Metabiota is the pioneer in comprehensive risk analytics that improve the world's resilience to epidemics. Built on a strong foundation of epidemiology and international field science including a worldwide network of on-the-ground experts, Metabiota delivers actionable, data-driven insights that help countries, governments and corporations manage and mitigate infectious diseases. With a strategic global presence and sustained partnerships, Metabiota's agile approach is helping the world track, transfer and terminate the risk associated with epidemic threats. The company's international footprint includes operations in 20 countries and offices in San Francisco, Washington, China, Canada, and Sierra Leone.

Metabiota currently supports a number of Cooperative Biological Engagement Program (CBEP) initiatives, including the Academic Engagement Partnership (AEP) Program, the Biological Threat Reduction Integrating Contract (BTRIC) in Ukraine, and grants in Tanzania to perform research activities. Metabiota's mission aligns well with CBEP; the entire Metabiota team is focused on supporting our USG Partners in reducing the risk of biological threats worldwide, and employs a collaborative and agile approach to biological risk reduction.

To ensure a successful program, Metabiota, in coordination with CBEP Regional Leadership and in-country partners, has built a team that brings unparalleled scientific expertise and unique access across the international infectious disease prevention, preparedness and response community. This enables us to be an incredible resource for actionable infectious disease intelligence, through the development of analysis methodologies that capture salient data relating to human and animal pathogens of concern, organic national and regional public health capacity, engagement priorities and constraints for the USG, regional and international public health organizations, and non-governmental organizations (NGOs) whose respective aims could impact CBEP objectives.

Project Overview

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Introduction

Through AEP Technical Direction 007, DTRA CBEP USPACOM Regional Leadership tasked the Metabiota team with creating a narrative, needs-based analysis document to DTRA CBEP and PACOM leadership that will capture regional requirements for risk reduction leading to the development of realistic and achievable end-states for the region. The desired analysis is multi-faceted and will include a characterization of the disease landscape within the region, factors that increase the likelihood and severity of disease outbreaks and biological threats, and current regional capacity the address biological threats including stakeholders, networks and initiatives operating within the region.

The Disease Landscape Section will detail current biological threats present in the region and characterize the risk of accidental, naturally occurring, and intentional disease outbreaks and biological events by pathogen. The Regional Capacity Section will include organic regional capabilities as well as an analysis of stakeholders, networks and initiatives operating within the region. This will allow for detailed analysis of the gaps present, as well as an analysis of the effectiveness of different approaches taken to address the biological threat spectrum. Ultimately, the intent of this endeavor is to assist CBEP in developing an informed, targeted and goal-oriented 5+ year strategic plan with measurable and achievable results.

Understanding

The Metabiota team understands that the US Department of Defense (DoD) initiated CBEP through DTRA in order to: secure and consolidate select agents; enhance Biosafety and Biosecurity (BS&S) standards; and strengthen the USPACOM region's ability to detect, diagnose, survey, and report emerging and re-emerging diseases of international security concern and that CBEP accomplishes these objectives in accordance with the World Health Organization (WHO) International Health Regulations (IHR) and World Health Organization for Animal Health Guidelines (OIE). The team further recognizes that to achieve its mission, CBEP works collaboratively with partner nations, U.S. Government agencies, and the international community to enhance disease surveillance capabilities; develop human resource expertise in public and animal health, promote safe and secure laboratory and field work environments; and consolidate pathogens of security concern into a minimal number of safe and secure facilities in a sustainable manner. Through the Academic Engagement Partnership (AEP) Program, Metabiota aims to support the CBEP mission of reducing the potential impact of biological threats through enhanced biological safety and security, awareness of biological risks, and knowledge related to biological pathogens.

In support of this approach, the Metabiota team intends to develop a high-value regional landscape analysis that will support strategic CBEP objectives by informing the regional engagement strategy with the aim of fostering collaboration on topics critical to biological threat reduction, enhancing the regional capacity to perform biorisk management and mitigate the threat of biological events. The team's on-the-ground experience and decades of expertise makes us well positioned to support the execution of this analysis and all of the associated activities as well as scientific engagement in the USPACOM's area of responsibility.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Purpose

The CBEP USPACOM Regional Strategy is being developed to address existing challenges faced within the region and support Country Managers (CMs) in the execution of their five+ year strategic plans. The recent strategic planning efforts within CBEP (multi-year plans, metrics, etc.) require a broader approach to regional analysis and calls for the development of a standardized methodology for information gathering and needs analysis that can support the validation of requirements and enhance the integration of country specific strategies.

To achieve this purpose, CBEP endeavors to develop a five+ year strategic regional plan that will guide DTRA's decision-making and engagements at a regional level. This plan includes but is not limited to: focusing on reducing biological threats, enhancing the transparency and confidence-building between DTRA PACOM and host countries, engaging scientists through cooperative pursuits, and enhancing host-nation capacity in disease detection and reporting, while adhering to international codes of security and safety to ultimately provide a mechanism for sustained engagement.

To accomplish this purpose, DTRA CBEP, through the Academic Engagement Partnership Program (AEP), will engage Metabiota Inc. and its cadre of Subject Matter Experts (SMEs) to provide a regional landscape analysis that will support the development of the CBEP PACOM engagement strategy.

Objectives

Through the collaborative engagement process with Metabiota and the development of the regional landscape analysis, DTRA CBEP will be able to:

- Characterize the region based on the disease landscape, organic regional capabilities, and external factors that impact CBEP objectives;
- Identify needs and areas of overlap with other stakeholders, providing avenues for successful engagement;
- Support regional leadership in providing overarching strategic guidance and goals to CBEP PACOM Country Managers in the development of their country engagement strategies and inform the development of a regional engagement strategy.

Threat Reduction Outcomes

Metabiota will provide a narrative, needs-based analysis document to DTRA CBEP leadership that will capture regional requirements for risk reduction leading to the development of realistic, measurable, and achievable end-states for the region. Additionally, the analysis will promote a global network of research collaborations and develop a sustainable infrastructure for advancing scientific research, including the early detection of emergent threats.

Increasing knowledge through conducting a regional analysis is critical to capacity building efforts across the PACOM region and supports the early detection and response to emerging events, thus safeguarding the world from biological threats. Without completion of the analysis, the region is subject to the following identified risks:

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

- Incomplete country and regional coverage of disease detection, reporting and response systems;
- Increased security threats due to improper handling of pathogens of security concern;
- Limited understanding of pathogens of concern circulating in the region;
- In-country and regional stakeholders with varying agendas, priorities, and goals.

The completion of the regional analysis will mitigate the identified risk factors by:

- Providing a roadmap that will guide regional engagement and develop forward operating presence in the region to facilitate successful, multi-year engagement;
- Informing planning and regional decision-making strategy that supports the CBEP mission and desired end-states;
- Validating the impact of a comprehensive strategy based on an overview of the arena, regional capabilities, the engagement and diseases landscape, identified gaps and areas of synchronicity to support the CBEP mission;
- Supporting a unified and streamlined approach across all countries and bolstering the effectiveness of CBEP Country Managers by providing them with an additional tool to inform their planning efforts, while ensuring roll-up to the overarching vision and mission of CBEP;
- Supporting informed action and engagement that will define CBEP's agenda in the region allowing for clear communication and partnerships with other USG agencies and external stakeholders;
- Optimizing outcomes with focus and defined thresholds for achievement;
- Increasing scientific capabilities through research collaboration and fostering an environment of scientific partnership.

Risk Management

The factors below have been identified as potential risks to project cost, schedule, and/or performance, and included are our strategies for mitigation and minimization of these risks.

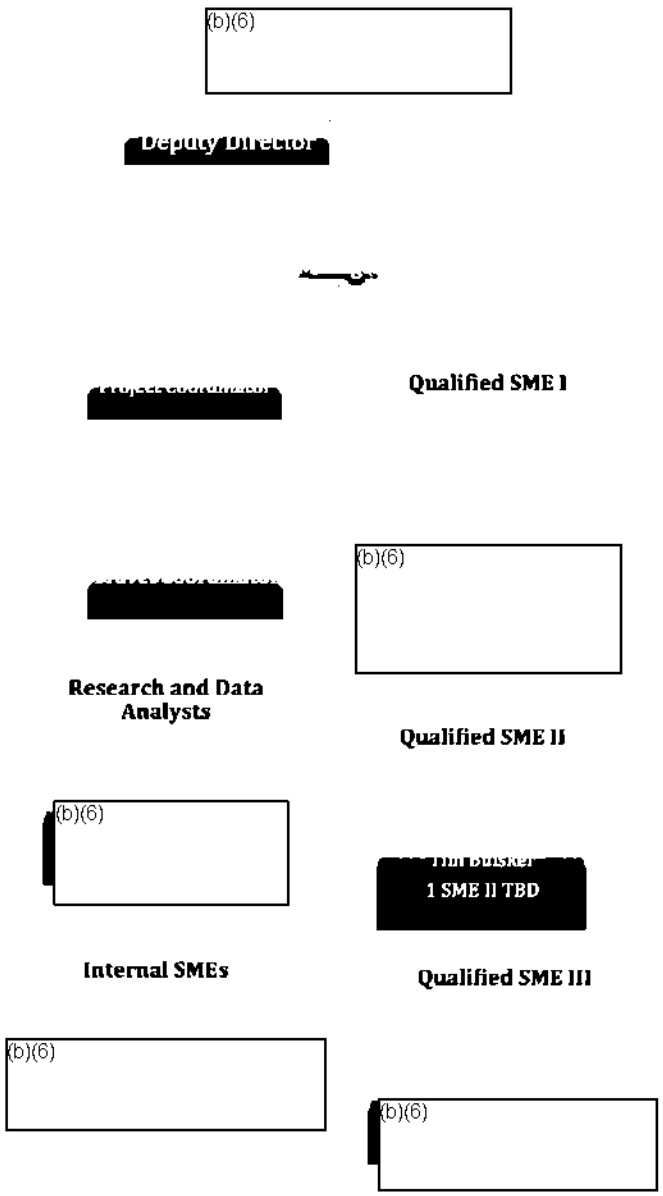
No.	Risk Factor/Rationale	Impact	Likeli hood	Consequence	Risk Level	Mitigation	Likeli hood	Consequence	Residual Risk
1	Short suspense on completing a useable document	Schedule and Performance	5	4	(b)(4); (b)(6)	Metabiota will employ rigor around process with routine scheduling & deliverables to maintain target deadlines	3	3	Medium

2	Broad scope of analysis	Schedule and Performance	3	5	(b)(4); (b)(6)	Metabiota will employ a feedback loop and routine course correction activities through engagement with CBEP PACOM leadership to ensure Scope stays focused on CBEP objectives	3	3	Medium
3	No forward presence in countries- difficult to achieve buy in and get access	Schedule and Performance	5	5		Metabiota will use personnel with local experience and subject matter expertise, as well as in country regional partners	3	3	Medium
4	Incomplete regional coverage- information is fragmented	Performance	5	5		Metabiota will work with stakeholders and provide a broader assessment of the region, in order to facilitate capturing hazards and capabilities, as well as opportunities to engage	3	3	Medium
5	Multiple country managers with different plans and objectives	Schedule and Performance	3	3	Medium	The team will engage country managers as a group and individually, to ensure that this assessment process assists them with their needs, as well as captures the data they collect in their country assessments to drive final results	2	3	Medium

					(b)(4); (b)(6)			(b)(4); (b)(6)
6	Massive amounts of data to sift through	Cost, Schedule & Performance	4	4		Metabiota will engage research analysts and SMEs to compile, coordinate and guide data collection process to include performing routine focused analysis of the data and impact to ensure it is delivered in a useable format to inform the strategic plan	2	1
7	Inability to obtain SMEs with appropriate expertise	Schedule and Performance	3	3	Medium	The Metabiota team will engage SMEs from across the scientific community to capture a larger range of expertise and specialization	2	2
8	Low integration of other U.S. stakeholders	Schedule	3	3	Medium	Metabiota will ensure continuous outreach and collaboration with U.S. partners to maintain open lines of communication	2	2
9	Underutilization of expatriate staff	Cost, Schedule & Performance	3	3	Medium	Metabiota will ensure that SMEs have adequate regional experience	2	2
10	Embassy health working group agendas	Schedule and Performance	3	3	Medium	Development of the assessment, targeted communication strategies and clear engagement activities will reduce barriers faced through competing agendas	2	2

11	Incomplete pathogen coverage	Performance	5	5	(b)(4); (b)(6)	The Metabiota team will engage SMEs from across the scientific community to capture a larger disease landscape that considers threats, as well as opportunities	2	2	(b)(4); (b)(6)

Management Approach



Introduction

Metabiota will employ its existing organizational leadership to interface with Regional Leads and Country Managers as needed to direct the operational and administrative support required to ensure implementation of the Regional Landscape Analysis. Our Southeast Asia Program Manager (b)(6) will oversee operations with the support of a Project Coordinator, Travel Coordinator, Research and Data Analysts and Subject Matter Experts to ensure that all aspects of cost, schedule and performance are monitored and reported to the AEP Contracting Officer Representative (COR) and AEP Program Leadership.

Project Team Structure

Metabiota's project team dedicated to completing this task will include the Metabiota AEP program leadership, the Program Manager, Project Coordinator, Travel Coordinator, Research and Data Analysts, and Subject Matter Experts that will be tasked with specific assignments to support the development and implementation of the regional landscape analysis based on their administrative and scientific expertise. This team of experts will ensure the overall project management and tasks associated with the analysis are met at every level using best practices, and that only the highest level of scientific rigor and expertise is applied to this effort.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

(b)(6)
Deputy Director
Qualified SME I
(b)(6)
Research and Data Analysts
Qualified SME II
(b)(6)
1 SME II TBD
Internal SMEs
Qualified SME III
(b)(6)
(b)(6)

Planning and Design

In communication and coordination with CBEP PACOM leadership, Metabiota will continue to develop the analysis-based strategy development framework required to complete the regional landscape analysis. The process involved in completing the analysis will include working group sessions where CBEP and Metabiota experts will continue to collaboratively build on and revise the previously developed framework and ensure that the collected research adequately addresses and assesses the comprehensive disease and engagement landscape of the region.

To complete the analysis, Metabiota will continue to engage its cadre of SMEs to populate the tool with relevant information. In addition, the team will continue to further enhance and refine questions and context required to address the complete regional picture with CBEP goals in mind. Throughout the research and revision process, Metabiota will engage CBEP for review and approval of the design, structure, and content prior to moving forward.

To complete the analysis, Metabiota will engage:

Research and Data Analysts- to conduct basic research using readily available, open-source information to inform the regional analysis.

SMEs (I, II, III)- to provide their regional expertise in the form of narratives and graphics to build upon the basic research component and already included information. Provide QAQC measures to collected information validating results. We will utilize SMEs in a layered approach based on their level of experience and particular area of expertise. SMEs at level I will validate information gathered by RDAs and ensure that the information is scientifically sound. SME IIs will use their expertise in a broader regional context or across a functional area - for example, epidemiology, microbiology, or disaster preparedness and response, to provide greater focus and context to the analysis. SME IIIs, who have a minimum of 7-10 years of experience in a specialized field, will provide oversight and expertise from their years of direct experience in their chosen field, and will validate, and QAQC material gathered by other researchers. In addition, they will be retained for their level of expertise in a specific field that requires an advanced level of expertise to build out both quantitative and qualitative requirements to complete the analysis.

Internal Collaborators – Metabiota SMEs working outside of the scope of the PACOM project and have regional expertise within the region will be utilized to further elaborate on the landscape and engagements.

Metabiota will follow up this engagement by ground-truthing facts gathered through basic research and engagement of technical SMEs to validate the data and expand on the information received through this process, whenever possible. In addition, Metabiota will maintain routine communication with CBEP leadership and CMs to coordinate external actions targeting areas of overlap to limit redundancy of efforts, and identify opportunities for synergistic engagement.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Execution

The core project management team will maintain oversight and implementation of the project at all times and will ensure rapid execution of the regional landscape analysis, tracking objectives to ensure the project stays within budget and on schedule. The project will be managed according to the phased implementation plan and will be course corrected as needed to ensure target end goals are reached. The following tools will be used to guarantee the project schedule will be maintained:

Project Administration:

1. Weekly team meetings and conference calls will be held to internally review the project achievements, accomplishments, barriers or challenges, and address any changes or updates that are required. The meetings will be scheduled and maintained by the Project Coordinator and will include the PM, SMEs, Research and Data Analysts, and AEP leadership, as needed based on the requirements and stage of implementation.
2. Routine communication to include emails, conference calls, and in-person meetings will be held with CBEP Regional Leadership and Metabiota to provide status updates and ensure course correction through the assessment.

Project Reporting:

1. Weekly status reports will be provided by the PM to senior MB leadership to maintain routine tracking and status updates on the project, and provide space for risk mitigation and internal course correction, as needed to ensure training goals are met.
2. Metabiota will provide weekly status reports to CBEP regional leadership to maintain visibility on project achievements and in support of routine in-person meetings.

Monitoring and Controlling

1. Routine risk assessment will be performed internally among the MB project management team to guarantee the project stays on track. This will be accomplished through the implementation of the project administration and reporting mechanisms.
2. Routine communications will be maintained with CBEP Regional Leadership to ensure the project remains on track and is implemented according to standard.
3. Routine oversight and coordination will be performed to ensure successful execution of the regional analysis. Monitoring will include both administrative and fiscal oversight.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Completion

Maintaining a focused project schedule and achieving targeted objectives through the continued coordination of routine meetings, working groups, and open communication with CBEP Regional Leadership, Metabiota will drive the project to completion by 31 October 2015, with the option to build out and populate a regional disease landscape and engagement dashboard. Following completion of deliverables, review, final validation, a back-and-forth dialogue with CBEP Regional Leadership, and presentation of the analysis, Metabiota will provide after-action reports, debriefings, and follow-on meetings to allow for lessons learned and continuation of solid execution and implementation of activities. Metabiota believes that the experience and management it will bring to this project as well as the continued expertise and support provided by the CBEP team will guarantee success.

Technical Approach

Introduction

Given that DTRA CBEPs mission is to reduce the risk of biological threats, Metabiota will employ a risk-based approach to support CBEP PACOM in the development of the multi-year engagement strategy. The building blocks of this risk-based landscape analysis are the pathogens of concern, the factors that impact the likelihood and severity of an event occurrence, and the policies, practices, and initiatives that aim to mitigate the biological threats present. In

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

order to inform CBEP PACOMs engagement strategy, Metabiota's approach is designed to fully elucidate the risks present, and show areas where CBEP can engage at the lowest cost to achieve the highest impact. Our approach parses the biological threat environment into potential naturally occurring, accidental, and intentional biological events. By doing so, it allows for the characterization of the event by specific factors that impact the likelihood and severity of that specific events occurrence, which in combination with the identification of priority pathogens enables us to identify the baseline risk present for the region of specific biological event scenarios. With the establishment of baseline risk, we are then able to identify and characterize the capacity to prevent, prepare for, respond to, or recover from the specific threat scenarios by analyzing the stakeholders, networks, initiatives, and organic regional capabilities. Once that is done, it allows us to graphically depict the residual risk, as well as identify gaps that DTRA CBEP can target within the region and characterize potential approaches to fill the gaps.

Metabiota will, in coordination with DTRA CBEP PACOM, develop and execute a targeted, analysis-based strategy development framework to collect the regionally relevant information and inform strategic planning.

The analysis-based strategy framework will:

- Facilitate an assessment that captures regional data and analyses to build a 5+ year roadmap/ strategic plan for CBEP engagement
- Address current capacities, capabilities, and gaps in partner country bio-surveillance and biosafety and security systems
- Collect sufficient, usable data to internally identify the appropriate end-states
    - End state: an agreement between CBEP and participating country resulting in "buy-in" for future engagement
- Be a tool to map out and inform the development of consistent, over-arching regional guidance to support country engagement activities
- Incorporate an iterative process between Metabiota and DTRA CBEP, with opportunities for feedback and course-correction
- Be adaptable and scalable to address other regional DTRA needs, or encompass new information as it arises, while achieving the end-state of informing a strategic plan

<u>The framework will not:</u>

- Be an implementation plan, but will inform the DTRA CBEP developed strategic and implementation plan
- Will not duplicate or be redundant to the country assessment tool
- Be an accumulation of country baseline assessments
- It will not dive deep into the gaps and linkages in BS&S, BSV and CBR capabilities across partner nations in the PACOM AOR.

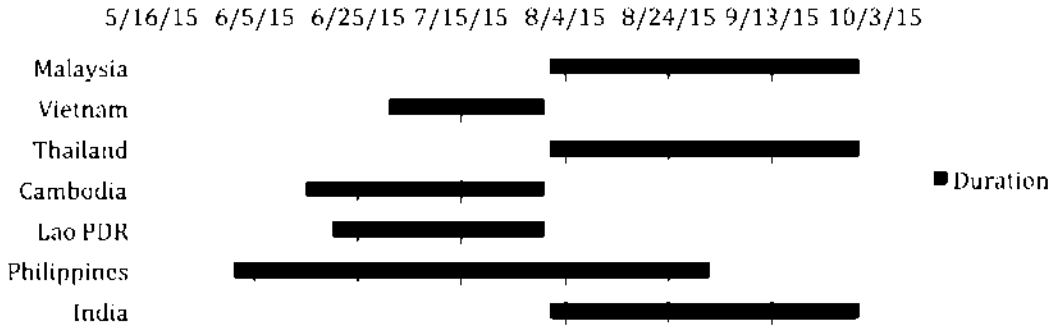
The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

The Metabiota team will perform the regional landscape analysis through a collaborative process that incorporates expertise from academic leaders, other government agencies, international partners, and both regional DTRA CBEP leadership and CMs, and is facilitated through the Academic Engagement Partnership (AEP) Program contract.

Communications Protocols

Metabiota will maintain open communications with CBEP to ensure full visibility on the status and process of completing the analysis. In order to collect the necessary information for completing the Regional Landscape Analysis report, the DTRA CBEP program office will facilitate communications with external stakeholders and participate in communications internal to Metabiota with stakeholders that spend much of their time in support of in-country programs with USAID, DHAPP, and other entities. Metabiota will inform the appropriate DTRA CM and Regional Leads of every intended conversation with U.S. Embassies, other U.S. Government organizations, country representatives, ministries, and other stakeholders no later than five business days prior to the intended date. Metabiota will develop and submit meeting agendas no later than three business days prior to meetings. As with all AEP communication, Metabiota will record meeting minutes for each communication and make them available to DTRA as part of the Monthly Report, if required. Additionally, Metabiota will include a DTRA CBEP representative on all communication to external stakeholders.

Metabiota will used a tiered engagement approach to seek out information via teleconference and in-person interviews (if appropriate) to fill gaps identified in the open source research conducted by Metabiota SMEs. As specific gaps are identified, Metabiota will review the source list of POCs and determine engagement based on area of expertise to solicit targeted information.



Metabiota will follow the below engagement protocol to ascertain the necessary information. If information can be gained by interviewing Tier 1 POCs, Tiers 2-4 will not be engaged. If Tier 1 POCs cannot supply all the needed information, Tier 2 POCs will be contacted, and so on down the list. Metabiota will attempt to work through internal mechanisms first to maintain targeted external engagements, and will only contact external POCs as critically necessary.

Metabiota will engage SMEs in the following order:

1. **Internal Metabiota SMEs (not participating in the PACOM assessment)**: Metabiota SMEs not actively participating in completing the assessment will be interviewed based on their regional expertise and engagement (ex. (b)(6) Director of PREDICT and (b)(6)
2. **Internal DTRA CBEP SMEs (Country Managers – utilizing Country Tool or coordinated interview engagement)**: Coordinated engagement with Country Managers using country tool or collaborative interview process during completion of country assessment, dependent on timing and pre-approved communication protocol.

3. **Consortium Partners and Regional Collaborators**: Metabiota will interview consortium partners and collaborators based in the US and abroad with active regional experience and engagements (ex. EcoHealth Alliance, UC Davis).
4. **Country-Specific Collaborators**: Metabiota will interview country-specific partners dependent on specific information that needs to be garnered to answer regional questions following the above engagements. Metabiota will coordinate with CMs to identify and notify them, per communication protocols, individuals for engagement in specific countries. Metabiota will coordinate with Subcontractors completing country assessments, where appropriate to collaborate on interviews to reduce duplication and the need to reach out to other in-country partners. Where that is not possible, Metabiota will submit a list of identified individuals and a call schedule to the CM and Regional Lead for approval prior to engagement.

Our general timeline for country engagement follows a staggered approach, allowing for time for CMs to socialize with in-country partners and review proposed questions for POCs, as well as allow Metabiota personnel to work with Country Managers to integrate Country assessments, coordinate interviews, as appropriate and sensitize the regional analysis to ensure proper engagement across the region.

Phases of Technical Approach

Phase 1: Continued Research and Active Engagement – Input from SMEs and Internal Partners
Phase 2: Validate, Expand, and QA/QC Analysis
Phase 3: Complete Gap and Approach Analysis, QA/QC, and Review
Phase 4: Post-Analysis: Internal Briefing, CM Briefing, Regional Leads Briefing
Phase 5(Optional): Populate Dashboard Tool

There will be five overarching phases to the technical approach. In Phase One, Metabiota will continue to engage RDAs and SMEs to conduct open-access research using published literature, stakeholder websites, and any other online resources available to source and gather information. Information will be narrative in format and will include graphs, maps, charts and other critical quantitative depictions of the information gathered. Information will be stored in an internal cloud-based server, so that it can be readily accessed and referenced by project personnel.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Researchers will be broken into teams, according to their areas of expertise, and will be assigned sections of the analysis to complete. Information will be uploaded on a weekly basis. In addition to sourcing open access information, expertise from Metabiota technical SMEs, and partners in the US will be used to build on open source research and drive the completion of the analysis. SMEs will be engaged, as-needed to complete sections of the analysis, speaking to their regional or academic knowledge and specifically related to their areas of expertise. This will ensure validity of the information, and integrity of the analysis. Metabiota's SMEs represent all related disciplines and have decades of expertise in areas such as public health, epidemiology, virology, microbiology, cultural anthropology, international affairs, medicine, disaster preparedness/response, veterinary medicine, infectious diseases, and health informatics, among others. Information gathered will be reviewed weekly and will be provided routinely to CBEP regional leads for their visibility and use in course correction.

In Phase Two of the project, Metabiota will validate, expand, and QA/QC the analysis. This will be completed through the engagement of CBEP SMEs, regional collaborators, and country-specific collaborators, when necessary and appropriate, to further enhance specific components of the analysis and include expertise and knowledge not available through open-source networks. The team will coordinate with CMs to share information and avoid duplication of efforts as respective country assessments are completed, to include participating in joint interviews with in-country collaborators. Metabiota will work to address any country-specific concerns that fold into the analysis (ex. Animal trade across borders in Lower Mekong Delta Region), as requested by individual CMs. The team will provide CBEP with a list of potential POCs, Engagement Plan, questions to be asked/gaps to be addressed with individual POCs, allowing for time for CBEP to socialize with in-country POCs as needed. Metabiota will work with CMs to ensure that interview questions are consolidated, so that interviews can be as efficient as possible. Additionally, Metabiota will ensure that CBEP CMs and Regional Leads have full visibility on all potential in-country contacts, topics to be discussed, and availability to be present for interviews as desired. Once CBEP has granted approval to move forward and POC interviews are conducted, Metabiota will provide interview notes to CMs and Regional Leads.

During this phase, Metabiota will consolidate all of the baseline information gathered in the creation of the Pathogen Profiles, Likelihood and Severity Factor (L&S) Profiles, and Stakeholder, Network, and Initiative Profiles into an overall view of the Regional Disease Landscape and Regional Capacity Landscape. The Disease Landscape will divide the pathogens of concern into potential origins of a threat event including intentional, naturally occurring, and accidental use, and provide a targeted overview of pertinent regional information. The Capacity Landscape will provide the relevant information regarding regional disease detection, diagnostics, and reporting, BS&S, and cooperative biological research capabilities. Factors included in the profiles, and further identified in the capacity and disease landscape analysis will be weighted accordingly within a scenario driven approach that identifies areas of risk, and will show areas of opportunity that would reduce risk and provide a platform in which to define metrics for mitigation. This will be further articulated through the completion of the gap and approach analysis during phase three.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

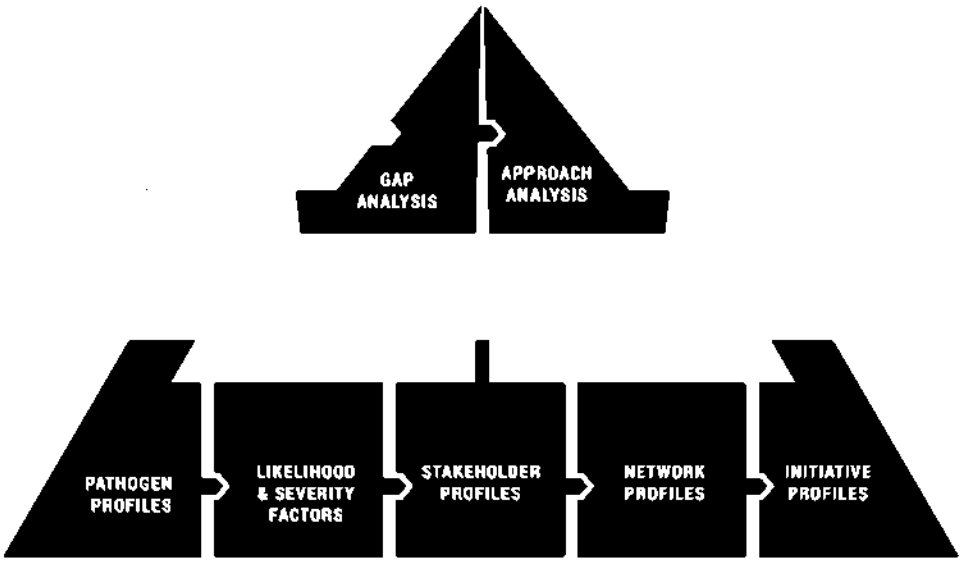
In addition, Metabiota will begin the QA/QC process to ensure accuracy and completeness of information, as well as editing and design of the document. This process will take place throughout Phase two and three, to guarantee validity, clarity, and integrity in the information gathered and presented in the final analysis.

Phase Three of the project will consist of reviews of gathered information to ensure accuracy and completeness, and confirm that information meets quality standards. Metabiota will engage SMEs, RDAs, graphics support personnel, and leadership teams to conduct multiple review and editing cycles of the analysis in order to ensure accuracy and completeness of the information gathered. Additionally, the team will conduct a gap analysis to collect information that could not be confidently assessed during the previous phases. The Gap Analysis will address gaps across multiple areas including disease detection, diagnostics, and reporting, BS&S capacity, geographic coverage, and understanding of specific pathogen characteristics. The team will use all of the baseline information gathered, the Disease and Capacity Landscape sections, and the Gap Analysis in order to create an Approach Analysis that will identify proven techniques that can be leveraged or emulated to achieve CBEP objectives. This section will address capacity building activities, increasing sustainability, increasing compliance, fostering meaningful collaboration, and increasing the scientific body of knowledge.

In addition, the gap analysis will speak to acknowledged gaps in the analysis, itself, identifying areas where information could not be sourced or located, and recognizing specific areas of the report where further research would be required. As well, using SME expertise, Metabiota will determine the underlying confidence in the collected information to ensure the accuracy of the analysis. The gathered information will be classified into three categories, and color-coded for easy reference:

1. Green- Information is known or verifiable
2. Yellow- Information is directly accepted, but not directly verifiable
3. Red- Information cannot be verified or is inference-based

This will visually depict the confidence in the gathered data and will support the accurate completion of the approach analysis.



While completing the Gap and Approach Analyses and continuing to review and rework the collected material as needed, the team will collaborate with individual CMs in order to provide beta testing of compiled information. CMs insight into the level and type of information gathered will be critical to ensuring a robust analysis that both provides regional insight and meets CM need at a country-specific level.

Phase Four of the project will consist of a post-analysis of the assessment with in-person briefings provided to CBEP CM and Regional Leads, and other identified stakeholders as directed by CBEP.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

In Phase Five (Optional) of the project, Metabiota will create a dashboard tool that will provide CBEP with data on disease outbreaks and spread presented in a powerful and insightful way. Metabiota's core competencies of data analysis visualization and risk assessment and mitigation strategies will drive the establishment of a tool for CBEP's continued use.

Our process, illustrated:

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Timeline and Milestones

Continued Research and Active Engagement - Input from SMEs and Internal Partners

Validate, Expand, and QAQC Analysis

Disease and Capacity Landscape Drafts Completed

- Gap & Approach Analysis, Final QAQC and Review

QAQC Completion, Gap and Approach Analysis Draft Completed

Independent Review, Revisions

Continued Revisions Following QAQC and Integrating CBEP Feedback

Draft Analysis Due

Post-Analysis: Internal Briefing, CM Briefing, Regional Leads Briefing

A copy of the updated timeline and milestones for the project will be provided via Smartsheet, and updated regularly to include an updated status and completion percentage for each section of the analysis. Key milestones and dates for the project are subject to change, but currently include:

- Basic Research Completed 7/30/15
- Disease and Capacity Landscapes 7/30/15
- Gap and Approach Analysis Drafts 8/21/15
- QA/QC Completion Date 8/21/15
- Independent Review 8/28/15
- Draft Deliverable Due 9/1/15
- Continued Review and Revisions Following QA/QC and CBEP Feedback 9/1/15-9/30/15
- Final Deliverable Due 10/1/15

Phase 1 – Continued Research and Active Engagement – Input from SMEs and Internal Partners (16 May – 30 July)

Objective: Completion of the targeted, informed baseline regional analysis identifying regional capabilities, capacities, enhancements, and gaps in regional BS&S systems to inform the CBEP strategy, with a focus on risk analysis and mitigation.

Process: During this phase, Metabiota will conduct open-access research using published literature, stakeholder websites, and both expertise from Metabiota technical SMEs and partners in the US to continue compiling and completing the regional analysis. Metabiota will hold regular working groups with CBEP Regional Leads to solicit feedback and review of the analysis and to course correct as needed.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Deliverables: Submission of a working draft of the analysis as well as regular document section reviews.

Phase 2 – Validate, Expand, and QA/QC Analysis (8 June – 31 August)

Objective: Engage DTRA CBEP SMEs, Regional Collaborators, and Country-Specific Collaborators to further enhance specific components of the analysis and include expertise and knowledge not available through open-source networks.

Process: Metabiota will coordinate engagement and cultivate synergies with Country Managers during completion of ongoing in-country assessments, depending on timing and pre-approved communication protocol. Upon CBEP approval, Metabiota will engage consortium partners and collaborators based in the US and abroad with active regional experience and engagements (ex. EcoHealth Alliance and UC Davis). Metabiota will identify gaps in available information and coordinate with CBEP Leads to plan, review and approve any and all communication with in-country collaborators. Additionally, Metabiota will conduct CBEP-desired ground-truthing exercises to include working groups, symposiums, table-top exercises, and site visits with in-country partners, technical SMEs, DTRA CMs, and other key stakeholders to validate, expand and provide deeper insight/guidance for completion of the tool. In addition, Metabiota will begin QA/QC analysis of the gathered information.

Deliverables:

- Submission of a working draft of the Engagement Protocol for review as well as regular document section reviews.

Phase 3 – Complete Gap & Approach Analysis, Final QA/QC and Review (15 July – 30 September)

Objective: Complete the gap and approach analysis. Review gathered information for accuracy and completeness, and ensure that information meets quality standards. Edit for content, clarity, and style.

Process: Metabiota will engage SMEs, RDAs, graphics support personnel, and leadership teams to conduct multiple review and editing cycles of the analysis in order to ensure accuracy and completeness of the information gathered. Information will be weighted according to confidence and validity ensuring integrity in the final product. Congruently, Metabiota will complete the gap and approach analysis, and will work with CBEP to ensure the final deliverable format and presented information is captured in a way that meets CBEP needs.

Deliverables:

- Complete Regional Baseline Analysis report to inform CBEP's strategic objectives.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Phase 4 – Post Analysis: Internal Briefing, CM Briefing, Regional Leads Briefing (1 – 31 October)

Objective: Complete regional landscape analysis and present it to CBEP Regional Leadership. Present analysis and potential for follow on in briefings to CM and Regional leadership, and others, as identified and requested by CBEP.

Process: Metabiota will complete the regional analysis, and present it to CBEP leadership, personnel and other identified stakeholders, as directed by CBEP via briefings, and in-person presentations.

Deliverables:

- Briefings to CBEP team members.

Phase 5 (Optional) – Populate & Develop Dashboard Tool (1 November 2015 – 15 May 2016)

Objective: Population of Interactive Layered Dashboard Tool

Process: Metabiota will create a powerful, layered dashboard tool that will provide CBEP with data on disease outbreaks and spread presented in a powerful and insightful way. Being able to better visualize epidemic and biological threat risk in the PACOM region will provide CBEP with unparalleled outbreak surveillance and risk analysis capabilities, will enable CBEP to more effectively and efficiently respond to regional disease risks, and will facilitate a more impactful strategic engagement plan in upcoming years.

Deliverables:

- Provide CBEP with a populated dashboard tool that contains all relevant information.

Metabiota Key Personnel

(b)(6) Deputy Director

(b)(6) is the Deputy Director of the Academic Engagement Partnership (AEP) Program and an Internationally Certified Emergency Manager (CEM®) with 14 years of experience leading, managing, and consulting on the full spectrum of Counter Weapons of Mass Destruction (CWMD) operations and Chemical-Biological Defense programs, as well as research and development in support of joint task forces, special operations forces, other government agencies, and the Department of Defense on the strategic, operations, and tactical level. (b)(6) driven leader with a proven track record of building value with partners through the identification of capability gaps, and the development and validation of effective solutions

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

to the unique challenges faced when dealing with Chemical, Biological, Radiological, Nuclear, and Explosive (CBRNE) threats. In addition, he is well versed at risk analysis and management, strategic planning, policy analysis and political engagement.

(b)(6) outheast Asia Regional Program Manager

(b)(6) s the Southeast Asia Regional Program Manager of the Academic Engagement Partnership (AEP) Program with over eight years experience as a global health project / program manager, with a focus in SE Asia regional activities, having lived and worked in Cambodia for four years supporting DoD efforts in the region. Since joining Metabiota in 2010, she has managed DTRA CBEP engagements in West and Central Africa, to include Ebola response efforts, as well as spending three years as the Program Manager on projects funded by USAID, AFHSC GEIS, BEP, NIH, USAMRIID, and HJF spanning all regions of Metabiota engagement.

Subject Matter Experts 1

(b)(6)

(b)(6) olds a PhD in Health Economics, Health Services and Policy Research from the University of Alberta School of Public Health. He has served as a Health Economist for the Institute of Health Economics, and also as a Lecturer in Health Economics at Hanoi Medical University (b)(6) s an IAS/NIDA Research Fellow in Health Economics, Drug Abuse and HIV/AIDS for the Johns Hopkins Bloomberg School of Public Health. He has extensive experience consulting for various international and governmental organizations including the World Bank and United Nations agencies, on global health and development issues in Southeast Asia. Much of his work focuses on determining cost-effective interventions, assessing health services and innovations, and strengthening health systems, particularly related to HIV/AIDS and emerging diseases within the region.

(b)(6)

(b)(6) has more than 10 years in infectious disease research, with graduate coursework in epidemiology and public health. She has designed, conducted, and analyzed experiments that directly contributed to the funding of a successful R01 grant application resulting in $1.25 million in funding over five years. She most recently served as a research fellow for the Laboratory of Infectious Diseases at the National Institute of Allergy and Infectious Diseases, National Institutes of Health. Previously, she served as a Quality Control Biochemist at INOVA Diagnostics.

(b)(6)

(b)(6) experience as a program manager and intelligence analyst with eight years of

in-country experience in conflict zones and transitional areas including North Africa, the Middle East, Central America, and the Andean Region. He has an MA in International Affairs from Tufts University, and has worked as a Graduate Intelligence Analyst at MetLife Global Corporate Security in the Intelligence and Risk Analysis Division. He also has experience in using Geospatial Information System (GIS) software to assess crisis response for high-threat/high-risk scenarios, configure corporate contingency plans, and create briefing documents.

(b)(6) roject Coordinator

(b)(6) will be engaged as the Project Coordinator for this effort. She joins the team following completion of an MBA with experience in project controls, coordination, strong writing and editing skills and will bring a business approach to the project, keeping track of all deliverables, scheduling, and facilitating coordination with both internal and external stakeholders. In addition to her business expertise (b)(6) worked as a Data Technician and Interviewer for NIH/CDC sponsored studies, while completing her undergraduate work at Duke.

(b)(6)

(b)(6) s a Research and Data Analyst supporting the Academic Engagement Program. Before joining Metabiota she worked as a Health Consultant with UNICEF-Liberia for two and half years where she coordinated the implementation of community based maternal, neonatal, and child health interventions. While earning her MPH, Elma was a Graduate Research Assistant for the Mercer University Center for Rural Health and Health Disparities where she conducted qualitative and quantitative data collection and analysis, supported local government and NGOs with policy development and implementation, and was a Research Intern at the Centers for Disease Control and Prevention.

(b)(6)

(b)(6) has over 10 years of experience developing, conducting, and managing public health research projects, as well as transforming research questions into operational study protocol and building data systems infrastructure. He holds an MA and PhD from the New School for Social Research and has served as a researcher for the Substance Abuse Unit, Department of Public Health in San Francisco, as well as the Center for AIDS Prevention Studies, University of California San Francisco.

(b)(6)

(b)(6) has over 10 years of experience in the public health sector, specifically in EMS emergency management and health education. He holds an MPH in Public Health, as well as a Graduate Certificate in Emergency Preparedness and Response. He has served as a Jurisdictional Coordinator at Hassett Willis & Company, Adjunct Faculty at the Loma Linda

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

School of Public Health, and as a Regional Disaster Medical Health Specialist for the Riverside County Department of Public Health.

Subject Matter Experts II

(b)(6) a biomedical scientist and science communicator with 10+ years of research experience in the microbiology, immunology, epidemiology, and pathogenesis of infectious diseases. She is also involved in global health and science outreach, advocacy, and communication, including through social media. She has extensively written and published her research in academic journals and presented at international scientific meetings, and has composed technical reports on leading topics in global HIV epidemiology and program implementation. She has served as a science writer/communicator/content producer for the World Bank Global HIV/AIDS Program as well as Independent Global Health and Science Consulting in Washington, DC, and was named one of the "100 Women Leaders in Global Health" by The Graduate Institute Geneva in 2014.

(b)(6)

(b)(6) a DVM from the University of California, Davis School of Veterinary Medicine, a PhD in Comparative Pathology and Viral Pathogenesis from the University of California, Davis, and an MS in Disease Ecology/Population Biology from the University of Virginia (b)(6) previously worked as an Instructor at the University of Virginia, and a Guest Instructor at the University of California, Davis. She has been a key member of several CDC Outbreak Response Teams: the Ebola Hemorrhagic fever outbreak response team in Kenema and Bo, Sierra Leone in 2014; the Marburg Hemorrhagic fever outbreak response team in Kabale, Uganda in 2012; the Filovirus Bat Ecology Team in Kitaka Mine, Uganda in 2012; and the Rift Valley fever virus Vaccine Initiative team in collaboration with Deltamune Pty., South Africa in 2010.

(b)(6)

(b)(6) xperience includes three years as an epidemiologist and program evaluator with the SC Department of Health and Environmental Control as well as a combined eight years of emergency preparedness and response experience including positions with a disaster preparedness and education firm, Emergency Medical Technician, and leading disaster response and recovery teams. (b)(6) s an experienced writer, researcher, and mixed methods evaluator with expertise in quantitative and qualitative data collection, analysis, presentation and grant writing.

(b)(6)

(b)(6) is a Data Manager with varied experience in biostatistics, statistics consulting, and data analysis. He holds an MPH in Epidemiology/Biostatistics and a PhD in Epidemiology from UC Berkeley. His dissertation was on health outcomes after low CD4 cell count and mathematical models of HIV transmission. Dr. Buisker has served as a Data Manager for the University of California, San Francisco and a Statistical Consultant for Metabiota. He has also served as an Assistant Statistician for the University of California, San Francisco and for RTI International.

TBD SME II

Subject Matter Experts III

(b)(6) – Senior Scientist

(b)(6) received his BA in Biology at Earlham College, his MD at Michigan State University, his MPH at Harvard University, and his MS in Biostatistics at Harvard University. He has most recently served as a medical epidemiologist and Health Informatics Branch Chief for the CDC's Global Aids Program (GAP) at the American Embassy, Lusaka, Zambia. As the Health Informatics Branch Chief (b)(6) directed the initiation, funds procurement, staffing, design, development, and national deployment of the SmartCare Electronic Health Record (EHR) System for a decade, growing to service over 770 facilities and more than 1,000,000 persons (>500,000 HIV positive), and collaborating with over 20 implementing partners.

(b)(6) has previously worked as a Medical Epidemiologist for the Centers for Disease Control and Prevention in Zambia covering three areas: surveillance activities including continued monitoring of the HIV epidemic in Zambia through HIV & Syphilis Antenatal Clinic Sentinel Surveillance (ANC SS) for 2006 and 2008, and the newer concerns of HIV drug resistance monitoring, drug resistant tuberculosis, and avian influenza; monitoring and evaluation (M&E) of PEPFAR program activities as part of a rapidly expanding CDC-Zambia budget (from $3M to $100M in five years); and managing the Information and Communications Technology (ICT) systems infrastructures for rapidly growing staff, nationally distributed offices, and new USG WAN security certification requirements.

(b)(6) Epidemiologist

An infectious disease epidemiologist with over 10 years of experience in development and implementation of epidemiologic and clinical research studies in international settings. She currently serves as the scientific technical lead on epidemiologic studies of various infectious diseases, including Lassa fever and Ebola, to characterize the morbidity, mortality and risk factors associated with disease and clinical outcome. Her vast experience includes clinical project management during the translational phase from pre-clinical studies through to implementation of Phase 1/2 clinical trials, with focused experience in managing all aspects of

clinical trials related to infectious diseases including pre-clinical toxicology studies, cGMP manufacturing, IND submission, clinical study design and protocol development, ICF and CRF development, IRB submissions, clinical trial conduct, immunological analysis, database development, statistical analysis, interpretation of results, and manuscript preparation.

(b)(6) Director of Behavioral Sciences

(b)(6) s a Medical Anthropologist with extensive experience coordinating behavioral research projects at sites in Asia, Africa (Cameroon, Gabon and DRC) and the US.

She has vast knowledge in planning field engagement and leading field teams in conducting formative research, integrating social scientific methods including key informant interviews, focus groups, behavioral trials, and other qualitative approaches with high-risk populations, including bushmeat hunters, butchers, vendors, and consumers; sex workers and the military throughout Central Africa.

(b)(6) enior Scientist

(b)(6) joined Metabiota in April 2013 as an expert on Emerging Diseases and Biosecurity. As a medical researcher and formerly Research Director for the French Institute of Research for Development (IRD, Marseille, France), he has spent his career working in and for developing countries of South America, Africa and Asia (1979-2012). His areas of focus include viral disease epidemiology, virus ecology, arboviruses, viral hemorrhagic fevers and understanding fundamentals of disease emergence. Since the late 70s, he has led international teams with partner institutions in developing countries, as well as teams of virologists at the International Network of the Institute Pasteur (Dakar, Senegal; Bangui, Central African Republic). Dr. Gonzalez worked for several years as a guest researcher at the Special Pathogen Branch of the Centers for Disease Control and Prevention (CDC) in Atlanta (Georgia, USA), as a visiting scientist at the Arbovirus Branch of the CDC in Fort Collins, and as a visiting professor of Epidemiology and Public Health at the Yale School of Medicine (New England, USA). In addition (b)(6) as worked to enhance high security laboratory practices and research (CDC, Yale), and on the early development of geographical information systems applied to Public Health and Infectious Diseases (Yale). From 1997 to 2007, he was invited to Mahidol University in Thailand as a visiting professor of Microbiology, where he founded the Research Center for Emerging Viral Diseases and developed a Technical Platform for the study of Emerging Vector-Borne Diseases (b)(6) has developed several innovative concepts including the evolution of viruses on the geological time scale and co-evolution as a general mode of evolution, among others.

(b)(6)

s an experienced leader in both the strategy and execution of data visualization with degrees in engineering, visual communication, and computer science. He has served as the lead UI/UX Designer for the Bates Creative Group as well as the Founder/Creative & Art

Director for Creative Manner Design Studio. His focus includes graphic design, map design, and user interface design, and his expertise includes Illustrator, CSS3, HTML 5, corporate branding, both graphic and print design, art direction, and brand development.

Research and Data Analysts

(b)(6)

(b)(6) joined Metabiota after completing her MPA in International Management. She has five years experience working in international development abroad and domestically, ranging in scope from a macro-level international development bank to micro-level grass roots development work. Her areas of expertise include project coordination, monitoring and evaluation, and event logistics. Before joining Metabiota she worked for two and a half years in rural Mozambique as a Community Health and NGO Development Volunteer with the US Peace Corps, implementing public health projects with local community health clinics and international donors.

(b)(6)

is a Research and Data Analyst supporting the Academic Engagement Program. She graduated magna cum laude from Wake Forest University in 2014 with an undergraduate degree in Politics and International Affairs. While earning her degree, Meredith was a research assistant analyzing the content and context of changes in the constitutional status of citizenship in Latin America. Her extensive undergraduate thesis earned her departmental honors.

(b)(6)

comes from a strong and varied research background, with first-hand experience both in the lab and in the field in ecology, evolutionary genetics, and virology. From her experience working at the leading edge of pandemic influenza research at the National Institutes of Health, she brings knowledge of the latest developments in the field. She is also skilled in the planning and implementation of environmental monitoring of large facilities as well as employee compliance through her work at an FDA-regulated contract lab.

(b)(6)

(b)(6) raduated from Yale University in 2014 with a BA in Environmental Studies, and is currently pursuing her MPH in Environmental and Occupational Health Sciences at the University of Washington. She has served as a Research Assistant at the University of Washington – Department of Environmental Health Sciences Microbiology Laboratory, as well as a Research Scientist at the Yale University School of Public Health. Her relevant coursework includes: Infectious Diseases of International Importance, Epidemiology, Global Health, and Environmentally Transmitted Microbial Hazards.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Metabiota Internal SMEs

(b)(6)

(b)(6) earned his Ph.D. in the field of molecular genetics at Rice University, before taking the role of Director of Research at mAbGen. There, he designed and built the prototype of their technology platform, a novel device to accelerate early stage drug discovery. The team's work spanned many scientific fields and resulted in a peer-reviewed scientific paper. In conjunction with the CEO (b)(6) set the company's strategic direction, evaluated competing technologies, and assessed larger biotechnology and pharmaceutical companies as potential strategic partners or acquirers for their technology. He also served as an Associate at Booz Allen Hamilton, where he provided strategic, policy, and technical advice toward reducing the threat of global disease outbreaks. Parts of these duties included the assessment, development, and management of international biological research programs funded by the US Department of Defense. He also facilitated discussions with key individuals in US and foreign government agencies and the private sector.

