of contamination to connecting corridors and object surfaces through the footwear and gloves used by HCWs. The risk of infection was eliminated by the use of disposable footwear covers and the application of more effective environmental and personal hygiene measures. With the help of effective infection control

procedures, none of 290 HCWs was infected when working in the AIIRs at this hospital. This study has provided information pertinent for infection control in AIIRs during the treatment of COVID-19 patients.



Research Article

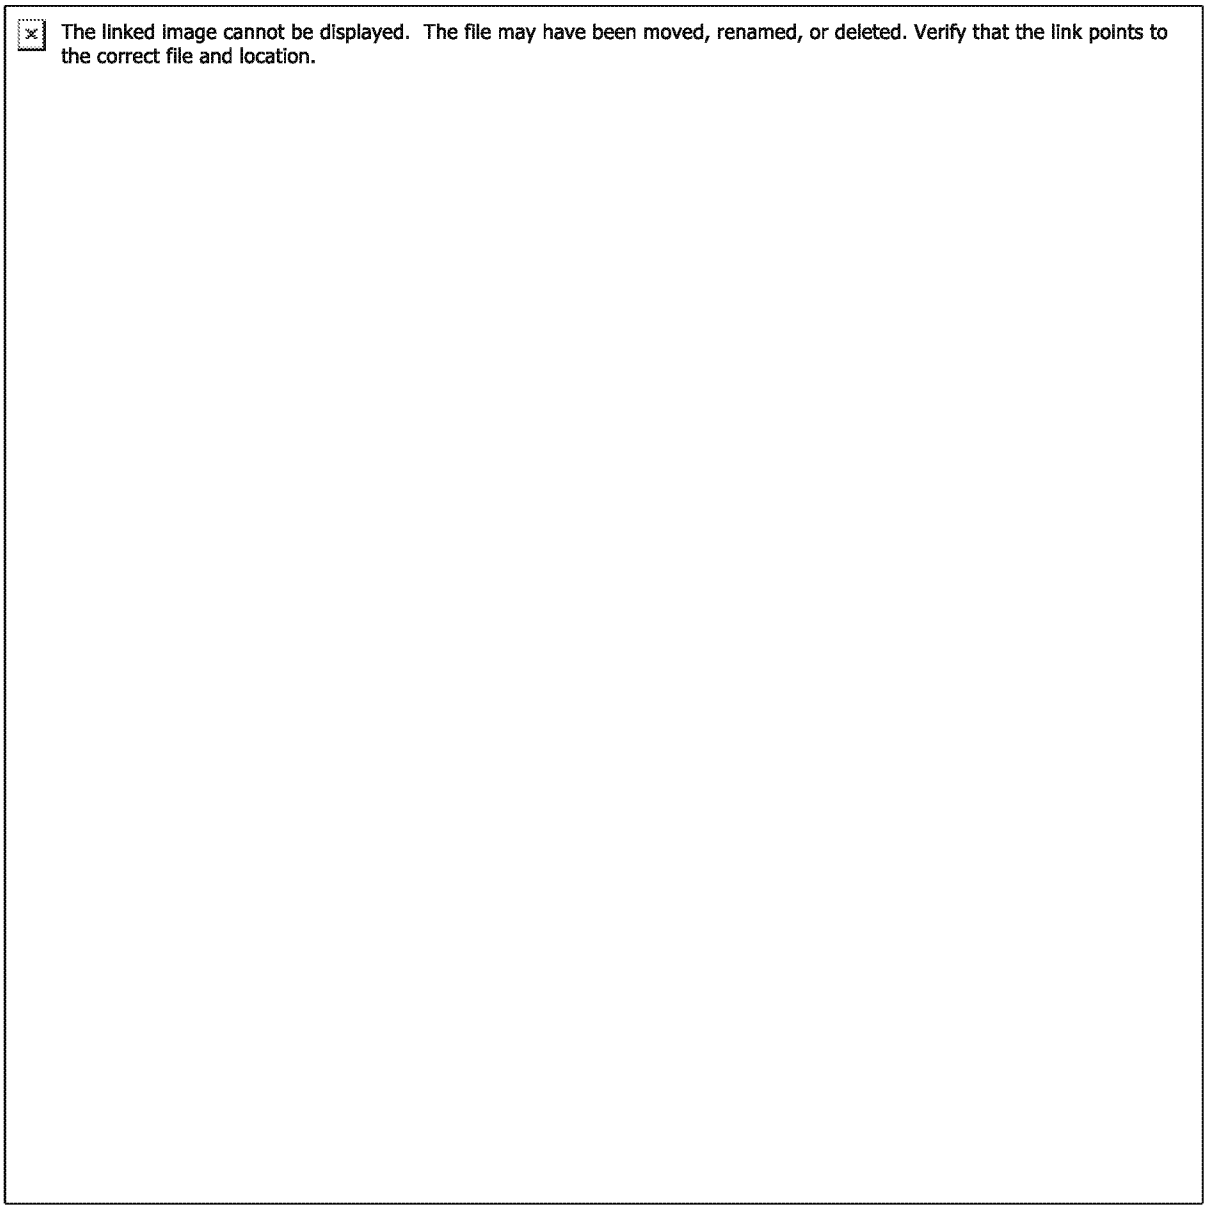
Long-Term Existence of SARS-CoV-2 in COVID-19 Patients: Host Immunity, Viral Virulence, and Transmissibility

Free Full Text (HTML) *Free* Full Text (PDF)

Xingyu Wang, Kun Huang, Haini Jiang, Lijuan Hua, Weiwei Yu, Dan Ding, Ke Wang, Xiaopan Li, Zhong Zou, Meilin Jin, Shuyun Xu

COVID-19 patients can recover with a median SARS-CoV-2 clearance of 20 days post initial symptoms (PIS). However, we observed some COVID-19 patients with existing SARS-CoV-2 for more than 50 days PIS. This study aimed to investigate the cause of viral clearance delay and the infectivity in these patients. Demographic data and clinical characteristics of 22 long-term COVID-19 patients were collected. The median age of the studied cohort was 59.83 ± 12.94 years. All patients were clinically cured after long-term SARS-CoV-2 infection ranging from 53 to 112 days PIS. Peripheral lymphocytes counts were normal. The ratios of interferon gamma (IFN-γ)-secreting cells to total $CD4^+$ and $CD8^+$ cells were normal as 24.68% ± 9.60% and 66.41% ± 14.87% respectively. However, the number of IFN-γ-secreting NK cells diminished (58.03% ±

11.78%). All patients presented detectable IgG, which positively correlated with mild neutralizing activity (Mean value neutralisation antibodies titers = 157.2, *P*= 0.05). No SARS-CoV-2 virus was isolated in Vero E6 cells inoculated with nasopharyngeal swab samples from all patients 50 days PIS, and the cytopathic effect was lacking. But one sample was positive for SARS-CoV-2 nucleic acid test in cell supernatants after two passages. Genome sequencing revealed that only three synonymous variants were identified in spike protein coding regions. In conclusion, decreased IFN-γ production by NK cells and low neutralizing antibodies might favor SARS-CoV-2 long-term existence. Further, low viral load and weak viral pathogenicity were observed in COVID-19 patients with long-term SARS-CoV-2 infection.



Research Article

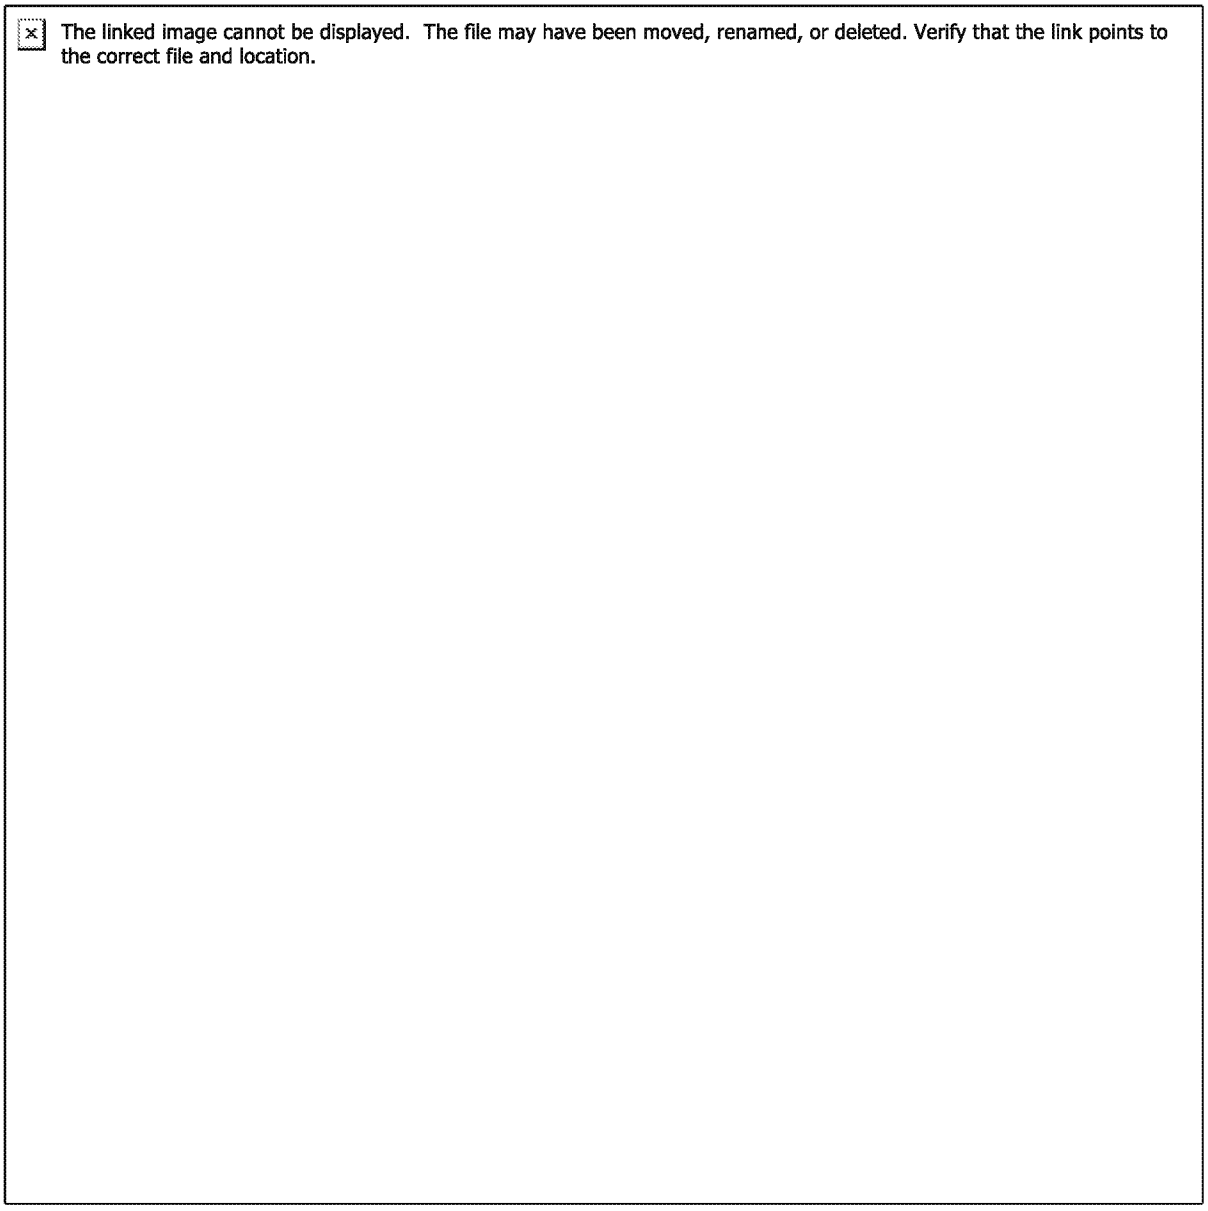
Comparison of Clinical and Epidemiological Characteristics of Asymptomatic and Symptomatic SARS-CoV-2 Infection in Children

Free Full Text (HTML) *Free* Full Text (PDF)

Jiehao Cai, Xiangshi Wang, Jun Zhao, Yanling Ge, Jin Xu, He Tian, Hailing Chang, Aimei Xia, Jiali Wang, Jinqiang Zhang, Zhongqiu Wei, Jingjing Li, Chuning Wang, Jianshe Wang, Qirong Zhu, Xiaowen Zhai, Mei Zeng

To understand the epidemiological and clinical features of the symptomatic and asymptomatic pediatric cases

of COVID-19, we carried out a prospective study in Shanghai during the period of January 19 to April 30, 2020. A total of 49 children (mean age 11.5 ± 5.12 years) confirmed with SARS-CoV-2 infection were enrolled in the study, including 11 (22.4%) domestic cases and 38 (77.6%) imported cases. Nine (81.8%) local cases and 12 (31.6%) imported cases had a definitive epidemiological exposure. Twenty-eight (57.1%) were symptomatic and 21 (42.9%) were asymptomatic. Neither asymptomatic nor symptomatic cases progressed to severe diseases. The mean duration of viral shedding for SARS-CoV-2 in upper respiratory tract was 14.1 ± 6.4 days in asymptomatic cases and 14.8 ± 8.4 days in symptomatic cases ($P > 0.05$). Forty-five (91.8%) cases had viral RNA detected in stool. The mean duration of viral shedding in stool was 28.1 ± 13.3 days in asymptomatic cases and 30.8 ± 18.6 days in symptomatic participants ($P > 0.05$). Children < 7 years shed viral RNA in stool for a longer duration than school-aged children ($P < 0.05$). Forty-three (87.8%) cases had seropositivity for antibodies against SARS-CoV-2 within 1–3 weeks after confirmation with infection. In conclusion, asymptomatic SARS-CoV-2 infection may be common in children in the community during the COVID-19 pandemic wave. Asymptomatic cases shed viral RNA in a similar pattern as symptomatic cases do. It is of particular concern that asymptomatic individuals are potentially seed transmission of SARS-CoV-2 and pose a challenge to disease control.



Research Article

A Prognostic Model to Predict Recovery of COVID-19 Patients Based on Longitudinal Laboratory Findings

Free Full Text (HTML) *Free* Full Text (PDF)

Suyan Tian, Xuetong Zhu, Xuejuan Sun, Jinmei Wang, Qi Zhou, Chi Wang, Li Chen, Shanji Li, Jiancheng Xu

The temporal change patterns of laboratory data may provide insightful clues into the whole course of COVID-19. This study aimed to evaluate longitudinal change patterns of key laboratory tests in patients with COVID-19, and identify independent prognostic factors by examining the associations between laboratory findings and outcomes of patients. This multicenter study included 56 patients with COVID-19 treated in Jilin Province, China, from January 21, 2020 to March 5, 2020. The laboratory findings, epidemiological characteristics and demographic data were extracted from electronic medical records. The average value of eosinophils and carbon dioxide combining power continued to significantly increase, while the average value of cardiac troponin I and mean platelet volume decreased throughout the course of the disease. The average value of lymphocytes approached the lower limit of the reference interval for the first 5 days and then rose slowly thereafter. The average value of thrombocytocrit peaked on day 7 and slowly declined thereafter. The average value of mean corpuscular volume and serum sodium showed an upward trend from day 8 and day 15, respectively. Age, sex, lactate dehydrogenase, platelet count and globulin level were included in the final model to predict the probability of recovery. The above parameters were verified in 24 patients with COVID-19 in another area of Jilin Province. The risk stratification and management of patients with COVID-19 could be improved according to the temporal trajectories of laboratory tests.

Research Article

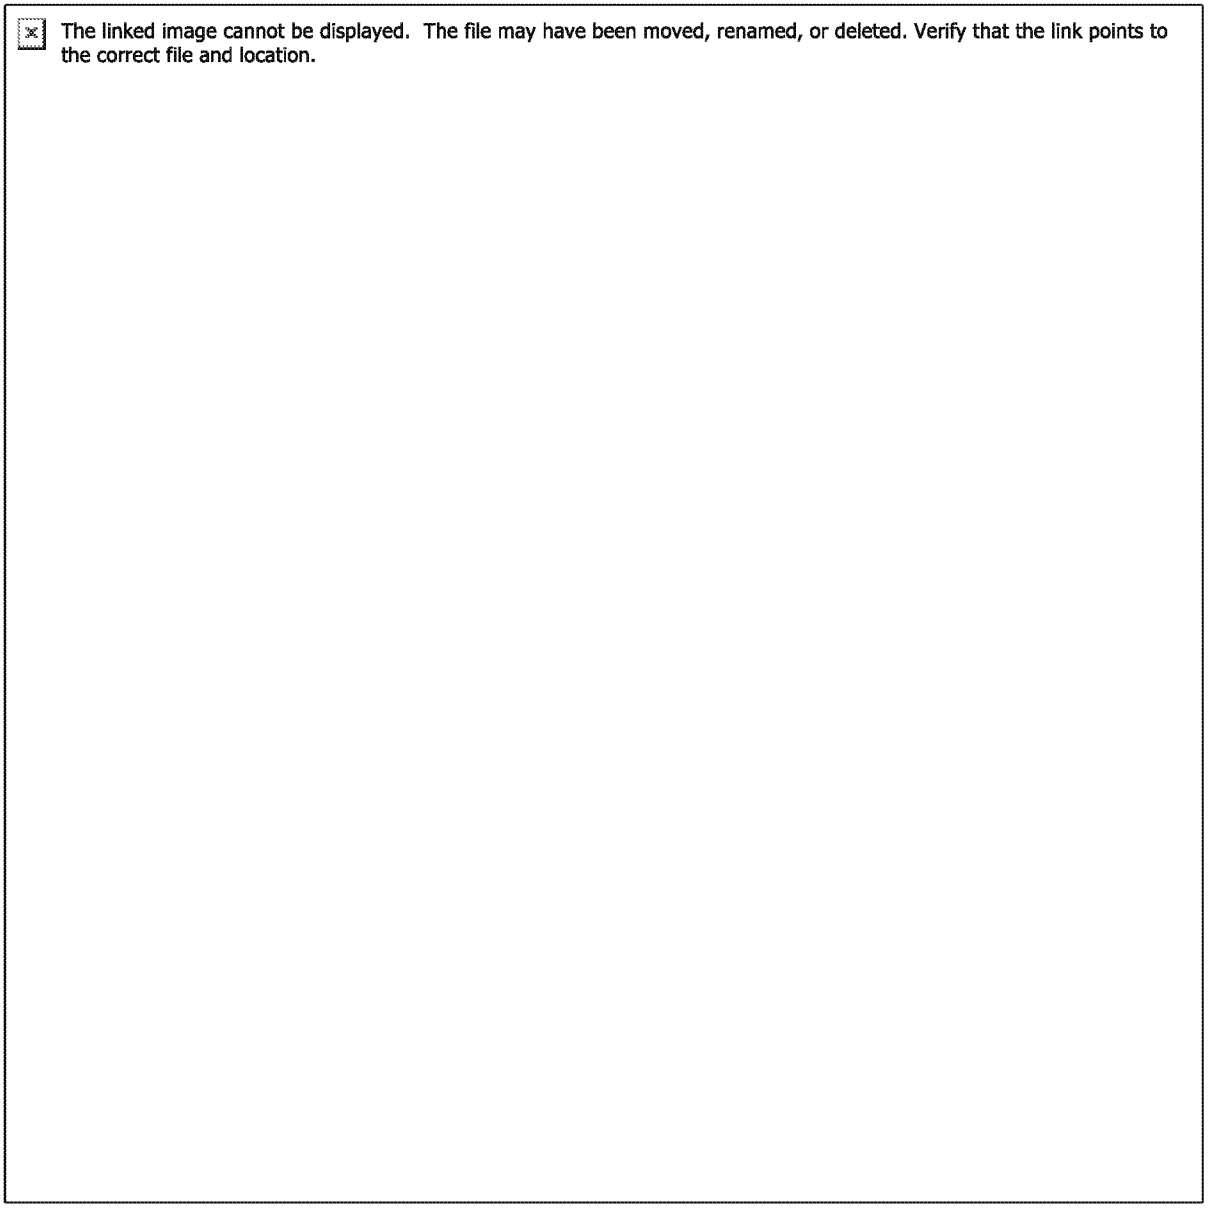
Viral and Antibody Kinetics of COVID-19 Patients with Different Disease Severities in Acute and Convalescent Phases: A 6-Month Follow-Up Study

Free Full Text (HTML) *Free* Full Text (PDF)

Xiaoyong Zhang, Suwen Lu, Hui Li, Yi Wang, Zhen Lu, Zhihong Liu, Qingtao Lai, Yali Ji, Xuan Huang, Yongyin Li, Jian Sun, Yingsong Wu, Xiaoning Xu, Jinlin Hou

Coronavirus disease 2019 (COVID-19), caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), has spread rapidly around the world, posing a major threat to human health and the economy. Currently, long-term data on viral shedding and the serum antibody responses in COVID-19 patients are still limited. Herein, we report the clinical features, viral RNA loads, and serum antibody levels in a cohort of 112 COVID-19 patients admitted to the Honghu People's Hospital, Hubei Province, China. Overall, 5.36% (6/112) of patients showed persistent viral RNA shedding (> 45 days). The peak viral load was higher in the severe disease group than in the mild group (median cycle threshold value, 36.4 versus 31.5; $P = 0.002$). For most patients the disappearance of IgM antibodies occurred approximately 4-6 weeks after symptoms onset, while IgG persisted for over 194 days after the onset of symptoms, although patients showed a 46% reduction in antibodies titres against SARS-CoV-2 nucleocapsid protein compared with the acute phase. We also studied 18 asymptomatic individuals with RT-qPCR confirmed SARS-CoV-2 infection together with 17 symptomatic

patients, and the asymptomatic individuals were the close contacts of these symptomatic cases. Delayed IgG seroconversion and lower IgM seropositive rates were observed in asymptomatic individuals. These data indicate that higher viral loads and stronger antibody responses are related to more severe disease status in patients with SARS-CoV-2 infection, and the antibodies persisted in the recovered patient for more than 6 months so that the vaccine may provide protection against SARS-CoV-2 infection.



Letter

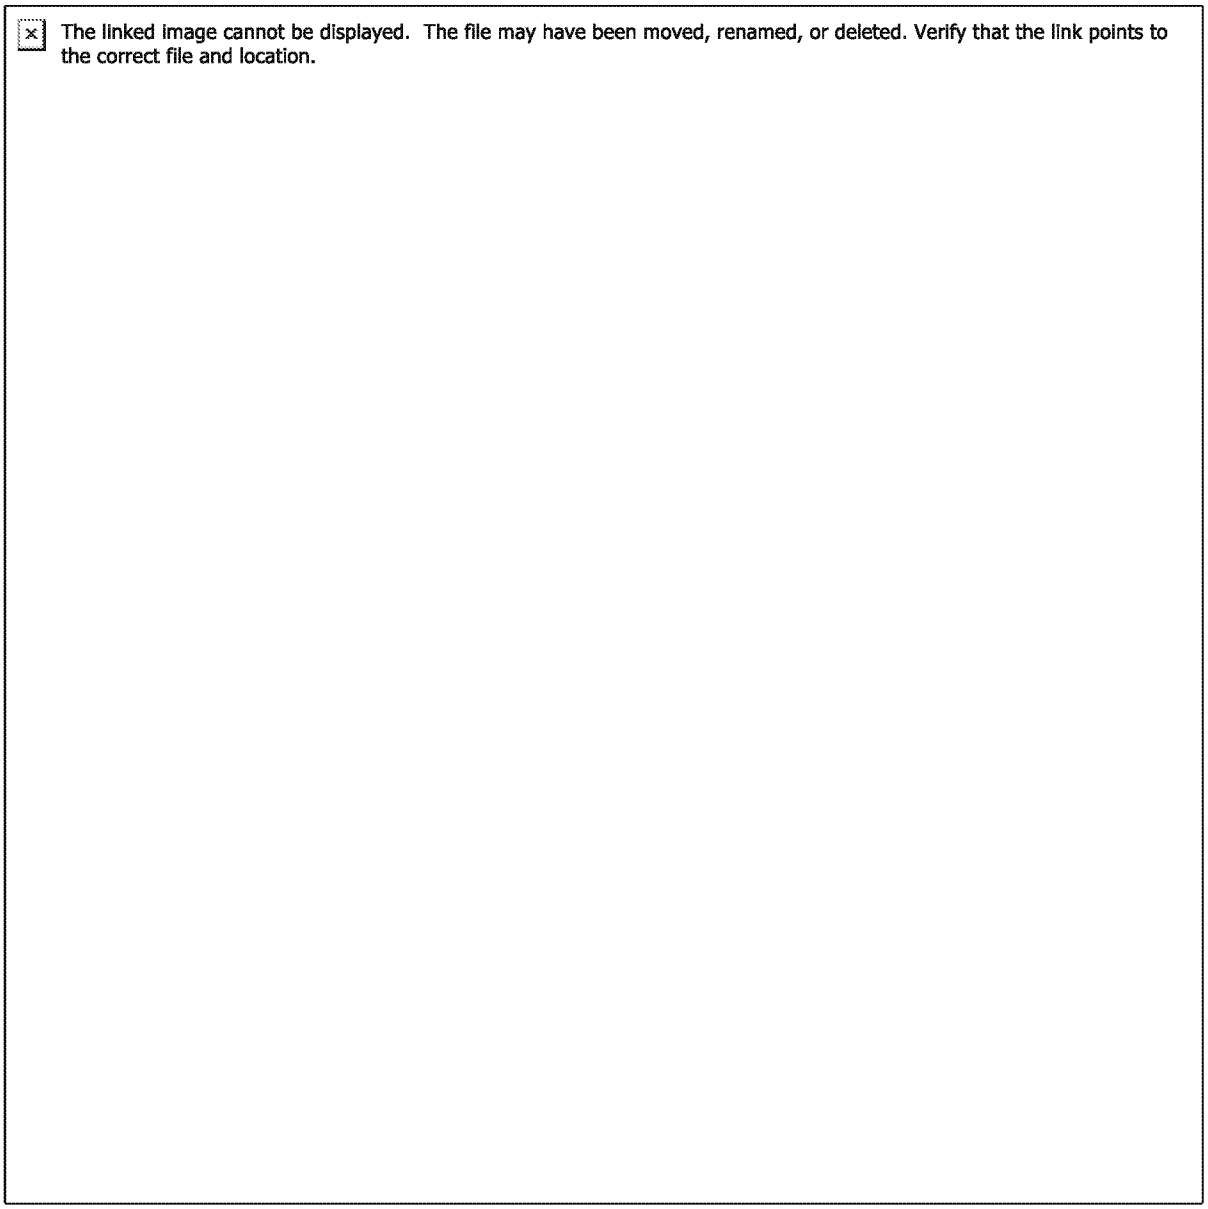
Feasibility Study of Mixing Throat Swab Samples for Severe Acute Respiratory Syndrome Coronavirus-2 Screening

Free Full Text (HTML) *Free* Full Text (PDF)

Yang Han, Qingyu Yang, Ying Liu, Ting Shu, Li Yue, Ting Xiao, Qin Zeng, Ying Wu, Xi Zhou, Dingyu Zhang

At present, viral nucleic acids are generally sampled using throat swabs and detected by quantitative real-time reverse transcription polymerase chain reaction (qRT-PCR). However, the capacity for SARS-CoV-2 nucleic acid detection is largely limited by the number of instruments, kits, and experienced laboratory personnel available. These limitations have caused low screening efficiency, which leads to a lag in identifying potential infections and may then exacerbate the spread of COVID-19 (Carter *et al*. 2020). Therefore, novel qRT-PCR approaches for nucleic acid detection are required to enhance testing efficiency.In

this study, we aimed to explore a practical method and procedure for SARS-CoV-2 qRT-PCR detection in 96-well plates using pooled throat swab samples. This method may reduce the cost of testing and increase the screening capacity for SARS-CoV-2 using existing instrument and kits, consequently facilitating the containment of COVID-19 worldwide.



Letter

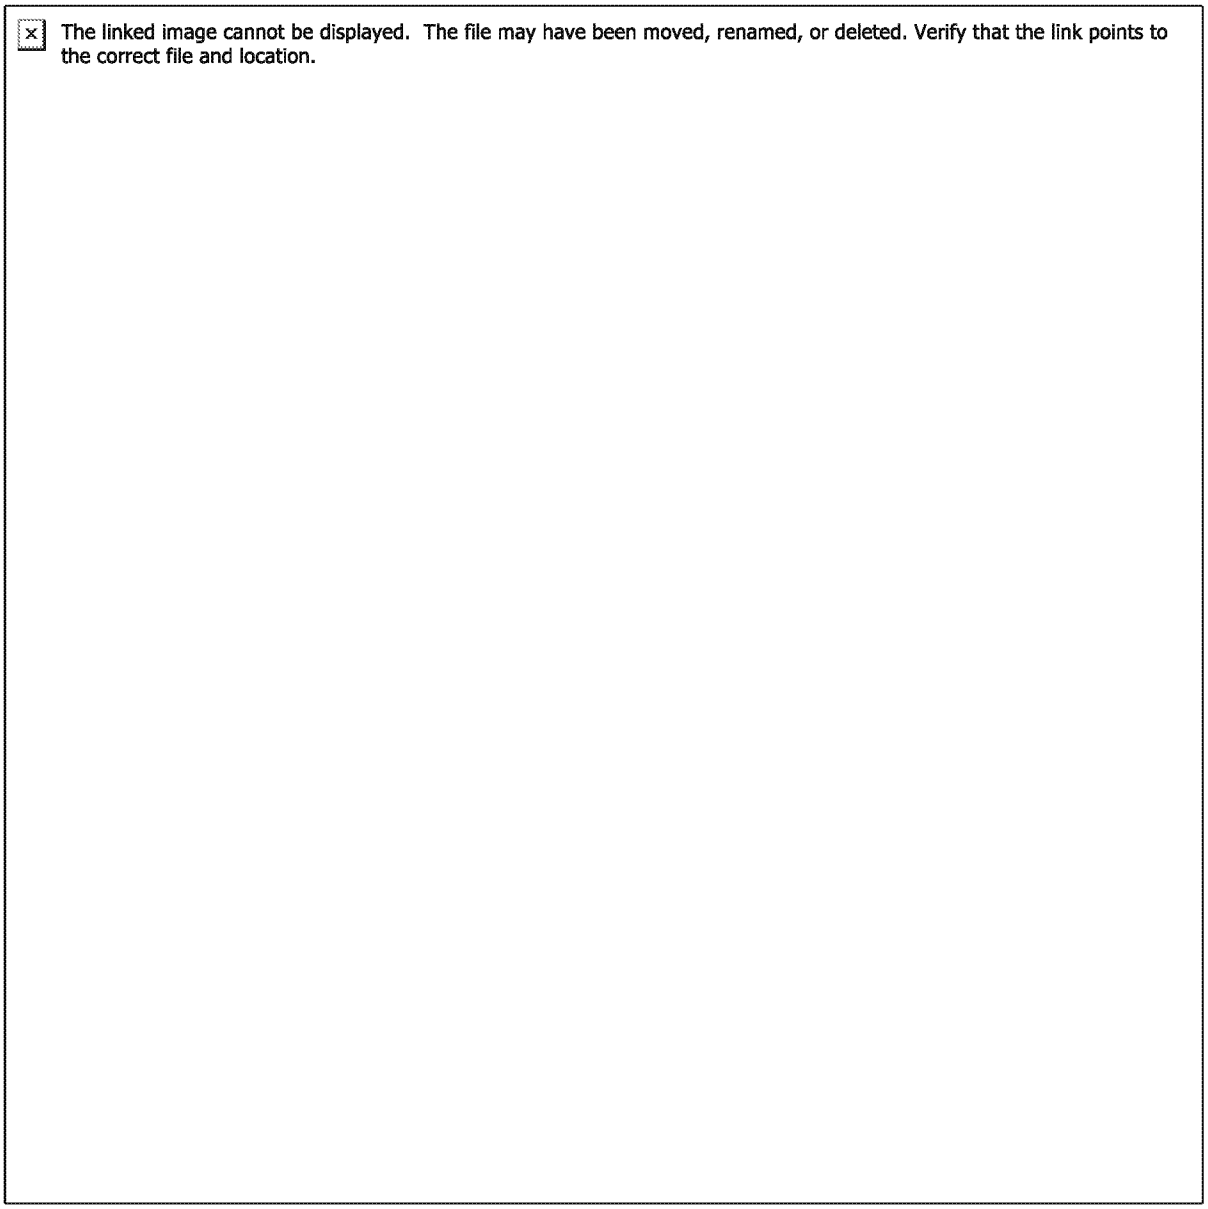
Patterns of Gustatory Recovery in Patients Affected by the COVID-19 Outbreak

Free Full Text (HTML) *Free* Full Text (PDF)

Carlos M. Chiesa-Estomba, Jerome R. Lechien, Maria R. Barillari, Sven Saussez

Coronavirus disease 2019 (COVID-19) is a viral infection caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). From March 2020, several studies indicate that many subjects affected by mild-to-moderate COVID-19 presented olfactory/gustatory dysfunction (OD/GD) that appeared strongly correlated between them but not with the other symptoms suggestive of upper airway infectionIn order to evaluate patterns of gustatoy recovery, data from patients with confirmed COVID-19 were collected prospectively from 4 University Hospitals. At this relatively early point in the pandemic, the authors considered that subjective patterns of recovery of olfactory disfunction in COVID-19 patients are valuable for our patients, for hypothesis

generation and treatment development.



Letter

Longitudinal Characteristics of T Cell Responses in Asymptomatic SARS-CoV-2 Infection

Free Full Text (HTML) *Free* Full Text (PDF)

Jingyi Yang, Ejuan Zhang, Maohua Zhong, Qingyu Yang, Ke Hong, Ting Shu, Dihan Zhou, Jie Xiang, Jianbo Xia, Xi Zhou, Dingyu Zhang, Chaolin Huang, You Shang, Huimin Yan

SARS-CoV-2 causes a spectrum of illness, ranging from an asymptomatic state to life-threatening multi-organ failure, and imposes a high socioeconomic burden on its sufferers and on society (Chen et al. 2020; Pan et al. 2020). Asymptomatic SARS-CoV-2 infection, confirmed by assay with quantitative real-time reverse transcription PCR (qRT-PCR), presented neither clinical symptom nor radiographic abnormality (Pan et al. 2020). While T cell responses are crucial for viral control, viral infection also induces significant count decrease and function impairment of T cells (Chen et al. 2020; Qin et al. 2020). Despite high rate of SARS-CoV-2 asymptomatic infections (Black et al. 2020), T cell responses of this population are still largely unknown. Here, we reported the kinetics of CD4+ and CD8+ T cell responses in an asymptomatic SARS-CoV-2 infected case.

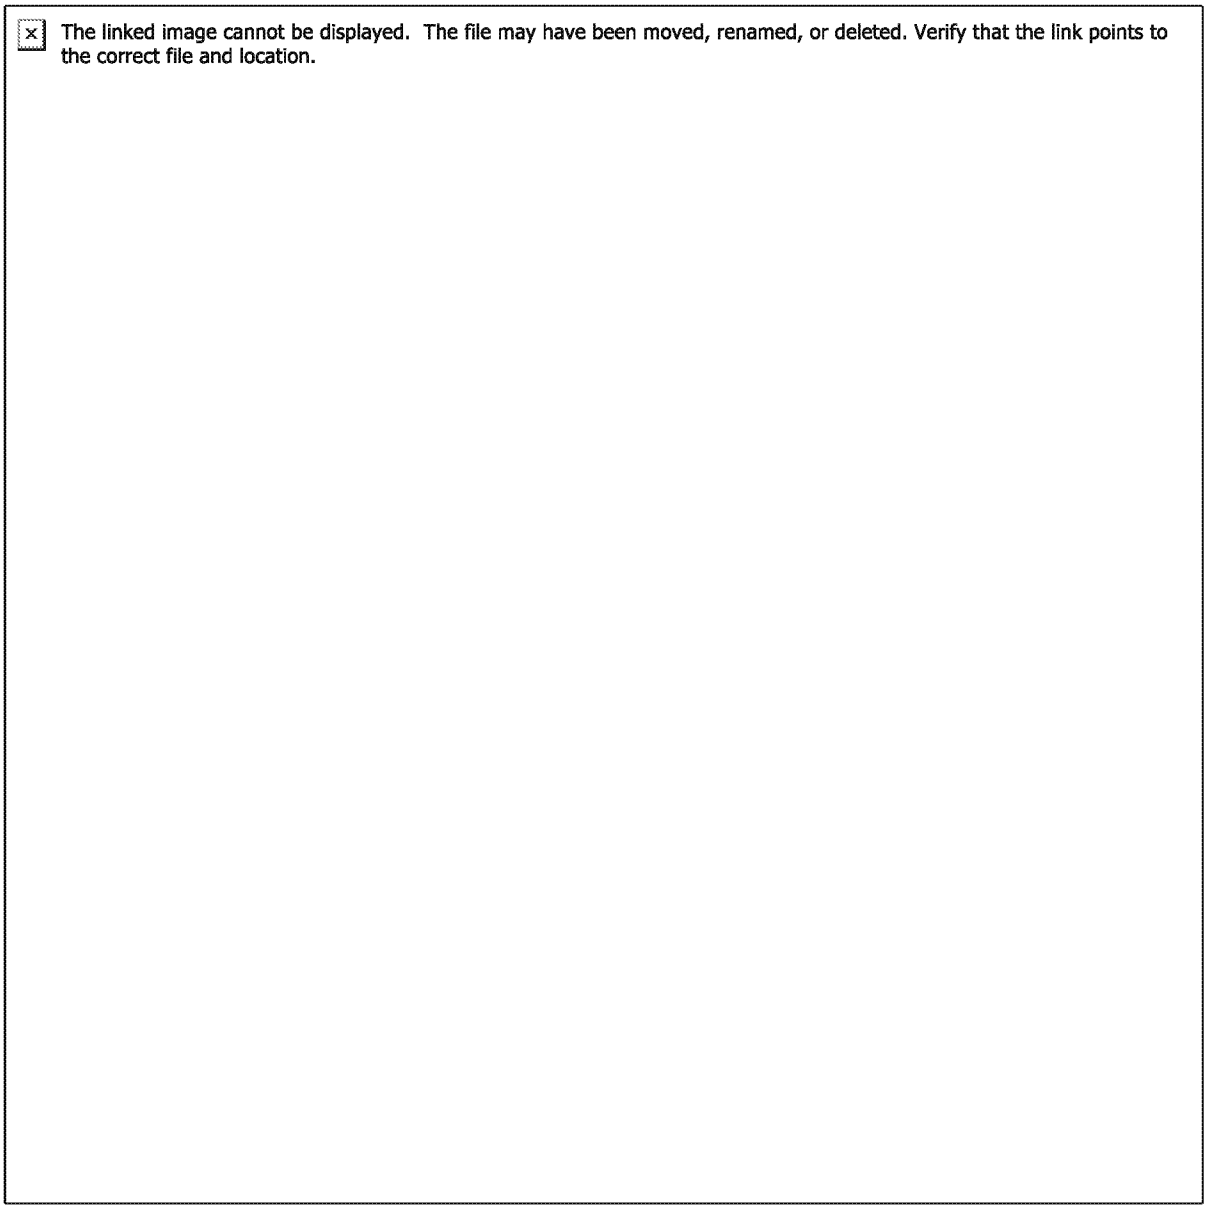
Clinical Characteristics of Hospitalized Patients with SARS-CoV-2 and Hepatitis B Virus Co-infection

Free Full Text (HTML) *Free* Full Text (PDF)

Xiaoping Chen, Qunqun Jiang, Zhiyong Ma, Jiaxin Ling, Wenjia Hu, Qian Cao, Pingzheng Mo, Lei Yao, Rongrong Yang, Shicheng Gao, Xien Gui, Wei Hou, Yong Xiong, Jinlin Li, Yongxi Zhang

In addition to the recent emerged SARS-CoV-2, hepatitis B virus (HBV) is one of the viruses which cause a global infection and threat public health. In worldwide, the prevalence of HBsAg is about 3.9% (Polaris Observatory 2018). According to a nationwide epidemiological survey of population whose ages range from 1 to 59 years in China, 2006, the prevalence of HBsAg was 7.2% (Liang *et al*. 2009). As SARS-CoV-2 and HBV both can cause liver damage (Fan *et al*. 2020), further understanding of the risk of SARS-CoV-2 on patients with HBV infection is urgently required in order to design an optimized treatment strategy. However, the impacts of SARS-CoV-2 infection on HBV patients are still not clear. For example, we do not yet know whether the SARS-CoV-2 infection is more severe in HBV patients and we also do not have much knowledge about the impact of SARS-CoV-2 on the course of HBV infection. In this retrospective study, we investigated the clinical characterizes of the patients coinfected with SARS-CoV-2 and HBV by analyzing the clinical records and laboratory tests of 123 COVID-19 patients admitted to Zhongnan Hospital of Wuhan University,

Wuhan, China, from January 5 to February 20, 2020.



Letter

SARS-CoV-2 Serological Survey of Cats in China before and after the Pandemic

Free Full Text (HTML) *Free* Full Text (PDF)

Junhua Deng, Yuxiu Liu, Chunyan Sun, Jingjing Bai, Jie Sun, Liying Hao, Xiangdong Li, Kegong Tian

The high percentage of seropositivity of cats in Wuhan, the epicentre of the SARS-CoV-2 epidemic, could be due to the large number of infected human cases (more than 14 folds than that in other cities) (Table 1) where cats may have been more frequently exposed to SARS-CoV-2 patients or contaminated environment. As yet, SARS-CoV-2 serological prevalence of cats in other Chinese cities remains unknown. Therefore, a serological survey including more cities with numbers of SARS-CoV-2 human cases in China will be valuable for elucidating the role of cats in transmission of the viruses and relieve public concerns. In this study, 630 cat serum samples collected before November 2019 and 423 cat serum samples collected during SARS-CoV-2 outbreak (from February 2020 to April 2020) in 20 cities in China for detecting the prevalence of SARS-CoV-2 specific antibodies.

A Study of Two Cases Co-Infected with SARS-CoV-2 and Human Immunodeficiency Virus

Free Full Text (HTML) *Free* Full Text (PDF)

Rong Zhang, Xiaohua Chen, Yuqing Huang, Qi Zhang, Yan Cheng, Nan Zhang, Haibo Zhang, Bo Yang, Fang Liu, Yingle Liu, Ke Lan

Since December 2019, A new type of coronavirus pneumonia (coronavirus disease 2019, COVID-19) has become endemic in Wuhan, China. So far, COVID-19 has developed into a global epidemic. The body's immune system plays an important role in the fight against COVID-19. Here, we followed up the clinical data and treatment of two COVID-19 patients diagnosed with acquired immunodeficiency syndrome (AIDS), hoping to be helpful for the subsequent diagnosis and treatment of patients with related diseases.