(b)(6) Director of PREDICT

(b)(6) recently joined the Metabiota team as the Director and PI for the USAID funded PREDICT program operating in Africa and Southeast Asia, and Metabiota's Director of Epidemiology and Information Management. (b)(6) comes to Metabiota following a successful tenure as Associate Director, Wildlife Health Monitoring and Epidemiology at WCS Canada. For his Ph.D. he studied how wolf predation and disease interact to affect the population dynamics of wood bison in northern Canada. His work focuses on wildlife diseases that either directly threaten wildlife conservation through impacts on wildlife demography, or indirectly threaten wildlife through human activities to control perceived or real threats to human or livestock health. He has worked on conservation / health issues like foot and mouth disease in Mongolian gazelles, bovine tuberculosis and brucellosis in American bison, chronic wasting disease in deer, and avian influenza in wild birds.

(b)(6) – Director of Surveillance, PREDICT

(b)(6) has many years experience working and living abroad providing operational and scientific research support in Africa and Asia related to emerging infectious disease. Her focus has been in the operational set up of research sites and managing surveillance operations. Her efforts have directly increased laboratory diagnostic capacity, as well as the capacity to control and respond to emerging infectious diseases in the countries that she has worked in. She now is the Director of Surveillance Operations for the PREDICT 2 program at Metabiota overseeing wildlife, livestock and human surveillance programs in over 8 countries across the globe. Corina was promoted to this position following 5

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

years spent in Guangzhou, China managing Metabiota's China office and Southeast Asia regional engagements.

Metabiota External SMEs and Stakeholder Relations-Resources in Region (including, but not limited to):

UC Davis	Institut Pasteur	AAHL
Wellcome Trust	Mahidol University	Eijkman Institute for Molecular Biology
Eco Health Alliance	UTMB	BEP
WCS	WHO	
Duke NUS	US-CDC	
NAMRU-2	Host Country Ministries & NGOs	

Cost Management

The Metabiota team and all partners will maintain an acute focus on cost management to ensure that this engagement is delivered at a reasonable cost to the government. Our team will ensure accurate and responsive financial reporting and will facilitate cost savings to the Government wherever possible. Our team will facilitate cost savings by employing a multi-pronged strategy which includes utilizing globally matrixed staff to provide their expertise at key junctures and providing ramp-up/ramp-down capability through the use of independent consultants and part time/on call (PTOC) personnel to fill key roles for limited duration.

Budget Narrative

Period of Performance

The Period of Performance for this effort is 16 May 2015 to 31 October 2015.

Labor

Metabiota's support of this effort is based on the solid expertise and cadre of exceptional researchers and SMEs the organization has on hand, and has engaged to support this project. Critical to developing an informed, targeted, and useable analysis is the reliance on field-specific expertise to inform and drive the regional assessment using risk analytics, scientific rigor and in-depth research analysis coupled with QAQC measures to provide an informative, pointed landscape of the PACOM region that will support CBEP's 5+ year strategic plan and programmatic metrics. SMEs from a variety of disciplines have been and will be engaged to support this project to ensure all aspects of the analysis are captured to include the disease landscape, political and economic environment, legislation and governmental requirements, cultural, religious and behavioral practices, geographical and environmental issues, security concerns, and the interstices and overlapping confluence of aspects that make this a multi-faceted assessment recognizing and addressing a dynamic and changing landscape. Key to the development of this framework is driving it to an end state that will support CBEP's long-term

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

mission in this area of operation. Metabiota's diverse team is dedicated to supporting this endeavor and bringing this project to completion. The experience of Metabiota's project management team, lead by (b)(6) is focused on achieving the desired end state and has built out the required labor to support this endeavor through rigorous recruiting and recognition of qualified experts. Team members supporting this effort are providing various levels of effort depending on their expertise and the required support needed to address specific components of the analysis. Utilizing a flexible schedule, and a cadre of team members, Metabiota can ramp up or down activity levels to address, build and support the needs required to complete this effort.

Costs for direct labor to support this activity is required for the following personnel:

Metabiota SEA Program Manage (b)(6) to oversee and execute the project to include management of the cost, schedule and performance. In addition, she will provide direct management and oversight of all project personnel to include labor and reporting, driving the project to completion.

Metabiota Project Coordinator (b)(6) will oversee the day-to-day activities of the project, as the key POC in Washington DC, supporting (b)(6) the overall execution of this work. She will coordinate daily with project staff, CBEP regional and country leadership to ensure they are provided routine visibility on the project to include coordination of in-person meetings, weekly reports, and analysis updates.

Subject Matter Experts 1, (b)(6) (b)(6) are required to provide experience and development, review, and adaptation of research documents and deliverables, as well as general research activities and facilitation of scientific collaboration.

Subject Matter Experts 2 (b)(6) and ye (b)(6) s are required to provide experience and development, review, and adaptation of research documents and deliverables, as well as general research activities and facilitation of scientific collaboration. This team is skilled in risk management, environmental studies, GIS, cultural anthropology, veterinary sciences and other related disciplines. This teams conducts open source research, validates the collected data, develops pathogen profiles, socio-economic, behavioral, and cultural components of the landscape, as well as provides critical scientific writing and editing skills to ensure document flow and mapping of information.

Subject Matter Experts 3 (b)(6) (b)(6) u are required to provide extensive experience and development, review, adaptation of research documents and deliverables, data and mapping visualization support, as well as general research activities and facilitation of scientific collaboration. Experts at this level bring a breath of regional and international experience to the project specifically focused in their areas of expertise to include microbiology, virology, health informatics, medical anthropology, and data analytics. This team provides QA/QC measures to

validate the data, as well as being a critical part of the team in collecting and driving the strict research aspects of this assessment.

Research and Data Analysts, (b)(6) (b)(6) are required to conduct general research activities and assist in document review and editing. This team makes up the general open research group of the project providing much needed daily research into all aspects of the analysis and supporting SMEs in developing and building out the assessment.

Additional costs for direct labor supporting the Deputy Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office. Additionally, SMEs within the organization may provide subject matter expertise from time to time to validate collected information or provide regional accuracy based on their expertise. Their time in doing so is not being requested for this effort.

Materials

EndNote is the industry standard software tool for publishing and managing bibliographies, citations, and references on the Windows and Macintosh desktop. We are requesting five EndNote licenses to support SMEs use of the software to accurately and professionally cite and reference all open source information gathered in support of this project. EndNote will standardize and format all citations in the document, reducing labor time and effort required for this endeavor. In addition, EndNote has networking capabilities allowing files to reside on a single server and the team to share references and results maximizing productivity.

Journal access is being requested to source critically valuable scientific information and publications providing key scientific findings and data supporting open source information gathering required to build out pathogen profiles and the disease landscape section of the regional analysis. Access to top journals includes Nature, New England Journal of Medicine, and the Journal of Virology.

Papers is an industry standard reference management software tool used to manage and organize references and maintain a library of PDF versions of scientific publications, as well as provides a uniform interface for document repository services, metadata editing, full screen reading and a variety of import/export capabilities that makes it easy to manage scientific resources. Five Papers licenses are being requested to support the online management and sharing of research publications contributing to the development of the regional landscape

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

analysis allowing SMEs to maximize productivity through data management, sharing and standardizing library resources.

Graphic Services are being requested to support the development, design and completion of the regional landscape analysis to provide CBEP with a highly professional document that can be distributed according to CBEP protocol or requirements. Utilizing graphic services is required to support the layout and flow of the framework, while incorporating the required mapping, tables, charts, and quantitative information supporting the narrative text, in a way this easily understood, delivered and best utilized by the end-user, delivering a polished finished product.

Communication costs are requested to support project personnel during international travel to ensure communication with SMEs is maintained and that contact with in-country partners is facilitated, should it be necessary for supporting collection and validation of information pertaining to the regional landscape analysis. In addition, communication costs are requested to support routine Skype communications with domestic and international project personnel, and partners to maintain routine communication necessary for the management of the project, conduct interviews with SMEs and in-country collaborators to build out the analysis and ensure validation of information collected.

Office materials and supply costs are requested to support routine development of the landscape analysis to include printed materials for presentation and delivery to CBEP during bi-weekly meetings, presentations and documents for CMs, and in routine course-correction and evaluation of gathered material to facilitate the completion of the assessment. Office materials and supplies include CDs and thumb drivers, printer paper, printer ink, highlighters, pens, white board supplies, and other related materials necessary for the project.

Cloud-based document management licenses are requested for five users to support Metabiota's use of Box to manage all project documents in support of shared materials, productivity and ensuring version control among the project team. In addition, as many of Metabiota's SME's are remote, the cloud-based system provides an interface in which materials can be easily tracked, accessed and managed for optimal organization.

Video conferencing and SMART board licensing and communications are required for five users to support enhanced communications across the project and provide an interactive environment supporting a collaborative and "think-tank" work space to outline, design, develop, and continue to enhance the analysis framework allowing team members to compile notes, images and other media into virtual notebooks stimulating product development and achieving the desired end state of a polished, directed outcome in support of CBEP's mission.

Other Direct Costs

Per contract guidelines Defense Base Act (DBA) insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all personnel for the period of

performance for this engagement. In addition, DBA insurance will be secured for Metabiota personnel traveling internationally in direct support of the regional analysis.

Travel

At the request of DTRA, travel is required for (b)(6) Southeast Asia Program Manager to travel to New Orleans to attend PACOM meetings, as well as the American Society for Microbiology General Meeting and to conduct working groups with DTRA CBEP Regional Leadership.

Travel is requested for (b)(6) Southeast Asia Program Manager to travel to Washington, DC to support management of the overall project, to include engagement with CBEP Regional Leadership at in-person meetings to provide status updates and course correction, integration and management of SMEs and other project personnel, external partners and in support of synergistic efforts with subcontractors conducting country assessments.

Travel is required for (b)(6) Deputy Director of the AEP Program to travel to Manila, Philippines to attend the World Health Organization Western Pacific Regional Office (WHO/WPRO) Technical Assistance Group (TAG) meeting on the Asia Pacific Strategy for Emerging Diseases (APSED).

Conclusion

Metabiota is committed to supporting our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP PACOM in the implementation of the PACOM Regional Landscape Analysis. Through strong project management and risk mitigation, Metabiota will ensure that the analysis will be executed in an efficient and timely manner and will deliver a top-quality product geared toward supporting enhanced biosurveillance and biosafety efforts in the region.

Pathogen: Influenza

Hu[illegible]nd [illegible]gin

Pathogen: Influenza

Human and Avian Origin

AKA: Flu, Bird flu, AI, HPAI, H5N1, H5N8, H7N9, H5N2, H7N3, H7N7, and H9N2

Hosts: Humans, wild and domestic poultry, and a range of mammal species

Zoonotic potential: Yes

Variations: Influenza A, Influenza B, Influenza C, Bird Flu, Swine Flu, Highly Pathogenic Avian Influenza (HPAI), Low Pathogenic Avian Influenza (LPAI), Avian Influenza

Disease burden: Unable to find regional annual numbers of infections and deaths - varies widely by strain. The WHO estimates annual worldwide deaths from all types of influenza at 250,000-500,000.

Morbidity/Mortality Rate: 0.001 - 60% mortality

Natural pathogen presence: Influenza affects all countries within SEA and frequently causes worldwide pandemics. Bangladesh, China, India, Indonesia, and Vietnam are considered endemic for H5N1 in poultry.

Regional Priority Ranking and Threat Ranking (CDC, WHO): HPAI is classified as a Select Agent by the USDA and as a CDC Category C Priority Agent.

Route of infection and Transmission Potential:
Form: Droplets, aerosols, direct or indirect contact (possible).
Sources: Nasal and oral secretions, contaminated water, droplets/aerosols from slaughter, fecal matter, infected tissue and blood
Route: Inhalation, ingestion, parenteral, contact with oral or nasal mucous membranes
Transmissibility: Human to human, animal to human, human to animal, animal to animal.

Incubation Period:
Human: 1 to 4 days; **Avian:** 2-8 or as long as 17 days.
Swine: 1 to 3 days

Clinical presentation

In humans:

Uncomplicated: Upper respiratory symptoms including sneezing, coughing, rhinitis, fever, chills, lack of energy/appetite, headache, sore throat, myalgia, weakness; nausea and vomiting (children). Can also be asymptomatic.

Complicated: Pneumonia, secondary bacteria or viral infection, bronchitis, transverse myelitis, Reye Syndrome, encephalopathy, myocarditis, pericarditis, myositis, (from avian influenza): chest pain, bleeding from nose and gums, lower respiratory tract diseases such as dyspnea, gastrointestinal symptoms like diarrhea, vomiting, and abdominal chest pain.

In animals:

Avian: Subclinical to severe in different species of wild and domestic poultry. Sinusitis, coughing, sneezing, green to white diarrhea, blood tinged oral and nasal discharge, decreased or deformed egg production.
Mammals: Upper respiratory symptoms including lethargy, coughing, fever, lack of energy/appetite, labored breathing, nasal discharge.

Diagnostics: *Viral culture, serology, rapid antigen testing, polymerase chain reaction (PCR), immunofluorescence assays, and rapid molecular assays.*
Prophylaxes and Availability: *Antivirals, vaccine for seasonal strains available. Seasonal vaccine effectiveness varies by year.*

Historical Events

Naturally occurring and Intentional

1918: *Spanish Flu: 50 million died across Europe and the United States, origin from avian source.*
1957: *H2N2 pandemic of Chinese origin which spread to the US and UK. 69,800 mortalities.*
1968 –1970: *H3N2 pandemic originating in Hong Kong.*
2009 – 2010: *H1N1 global epidemic. While this virus had lower mortality than past pandemics, it was highly transmissible.*

Surveillance: The WHO Global Influenza Surveillance and Response System (GISRS) monitors influenza viruses in the region with regional partners, including animal health agencies and national veterinary authorities. OIE maintains up-to-date data on global cases of AI, based on regular country reporting. FluNet is a publically available database maintained by the WHO that serves as a global influenza surveillance network.

Regional Expertise: Research, surveillance in humans and animals, laboratory diagnostics including molecular, and outbreak response are found on some level in most of the SEA countries.

Regional Spend per Year: (total):

Biocontainment: Seasonal flu strains can potentially be encountered in laboratories across the region. The 1918 virus and several other highly pathogenic avian strains that are classified as BSL 3 viruses are stored at labs in the region. There are numerous repositories of AI samples throughout SEA due to ongoing surveillance activities.

Potential and Use for Weaponization: High potential for weaponization, no known attempts.

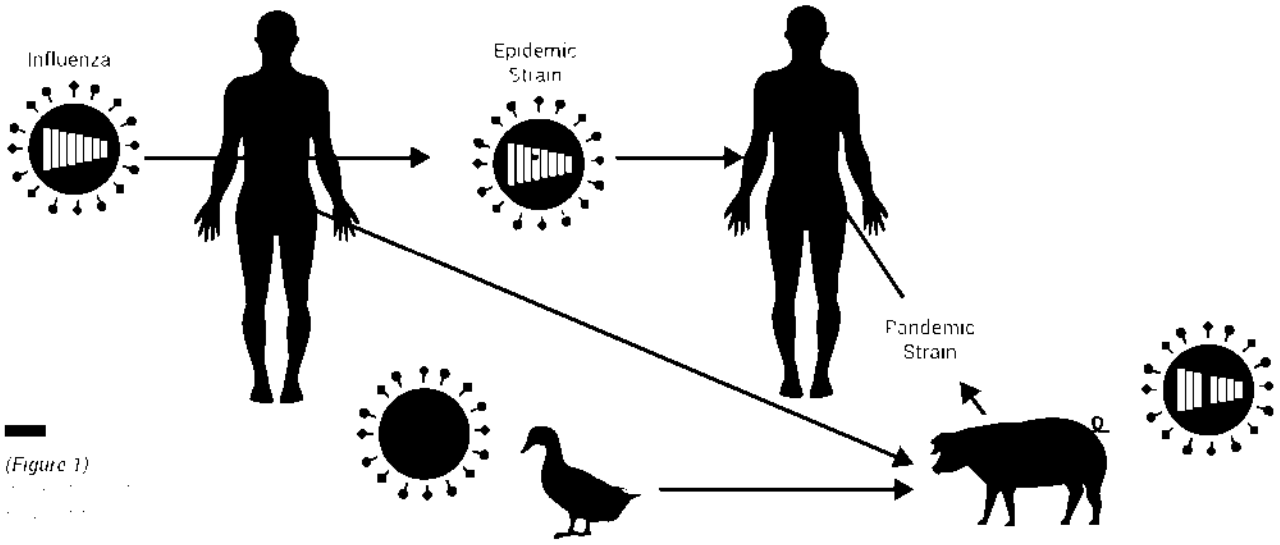
Epidemic Risk Potential: High. Historically, epidemics and pandemics have occurred at regular intervals.

Variations

Drug resistant forms, genotypes, serotypes, strains, pathogenic vs. non pathogenic

All three types of influenza (A, B, and C) can infect humans. Influenza A is of primary concern as it also infects animals, though is generally is more pathogenic to humans. **Influenza viruses are also classified by their surface antigen types:** hemagglutinin and neuraminidase (HA and NA). There are 18 known HAs (H1-H18) and 1 known NAs (N1-11), although only a small subset of subtypes have historically infected humans. All HA and NA variants can be found in wild aquatic birds.

Influenza A H1N1 and H3N2 viruses are currently circulating in humans, and one strain of influenza B virus is included in the season vaccine. H5 and H7 subtypes of avian origin have infected humans and caused outbreaks, but transmission is not as easily sustained as with influenza viruses of human origin.

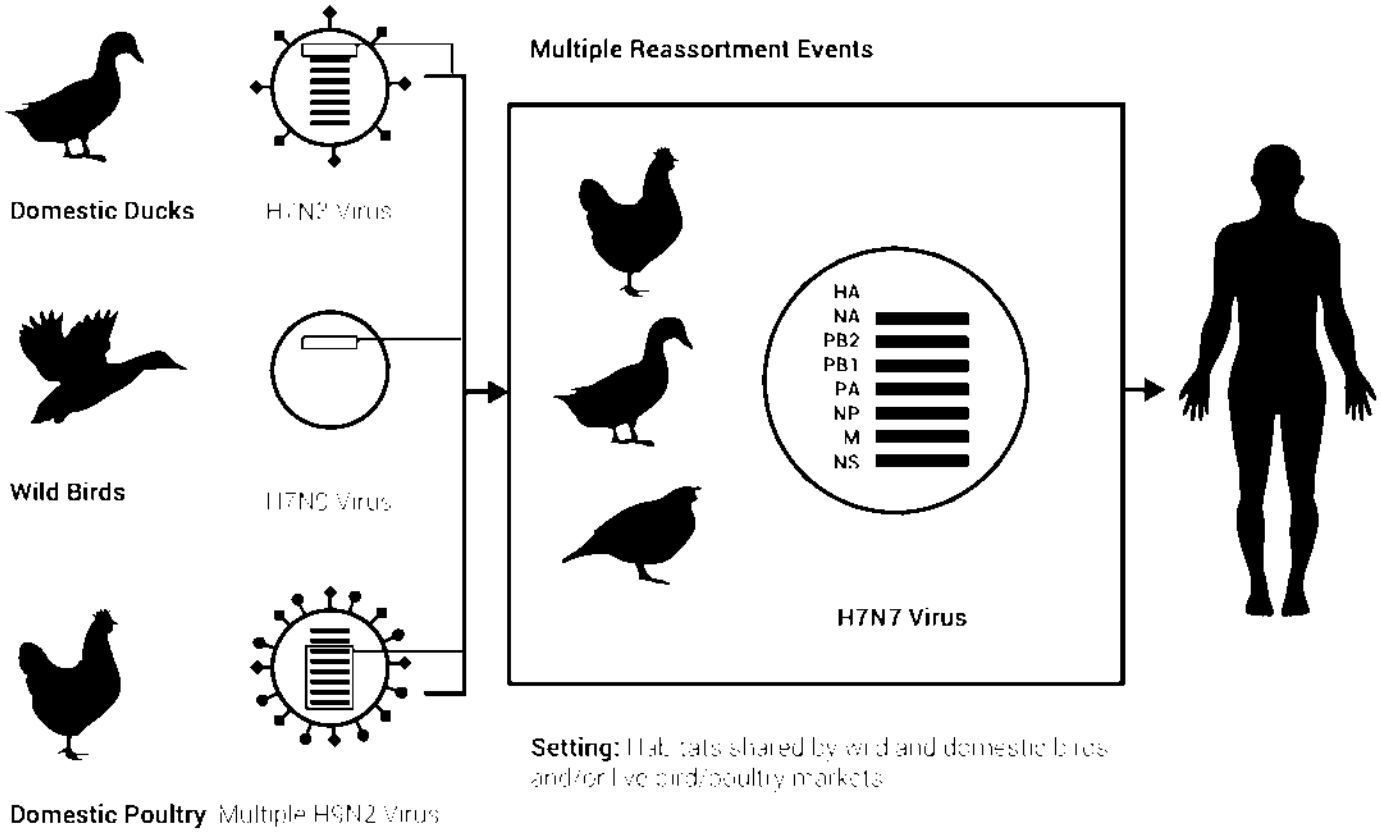


Influenza viruses infecting humans can be divided into seasonal and pandemic strains. Pandemic strains are those that transmit very easily, for which there is little pre existing immunity (including avian influenza), and that have the capability of human-to-human transmission. Avian influenza strains also are divided into two groups based upon the ability of the virus to produce disease in chickens: low pathogenic avian influenza (LPAI), and highly pathogenic avian influenza (HPAI).

Hosts

List animals that can be infected and zoonotic potential. Explain whether they are natural reservoirs, dead end, spill-over/accidental

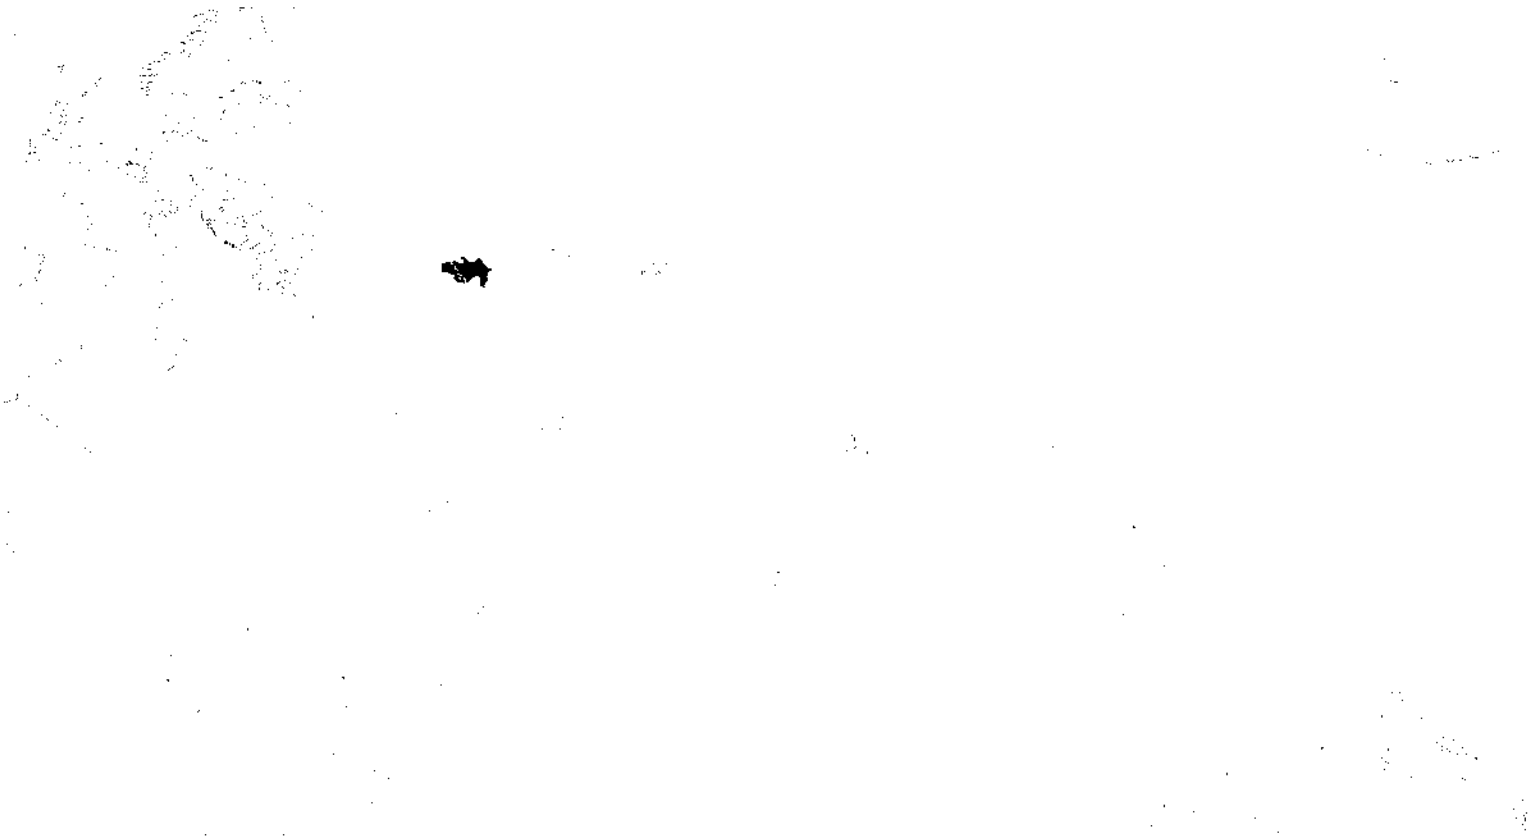
Influenza can infect humans, dog, horses, seals, bats, and has even caused infections in wild and domestic feline species. Wild water birds, domestic poultry, and swine are hosts of primary concern. Wild birds are the reservoir hosts for influenza, and typically do not present symptoms. However, they can transmit the virus to domestic poultry, in which pathogenicity is often higher. Poultry can then transmit the virus to humans or swine (the virus can also be transmitted directly from wild birds to humans or swine). Sustained transmission may occur in any of these species, although avian viruses must typically acquire specific mutations to achieve sustained transmission in humans.



The potential for zoonosis varies by subtype and strain, but it can be very high. This is exacerbated by the fact that different subtypes can reassort in permissive hosts, leading to the emergence of a virus that may be antigenically novel (there is little pre-existing immunity in the human population). Swine are of primary concern for reassortant viruses, as they can be infected with both avian and human influenza viruses1 ***(Figure 1).***

(Figure 1)

Reassortment was key in the outbreak of H7N9 virus in China in 2013, when the virus was shared between wild and domestic birds sharing habitats, and/or live bird markets ***(Figure 2)***.



Genetic Evolution of H7N9 Virus in China, 2013

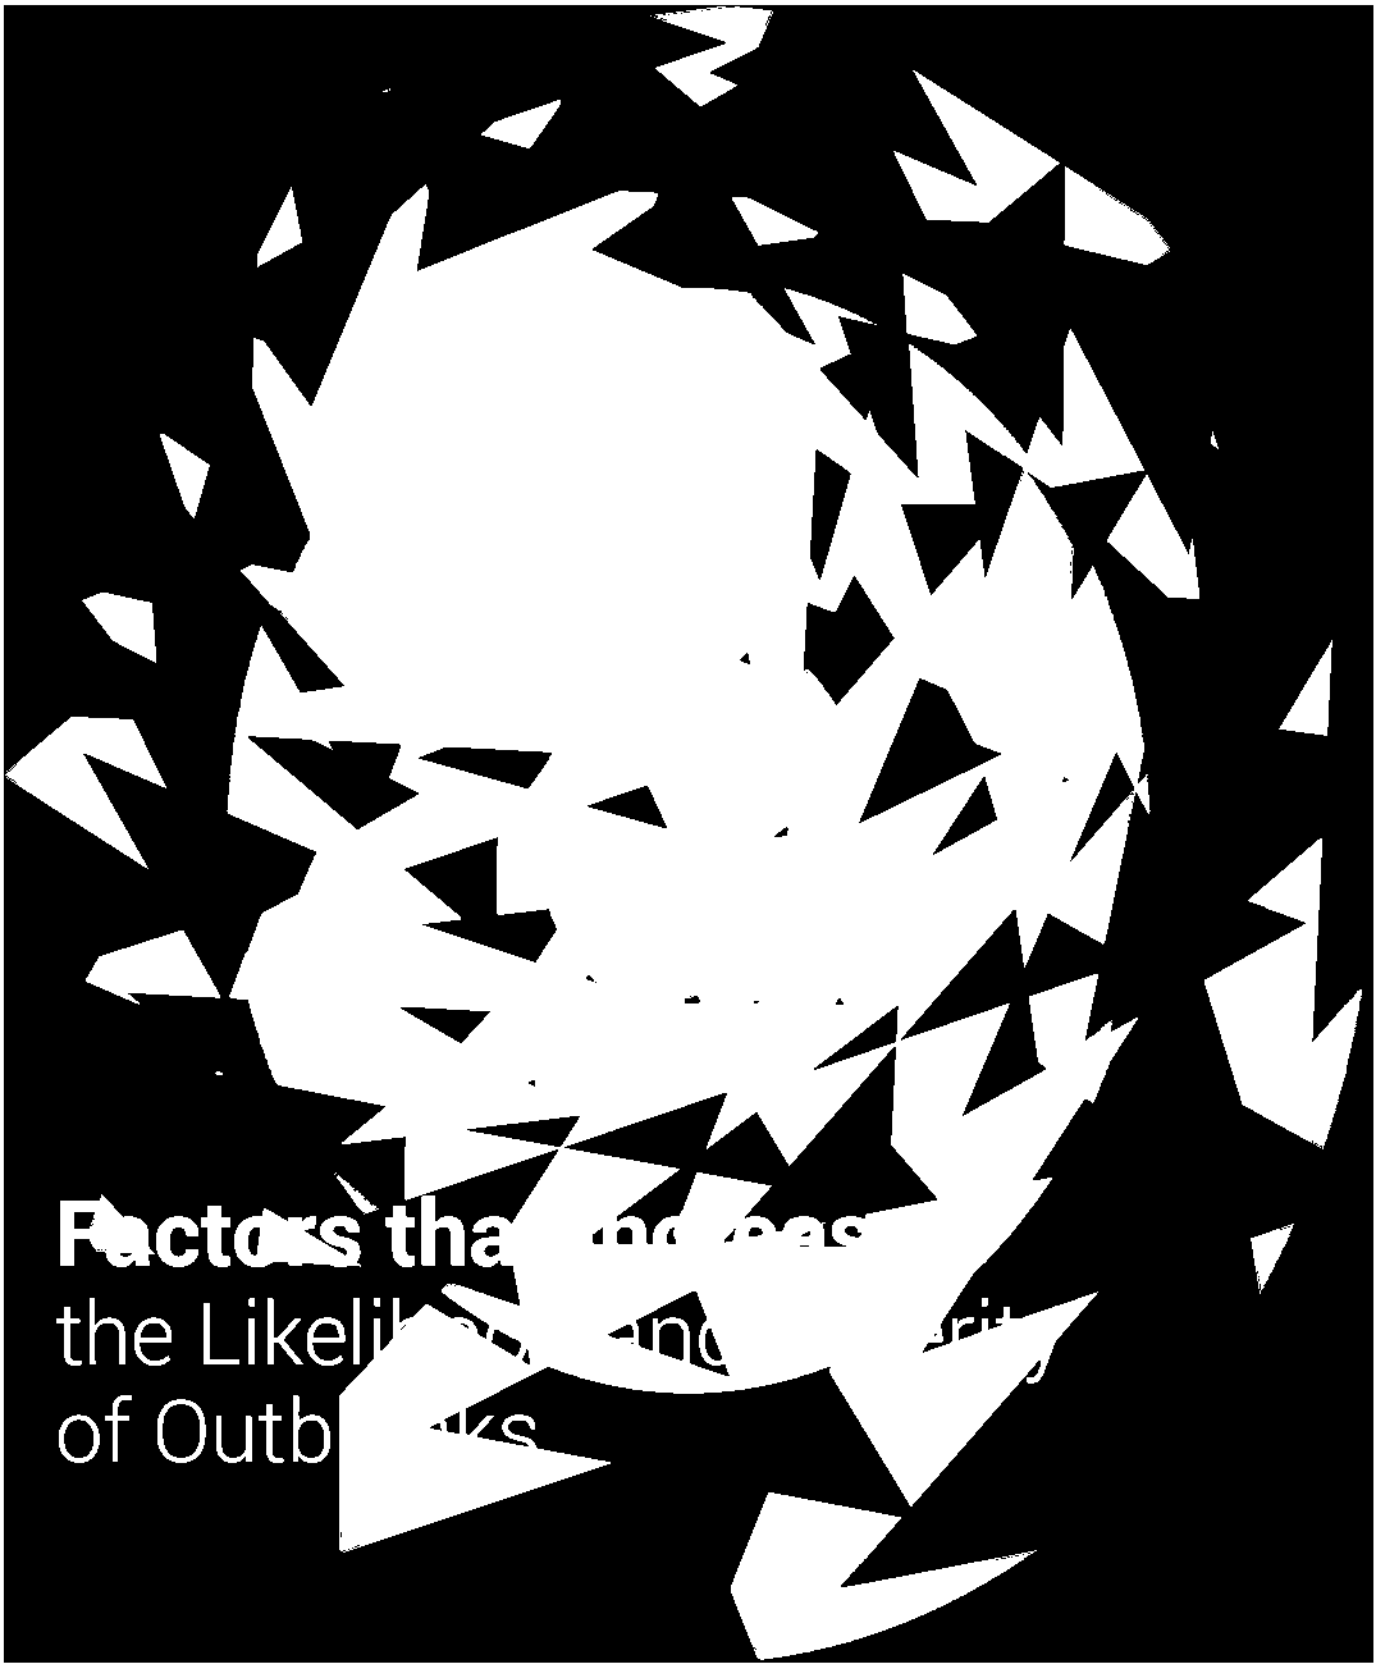
Month of Out Break



Seasonal influenza is largely represented by circulating human influenza A and B viruses and is endemic to all countries. In temperate regions, seasonal influenza peaks in the winter months, whereas tropical climates have no clear season for influenza, and cases occur sporadically throughout the year

Avian influenza viruses have caused outbreaks in humans in the past, including the first major outbreak of H5N1 in 1997 and it's the reemergence of sporadic cases in 2003 (see Historical Outbreaks). H5N1 can be found in poultry and wild birds in SEA and is known to have previous or current transmission among humans in Bangladesh, Cambodia, China, Indonesia, Laos, Thailand, and Vietnam. Among poultry, outbreaks have occurred in Cambodia, China, Indonesia, Japan, Laos, and Bangladesh, China, India, Indonesia, and Vietnam are considered to be endemic for the Asian-origin HPAI H5N1 virus in poultry. H7N9 is another avian-origin influenza virus of concern. The first human case of H7N9 was reported in China in 2013, which resulted in an outbreak of cases across 13 provinces in China. It is expected that sporadic cases occurring from poultry contact will continue to be reported in China

H9N2 and H6 viruses are broadly circulating in Chinese birds, and seropositivity to these viral subtypes has been detected in workers exposed to live poultry in China[4].

METABIOTA

Factors that Increase
the Likelihood and Severity of Outbreaks

INFLUENZA (ORTHOMYXOVIRIDAE)

Cross-border tensions or political disputes among countries within the region may hinder information sharing, cooperative research, and third party technical assistance, all central to preparation and response to an influenza outbreak. Unrestricted movement of individuals throughout the region without agreed-upon regulations and epidemiological information sharing also raises the risk of influenza outbreak spread.

Low socio economic and development statuses of countries within the region increase the likelihood of influenza outbreaks. Unregulated and informal farming practices, including "Backyard Farmers," are prevalent within the region and heighten the risk of emergence and spread of avian influenza through poor sanitation and colocalization of farm animal species and humans vulnerable to influenza infection. Variations in socio-economic status between and within countries may lead to inequitable distribution of influenza response resources and poor knowledge and public health education regarding influenza.

Traditional religious practices and celebrations that occur annually throughout the religiously diverse SEA region involve the congregation and close contact of thousands, traveling long distances (often from urban to rural locations), and even the release of thousands of captive birds (Vesak Day). Each of these aspects could very easily facilitate influenza transmission and geographic spread.

The region has much clinical and scientific experience with and expertise of influenza. The pathogen is being studied throughout the region, with advanced methods and technology in some laboratories, and poor biosafety and biosecurity in others. Accidental introduction of pathogenic influenza strains is possible, though biomedical expertise may mitigate and expedite the detection and response to an outbreak.

Variations in the healthcare and health system capacity of the region, including preparedness and response, will influence the likelihood and severity of an influenza outbreak. In some areas, there are severe gaps in antiviral stockpiles and ventilators and limited capacity for pandemic surge capacity including skilled health workers. However, the region has clinical experience with avian influenza and several countries have developed treatment guidelines for and training of management for human and avian influenza.

Potential increases in wild swine populations may increase the risk for avian and human influenza spillover, especially among hunters and game professionals. Temperature and climate influence how and when influenza may be transmitted, as well as the external stability of the pathogen. External environment also influences pathogen spread via fecal matter in airborne poultry dust and movement of infected birds or humans, including those spreading the pathogen through contaminated fomites.

info@metabiota.com www.metabiota.com

Political

Please discuss how the following factors (or any genera political factors) may increase or mitigate risk and/or severity of pathogen/agent outbreaks or impact on region, including any relevant specific dynamics within a countries or countries.

P-TA	**Terrorist activity**
P-UR	**Political unrest/volatility**
P-BC	**Border conflict, cross-border relationships, refugee issues**
S-HPC	**Heavily indebted poor countries**

Viruses may emerge unnoticed and flourish in uncontrolled areas. Laboratories with hazardous substances and bio weapons programs also present risks in spaces that lack central government control. Non-state armed groups that adhere to ideologies that support the use of biological weapons and possess the means to obtain and deploy them also increase the risk profile. Unstable governments may lack the means to track and contain biological threats. Cross-border conflicts may hamper government controls over biological agents and pandemic threats and increase the chances of weaponized uses

The most significant cross-border risks in the relevant Southeast Asian countries are concentrated in tensions surrounding increasing Chinese assertiveness in the South China Sea and border disputes between India and Pakistan. South China Sea border disputes involve tier-one and tier-two countries, most prominently Indonesia, the Philippines, and Vietnam.

Openness to outside technical help (much of the technical assistance and funding would likely originate in western countries) will be key in mitigating an influenza outbreak in SEA. While information sharing has improved considerably since the 2003 outbreak of SARS, an increase in geopolitical tensions could jeopardize international assistance and research efforts.

Tense geopolitical conditions would likely constrain health information sharing. The first case of avian influenza A (H7N9), a virus with a 22% fatality rate and judged to have a high pandemic potential, appeared outside China for the first time on 12 February 2014 in Malaysia, carried by a traveler arriving from the affected area in China. Relatively unrestricted movement of travelers, if not accompanied by equivalent information sharing and government to government cooperation, raises the region's influenza risk profile.

Increasing regional tensions over China's efforts to assert control over maritime interests through its 'nine dash line' (most recently highlighted by the first Indonesian sinking of a Chinese fishing vessel on 20 May) reduce the prospects for interstate cooperation should a new strain of avian flu emerge in China and spread to a neighbor in the region, a prospect assessed as highly probable, according to a consultancy with expertise in risk analytics and pandemics. Moving forward, a key metric in assessing levels of interstate cooperation and the resulting influenza risk profile is assessing partner countries' levels of sustained engagement with the CDC's global bio-surveillance program and the WHO National Influenza Centres, even amidst increasing security and political challenges.

Socio-Economic

Please discuss how the following factors (or any general socio-economic factors) may increase or mitigate risk and/or severity of pathogen/agent outbreaks or impact on region, including any relevant specific dynamics within a countries or countries.

S-PV Poverty Low income (living below $2.50/day)
S-TR Trade, wet markets
S-TS Transportation - people in close contact traveling, transporting animals
S-LIT Literacy S-AG Agrarian (relationship w/livestock) livestock movements
S-SD Shelter/Dwelling
S-IN Infrastructure
MN Malnutrition
S-PD Population Density
S-ED Education
WS Water sources S-CM Crime
S-FS Food sources
S-APD Animal Population Density

Clear linkages exist between specific socio-economic factors and higher risk of influenza emergence and severity. The Human Development Index (HDI), a global study commissioned by the United Nations Development Programme, permits side-by-side comparisons of socio-economic outcomes and corresponding pandemic risks.10 These development factors, including education levels, sanitary practices, waste disposal infrastructure, social cohesion, medical capacity, and inequality, influence the likelihood of the emergence of a pandemic, a country's capacity to contain the threat, and the overall impact of the outbreak. Additional factors separate from development levels that may heighten pandemic risks include agricultural practices, population density, transportation and frequency of movement, and live animal markets. Frequency of movement and population density are areas of concern in more developed countries with extensive transportation systems and international travel, while agricultural practices and open markets frequently are factors in less-developed countries.

The prevalence of "backyard farmers" and non-industrial farms following traditional animal husbandry practices within the region (especially in rural areas) increases the risk for an avian influenza outbreak. This informal animal production sector is largely unregulated and biosecurity is low. Poor regulatory and monitoring mechanisms may fail to ensure that small-scale poultry farms apply proper sanitation procedures and result in delayed detection of an outbreak well after the initial case. Furthermore, key research findings show that exposure to poultry in live bird markets and raising poultry are the primary sources of human avian influenza infections. The collocating of various species (as happens on many smaller farms and in wet markets), especially wild birds, with domestic poultry and pigs, leads to a volatile incubation chamber of novel influenza viruses. Brown et al. (2015) report that the presence of backyard poultry farms housing a variety of species is a key factor in increasing the risk of AI outbreaks.11 Additionally, Fuller et al. (2014) report in their risk analysis that live bird market density is directly associated with AI infections.12 Thus, poultry as well as pig farming are cultural/socio economic practices that can create a context ripe for infection and transmission of influenza pathogens. Additionally, rice farming can create habitats for wild waterfowl, and when practiced alongside raising free range ducks, can increase the potential of both animal and human infection.

Estimated poultry density and AI outbreak locations geo-referenced in South and Southeast Asia, December 2003 – June 2004. (FAO-EMPRES and FAO-LEAD)

Source: FAO-EMPRES and FAO-LEAD.

Proven methods for preventing human transmission of Avian Flu include proper use of Personal Protective Equipment (PPE),13 basic personal hygiene, and safe storage and preparation of meat.14 Those countries with very low levels of socio-economic development are unlikely to possess the resources and internal expertise to meet such basic requirements. Other factors that increase influenza risk include income growth and its accompanied increase in meat consumption and traditional live animal markets. Poor educational outcomes have a deleterious effect on a country's capacity to contain a virus as the population may lack knowledge of proper sanitation procedures and scientifically grounded procedures for preventing spread.

Low levels of socio-economic development indicate deeply entrenched difficulties that require a long-term commitment. CBEP commissioned a report on performance metrics that established a distinction between partner countries' capabilities and capacities.15 Operational readiness indicates a partner country's level of capabilities while the building blocks that enable readiness are classified as capacities, according to the report Creating operational readiness to prevent the emergence and spread of influenza outbreaks will require sustainable investments in long-term capacities and socio-economic development.

info@mctabiota.com www.mctabiota.com

Finally, Laar and DeBruin (2015) shed light on issues of access and accessibility in countries where there is an increasing gap between the rich and the poor. Influenza preparedness and response plans as well as their implementation during an outbreak often include an unfair distribution of scarce resources that are not allocated among marginalized populations.16 Thus, establishing an ethical distribution of resources to prepare and respond to influenza crises is currently an issue for developing countries and a consideration for donor countries as well as international NGOs partnering in a region such as Southeast Asia to build their preparedness and response capacities ethically-appropriate.

Cultural

Please discuss how the following factors (or any genera cultural factors) may increase or mitigate risk and/or severity of pathogen/agent outbreaks or impact on region, including any relevant specific dynamics within a countries or countries

C-BP	Burial practices
C-SA	Sexual activity
C-MG	Minority groups/prejudice
C-RB	Traditional religious beliefs/ animal sacrifice/traditional medicine

Any practices that involve congregation or close contact could potentially enhance influenza transmission. Hot spot areas include those where human to human transmission between the sick and healthy occurs, as well as where large populations interact, and popular start/end points for traveling significant distances.

The Southeast Asian region is historically ethnically and religiously diverse with large Islamic, Christian, Hindu, and Buddhist populations, all of which celebrate their faith regularly and publicly in large gatherings that present ideal scenarios for virus transmission. The end of the fasting month of Ramadan is a big event in Muslim countries such as Indonesia, Brunei, and Malaysia. Known as "Lebaran" in Indonesia and "Hari Raya" in Malaysia and Brunei, it is a time when Muslims interact extensively with family and friends. In Indonesia, strongly held traditions to visit family at this time necessitate the exodus of an estimated 7.13 million people (2011 estimate) from Jakarta alone, as well as millions more from other urban centers to rural villages (where direct contact with infected poultry is far more likely).17 This busy travel period also causes packed conditions at airports, bus stations, and other travel points. In all three countries, daily mass prayer gatherings take place at mosques, open fields, parks, and on major streets. These gatherings can include several hundred people.

Another notable festival that is celebrated in both Malaysia and Singapore is the Tamil Hindu celebration of Thaipusam, when several thousand worshippers from both urban and rural locations congregate to ask the god of war to cleanse their sins and provide them with prosperity in the coming year. Lastly, Buddhists in Sri Lanka, Nepal, Bangladesh, India, Indonesia, the Philippines, Singapore, Vietnam, Thailand, Cambodia, Lao PDR, Malaysia and Myanmar celebrate Buddha's birth, enlightenment, and death in April/May on "Vesak Day." This holiday is significant in the context of influenza transmission for the thousands of devotees that it draws to assemble in temples, but even more so for the "symbolic act of liberation" that is performed each year, when birds, insects, and animals are released by the thousands and given freedom from captivity.[18]

Access/Use

Please discuss how the following factors (or any general access/use factors) may increase or mitigate risk and/or severity of pathogen/agent outbreaks or impact on region, including any relevant specific dynamics within a countries or countries.

A-LA Laboratory access, use, expertise (basic and clinical research)
A-BS Biosafety and biosecurity
A-W Access, use, and potential for weaponization

The region has strong basic and clinical research programs investigating influenza, and it is among the most studied infectious agents in the region. Indonesian researchers, in particular, have a significant number of programs investigating avian influenza virus, and Vietnam and Malaysia have the next highest fractions of researchers who study avian influenza virus.

There are numerous laboratory and research networks that focus on or have expertise in influenza surveillance (including molecular diagnostics) and research. For example, through the SEACIRN network, a new biosafety level 3 laboratory facility was established at the Hospital for Tropical Diseases, Ho Chi Minh City, Viet Nam for isolation of H5N1 viruses and emerging (pandemic) influenza viruses. Pyro-sequencing capacity was also established there to characterize viruses and detect mutations in the influenza virus genome that confer antiviral drug resistance. Moreover, trainings are performed on an ongoing basis at the reference laboratory in Ho Chi Minh City, followed by on-site training at participating laboratories in the SEACIRN network to ensure a high level of quality and consistency in technical activities. To ensure quality, each MDL laboratory is enrolled in at least two different external quality assurance programs for molecular influenza diagnostics. Furthermore, proficiency testing for diagnosing influenza by RT PCR is performed before sites are allowed to start screening patients.

Another diagnostic laboratory network, the Asia Partnership on Emerging Infectious Diseases Research (APEIR), was initially focused on regional collaboration in avian influenza research, and its first projects have developed and informed surveillance and response capacities within the region, including in Cambodia, China, Indonesia, Thailand and Vietnam (Refer to APEIR Stakeholder profile for more detailed information).

There is also strong animal laboratory capacity within the region. Animal laboratory capacity, including molecular diagnostics, has been strengthened in Indonesia and Vietnam in recent years, following the 2004 HPAI outbreak. Real time PCR was promoted for direct diagnosis of the infection and international reference laboratories were utilized to transfer technologies and specified methodologies, such as verified reagents and test sequences to national laboratories in the affected countries. Also, the Veterinary Research Institute (VRI) in Ipoh, Malaysia was nominated as the ASEAN regional laboratory for avian influenza and is paired with the Australian Animal Health Laboratory (AAHL) in a twinning lab program to build capacity for diagnosis and systematic management as well as bio-risk management and quality assurance. More recently, diagnostic protocols and the development of a regional algorithm and SOPs were reported at the 2013 Lab-TAG meeting by the AAHL, in response to the emergence of avian influenza (Lab TAG, 2013).

The laboratory and research focus on influenza may mitigate the impact of influenza on the region, as there is diagnostic and scientific capacity and expertise that may help prevent or diminish influenza epidemics in the region and worldwide. For example, SEAICRN has mandated the sharing of data and protocols, which may prove essential in improving biosurveillance and enabling a quick and effective response to epidemics in the region and worldwide. During the H1N1 pandemic, a number of non-Asian countries used these protocols, adapted them to their own local circumstances, including translation, and implemented them. SEAICRN has also stated that they are committed to sharing all data with all institutions and national and international authorities, in line with the IHR 2005, which can certainly improve regional, national, and global surveillance. Finally, the OIE/FAO Network of Expertise on Animal Influenza identified the link between international expertise with Indonesian scientists to cultivate the methodology of antigenic cartography to depict antigenic mismatches in vaccines for poultry (OFFLU, 2013).

While a strong research and clinical diagnostic focus on influenza may mitigate its impact on the region, the

presence of pathogenic influenza strains also puts the region at risk for accidental outbreaks. Biosafety in this region often fails to meet international standards, and agents are often studied at a lower biosafety level (BSL) than is recommended by international standards.

WHO SEARO National Influenza Centers each study and maintain samples of HPAI. These laboratories, unlike other unaffiliated labs in the region, are required to meet basic BSL2 standards and use BSL3 work practices in accordance with the WHO Laboratory Biosafety Manual.

Additionally, influenza is a pathogen that has implications in dual-use research. Most research institutions in the region do not have policies in place guiding dual-use research of concern, and only Malaysia and Singapore have legislation that control trade in dual-use goods [1].

Healthcare and Health Systems

Please discuss how the following factors (or any genera healthcare and health systems factors) may increaseor mitigate risk and/or severity of pathogen/agent outbreaks or impact on region, including any relevant specific dynamics within a countries or countries.

H-HC	Healthcare (emergency, primary, tertiary, etc.)
H-HS	Health systems
H-MCH	Maternal & Child Health (prenatal & postpartum care)
H-HH	Human Health (genetic, health status, vaccination coverage, immunity,etc.)
H-AH	Animal Health and Veterinary Medicine

Referral hospitals for avian and human influenza exist in Cambodia, Indonesia, Lao PDR, Taiwan, Thailand, and Viet Nam. These countries have developed treatment guidelines for and training of management for human and avian influenza, including patient isolation and antiviral treatment. Taiwan provides free care to influenza patients.

From an analysis of influenza preparedness prior to the H1N1 pandemic in Cambodia, Indonesia, Lao PDR, Taiwan, Thailand, and Viet Nam, it was learned that most patients only arrive at public healthcare facilities when their symptoms are severe, and their first point of contact is usually a private or informal health care provider. [1]

Health System factors prior to the H1N1 pandemic22

In an analysis of influenza preparedness prior to the H1N1 pandemic, there was a range in levels of preparedness within the context of health systems and across countries. In all six countries studied (Cambodia, Indonesia, Lao PDR, Taiwan, Thailand, and Viet Nam), preparedness activities were dependent on the existing public sector healthcare workforce, and human resources for avian and human influenza were limited. Highly skilled healthcare workers, especially physicians and nurses, were a problem in developing countries, and additional training specific to influenza response in all countries was limited to those involved in surveillance, case detection, and infection control. Cambodia, Indonesia, Lao PDR, and Thailand did not have a plan for surge capacity of healthcare workers during a crisis.

Most countries have a model hospital preparedness plan that can be used during a pandemic; however, Lao PDR and Cambodia did not have surge capacity for extra hospital beds. Within Taiwan and Vietnam's plans there was an explicit surge capacity for hospital staff.

While all countries had stockpiled antivirals, the amount stockpiled varied greatly. Taiwan had a national stockpile that covered 10% of its population, with the ability to increase the stockpile. Thailand and Indonesia's national stockpiles only covered 1% of their populations, while Cambodia's was only enough for a dismal 0.1% of its population.

While active and widespread, public health education on influenza has been more focused on avian influenza and preventing its transmission, including messages on handling of livestock and basic health hygiene. There was less focus on pandemic human influenza.

Health System capacity for Influenza in the Greater Mekong Subregion [2] and its impact on mortality

info@metabiota.com www.metabiota.com

There is great geographical variation in the distribution of influenza response resources, specifically hospital beds, healthcare workers, oseltamivir, and ventilators in the Greater Mekong Subregion. Analyses of key resources across provinces within countries in the region found that are many areas, within and between countries, that are underserved with regard to availability of resources appropriate to the population size (Figure 1). Lao PDR and Cambodia are particularly underserved in influenza response resources, and both Thailand and Vietnam have provinces and regions with lower resource densities. Taiwan has relatively few provinces with resource gaps, though it does not have sufficient oseltamivir supplies. Overall, ventilators are lacking in the region. Furthermore, these high and low resource provinces do not occur in isolation; clusters of provinces with similar resource distributions, for one or more resource, can be identified (Figure 2). Provinces with mismatched resource supplies (an oversupply of at least one resource with an undersupply of at least one other) were located mostly in Thailand and Vietnam, and approximately 20% of the Thai population lives in provinces with resource mismatches.[25] The consequences of these resource gaps could be substantial with regard to mortality during an influenza pandemic. Filling in resource gaps would prevent many deaths, primarily within low resource regions (Figure 3). [26]

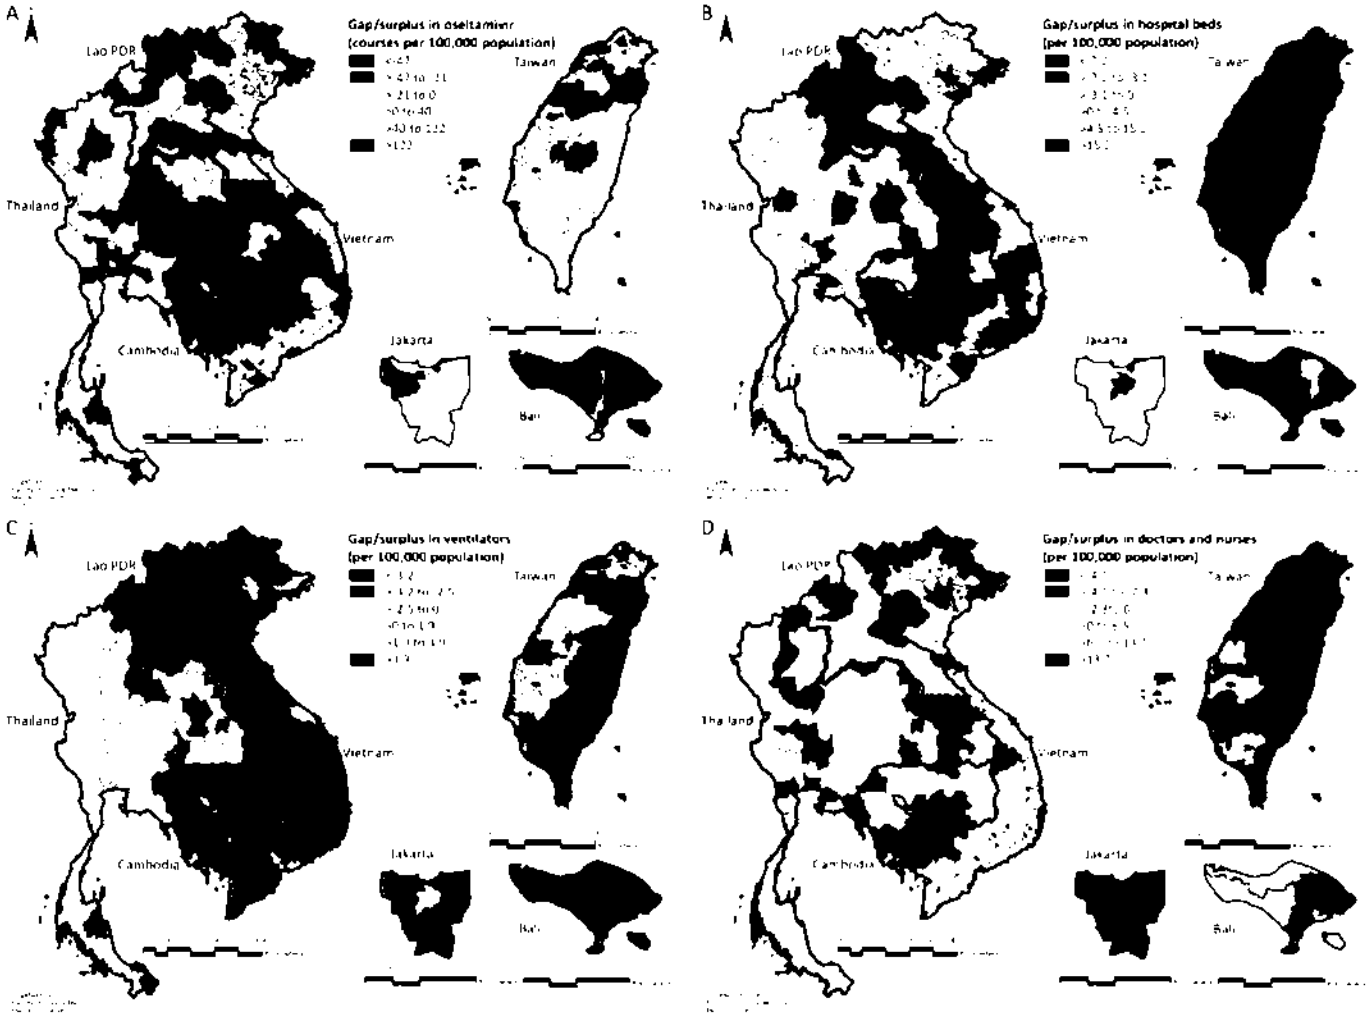

Figure 1. Geographical distribution of estimated health system resource gaps for a modeled pandemic influenza scenario.(Rudge et al 2012)

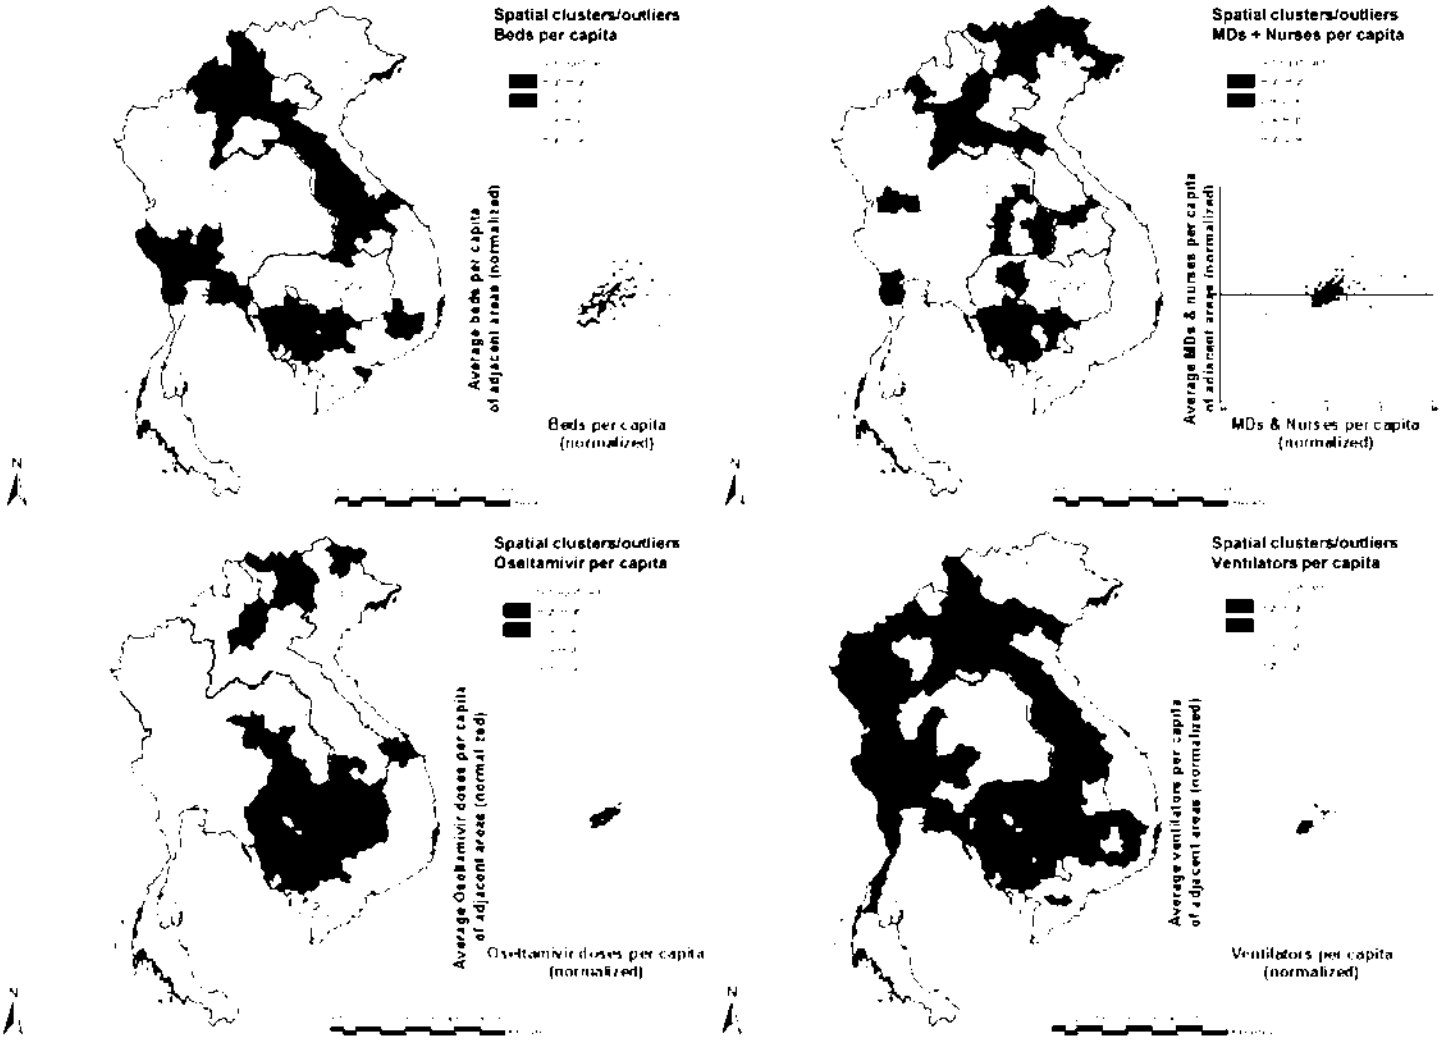

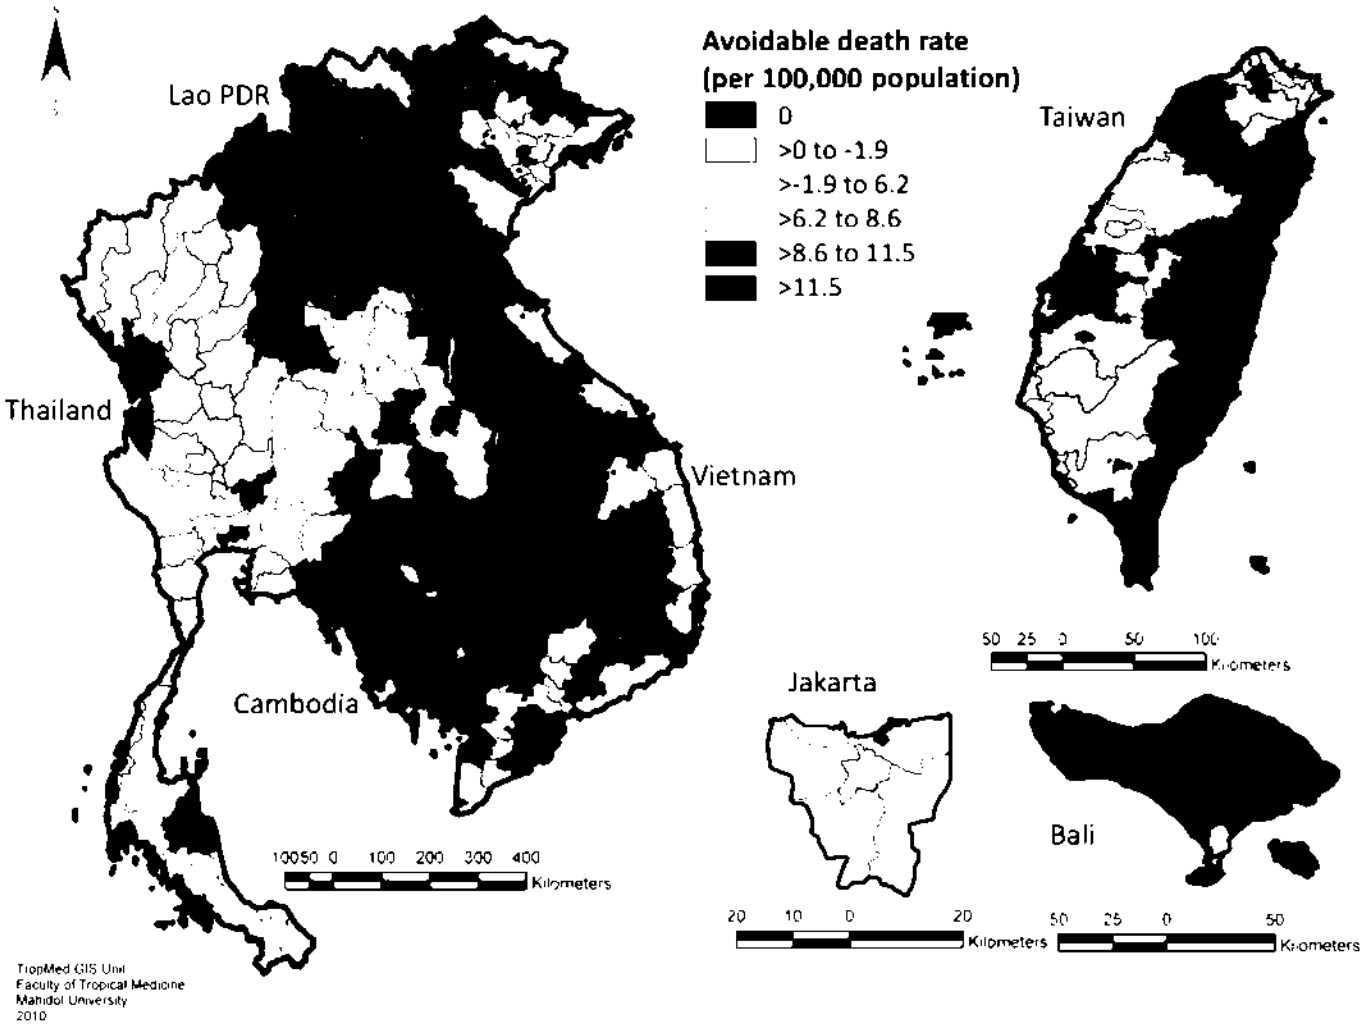

Figure 2. Spatial clusters and outliers of healthcare resources across provinces in the Greater Mekong Subregion. (Hanvoravongchai et al. 2012)

Figure 3. Geographical distribution of estimated avoidable mortality rates due to resource gaps for a modeled pandemic influenza scenario. (Rudge et al 2012)

Current global recommendations for seasonal influenza vaccine include five groups: pregnant women, health care workers, children 5 to 59 months, the elderly, and persons with high risk conditions. Among these groups, pregnant women are listed as the most important group. A multi-year survey study conducted by Gupta et al (2012) of ASEAN member states found that only Indonesia, Malaysia, Singapore, Thailand, and Vietnam (all high or middle income countries) had issued guidelines for the use of seasonal influenza vaccines. Of the five countries with guidelines, Singapore and Thailand recommend vaccination for pregnant women, while Singapore, Thailand, and Vietnam recommend vaccination for young children (Figure 4).

Figure 4. Characteristics of seasonal influenza vaccine use among nine Southeast Asian countries (Gupta, V. et al 2012)

Country	Public sector use (year of introduction)	Months of immunization administration	Vaccine guidelines	WHO recommended target groups [4]					Other target groups					
				Pregnant women	Health care workers	Children 6-59 months	Elderly	Persons with high risk conditions†	Institutionalized individuals	Medical care or hospitalization in previous year*	Children on long-term aspirin therapy	Pilgrims to the Hajj	Obesity	Household contact, caregivers of children or high risk

*Due to chronic metabolic diseases (including diabetes mellitus), renal dysfunction, haemoglobinopathies or immunosuppression (including by medication or HIV).
†High risk conditions: Malaysia (chronic cardiovascular, pulmonary, metabolic or renal disease, or who are immunocompromised); Philippines (chronic pulmonary or cardiovascular disorders); Singapore (diseases of the pulmonary or cardiovascular systems, including asthma); Thailand (chronic obstructive pulmonary disease, asthma, heart disease, stroke, kidney failure, cancer, diabetes, thalassemia, immunosuppression including persons infected with HIV); Vietnam (COPD, congenital heart disease, heart failure, diabetes, immunodeficiency).
**Only includes elderly with ≥1 more of the following chronic conditions: chronic cardiovascular, pulmonary, metabolic or renal disease, or who are immunocompromised.
doi:10.1371/journal.pone.0052842.t003

Seasonal influenza vaccination in the SEA region is negligible compared to North America and Europe, which makes influenza epidemics more of a risk. An extensive survey of seasonal influenza vaccine distribution and vaccine recommendation policies was conducted in 2010, which revealed that Southeast Asia had the second lowest distribution of the six WHO regions. No countries in the region met the "hurdle" distribution rate of 159 doses/ 1000 population. Please refer to the influenza pathogen profile for more detailed information on vaccination coverage

In addition to being classified by type (A, B, or C), influenza viruses are also classified by their surface antigen types, hemagglutinin and neuraminidase, (HA and NA). Mutations that change amino acids in surface antigens produce selective advantages for viral strains by allowing them to evade preexisting immunity ("antigenic drift"). The HA and NA can evade preexisting population immunity by either antigenic drift or antigenic shift, in which the virus acquires an HA of a new subtype by genetic reassortment with another influenza A virus.28 The influenza virus's ability to mutate combined with the extremely large number of potential strains make it unlikely that pre-existing immunity in a population would reduce the effect of an influenza outbreak.

In individuals, however, there are several pre-existing conditions that might exacerbate influenza disease. These include asthma; neurological conditions; chronic lung disease, heart disease; a weakened immune system; morbid obesity; and blood, endocrine, metabolic, kidney, or liver disorders.

Due to their history with avian influenza and SARS and their zoonotic nature, the region has strengthened connections between the human and animal health communities, especially with regard to surveillance activities. The participation from both communities and their collaboration is a factor that may reduce the severity of an influenza outbreak if caught and addressed quickly.

According to WAHID information on RAHIS, vaccination is carried out across Southeast Asia for the purposes of limiting and controlling the spread of HPAI, although the degree to which vaccination campaigns are implemented is not mentioned.29 Over 99% of the 110 billion doses of AI vaccine have been used in poultry from 2002 to 2010 have been used in China including Hong Kong (91%), Egypt (4.7%), Indonesia (2.3%), and Vietnam (1.4%), where vaccination programs have been nationwide and routine to all poultry. Ten other countries used vaccine in poultry in a focused, risk-based manner but this accounted for less than 1% of the vaccine used.[29]

Starting in 2004, the ASEAN member countries (supported by the FAO and the OIE) began working for a uniform regional capability for diagnosis and surveillance for H5N1 HPAI infections. Regular meetings of directors of the national diagnostic laboratories of the Southeast Asian countries promoted prioritization of H5N1 laboratory capability among participants and common approaches to enhancing and maintaining capability. These approaches built on the experience with other transboundary animal diseases of the FAO/OIE Global Framework for the Progressive Control of Transboundary Animal Diseases (GF- TADs) (FAO/OIE 2004). Since 2007, annual capacity exercises have been implemented across the network, with 13 laboratories from 8 countries participating. The analyses and follow up of these rounds identified issues, with a marked increase in the harmonization achieved among the ASEAN countries both for real time PCR detection of agent and for H5HI serology.31

(Please refer to the ASEAN Stakeholder Profile for information on the Animal Health Laboratory Framework.)

Wild swine populations are experiencing a demographic explosion in several parts of the globe.32 Increases have been observed in most locations where animal data is available. However, further animal surveillance is required in Southeast Asia to identify the specific population increases among wild swine in the region

Increases in the interaction between wild swine and humans have the potential to create a greater risk of zoonotic infections and transmission to humans including those from influenza. Hunters and game professionals are suggested to be the most likely to acquire infections from wild swine. Additionally, other potential viral spillover areas of concern include residential housing in semi-natural areas and recreational activities in the same context for viral spillover.

Bird migration networks are an important risk factor for the spread and evolution of the HPAI virus throughout Southeast Asia. Tian et al (2015) used four bird vector species for H5N1 to analyze the bird migration patterns, which represented virus occurred between migratory avian flyways and that bird migrations coincided with the peaks of HPAI H5N1 epidemics (See Figure 4) 33 These findings support recent calls for increased collaboration between countries located along the same flyways, and suggest that in addition to regional surveillance, flyway-based strategies should also be implemented

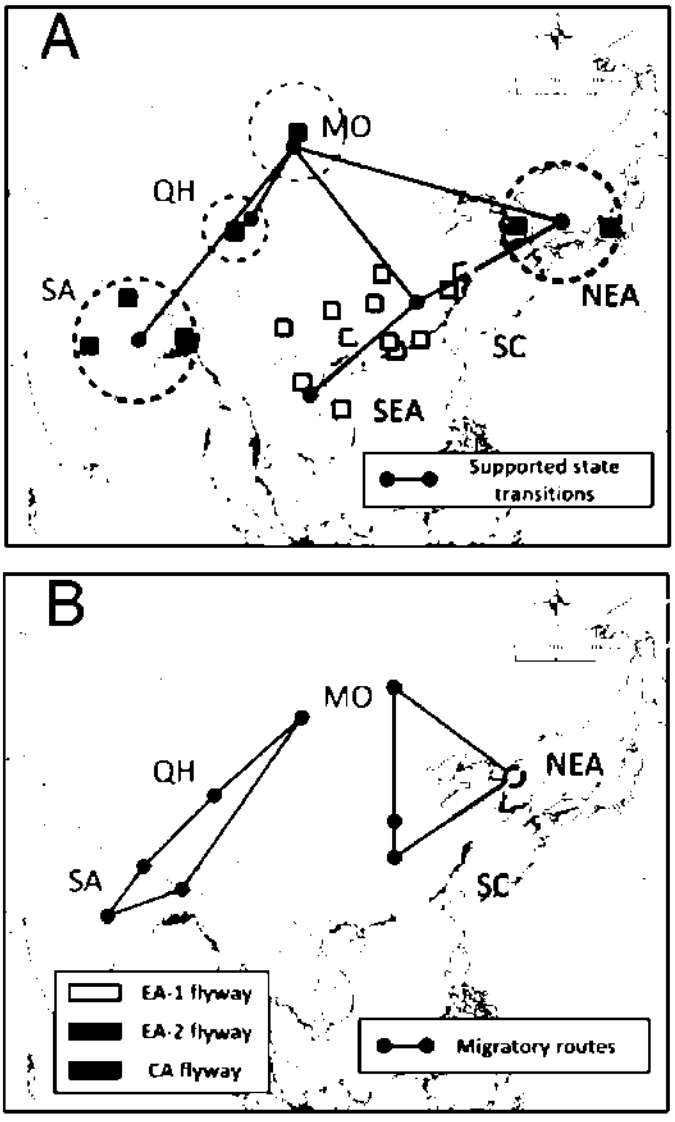

Figure 4. Viral migration and bird migration networks in Asia. (A) Supported state transitions of HPAI H5N1 clades 2.3.2. (B) The migration routes of the four main bird species [bar-headed goose (Anser indicus), swan goose (Anser cygnoides), ruddy shelduck (Tadorna ferruginea), and northern pintail (Anas acuta)] in the Central Asian (CA, red line), East Asian–Australasian 1 (EA-1, starting at Hong Kong, green line), and East Asian–Australasian 2 flyways (EA-2, starting at Poyang Lake, dark green line). (Tian, et al 2015)

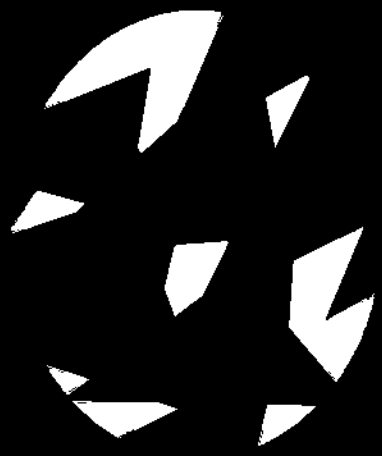
Influenza viruses generally transmit better in lower temperature, lower humidity environments. It has also been suggested that while influenza transmits primarily via aerosol in these environments, in warmer, more humid environments it transmits primarily by contact. Tamerius et al. (2013) report that their model for environmental predictors of seasonal influenza epidemics in tropical climates indicates seasonal influenza re-emergence is more probable during peak precipitation months or periods when rainfall exceeds 150mm per month [34] Conversely, in temperate climates seasonal re-emergence is more probable in cold-dry months or the winter.

The ability of AI viruses to survive in the environment depends on temperature and humidity. For example, the stability of the H5N1 HPAI virus in wet feces in the environment was more than 40 days at 4°C (39.2°F). The virus becomes less stable as the temperature increases at 25°C (77°F) the virus was stable for 8 days and at 35°C (95°F) the virus was stable for only 2 days.

Climate change is a significant contributor causing rural populations to migrate to urban centers where the most common destination is slum dwellings. As seawaters rise, coastal communities will also be forced to relocate. This ultimately could lead to close proximity living and poor sanitation, facilitating influenza infection and transmission.

Physical Environment



Avian influenza viruses are generally sensitive to most detergents and disinfectants, and heating and drying will inactivate them. However, avian influenza viruses can persist in soil, feces, and pond water for varying amounts of time, depending on environmental conditions. Thus, the sanitation of the physical environment can affect the risk of an outbreak of avian influenza. Poor sanitation and polluted water sources are often associated in backyard poultry settings, which is especially important considering that influenza is a gastrointestinal infection in birds. Kang et al. (2015) report that the sanitation status of poultry farms is a significant contributor to outbreaks and routine environmental sampling is effective at controlling the spread of transmission. Improving poultry market management as well as farm management alongside sanitation are crucial to reduce the risk of avian influenza.[35]

Infrastructure

Movement of infected feces on boots, tires, or other fomites is thought to be a leading cause of expansion of outbreaks, thus any factors that increase movement of humans (and birds) will enhance the risk of an outbreak and its expansion. Road infrastructure must be in place for sample transport by veterinary personnel to laboratories for diagnostic testing as well as vaccine dissemination. Nonetheless, increased infrastructure enhances the potential movement of infected animals, allowing the more rapid spread of an outbreak and exacerbating control efforts. Additionally, Brown et al. (2015) demonstrate the proximity to highways can promote epidemic dispersal [36]. Finally, the increase of global trade and travel dramatically heighten the risk of pandemics.

A primary component of airborne poultry dust is fecal material. Virus contaminated particulate matter from infected poultry can be dispersed into the environment leading to virus spread outside of the flock. Human and animal populations downwind from buildings holding infected birds can be at risk[37]

The World Or tion for Animal Healt

Activities/Projects:

- OIE/JTF Project for Controlling Zoonoses in Asia under One Health Concept seeks to strengthen the capacity of veterinary services and enhance collaboration between veterinary services and the public health sector of member countries on reducing risks for zoonotic potential. Influenza is one of the chosen priority topics for joint action between SAAHC, ASEAN, SPC, and other stakeholders.[1]
- OIE Regional Workshop on Enhancing Influenza A viruses National Surveillance Systems (26-28 August, 2014). Sessions included (1) Updates on HPAI control measures; (2) Epidemiological aspect and surveillance metrics; (3) Legal and social aspects of surveillance; (4) Regional collaboration and data sharing
- IDENTIFY Project coordinates efforts among FAO, OIE, and WHO to promote strengthening laboratory capacity across the region. The project pairs international reference laboratories with leading national laboratories in the region for knowledge sharing and troubleshooting. The United Kingdom and India are currently paired to focus on equine influenza.

info@mctabiota.com www.mctabiota.com

Mekong Basi
Disease Surv e

Activities/Projects:

- The Cross Border Information Exchange Schedule attempts to standardize reporting timelines for infectious disease cases. National MBDS coordinators and adjacent provincial site coordinators exchange routine surveillance data about suspected outbreaks. Influenza is a top priority disease and should be reported daily. The frequency of cross border information exchange varies by country. Cross border reports are traded between many different combinations of cities in Laos, Thailand, Vietnam, Cambodia, China, and Myanmar [4]
- Partnered with the Nuclear Threat Initiative, Global Health and Security Initiative (GHSI) supports the international health community to prevent, detect, and respond to biological threats by increasing human resource and surveillance capacity.[3] In 2008 NTI GHSI received a $2.5 million grant to respond to infectious disease outbreaks in Southeast Asia [4]

Tools/Resources:
GeoChat is a collaboration tool to escalate response to potential outbreaks. The hospital network of Thailand including over 900 facilities exchanges information and exchanges alerts to detect influenza outbreaks in real time from across the country. GeoChat is not yet used throughout the entire Mekong Basin region [5]

Pasteur Institute

Activities/Projects:

- The Pasteur Institute hosts a WHO reference laboratory for furthering research on influenza among other pathogens.
- The Severe Influenza in Africa and Asia study identifies factors that have been identified to be potentially associated with severe forms of influenza in the industrialized and developing world. The hypothesis is that the severity of influenza might be higher in developing countries compared to industrialized countries due to factors such as malnutrition and poor health systems. The lab runs case control studies to study these factors and influenza in Africa and Asia
- Reinforce Surveillance networks for flu viruses in Africa and Southeast Asia (DHHS)- This project's objectives are to reinforce surveillance networks for flu viruses in Africa and South East Asia, particularly regarding avian flu, as well as to perform epidemiological studies.

info@metabiota.com www.metabiota.com

Asia Partners
Emerging Infe , Research

Activities/Projects:

- APEIR was initiated in 2006 to promote regional collaboration on avian influenza research—the partnership expanded its scope in 2009 to include all emerging infectious diseases (EIDs). The network aims to accommodate, and facilitate the researchers with and within countries in order to support the activities on knowledge generation (i.e., through research), research capacity building (e.g., by coordinating multiple researchers in developing high-quality research proposals, planning and conducting joint research projects), and policy and social advocacy (e.g., by disseminating research results to policy makers) through the network and partnership.
- Mitigating Biosecurity Threats from Infectious Diseases with Pandemic Potential was a joint project between APEIR, MBDS, and ASEAN+3FETN. The underlying objective of the project is to strengthen regional capacity for understanding, preventing, preparing for, and responding to disease agents that have bioterrorism and/or pandemic potential in Southeast Asia. The collaborative research program seeks to understand the transmission dynamics of the aforementioned infectious disease pathogens in preparation for this regional development, and to encourage international research collaboration to increase Southeast Asia's overall research capacity. The transmission of influenza was included in the project as well as melioidosis, salmonella, and SARS.

- APEIR projects completed during it's first phase (2006-2009):
  - *Forming Regional Network for Surveillance and Monitoring of Influenza Viruses in Migratory Birds*
    Locations: Thailand, China, Indonesia, Vietnam
  - *Study on Socio Economic Impact of HPAI Outbreaks and Control Measures on Small Scale and Backyard Poultry Producers*
    Locations: China, Indonesia, Vietnam
  - Characteristics and Dynamics of Backyard Chicken Systems in 5 Asian Countries in Relations to Reduce and Manage Avian Influenza Risks
    Locations: Cambodia, Thailand, China, Indonesia, Vietnam
  - Policy Analysis for Pandemic Influenza Preparedness
    Locations: Indonesia, Thailand, Vietnam
  - Studies on the Effectiveness of Avian Influenza Control Measures
    Locations: China, Indonesia, Thailand, Vietnam

- APIFH Phase II- Building on past research on avian influenza and ongoing knowledge-translation activities in the health field, this new phase of work will help APCIR build and support regional capacity to communicate and share knowledge to promptly address emerging infectious disease threats

info@mctabiota.com www.mctabiota.com

Centers for Disease Cont

Activities/Projects:

- Global Disease Detection (GDD) was established to strengthen disease detection and response capacity globally. There are GDD centers in China, India, Bangladesh, and Thailand. One component focuses on pandemic influenza preparedness and response. GDD develops influenza surveillance capacity in host countries by improving and expanding global surveillance networks, increasing virus isolation, and improving epidemiological data collection. The CDC operates these GDD centers in Bangladesh, China, India, Thailand, and other countries outside of the SEA region. [7]

- WHO funds nine cooperative agreements with the ministries of health or designated institution by to identify, diagnose, and respond to seasonal, avian, and seasonal pandemic influenza in the SEA region. Six of the countries that received sustainability grants included Bangladesh, India, Indonesia, Nepal, Sri Lanka, and Thailand. These countries are expected to participate in WHO's GISRS while developing a surveillance system that will eventually phase out U.S. government funding.[8]

Tools/Resources:
Collaboration with WHO's FluNet

WHO

Activities/Projects:

- The WHO Global Influenza Surveillance and Response System (GISRS) monitors influenza viruses in the region GISRS has conducted influenza virological surveillance for over 50 years. The WHO GISRS monitors the evolution of influenza viruses and provides recommendations for laboratory diagnostics, vaccines, antiviral susceptibility and risk assessment. It also serves as a global alert system for the emergence of influenza viruses with pandemic potential.[10]
- Pandemic Influenza Preparedness (PIP) Plan framework used to monitor the spread of influenza A/H5 viruses in human and animal populations for Member States and stakeholders. Framework is used to assess the global trend of the disease, the public health risk it poses, its pandemic potential, and to trigger public health actions for pandemic preparedness.[11]

Tools/Resources:

(1) FluNet: a publically available da tabase for surveillance updated with influenza strains collected worldwide. This data helps to track the move- ment of viruses globally and interpret epidemiological data. [12]

(2) FluID: a global data sharing plat form to link regional influenza epi- demiological data into a single data- base. Provides connections between existing databases and compliments existing virological data collection tool FluNet. [13]

(3) WHO H5 Reference Laboratories Network: a component of GISRS in relation to avian influenza A(H5N1) infections in humans and influenza pandemic preparedness.[14]

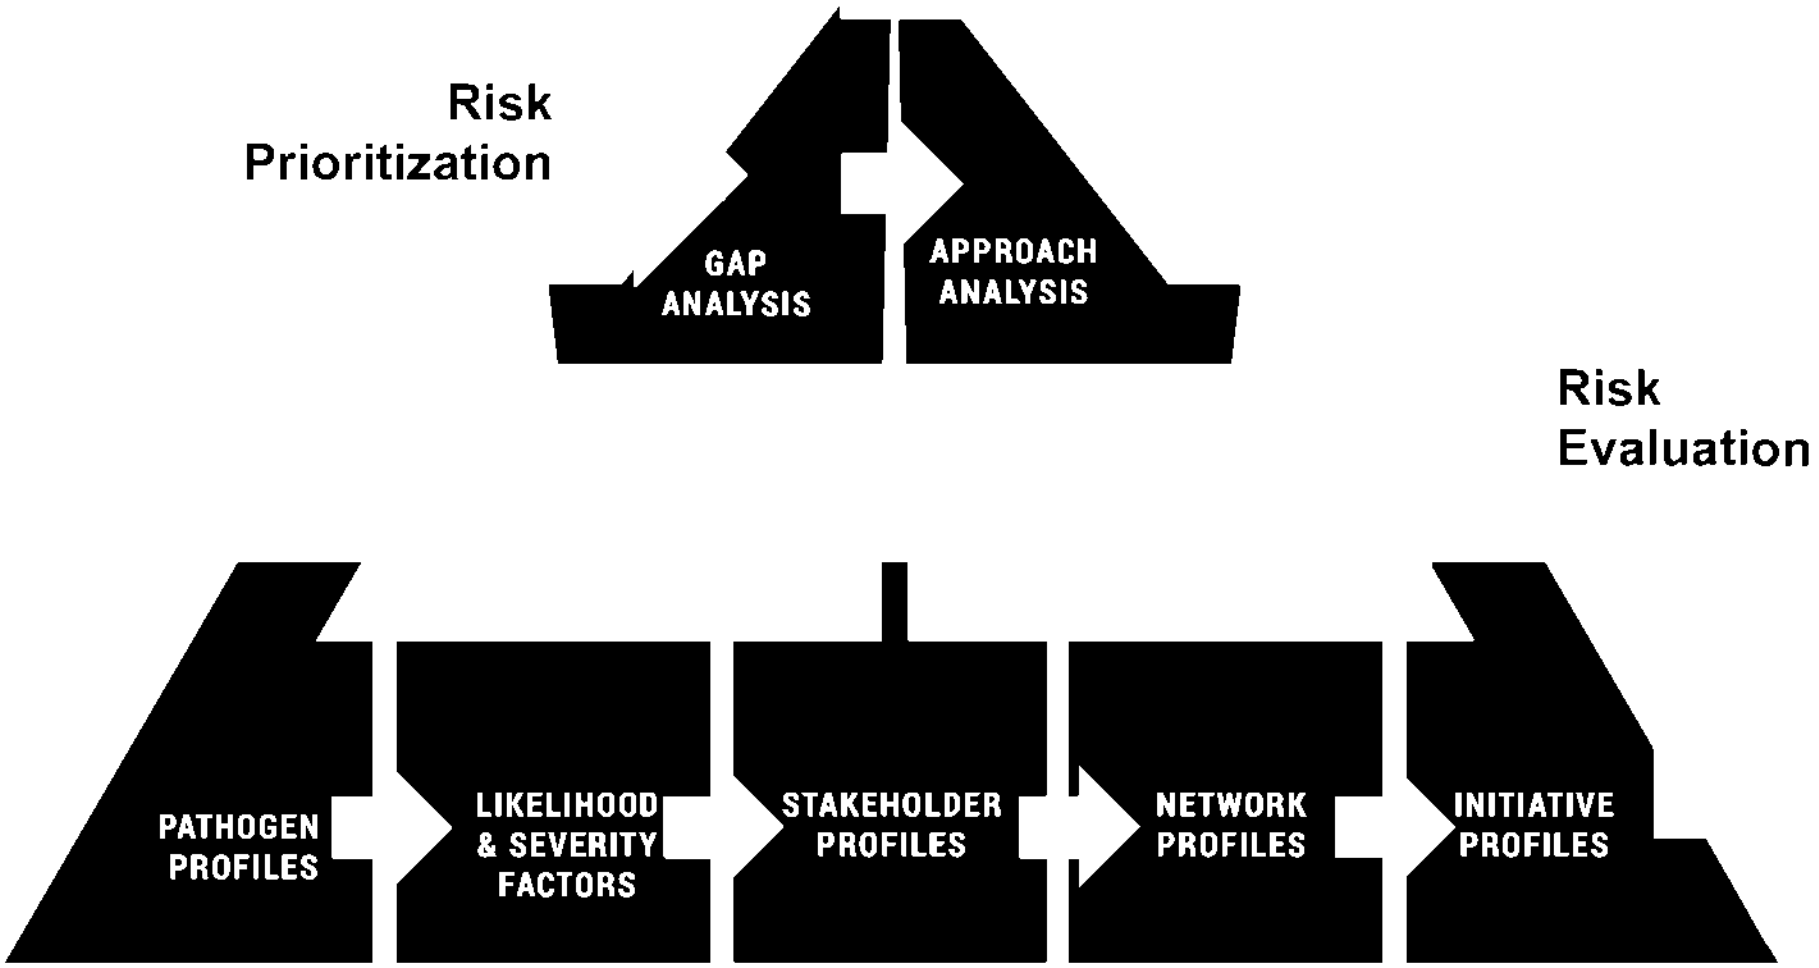
Regional Landscape Analysis
Update to CBEP PACOM PM
16 July 2015

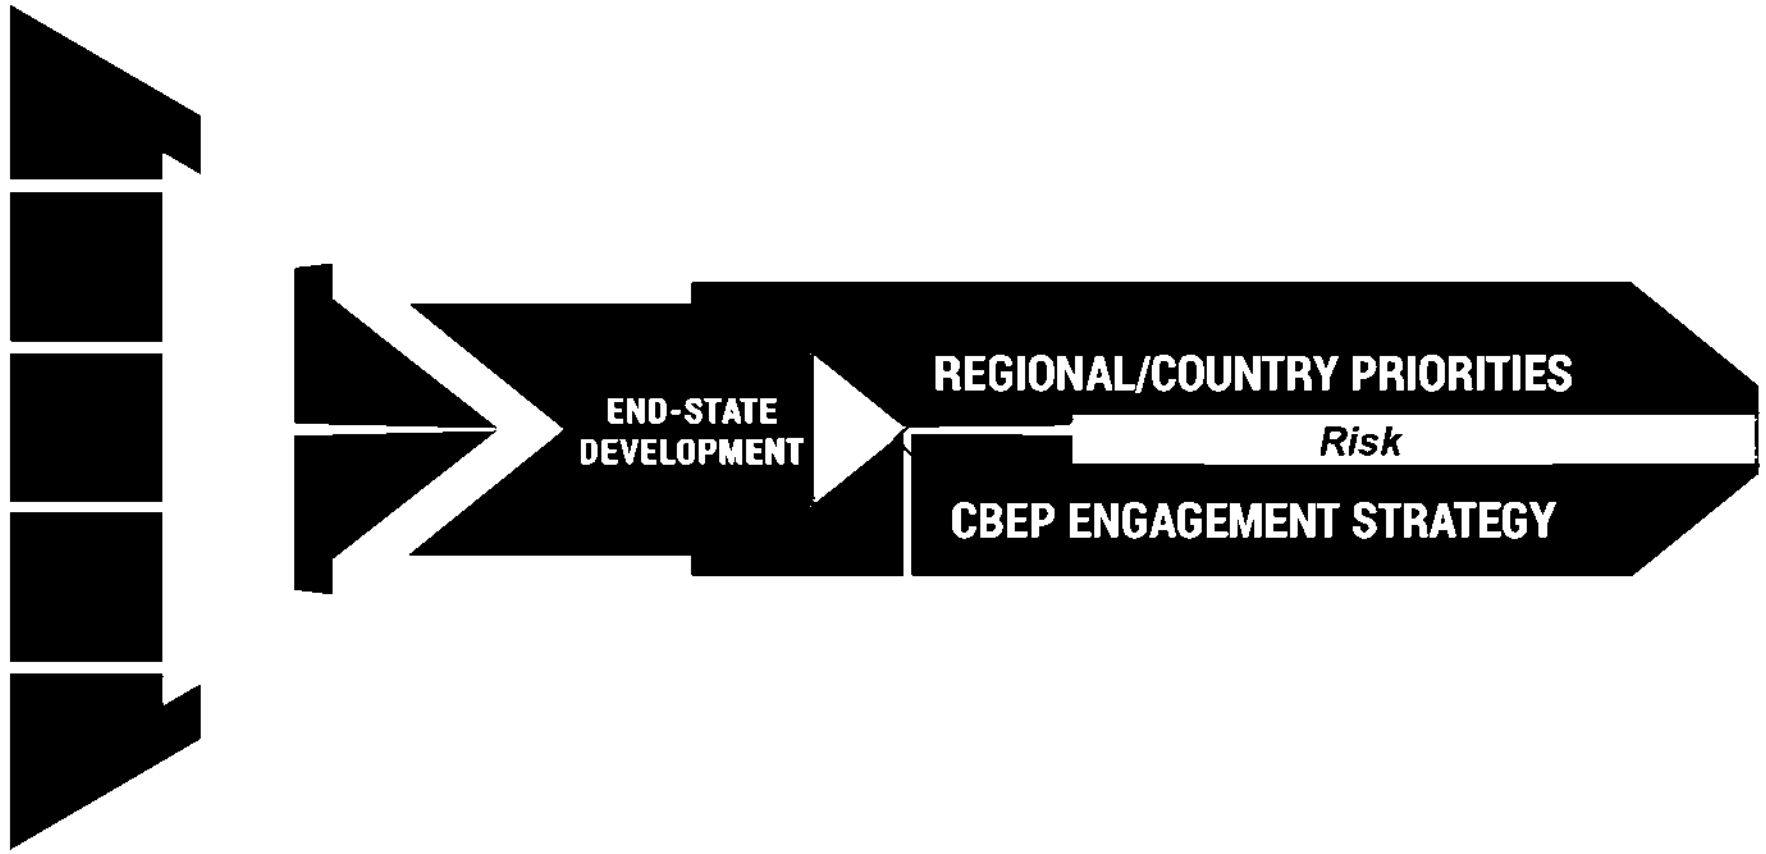
METABIOTA

Overview



Purpose: To provide a regional landscape analysis that will support the development of the CBEP PACOM engagement strategy

Objectives:



1) Characterize the regional disease landscape, organic capabilities, and external stakeholder influence to identify where priorities align with CBEP objectives
2) Identify needs, gaps, and areas of overlap with other stakeholders
3) Provide a framework that will inform strategic engagement planning

Outcomes: A narrative, biological risk based analysis to facilitate development of realistic, measurable, and achievable regional end-states

H (b)(6)

Please find attached Technical Direction for implementing a study on the risk of bat-borne virus transmission from the annual bat cull in Nagaland, India. A proposal and estimated budget for this activity is requested NLT 10 June 2015. Please feel free to communicate directly with the CBEP POCs for this TD (b)(6) if you have any questions about the requirement.

Cheers,

(b)(6)

San Francisco, CA 94104-4923

Subject: HDTRA1-14-C-0104 Technical Direction for the Study of the Risk of Bat-borne Virus Transmission from the Annual Bat Cull in Nagaland, India.

Dear (b)(6)

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to administer a study of the Risk of Bat-borne Virus Transmission from the Annual Bat Cull in Nagaland in accordance with SOW Section 4.3, Task 3. This study will determine the virus community of three species of bats in a cave in Nagaland, India and if there is a risk of human infection. This particular site is very important because there is an annual bat harvest in October where numerous individuals from surrounding villages visit. This study will sample this cave for the presence of known select agents that are naturally harbored by bats and that have caused mortality in humans. Metabiota shall visit this site three times to collect bat excreta, urine, oral swabs, anal swabs, blood, sera, and tissues (kidney, spleen, lung, intestine) from harvested bats. The first visit will be 4-6 weeks before the bat harvest to ascertain the base line level of prevalence, the second trip will be during the harvest, and the third trip will be 4-6 weeks after the harvest. A proposal and estimated budget not to exceed $150,000 for implementing this requirement is requested by 10 June 2015.

Nothing in this letter shall constitute a contractual direction or affect the current negotiated cost, price or schedule contained in the contract. If the contractor believes there is an impact, the contractor must disregard that portion of the communication and immediately contact the contracting officer for direction.

Metabiota shall proceed with all coordination necessary to implement this task and communicate as needed with DTRA CBEP Points of Contacts listed below.

Content: Updated Budget Narrative Supporting TD 0004 "DTRA/CBEP Implementation of an Epigenetics and Genomics of Infectious Diseases Workshop in the Middle East South Asia Region" based on request by CBEP Regional Leadership to extend the Period of Performance (PoP) from 30 November 2015 to 15 May 2016 and revise the project schedule.

Budget Narrative

Following conversations with (b)(6) it was determined that the project period of performance, schedule, and additional performance requirements be amended to guarantee successful implementation of the MESA Epigenetics and Genomics of Infectious Diseases Workshop. The extension of the project will ensure there is sufficient time for PAO approval of all workshop related materials to include, but not limited to, the following:

- Conference Announcement
- Registration Guidelines
- Abstract Submission Guidelines
- Abstract Licensing and Publishing Agreement
- Travel Support Request
- Permission for Attendance
- Website submission forms and applications
- Workshop Website

Solicitation of participants across the region cannot begin until the website is operational and all documents are approved. Once the website is up and running, sufficient time must be allotted for participants to submit for attendance, provide abstracts, Scientific Advisory Board review and selection, notification, and travel arrangements made. Extending the PoP allows the above mentioned activities to be completed in an optimal timeframe, ensuring scientific integrity and rigor is applied to the event. In addition, extending the PoP allows for additional activities to be conducted that will support the successful outcome of the event, to include garnering sufficient regional support and interest to attract an ideal number of participants from varying scientific backgrounds and countries.

Extending the PoP will provide a forum for the following:

This material shall not be disclosed outside the U.S Government and shall not be duplicated, used or disclosed in a whole or in part for any purpose other than to evaluate this material. If, however, a contract is awarded to this offeror as a result of- or in connection with- the submission of this material, the U.S Government shall have the right to duplicate, use or disclose the data to the extent provided in the resulting contract. This restriction does not limit the U.S Government's right to use information contained in this material if it is obtained from another source without restriction.

1) Preparation of a conference proceedings report that describes the state of the science in the MESA region for genomics and epigenetics of infection and possible synergies for cooperation among conference attendees. The proceedings report will include two components: 1) a narrative prepared by Gryphon Scientific and the Jordan Royal Scientific Society (RSS); and 2) papers submitted by conference presenters for inclusion in the proceedings book.
2) Request presenters to submit papers for inclusion in the proceedings book. Submission of papers will be optional. Gryphon Scientific staff will proofread and edit the papers prior to inclusion in the report.
3) Conduct an outreach reception for science and cultural attaches of country Embassies located in Washington, DC. The purpose of this reception is to inform Embassies about the conference and encourage their assistance in informing leading scientific organizations and scientists in their respective countries about the conference. This reception will provide an opportunity for Embassy staff to ask questions formally and informally to Gryphon Scientific, Metabiota, and DTRA. Staff from the Department of State's country or regional desks, International Security and Nonproliferation Bureau, and OES Bureau will be invited to the reception. If the Office of Naval Research Global (ONRG) program manager (who has provided RSS with funds to support its work on the conference) is in Washington, DC, she will be invited to participate.

These additional activities, that fall within the scope of this project, will ensure a successful event that promotes the CBEP mission within the region and fosters a collaborative environment of scientific engagement based on strong scientific integrity, attention, and allows for an optimal timeframe in which to host the workshop and ensure the most diverse and relevant group of attendees is selected and supported. Costs incurred to support the extension will involve additional labor hours of key personnel, and CLS support for the outreach reception held with the S&T leads at US Embassies in Washington D.C.

Period of Performance

The Period of Performance for this effort has been extended. It is revised to June 1, 2015 to May 15, 2016.