Different Laboratory Abnormalities in COVID-19 Patients with Hypertension or Diabetes

Free Full Text (HTML) *Free* Full Text (PDF)

Xiaojun Wu, Tong Wang, Yilu Zhou, Xiaofan Liu, Hong Zhou, Yang Lu, Weijun Tan, Mingli Yuan, Xuhong Ding, Jinjing Zou, Ruiyun Li, Hailing Liu, Rob M. Ewing, Yi Hu, Henxiang Nie, Yihua Wang

We reported recently that hypertension is a risk factor for severe cases of COVID-19, independent of age and other variables (Liu *et al*. 2020a). An important question is why patients with hypertension and diabetes yield poorer clinical outcomes than those without. Human pathogenic coronavirus SARS-CoV-2 utilizes angiotensin-converting enzyme 2 (ACE2) as a receptor for viral cell entry. Since the levels of ACE2 are substantially increased in patients with hypertension or diabetes, who are treated with ACE inhibitors (ACEIs) and angiotensin Ⅱ type-Ⅰ receptor blockers (ARBs) (Ferrario *et al*. 2005), Fang and colleagues hypothesized that ACE2-stimulating drugs could potentially increase the risk of developing severe COVID-19 (Fang *et al*. 2020). This was not supported by a recent study led by Dr. Reynolds (Reynolds *et al*. 2020), whose analysis showed no positive association for ACEIs or ARBs for either the risk of SARS-CoV-2 infection or severe illness (Reynolds *et al*. 2020). What else might explain the poorer clinical outcomes of COVID-19 patients with hypertension or diabetes? To explore this question, we re-analysed the same cohort of 99

COVID-19 patients discharged from the general wards of Renmin Hospital of Wuhan University between 5 February 2020 and 14 March 2020 (Ethics approval No: WDRY2020-K124) (Liu *et al*. 2020a, b).

Epidemiological, Clinical and Serological Characteristics of Children with Coronavirus Disease 2019 in Wuhan: A Single-centered, Retrospective Study

Free Full Text (HTML) *Free* Full Text (PDF)

Dan Luo, Zhi Xia, Heng Li, Danna Tu, Ting Wang, Wei Zhang, Lu Peng, Wenfu Yi, Sai Zhang, Junhua Shu, Hui Xu, Yong Li, Buyun Shi, Chengjiao Huang, Wen Tang, Shuna Xiao, Xiaolan Shu, Yan Liu, Yuan Zhang, Shan Guo, Zhi Yu, Baoxiang Wang, Yuan Gao, Qinxue Hu, Hanzhong Wang, Xiaohui Song, Hong Mei, Xiaoqin Zhou, Zhenhua Zheng

In December 2019, SARS-CoV-2 was first detected in the samples obtained from three adult patients who suffered from an unknown viral pneumonia in Wuhan (Li *et al.* 2020). This unknown viral pneumonia is further named as coronavirus disease 2019 (COVID-19) by the World Health Organization. To date, the number of new COVID-19 cases has continued to skyrocket and the impact of SARS-CoV-2 on humans is far greater than any pathogen of this century in both breadth and depth. Previous studies have shown that adults with COVID-19 have symptoms of fever, dry cough, dyspnea, fatigue and lymphocytopenia. Moreover, COVID-19 is more likely to cause death in the elderly, especially those with chronic comorbidities (Huang *et al.* 2020). In Wuhan, more than 50,000 COVID-19 cases have been confirmed, including over 780 pediatric patients, and only one child death case (Lu *et al.* 2020). Although the number of children cases was far fewer than that of

adults, COVID-19 might endanger children's health and the information on children remains limited, especially in serological study. In the retrospective study, the investigators analyzed the epidemiological, clinical and serological characteristics of children with COVID-19 in Wuhan in the early stages of the outbreak, which might provide theoretical and practical help in controlling COVID-19 and similar emerging infectious diseases in the future.

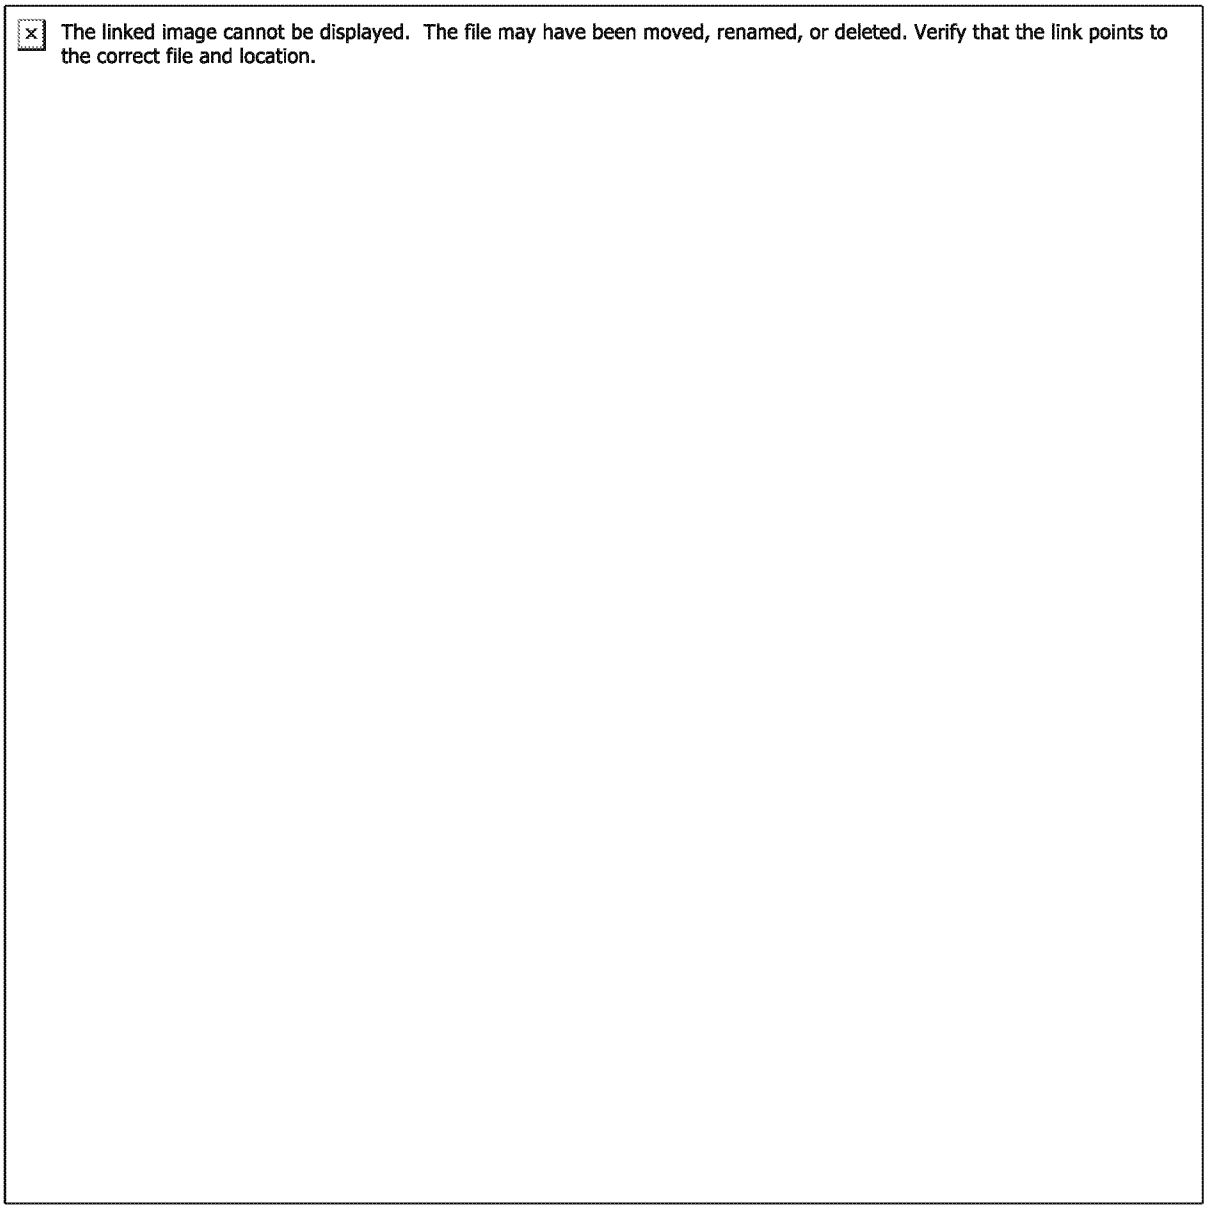
Inception of the Modern Public Health System in China and Perspectives for Effective Control of Emerging Infectious Diseases: In Commemoration of the 140th Anniversary of the Birth of the Plague Fighter Dr. Wu Lien-Teh

Free Full Text (HTML) *Free* Full Text (PDF)

Qingmeng Zhang, Ahmed Niaz, George F. Gao, Fengmin Zhang

In this article, we systematically review Dr. Wu Lien-Teh's academic achievements and outstanding contributions in the prevention and control of the plague epidemic in northeast China and introduce the development of the earliest public health epidemic prevention system in China in order to commemorate the 140th anniversary of Dr. Wu Lien-Teh's birth. We hope that this article will provide insights into the effective prevention and control of emerging infectious diseases as well as the current worldwide pandemic of COVID-

19, facilitating the improvement and development of public health systems in China and around the globe.



Perspective

Coping with COVID-19 in Sub-Saharan Africa: What Might the Future Hold?

Free Full Text (HTML) *Free* Full Text (PDF)

Franck J. D. Mennechet, Guy R. Takoudjou Dzomo

Sub-Saharan countries are sadly linked with similar poor indicators, such as high poverty and mortality rates, the burden of disease, fragile health systems and poorly developed infrastructure. Along with the rest of the world, Sub-Saharan countries are facing this new coronavirus outbreak. Nevertheless, chaotic predictions of a particularly destructive epidemic in Africa do not seem to be borne out, at least for the time being. But uncertainties remain, such as how the virus is spreading in countries with low incomes, informal economies, high HIV/tuberculosis prevalence, extremely low median age, or warm/dry climates and for which containments are almost impossible to enforce? Not even 8 months after the first reported case in China, parts of the world are already showing post-lockdown twilight measures. Yet, the war is certainly far from over, because the virus is gaining ground in the sub-Saharan zone. This viewpoint attempts to describe the COVID-19 crisis in a sub-Saharan perspective, in particular in the Republic of Chad, from both, distant

perception and by living it on a daily basis.

From: Vinu Arumugham[igesynth1@yahoo.com]
Sent: Sun 4/11/2021 12:36:34 PM (UTC-05:00)
Subject: Plant protein contaminated COVID-19 vaccines cause clotting; It's a lab virus; Unstable mRNA ; Judge to FCC on radiation danger: 'I am Inclined to Rule Against You'

SARS-CoV-2 vaccines and clotting disorders

Plant proteins that contaminate SARS-CoV-2 vaccines, excipients have high protein sequence homology to IEDB listed thrombocytopenia related platelet factor 4 epitopes thus explaining induction of autoimmune bleeding disorders

https://doi.org/10.5281/zenodo.4641692

Heparin induced thrombocytopenia (HIT) is due to animal protein contamination

Heparin is derived from porcine and bovine sources and is thus contaminated with porcine/bovine proteins. As detailed below, with just a few amino acid residue differences compared to Platelet Factor 4 (PF4) epitopes involved in thrombocytopenia, porcine and bovine antigens are ideally suited for heparin induced thrombocytopenia.

Analyzing 23000+ epitopes covering 82 autoimmune diseases in the Immune Epitope Database, 57% have only one and 78% have up to two amino acid residue differences compared to animal, fungal or plant peptides present in vaccines; an unmistakable signature of the role of vaccines in their etiologies
https://doi.org/10.5281/zenodo.3603480

The BLASTP match scores for bovine/porcine antigens compared to PF4 epitopes ranges from 26-46 compared to 19.7 BLASTP match score for the epitope that resulted in Pandemrix induced narcolepsy. Higher scores mean higher probability of cross-reaction.

Same problem as Pandemrix-induced narcolepsy, different contaminants.

How the FDA squashed any discussion of safety and rushed to authorize the Pfilthy Pfizer vaccine:

Hearing Without Listening

www.pogo.org/analysis/2020/12/hearing-without-listening/

"Truncated and modified mRNA species" in the Pfizer/Moderna vaccines will cause autoimmunity, allergies, asthma, etc.

People forget the old saying **"If it sounds too good to be true, it probably is".**

Traditional vaccines took a decade to develop and they were ineffective and unsafe in most cases**.** Now they want us to believe that they magically created "safe and effective" vaccines based on never-used-before mRNA technology, in just months. That's like winning the lottery. Twice. The Pharma CEOs certainly won the lottery but now Pfizer's Pfilth is being exposed.

"Cyberattackers" exposed the cover up by our corrupted regulators**.**

The EMA covid-19 data leak, and what it tells us about mRNA instability
https://www.bmj.com/content/372/bmj.n627

On a good day at the vaccine plant, as much as 30% of the mRNA in the vaccine can be "truncated and modified" due to instability. That means instead of producing the target spike protein, this mRNA will direct the cell to produce RANDOM proteins with RANDOM peptides that can have high homology to ANYTHING. These random proteins can have peptides that have high homology to peptides in self-proteins, food proteins, aeroallergen proteins, etc. The result is the immune system is being trained to attack self-proteins (autoimmunity), food proteins (food allergy), aeroallergen (asthma) etc. These mRNA vaccines come with a powerful lipid-in-water-emulsion adjuvant that boosts all the above diseases.

So this is an ALL-diseases-in-one, shot. Making them Pharma's most sickening vaccines yet. With **85 millions doses, the vaccines have killed AT LEAST 1500 people** by VAERS documentation alone.

We have not even started to count how many will be maimed for life. **CORRUPTED SCIENCE KILLS EFFICIENTLY**.

SARS-CoV-2 originated in a lab

In a world of conspiring criminals, it takes "conspiracy theorists" to expose the truth ...

A Bayesian analysis concludes beyond a reasonable doubt that SARS-CoV-2 is not a natural zoonosis but instead is laboratory derived
https://doi.org/10.5281/zenodo.4470232

FDA/CDC's Bell's palsy lie exposed. What else are they lying about? Plenty.

www.cdc.gov/vaccines/covid-19/info-by-product/clinical-considerations.html

"Cases of Bell's palsy were reported following vaccination in participants in both the Pfizer-BioNTech and Moderna COVID-19 vaccines clinical trials. However, the FDA does not consider these to be above the frequency expected in the general population and has not concluded that these cases were causally related to vaccination."

I exposed the FDA/CDC lie above back in Dec 2020 and now a team has exposed the lie again in the Lancet Infectious Disease journal.

Bell's palsy and SARS-CoV-2 vaccines
www.thelancet.com/journals/laninf/article/PIIS1473-3099(21)00076-1/fulltext#%20

"Therefore, the observed incidence of Bell's palsy in the vaccine arms is between 3·5-times and 7-times higher than would be expected in the general population. This finding signals a potential safety phenomenon and suggests inaccurate reporting of basic epidemiological context to the public."

www.statnews.com/2020/12/28/chance-illnesses-after-covid-19-vaccinations-could-test-public-confidence-even-if-the-problems-are-unrelated/

Article above says: "Eight people in the Pfizer and Moderna trials, which enrolled nearly 74,000 participants in total, were diagnosed with the condition — seven in the vaccine arms and one in the placebo arm of the Moderna trial. The jury is still out on whether Bell's palsy, which afflicts about 40,000 people a year in the U.S., is an occasional side effect of taking a Covid-19 vaccine."

So about 1 in 8250 (330,000,000/40,000) will develop Bell's palsy each year in the US. Say the trial ran for 3 months. That makes it 1 in 33,000 probability of occurrence during the trial. One case in the placebo arms consisting of 37000 people is therefore as expected.

What's the probability of 7 cases of Bell's palsy occurring merely by chance, in the vaccine arms?

(((32999÷33000)^36993)×((1÷33000)^7)×(37000!))÷(36993!×7!) = 0.00014

1 in ~7,000. Why is "the jury still out"? The vaccine caused the Bell's palsy cases.

VAERS shows >1000 deaths after COVID-19 vaccines. Clustering of deaths on days post-vaccination and comparing with

the same data following flu vaccines, makes it clear that most of these deaths were CAUSED by the COVID-19 vaccines.

https://childrenshealthdefense.org/defender/facebook-posts-vaers-link-covid-vaccines-injuries-death

https://childrenshealthdefense.org/defender/latest-data-cdc-vaers/

"Misinformation" and censorship

Facebook censors were wrong 80% of the time.

https://businessinsider.com/facebook-supreme-court-oversight-board-overturns-4-of-5-cases-2021-1

People don't trust BigTech, mainstream media and the government.

Fauci's no mask needed, then wear a mask, then wear TWO now, does not earn him any trust. Fauci admitted lying about vaccine-related herd immunity targets.

Should Leaders Tell Noble Lies? - Strategic Leaders Academy

https://strategicleadersacademy.com/should-leaders-tell-noble-lies/

Then Fauci admitted that injected vaccines do not offer herd Immunity at all.

"Administration of parenterally administered vaccines alone typically does not result in potent mucosal immunity that might interrupt infection or transmission"

http://acpjournals.org/doi/10.7326/M21-0111

The WHO flip-flopped on COVID-19 vaccine safety in pregnancy.

Moderna's COVID-19 vaccine now recommended for pregnant women, WHO says in guidance reversal

www.foxnews.com/health/moderna-covid-vaccine-pregnant-women-who-guidance-reversal

So the "authorities", mainstream media and BigTech are not even trying to EARN trust because they spread **"OFFICIAL" MISINFORMATION**. With censorship and fraudulent "fact-checking", they are only **REAFFIRMING** that they all have plenty to hide.

Even the Wall Street Journal and MEDPAGETODAY have become victims of the "fact-check" mafia.

https://www.wsj.com/articles/fact-checking-facebooks-fact-checkers-11614987375

Vaccines absolutely do cause autism

The CDC has flip-flopped twice in ~5 months on the fraudulent claim that "Vaccines do not cause autism", on their website. It suggests that the CDC's vaccine/autism claims are based on the conjunction of Jupiter and Saturn, not science.

They were forced to take the false claim down because ICAN demonstrated there was **ZERO** science behind that claim.

The CDC Finally Capitulated To ICAN's Legal Demands and Removed the Claim that "Vaccines Do Not Cause Autism"

From Its Website!

https://www.icandecide.org/ican_press/the-cdc-finally-capitulated-to-icans-legal-demands-and-removed-the-claim-that-vaccines-do-not-cause-autism-from-its-website/

THE CDC JUST SOLIDIFIED THAT ITS DECISIONS ARE NOT DRIVEN BY SCIENCE

https://www.icandecide.org/ican_press/the-cdc-just-solidified-that-its-decisions-are-not-driven-by-science/

FACT: Milk protein contaminated vaccines (DTap/Tdap/Prevnar 13/ActHiB) cause at least 75% of autism cases.

Autism pathogenesis: Piecing it all together, from end to beginning ...
https://doi.org/10.5281/zenodo.1477515

CDC caught lying, again about the COVID-19 vaccine this time.

CDC Investigation

http://fullmeasure.news/news/cover-story/cdc-investigation

Vaccine mandates are based on a lie; Repeal all mandates immediately; Try the corrupted liars who created mandates, for CRIMES AGAINST HUMANITY

"Administration of parenterally administered vaccines alone typically does not result in potent mucosal immunity that might interrupt infection or transmission"

SARS-CoV-2 Vaccines: Much Accomplished, Much to Learn

www.acpjournals.org/doi/10.7326/M21-0111

So Fauci admits now that **ALL** injected vaccines are for individual protection only. **No herd/community immunity.** So no vaccine mandates are justifiable for **ANY** injected vaccine.

And of course this also means the vaccinated can become infected super-spreaders as occurs with the failed flu shot and failed pertussis vaccines.

Yan J, Grantham M, Pantelic J, de Mesquita PJ, Albert B, Liu F, et al. Infectious virus in exhaled breath of symptomatic seasonal influenza cases from a college community. Adamson W, Beato-Arribas B, Bischoff W, Booth W, Cauchemez S, Ehrman S, et al., editors. Proc Natl Acad Sci. National Academy of Sciences; 2018;

The potential role of subclinical Bordetella Pertussis colonization in the etiology of multiple sclerosis
pubmed.ncbi.nlm.nih.gov/26724970/

This is the consequence of **insanely injecting** antigens of pathogens whose natural routes of exposure are mucosal surfaces in the nose, mouth or eyes.

Discrimination on the basis of vaccination status (is inherently wrong)
blogs.bmj.com/medical-ethics/2021/03/01/discrimination-on-the-basis-of-vaccination-status-is-inherently-wrong/

"In practical terms, **vaccine mandates imply that all humans are born in a defective, inherently harmful state; a repugnant conclusion**."

NOTICE!

By authority of the Nuremberg Code on Medical Experimentation, I do hereby exercise my right to refuse to submit to or to administer the Covid-19 vaccine. The United States Government has prosecuted, convicted and executed Medical Doctors who have violated the Nuremberg Code on Medical Experimentation. Aiders and abettors of Nuremberg Crimes are equally guilty and have also been prosecuted, convicted, and executed.

Francis A. Boyle
Professor of Law.

My comment in the Annals of Internal Medicine, against Fauci's "SARS-CoV-2 Vaccines: Much Accomplished, Much to Learn"

https://www.acpjournals.org/doi/10.7326/M21-0111

Vinu Arumugham Independent 18 January 2021
These vaccines are unsafe, unnecessary and must be immediately withdrawn

The vaccine safety claims made by the authors are unsupported by evidence. Vaccines must be designed for safety. These vaccines were not designed at all. So they are unsafe by definition. I predicted the allergic sensitization and autoimmunity risks with these vaccines which have now been confirmed.

The Pfizer/BioNTech vaccine is unnecessary, unsafe and should not be authorized.

https://www.regulations.gov/document?D=FDA-2020-N-1898-0039

Robert F Kennedy Jr. warned the FDA months back about the risk of allergic reactions due to the use of polyethylene glycol (PEG) in the vaccines.
https://childrenshealthdefense.org/defender/pfizer-covid-vaccine-allergic-reactions/

The FDA/VRBPAC ignored us and authorized these horrendously dangerous vaccines.

Recently, Dr. Peter Marks of the FDA admitted that the population was sensitized by PEG-containing pharmaceutical preparations (that include other vaccines/injections).

https://www.wsj.com/articles/scientists-eye-potential-culprit-for-covid-19-vaccine-allergic-reactions-11608901200?mod=hp_lead_pos2

"What we're learning now is that those **allergic reactions could be somewhat more common** than the highly uncommon that we thought they were **because people do get exposed to polyethylene glycol in various pharmaceutical preparations,**" - Peter Marks, Director, CBER,FDA.

We of course already knew that any vaccine/injection that has enough allergen to cause a reaction, has more than enough allergen to guarantee sensitization/priming (causing the development of new allergy).

Evidence that Food Proteins in Vaccines Cause the Development of Food Allergies and Its Implications for

Vaccine Policy

https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3571073

www.sciencemag.org/news/2020/12/suspicions-grow-nanoparticles-pfizer-s-covid-19-vaccine-trigger-rare-allergic-reactions

"he worries anti-PEG antibodies triggered by the first shot could increase the risk of an allergic reaction to the second or to PEGylated drugs."

- Janos Szebeni, an immunologist at Semmelweis University

So now, these vaccines have sensitized millions to PEG. The goal is to sensitize/boost PEG allergy in a 100 million more in the next 100 days.

PEG is contaminated with 1,4-dioxane, a carcinogen.

https://www.fda.gov/cosmetics/potential-contaminants-cosmetics/14-dioxane-cosmetics-manufacturing-byproduct

As predicted, Pfizer COVID-19 vaccine induced autoimmunity (thrombocytopenia) killed a Florida doctor. This is just the tip of the iceberg. Thousands of cases of vaccine induced autoimmune diseases may take months/years to be diagnosed and will be dismissed as unrelated to the vaccine.

https://www.nytimes.com/2021/01/12/health/covid-vaccine-death.html

Only a few lots were tested in the trial. No one has a clue what other lots will do. 100-fold variation of contaminants in vaccines makes trials and epidemiological studies worthless as I detailed in my comments in the Annals of Internal Medicine before. Vaccine safety remains an oxymoron.

https://www.acpjournals.org/doi/10.7326/m18-2101

California calls for pause of 330,000 doses, investigation after allergic reactions to Moderna vaccine batch

https://www.mercurynews.com/2021/01/18/coronavirus-california-calls-for-pause-investigation-after-allergic-reactions-to-moderna-vaccine-batch/

What's worse? Effective, life-saving, cheap, safe medicines such as famotidine/cetirizine/ivermectin are being ignored in this blind race to vaccinate at any cost.

Immunological mechanisms explaining the role of vaccines, IgE, mast cells, histamine, elevating ferritin, IL-6, D-dimer, VEGF levels in COVID-19 and dengue, potential treatments such as mast cell stabilizers, antihistamines: Predictions and confirmations

https://europepmc.org/article/PPR/PPR241819

Big picture of the damage vaccines do:

Vaccines and Biologics injury table based on mechanistic evidence – Feb 2020

Covering over 125 conditionshttps://zenodo.org/record/3647593/files/vbitr2_final.pdf?download=1

The organized suppression of vaccine safety science:

Retraction of scientific papers: the case of vaccine research
https://www.tandfonline.com/doi/full/10.1080/09581596.2021.1878109

The WHO's flip-flopping "science" competes with CDC's incompetence

WHO Recommends Against Moderna, Pfizer Vaccines for Most Pregnant Women

https://www.wsj.com/articles/who-recommends-against-moderna-pfizer-vaccines-for-most-pregnant-women-11611775138

Pregnant Women May Receive Covid Vaccines Safely, W.H.O. Says
https://www.nytimes.com/2021/01/29/health/covid-vaccine-pregnancy.html

Moderna's COVID-19 vaccine now recommended for pregnant women, WHO says in guidance reversal

https://www.foxnews.com/health/moderna-covid-vaccine-pregnant-women-who-guidance-reversal

Not to be outdone by the flip-flopping CDC, WHO did a flip-flop on COVID-19 vaccine during pregnancy.

Latest evidence that there is ZERO science behind vaccines or vaccine safety. They just pull their "science" out of a hat. Follow the money.

These flip-flopping, lying, organized criminals at the CDC/WHO, are the "reputable sources" for your "fact-checkers".

Judge to FCC: 'I am Inclined to Rule Against You'

https://childrenshealthdefense.org/defender/judge-to-fcc-i-am-inclined-to-rule-against-you/

The New Hampshire Commission report below has ripped FCC's 5G (and all other cellular) RF safety claims:

Final Report of the Commission to Study The Environmental and Health Effects of Evolving 5G Technology

http://www.gencourt.state.nh.us/statstudcomm/committees/1474/reports/5G%20final%20report.pdf

"RECOMMENDATION 1- Propose a resolution of the House to the US Congress and Executive Branch to **require the Federal Communication Commission (FCC) to commission an independent review** of the current radiofrequency (RF) standards of the electromagnetic radiation in the 300MHz to 300GHz microwave

spectrum as well as a health study to assess and recommend mitigation for the health risks associated with the use of cellular communications and data transmittal."

"A likely explanation as to why **regulatory agencies have opted to ignore the body of scientific evidence demonstrating the negative impact of cellphone radiation** is that **those agencies are "captured"** (see Harvard University publication entitled, "Captured Agency: How the Federal Communications Commission Is Dominated by the Industries It Presumably Regulates" linked in Appendix G). This report documents how **the leadership roles in some agencies (the FCC in particular) are filled by individuals with strong industry ties** and hence are more **focused on**

industry interests than the health of citizens"

Dr Menachery and Professor Baric

Can you please reply to this email of 14 April 2020, shown below?

I have copied the UNC Chancellor and UTMB President, so that they can be aware of this apparent lack of responsiveness and openness of their staff.

Please respond openly and honestly to my questions.

I look forward to hearing from you, without further delay.

best wishes
Marcus Williamson

Dr Menachery and Professor Baric

I've just read this article:

https://nam11.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2Fnm.3985%23ref-CR2&data=04%7C01%7Cvimenach%40utmb.edu%7C0cddf98e17914e6b046c08d9121bfa23%7C7

bef256d85db4526a72d31aea2546852%7C0%7C0%7C637560733637532091%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C1000&sdata=SPcuOovtOgc6hBnkWi50dqY593aJM%2FyKFhWedUi%2FZCQ%3D&reserved=0

which says:

"Using the SARS-CoV reverse genetics system[2], we generated and characterized a chimeric virus expressing the spike of bat coronavirus SHC014 in a mouse-adapted SARS-CoV backbone. The results indicate that group 2b viruses encoding the SHC014 spike in a wild-type backbone can efficiently use multiple orthologs of the SARS receptor human angiotensin converting enzyme II (ACE2), replicate efficiently in primary human airway cells and achieve in vitro titers equivalent to epidemic strains of SARS-CoV. Additionally, in vivo experiments demonstrate replication of the chimeric virus in mouse lung with notable pathogenesis."

Did you and your group, deliberately or inadvertantly, create the virus now known as COVID-19?

Was that virus then somehow released into the environment in Wuhan, deliberately or accidentally, by one or more of your co-authors, who live and work there?

Please respond openly and honestly, thank you.

Look forward to hearing from you.

best wishes
Marcus Williamson

Hello Inventors,

Attached is a Declaration form for the patent application entitled "LIVE ATTENTUATED ZIKA VIRUS WITH 3'UTR DELETION, VACCINE CONTAINING AND USE THEREOF" a copy of which is also attached.

You all are listed as inventors of this technology and as such it is required to sign the attached form to file with the US patent office, the form affirms that you are an inventor of this technology and you have allowed UTMB to file this patent application on your behalf.
Please sign (e-signatures are ok) and return to me at your convenience. Thanks

Best

PTO/AIA/01 (06-12)
Approved for use through 11/30/2020. OMB 0651-0032
U.S. Patent and Trademark Office; U.S. DEPARTMENT OF COMMERCE

DECLARATION (37 CFR 1.63) FOR UTILITY OR DESIGN APPLICATION USING AN APPLICATION DATA SHEET (37 CFR 1.76)

Title of Invention	LIVE ATTENTUATED ZIKA VIRUS WITH 3'UTR DELETION, VACCINE CONTAINING AND USE THEREOF

As the below named inventor, I hereby declare that:

This declaration is directed to:

☐ The attached application, or

☒ United States application or PCT international application number 16/485,818 filed on August 14, 2019.

The above-identified application was made or authorized to be made by me.

I believe that I am the original inventor or an original joint inventor of a claimed invention in the application.

I hereby acknowledge that any willful false statement made in this declaration is punishable under 18 U.S.C. 1001 by fine or imprisonment of not more than five (5) years, or both.

WARNING:

Petitioner/applicant is cautioned to avoid submitting personal information in documents filed in a patent application that may contribute to identity theft. Personal information such as social security numbers, bank account numbers, or credit card numbers (other than a check or credit card authorization form PTO-2038 submitted for payment purposes) is never required by the USPTO to support a petition or an application. If this type of personal information is included in documents submitted to the USPTO, petitioners/applicants should consider redacting such personal information from the documents before submitting them to the USPTO. Petitioner/applicant is advised that the record of a patent application is available to the public after publication of the application (unless a non-publication request in compliance with 37 CFR 1.213(a) is made in the application) or issuance of a patent. Furthermore, the record from an abandoned application may also be available to the public if the application is referenced in a published application or an issued patent (see 37 CFR 1.14). Checks and credit card authorization forms PTO-2038 submitted for payment purposes are not retained in the application file and therefore are not publicly available.

(57) **ABSTRACT**

The present invention discloses a live attenuated strain of Zika virus (ZIKV) having a deletion in the 3' untranslated region (3'UTR) of the viral genome, which may affect viral RNA synthesis and sensitivity to type I interferon inhibition, but may not affect viral RNA translation. The present invention also discloses the use of these live attenuated ZIKV strains in the preparation of ZIKV vaccines and for providing immunoprotection against ZIKV infection and congenital ZIKV syndrome, particularly in pregnant females.

Specification includes a Sequence Listing.

LIVE ATTENUATED ZIKA VIRUS WITH 3'UTR DELETION, VACCINE CONTAINING AND USE THEREOF

RELATED APPLICATIONS

[0001] This PCT application claims priority to U.S. Provisional Application No. 62/458,839, filed on Feb. 14, 2017, the contents of which are incorporated by reference in their entirety herein.

STATEMENT REGARDING FEDERALLY SPONSORED RESEARCH OR DEVELOPMENT

[0002] The invention was funded by NIH grant AI120942.

FIELD OF THE INVENTION

[0003] The invention generally relates to the development of a live attenuated strain of Zika virus (ZIKV) and vaccine compositions comprising this strain. The strain and vaccines comprising it may be used in humans and animals for treating or providing immunoprotection against ZIKV, which may cause congenital ZIKV syndrome and Guillan-Barré syndrome. The invention specifically discloses methods of protecting against congenital ZIKV syndrome, including microcephaly.

BACKGROUND OF THE INVENTION

[0004] The mosquito-borne ZIKV has recently caused a global threat to public health. The most devastating disease associated with Zika virus (ZIKV) infection is the wide range of congenital abnormalities (including microcephaly) now collectively known as congenital ZIKV syndrome (Reference 1). Prevention of congenital ZIKV syndrome is the most pressing task to reduce the burden of epidemics on family and society (Reference 2). In particular, pregnant women without ZIKV immunity in endemic countries are at risk for fetal infection and congenital defects. Since ZIKV could also be sexually transmitted, women living in non-endemic regions can also be at risk when exposed to men who have traveled to endemic countries.

[0005] ZIKV is spread to people primarily through the bite of an infected *Aedes* species mosquito. The most common symptoms of ZIKV are fever, rash, joint pain, and conjunctivitis. The illness is usually mild, with symptoms appearing 2 to 7 days after being bitten by an infected mosquito and lasting for several days to a week. However, there have been reports of congenital ZIKV syndrome, e.g., serious birth defects, especially microcephaly, and other poor pregnancy outcomes in babies of mothers who were infected with ZIKV while pregnant. There have also been cases of Guillain-Barré syndrome (GBS) reported in patients following suspected ZIKV infection. GBS is a rare disorder where a person's own immune system damages the nerve cells, causing muscle weakness and sometimes, paralysis. These symptoms can last anywhere from a few weeks to several months, although some people have permanent damage and, in rare cases, GBS may result in death.

[0006] ZIKV is a member of the *Flavivirus* genus (in the family Flaviviridae), which also includes other important human pathogens, e.g., yellow fever (YFV), West Nile (WNV), Japanese encephalitis (JEV), tick-borne encephalitis (TBEV), and Dengue viruses (DENV). Like other members of the *Flavivirus* genus, Zika contains a positive single-stranded genomic RNA, encoding a polyprotein that is processed into three structural proteins (capsid [C], premembrane [prM], and envelope [E] proteins) and seven nonstructural proteins (NS1, NS2A, NS2B, NS3, NS4A, NS4B, and NS5). Structural proteins form virions, whereas nonstructural proteins participate in viral RNA synthesis, virion assembly, and evasion of immune response.

[0007] Both inactivated and live-attenuated vaccines have been developed for flaviviruses, including YFV, JEV, TBEV, and DENV (Reference 3). Rapid and promising progress has been made toward ZIKV vaccine development (References 4 and 5). Inactivated ZIKV and subunit vaccines (expressing viral prM/E proteins) have shown efficacy in mice and nonhuman primates (References 6-8). A successful vaccine requires a fine balance between immunogenicity and safety. Live-attenuated vaccines generally offer fast and durable immunity, but sometimes with the trade-off of reduced safety; whereas inactivated and subunit vaccines provide enhanced safety at the cost of reduced immunogenicity, and often require multiple doses and periodic boosters.

[0008] The present invention addresses the need for novel ZIKV vaccines that serve at-risk populations in order to treat and/or provide immunoprotection against infections elicited by ZIKV and to prevent congenital ZIKV syndrome, especially microcephaly.

BRIEF SUMMARY OF THE INVENTION

[0009] The invention in general relates to a live attenuated Zika virus (ZIKV) strain, comprising a deletion in the 3' untranslated region (3'UTR) of the ZIKV genome.

[0010] The invention more specifically relates to a live attenuated Zika virus (ZIKV) strain, wherein the 3'UTR deletion ranges from a 10-nucleotide deletion to a 50-nucleotide deletion (i.e., Δ10, Δ11, Δ12, Δ13, Δ14, Δ15, Δ16, Δ17, Δ18, Δ19, Δ20, Δ21, Δ22, Δ23, Δ24, Δ25, Δ26, Δ27, Δ28, Δ29, Δ30, Δ31, Δ32, Δ33, Δ34, Δ35, Δ36, Δ37, Δ38, Δ39, Δ40, Δ41, Δ42, Δ43, Δ44, Δ45, Δ46, Δ47, Δ48, Δ49 or Δ50 3'UTR deletion), in exemplary embodiments the 3'UTR deletion is a 10-nucleotide deletion, a 20-nucleotide deletion, or a 30-nucleotide deletion.

[0011] The invention more specifically relates to a live attenuated Zika virus (ZIKV) strain comprising a 3'UTR having at least 80%, at least 85%, at least 90%, at least 95%, at least 98%, at least 99%, or 100% identity to the nucleic acid sequence of SEQ ID NO: 2, 3, 4, or 5.

[0012] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which is incompetent in infecting mosquitoes.

[0013] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which exhibits decreased viral RNA synthesis compared to wildtype ZIKV strains.

[0014] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which exhibits increased sensitivity to type-I interferon inhibition compared to wildtype ZIKV strains.

[0015] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described wherein the deletion does not affect viral RNA translation.

[0016] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which is an mCherry ZIKV strain.

[0017] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which comprises or consists of a deletion variant of SEQ ID

NO:6 wherein the sequence "CCAGAAGAGG" (3'UTR 10-nucleotide deletion) (SEQ ID NO:8) is deleted therefrom.

[0018] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which comprises or consists of a deletion variant of SEQ ID NO:6 wherein the sequence "CTGTGGATCTCCAGAAGAGG" (3'UTR 20-nucleotide deletion) (SEQ ID NO:9) is deleted therefrom.

[0019] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which comprises or consists of a deletion variant of SEQ ID NO:7 wherein the sequence "CCAGAAGAGG" (3'UTR 10-nucleotide deletion) (SEQ ID NO:8) is deleted therefrom.

[0020] The invention also specifically relates to a live attenuated Zika virus (ZIKV) strain as above-described which comprises or consists of a deletion variant of SEQ ID NO:7 wherein the sequence "CTGTGGATCTCCAGAAGAGG" (3'UTR 20-nucleotide deletion) (SEQ ID NO:9) is deleted therefrom.

[0021] The invention also specifically relates to an immunogenic composition comprising a live attenuated ZIKV strain as above-described, which further comprises at least one pharmaceutically acceptable carrier or excipient.

[0022] The invention also specifically relates to an immunogenic composition comprising a live attenuated ZIKV strain as above-described, which is suitable for parenteral or enteral administration.

[0023] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described.

[0024] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, which induces a $CD8^+$ T cell response, an antibody response, and/or a cellular immune response against ZIKV.

[0025] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, which produces a neutralizing antibody titer equivalent to that of wildtype ZIKV infection.

[0026] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, wherein the subject is a pregnant female.

[0027] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, in order to prevent congenital ZIKV syndrome.

[0028] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, in order to prevent microcephaly.

[0029] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, wherein at least 1.0×10^1, 1.0×10^2, 1.0×10^3, 1.0×10^4, 1.0×10^5, or 1.0×10^6 IFUs of the live attenuated ZIKV strain is administered to the subject.

[0030] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, wherein the administration of said composition prevents viremia in said subject after subsequent challenge with a wildtype ZIKV strain.

[0031] The invention also specifically relates to a method of eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain or immunogenic composition as above-described, wherein the subject is a human.

BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWINGS

[0032] FIG. **1**A-**1**F contain characterizations of the 3'UTR deletion mutants in cell culture. FIG. **1**A provides sequences of the ZIKV 3'UTR deletions. FIG. **1**B shows an immunostaining focus assay of mutant viruses. Equal amounts of RNAs (10 μg) transcribed from their corresponding infectious cDNA clones were electroporated into Vero cells. On day 4 or 5 post-transfection, culture fluids from the transfected cells were harvested and quantified for infectious viruses (defined as P0 virus) using an immunostaining focus assay on Vero cells. FIG. **1**C demonstrates the replication kinetics of WT and mutant viruses. Vero cells in 24-well plates (2×10^5 cells per well) were infected with WT and mutant viruses at an MOI of 0.01. Culture fluids were quantified for infectious viruses on days 1 to 5 using the immunostaining focus assay. From left to right for each day, the bars correspond to: WT, 10-del, 20-del, 30-del-a, and 30-del-b. FIG. **1**D illustrates a Renilla luciferase reporter replicon construct. FIG. **1**E contains a replicon analysis of the 3'UTR deletions. A Renilla luciferase reporter replicon of ZIKV (FIG. **1**D) was engineered with various 3'UTR deletions. Equal amounts of replicon WT and mutant RNAs (10 μg) were electroporated into Vero cells. Luciferase signals were measured at the indicated time points. A non-replicative replicon containing an NS5 polymerase-inactive GDD mutation was included as a negative control. The averages of three replicates are presented. Error bars represent standard deviations. RLU, relative light units. The top curve corresponds to WT and the bottom curve corresponds to the GDD control. FIG. **1**F shows the interferon-β inhibition of WT and mutant ZIKVs. Vero cells were seeded in 96-well plate (1.5×10^4 cell per well) one day before interferon treatment and viral infection. The cells were infected at an MOI 0.05 in the presence of IFN-β (55, 167, 500, or 1,500 IU/ml). Viral infection and interferon treatment were initiated at the same time. At 48 h post-infection and interferon-β treatment, viral titers were quantified using

the immunostaining focus assay on Vero cells. Percentages of viral titer inhibition are presented in $\log_{10}$ scale. Viral titers without interferon-β treatment are set as 100%. Average results of three independent experiments are shown. Error bars represent standard deviations. Symbols ** and *** indicate P values <0.01 and <0.001, respectively. From left to right for each day, the bars correspond to: WT, 10-del, 20-del, 30-del-a, and 30-del-b.

[0033] FIG. **2**A-**2**B shows the sequence information of the 3'UTR and the deletion mutants. FIG. **2**A depicts the predicted RNA secondary structure of the ZIKV 3'UTR. The stem-loop structure of the 3'UTR of the ZIKV genome is presented as previously reported (References 33,34). The nucleotide sequence of the shaded stem-loop is shown. The deleted sequences for 10-del, 20-del, 30-del-a, and 30-del-b mutants are displayed in blue, magenta, green, and orange, respectively. FIG. **2**B shows a sequence alignment of the deleted region (nucleotide position 10,630-10,674) in the 3'UTR. The 10-del nucleotides are indicated. Within the 10-del region, sequence variations are observed for early isolates (P6-740, MR766, and DAK-41525 were isolated in 1966, 1947, and 1984, respectively), while an identical sequence is observed for the strains isolated after 2010 (FSS13025, H/PF2013, PRVABC 59, Natal RGN, and ZKV2015).

[0034] FIG. **3** shows an immunofluorescence assay (IFA) of viral protein expression in cells transfected with WT or 3'UTR deletion ZIKV RNA. Vero cells were electroporated with 10 μg of genomic WT or 3'UTR deletion RNA of ZIKV. On day 2 and 3 post-transfection, IFA was performed to examine viral E protein expression using a mouse mAb (4G2) and Alexa Fluor® 488 goat anti-mouse IgG as the primary and secondary antibodies, respectively. Green and blue represent E protein and nuclei (stained with DAPI), respectively. Viral E protein staining is visible for WT and all mutant groups on both days.

[0035] FIG. **4**A-**4**C contain a stability analysis of the 3'UTR deletion ZIKVs in cell culture. P0 viruses (derived from the culture fluids of RNA-transfected cells from FIG. **1**) were continuously cultured on Vero cells for five rounds (5 days for each round of culture), resulting in P5 viruses. The P5 viruses were then characterized. FIG. **4**A shows the results of an immunostaining focus assay. WT and P5 mutant viruses were analyzed using an immunostaining focus assay on Vero cells. For each mutant virus, three independent selections were performed on Vero cells. Representative images of infectious foci for each P5 mutant virus are presented. FIG. **4**B shows replication kinetics. Vero cells in 24-well plates (2×10^5 cells per well) were infected with WT and P5 mutant viruses at an MOI of 0.01. Culture fluids were quantified for infectious viruses on days 1 to 5 using the immunostaining focus assay on Vero cells. From left to right for each day, the bars correspond to: WT, 10-del, 20-del, 30-del-a, and 30-del-b. FIG. **4**C shows adaptive mutations in P5 mutant viruses. The complete genomes of P5 mutant viruses were sequenced for each of the three independent selections. The adaptive mutations are indicated by their amino acid positions of indicated genes based on ZIKV FSS13025 strain (GenBank number KU955593.1).

[0036] FIG. **5**A-**5**G show a characterization of 3'UTR mutants in the A129 mouse model. FIG. **5**A contains an experimental scheme. In two separate experiments, three-week old A129 mice (n=8) were immunized via the S.C. route with 1×10^4 IFU WT and mutant viruses. The immunized mice were monitored for weight loss, survival, and viremia. FIG. **5**B shows the results for weight loss. Weight loss is indicated by percentage using the weight on the day before immunization as 100%. The lowest curve corresponds to WT. FIG. **5**C shows the results for survival. The lowest curve corresponds to WT. FIG. **5**D shows the results for viremia. Viremias were quantified by an immunostaining focus assay from day 2 to 4 post-infection. From left to right for each day, the bars correspond to: WT, 10-del, 20-del, 30-del-a, and 30-del-b. FIG. **5**E shows the pre-challenge neutralization antibody titers. On day 28 post-immunization, mouse sera were measured for neutralizing titers using an mCherry ZIKV infection assay (FIG. **6**A-**6**B). FIG. **5**F shows the post-challenge viremia. On day 28 post-immunization, mice were challenged with 1×10^5 PFU parental virus (ZIKV strain FSS13025) via the I.P. route. Viremia on day 2 post-challenge was quantified using the immunostaining focus assay. FIG. **5**G shows the post-challenge neutralization antibody titer. On day 28 post-challenge, mouse sera were quantified for neutralizing titers using the mCherry ZIKV infection assay. L.O.D.: limit of detection.

[0037] FIG. **6**A-**6**B show the construction of mCherry ZIKV. FIG. **6**A shows a schematic genome of an mCherry ZIKV. A DNA fragment (encoding the first 25 amino acids of C gene, the mCherry gene, and the foot-and-mouth virus 2A protein) was in-frame fused with the open-reading-frame of ZIKV genome. FIG. **6**B shows the mCherry expression in Vero cells transfected with mCherry ZIKV RNA. The expression of mCherry in transfected Vero cells was analyzed by fluorescent microscopy at the indicated days post-transfection. The mCherry ZIKV was used to estimate antibody neutralization titers of mouse sera, as described in Methods.

[0038] FIG. **7**A-**7**C show the efficacy of immunization with 100 IFU 10-del virus. FIG. **7**A shows the viremia after immunization with 100 IFU of WT (left bar) or 10-del ZIKV (right bar). Three-week-old A129 mice (n=5) were immunized with 100 IFU WT or 10-del virus via the S.C. route. Viremia was quantified by immunostaining focus assay from day 2 to 6. L.O.D., limit of detection. FIG. **7**B shows the pre-challenge neutralization antibody titers. On day 28 post-immunization, mouse sera were quantified for ZIKV neutralizing antibody titers. FIG. **7**C shows the viremia after challenge with ZIKV (Puerto Rico strain PRVABC59). On day 28 post-immunization, the mice were challenged with 1×10^6 IFU of ZIKV via the I.P. route. Viremias were quantified by immunostaining focus assay on day 2 post-challenge.

[0039] FIG. **8**A-**8**C show the efficacy of immunization with 10 IFU 10-del virus. FIG. **8**A shows the viremia after immunization with 10 IFU of WT or 10-del ZIKV. Three-week-old A129 mice (n=5) were immunized with 10 IFU WT or 10-del virus via the S.C. route. Viremia were quantified by immunostaining focus assay from day 4 to 7. L.O.D., limit of detection. FIG. **8**B shows the pre-challenge neutralization antibody titers. Three-week-old A129 mice (n=5) were immunized with 10 IFU 10-del ZIKV and PBS via the S.C. route. On day 28 post-immunization, mouse sera were quantified for ZIKV neutralizing antibody titers. On the same day, the mice were challenged with 1×10^6 IFU of ZIKV (Puerto Rico strain PRVABC59) via the I.P. route. FIG. **8**B shows the viremia after challenge with epidemic ZIKV (Puerto Rico strain PRVABC59). On day 2 post-

challenge, viremias were quantified using an immunostaining focus assay. L.O.D.: limit of detection.

[0040] FIG. **9**A-**9**D show the T cell responses after primary infection with ZIKV WT or 10-del mutant. A129 mice were infected with 1×10^4 IFU WT and 10-del viruses. On day 28 post-infection, mouse spleens were harvested. Splenocytes were counted, cultured ex vivo with WT ZIKV for 24 h, and stained for markers (IFN-γ, CD3, and CD4 or CD8). The T cells were gated based on staining for these markers. FIG. **9**A shows percentages of $CD4^+IFN\text{-}\gamma^+$ cells and $CD8^+IFN\text{-}\gamma^+$ cells. FIG. **9**B shows the average total number of T cell subsets per spleen. Supernatants from the ex vivo culture were harvested on day 2 after WT ZIKV re-stimulation, and measured for IFN-γ and IL-2 production. FIG. **9**C shows IFN-γ production. FIG. **9**D shows IL-2 production. Data are presented as means±SEM, n=2-4 per group. *P<0.05 or **P<0.01 difference between the virus- and mock-infected mice.

[0041] FIG. **10**A-**10**C show the safety evaluation of 10-del virus. FIG. **10**A shows the viral loads in organs of infected A129 mice. Three-week-old A129 mice were immunized with 1×10^4 IFU of WT and 10-del viruses. Organs from infected mice were collected and homogenized on day 6 and 10 post-infection. The amounts of viruses were quantified on Vero cells using an immunostaining focus assay. The mean results from three animals are presented. Bars denote standard errors. "*" denotes no detectable virus. From left to right on each day, the bars correspond to: heart, lung, liver, spleen, kidney, muscle, brain, testis, and eye. FIG. **10**B shows a comparison of neurovirulence of WT and 10-del viruses in CD1 newborn mouse. Groups of one-day-old CD1 mice (n=7-10) were injected via the I.C. route with 10 to 1×10^4 IFU of WT or 10-del virus. All 10-del virus curves show 100% survival, while WT curves show less than 100% survival. FIG. **10**C shows the results of a mosquito infectivity assay. *Aedes aegypti* were fed with WT or 10-del virus on artificial blood-meals. On day 7 post-feeding, individual engorged, incubated mosquitoes were homogenized and infection was assayed by immunostaining of viral protein expression on inoculated Vero cells (see Methods for details). The number of infected mosquitos and total number of engorged mosquitoes are indicated.

[0042] FIG. **11**A-**11**C shows the comparison of viremia and efficacy of P0 and P5 10-del viruses. FIG. **11**A shows the viremia after immunization with 100 IFU of P0 or P5 10-del ZIKV. Three-week-old A129 mice (n=5) were immunized with 100 IFU P0 or P5 10-del virus via the S.C. route. Viremia was quantified by immunostaining focus assay from day 4 to 6. L.O.D., limit of detection. FIG. **11**B shows pre-challenge neutralization antibody titers. On day 28 post-immunization, mouse sera were quantified for ZIKV neutralizing antibody titers. FIG. **11**C shows viremia after challenge with wild-type ZIKV. On day 28 post-immunization, the mice were challenged with 1×10^6 IFU of an epidemic strain of ZIKV (Puerto Rico strain PRVABC59) via the I.P. route. On day 2 post-challenge, viremias were quantified using an immunostaining focus assay.

[0043] FIG. **12**A-**12**B show a sperm count analysis of A129 mice infected with WT or 10-del mutant virus. Male A129 mice were infected with 1×10^4 IFU of WT and 10-del viruses (n=4 per group). On day 16 p.i., epididymis was harvested for sperm count analysis. FIG. **12**A shows total sperm counts. FIG. **12**B shows motile sperm counts. One-way ANOVA test was performed to indicate statistical significance among different infection groups. n.s., not significant; ***very significant (p value <0.001); ****extremely significant (p value <0.0001).

[0044] FIG. **13**A-G shows that ZIKV-3'UTR-Δ10-LAV protects pregnant C57BL/6 mice and their developing fetuses. FIG. **13**A shows the scheme of immunization of wild-type (WT) C57BL/6 female mice with 10^5 FFU of ZIKV-3'UTR-Δ10-LAV (Δ10; n=12) or PBS sham (n=16). FIG. **13**B shows experiments wherein serum was collected at day 28 post-immunization and analyzed for neutralizing activity using an mCherry infectious ZIKV. Representative neutralization curves are shown. Error bars denote the standard deviation (SD) of duplicate technical replicates. FIG. **13**C shows NT_{50} values of neutralizing antibodies were measured for individual animals. The dashed lines indicate the limit of detection (L.O.D.) of the assay. FIG. **13**D-G shows that at day 35 post-immunization, vaccinated female mice were mated with WT C57BL/6 males. A subset of the female mice developed vaginal plugs. Pregnant mice (n=8 pooled from two independent experiments) were administered 2 mg of anti-Ifnarl blocking antibody on E5, and one day later (E6), challenged with 10^5 FFU of a pathogenic, mouse adapted ZIKV Dakar 41519 strain. On E13, animals were euthanized; maternal spleen (FIG. **13**D), maternal brain (FIG. **13**E), placenta (FIG. **13**F), and fetal heads (FIG. **13**G) were harvested and quantified for viral RNA levels. Median viral RNA levels are indicated for each group. Asterisks indicate significant differences (Mann-Whitney test: ****, P value <0.0001). All negative samples are plotted at the half value of L.O.D. The results in the Figure are pooled from two independent experiments.

[0045] FIG. **14**A-I show that ZIKV-3'-UTR-Δ10-LAV protects young A129 male mice against testis infection and injury. FIG. **13**A contains the scheme of immunization of 3-week-old A129 male mice with 10^4 FFU of ZIKV-3'-UTR-Δ10-LAV (Δ10; n=6) or PBS sham (n=4 or 6). At day 28 post-immunization, mice were measured for neutralization antibody titers. On the same day, mice from one sham group and mice from Δ10-immunized group were challenged with 10^6 FFU of ZIKV-PRVABC59, and viremia was measured at day 2 post-challenge (day 30 post-immunization). At day 49 post-immunization, mice were analyzed for sperm counts and viral load in the testis. FIG. **14**A-B shows viremia after immunization with Δ0 vaccine candidate. FIG. **14**C contains NT50 values of antibody neutralization at day 28 post-immunization were measured for individual animals in each group. The dashed lines indicate the limit of detection (L.O.D.) of the assay. FIG. **14**D shows viremia at day 2 post-challenge (day 30 post-immunization) with ZIKV PRVABC59. FIG. **14**E shows viral load in the testis at day 21 post-challenge (day 49 post-immunization). FIG. **14**F-G show total (F) and motile (G) sperm counts at day 21 post-challenge. (H-I) Testis weight (H) and representative images of testis (i) from animals from sham, sham with challenge, and Δ10-immunized and challenged groups at day 21 post-challenge. Scale bar, 1 mm. Asterisks indicate significant differences (One-way ANOVA: ****, P value <0.0001; ***, P value <0.001). Non-significant (n.s.), P value >0.5. All negative samples are plotted at the half value of L.O.D. Error bars represent standard deviations.

[0046] FIG. **15**A-D shows that ZIKV-3'UTR-Δ10-LAV and ZIKV-3'UTR-Δ20-LAV protect rhesus macaques (RM) from ZIKV infection. FIG. **15**A shows the scheme of immunization of RM with 10^3 FFU of WT ZIKV strain FSS13025

(n=4), ZIKV-3'UTR-Δ10-LAV (Δ10; n=4), ZIKV-3'UTR-Δ20-LAV (Δ20; n=3), or PBS sham (n=2) via the subcutaneous route. FIG. **15**B shows viremia measured at day 2, 3, 4, 5, 7, and 10 post-immunization by qRT-PCR. Each colored line represents data from different animals in each group. The dashed line indicates the limit of detection (L.O.D.) of the assay. FIG. **15**C shows pre- and post-challenge antibody neutralization titers. On various days post-immunization, sera were measured for neutralizing titers using an mCherry ZIKV infection assay. Red arrows indicate challenge with 10^3 FFU of epidemic ZIKV strain PRVABC59 via the subcutaneous route at day 56 post-immunization. The number of animals whose antibody neutralization titers increased by ≥4-fold after challenge is indicated by symbol "↑" for each experimental group. FIG. **15**D shows post-challenge viremia. Viremia was measured by qRT-PCR at day 2, 3, 4, 5, 7, and 10 post-challenge. All negative samples are plotted at the half value of L.O.D. Error bars represent standard deviations.

[0047] FIG. **16**A-H shows a safety evaluation of ZIKV-3'-UTR-Δ20-LAV (Δ20) vaccine candidate. FIG. **16**A shows viral loads in organs of infected A129 mice. Three-week-old A129 mice (n=7) were subcutaneously immunized with 10^3 FFU of WT ZIKV FSS13025 (left panel) and its derivative Δ20 vaccine candidate (right panel). Organs from infected mice were collected and homogenized at day 6 and 10 post-infection. The amounts of viruses were quantified on Vero cells using a focus forming assay. The mean results from seven animals are presented. Bars denote standard errors. The dashed lines indicate the limit of detection (L.O.D.) of the assay. FIG. **16**D-F shows the effect of Δ20 vaccination on the testis. Three-week-old A129 mice (n=5) were subcutaneously infected with 1×10^3 FFU of WT ZIKV FSS13025 or Δ20 vaccine candidate. At day 28 post-infection, animals from each group were analyzed for testis weight (FIG. **16**B), testis size (FIG. **16**C), total sperm counts (FIG. **16**D), motile sperm counts (FIG. **16**E), and viral RNA load (FIG. **16**F). Scale bar, 1 mm. (FIG. **16**G) Comparison of neurovirulence of WT ZIKV FSS13025 and Δ20 vaccine candidate in outbred CD-1 mice. One-day-old CD-1 mice (n=7-8 per group) were injected intracranially with 10 to 10^4 FFU of WT ZIKV or 10^3 to 10^4 FFU of Δ20 vaccine candidate. Survival mice and total infected animals are indicated. (FIG. **16**H) Analysis of vector competency. *Aedes aegypti* were fed on artificial blood-meals spiked with 10^6 FFU/ml of WT ZIKV FSS13025 or Δ20 vaccine virus. At day 7 post-feeding, individual engorged mosquitoes were assayed for infection by immunostaining of viral protein expression on inoculated Vero cells. The number of infected mosquitos and total number of engorged mosquitoes are indicated. Asterisks indicate significant differences (One-way ANOVA: ***, P value <0.001; **, P value <0.01; *, P value <0.05). Non-significant (n.s.) with P value >0.5. All negative samples are plotted at the half value of L.O.D. Error bars represent standard deviations.

[0048] FIG. **17**A-C shows the infectious ZIKV burden in placentas and fetal heads from sham or ZIKV-3'UTR-Δ10-LAV-immunized dams. In the pregnancy protection experiment (see details in FIG. **13**), at day 7 post-challenge (equivalent to E13), placenta (FIG. **17**A) and fetal heads (FIG. **17**B) were collected from PBS sham and ZIKV-3'UTR-Δ10-LAV-immunized dams, and quantified for infectious ZIKV using a focus forming assay. Dashed lines indicate limit of detection (L.O.D.) of the assays. Results are pooled from two independent biological experiments, and each symbol represents data from an individual placenta (n=23) or fetus (n=30). (FIG. **17**C) Correlation of E13 placenta viral burden with antibody neutralizing NT_{50} values of ZIKV-3'UTR-Δ10-LAV. P and R^2 values reflect Pearson correlation tests. All negative samples are plotted at the half value of L.O.D. Error bars represent standard deviations.

[0049] FIG. **18** A-I contains experiments which show that ZIKV-3'UTR-Δ10-LAV protects adult A129 male mice against testis infection and injury. (A) Scheme of immunization of 15-week-old A129 male mice with 1×10^4 FFU of ZIKV-3'UTR-Δ10-LAV (Δ10; n=5) or PBS sham (n=5). At day 28 post-immunization, mice were measured for neutralizing antibody titers. On the same day, the mice were challenged with 10^6 FFU of ZIKV-PRVABC59. Peak viremia was measured at day 2 post-challenge (day 30 post-immunization). At day 49 post-immunization, mice were euthanized and measured for total and motile sperm counts and viral loads in the testis. FIG. **18**B shows viremia after ZIKV-3'UTR-Δ10-LAV immunization. FIG. **18**C shows NT_{50} values of antibody neutralization at day 28 post-immunization. Antibody neutralizing titers were measured for individual animals in each group by an mCherry ZIKV. The dashed lines indicate the limit of detection (L.O.D.) of the assay. FIG. **18**D shows day 2 post-challenge (day 30 post-immunization) viremia. At day 21 post-challenge, animals from each group were analyzed for testis viral load FIG. **18**E shows testis viral load, FIG. **18**F shows total sperm counts, FIG. **18**G shows motile sperm counts, FIG. **18**H shows testis weight, and FIG. **18**I shows testis size. Representative images of testis are presented in (i). Scale bar, 1 mm. Asterisks indicate significant differences (One-way ANOVA: *, P value <0.05; **, P value <0.01; ****, P value <0.0001). Non-significant (n.s.), P value >0.5. All negative samples are plotted at the half value of L.O.D. Error bars represent standard deviations.

[0050] FIG. **19**A-B shows infectious virus in serum of challenged rhesus macaque. Infectious virus in RM serum (viremia) was collected at days 2, 3, 4, 5, 7, and 10 post-immunization (FIG. **19**A) or post-challenge (FIG. **19**B) was quantified by a focus forming assay. (See detailed experimental scheme in FIG. **15**A-D). Dashed lines indicate limit of detection (L.O.D.) of the assays. All negative samples are plotted at the half value of L.O.D.

[0051] FIG. **20**A-I shows that ZIKV-3'-UTR-Δ20-LAV protects young A129 male mice against testis infection and injury. FIG. **20**A shows the scheme of immunization of 3-week-old A129 male mice with 10^3 FFU of ZIKV-3'-UTR-Δ20-LAV (Δ20; n=6) or PBS sham (n=4 or 6). FIG. **20**B shows viremia post immunization. At day 28 post-immunization, immunized mice were measured for neutralization antibody titers. At the same day, mice from one sham group and mice from Δ20-immunized group were challenged with 10^6 FFU of ZIKV-PRVABC59. FIG. **20**D shows viremia measured at day 2 post-challenge (day 30 post-immunization). FIG. **20**E&F show that at day 49 post-immunization, mice were analyzed for sperm counts and viral loads in testis. FIG. **20**C shows NT_{50} values of antibody neutralization at day 28 post-immunization were measured for individual animals in each group. The dashed lines indicate the limit of detection (L.O.D.) of the assay. FIG. **20**D shows day 2 post-challenge (day 30 post-immunization) viremia. FIG. **20**E & F respectively show total (E) and motile (F) sperm

counts at day 21 post-challenge (equivalent to day 49 post-immunization). FIG. **20**G shows testis weight from animals from sham, sham with challenge, and Δ20-immunized and challenged groups at day 21 post-challenge. FIG. **20**H shows viral load in testis at day 21 post-challenge. FIG. **20**I contains representative images of testis harvested at day 21 post-challenge. Scale bar, 1 mm. Asterisks indicate significant differences (One-way ANOVA: ****, P value <0.0001). Non-significant (n.s.) with P value >0.5. All negative samples are plotted at the half value of L.O.D. Error bars represent standard deviations.

[0052] FIG. **21** contains a summary of experiments which evaluated the stability of ZIKV-3'UTR-Δ20-LAV in cell culture. P0 viruses (derived from the culture fluids of RNA-transfected cells) were continuously cultured on Vero cells for five rounds (5 days for each round of culture), resulting in P5 viruses. The complete genomes of P5 mutant viruses were sequenced. All P5 viruses retained the 20-nucleotide deletion in the 3'UTR. In addition, several adaptive mutations are recovered; these mutations are presented by their amino acid positions of indicated genes based on ZIKV FSS13025 strain (GenBank number KU955593.1). Results from three independent passages are presented.

[0053] FIG. **22** depicts the results of experiments wherein 5 micrograms of a Zika DNA plasmid according to the invention was transfected into Vero cells through electroporation. Culture fluids were collected from day 1 to 5. Infectious viral titers were measured by plaque assay on Vero cells.

[0054] FIG. **23** shows the yield of ZIKV DNA vaccine candidates on Vero cells. Five micrograms of indicated DNA plasmid was transfected into Vero cells through electroporation. Culture fluids were collected from day 1 to 5. Infectious viral titers were measured by plaque assay on Vero cells.

DETAILED DESCRIPTION OF THE INVENTION

[0055] The present invention in general relates to the construction and characterization of a novel live attenuated Zika virus (ZIKV) strain having one or more deletions in the 3' untranslated region (3'UTR). These ZIKV deletion mutants may have reduced RNA production and increased susceptibility to interferon-β inhibition, and thus can be utilized as effective live attenuated vaccines against ZIKV. Particularly we show herein that live-attenuated ZIKV vaccine candidates containing deletions in the 3' untranslated region of the ZIKV genome (ZIKV-3'UTR-LAV) prevent viral transmission during pregnancy and testis damage in mice, as well as inhibiting infection in non-human primates. We also demonstrate a desirable safety profile of the vaccine candidates. Our results suggest that ZIKV-3'UTR-LAV potentially may be used to vaccinate humans against Zika virus infection.

[0056] Moreover, as evidenced by the results disclosed herein mutated live attenuated Zika virus strains according to the invention and compositions containing same may be used in treating or providing immunoprotection against infections elicited by ZIKV, including congenital ZIKV syndrome, microcephaly, and Guillan-Barré syndrome (GBS).

[0057] The present invention provides a vaccine which may be used to prevent viremia in pregnant women and travelers to epidemic/endemic regions to avert congenital ZIKV syndrome and which may also be useful to suppress epidemic transmission. The ZIKV strain of the invention is a live-attenuated vaccine candidate that contains a deletion or "Δ" in the 3' untranslated region of ZIKV genome, preferably a 10-nucleotide deletion (10-del ZIKV) or a 20-nucleotide deletion (20-del ZIKV) and more preferably comprising or consisting of the Zika strains having the sequences in Appendix A modified as set forth in Appendix B. The 10-del ZIKV is highly attenuated, immunogenic, and protective in the A129 mouse model. A single dose of 10 IFU of 10-del ZIKV elicited a high level of neutralizing antibodies and completely prevented viremia after challenge. Besides the antibody response, the immunized mice also developed a robust T cell response. Intracranial inoculation of one-day-old CD1 mice with 1×10^4 IFU of 10-del ZIKV caused no detectable disease, whereas infections with 10 IFU of wild-type ZIKV were lethal. Mechanistically, the 10-del ZIKV attenuated its virulence through decreased viral RNA synthesis and increased sensitivity to type-I interferon inhibition. The attenuated 10-del ZIKV was incompetent in infecting mosquitoes, representing an additional safety feature for use in non-endemic regions. Collectively, the safety and efficacy results warrant further development of this promising live-attenuated ZIKV vaccine candidate.

[0058] The live attenuated ZIKV strains of the invention may further comprise additional mutations to the ZIKV genome. A mutation can be, but is not limited to, a deletion of non-coding or coding nucleotides, a deletion of one or more amino acids, an addition of one or more amino acids, a substitution (conserved or non-conserved) of one or more amino acids or a combination thereof ZIKV can be mutated, e.g., using deletions to the 3'UTR, such that the infectivity of ZIKV is reduced. In certain embodiments, the infectivity of ZIKV is reduced by a factor of at least 5, 10, 50, 100, 500, 10, 5×10^3, 10^4, 5×10^4, 10^5, 5×10^5, or at least 10^6.

[0059] Additionally, ZIKV can be mutated, e.g., having deletions to the 3'UTR and/or using point mutations, such that the rate of replication of the recombinant virus is reduced or increased. The rate of replication can be determined by any standard technique known to the skilled artisan. The rate of replication is represented by the growth rate of the virus and can be determined by plotting the viral titer over the time post infection. The viral titer can be measured by any technique known to the skilled artisan. In certain embodiments, a suspension containing the virus is incubated with cells that are susceptible to infection by the virus including, but not limited to, Vero cells, LLC-MK-2 cells, Hep-2 cells, LF 1043 (HEL) cells, MRC-5 cells, WI-38 cells, tMK cells, 293 T cells, QT 6 cells, QT 35 cells, or chicken embryo fibroblasts (CEF). Subsequent to the incubation of the virus with the cells, the number of infected cells is determined. In certain specific embodiments, the virus comprises a reporter gene. Thus, the number of cells expressing the reporter gene is representative of the number of infected cells. In a specific embodiment, the virus comprises a heterologous nucleotide sequence encoding mCherry, and the number of cells expressing mCherry, i.e., the number of cells infected with the virus, is determined using FACS.

[0060] The assays described herein may be used to assay viral titre over time to determine the growth characteristics of the virus. In a specific embodiment, the viral titre is determined by obtaining a sample from the infected cells or

the infected subject, preparing a serial dilution of the sample and infecting a monolayer of cells that are susceptible to infection with the virus at a dilution of the virus that allows for the emergence of single plaques. The plaques can then be counted and the viral titre express as plaque forming units per milliliter of sample. In a specific embodiment of the invention, the growth rate of a virus of the invention in a subject is estimated by the titer of antibodies against the virus in the subject. Without being bound by theory, the antibody titer in the subject reflects not only the viral titer in the subject but also the antigenicity. If the antigenicity of the virus is constant, the increase of the antibody titer in the subject can be used to determine the growth curve of the virus in the subject. In a preferred embodiment, the growth rate of the virus in animals or humans is best tested by sampling biological fluids of a host at multiple time points post-infection and measuring viral titer.

[0061] The expression of heterologous gene sequence in a cell culture system or in a subject can be determined by any technique known to the skilled artisan. In certain embodiments, the expression of the heterologous gene is measured by quantifying the level of the transcript. The level of the transcript can be measured by Northern blot analysis or by RT-PCR using probes or primers, respectively that are specific for the transcript. The transcript can be distinguished from the genome of the virus because the virus is in the antisense orientation whereas the transcript is in the sense orientation. In certain embodiments, the expression of the heterologous gene is measured by quantifying the level of the protein product of the heterologous gene. The level of the protein can be measured by Western blot analysis using antibodies that are specific to the protein.

[0062] The invention provides a live attenuated ZIKV strain comprising a deletion of one or more nucleotides in the 3'UTR of the ZIKV genome. In some embodiments, the ZIKV strain of the invention may comprise a 1-nucleotide deletion, a 2-nucleotide deletion, a 3-nucleotide deletion, a 4-nucleotide deletion, a 5-nucleotide deletion, a 6-nucleotide deletion, a 7-nucleotide deletion, an 8-nucleotide deletion, a 9-nucleotide deletion, a 10-nucleotide deletion, an 11-nucleotide deletion, a 12-nucleotide deletion, a 13-nucleotide deletion, a 14-nucleotide deletion, a 15-nucleotide deletion, a 16-nucleotide deletion, a 17-nucleotide deletion, an 18-nucleotide deletion, a 19-nucleotide deletion, a 20-nucleotide deletion, 21-nucleotide deletion, a 22-nucleotide deletion, a 23-nucleotide deletion, a 24-nucleotide deletion, a 25-nucleotide deletion, a 26-nucleotide deletion, a 27-nucleotide deletion, a 28-nucleotide deletion, a 29-nucleotide deletion, a 30-nucleotide deletion, 31-nucleotide deletion, a 32-nucleotide deletion, a 33-nucleotide deletion, a 34-nucleotide deletion, a 35-nucleotide deletion, a 36-nucleotide deletion, a 37-nucleotide deletion, a 38-nucleotide deletion, a 39-nucleotide deletion, a 40-nucleotide deletion, a 41-nucleotide deletion, a 42-nucleotide deletion, a 43-nucleotide deletion, a 44-nucleotide deletion, a 45-nucleotide deletion, a 46-nucleotide deletion, a 47-nucleotide deletion, a 48-nucleotide deletion, a 49-nucleotide deletion, or a 50-nucleotide deletion in the 3'UTR of the ZIKV genome.

[0063] The live attenuated ZIKV strains of the present invention, nucleotide sequences encoding the same, vectors encoding the same, and cells comprising nucleotide sequences encoding said strains may be further modified, engineered, optimized, or appended in order to provide or select for various features. In addition to deletions within the 3'UTR, the attenuated virus may also contain other mutations including, but not limited to, replacing a gene of the human virus with the analogous gene of a virus of a different species, of a different subgroup, or of a different variant.

[0064] In some embodiments, other mutations may be introduced into the virus (e.g., missense mutations) can be introduced into the C, prM, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B, or NS5 proteins of the recombinant virus. Also, the mutations may include additions, substitutions, deletions, or combinations thereof. For example a deletion mutation in any of the C, prM, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B, or NS5 proteins may be introduced. In other embodiments, a missense mutation may be introduced which results in a cold-sensitive mutation or a heat-sensitive mutation. In some embodiments, major phosphorylation sites of viral protein may be removed.

[0065] In other embodiments, deletions are introduced into the genome of the recombinant virus. In more specific embodiments, a deletion can be introduced into the C, prM, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B, or NS5 proteins of the recombinant virus.

[0066] In certain embodiments, the intergenic region of the recombinant virus is altered. In one embodiment, the length of the intergenic region is altered. In another embodiment, the intergenic regions may be shuffled from 5' to 3' end of the viral genome. In other embodiments, the genome position of a gene or genes of the recombinant virus can be changed.

[0067] In certain embodiments, attenuation of the virus is further enhanced by replacing a gene of the wild type virus with a gene of a virus of a different species, of a different subgroup, or of a different variant.

[0068] The attenuated phenotypes of a recombinant virus of the invention can be tested by any method known to the artisan. A candidate virus can, for example, be tested for its ability to infect a host or for the rate of replication in a cell culture system. In certain embodiments, growth curves at different temperatures are used to test the attenuated phenotype of the virus. For example, an attenuated virus is able to grow at 35° C., but not at 39° C. or 40° C. In certain embodiments, different cell lines can be used to evaluate the attenuated phenotype of the virus. For example, an attenuated virus may only be able to grow in monkey cell lines but not the human cell lines, or the achievable virus titers in different cell lines are different for the attenuated virus. In certain embodiments, viral replication in the respiratory tract of a small animal model, including but not limited to, hamsters, cotton rats, mice and guinea pigs, is used to evaluate the attenuated phenotypes of the virus. In other embodiments, the immune response induced by the virus, including but not limited to, the antibody titers (e.g., assayed by plaque reduction neutralization assay or ELISA) is used to evaluate the attenuated phenotypes of the virus. In certain embodiments, the ability of the recombinant virus to elicit pathological symptoms in an animal model can be tested. A reduced ability of the virus to elicit pathological symptoms in an animal model system is indicative of its attenuated phenotype. In a specific embodiment, the candidate viruses are tested in a monkey model for nasal infection, indicated by mucous production.

[0069] Various assays can be used to test the safety of a vaccine. For example, sucrose gradients and neutralization

assays can be used to test the safety. A sucrose gradient assay can be used to determine whether a heterologous protein is inserted in a virion. If the heterologous protein is inserted in the virion, the virion should be tested for its ability to cause symptoms even if the parental strain does not cause symptoms. Without being bound by theory, if the heterologous protein is incorporated in the virion, the virus may have acquired new, possibly pathological, properties.

[0070] Attenuated virus produced according to the invention will be used to confer prophylactic or therapeutic protection in susceptible hosts against ZIKV infection, e.g., to treat or prevent ZIKV infection and/or to prevent congenital ZIKV syndrome or GBS. The attenuated ZIKV strain may be formulated using known techniques for formulating attenuated viral vaccines or immunogenic compositions of viral vaccines.

[0071] In one embodiment, the 3'UTR of the ZIKV strain of the invention comprises the nucleic acid sequence of the 3'UTR of the 10-del mutant ZIKV strain, SEQ ID NO: 2.

[0072] In one embodiment, the 3'UTR of the ZIKV strain of the invention comprises the nucleic acid sequence of the 3'UTR of the 20-del mutant ZIKV strain, SEQ ID NO: 3.

[0073] In one embodiment, the 3'UTR of the ZIKV strain of the invention comprises the nucleic acid sequence of the 3'UTR of the 30-del-a mutant ZIKV strain, SEQ ID NO: 4.

[0074] In one embodiment, the 3'UTR of the ZIKV strain of the invention comprises the nucleic acid sequence of the 3'UTR of the 30-del-b mutant ZIKV strain, SEQ ID NO: 5.

[0075] In some exemplary embodiments the ZIKV strain of the invention comprises or consists of the sequences set forth in Appendix A modified as set forth in Appendix B.

[0076] In some exemplary embodiments immunogenic compositions are provided containing a therapeutically or prophylactically effective amount of a ZIKV strain which comprises or consists of the sequences set forth in Appendix A modified as set forth in Appendix B.

[0077] In some exemplary embodiments individuals in need thereof are administered therapeutically or prophylactically effective amount of a ZIKV strain which comprises or consists of the sequences set forth in Appendix A modified as set forth in Appendix B.

Administration

[0078] The immunogenic compositions of the present invention may be administered in a number of ways depending upon whether local or systemic treatment is desired. In exemplary embodiments administration may be topical, parenteral, or enteral.

[0079] The pharmaceutical compositions of the invention are typically suitable for parenteral administration. As used herein, "parenteral administration" of a pharmaceutical composition includes any route of administration characterized by physical breaching of a tissue of a subject and administration of the pharmaceutical composition through the breach in the tissue, thus generally resulting in the direct administration into the blood stream, into muscle, or into an internal organ. Parenteral administration thus includes, but is not limited to, administration of a pharmaceutical composition by injection of the composition, by application of the composition through a surgical incision, by application of the composition through a tissue-penetrating non-surgical wound, and the like. In particular, parenteral administration is contemplated to include, but is not limited to, subcutaneous, intraperitoneal, intramuscular, intrasternal, intravenous, intraarterial, intrathecal, intraventricular, intraurethral, intracranial, intrasynovial injection or infusions; and kidney dialytic infusion techniques.

[0080] Formulations of a pharmaceutical composition suitable for parenteral administration typically generally comprise the active ingredient combined with a pharmaceutically acceptable carrier, such as sterile water or sterile isotonic saline. Such formulations may be prepared, packaged, or sold in a form suitable for bolus administration or for continuous administration. Injectable formulations may be prepared, packaged, or sold in unit dosage form, such as in ampoules or in multi-dose containers containing a preservative. Formulations for parenteral administration include, but are not limited to, suspensions, solutions, emulsions in oily or aqueous vehicles, pastes, and the like. Such formulations may further comprise one or more additional ingredients including, but not limited to, suspending, stabilizing, or dispersing agents. In one embodiment of a formulation for parenteral administration, the active ingredient is provided in dry (i.e. powder or granular) form for reconstitution with a suitable vehicle (e.g. sterile pyrogen-free water) prior to parenteral administration of the reconstituted composition. Parenteral formulations also include aqueous solutions which may contain excipients such as salts, carbohydrates and buffering agents (preferably to a pH of from 3 to 9), but, for some applications, they may be more suitably formulated as a sterile non-aqueous solution or as a dried form to be used in conjunction with a suitable vehicle such as sterile, pyrogen-free water. Exemplary parenteral administration forms include solutions or suspensions in sterile aqueous solutions, for example, aqueous propylene glycol or dextrose solutions. Such dosage forms can be suitably buffered, if desired. Other parentally-administrable formulations which are useful include those which comprise the active ingredient in microcrystalline form, or in a liposomal preparation. Formulations for parenteral administration may be formulated to be immediate and/or modified release. Modified release formulations include delayed-, sustained-, pulsed-, controlled-, targeted and programmed release.

[0081] The terms "oral", "enteral", "enterally", "orally", "non-parenteral", "non-parenterally", and the like, refer to administration of a compound or composition to an individual by a route or mode along the alimentary canal. Examples of "oral" routes of administration of a vaccine composition include, without limitation, swallowing liquid or solid forms of a vaccine composition from the mouth, administration of a vaccine composition through a nasojejunal or gastrostomy tube, intraduodenal administration of a vaccine composition, and rectal administration, e.g., using suppositories for the lower intestinal tract of the alimentary canal.

[0082] Preferably, the formulated virus containing composition is suitable for intranasal, injection, topical or oral administration, for example as a dried stabilized powder for reconstitution in a suitable buffer prior to administration or in an aerosol composition. In a preferred embodiment, the composition is intranasally administered.

[0083] Pharmaceutical compositions and formulations for topical administration may include transdermal patches, ointments, lotions, creams, gels, drops, suppositories, sprays, liquids, semi-solids, monophasic compositions, multiphasic compositions (e.g., oil-in-water, water-in-oil), foams microsponges, liposomes, nanoemulsions, aerosol

foams, polymers, fullerenes, and powders (see, e.g., Reference 35, Taglietti et al. (2008) Skin Ther. Lett. 13:6-8). Conventional pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable.

[0084] Compositions and formulations for oral administration include powders or granules, suspensions or solutions in water or non-aqueous media, capsules, sachets or tablets. Thickeners, flavoring agents, diluents, emulsifiers, dispersing aids or binders may be desirable.

[0085] Compositions and formulations for parenteral, intrathecal, or intraventricular administration may include sterile aqueous solutions that may also contain buffers, diluents and other suitable additives such as, but not limited to, penetration enhancers, carder compounds and other pharmaceutically acceptable carriers or excipients.

[0086] Pharmaceutical compositions of the present invention include, but are not limited to, solutions, emulsions, and liposome-containing formulations. These compositions may be generated from a variety of components that include, but are not limited to, preformed liquids, self-emulsifying solids and self-emulsifying semisolids.

[0087] The pharmaceutical formulations of the present invention, which may conveniently be presented in unit dosage form, may be prepared according to conventional techniques well known in the pharmaceutical industry. Such techniques include the step of bringing into association the active ingredients with the pharmaceutical carrier(s) or excipient(s). In general the formulations are prepared by uniformly and intimately bringing into association the active ingredients with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

[0088] The compositions of the present invention may be formulated into any of many possible dosage forms such as, but not limited to, tablets, capsules, liquid syrups, soft gels, suppositories, aerosols, and enemas. The compositions of the present invention may also be formulated as suspensions in aqueous, non-aqueous or mixed media. Aqueous suspensions may further contain substances that increase the viscosity of the suspension including, for example, sodium carboxymethylcellulose, sorbitol and/or dextran. The suspension may also contain stabilizers.

[0089] In one embodiment of the present invention the pharmaceutical compositions may be formulated and used as foams. Pharmaceutical foams include formulations such as, but not limited to, emulsions, microemulsions, creams, jellies and liposomes. While basically similar in nature these formulations vary in the components and the consistency of the final product. Agents that enhance uptake of oligonucleotides at the cellular level may also be added to the pharmaceutical and other compositions of the present invention. For example, cationic lipids, such as lipofectin, cationic glycerol derivatives, and polycationic molecules, such as polylysine, also enhance the cellular uptake of oligonucleotides.

[0090] The compositions of the present invention may additionally contain other adjunct components conventionally found in pharmaceutical compositions. Thus, for example, the compositions may contain additional, compatible, pharmaceutically-active materials such as, for example, antipruritics, astringents, local anesthetics or anti-inflammatory agents, or may contain additional materials useful in physically formulating various dosage forms of the compositions of the present invention, such as dyes, flavoring agents, preservatives, antioxidants, opacifiers, thickening agents and stabilizers. However, such materials, when added, should not unduly interfere with the biological activities of the components of the compositions of the present invention. The formulations can be sterilized and, if desired, mixed with auxiliary agents, e.g., lubricants, preservatives, stabilizers, wetting agents, emulsifiers, salts for influencing osmotic pressure, buffers, colorings, flavorings and/or aromatic substances and the like which do not deleteriously interact with the nucleic acid(s) of the formulation.

[0091] The compositions of the present invention may include excipients known in the art. Examples of excipients used for vaccine formulation such as adjuvants, stabilizers, preservatives, and trace products derived from vaccine manufacturing processes include but are not limited to: Aluminum Hydroxide, Amino Acids, Benzethonium Chloride, Formaldehyde or Formalin, Inorganic Salts and Sugars, Vitamins, Asparagine, Citric Acid, Lactose, Glycerin, Iron Ammonium Citrate, Magnesium Sulfate, Potassium Phosphate, Aluminum Phosphate, Ammonium Sulfate, Casamino Acid, Dimethyl-betacyclodextrin, 2-Phenoxyethanol, Bovine Extract, Polysorbate 80, Aluminum Potassium Sulfate, Gelatin, Sodium Phosphate, Thimerosal, Sucrose, Bovine Protein, Lactalbumin Hydrolysate, Formaldehyde or Formalin, Monkey Kidney Tissue, Neomycin, Polymyxin B, Yeast Protein, Aluminum Hydroxyphosphate Sulfate, Dextrose, Mineral Salts, Sodium Borate, Soy Peptone, MRC-5 Cellular Protein, Neomycin Sulfate, Phosphate Buffers, Polysorbate, Bovine Albumin or Serum, DNA, Potassium Aluminum Sulfate, Amorphous Aluminum Hydroxyphosphate Sulfate, Carbohydrates, L-histidine, Beta-Propiolactone, Calcium Chloride, Neomycin, Ovalbumin, Potassium Chloride, Potassium Phosphate, Sodium Phosphate, Sodium Taurodeoxychoalate, Egg Protein, Gentamicin, Hydrocortisone, Octoxynol-10,.α-Tocopheryl Hydrogen Succinate, Sodium Deoxycholate, Sodium Phosphate, Beta-Propiolactone, Polyoxyethylene 910, Nonyl Phenol (Triton N-101, Qctoxynol 9), Octoxinol-9 (Triton X-100), Chick Kidney Cells, Egg Protein, Gentamicin Sulfate, Monosodium Glutamate, Sucrose Phosphate Glutamate Buffer Calf Serum Protein, Streptomycin, Mouse Serum Protein, Chick Embryo Fibroblasts, Human Albumin, Sorbitol, Sodium Phosphate Dibasic, Sodium Bicarbonate, Sorbitol, Sucrose, Potassium Phosphate Monobasic, Potassium Chloride, Potassium Phosphate Dibasic, Phenol, Phenol Red (Phenolsulfonphthalein), Amphotericin B, Chicken Protein, Chlortetracycline, Ethylenediamine-Tetraacetic Acid Sodium (EDTA), Potassium Glutamate, Cell Culture Media, Sodium Citrate, Sodium Phosphate Monobasic Monohydrate, Sodium Hydroxide, Calcium Carbonate, D-glucose, Dextran, Ferric (III) Nitrate, L-cystine, L-tyrosine, Magnesium Sulfate, Sodium Hydrogenocarbonate, Sodium Pyruvate, Xanthan, Peptone, Disodium Phosphate, Monosodium Phosphate, Polydimethylsilozone, Hexadecyltrimethylammonium Bromide Ascorbic Acid, Casein, Galactose, Magnesium Stearate, Mannitol, Hydrolyzed Porcine Gelatin, Freund's emulsified oil adjuvants (complete and incomplete), Arlacel A, Mineral oil, Emulsified peanut oil adjuvant (adjuvant 65), Corynebacterium granulosum-derived P40 component, Lipopolysaccharide, Mycobacterium and its components, Cholera toxin, Liposomes, Immunostimulating complexes (ISCOMs), Squalene, and Sodium Chloride.