Labor

To accommodate the extended period of performance, conduct the original scope of work, and conduct the requested additions to the scope of work, an increase in labor hours and costs of project personnel is requested. All other direct costs will remain the same. These changes result in a final project budget of $488,040 which is an increase of $94,490.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government.

The new period of performance extends the original contract by 5.5 months, which allows all project staff and collaborators to carry out conference planning to the optimal extent. To accommodate this, we propose the following additions to project staff hours:

Metabiota Program Manager (b)(6)
LOE: 475 Hours
(b)(6) total hours will be increased from 300 to 425 to allow for continued program management activities and oversight for the duration of the period of performance. Tasks will include: overseeing project personnel in the execution of requirements and implementing the workshop, managing project deliverables, including submission of requirements to CBEP, tracking project requirements, interacting and reporting to CBEP personnel providing project visibility and coordination, financial monitoring, coordination and management of Gryphon Scientific personnel, and coordination with RSS to ensure deliverables are met and workshop is implemented. She will ensure overall logistical management of the event, and make sure the project is on track and completed within scope and budget. She will travel to Jordan in support of the workshop to provide on the ground coordination with CLS, Gryphon, and RSS to ensure smooth implementation of the event.

Research and Data Analysts

Metabiota Project Coordinator (b)(6)
LOE: 452 Hours
(b)(6) hours will be increased from 396 to 417 allowing for continued project coordination throughout the duration of the period of performance. Activities will continue to include day-to-day coordination of the project, communication with collaborators, processing of project documents, attendance of the conference, and general travel and CLS support.

Gryphon Junior Analyst (b)(6)
LOE: 340 Hours
The Junior Analyst's total hours will increase from 115 to 340, spending approximately 50% of her time until the conference identifying experts working in relevant fields and on relevant research through extensive literature review, assisting the abstract submission and review process, assisting the travel application and review process, preparing the traveler information for conference attendees, and preparing the abstract book.

Gryphon Contract Administrator (b)(6)
LOE: 100 Hours
(b)(6) total hours will increase from 95 to 100, allotting for preparation of purchase orders with the graphic designer and website developer, review of invoices, and assistance with development of a memorandum of understanding between Gryphon Scientific and RSS.

Subject Matter Experts

Gryphon Principal Investigator (b)(6)
Subject Matter Expert III
LOE: 500 Hours
(b)(6) total hours will remain at 500, spending an average of 25% of her time on the site visit, conference planning and facilitation, Embassy outreach reception, scientific advisory board interactions, agenda development, invitation of invited speakers, and preparation of the proceedings reports.

Gryphon Senior Analyst (b)(6)
Subject Matter Expert I
LOE: 390 Hours
(b)(6) otal hours will increase from 225 to 390, spending an average of 25% of her time on conference planning, design of the conference logo, abstract review, travel applications and review, informing of prospective attendees of their acceptance and presentation format, copy edit of the abstract book and submitted papers, review of the proceedings report, and attendance at Embassy outreach reception.

Gryphon Senior Analyst (b)(6)
Subject Matter Expert I
LOE: 750 Hours
(b)(6) tal hours will increase from 400 to 750, spending an average of 45% of his time on the site visit, conference planning, conference website development, abstract submission and review, Embassy outreach reception, agenda development, informing of prospective attendees of their acceptance and presentation format, oversight of preparation of the abstract book, preparation of the proceedings report, and editing of submitted papers.

Additional costs for direct labor supporting the Deputy Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

Materials

CLS will print and bind the proceedings books and carry out all logistics for the Embassy outreach reception. This function is in addition to CLS's other responsibilities for this project, which are: all logistics, including catering, staff, and participant travel for the conference; staff travel prior to the conference; and printing and shipping of the abstract books. Costs for both the proceedings book and the Embassy outreach reception are not included in the revised budget, since they fall within the scope of CLS's contract.

Costs for the workshop website were reduced following final negotiation and procurement of services with the vendor.

Other Direct Costs

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government.

No additional costs are requested. Costs for SoS insurance were reduced to reflect SoS support for (b)(6) only, to attend the workshop in March.

Subcontracts

Gryphon Scientific's subcontract will be modified to increase their labor support for the extended period of performance. Costs are captured under the appropriate labor categories in CLIN 1002.

Travel

Travel costs are increased to requested the attendance of (b)(6) on the scoping visit in conjunction with (b)(6) Program Manager and (b)(6) Gryphon Senior Analyst to travel to Amman, Jordan in October 2015. The scoping visit is critical for meeting with RSS key personnel supporting this engagement to include members of the scientific board, and to ensure in-country logistical support services being provided by CLS in support of this event are captured and clearly communicated to support implementation, and to ensure all facility and hosting requirements are in place to facilitate this event.

Metabiota team travel to the Workshop has been reduced from 4 participants to 3, in an attempt to reduce costs, and in exchange for (b)(6) attending the scoping visit in October.

Conclusion

Metabiota is committed to support our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP CENTCOM in the implementation of the DTRA/CBEP Epigenetics and Genomics of Infectious Diseases Workshop in the Middle East South Asia Region. Metabiota will ensure, through strong project management and risk mitigation that the training will be executed in an efficient and timely manner delivering a top quality course geared to support enhanced biosurveillance and biosafety efforts in the region.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government.

Revised Project Schedule
PoP: 1 June 2015 – 15 May 2016

Key dates

2015

7/27: First Meeting of Scientific Advisory Board (virtual, half-day)
8/24 (week of): invite the invited speakers
September: Embassy outreach reception
10/9: Abstract submission deadline
10/11-10/13 (2 days): Visit RSS to prepare for conference
10/14: Abstracts distributed to review board
10/23: Abstract review deadline (online)
10/26 (week of): Advisory board review meeting (virtual, half-day)
10/30: Send Metabiota/DTRA preferred requirements
11/4: Registration and travel support application deadline
11/2 or 3: Send Final Results of Selected Abstract Assignment for Confirmation
11/6: Confirm Final Results of Selected Abstract Assignment (online)
11/9 (week of): Notify applicants of decision
11/16: Send abstracts to DTRA
12/7: Complete Travel Training Requirements for U.S. citizens (online)

2016

1/4/2016: Send Travel Information for all supported travelers to DTRA
1/4/2016: Drafts of posters deadline for DTRA funded research
1/5/2016: Send draft poster/talks to Metabiota/DTRA for review for DTRA funded research
1/25/2016: Deadline to complete Abstract Book to send to CLS for printing
3/7/2016-3/8/2016: Conference (Amman, Jordan)
3/9/2016: half-day after action meeting with Gryphon, Metabiota, DTRA, CLS, RSS, and ONRG
4/1/2016: Deadline for proceedings book to DTRA

Confirmed advisory board members

1. [redacted] (b)(6) al Committee on Ethics, Jordan
2. [redacted] ordan Royal Scientific Society, Jordan
3. [redacted] sity of Jordan, Jordan
4. [redacted] an Academy of Sciences, Pakistan
5. [redacted] University of Connecticut
6. [redacted] MPH, Unite Nations Population Fund, Afghanistan
7. [redacted] yphon Scientific, USA
8. [redacted] University, UAE
9. [redacted] enter for Disaster and Humanitarian Assistance Medicine, Iraq

Three additional members have been invited.

Metabiota Inc.
Contract No: HDTRA1-14-C-0104
TD: 015

Content: Budget Narrative Supporting TD-015 "Technical Direction for Continued Health Informatics Support in Vietnam" based on request by CBEP Regional Leadership to ensure completion and delivery of the final report created by (b)(6) in support of this effort.

Budget Narrative

Metabiota was previously issued a Technical Direction Memo to proceed with the fulfillment of a Global Health Security Information Systems and Surveillance contract position to be stationed in Vietnam; authorizing disclosure of position requirements and soliciting candidates for the position. In support of this effort, (b)(6) promoted reducing biological threats, engaging scientists through cooperative pursuits, and enhancing host-nation capacity in disease surveillance and response, while adhering to international codes of security and safety to ultimately provide a mechanism for sustained engagement.

The extension of the project will ensure there is sufficient time for de-briefing meetings with in-country personnel as well as editing and preparing the report for submission to CBEP.

Continuing support of this project will provide a forum for the following:

1) The Vietnamese Tet holiday held previously in the year has delayed the timeline for accomplishing established goals. Extending the project will ensure that (b)(6) has time to finish working with in-country partners to expedite the assessment and ensure all activities are completed prior to his departure from the country.
2) Ensuring time for editing and preparation of the final report for submission of polished, high quality deliverable to CBEP.

These additional activities that fall within the scope of this project will ensure a successful report that promotes the CBEP mission within the region and fosters a collaborative environment of scientific engagement based on strong scientific integrity, attention, and allows for an optimal timeframe in which to complete the final deliverable. Costs incurred to support this extension will involve additional labor hours of key personnel.

Period of Performance

The Period of Performance for this effort is May 16, 2015 to June 30, 2015.

This material shall not be disclosed outside the U.S Government and shall not be duplicated, used or disclosed in a whole or in part for any purpose other than to evaluate this material. If, however, a contract is awarded to this offeror as a result of- or in connection with- the submission of this material, the U.S Government shall have the right to duplicate, use or disclose the data to the extent provided in the resulting contract. This restriction does not limit the U.S Government's right to use information contained in this material if it is obtained from another source without restriction.

Labor

To accommodate the extended period of performance, conduct the original scope of work, and conduct the requested additions to the scope of work, an increase in labor hours and costs of project personnel is requested. All other direct costs will remain the same. These changes result in a final project budget of $51,804.80.

The new period of performance extends the original contract by 1.5 months, which allows (b)(6) (b)(6) to finish his final report to the optimal extent. To accommodate this, we propose the following additions to project staff hours:

Metabiota Program Manager (b)(6)
LOE: 8 Hours
(b)(6) hours will total 8 hours during this period to allow for continued program management activities and oversight for the duration of the period of performance. Tasks will include: overseeing project personnel in the execution of requirements, managing project deliverables, including submission of requirements to CBEP, interacting and reporting to CBEP personnel providing project visibility and coordination, financial monitoring, coordination and management, and coordination with (b)(6) to ensure deliverables are met, and contract is closed out. She will ensure that the project is finalized and closed out accordingly with all deliverables submitted to CBEP and CDC personnel.

Health Informatics Specialist (b)(6)
LOE: 176 Hours
(b)(6) hours will total 176 hours in this period, allowing for continued contact with in-country partners and completion of the evaluation report in a timely manner in order to identify gaps in the capability and capacity of the existing disease reporting and response systems, as well as supporting information systems software and other tools to meet the Vietnam National and International Health Regulation's (IHR 2005) reporting requirements in the scope of GHS Agenda.

Other Direct Costs

No additional costs are requested. Costs for DBA insurance were previously incurred for (b)(6) (b)(6) time in Vietnam.

Conclusion

Metabiota is committed to support our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP PACOM in the continuation of Health

Executive Summary

In response to Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) regional leadership tasking via the Academic Engagement Partnership (AEP) contract vehicle, Technical Direction 014, Metabiota, Inc. seeks to support the DTRA CBEP mission by conducting a technical writing training workshop in Kenya in order to advance Kenyan One Health research publication capacities. These proposed efforts will focus on the development and enhancement of all aspects of technical writing in addition to the journal identification, submission, and review processes for key members of the One Health research community in Kenya, thereby expanding Kenyan scientific research networks and collaboration opportunities while concurrently facilitating cooperative research and scientific engagement in the greater region in support of the DTRA CBEP mission.

Through this activity, Metabiota will engage with the Kenyan Zoonotic Disease Unit (ZDU), Global Implementation Solutions (GIS), and other key stakeholders from the Regional Conference on Zoonotic Diseases in Eastern Africa Conference as well as Subject Matter Experts (SMEs) in the areas of statistics, epidemiology, microbiology, diagnostics, and technical scientific writing in order to direct technical and programmatic support in the development and implementation of this technical writing training in order to expand Kenyan One Health research capacities and network.

This document outlines the approach that Metabiota will employ to accomplish this requirement. In short, Metabiota intends to:

1. Identify the current status and technical writing training needs in the One Health sector in Kenya, and the most effective engagement approach to enhancing those capabilities.
2. Facilitate the rollout of a technical writing workshop and mentorship program for key members of the One Health community in Kenya.
3. Support the expansion of Kenyan technical writing capabilities to meet international peer-review publication requirements and expectations thereby enhancing Kenyan scientific networks and research collaboration to reach the global scientific community.

Project Overview

Background

Especially dangerous pathogens are a challenge for both human and animal health and security infrastructures, and pose a significant threat to security and economic stability across the globe. To manage these threats, DTRA CBEP aims to reduce potential impacts of biological threats by enhancing biological safety and security (BS&S), awareness of biological risks, and knowledge related to biological pathogens globally.

To do so, DTRA CBEP works collaboratively with partner nations, other USG agencies, and the international community to enhance disease surveillance capabilities; develop human resource expertise in public and animal health; promote safe and secure laboratory and field work environments; and consolidate pathogens of security concern into a minimal number of safe and

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

secure facilities in a sustainable manner. In AFRICOM, specifically, DTRA CBEP seeks to increase regional collaboration on topics critical to biological threat reduction and enhance the regional capacity to perform biorisk management and mitigate the threat of infectious disease events.

To further this effort DTRA CBEP supported a Regional Conference on Zoonotic Diseases in Eastern Africa in March 2015. This activity's primary objective was to: encourage regional scientists to gather, process, analyze, present and publish their findings to further the understanding of zoonotic diseases and on-going work towards their prevention and control. In an effort to broaden the long-term impact of this activity and enhance Kenyan research scientist's capacity to conduct, collaborate, and disseminate research in the One Health sector at the international level. DTRA CBEP tasked Metabiota with conducting a follow-on workshop on technical writing for Kenyan research scientists who took part in this earlier workshop.

In support of this approach, Metabiota intends to provide administrative and technical support for the rollout of a One Health Zoonotic Disease Technical Writing Workshop. Metabiota will coordinate with POCs with the organizers and key stakeholders from the Regional Conference on Zoonotic Diseases in Eastern Africa in order to develop an understanding of Kenya's technical writing capacities and needs in the One Health sector. Metabiota will identify subject matter experts (SMEs) who possess expertise salient to their own in an effort to establish the optimal team needed to mentor, train, and shepherd up to twenty Kenyan participants through the publication drafting and submission process for submission to internationally recognized peer-reviewed journals in their respective fields. This technical writing workshop will increase international knowledge sharing and scientific collaboration on topics critical to biological threat reduction in the one health sector, and enhance the regional capacity to perform biorisk management and mitigate the threat of infectious disease events. Our team's on-the-ground experience and decades of expertise makes us well positioned to support the implementation of these and associated activities, as well as scientific engagement in Kenya and the greater region.

Goals and Objectives

This activity aims to provide DTRA CBEP partners in Kenya with support to enhance Kenyan One Health research scientist's capacity to conduct, collaborate, and disseminate research at the international level. The delivery of these requirements will cultivate continued knowledge enhancement throughout Kenya and expanded in country and regional capacity to conduct disease detection, surveillance, and control.

To achieve this purpose, Metabiota and their collaborative partners will:

- Identify the current status and technical writing training needs in the One Health sector in Kenya, and the most effective engagement approach to enhancing those capabilities;
- Facilitate the rollout of a technical writing workshop and mentorship program for key members of the One Health community in Kenya;
- Support the expansion of Kenyan technical writing capabilities to meet international peer-review publication requirements and expectations thereby enhancing Kenyan scientific networks and research collaboration to reach the global scientific community.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Threat Reduction Impact

Through the implementation of Metabiota-facilitated technical writing workshop in Kenya and the activities leading up to and following the workshop, DTRA CBEP will have:

- Developed and enhanced technical research publication capacities in Kenya thereby expanding international scientific collaboration opportunities on topics of zoonotic disease detection, surveillance, and control;
- Disseminated scientific data related to zoonotic disease incidence and prevalence of pathogens of concern thereby increasing awareness and transparency;
- Supported collaborative awareness efforts in the region and foster collaborative scientific research by providing key capacities for the dissemination of knowledge to engaged members of the One Health community.

This activity will provide a measurable and achievable result in raising awareness of zoonotic disease research among DTRA CBEP AFRICOM partner countries and facilitating efforts in Kenya to enhance the capacities of researchers who play a pivotal role in the detection and control of zoonotic diseases in the region. Moreover, this activity will concurrently promote the development of a sustainable infrastructure for advancing scientific research in the One Health community.

Risk Management

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
				Cost		(b)(4); (b)(6)
Subject Matter Expert Subcontracting	Due to limited insight into participant profiles and research activities, additional costs and time-delays may occur to identify and coordinate the most appropriate SME coordination, which may impact the ability to conduct this activity in full.	3	3	Medium	As soon as Metabiota has a basic understanding of the participants' work, Metabiota will begin contacting possible SMEs, refining the list as better understanding develops. Metabiota will attempt to reach basic agreement with SMEs as soon as possible and issue authorization to proceed while subcontracts are being put into place.	
				Schedule		
Project Coordination	Kenya One Health Technical Writing Workshop involves a significant number of stakeholders and participants representing various organizations, putting implementation activities at risk of delay or cancellation.	5	2	Medium	Establish and hold regular calls with all stakeholders and identify multiple possible implementation dates. Identify critical components as early as possible and redirect efforts when it becomes clear that targeted implementation dates will not be achievable.	

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Performance						
Unknown skill levels of workshop participants	If the skill levels of writing of the various participants varies widely, this would impact the efficacy of the workshop, and potentially impact the ability to deliver a submission-quality manuscript in the time allotted.	4	4	(b)(4); (b)(6)	Work with Kenyan stakeholders and DTRA to identify appropriate participants and better understand the requirement for the quality of the final manuscripts.	(b)(4); (b)(6)
Political Instability	Sporadic violence in northeastern Kenya may lead to risks of being unable to safely complete in-country work.	2	5	Medium	Coordinate closely with DTRA and AFRICOM to be aware of any potential risks to performers, and target a location for the workshop well away from risky areas.	

Implementation Plan

Introduction

Metabiota will employ its existing organizational leadership to interface with the Regional Science Manager and Regional Program Manager, and Country Manager to direct the operational and administrative support required to ensure implementation of the Kenya One Health Zoonotic Technical Writing Workshop. Our Program Manager will oversee these activities, with the support of both CONUS and OCONUS Metabiota staff to ensure that all aspects of cost, schedule and performance are monitored and reported to the AEP Contracting Officer Representative (COR) and AEP Program Leadership.

Communications Protocols

Metabiota will maintain open communications with international collaborators necessary for implementing the workshop, to include regional partners facilitating the workshop engagement and logistics. In addition, Metabiota will maintain routine communication with DTRA CBEP to ensure they have full visibility on the training engagement, status and process of execution.

Technical Approach

Phases of Technical Approach

Metabiota will use a phased technical approach to manage all tasks required for successful implementation of the project phases and to provide overall feedback and reporting on the proceedings outlining the accomplishment of objectives. The following phases are required for this project:

Phase 1: Programmatic Coordination and Training Landscape Review
Phase 2: Participant Identification and SME Mentor Pairing
Phase 3: Hypothesis Development and Article Framing
Phase 4: Writing Workshop Implementation

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Phase 5: Paper Finalization and Publication Submission
Phase 6: Post-submission Assistance and Summary Report Development

Our technical approach is predicated on the following assumptions gleaned from a short discussion with DTRA: 1) that the technical level of the participants will be of a wide range, but generally lower than that of accomplished US scientists, and 2) that the target end goal is to have fairly well-polished, submission-ready manuscripts by the end of Phase 5.

Phase 1 – Programmatic Coordination and Landscape Analysis (Aug. 24-Sep. 14, 2015)
Objective: Establish a communication and coordination plan with the Kenyan Zoonotic Disease Unit (ZDU), Global Implementation Solutions (GIS), and other stakeholders from the Regional Conference on Zoonotic Diseases in Eastern Africa Conference to initiate collaboration and conduct a landscape review of technical writing capacities and needs in the One Health sector in Kenya.

Process: Metabiota, in coordination with DTRA CBEP, will identify POCs with the organizers and key stakeholders from the Regional Conference on Zoonotic Diseases in Eastern Africa the took place in Naivasha, Kenya, March 2015. Through this collaboration, Metabiota will develop an understanding of Kenya's technical writing capacities and needs in the One Health sector. Based on stakeholder input, Metabiota will develop an analysis of the landscape of the writing capacities in Kenya and provide recommendations for participant criteria and training content.

Deliverables:

- Deliverable 1: Submission of key organizer and stakeholder POC list
- Deliverable 2: Submission of participant criteria and training content recommendations

Phase 2 –Participant Identification and SME Mentor Pairing (Sep. 15-Oct. 31, 2015)
Objective: Identify twenty individuals to participate in the Kenya Technical Writing Workshop and assign appropriate SME mentors (up to five) based upon participant areas of expertise and capacity development needs.

Process: Metabiota, in coordination with DTRA CBEP and key stakeholders, will identify up to twenty participants to take part in the Kenya Technical Writing Workshop based on the participant criteria established in Phase 1. Metabiota will work with participants to understand their research in order to further understand the specific level of assistance required and begin the process of identifying SME mentors for each participant. Metabiota will rely primarily on our own expertise to identify SME mentors based on the participant's capacity needs, areas of expertise, and anticipated publication content, but will solicit and consider recommendations from the stakeholder POCs and DTRA CBEP. Each SME mentor will supervise and collaborate with up to five participants. It is expected that some SME mentors (especially from academia) may each also identify one (1) Research and Data Analyst to assist with Phase 3 & Phase 5.

Deliverables:

- Deliverable 1: Submission of participant list and their assigned SME mentors

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Phase 3 – Hypothesis Development and Article Framing (Nov. 2, 2015-Jan. 29, 2016)
Objective: Participants will draft hypotheses for testing, via the scientific method, prior to their attendance at the Kenya Writing Workshop, and with the assistance of their assigned SME mentor. Participants will also develop an outline for their idea for a journal submission, to be based on this hypothesis and their supportive data.

Process: Metabiota, in coordination with DTRA CBEP, will request that selected participants furnish an idea for a proposed journal article, in the form of a hypothesis. This hypothesis would require testing, in the form of research and conclusion-building, and would need to be supported by pre-existing data. Participants will state how their data can be used to test their hypotheses, and that this data is authorized for use and accessible to them. SME mentors and, if needed, their RDAs will work closely with the participants to understand their research goals and the body of data collected. They will then assist participants in refining their analyses before, during, and after the Kenya Writing Workshop. Metabiota`s has observed a high level of variability in scientific capability in our wide experience with international scientific research, and believe that this stage may require a significant amount of labor to jointly work through the existing data and construct logical conclusions depending on the technical abilities of the respective participants. If time permits, participants should write a rough draft of their manuscript prior to the writing workshop. It should be noted that this phase spans several major holidays, including Thanksgiving, Christmas, and New Year`s Day.

Deliverables:

- Deliverable 1: Submission of participants` hypotheses and writing concepts and approach plan, along with statements of accessible, supporting data.

Phase 4 – Writing Workshop Implementation (Feb. 1-14, 2016)
Objective: Conduct a six day workshop on various aspects of technical writing in order to train and mentor up to twenty participants representing the Kenyan One Health research sector.

Process: Metabiota will coordinate with the SME mentors and participants to conduct the six-day training in Kenya. Lecture and working group sessions will cover topics including but not limited to scientific paper formatting, styling, and general requirements; the ethics of journal publication and authorship; the inclusion of background research and citing references, and understanding the impact factor and journal submission organizational techniques. Participants will take both pre- and post-training tests to measure the knowledge gained throughout the workshop. Each participant will have access to the coaches, and be able to work directly with the SMEs on their material. The timing of the workshop listed here is subject to change.

Deliverables:

- Deliverable 1: Submission of the Training Trip Report and After-Action Report detailing the overall training processes and lessons learned and the results of knowledge gained assessments.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Phase 5 – Paper Finalization and Publication Submission (Feb. 15-Apr. 15)
Objective: Refine scientific manuscripts for submission to internationally recognized peer-reviewed journals.

Process: Metabiota and the SME and RDA mentors will maintain communication and provide programmatic and technical support to participants through the refinement and journal submission process. With the support provided to them, participants will identify the best-suited journals for submission based upon the impact and topics of their research, and other factors, and will submit the manuscript per the publication's specific requirements.

Deliverables:

- Deliverable 1: Submission of final manuscripts and journal identification
- Deliverable 2: Submission of progress reports of manuscript submission status and results

Phase 6 – Post-submission Assistance and Summary Report Development (April 15-May 15, 2015)
Objective: Provide technical and program management support during the post-submission stages and in the response to journal comments and publication refinement process.

Process: Journal articles are rarely, if ever, accepted upon initial submission. Following peer-review and pending journal interest, authors are often requested to address questions, revise narrative, and potentially perform additional experiments or conduct additional data analyses. To ensure support through potential publication, the Metabiota team will work jointly with the SME mentors and participants to provide technical and programmatic support during the post-submission phase, to include assisting in the response to journal reviewer questions and comments as well as the process of refining data analyses, data presentation, or the text of the manuscript. Once complete, Metabiota will develop a final report detailing the overall processes and lessons learned, and submission results of all publications.

Deliverables:

- Deliverable 1: Final report detailing overall processes and lessons learned as well as submission acceptance results for publishing participant's research articles in internationally recognized peer-reviewed journals.

Management Approach

Project Team Structure

Metabiota's project team will include the AEP program leadership, the Program Manager, Project Coordinator, Travel Coordinator and a team of Subject Matter Experts and Research and Data Analysts that will be tasked with specific assignments to support the development and implementation of this activity based on their administrative and scientific expertise. This team of experts will ensure the overall project management and tasks associated with the training are

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

met at every level using best practices, and that only the highest level of scientific rigor and expertise is applied to this effort.

Initiation

Metabiota initiated planning for this activity upon receipt of TD-014. Metabiota sought and will continue to seek additional clarifications and complete understanding of the requirements from DTRA CBEP and other stakeholders. However, this proposal represents a formalization of the work required to develop a plan capable of answering the requirement as tasked to us by DTRA CBEP given our current understanding. Following authorization to proceed by DTRA CBEP, Metabiota will move into the execution of the planned activities, and will adjust the operating plan accordingly to account for new information.

Execution

The core project management team will maintain oversight and implementation of the project at all times and will ensure rapid execution of all phases, tracking objectives to ensure the project stays on schedule and within budget to complete this activity. The project will be managed according to the phased implementation plan and will be course corrected, as needed to ensure target end-goals are reached. The following tools will be used to guarantee the project schedule will be maintained:

Project Administration:

1. Weekly team meetings and conference calls will be held to internally review the project achievements, accomplishments, barriers or challenges, and address any changes or updates that are required. The meetings will be scheduled and maintained by the Project Coordinator and will include the Program Manager, Training Coordinator, and AEP leadership, as needed based on the requirements and stage of implementation.
2. Routine calls and communication via email will be held with DTRA CBEP regional leadership and Metabiota to provide routine status updates and ensure training implementation.

Project Reporting:

1. Weekly status reports will be provided by the Program Manager to senior Metabiota leadership to maintain routine tracking and status updates on the project, and provide space for risk mitigation and internal course correction, as needed to ensure training goals are met.

Monitoring and Controlling

1. Routine risk assessment will be performed internally among the Metabiota project management team to guarantee the project stays on track. This will be accomplished through the implementation of the project administration and reporting mechanisms.
2. Routine communications will be maintained with DTRA CBEP regional leadership to ensure the project remains on track and is implemented according to standard.
3. Routine oversight and coordination will be performed to ensure subcontractors perform all necessary requirements to ensure successful execution of the training. Monitoring will include both administrative and fiscal oversight.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Timeline

Phase	Q3 2015			Q4 2015			Q1 2016			Q1 2016		
	July	Aug	Sept	Oct	Nov	Dec	Jan	Feb	March	April	May	
Phase 1: Programmatic Coordination and Landscape Analysis												
Phase 2: Participant Identification and SME Mentor Pairing												
Phase 3: Hypothesis Development and Article Framing												
Phase 4: Writing Workshop Implementation												
Phase 5: Paper Finalization and Publication Submission												
Phase 6: Post-submission Assistance and Summary Report Development												

Completion

Metabiota will drive the project to completion in a timely manner by maintaining a focused project schedule with routine meetings and communication with DTRA CBEP regional leadership. This will allow for continued coordination, while maintaining targeted objectives. As the activity progresses, Metabiota will provide all required deliverables and after action reports to allow for lessons learned and continuation of solid execution and implementation of activities. Metabiota believes that the experience and management it will bring to this project, in collaboration with DTRA CBEP will guarantee success.

Cost Management

The Metabiota team and all partners will maintain an acute focus on cost management to ensure that this activity is delivered at a reasonable cost to the government. Our team will provide full oversight of any potential subcontractors or independent consultants to ensure accurate and responsive financial reporting and will facilitate cost savings wherever possible. Metabiota will

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

follow procurement regulations ensuring the best value is obtained under the time constraints using all means available.

Budget Narrative
The Metabiota AEP contract vehicle has been changed to a Time & Materials (T&M) contract in the option year (16 May 2015 – 15 May 2016). Under a T&M mechanism, this proposal is not a contractually binding document. Rather, it represents Metabiota's best faith effort to determine the level of effort required to execute the requirements outlined in both the letter of technical direction and subsequent communications with DTRA stakeholders. Should the effort require additional labor beyond that proposed, DTRA Contracting and the Contracting Officer's Representative (COR) would be notified to seek additional funding; **should the effort require less labor than proposed, DTRA would not be billed for the proposed labor left unfulfilled**. For the purpose of budget tracking, Metabiota will be reporting updates to the project and burn rate by CLIN in CDRL A001 (Monthly Progress Report).

Period of Performance

The Period of Performance for this effort is July 21, 2015 to May 15, 2016.

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As some of our Subject Matter Experts and Research and Data Analysts may be independent consultants or subcontractors, the Metabiota PM will additionally oversee and ensure that all project personnel adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PM will provide management oversight of the project team, including subcontractors and independent consultants throughout the span of the project.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

The Metabiota PM will oversee the coordination between the Kenyan stakeholders and the workshop planning team, and will ensure the project team captures and keeps in account stakeholder input regarding key information relevant to the planning of the workshop. The PM will travel to Kenya to ensure the execution of the workshop proceeds smoothly and to provide oversight over all subcontractors and independent consultants. Lastly, the PM will provide oversight to ensure all required project closeout activities occur in a timely fashion.

Metabiota Subject Matter Expert I: The Metabiota SME I will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM and will manage the project team, including all subcontractors, to ensure all project requirements and deliverables are met and the program remains within scope, budget, and timeline.

The PC will lead coordination with the Kenyan stakeholders to identify workshop participants and in the coordination of SME selection and pairing with the most appropriate workshop participants. The PC will establish and maintain regular communication between the SMEs and the participants prior to and following the workshop. The PC will drive the coordination required to sufficiently gather the answers to the logistical questions that will arise in the planning and execution of the in-country workshop. The PC will travel to Kenya to ensure the execution of the workshop proceeds smoothly.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As these SMEs also are likely unfamiliar with DoD contracting, the Metabiota PC will assist the SMEs, RDAs, and/or their organizations with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Phases 1 – 2:
As indicated above, the PM and PC will serve in all phases. Specifically relevant to phases 1 – 2, both the PM and PC also have advanced degrees and will assist the Metabiota SME III in the ground truthing of the participants' data and draft manuscripts (if available).

Metabiota Subject Matter Expert III: The Metabiota SME III will participate in the ground truthing of participants by leading the team (along with the PM and PC) that develops an understanding of the research that has been done by each of the participants. This will inform the team's work in the matching of relevant SMEs for each workshop participant. The SME III

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

will leverage their knowledge of the field and network of contacts to propose a potential list of SMEs for matching with participants for phases 3 – 6.

Phases 3 – 6:
Subject Matter Experts II and III (5 total): We expect to secure a mix of SME II and SME III personnel from both within Metabiota and the academic community. All SMEs will be fully qualified scientific experts with experience publishing in peer-reviewed journals; the differential between levels exists to allow for pay banding based on home locations and existing salaries. We propose in our budget 2 SME IIs and 3 SME IIIs but this mix is subject to change. These SMEs will travel to Kenya to implement the writing workshop.

The SMEs II and III will each be assigned to work with 4 participants during phases 3 – 6. These SMEs will be required to coordinate closely with their assigned participants to work on developing their manuscripts. This will require fully understanding the research that has been done, including a significant dive into the data collection and analysis that may have already been done to ensure that the work meets the standards required for publication in peer-reviewed journals. Prior to the workshop, SMEs will guide participants in the proper framing of hypotheses and the narrative structure of scientific research papers. If necessary, SMEs will assist participants in applying modern data analysis techniques. During the workshop, SMEs will provide a mix of lectures discussing topics relevant to the authoring, editing, and publishing of scientific research, small group work reflecting those lectures, and one-on-one time with each of their assigned participants. Following the workshop, SMEs will provide follow-on mentoring to participants as they incorporate the lessons learned into the final drafts of their manuscripts. Where applicable, SMEs may provide some assistance with the actual process of submitting manuscripts to journals and responding to referee feedback.

Research and Data Analysts (5 total): Depending on the level of effort that is determined to be required in assisting the participants with additional data analysis and help in drafting and polishing manuscripts, RDAs may also be leveraged. Prior to the workshop, we envision one RDA at the post-doctoral level per primary SME (*i.e.*, 1 RDA per 4 participants). RDAs will work alongside the SME to understand the research that has been done by each participant. RDAs will be enlisted to do the work closely with participants to re-analyze data using the best available statistical techniques under the guidance of the primary SME. Additionally, RDAs will be available after the workshop to assist participants with the finalizing and submitting their manuscripts. RDAs will not travel to nor participate in the workshop.

Additional costs for direct labor supporting the AEP Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

Materials
We have budgeted for the possibility that we may need to provide access to scientific journal articles to the workshop participants while they are working on their manuscripts. Our estimate provides up to 20 articles per participant at an estimated access price of $35 per article. However, it may be possible to provide some level of access to the participants at a lower cost

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

via pairing with an academic mentor during Phases 3 – 5, and if we are able to facilitate this, the budget for journal access may only be partially utilized.

We have also budgeted for a small quantity of office supplies to accommodate the printing of agendas, training materials, or workshop materials needed to successfully execute and support in-country project activities.

Lastly, we have budgeted for international communications ability for our project team while they are in country implementing the workshop. The costs budgeted here reflect activating a moderate international calling and data plan for each traveler's cell phone, but the Metabiota team is continuously investigating methods for securing this capability at lower cost.

Other Direct Costs
Per contract guidelines DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts
Subcontracts will be issued to SMEs, RDAs, and/or their home organizations as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel
Travel is requested to support the program manager, project coordinator, and the 5 subject matter experts to Nairobi, Kenya to implement the writing workshop. The travel budget represents the estimated amount required; travel on the AEP contract is cost reimbursable.

Our travel budget assumes the workshop will be held on 6 consecutive days, with an additional day budgeted for set-up and coordination activities. If, through discussion with the Kenyan stakeholders, an alternative schedule is created or an alterative location is desired, travel costs may be impacted accordingly.

Conclusion
Metabiota is committed to support our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP's mission in Kenya in the implementation of Kenya One Health Technical Writing Training. Metabiota will ensure, through strong project management and risk mitigation, that the training will be executed in an efficient and timely manner delivering a top quality program geared to support enhanced biosurveillance and biosafety efforts in the region.

Appendix A - Team Metabiota Overview

Metabiota is the pioneer in comprehensive risk analytics that improve the world's resilience to epidemics. Built on a strong foundation of epidemiology and international field science, including a worldwide network of on-the-ground experts, Metabiota delivers actionable, data-driven insights that help countries, governments and corporations manage and mitigate infectious diseases. With a strategic global presence and sustained partnerships, Metabiota's agile approach is helping the world track, transfer and terminate the risk associated with epidemic threats. The company's international footprint includes operations in 20 countries and offices in San Francisco, Washington, China, Canada, and Sierra Leone.

Metabiota currently supports a number of Defense Threat Reduction Agency's Cooperative Biological Engagement Program (DTRA CBEP) initiatives, including the Academic Engagement Partnership (AEP) Program, the Biological Threat Reduction Integrating Contract (BTRIC) in Ukraine, and grants in Tanzania to perform research activities. Metabiota's mission aligns well with DTRA CBEP and the entire Metabiota team is focused on supporting our USG Partners in reducing the risk of biological threats worldwide, and employs a collaborative and agile approach to biological risk reduction.

To ensure a successful event, Metabiota, in coordination with DTRA CBEP regional leadership and in country partners have built a team that brings unparalleled scientific expertise and unique access across the international infectious disease prevention, preparedness and response community. This enables us to be an incredible resource for actionable infectious disease intelligence, through the development of analysis methodologies that capture salient data relating to human and animal pathogens of concern, organic national and regional public health capacity, engagement priorities and constraints for the USG, regional and international public health organizations, and non-governmental organizations (NGO) whose respective aims could impact DTRA CBEP objectives.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Executive Summary

In response to Defense Threat Reduction Agency Cooperative Biological Engagement Program (DTRA CBEP) regional leadership tasking via the Academic Engagement Partnership (AEP) contract vehicle, Technical Direction 013, Metabiota, Inc. (Metabiota) seeks to support the DTRA CBEP mission to increase One Health Epidemiology (OHE) capacity in Uganda by facilitating OHE training events. This initiative will enhance local outbreak preparedness and response capabilities of public health professionals operating in Uganda to mitigate the threat of human, veterinary, and economic loss associated with the spread especially dangerous pathogens (EDP) and associated diseases.

These proposed efforts will enhance local Ugandan capacity at the District level to conduct disease prevention, detection, surveillance and response activities. Moreover, this activity will concurrently facilitate cooperative scientific engagement amongst key stakeholders for disease detection and control in Uganda, in support of the DTRA CBEP mission.

This document outlines the approach that Metabiota will employ to accomplish the requirement. In short, Metabiota intends to:

- Facilitate the conduction of Module 1 OHE training for stakeholder-identified Cohorts 9 & 10 thereby enhancing District-level knowledge of basic epidemiology best practices;
- Facilitate the conduction of Module 2 OHE training for stakeholder-identified Cohorts 9 & 10 thereby enhancing District-level knowledge of outbreak investigations for EDPs;
- Enhance local scientific capacities by fostering collaborations and communications between participants of unique Districts in Uganda.

Project Overview

Background

In recent decades, we have experienced a dramatic increase in the rate of emergence and re-emergence of infectious diseases. On average, one new virus emerges every 19 months, most often with origins in animal populations. The threat of emerging pathogens affecting humans worldwide continues to increase; and underscores the need for effective, integrated human and animal disease surveillance, reporting, diagnostics and response capabilities.

To manage these risks, DTRA CBEP aims to reduce potential impacts of biological threats by enhancing biological safety and security (BS&S), awareness of biological risks, and knowledge related to biological pathogens globally. To do so, DTRA CBEP works collaboratively with partner nations, other USG agencies, and the international community to enhance disease surveillance capabilities; develop human resource expertise in public and animal health; promote safe and secure laboratory and field work environments; and consolidate pathogens of

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

security concern into a minimal number of safe and secure facilities in a sustainable manner. In AFRICOM, specifically, DTRA CBEP seeks to enhance OHE capabilities and develop and maintain local and regional capacity in order to sustainably manage the threat of infectious disease events.

In support of this approach, Metabiota intends to administer high-value OHE trainings in order to support strategic DTRA CBEP objectives by enhancing local and regional collaboration on topics critical to biological threat reduction, and enhancing the regional capacity to perform biorisk management and mitigate the threat of infectious disease events. Metabiota's on-the-ground experience and decades of expertise makes it well positioned to support the implementation of this activity, as well as overall scientific engagement in AFRICOM's area of responsibility.

Goals and Objectives

Metabiota will engage with key Ugandan stakeholders including the Ministry of Health (MOH) and the Centers for Disease Control and Prevention – Uganda (CDC-UGA), to conduct a series of a One Health Epidemiology (OHE) training courses, originally developed by epidemiologists from the Walter Reed Army Institute of Research (WRAIR), for District-level health practitioners in Uganda. This OHE training series will cover basic epidemiology (Module One) and outbreak investigations (Module Two). These modules introduce basic concepts of epidemiology, statistics, outbreak investigation, surveillance, One Health, and clinical recognition of pathogens with bioterror potential.

To achieve this purpose, Metabiota and the collaborative partners will:

- Coordinate with key stakeholders in Uganda to identify up to 4 Ugandan OHE trainers to conduct OHE trainings;
- Collaborate with key stakeholders in Uganda, to ensure the identified 25-30 district representatives per cohort meet OHE training participant criteria and are able to fulfill all training requirements;
- Facilitate the conduction of Module 1 OHE training for Cohorts 9 & 10 thereby enhancing Districts-level knowledge of basic epidemiology best practices;
- Facilitate the conduction of Module 2 OHE training for Cohorts 9 & 10 thereby enhancing Districts-level knowledge of outbreak investigations for EDPs;
- Foster collaborations and communications between participants of unique Districts in Uganda.

Threat Reduction Outcomes

Through the implementation of Metabiota facilitated OHE trainings for key stakeholders in Uganda, DTRA CBEP will have:

- Increased local scientific capacities by fostering collaborations between participants of unique Districts.
- Enhanced and improved disease detection, reporting and response systems across

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Uganda.

- Enhanced the capacity to detect and diagnose diseases and emerging threats of pathogens of concern.
- Implemented laboratory management best practices and principles by following internationally accepted guidelines and standards for reporting outbreaks.

This activity will provide a measurable and achievable result in raising awareness of EDPs among DTRA CBEP AFRICOM partners and facilitating efforts in Uganda to formally educate those who play a pivotal role in disease detection and outbreak response related efforts. Moreover, this activity will concurrently promote a sub-regional network of stakeholders thereby enhancing the development of a sustainable infrastructure for advancing scientific research, including early detection of emergent threats.

Risk Management

In order to maintain our course of action and guarantee trainings that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown on the next page as Table 1. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
Cost						
Communication and cultural boundaries disrupting training preparation and execution	Participants, and presenters do not have a clear understanding of logistical support	4	5	(b)(4); (b)(6)	Before the training Metabiota will support CDC-Uganda and MoH to ensure communication is provided to participants and presenters clearly outlines support for the training	Med
Schedule						
Submission of CCRs and TEPs	CCRs must be submitted at least 45 days prior to each event, and TEPs 65 days prior, and are dependent upon receipt of Letters of Technical Direction	5	5	(b)(4); (b)(6)	Upon receipt of the Letter of Technical Direction, Metabiota shall immediately submit all DTRA required travel documents	**Med-High**
Performance						

Ability to Collaborate with MoH Uganda	Trainers from the MoH Uganda are required for effective implementation	4	2	Med	Metabiota will directly engage MoH trainers to ensure buy-in and support	(b)(4); (b)(6)
Logistics Coordination	Russian based logistics company that is locally staffed, which can lead to misinterpretation of vital information	3	3	Med	Metabiota will directly engage both Russian and local based offices of TTTI/CLS	

Implementation Plan

Introduction

Metabiota will employ its existing organizational leadership to interface with the Regional Science Manager and Country Manager, as needed, to direct the operational and administrative support required to ensure implementation of the OHE Training. Our Program Manager will oversee administrative and operational functions, with the support of a project manager, travel coordinator, SMEs, trainers, and mentors to ensure that all aspects of cost, schedule, and performance are monitored and reported to the AEP Contracting Officer Representative (COR) and AEP Program Leadership.

Communications Protocols

Metabiota will maintain open communications with international collaborators necessary for implementing the training, to include local and regional stakeholders. In addition, Metabiota will maintain routine communication with DTRA CBEP to ensure they have full visibility on the training engagement, status, and process of execution.

Technical Approach

Components of Technical Approach

Metabiota will use the following technical approach to manage all tasks required for successful implementation of the project components and to provide overall feedback and reporting on the proceedings outlining the accomplishment of objectives. The following components will be executed concurrently and are required for this project:

Phase 1: Program Management and Coordination
Phase 2: Training Administration
Phase 3: Training Implementation

Component 1 – Program Management and Coordination (June 1, 2015 – December 31, 2015)

Objective: Coordinate with key in-country stakeholders to ensure trainers are properly oriented with the OHE training materials and training plan, participants meet criteria and have

committed to fulfilling all requirements, and ensure responsible parities for contingent steps (logistics planning, participant coordination, trainer coordination, etc.) are identified and able to fulfill responsibilities within time, budget, and scope.

Process: Metabiota, in coordination with DTRA CBEP and key in-country stakeholders, will establish a communication plan and responsibility matrix for the conduction of the four OHE trainings, covering Module 1 and 2 for Cohorts 9 and 10. The project team will coordinate to finalize the trainer and participant lists for each cohort and training (4 trainings total, 3 trainers per training, 25-30 participants per cohort) and ensure all parties involved are able to participate in full and fulfill all training requirements.

Metabiota will coordinate with local partners to disseminate timely and accurate correspondences and Letters of Invitation (LOIs) to all participants and trainers. Metabiota will coordinate with CLS for all participant and event logistics, as well as for the procurement of any necessary materials and training supplies.

Deliverables:

- Deliverable #1: Effective communications between all stakeholders to ensure all project activities are efficiently executed in accordance with Client and Host Country expectations and guidelines;
- Deliverable #2: Maintain project schedules to ensure implementation of high-quality trainings within proposed project budget and in accordance with the technical approach (above);
- Deliverable #3: Maintain client, stakeholder, and contractor relationships;
- Deliverable #4: Submission of all final training related documentation and reports.

Component 2 – Training Administration (July 1, 2015 - December 31, 2015)
Objective: Develop quantitative and qualitative evaluations of all training Module 1 and Module 2 events. Provide lessons learned and recommendations in After Action Reports (AARs).

Process: Metabiota, in coordination with in-country stakeholders and Ugandan OHE trainers, will conduct both daily evaluations and pre- and post-training testing in order to develop a comprehensive evaluation of the training implementation. After the completion of all four trainings and data analysis, Metabiota will develop a comprehensive qualitative and quantitative evaluation of the training implementation.

Deliverables:

- Deliverable #1: Develop all training-related documentation and CDRLs - Responsibility Matrix, Training Event Plans (TEPs), CLS forms, and Finalized Trainer and Participant Lists;
- Deliverable #2: Development of After Action Report;

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

- Deliverable #3: Development of training evaluation report(s).

Component 3 – Training Implementation (July 1, 2015 - November 30, 2015)
Objective: Facilitate the conduction of Module 1 and 2 OHE trainings (5 days each) for Cohorts 9 and 10 in the Wakiso and Hoima Districts, respectively, and provide technical and programmatic support for the trainers and participants to complete of interim training requirements between Modules 1 and 2. Additionally, Metabiota will support and encourage collaboration and communication establishment amongst participants, with a focus on neighboring Districts, throughout the training sessions and the interim activities.

Process: Metabiota, in coordination with DTRA CBEP and key in-country stakeholders, will facilitate the four OHE trainings. In order to provide the Ugandan stakeholders with both technical and programmatic support and ensure project goals and objectives are being met, Metabiota trainers and, potentially, a scientific mentor will travel to each of the four trainings. Metabiota will conduct pre- and post- training testing as well as hold daily feedback sessions with the Ugandan trainers to identify gaps, reorient (if necessary) training approaches, and discuss lessons learned.

Deliverables:

- Deliverable #1: Submission of daily training evaluations and participant feedback;
- Deliverable #2: Submission of four Training Trip Reports (TTR) highlighting next step recommendations and cohort and module-specific lessons learned.

The below table describes the detailed technical approach that Metabiota will take to complete this effort and provide the required deliverables. The following table (Timeline) describes the anticipated timeline of each phase.

Timeline

Training	May-15	Jun-15	Jul-15	Aug-15	Sep-15	Oct-15	Nov-15
Mod 1			[redacted]		Cohort 10		
Mod 2					[redacted]		Cohort 10

Management Approach

Project Team Structure
Metabiota's project team dedicated to completing this task will include the Metabiota AEP program leadership, the Program Manager, Project Coordinator, Training Coordinator, Trainers, SMEs and Local National trainers, that will be tasked with specific assignments to support the development and implementation of training based on their administrative and scientific expertise. This team of experts will ensure the overall project management and tasks associated

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

with this effort are met at every level using best practices, and that only the highest level of scientific rigor and expertise is applied to this effort.

Initiation

Prior to initiating any action, Metabiota and DTRA CBEP will secure a clear understanding of the objectives and mission of this undertaking, and make sure all stakeholders agree to it. Following authorization to proceed by DTRA CBEP, Metabiota will move into the planning and execution of the community outreach and regional workshop activities.

Execution

The core project management team will maintain oversight and implementation of the project at all times and will ensure rapid execution of this effort, tracking objectives to ensure the project stays on schedule to complete the training modules. The project will be managed according to the phased implementation plan and will be course-corrected, as needed, to ensure target end-goals are met. The following tools will be used to guarantee the project schedule will be maintained:

Project Administration:

1. Weekly team meetings and conference calls will be held to internally review the project achievements, accomplishments, barriers, or challenges, and address any changes or updates that are required. The meetings will be scheduled and maintained by the Project Coordinator and will include the Program Manager, Training Coordinator, SMEs, and AEP leadership, as needed, based on the requirements and stage of implementation. Routine calls and communication will be held with DTRA CBEP regional leadership and Metabiota to provide routine status updates and ensure project implementation expectations are met.

Project Reporting:

1. Weekly status reports will be provided by the Program Manager to senior Metabiota leadership to maintain routine tracking and status updates on the project, and provide space for risk mitigation and internal course correction as needed to ensure training goals are met.

Monitoring and Controlling:

1. Routine risk assessment will continue to be performed internally among the Metabiota project management team to guarantee the project stays on track. This will be accomplished through the implementation of the project administration and reporting mechanisms.
2. Routine communications will be maintained with DTRA CBEP regional leadership to ensure the project remains on track and is implemented according to standard. Routine oversight and coordination will be performed to ensure subcontractors are meeting contract requirements to ensure successful planning and execution of the

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

training. Monitoring will include both administrative and fiscal oversight when appropriate.

Completion:
Metabiota will drive the project to completion in a timely manner by maintaining a focused project schedule with routine meetings and communication with DTRA CBEP regional leadership. This will allow for continued coordination, while maintaining targeted objectives. As the activity progresses, Metabiota will provide all required deliverables and after action reports to allow for lessons learned and continuation of solid execution and implementation of activities. Metabiota believes that the experience and management it will bring to this project, in collaboration with DTRA CBEP will guarantee success.

Cost Management
The Metabiota team and all partners will maintain an acute focus on cost management to ensure that the training is delivered at a reasonable cost to the government. Our team will ensure accurate and responsive financial reporting and will facilitate cost savings to the Government wherever possible. Metabiota will follow procurement regulations ensuring the best price is received under the time constraints using all means available.

Budget Narrative

Period of Performance
The Period of Performance for this effort is May 16, 2015 to December 31, 2015.

Labor
Costs for direct labor to support this activity is required for the following personnel:

- Metabiota Program Manager (b)(6) will oversee the execution of program objectives towards the completion of DTRA CBEP goals at the regional level, and will lead communication with DTRA CBEP for this activity. (b)(6) will do so by maintaining oversight of stakeholder coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. (b)(6) will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables erstwhile ensuring the program remains within scope, budget, and timeline.
- Metabiota Project Coordinator (Research and Data Analyst): (b)(6) will ensure the execution of project objectives towards the completion of DTRA CBEP goals at the project level. (b)(6) will do so by supporting stakeholder coordination and project execution, with a focus on project milestone achievement and stakeholder buy-in development and maintenance. (b)(6) will regularly communicate project status with (b)(6) and will assist (b)(6) in anticipating, managing, and communicating project risks and recommended mitigation strategies to the funder (b)(6).