[0092] The vaccine or immunogenic composition may be used in the vaccination of a mammalian host, particularly a

human, nonhuman primate, ape, monkey, horse, cow, carabao, goat, duck, bat, or other suitable non-human host. A dosage may comprise at least 10 IFU, 10^1 IFU, 10^2 IFU, 10^3 IFU, 10^4 IFU, 5×10^4 IFU, 10^5 IFU, 5×10^5 IFU, 10^6 IFU, 5×10^6 IFU, 10^7 IFU, 5×10^7 IFU, 10^8 IFU, or 5×10^8 IFU of said live attenuated ZIKV strain. In some instances the subject may be immunocompromised or may have another condition, e.g., may be pregnant.

Definitions

[0093] The "3'UTR" or "3' untranslated region" or "three prime untranslated region" of the ZIKV genome corresponds to the section of RNA that immediately follows the translation termination codon of the genomic polyprotein.

[0094] An "adjuvant" refers to a substance that enhances an immune response, e.g., an antibody or cell-mediated immune response against a specific agent, e.g., an antigen, or an infectious agent.

[0095] An "attenuated" or "live attenuated" virus strain refers a mutated or modified or recombinant virus having reduced or no virulence or propensity to cause a disease or infection normally associated with the "wild-type" or "unmodified" (or in this case "non-mutated") virus.

[0096] An "attenuated" or "live attenuated" ZIKV strain, in particular, refers to a ZIKV strain that has been modified to have reduced or no virulence or propensity to cause a disease or infection which is normally associated with a "wild-type" or "unmodified" or "non-mutated" virus, in particular congenital ZIKV syndrome or GBS. More particularly, this includes "attenuated" ZIKV strains that are "modified" or "altered" or "mutated" to have one or more deletions in the 3'UTR of the ZIKV genome, e.g., a 10-nucleotide, 20-nucleotide, or 30-nucleotide deletion in the 3'UTR, preferably a 10-nucleotide deletion. The deletions may not disrupt RNA translation. The deletions may slow RNA production and increase interferon-β susceptibility. Such live attenuated ZIKV strain elicits immunoprotection against the virus, i.e., maintains an important immunogenic epitope.

[0097] "Heterologous" means derived from a genetically distinct entity from the rest of the entity to which it is being compared. For example, a polynucleotide may be placed by genetic engineering techniques into a plasmid or vector derived from a different source, and is a heterologous polynucleotide. A promoter removed from its native coding sequence and operatively linked to a coding sequence other than the native sequence is a heterologous promoter. The polynucleotides of the invention may comprise additional sequences, such as additional encoding sequences within the same transcription unit, controlling elements such as promoters, ribosome binding sites, 5'UTR, 3'UTR, transcription terminators, polyadenylation sites, additional transcription units under control of the same or a different promoter, sequences that permit cloning, expression, homologous recombination, and transformation of a host cell, and any such construct as may be desirable to provide embodiments of this invention.

[0098] An "immunogenic composition" herein refers to a composition containing a live attenuated ZIKV strain according to the invention which elicits an immune response in a susceptible host, e.g., an antibody, Th1 or cellular (e.g., T cell-mediated) immune response.

[0099] An "isolated" biological component (such as an isolated bacterium or nucleic acid) refers to a component that has been substantially separated or purified away from its environment or other biological components in the cell of the organism in which the component naturally occurs, for instance, other chromosomal and extra-chromosomal DNA and RNA, proteins, and organelles. Nucleic acids and proteins that have been "isolated" include nucleic acids and proteins purified by standard purification methods. The term also embraces nucleic acids and proteins prepared by recombinant technology as well as chemical synthesis.

[0100] The term "nucleic acid" and "polynucleotide" refer to RNA or DNA that is linear or branched, single or double stranded, or a hybrid thereof. The term also encompasses RNA/DNA hybrids. The following are non-limiting examples of polynucleotides: a gene or gene fragment, exons, introns, mRNA, tRNA, rRNA, ribozymes, cDNA, recombinant polynucleotides, branched polynucleotides, plasmids, vectors, isolated DNA of any sequence, isolated RNA of any sequence, nucleic acid probes and primers. A polynucleotide may comprise modified nucleotides, such as methylated nucleotides and nucleotide analogs, uracyl, other sugars and linking groups such as fluororibose and thiolate, and nucleotide branches. The sequence of nucleotides may be further modified after polymerization, such as by conjugation, with a labeling component. Other types of modifications included in this definition are caps, substitution of one or more of the naturally occurring nucleotides with an analog, and introduction of means for attaching the polynucleotide to proteins, metal ions, labeling components, other polynucleotides or solid support. The polynucleotides can be obtained by chemical synthesis or derived from a microorganism. The term "gene" is used broadly to refer to any segment of polynucleotide associated with a biological function. Thus, genes include introns and exons as in genomic sequence, or just the coding sequences as in cDNAs and/or the regulatory sequences required for their expression. For example, gene also refers to a nucleic acid fragment that expresses mRNA or functional RNA, or encodes a specific protein, and which includes regulatory sequences.

[0101] A "pharmaceutically acceptable carrier" or "excipient" refers to compounds or materials conventionally used in immunogenic or vaccine compositions during formulation and/or to permit storage.

[0102] "Prophylactically effective amount" of a live attenuated ZIKV strain according to the invention refers to an amount sufficient to prevent or reduce the incidence of infection in a susceptible host.

[0103] The term "recombinant" means a polynucleotide with semisynthetic, or synthetic origin which either does not occur in nature or is linked to another polynucleotide in an arrangement not found in nature.

[0104] A "susceptible host" herein refers to a host or animal that may be infected by ZIKV. Such hosts include humans or animals, e.g., a human, nonhuman primate, ape, monkey, horse, cow, carabao, goat, duck, bat, or other suitable non-human host.

[0105] "Therapeutically effective amount" of a live attenuated ZIKV strain according to the invention refers to an amount sufficient to treat ZIKV infection or a disease associated therewith in a susceptible host.

[0106] A "vaccine" composition herein refers to a composition containing a live attenuated ZIKV strain according to the invention which elicits a therapeutic or prophylactic immune response against ZIKV.

[0107] "ZIKV infection" or "infection elicted by ZIKV" herein refers to the infection of a susceptible host with ZIKV and diseases associated therewith, including congenital ZIKV syndrome and Guillan-Barré syndrome (GBS).

[0108] The following examples are offered to illustrate, but not to limit, the claimed invention.

EXAMPLES

Example 1: Generating Live Attenuated ZIKV Strains with 3'UTR Deletions

[0109] Materials and Methods:

[0110] Viruses: The ZIKV Cambodian strain FSS13025 (GenBank number KU955593.1) was generated from an infectious cDNA clone pFLZIKV as described previously (Reference 10). All the cell lines are tested negative for mycoplasma.

[0111] Plasmid construction. Standard molecular biology procedures were performed for all plasmid constructions. Standard overlap PCR was performed to amplify the DNA fragment between unique restriction enzyme sites EcoRI and ClaI using corresponding primer pairs. The DNA fragment containing 3'UTR deletion mutations were individually introduced into the pFLZIKV and pZIKV Rep (replicon cDNA plasmid, Reference 11) through EcoRI and ClaI. All the constructs were verified by DNA sequencing. Primer sequences are available upon request. All restriction enzymes were purchased from New England BioLabs (Ipswitch, Mass.).

[0112] Results:

[0113] We chose to pursue a live-attenuated vaccine to capitalize on its advantages of single-dose immunization, a rapid and robust immune response, and long-lived protection. We attenuated wild-type (WT) ZIKV through deletion of a portion of the 3' untranslated region (3'UTR) of the viral genome, as has been successfully used to develop a DENY vaccine currently in a phase III clinical trial (Reference 9). Using an infectious cDNA clone of the ZIKV Cambodian strain FSS13025 (Reference 10) (which is closely related to strains now circulating in the Americas), we prepared a panel of recombinant viruses containing distinct 3'UTR deletions (FIG. **1**A). Mutants 10-del, 20-del, 30-del-a, and 30-del-b contained overlapping 10-to-30-nucleotide deletions, which were expected to change the local secondary structure of the viral 3'UTR (FIG. **2**).

Example 2: Replication and IFN-β Inhibition Analysis of ZIKV 3'UTR Deletion Mutants

[0114] Materials and Methods:

[0115] Cells and antibodies. Vero cells were purchased from the American Type Culture Collection (ATCC, Bethesda, Md.), and maintained in a high glucose Dulbecco modified Eagle medium (DMEM) (Invitrogen, Carlsbad, Calif.) supplemented with 10% fetal bovine serum (FBS) (HyClone Laboratories, Logan, Utah) and 1% penicillin/streptomycin (Invitrogen, Carlsbad, Calif.) at 37° C. with 5% CO_2. The following antibodies were used in this study: a mouse monoclonal antibody (mAb) 4G2 cross-reactive with flavivirus E protein (ATCC), ZIKV-specific HMAF (hyper-immune ascitic fluid), World Reference Center of Emerging Viruses and Arboviruses (WRCEVA) at the University of Texas Medical Branch], Anti-Mouse IgG (H+L) Antibody Horseradish Peroxidase-labeled (KPL, Gaithersburg, Md.), and goat anti-mouse IgG conjugated with Alexa Fluor 488 (Thermo Fisher Scientific).

[0116] RNA transcription and transfection. Full-genome ZIKV, mCherry ZIKV, and replicon RNAs were in vitro transcribed using a T7 mMessage mMachine kit (Ambion, Austin, Tex.) from cDNA plasmids pre-linearized by ClaI. The RNA was precipitated with lithium chloride, washed with 70% ethanol, re-suspended in RNase-free water, quantitated by spectrophotometry, and stored at −80° C. in aliquots. The RNA transcripts (10 μg) were electroporated into Vero cells following a protocol described previously (Reference 31).

[0117] Indirect immunofluorescence assays (IFA). Vero cells were electroporated with 10 μg of genomic WT or 3'UTR deletion RNA of ZIKV and grown in an 8-well Lab-Tek chamber slide (Thermo Fisher Scientific, Waltham, Mass.). On day 2 and 3 post-transfection, the cells were fixed in 100% methanol at −20° C. for 15 min. After 1 h incubation in a blocking buffer containing 1% FBS and 0.05% Tween-20 in PBS, the cells were treated with a mouse monoclonal antibody 4G2 for 1 h and washed three times with PBS (5 min for each wash). The cells were then incubated with Alexa Fluor® 488 goat anti-mouse IgG for 1 h in blocking buffer, after which the cells were washed three times with PBS. The cells were mounted in a mounting medium with DAPI (4',6-diamidino-2-phenylindole; Vector Laboratories, Inc.). Fluorescence images were observed under a fluorescence microscope equipped with a video documentation system (Olympus).

[0118] Immunostaining focus assay of mutant viruses. Equal amounts of RNAs (10 μg) transcribed from their corresponding infectious cDNA clones were electroporated into Vero cells. On day 4 or 5 post-transfection, culture fluids form the transfected cells were harvested and quantified for infectious viruses (defined as P0 virus) using an immunostaining focus assay on Vero cells.

[0119] Immunostaining focus assay and immunostaining. Viral samples were ten-fold serially diluted six times in DMEM. For each dilution, 100 μl sample was added to a 24-well plate containing Vero cells at about 90% confluency. The infected cells were incubated for 1 h and swirled every 15 min to ensure complete coverage of the monolayer for even infection. After 1 h incubation, 0.5 ml of methyl cellulose overlay containing 2% FBS 1% penicillin/streptomycin was added to each well. The plate was incubated at 37° C. for four days. Following the incubation, methyl cellulose overlay was removed and 0.5 ml methanol-acetone (1:1) solution was added into each well and incubated at room temperature for 15 min. Fixation solution was aspirated and plates were allowed to air dry, then washed three times with PBS and incubated in blocking buffer (PBS supplemented with 3% FBS), followed by 1 h incubation with ZIKV-specific HMAF. Plates were washed three times with PBS followed by an hour-long incubation with a secondary antibody conjugated to horseradish peroxidase (KPL, Gaithersburg, Md.). Detection proceeded with the addition of aminoethylcarbazole substrate (ENZO Life sciences, Farmingdale, Mass.) prepared according to the vendor's instructions.

[0120] Luciferase assay. The luciferase assay was performed as previously reported (Reference 11). Briefly, Vero cells transfected with WT or mutant ZIKV replicon RNAs (10 μg) were seeded in a 12-well plate. At various time points, the cells were washed once with phosphate-buffered

saline (PBS) and lysed using cell lysis buffer (Promega, Madison, Wis.). The cells were scraped from plates and stored at −80° C. The luciferase signals were measured by Cytation 5 (Biotek) according to the manufacturer's instructions.

[0121] Replication curves. Subconfluent Vero cells in 24-well plates (2×10^5 cells per well) were infected with WT or mutant P0 ZIKV at a multiplicity of infection (MOI) of 0.01 in triplicate wells. Virus stocks were diluted in DMEM containing 2% FBS and 1% penicillin/streptomycin. One hundred microliters of virus were added to each well of the 12-well plates. After 1 h attachment (5% CO_2 at 37° C.), the inocula were removed, monolayers were washed three times with PBS, and 1 ml DMEM medium containing 2% FBS and 1% penicillin/streptomycin was added to each well. Culture fluids were quantified for infectious viruses on days 1 to 5 using the immunostaining focus assay.

[0122] Replicon analysis of the 3'UTR deletions. A Renilla luciferase reporter replicon of ZIKV was engineered with various 3'UTR deletions. Equal amounts of replicon WT and mutant RNAs (10 μg) were electroporated into Vero cells. Luciferase signals were measured at several time points. A non-replicative replicon containing an NS5 polymerase-inactive GDD mutation was included as a negative control.

[0123] Interferon-β inhibition of WT and mutant ZIKVs. Vero cells were seeded in 96-well plate (1.5×10^4 cell per well) one day before interferon treatment and viral infection. The cells were infected at an MOI 0.05 in the presence of IFN-β (55, 167, 500, or 1,500 IU/ml). Viral infection and interferon treatment were initiated at the same time. At 48 h post-infection and interferon-β treatment, viral titers were quantified using the immunostaining focus assay on Vero cells.

[0124] Results:

[0125] Upon transfection into Vero cells, all mutant genomic RNAs generated viral E protein-expression cells (FIG. **3**) and infectious viruses (defined as P0 viruses). Compared with the WT, all mutants exhibited smaller infectious foci (FIG. **1**B), slower replication kinetics, and lower peak titers (FIG. **1**C). To examine the mutational effects on viral replication, we engineered the deletions into a luciferase ZIKV replicon (Reference 11). The replicon results showed that the 3'UTR deletions did not affect viral RNA translation (indicated by the luciferase signals at 2-6 h post-transfection), but decreased RNA synthesis (indicated by the luciferase activities at 24-48 h post-transfection; FIG. **1**D & **1**E); a similar observation was previously reported for West Nile virus, a closely related flavivirus (Reference 12). Since the 3'UTR of flavivirus may also modulate host innate immune response (References 13, 14), we compared the susceptibility of the WT and mutant viruses to interferon inhibition. All four mutant viruses were much more sensitive to interferon-β inhibition than the WT virus, among which mutant 10-del exhibited the greatest inhibition (FIG. **1**F). Collectively, these results indicate that 3'UTR deletions attenuate ZIKV replication through diminished viral RNA synthesis and increased vulnerability to type-I interferon inhibition.

Example 3: Stability of Mutant Viruses

[0126] Materials and Methods:

[0127] Stability of 3'UTR mutants, RNA extraction, and RT-PCR. To examine the stability of 3'UTR mutants, we passaged them on Vero cells for five rounds (5 days for each round of culture),. Briefly, 1.5×10^6 Vero cells were seeded into T-25 flask. The virus derived from RNA transfection, defined as P0 was used to infect the Vero cells. At 5 d p.i., culture fluid (100 μl) was transferred to a new T-25 flask containing Vero cells in 5 ml of culture medium. After five rounds of such passaging (P5), viral RNAs were extracted from the P5 culture fluids using QIAamp Viral RNA Kit (Qiagen). Viral RNAs were amplified by RT-PCR using SuperScript III one-step RT-PCR kits (Invitrogen). The P5 viruses were subjected to complete genome-length sequencing. Three independent passages were performed for each mutant virus.

[0128] Immunostaining focus assay. WT and P5 mutant viruses were analyzed using an immunostaining focus assay on Vero cells. For each mutant virus, three independent selections were performed on Vero cells.

[0129] Replication kinetics. Subconfluent Vero cells in 24-well plates (2×10^5 cells per well) were infected with WT and P5 mutant viruses at a multiplicity of infection (MOI) of 0.01 in triplicate wells. Virus stocks were diluted in DMEM containing 2% FBS and 1% penicillin/streptomycin. One hundred microliters of virus were added to each well of the 12-well plates. After 1 h attachment (5% CO_2 at 37° C.), the inocula were removed, monolayers were washed three times with PBS, and 1 ml DMEM medium containing 2% FBS and 1% penicillin/streptomycin was added to each well. Culture fluids were quantified for infectious viruses on days 1 to 5 using the immunostaining focus assay on Vero cells.

[0130] Results:

[0131] To test the stability of the mutant viruses, we passaged them five times on Vero cells (an approved cell line for vaccine production, see Reference 15). The passage 5 (P5) viruses developed larger infectious foci (FIG. **4**A) and faster replication kinetics than the corresponding P0 viruses on Vero cells (Compare FIG. **4**B with FIG. **1**C). Complete genome sequencing of P0 and P5 viruses showed that all mutants retained the original deletions, but the P5 viruses had accumulated additional mutations in the E and/or NS1 genes, which presumably were Vero cell-adaptive mutation (s) and/or compensatory mutation(s) to 3'UTR deletions (FIG. **4**C). In some embodiments, these mutations may be introduced into the infectious cDNA clone for vaccine production. Either way, the results indicated that the engineered deletions are stable when propagated on Vero cells, and further passaging of the mutant viruses on Vero cells to P20 did not change the engineered 3'UTR deletions.

Example 4: Characterization of 3'UTR Mutants in the A129 Mouse Model

[0132] Materials and Methods:

[0133] Vaccination and challenge of mice. Three-week old A129 mice (n=8) were immunized by the subcutaneous (S.C.) route with 1×10^4 IFU WT and mutant viruses. Mock-infected mice were given PBS by the same route. Mice were weighed and monitored daily for progression of disease. Mice were anesthetized and bled via the retro orbital sinus (R.O.) every two days. Viremias were quantified by an immunostaining focus assay from day 2 to 4 post-infection. On day 28 post-immunization, mice were anesthetized and bled to measure neutralization antibody titers using a mCherry ZIKV infection assay. The vaccinated mice were then challenged via the intraperitoneal (I.P.) route with 1×10^5 PFU parental virus (ZIKV strain FSS13025). On day 2 post-challenge, the mice were bled to measure viremia.

Blood was clarified post collection by centrifugation at 3,380×g for 5 min and immediately stored at −80° C. for storage. Viral titers of sera and inoculum were determined by an immunostaining focus assay on Vero cells, as described above. All animal testing was performed in accordance with UTMB policy as approved by the UTMB IACUC.

[0134] Construction of mCherry ZIKV. A DNA fragment encoding the first 25 amino acids of C gene, the mCherry gene, and the foot-and-mouth virus 2A protein was in-frame fused with the open-reading-frame of ZIKV genome. The expression of mCherry in transfected Vero cells was analyzed by a fluorescent microscopy at days 2-6 post-transfection. The mCherry ZIKV was used to estimate antibody neutralization titers of mouse sera.

[0135] Antibody neutralization assay. Neutralizing activity of mouse sera was assessed using a newly established mCherry ZIKV. The sera were 2-fold serially diluted starting at 1:100 in DMEM with 2% FBS and 1% penicillin/streptomycin. Serial dilution of mice sera was incubated with mCherry ZIKV at 37° C. for 2 h. Antibody-virus complexes were added to pre-seeded Vero cells in 96-well plates. After 48 h post-infection, cells were visualized by fluorescence microscopy using Cytation 5 Cell Imaging Multi-Mode Reader (Biotek) to quantify the mCherry fluorescence-positive cells. The percentage of fluorescence-positive cells in the non-treatment controls was set at 100%. The fluorescence-positive cells from serum-treated wells were normalized to those of non-treatment controls. A four-parameter sigmoidal (logistic) model in the software GraphPad Prism 7 was used to calculate the neutralization titers (NT_{50}).

[0136] Results:

[0137] We evaluated the immunogenicity and efficacy of the mutant viruses in an A129 (interferon α/β receptor-deficient) mouse model (Reference 16) (FIG. **5**A). After subcutaneous (S.C.) inoculation with 1×10^4 IFU of virus, mice infected with the WT virus had significantly more weight loss than those infected with mutant viruses; whereas the differences in mean weight loss among the four mutant virus-infected groups were not statistically significant (FIG. **5**B). About 50% of the mice succumbed to the WT virus infection, whereas no mortality was observed in the mutant virus-infected mice (FIG. **5**C). The WT virus produced significantly higher peak viremia than the mutant viruses, among which the 10-del virus had the lowest viremic profile (FIG. **5**D). The viremia for 10-del mutant dropped to 700 IFU, 350 IFU, and undetectable on days 5, 6, and 7 post-infection, respectively. Sequencing analysis confirmed that the engineered deletions were retained without other mutations in the mutant viruses recovered from the mouse sera. On day 28 post-infection, mouse sera were taken and quantified for pre-challenge neutralization titers using an mCherry ZIKV (FIG. **6**). Comparable pre-challenge neutralization titers of $(1.8\pm1.1)\times10^3$ to $(8.6\pm1.5)\times10^3$ were observed among the WT and mutant virus-infected mice (FIG. **5**E). After challenge with 1×10^5 IFU of WT ZIKV (Cambodian strain FSS13025) on day 28 post-immunization, the immunized mice had no detectable peripheral viremia, whereas the mock-immunized group produced a mean viremia of $(8.5\pm1.5)\times10^6$ IFU/ml on day 2 post-challenge (FIG. **5**F). On day 28 post-challenge, we measured the neutralization titers of the mouse sera again; remarkably, the post-challenge neutralization titers were equivalent to the pre-challenge neutralization titers (compare FIG. **5**E & **5**G), suggesting that a sterilizing antibody response had been achieved by a single vaccination. Altogether, the results demonstrate that the mutant viruses are highly attenuated, immunogenic, and protective in A129 mice.

Example 5: Further Characterization of 10-del Mutant ZIKV

[0138] Materials and Methods:

[0139] Viruses. The Puerto Rico strain PRVABC59 (GenBank number KU501215) was obtained from WRCEVA. All the cell lines are tested negative for mycoplasma.

[0140] Immunization with 100 IFU 10-del virus. Three-week-old A129 mice (n=5) were immunized with 100 IFU WT or 10-del virus via the S.C. route. Viremia was quantified by immunostaining focus assay from day 2 to 6. On day 28 post-immunization, mouse sera were quantified for ZIKV neutralizing antibody titers. Also on day 28 post-immunization, the mice were challenged with 1×10^6 IFU of ZIKV (Puerto Rico strain PRVABC59) via the I.P. route. Viremias were quantified by immunostaining focus assay on day 2 post-challenge.

[0141] Immunization with 10 IFU 10-del virus. Three-week-old A129 mice (n=2 for each virus) were immunized with 10 IFU WT or 10-del ZIKV via the S.C. route. On day 28 post-immunization, mouse sera were quantified for ZIKV neutralizing antibody titers. On the same day, the mice were challenged with 1×10^6 IFU of ZIKV (Puerto Rico strain PRVABC59) via the I.P. route. On day 2 post-challenge, viremias were quantified using an immunostaining focus assay.

[0142] Results:

[0143] Since the 10-del virus produced the lowest viremia in mice (FIG. **5**D), yet induced a neutralizing antibody response comparable to those of the WT and other mutants (FIG. **5**E-**5**G), we prioritized this mutant for further characterization. At a dose of 100 IFU, 10-del virus-infected mice showed a delayed peak viremia that was >100-fold lower than that of the WT virus (FIG. **7**A). Equivalent levels of pre-challenge neutralization titers were induced by the WT and 10-del viruses (FIG. **7**B), leading to complete protection from viremia after challenge with 1×10^6 IFU of Puerto Rico ZIKV strain PRVABC59 (FIG. **7**C). Furthermore, even when immunized at a dose of only 10 IFU, 10-del virus-infected mice generated a neutralization titer of $(9.7+6.8)\times10^3$, and were fully protected from viremia after challenge (FIG. **8**).

[0144] It is noteworthy that mice immunized with different doses of 10-del mutant (10, 10^2, and 10^4 IFU) induced similar neutralization antibody titers and completely prevented viremia upon challenge (compare FIG. **5** and FIGS. **7** & **8**).

[0145] Collectively, these results demonstrate that the 10-del virus is a potent vaccine candidate.

Example 6: Comparison of P0 and P5 10-del Viruses

[0146] Materials and Methods:

[0147] Immunization with P0 or P5 10-del virus: Three-week-old A129 mice (n=5) were immunized with 100 IFU P0 or P5 10-del virus via the S.C. route. Viremia were quantified by immunostaining focus assay from day 4 to 6.

[0148] Pre-challenge neutralization antibody titers: On day 28 post-immunization, mouse sera were quantified for ZIKV neutralizing antibody titers.

[0149] Viremia after challenge with wild-type ZIKV: On day 28 post-immunization, the mice were challenged with 1×10^6 IFU of an epidemic strain of ZIKV (Puerto Rico strain PRVABC59) via the I.P. route. On day 2 post-challenge, viremias were quantified using an immunostaining focus assay.

[0150] Results:

[0151] Since P5 virus accumulated Vero cell-adaptive mutations (FIG. **4**C), we compared the virulence and immunogenicity between the P0 and P5 10-del viruses in the A129 mice. After immunization with 100 IFU virus via the S.C. route, the P0 and P5 viruses generated comparable viremia and induced equivalent neutralization titers (FIG. **11**A & **11**B). After challenging with 1×10^6 IFU of Puerto Rico strain PRVABC59 ZIKV via the I.P. route, no viremia was detected in the P0 or P5 virus-vaccinated mice; in contrast, robust viremia were detected in the sham group (FIG. **11**C). These results indicate that the Vero cell-adaptive mutations recovered from the P5 virus do not significantly affect the virulence and immunogenicity of the 10-del virus.

Example 7: T Cell Responses in A129 Mice Immunized with 10-del ZIKV

[0152] Materials and Methods:

[0153] Measuring T cell responses in A129 mice. A129 mice were infected with 1×10^4 IFU WT and 10-del viruses. On day 28 post-infection, mouse spleens were harvested. Splenocytes were counted, cultured ex vivo with WT ZIKV for 24 h, and stained for markers (IFN-γ, CD3, and CD4 or CD8). The T cells were gated based on staining for these markers, percentages of $CD4^+IFN\text{-}\gamma^+$ cells and $CD8^+IFN\text{-}\gamma^+$ cells were counted, and average total number of T cell subsets per spleen was recorded. Supernatants from the ex vivo culture were harvested on day 2 after WT ZIKV re-stimulation, and measured for IFN-γ and IL-2 production.

[0154] Bio-Plex immuneassay. Approximately 3×10^5 splenocytes were plated in 96-well plates and stimulated with 1.25×10^4 IFU ZIKV strain FSS13025 for 48 h. Culture supernatants were harvested and cytokine production were measured using a Bio-Plex Pro Mouse Cytokine Assay (Bio-Rad, Hercules, Calif.).

[0155] Intracellular cytokine staining (ICS). Approximately 2.5×10^6 splenocytes were stimulated with 1×10^5 IFU live ZIKV (strain FSS13025) for 24 h. During the final 5 h of stimulation, BD GolgiPlug (BD Bioscience) was added to block protein transport. Cells were stained with antibodies for CD3, CD4, or CD8; fixed in 2% paraformaldehyde, and permeabilized with 0.5% saponin before addition of anti-IFN-γ, or control rat IgG1 (e-Biosciences). Samples were processed with a C6 Flow Cytometer instrument. Dead cells were excluded on the basis of forward and side light scatter. Data were analyzed with a CFlow Plus Flow Cytometer (BD Biosciences).

[0156] Results:

[0157] We analyzed the T cell responses in A129 mice immunized with 1×10^4 IFU of WT and 10-del viruses. On day 28 post-immunization, ZIKV-specific T cells were re-stimulated with live WT virus in vitro, and analyzed using an intracellular cytokine staining (ICS) assay and a Bio-Plex immunoassay. The results showed that both WT and mutant virus-immune $CD4^+$ and $CD8^+$ T cells had higher IFN-γ responses than the mock-immunized group (FIG. **9**A & **9**B). Furthermore, these immune T cells induced more IFN-γ (FIG. **9**C) and IL2 (FIG. **9**D) than the mock group; particularly, the 10-del mutant-immune T cells produced 4-fold higher IFN-γ than the WT virus-immune group. These results indicate that 10-del vaccine candidate induces a robust T cell response.

Example 8: Safety of 10-del Vaccine Candidate

[0158] Materials and Methods:

[0159] Organ virus titers. The heart, lung, liver, spleen, kidney, muscle, brain, testis, and eye were harvested on day 6 and 10 post-infection after 1×10^4 IFU of WT and 10-del virus vaccination via the S.C. route. Organ titrations were performed using a immunostaining focus assay as described above. In brief, 500 μl of DMEM with 2% FBS and penicillin/streptomycin along with a steel ball bearing were placed in a 2-ml Eppendorf tube. The organ (whole or part) was placed in the tube. Tubes were weighed, and organ weight was determined by subtracting the tube weight. Tissues were homogenized in a Qiagen TissueLyser II shaking at 26 p/second for 5 minutes. The homogenate was clarified by centrifugation for 5 min at 12,000 rpm and titrated on Vero monolayer using an immunostaining focus assay. The titer was then adjusted for volume and organ weight to report the organ loads as IFU/g (Reference 16).

[0160] Neurovirulence on newborn CD1 mice. Groups of 1-day-old outbred CD1 mice (n=7-10) were injected intracranially (I.C.) with WT or 10-del with serial tenfold dilutions from 10,000 IFU to 10 IFU. Mice were monitored daily for morbidity and mortality.

[0161] Experimental infection of mosquitoes with ZIKV. *Aedes aegypti* mosquitoes derived from a Galveston, Tex. colony were exposed for 45 min to blood-meals consisting of 1% (weight/volume) sucrose, 20% (vol/vol) FBS, 5 mM ATP, 33% (vol/vol) PBS-washed human blood cells (UTMB Blood Bank), and 33% (vol/vol) DMEM medium and combined with 1 ml virus offered in Hemotek 2-ml heated reservoirs (Discovery Workshops) covered with a mouse skin. Virus titers in the blood meals were 1×10^6 IFU/ml. Infectious blood meals were loaded on cartons containing *Ae. aegypti*. Fully engorged mosquitoes were incubated at 28° C., 80% relative humidity on a 12:12 h light:dark cycle with ad lib access to 10% sucrose solution for 7 days and harvested by freezing at -20° C. for 3 h. Whole mosquitoes were individually homogenized (Retsch MM300 homogenizer, Retsch Inc., Newton, Pa.) in DMEM with 20% FBS and 250 μg/ml amphotericin B and stored at −80° C. Samples were centrifuged for 10 min at 5,000 rpm, and 75 μl of each sample supernatant were inoculated into 96-well plates containing Vero cells at 37° C. and 5% CO_2 for 3 days, when they were fixed with a mixture of ice-cold acetone and methanol (1:1) solution and immunostained as described above. Infection was determined by detection of virus in the homogenized mosquito. The infection rate was recorded as the fraction of positive mosquitoes divided by the total number of engorged, incubated mosquitoes.

[0162] Testis and sperm count analyses: A129 mice were infected with 1×10^4 IFU of WT or 10-del mutant virus. A mock-infected group with PBS was included as a negative control. On day 16 p.i., the mice were euthanized and necropsied; epididymis and testes were harvested immediately as previously described (Reference 32). Briefly, the epididymis was placed into 1 ml of pre-warmed M2 media

at 37° C. To release the sperm, the epididymis was cut lengthwise six times and incubated for 10 min, agitating every 2 min at 37° C. Following the incubation, the media containing the sperm was immediately diluted 1:50 into pre-warmed M2 media and counted on a hemocytometer. Motile sperms were categorized into progressive and non-progressive. Progressively motile sperms are described as continuous displacement of the head by flagellar movement. Non-progressively motile sperms are described as little to no displacement of the head by flagellar movement. In the non-motile sperms, no flagellar movement was observed.

[0163] Results:

[0164] Three sets of experiments were performed to analyze the safety of the 10-del vaccine candidate. First, we measured the viral loads in different organs after S.C. inoculation of A129 mice with 1×10^4 IFU of WT or 10-del viruses (FIG. **10**A). On day 6 post-infection, the WT-infected mice had high viral loads in all organs tested, whereas the 10-del-infected mice had no virus in muscle or brain, and lower viral loads in heart, lung, liver, spleen, kidney, testes, and eye. On day 10 post-infection, WT virus-infected mice retained viral loads in kidney, brain, testis, and eye, among which testes had the highest mean titer; in contrast, no virus could be detected ($<10^2$ IFU/mL) in any organs from the 10-del-infected mice. Since ZIKV infection was reported to damage the testes in mice (References 17, 18), we examined the effect of immunization on the function of testes in the A129 mice. On day 16 post-immunization, similar weight and size of testes were recovered from the mock-, WT virus-, and 10-del mutant-infected mice. However, motile and total sperm counts were reduced in the WT virus-infected mice, whereas the 10-del virus-infected mice did not significantly compromise the sperm counts when compared with the mock group (FIG. **12**).

[0165] Second, we examined the neurovirulence of 10-del virus through intracranial (I.C.) injection of one-day-old CD1 mice (FIG. **10**B). The newborn mice succumbed to WT virus infection in a dose-responsive manner; even a dose of 10 IFU resulted in 25% mortality. Remarkably, mice infected with 10-del virus did not show any apparent disease or death, even at a dose of 1×10^4 IFU. Finally, we determined if 10-del virus could infect *Aedes aegypti* mosquitoes, the main transmission vector of ZIKV in the Americas (References 19, 20). After exposure to artificial blood-meals containing 1×10^6 IFU/ml of WT or 10-del virus and incubation for 7 days, 56% of the engorged mosquitoes were infected by the WT virus, whereas no mosquitoes were infected by the 10-del mutant. Furthermore, intrathorax injection of 10-del virus to mosquitoes did not yield any infectious virus on day 7 after injection. Collectively, our results demonstrated that the 10-del virus significantly reduced or eliminated viral loads in mouse organs, decreased neurovirulence by >1,000-fold, and attenuated its ability to infect the principal urban mosquito vector, all suggestive of an excellent safety profile.

[0166] Our data indicate that the 3'UTR 10-del ZIKV is a promising live-attenuated vaccine candidate with a good balance between immunogenicity and safety. A single immunization elicited robust antibody and T cell responses, and significantly, unlike the subunit and inactivated ZIKV vaccines published to date, likely induces sterilizing immunity and providing complete protection against parental and epidemic strains of ZIKV. Vaccine-induced sterilizing immunity is likely critical for a successful ZIKV vaccine to prevent viremia and congenital abnormalities. The safety profile of this vaccine candidate is highlighted by the low viremia, little and transient viral loads in organs, and limited weight loss in the severe A129 mouse model, as well as a complete lack of morbidity and mortality in one-day-old mice after receiving an intracranial (I.C.) injection. The latter safety result is impressive because I.C. inoculation with YFV 17D and JEV SA14-14-2 (two licensed live-attenuated flavivirus vaccines) results in lethal disease in one-day-old newborn mice (References 21, 22). Although potential homologous recombination between the WT and vaccine ZIKVs might pose a safety liability for the 10-del vaccine candidate, it should be noted that recombination events are rare and could not be detected in cell culture (References 23-27). Compared with the chimeric, live-attenuated ZIKV vaccine (e.g., YFV 17D expressing ZIKV prM-E or DENV expressing ZIKV prM-E (Reference 28)), our 3'UTR mutant vaccine has the advantage of retaining all ZIKV structural and nonstructural genes that may contribute to antiviral protection, as indicated from dengue vaccine studies (References 29, 30).

[0167] Compared with the chimeric, live-attenuated ZIKV vaccine (e.g., YFV 17D expressing ZIKV prM-E), our 3'UTR mutant vaccine has the advantage of retaining all ZIKV structural and nonstructural genes that may contribute to antiviral protection, as indicated from dengue vaccine studies (References 29, 30). Mechanistically, the 3'UTR mutant viruses appeared to be attenuated through decreased viral RNA replication and increased sensitivity to type-I interferon inhibition. The latter mechanism is in agreement with a recent report that genetic diversity at the 3'UTR of DENV contributes to epidemic potential (Reference 14). Taken together, our results indicate that the 3'UTR mutant ZIKV is an attractive vaccine candidate that should be advanced to non-human primates for further development.

Additional in Vivo Experiments to Characterize Safety and Efficacy of Live Attenuated ZIKV Strains with 3'UTR Deletions

[0168] Materials and Methods:

[0169] Additional in vivo systems using the Materials and Methods and the examples which follow were also employed to characterize the safety and efficacy of vaccine candidates, including C57BL/6J mouse pregnancy, A129 mouse testis protection, viral loading in A129 mouse organ, CD-1 mouse neurovirulence, and rhesus macaque efficacy (see details below). The protocols for each of these experimental systems have been previously established (e.g., inoculum dose, infection route, challenge dose, and end-point measurement), and were not altered when evaluating these vaccine candidates. Therefore, different inoculum doses, challenge doses, and end-point measurements (e.g., qRT-PCR to measure viral RNA and focus forming assay to measure infection virus) were used in different in vivo systems according to the established protocols. The detailed information is described below and indicated in the Examples which follow.

[0170] Mouse Studies: All in vivo experiments using mice were performed in accordance with the recommendations in the Guide for the Care and Use of Laboratory Animals of the National Institutes of Health. The protocols were approved by the Institutional Animal Care and Use Committee (IACUC) at the Washington University School of Medicine (Assurance Number A3381-01) and the IACUC at the University of Texas Medical Branch (UTMB; Protocol

Number 0209068B). Dissections and footpad injections were performed under anesthesia that was induced and maintained with ketamine hydrochloride and xylazine at the Washington University or isoflurane at UTMB. All efforts were made to minimize animal suffering. Rhesus macaque experiments were reviewed and approved by Vaccine Research Center Animal Care and Use Committee at the National Institute of Allergy and Infectious Diseases, the National Institutes of Health. The non-human primate experiments were performed in compliance with the pertinent regulations and policies from the National Institutes of Health.

[0171] Viruses and cells: The ZIKV Cambodian strain FSS13025 (GenBank number KU955593.1) was produced from an infectious cDNA clone (Reference 35). The ZIKV-3'UTR-Δ10-LAV and ZIKV-3'UTR-Δ20-LAV strains were generated as described. The Zika Puerto Rico strain PRVABC59 (GenBank number KU501215) and Dakar 41519 strain (GenBank number HQ234501.1) were obtained originally from Dr. Robert Tesh from the World Reference Center of Emerging Virus and Arboviruses (WRCEVA) at UTMB. The mouse-adapted ZIKV-Dakar 41519 strain was passaged twice in Rag1-/- mice (Jackson Laboratories) and described previously (Reference 29). Vero cells were purchased from the American Type Culture Collection (ATCC CCL-81; Bethesda, Md.), and maintained at 37° C. with 5% CO_2 in a high glucose Dulbecco modified Eagle medium (DMEM; Invitrogen, Carlsbad, Calif.) with 10% fetal bovine serum (FBS; HyClone Laboratories, Logan, Utah) and 1% penicillin/streptomycin (Invitrogen, Carlsbad, Calif.). All cell lines tested negative for mycoplasma.

[0172] Antibodies: The following antibodies were used in this study: anti-mouse IFN alpha/beta receptor 1 (Ifnar1) monoclonal antibody (clone MAR1-5A3; Leinco Technologies, Inc., St. Louis, Mo.); ZIKV-specific HMAF (hyperimmune ascites fluids; obtained from WRCEVA), anti-mouse IgG antibody labeled with horseradish peroxidase (KPL, Gaithersburg, Md.), and goat anti-mouse IgG conjugated with Alexa Fluor 488 (Thermo Fisher Scientific, Providence, R.I.).

[0173] A129 mouse experiments: A129 mice were bred in the animal facilities at UTMB. All mice were housed in pathogen-free mouse facilities. Three-week or 15-week old male A129 mice were infected with PBS (two sham groups), 10^4 FFU of ZIKV-3'UTR-Δ10-LAV (Δ10), or 10^3 FFU of ZIKV-3'UTR-Δ20-LAV (Δ20). Mice were anesthetized and bled via the retro orbital sinus (R.O.) for viremia testing. At day 28 post-immunization, mice were measured for neutralizing antibody titers using an mCherry ZIKV infection assay (Reference 36). On the same day, one sham group of PBS-immunized mice and Δ10- and Δ20-immunized mice were challenged with 10^6 FFU of ZIKV PRVABC59. Another sham group of mice was used as an unchallenged negative control. At day 49 post-immunization, mice were euthanized and necropsied. Epididymis and testes were harvested immediately as previously described (Reference 32). Motile and non-motile sperms were counted manually on an emocytometer by microscopy. Total sperm counts equal to the sum of motile and non-motile sperms. For quantification of viral loads, testes were homogenized and infectious viral levels were measured by a focus forming assay or quantitative reverse transcriptase PCR (qRT-PCR) (Reference 36).

[0174] The qRT-PCT primer/probe set includes forward primer (1193F: 5'-CCGCTGCCCAACACAAG-3'), reverse primer (1269R: 5'-CCACTAACGTTCTTTTGCAGACAT-3'), and probe (5'-FAM/AGCCTACCT/ZEN/TGACAAGCAATCAGACACTCAA/3IABkFQ-3'). The probe contains a 5'-FAM reporter dye, 3' IBFQ quencher, and an internal ZEN quencher.