(b)(6) will also assis (b)(6) in ensuring all project requirements and deliverables are fulfilled while concurrently ensuring the project remains within scope, budget, and timeline.

- Metabiota Technical Manager (Trainer III)- (b)(6) will oversee all aspects of the execution of the training events. (b)(6) will submit and track all Training Event Plans (TEPs), Training Trip Reports (TTRs), and After Action Reports (AARs). (b)(6) will also direct and manage the local trainers, ensuring optimal execution of all training objectives. (b)(6) will manage in-country stakeholders and project execution, with a focus on buy-in maintenance. (b)(6) will direct feedback sessions with the local trainers daily, along with the Scientific Mentor, to discuss training material, lessons-learned, and review survey results from the participants. In addition (b)(6) will suppor (b)(6) ensuring the program remains within scope, budget and timeline.
- Metabiota Scientific Mentor- (b)(6) is an internationally known expert in epidemiology, virus ecology, viral hemorrhagic fevers, fundamentals and domains of disease emergence. Since the 1970s, he has been leading international teams with partner institutions of developing countries (Dakar, Senegal; Bangui, Central African Republic). He largely contributed to developing tools and implementing strategies for the control and prevention of transmitted disease, and has been published in more than two hundred scientific papers in peer-reviewed journals. (b)(6) will support the OHE training programs by mentoring the local trainers and District participants in outbreak investigation and response best practices. In addition (b)(6) will facilitate the scientific collaborations and support daily training implementation discussions.
- Metabiota Regional Trainer and Mentor (Trainer I)- (b)(6) f Sierra Leone, is a recognized epidemiologist focusing in VHF contact tracing and rapid response systems (b)(6) has lead on-the-ground teams of health workers investigating VHF outbreaks and clusters. (b)(6) will serve as a regional scientific mentor to both the participants and the local trainers. In addition, (b)(6) will facilitate and support scientific collaborations and provide lessons-learned from his field experience while operating in the recent/ongoing Ebola outbreak in West Africa.
- Metabiota Local Trainers (Trainer I)- (b)(6) (b)(6) will serve as lead trainers of the OHE modules 1 and 2 material. Each trainer is a Ministry-recognized and selected expert in the areas of outbreak investigation, surveillance, and response. They will execute the pre- and post-tests, as well as the daily surveys from the participants. The Trainers will lead small group sessions in a 1:6 ratio, and support and guide the participants' working projects that occur between modules. Working closely with I (b)(6) the Trainers will implement all OHE training materials including lectures, computer enrichment sessions, and exercises.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Additional costs for direct labor supporting the AEP Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

Materials

Minor materials and supplies are required to support project activities including stakeholder outreach and coordination, training material production, and host country approval facilitation. Materials will include:

International Communication-Semi-monthly stakeholder meetings will occur to coordinate all upcoming trainings in-county. Internet systems and international calls will be utilized for this effort. Routine updates will take place via e-mail.

Printing Services- One set of OHE Modules 1 and 2 books, for 25 participants, and one set of Instructor Manuals, for 2 trainers, will be required. It is assumed that CLS will manage printing of all necessary materials. Metabiota will prepare the necessary documentation (e.g., CLS request forms) when seeking support for this activity.

Other Direct Costs

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all project participants in accordance with DBA guidelines.

Subcontracts

Local trainers may be utilized for execution of the training and will be subject to an Independent Consultant agreement.

Travel

Funds are requested for three Metabiota personnel (two CONUS, one OCONUS) to travel to Uganda to facilitate each training event, four in total. Specifically, funding has been budgeted to support travel for two Metabiota personnel from CONUS for training implementation and oversight purposes. Additionally, in an effort to promote regional networking and capacity development, Metabiota has also budgeted travel funds for a Sierra Leonean field epidemiologist (e.g. (b)(6)) to air in training implementation. Metabiota staff will support project implementation, coordinate stakeholders, and provide technical support for Ugandan OHE trainers. Metabiota staff will hold daily feedback sessions with the trainers prior to beginning coursework for the day, and support computer enrichment activities that follow each evening. Prior to execution of travel, a cost estimate will be provided to the AEP COR for review and approval. Metabiota will submit CLS forms requesting travel logistics support for participants (e.g., Trainees).

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Conclusion

Metabiota is committed to support our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP AFRICOM in the implementation of the One Health Epidemiology Training in Uganda. Metabiota will ensure, through strong project management and risk mitigation, that the training will be executed in an efficient and timely manner, delivering a top-quality course geared to support enhanced biosurveillance and biosafety efforts in the region.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Appendix A - Team Metabiota Overview

Metabiota is the pioneer in comprehensive risk analytics that improve the world's resilience to epidemics. Built on a strong foundation of epidemiology and international field science, including a worldwide network of on-the-ground experts, Metabiota delivers actionable, data-driven insights that help countries, governments and corporations manage and mitigate infectious diseases. With a strategic global presence and sustained partnerships, Metabiota's agile approach is helping the world track, transfer and terminate the risk associated with epidemic threats. The company's international footprint includes operations in 20 countries and offices in San Francisco, Washington, China, Canada, and Sierra Leone.

Metabiota currently supports a number of Defense Threat Reduction Agency's Cooperative Biological Engagement Program (DTRA CBEP) initiatives, including the Academic Engagement Partnership (AEP) Program, the Biological Threat Reduction Integrating Contract (BTRIC) in Ukraine, and grants in Tanzania to perform research activities. Metabiota's mission aligns well with DTRA CBEP and the entire Metabiota team is focused on supporting our USG Partners in reducing the risk of biological threats worldwide, and employs a collaborative and agile approach to biological risk reduction.

To ensure a successful event, Metabiota, in coordination with DTRA CBEP regional leadership and in-country partners have built a team that brings unparalleled scientific expertise and unique access across the international infectious disease prevention, preparedness and response community. This enables us to be an incredible resource for actionable infectious disease intelligence, through the development of analysis methodologies that capture salient data relating to human and animal pathogens of concern, organic national and regional public health capacity, engagement priorities and constraints for the USG, regional and international public health organizations, and non-governmental organizations (NGO) whose respective aims could impact DTRA CBEP objectives.

Proposal Development			
Metabiota	PM	The Program Manager (PM) participates in and leads proposal development, tasking the Project Coordinator (PC) with specific assignments. The PM is also responsible for development of the budget to include labor estimates.	49
Metabiota	SME1	The Project Coordinator (PC) participates in proposal development by contributing ideas toward the plan and writing specific sections as tasked by the PM.	44
Phase 1 - Project Coordination & Landscape Analysis			
Metabiota	PM	The PM will oversee coordination with relevant stakeholders and the development and submission of the training landscape review.	47
Metabiota	SME1	The PC leads coordination with Kenyan stakeholders and the development of a training landscape analysis.	42
Phase 2 - Participant Identification and SME Matching			
Metabiota	PM	The PM will oversee the identification and selection of workshop participants as well as ensure subcontracted SMEs follow all DTRA CBEP requirements and best practices.	94
Metabiota	SME1	The PC leads coordination in identifying and selecting workshop participants as well as identifying and establishing subcontractor agreements with the selected mentor SMEs.	105
Metabiota	SME3	The Subject Matter Expert 3 (SME3) will participate in initial coordination and communication activities necessary to appropriately pair them with workshop participants.	101
Phase 3 - Hypothesis Development and Article Framing			
Metabiota	PM	The PM will oversee the coordination and mentorship activities, as well as provide oversight and guidance for logistic coordination in anticipation of the workshop.	109
Metabiota	SME1	The PC will lead coordination between mentor SMEs and participants through the hypothesis development and framing period. The PC will provide oversight and management support to the mentor SMEs throughout this phase. The PC will communicate programmatic and logistic requirements and stakeholder input to the PM.	218
Metabiota or IC	SME3	The Subject Matter Expert 3 (SME3) will provide mentorship and support to participants in developing a draft hypotheses to their assigned participants (up to 4). SMEs will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis and initial drafting of their manuscript.	103
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in developing a draft hypotheses. RDA will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis using statistical best practices, and in the initial drafting of their manuscript.	140
Metabiota or IC	SME3	The Subject Matter Expert 3 (SME3) will provide mentorship and support to participants in developing a draft hypotheses to their assigned participants (up to 4). SMEs will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis and initial drafting of their manuscript.	103
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in developing a draft hypotheses. RDA will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis using statistical best practices, and in the initial drafting of their manuscript.	140
Metabiota or IC	SME3	The Subject Matter Expert 3 (SME3) will provide mentorship and support to participants in developing a draft hypotheses to their assigned participants (up to 4). SMEs will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis and initial drafting of their manuscript.	103
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in developing a draft hypotheses. RDA will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis using statistical best practices, and in the initial drafting of their manuscript.	140
Metabiota or IC	SME2	The Subject Matter Expert 2 (SME2) will provide mentorship and support to participants in developing a draft hypotheses to their assigned participants (up to 4). Smes will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis and initial drafting of their manuscript.	103
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in developing a draft hypotheses. RDA will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis using statistical best practices, and in the initial drafting of their manuscript.	140
Metabiota or IC	SME2	The Subject Matter Expert 2 (SME2) will provide mentorship and support to participants in developing a draft hypotheses to their assigned participants (up to 4). Smes will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis and initial drafting of their manuscript.	103
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in developing a draft hypotheses. RDA will work closely with the participants in order to understand their research goals and the body of data collected, and will assist participants in refining their analysis using statistical best practices, and in the initial drafting of their manuscript.	140
Phase 4 - Writing Workshop Implementation			
Metabiota	PM	The PM will oversee the production of the workshop and ensure project objectives and subcontractor requirements are met. The PM will coordinate post-action report submissions to the funder.	72
Metabiota	SME1	The PC will lead the conduction of the 5-day workshop, ensuring project objectives and subcontractor requirements are fullfilled. The PC will provide subcontractor oversight in the collection of post-training reports and knowledge gained assessments.	72
Metabiota or IC	SME3	The SME3 will conduct workshop lectures related to their area of expertise and will lead working group sessions and individual mentorship to participants over 5 days. SME3 will draft TTRs and after action reports detailing the overall training processes and lessons learned.	72
Metabiota or IC	SME3	The SME3 will conduct workshop lectures related to their area of expertise and will lead working group sessions and individual mentorship to participants over 5 days. SME3 will draft TTRs and after action reports detailing the overall training processes and lessons learned.	72
Metabiota or IC	SME3	The SME3 will conduct workshop lectures related to their area of expertise and will lead working group sessions and individual mentorship to participants over 6 days. SME3 will draft TTRs and after action reports detailing the overall training processes and lessons learned.	72
Metabiota or IC	SME2	The SME2 will conduct workshop lectures related to their area of expertise and will lead working group sessions and individual mentorship to participants over 6 days. SME2 will draft TTRs and after action reports detailing the overall training processes and lessons learned.	72
Metabiota or IC	SME2	The SME2 will conduct workshop lectures related to their area of expertise and will lead working group sessions and individual mentorship to participants over 6 days. SME2 will draft TTRs and after action reports detailing the overall training processes and lessons learned.	72
Phase 5 - Paper Finalization and Publication Submission			
Metabiota	PM	The PM will oversee the coordination of the submission process. The PM will communicate the status of manuscript submissions and acceptance with the funder.	49

Metabiota	SME1	The PC leads coordination throughout the manuscript finalization and submission process. The PC provide support in the journal identification and submission process, and will communicate submission stastus to the PM and funder.	97
Metabiota or IC	SME3	The SME3 will provide mentorship to work shop participants in the refinement and journal submission process. SME3 will assist participants in the journal identification process in order for them to select the best suited journals for submission based upon the impact and topics of their research	72
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in refining the manuscripts and identifying and submitting to appropriate Journals for publication. The RDA will work closely with the participants to identify the most appropriate journals for submission, and to verify all publication-specific requirements are met	136
Metabiota or IC	SME3	The SME3 will provide mentorship to work shop participants in the refinement and journal submission process. SME3 will assist participants in the journal identification process in order for them to select the best-suited journals for submission based upon the impact and topics of their research	72
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in refining the manuscripts and identifying and submitting to appropriate Journals for publication. The RDA will work closely with the participants to identify the most appropriate journals for submission, and to verify all publication-specific requirements are met	136
Metabiota or IC	SME3	The SME3 will provide mentorship to work shop participants in the refinement and journal submission process. SME3 will assist participants in the journal identification process in order for them to select the best-suited journals for submission based upon the impact and topics of their research	72
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in refining the manuscripts and identifying and submitting to appropriate Journals for publication. The RDA will work closely with the participants to identify the most appropriate journals for submission, and to verify all publication-specific requirements are met	136
Metabiota or IC	SME2	The SME2 will provide mentorship to work shop participants in the refinement and journal submission process. SME2 will assist participants in the journal identification process in order for them to select the best-suited journals for submission based upon the impact and topics of their research	72
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in refining the manuscripts and identifying and submitting to appropriate Journals for publication. The RDA will work closely with the participants to identify the most appropriate journals for submission, and to verify all publication-specific requirements are met	136
Metabiota or IC	SME2	The SME2 will provide mentorship to work shop participants in the refinement and journal submission process. SME2 will assist participants in the journal identification process in order for them to select the best-suited journals for submission based upon the impact and topics of their research	72
Metabiota or IC	RDA	The Research and Data Analysts (RDA) will provide support to the mentor SMEs and participants in refining the manuscripts and identifying and submitting to appropriate Journals for publication. The RDA will work closely with the participants to identify the most appropriate journals for submission, and to verify all publication-specific requirements are met.	136
Phase 6 - Post-submission Assistance and Summary Report Development			
Metabiota	PM	The PM will oversee the program management and technical support during the post-submission stage provided by the SME mentors and the Metabiota team. The PM will ensure the delivery of all requirements and reports to the funder	10
Metabiota	SME1	The PC will provide program management and technical support to the workshop participants and SME mentors during the post submission stage. The PC will develop a final report detailing the overall processes and lessons learned, in addition to the results of all publication submissions, to the PM to be communicated to the funder	10
Metabiota or IC	SME3	The SME3 will, if necessary, work with participants post-submission to provide guidance toward answering any questions or comments that arise during the peer review process.	20
Metabiota or IC	SME3	The SME3 will, if necessary, work with participants post-submission to provide guidance toward answering any questions or comments that arise during the peer review process.	20
Metabiota or IC	SME3	The SME3 will, if necessary, work with participants post-submission to provide guidance toward answering any questions or comments that arise during the peer review process.	20
Metabiota or IC	SME2	The SME2 will, if necessary, work with participants post-submission to provide guidance toward answering any questions or comments that arise during the peer review process.	20
Metabiota or IC	SME2	The SME2 will, if necessary, work with participants post-submission to provide guidance toward answering any questions or comments that arise during the peer review process.	20

RE: HDTRA1-14-C-0104 Technical Direction 014 for the Development of a writing workshop to mentor selected participants of the One Health Zoonotic Diseases Workshop held in Kenya in March 2015.

Dear (b)(6)

Metabiota, Inc. (Metabiota) is pleased to present the attached proposal in response to the above referenced Letter of Technical Direction sent by DTRA on 21 July 2015.

For the effort described, Metabiota estimates the Rough Order of Magnitude (ROM) to be **$620,692.00** for a Period of Performance of 07/21/15 – 05/15/16. The detailed budget is included.

Please feel free to contac (b)(6) with questions or concerns at

Team Metabiota Overview

Metabiota, Inc. is the pioneer in comprehensive risk analytics that improve the world's resilience to epidemics. Built on a strong foundation of epidemiology and international field science, including a worldwide network of on-the-ground experts, Metabiota delivers actionable, data-driven insights that help countries, governments and corporations manage and mitigate infectious diseases. With a strategic global presence and sustained partnerships, Metabiota's agile approach is helping the world track, transfer and terminate the risk associated with epidemic threats. The company's international footprint includes operations in 20 countries and offices in San Francisco, Washington, D.C., China, Canada, and Sierra Leone.

Metabiota currently supports a number of Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) initiatives, including the Academic Engagement Partnership (AEP) Program, the Biological Threat Reduction Integrating Contract (BTRIC) in Ukraine, and grants in Tanzania to perform research activities. Metabiota's mission aligns well with CBEP and the entire Metabiota team is focused on supporting our U.S. Government (USG) Partners in reducing the risk of biological threats worldwide, and employs a collaborative and agile approach to biological risk reduction.

Metabiota has built a team that brings unparalleled scientific expertise and unique access across the international infectious disease prevention, preparedness and response community. This enables us to be an incredible resource for actionable infectious disease intelligence, through the development of analysis methodologies that capture salient data relating to human and animal pathogens of concern, organic national and regional public health capacity, engagement priorities and constraints for the USG, regional and international public health organizations, and non-governmental organizations (NGOs) whose respective aims could impact CBEP objectives.

Project Overview

Introduction

Through AEP Technical Direction 006, DTRA CBEP Regional Leadership tasked Metabiota with assisting scientists from the Research Institute of Tropical Medicine (RITM) in the Philippines in executing a preliminary study on paramyxoviruses in support of biosurveillance activities across the Pacific Region. The study will take place over a 16.5-month period and will involve researchers and Subject Matter Experts (SMEs) from Metabiota, as well as key partners from Duke NUS and RITM to identify henipaviruses and potentially related strains circulating in Province Sultan Kudarat to accomplish the following objectives:

1. Determine the natural reservoir and host range for Nipah virus, other paramyxoviruses, and filoviruses in the Philippines
2. Enhance RITM capacity in next generation sequencing and analysis
3. Develop strain specific assays for the viruses detected during screening

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

4. Generate full length genomes in part by using next generation sequencing platforms
5. Phylogenetic analysis of paramyxovirus and filovirus-positive samples
6. Develop long term surveillance capabilities and research engagements involving bats, human, and peridomestic species in the Philippines

Background

Bats are the only flying mammal (of the order Chiroptera), and are one of the most abundant, diverse vertebrates dispersed across all continents except Antarctica. They consist of more than 1100 species across 17 families (Nowak, 1994). Bats face the same threats as other mammals: habitat loss and hunting pressure. Bats host many noteworthy viral pathogens including filoviruses, coronaviruses, and paramyxoviruses, and are implicated as the sources of transferring these viruses to both humans and livestock. Understanding the ecology of reservoir-borne viruses is critical to the prevention of zoonotic epidemics and the global community's ability to implement preventative measures through biosurveillance initiatives that mitigate the threat of these viruses causing disease outbreaks on a pandemic scale.

The diversity of pathogens of potential public health importance discovered in or associated with bats has increased markedly. Yet the significance of these pathogens remains largely unknown. This lack of information on the basic biology of bat diseases in SE Asia is of great concern. The emergence of Ebola Reston virus in the Philippines demonstrates how; Emerging Infectious Diseases (EIDs) have no geographic borders, anthropogenic landscape changes can influence emergence, increased interactions between humans and bats lead to opportunities for transmission, and virus in reservoirs displaying no apparent illness can infect incidental hosts such as livestock and humans.

In addition, the discovery of the Nipah virus in the Philippines leads to many questions pertinent to public health. Nipah virus, a bat borne paramyxovirus that causes high morbidity and mortality to humans and livestock, was detected in 2014 in two villages in the southern islands of the Philippines (Province Sultan Kudarat). Human and horse deaths, in addition to neurologic disease in humans, prompted an investigation. Of the 17 patients studied, 41% had prepared or eaten horsemeat, the most likely transmission route. Surveillance detected neutralizing antibodies to henipaviruses in three patients. Deep sequencing detected a 71bp fragment that was closely related to Nipah virus sequences. Unfortunately, very little is known concerning the involvement of bats in the Philippines in henipavirus maintenance and transmission and requires further investigation. The unique aspects of the Philippines, being an archipelago with over 7,000 islands with exceptional bat biodiversity, severe habitat loss, human encroachment, and continued hunting and consumption of fruit bats, make it an optimal location to perform research into henipavirus and related strains that are circulating in this region.

Understanding

The Metabiota team understands that the U.S. Department of Defense (DoD) initiated CBEP through DTRA in order to: secure and consolidate select agents; enhance Biosafety and Biosecurity (BS&S) standards; and strengthen the USPACOM region's ability to detect,

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

diagnose, survey, and report emerging and re-emerging diseases of international security concern and that CBEP accomplishes these objectives in accordance with the World Health Organization (WHO) International Health Regulations (IHR) and World Organization for Animal Health (OIE). The team further recognizes that to achieve its mission, CBEP works collaboratively with partner nations, USG agencies, and the international community to enhance disease surveillance capabilities; develop human resource expertise in public and animal health; promote safe and secure laboratory and field work environments; and consolidate pathogens of security concern into a minimal number of safe and secure facilities in a sustainable manner. Through the AEP Program, and implementation of this project, Metabiota aims to support the CBEP mission of reducing the potential impact of biological threats through enhanced biological surveillance, awareness of biological risks, and knowledge related to biological pathogens.

In support of achieving the CBEP mission, Metabiota intends to administer a high-value study that will support strategic CBEP objectives by increasing regional collaboration on topics critical to biological threat reduction, and enhancing the regional capacity to perform biosurveillance activities that reduce the threat of infectious disease events. The team's on-the-ground experience and expertise make us well positioned to support the implementation of this study in the USPACOM's area of responsibility.

Purpose

The purpose of this study is to provide scientific expertise and research support in conducting preliminary surveillance activities in Sultan Kudarat Province to determine the seroprevalance of henipavirus, and other related strains, in bats, as well as determining what animals may be exposed and the resulting potential threat of cross species transmission and human infection. The study will involve intensively sampling bats, specifically fruit bats, in the villages of Sultan Kudarat Province, where the 2014 Nipah virus outbreak occurred, and analysis of the collected samples and data to understand circulating genotypes and the potential for cross-species transmission. This study will support building host country capacity to detect, prevent and respond to infectious disease threats, as well as building biosurveillance networks and scientific collaborations across the region, further mitigating infectious disease threats and the potential for outbreaks.

To achieve this purpose, CBEP has identified the need for a study to determine the virus community of bat colonies in the Philippines, and if there is a risk of human infection due to cross species transmission and the animal-human interface existing in this region. Identifying the virus community in the colonies of bats is critical to understanding the risk posed in cultural practices involving the hunting and consumption of bats, as well as the treat created through cross species transmission, and the preventive measures that can be implemented to support the reduction of infectious disease threats circulating in this region.

This research will promote global health security and threat reduction by supporting fundamental research to decrease the threat of infectious diseases at the animal-human interface, as well as enhancing regional capability for pathogen research and surveillance. The study

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

provides opportunities for research cooperation between U.S., regional, and host country scientists, contributing to a greater understanding of pathogen infection in humans and infectious disease surveillance. This will serve to enhance the host nation's capacity in disease surveillance and response, while adhering to international codes of security and safety to ultimately provide a mechanism for sustained engagement through ongoing surveillance and research activities.

To accomplish this purpose. DTRA CBEP, through AEP has engaged the Metabiota team and its cadre of Subject Matter Experts (SMEs) to support the study performed by the Research Institute for Tropical Medicine (RITM) in the Philippines in conjunction with Research Collaborators at Duke National University Singapore (NUS.)

Objectives

Through the implementation of the study on bat-borne virus transmission, facilitated by Metabiota, DTRA CBEP will be able to:

- Identify the reservoir and putative host range for Nipah or related viruses in the Philippines;
- Examine the seroprevalance of Nipah or related viruses in bats in the Philippines;
- Understand the risk factors for cross-species transmission, including which animals may be amplifying reservoirs;
- Improve molecular virus diagnostics and epidemiology study systems, to include enhancing RITM capacity in next generation sequencing and analysis;
- Generate full length genomes in part by using next generation sequencing platforms;
- Phylogenetic analysis of paramyxovirus and filovirus-positive samples;
- Develop strain specific assays for the viruses detected during screening;
- Support long-term surveillance in both wildlife and humans surrounding the use of bush meat in the Philippines;
- Support the development and implementation of biosafety and security measures to include best handling and laboratory practices supporting threat reduction;
- Support the development of disease reporting, surveillance and response systems regionally, thereby reducing global threat;
- Support regional scientists through capacity building efforts and scientific collaboration.

Threat Reduction Outcomes

The study will provide a measurable and achievable result in building scientific capacity in the region while promoting a global network of biosurveillance. detection and response, including the early detection of emergent threats.

Advancing research knowledge through the completion of relevant scientific studies is critical to capacity building efforts in host countries and supporting the early detection and response to emerging threats, as well as biosafety and security measures, thus safeguarding the world from infectious disease threats. Without completion of this study, the region is subject to the following identified risks:

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

- Reduced regional biosurveillance capability and characterization of novel infectious disease outbreaks;
- Increased security threats due to practices potentially leading to disease transmission;
- Increased security threats due to improper handling, storage, and transport of pathogens of security concern;
- Decreased communication and scientific engagement among host-country scientists and the global scientific community, which can provide reach back support and capacity building to strengthen the host country's ability to detect and respond to disease threats;
- Reduced risk management capacity.

The completion of the study will mitigate the identified risk factors by:

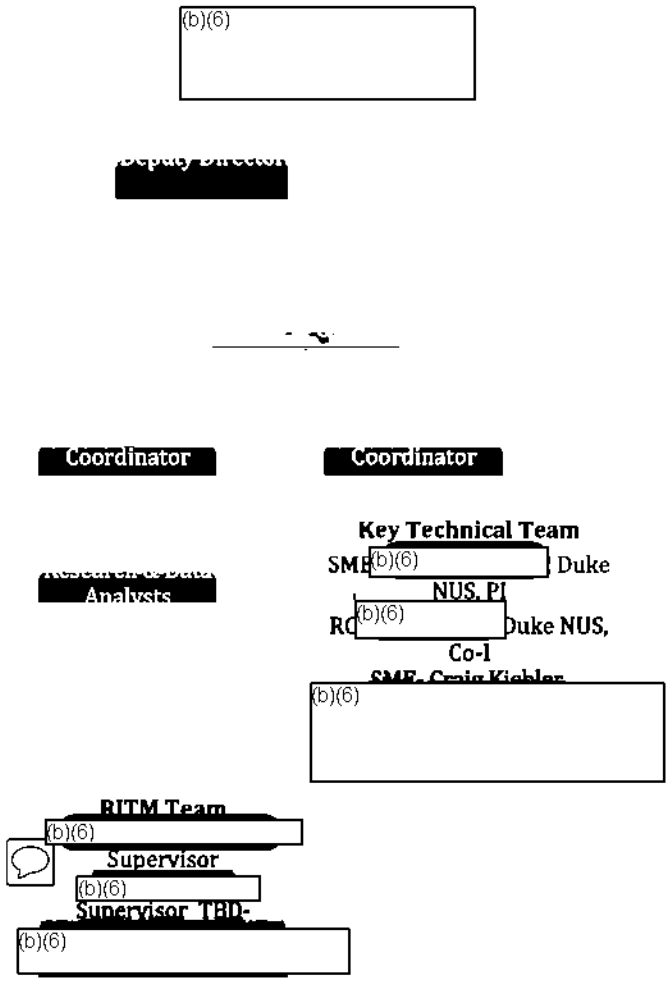
- Improving and enhancing disease detection, reporting and response systems across the region;
- Decreasing security threats due to practices potentially leading to disease transmission;
- Implementing and improving biorisk management best practices and principles based on internationally acceptable guidelines and standards (enhancing the capacity to account for, safeguard, and secure pathogens of concern);
- Increasing biosafety measures in regional biosurveillance activities;
- Increasing scientific capabilities through research collaboration and fostering an environment of scientific partnership.

Risk Management

Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
Logistical						
Costs to Exceed NTE	Realistic costs for implementing the study currently exceed NTE price.	4	4	**Med-High**	Metabiota will work to mitigate costs by choosing low-cost travel and procurement options.	Med
Materials Unavailable In Country	Materials and supplies that cannot be procured in country must be bought abroad and shipped through CLS, incurring extra cost, requiring extra lead time, and presenting further logistical challenges.	3	4	**Med-High**	Metabiota will work to purchase all materials/supplies possible in country, and will procure the rest from cost-effective sources to be shipped through CLS, or will have CLS procure and ship items according to approval.	(b)(4); (b)(6)
Team Coordination	Coordinating multiple teams from the US, Singapore, and Philippines presents logistical and cost challenges.	3	3	**Med-High**	Metabiota will work with in-country and international partners to handle logistical challenges as they arise.	

Extension of PoP	Research analysis timeframe will be extended to account for additional review requirements and adjusted timeframe to complete activities.	3	3	**Med-High**	Metabiota will work with collaborators to ensure deliverables are met in the allowable PoP and will coordinate with SMEs to maximize results on the project.	(b)(4); (b)(6)
Engagement of Local PI	The Lead Investigator at RITM is out of country for training activities through July. The RITM research team is concerned with beginning this engagement without him.	4	2	Med	Metabiota will work with DUKE NUS collaborators and scientists at RITM to set up agreements, logistical requirements and pre-coordination to support this activity in July, with a kickoff in August once he returns to the Philippines and can lead this effort.	
Location of Surveillance Sites	Sultan Kudarat Province is located in Southwestern Mindanao, a militarized, conflict zone. This may impede access to identified research sites in the region, as well as may require site relocation or additional training and security measures increasing costs and changing the scope.	4	5	(b)(4); (b)(6)	Local investigators will be used to conduct all sampling activities, as US personnel will not be granted access to sites. Additional training and security measures will be implemented, if necessary to ensure safety is maintained. Alternative sites and access to samples have been identified by the team and will be used, if necessary.	Med
Rainy Season	Manila's rainy season occurs from May - Nov with August being the wettest month often causing flooding and posing additional challenges to logistical implementation of sampling activities.	4	4	**Med-High**	Metabiota will work with RITM to shift sampling activities to drier months if needed and will look at targeting colonies in locations that will be most easily reached and less susceptible to severe rains and flooding.	Med
Field Sampling Logistical Requirements	Necessary shifts in sampling sites, due to weather or security concerns may result in unforeseen needs not identified in the project budget and technical requirements increasing costs.	4	3	**Med-High**	Metabiota will work with regional partners to identify needs up front and will implement best practices to ensure project is managed within scope and budget.	(b)(4); (b)(6)
Travel						
Program Startup Travel	The Philippines is a new area of operation, so travel to the region will be critical for oversight in the new program.	3	3	**Med-High**	Metabiota will work with in-country partners to secure the best rates for travel and logistics.	Med
Short Suspense Travel	Travel will need to begin in a relatively short period of time and several trips will be necessary to ensure study implementation, so this increases cost.	3	3	**Med-High**	Metabiota will start the travel logistics as soon as possible and will seek out the lowest feasible travel costs.	(b)(4); (b)(6)

Management Approach



Introduction

Metabiota will employ its existing organizational leadership to interface with the Regional Science Manager and Country Manager as needed to direct the operational and administrative support required, ensuring implementation of the Nipah Research Activity Project. Our Program Manager (b)(6) will oversee study implementation with the support of a project coordinator, travel coordinator, research and data analysts, SMEs and research collaborators, to ensure that all aspects of cost, schedule and performance are monitored and reported to the AEP Contracting Officer Representative (COR) and AEP Program Leadership.

Project Team Structure

Metabiota's project team dedicated to completing this task will include the Metabiota AEP program leadership, the Program Manager, project coordinator, travel coordinator, research and data analyst, and a team of SMEs that will be tasked with specific assignments to support the development and implementation of the study based on their administrative and scientific expertise. Specifically, Metabiota will engage Duke NUS SMEs and RCs to oversee the technical implementation of this effort, and in direct support of the RITM researchers. RITM leadership will provide overall on-the-ground supervision, and will oversee their in-country team of field and laboratory research assistants that will conduct the day-to-day duties of the project. This team of experts will ensure the overall project management and tasks associated with the workshop are met at every level using best practices, and that only the highest level of scientific rigor and expertise is applied to this effort.

This material shall not be disclosed outside the U.S Government and shall not be duplicated, used or disclosed in a whole or in part for any purpose other than to evaluate this material. If, however, a contract is awarded to this offer or as a result of- or in connection with- the submission of this material, the U.S Government shall have the right to duplicate, use or disclose the data to the extent provided in the resulting contract. This restriction does not limit the U.S Government's right to use information contained in this material if it is obtained from another source without restriction.

Initiation

Following guidance from CBEP USPACOM leadership, and working collaboratively with SMEs and RCs from Duke NUS, as well as local collaborators from RITM, Metabiota will initiate a project kickoff meeting held at Duke NUS in Singapore with all key collaborators. The kickoff meeting will involve discussions surrounding the objectives, ethical clearance, timeline, deliverables, staff coordination, sample storage, cold chain, field collection, sample screening, and data analysis required to implement this study. Duke NUS researchers will demonstrate their team's standard operating procedures and will provide study specific training for RITM collaborators on sample collection, to include collection of bat excreta, trapping and sampling of bats, and bat necropsy, as well as PCR-sequencing, study methodologies and data analysis. This kickoff meeting and the associated short training will ensure that study protocols are

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

understood and can be implemented along with project review and logistical management of conducting the sampling and analysis throughout the remainder of the project. In addition, Metabiota will complete additional technical documents required by CBEP for study design, BS&S review ensuring biorisks associated with this research are mitigated through identification and implementation of enhanced safety and security measures. Prior to initiating any action, Metabiota's team and CBEP will secure a clear understanding of the objectives and mission of this undertaking, and ensure buy-in from all stakeholders. Following initiation of the study, to include implementation of all contractual requirements, ethical clearance, and appropriate agreements, Metabiota will move into the planning and execution phases of the study.

Planning and design

Completion of this task requires a 16.5-month study, to accommodate the contract PoP, and to maximize research time allowed for this effort, involving routine surveillance of identified bat colonies, and associated sample and data analysis conducted by RITM and Duke NUS. To facilitate this engagement Duke NUS and RITM and MoU will be signed between Duke NUS and RITM to support research collaboration and sample transfer. The surveillance will occur routinely in the Sultan Kudarat Province, of Mindanao, unless safety concerns and weather restrictions prohibit sampling in the area. If that is the case, colonies will be identified and sampled around Manila. RITM has previous experience working on bats and their related viruses and are very familiar with roosting sites where sampling can be conducted, with minimal disturbance to the colonies. In addition, aliquots of previously collected samples from in-country research collaborators working with RITM may be used to support this effort and provide additional data for testing, if field sampling events cannot be implemented as planned. All ethical clearance requirements to include, proper research agreements such as a MoU and MTA, will be implemented prior to any sampling or analysis-taking place.

The study-specific training provided to RITM researchers by Duke-NUS SMEs at the kickoff meeting in Singapore will facilitate the successful execution of the sampling events to include implementation of safe and secure sample collection, sample transport, and sample storage to ensure the highest likelihood of detecting viral RNA following study specific guidelines and protocol requirements. This will build on the CBEP sponsored training events hosted at Duke NUS in May 2015 and AAHL in April 2015, which included sample processing and training in both BSL2+ and BSL4 high containment facilities. Following sample collection over the intended sampling period, samples will be transported, stored and processed at RITM following safe handling practices and maintaining cold chain requirements. All samples will be stored in a virus inactivation buffer (RNALater, RNA Shield, or isogunadine), and extracted nucleic acids will be sent from RITM to Duke NUS for NGS library preparation and screening, following international regulations regarding sample shipments, and transfer of select agents following BS&S procedures. Remaining samples will be stored at RITM future research and enhanced virus characterization.

To accomplish the research goals of the study and due to the duration required to complete all activities, Metabiota intends to hold the kickoff meeting in August, following engagement of

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Duke NUS and RITM to secure study approval and implement the research. This will ensure strong coordination, oversight and implementation of the study in a collaborative framework. Following the kickoff meeting, Metabiota and Duke NUS project personnel will travel to Manila in support of BS&S activities, surveillance initiation, and research integration, ensuring strong regional ties and securing the project management efforts and logistical coordination required on the ground. For procurement and shipping of materials that cannot be purchased in country or by Duke NUS locally to support their efforts, Metabiota will utilize the services of CLS for logistical needs. In addition, CLS will be engaged for all travel requirements both in-country and internationally for those participating in the research activities, to include in-country surveillance as appropriate, and international travel for research collaborators that will be supporting this effort, but not charging time to the project.

Execution

The core project management team will maintain oversight and implementation of the study at all times and will ensure successful execution of the research, tracking implementation to ensure the study stays on schedule to meet the deliverable requirements within the study timeframe. The study will be managed according to the steps required to implement the research and will be course corrected as needed to ensure target end goals are reached. The following tools will be used to guarantee that the project schedule will be maintained:

Project Administration:

1. Weekly team meetings and conference calls will be held to internally review the project achievements, accomplishments, barriers or challenges, and address any changes or updates that are required. The meetings will be scheduled and maintained by the Project Team and will include the PM, Project Coordinator, RDA, SMEs and AEP leadership as needed based on the requirements and stage of implementation.
2. Routine calls and communication via email will be held with CBEP regional leadership, in-country collaborators, external SMEs and RCs, and Metabiota to provide routine status updates and ensure study implementation.

Project Reporting:

1. Weekly status reports will be provided by the PM to senior MB leadership to maintain routine tracking and status updates on the project, and provide space for risk mitigation and internal course correction as needed, to ensure that project goals are met.

Monitoring and Controlling

1. Routine risk assessment will be performed internally among the MB project management team to guarantee that the project stays on track. This will be accomplished through the implementation of the project administration and reporting mechanisms.
2. Routine communications will be maintained with CBEP regional leadership to ensure that the project remains on track and is implemented according to existing standards.
3. Routine communication, to include monthly Skype meetings with the project teams and monthly reporting requirements implemented with teams in Singapore and the Philippines, will be maintained to ensure that the study is progressing and to

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

troubleshoot any challenges faced in the field. Metabiota will maintain oversight and coordination of the study to ensure Duke NUS and RITM are maintaining technical, administrative and fiscal requirements to ensure successful execution of the research project.

Completion

Maintaining a focused project schedule with routine meetings and communication with CBEP regional leadership and partners, and allowing for continued coordination while maintaining targeted objectives, Metabiota will complete the research activity within the 16.5-month requirement. Dedicating experienced technical personnel to this project, as well as maintaining programmatic oversight will ensure that we meet the project objectives by May 2016. Metabiota believes that the experience and management it will bring to this project, in collaboration with regional SMEs, RCs, and CBEP, will guarantee success.

Technical Approach

Introduction

Metabiota will take every action possible to ensure the study can be completed in the assigned timeframe. We intend to implement the proposed research activities according to all necessary CBEP requirements by developing a detailed technical proposal (in historical CBEP terminology, the "Form A" plus associated documents like the Protocol Risk Assessment Tool, or PRAT) for review by the DTRA CBEP Science team prior to initiation of field activities. As this research does not propose procedures on animal subjects that inflict harm, Metabiota and partners will pursue an IACUC exemption status in accordance with US, Philippine and Singaporean regulations to ensure compliance protocols are met prior to implementation of research.

The content of the following technical proposal outlines the proposed activities which will be documented more fully in the finalized Form A. Metabiota welcomes all comments, questions, and requests for clarifications from DTRA CBEP and associated reviewers In addition, Metabiota will implement the proposed research activities according to CBEP requirements, to include development of a Form A research and work plan, to address additional research requirements, and ensuring the study can be implemented in the assigned timeframe, supporting solid scientific engagement within the region and resulting in risk mitigation and scientific collaboration to further develop and enhancement of biosafety and biosurveillance efforts on an international plane as we work to finalize project documentation.

This will be facilitated through the study implementation as follows: The identified colonies, specifically those of fruit bats, at either roosting or foraging sites, will be intensively sampled for the presence of known select agents that are naturally harbored in bats and that have caused mortality in humans. Previous studies monitoring bat colonies for virus shedding in their urine found there were distinct fluctuations of virus shedding. These viruses are of public health importance and our goal is to identify the natural reservoirs for these viruses, their distribution

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

and understand the genetic diversity. Urine and fecal samples will be collected from underneath bat roosts using the required catchment supplies, and PPE for safe handling. Samples will be placed into lysis buffer/inactivation buffer, and processed in certified BSC II safety cabinets. Samples will be screened with PCR family-specific primers using next generation sequencing approaches to capture the maximum divergent virus lineages. This will promote knowledge on which viruses are circulating in the bats and when the peak shedding period is.

Field:
Colonies of fruit bats in the genus Pteropus or related pteropodids will be identified and urine and feces will be collected from them either bi-weekly or monthly. Plastic sheets will be placed underneath these colonies in the morning and individual urine samples and a pooled urine sample will be collected. Feces will also be collected. All samples will be stored in virus inactivation buffer (RNA Later, RNA Shield, Qiagen lysis buffer) and placed into a cold chain until brought back to RITM for storage at -80C and processing in BSC II safety cabinets. A maximum of fifty individual urine and fecal samples will be collected each trip, in addition to a pooled urine sample. Collectors will wear personal protective equipment, including N-95 masks, Tyvek suits, eye protection and gloves. Samples will be labeled with a unique identifier including the date and site of collection.

Laboratory:
Samples will be given a unique identification number and this will be tagged to the sample type and organism type so that there will be shared identification markers between data categories. This will enable researchers to maintain sample fidelity and ensure a known location for each original sample, extracted nucleic acid, and PCR product. All original samples will be kept in a secured, locked freezer, and sample information will only be made available to the project team members following appropriate in-country and ethical guidelines for sample storage and analysis. Biosafety and biosecurity will be maintained through the rigorous PPE used during collection, the disposal of the PPE, the placement of samples into lysis buffer/inactivation buffer, the processing of samples in certified BSC II cabinets, and the storage in locked freezers with access and location given only to certified staff.

RNA and DNA will be extracted from collected material (urine or feces) or from tissues (spleen, liver, lungs, and intestines) collected opportunistically from dead bats. Nucleic acid will be extracted using a QIAamp Viral RNA, QIAamp DNA Mini Kit, or an AllPrep DNA/RNA Mini Kit (Qiagen). These extractions will be enriched with either pathogen-specific biotinylated probes, sera, or by differential centrifugal spins. RNA will be chemically fractionated and double-stranded DNA will be synthesized. DNA will be pulled down by AMPure Agencourt beads and the DNA libraries will be constructed using a Clontech library construction kit or an Illumina Nextera or TruSeq sample preparation kit. Adaptors will be added to the libraries so samples can be multiplexed on a single run. Libraries will be analyzed for quality control purposes and these will be run on an Illumina MiSeq or Hiseq at the Duke-NUS Genome Science Center. Sequence contigs will be aligned to host genomes or the closest related

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

vertebrate full genome and the matched sequences will be removed. Duke NUS researchers will de novo assemble the remaining sequences and use the BLAST or DIAMOND or KRAKEN algorithm to identify any virus elements. This NGS approach will aid in developing new specific primers for identified and newly discovered pathogens and improve the screening of samples using PCR and/or real time PCR as indicated above. In addition, to investigate the evolutionary genomics of selected pathogens of interest, as identified from the qPCR and serological surveys, the Duke NUS team will amplify multiple genes by Sanger sequencing using standard protocols.

Evolutionary dynamics analysis of pathogens:
Duke NUS will use a variety of analyses to determine the evolutionary dynamics of selected pathogens. Large-scale phylogenetic analyses will be conducted using maximum likelihood as implemented in RaxML, PhyML, or other programs as deemed appropriate. Phylogenetic reconstructions of genetic data will also be conducted with time-stamped sequence data using a relaxed-clock Bayesian Markov-chain Monte Carlo method as implemented in BEAST. This method allows for variable nucleotide substitution rates among lineages and also incorporates phylogenetic uncertainty by sampling phylogenies and parameter estimates in proportion to their posterior probability. For all analyses, an uncorrelated lognormal relaxed molecular clock will be used to accommodate variation in molecular evolutionary rate among lineages, the SRD06 codon position model, with a different rate of nucleotide substitution for the first plus second versus the third codon position, and the HKY85 substitution model then applied to these codon divisions. These particular parameters have proven generally robust in analysis of viral sequence data; however, their suitability will be assessed throughout the course of the project. The analyses will be conducted with a time-aware linear Bayesian skyride coalescent tree prior over the unknown tree space, with relatively uninformative priors on all model parameters. At least three independent analyses of 50-million generations will be performed and these analyses combined after the removal of an appropriate burn-in (10–20% of the samples in most cases), with 5,000 generations sampled from each run for a total of 15,000 trees and parameter estimates from which mean substitution rates, mean TMRCAs, Maximum Clade Credibility phylogenetic trees, and relative genetic diversity over time will be derived.

In addition, co-estimation of the temporal phylogeny (described above) will be conducted and ancestral state reconstruction of tip associated phenotypic traits, such as habitat, host species, and the age and sex of the animal will be completed. These traits are mapped to the phylogeny during the Bayesian tree search that allows for a statistical comparison of phenotype and genotype. This will allow Duke NUS researchers to test, for example, hypotheses about the distribution of of pathogens in different host species and habitats. If these analyses demonstrate significant asscoiation between observed penotypic trait and inferred evolutionary history, such as pathogens that were isolated from different subsets of the animal populations, such as a species restriction, teams may be able to identify potential molecular markers distinguishing these groups.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Selection analysis will also be performed using DataMonkey and HYPHY. As an example, the single likelihood ancestor counting (SLAC) method, a codon-based approach as implemented in HYPHY will be used with a critical *p*-value of 0.05. Based on the most appropriate model of nucleotide substitution and a given tree topology, the SLAC method calculates a global dN/dS rate ratio (with 95% confidence intervals) and tests selection of variable codon sites based on the inference of the ancestral sequence. To determine if species selection was acting differentially on pathogens, dN/dS ratio estimates (with confidence intervals) will be calculated independently for each lineage.

This approach is geared towards achieving the following objectives:

- Determination of the natural reservoir and host range for Nipah virus in the Philippines;
- Serology of Nipah virus in bats;
- Description of the risk factors for cross species transmission and which animals may act as amplifying reservoirs to infect humans;

Implementation of this approach will result in:

- The determination of the specific criteria for molecular study for paramyxoviruses, specifically Nipah and Hendra virus utilizing isolates identification with CSIRO-validated methods and protocols for PCR;
- Phylogenetic analysis of paramyxoviruses (Nipah virus) and prevalent genotypes and relatedness to pathogenic variants will be determined;
- Control measures and biorisk assessment determination for the human activities regarding bat hunting and consumption of livestock that died from aberrant causes;
- Sample collection maintained at the RITM in Manila for future research and enhanced virus characterization supporting long-term research engagement and enhanced capacity building;
- Findings from the study will be used to produce policies that will minimize the exposure of bat borne viruses to livestock and how to minimize human exposure to bat excreta and urine;
- Enhanced biosurveillance capabilities to include training of researchers in the screening of bat diagnostic samples for virus surveillance, prevention and response;
- Regional collaboration and research engagement to include shipment of collected samples to Duke NUS for sequencing and analysis.

Communications Protocols

Metabiota will maintain open communications with international collaborators necessary for implementing the study, to include monthly project calls and routine email communication with the teams implementing and coordinating research activities. In addition, Metabiota will maintain routine communication with CBEP regional leadership to ensure they have full visibility on the project, status and process of execution.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Phases of Technical Approach

Metabiota will use a phased technical approach to manage all tasks required for successful implementation of the project and to provide overall feedback and reporting on the project route to success. Metabiota will ensure that all CBEP requirements are met in implementing the research project, to include additional BS&S safety review and implemented measures, and a site assessment of partner laboratories, as required. The following phases are required for this project:

Phase 1*: Refine the Technical Proposal to include development of a Form A, as required by CBEP and developing a work plan to address BS&S requirements.

Objective and Process: Meet with all project stakeholders to develop a Form A, as required, which will expand upon objectives and overarching technical approach described above. The technical work plan will also outline all necessary BS&S, as well as biorisk safeguards related to project implementation.

Deliverable: Project Form A, SOP Manual, finalized PRAT

*Phase 1 will be implemented following guidelines received from CBEP based on review and submission of this proposal and PRAT.

Phase 2: Hold a project kickoff meeting in Singapore with research and administrative teams.

Objective and Process: Metabiota will coordinate with Duke NUS and RITM to schedule and facilitate a project kickoff meeting outlining the objectives of the study, logistical coordination required toward implementation, review of protocols and on-site training for RITM researchers in preparation for sampling and implementation following study specific guidelines and to further mitigate risk posed during sampling and analysis.

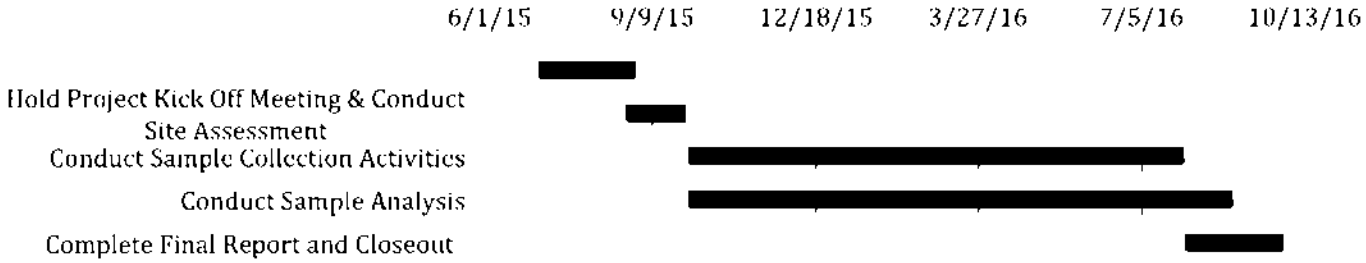
Deliverable: Initiation of research activities, study-specific training on protocols and safe handling, and sampling techniques required for project execution.

Phase 3: Implement sampling of bat colonies at identified sites.

Objective and Process: Metabiota will work with Duke NUS and RITM to identify appropriate sites, and collect bat samples following study-specific and safety protocols. Samples will be collected by a team of 4 local ecologists and will be overseen by Duke NUS-trained researchers at RITM. All samples will be transported back to RITM for sample processing and analysis following safe handling and proper cold chain methods of transport.

Deliverable: Collected samples from bats will be transported back to RITM for further processing.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.



Phase 4: Sample screening and analysis.

Objective and Process: Screen samples using family-specific PCR primers at RITM, and ship aliquots to Duke NUS for deep sequencing approaches to capture the maximum divergent virus lineages to identify the virus strains circulating in the bats and possibilities for cross species and human infection.

Deliverable: Final report showing findings from the study that can be used to produce policies that will minimize the exposure of bat-borne viruses to livestock, as well as, during the collection and processing of bat catches as a food source, further reducing infectious disease threats.

To accomplish the above phases, Metabiota will work with Duke NUS and RITM to initiate and implement the 16.5-month research activity resulting in increased biosurveillance and security measures and a greater scientific understanding of the ecology of reservoir-borne viruses and their transmission to prevent zoonotic epidemics. This effort will support the global community's ability to implement preventative measures through biosurveillance, detection and response initiatives that mitigate the threat of these viruses causing disease outbreaks on a pandemic scale.