[0175] Mouse pregnancy experiments: C57BL/6J mice were bred and housed in pathogen-free mouse facilities at Washington University School of Medicine. One day prior to immunization, the eight-week old female C57BL/6J mice were dosed with 0.5 mg of anti-Ifnar1 antibody via an intraperitoneal route. Subsequently, mice were subcutaneously inoculated in the footpad with 10^5 FFU of ZIKV-3'UTR-Δ10-LAV or PBS sham. Immunized wild-type (WT) C57BL/6 female mice were mated with naïve WT male mice. At embryonic day 5 (E5), pregnant dams were injected intraperitoneally with 2 mg of anti-Ifnar1 antibody. On E6, mice were inoculated subcutaneously with 10^5 FFU of mouse-adapted ZIKV Dakar 41519 via footpad injection. All animals were sacrificed on E13 and analyzed for viral loads in placentas, fetuses, and maternal tissues. Briefly, maternal blood, organs from dams (brain and spleen) and fetuses (placenta and fetal head) were collected. Serum was prepared after coagulation and centrifugation. Organs were weighed and homogenized using a bead-beater apparatus (MagNA Lyser, Roche). Viral RNA was extracted from serum and tissue samples using the RNeasy Mini kit (Qiagen). The viral RNA levels were determined by TaqMan one-step qRT-PCR on an ABI 7500 Fast Instrument using standard cycling conditions. Viral burden is expressed on a log10 scale as viral RNA equivalents per gram or per milliliter after comparison with a standard curve produced using serial 5-fold dilutions of ZIKV RNA from known quantities of infectious virus. The following primer/probe set was used for ZIKV qRT-PCR: forward primer (1183F: 5'-CCACCAATGTTCTCTTGCAGACATATTG-3'), reverse primer (1268R: 5'-TTCGGACAGCCGTTGTCCAACACAAG-3'), and probe (1213F: 5'-56-FAM/AGCCTACCTTGACAAGCAGTC/3IABkFQ-3'). Wherever indicated, viral burden for some samples was determined by focus forming assay on Vero cells (Reference 28).

[0176] Quantification of viral load in organs from A129 mice: A129 mice were infected and organs were quantified for viral load using a focus forming assay (Reference 28). Viral RNA in testis also was quantified by qRT-PCR. Briefly, testes were harvested and placed in DMEM with beads for homogenization. After homogenization, the supernatant was used to extract viral RNA using RNeasy Mini kit (Qiagen). Extracted RNA was eluted in 40 μl RNase-free water. qRT-PCR assays were performed on the LightCycler® 480 System (Roche) following the manufacturer's protocol by using a 50-μl reaction of the QuantiTect Probe RT-PCR Kit (QIAGEN) and 10 μl RNA template. The viral load was calculated based on a standard curve produced using serial 10-fold dilutions of ZIKV RNA from known quantities of infectious virus. The qRT-PCT primer/probe set includes forward primer (1193F: 5'-CCGCTGCCCAACACAAG-3'), reverse primer (1269R: 5'-CCACTAACGTTCTTTTGCAGACAT-3'), and probe (5'-FAM/AGCCTACCT/ZEN/TGACAAGCAATCAGACACTCAA/3IABkFQ-3'). The probe contains a 5'-FAM reporter dye, 3' IBFQ quencher, and an internal ZEN quencher.

[0177] Vaccination of non-human primates: Rhesus macaque (*Macaca mulatta*) experiments were performed at Bioqual, Inc. (Rockville, Md.). All animal experiments were reviewed and approved by the Animal Care and Use Committee of the Vaccine Research Center, the National Institute of Allergy and Infectious Diseases, the National Institutes of Health. Animals were housed and cared in accordance with local, state, federal, and institutional policies in an American Association for Accreditation of Laboratory Animal Care-accredited facility at the Bioqual Inc. Rhesus macaques (3-4/group) were randomized by body weight, gender, and age, and subcutaneously administered with 10^3 FFU of parental WT ZIKV strain FSS13025, ZIKV-3'UTR-Δ10-LAV, ZIKV-3'UTR-Δ20-LAV, or PBS sham at day 0. Blood was collected at day 2, 3, 4, 5, 7, and 10 for viremia testing and weekly for analysis of antibody responses by an mCherry ZIKV neutralization assay (References 36, 38). The immunized animals were subcutaneously challenged with 10^3 FFU of ZIKV strain PRVABC59 at week 8. Blood samples were collected for determination of viral load at day 2, 3, 4, 5, 7, and 10 and neutralization antibody at week 2, 4, and 6 post-challenge.

[0178] Viremia from rhesus macaques was quantified by a qRT-PCR assay and focus forming assay as described in the proceeding section. For qRT-PCR quantification, viral RNA was extracted from rhesus serum using QlAamp Viral RNA Kits (QIAGEN) following the manufacture instruction. Extracted RNA was eluted in 40 μl RNase-free water. qRT-PCR assay was performed as described above. In vitro transcribed full-length ZIKV RNA was used as a standard for qRT-PCR quantification. The primer/probe set is described in the proceeding section.

[0179] Neutralization assay and neurovirulence: All antibody neutralization titers were determined using an mCherry ZIKV as previously reported (Reference 36). The dilution folds that neutralized 50% of mCherry ZIKV infection (NT50) were presented. For measuring neurovirulence, 1-day-old outbred CD-1 mice (Charles River) were injected intracranially with indicated amounts of viruses. The infected mice were monitored for morbidity and mortality as reported previously (Reference 36).

[0180] Mosquito infection: For measuring mosquito infection, artificial blood-meal spiked with 10^6 FFU/ml of indicated viruses was used to feed *Aedes aegypti* mosquitoes (derived from a Galveston, Texas), and engorged mosquitoes were incubated at 28° C., 80% relative humidity on a 12:12 h light:dark cycle with ad libitum access to 10% sucrose. The infection rates were determined at day 7 post-feeding as reported previously (Reference 10).

[0181] Data analysis: All data from these experiments the results of which are described in the examples which follow and are contained in the figures referenced therein were analyzed with GraphPad Prism v7.02 software. Data are expressed as the mean±standard deviation (SD). Comparisons of groups were performed using Mann-Whitney test or one-way ANOVA with a multiple comparisons correction. A P value of <0.05 indicates statistically significant.

Example 9: Prevention of Vertical Transmission in Pregnant Mice

[0182] The live-attenuated vaccine candidate described herein which contains a 10-nucleotide deletion in the 3'UTR of ZIKV genome (ZIKV-3'UTR-Δ10-LAV) was tested for its ability to prevent in utero transmission. In these experiments we subcutaneously inoculated 10^5 focus-forming units (FFU) of ZIKV-3'UTR-Δ10-LAV or PBS-sham into 8-week-old wild-type C57BL/6 female mice (FIG. **13**A). Because mice are not a native host for ZIKV due in part to a species-dependent lack of antagonism of type I IFN signaling (References 39, 40), we administered 0.5 mg of anti-Ifnarl blocking antibody to female mice one day prior to vaccination to facilitate transient replication of ZIKV-3'UTR-Δ10-LAV and to attempt to produce disease (Reference 41). At day 28 post-vaccination, the animals were phlebotomized and serum was analyzed for neutralizing antibody (FIG. **13**B); all ZIKV-3'UTR-Δ10-LAV-immunized mice developed high neutralizing antibody titers of 18,900±5,900 (mean±standard deviation; n=13), whereas, as expected, the PBS-immunized animals did not develop detectable neutralizing antibodies (FIG. **13**C). At day 35 post-vaccination, the immunized females were mated with 12-week-old wild-type (WT) C57BL/6 male mice and monitored for vaginal plugs (FIG. **13**A). At embryo day 6 (E6), pregnant mice were challenged subcutaneously with 10^5 FFU of a mouse-adapted, pathogenic ZIKV African strain Dakar 41519 (Reference 42); to facilitate ZIKV-Dakar dissemination to the maternal decidua and fetal placenta, the pregnant mice were administered 2 mg of anti-Ifnarl antibody at E5, one day before the challenge. At E13, maternal and fetal organs were harvested and measured for viral load.

[0183] After a single immunization, ZIKV-3'UTR-Δ10-LAV reduced median viral loads in the maternal spleen and brain by ~49,000-fold and ~120-fold, respectively (FIG. **13**D-E). Placentas and fetal heads from the vaccinated dams showed 138,000-fold and 260-fold decreases in viral RNA loads, respectively, when compared with the PBS-immunized dams (FIG. **13**F-G). Notably, 21 of 30 (70%) placentas and 21 of 30 (70%) fetal heads from ZIKV-3'UTR-Δ10-LAV-immunized dams had viral RNA loads at or below the detection limit; no infectious virus was recovered by focus forming assay from the placentas or fetal heads from the vaccinated dams (FIG. **17**A-B). In addition, the immune correlate between the EC_{50} values and the levels of infectious viruses recovered in the placenta revealed an expected inverse relationship between neutralizing titers and levels of ZIKV particles in placenta (FIG. **17**C). Collectively, the data suggest that ZIKV-3'UTR-Δ10-LAV protects maternal organs from infection, partially prevents viral transmission to the fetus during an early stage of pregnancy, and limits fetal replication.

Example 10: Protection of ZIKV-Induced Damages to Testes

[0184] We examined the ability of ZIKV-3'UTR-Δ10-LAV to prevent testis infection and injury in $Ifnar1^{-/-}$ A129 mice (FIG. **14**A). Since male mice reach sexual maturity at 8-week-old, we tested the vaccine efficacy in two age groups of mice: 3-week-old young males and 15-week-old adult males. Three-week-old young A129 male mice were vaccinated with a single-dose of 10^4 FFU of ZIKV-3'UTR-Δ10-LAV or PBS sham. The ZIKV-3'UTR-Δ10-LAV generated a peak viremia of $1.2\pm0.34\times10^4$ FFU (n=6) at day 4 post-vaccination (FIG. **14**B). At day 28 post-vaccination, ZIKV-3'UTR-Δ10-LAV had induced robust neutralizing antibody titers of 7,700 ±2,600 (n=6) (FIG. **14**C). At the same day, the animals were challenged intraperitoneally with 10^6 FFU of an epidemic ZIKV strain from Puerto Rico (PRVABC59). No viremia was detected from the ZIKV-3'UTR-Δ10-LAV-

vaccinated mice after challenge, whereas the sham-vaccinated animals sustained a mean peak viremia of $7.1\pm5.9\times10^6$ FFU/ml (n=6) at day 2 post-challenge (FIG. **14**D). At day 21 post-challenge, viral burden in the testis of PBS-immunized mice reached $5.8\pm8.4\times10^6$ FFU/g (n=6), whereas no infectious virus was detected in the testes of ZIKV-3'UTR-Δ10-LAV-immunized mice (FIG. **14**E). Both total and motile sperm counts from the ZIKV-3'UTR-Δ10-LAV-immunized mice were equivalent to those from age-matched unvaccinated, unchallenged healthy male mice. In contrast, the PBS-immunized, ZIKV-challenged mice showed 85% and 90% reduction for total and motile sperm counts, respectively, at day 21 post-infection (FIG. **14**F&G). Consistent with these data, the testis weight and size from the PBS-immunized, ZIKV-challenged mice were reduced, whereas no such reduction was observed in the ZIKV-3'UTR-Δ10-LAV-immunized, ZIKV-challenged animals (FIG. **14**H&I).

[0185] In 15-week-old adult A129 male mice, vaccination with ZIKV-3'UTR-Δ10-LAV also protected against testis infection, injury, and oligospermia (FIG. **17**A-G). However, challenge of the PBS-vaccinated adult males with ZIKV PRVABC59 did not reduce the testis weight and size (FIG. **17**H&I) as much as that observed in the corresponding sham-vaccinated, young males (FIG. **17**H&I), suggesting an age-dependent testis pathology. Collectively, the results indicate that a single-dose immunization of ZIKV-3'UTR-Δ10-LAV protects the testis from infection and injury in male mice.

Example 11: Efficacy in Non-Human Primates

[0186] To determine whether the efficacy in mice extends to non-human primates (NHPs), we evaluated the viremia, immunogenicity, and potency of ZIKV-3'UTR-Δ10-LAV in rhesus macaques (RM; FIG. **15**A). First, we assessed the level of attenuation of ZIKV-3'UTR-Δ10-LAV in RM by comparing viremia to the parental WT virus. After subcutaneous inoculation with 10^3 FFU, WT ZIKV (2010 Cambodian strain FSS 13025) produced high levels of viremia in each of the four inoculated RM, with a mean peak viremia of 9.6 and 28.8×10^4 genome copies/ml at days 4 and 5 post-infection, respectively (FIG. **15**B, top panel). In contrast, only one of the four ZIKV-3'UTR-Δ10-LAV-inoculated RM exhibited viremia, and this level was just above the limit of detection of our qRT-PCR assay (FIG. **15**B, second panel); thus, ZIKV-3'UTR-Δ10-LAV is highly attenuated in RM.

[0187] We next evaluated the immunogenicity of ZIKV-3'UTR-Δ10-LAV by measuring neutralizing antibodies from serum at days 5-98 post-immunization. Neutralizing antibodies elicited by WT ZIKV were detectable at day 7-10, peaked at $1/1{,}000$ to $1/10{,}000$ at day 14, and plateaued thereafter (FIG. **15**C, top panel). Compared with the WT ZIKV infection, ZIKV-3'UTR-Δ10-LAV-inoculated animals showed slightly delayed production and lower levels of neutralizing antibody, with titers of ~$1/100$ at days 21-56 (FIG. **15**C, second panel). At day 56 post-immunization, all RM were challenged with 10^3 FFU of the epidemic ZIKV strain PRVABC59. Notably, no viremia was detected upon challenge in any of the RM that were pre-infected with WT ZIKV or vaccinated with the ZIKV-3'UTR-010-LAV (FIG. **15**D, top two panels). As controls, two PBS-inoculated RM were challenged in parallel and high levels of viremia were measured (FIG. **15**D bottom panel). In addition to analysis of viral RNA by qRT-PCR, we also performed focus forming assays to measure infectious virus; infectious ZIKV was detected only in naive RM challenged with WT ZIKV (FIG. **19**).

[0188] To examine whether the ZIKV challenge resulted in boosted immune responses, we measured neutralizing activity post-challenge. No increase in neutralizing activity was observed in the WT ZIKV-vaccinated RM after challenge (FIG. **15**C, top panel), indicating that the initial infection likely conferred sterilizing immunity. In contrast, the neutralizing antibody titers rose after challenge from approximately $1/100$ to $1/1{,}000$-$1/10{,}000$ in the ZIKV-3'UTR-Δ10-LAV-immunized animals (FIG. **15**C, second panel), demonstrating an anamnestic response and suggesting a low level of infection after challenge that was not detectable by qRT-PCR of serum. As expected, the PBS-inoculated control RM increased their neutralizing titers to ~$1/10{,}000$ after challenge (FIG. **15**C, bottom panel).

[0189] Since ZIKV-3'UTR-Δ10-LAV did not elicit sterilizing immunity in RM, we evaluated whether a second live-attenuated vaccine candidate ZIKV-3'UTR-Δ20-LAV (Reference 36), which contains a 20-nucleotide deletion in the 3'UTR, could induce a stronger immune response. ZIKV-3'UTR-Δ20-LAV was shown previously, and paradoxically, to be less attenuated than ZIKV-3'UTR-Δ10-LAV in A129 mice, most likely because it is less sensitive to type-I IFN inhibition compared to ZIKV-3'UTR-Δ10-LAV (Reference 36). After subcutaneous inoculation of 10^3 FFU of ZIKV-3'UTR-Δ20-LAV, two of the three RM had low, but detectable viremia (FIG. **15**B, third panel). The immunized animals rapidly produced neutralizing antibodies by day 10, with inhibitory titers plateauing at $1/1{,}000$ to $1/10{,}000$ by days 14-21 (FIG. **15**C, third panel). After challenge with 10^3 FFU of ZIKV PRVABC59 at day 56, viremia was not detected by qRT-PCR (FIG. **15**D, third panel) and no rise in neutralizing antibody titers was observed (FIG. **15**C, third panel) in the ZIKV-3'UTR-Δ20-LAV-immunized animals. Although low number of animals were used for each vaccine candidates, the results suggest that a single-dose vaccination of ZIKV-3'UTR-Δ20-LAV -induces sterilizing immunity in NHPs (i.e., no detectable viremia and no increase of neutralizing antibody titer after challenge).

[0190] We also evaluated another live-attenuated ZIKV vaccine candidate encoding an NS1 without glycosylation (ZIKV-NS1-LAV) in RM. ZIKV-NS1-LAV was recently shown to prevent in utero transmission in a mouse pregnancy model (Reference 43). After subcutaneous immunization of four RMs with 10^3 FFU of ZIKV-NS1-LAV, none of the animals showed any detectable viral RNA (FIG. **15**B, fourth panel). Back titering of the ZIKV-NS1-LAV inoculum using focus-forming assay confirmed the infectivity of viral stock with the expected infectious titer. Unexpectedly the immunization did not elicit any neutralizing activity (FIG. **15**C, fourth panel). After challenge with 10^3 FFU of ZIKV PRVABC59 at day 56, all four animals displayed robust viremia (FIG. **15**D, fourth panel) and generated neutralizing antibody titers (FIG. **15**C, fourth panel). These results indicate that ZIKV-NS1-LAV is incapable of replicating and triggering antibody responses in RM.

Example 12: Testis Protection and Safety Analysis of ZIKV-3'UTR-Δ20-LAV

[0191] Because of the highly desirable sterilizing immunity induced by ZIKV-3'UTR-Δ20-LAV in RM, we further tested its efficacy and safety. Similar to ZIKV-3'UTR-Δ10-

LAV, immunization of male A129 mice with 10^3 FFU of ZIKV-3'UTR-Δ20-LAV completely prevented viral infection and testis injury after challenge with ZIKV PRVABC59, as determined by a lack of detectable viremia post-challenge, the absence of oligospermia, and no decrease in testis weight and size (FIG. **20**). Next, five sets of experiments were performed to characterize the safety of ZIKV-3'UTR-Δ20-LAV.

[0192] First, we measured the organ viral loads after subcutaneous inoculation of A129 mice with 10^3 FFU of ZIKV-3'UTR-Δ20-LAV or parental WT ZIKV (FIG. **16**A). At day 6 post-infection, WT ZIKV-infected mice exhibited high viral loads in all tested organs, whereas no virus was detected ($\leq 10^2$ FFU/ml) in liver or brain from the ZIKV-3'UTR-Δ20-LAV-infected mice, with other organs (except spleen) exhibiting lower levels of the vaccine virus than those of the WT-infected animals. At day 10 post-infection, WT ZIKV-infected mice retained viral loads in the heart, spleen, kidney, testis, eye, and brain, whereas no organs from the ZIKV-3'UTR-Δ20-LAV-infected mice had any detectable virus.

[0193] Second, we examined the potential adverse effect of ZIKV-3'UTR-Δ20-LAV on the testis in 3-week-old A129 mice. As expected, at day 21 post-infection, WT ZIKV infection reduced testis weight and size (FIG. **16**A-C), lowered total and motile sperm counts (FIG. **16**D-E), and resulted in viral RNA in the shrunken testis (FIG. **16**F). In contrast, ZIKV-3'UTR-Δ20-LAV did not affect sperm counts or testis weight and size (FIG. **16**B-E), with no detectable viral RNA in the testes (FIG. **16**F).

[0194] Third, we evaluated the neurovirulence of ZIKV-3'UTR-Δ20-LAV through intracranial inoculation of 1-day-old CD-1 mice (FIG. **16**G). As reported previously (Reference 36), neonates succumbed to WT ZIKV infection; even a dose of only 10 FFU resulted in 13% mortality (FIG. **16**G). In contrast, no mortality was observed in mice that were inoculated with 10^3 FFU of ZIKV-3'UTR-Δ20-LAV; however, infection with 10^4 FFU of ZIKV-3'UTR-Δ20-LAV resulted in a mortality rate of 29%.

[0195] Fourth, we tested if the vaccine candidate could infect *Aedes aegypti* mosquitoes, the main vector of ZIKV (References 19, 20). After feeding on artificial blood-meals containing 10^6 FFU/ml of ZIKV-3'UTR-Δ20-LAV or WT ZIKV, 50% of the engorged mosquitoes were infected by WT ZIKV, whereas no mosquitoes were infected by ZIKV-3'UTR-Δ20-LAV (FIG. **16**H).

[0196] Finally, we tested the stability of ZIKV-3'UTR-Δ20-LAV in cell culture. After continuous culture of ZIKV-3'UTR-Δ20-LAV on Vero cells (an approved cell line for vaccine production (Reference 44) for five rounds, all recovered P5 viruses (derived from three independent experiments) retained the 20-nucleotide deletion. However, the P5 viruses accumulated additional mutations in the E- and NS1-encoding genes (FIG. **21**), which may represent Vero-cell-adaptive mutation(s) or compensatory mutation(s) to 3'UTR deletion. Further passaging of the viruses to P10 did not change the 20-nucleotide deletion, indicating that the deletion is stable in cell culture. Moreover, we passaged ZIKV-3'UTR-Δ20-LAV in A129 mice for three rounds (3 days per round); all recovered viruses retained the 20-nucleotide deletion, further suggesting the stability of the mutant virus. Taken together, these results demonstrate an excellent safety profile of ZIKV-3'UTR-Δ20-LAV, including limited, transient viral loads in mouse organs, no adverse effect on testicular function, decreased neurovirulence, incompetency to infect mosquitoes, and good stability.

CONCLUSIONS

[0197] Herein we demonstrate that live-attenuated ZIKV vaccine candidates containing deletions in the 3' untranslated region of the ZIKV genome (ZIKV-3'UTR-LAV), i.e., 10 and 20 nucleotide deletions, prevent viral transmission during pregnancy and testis damage in mice, as well as infection of non-human primates. After a single-dose vaccination, pregnant mice challenged with ZIKV at embryonic day 6 (E6) and evaluated at E13 show markedly diminished levels of viral RNA in maternal, placental, and fetal tissues. Vaccinated male mice challenged with ZIKV are protected against testis infection, injury, and oligospermia. A single immunization of rhesus macaques elicited a rapid and robust antibody response, conferring complete protection upon challenge. Furthermore, the ZIKV-3'UTR-LAV vaccine candidates have a desirable safety profile. These results suggest that further development of ZIKV-3'UTR-LAV is warranted for humans.

[0198] Particularly our results showed that a single immunization of ZIKV-3'UTR-Δ10-LAV prevented maternal-to-fetal transmission early during pregnancy in C57BL/6 mice. Although no infectious challenge virus was detected, very low levels of viral RNA were recovered from ~30% of placenta and fetal heads from the vaccinated dams after challenge; these breakthrough viral RNAs might derive from stable antibody-virus complexes, which can last for several days in vivo (Reference 47).

[0199] Based on these results the clinical implications of such breakthrough non-infectious viral RNA will be determined in other species and in particular will be evaluated in non-human primates (NHPs) and if successful in humans. In male A129 mice, a single-dose immunization of either ZIKV-3'UTR-Δ10-LAV or ZIKV-3'UTR-Δ20-LAV prevented testis infection and injury after challenge, indicating an additional benefit of vaccination to protect the male reproductive system. Notably, unprotected young A129 mice (3- or 7-week-old) infected with ZIKV developed smaller testes, whereas adult mice (19-week-old when infected) did not, suggesting that ZIKV infection might cause more severe reproductive damage in younger males. As noted above the clinical relevance of this observation will be confirmed in NHPs and humans.

[0200] In NHPs, a single-dose vaccination with ZIKV-3'UTR-Δ10-LAV or ZIKV-3'UTR-Δ20-LAV induced sufficient immune responses to prevent viremia, with the ZIKV-3'UTR-Δ10-LAV eliciting greater immunogenicity, as reflected by its ability to induce sterilizing immunity against challenge. One limitation of the current non-human primate results is the low number of animals used for each vaccine candidates (n=3-4). ZIKV vaccine-induced sterilizing immunity might be critical for protection of congenital abnormalities in humans.

[0201] Live-attenuated vaccines generally have the advantage of single dose, rapid induction of durable immunity. Since ZIKV is endemic primarily in low income countries, a vaccine with single-dose efficacy is of practical importance, particularly when controlling an explosive outbreak or immunizing population in remote areas where multiple doses and periodic boosting will be challenging (Reference 45). Thus, live-attenuated vaccines may be useful for immunizing populations living in and traveling to ZIKV-endemic

areas. Besides our ZIKV-3'UTR-LAV, a single-dose immunization with nucleoside-modified mRNA expressing ZIKV prM-E (50 μg) (Reference 46) or a recombinant rhesus adenovirus serotype 52 vector expressing ZIKV prM-E (10^{11} viral particles) (Reference 8) was also shown to rapidly elicit antibody response and prevent viremia in NHPs; whether these two vaccines achieved sterilizing immunity was not determined. All other vaccine platforms, including inactivated vaccine and prM-E DNA vaccine, need two shots to elicit robust antibody response for viremia protection in NHPs (References 7, 8).

[0202] It is conceivable that in immunocompromised individuals and pregnant women, vaccination with live-attenuated virus may be contraindicated to avoid potential adverse risks. However, these individuals could be protected using inactivated, subunit, or gene-based replication-defective vaccines. Therefore, it is desirable that multiple vaccine platforms be developed in parallel with those described herein in order to provide complementary options for preventing and controlling ZIKV infection and disease.

Example 13: DNA Plasmid-Launched Wild-Type Zika Virus and Vaccines

[0203] In order to facilitate the development of vaccines for preventing and controlling ZIKV infection and disease the inventors have developed a DNA plasmid that can be directly transfected into cells to generate Zika virus (ZIKV). The new DNA-launched ZIKV full-length (FL) clone is assembled in the backbone of the pCC1 vector. Besides the pCC1 vector sequence, it contains an eukaryotic promoter CMV or SV40, the full genome of ZIKV strain FSS13025, HDVr sequence, and poly-A tail. The clones are named as CMV ZIKV FL and SV40 ZIKV FL depending on the types of promoters used to transcribe the viral RNA. DNA-launched ZIKV full-length clones used to construct live attenuated ZIKV vaccine candidates are listed in Appendix A.

[0204] As shown in FIG. **22**, both pCC1-CMV ZIKV FL and pCC1-SV40 ZIKV FL can efficiently launch wild-type ZIKV by transfection of DNA plasmid into Vero cells. In the experiments 5 micrograms of indicated DNA plasmid was transfected into Vero cells through electroporation. Culture fluids were collected from day 1 to 5. Infectious viral titers were measured by plaque assay on Vero cells.

[0205] Using the DNA-launched ZIKV FL clones (SEQ ID NO:6 and 7), we made DNA-launched live attenuated ZIKV vaccine candidates. Specifically, we engineered the 3'UTR 10-del or 20-del mutations (References 19, 48) into the DNA-launched ZIKV FL clones, resulting in ZIKV Del 10 and ZIKV Del 20, respectively. Depending on the promoter types, these DNA vaccine candidates are named as CMV ZIKV Del 10, CMV ZIKV Del 20, SV40 ZIKV Del 10, and SV40 ZIKV Del 20. Detailed description of the sequences of these particular DNA vaccine candidates is summarized in Appendix B. As shown in FIG. **23**, the four DNA-launched live-attenuated ZIKV vaccine plasmids can also produce robust levels of vaccines after transfecting the DNA into Vero cells.

Appendix A: ZIKV Full-Length Clones used to Construct Live Attenuated ZIKV Vaccine Candidates

[0206] 1. CMV ZIKV Full Length (FL) sequence: SEQ ID NO: 6 in Sequence Listing

[0207] 2. SV40 ZIKV Full Length (FL) sequence: SEQ ID NO:7 in Sequence Listing

Appendix B: Detailed Description of Sequences of Exemplary Live Attenuated ZIKV Vaccine Candidates

[0208] CMV ZIKV Del 10: Consists of a deletion variant of SEQ ID NO: 6 wherein the sequence "CCAGAAGAGG" (SEQ ID NO: 8 in Sequence Listing) is deleted.

[0209] CMV ZIKV Del 20: Consists of a deletion variant of SEQ ID NO: 6 wherein the sequence "CTGTGGATCTCCAGAAGAGG" (SEQ ID NO: 9 in Sequence Listing) is deleted.

[0210] SV40 ZIKV Del 10: Consists of a deletion variant of SEQ ID NO: 7 wherein the sequence "CCAGAAGAGG" (SEQ ID NO: 8 in Sequence Listing) is deleted.

[0211] SV40 ZIKV Del 10: Consists of a deletion variant of SEQ ID NO: 7 wherein the sequence "CTGTGGATCTCCAGAAGAGG" (SEQ ID NO: 9 in Sequence Listing) is deleted.

[0212] One skilled in the art will readily appreciate that the present invention is adapted to carry out the objects and obtain the ends and advantages mentioned, as well as those inherent therein. The prior examples along with the methods, procedures, treatments, molecules, and specific compounds described herein are presently representative of preferred embodiments, are examples, and are not intended as limitations on the scope of the invention. Changes therein and other uses will occur to those skilled in the art which are encompassed within the spirit of the invention as defined by the scope of the claims.

1. A live attenuated Zika virus (ZIKV) strain, comprising a deletion in the 3' untranslated region (3'UTR) of the ZIKV genome.

2-26. (canceled)

27. The live attenuated ZIKV strain of claim **1**, wherein

(i) the 3'UTR deletion ranges from a 10-nucleotide deletion to a 50-nucleotide deletion (i.e., Δ10, Δ11, Δ12, Δ13, Δ14, Δ15, Δ16, Δ17, Δ18, Δ19, Δ20, Δ21, Δ22, Δ23, Δ24, Δ25, Δ26, Δ27, Δ28, Δ29, Δ30, Δ31, Δ32, Δ33, Δ34, Δ35, Δ36, Δ37, Δ38, Δ39, Δ40, Δ41, Δ42, Δ43, Δ44, Δ45, Δ46, Δ47, Δ48, Δ49 or Δ50 3'UTR deletion);

(ii) the 3'UTR deletion is a 10-nucleotide deletion, a 20-nucleotide deletion, or a 30-nucleotide deletion;

(iii) the 3'UTR deletion is a 10-nucleotide deletion; or

(iv) the 3'UTR deletion is a 20-nucleotide deletion.

28. The live attenuated ZIKV strain of claim **1**, comprising a 3'UTR having at least 80%, at least 85%, at least 90%, at least 95%, at least 98%, at least 99%, or 100% identity to the nucleic acid sequence of SEQ ID NO: 2, 3, 4, or 5.

29. The live attenuated ZIKV strain of claim **27**, comprising a 3'UTR having at least 80%, at least 85%, at least 90%, at least 95%, at least 98%, at least 99%, or 100% identity to the nucleic acid sequence of SEQ ID NO: 2, 3, 4, or 5.

30. The live attenuated ZIKV strain of claim **1**, which comprises at least one of the following:

(i) is incompetent in infecting mosquitoes;

(ii) exhibits decreased viral RNA synthesis compared to wildtype ZIKV strains;

(iii) exhibits increased sensitivity to type-1 interferon inhibition compared to wildtype ZIKV strains;

(iv) the deletion does not affect viral RNA translation; or

(v) it comprises an mCherry ZIKV strain.

31. The live attenuated ZIKV strain of claim **1**, which comprises at least one of the following:

(i) comprises or consists of a deletion variant of SEQ ID NO:6 wherein the sequence "CCAGAAGAGG" (3'UTR 10-nucleotide deletion) (SEQ ID NO:8) is deleted therefrom;

(ii) comprises or consists of a deletion variant of SEQ ID NO:6 wherein the sequence "CTGTGGATCTCCAGAAGAGG" (3'UTR 20-nucleotide deletion) (SEQ ID NO:9) is deleted therefrom;

(iii) comprises or consists of a deletion variant of SEQ ID NO:7 wherein the sequence "CCAGAAGAGG" (3'UTR 10-nucleotide deletion) (SEQ ID NO:8) is deleted therefrom; or

(iv) comprises or consists of a deletion variant of SEQ ID NO:7 wherein the sequence "CTGTGGATCTCCAGAAGAGG" (3'UTR 20-nucleotide deletion) (SEQ ID NO:9) is deleted therefrom.

32. An immunogenic composition comprising a live attenuated ZIKV strain according to claim **1**, which further comprises at least one pharmaceutically acceptable carrier or excipient

33. The immunogenic composition of claim **32**, which is suitable for parenteral or enteral administration.

34. A method for eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain according to claim **1** in a subject in need thereof.

35. A method for eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain according to claim **27**, in a subject in need thereof.

36. A method for eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain according to claim **28**, in a subject in need thereof.

37. A method for eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain according to claim **29**, in a subject in need thereof.

38. A method for eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain according to claim **30**, in a subject in need thereof.

39. A method for eliciting an immune response in a subject in need thereof comprising administering a prophylactically or therapeutically effective amount of a live attenuated ZIKV strain according to claim **31**, in a subject in need thereof.

40. The method of claim **34**, wherein the immune response comprises a $CD8^+$ T cell response, an antibody response, and/or a cellular immune response against ZIKV and/or the immune response comprises a neutralizing antibody titer equivalent to that of wildtype ZIKV infection.

41. The method of claim **34**, wherein the subject is a pregnant female.

42. The method of claim **34**, which (i) prevents congenital ZIKV syndrome, and/or (ii) prevents microcephaly.

43. The method of claim **34**, wherein the prophylactically or therapeutically effective amount of the live attenuated ZIKV strain comprises at least 1.0×10^1, 1.0×10^2, 1.0×10^3, 1.0×10^4, 1.0×10^5, or 1.0×10^6 IFUs.

44. The method of claim **34**, which prevents viremia in said subject after subsequent challenge with a wildtype ZIKV strain.

45. The method of claim **34**, wherein the subject treated is a human.

PTO/AIA/01 (06-12)
Approved for use through 11/30/2020. OMB 0651-0032
U.S. Patent and Trademark Office; U.S. DEPARTMENT OF COMMERCE

DECLARATION (37 CFR 1.63) FOR UTILITY OR DESIGN APPLICATION USING AN APPLICATION DATA SHEET (37 CFR 1.76)

Title of Invention	LIVE ATTENTUATED ZIKA VIRUS WITH 3'UTR DELETION, VACCINE CONTAINING AND USE THEREOF

As the below named inventor, I hereby declare that:

This declaration is directed to:

☐ The attached application, or

☒ United States application or PCT international application number 16/485,818 filed on August 14, 2019.

The above-identified application was made or authorized to be made by me.

I believe that I am the original inventor or an original joint inventor of a claimed invention in the application.

I hereby acknowledge that any willful false statement made in this declaration is punishable under 18 U.S.C. 1001 by fine or imprisonment of not more than five (5) years, or both.

WARNING:

Petitioner/applicant is cautioned to avoid submitting personal information in documents filed in a patent application that may contribute to identity theft. Personal information such as social security numbers, bank account numbers, or credit card numbers (other than a check or credit card authorization form PTO-2038 submitted for payment purposes) is never required by the USPTO to support a petition or an application. If this type of personal information is included in documents submitted to the USPTO, petitioners/applicants should consider redacting such personal information from the documents before submitting them to the USPTO. Petitioner/applicant is advised that the record of a patent application is available to the public after publication of the application (unless a non-publication request in compliance with 37 CFR 1.213(a) is made in the application) or issuance of a patent. Furthermore, the record from an abandoned application may also be available to the public if the application is referenced in a published application or an issued patent (see 37 CFR 1.14). Checks and credit card authorization forms PTO-2038 submitted for payment purposes are not retained in the application file and therefore are not publicly available.

Subject: Re: Happy Thanksgiving and meeting next year, June 12-13, 2020

Hi professors,

I apologize if you are bothered by this email. I am helping my friend, Ed Seto to advertise his recruiting post-doc:

Postdoctoral Position

Applications are invited for a postdoctoral fellowship to study the structures, functions, and mechanisms of histone deacetylases. Candidates with experiences in biochemical, molecular, and

cell biological approaches are preferred.

Recent selected articles from our lab:
PMID: 32540961
PMID: 32457045
PMID: 31162605
PMID: 30517871
PMID: 30456376
PMID: 29958910

Please send a CV and names of three references to:

Ed Seto, Ph.D.

Subject: Tell the NIH to Stop the Racial Profiling of Asian Scientists and Researchers (Due Fri 4/9 at 5pm ET)

Hi all,

Asian Americans Advancing Justice | AAJC is submitting a comment to the National Institutes of Health (NIH) to raise our concern on the mass racial profiling and discriminatory investigations and prosecutions of Asian American and immigrant scientists, researchers, and scholars and NIH's role in these efforts.

Asian American communities have been grossly impacted by the profiling and unjust prosecutions for espionage of students, scientists, and researchers of Asian descent under the pretext of securing American research particularly under the Justice Department's "China Initiative." NIH intervention and investigations have led to the dismissal, resignation, and termination of Asian scientists, as well as a growing fear among Asian Americans and Asian immigrants of being targeted and scapegoated based on their race, ethnicity, and national origin.

NIH has launched an effort to end structural racism in biomedical research through its new UNITE initiative. Individuals and organizations are invited to submit suggestions through its Request for Information (RFI) platform on ways NIH can stand against structural racism and achieve racial equity in biomedical research.

Join us by signing on to Asian Americans Advancing Justice | AAJC's comment or submitting your own comment to NIH on the harms resulting from the racial discrimination and profiling of Asian Americans and Asian immigrants in the scientific research environment. The comment also includes a set of recommendations on appropriate measures to address racial profiling and promote racial equity within the agency.

Full text of Advancing Justice | AAJC's comment is available here.

You can take action now by:

- **Signing on to our comment to NIH** on the racial profiling and targeting of Asian American and Asian immigrant scientists, researchers, and scholars. **The deadline to sign on is April 9 at 5pm ET.**

**Please note we accept both individual and organizational signatories. We encourage impacted persons to consult with their attorneys first before signing on to the comment to reduce risk. If you are concerned about signing publicly, you may also submit comments anonymously.*

- **Submitting your own comment to NIH** We encourage you to add new recommendations, modify existing recommendations to align with your priorities, and include additional evidence, data and references. Comments may be submitted anonymously. **The submission deadline is April 9 at 11:59PM ET.**

  - Letter template for individuals
  - Letter template for organizations
  - Note: If you are submitting a letter using this template, please send a copy to Vivin Qiang at vqiang@advancingjustice-aajc.org. This assists our organization in further combating the racial profiling of Asian Americans and Asian immigrants.

If you have any questions, please reach out to Gisela Kusakawa at gkusakawa@advancingjustice-aajc.org.

If you believe you are being targeted by the government and you are looking for attorney referrals, please contact 202-935-6014 using the Signal app and a staff member from Advancing Justice | AAJC will reach out to you directly (Available in English & Mandarin/普通话). Please contact Vivin Qiang to learn more.

We hope you consider signing on or submitting your own comment to NIH. Thank you for your time and consideration of this request!

If you would no longer like to receive updates and action alerts from Advancing Justice | AAJC, please contact Vivin Qiang.

Best,

Vivin

Subject: Thank you and happy new year!

Dear colleagues:

Greetings and happy new year!

I hope that you all have enjoyed our annual meeting last two days, which I consider as a success. There were more than 300 registrations, and in each session, there were at least 100 attendees at various times. Once again, I wish to thank all the speakers, cochairs, panelists and all of you for your participation and discussion. I especially want to thank the organizing committee

members, Genhong Cheng, Haitao Guo, Renfeng Li, Yuying Liang, Wenjun Ma, Tongqing Zhou, and hi-Ming Zheng for their help that made this symposium possible. I would hope that our annual meeting next year will happen in person.

As I finish my term as the Founding President of this association, which is effective today, I would like to offer my most sincere appreciation and thanks for your care, trust, understanding, patience, and support. It is all because of you last few years that this association and the WeChat group is so strong, entertaining, and full of fun!

In the meantime, I would like to introduce the new leadership team of SCBA-Virology Division as follows:

President: Haitao Guo, Ph.D, University of Pittsburgh School of Medicine
Secretary: Tongqing Zhou, Ph.D, Vaccine Research Center, NIAID, NIH
Treasurers: Yuying Liang , Ph.D, University of Minnesota, and Wenjun Ma, Ph.D, University of Missouri

I wish you all a happy, healthy, and prosperous 2021!

Dear All,

Good morning. I am so excited that our work is accepted by Acta Neuropathologica Communications which is an excellent journal in the field of neurodegenerative diseases. Both reviewers liked this manuscript very much in particular the novel finding about retinal vascular degeneration after zika virus infection. Thank you very much for your critical contributions to this work. Moreover, as you know, Yi has left my lab in March. So this publication is a fruit of her work in the past three years. We appreciated all of her contributions and wish the best for her next journey!

Cheers,
Wenbo

Zika virus induces neuronal and vascular degeneration in developing mouse retina Yi Li; Shuizhen Shi; Fan Xia; Chao Shan; Yonju Ha; Jing Zou; Awadalkareem Adam; Ming Zhang; Tian Wang; Hua Liu; Pei-Yong Shi; Wenbo Zhang Acta Neuropathologica Communications

Dear Professor Zhang,

I am pleased to inform you that your manuscript "Zika virus induces neuronal and vascular degeneration in developing mouse retina" (ANEC-D-21-00206R1) has been accepted for publication in Acta Neuropathologica Communications.

Before publication, our production team will check the format of your manuscript to ensure that it conforms to the standards of the journal. They will be in touch shortly to request any necessary changes, or to confirm that none are needed.

Articles in this journal may be held for a short period of time prior to publication. If you have any concerns please contact the journal.

Please quote your manuscript number, ANEC-D-21-00206R1, when inquiring about this submission.

We look forward to publishing your manuscript and I do hope you will consider Acta Neuropathologica Communications again in the future.

Best wishes,

Jeroen J.M. Hoozemans

Zika virus induces neuronal and vascular degeneration in developing mouse retina

Yi Li[1], Shuizhen Shi[1], Fan Xia[1], Chao Shan[2], Yonju Ha[1], Jing Zou[2], Awadalkareem Adam[3], Ming Zhang[4], Tian Wang[3], Hua Liu[1,5*], Pei-Yong Shi[2,6*] and Wenbo Zhang[1,6,7*]

Abstract

Zika virus (ZIKV), a mosquito-borne flavivirus, can cause severe eye disease and even blindness in newborns. However, ZIKV-induced retinal lesions have not been studied in a comprehensive way, mechanisms of ZIKV-induced retinal abnormalities are unknown, and no therapeutic intervention is available to treat or minimize the degree of vision loss in patients. Here, we developed a novel mouse model of ZIKV infection to evaluate its impact on retinal structure. ZIKV (20 plaque-forming units) was inoculated into neonatal wild type C57BL/6J mice at postnatal day (P) 0 subcutaneously. Retinas of infected mice and age-matched controls were collected at various ages, and retinal structural alterations were analyzed. We found that ZIKV induced progressive neuronal and vascular damage and retinal inflammation starting from P8. ZIKV-infected retina exhibited dramatically decreased thickness with loss of neurons, initial neovascular tufts followed by vessel dilation and degeneration, increased microglia and leukocyte recruitment and activation, degeneration of astrocyte network and gliosis. The above changes may involve inflammation and endoplasmic reticulum stress-mediated cell apoptosis and necroptosis. Moreover, we evaluated the efficacy of preclinical drugs and the safety of ZIKV vaccine candidate in this mouse model. We found that ZIKV-induced retinal abnormalities could be blocked by a selective flavivirus inhibitor NITD008 and a live-attenuated ZIKV vaccine candidate could potentially induce retinal abnormalities. Overall, we established a novel mouse model and provide a direct causative link between ZIKV and retinal lesion in vivo, which warrants further investigation of the underlying mechanisms of ZIKV-induced retinopathy and the development of effective therapeutics.

Keywords: Zika virus, Retina, Neuronal degeneration, Vascular degeneration, Inflammation, Endoplasmic reticulum stress, Drug efficacy, Vaccine safety

Introduction

Zika virus (ZIKV) is an enveloped and spherical flavivirus which is transmitted by *Aedes* mosquitoes [15]. The virus was initially isolated from a rhesus monkey in the Zika Forest of Uganda in 1947 [8], and has caused outbreaks in Asia, the Pacific island and more recently in South and Central America [3, 4, 24], followed by a rapid spread to other countries during 2015–2016 including autochthonous transmissions in Florida and Texas in the United States [11]. Although symptomatic infection in humans results in mostly a mild and self-limiting febrile disease, it has also been linked to a neurological autoimmune disorder Guillain-Barré syndrome in adults and microcephaly in fetuses and infants born to infected mothers during pregnancy [3, 15, 34]. In addition to neuronal damage in the brain, infants with congenital ZIKV infection are associated with a high rate of ocular abnormalities in which the most common lesions are retinal lesions, chorioretinal atrophy and optic nerve abnormalities.

Occasionally calcification in the retina and lens are also noted [5]. Mechanisms of ZIKV-induced retinal abnormalities are unknown and no therapeutic intervention is available to treat or minimize the degree of vision loss in patients.

Studies of pathology related to ZIKV infection in human subjects have been limited since most of the infected individuals are asymptomatic or mildly symptomatic; and only 4–8% fetuses or infants from pregnant women with confirmed ZIKV infection exhibit ZIKV-associated birth defects [28, 38]. Therefore animal models are critical for investigation of ZIKV-induced pathology. Mouse models have been widely used in biomedical research due to low-cost maintenance, a short reproductive cycle and easy genetic modification. Because ZIKV does not replicate efficiently in adult wild type (WT) mice, blocking type I interferon receptor (IFNAR1) by gene deletion or blocking antibody is necessary to overcome infection barrier [1]. However, no apparent retinal pathology or abnormality was observed in ZIKV-infected adult mice with IFNAR blockade or in IFNAR heterozygous fetuses from ZIKV-infected IFNAR deficient ($IFNAR1^{-/-}$) dam despite the presence of viremia [16] and moderate loss of retinal ganglion cells (RGCs) and cones at 60–70 days after infecting 3-week-old A129 $IFNAR1^{-/-}$ mice [36]. Moreover, blockade of IFN pathway causes immune deficiency which may compromise the understanding of pathological changes upon ZIKV infection. Chorioretinitis and retinal cell death were found in adult WT mice receiving injections of a substantial amount of ZIKV into vitreous or aqueous humor [30, 31]. Nevertheless, intravitreal injection or intra-aqueous injection is not a disease-relevant route for ZIKV transmission to the retina. Two studies show intra-amniotic injection of ZIKV into C57BL/6 WT mice at embryonic day 13.5 (E13.5) or E15 allow infected mice to grow into puberty and recapitulate several symptoms of clinical congenital Zika syndrome including severe retinal neuronal degeneration [6, 29]. The limitation of intra-amniotic injection is that this procedure requires surgery and special skills and the maternal immune response and placental insufficiency may affect neural development, making it complicated to interpret the data.

Mouse retinal development is initiated at approximately E12. It continues during the first 3 weeks after birth in a process very similar to human retinal development during the third trimester of pregnancy [9]. At birth (postnatal day (P) 0), mouse retina consists of a multitude of neuroblasts (progenitors) and some differentiated RGCs, amacrine cells and horizontal cells. From P0 to P8, retinal development continues, including the formation of bipolar cells, photoreceptors (rods and cones) and a single glial cell type (Müller cells) by neuroblasts in a temporally ordered sequence [18], the formation of each retinal layers, and the maturation of neuronal synapses [9]. Coincident with the final stages of neuronal differentiation, the eyes are open and the vision process is initiated at P14. Mouse retinal vascularization begins at P0 and completes by P21 [9]. Taking these advantages, we established a novel mouse model using postnatally developing mouse retina to study retinal abnormalities associated with ZIKV, provided a causative link between ZIKV and retinal lesion in vivo, and demonstrated its use to test the efficacy and safety of therapeutic interventions.

Materials and methods

Mice

C57BL/6J mouse colony was purchased from Jackson Laboratory (Bar Harbor, ME) and maintained in the animal facility at the University of Texas Medical Branch. Mice were housed under standard conditions of 12:12 light/dark cycle with food and water available ad libitum. Animal protocols were approved by the Institutional Animal Care and Use Committee. All experimental procedures and use of animals were performed in accordance with the Association for Research in Vision and Ophthalmology Statement for the Use of Animals in Ophthalmic and Vision Research.

ZIKV infection and inhibitor treatment

ZIKV Cambodian strain FSS13025 that is phylogenetically closely related to those circulating in the Americas was produced using an infectious complementary DNA (cDNA) clone as described previously [26]. A live-attenuated ZIKV vaccine candidate that contains a 10-nucleotide deletion in the 3' untranslated region of the ZIKV genome (10-del ZIKV) was developed and produced using the FSS13025 infectious clone [25]. ZIKV (20 PFU in 10 μl PBS) or 10-del ZIKV (20 or 200 or 2000 PFU in 10 μl PBS) was injected into neonatal mice at Postnatal day (P) 0 subcutaneously. Sofosbuvir (SOF) (80 mg/kg) was injected right after ZIKV injection once every day until day 13 (P0–P7: subcutaneously; P8-P13: intraperitoneally). NITD008 (5 mg/kg) was injected right after ZIKV injection and once every other day until day 12 (P0–P6: subcutaneously; P8–P12: intraperitoneally). Vehicle (PBS with 1% DMSO) was injected into control mice. All infected mice were observed every day. The eyeballs were harvested at P5, P8, P11, P14 and P21.

Immunofluorescence staining of retinal sections

Eyeballs were fixed in 4% paraformaldehyde (PFA) for 60 min, equilibrated in 30% sucrose overnight, and embedded in OCT compound. Cryosections (10 μm) were cut through the optic nerve, post-fixed with 4% PFA for 10 min, rinsed with PBS, permeabilized with

PBS containing 0.1% Triton X-100 for 15 min at room temperature, and blocked with PowerBlock (BiogenX, San Ramon, CA) for 1 h at room temperature. Next, sections were probed with primary antibodies against calbindin (1:1000, ab82812, Abcam, Cambridge, MA), CD31 (1:1000. 553369, BD Biosciences, San Jose, CA), cleaved-caspase3 (1:400, 9661, Cell signaling, Danvers, MA), cone-arrestin (1:5000, AB15282, MilliporeSigma, Burlington, MA), Dab1 (1:3000, 18936, Rockland, Pottstown, PA), GFAP (1:500, Z033401-2, Agilent Technologies, Santa Clara, CA), glutamine synthetase (1:1000, MAB302, MilliporeSigma), PKCα (1:500, P5704, MilliporeSigma), pRIP3 (1:1000, 205421, Abcam), rhodopsin (1:2000, sc-57432, Santa Cruz Biotechnology, Santa Cruz, CA) and ZIKV antibody (1:500, NBP2-52666, Novus Biologicals, Littleton, CO) overnight at 4 °C. After washing with PBS, sections were incubated with appropriate secondary antibodies for 1 h and mounted with medium containing DAPI (Abcam) or nuclei were counterstained with propidium iodide (PI; ThermoFisher Scientific, Waltham, MA). Images were taken with confocal microscopy (LSM 800, Carl Zeiss, Inc., Thornwood, NY).

Immunostaining of retinal whole-mounts

Eyes were enucleated and fixed in 4% PFA at 4 °C overnight. Next day, retinas were dissected, washed with PBS, blocked and permeabilized with PBS containing 5% normal goat serum and 0.3% Triton X-100 for 3 h at room temperature. Retinas were then incubated with isolectin B4 (ThermoFisher Scientific) or primary antibodies against Iba1 (1:200, 019–19741, FUJIFILM Wako Chemicals, Richmond, VA), Tuj1 (1:400, 801202, BioLegend, San Diego, CA), RBPMs (1:200, ABN1376 (guinea pig) or ABN1362 (rabbit), MilliporeSigma), CD31 (1:200), CD45 (1:400, 550539, BD Biosciences) and GFAP (1:500) overnight at 4 °C. Subsequently, retinas were washed with PBS and then incubated with appropriate secondary antibodies at 4 °C for 4 h. Finally, retinas were mounted with aqua-mount medium (ThermoFisher Scientific), and images were captured with confocal microscopy.

Hematoxylin and Eosin (H&E) staining

After fixation, retinal frozen sections were immersed into hematoxylin for 5 min followed by washing in double distilled water (ddH_2O). Slides were then dipped in 0.5% Eosin for 45 s, washed in ddH_2O, dehydrated in graded ethanol and vitrified by xylene. Slides were mounted with Permount mounting medium (ThermoFisher Scientific). Images were captured by a digital camera in a bright field microscope (Leica Camera Inc., Allendale, NJ) for retinal structure.

Real-time quantitative PCR

Retinas were collected at P5 or P8 from control and ZIKV-infected mice. Total retinal mRNA was isolated using miRNeasy Mini Kit (Qiagen, Germantown, MD), quantified using NanoDrop (ThermoFisher Scientific), and converted to cDNA using High-Capacity cDNA Reverse Transcription Kit (ThermoFisher Scientific). Quantitative PCR was performed with SYBR Green Master Mix (Applied Biosystems, Waltham, MA) using a PCR system (StepOnePlus; Applied Biosystems). Primer sequences for mouse transcripts were as follows: Hprt For-5′-GAA AGA CTT GCT CGA GAT GTC ATG-3′; Hprt Rev-5′-CAC ACA GAG GGC CAC AAT GT-3′; ZIKV prM gene For-5′-GAG AGC GAG GAA CAT CCA GAC T-3′; ZIKV prM gene Rev-5′-CCT GAA GTT CCT GCT GGG TAG T-3′. Inflammatory genes: CXCL10 For-5′-GGA CGG TCC GCT GCA A-3′; CXCL10 Rev-5′-CCC TAT GGC CCT CAT TCT CA-3′; MCP1 For-5′-GGC TCA GCC AGA TGC AGT TAA-3′; MCP1 Rev-5′-CCT ACT CAT TGG GAT CAT CTT GCT-3; ICAM-1 For-5′-CAG TCC GCT GTG CTT TGA GA-3′; ICAM-1Rev-5′-CGG AAA CGA ATA CAC GGT GAT-3′; IL-1β For-5′-AGT TGA CGG ACC CCA AAA GA-3′; Il-1β Rev-5′-GGA CAG CCC AGG TCA AAG G-3′; IL-6 For-5′-CCA CGG CCT TCC CTA CTT C-3′; IL-6 Rev-5′-TTG GGA GTG GTA TCC TCT GTG A-3′; iNos For-5′-GGC AGC CTG TGA GAC CTT TG-3′; iNos Rev-5′-TGC ATT GGA AGT GAA GCG TTT-3′; TNFα For-5′-GGT CCC CAA AGG GAT GAG AA-3′; TNFα Rev-5′-TGA GGG TCT GGG CCA TAG AA-3′; VCAM-1 For-5′-ACA AGT CTA CAT CTC TCC CAG GAA TAC-3′; VCAM-1 Rev-5′-CAC AGC ACC ACC CTC TTG AA-3′. ER stress genes: GRP78 For-5′-ACT TGG GGA CCA CCT ATT CCT-3′; GRP78 Rev-5′-ATC GCC AAT CAG ACG CTC C-3′; XBP1s For-5′-TGC TGA GTC CGC AGC AGG TG-3′; XBP1s Rev-5′-GCT GGC AGG CTC TGG GGA AG-3′; ATF4 For-5′-TCC TGA ACA GCG AAG TGT TG-3′; ATF4 Rev-5′-ACC CAT GAG GTT TCA AGT GC-3′; CHOP For-5′-CTG GAA GCC TGG TAT GAG GAT-3′; CHOP Rev-5′-CAG GGT CAA GAG TAG TGA AGG T-3′; ATF6 For-5′-TGC CTT GGG AGT CAG ACC TAT-3′; ATF6 Rev-5′-GCT GAG TTG AAG AAC ACG AGT C-3′. Data were normalized to internal control Hprt and the fold difference in different transcripts was calculated by the ΔΔCT method.

Fluorescence in situ hybridization (FISH) using RNAscope technology

Eyeballs were fixed in 4% PFA for 60 min, equilibrated in 30% sucrose overnight, and embedded in OCT compound. Cryosections (10 μm) were cut through the

optic nerve. Then retinal sections were boiled in the target retrieval reagent (Cat #322000, Advanced Cell Diagnostics, Hayward, CA); and protease digestion was performed using protease 3 (Cat #322337, Advanced Cell Diagnostics). Next, the tissue slides were immediately rinsed with water and incubated with Zika probe (Cat #467771, Advanced Cell Diagnostics) targeting JN860885.1, and then hybridized with the signal amplification reagents of RNAscope Fluorescent Multiplex detection kit (Advanced Cell Diagnostics) following the manufacturer's instructions. At the last step, sections were counterstained with DAPI to label nuclei, and images were taken by confocal microscopy.

Statistical analysis

Statistical analysis was conducted using GraphPad Prism program (GraphPad Software, Version 8.0, La Jolla, CA). Results were presented as mean ± standard error of mean (SEM) and analyzed by Student's t-test. A P value < 0.05 was considered statistically significant.

Results

ZIKV infection induces retinal neuronal loss and glial disruption and activation

To develop a simple and reproducible animal model of ZIKV, we inoculated ZIKV (20 plaque-forming units (PFU)) into neonatal C57BL/6J mice at P0 subcutaneously (Fig. 1a) and observed mouse behavior afterwards until P21. We found that ZIKV-infected mice exhibited less movement, tremors and bilateral hind limb paralysis. They had significantly reduced body weight, body length and head length compared to age-matched uninfected mice (Fig. 1b).

To test whether retinal pathology occurs in mice infected with ZIKV, we stained retinal sections from ZIKV-infected and control mice at P21 by H&E and examined their structures (Fig. 1c). In control group, all retinal layers were intact and noted with dense ganglion cell layer (GCL), inner nuclear layer (INL) and outer nuclear layer (ONL), which were separated by two plexiform layers (inner plexiform layer (IPL) and outer plexiform layer (OPL). However, the retinas of ZIKV-infected mice exhibited greatly reduced total retinal thickness with few GCL cells, attenuated INL and almost disappeared IPL and OPL (Fig. 1c).

To further define the morphological alterations in the retinas of ZIKV-infected mice (Fig. 2a), we performed immunohistochemical staining with antibodies against retinal cell specific markers. In the outer retinas of ZIKV-infected mice, the expression of rhodopsin, the marker for rod photoreceptor cells, showed an apparent decline in immunointensity compared with control retinas (Fig. 2b, g). Moreover, cone photoreceptor cells, evaluated by the staining with antibody against cone arrestin, distributed evenly throughout the retina in control group. In comparison, cone arrestin staining was aberrant, and the number and length of cone photoreceptor cells were significantly decreased in ZIKV-infected retinas (Fig. 2c, h).

We also evaluated alternations of horizontal cells, amacrine cells and rod bipolar cells, which are intermediate neurons connecting photoreceptors and retinal ganglion cells (RGCs), with antibodies against calbindin, Dab1 and PKCα, respectively. We observed that the horizontal cell bodies were located in the INL of control retinas, but they were largely decreased in ZIKV-infected retinas (Fig. 2d, i). Similarly, Dab1, the marker for amacrine cells that contribute to vertical communication within the retina, was expressed in the retinal INL in control mice, whereas it was barely found in ZIKV-infected mice (Fig. 2e, j). Rod bipolar cells are responsible for transmitting signals from photoreceptors to RGCs. In control retina, PKCα was expressed in rod bipolar cell bodies and axon terminals which reach the border between the IPL and GCL. But less rod bipolar cell bodies and axon terminals, and shorter axons were found in ZIKV-infected retinas (Fig. 2f, k).

RGCs are the only output neurons of the retina which collect visual information and send it to the brain through their axons. To further investigate whether RGCs were affected by ZIKV infection, we used Tuj1 antibody, a marker for RGCs in the retina to stain retinal flatmounts from two groups of mice at P21. We found that the number of RGCs and the diameter of axons in the peripheral, middle and central area of the retina were dramatically decreased in ZIKV-infected mice compared to control mice (Fig. 2l). These results indicate all retinal neurons undergo significant loss during ZIKV infection.

Retinal glial cells, which include both Müller cells and astrocytes, are crucial for maintaining normal function of the retina. To assess their changes in the retina after ZIKV infection, we stained retinal flatmounts or sections with antibody against-GFAP, a marker for astrocytes and gliosis, or antibody against-glutamine synthetase (GS), which is expressed in Müller cells and their processes. We observed that the astrocyte network, which serves as a template for angiogenesis and maintains vascular integrity [21], was disorganized and astrocyte gliosis was dramatically increased (Fig. 3a, b). Moreover, GFAP level was dramatically increased in Müller cells (Fig. 3b), which were GS-positive and became shorter with abnormal morphology in ZIKV-infected retinas (Fig. 3c).

These results indicate that ZIKV infection at P0 leads to thinning and aberrant retinal structure and marked loss of retinal neurons, associated with the disruption of astrocyte network and gliosis.

ZIKV infection elicits loss of retinal vasculature and increase in inflammation

To further characterize the influence of ZIKV on retinal vasculature, we stained ZIKV-infected and control retinas with antibody for endothelial cell marker CD31 at P21. In control mice, the inner retinal vasculature had developed into three layers: the superficial, intermediate and deep layers at P21. In contrast, only the superficial layer of vasculature was observed in retinal section of ZIKV-infected mice (Fig. 3d, upper panel). Moreover, vessel density was greatly decreased while large avascular area was observed in the superficial layer of

ZIKV-infected retinas (Fig. 3d, middle and lower panels), suggesting ZIKV infection either inhibits vessel development or induces vessel degeneration.

Immune response and inflammatory cascade play an important role in retinal pathology. Therefore, we further investigated whether ZIKV could cause inflammatory immune response in mice retina. Whole-mount retinas were stained with antibody against CD45, which was expressed on leukocytes. In control group, there were few leukocytes. However, CD45-positive cells were abundant in ZIKV-infected retinas, suggesting ZIKV infection increases leukocyte infiltration in the retina (Fig. 3e). In addition to leukocytes from circulation, microglia play an important role in retinal inflammation by functioning as resident innate immune cells. We subsequently investigated changes of microglia in retinal flatmounts by labeling them with anti-Iba1 antibody. While microglia were sparsely distributed and exhibited a highly ramified morphology (resting state) in control retinas, ZIKV-infected retinas showed massive amount of microglia with retracted processes and amoeboid soma (activated state) [23] (Fig. 3f).

Overall, these data indicate that ZIKV infection can cause a severe vascular phenotype with prominently reduced vascular coverage and vessel density, accompanied with increased inflammation in the retina.

ZIKV induces progressive retinal degeneration and inflammation

To determine the onset of ZIKV-induced retinopathy in our mouse model, we collected samples from ZIKV-infected and control mice at P5, P8, P11 and P14, respectively. ZIKV RNA was detected in 50% of P5 retinas and all P8 retinas, and its average level in P8 retinas was more than 1000-fold higher than that in P5 retinas (Fig. 4a), suggesting P5 was a very early stage when ZIKV entered retinas. Analysis of ZIKV RNA by RNAscope and protein by a pan flavivirus antibody (4G2) revealed

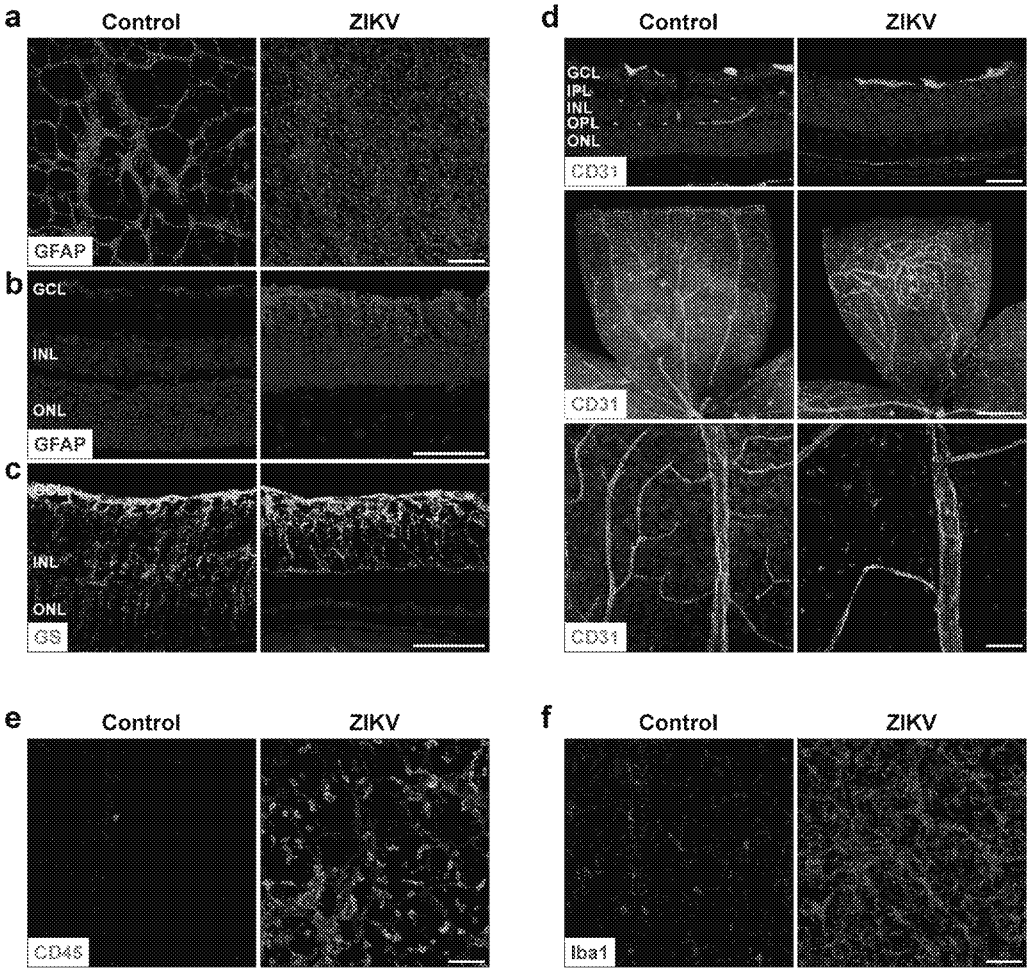

Fig. 3 ZIKV infection induces retinal gliosis, vessel impairment and inflammation. ZIKV was injected into neonatal mice at P0 and retinas were collected at P21. **a**, **b** Representative images of GFAP staining in retinal flatmounts and sections. **c** Representative images of glutamine synthetase (GS) staining in retinal sections. **d** CD31 staining for vasculature in retinal sections (upper panel) and flatmounts (middle and lower panels). **e** CD45 staining for leukocytes. **f** Iba1 staining for microglia. that ZIKV-infected cells were mainly present in the GCL and INL at P8 (Fig. 4b, c). Morphologically, at P5, there was no evident difference in retinal thickness (Additional file 1: Fig. S1a), vascular area and vessel density (Additional file 1: Fig. S1b), the number and morphology of RGCs and their axons (Additional file 1: Fig. S1c, S1d and S1g), astrocyte network (Additional file 1: Fig. S1e), and the number of leucocytes (Additional file 1: Fig. S1f and S1h) between ZIKV-infected and control mice. At P8, retinal thickness (Fig. 5a), vascular area and vessel density (Fig. 5b) and astrocyte network (Fig. 5e) were indistinguishable in control and ZIKV-infected retinas. However, a close examination revealed that abnormal neovascular tufts (Fig. 5b, lower panel), increased microglia with activated morphology (Fig. 5f and i) and many leukocytes ($CD45^+$ cells) (Fig. 5g and j) were present in ZIKV-infected retinas. Moreover, although no significant difference was observed in the number and morphology of RGCs and their axons (Fig. 5c, d and h), there was a slight trend toward reduced RGCs.

At P11, vessel density was significantly decreased accompanied with microvessel enlargement (Additional file 1: Fig. S2a), and prominent loss of RGC and their axons were observed in ZIKV-infected retinas (Additional file 1: Fig. S2b). As time went on, ZIKV-infected mice turned to be weaker with unsteady gait and mild ataxia at P14. At this time point, retinal morphological changes were much similar to what occurred at P21 (Fig. 6). The thickness of total retina, IPL and INL was all significantly decreased (Fig. 6a).

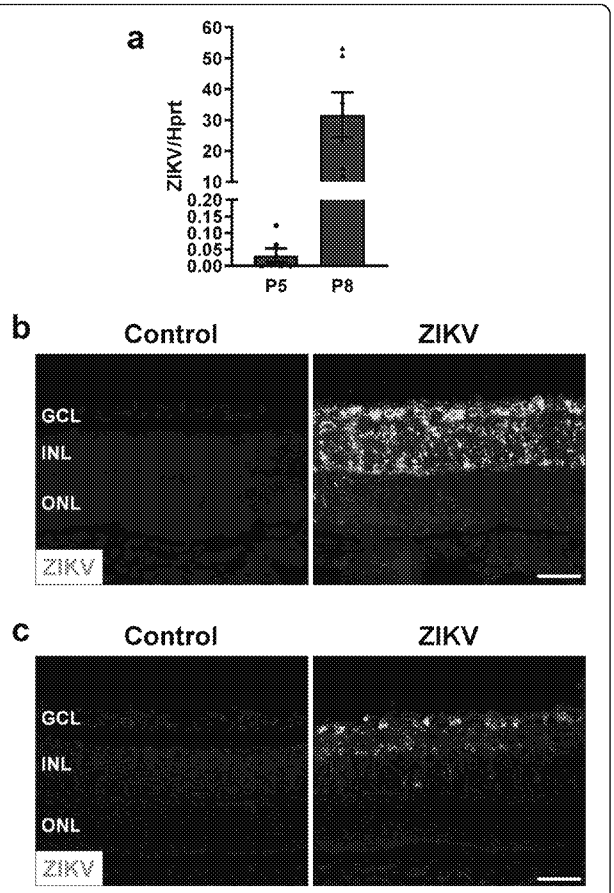

Fig. 4 ZIKV expression in the retina. ZIKV was injected into neonatal mice at P0 and retinas were collected at P5 and P8. **a** Viral RNA in the retinas was detected by qPCR. n = 6 per group. **b** Zika viral RNA in retinal sections was assessed by FISH at P8. **c** ZIKV protein expression was examined by immunostaining with a pan flavivirus antibody (4G2) at P8. n = 3 per group

Vascular density was further decreased (Fig. 6b), RGCs and their axons were largely diminished (Fig. 6c) and astrocyte network was disrupted (Fig. 6d), associated with exacerbated microglial recruitment and activation (Fig. 6e) and leukocyte infiltration (Fig. 6f). These results indicate that ZIKV induces progressive retinal degeneration and inflammation from P8 although it does not affect initial vascular development and formation of retinal layers.

Potential mechanisms of ZIKV-induced retinal degeneration

Excessive or uncontrolled inflammation and endoplasmic reticulum (ER) stress are key mediators for cell death [13]. To determine the potential mechanisms of ZIKV-induced retinal degeneration, we analyzed retinal inflammation and ER stress in P8 retinas (Fig. 7a and b). We found that levels of several key inflammatory molecules including chemokines (CCL2 and CXCL10), pro-inflammatory cytokines (TNFα, IL-1β and IL-6), adhesion molecules (ICAM-1 and VCAM-1) and iNOS were all increased 1.6–1300 folds in ZIKV-infected retinas. Similarly, key molecules involved in ER stress, including XBP1s, GRP78 and CHOP, were significantly increased. Associated with increases in inflammation and ER stress, analysis of cleaved caspase 3, a marker for apoptosis, and phosphorylated receptor-interacting protein 3 (pRIP3), a marker for necroptosis, revealed that both cleaved caspase 3 and pRIP3 were significantly increased in ZIKV-infected retinas in which cleaved caspase 3-positive cells were mainly localized in the INL whereas pRIP3-positive cells were mainly located in the GCL and IPL (Fig. 7c). These results suggest that ZIKV-induced retinal degeneration may involve inflammation and ER stress-mediated cell apoptosis and necroptosis.

Evaluation of the drug efficacy in the model of ZIKV-induced retinopathy

Having established and characterized this mouse model of ZIKV-induced retinopathy, we assessed whether it could be used for drug discovery. Recent studies have showed that antiviral agent sofosbuvir (SOF; a clinically approved drug for hepatitis C virus) could reduce ZIKV viral load [2, 10], therefore we tested if SOF can inhibit ZIKV-induced retinal degeneration. P0 pups were infected with ZIKV, followed by administration of SOF (80 mg/kg) or vehicle control every day until P13. At P14 when ZIKV-induced retinal degeneration was evident, we examined ZIKV-induced retinal alternations. We found that there was significant variation in SOF-treated pups in which SOF only successfully blocked ZIKV-induced retinal degeneration in 44% pups (Table 1 and Additional file 1: Fig. S3), suggesting SOF is not a sufficient inhibitor for ZIKV infection. NITD008 is a selective flavivirus inhibitor that shows potent efficacy against ZIKV infection [7, 35]. We administered NITD008 (an adenosine analog, 5 mg/kg) or vehicle control right after ZIKV injection and once every other day until day 12, and found that all NITD008-treated ZIKV-infected mice exhibited normal retinal structure which was comparable with non-infected mice (Table 1 and Fig. 8a). Moreover, NITD008 treatment blocked ZIKV-induced degeneration of retinal vasculature (Fig. 8b) and RGCs (Fig. 8c), and gliosis and inflammation (Fig. 8d–f). Collectively, these results indicate that our model can be used to evaluate drug efficacy and NITD008 is an effective candidate to treat ZIKV-induced retinopathy.

Evaluation of the safety of ZIKV vaccine candidate

There is currently no licensed human vaccine for ZIKV, but several vaccine candidates have been developed

and evaluated in preclinical and clinical studies [27]. We tested whether our mouse model can be used to evaluate the safely of ZIKV vaccine candidates. We chose to evaluate a live-attenuated ZIKV vaccine with a 3'UTR deletion (10-del ZIKV) [25] in the current model. After subcutaneously inoculating the live-attenuated ZIKV vaccine (20, 200, or 2000 PFU) into neonatal C57BL/6 mice at P0 and collecting retinas at P21, we found the low dose had no effect on retinal structure, but medium and high doses of vaccine candidate caused retinal pathology at rates of 50% and 87.5% respectively (Table 2). The retinas with abnormality exhibited decreased retinal thickness (Fig. 9a), reduced vasculature (Fig. 9b), loss of RGCs (Fig. 9c), and/or increased gliosis (Fig. 9d) and microglial activation and leukocyte infiltration (Fig. 9e and f) as seen in ZIKV-infected WT retinas. These data suggest that this live-attenuated ZIKV vaccine may potentially induce retinal degeneration if non-optimal dose was provided during pregnancy.

Discussion

Mouse models have been widely used in biomedical research due to low-cost maintenance, a short reproductive cycle and easy genetic modification. In this study, we developed a novel and reproducible model of ZIKV-induced retinopathy using immunocompetent C57BL/6 mice. We demonstrated that P0 pups inoculated with ZIKV developed significant loss of RGCs and their axons, and retinal thinning during growing-up, which recapitulates a series of clinical features reflecting retinal neuronal and axonal degeneration when using non-invasive imaging to examine infants with Congenital Zika Syndrome, including neurosensory retinal thinning, discontinuation of the photoreceptor inner and outer segment junction, and optic nerve hypoplasia [33]. Moreover, retinal pathologic changes and the severity of retinal neuronal degeneration in our model are comparable to those when mice are infected at E13.5 and E15 via intra-amniotic injection with ZIKV [6, 29] though it is much easier to infect neonatal mice by subcutaneous injection of ZIKV, which brings virus to the retina via blood circulation, similar to what occurs following intra-amniotic injection. Clinically, among completed pregnancies with positive nucleic acid tests confirming ZIKV infection identified in the first, second, and third trimesters, CDC's analysis demonstrated the percentage of fetuses or infants with possible Zika-associated birth defects was 8%, 5%, and 4%, respectively [28]; another study of pregnancy outcomes after ZIKV infection in French Territories in the Americas also found that neurologic and ocular defects were 12.7%, 3.6% and 5.3%, respectively [14]. Therefore, our model is disease-relevant since pups are infected with ZIKV at a time point equivalent to human retinal development in the third trimester when ZIKV infection could still cause birth defects.

In addition to neurodegeneration, we found dramatic decreases of retinal vascular coverage and density in ZIKV-infected retinas. While ZIKV-induced neuronal damage is well appreciated in the brain and retina, the impact of ZIKV on vessels is largely unknown although a few in vitro studies demonstrate ZIKV could infect and replicate in endothelial cells, break down endothelial barriers and impair endothelial cell lipid homeostasis [17, 20, 22, 37], and Garcez et al. reported reduction in the vasculature density and vessel branching in the brain from IFN-deficient mouse with congenital ZIKV infection and reduced retinal vascular network was displayed in one image of this article [12]. Our study represents the first one to investigate ZIKV-induced retinal vasculature changes in detail. Unlike Garcez et al.'s study suggesting that the reduction of vasculature is caused by perturbation of vascular development by ZIKV [12], we found that initial retinal vascular development at P5 and P8 after ZIKV inoculation was not retarded although vascular tufts were noticed at P8. From P11 to P21, progressive reduction of vascular network was observed and large avascular area in the retina was found at P21, associated with extensive alterations in astrocyte morphology and disruption of its network that is usually in line with vasculature and supports vessels. These data suggest that ZIKV indeed induces significant retinal vascular degeneration in addition to possible perturbation of vascular development.

Of note, significant changes in vasculature are also found in infants with congenital Zika syndrome. In one study using OCT to examine retinal abnormalities, vessels appear very sparse and thin in some fundus

(See figure on next page.)

photography images [33]. In another study using fluorescein angiography to evaluate retinal vasculature changes, diffuse avascularity of the peripheral retina, retinal vessels rectification, abnormal arteriovenous shunts, and vascular attenuation, leakage and tuft are observed [32]. These observations further support that our model is clinically relevant.

Using this model, we performed studies with drug and vaccine discovery. We evaluated the therapeutic effects of two potential ZIKV antiviral compounds. While the administration of sofosbuvir at 20–33 mg/kg/day was shown to increase survival rate and prevent body weight loss in Swiss mice infected with ZIKV (i.p., 2×10^7 PFU) at P3 [10] and in anti-IFNAR1 antibody-treated C57BL/6J mice infected with ZIKV (s.c., 10^5 PFU) at 5 weeks of age [2], sofosbuvir at 80 mg/kg/day in our model only exhibited protection in a portion of mice. In contrast, adenosine analog NITD008 which exhibits potential antiviral activity against several Flaviviruses including ZIKV [7] potently prevented ZIKV-induced retinal neuronal and

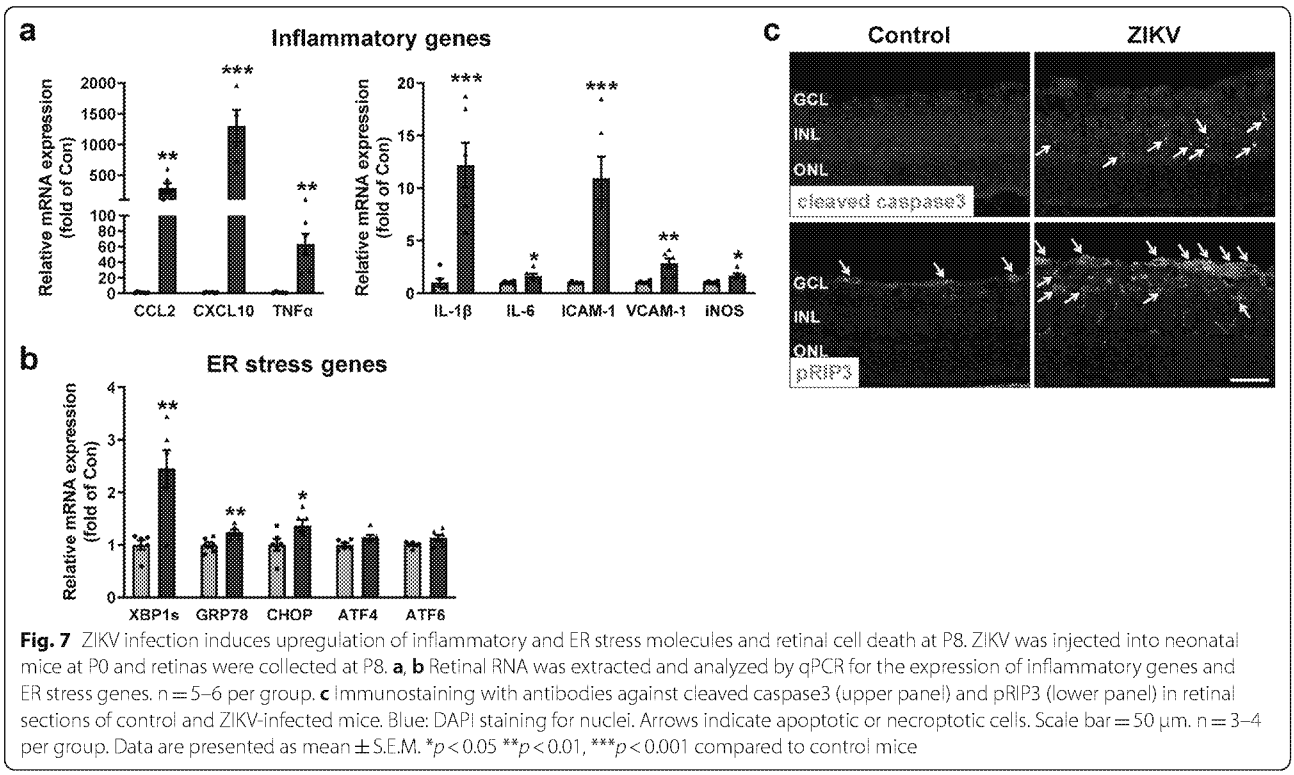

Fig. 7 ZIKV infection induces upregulation of inflammatory and ER stress molecules and retinal cell death at P8. Data are presented as mean ± S.E.M. *$p < 0.05$ **$p < 0.01$, ***$p < 0.001$ compared to control mice

Table 1 Comparison of the efficacy of SOF and NITD008 against ZIKV-induced retinal pathology

Inhibitor	ZIKV-infected mice with inhibitor	Mice with normal retinas	Inhibition rate (%)
SOF	9	4	44
NITD008	12	12	100

ZIKV was injected into neonatal mice at P0, followed by SOF or NITD008 treatment, and retinas were collected at P14 and compared for abnormalities

vascular degeneration and inflammation at 5 mg/kg once every other day. The different effects between NITD008 and sofosbuvir are consistent with their in vitro efficacies in which NITD008 inhibits ZIKV in Vero cells with an IC50 of less than 1 μM whereas sofosbuvir inhibits ZIKV in Huh7 cells with an IC50 around 4 μM but has no effects in Vero and A549 cells even at 50 μM [19]. Therefore NITD008 is a more effective candidate than sofosbuvir against ZIKV-induced retinal pathology and warrants to further investigate the efficacy of this compound against ZIKV in pre-clinical and clinical studies. In addition, we investigated the safety of a live-attenuated ZIKV vaccine candidate (10-del ZIKV) [25]. While 10-del ZIKV does not cause mortality when it is intracranially inoculated into P1 CD-1 mice at 1000 times of lethal infectious focus units of wild-type ZIKV [25], it induced retinal abnormality in this model though at much attenuated effects compared to wild-type ZIKV. Therefore, precautions and further optimization of the candidate vaccine are needed to achieve better safety when it is given to pregnant women. Altogether, these studies indicate this model is a sensitive one for drug and vaccine discovery. It has clinically relevant features and can provide additional information which other models may have overlooked.