Timeline

Metabiota Key Personnel

Jeff Engle- Deputy Director

(b)(6) s the Deputy Director of the Academic Engagement Partnership (AEP) Program and an Internationally Certified Emergency Manager (CEM®) with 14 years of experience leading, managing, and consulting on the full spectrum of Counter Weapons of Mass Destruction (CWMD) operations and Chemical/Biological Defense programs, as well as research and development in support of joint task forces, special operations forces, other government agencies, and the Department of Defense on the strategic, operations, and tactical level (b)(6) s a driven leader with a proven track record of building value with partners through the identification of capability gaps, and the development and validation of effective solutions to the unique challenges faced when dealing with Chemical, Biological, Radiological, Nuclear, and Explosive (CBRNE) threats. In addition, he is well versed at risk analysis and management, strategic planning, policy analysis and political engagement.

(b)(6) ogram Manager

v is the Southeast Asia and Middle East Regional Program Manager of the Academic Engagement Partnership (AEP) Program with over eight years experience as a global health project/program manager, with a focus in SE Asia regional activities, having lived and worked in Cambodia for four years supporting DoD efforts in the region. Since joining Metabiota in 2010, she has managed DTRA CBEP engagements in West and Central Africa, to include Ebola response efforts, as well as spending three years as the Program Manager on projects funded by USAID, AFHSC GEIS, BEP, NIH, USAMRIID, and HJF spanning all regions of Metabiota engagement.

(b)(6) Research and Data Analyst

(b)(6) oined Metabiota in May after completing her MPA in International Management. She has five years experience working in international development, ranging in scope from a macro-level international development bank to micro-level grass roots development work. She worked for two and a half years in rural Mozambique doing public health project management with the US Peace Corps, local community health clinics, and international donors.

(b)(6) Subject Matter Expert

(b)(6) joined Metabiota in March, and will be engaged as a Subject Matter Expert for this effort supporting programmatic and logistical requirements. She joins the team following completion of an MBA with experience in project controls, coordination, strong writing and editing skills and will bring a business approach to the project, keeping track of all deliverables, scheduling, and facilitating coordination with both internal and external stakeholders. In addition to her business expertise (b)(6) vorked as a Data Technician and Interviewer for NIH/CDC sponsored studies, while completing her undergraduate work at Duke.

(b)(6) DVM, MPH - Subject Matter Expert

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

(b)(6) will join the project as a technical lead for BS&S and protocol review. He recently joined Metabiota from the CDC where he was assigned to the Outbreak Response and Prevention Branch (ORPB) as an Epidemic Intelligence Service Officer. He was the lead epidemiologist responsible for investigating multi-state foodborne, waterborne, and zoonotic enteric disease. He was also the Science Lead for the CDC Emergency Operations Center (EOC) team responsible for developing Ebola surveillance, preparedness and response protocols and training programs for unaffected African countries. (b)(6) previously worked for the Central Intelligence Agency as an Operations Officer in the National Clandestine Service.

(b)(6) Ph.D. – Subject Matter Expert

(b)(6) ceived his BS in Entomology and Zoology from the University of Wisconsin at Madison and his PhD in Parasitology with a focus on vector borne infectious diseases from Department of Tropical Medicine at Tulane University. He was the laboratory manager for a large mosquito control company and his doctoral research focused on the transmission cycles of arboviruses between birds and mosquitoes, especially regarding the relative contribution of these individuals towards viral amplification and dampening. As a Senior Research Fellow at Duke-NUS, his current work focuses on the ecology and evolution of novel and reemerging infectious diseases in different animal populations in Singapore. His aim is to understand how ecological and climatological variables impact the presence or absence of host, ectoparasites, and parasites in different habitats and if there is exchange or isolation of genes. His primary interest is on the viral ecology in the bats of Singapore. He also is the insectary manager and works on arbovirus dynamics in mosquitoes.

(b)(6) – Research Collaborator

(b)(6) primary training was in ecology and evolution at The University of Melbourne. He obtained his PhD at The University of Hong Kong in 2003, where he also undertook his post-doctoral training in the Department of Microbiology. (b)(6) is an authority on the evolutionary aspects of influenza virus biology, especially at the human-animal interface; he has provided seminal studies on H5N1 viruses as well as the pandemic viruses of 1918, 1957, 1968 and 2009. In 2007 (b)(6) was awarded a 7-year Career Development Award to continue his work on influenza as part of the NIAID/NIH Centers of Excellence for Influenza Research and Surveillance. His research in the Laboratory of Virus Evolution integrates ideas from a number of different fields including evolutionary genetics, virology, ecology, and infectious disease epidemiology. His research is directed at efforts to better understand viral disease ecosystems in Asia, specifically the animal-human interface, and to support rational implementation of disease control and intervention strategies. He conducts human and animal disease surveillance, isolates and characterizes pathogens (genetic and phenotypic), and generates hypotheses that to test in the lab. He is primarily interested in the roles played by mutation, natural selection, recombination/reassortment and host immune response on virus diversity within an individual, during transmission within a population and during inter-species transmission between hosts.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Cost Management

The Metabiota team and all partners will maintain an acute focus on cost management to ensure that the study is delivered at a reasonable cost to the Government. Our team will provide full oversight of Duke NUS and RITM to ensure accurate and responsive financial reporting and will facilitate cost savings to the Government wherever possible. Metabiota will follow all procurement and travel regulations, ensuring the best price is secured while maintaining product integrity.

Budget Narrative

Period of Performance

The Period of Performance for this effort is June 1, 2015 to September 30, 2016.

Labor

Costs for direct labor to support this activity is required for the following personnel:

Metabiota Program Manager, (b)(6), to oversee and execute the project to include management of deliverables, logistics, management of project personnel, tracking of project requirements, and implementation.

Metabiota Subject Matter Expert (SME) (b)(6) to provide overall expertise in project coordination in direct support of the program manager, to include tracking of deliverables, project schedules, sub-contracted SMEs, and local collaborators facilitating execution of the research project. She will assist in coordination of the research project until an identified SME can be hired to support coordination of this effort through the duration of the project at .5 FTE. (b)(6) ill provide the necessary support to ensure project kickoff and execution and a smooth transition with the new hire to facilitate this engagement. Once they are onboard she will maintain visibility across the program and provide support at a lower LOE.

Metabiota Subject Matter Expert (SME), (b)(6), will be engaged to provide expertise in BS&S review, protocol review, and scientific collaboration in support of technical execution of the project providing general oversight and engagement with collaborating research partners building local capacity and ensuring scientific integrity across the project.

Metabiota Research and Data Analysts (b)(6) will be engaged to provide administrative, scientific and technical support to the project, integrating with both Duke NUS and RITM researchers to ensure scientific rigor and project support to facilitate this engagement is maintained throughout the duration of the study.

Duke NUS Research and Data Analyst will be engaged to support the laboratory testing and bat trapping in conjunction with the RITM team in supporting this research. This individual will

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

assist in training RITM field teams, trapping bats, field collection and processing of samples and setting up diagnostic assays. They will perform basic laboratory techniques to include nucleic acid extraction, PCR, and basic sequence analysis.

RITM Supervisor, (b)(6) will maintain oversight of all implemented activities performed by RITM as the most senior researcher for this engagement. He will participate in project management and scientific implementation requirements and activities in conjunction with Metabiota personnel and Duke NUS RCs, to include facilitating in-country agreements and ethical approvals.

RITM Researchers, will provide project oversight and will participate in the collection of bat samples in conjunction with a team of local ecologists, transport the samples to RITM, and process and screen the samples for evidence of paramyxoviruses. In addition, they will prepare the laboratory and field reports and will process all data and analysis with support from senior researchers working on this project.

Additional costs for direct labor supporting the Deputy Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

In addition, labor costs are not being requested for RCs from Duke NUS, who will be providing research collaboration to support implementation of the research project including oversight of sampling, analysis, and data management.

Materials

Materials and supplies are required to support the implementation of research activities for this project. Materials include bat trapping equipment, field supplies for sample dissection and collection, and laboratory materials to include extraction kits, PCR reagents, Elisa plates, and sequencing costs required for technical implementation. CLS will procure and ship all identified supplies that will not be purchased in country, directly by Metabiota, or Duke NUS to support laboratory and field training operations at the laboratory in Singapore.

Publication costs are requested to support the submission of abstracts and other publications generated from this research activity. All documents will be pre-approved by the PAO.

Communication costs and video conferencing are requested to support routine communication with project personnel based internationally, as well as during international travel to India and Singapore in support of project implementation.

Internet and cloud-based document management costs are requested to support routine communications and management of project files in support of this engagement.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

RITM will provide research services to implement this study. Research services will include trapping, sample collection, transport and analysis at RITM, Manila.

RITM will provide ecology services to support bat trapping, handling and sampling. Services will be provided for a six-month period during which sample collection will be ongoing.

Other Direct Costs

Per contract guidelines Defense Base Act (DBA) insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for Duke NUS and RITM personnel for the period of performance for this engagement. In addition, DBA insurance will be secured for Metabiota personnel traveling to Singapore and the Philippines in support of this activity.

SOS Insurance is required for Metabiota personnel traveling to Singapore and Philippines to support this research activity, ensuring they are covered for emergency and evacuation services if necessary.

Subcontracts

A Subcontract will be issued to Duke NUS and RITM to support their labor requirements on this engagement, as well as in-country materials, required for support of this project. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel

Travel is requested for Metabiota and RITM personnel to travel to Singapore to conduct the project kickoff meeting with Duke NUS at the start of this engagement to support protocol review, logistical requirements, contract implementation, project-specific training, ensuring the study is outlined and established with all teams prior to initiation of sampling and research activities.

Travel is also requested to support Metabiota and Duke NUS personnel to travel to Manila to support project implementation with RITM researchers to include laboratory and field oversight during the first events, with follow on by the Duke NUS researcher to ensure the study is moving forward smoothly and according to protocol. Travel support for Duke NUS personnel not requesting labor costs, will be covered by CLS. In addition, travel is required for RITM researchers to travel in country to implement sampling activities at the surveillance sites. This travel will be covered by CLS.

Travel is requested for (b)(6) to travel from California to DC in support of overall program management and meetings with AEP and CBEP regional leadership to effectively manage the research activity through in-person meetings and coordinated efforts.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Conclusion

The diversity of pathogens of potential public health importance discovered in or associated with bats has increased markedly. Yet the significance of these pathogens remains largely unknown. This lack of information on the basic biology of bat diseases in SE Asia is of great concern. The emergence of Ebola Reston virus in the Philippines demonstrates how; EIDs have no geographic borders, anthropogenic landscape changes can influence emergence, increased interactions between humans and bats lead to opportunities for transmission, and virus in reservoirs displaying no apparent illness can infect incidental hosts such as livestock and humans. The detection of Nipah virus, during the 2014 outbreak, shows the need for increased biosurveillance, detection and response activities to support, address and prevent this potential emerging disease threat. and how critical this research is to building local capacity and regional scientific engagement to support risk mitigation through greater understanding of the disease landscape of the region.

Metabiota is committed to support our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP PACOM in the implementation of the study. Metabiota will ensure, through strong project management and risk mitigation, that the research will be executed in an efficient and timely manner. delivering a top quality study designed to support enhanced biosurveillance and biosafety efforts in the region.

Team Metabiota Overview

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Metabiota is the pioneer in comprehensive risk analytics that improve the world's resilience to epidemics. Built on a strong foundation of epidemiology and international field science including a worldwide network of on-the-ground experts, Metabiota delivers actionable, data-driven insights that help countries, governments and corporations manage and mitigate infectious diseases. With a strategic global presence and sustained partnerships, Metabiota's agile approach is helping the world track, transfer and terminate the risk associated with epidemic threats. The company's international footprint includes operations in 20 countries and offices in San Francisco, Washington, China, Canada, and Sierra Leone.

Metabiota currently supports a number of Cooperative Biological Engagement Program (CBEP) initiatives, including the Academic Engagement Partnership (AEP) Program, the Biological Threat Reduction Integrating Contract (BTRIC) in Ukraine, and grants in Tanzania to perform research activities. Metabiota's mission aligns well with CBEP; the entire Metabiota team is focused on supporting our USG Partners in reducing the risk of biological threats worldwide, and employs a collaborative and agile approach to biological risk reduction.

To ensure a successful program, Metabiota, in coordination with CBEP Regional Leadership and in-country partners, has built a team that brings unparalleled scientific expertise and unique access across the international infectious disease prevention, preparedness and response community. This enables us to be an incredible resource for actionable infectious disease intelligence, through the development of analysis methodologies that capture salient data relating to human and animal pathogens of concern, organic national and regional public health capacity, engagement priorities and constraints for the USG, regional and international public health organizations, and non-governmental organizations (NGOs) whose respective aims could impact CBEP objectives.

Project Overview

Introduction

Through AEP Technical Direction 007, DTRA CBEP USPACOM Regional Leadership tasked the Metabiota team with creating a narrative, needs-based analysis document to DTRA CBEP and PACOM leadership that will capture regional requirements for risk reduction leading to the development of realistic and achievable end-states for the region. The desired analysis is multi-faceted and will include a characterization of the disease landscape within the region, factors that increase the likelihood and severity of disease outbreaks and biological threats, and current regional capacity the address biological threats including stakeholders, networks and initiatives operating within the region.

The Disease Landscape Section will detail current biological threats present in the region and characterize the risk of accidental, naturally occurring, and intentional disease outbreaks and

biological events by pathogen. The Regional Capacity Section will include organic regional capabilities as well as an analysis of stakeholders, networks and initiatives operating within the region. This will allow for detailed analysis of the gaps present, as well as an analysis of the effectiveness of different approaches taken to address the biological threat spectrum. Ultimately, the intent of this endeavor is to assist CBEP in developing an informed, targeted and goal-oriented 5+ year strategic plan with measurable and achievable results.

Understanding

The Metabiota team understands that the US Department of Defense (DoD) initiated CBEP through DTRA in order to: secure and consolidate select agents; enhance Biosafety and Biosecurity (BS&S) standards; and strengthen the USPACOM region's ability to detect, diagnose, survey, and report emerging and re-emerging diseases of international security concern and that CBEP accomplishes these objectives in accordance with the World Health Organization (WHO) International Health Regulations (IHR) and World Health Organization for Animal Health Guidelines (OIE). The team further recognizes that to achieve its mission, CBEP works collaboratively with partner nations, U.S. Government agencies, and the international community to enhance disease surveillance capabilities; develop human resource expertise in public and animal health, promote safe and secure laboratory and field work environments; and consolidate pathogens of security concern into a minimal number of safe and secure facilities in a sustainable manner. Through the Academic Engagement Partnership (AEP) Program, Metabiota aims to support the CBEP mission of reducing the potential impact of biological threats through enhanced biological safety and security, awareness of biological risks, and knowledge related to biological pathogens.

In support of this approach, the Metabiota team intends to develop a high-value regional landscape analysis that will support strategic CBEP objectives by informing the regional engagement strategy with the aim of fostering collaboration on topics critical to biological threat reduction, enhancing the regional capacity to perform biorisk management and mitigate the threat of biological events. The team's on-the-ground experience and decades of expertise makes us well positioned to support the execution of this analysis and all of the associated activities as well as scientific engagement in the USPACOM's area of responsibility.

Purpose

The CBEP USPACOM Regional Strategy is being developed to address existing challenges faced within the region and support Country Managers (CMs) in the execution of their five+ year strategic plans. The recent strategic planning efforts within CBEP (multi-year plans, metrics, etc.) require a broader approach to regional analysis and calls for the development of a standardized methodology for information gathering and needs analysis that can support the validation of requirements and enhance the integration of country specific strategies.

To achieve this purpose, CBEP endeavors to develop a five+ year strategic regional plan that will guide DTRA's decision-making and engagements at a regional level. This plan includes but is not limited to: focusing on reducing biological threats, enhancing the transparency and

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

confidence-building between DTRA PACOM and host countries, engaging scientists through cooperative pursuits, and enhancing host-nation capacity in disease detection and reporting, while adhering to international codes of security and safety to ultimately provide a mechanism for sustained engagement.

To accomplish this purpose, DTRA CBEP, through the Academic Engagement Partnership Program (AEP), will engage Metabiota Inc. and its cadre of Subject Matter Experts (SMEs) to provide a regional landscape analysis that will support the development of the CBEP PACOM engagement strategy.

Objectives

Through the collaborative engagement process with Metabiota and the development of the regional landscape analysis, DTRA CBEP will be able to:

- Characterize the region based on the disease landscape, organic regional capabilities, and external factors that impact CBEP objectives;
- Identify needs and areas of overlap with other stakeholders, providing avenues for successful engagement;
- Support regional leadership in providing overarching strategic guidance and goals to CBEP PACOM Country Managers in the development of their country engagement strategies and inform the development of a regional engagement strategy.

Threat Reduction Outcomes

Metabiota will provide a narrative, needs-based analysis document to DTRA CBEP leadership that will capture regional requirements for risk reduction leading to the development of realistic, measurable, and achievable end-states for the region. Additionally, the analysis will promote a global network of research collaborations and develop a sustainable infrastructure for advancing scientific research, including the early detection of emergent threats.

Increasing knowledge through conducting a regional analysis is critical to capacity building efforts across the PACOM region and supports the early detection and response to emerging events, thus safeguarding the world from biological threats. Without completion of the analysis, the region is subject to the following identified risks:

- Incomplete country and regional coverage of disease detection, reporting and response systems;
- Increased security threats due to improper handling of pathogens of security concern;
- Limited understanding of pathogens of concern circulating in the region;
- In-country and regional stakeholders with varying agendas, priorities, and goals.

The completion of the regional analysis will mitigate the identified risk factors by:

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

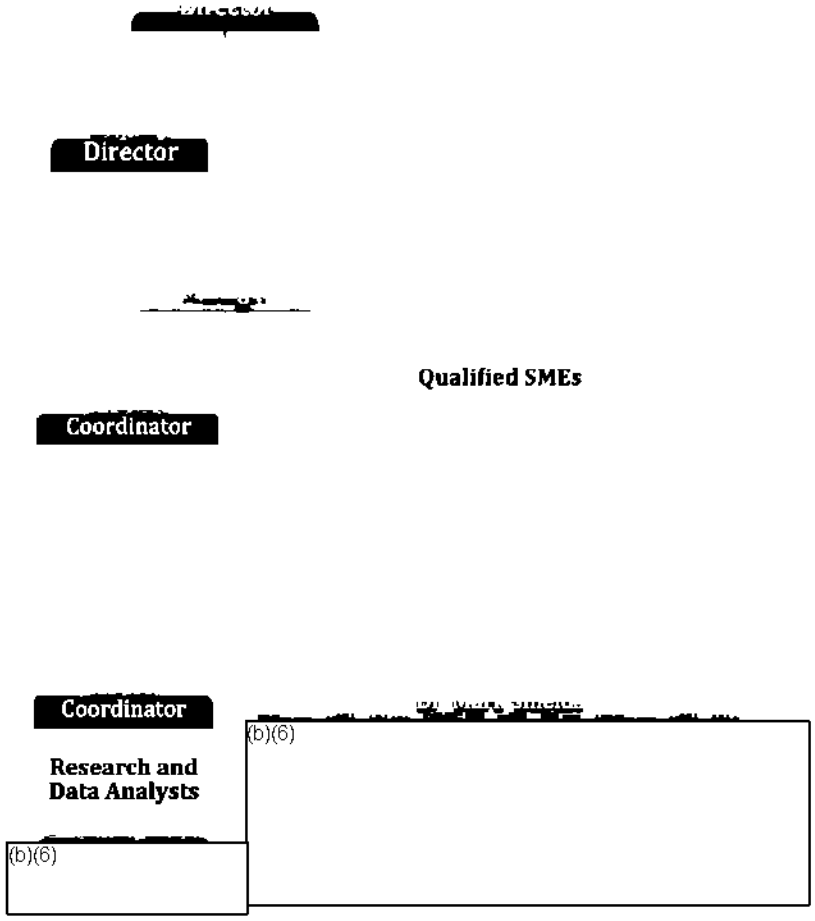
- Providing a roadmap that will guide regional engagement and develop forward operating presence in the region to facilitate successful, multi-year engagement;
- Informing planning and regional decision-making strategy that supports the CBEP mission and desired end-states;
- Validating the impact of a comprehensive strategy based on an overview of the arena, regional capabilities, the engagement and diseases landscape, identified gaps and areas of synchronicity to support the CBEP mission;
- Supporting a unified and streamlined approach across all countries and bolstering the effectiveness of CBEP Country Managers by providing them with an additional tool to inform their planning efforts, while ensuring roll-up to the overarching vision and mission of CBEP;
- Supporting informed action and engagement that will define CBEP's agenda in the region allowing for clear communication and partnerships with other USG agencies and external stakeholders;
- Optimizing outcomes with focus and defined thresholds for achievement;
- Increasing scientific capabilities through research collaboration and fostering an environment of scientific partnership.

Risk Management

No.	Risk Factor/Rationale	Impact	Likelihood	Severity	Current Risk Level	Mitigation	Likelihood	Consequence	Residual Risk
					(b)(4); (b)(6)				(b)(4); (b)(6)
1	No forward presence in countries-difficult to achieve buy in and get access	Schedule and Performance	5	5		Metabiota will use personnel with local experience and subject matter expertise, as well as in country regional partners	2	2	
2	Incomplete regional coverage-information is fragmented	Performance	5	5		Metabiota will work with stakeholders and provide a broader assessment of the region, in order to facilitate capturing hazards and capabilities, as well as opportunities to engage	2	2	
3	Incomplete pathogen coverage	Performance	5	5		The Metabiota team will engage SMEs from across the scientific community to capture a larger disease landscape that considers threats, as well as opportunities	2	2	
4	Multiple country managers with different plans and objectives	Schedule and Performance	3	3	Medium	The team will engage country managers as a group and individually, to ensure that this assessment process assists them with their needs, as well as captures the data they collect in their country assessments to drive final results	2	1	

										(b)(4); (b)(6)
5	Embassy health working group agendas	Schedule and Performance	3	3	Medium	Development of the assessment, targeted communication strategies and clear engagement activities will reduce barriers faced through competing agendas	2	2		
6	Massive amounts of data to sift through	Cost, Schedule & Performance	4	4	(b)(4); (b)(6)	Metabiota will engage research analysts and SMEs to compile, coordinate and guide data collection process to include performing routine focused analysis of the data and impact to ensure it is delivered in a useable format to inform the strategic plan	2	1		
7	Broad scope of analysis	Schedule and Performance	3	5		Metabiota will employ a feedback loop and routine course correction activities through engagement with CBEP PACOM leadership to ensure Scope stays focused on CBEP objectives	2	1		
8	Short suspense on completing a useable document	Schedule and Performance	5	4		Metabiota will employ rigor around process with routine scheduling & deliverable to maintain target completion deadlines	2	1		

Management Approach



Introduction

Metabiota will employ its existing organizational leadership to interface with Regional Leads and Country Managers as needed to direct the operational and administrative support required to ensure implementation of the Regional Landscape Analysis. Our Southeast Asia Program Manager (b)(6) will oversee operations with the support of a Project Coordinator, Travel Coordinator, Research and Data Analysts and Subject Matter Experts to ensure that all aspects of cost, schedule and performance are monitored and reported to the AEP Contracting Officer Representative (COR) and AEP Program Leadership.

Project Team Structure

Metabiota's project team dedicated to completing this task will include the Metabiota AEP program leadership, the Program Manager, Project Coordinator, Travel Coordinator, Research and Data Analysts, and Subject Matter Experts that will be tasked with specific assignments to

support the development and implementation of the regional landscape analysis based on their administrative and scientific expertise. This team of experts will ensure the overall project management and tasks associated with the analysis are met at every level using best practices, and that only the highest level of scientific rigor and expertise is applied to this effort.

Planning and Design

In communication and coordination with CBEP PACOM leadership, Metabiota will continue to develop the analysis-based strategy development framework required to complete the regional landscape analysis. The process involved in completing the analysis will include working group sessions where CBEP and Metabiota experts will continue to collaboratively build on and revise the previously developed framework and ensure that the collected research adequately addresses and assesses the comprehensive disease and engagement landscape of the region.

To complete the analysis, Metabiota will continue to engage its cadre of SMEs to populate the tool with relevant information. In addition, the team will continue to further enhance and refine questions and context required to address the complete regional picture with CBEP goals in

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

mind. Throughout the research and revision process, Metabiota will engage CBEP for review and approval of the design, structure, and content prior to moving forward.

To complete the analysis, Metabiota will engage:
Research and Data Analysts- to conduct basic research using readily available, open-source information to inform the regional analysis.
SMEs- to provide their regional expertise in the form of narratives and graphics to build upon the basic research component and already included information. Provide QAQC measures to collected information validating results.
Internal Collaborators – Metabiota SMEs working outside of the scope of the PACOM project and have regional expertise within the region will be utilized to further elaborate on the landscape and engagements.

Metabiota will follow up this engagement by ground-truthing facts gathered through basic research and engagement of technical SMEs to validate the data and expand on the information received through this process. In addition, Metabiota will maintain routine communication with CBEP leadership and CMs to coordinate external actions targeting areas of overlap to limit redundancy of efforts, and identify opportunities for synergistic engagement.

Execution
The core project management team will maintain oversight and implementation of the project at all times and will ensure rapid execution of the regional landscape analysis, tracking objectives to ensure the project stays on schedule to complete the training exercises. The project will be managed according to the phased implementation plan and will be course corrected as needed to ensure target end goals are reached. The following tools will be used to guarantee the project schedule will be maintained:

Project Administration:
1. Weekly team meetings and conference calls will be held to internally review the project achievements, accomplishments, barriers or challenges, and address any changes or updates that are required. The meetings will be scheduled and maintained by the Project Coordinator and will include the PM, SMEs, Research and Data Analysts, and AEP leadership, as needed based on the requirements and stage of implementation.
2. Routine communication to include emails, conference calls, and in-person meetings will be held with CBEP Regional Leadership and Metabiota to provide status updates and ensure course correction through the assessment.

Project Reporting:
1. Weekly status reports will be provided by the PM to senior MB leadership to maintain routine tracking and status updates on the project, and provide space for risk mitigation and internal course correction, as needed to ensure training goals are met.
2. Metabiota will provide weekly status reports to CBEP regional leadership to maintain visibility on project achievements and in support of routine in-person meetings.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Monitoring and Controlling

1. Routine risk assessment will be performed internally among the MB project management team to guarantee the project stays on track. This will be accomplished through the implementation of the project administration and reporting mechanisms.
2. Routine communications will be maintained with CBEP Regional Leadership to ensure the project remains on track and is implemented according to standard.
3. Routine oversight and coordination will be performed to ensure successful execution of the regional analysis. Monitoring will include both administrative and fiscal oversight.

Completion

Maintaining a focused project schedule and achieving targeted objectives through the continued coordination of routine meetings, working groups, and open communication with CBEP Regional Leadership, Metabiota will drive the project to completion by 31 October 2015, with the option to build out and populate a regional disease landscape and engagement dashboard. Following completion of deliverables, review, final validation, a back-and-forth dialogue

with CBEP Regional Leadership, and presentation of the analysis, Metabiota will provide after-action reports, debriefings, and follow-on meetings to allow for lessons learned and continuation of solid execution and implementation of activities. Metabiota believes that the experience and management it will bring to this project as well as the continued expertise and support provided by the CBEP team will guarantee success.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Technical Approach

Introduction

Given that DTRA CBEPs mission is to reduce the risk of biological threats, Metabiota will employ a risk-based approach to support CBEP PACOM in the development of the multi-year engagement strategy. The building blocks of the risk-based landscape analysis are the pathogens of concern, the factors that impact the likelihood and severity of an events occurrence, and the policies, practices, stakeholders, networks, and initiatives that aim to mitigate the biological threats present. In order to inform CBEP PACOMs engagement strategy, Metabiota's approach is designed to fully elucidate the risks present, and show areas where CBEP can engage at the lowest cost to achieve the highest impact. Our approach parses the biological threat environment into potential naturally occurring, accidental, and intentional biological events. By doing so, it allows for the characterization of the event by specific factors that impact the likelihood and severity of that specific events occurrence, which in combination with the identification of priority pathogens enables us to identify the baseline risk present for the region of specific biological event scenarios. With the establishment of baseline risk, we are then able to identify and characterize the capacity to prevent, prepare for, respond to, or recover from the specific threat scenarios by analyzing the stakeholders, networks, initiatives, and organic regional capabilities. Once that is done, it allows us to graphically depict the residual risk, as well as identify gaps that DTRA CBEP can target within the region and characterize potential approaches to fill the gaps.

Metabiota will, in coordination with DTRA CBEP PACOM, develop and execute a targeted, analysis-based strategy development framework to collect the regionally relevant information and inform strategic planning.

The analysis-based strategy framework will:

- Facilitate an assessment that captures regional data and analyses to build a 5+ year roadmap/ strategic plan for CBEP engagement
- Address current capacities, capabilities, and gaps in partner country bio-surveillance and biosafety and security systems
- Collect sufficient, usable data to internally identify the appropriate end-states
    - End state: an agreement between CBEP and participating country resulting in "buy-in" for future engagement
- Be a tool to map out and inform the development of consistent, over-arching regional guidance to support country engagement activities
- Incorporate an iterative process between Metabiota and DTRA CBEP, with opportunities for feedback and course-correction
- Be adaptable and scalable to address other regional DTRA needs, or encompass new information as it arises, while achieving the end-state of informing a strategic plan

The framework will not:

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

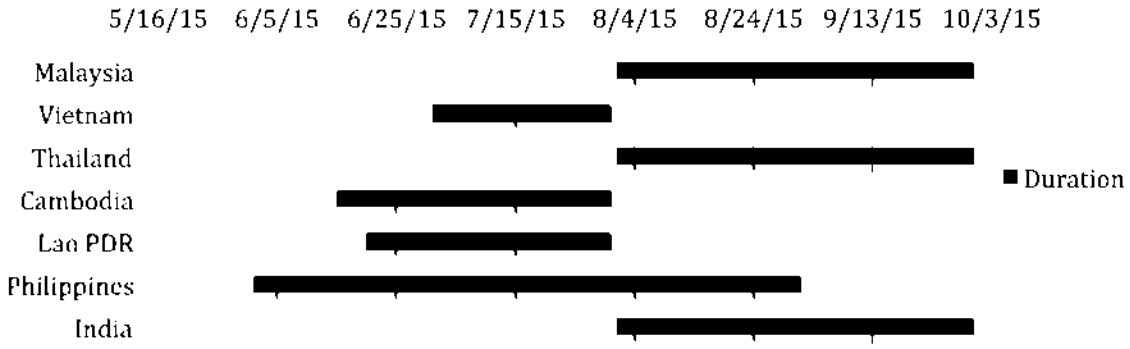
- Be an implementation plan, but will inform the DTRA CBEP developed strategic and implementation plan
- Will not duplicate or be redundant to the country assessment tool
- Be an accumulation of country baseline assessments
- It will not dive deep into the gaps and linkages in BS&S, BSV and CBR capabilities across partner nations in the PACOM AOR.

The Metabiota team will perform the regional landscape analysis through a collaborative process that incorporates expertise from academic leaders, other government agencies, international partners, and both regional DTRA CBEP leadership and CMs, and is facilitated through the Academic Engagement Partnership (AEP) Program contract.

Communications Protocols

Metabiota will maintain open communications with CBEP to ensure full visibility on the status and process of completing the analysis. In order to collect the necessary information for completing the Regional Landscape Analysis report, the DTRA CBEP program office will facilitate communications with external stakeholders and participate in communications internal to Metabiota with stakeholders that spend much of their time in support of in-country programs with USAID, DHAPP, and other entities. Metabiota will inform the appropriate DTRA CM and Regional Leads of every intended conversation with U.S. Embassies, other U.S. Government organizations, country representatives, ministries, and other stakeholders no later than five business days prior to the intended date. Metabiota will develop and submit meeting agendas no later than three business days prior to meetings. As with all AEP communication, Metabiota will record meeting minutes for each communication and make them available to DTRA as part of the Monthly Report, if required. Additionally, Metabiota will include a DTRA CBEP representative on all communication to external stakeholders.

Metabiota will used a tiered engagement approach to seek out information via teleconference and in-person interviews (if appropriate) to fill gaps identified in the open source research conducted by Metabiota SMEs. As specific gaps are identified, Metabiota will review the source list of POCs and determine engagement based on area of expertise to solicit targeted information.



Metabiota will follow the below engagement protocol to ascertain the necessary information. If information can be gained by interviewing Tier 1 POCs, Tiers 2-4 will not be engaged. If Tier 1 POCs cannot supply all the needed information, Tier 2 POCs will be contacted, and so on down the list. Metabiota will attempt to work through internal mechanisms first to maintain targeted external engagements, and will only contact external POCs as critically necessary.

Metabiota will engage SMEs in the following order:

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

1. **Internal Metabiota SMEs (not participating in the PACOM assessment)**: Metabiota SMEs not actively participating in completing the assessment will be interviewed based on their regional expertise and engagement (ex. (b)(6) Director of PREDICT and (b)(6) Director of VIZIONS).
2. **Internal DTRA CBEP SMEs (Country Managers – utilizing Country Tool or coordinated interview engagement)**: Coordinated engagement with Country Managers using country tool or collaborative interview process during completion of country assessment, dependent on timing and pre-approved communication protocol.
3. **Consortium Partners and Regional Collaborators**: Metabiota will interview consortium partners and collaborators based in the US and abroad with active regional experience and engagements (ex. EcoHealth Alliance, UC Davis).
4. **Country-Specific Collaborators**: Metabiota will interview country-specific partners dependent on specific information that needs to be garnered to answer regional questions following the above engagements. Metabiota will coordinate with CMs to identify and notify them, per communication protocols, individuals for engagement in specific countries. Metabiota will coordinate with Subcontractors completing country assessments, where appropriate to collaborate on interviews to reduce duplication and the need to reach out to other in-country partners. Where that is not possible, Metabiota will submit a list of identified individuals and a call schedule to the CM and Regional Lead for approval prior to engagement.

Our general timeline for country engagement follows a staggered approach, allowing for time for CMs to socialize with in-country partners and review proposed questions for POCs, as well as allow Metabiota personnel to work with Country Managers to integrate Country assessments, coordinate interviews, as appropriate and sensitize the regional analysis to ensure proper engagement across the region.

Phases of Technical Approach

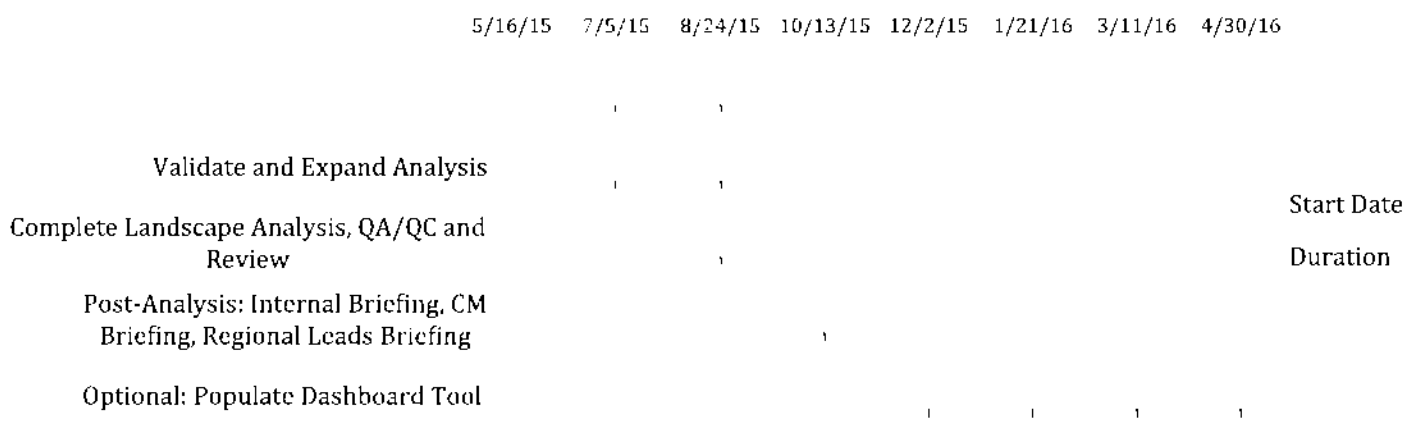
Phase 1: Continued Research and Active Engagement – Input from SMEs and Internal Partners
Phase 2: Validate and Expand Analysis
Phase 3: Complete Needs Assessment and Analysis, QA/QC and Review
Phase 4: Post-Analysis: Internal Briefing, CM Briefing, Regional Leads Briefing

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Phase 5(Optional): Populate Dashboard Tool

There will be five phases to the technical approach. In Phase One, Metabiota will continue to conduct open-access research using published literature, stakeholder websites, and both expertise from Metabiota technical SMEs and partners in the US to fill gaps and drive the completion of the analysis. SMEs will be engaged on an as-needed basis to fill gaps in collected information related to their areas of expertise. Metabiota's SMEs represent all related disciplines and have decades of expertise in areas such as public health, epidemiology, virology, microbiology, cultural anthropology, international affairs, medicine, disaster preparedness/response, veterinary medicine, infectious diseases, and health informatics, among others. We plan to utilize this expertise to engage SMEs based on their level of regional expertise.

In Phase Two of the project, Metabiota will validate and expand the analysis to engage CBEP SMEs, regional collaborators, and country-specific collaborators to further enhance specific components of the analysis and include expertise and knowledge not available through open-source networks. The team will coordinate with CMs to share information and avoid duplication of efforts as respective country assessments are completed. Metabiota will work to address any country-specific concerns in the analysis, as requested by individual CMs. The team will provide CBEP with a list of potential POCs, Engagement Plan, questions to be asked/gaps to be addressed with individual POCs, allowing for time for CBEP to socialize with in-country POCs as needed. Metabiota will work with CMs to ensure that interview questions are consolidated, so that interviews can be as efficient as possible. Additionally, Metabiota will ensure that CBEP CMs and Regional Leads have full visibility on all potential in-country contacts, topics to be discussed, and availability to be present for interviews as desired. Once CBEP has granted approval to move forward and POC interviews are conducted, Metabiota will provide interview notes to CMs and Regional Leads.



Phase Three of the project will consist of reviews of gathered information to ensure accuracy and completeness, and confirm that information meets quality standards. Metabiota will engage SMEs, Research and Data Analysts, graphics support personnel, and leadership teams to conduct multiple review and editing cycles of the analysis in order to ensure accuracy and completeness of the information gathered. Additionally, the team will conduct a gap analysis to collect information that could not be confidently assessed during the previous phases.

Phase Four of the project will consist of a post-analysis of the assessment with in-person briefings provided to CBEP CM and Regional Leads, and other identified stakeholders as directed by CBEP.

In Phase Five of the project, Metabiota will create a dashboard tool that will provide CBEP with data on disease outbreaks and spread presented in a powerful and insightful way. Metabiota's core competencies of data analysis visualization and risk assessment and mitigation strategies will drive the establishment of a tool for CBEP's continued use.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Timeline

Phase 1 – Continued Research and Active Engagement – Input from SMEs and Internal Partners (16 May – 31 August)

Objective: Completion of the targeted, informed baseline regional analysis identifying regional capabilities, capacities, enhancements, and gaps in regional BS&S systems to inform the CBEP strategy, with a focus on risk analysis and mitigation.

Process: During this phase, Metabiota will conduct open-access research using published literature, stakeholder websites, and both expertise from Metabiota technical SMEs and partners in the US to continue compiling and completing the regional analysis. Metabiota will hold regular working groups with CBEP Regional Leads to solicit feedback and review of the analysis and to course correct as needed.

Deliverables: Submission of a working draft of the analysis as well as regular document section reviews.

Phase 2 – Validate & Expand Analysis (8 June – 31 August)

Objective: Engage DTRA CBEP SMEs, Regional Collaborators, and Country-Specific Collaborators to further enhance specific components of the analysis and include expertise and knowledge not available through open-source networks.

Process: Metabiota will coordinate engagement and cultivate synergies with Country Managers during completion of ongoing in-country assessments, depending on timing and pre-approved communication protocol. Upon CBEP approval, Metabiota will engage consortium partners and collaborators based in the US and abroad with active regional experience and engagements (ex. EcoHealth Alliance and UC Davis). Metabiota will identify gaps in available information and coordinate with CBEP Leads to plan, review and approve any and all communication with in-country collaborators. Additionally, Metabiota will conduct CBEP-desired ground-truthing

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

exercises to include working groups, symposiums, table-top exercises, and site visits with in-country partners, technical SMEs, DTRA CMs, and other key stakeholders to validate and provide deeper insight/guidance for completion of the tool.

Deliverables:

- Submission of a working draft of the Engagement Protocol for review as well as regular document section reviews.

Phase 3 – Complete Needs Assessment & Analysis, QA/QC and Review (15 July – 30 September)

Objective: Review gathered information for accuracy and completeness, and ensure that information meets quality standards. Edit for content, clarity, and style.

Process: Metabiota will engage SMEs, Research and Data Analysts, graphics support personnel, and leadership teams to conduct multiple review and editing cycles of the analysis in order to ensure accuracy and completeness of the information gathered. Additionally, information that cannot be confidently verified will be provided to CBEP. Metabiota will ensure that the deliverable format meets CBEP needs and that all relevant information is captured.

Deliverables:

- Complete Analysis Document and supporting documents to inform CBEP's strategic objectives.

Phase 4 – Post Analysis: Internal Briefing, CM Briefing, Regional Leads Briefing (1 – 31 October)

Objective: Complete regional landscape analysis and present it to CBEP Regional Leadership. Present analysis and potential for follow on in briefings to CM and Regional leadership, and others, as identified and requested by CBEP.

Process: Metabiota will complete the regional analysis, and present it to CBEP leadership, personnel and other identified stakeholders, as directed by CBEP via briefings, and in-person presentations.

Deliverables:

- Briefings to CBEP team members.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Phase 5 (Optional) – Populate & Develop Dashboard Tool (1 November 2015 – 15 May 2016)

Objective: Population of Interactive Layered Dashboard Tool

Process: Metabiota will create a powerful, layered dashboard tool that will provide CBEP with data on disease outbreaks and spread presented in a powerful and insightful way. Being able to better visualize epidemic and biological threat risk in the PACOM region will provide CBEP with unparalleled outbreak surveillance and risk analysis capabilities, will enable CBEP to more effectively and efficiently respond to regional disease risks, and will facilitate a more impactful strategic engagement plan in upcoming years.

Deliverables:

- Provide CBEP with a populated dashboard tool that contains all relevant information.

Metabiota Key Personnel

(b)(6) Deputy Director

(b)(6) s the Deputy Director of the Academic Engagement Partnership (AEP) Program and an Internationally Certified Emergency Manager (CEM®) with 14 years of experience leading, managing, and consulting on the full spectrum of Counter Weapons of Mass Destruction (CWMD) operations and Chemical Biological Defense programs, as well as research and development in support of joint task forces, special operations forces, other government agencies, and the Department of Defense on the strategic, operations, and tactical level. (b)(6) s a driven leader with a proven track record of building value with partners through the identification of capability gaps, and the development and validation of effective solutions

to the unique challenges faced when dealing with Chemical, Biological, Radiological, Nuclear, and Explosive (CBRNE) threats. In addition, he is well versed at risk analysis and management, strategic planning, policy analysis and political engagement.

(b)(6) - Southeast Asia Regional Program Manager

Ms (b)(6) the Southeast Asia Regional Program Manager of the Academic Engagement Partnership (AEP) Program with over eight years experience as a global health project / program manager, with a focus in SE Asia regional activities, having lived and worked in Cambodia for four years supporting DoD efforts in the region. Since joining Metabiota in 2010, she has managed DTRA CBEP engagements in West and Central Africa, to include Ebola response efforts, as well as spending three years as the Program Manager on projects funded by USAID, AFHSC GEIS, BEP, NIH, USAMRIID, and HJF spanning all regions of Metabiota engagement.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

(b)(6) Project Coordinator

(b)(6) will be engaged as the Project Coordinator for this effort. She joins the team following completion of an MBA with experience in project controls, coordination, strong writing and editing skills and will bring a business approach to the project, keeping track of all deliverables, scheduling, and facilitating coordination with both internal and external stakeholders. In addition to her business expertise (b)(6) worked as a Data Technician and Interviewer for NIH/CDC sponsored studies, while completing her undergraduate work at Duke.

Subject Matter Experts

(b)(6) PhD- Senior Scientist

(b)(6) joined Metabiota in April 2013 as an expert on Emerging Diseases and Biosecurity. As a medical researcher and formerly Research Director for the French Institute of Research for Development (IRD, Marseille, France), he has spent his career working in and for developing countries of South America, Africa and Asia (1979-2012). His areas of focus include viral disease epidemiology, virus ecology, arboviruses, viral hemorrhagic fevers and understanding fundamentals of disease emergence. Since the late 70s, he has led international teams with partner institutions in developing countries, as well as teams of virologists at the International Network of the Institute Pasteur (Dakar, Senegal; Bangui, Central African Republic) (b)(6) worked for several years as a guest researcher at the Special Pathogen Branch of the Centers for Disease Control and Prevention (CDC) in Atlanta (Georgia, USA), as a visiting scientist at the Arbovirus Branch of the CDC in Fort Collins, and as a visiting professor of Epidemiology and Public Health at the Yale School of Medicine (New England, USA). In addition, (b)(6) has worked to enhance high security laboratory practices and research (CDC, Yale), and on the early development of geographical information systems

applied to Public Health and Infectious Diseases (Yale). From 1997 to 2007, he was invited to Mahidol University in Thailand as a visiting professor of Microbiology, where he founded the Research Center for Emerging Viral Diseases and developed a Technical Platform for the study of Emerging Vector-Borne Diseases (b)(6) has developed several innovative concepts including the evolution of viruses on the geological time scale and co-evolution as a general mode of evolution, among others.

(b)(6) MD, MPH, MS, FACPM – Senior Scientist

(b)(6) eceived his BA in Biology at Earlham College, his MD at Michigan State University, his MPH at Harvard University, and his MS in Biostatistics at Harvard University. He has most recently served as a medical epidemiologist and Health Informatics Branch Chief for the CDC's Global Aids Program (GAP) at the American Embassy, Lusaka, Zambia. As the Health Informatics Branch Chie (b)(6) directed the initiation, funds procurement, staffing, design, development, and national deployment of the SmartCare Electronic Health

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Record (EHR) System for a decade, growing to service over 770 facilities and more than 1,000,000 persons (>500,000 HIV positive), and collaborating with over 20 implementing partners.

(b)(6) previously worked as a Medical Epidemiologist for the Centers for Disease Control and Prevention in Zambia covering three areas: surveillance activities including continued monitoring of the HIV epidemic in Zambia through HIV & Syphilis Antenatal Clinic Sentinel Surveillance (ANC SS) for 2006 and 2008, and the newer concerns of HIV drug resistance monitoring, drug resistant tuberculosis, and avian influenza; monitoring and evaluation (M&E) of PEPFAR program activities as part of a rapidly expanding CDC-Zambia budget (from $3M to $100M in five years); and managing the Information and Communications Technology (ICT) systems infrastructures for rapidly growing staff, nationally distributed offices, and new USG WAN security certification requirements.

(b)(6) PhD

(b)(6) earned his Ph.D. in the field of molecular genetics at Rice University, before taking the role of Director of Research at mAbGen. There, he designed and built the prototype of their technology platform, a novel device to accelerate early stage drug discovery. The team's work spanned many scientific fields and resulted in a peer-reviewed scientific paper. In conjunction with the CEO (b)(6) set the company's strategic direction, evaluated competing technologies, and assessed larger biotechnology and pharmaceutical companies as potential strategic partners or acquirers for their technology. He also served as an Associate at Booz Allen Hamilton, where he provided strategic, policy, and technical advice toward reducing the threat of global disease outbreaks. Parts of these duties included the assessment, development, and management of international biological research programs funded by the US Department of Defense. He also facilitated discussions with key individuals in US and foreign government agencies and the private sector.

(b)(6) Epidemiologist

An infectious disease epidemiologist with over 10 years of experience in development and implementation of epidemiologic and clinical research studies in international settings. She currently serves as the scientific technical lead on epidemiologic studies of various infectious diseases, including Lassa fever and Ebola, to characterize the morbidity, mortality and risk factors associated with disease and clinical outcome. Her vast experience includes clinical project management during the translational phase from pre-clinical studies through to implementation of Phase 1/2 clinical trials, with focused experience in managing all aspects of clinical trials related to infectious diseases including pre-clinical toxicology studies, cGMP manufacturing, IND submission, clinical study design and protocol development, ICF and CRF development, IRB submissions, clinical trial conduct, immunological analysis, database development, statistical analysis, interpretation of results, and manuscript preparation.

(b)(6) - Director of Behavioral Sciences

(b)(6) is a Medical Anthropologist with extensive experience coordinating behavioral research projects at sites in Asia, Africa (Cameroon, Gabon and DRC) and the US.

She has vast knowledge in planning field engagement and leading field teams in conducting formative research, integrating social scientific methods including key informant interviews, focus groups, behavioral trials, and other qualitative approaches with high-risk populations, including bushmeat hunters, butchers, vendors, and consumers; sex workers and the military throughout Central Africa.

(b)(6) PhD – Director of PREDICT

(b)(6) recently joined the Metabiota team as the Director and PI for the USAID funded PREDICT program operating in Africa and Southeast Asia, and Metabiota's Director of Epidemiology and Information Management. (b)(6) comes to Metabiota following a successful tenure as Associate Director, Wildlife Health Monitoring and Epidemiology at WCS Canada. For his Ph.D. he studied how wolf predation and disease interact to affect the population dynamics of wood bison in northern Canada. His work focuses on wildlife diseases that either directly threaten wildlife conservation through impacts on wildlife demography, or indirectly threaten wildlife through human activities to control perceived or real threats to human or livestock health. He has worked on conservation / health issues like foot and mouth disease in Mongolian gazelles, bovine tuberculosis and brucellosis in American bison, chronic wasting disease in deer, and avian influenza in wild birds.

(b)(6) rPH – Director of Surveillance, PREDICT

(b)(6) has many years experience working and living abroad providing operational and scientific research support in Africa and Asia related to emerging infectious disease. Her focus has been in the operational set up of research sites and managing surveillance operations. Her efforts have directly increased laboratory diagnostic capacity, as well as the capacity to control and respond to emerging infectious diseases in the countries that she has worked in. She now is the Director of Surveillance Operations for the PREDICT 2 program at Metabiota overseeing wildlife, livestock and human surveillance programs in over 8 countries across the globe. (b)(6) was promoted to this position following 5 years spent in Guangzhou, China managing Metabiota's China office and Southeast Asia regional engagements.

(b)(6) PhD

(b)(6) holds a PhD in Health Economics, Health Services and Policy Research from the University of Alberta School of Public Health. He has served as a Health Economist for the Institute of Health Economics, and also as a Lecturer in Health Economics at Hanoi Medical University. (b)(6) is an IAS/NIDA Research Fellow in Health Economics, Drug Abuse and HIV/AIDS for the Johns Hopkins Bloomberg School of Public Health. He has extensive

experience consulting for various international and governmental organizations including the World Bank and United Nations agencies, on global health and development issues in Southeast Asia. Much of his work focuses on determining cost-effective interventions, assessing health services and innovations, and strengthening health systems, particularly related to HIV/AIDS and emerging diseases within the region.