At present, the mechanisms underlying ZIKV-induced retinal degeneration remains to be elucidated. By analyzing retinal changes at different time points after ZIKV infection, we found retinal neural and vascular development appeared normal at P5 and P8 but expressions of genes involved in inflammation and ER stress were significantly upregulated in P8 retinas of ZIKV-infected pups. Considering inflammation and ER stress play key roles in cell death, it is possible that they are partially involved in ZIKV-induced increases in retinal cell apoptosis and necroptosis at P8 and subsequent progress of retinal degeneration from P11 to P21. Further studies to modulate these two pathways and determine their effects on ZIKV-induced retinopathy are needed to test this possibility. Moreover, an integrated approach with single-cell and omics technologies would often provide better insights on this process. One advantage of our model is that it is easier to study molecular mechanisms with genetically modified mice than the model with intra-amniotic injection since transgenic mice often have lower

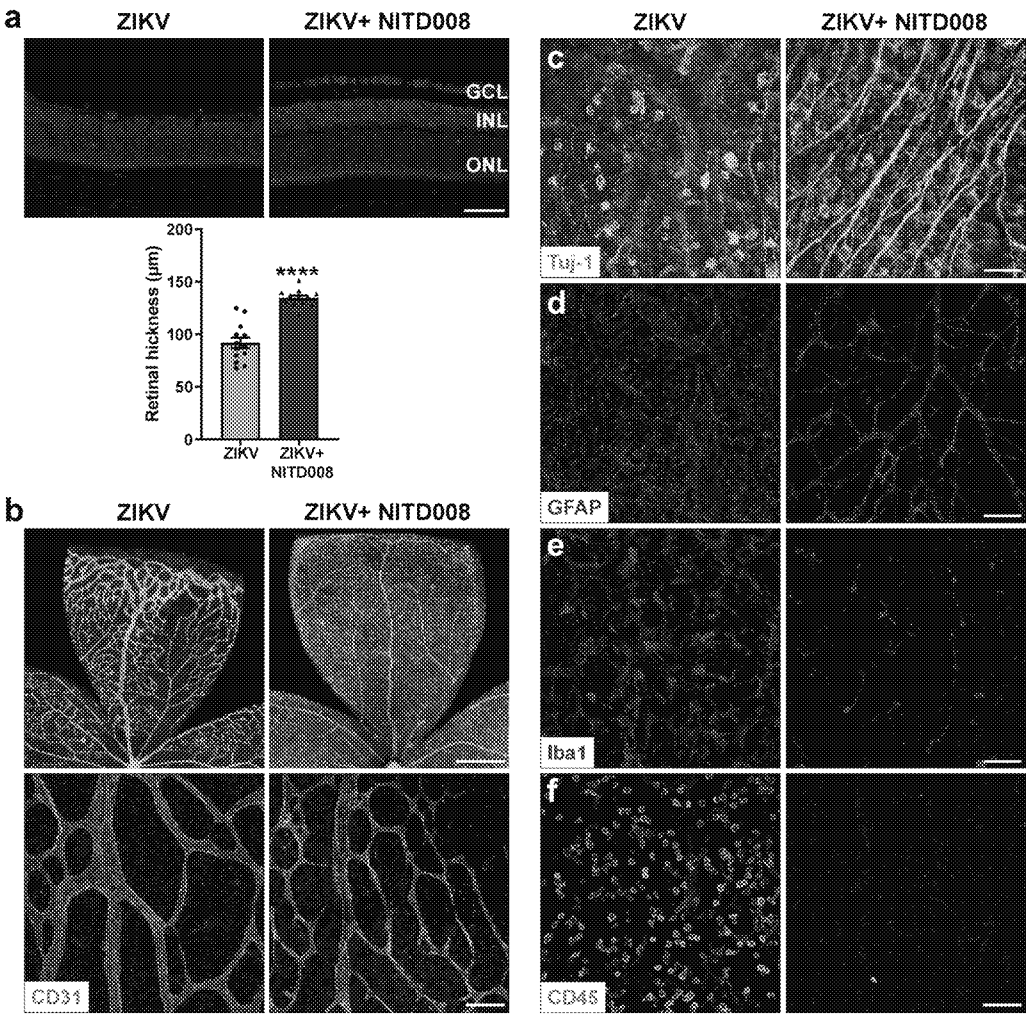

Fig. 8 NITD008 treatment blocks ZIKV-induced retinal abnormalities. ZIKV was injected into neonatal mice at P0, followed by NITD008 treatment right after ZIKV infection and every other day until day 12, and retinas were collected at P14. **a** Representative images of PI-stained retinal sections at P14. Graph represents the thickness of total retina from GCL to ONL. n = 12–13 per group. **b** Representative images of retinal flatmounts labeled with CD31 (green) for vasculature. **c**–**f** Representative images of retinal flatmounts labeled with anti-Tuj1 for RGCs, anti-GFAP for astrocytes, anti-Iba1 for microglia, and anti-CD45 for leukocytes. n = 4–8 per group. Scale bar = 50 μm except the upper panel in b where scale bar = 500 μm. Data are presented as mean ± S.E.M. ****$p < 0.0001$ compared to control mice

Table 2 The abnormal rate of the retinas after injection with ZIKV vaccine candidate

ZIKV-vaccine dose (PFU)	Total vaccinated mice	Mice with abnormal retina	Abnormal rate (%)
20	5	0	0
200	8	4	50
2000	8	7	87.5

Various dose of a live-attenuated ZIKV vaccine candidate was injected into neonatal mice at P0, and retinas were collected at P21 and compared for abnormalities

birth rates than WT mice and ZIKV infection during pregnancy could further reduce it [6, 29].

Conclusions

In summary, we developed an easily inducible, reproducible and clinic-relevant mouse model of ZIKV-induced retinopathy. Using this model, we provided the first evidence that retinal vessels similar to neurons underwent progressive degeneration after ZIKV infection, and inflammation, ER stress, apoptosis and necroptosis may be potentially involved in this process. Moreover, we demonstrated the feasibility of using this model in drug discovery and vaccine safety evaluation and found that

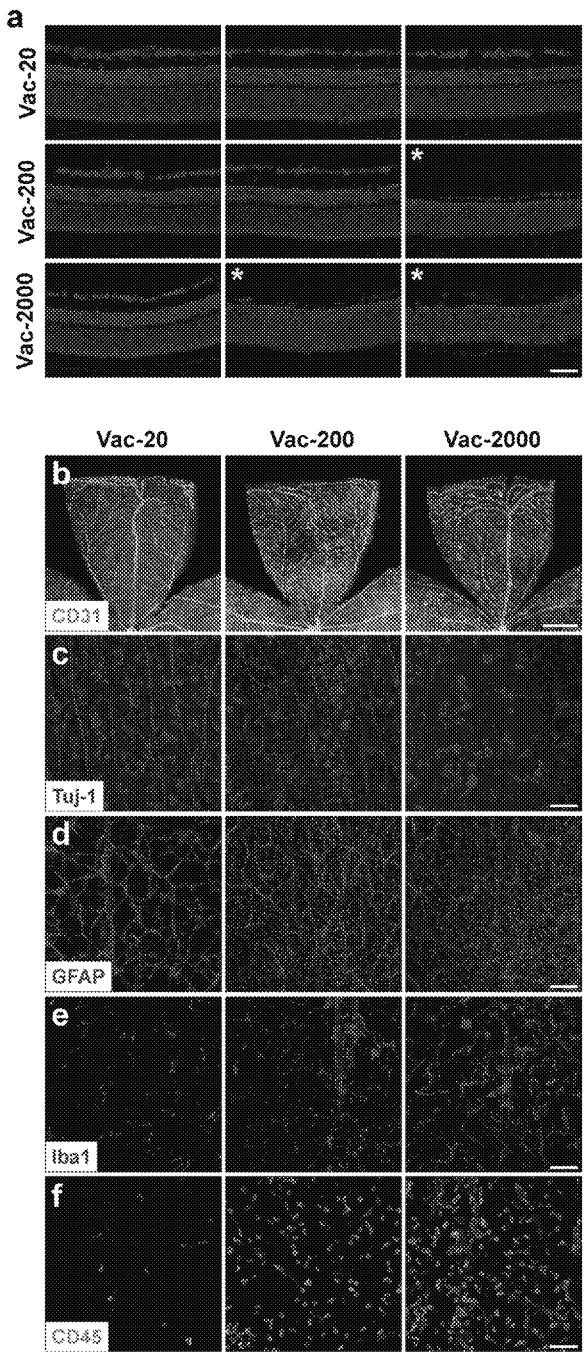

Fig. 9 The effects of live attenuated ZIKV vaccine candidate on retina. Various dose of a live-attenuated ZIKV vaccine candidate (Vac-20 or 200 or 2000 PFU) was subcutaneously injected into neonatal mice at P0 and retinas were collected at P21. **a** Representative images of PI-stained retinal sections. Stars indicate retinal samples with decreased thickness. **b**–**f** Representative images of retinal flatmounts labeled with anti-CD31 for vessels, anti-Tuj1 for RGCs and their axons, anti-GFAP for astrocytes, anti-Iba1 for microglia, and anti-CD45 for leukocytes. Scale bar = 50 μm except b where scale bar = 500 μm. n = 5 for Vac-20; n = 8 for Vac-200 and Vac-2000

NITD008 is a better drug candidate than sofosbuvir in treating ZIKV-induced retinopathy.

Subject: Hoping to help

Dear Chao,
We've just read your article published in Proceedings of the National Academy of Sciences of the United States of America (http://www.ncbi.nlm.nih.gov/pubmed/32747564), and, first of all, congrats, it's very interesting. We are writing to the email we found in affiliation.
We are contacting to present you our services. We are known by our ehealth products like websites, big data, machine learning, Gsuite (e.g. automate pdf report creation from google sheets), etc, but today we want to offer you a service to help you in the social media field for researchers, especially twitter. Every time more scientists ask us about managing his/her online profile, marketing is also coming to our field... We are data scientist.
We can help to improve your social presence. I hope you think we can help you, it would be a pleasure. Just answer and we can discuss by email o teleconference.
Kind regards,
onmedic team
onmedic.com

Subject: WHO working group on COVID-19 assays

Dear All,

Please find below the agenda for our group call on Wednesday December 2, 2020 at 2:30PM CET (Geneva time).

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays

1. Jilian Sacks, FIND – Assessment of serologic assays
2. Paul Bieniasz, Rockefeller – Coronavirus neutralizing antibodies before and after SARS-CoV-2 infection

Dear Dr. Shi and Dr. Shan,

Based on the reasoning provided, Steve obtained approval to proceed with these changes. We will update your article as requested and approve the revised proof for publication on your behalf.

Thank you,

Dani

Subject: RE: PNAS MS# 2020-05722R Publication Update

Hi Pei-Yong,

Please confirm that the new change swaps the positions and letters for affiliations a and b, but no author affiliations are changed (only letters).

I will check with the editorial office to see if an exception can be made, but I want to be sure that I understand the details.

Thank you.

Hi Steve,

Could you help to make a change for the paper "**A Zika virus envelope mutation preceding the 2015 epidemic enhances virulence and fitness for transmission**," 2020-05722R?

We would like to switch the affiliation order between a and b (see attachment). Could you help on this?

Many thanks for your help.

Best,
Chao

Subject: PNAS MS# 2020-05722R Publication Update

Dear Dr. Shi,

PNAS has scheduled publication of your article, "**A Zika virus envelope mutation preceding the 2015 epidemic enhances virulence and fitness for transmission**," 2020-05722R, in Latest Articles the week of August 3, 2020. Your article may publish in Latest Articles any day during that week. The Latest Articles publication date is the official date of record.

PNAS will not publish your article until the production vendor, Sheridan Journal Services, has incorporated the changes you made on the proofs. If you have requested a second set of proofs, your article will not publish until you have reviewed the edits. If you have questions about proofs, please contact (PNAS_Specialist.djs@sheridan.com).

The press embargo on your article will lift on August 3, 2020 at 3:00 PM U.S. Eastern time. The embargo date is the earliest possible date that your article can publish. Embargoed copies of your accepted article will be available to journalists starting Wednesday, July 29, 2020, on a secure reporters-only web site. Should you or your institution's public relations office have any press- or embargo-related questions, please contact the PNAS News Office at pnasnews@nas.edu or 202-334-1310.

Public Information Officers (PIOs) and authors may post an embargoed press release to EurekAlert! as early as 2:00 PM US ET the Wednesday afternoon before the embargo lifts. Embargo information must be noted in ALL CAPS at the top of the press release. Authors and press officers are responsible for ensuring that embargoed press releases are not published, broadcast, or posted online in any form in the public domain, including any open access site, prior to the embargo date and time. Failure to comply with the PNAS embargo policy may result in author sanctions.

PNAS provides journalists with access to embargoed content through EurekAlert!. Journalists should register with EurekAlert! at http://www.eurekalert.org/register.php and request access to PNAS materials. If they are already registered with EurekAlert!, they can request access to PNAS at http://www.eurekalert.org/account.php.

If you must delay publication for a special reason, please notify the PNAS News Office immediately, no later than noon US ET on Tuesday, July 28, 2020.

PNAS automatically deposits the final, published version of all its content, regardless of funding, in PubMed Central (PMC) and makes it free at both PMC and PNAS within 6 months of publication. For release immediately on publication, the open access surcharge is $1,300 for authors from institutions with a site license/open access membership. For more information, please see our editorial (https://www.pnas.org/cgi/content/full/102/15/5303). For information about the PNAS open access option, including fees and license details, please visit https://www.pnas.org/page/subscriptions/open-access.

Best regards,

主题: Nature 2020-12-22159 out to review; possible response required

Dear Professor Chen,

Thank you for submitting your manuscript entitled "Glucagon-like peptide-2 receptor is a receptor for tick-borne encephalitis virus to infect nerve cells" to Nature. I am pleased to tell you that we are sending your paper out for review. (I apologise for the delay in letting you know. The holidays and the increased submissions due to the new SARS-CoV-2 variants caused some delay.)

We are continually improving the quality of methods and statistics reporting in our papers. To that end, we now ask that two items are completed for all life sciences papers: an editorial policy checklist that verifies compliance with all required editorial policies, and a reporting summary that collates information on experimental design and reagents. Links to these checklists are found here:

Reporting summary: https://www.nature.com/authors/policies/ReportingSummary.pdf
Editorial policy checklist: https://www.nature.com/authors/policies/Policy.pdf

Please return the completed forms within 48 hours. These forms are dynamic 'smart pdfs' and must therefore be downloaded and completed in Adobe Reader (i.e. they cannot be opened in a web browser). For guidance, see http://www.nature.com/authors/policies/availability.html.

Papers containing structural data (X-ray, NMR, or cryoEM) must contain a completed standard table for such data at submission (https://www.nature.com/nature/for-authors/forms-and-declarations). In addition, both crystallographic and NMR structures (but not cryoEM structures) must now be submitted to the PDB, and a validation report provided, before the paper can be sent to referees.

The reporting summary (and validation report if appropriate) will be made available to the referees to aid in their evaluation of your work; if you have selected double-blind peer review, you should ensure that they do not contain any information that could potentially identify you.

Please note that Nature implements transparent peer review of original research manuscripts, in which we publish the

reviewer comments to the authors and author rebuttal letters as a supplementary peer review file, if the author agrees at the point of acceptance. This will apply to new manuscripts submitted on or after 1st February 2020. Upon author request, confidential information and data can be removed from the reviewer reports and rebuttal letters prior to publication. For more information, please refer to our FAQ page.

Nature is committed to improving transparency in authorship. As part of our efforts in this direction, we are now requesting that all authors identified as 'corresponding author' create and link their Open Researcher and Contributor Identifier (ORCID) with their account on the Manuscript Tracking System prior to acceptance. ORCID helps the scientific community achieve unambiguous attribution of all scholarly contributions. You can create and link your ORCID from the home page of the Manuscript Tracking System by clicking on 'Modify my Springer Nature account' and following the instructions in the link below. Please also inform all co-authors that they can add their ORCIDs to their accounts and that they must do so prior to acceptance.
https://www.springernature.com/gp/researchers/orcid/orcid-for-nature-research

For more information please visit http://www.springernature.com/orcid

If you experience problems in linking your ORCID, please contact the Platform Support Helpdesk.

Finally, we would like to inform you that on a case by case basis we coordinate a brief consultation between referees and editors after all referee reports have been received. This is to improve the peer review process and the feedback provided to authors. Referees are given the opportunity to make comments on their peers' concerns and update their reports to comment on issues raised by the other reviewers. If we feel it would be helpful, we will engage reviewers in this additional consultation with the goal of providing you with the most valuable feedback possible.

We will be in touch again as soon as we have received comments from our referees. In the meantime - the status of your manuscript can be followed in the manuscript tracking system.

Yours sincerely,

Clare Thomas
Senior Editor
Nature

* Nature Research's author and referees' website (www.nature.com/authors) contains information about and links to policies and resources.

Our flexible approach during the COVID-19 pandemic
If you need more time at any stage of the peer-review process, please do let us know. While our systems will continue to remind you of the original timelines, we aim to be as flexible as possible during the current pandemic. We are committed to processing manuscripts related to COVID-19 with our highest priority, and endeavour to expedite the peer-review process for COVID-19 submissions as much as is possible. Thank you for your understanding.

Dear all,

Happy Thanksgiving to you and your family!

It is unfortunate we could not be together to celebrate this special day. As my postdoc mentor, Alan Weiner, wrote to me today, "It may be a crazy year, but it's also a well-deserved year for you. Now everybody around the world understands what you do, how well you do it, and above all why."

Congratulations to everyone for your accomplishments! Our work has changed the world. I'm so proud of you and thankful for your dedication to our noble mission.

All the best, Pei-Yong

Dear all,

Thanks for your great contributions in the study entitled "A mutation-mediated evolutionary adaptation of Zika virus in mosquito and mammal host".
As you are reviewing the manuscript, please keep in mind the following:

1. Please confirm that your author information is correct.
2. Please feedback if there are any errors.

I would greatly appreciate it if you could give me feedback before 9 am on December 5th.

Looking forward to hearing from you.

Best regards,

Xi Yu

主题: Decision on Nature manuscript 2020-12-22159

* Please ensure you delete the link to your home page in this e-mail if you wish to forward it to your co-authors.

Dear Professor Chen

Your manuscript entitled "Glucagon-like peptide-2 receptor is a receptor for tick-borne encephalitis virus to infect nerve cells" has now been seen by 3 referees, whose comments are attached below. While they find your work of potential interest, as do we, they have raised important concerns that in our view need to be addressed before we can consider publication in Nature.

Should further experimental data allow you to address these criticisms, we would be happy to consider a revised manuscript (unless something similar has been accepted at Nature or appeared elsewhere in the meantime). To make a good case for reconsideration we feel that it would be essential, in particular, to improve the experiments pertaining to binding of TBEV to GLP2R, provide more mechanistic insight into the proposed receptor function of GLP2R and to perform the in vivo experiments using a more natural route of infection.

We are committed to providing a fair and constructive peer-review process. Please do not hesitate to contact us if there are specific requests from the reviewers that you believe are technically impossible or unlikely to yield a meaningful outcome.

Any revised manuscript should conform to our format instructions and publication (see https://www.nature.com/nature/for-authors). We would appreciate your careful attention to the following:

STATISTICS: When revising your manuscript, you should ensure that any statistical analysis used is sound and that it conforms to Nature's guidelines (https://www.nature.com/nature/for-authors/formatting-guide). A collection of articles explaining the basics of statistical analysis and advice on how to best present it can be found at https://www.nature.com/collections/qghhqm.

REPRODUCIBILITY: We ask authors to provide a Reporting Summary and Editorial Policy Checklist to improve the

quality and transparency of methods and statistical reporting (see https://www.nature.com/news/announcement-reducing-our-irreproducibility-1.12852). These should be updated to reflect the revisions made and submitted with the revised manuscript.

DATA AND CODE AVAILABILITY STATEMENTS: We strongly support public availability of data and custom code. All Nature papers must include a Data Availability Statement (DAS) and (if applicable) a Code Availability Statement (CAS) after the main text statements and before the Extended Data legends. A detailed document outlining the data availability policy, containing various DAS examples you may use or modify, can be found at https://www.nature.com/documents/nr-data-availability-statements-data-citations.pdf. For some data types, deposition in a public repository is mandatory (see https://www.nature.com/nature-research/editorial-policies/reporting-standards#availability-of-data).

EXTENDED DATA: Extended Data do not appear in the print version of the paper but are included online within the full-text HTML and at the end of the online PDF. Extended Data are an integral part of the paper, and only data that directly contribute to the main message should be included. All Extended Data must be referred to in the main text, and their legends should be listed sequentially at the end of the main text, not in the Extended Data files. The Extended Data should be assembled into a maximum of 10 A4 size, multi-panelled display items, submitted as individual files in .jpg, .tif or .eps format only. They should be of the same quality as print figures, but there are important differences in their formatting. More specific instructions are provided here: http://s3-service-broker-live-19ea8b98-4d41-4cb4-be4c-d68f4963b7dd.s3.amazonaws.com/uploads/ckeditor/attachments/7823/3h_Extended_data.pdf. We encourage authors who are describing complex processes to include a schematic
of the main finding as part of the Extended Data to aid readers unfamiliar with the immediate discipline.

SUPPLEMENTARY INFORMATION: Supplementary Information (SI) is online-only, peer-reviewed material that is essential background to the study (e.g., large data sets, more complex methods, and calculations), but which is too large or impractical, or of interest only to a few specialists, to justify inclusion in the print version of the paper (see https://www.nature.com/nature/for-authors/supp-info for further details). While SI should not typically contain data figures (any figures additional to those appearing in the main text should be formatted as Extended Data), we require that the raw, uncropped data for gels be presented as an SI figure (see below). Tables may be included in SI, but only if they are unsuitable for formatting as Extended Data (e.g., tables containing large data sets or raw data tables that are best suited to Excel files). If a manuscript has SI, each discrete item of the SI (e.g., videos, tables) must be referred to at an appropriate point in the main manuscript.

SOURCE DATA (GRAPHS): To increase transparency, we strongly encourage you to provide, in spreadsheet form, the data underlying the graphical representations used in figures. In the case of all experiments presenting data from animal models, this is a requirement and is not optional. This is in addition to our well-established data-deposition policy for specific types of experiments and large datasets. Online readers of the manuscript will be able to access the graphical source data directly from the figure legend. Spreadsheets must be submitted in .xls, .xlsx or .csv formats. One file per figure is permitted. If there is a multi-panelled figure, the source data for each panel should be clearly labeled in the file; alternatively the source data for a figure can be included in multiple, clearly labeled sheets within an Excel file. File sizes of up to 30 MB are permitted, but it is expected that the vast majority of graphical source data files will be considerably smaller than this.
When submitting these files with your manuscript, you should select the "Source Data" file type and use the title field in the file description tab to indicate the figure(s) to which the source data pertain.

RAW DATA (GELS): You must provide the original source images for all data obtained by electrophoretic separation (e.g., EMSA, northern/Southern/western blots, etc). The raw images should be assembled into a single .pdf or .tif file (multiple gels on a single page is encouraged). The file should be uploaded as Supplementary Figure 1. The full scanned images must be in uncropped form and contain labeled size/molecular weight markers and loading controls. There should be an accurate indication of how the gels were cropped for the final figure. The figure legends and raw data files should indicate whether controls (such as beta-actin) were run on the same gel as loading controls, or on separate gels as sample processing controls (see https://www.nature.com/authors/policies/image.html). While the data can be displayed in a relatively informal style, there must be a correspondence between each source data image and a specific main text or Extended Data figure. The main text or Extended
Data figure legends should refer to the uncropped scans explicitly (e.g., “For gel source data, see Supplementary Figure

1."). For examples, see
https://images.nature.com/full/nature-assets/nature/journal/v520/n7547/extref/nature14363-s1.pdf or

ORCID: Nature is committed to improving transparency in authorship. As part of our efforts in this direction, we now request that all authors identified as 'corresponding author' create and link their Open Researcher and Contributor Identifier (ORCID) with their account on our Manuscript Tracking System (MTS) prior to acceptance. ORCID helps the scientific community achieve unambiguous attribution of all scholarly contributions. For more information and instructions on how to associate your ORCID and MTS accounts, please see
https://www.springernature.com/gp/researchers/orcid/orcid-for-nature-research. If you do not yet have an ORCID you will be able to create one in minutes.

IMPORTANT: All authors identified as 'corresponding author' on the manuscript must follow these instructions before submitting the final version of the manuscript. While non-corresponding authors do not have to link their ORCIDs, they are encouraged to do so. Please note that it will NOT be possible to add/modify ORCIDs once the paper is accepted.

To support ORCID's aims, we only allow a single ORCID identifier to be attached to one account. If you have any issues attaching an ORCID identifier to your MTS account, please contact the Platform Support Helpdesk.

The revised paper should be submitted using the link below:

https://mts-nature.nature.com/cgi-bin/main.plex?el=A6K4DbF4A4EPNg2J3A9ftdu9qZwBTzfQBA5p7nH4GxbgZ

NOTE: This url links to your confidential home page and therefore to manuscripts you may have submitted or be reviewing for us. If you wish to forward this email to co-authors, please delete the link to your home page first.

In the meantime, we hope that you will find our referees' comments helpful. Please do not hesitate to contact me if there is anything you would like to discuss.

Yours sincerely

Clare Thomas
Senior Editor
Nature

Referees' comments:

Referee #1 (Remarks to the Author):

This manuscript identified a cellular receptor required for TBEV entry, GPCR glucagon-like peptide-2 receptor (GLP2R), by performing a genome-wide CRISPR-Cas9 screening in human glioma T98G cells. Briefly, GLP2R deficiency specifically disrupted TBEV infection, but does not affect other neurotropic viruses. They found that the extracellular loop 1 (ECL1) of GLP2R was mainly responsible for TBEV binding through its envelope (E) protein, and this interaction was inhibited with a synthetic peptide Y41L demonstrating the importance of ECL1 in viral E protein binding. In vivo, glp2r-/- mice showed significant reduction of virus titers and 100% survival, together with little or no infectious virus detected in blood or tissues, suggesting that glp2r is important for TBEV pathogenesis. Overall, the strengths of the paper include using unbiased CRISPR-Cas9 screen to identify a novel TBEV entry receptor which is crucial for developing pathogenesis in vivo and identifying a specific
GLP2R's ECL1 domain that could provide potential antiviral insights. However, it is concerning that why are non-neuronal cells still susceptible to infection even with no GLP2R gene expression. Despite claiming that GLP2R is mainly expressed in the CNS and enteric neurons, the manuscript failed to show the specificity of GLP2R expression in different cell types and organs. Overall, several points are raised below to strengthen this manuscript.

Major

1. The authors should indicate how many of the genes targeted by the screen are considered as "top candidate". Is GLP2R the best gene in the screening list? The author should include other top candidate genes and verify their function to further validate their screening results.

2. In Figure 1c and 1d, the authors should clarify and include the detailed method of GLP2R trans-complement and shows the efficiency of GLP2R trans-complement.

3. In Figure 1c, even though glp2r gene was knocked out, there are still virus infection occurring and titer still increases over time. In extended data figure 6 (e), there is still virus infection in BHK-21 cells and Vero E6 cells with or without GLP2R. Hence, GLP2R could be involved in facilitating the virus entry as a co-receptor but not a “true” receptor of TBEV.

4. Extended data Fig 6a, surface protein expression of GLP2R in cell lines and primary astrocytes should be performed instead of mRNA gene expression to correlate with viral entry.

5. For the specificity of receptor, the authors should compare other glucagon receptors for TBEV binding and infection. Moreover, all interaction experiments utilized GFP- or HA-tagged GLP2R. Authors should show the interaction between endogenous GLP2R and TBEV.

6. In Figure 2, the authors should clarify the exact binding site of H33D as a functional ligand of GLP2R to inhibit TBEV infection. Does H33D bind to the region in GLP2R similar to TBEV?

7. In Figure 3, TBEV envelope domain III binds to the extracellular domain loop1 of GLP2R to modulate TBEV attachment and internalization. But what is the function of cytosolic domain of GLP2R in TBEV infection? Is it be involved in endocytosis or internalization of the virus?

8. For the therapeutic approach, the ECL1 peptide such as Y41L has to be determined in vivo pathogenesis of TBEV.

9. If GLP2R is also specific to enteric neurons, neuronal cells should be used instead of primary brain astrocytes. Did the authors identify if TBEV infect enteric neurons as well?

10. In Figure 4, the authors claimed that “GLP2R is specifically required for TBEV infection of human nerve cells and mainly expressed in the central nervous system and enteric neurons”. This is not supported by the data shown, where TBEV-infected wild type mice showed lesions in the spleen and small intestine, yet there are no infection and lesions in the spleen and small intestine of glp2r-/- mice. Hence, the author should clarify if GLP2R is potentially a TBEV receptor specific to certain cell types in different organs.

11. Please explain the reason that HE staining showed lesions to the brain, spleen, and small intestine in the TBEV-infected wild type mice but showed no such pathology in glp2r-/- mice since glp2r is not the only receptor and there exists additional receptor which means TBEV can also infect glp2r-/- mice as well in other organs except for brain.

12. In H&E staining, the detection of viral RNA by using in-situ hybridization has to be shown to prove the existence of virus infection in tissues. In addition, is it not clear what cell types are expressing GLP2R, Hence, the authors should include IHC staining or in-situ hybridization data of viral and GLP2R in WT and knockout tissues.

Minor

1. In Figure 4, the display of both WT and Glp2r -/- needs to be identical to other figures.

2. There is no specific experiment on HSPG. Is HSPG still required for the function of GLP2R as a receptor? If HSPG is deficient in cells, Does TBEV still utilize GLP2R in this condition?

Referee #2 (Remarks to the Author):

Yang et al report on studies with the goal of identifying the entry receptor for tick-borne encephalitis virus (TBEV). The authors performed a genome-wide CRISPR-Cas9 knockout screen using human glioma T98G cells exposed to TBEV-FE, strain WH2012 and identified G-protein-coupled receptor glucagon-like peptide-2 receptor (GLP2R) as a putative receptor for TBEV to infect nerve cells. In vitro knockdown or knockout of GLP2R reduced TBEV infection of a variety of tumor, neuronal and other human cell lines, and trans supply of GLP2R restored viral replication levels. Importantly, they demonstrate specificity for TBEV via direct comparisons with other flaviviruses, which do not show any impairment in viral replication in glp2r-/- cell lines.
The authors also convincingly demonstrate that GLP2R directly binds to viral envelope domain III through its extracellular loop 1 (ECL1), using immunoprecipitation and site directed mutagenesis approaches. Binding studies using ECL1 peptide, and GLP2R antibodies were less convincing and less direct in assessing protein-protein interactions. GLP2R-deficient mice, generated by the authors, survived TBEV infection with minimal detection of viral RNA and without detectable infectious virus in multiple organs, including the brain. The route of administration in these studies was not via a natural route, and the results suggest that GLP2R is not necessarily neural cell specific, as the title of the manuscript states.

Specific Comments:
1. The article needs to begin with an introduction to TBEV as a cause of viral encephalitis including epidemiology and countries where it is endemic, and all target cell types. It also lacks a more thorough discussion of GLP2R expression and function in neural cell types. This is important information with regard to what is known about cellular targets and course of disease.

The approaches are well designed and use of appropriate controls demonstrates their success in identifying GLPR2 via CRISPR-Cas9 knockout screen, knocking down and knocking out this gene in glioma tumor and neuronal cell lines, and demonstrating that GLPR2 deficiency dose-dependently decreases TBEV replication rates in cell lines. They also demonstrate that increased expression of GLPR2 in a number of human cell lines increased TBEV replication. It is also important that the authors examined both viral RNA levels and infectious virions using appropriate assays.

The authors found that BHK and Vero cells, however, do not require GLPR2 for TBEV replication, supporting the notion that only human cells utilize GLPR2 during TMEV infection.

The binding experiments in Fig 2 do not directly assess interaction with GLPR2. Quantitative competitive binding assays with controls are needed. Detection of viral RNA does not assess binding and the Ab-based assays are not convincing. Also, as use of ligand for GLPR2 only modestly prevents TBEV replication without dose-dependency, studies are needed to assess whether binding sites differ between ligand and viral envelope. The analyses determining the effect of TBEV replicon indirectly supports the notion that TBEV binds GLPR2.

Fig 3 more convincingly demonstrates direct interactions between TBEV envelope and GLPR2 via immunoprecipitation and site-specific mutagenesis.

Fig 4 shows that loss of GLPR2 results in diminished detection of virus within the blood, spleen, intestine, and brain. As GLPR2 is expressed in brain and intestine, it is unclear why the blood and spleen exhibit much lower viral titers, and does not completely support the conclusion that GLPR2 is a neural cell specific receptor for TBEV. The authors also inoculated virus intraperitoneally, which apparently allows limited infection via a different entry mechanisms. The authors should repeat the murine infection studies using a subcutaneous inoculation route and assess the skin, draining lymph nodes, blood, intestine, spleen and brain for viral RNA and infectious virions.

Referee #3 (Remarks to the Author):

In this study, Yang et al. have conducted a CRISPR-cas9 screen in a human glioma cell line to identify host factors essential for the infectious life cycle of Tick-Borne Encephalitis Virus (TBEV), a member of the flavivirus genus that

causes severe encephalitis disease. The authors identified the G-protein coupled receptor glucagon-like peptide-2 (GLP2R) as a receptor for TBEV. The authors showed that GLP2R expression blockage by RNA interference or deletion of the glp2R gene by CRISPR inhibits infection of some cell lines by different TBEV strains. GLP2R interacts, through its extracellular ECL1 region, with the domain III of the TBEV envelope glycoprotein. Importantly, mice lacking the glp2r gene survive TBEV infection and present no detectable infectious particles in the brain.
Altogether, the data presented in this paper are potentially interesting but remain very weak to conclude that GLP2R is a key host factor for TBEV entry. A major weakness of this study is that the authors have never proved that GLP2R fullfills the criteria of a viral entry receptor. For instance, there is no data showing a clear relationship between TBEV infection and GLP2R cell surface expression. If GLP2R is an authentic receptor, ectopic expression of this protein in cells poorly susceptible or refractory to TBEV should render them permissive to infection. Furthermore, the authors claim that GLP2R modulates TBEV internalization. Unfortunalely, the data supporting this conclusion (Fig 2) are not convincing since the authors did not perform specific entry experiments to prove that GLP2R triggers TBEV particle uptake (for instance: live imaging, TIRFF microscopy, receptor-virus co-internalization assay etc…). The data with the H33D peptide are also not in favor of a major role
of GLP2R in TBEV entry. It is unclear whether the moderate inhibitory effect observed is due to the ability of this product to compete with TBEV binding, to block virus entry by promoting GLP2R endocytosis or to activate intracellular signaling that might impact indirectly with the early stages of virus infection.

In conclusion, the data presented in this paper indicated that GLP2R is a proviral factor for TBEV. However, this study suffers from a lack of important mechanistic insights about the precise function of this G-protein coupled receptor during TBEV entry. In my opinion, in its current form, this manuscript doesn't meet the high-quality standards for publication in this prestigious journal.

Dear Dr. Shi,

PNAS has scheduled publication of your article, "**A Zika virus envelope mutation preceding the 2015 epidemic enhances virulence and fitness for transmission**," 2020-05722R, in Latest Articles the week of August 3, 2020. Your article may publish in Latest Articles any day during that week. The Latest Articles publication date is the official date of record.

PNAS will not publish your article until the production vendor, Sheridan Journal Services, has incorporated the changes you made on the proofs. If you have requested a second set of proofs, your article will not publish until you have reviewed the edits. If you have questions about proofs, please contact (PNAS_Specialist.djs@sheridan.com).

The press embargo on your article will lift on August 3, 2020 at 3:00 PM U.S. Eastern time. The embargo date is the earliest possible date that your article can publish. Embargoed copies of your accepted article will be available to journalists starting Wednesday, July 29, 2020, on a secure reporters-only web site. Should you or your institution's public relations office have any press- or embargo-related questions, please contact the PNAS News Office at pnasnews@nas.edu or 202-334-1310.

Public Information Officers (PIOs) and authors may post an embargoed press release to EurekAlert! as early as 2:00 PM US ET the Wednesday afternoon before the embargo lifts. Embargo information must be noted in ALL CAPS at the top of the press release. Authors and press officers are responsible for ensuring that embargoed press releases are not published, broadcast, or posted online in any form in the public domain, including any open access site, prior to the embargo date and time. Failure to comply with the PNAS embargo policy may result in author sanctions.

PNAS provides journalists with access to embargoed content through EurekAlert!. Journalists should register with EurekAlert! at http://www.eurekalert.org/register.php and request access to PNAS materials. If they are already registered with EurekAlert!, they can request access to PNAS at http://www.eurekalert.org/account.php.

If you must delay publication for a special reason, please notify the PNAS News Office immediately, no later than noon US ET on Tuesday, July 28, 2020.

PNAS automatically deposits the final, published version of all its content, regardless of funding, in PubMed Central (PMC) and makes it free at both PMC and PNAS within 6 months of publication. For release immediately on publication, the open access surcharge is $1,300 for authors from institutions with a site license/open access membership. For more information, please see our editorial (https://www.pnas.org/cgi/content/full/102/15/5303). For information about the PNAS open access option, including fees and license details, please visit https://www.pnas.org/page/subscriptions/open-access.

Hi Steve,

Yes. You are right. I have included an image for the correction.

Thank you so much!

Pei-Yong

Hi Pei-Yong,

Please confirm that the new change swaps the positions and letters for affiliations a and b, but no author affiliations are changed (only letters).

I will check with the editorial office to see if an exception can be made, but I want to be sure that I understand the details.

Thank you.

Hi Steve,

Could you help to make a change for the paper "**A Zika virus envelope mutation preceding the 2015 epidemic enhances virulence and fitness for transmission**," 2020-05722R?

We would like to switch the affiliation order between a and b (see attachment). Could you help on this?

Many thanks for your help.
Best,
Chao

Subject: PNAS MS# 2020-05722R Publication Update

Dear Dr. Shi,

PNAS has scheduled publication of your article, "**A Zika virus envelope mutation preceding the 2015 epidemic enhances virulence and fitness for transmission**," 2020-05722R, in Latest Articles the week of August 3, 2020. Your article may publish in Latest Articles any day during that week. The Latest Articles publication date is the official date of record.

PNAS will not publish your article until the production vendor, Sheridan Journal Services, has incorporated the changes you made on the proofs. If you have requested a second set of proofs, your article will not publish until you have reviewed the edits. If you have questions about proofs, please contact (PNAS_Specialist.djs@sheridan.com).

The press embargo on your article will lift on August 3, 2020 at 3:00 PM U.S. Eastern time. The embargo date is the earliest possible date that your article can publish. Embargoed copies of your accepted article will be available to journalists starting Wednesday, July 29, 2020, on a secure reporters-only web site. Should you or your institution's public relations office have any press- or embargo-related questions, please contact the PNAS News Office at pnasnews@nas.edu or 202-334-1310.

Public Information Officers (PIOs) and authors may post an embargoed press release to EurekAlert! as early as 2:00 PM US ET the Wednesday afternoon before the embargo lifts. Embargo information must be noted in ALL CAPS at the top of the press release. Authors and press officers are responsible for ensuring that embargoed press releases are not published, broadcast, or posted online in any form in the public domain, including any open access site, prior to the embargo date and time. Failure to comply with the PNAS embargo policy may result in author sanctions.

PNAS provides journalists with access to embargoed content through EurekAlert!. Journalists should register with EurekAlert! at http://www.eurekalert.org/register.php and request access to PNAS materials. If they are already registered with EurekAlert!, they can request access to PNAS at http://www.eurekalert.org/account.php.

If you must delay publication for a special reason, please notify the PNAS News Office immediately, no later than noon US ET on Tuesday, July 28, 2020.

PNAS automatically deposits the final, published version of all its content, regardless of funding, in PubMed Central (PMC) and makes it free at both PMC and PNAS within 6 months of publication. For release immediately on publication, the open access surcharge is $1,300 for authors from institutions with a site license/open access membership. For more information, please see our editorial (https://www.pnas.org/cgi/content/full/102/15/5303). For information about the PNAS open access option, including fees and license details, please visit https://www.pnas.org/page/subscriptions/open-access.

Best regards,

Subject: BioArt-We would like to report your study on PNAS

Dear Professors,

This is Xin from BioArt, which is one of the best online scientific media in China.

I'm writing this email to see whether you would like to provide a short report introducing your study on ***PNAS*** and entitled **"A Zika virus envelope mutation preceding the 2015 epidemic enhances virulence and fitness for transmission"**. If this is inconvenient to you, would you please forward this email to the first author to see if he is willing to write? It is a solid and decent research, we would like to introduce it to more scholars.

BioArt is an online media based on WeChat platform in China. We have almost 300 thousands followers, in which most are PhD researchers in life science and medicine fields. BioArt enjoys a high reputation in Chinese biological and medical community for our professional contents and it has been continuously voted Top 1 academic WeChat official account for three years.

Thank you for your attention. If you have any question, please don't hesitate to let me know. And we are looking forward to your reply.

Best,

Xin

22-Feb-2021

Dear Prof. Shi:

How are you!
We heard that the extreme cold snap bring historic snow strom and power problem in Texas. Hope you are fine and everything is going well.

We thought it is not suitable for you to organize the reviewing process at this time, thus we removed the manuscript from your Editor Center. And hope to have the chance to invite you again when future manuscripts come in that fall under your area of expertise.

Wish you and your family a healthy, smooth and auspicious year of 2021!

Best regards,

Editorial Office, Virologica Sinica

Subject: our manuscript

Dear Dr. Shi,

Thank you very much for collaborating with us in this project. Please revise it freely and let us know which title is good or what title you would suggest. Moreover, as we discussed, please suggest 4-5 potential reviewers. We expect to get the manuscript submitted Monday or Tuesday to Nature Communication or other journals you suggested. In addition, please share it with Chao and Jin because all authors need to approve it before submission.

Cheers,

Wenbo

About *Virologica Sinica*
Virologica Sinica is an academic journal which aims at presenting the cutting-edge research on viruses all over the world. The journal publishes peer-reviewed original research articles, reviews, and letters to the editor, to encompass the latest developments in all branches of virology, including research on animal, plant and microbe viruses. The journal welcomes articles on virus discovery and characterization, viral epidemiology, viral pathogenesis, virus-host interaction, vaccine development, antiviral agents and therapies, and virus related bio-techniques. *Virologica Sinica*, the official journal of the Chinese Society for Microbiology, will serve as a platform for the communication and exchange of academic information and ideas in an international context. The journal is published by Springer Press, and abstracted/indexed in: SCI, JCR, PubMed/Medline, PubMed Central, Google Scholar, etc.

Editorial advantages:
√ Worldwide readership and increasing impact
√ Rapid peer review and online publication
√ Publish special issues and focused topics
√ Support open access and open archive

Please visit the following websites for more information about Virologica Sinica.

Subject: Manuscript review for Virologica Sinica Manuscript ID VS-2021-5603 - "Inhibition of Chikungunya virus Replication by Lycorine".

14-May-2021

Dear Prof. Shi:

Thank you for replying to my invitation to review for Virologica Sinica entitled "Inhibition of Chikungunya virus Replication by Lycorine"

It is unfortunate that you are unable to review this manuscript this time. I will keep you in mind when future manuscripts come in that fall under your area of expertise.

Sincerely,
Lijun Rong
Editor, Virologica Sinica

About Virologica Sinica

Virologica Sinica is an academic journal which aims at presenting the cutting-edge research on viruses all over the world. The journal publishes peer-reviewed original research articles, reviews, and letters to the editor, to encompass the latest developments in all branches of virology, including the research on animal, plant and microbe viruses. The journal welcomes studies on virus discovery and characterization, viral epidemiology, viral pathogenesis, virus-host interaction, vaccine development, antiviral agents and therapies, and virus related bio-techniques.

Virologica Sinica, the official journal of the Chinese Society for Microbiology, holds an editorial board of experts from a broad range of research fields worldwide, and will serve as a platform for the communication and exchange of academic information and ideas in an international context. The journal is published by Springer-Verlag Press, and abstracted/indexed in: Science Citation Index Expanded (SCIE), Journal Citaton Reports (JCR), PubMed/Medline, Pubmed Central, Scopus, BIOSIS Previews, EMBASE, Google Scholar, and etc.

VS-2021-5603 - “Inhibition of Chikungunya virus Replication by Lycorine”.

14-May-2021

Dear Prof. Shi,

Manuscript ID VS-2021-5603 entitled "Inhibition of Chikungunya virus Replication by Lycorine" with Dr. Bo Zhang as corresponding author has been submitted to Virologica Sinica.

I invite you to review this manuscript. The author list and abstract are appended below, plus more detailed information about Virologica Sinica and its editorial criteria.

To respond automatically, click below:

*** PLEASE NOTE: This is a two-step process. After clicking on the link, you will be directed to a webpage to confirm. ***

Agreed:

MANUSCRIPT DETAILS

TITLE: Inhibition of Chikungunya virus Replication by Lycorine

AUTHORS: Li, Na; Wang, Zhen; Wang, Rui; Zhang, Zherui; Zhang, Ya-Nan; Deng, Cheng-Lin; Zhang, Bo; Shang, Lu-Qing; Ye, Hanqing

ABSTRACT: Chikungunya virus (CHIKV) is a mosquito-borne alphavirus. As an emerging virus, CHIKV imposes a threat to public health. Currently, there are no vaccine or antiviral available for prevention of CHIKV infection. In this study, we found that lycorine could inhibit CHIKV in cell culture without apparent cytotoxicity. In addition, it exhibited broad-spectrum anti-alphavirus activity, including Sindbis virus (SINV), Semliki Forest virus (SFV), and Venezuelan equine encephalomyelitis virus (VEEV). The time of addition studies indicated that lycorine functions at an early post-entry stage of CHIKV life cycle. The results based on two different CHIKV replicons provided further evidence that lycorine exerts its antiviral activity mainly by inhibiting CHIKV translation.