(b)(6) PhD

(b)(6) a biomedical scientist and science communicator with 10+ years of research experience in the microbiology, immunology, epidemiology, and pathogenesis of infectious diseases. She is also involved in global health and science outreach, advocacy, and communication, including through social media. She has extensively written and published her research in academic journals and presented at international scientific meetings, and has composed technical reports on leading topics in global HIV epidemiology and program implementation. She has served as a science writer/communicator/content producer for the World Bank Global HIV/AIDS Program as well as Independent Global Health and Science Consulting in Washington, DC, and was named one of the "100 Women Leaders in Global Health" by The Graduate Institute Geneva in 2014.

(b)(6) DVM, PhD, MS

(b)(6) olds a DVM from the University of California, Davis School of Veterinary Medicine, a PhD in Comparative Pathology and Viral Pathogenesis from the University of California, Davis, and an MS in Disease Ecology/Population Biology from the University of Virginia. (b)(6) s previously worked as an Instructor at the University of Virginia, and a Guest Instructor at the University of California, Davis. She has been a key member of several CDC Outbreak Response Teams: the Ebola Hemorrhagic fever outbreak response team in Kenema and Bo, Sierra Leone in 2014; the Marburg Hemorrhagic fever outbreak response team in Kabale, Uganda in 2012; the Filovirus Bat Ecology Team in Kitaka Mine, Uganda in 2012; and the Rift Valley fever virus Vaccine Initiative team in collaboration with Deltamune Pty., South Africa in 2010.

(b)(6) PhD, MPH

(b)(6) xperience includes three years as an epidemiologist and program evaluator with the SC Department of Health and Environmental Control as well as a combined eight years of emergency preparedness and response experience including positions with a disaster preparedness and education firm, Emergency Medical Technician, and leading disaster response and recovery teams (b)(6) is an experienced writer, researcher, and mixed methods evaluator with expertise in quantitative and qualitative data collection, analysis, presentation and grant writing.

(b)(6)

(b)(6) has more than 10 years in infectious disease research, with graduate coursework in epidemiology and public health. She has designed, conducted, and analyzed experiments that directly contributed to the funding of a successful R01 grant application resulting in $1.25 million in funding over five years. She most recently served as a research fellow for the Laboratory of Infectious Diseases at the National Institute of Allergy and Infectious Diseases, National Institutes of Health. Previously, she served as a Quality Control Biochemist at INOVA Diagnostics.

(b)(6) MA

has experience as a program manager and intelligence analyst with eight years of in-country experience in conflict zones and transitional areas including North Africa, the Middle East, Central America, and the Andean Region. He has an MA in International Affairs from Tufts University, and has worked as a Graduate Intelligence Analyst at MetLife Global Corporate Security in the Intelligence and Risk Analysis Division. He also has experience in using Geospatial Information System (GIS) software to assess crisis response for high-threat/high-risk scenarios, configure corporate contingency plans, and create briefing documents.

(b)(6), MPA

(b)(6) oined Metabiota after completing her MPA in International Management. She has five years experience working in international development abroad and domestically, ranging in scope from a macro-level international development bank to micro-level grass roots development work. Her areas of expertise include project coordination, monitoring and evaluation, and event logistics. Before joining Metabiota she worked for two and a half years in rural Mozambique as a Community Health and NGO Development Volunteer with the US Peace Corps, implementing public health projects with local community health clinics and international donors.

(b)(6) , MPH

is a Research and Data Analyst supporting the Academic Engagement Program. Before joining Metabiota she worked as a Health Consultant with UNICEF-Liberia for two and half years where she coordinated the implementation of community based maternal, neonatal, and child health interventions. While earning her MPH, Elma was a Graduate Research Assistant for the Mercer University Center for Rural Health and Health Disparities where she conducted qualitative and quantitative data collection and analysis, supported local government and NGOs with policy development and implementation, and was a Research Intern at the Centers for Disease Control and Prevention.

(b)(6) Research and Data Analyst

s a Research and Data Analyst supporting the Academic Engagement Program.

She graduated magna cum laude from Wake Forest University in 2014 with an undergraduate degree in Politics and International Affairs. While earning her degree, (b)(6) was a research assistant analyzing the content and context of changes in the constitutional status of citizenship in Latin America. Her extensive undergraduate thesis earned her departmental honors.

(b)(6) earch and Data Analyst

comes from a strong and varied research background, with first-hand experience both in the lab and in the field in ecology, evolutionary genetics, and virology. From her experience working at the leading edge of pandemic influenza research at the National Institutes of Health, she brings knowledge of the latest developments in the field. She is also skilled in the planning and implementation of environmental monitoring of large facilities as well as employee compliance through her work at an FDA-regulated contract lab.

(b)(6) hDc, MA

(b)(6) has over 10 years of experience developing, conducting, and managing public health research projects, as well as transforming research questions into operational study protocol and building data systems infrastructure. He holds an MA and PhD from the New School for Social Research and has served as a researcher for the Substance Abuse Unit, Department of Public Health in San Francisco, as well as the Center for AIDS Prevention Studies, University of California San Francisco.

(b)(6) H, PhD

(b)(6) is a Data Manager with varied experience in biostatistics, statistics consulting, and data analysis. He holds an MPH in Epidemiology/Biostatistics and a PhD in Epidemiology from UC Berkeley. His dissertation was on health outcomes after low CD4 cell count and mathematical models of HIV transmission. (b)(6) as served as a Data Manager for the University of California, San Francisco and a Statistical Consultant for Metabiota. He has also served as an Assistant Statistician for the University of California, San Francisco and for RTI International.

(b)(6) an experienced leader in both the strategy and execution of graphic design with degrees in engineering, visual communication, and computer science. He has served as the lead UI/UX Designer for the Bates Creative Group as well as the Founder/Creative & Art Director for Creative Manner Design Studio. His focus includes both graphic design and user interface design, and his expertise includes Illustrator, CSS3, HTML 5, corporate branding, both graphic and print design, art direction, and brand development.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Metabiota External SMEs and Stakeholder Relations-Resources in Region (including, but not limited to):

UC Davis	Institut Pasteur	AAHL
Welcome Trust	Mahidol University	Eijkman Institute for Molecular Biology
Eco Health Alliance	UTMB	BEP
WCS	WHO	
Duke NUS	US-CDC	
NAMRU-2	Host Country Ministries & NGOs	

Cost Management

The Metabiota team and all partners will maintain an acute focus on cost management to ensure that this engagement is delivered at a reasonable cost to the government. Our team will ensure accurate and responsive financial reporting and will facilitate cost savings to the Government wherever possible. Our team will facilitate cost savings by employing a multi-pronged strategy which includes utilizing globally matrixed staff to provide their expertise at key junctures and providing ramp-up/ramp-down capability through the use of independent consultants and part time/on call (PTOC) personnel to fill key roles for limited duration.

Budget Narrative

Period of Performance

The Period of Performance for this effort is 16 May 2015 to 31 October 2015.

Labor

Metabiota's support of this effort is based on the solid expertise and cadre of exceptional researchers and SMEs the organization has on hand, and has engaged to support this project. Critical to developing an informed, targeted, and useable analysis is the reliance on field-specific expertise to inform and drive the regional assessment using risk analytics, scientific rigor and in-depth research analysis coupled with QAQC measures to provide an informative, pointed landscape of the PACOM region that will support CBEP's 5+ year strategic plan and programmatic metrics. SMEs from a variety of disciplines have been and will be engaged to support this project to ensure all aspects of the analysis are captured to include the disease landscape, political and economic environment, legislation and governmental requirements, cultural, religious and behavioral practices, geographical and environmental issues, security concerns, and the interstices and overlapping confluence of aspects that make this a multi-faceted assessment recognizing and addressing a dynamic and changing landscape. Key to the development of this framework is driving it to an end state that will support CBEP's long-term mission in this area of operation. Metabiota's diverse team is dedicated to supporting this endeavor and bringing this project to completion. The experience of Metabiota's project

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

management team, lead by (b)(6) is focused on achieving the desired end state and has built out the required labor to support this endeavor through rigorous recruiting and recognition of qualified experts. Team members supporting this effort are providing various levels of effort depending on their expertise and the required support needed to address specific components of the analysis. Utilizing a flexible schedule, and a cadre of team members, Metabiota can ramp up or down activity levels to address, build and support the needs required to complete this effort.

Costs for direct labor to support this activity is required for the following personnel:

Metabiota SEA Program Manage (b)(6) to oversee and execute the project to include management of the cost, schedule and performance. In addition, she will provide direct management and oversight of all project personnel to include labor and reporting, driving the project to completion.

Metabiota Project Coordinator, (b)(6) will oversee the day-to-day activities of the project, as the key POC in Washington DC, supporting (b)(6) in the overall execution of this work. She will coordinate daily with project staff, CBEP regional and country leadership to ensure they are provided routine visibility on the project to include coordination of in-person meetings, weekly reports, and analysis updates.

Subject Matter Experts 1, (b)(6) (b)(6) are required to provide experience and development, review, and adaptation of research documents and deliverables, as well as general research activities and facilitation of scientific collaboration.

Subject Matter Experts 2, (b)(6) and yet-to-be identified individuals are required to provide experience and development, review, and adaptation of research documents and deliverables, as well as general research activities and facilitation of scientific collaboration. This team is skilled in risk management, environmental studies, GIS, cultural anthropology, veterinary sciences and other related disciplines. This teams conducts open source research, validates the collected data, develops pathogen profiles, socio-economic, behavioral, and cultural components of the landscape, as well as provides critical scientific writing and editing skills to ensure document flow and mapping of information.

Subject Matter Experts 3, (b)(6) and (b)(6) are required to provide extensive experience and development, review, and adaptation of research documents and deliverables, as well as general research activities and facilitation of scientific collaboration. Experts at this level bring a breath of regional and international experience to the project specifically focused in their areas of expertise to include microbiology, virology, health informatics, medical anthropology, and data analytics. This team provides QAQC measures to validate the data, as well as being a critical part of the team in collecting and driving the strict research aspects of this assessment.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Research and Data Analysts (b)(6) and a yet-to-be identified individual are required to conduct general research activities and assist in document review and editing. This team makes up the general open research group of the project providing much needed daily research into all aspects of the analysis and supporting SMEs in developing and building out the assessment.

Additional costs for direct labor supporting the Deputy Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office. Additionally, SMEs within the organization may provide subject matter expertise from time to time to validate collected information or provide regional accuracy based on their expertise. Their time in doing so is not being requested for this effort.

Materials

EndNote is the industry standard software tool for publishing and managing bibliographies, citations, and references on the Windows and Macintosh desktop. We are requesting five EndNote licenses to support SMEs use of the software to accurately and professionally cite and reference all open source information gathered in support of this project. EndNote will standardize and format all citations in the document, reducing labor time and effort required for this endeavor. In addition, EndNote has networking capabilities allowing files to reside on a single server and the team to share references and results maximizing productivity.

Journal access is being requested to source critically valuable scientific information and publications providing key scientific findings and data supporting open source information gathering required to build out pathogen profiles and the disease landscape section of the regional analysis. Access to top journals includes Nature, New England Journal of Medicine, and the Journal of Virology.

Papers is an industry standard reference management software tool used to manage and organize references and maintain a library of PDF versions of scientific publications, as well as provides a uniform interface for document repository services, metadata editing, full screen reading and a variety of import/export capabilities that makes it easy to manage scientific resources. Five Papers licenses are being requested to support the online management and sharing of research publications contributing to the development of the regional landscape analysis allowing SMEs to maximize productivity through data management, sharing and standardizing library resources.

Graphic Services are being requested to support the development, design and completion of the regional landscape analysis to provide CBEP with a highly professional document that can be distributed according to CBEP protocol or requirements. Utilizing graphic services is required to support the layout and flow of the framework, while incorporating the required mapping, tables, charts, and quantitative information supporting the narrative text, in a way this easily understood, delivered and best utilized by the end-user, delivering a polished finished product.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Communication costs are requested to support project personnel during international travel to ensure communication with SMEs is maintained and that contact with in-country partners is facilitated, should it be necessary for supporting collection and validation of information pertaining to the regional landscape analysis. In addition, communication costs are requested to support routine Skype communications with domestic and international project personnel, and partners to maintain routine communication necessary for the management of the project, conduct interviews with SMEs and in-country collaborators to build out the analysis and ensure validation of information collected.

Office materials and supply costs are requested to support routine development of the landscape analysis to include printed materials for presentation and delivery to CBEP during bi-weekly meetings, presentations and documents for CMs, and in routine course-correction and evaluation of gathered material to facilitate the completion of the assessment. Office materials and supplies include CDs and thumb drivers, printer paper, printer ink, highlighters, pens, white board supplies, and other related materials necessary for the project.

Cloud-based document management licenses are requested for five users to support Metabiota's use of Box to manage all project documents in support of shared materials, productivity and ensuring version control among the project team. In addition, as many of Metabiota's SME's are remote, the cloud-based system provides an interface in which materials can be easily tracked, accessed and managed for optimal organization.

Video conferencing and SMART board licensing and communications are required for five users to support enhanced communications across the project and provide an interactive environment supporting a collaborative and "think-tank" work space to outline, design, develop, and continue to enhance the analysis framework allowing team members to compile notes, images and other media into virtual notebooks stimulating product development and achieving the desired end state of a polished, directed outcome in support of CBEP's mission.

Other Direct Costs

Per contract guidelines Defense Base Act (DBA) insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all personnel for the period of performance for this engagement. In addition, DBA insurance will be secured for Metabiota personnel traveling internationally in direct support of the regional analysis.

Travel

At the request of DTRA, travel is required for Carlyle Gollogly, Southeast Asia Program Manager to travel to New Orleans to attend PACOM meetings, as well as the American Society for Microbiology General Meeting and to conduct working groups with DTRA CBEP Regional Leadership.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Travel is requested for (b)(6) Southeast Asia Program Manager to travel to Washington, DC to support management of the overall project, to include engagement with CBEP Regional Leadership at in-person meetings to provide status updates and course correction, integration and management of SMEs and other project personnel, external partners and in support of synergistic efforts with subcontractors conducting country assessments.

Travel is required for (b)(6) Deputy Director of the AEP Program to travel to Manila, Philippines to attend the World Health Organization Western Pacific Regional Office (WHO/WPRO) Technical Assistance Group (TAG) meeting on the Asia Pacific Strategy for Emerging Diseases (APSED).

Conclusion

Metabiota is committed to supporting our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP PACOM in the implementation of the PACOM Regional Landscape Analysis. Through strong project management and risk mitigation, Metabiota will ensure that the analysis will be executed in an efficient and timely manner and will deliver a top-quality product geared toward supporting enhanced biosurveillance and biosafety efforts in the region.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

RE: HDTRA1-14-C-0104 Technical Direction for Continued Implementation Clinician Training in Uganda

Dear (b)(6)

Metabiota, Inc. (Metabiota) is pleased to present the attached proposal in response to the above referenced Letter of Technical sent by DTRA on June 08, 2015.

The Letter of Technical Direction provided an estimated price based on a Period of Performance end date of August 30, 2015. To continue the most effective clinician training seminars in Uganda, Metabiota would continue to engage IMAI-IMAIC (Alliance) for implementation. The total Rough Order of Magnitude is estimated at **$1,207,176** for a Period of Performance of May 16, 2015 to August 30, 2015.

Metabiota's Subcontractor, the Alliance, has provided eleven (11) effective trainings under the AEP Contract and has designed a full training plan, which includes twenty-five (25) additional trainings. The total would be an estimated thirty-six (36) training events for 2015. To capture the optimal effectiveness of the Clinician Training Program, Metabiota proposes a second Rough Order of Magnitude of **$1,562,600** for a period of performance of September 1, 2015 to February 28, 2016.

Acceptance of the full training program as described in Metabiota's proposal would equate a base price of $1,207,176 and an option period price of $1,562,600. The total estimated price would be **$2,769,776** for a Period of Performance of May 16, 2015 to February 28, 2016.

Please feel free to contact (b)(6) with questions or concerns at (b)(6)
(b)(6)

Good Evening (b)(6)

Attached, please find Metabiota's budget and technical proposal in response to the above referenced Letter of Technical Direction sent by DTRA on June 08, 2015.

The Technical Direction provided an estimated Period of Performance end date of August 30, 2015. Metabiota intends to continue to engage IMAI-IMAIC (Alliance) for implementation. The total Rough Order of Magnitude is estimated at $1,207,176 for a Period of Performance of May 16, 2015 to August 30, 2015 (Included in attachment "Metabiota_AEP _Budget 1_TD008_Clinician_Training_Uganda_20150610").

The Alliance, has provided eleven (11) effective trainings under the AEP Contract and has designed a full training plan, which includes twenty-five (25) additional trainings for an estimated total thirty-six (36) training events. To capture the optimal effectiveness of the Clinician Training Program, Metabiota proposes a second Rough Order of Magnitude of $1,562,600 for a period of performance of September 1, 2015 to February 28, 2016 (included in attachment "Metabiota_AEP _Budget 2_TD008_Clinician_Training_Uganda_20150610").

Acceptance of the full training program as described in Metabiota's proposal would equate a base price of $1,207,176 and an option period price of $1,562,600. The total estimated price would be $2,769,776 for a Period of Performance of May 16, 2015 to February 28, 2016.

Please feel free to contact me with questions or concerns.

Thank you,

Training Reinforcement: Mentoring and Physical Improvement to Improve Care and Notification Process

Assessments Before and After Training

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Executive Summary

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) has tasked Metabiota, Inc. through the Academic Engagement Partnership (AEP) contract vehicle with developing and delivering clinician training in Uganda. These events support accurate and rapid identification of infectious disease agents, which is an integral component of the disease reporting process and paramount for mitigation of epidemics. This initiative will support the preparedness and capabilities of clinical professionals operating in Uganda to reduce the threat of spreading causative agents of potentially dangerous diseases.

Detailed herein, the Metabiota team endeavors to fulfill this requirement through execution of continued training implementation of health practitioners in Uganda. Through the implementation of coherent training methodologies that are driven by on-the-ground experience and decades of expertise, as well as follow on engagements and deliverables, Metabiota is well positioned to support training activities and scientific engagement in the USAFRICOM's region of responsibility.

Project Overview

Introduction

Through AEP Technical Direction TD-008, DTRA CBEP tasked the Metabiota team to execute Clinician Training in Uganda. The overarching goal of the work outlined in this proposal is to bolster existing public health capacity in the region. The trainings outlined below will serve to improve the host countries abilities to detect, diagnose and report events with the potential to cause public health emergencies of international concern (PHEIC), especially those associated with U.S. Select Agents and Toxins, in accordance with World Health Organization (WHO) International Health Regulations 2005 (IHR 2005) and WHO African Regional Office (AFRO) / U.S. Centers for Disease Control (CDC) Integrated Disease Surveillance and Response (IDSR) systems.

District-level hospital workers require training in infectious disease detection and diagnosis in order to provide early notification of a potential PHEIC. District hospitals provide a substantial proportion of the initial emergency care and ongoing inpatient management of patients with infectious diseases. Strengthening the capacity of district clinicians to perform a differential diagnosis, and to use appropriate and available laboratory tests, will improve early reporting of diseases and, potentially, mitigate the risk of an epidemic.

Background

The Metabiota team understands that the US Department of Defense (DoD) initiated CBEP through DTRA in order to reduce the threat of biological outbreaks. The team further recognizes that to achieve its mission, CBEP works collaboratively with partner nations, U.S. Government agencies, and the international community to enhance disease surveillance

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

capabilities; develop human resource expertise in public and animal health, promote safe and secure laboratory and field work environments; and consolidate pathogens of security concern into a minimal number of safe and secure facilities in a sustainable manner. Through the Academic Engagement Partnership (AEP) Program, Metabiota aims to support the CBEP mission of reducing the potential impact of biological threats through enhanced biological safety and security, awareness of biological risks, and knowledge related to biological pathogens.

In support of this approach, the Metabiota team, along with its partners, intends to administer high-value trainings that will support strategic CBEP objectives by strengthening the region's capacity to diagnose and detect diseases; thereby enhancing local management and mitigation of infectious disease events. The team's on-the-ground experience and decades of expertise makes us well positioned to support the implementation of these trainings and all of the associated activities, as well as scientific engagement in the AFRICOM's area of responsibility.

Purpose

The purpose of the Clinician Training requirement is to enhance the ability of Ugandan clinician's and health workers to recognize key diseases early, report them according to district and national protocols, and rapidly use laboratory support, as available, to confirm possible diagnoses. It is expected that this will help improve the timeliness of identification of unusual diseases and, ultimately, enable more rapid and better responses to disease outbreaks. Targeted training materials supported by on-site clinical mentoring, will assist in disease identification and reporting.

To accomplish this purpose, DTRA CBEP, through the AEP contract, will engage Metabiota and it's cadre of Subject Matter Experts (SMEs), Qualified Trainers (QTs), as well as project partners the IMAI/IMCI Alliance and Walimu, to implement the clinician training events in Uganda.

Objective

Metabiota will implement training activities in Uganda to bolster clinical capabilities for responding to and providing care for patients exposed to especially dangerous pathogens (EDP). Ensuring proper protocols are employed to manage potentially infected patients will ultimately mitigate the threat of further disease transmission. Investing in preventative clinical care capabilities will, ultimately, save lives and prevent potentially catastrophic economic outcomes, which can be associated with epidemics.

The project, initially approved in February 2015, included several objectives that have been completed (e.g., Objectives 1-3). This included adaptation of generic training materials and conducting gap analyses. All training materials previously provided to DTRA have been PAO approved, and have served as the foundation for implementation of training activities in Uganda (Objective 4).

Generic training materials provided via **Objective 1** serve as the foundation for training in all countries to be trained. However, it is recognized that each country may have unique needs

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

related to endemic threats and their respective health care systems. **Objective 2** requires a gap analysis be performed, which will characterize the existing health care infrastructure and identify endemic threats, including pathogens on the U.S. Select Agent list and those of concern to overall public health. Leveraging this information, a country-specific adaptation (**Objective 3**) of the WHO AFRO/CDC IDSR, which fulfills IHR requirements for disease reporting, will be developed and, ultimately, implemented (**Objective 4**).

Threat Reduction Outcomes

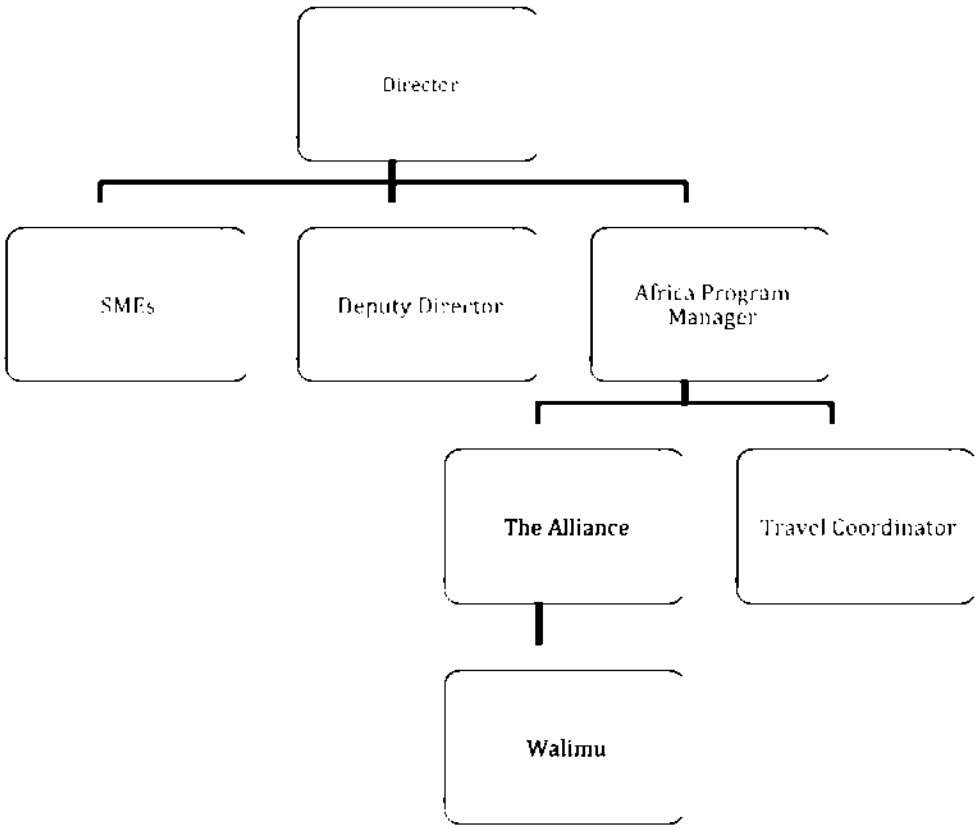
The proposed project seeks to improve health care infrastructure within Uganda. Specifically, the clinician training program will train in-country health workers to recognize, respond to, and report pathogens, which could cause epidemics and result in significant financial burden. Early identification and response will mitigate potential loss of human life and economic burden.

In addition to improving response to general diseases of concern to the host country, these trainings will provide information relevant to preparedness and response to potential VHF (Viral Hemorrhagic Fever) exposure, including Ebola, Lassa fever, and Marburg viruses, all of which are EDPs (Especially Dangerous Pathogens).

Increased biosafety acumen when working with pathogens, particularly EDPs such as VHFs, is a cornerstone of CBEP engagement. As part of the VHF training, health workers will be trained to properly implement biosafety protocols, including dawning and doffing personal protective equipment (PPE), as required by the agent in question. All engaged countries will be trained to follow internationally recognized reporting measures. In addition, as part of the materials adaptation process, gap analyses of the host countries health care system, including previously implemented trainings, will be performed. The gap analyses will be presented as reports, and information presented within them will help all stakeholders (e.g., USG and host country ministries) understand potential areas of future engagement to further bolster the host countries capabilities.

Management Approach

Introduction



Metabiota will continue to employ its existing organizational leadership to interface with the Regional Science Manager, and Country Manager, as needed to direct the operational and administrative support required to ensure successful and timely execution of all Clinician Training events in Africa. Our Program Manager will maintain oversight of training execution, with the support of a travel coordinator, Research Collaborators and Subject Matter Experts to ensure that all aspects of cost, schedule and performance are monitored and reported to the AEP Contracting Officer Representative (COR) and AEP Program Leadership.

Project Team Structure

Metabiota's project team dedicated to completing this task will include the Metabiota AEP program leadership, the Program Manager, Project Coordinator, Travel Coordinator and the Teams Research Collaborators and Subject Matter Experts that will be tasked with specific

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

assignments to support the development and implementation of training events based on their administrative and scientific expertise. This team includes experts from the Alliance and in-country implementer, Walimu. The Alliance and Walimu will utilize their in-country expertise and engagement with local stakeholders to ensure successful training events. Our team of experts will maintain the overall project management and tasks associated with the training are met at every level using best practices, and that only the highest level of scientific rigor and expertise is applied to this effort.

Execution

The project management team will continue to maintain oversight and implementation of the project at all times and will ensure rapid execution of all training events, tracking objectives to ensure the project stays on schedule to complete the training exercises. The project will be managed according to the continual implementation plan and will be course corrected, as needed, to ensure target end-goals are reached. The following tools will be used to guarantee the project schedule will be maintained:

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Project Administration:

1. Weekly team meetings and conference calls will continue to be held to internally review the project achievements, accomplishments, barriers or challenges, and address any changes or updates that are required. The meetings will be scheduled and maintained by the Project Coordinator and will include the PM, SME, Scientific Mentor and AEP leadership, as needed based on the requirements and stage of implementation.
2. Routine calls and communication via email will continue with CBEP regional leadership and Metabiota to provide routine status updates and ensure training implementation.

Project Reporting:

1. Weekly status reports will continue to be provided by the PM to senior Metabiota leadership to maintain routine tracking and status updates on the project, and provide space for risk mitigation and internal course correction, as needed to ensure training goals are met.

Monitoring and Controlling

1. Routine risk assessment will continue to be performed internally among the Metabiota project management team to guarantee the project stays on track. This will be accomplished through the implementation of the project administration and reporting mechanisms.
2. Routine communications will be maintained with CBEP regional leadership to ensure the project remains on track and is implemented according to standard.
3. Routine oversight and coordination will be maintained to ensure CLS is performing in-country logistical requirements, when necessary, to ensure successful execution of the training.

Completion

Maintaining a focused project schedule with routine meetings and communication with CBEP regional leadership allowing for continued coordination, while maintaining targeted objectives, Metabiota will drive the project to completion through the determined project end-date. Metabiota will provide the required deliverables of clinician training trip reports. Metabiota believes that the experience and management it will bring to this project, in collaboration with CBEP will guarantee success.

Technical Approach

Introduction

To facilitate effective training of health workers in Metabiota, and its partners the Alliance and Walimu, will employ the IMAI training materials, which are comprised of the following: 1) WHO IMAI District Clinician Manual (DCM), 2) pocket guidebook, and 3) Quick Check wall charts. The intended purpose of these materials is three-fold: to improve district hospital clinical management and surveillance of key notifiable diseases by the involvement and preparation of clinical teams for disease recognition; implement sustainable practices for case management of

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

severely ill patients; and to ensure that proper reporting procedures are in place, which align with international standards (IHR).

Of particular importance, the training materials include the new WHO IMAI DCM, which outlines and provides reference for 1) triage training, 2) emergency treatments, 3) management of severely ill patients of any etiology, and 4) the clinician's role in surveillance of diseases with epidemic potential (called the Quick Check+ training curriculum). On-site clinical mentoring and quality improvement activities, as well as ongoing monitoring and on-site evaluations will further support training.

In addition to providing a simplified algorithm for emergency triage, assessment and treatment, and the ongoing management of severely ill adolescent and adult patients, the evidence-based WHO manual integrates the identification of notifiable, epidemic-prone diseases within a case management approach based on support for clinical reasoning using differential diagnosis. The manual's differential diagnosis tables include the important notifiable diseases with case definitions and a chapter on disease reporting, which lists all IDSR notifiable diseases and indicates the section of the IMAI DCM where they can be found. The disease-specific sections focus primarily on case definition, diagnosis based on clinical and laboratory features, guidance for specific empirical treatment(s) and supportive care, assessment of response to treatment, and instructions on when to report. Importantly, the IMAI septic shock guidelines have been incorporated into the viral haemorrhagic fever (VHF) pocket guides, which will be used in VHF epidemic-prone areas of East and West Africa.

Derived from the IMAI DCM product is a participatory training course, Quick Check+, which addresses emergency triage and treatments for adults. This course trains the clinical teams to support the triage, emergency management, and infection prevention and control of severely ill adolescent and adult patients, who present with severe acute respiratory infections, VHFs, or other communicable diseases. The short disease surveillance course and reporting training module, used within the clinical training course, has the advantage of effectively engaging busy clinicians and hospital managers for disease reporting and has been very well received in this context. Training all relevant cadres (nurses, managers, and auxiliary staff, in addition to district clinicians such as medical doctors, general practitioners or other senior clinical cadres) within the district hospital helps ensure implementation after training utilizing the following:

- Engaging hospital managers who are key in planning and supporting the budget and organization requirements for improved care and reporting
- Recognizing the important role of senior clinical nurses in providing care during most hours of the day
- Supporting the role of auxiliaries in their contacts with patients, triage, and community linkages

The interventions will be implemented through the following mechanisms:

- Provision of country-adapted guidelines (country-adapted versions of the WHO IMAI DCM and Hospital Care for Children) to participating healthcare workers;

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

- In-service training;
- Mentoring/quality improvement interventions on a regular basis after training, with mentors able to address both pediatric and adult care, infection control, and disease surveillance issues.

The approach encompasses a combination of two training activities for the participatory Quick Check+ training for clinical teams: a four-hospital clinical team training and in-hospital training for the entire clinical staff in a single hospital. Importantly, integration of these trainings will be done in a manner that will not overwhelm recipients and in a way that will be sustainable by health care systems within respective countries. In addition to implementation of trainings a follow-up mentoring schedule will be determined based on the needs of a given country.

Training Implementation

Since the initiation of this effort in early 2015, eleven training events and mentoring visits have occurred that include regional trainings of up to 4 hospital teams, and Train-the-Trainer activities. The average training has encompassed 33 participants and has been comprised of clinicians, nurses, and hospital administrators. Regions within Uganda that have hosted these trainings include Hoima Regional Referral Hospital, Mubende Regional Referral Hospital, and Kiboga General Hospital.

An additional 25 training events utilizing the IMAI Quick Check+ materials have been scheduled throughout Phase 1 (11 events) and Phase 2 (14 events) periods of performance (Table 1), encompassing Regional, In-hospital, and Train the Trainer (TOT) activities. Many of the Regional trainings run concurrently encompassing a pre-defined Region One and Region Two cohort of participants.

The Regional and In-Hospital courses will be conducted in several classrooms for managers, district clinicians, nurses and auxiliaries, with the clinical team from each hospital. Practical sessions will include putting on personal protection equipment, case scenarios with expert patient-trainers, and facilitation skills. During the initial training event, potential future trainers will be identified based upon their test scores and competency in the practical sessions. These participants will receive Train the Trainer instruction during a unique training event. The overall goal of the TOT training is to increase the pool of competent hospital and regional facilitators in which the Quick Check+ course may be independently provided, thus improving the region's capacity for disease detection and treatment.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Deliverables

- Submission of the TEP, Travel Authorization and CCRs for each training event.
- Submission of TTRs (Travel Trip Reports) five days after training completion.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Risk Management

In order to maintain course action and guarantee trainings that will reduce regional risk and forward CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed below:

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
Cost						
Technical Direction NTE Ceiling	The current budget with events, travel, management, procurement, and execution will exceed the ceiling for the technical direction	5	4	(b)(4); (b)(6)	Metabiota will monitor costs and work diligently to seek out the lowest costs possible for procurement and travel, as well as mitigate extended labor hours during events	**Med-High**
Inadequate funds to meet end-state program objectives	Per the LOTD, Metabiota is only to propose activities through August. The Alliance has developed a comprehensive training schedule to ensure information is effectively dissiminated and institutionalized	4	4		A subsequent budget has been proposed, allowing the Alliance to continue trainings through February. Approval of this budget would allow for additional trainings and post training mentoring/evaluations to occur.	Med
Schedule						
Submission of CCRs and TEPs	The CCR deadline is 45 days prior to travel and the TEP deadline is 60 days prior	2	5	**Med-High**	Team shall adhere to all State Department travel safety guidelines for each region.	(b)(4); (b)(6)
Project Coordination	Team dispersed over several time zones engaged in execution of training and mentoring events. Many events occurring per month.	3	4	**Med-High**	Hold routine calls with regional and country leadership, and collaborators, as needed to understand and implement technical requirements and ensure communication across the training events. Continually capture lessons learned to build upon effective communications.	
Performance						

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Safety and Security	Regions of Africa are considered a high threat for terrorism. Crime is a consistent threat.	3	5	**Med-High**	Team shall adhere to all State Department travel safety guidelines for each region.	Med
Logistics Coordination	There are a lot of moving pieces to get all equipment, trainers, facilities, and trainees in position to execute training on the required timeline	3	4	**Med-High**	Communicate with CLS frequently to ensure in-country support is achieved, with local vendors.	(b)(4); (b)(6)
Unified Goals	Ministries of Health and Regional CDC and other NGOs differ in independent objectives and scope.	4	3	Med	Metabiota will engage all local Ministries and Organizations as groups and individually, to ensure communication and unification of objectives	
Participant Engagement	Several cultural differences exist in Africa that impacts their ability to engage. These differences include: expected remunerations, levels of accommodations, and gender disparities.	3	3	Med	Metabiota will research each country and region that activities will occur to determine presence of cultural uniquenesses, and strategies to overcome potential obstacles to participant attendance.	

Identifying and acknowledging the risks associated with not implementing this training, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix (above).

Cost Management

The Metabiota team and all partners will maintain an intense focus on cost management to ensure that the training is delivered at a reasonable cost to the government. Our team will ensure accurate and responsive financial reporting and will facilitate cost savings to the Government wherever possible. Metabiota will follow procurement regulations ensuring the best price is received under the time constraints using all means available.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Budget Narrative

Period of Performance

The technical narrative captures activities required to effectively bolster capabilities of clinical personnel working in hospitals throughout Uganda. A period of performance has been proposed, which exceeds guidelines presented in AEP Letter of Technical Direction – 008 (TD-008). To this end, Metabiota has provided two budgets: 1) Captures activities defined by TD-008 (ending 31 August 2015) and 2) Optimal period of performance to accomplish end-state objectives (ending 28 February 2016)

Labor

The labor budget is focused on overall program management, material enhancements, training, mentoring and monitoring after training in an effort to expand improvements in case recognition, reporting, clinical care and infection control to more hospitals.

The Alliance brings a wealth of clinician training experience, which is specialized for working in the developing world. Given the relative newness of this organization and considering their origins were based out of non-governmental organizations, the Alliance will require assistance navigating aspects of coordination with the Prime contractor (Metabiota) and the Client (DTRA), including program management, scheduling of training activities, and Contract Data Requirements Lists (CDRL; Training Event Plans, Training Activity Reports, Monthly Progress Reports, etc.). To this end, Metabiota is proposing a program management team, consisting of Program and Training Managers, to continue supporting the Alliance with implementation of objectives in Uganda, as outlined within this scope of work.

Costs for direct labor to support this activity is required for the following personnel:

Program Manager(s): All aspects of program operations and administration, material adaptation, management of training, and implementation will be overseen by the Program Managers (PM) for Metabiota and the Alliance. The PM's will manage cost, schedule and performance of the program, including all required DTRA CBEP deliverables. In addition, PM's will manage all proposed activities with the Metabiota SMEs and the Alliance and its partner "Walimu". The PM's will work with Metabiota leadership and financial divisions to support the program's execution, and ensure that deliverables meet quality standards and requirements. The PM's will also develop best practices to improve program performance, and mine and coordinate resources to overall benefit this program.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

SME III, II and I: In preparation for training delivery and implementation in Africa, Metabiota SME's will work closely with (b)(6) and her team, which include a cache of physicians with decades of experience operating within Africa, on collaborations and engagements with the MoH of Uganda. Periodically, Metabiota SMEs will also travel with the Alliance to Uganda for strategic planning activities and to participate in clinician training events. Our collective team of SME's will engage with the in-country subcontractors, "Walimu", for further competency building. Using their in-depth scientific and medical expertise, our SME's will review and provide input to training reports and materials.

Scientific Mentor: Assistance with overseeing the training events, mentoring local nationals, and providing recommendations for additional material content will be guided by the Scientific Mentor. As a leader in their field, the Scientific Mentor will support collaborations between groups both regionally and internationally. On mentoring visits, the Scientific Mentor will work with hospital staff and administrators to identify barriers to reporting notifiable conditions and to improve triage of severely ill patients and their effective case management.

Research and Data Analyst: Support of the programs' research, data entry and analysis will be provided by the Research and Data Analyst (RDA). The RDA will also support material and deliverable production and submissions. Organization of program documents, and archiving of materials will be an important responsibility of the RDA. The RDA will also assist in the management of internal and stakeholder meetings and execution.

Additional costs for direct labor supporting the Deputy Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

Collectively, the aforementioned personnel will coordinate efforts to support the following activities:

Training and Mentoring After Training

A substantial number of training courses will be carried out using several approaches to training – a training for clinical teams from district hospitals (usually at the regional hospital), in-hospital training for larger hospitals. Several facilitator ToT short courses would be conducted for 3 days prior to clinical team training.

Training Reinforcement: Mentoring and Physical Improvement to Improve Care and Notification Process

Facilitators on mentoring visits will work with hospital staff and administrators to identify barriers to reporting notifiable conditions and to improve triage of severely ill patients and their effective case management. Examples of physical improvement which fit within a modest budget include adding signs and trolleys to improve patient flow in the emergency area, physical modifications to isolate infectious patients and locate severely ill patients near the nursing station, adding secured blood pressure cuffs and thermometers to identify severely ill

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

patients, and tools such as clipboards and notice boards to ensure records are retained and organized for accurate reporting. Clinical training facilitators and Alliance staff will deliver the package of hospital improvements and ensure staff are capable of conducting case notification through the Uganda DHIS 2 health management information system.

Assessments Before and After Training

Facility assessments use a standardized questionnaire and surveyor observations, which complement the WHO/USAID SARA-H hospital assessment (which lacks questions on adult emergency triage and management of adult severely ill patients). In addition, an on-site clinical observer with data entry capacity will conduct case observation and observe success in reporting notifiable diseases and improving case management at the hospital before and after the training. Data will be collected on low-end smartphones and reported through Commcare, a tool used by the WHO, Brac, PATH and Partners in Health among others and supported by USAID and the UN and Gates Foundations, among others. The data is analyzed using the DHIS 2 software, a health management information system used by the MoH in Uganda.

The Alliance is committed to capacitating national staff and supporting their substantial role during in-country project management, as well as, utilizing them as a source of subject matter expertise and clinical facilitation and mentoring.

Materials

Communications

Cost for international cell phone services and data plans, airtime for project staff, laptop modems for country team laptops required to establish a reliable and stable Internet connection for reporting and other online needs, to include maintaining communication in remote areas.

Printing

Printing of all necessary training materials will be managed by Walimu and the Alliance.

Office and Medical Training Materials

These materials, supplies, and minor equipment will be used for implementing training, as well as programmatic coordination between management in the US and Kampala, Uganda. Minor office supplies include computer equipment such as laptops, docking stations, large screens, printers, scanner, photocopier, and software.

Each trained clinical team is provided with a pulse oximeter for individual clinical use/further training of other clinicians in hospital and a hospital-grade pulse oximeter with replaceable probes. No single piece of equipment exceeds $5,000.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Training Event Logistics

Conference Services are required, as a venue is needed for practicum section of the training events to house participants, trainers, and additional Metabiota and CBEP personnel attending the event. Conference services will include on-site catering to facilitate completion of the training within an efficient timeframe.

To date, the Alliance managed all training costs, including venue, food, per diem, transportation (for facilitators and participants), training supplies, projectors, communication costs, and all printing needs as well as their shipment and clearance into country and delivery to the training venues, as allowed in the originally approved proposal. Metabiota will transition the training logistics costs to CLS for scheduled August trainings, as well as all Phase 2 trainings, if approved/awarded. However, June and July training events have been scheduled and approved, making the involvement of CLS challenging due to an extremely short suspense.

Shipping costs

All materials procured within the US will be shipped to Uganda via CLS' Single Shipper mechanism. Shipping costs for movement of training materials and supplies generated or procured in Uganda have been budgeted and will be managed by Metabiota, the Alliance, and Walimu.

Other Direct Costs

Per contract guidelines DBA insurance is required for all personnel engaged on the AEP project. DBA costs were based (b)(6) of the total compensation for all personnel when operating in Uganda.

Subcontracts

A Subcontract will be issued to the Alliance for time provided by their Trainers, as well as materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel

Travel is requested for Metabiota and Alliance personnel to travel to and within Uganda to continue implementation of clinician training activities. Personnel will be providing programmatic, administrative, operational, and technical oversight (as described in the Labor Section of this narrative) to ensure trainings are implemented efficiently. Prior to execution of travel, a cost estimate will be provided to the AEP COR for review and approval.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Metabiota will submit CLS forms requesting travel logistics support when, and if, it is required for project participants (e.g., Trainees).

Conclusion

Metabiota is committed to support our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP AFRICOM in the implementation of the Africa Clinician Training. Metabiota will ensure, through strong project management and risk mitigation that the training will be executed in an efficient and timely manner delivering a top quality course geared to support enhanced biosurveillance and biosafety efforts in the region.

Team Metabiota Overview

Metabiota is the pioneer in comprehensive risk analytics that improve the world's resilience to epidemics. Built on a strong foundation of epidemiology and international field science, including a worldwide network of on-the-ground experts, Metabiota delivers actionable, data-driven insights that help countries, governments and corporations manage and mitigate infectious diseases. With a strategic global presence and sustained partnerships, Metabiota's agile approach is helping the world track, transfer and terminate the risk associated with epidemic threats. The company's international footprint includes operations in 20 countries and offices in San Francisco, Washington, China, Canada, and Sierra Leone.

Metabiota currently supports a number of Cooperative Biological Engagement Program (CBEP) initiatives, including the Academic Engagement Partnership (AEP) Program, the Biological Threat Reduction Integrating Contract (BTRIC) in Ukraine, and grants in Tanzania to perform research activities. Metabiota's mission aligns well with CBEP and the entire Metabiota team is focused on supporting our USG Partners in reducing the risk of biological threats worldwide, and employs a collaborative and agile approach to biological risk reduction.

To ensure a successful event, Metabiota, in coordination with CBEP regional leadership and in country partners have built a team that brings unparalleled scientific expertise and unique access across the international infectious disease prevention, preparedness and response community. This enables us to be an incredible resource for actionable infectious disease intelligence, through the development of analysis methodologies that capture salient data relating to human and animal pathogens of concern, organic national and regional public health capacity, engagement priorities and constraints for the USG, regional and international public health organizations, and non-governmental organizations (NGO) whose respective aims could impact CBEP objectives.

Metabiota will continue to engage the Alliance for implementation of the aforementioned objectives. The Alliance is a US based non-profit non-governmental organization (NGO), which includes institutions and individuals involved in the development, country adaptation,

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

and implementation of the IMAI training materials, which aim to improve disease recognition, case management of severely ill patients, and reporting of notifiable diseases in coordination with WHO standards and regulations. The Alliance works closely with WHO headquarters, AFRO and the WHO in country offices, allowing for quick in roads and rapid implementation to most developing nations, including countries in East and West Africa. The Alliance already has an established footprint in Uganda and has support from the clinical services staff in the Ugandan Ministry of Health (MoH).

The Alliance includes Walimu, a US and Ugandan based NGO, which is currently supporting the implementation of training in Uganda. Walimu is a non-profit organization made up of physicians from Uganda and the US, working to improve medical are in Uganda. Their vision to empower Ugandan health officers to address local problems in innovative ways, which will lead to the transformation of medical training and patient care to meet international standards of excellence. As a collaborator with the Alliance, Walimu serves as a bridge to Alliance-related activities and their execution in clinical services.

Executive Summary

In response to Defense Threat Reduction Agency Cooperative Biological Engagement Program (DTRA CBEP) regional leadership tasking via the Academic Engagement Partnership (AEP) contract vehicle, Technical Direction 013. Metabiota, Inc. (Metabiota) seeks to support the DTRA CBEP mission to increase One Health Epidemiology (OHE) capacity in Uganda by facilitating OHE training events. This initiative will enhance local outbreak preparedness and response capabilities of public health professionals operating in Uganda to mitigate the threat of human, veterinary, and economic loss associated with the spread especially dangerous pathogens (EDP) and associated diseases.

These proposed efforts will enhance local Ugandan capacity at the District level to conduct disease prevention, detection, surveillance and response activities. Moreover, this activity will concurrently facilitate cooperative scientific engagement amongst key stakeholders for disease detection and control in Uganda, in support of the DTRA CBEP mission.

This document outlines the approach that Metabiota will employ to accomplish the requirement. In short, Metabiota intends to:

- Facilitate the conduction of Module 1 OHE training for stakeholder-identified Cohorts 9 & 10 thereby enhancing District-level knowledge of basic epidemiology best practices;
- Facilitate the conduction of Module 2 OHE training for stakeholder-identified Cohorts 9 & 10 thereby enhancing District-level knowledge of outbreak investigations for EDPs;
- Enhance local scientific capacities by fostering collaborations and communications between participants of unique Districts in Uganda.

Project Overview

Background

In recent decades, we have experienced a dramatic increase in the rate of emergence and re-emergence of infectious diseases. On average, one new virus emerges every 19 months, most often with origins in animal populations. The threat of emerging pathogens affecting humans worldwide continues to increase; and underscores the need for effective, integrated human and animal disease surveillance, reporting, diagnostics and response capabilities.

To manage these risks, DTRA CBEP aims to reduce potential impacts of biological threats by enhancing biological safety and security (BS&S), awareness of biological risks, and knowledge related to biological pathogens globally. To do so, DTRA CBEP works collaboratively with partner nations, other USG agencies, and the international community to enhance disease surveillance capabilities; develop human resource expertise in public and animal health; promote safe and secure laboratory and field work environments; and consolidate pathogens of

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

security concern into a minimal number of safe and secure facilities in a sustainable manner. In AFRICOM, specifically, DTRA CBEP seeks to enhance OHE capabilities and develop and maintain local and regional capacity in order to sustainably manage the threat of infectious disease events.

In support of this approach, Metabiota intends to administer high-value OHE trainings in order to support strategic DTRA CBEP objectives by enhancing local and regional collaboration on topics critical to biological threat reduction, and enhancing the regional capacity to perform biorisk management and mitigate the threat of infectious disease events. Metabiota's on-the-ground experience and decades of expertise makes it well positioned to support the implementation of this activity, as well as overall scientific engagement in AFRICOM's area of responsibility.

Goals and Objectives

Metabiota will engage with key Ugandan stakeholders including the Ministry of Health (MOH) and the Centers for Disease Control and Prevention – Uganda (CDC-UGA), to conduct a series of a One Health Epidemiology (OHE) training courses, originally developed by epidemiologists from the Walter Reed Army Institute of Research (WRAIR), for District-level health practitioners in Uganda. This OHE training series will cover basic epidemiology (Module One) and outbreak investigations (Module Two). These modules introduce basic concepts of epidemiology, statistics, outbreak investigation, surveillance, One Health, and clinical recognition of pathogens with bioterror potential.

To achieve this purpose, Metabiota and the collaborative partners will:

- Coordinate with key stakeholders in Uganda to identify up to 4 Ugandan OHE trainers to conduct OHE trainings;
- Collaborate with key stakeholders in Uganda, to ensure the identified 25-30 district representatives per cohort meet OHE training participant criteria and are able to fulfill all training requirements;
- Facilitate the conduction of Module 1 OHE training for Cohorts 9 & 10 thereby enhancing Districts-level knowledge of basic epidemiology best practices;
- Facilitate the conduction of Module 2 OHE training for Cohorts 9 & 10 thereby enhancing Districts-level knowledge of outbreak investigations for EDPs;
- Foster collaborations and communications between participants of unique Districts in Uganda.

Threat Reduction Outcomes

Through the implementation of Metabiota facilitated OHE trainings for key stakeholders in Uganda, DTRA CBEP will have:

- Increased local scientific capacities by fostering collaborations between participants of unique Districts.
- Enhanced and improved disease detection, reporting and response systems across

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Uganda.

- Enhanced the capacity to detect and diagnose diseases and emerging threats of pathogens of concern.
- Implemented laboratory management best practices and principles by following internationally accepted guidelines and standards for reporting outbreaks.

This activity will provide a measurable and achievable result in raising awareness of EDPs among DTRA CBEP AFRICOM partners and facilitating efforts in Uganda to formally educate those who play a pivotal role in disease detection and outbreak response related efforts. Moreover, this activity will concurrently promote a sub-regional network of stakeholders thereby enhancing the development of a sustainable infrastructure for advancing scientific research, including early detection of emergent threats.