About Virologica Sinica

Virologica Sinica is an academic journal which aims at presenting the cutting-edge research on viruses all over the world. The journal publishes peer-reviewed original research articles, reviews, and letters to the editor, to encompass the latest developments in all branches of virology, including the research on animal, plant and microbe viruses. The journal welcomes studies on virus discovery and characterization, viral epidemiology, viral pathogenesis, virus-host interaction, vaccine development, antiviral agents and therapies, and virus related bio-techniques.

Virologica Sinica, the official journal of the Chinese Society for Microbiology, holds an editorial board of experts from a broad range of research fields worldwide, and will serve as a platform for the communication and exchange of academic information and ideas in an international context. The journal is published by Springer-Verlag Press, and abstracted/indexed in: Science Citation Index Expanded (SCIE), Journal Citaton Reports (JCR), PubMed/Medline, Pubmed Central, Scopus, BIOSIS Previews, EMBASE, Google Scholar, and etc.

To be accepted for publication in Virologica Sinica, research articles must satisfy the following criteria:

1. The study presents novel findings and results have not been published elsewhere.
2. Experiments, statistics, and other analyses are performed to a high technical standard and dataset and figures are in good quality.
3. Conclusions are well supported by the data, and significance is well defined.
4. The research meets all the ethics of experimentation and research integrity.
5. If the article is not presented in good English, we will have it polished before the final acceptance.

Subject: Inquiry for a business partnership from Uzbekistan & Central Asia

Dear Colleagues

It is important to mention that from 2020, Uzbekistan introduced a visa free regime for 85 countries up to 30days regardless of their visit.

The local incoming travel agency **"ORIENT STAR GROUP"** was established by a team of professionals. **(Licence number: T-0017-18).** Our office is located in the capital of **Uzbekistan,** in **Tashkent** city, one of the important and tourist cities of **Uzbekistan and Central Asia**. We organize tours throughout Uzbekistan as well as combined tours in Central Asia along the legendary **"Great Silk Road".** The agency is still young, founded in 2016 and the professional team we speak in different languages. We started to work with the following language markets such as Spanish, French, German, Italian, English, Russian, Turkish, Arabic, Japanese, Chinese. In the bellow**, some tour packages with rates for 2021.** With these different tour packages, tourists will have the opportunity to get to know not only the history and architecture of Uzbekistan, but also the country and **its people, customs, traditions, daily life of the current local people.**

For further information, please contact us.

Now, You can travel virtually to our land, just click the below links:

Subject: UPDATED: Save the date COVAX Enabling Sciences Workshop: Global and local approaches to detect and interpret SARS-CoV-2 variants

COVAX ES Workshop April 16th draft Agenda v1.pdf

Dear All,

Final agenda COVAX Enabling Sciences Workshop: Global and local approaches to detect and interpret SARS-CoV-2 variants attached.

Friendly reminder if you have not yet registered please use highlighted link by Wednesday, April 14th EOD.

Thank you.
Judy

Dear all,

We are emailing to invite you to a webinar workshop led by the COVAX Enabling Sciences SWAT Team on April 16, 2021, from 6:00-9:00 PT / 14:00-17:00 CET.

The topic of the workshop is "**Global and local approaches to detect and interpret SARS-CoV-2 variants**". The goal of the workshop is to discuss how to rapidly generate actionable information on the immunological consequences of emerging SARS-CoV-2 variants. This requires connecting local pathogen genomic sequencing and epidemiology with high quality virology and immunology. There will also be a discussion of how immunological knowledge gained in one country or region can feed into, and benefit from, large international efforts and inform global and local decision making.

This workshop is organized by the COVAX Enabling SWAT team co-led by CEPI and the Bill & Melinda Gates Foundation.

To attend the workshop, please register here by Wednesday, April 14th EOD. This workshop will be held on Zoom and you will find the Zoom link within the registration portal a couple of days before the event. Once you have registered, there will be an option to add this event to your calendar. In addition to the Zoom link being in your registration portal, our systems will also email you the Zoom link information on three occasions (the day before the event, one hour before the event, and once we go-live). *Please ensure our emails are not going into the junk folder.*

As email lists are imperfect, please forward this email invite to the appropriate contact(s) in your organization and contact Judy Hubbard at the Gates Foundation (Judy.Hubbard@gatesfoundation.com) to indicate who from your group should be invited. Please note that anyone who was forwarded the original calendar save the date may not have necessarily received this email, but may register using the same link provided above.

We look forward to your participation at the workshop.

Thank you.
Judy Hubbard, sent on behalf of

Workshop Agenda

Global and local approaches to detect and interpret SARS-CoV2 variants

DATE	TIME	LOCATION
Friday, April 16th, 2021	06:00 – 9:00 PT/ 15:00 – 18:00 CET	Zoom Webinar

We all share a common goal to develop safe and effective vaccines. The Enabling Sciences SWAT team aims to provide cross-cutting product-agnostic support to COVID-19 vaccine developers in the area of diagnostics, standards and animal models.

Rapid assessment of the biological impacts of new variants of SARS-CoV-2 requires the collaboration of epidemiologists, virologists and immunologists at the local and global level. However, these efforts are often disconnected from one another, resulting in delays and an incomplete picture of the implications for vaccines and diagnostics.

The objective of this workshop is to share information on how to efficiently connect local pathogen genomic sequencing, epidemiology, virology and immunology to rapidly generate actionable information on the immunological consequences of emerging SARS-CoV-2 variants. There will be a discussion of how knowledge gained in one country or region can feed into, and benefit from, large international efforts and inform global and local decision making. We will discuss ideas for best practices for assessing virus neutralization activity, and approaches to standardizing assays and protocols to improve interpretation of results generated in different labs and geographies

This workshop is convened by the COVAX Enabling Sciences SWAT team, which is co-led by CEPI and the WHO and includes members from the Bill & Melinda Gates Foundation, NIAID and industry. COVAX is the vaccines pillar of the Access to COVID-19 Tools (ACT) Accelerator, co-led by Gavi, the Coalition for Epidemic Preparedness Innovations (CEPI) and WHO. COVAX aims to accelerate the development and manufacture of COVID-19 vaccines, and to guarantee fair and equitable access to appropriate, safe and efficacious vaccines for all countries.

Time (CET)	Presentation Title *(TBD)*	Speaker(s)
15:00-15:05	Welcome and meeting objectives	*TBC, ES SWAT*
15:05-15:20	South Africa Pathogen Genomics Sequencing & AfCDC PGI program	**Tulio DeOliveira,** KRISP
15:20-15:30	Assessing immunological implications of VoCs in South Africa	**Penny Moore,** NICD

15:30-15:40	Immune escape and evidence for re-infection with P.1 in Brazil	**Ester Sabino**, U. Sao Paulo
15:40-15:50	Impact of B.1.1.7 on vaccine induced immune responses	**Ravi Gupta,** Cambridge
15:50-16:00	India Consortium for COVID-19 genomics	**Anurag Agrawal**, CSIR/IGIB
16:00-16:25	**Panel Discussion**	Moderated by **Karen Makar**, BMGF
16:25-16:30	*BREAK*	
16:30-16:40	WHO framework for response to new COVID vaccines	**Sylvie Briand,** WHO
16:40-16:50	Pulling it all together in the COG-UK	**Sharon Peacock,** COG-UK
16:50-17:00	CEPI's Agility program: a centralised approach to evaluate VoCs	**Simon Funnell**, PHE
17:00-17:10	Virus stock and sequencing QC- best practices & available resources	**Sujatha Rashid**, BEI
17:10-17:20	SARS-CoV-2 Interagency Group (SIG) Variant Assessment/Characterization	*TBC, NIAID*
17:20-17:30	ACTIV/TRACE OpenData portal	**Christine Colvis,** NIH/NCATS
17:30-17:55	**Panel Discussion**	Moderated by**: Bill Dowling,** CEPI
17:55-18:00	Wrap up & Next Steps	*TBC, ES SWAT*

Subject: Save the date COVAX Enabling Sciences Workshop: Global and local approaches to detect and interpret SARS-CoV-2 variants

Dear All

The goal of the workshop is to discuss how to rapidly generate actionable information on the immunological consequences of emerging SARS-CoV-2 variants. This requires connecting local pathogen genomic sequencing and epidemiology with high quality virology and immunology. There will also be a discussion of how immunological knowledge gained in one country or region can feed into, and benefit from, large international efforts and inform global and local decision making.

Agenda and registration link forthcoming.

Thank you.
Karen

Greetings everyone!

If you haven't booked a recording already, you can do so at this link: http://projectionnet.com/wmf2021/Login.aspx. Recording appointments are available through June 11 but I encourage you to book soon. We have also coordinated some additional recording appointments on June 14 and 15 and my colleague, Kellen Bagnoli can assist you with making those appointments.

Best regards,
Erin

Subject: Speaker information update for ASM World Microbe

Dear Zengli, Vineet, and Jesse,

Thank you again for your participation in ASM World Microbe. You are scheduled for the ASV session "Tracking SARS Coronavirus variants and evolution". Your talks will be **pre-recorded**, and you will each have **30 minutes**. The talks will be available to conference participants starting on June 21.

We will have a **LIVE** "After Chat" panel discussion with myself and Volker Thiel as your hosts on **June 21, 3:45-4:30 pm EST**. Please let us know if you cannot attend the discussion panel.

The talk order for the session will be:

Zhengli Shi
Vineet Menarchy
Jesse Bloom

Please let us know if you have any questions.

Best regards,
Kristen and Volker

Hi Vineet,
That's great that you will be able to participate in the after chat. There were some changes to the session recently. So, you do have 30 minutes. Looks like Erin is fixing that for you.
Cheers,
Kristen

Hi Kristen ,

I should be able to participate in the After chat from the times allotted.

Also, can you please confirm I have 30 minutes as my recording session stated that it was a 20 minute slot.

Thanks

Hi Kristen,

Thanks for coordinating all of this.

As far as the AfterChat, can I be a *maybe*? I would like to do this and have blocked out the time, but I was just called for jury duty the week of June 21 and it's unclear if I'll be required to show up on June 21 itself. I can do the AfterChat if I don't have to be on a jury then, but may not know until shortly beforehand.

Also (and I apologize if I missed this in an earlier e-mail), how exactly do we upload and record our talks? If instructions just haven't been sent yet that's fine, but I wanted to make sure I didn't miss them.

Thanks,
Jesse

Dear Xuping,
We just read your article published in mBio (http://www.ncbi.nlm.nih.gov/pubmed/31662457), and, first of all, congrats, it's very interesting. We are writing to the email we found in affiliation. Sorry if our English is not perfect, we are data scientists, not grammar experts.
We are contacting you to present our services. We are known for our ehealth products, like websites, big data, machine learning, Gsuite resellers - now called Google Workspace (e.g. automate pdf report creation from google sheets), etc - but today we want to offer you a service to help you in the social media field for researchers, especially Twitter. Lots of scientists have asked us about managing their online profilesWe can help you to improve your social presence. Please reply if you are interested in having hundreds or thousands of followers, and we can discuss by email or teleconference.
Kind regards,
onmedic team

Subject: Invitation for Manuscript Review, Virologica Sinica VS-2021-5454

VS-2021-5454 - "Ozone Water is an Effective Disinfectant for SARS-CoV-2" .

14-Jan-2021

Dear Prof. Shi,

Manuscript ID VS-2021-5454 entitled "Ozone Water is an Effective Disinfectant for SARS-CoV-2" with Dr. Yun Wang as corresponding author has been submitted to Virologica Sinica.

I invite you to review this manuscript. The author list and abstract are appended below, plus more detailed information about Virologica Sinica and its editorial criteria.

To respond automatically, click below:

*** PLEASE NOTE: This is a two-step process. After clicking on the link, you will be directed to a webpage to confirm. ***

Agreed:

MANUSCRIPT DETAILS

TITLE: Ozone Water is an Effective Disinfectant for SARS-CoV-2

AUTHORS: Hu, Xiao; Chen, Xinwen; Yang, Qi; Li, Pan; Ma, Jun; Guan, Wuxiang; Wang, Yun; Pei, Rongjuan; Chen, Zhen; Su, Zhengyuan; Deng, Fei; Chen, Quanjiao

ABSTRACT: The severe acute respiratory syndrome coronavirus (SARS-CoV-2) can reportedly survive on various materials for days. This property of SARS-CoV-2 probably plays a vital role in the materials-to-human transmission pathway, which accounts for a significant fraction of new infection cases in China

nowadays. Therefore, there is an urgent need to develop safe and effective environmental disinfectants for SARS-CoV-2. Ozone water has been shown to inactivate a broad spectrum of viral pathogens. Therefore, in this study, we aimed to test its effectiveness in inactivating SARS-CoV-2. We showed that ozone water with ozone concentrations greater than 18 mg/L could effectively inactivate SARS-CoV-2, with complete viral inactivation occurring within 1 min. Compared to traditional chemical disinfectants, ozonated water is safe and readily available as a low-cost disinfectant. Therefore, it can be considered for use in the elimination of SARS-CoV-2 contamination in public areas and facilities.

About Virologica Sinica

Virologica Sinica is an academic journal which aims at presenting the cutting-edge research on viruses all over the world. The journal publishes peer-reviewed original research articles, reviews, and letters to the editor, to encompass the latest developments in all branches of virology, including the research on animal, plant and microbe viruses. The journal welcomes studies on virus discovery and characterization, viral epidemiology, viral pathogenesis, virus-host interaction, vaccine development, antiviral agents and therapies, and virus related bio-techniques.

Virologica Sinica, the official journal of the Chinese Society for Microbiology, holds an editorial board of experts from a broad range of research fields worldwide, and will serve as a platform for the communication and exchange of academic information and ideas in an international context. The journal is published by Springer-Verlag Press, and abstracted/indexed in: Science Citation Index Expanded (SCIE), Journal Citaton Reports (JCR), PubMed/Medline, Pubmed Central, Scopus, BIOSIS Previews, EMBASE, Google Scholar, and etc.

To be accepted for publication in Virologica Sinica, research articles must satisfy the following criteria:

1. The study presents novel findings and results have not been published elsewhere.
2. Experiments, statistics, and other analyses are performed to a high technical standard and dataset and figures are in good quality.
3. Conclusions are well supported by the data, and significance is well defined.
4. The research meets all the ethics of experimentation and research integrity.
5. If the article is not presented in good English, we will have it polished before the final acceptance.

Subject: U.S. China Gene Editing Technologies to Detect and Respond to Viral Pathogens - workshop - July 14 and July 16

Greetings,

I wanted to let you all know that as a follow on to our bio dialogue discussions NASEM is holding a small invitation only virtual workshop on ***Opportunities and Best Practices for Using Gene Editing Technologies to Detect and Respond to Viral Pathogens***. The virtual workshop will take place over Zoom on the evenings on **Tuesday, July 14 and Thursday, July 16 for U.S. participants (6-8 PM U.S. PT / 9-11 PM U.S. ET on both evenings)** and the mornings of Wednesday July 15 and Friday July 17 for Chinese participants (9-11 AM Beijing time)**.**

The workshop will explore the use of genome editing technologies, such as those based on CRISPR-Cas systems, to understand and combat viral pathogens. Issues to be discussed include the use of genome editing as a research tool to better understand the basic biology of viral infection and interactions with the immune system; the development of rapid CRISPR-based diagnostic systems to detect viral pathogens; and the potential to use genome editing as an innovative anti-viral strategy as well as best practices for biosafety and biosecurity. Diane Griffin and George Gao will co-chair and Nancy Connell is organizing with help from Katie Bowman, Fran Sharples and Hui Sun from CAS. We expect that the workshop will include approximately 6 or 7 invited speakers with about 30 total participants split between the U.S. and China. The preliminary agenda is below. The first day will focus on the development of CRISPR-based diagnostic systems to detect viral pathogens such as SARS-CoV2. The second day will focus on the potential to use genome editing as an innovative anti-viral strategy, as well as best practices for biosafety and biosecurity.

We hope that you can participate in some or all of the workshop. If you plan to participate please RSVP, and we will send the Zoom link to you before the call.

Happy to answer any questions that you have. Hope you have a great July 4th.

PS as we discussed at the end of the 3rd bio dialogue Zoom meeting last month we plan to hold another bio dialogue meeting in August. I will be back in touch to start planning that meeting after the gene editing workshop.

Kind regards,

Ben

Virtual Workshop on Opportunities and Best Practices for Using Gene Editing Technologies to Detect and Respond to Viral Pathogens
Agenda

Day 1: **Evening of July 14 in US (Tuesday) and Morning of July 15 in Beijing (Wednesday)**

- Welcome
  - US welcome and focus of the 2 sessions and how they extend the topics of the 3 bio dialogue meetings held in May/June *[5min]* – **Diane Griffin**, NASEM
  - China welcome *[5 min]* – **George Gao**, China CDC

- Opening Presentation: Introduction to how CRISPR-based technologies can be applied to diagnosis and treatment of disease *[10 min]*
  Nancy Connell, Johns Hopkins University

- Detecting Viral Pathogens *[75 min] – 3 presentations x 15 min each followed by panel discussion*
  Session moderator: **David Walt**, Harvard University
  - **Feng Zhang** [invited], Massachusetts Institute of Technology*: Development of CRISPR/Cas-based systems to detect viral pathogens)*
  - **Chunbo Lou** [invited]**,** Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences: *Paired Design of dCas9 as a Systematic Platform for the Detection of Featured Nucleic Acid Sequences in Pathogenic Strains*
  - **Charles Chiu** [invited]*,* University of California San Francisco: *Detection of SARS-CoV-2 using CRISPR/Cas-based systems)*
  - Moderated Discussion *[30 min]*

- Looking ahead to session 2 – **Nancy Connell**, Johns Hopkins University *[5 min]*
- Adjourn until second session

Day 2: **Evening of July 16 in US (Thursday) and Morning of July 17 in Beijing (Friday)**

- Welcome – **Nancy Connell**, Johns Hopkins University [*5min]*

- Responding to viral pathogens [60 min] - *3 presentations x 15 min each followed by panel discussion.*
  Session moderator: **Nancy Connell**, Johns Hopkins University
  - **Deyin Guo** [invited], School of Medicine (Shenzhen), Sun Yat-sen University: *CRISPR-Cas Targeting of Host Genes as an Antiviral Strategy*
  - **Xin Zhao** [invited]**,** Institute of Microbiology, Chinese Academy of Sciences: *Receptor hunting of Enterovirus B by CRISPR screening*
  - **Stanley Qi** [invited, recommended colleague]*,* Stanford University: *Development of CRISPR as an Antiviral Strategy to Combat SARS-CoV-2 and Influenza")*
  - Moderated Discussion *[30 min]*

- Capturing the opportunities through responsible development *[30 min]*
  - **Weiwen Zhang** [invited], Tianjin University: The importance of promoting responsible development around technologies such as gene editing, including following good biosafety/biosecurity practices) [15 min]
  - Discussion among all participants *[20 min]*

- Thanks to all speakers and participants and adjourn virtual workshop

Agenda_Virtual Workshop on Gene Editing Technologies to Detect and Respond to Viral Pathogens (2).docx
Participant List_Virtual Workshop on Gene Editing Technologies to Detect and Respond to Viral Pathogens (3).docx

Greetings,

Thank you again for agreeing to participate in the *US-China Virtual Workshop on Opportunities and Best Practices for Using Gene Editing Technologies to Detect and Respond to Viral Pathogens.* **The final workshop agenda and participant list is attached.** The workshop will take place over Zoom, the Zoom link to connect the day 1 and day 2 sessions are below:

Day 1: The development of CRISPR-based diagnostic systems to detect viral pathogens such as SARS-CoV2.

Evening of July 14 in the U.S. (Tuesday from 6-8PM PT and 9-11PM ET) and Morning of July 15 in China (Wednesday from 9-11AM)

Morning of July 15 in China (Wednesday from 9-11AM) *Evening of July 14 in the U.S. (Tuesday from 6-8PM PT and 9-11PM ET) and*

Zoom Link: https://nasem.zoom.us/j/91842954740?pwd= **552.136**
(Meeting ID: 918 4295 4740 and Password: **552.136**)

Day 2: The potential to use genome editing as an innovative anti-viral strategy, as well as best practices for biosafety and biosecurity.

Evening of July 16 in the U.S. (Thursday from 6-8PM PT and 9-11PM ET) and Morning of July 17 in China (Friday from 9-11AM)

Morning of July 17 in China (Friday from 9-11AM) *and evening of July 16 in the U.S. (Thursday from 6-8PM PT and 9-11PM ET)*

Link: https://nasem.zoom.us/j/93050757697?pwd= **552.136**
(Meeting ID: 930 5075 7697 and Password: **552.136**)

As noted on the agenda, at the end of each session there will be time for Q&A and discussion. All discussions will be off the record and not-for-attribution, and no public written product will be prepared.

Thank you again for your interest in this workshop. Please let us know if you have any questions or concerns, and we look forward to a very interesting and productive two days.

Best regards,

Katie Bowman and Ben Rusek, US National Academies

Fran Sharples, PhD

Virtual Workshop on Opportunities and Best Practices for Using Gene Editing Technologies to Detect and Respond to Viral Pathogens

AGENDA

Day 1: Evening of July 14 in US (Tuesday from 6-8PM PT and 9-11PM ET) and Morning of July 15 in Beijing (Wednesday from 9-11AM)

Day 2: Evening of July 16 in US (Thursday from 6-8PM PT and 9-11PM ET) and Morning of July 17 in Beijing (Friday from 9-11AM)

Day 1 (July 14 US / July 15 China)

Welcome Remarks
- **Diane Griffin**, U.S. National Academies of Sciences, Engineering, and Medicine *[5 min]*
- **George Gao**, Chinese Center for Disease Control and Prevention *[5 min]*

Opening Presentation
- **Nancy Connell**, Johns Hopkins University: *Introduction to how CRISPR-based technologies can be applied to diagnosis and treatment of disease [10 min]*

Detecting Viral Pathogens
- Session moderator: **David Walt**, Harvard University
- Speakers:
  - **Feng Zhang**, Massachusetts Institute of Technology: *Development of CRISPR/Cas-based systems to detect viral pathogens [15 min]*
  - **Chunbo Lou**, Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences and **Jin Wang**, Shenzhen Second People's Hospital, Shenzhen University: *Paired design of dCas9 as a systematic platform for the detection of featured nucleic acid sequences in pathogenic strains [20 min]*
  - **Wayne Xianding Deng**, University of California San Francisco: *Detection of SARS-CoV-2 using CRISPR/Cas-based systems [15 min]*
- Moderated Discussion *[30 min]*

Looking Ahead to Day 2
- **Nancy Connell**, Johns Hopkins University *[5 min]*

Adjourn until Second Session

Day 2 (July 16 US / July 17 China)

Welcome Remarks
- **Nancy Connell**, Johns Hopkins University *[5 min]*

Responding to Viral Pathogens
- Session moderator: **Nancy Connell**, Johns Hopkins University
- Speakers:

- **Deyin Guo**, School of Medicine (Shenzhen), Sun Yat-sen University: *CRISPR-Cas targeting of host genes as an antiviral strategy [15 min]*
- **Xin Zhao**, Institute of Microbiology, Chinese Academy of Sciences: *Receptor hunting of Enterovirus B by CRISPR screening [15 min]*
- **Marie La Russa**, Stanford University: *Development of CRISPR as an antiviral strategy to combat SARS-CoV-2 and influenza [15 min]*

– Moderated Discussion *[30 min]*

Capturing the Opportunities through Responsible Development

– Discussion moderator: **Nancy Connell**, Johns Hopkins University
– Exchange of views and discussion among all participants *[30 min]*

Adjourn Virtual Workshop

Virtual Workshop on Opportunities and Best Practices for Using Gene Editing Technologies to Detect and Respond to Viral Pathogens: Speakers and Participants

PARTICIPANT LIST

July 14/15 and July 16/17, 2020

Speakers from China

1. **George F. Gao**, Director-General, China Centers for Disease Control
2. **Chunbo Lou**, Principal Investigator, Shenzhen Institutes of Advanced Technology
3. **Xin Zhao**, Associate Research Fellow, Institute of Microbiology, Chinese Academy of Sciences (CAS)
4. **Deyin Guo**, School of Medicine (Shenzhen), Sun Yat-sen University

Speakers from the U.S.

5. **Diane Griffin**, Vice President, U.S. National Academy of Sciences
6. **Nancy Connell,** Senior Scholar, Center for Health Security, Johns Hopkins University
7. **David Walt,** Hansjörg Wyss Professor of Biologically Inspired Engineering and Professor of Pathology, Harvard University; Institute Professor, Howard Hughes Medical Institute
8. **Feng Zhang,** James and Patricia Poitras Professor of Neuroscience and Professor, Brain and Cognitive Sciences and Biological Engineering, Massachusetts Institute of Technology; Investigator, Howard Hughes Medical Institute
9. **Marie La Russa,** Research Associate, Stanford University
10. **Wayne Xianding Deng**, Postdoctoral Fellow, University of California San Francisco

Participants from China

11. **Wei Li**, PI, Deputy Director, State Key Laboratory of Stem Cell and Reproductive Biology, Institute of Zoology, CAS
12. **Haoyi Wang**, PI, Group leader of Genome Engineering Technology, Institute of Zoology, CAS
13. **Yi Shi, PI,** Deputy Director of CAS Key laboratory of Pathogenic Microbiology & Immunology, Institute of Microbiology, CAS
14. **Jin Wang**, Professor, Shenzhen Second People's Hospital, the First Affiliated Hospital of Shenzhen University
15. **Zhengli Shi**, Wuhan Institute of Virology
16. **Zhigao Bu,** Harbin Veterinary Research Institute [invited]
17. **Zhiming Yuan**, Wuhan Institute of Virology [invited]

Participants from the U.S.

18. **David Relman**, [HYPERLINK "https://en.wikipedia.org/wiki/Stanford_University_School_of_Medicine" \o "Stanford University School of Medicine"].
19. **Peggy Hamburg,** Foreign Secretary, U.S. National Academy of Medicine
20. **Harvey Fineberg,** President, Gordon and Betty Moore Foundation
21. **Stanley Perelman**, University of Iowa Health Care
22. **Jim LeDuc**, [HYPERLINK "https://www.utmb.edu/gnl" \t "_blank"], University of Texas Medical Branch
23. **Dave Franz**, U.S. Army Medical Research and Materiel Command, retired
24. **Alta Charo,** University of Wisconsin, Madison

25. **Raymond Jeanloz,** [HYPERLINK "https://en.wikipedia.org/wiki/University_of_California,_Berkeley" \o "University of California, Berkeley"]
26. **Kristian Andersen,** Scripps Research [invited]
27. **Trevor Bedford**, Fred Hutchinson Cancer Research Center [invited]
28. **Sara L. Sawyer,** University of Colorado Boulder [invited]

NAS and CAS staff:

29. **Katie Bowman**, Board on Life Sciences (BLS), U.S. National Academies of Sciences, Engineering, and Medicine (NASEM)
30. **Fran Sharples**, BLS, NASEM
31. **Ben Rusek**, Policy and Global Affairs Division (PGA), NASEM
32. **Hui Sun**, Chinese Academy of Sciences
33. **Micah Lowenthal**, PGA, NASEM
34. **Communications support**, NASEM

Research Update Template.xlsx

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Research Update Template.xlsx

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Subject: SARS-CoV-2 Weekly Investigators Meeting

Hi Everyone,

As a reminder, I will be sending out a brief introduction to the following weeks presenter. Please join if you are interested in listening to this week's presentation. *

Also, if you have any interest in presenting, please reach out to me so I can put you on the schedule.

Thanks,
Rebecca

Hi Everyone,

We will be incorporating COVID-19 Cohort presentations to our arsenal of talks. As a reminder, the goal for the weekly SARS-CoV-2 Investigators meeting is to provide a platform that is informative and encourages collaboration.

If you would like to present your research, please let me know. *

Research Update Template.xlsx

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Marciela DeGrace is inviting you to a scheduled ZoomGov meeting.

RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET

Immunity topics plus Gao for 3rd China U.S. Dialogue v2.docx

RE: ZOOM link 3rd Virtual U.S. China dialogue meeting, Tuesday, June 9, 9-11PM ET

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

- Use of antibody assays in diagnosis of acute disease and as an indicator of protection (Le Duc)
  - How is immune response being measured?
  - Was there standardization of testing tools?

Required Attendees: LeDuc, James W.

Immunity topics plus Gao for 3rd China U.S. Dialogue v2.docx

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

3rd U.S.-China Virtual Dialogue Conference Call

COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

Questions:

Immune Response and Immunotherapy

- Use of antibody assays in diagnosis of acute disease and as an indicator of protection (Le Duc)
  - How is immune response being measured?
  - Was there standardization of testing tools?
- **What is the overall situation of serologic investigation in the US? (Fineberg)**
- What can be said about the characterization of the (Perlman)
  - Innate immune responses?
  - humoral immune response?
  - cellular immune response?
- What is China's experience in using immune plasma or other antibody-based therapies for COVID-19 patients and for prevention of infection? (Hamburg)
  - Is the use of immune plasma effective?
  - Have there been any complications?
- What has been China's experience with human monoclonal antibodies for treatment and prevention? (Hamburg)
  - Do a majority of the monoclonal antibodies isolated from patient B cells produce neutralizing antibodies?
- What immunopathologies are evident in the patients with COVID-19? (Relman)
  - Are there any biomarkers in patients who develop systemic inflammation?
  - What is the most effective treatment for patients who develop a cytokine storm?

Immunity

- After recovery, what types of antiviral immune responses are present? (Saif)
  - Do these immune responses protect from re-infection?
  - What is known about the durability of neutralizing antibody and longevity of protective immunity?

  Did recovery from SARS provide any protection from infection with SARS-CoV-2?
- **Progress in the development of vaccine in the U.S. especially mRNA vaccine? (Baric)**

Reactivation or Reinfection of Recovered Patients/Fall resurgence

- Has reactivation of latent virus or re-infection been seen among survivors? (Shi)
- Is reactivation/reinfection a concern with respect to a fall resurgence?
- What steps should be taken in anticipation of a fall resurgence in transmission? (Fineberg)

- **What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the U.S.? (Fineberg)**

Immunity topics plus Gao for 3rd China U.S. Dialogue v2.docx
Chinese Participants-0610.docx

Greetings,

I have attached the list of Chinese participants for the meeting tomorrow (that I just received). There will be fewer people on their side this time (at our request). **Please let me know if you are not planning to participate.**

I have also attached the **American version** of the agenda / list of questions. Recall that their version lists Harvey Fineberg and Ralph Baric as discussants to answer Dr. Gao's questions but not the other names.

FYI the Zoom link for the meeting is:
https://nasem.zoom.us/j/95921551654?pwd= **552.136**

Please let me know if you have any questions or concerns. Thanks again for taking the time to participate in these meetings.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

I have attached the American version of the agenda for the 3rd U.S. China virtual dialogue meeting on immunity and related topics set to take place on **Tuesday night, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time).

As you can see we have incorporated George Gao's questions into the agenda, we hope that **Harvey Fineberg** can provide information on and lead the discussion of 1) serologic investigation in the U.S. 2) strategy in the U.S. for the second half of this year 3) vaccine availability in the U.S. and that **Ralph Baric** can do the same re progress in the development of vaccine in the U.S. (especially mRNA vaccine).

We have also listed delegation member names after the other Immunity questions. Like previously, folks are listed simply so someone is responsible for getting an answer from the Chinese to each question during the discussion. I will send a version to CAS without those names listed but will let them know who we have asked to answer George's questions.

Please let us know if you have any thoughts or comments on the agenda or this plan. I will send you the Zoom link later tonight or tomorrow morning.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19 Tuesday, June 9, 9-11PM ET
Importance: High

Greetings,

Good news, just heard back from CAS. They agreed to hold the 3rd dialogue meeting on the proposed immunity topics on **Tuesday, June 9 from 9:00-11:00 PM ET** (9-11 AM the next morning, Beijing time). Please hold that time on your calendar.

CAS let us know that George Gao wants to add the following questions to the discussion:

- Could any US participant introduce the progress in the development of vaccine in the US, especially mRNA vaccine?
- How is the overall situation of serologic investigation in the US?
- What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the US ?

We will send out a new agenda and Zoom link for the meeting later in the week.

Kind regards,

Ben

Subject: RE: 3rd Virtual U.S. China dialogue meeting on COVID-19
Importance: High

Greetings,

Good news: Last night CAS leadership agreed to hold the 3rd virtual dialogue (Zoom meeting) on the list of Immunity topics we proposed. However they would like to push the dates for the 3rd meeting back to the first or second week of June (so no Zoom meeting on Tuesday night next week). Some of our Chinese counterparts are involved in China's National People's Congress taking place next week.

We are targeting **one night on June 1-4 or on June 8-11** (at 9-11 PM ET for the Americans, the following morning for the Chinese group.)

Please send your availability to participate on those nights (or maybe simply send the nights you can't participate) to Hope Hare [HHare@nas.edu] so we can propose a date or dates to CAS that works best for the American group.

Thanks again for your availability and willingness to participate in this initiative and I hope you have a good long weekend.

Kind regards,

Ben

3rd U.S.-China Virtual Dialogue Conference Call

COVID-19 immunity, including the relationship between previous infection, antibody response, reinfection and convalescent plasma and preparing for a possible Fall 2020 resurgence of the virus.

Questions:

Immune Response and Immunotherapy

- Use of antibody assays in diagnosis of acute disease and as an indicator of protection (Le Duc)
  - How is immune response being measured?
  - Was there standardization of testing tools?
- **What is the overall situation of serologic investigation in the US? (Fineberg)**
- What can be said about the characterization of the (Perlman)
  - Innate immune responses?
  - humoral immune response?
  - cellular immune response?
- What is China's experience in using immune plasma or other antibody-based therapies for COVID-19 patients and for prevention of infection? (Hamburg)
  - Is the use of immune plasma effective?
  - Have there been any complications?
- What has been China's experience with human monoclonal antibodies for treatment and prevention? (Hamburg)
  - Do a majority of the monoclonal antibodies isolated from patient B cells produce neutralizing antibodies?
- What immunopathologies are evident in the patients with COVID-19? (Relman)
  - Are there any biomarkers in patients who develop systemic inflammation?
  - What is the most effective treatment for patients who develop a cytokine storm?

Immunity

- After recovery, what types of antiviral immune responses are present? (Saif)
  - Do these immune responses protect from re-infection?
    - What is known about the durability of neutralizing antibody and longevity of protective immunity?

  Did recovery from SARS provide any protection from infection with SARS-CoV-2?
- **Progress in the development of vaccine in the U.S. especially mRNA vaccine? (Baric)**

Reactivation or Reinfection of Recovered Patients/Fall resurgence

- Has reactivation of latent virus or re-infection been seen among survivors? (Shi)
- Is reactivation/reinfection a concern with respect to a fall resurgence?
- What steps should be taken in anticipation of a fall resurgence in transmission? (Fineberg)

- **What is the COVID-19 prevention and control strategy in the US for the second half of this year? When do you expect COVID-19 vaccine to be available in the U.S.? (Fineberg)**

Chinese Participants

Ling Chen: Dr. Ling Chen is a professor and founding director of CAS Guangzhou Institute of Biomedicine and Health, former deputy director of State Key Lab of Respiratory Disease.

Chen Dong: Dr. Chen Dong is Director and a professor of the Institute for Immunology, Dean of the School of Medicine at Tsinghua University, CAS member.

George F. Gao: Dr. George F. Gao is Director-General of CCDC, a professor at the CAS Institute of Microbiology, CAS member.

Qihan Li: Dr. Qihan Li is a professor of the Institute of Medical Biology, Chinese Academy of Medical Science, Peking Union Medical College. His research focuses on viral vaccine and viral immunology.

Wenjie Tan: Dr. Wenjie Tan is Chief and a professor of the Biotech Center for Viral Disease Emergency, National Institute for Viral Disease Control and Prevention, CCDC.

Jianqing Xu: Dr. Jianqing Xu is a professor of the Institutes of Biomedical Sciences, Fudan University.

Zhiming Yuan: Dr. Zhiming Yuan is a professor of CAS Wuhan Institute of Virology, Director of Wuhan P4 lab.

Subject: SARS-CoV-2 Weekly Investigators Meeting - June 22nd

Good evening!

Thank you Dr. Krammer and those who attended last week's presentation titled "**Antibody responses to SARS-CoV-2 vaccination**". This week we have Dr. Sara Cherry who will be speak on "**SARS-CoV-2 and antiviral therapeutics**".

See all of your names in the morning!

Best,
Rebecca

Subject: SARS-CoV-2 Weekly Investigators Meeting - June 29th

Hi All!

On Tuesday, June 22nd, Dr. Sara Cherry presented on "**SARS-CoV-2 and antiviral therapeutics**." Thank you Dr. Cherry and everyone who was able to make it.

Next Tuesday, June 29th, Dr. Seema Lakdawala will be presenting on "**PHIGHT COVID: Public Health Interventions aGainst Human Transmission of COVID-19**". Hope you all can make it!

We are in need of presenters starting in mid-July. If you are interested in presenting, please let me know.

Best,
Rebecca

Research Update Template.xlsx

Cancelling tomorrow's meeting due to the new federal holiday.

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Marciela DeGrace is inviting you to a scheduled ZoomGov meeting.

Subject: SIG U19 monthly call

Hi Everyone,
We will have our monthly SIG u19 call tomorrow. The only change is that we will be starting 30 minutes later, for a brief call. I sent out a revised invitation.
Thank you

Toni Baric

Dept of Microbiology & Immunology

9025 Burnett Womack Bldg CB# 7292

Chapel Hill, NC 27599-7292

919-966-3507

tcbaric@med.unc.edu

From: Baric, Toni C[antoinette_baric@med.unc.edu]

Attendees: Baric, Ralph S; Berhorst, Jackie; Menachery, Vineet; Ferris, Martin Thomas; Fischer, William A. II; Graham, Jessica ; Graham, Rachel; Gralinski, Lisa E; Heise, Mark T; Ireton, Renee; Kathleen Voss; Klaus Schughart (kschugha@uthsc.edu); Leist, Sarah Rebecca; Linnertz, Colton; Lund, Jennifer; Shannon McWeeney; mgale@u.washington.edu; Michael Davis; Miller, Darla; Michael Mooney; Pardo Manuel de Villena, Fernando; Schaefer, Alexandra; Schughart, Klaus; Shaw, Ginger; Sheahan, Timothy Patrick; Suthar, Mehul S. (mehul.s.suthar@emory.edu); Swarts, Jessica; West, Ande; Ralph Baric; Graham PhD, Jessica B; Michael J Gale

Location: https://zoom.us/j/99380423092?pwd= **552.136**

Importance: Normal

Subject: SIG U19 Monthly Meeting

Start Time: Thur 6/24/2021 1:00:00 PM (UTC-05:00)

End Time: Thur 6/24/2021 2:00:00 PM (UTC-05:00)

Required Attendees: Baric, Ralph S; Berhorst, Jackie; Menachery, Vineet; Ferris, Martin Thomas; Fischer, William A. II; Graham, Jessica ; Graham, Rachel; Gralinski, Lisa E; Heise, Mark T; Ireton, Renee; Kathleen Voss; Klaus Schughart (kschugha@uthsc.edu); Leist, Sarah Rebecca; Linnertz, Colton; Lund, Jennifer; Shannon McWeeney; mgale@u.washington.edu; Michael Davis; Miller, Darla; Michael Mooney; Pardo Manuel de Villena, Fernando; Schaefer, Alexandra; Schughart, Klaus; Shaw, Ginger; Sheahan, Timothy Patrick; Suthar, Mehul S. (mehul.s.suthar@emory.edu); Swarts, Jessica; West, Ande

Optional Attendees: Ralph Baric; Graham PhD, Jessica B; Michael J Gale

This call will start 30 minutes later than usual and will be brief.

Subject: RE: WHO Working Group on COVID-19 Assay

Dear All,

Please find below the agenda for this week's WHO working group on COVID-19 assays group call.

Best,
Lauren - Bill, Simon and César

Agenda for WHO working group on COVID-19 assays group call Wednesday June 30 2:30PM CET (Geneva Time)

1. Javier Castillo-Olivares Pallardo (Cambridge) - *Defining correlates of humoral immunity to COVID-19 using samples from patients and healthcare workers'*
2. Merryn Voysey (U Oxford) - *Correlates of protection against symptomatic and asymptomatic SARS-CoV-2 infection*

-----Original Appointment-----

Subject: RE: WHO COVID-19 Animal Models Group Call

Dear All,

Please find below the agenda for this week's WHO COVID-19 Animal Models group call.

Best,
Lauren – César, Simon, and Bill

Agenda WHO COVID-19 Animal Models group call Thursday June 24 3PM CET (Geneva time)

1. Rineke de Jonge (Wageningen Bioveterinary Research) - *Vaccine-mediated enhanced disease in a SARS-CoV-2 hamster model?*
2. Julia Port (NIH) - *Western diet increases COVID-19 disease severity in the Syrian hamster*

-----Original Appointment-----

Subject: RE: WHO COVID-19 Animal Models Group Call

Dear All,

Please find below the agenda for this week's WHO COVID-19 Animal Models group call.

Best,
Lauren – César, Simon, and Bill

Agenda WHO COVID-19 Animal Models group call Thursday July 1 3PM CET (Geneva time)

1. David Muller (U. Queensland) - *Complete protection by a single dose skin patch delivered SARS-CoV-2 spike vaccine in mice*
2. Kyle Rosenke (NIAID/RML) - *UK B.1.1.7 variant exhibits increased respiratory replication and shedding in nonhuman primates*

-----Original Appointment-----

Subject: Thanks for the great session

Dear Zhengli, Vineet, and Jesse,

Thanks so much for your very interesting talks for the World Microbe Forum. I was so impressed with the science, and your recordings were really polished.

I hope to see you in person in the future. Take care!

Best,
Kristen

Kristen Bernard, DVM, PhD
Professor of Virology

Research Update Template.xlsx

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

****Cancelling due to the holiday weekend*****

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Marciela DeGrace is inviting you to a scheduled ZoomGov meeting.

Research Update Template.xlsx

Hi everyone,

We are cancelling tomorrow's meeting due to a conflict with the WHO Consultation on COVID-19 vaccine research. If you would like to attend please find information here: https://www.who.int/news-room/events/detail/2021/08/13/default-calendar/who-consultation-on-covid-19-vaccines-research-13-august-2021

Hello everyone,

Thank you for filling out the poll for times. The time that worked best for most people was **Fridays from 8 am – 9:30am ET.** For those of you who preferred the Friday 8:30am start time due to conflicts, please feel free to join when you can during the meeting.

If you have yet to fill out the capabilities sheet, please do so as soon as you can and send to me and Leah Vincent.

Finally, I wanted to let you all know that multiple B.1.1.7 and B.1.351 viruses are now available on BEI. You can find them here.

Thank you, and looking forward to speaking on Friday February 12th.

Marciela

Marciela DeGrace is inviting you to a scheduled ZoomGov meeting.