Risk Management

In order to maintain our course of action and guarantee trainings that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown on the next page as Table 1. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
Cost						
Communication and cultural boundaries disrupting training preparation and execution	Participants, and presenters do not have a clear understanding of logistical support	4	5	(b)(4); (b)(6)	efore the training Metabiota will pport CDC-Uganda and MoH to nsure communication is provided to articipants and presenters clearly utlines support for the training	Med
Schedule						
Submission of CCRs and TEPs	CCRs must be submitted at least 45 days prior to each event, and TEPs 65 days prior, and are dependent upon receipt of Letters of Technical Direction	5	5	(b)(4); (b)(6)	Upon receipt of the Letter of Technical Direction, Metabiota shall immediately submit all DTRA required travel documents	**Med-High**
Performance						

						(b)(4); (b)(6)
Ability to Collaborate with MoH Uganda	Trainers from the MoH Uganda are required for effective implementation	4	2	Med	Metabiota will directly engage MoH trainers to ensure buy-in and support	
Logistics Coordination	Russian based logistics company that is locally staffed, which can lead to misinterpretation of vital information	3	3	Med	Metabiota will directly engage both Russian and local based offices of TTTI/CLS	

Implementation Plan

Introduction

Metabiota will employ its existing organizational leadership to interface with the Regional Science Manager and Country Manager, as needed, to direct the operational and administrative support required to ensure implementation of the OHE Training. Our Program Manager will oversee administrative and operational functions, with the support of a project manager, travel coordinator, SMEs, trainers, and mentors to ensure that all aspects of cost, schedule, and performance are monitored and reported to the AEP Contracting Officer Representative (COR) and AEP Program Leadership.

Communications Protocols

Metabiota will maintain open communications with international collaborators necessary for implementing the training, to include local and regional stakeholders. In addition, Metabiota will maintain routine communication with DTRA CBEP to ensure they have full visibility on the training engagement, status, and process of execution.

Technical Approach

Components of Technical Approach

Metabiota will use the following technical approach to manage all tasks required for successful implementation of the project components and to provide overall feedback and reporting on the proceedings outlining the accomplishment of objectives. The following components will be executed concurrently and are required for this project:

Phase 1: Program Management and Coordination
Phase 2: Training Administration
Phase 3: Training Implementation

Component 1 – Program Management and Coordination (June 1, 2015 – February 29, 2016)

Objective: Coordinate with key in-country stakeholders to ensure trainers are properly oriented with the OHE training materials and training plan, participants meet criteria and have

committed to fulfilling all requirements, and ensure responsible parities for contingent steps (logistics planning, participant coordination, trainer coordination, etc.) are identified and able to fulfill responsibilities within time, budget, and scope.

Process: Metabiota, in coordination with DTRA CBEP and key in-country stakeholders, will establish a communication plan and responsibility matrix for the conduction of the four OHE trainings, covering Module 1 and 2 for Cohorts 9 and 10. The project team will coordinate to finalize the trainer and participant lists for each cohort and training (4 trainings total, 4 Uganda based independent consultant trainers per training, 3 Metabiota personnel working in a management and oversight capacity per training, 25-30 participants per cohort) and ensure all parties involved are able to participate in full and fulfill all training requirements.

Metabiota will coordinate with local partners to disseminate timely and accurate correspondences and Letters of Invitation (LOIs) to all participants and trainers. Metabiota will coordinate with CLS for all participant and event logistics, as well as for the procurement of any necessary materials and training supplies.

Metabiota will hold bi-weekly meetings with CDC Uganda to ensure that the schedule for dissemination of LOIs remains on target. Metabiota also utilizes these exchanges to coordinate and communicate the status of the LOIs to the DTRA COR. These bi-weekly meetings additionally enhance communication between stakeholders and provide insight into any potential gaps in performance.

Deliverables (Program Management) – All deliverables associated with Component 1 are associated with overall program management to ensure effective implementation of the all project objectives:

- Deliverable #1: Effective communications between all stakeholders to ensure all project activities are efficiently executed in accordance with Client and Host Country expectations and guidelines; including delivery of meeting minutes during stakeholder calls.
- Deliverable #2: Maintain project schedules to ensure implementation of high-quality trainings within proposed project budget and in accordance with the technical approach (above);
- Deliverable #3: Maintain client, stakeholder, and contractor relationships;

Component 2 – Training Administration (July 1, 2015 – February 29, 2015)
Objective: Develop quantitative and qualitative evaluations of all training Module 1 and Module 2 events. Provide lessons learned and recommendations in After Action Reports (AARs).

Process: Metabiota, in coordination with in-country stakeholders and Ugandan OHE trainers, will conduct both daily evaluations and pre- and post-training testing in order to develop a

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

comprehensive evaluation of the training implementation. After the completion of all four trainings and data analysis, Metabiota will develop a comprehensive qualitative and quantitative evaluation of the training implementation.

Deliverables:

- Deliverable #1: Develop all pre training related documentation and CDRLs - Responsibility Matrix. Training Event Plans (TEPs), CLS forms, and Finalized Trainer and Participant Lists;
- Deliverable #2: Development of After Action Report;
  -After Action Reports will contain in-depth recommendations, detailed lessons –learned, and further insight for the DTRA COR.

Component 3 – Training Implementation (July 1, 2015 - February 29, 2015)
Objective: Facilitate the conduction of Module 1 and 2 OHE trainings (5 days each) for Cohorts 9 and 10 in the Jinja and Hoima Districts, respectively, and provide technical and programmatic support for the trainers and participants to complete of interim training requirements between Modules 1 and 2. Additionally, Metabiota will support and encourage collaboration and communication establishment amongst participants, with a focus on neighboring Districts, throughout the training sessions and the interim activities.

Process: Metabiota, in coordination with DTRA CBEP and key in-country stakeholders, will facilitate the four OHE trainings. In order to provide the Ugandan stakeholders with both technical and programmatic support and ensure project goals and objectives are being met, Metabiota trainers and, potentially, a scientific mentor will travel to each of the four trainings. Metabiota will conduct pre- and post- training testing as well as hold daily feedback sessions with the Ugandan trainers to identify gaps, reorient (if necessary) training approaches, and discuss lessons learned.

Deliverables:

- Deliverable #1: Submission of daily training evaluations and participant feedback;
- Deliverable #2: Submission of four Training Trip Reports (TTR)
  -providing high level overview of the trainings and highlighting next step recommendations and cohort and module-specific lessons learned.
  -Contractually required through CDRL 15

The below table describes the detailed technical approach that Metabiota will take to complete this effort and provide the required deliverables. The following table (Timeline) describes the anticipated timeline of each phase.

Timeline

2015:

Training	May-15	Jun-15	Jul-15	Aug-15	Sep-15	Oct-15	Nov-15
Mod 1					Cohort 9		Cohort 10
Mod 2							Cohort 9

2015/2016:

Training	Dec-15	Jan-16	Feb-16	Mar-16	Apr-16	May-16
Mod 1						
Mod 2		Cohort 10				

Management Approach

Project Team Structure

Metabiota's project team dedicated to completing this task will include the Metabiota AEP program leadership, the Program Manager, Project Coordinator, Training Coordinator, Trainers, SMEs and Local National trainers, that will be tasked with specific assignments to support the development and implementation of training based on their administrative and scientific expertise. This team of experts will ensure the overall project management and tasks associated with this effort are met at every level using best practices, and that only the highest level of scientific rigor and expertise is applied to this effort.

Initiation

Prior to initiating any action, Metabiota and DTRA CBEP will secure a clear understanding of the objectives and mission of this undertaking, and make sure all stakeholders agree to it. Following authorization to proceed by DTRA CBEP, Metabiota will move into the planning and execution of the community outreach and regional workshop activities.

Execution

The core project management team will maintain oversight and implementation of the project at all times and will ensure rapid execution of this effort, tracking objectives to ensure the project stays on schedule to complete the training modules. The project will be managed according to the phased implementation plan and will be course-corrected, as needed, to ensure target end-

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

goals are met. The following tools will be used to guarantee the project schedule will be maintained:

Project Administration:

1. Weekly team meetings and conference calls will be held to internally review the project achievements, accomplishments, barriers, or challenges, and address any changes or updates that are required. The meetings will be scheduled and maintained by the Project Coordinator and will include the Program Manager, Training Coordinator, SMEs, and AEP leadership, as needed, based on the requirements and stage of implementation. Routine twice montly calls and communication will be held with between DTRA CBEP regional leadership and Metabiota to provide routine status updates and ensure project implementation expectations are met. Routine twice monthly calls will also be held between Metabiota, DTRA CBEP regional leadership and local stakeholders to ensure project coordination expectations are met.

Project Reporting:

1. Weekly status reports will be provided by the Program Manager to senior Metabiota leadership to maintain routine tracking and status updates on the project, and provide space for risk mitigation and internal course correction as needed to ensure training goals are met.

Monitoring and Controlling:

1. Routine risk assessment will continue to be performed internally among the Metabiota project management team to guarantee the project stays on track. This will be accomplished through the implementation of the project administration and reporting mechanisms.
2. Routine communications will be maintained with DTRA CBEP regional leadership to ensure the project remains on track and is implemented according to standard. Routine oversight and coordination will be performed to ensure subcontractors are meeting contract requirements to ensure successful planning and execution of the training. Monitoring will include both administrative and fiscal oversight when appropriate.

Completion:

Metabiota will drive the project to completion in a timely manner by maintaining a focused project schedule with routine meetings and communication with DTRA CBEP regional leadership. This will allow for continued coordination, while maintaining targeted objectives. As the activity progresses, Metabiota will provide all required deliverables and after action reports to allow for lessons learned and continuation of solid execution and implementation of activities. Metabiota believes that the experience and management it will bring to this project, in collaboration with DTRA CBEP will guarantee success.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Cost Management

The Metabiota team and all partners will maintain an acute focus on cost management to ensure that the training is delivered at a reasonable cost to the government. Our team will ensure accurate and responsive financial reporting and will facilitate cost savings to the Government wherever possible. Metabiota will follow procurement regulations ensuring the best price is received under the time constraints using all means available.

Budget Narrative

Period of Performance

The Period of Performance for this effort is May 16, 2015 to February 29, 2015.

One Health Epidemiology Uganda is a legacy project that allows Metabiota to incur costs immediately as the proposed period of performance begins, and regardless of a DTRA CBEP decision to move forward. In kind, our team accrued a total of 215 hours during this period to design and develop the proposal. This effort involved a total of 93 program management hours, 84 research and data analyst hours, 16 SME III hours, 16 SME I hours, and 6 Trainer I hours.

The original period of performance was altered from May 16, 2015 through December 31, 2016 to May, 2015 through February to allow for the planned execution of both module 1 and module 2 of cohort 10. The postponement of Cohort 9 from its original schedule dictated a need to shift the trainings accordingly.

Labor

Costs for direct labor to support this activity is required for the following personnel:

- Metabiota Program Manager: (b)(6) will oversee the execution of program objectives towards the completion of DTRA CBEP goals at the regional level, and will lead communication with DTRA CBEP for this activity. (b)(6) will do so by maintaining oversight of stakeholder coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. (b)(6) will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables erstwhile ensuring the program remains within scope, budget, and timeline. Additionally, prior to (b)(6) arrival and as part of his onboarding process, program management responsibilities were shared by Metabiota Program Manager (b)(6). As of July 7th 2015 and throughout the remaining period of performance (b)(6) will be the sole Program Manager for this effort.
- Metabiota Project Coordinator (Research and Data Analyst; RDA) (b)(6) will ensure the execution of project objectives towards the completion of DTRA CBEP goals at the project level. (b)(6) will do so by supporting stakeholder coordination and project execution, with a focus on project milestone achievement and stakeholder buy-in development and maintenance. (b)(6) will regularly communicate project status

with [redacted] and will assist [redacted] ticipating, managing, and communicating project risks and recommended mitigation strategies to the funder. [redacted] will also assis[redacted] in ensuring all project requirements and deliverables are fulfilled while concurrently ensuring the project remains within scope, budget, and timeline.

- Metabiota Technical Manager (Trainer III) [redacted] will oversee all aspects of the execution of the training events. [redacted] will submit and track all Training Event Plans (TEPs), Training Trip Reports (TTRs), and After Action Reports (AARs) [redacted] ill also direct and manage the local trainers, ensuring optimal execution of all training objectives. [redacted] will manage in-country stakeholders and project execution, with a focus on buy-in maintenance. [redacted] will direct feedback sessions with the local trainers daily, along with the Scientific Mentor, to discuss training material, lessons-learned, and review survey results from the participants. In addition [redacted] will support [redacted] in ensuring the program remains within scope, budget and timeline [redacted] s contribution to this effort will have discontinued from 08/01/2015.
- Metabiota Training Administrator (Trainer I)- [redacted] MPH will play a vital role in implementation, coordination, and reporting. He will travel to the field for trainings and lead reporting efforts. He will additionally support [redacted] by attending meetings and communicating with relevant stakeholders. From a technical perspective he will use his expertise to support the administrative efforts of [redacted] during field trainings and in the development of After Action Reports (AARs) and Training Trip Reports (TTRs).
- Metabiota Subject Matter Expert (SME III)- [redacted] MD, PhD is an internationally known expert in epidemiology, virus ecology, viral hemorrhagic fevers, fundamentals and domains of disease emergence. Since the 1970s, he has been leading international teams with partner institutions of developing countries (Dakar, Senegal; Bangui, Central African Republic). He largely contributed to developing tools and implementing strategies for the control and prevention of transmitted disease, and has been published in more than two hundred scientific papers in peer-reviewed journals [redacted] will support the OHE training programs by mentoring the local trainers and District participants in outbreak investigation and response best practices. In addition, [redacted] will facilitate the scientific collaborations and support daily training implementation discussions.
- Metabiota Project Support Staff (SME I)- [redacted] was involved in supporting the development of the Technical proposal and budget for OHE Uganda. Her involvement in this project will have discontinued from 08/01/2015.
- Metabiota Regional Trainer and Mentor (Trainer I)- [redacted] based in Sierra Leone, is a recognized epidemiologist focusing in VHF contact tracing and rapid response systems. [redacted] as lead on-the-ground teams of health workers investigating VHF outbreaks and clusters [redacted] ll serve as a regional scientific mentor to both the participants and the local trainers. In addition, [redacted]

will facilitate and support scientific collaborations and provide lessons-learned from his field experience while operating in the recent/ongoing Ebola outbreak in West Africa.

- Metabiota Local Trainers (Research and Data Analyst)- (b)(6) (b)(6) will serve as lead trainers of the OHE modules 1 and 2 material. Each trainer is a Ministry-recognized and selected expert in the areas of outbreak investigation, surveillance, and response. They will execute the pre- and post-tests, as well as the daily surveys from the participants. The Trainers will lead small group sessions in a 1:6 ratio, and support and guide the participants' working projects that occur between modules. Working closely with (b)(6) (b)(6) the Trainers will implement all OHE training materials including lectures, computer enrichment sessions, and exercises.

  Although this was not the case when the budget was originally developed, we have noted the Ambassador's memo stating that MOH employees as well as Government of Uganda employees in general are no longer able to receive salary supplements. With respect to this issue, our communication with in-country performers thus far has yielded confirmation stating that all of our IC trainers will not be non-MOH/non-GoU employees.

  The fourth trainer mentioned is designated as TBD for the fact that the originally identified individual was in-fact an employee of the Government of Uganda. It has been determined that the hours designated are still necessary, and will be assigned to an appropriate candidate that is yet to be identified by local stakeholder CDC Uganda. Thus it would behoove us to maintain this number of available hours without assigning them specifically.

Additional costs for direct labor supporting the AEP Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

Materials

Minor materials and supplies are required to support project activities including stakeholder outreach and coordination, training material production, and host country approval facilitation. Materials will include:

International Communication-Semi-monthly stakeholder meetings will occur to coordinate all upcoming trainings in-county. Internet systems and international calls will be utilized for this effort. Routine updates will take place via e-mail.

Printing Services- One set of OHE Modules 1 and 2 books, for 25 participants, and one set of Instructor Manuals, for 2 trainers, will be required. It is assumed that CLS will manage printing of all necessary materials. Metabiota will prepare the necessary documentation (e.g., CLS request forms) when seeking support for this activity.

Other Direct Costs

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all project participants in accordance with DBA guidelines.

Subcontracts

Local trainers may be utilized for execution of the training and will be subject to an Independent Consultant agreement.

Travel

Funds are requested for three Metabiota personnel (two CONUS, one OCONUS) to travel to Uganda to facilitate each training event, four in total. Specifically, funding has been budgeted to support travel for two Metabiota personnel from CONUS for training implementation and oversight purposes. Additionally, in an effort to promote regional networking and capacity development, Metabiota has also budgeted travel funds for a Sierra Leonean field epidemiologist (e.g. (b)(6) to air in training implementation. Metabiota staff will support project implementation, coordinate stakeholders, and provide technical support for Ugandan OHE trainers. Metabiota staff will hold daily feedback sessions with the trainers prior to beginning coursework for the day, and support computer enrichment activities that follow each evening. Prior to execution of travel, a cost estimate will be provided to the AEP COR for review and approval. Metabiota will submit CLS forms requesting travel logistics support for participants (e.g., Trainees).

Ground Transportation (b)(6) s an epidemiologist (Trainer I) based in Sierra Leone. He will inevitably be arriving at the Entebbe International Airport at a different time and with a different airline carrier than DC based Metabiota staff. Thus with respect to both safety and timliness, we saw it necessary to provide him with individual and seperate transport upon arrival, and before departure. Washington, DC based staff will share ground transport with eachother for both arrival and departure. Once James makes contact with other Metabiota Staff members he will be sharing all in country ground transportation with them.

Conclusion

Metabiota is committed to support our customers and partners in achieving their objectives. Our global reach, enduring relationships with key partners in public health, and core mission of providing actionable infectious disease intelligence to make a positive impact on global health security will ensure success for DTRA CBEP AFRICOM in the implementation of the One Health Epidemiology Training in Uganda. Metabiota will ensure, through strong project management and risk mitigation, that the training will be executed in an efficient and timely manner, delivering a top-quality course geared to support enhanced biosurveillance and biosafety efforts in the region.

The information contained herein is Metabiota PROPRIETARY information and may include Metabiota CONFIDENTIAL information and shall not be disclosed outside of the U.S. Government, as per the statement found on the cover page.

Appendix A - Team Metabiota Overview

Metabiota is the pioneer in comprehensive risk analytics that improve the world's resilience to epidemics. Built on a strong foundation of epidemiology and international field science, including a worldwide network of on-the-ground experts, Metabiota delivers actionable, data-driven insights that help countries, governments and corporations manage and mitigate infectious diseases. With a strategic global presence and sustained partnerships, Metabiota's agile approach is helping the world track, transfer and terminate the risk associated with epidemic threats. The company's international footprint includes operations in 20 countries and offices in San Francisco, Washington, China, Canada, and Sierra Leone.

Metabiota currently supports a number of Defense Threat Reduction Agency's Cooperative Biological Engagement Program (DTRA CBEP) initiatives, including the Academic Engagement Partnership (AEP) Program, the Biological Threat Reduction Integrating Contract (BTRIC) in Ukraine, and grants in Tanzania to perform research activities. Metabiota's mission aligns well with DTRA CBEP and the entire Metabiota team is focused on supporting our USG Partners in reducing the risk of biological threats worldwide, and employs a collaborative and agile approach to biological risk reduction.

To ensure a successful event, Metabiota, in coordination with DTRA CBEP regional leadership and in-country partners have built a team that brings unparalleled scientific expertise and unique access across the international infectious disease prevention, preparedness and response community. This enables us to be an incredible resource for actionable infectious disease intelligence, through the development of analysis methodologies that capture salient data relating to human and animal pathogens of concern, organic national and regional public health capacity, engagement priorities and constraints for the USG, regional and international public health organizations, and non-governmental organizations (NGO) whose respective aims could impact DTRA CBEP objectives.

All international shipments have arrived at IVM, and things are in place with the Institute for the training. We will spend the day there tomorrow to go through inventory, logistics, administration, and materials review. I will keep you posted if anything comes up, but otherwise we are looking good!

>

>As we didn't have a chance to chat, I wanted to respond to your below email. I completely understand your concern regarding costs for this event, and we are tracking costs to ensure we are within budget. The TAF submitted is a ROM based on estimated costs prior to purchase, and is developed to ensure that we plan for any potential cost variations dependent on when approval is secured and reservations made. That being said, please see responses to your questions/concerns addressed below:

>

>Hote rates included in the TAF are included at the allowed USG per diem rate (as this is an estimate and not to exceed amount). However, we anticipate hotel rates to be much less. Valia is currently working with the Marriott to secure block room rates below the USG rate, and ensure they can manage our group size during the event. If we can not secure rooms at the Marriott, we will contact the Sheraton and Intercontinental. We anticipate actual room rates to be around the 130/nt, as you mentioned below. We will provide you with an update once Valia has further details from the Marriott.

>

>As a company policy, we are required to book all of our flights through Uniglobe Travel. They are an approved USG contractor and have worked for many organizations securing USG funded flights. All flights purchased are at the lowest economy fare, according to FTR. The costs included for the flights were estimates based on 3 different flight options (using the higher priced routes) in case flight costs increased prior to purchase. However, through the agency we have identified flights around the $900 range for all locations, and will purchase the least expensive non-refundable, non-upgradable economy fare, ensuring best price to the USG, on US carriers (which often increases costs, but is in accordance with FTR.) However, it is not always possible to obtain the lowest possible fare available online via the travel agency. However, we will be sure to research all options prior to purchase, and will use the best routes/times available dependent on individual attendance on the networking day. For our team, those not attending the networking day will take the red-eye out on the 9th. For those attending, they will take the red-eye out on the 10th. We will secure hotel rooms accordingly, based on flight arrangements.

>

>Per diem is calculated at 75% on travel days, and 100% when meals are not provided. Per diem will be reduced according to the Meal Breakdown for all meals provided by CLS according to the agenda. As we have yet to finalize these requirements, we have estimated per diem at 75% on travel days and 100% on all other days, however, when billed it will again, be reduced according to meals provided and final itineraries for all travelers. (The formula in the spreadsheet calculates 75% on travel days, although it does not separate it out, so I apologize if this is confusing).
>
>The vehicle rental is an SUV seating a total of 8 passengers for Gryphon/Metabiota personnel. The vehicle will be rented according to the agenda, and used only for airport transfer and transport to/from the conference, as needed. This will be noted in the CLS logistics form, as well, so that we are not included in the cost for local transportation they will be providing. (b)(6) s still working with rental agencies to secure a vehicle and final quotation, we estimated the cost according to the smaller 4 door we rented on the last trip, and the number of days required. Again, as this is an estimate, we anticipate costs being lower, and should have the final quote shortly.
>
>Our total estimated travel costs for our team's attendance at the workshop is currently under the approved TD budget for travel. If you'd like an update on total expenses v budget, please let me know, as I'd be happy to send it along.
>
>I hope that this helps to answer your questions/cost concerns. I can jump on a call Friday, KZ time, if you'd like to discuss this further, or we can catch up when I see you in KZ. Please let me know what works best for you.

(b)(6)
>>Since we have a little time on the Jordan CLS, Michael and I had a few questions/comments.
>>
>>Hotel cost- If we are going Marriott it is currently closer to $150 a night pp. They might want to contact the hotel to ensure they can handle the entire conference and see if we can get a group discount saving us even more. Current savings would be around $2700 Hotel Length-This will be dependent specifically on which flight they take but currently they would be leaving the 4th and not getting in until the 5th. There are red-eyes out the 9th or they would have to stay nearly an entire day to red eye out on the 10th (this applies to us as well)
>>Flights- A quick search is showing most flights from IAD are closer to $800, same with LAX. They identified RKV as they flight from Iceland but the international airport is KEF, flight cost should be closer to 600. Miami

should be closer to 1200. This would be a savings of nearly 2800. These flight prices could be due selection of refundable tickets or selection of a specific airline but I am not sure.
>>Per diem- we normally provide only 75% per diem on travel days, they have it at 100% Car rental- They do not identify the specific type of car they are renting. 4 doors are closer to 200-300 for the entire period, a van would be more comparable.
>>
>>Maybe we can talk early next week. I know these might seem minor but it all helps make sure we can come under budget. These also may be things that CLS just decides and we may not have as much control over.
>>
>>Have a nice weekend!

Hi (b)(6)

In the version attached to your previous email, I noted that the budget still stated $381,705.27 in boxes 9b and 10, but was corrected to
$350,242.27 in boxes 5 and 11. If this was supposed to the be the case, please find a signed version attached.

Alternatively, I have updated the previous Word document (now v2, attached) to reflect the $350,242.27 budget in all boxes. I have also PDF'd and signed this version.

Hopefully, I am not confusing the matter.

Best,
(b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE)

This revision shall serve as an official request to update proposed labor costs, as appropriate, using the Foreign Local National rates established with P00020.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES).

Technical Approach: Metabiota will use the following technical approach to manage all tasks required for successful implementation of the project components and to provide overall feedback and reporting on the proceecings outlining the accomplishment of objectives. The following components will be executed concurrently and are required for this project:

Phase 1: Program Management and Coordination
Phase 2: Training Administration
Phase 3: Training Implementation

Objective: Coordinate with key in-country stakeholders to ensure trainers are properly oriented with the OHE training materials and training plan, participants meet criteria and have committed to fulfilling all requirements, and ensure responsible parities for contingent steps (logistics planning, participant coordination, trainer coordination, etc.) are identified and able to fulfill responsibilities within time, budget, and scope.

Process: Metabiota, in coordination with DTRA CBEP and key in-country stakeholders, will establish a communication plan and responsibility matrix for the conduction of the four OHE trainings, covering Module 1 and 2 for Cohorts 9 and 10. The project team will coordinate to finalize the trainer and participant lists for each cohort and training (4 trainings total, 4 Uganda based independent consultant trainers per training, 3 Metabiota personnel working in a management and oversight capacity per training, 25-30 participants per cohort) and ensure all parties involved are able to participate in full and fulfill all training requirements.

Metabiota will coordinate with local partners to disseminate timely and accurate correspondences and Letters of Invitation (LOIs) to all participants and trainers. Metabiota will coordinate with CLS for all participant and event logistics, as well as for the procurement of any necessary materials and training supplies.

Deliverables (Program Management) – All deliverables associated with Component 1 are associated with overall program management to ensure effective implementation of the all project objectives:
- Deliverable #1: Effective communications between all stakeholcers to ensure all project activities are efficiently executed in accordance with Client and Host Country expectations and guidelines; including delivery of meeting minutes during stakeholder calls.
- Deliverable #2: Maintain project schedules to ensure implementation of high-quality trainings within proposed project budget and in accordance with the technical approach (above);
- Deliverable #3: Maintain client, stakeholder, and contractor relationships;

Training Administration (July 1, 2015 – February 29, 2016) Objective: Develop quantitative and qualitative evaluations of all training Module 1 and Module 2 events. Provide lessons learned and recommendations in After Action Reports (AARs).

Process: Metabiota, in coordination with in-country stakeholders and Ugandan OHE trainers, will conduct both daily evaluations and pre- and post-training testing in order to develop a comprehensive evaluation of the training implementation. After the completion of all four trainings and data analysis, Metabiota will develop a comprehensive qualitative and quantitative evaluation of the training implementation.

Deliverables:
- Deliverable #1: Develop all pre training related documentation and CDRLs - Responsibility Matrix, Training Event Plans (TEPs), CLS forms, and Finalized Trainer and Participant Lists;
- Deliverable #2 Development of After Action Report;

-After Action Reports will contain in-depth recommendations, detailed lessons –learned, and further insight for the DTRA COR.

Training Implementation (July 1, 2015 - February 29, 2016) Objective: Facilitate the conduction of Module 1 and 2 OHE trainings (5 days each) for Cohorts 9 and 10 in the Jinja and Hoima Districts, respectively, and provice technical and programmatic support for the trainers and participants to complete of interim training requirements between Modules 1 and 2. Additionally, Metabiota will support and encourage collaboration and communication establishment amongst participants, with a focus on neighboring Districts, throughout the training sessions and the interim activities.

Process: Metabiota, in coordination with DTRA CBEP and key in-country stakeholders, will facilitate the four OHE trainings. In order to provide the Ugandan stakeholders with both technical and programmatic support and ensure project goals and objectives are being met, Metabiota trainers and, potentially, a scientific mentor will travel to each of the four trainings. Metabiota will conduct pre- and post- training testing as well as hold daily feedback sessions with the Ugandan trainers to identify gaps, reorient (if necessary) training approaches, and discuss lessons learned.

Deliverables:

- Deliverable #1: Submission of daily training evaluations and participant feedback;
- Deliverable #2: Submission of four Training Trip Reports (TTR)

-providing high level overview of the trainings and highlighting next step recommendations and cohort and module-specific lessons learned.
-Contractually required through CDRL 15

The following table (Timeline) describes the anticipated timeline of each phase.

Training	May 2015	Jun 2015	Jul 2015	Aug 2015	Sep 2015	Oct 2015	Nov 2015	Dec 2015	Jan 2016	Feb 2016	Mar 2016	Apr 2016	May 2016
Mod 1						Cohort 9		Cohort 10					
Mod 2								Cohort 9		Cohort 10			

Risk Management:
In order to maintain our course of action and guarantee trainings that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation Plan	Residual Risk
		Cost				
Communication and cultural boundaries disrupting training preparation and execution	Participants, and presenters do not have a clear understanding of logistical support	4	5	(b)(4); (b)(6)	Before the training Metabiota will support CDC-Uganda and MoH to ensure communication is provided to participants and presenters clearly outlines support for the training	Med
		Schedule				
Submission of CCRs and TEPs	CCRs must be submitted at least 45 days prior to each event, and TEPs 65 days prior, and are dependent upon receipt of Letters of Technical Direction	5	5		Upon receipt of the Letter of Technical Direction, Metabiota shall immediately submit all DTRA required travel documents	Med-High
		Performance				(b)(4); (b)(6)
Ability to collaborate with MoH Uganda	Trainers from MoH Uganda are required for effective implementation	3	3	Med	Metabiota will directly engage MoH trainers to ensure buy-in and support	
Logistics coordination	Russian based logistics company that is locally staffed, which can lead to misinterpretation of vital information	3	3	Med	Metabiota will directly engage both Russian and local based offices of TTI/CLS	

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$279,635
1003	MATERIALS	$12,632
1004	ODCs	$12,147
1005	TRAVEL	$45,828
TOTAL		**$350,242.27**

9c. TO SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES.)

Period of Performance:
The Period of Performance for this effort is May 16, 2015 to February 29, 2015.
One Health Epidemiology Uganda is a legacy project that allows Metabiota to incur costs immediately as the proposed period of performance begins, and regardless of a DTRA CBEP decision to move forward. In kind, our team accrued a total of 215 hours during this period to design and develop the proposal. This effort involved a total of 93 program management hours, 84 research and data analyst hours, 16 SME III hours, 16 SME I hours, and 6 Trainer I hours.

The original period of performance was altered from May 16, 2015 through December 31, 2015 to May 15, 2015 through February 2016 to allow for the planned execution of both module 1 and module 2 of cohort 10. The postponement of Cohort 9 from its original schedule dictated a need to shift the trainings accordingly.

Labor:
Costs for direct labor to support this activity is required for the following personnel:

- Metabiota Program Manager, (b)(6) will oversee the execution of program objectives towards the completion of DTRA CBEP goals at the regional level, and will lead communication with DTRA CBEP for this activity. (b)(6) will do so by maintaining oversight of stakeholder

coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. (b)(6) will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables erstwhile ensuring the program remains within scope, budget, and timeline. Additionally, prior to (b)(6) arrival and as part of his onboarding process, program management responsibilities were shared by Metabiota Program Manage (b)(6) and (b)(6) As of July 7th 2015 and throughout the remaining period of performance (b)(6) will be the sole Program Manager for this effort. The previous period of performance was extended through February 29, 2016. To this end, additional LOE for (b)(6) required to ensure successful execution and closeout of this training program effectively enabling him to maintain management of communication between key stakeholders. This time will also be used to support in country activities directly related to the execution of training modules. The additional LOE was determined using project actuals to date.

- Metabiota Project Coordinator (Research and Data Analyst; RDA) (b)(6) will ensure the execution of project objectives towards the completion of DTRA CBEP goals at the project level. (b)(6) will do so by supporting stakeholder coordination and project execution, with a focus on project milestone achievement and stakeholder (b)(6) development and maintenance. Ms. Diggs will regularly communicate project status with (b)(6) will assis (b)(6) nticipating, managing, and communicating project risks and recommended mitigation strategies to the fund (b)(6) will also a n ensuring all project requirements and deliverables are fulfilled while concurrently ensuring the project remains within scope, budget, and timeline. With an extended period of performance, through February 29, 2016, an additional two months of LOE is required for (b)(6) o provide logistics and planning support. (b)(6) ll continue in her current capacity throughout this effort, and may be required to (b)(6) trainings. The additional LOE was determined using project actuals to date.
- Metabiota Technical Manager (Trainer III) (b)(6) will oversee all aspects of the execution of the training event (b)(6) (b)(6) ll submit and track all Training Event Plans (TEPs), Training Trip Reports (TTRs), and After Action Reports (AARs). (b)(6) l also direct and manage the local trainers, ensuring optimal execution of al training objectives. (b)(6) will manage in-country stakeholders and project execution, with a focus on buy-in maintenance. (b)(6) will direct feedback sessions with the local trainers daily, along with the Scientific Mentor, to discuss training material, lessons-learned, and review su ey results from the participants. In addition (b)(6) will suppor (b)(6) in ensuring the program remains within scope, budget and timeline. (b)(6) contribution to this effort will have discontinued from 08/01/2015.
- Metabiota Training Administrator (Trainer I)- (b)(6) MPH will play a vital role in implementation, coordination, and reporting. He will travel to the field for trainings and lead reporting efforts. He will additionally support (b)(6) attending meetings and communicating with relevant stakeholders. From a technical perspective he will use his expertise to support the administrative efforts (b)(6) during field trainings and in the development of After Action Reports (AARs) and Training Trip Reports (TTRs).
- Metabiota Subject Matter Expert (SME III) (b)(6) an internationally known expert in epidemiology, virus ecology, viral hemorrhagic fevers, fundamentals and domains of disease emergence. Since the 1970s, he has been leading international teams with partner institutions of developing countries (Dakar, Senegal, Bangui, Central African Republic). He largely contributed to developing tools and implementing strategies for the control and prevention of transmitted disease, and has been published in more than two hundred scientific papers in peer-reviewed journals. (b)(6) will support the OHE training programs by mentoring the local trainers and District participants in outbreak investigation and response best practices. In addition (b)(6) ill facilitate the scientific collaborations and support daily training implementation discussions.
- Metabiota Project Support Staff (SME (b)(6) as involved in supporting the development of the Technical proposal and budget for OHE Uganda. Her involvement in this project will have discontinued from 08/01/2015.
- Metabiota Regional Trainer and Mentor (Trainer I)- (b)(6) based in Sierra Leone, is a recognized epidemiologist focusing in VHF contact tracing and rapid response systems. (b)(6) has lead on-the-ground teams of health workers investigating VHF outbreaks and clusters. (b)(6) will serve as a regional scientific mentor to both the participants and the local trainers. In addition, (b)(6) ill facilitate and support scientific collaborations and provide lessons-learned from his field experience while operating in the recent/ongoing Ebola outbreak in West Africa.
- Metabiota Local Trainers (Research and Data Analyst Lead trainers (TBD) to support OHE Cohort 10 Module 2) will execute the pre- and post-tests, as well as the daily surveys from the participants. The Trainers will lead small group sessions in a 1:6 ratio, and support and guide the participants' working projects that occur between modules. Working closely wit (b)(6) the Trainers will implement all OHE training materials including lectures, computer enrichment sessions, and exercises.

(b)(6) an independent contractor currently working to support the Ugandan Ministry of Health as an infectious disease epidemiologist. He has been brought onto this training as part of the Metabiota team (b)(6) e was supported by research and data analyst (RDA) hours for Cohort 9 Module 1 training. However, upon the approval of the AFRICOM Foreign Local National (FLN) rates, he will henceforth be supported by this labor category.

Additional costs for direct labor supporting the AEP Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

Materials:

Minor materials and supplies are required to support project activities including stakeholder outreach and coordination, training material production, and host country approval facilitation. Materials will include:

International Communication-Semi-monthly stakeholder meetings will occur to coordinate all upcoming trainings in-county. Internet systems and international calls will be utilized for this effort. Routine updates will take p ace via e-mail

Printing Services- One set of OHE Modules 1 and 2 books, for 25 participants, and one set of Instructor Manuals, for 2 trainers, will be required. It is assumed that CLS will manage printing of all necessary materials. Metabiota will prepare the necessary documentation (e.g., CLS request forms) when seeking support for this activity.

Other Direct Costs:

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all project participants in accordance with DBA guidelines.

Subcontracts:

Local trainers may be utilized for execution of the training and will be subject to an Independent Consultant agreement.

Travel:

Funds are requested for three Metabiota personnel (two CONUS, one OCONUS) to travel to Uganda to facilitate each training event, four in total. Specifically, funding has been budgeted to support travel for two Metabiota personnel from CONUS for training implementation and oversight purposes. Additionally, in an effort to promote regional networking and capacity development, Metabiota has also budgeted travel funds for a Sierra Leonean field epidemiologist (e.g. (b)(6)) to air in training implementation. Metabiota staff will support project implementation, coordinate stakeholders, and provide technical support for Ugandan OHE trainers. Metabiota staff will hold daily feedback sessions with the trainers prior to beginning coursework for the day, and support computer enrichment activ ties that follow each evening. Prior to execution of travel, a cost estimate will

be provided to the AEP COR for review and approval. Metabiota will submit CLS forms requesting travel logistics support for participants (e.g., Trainees).

Good evening (b)(6)

Attached please find both a word version and a signed PDF version of our updated TD response for TD-024.

We have made the requested deletions in the first ask.

We have left in the TD Response Development LOE as that activity is part of the TD and has never been part of the PMO. If this is a new direction I suggest we convene a leadership meeting to discuss.

For the 3rd ask we've reviewed all activities that would be at a significantly reduced risk done in person and have reduced the PM's trip to DC to 3 days, the minimal time we believe we could execute those activities.

Thank you for your consideration and we look forward to your reply.

V/R,

(b)(6)

Film Narrative of Epigenetics and Genomics of Infectious Diseases in the Middle East and South Asia.	HOURS. **160** DOLLARS: $ **$60,000**

6. CONTRACTING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME. (b)(6)
PHON (b)(6) MA (b)(6)	PHONE EMAI (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE).

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to develop a Film Narrative of Epigenetics and Genomics of Infectious Diseases in the Middle East, South Asia and CBEP collaborations in the CENTOM Region in accordance with SOW section 4.3, Task 3.

Metabiota shall develop a 2-5-minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, which was held at the Royal Scientific Society (RSS) on March 7-8, 2016 in Amman, Jordan. The visual narrative (2-5 minutes) objectives are to document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. Metabiota shall develop the specific script in coordination with CBEP CENTCOM regional managers. The footage and interviews that Metabiota has from the conference can be utilized for the visual narrative. The visual narrative should be completed by June 30 2016. Total costs for the narrative shall not exceed $60,000.

Deliverables:

- A short film narrative of 2-5 minutes on 3 DVDs. Final film must go through Public Affairs Office (PAO) approval at DTRA.

The period of performance for this effort will be from May 1 to June 30 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $60,000.00 is requested by 19 April. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Phase 1: Proposal Development & Initiation (Task 1)

Metabiota developed a project plan and implementation strategy that aligns with the narrative from Box 8. It is anticipated that the plan for TD-24 is considered a living document, and it is expected that revisions to the plan may be necessary following stakeholder meetings. During proposal development, Metabiota will use Program Manager (PM) and Project Coordinator (PC, billed as a Subject Matter Expert 1) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Metabiota assumes the following:

1. The PoP assigned to this project will allow enough time for PAO approval of the final video. However, if PAO approval extends beyond the project timeframe, Metabiota will work with AEP regional leadership and the COR to adjust the PoP or allow for final approval of the video outside of the project timeframe, as appropriate and within contractual compliance;
2. Production services required for this project will be complete within 3 weeks allowing enough time for PAO approval of the final video. Should services required extend past this timeframe, Metabiota will work with the CBEP CENTCOM regional leads (and COR, if necessary) to adjust the schedule accordingly;
3. Box 8 of TD-24 states that this project will be completed in accordance with section 4.3, Task 3, which refers to Qualified Trainers (QTs). Based on the requirements, Metabiota has replaced Qualified Trainers with Task 4- Subject Matter Experts. Metabiota assumes this will be acceptable in the execution of the project and engagement of SMEs for this effort.

Project Coordination (Task 1)

The Project team will be led by an experienced Program Manager (PM (b)(6) and supported by a highly effective Project Coordinator (PC) (b)(6) MPA, to cover Task 1 – Project Coordination. The selected for this project, because they implemented TD-07 the Middle East South Asia Epigenetics and Genomics of Infectious Disease Conference and have the historical knowledge to effectively and efficiently manage the requirements identified for TD-24. In addition, Metabiota will engage (b)(6) om Gryphon Scientific LLC to assist in narrative development as a SME under Task 4 (b)(6) s the PI and senior technical implementer on TD-07, working closely with (b)(6) (b)(6)

Note: The Metabiota PM confirms subcontractor knowledge of the contractual requirements prior to TD approval.

Phase 2: Preparation (Task 1)

Upon TD approval, the PM will establish routine communications with project team members and CBEP to initiate project implementation. The PM will hold a kick-off meeting within 5 days of approval, with participation from the AEP PMO, project team members and key CBEP stakeholders to review project requirements and ensure a mutual understanding of project goals and objectives is realized. The PM, with assistance from the PC, will identify and engage the videography firm required to execute production of the video. The PM will lead coordination and integration of the project team with CBEP stakeholders to develop the narrative and complete the film.

The project team will ensure that all necessary documentation required prior to initiating tasks is completed correctly and submitted on time, including CTR CLS Form (CDRL A016) and the Monthly Reports (CDRL A001). The project team will work closely with CBEP regional leads, A&AS support staff, and CLS to ensure that all logistics requirements are coordinated and implemented according to the project schedule and contractual

requirements. The Metabiota Travel Coordinator will coordinate with the project team to assist in the request of travel requirements supporting this effort and will ensure that travel arrangements are secured, immediately following approval by the COR, and in line with the project schedule and execution requirements.

Sub-Phase 2.1: Film Narrative Development and Adaptation (Tasks 1,4)

Metabiota will select and engage a videography firm to produce the film, following sourcing of an appropriate vendor for this engagement. The project team will engage the CBEP regional leads to ensure the technical requirements are clearly determined and will select a service provider at best cost to the government, meeting the requirements identified. Upon engagement of the videography firm, Metabiota will transfer the existing, unedited video footage and interviews collected during the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) from 7-8 March 2016 to the firm in order to produce the film. The unedited video footage, interviews, and photographs captured during this event will provide the raw material to effectively and relevantly document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. The Metabiota team will work directly with CBEP regional leads and the videography firm to determine the narrative and produce the film

Sub-Phase 2.2: Coordination for Material Shipment (Task 1)

Shipment of materials and final edited film, if deemed necessary, will be handled via CLS. The project team will deliver the final edited and PAO approved film utilizing the appropriate CLS forms (CDRL A0016 and associated forms) to the CBEP team for appropriate routing, adhering to contract timelines and deliverable schedule. The Metabiota team will work closely with CBEP, A&AS, and CLS staff members to coordinate and execute any logistical requirements, as needed.

Phase 3: Implementation (Tasks 1,4)

The Metabiota Project Team will develop and create a 2-5 minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) on March 7-8, 2016 in Amman, Jordan. The film will be produced in the English language and may include visual frames of speakers on stage, panning of audience, and snapshots of the discussion panels, poster session, and participants asking questions and engaging with speakers. The film may also include short interviews with conference organizers, Scientific Advisory Board members, speakers, presenters, and attendees concerning the importance, relevancy, and benefits of the conference, among other topics. The film will be produced utilizing the technical expertise of the film editors, Metabiota team, and CBEP regional leads to showcase the conference and highlight the scientific initiatives and engagements stemming from this event and CBEP efforts in the region. Suitable background music will be included, as well as sub-titles, if deemed necessary. Metabiota will ensure that the film is adjusted/edited according to guidelines received from CBEP, and other key stakeholders. CLS will be engaged to provide logistical support (CDRL A0016), should it be required for this effort. In addition, Metabiota will ensure PAO approval of the film, and will coordinate with the technical team to address any necessary changes prior to completion and final delivery of the product.

To support implementation efforts, the Metabiota PM will travel to Washington DC for meetings with CBEP regional leads and the project team to develop the narrative and review the video footage. The PM will participate in working sessions, brainstorming, and technical development of the film narrative during scheduled in person meetings to ensure execution of the narrative and completion of the project. In addition, the PM will meet with the videography firm to review performance and completion of tasks associated with this project.

Phase 4: Project Closeout (Task 1)

The project team will close out all activities associated with this project, to include final reporting, invoicing, and submission of all relevant CDRLs according to the outlined schedule. In addition, the project team will contribute to lessons learned conversations with CBEP detailing enhancements that could be made should this type of project be repeated, as necessary and requested by CBEP regional leads. Finally, unedited and edited film, and other relevant materials will be provided to CBEP.

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$36,810
1003	MATERIALS	$10,695
1004	ODCs	$0
1005	TRAVEL	$2,373
TOTAL		**$49,877.97**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES).

Labor

Costs for direct labor to support this activity is required for the following personnel:

Metabiota Program Manager (PM): The Metabiota PM will provide direct oversight of the planning and execution of the program, ensuring all objectives are met in accordance with the project SOW maintaining scope, budget, and timeline. The PM will ensure completion of CBEP goals in direct support of this activity and the CBEP mission throughout the lifecycle of the project, and will ensure project close out. To guarantee that all requirements are met, the PM will manage the SME 1 to ensure day-to-day activities for the project are completed on time, and to the quality required by CBEP. The PM will participate in routine conference calls and other forms of communication with CBEP regional leads and SMEs to ensure project execution. The PM will oversee the subcontractors on this effort, to include the services provided by the videography company in execution of the film. The PM will ensure all contract CDRLs are met and delivered according to the project timeline, and contract requirements.
LOE: 80 hours

Metabiota Project Coordinator: A SME 1 will act as a Project Coordinator (PC) throughout the planning, execution and close out of project objectives and activities. The PC will support the planning and execution of CBEP objectives towards the completion of project goals by participating in proposal development, stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to CBEP and other stakeholders. The PC will regularly communicate the project status with the PM. The PC will participate in routine project communications, to include leading regular coordination calls with the project team, CBEP, the videography company, and other key stakeholders.
LOE: 60 hours

SME 3: (b)(6) from Gryphon Scientific will be engaged to support technical development of the film narrative for this project. Having coordinated the MESA Epigenetics and Genomics of Infectious Diseases Conference with the Metabiota team, she is critical in ensuring the conference message is received and communicated through the fil (b)(6) will work directly with Metabiota and CBEP to develop the narrative, review the footage, and provide subject matter expertise to the team and the production services in development and execution of the film. Should edits or revisions be required following CBEP and PAO guideline (b)(6) ill participate in editing and refining the narrative to be delivered in the

final product. (b)(6) will be responsible for all monthly reporting and deliverables assigned to the Gryphon subcontract by Metabiota in execution of this project.
LOE: 80 hours

Reachback programmatic support to include finance, accounting, and contracts, will be provided as part of CLIN 1001 (FFP) and will not be separately invoiced.

Materials
Training Materials: Two (2) external hard drives will be procured to store the photos, raw video footage, and the final edited video.

Production Services: Metabiota will engage a videography firm to produce the short video for this effort. This will include identification of sound bites, completion of film transcripts, editing, and production of the video.

Metabiota will conduct market research and ensure the best price is secured, maintaining quality and technical requirements for all procurement of goods. Metabiota will coordinate directly with CLS for all shipping requirements, and will ensure cost management for all procured supplies, as necessary to complete the scope of this effort.

Subcontracts
The subcontract with Gryphon Scientific will be modified to include labor hours and materials required for implementation of this project. Costs are captured under the labor and materials budgets.

Travel
Travel costs will be cost reimbursable and provide best cost to the government following JTR regulations. Travel is requested for the PM to meet with the project team, Gryphon SME, CBEP, the videography company, and other key stakeholders to support the execution of Phase 3, and ensure development of the film narrative and completion of the project. The PM will travel to Washington DC to take part in in person meetings, brainstorming activities, narrative development and review of film footage and sound bites developed by the videography company supporting this project.

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to develop a Film Narrative of Epigenetics and Genomics of Infectious Diseases in the Middle East, South Asia and CBEP collaborations in the CENTOM Region in accordance with SOW section 4.3, Task 3.

Metabiota shall develop a 2-5-minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, which was held at the Royal Scientific Society (RSS) on March 7-8, 2016 in Amman, Jordan. The visual narrative (2-5 minutes) objectives are to document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. Metabiota shall develop the specific script in coordination with CBEP CENTCOM regional managers. The footage and interviews that Metabiota has from the conference can be utilized for the visual narrative. The visual narrative should be completed by June 30 2016. Total costs for the narrative shall not exceed $60,000.

Deliverables:

- A short film narrative of 2-5 minutes on 3 DVDs. Final film must go through Public Affairs Office (PAO) approval at DTRA.

The period of performance for this effort will be from May 1 to June 30 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $60,000.00 is requested by 19 April. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Phase 1: Proposal Development & Initiation (Task 1)

Metabiota developed a project plan and implementation strategy that aligns with the narrative from Box 8. It is anticipated that the plan for TD-24 is considered a living document, and it is expected that revisions to the plan may be necessary following stakeholder meetings. During proposal development, Metabiota will use Program Manager (PM) and Project Coordinator (PC, billed as a Subject Matter Expert 1) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Metabiota assumes the following:

1. The PoP assigned to this project will allow enough time for PAO approval of the final video. However, if PAO approval extends beyond the project timeframe, Metabiota will work with AEP regional leadership and the COR to adjust the PoP or allow for final approval of the video outside of the project timeframe, as appropriate and within contractual compliance;
2. Production services required for this project will be complete within 3 weeks allowing enough time for PAO approval of the final video. Should services required extend past this timeframe, Metabiota will work with the CBEP CENTCOM regional leads (and COR, if necessary) to adjust the schedule accordingly;
3. Box 8 of TD-24 states that this project will be completed in accordance with section 4.3, Task 3, which refers to Qualified Trainers (QTs). Based on the requirements, Metabiota has replaced Qualified Trainers with Task 4- Subject Matter Experts. Metabiota assumes this will be acceptable in the execution of the project and engagement of SMEs for this effort.

Project Coordination (Task 1)

The Project team will be led by an experienced Program Manager (PM) (b)(6) and supported by a highly effective Project Coordinator (PC) (b)(6) to cover Task 1 – Project Coordination. The PM and PC were selected for this project, because they implemented TD-07 the Middle East South Asia Epigenetics and Genomics of Infectious Disease Conference and have the historical knowledge to effectively and efficiently manage the requirements identified for TD-24. In addition, Metabiota will engage (b)(6) Gryphon Scientific LLC to assist in narrative development as a SME under Task (b)(6) was the PI and senior technical implementer on TD-07, working closely with (b)(6) (b)(6)

Note: The Metabiota PM confirms subcontractor knowledge of the contractual requirements prior to TD approval.

Phase 2: Preparation (Task 1)

Upon TD approval, the PM will establish routine communications with project team members and CBEP to initiate project implementation. The PM will hold a kick-off meeting within 5 days of approval, with participation from the AEP PMO, project team members and key CBEP stakeholders to review project requirements and ensure a mutual understanding of project goals and objectives is realized. The PM, with assistance from the PC, will identify and engage the videography firm required to execute production of the video. The PM will lead coordination and integration of the project team with CBEP stakeholders to develop the narrative and complete the film.

The project team will ensure that all necessary documentation required prior to initiating tasks is completed correctly and submitted on time, including CTR CLS Form (CDRL A016) and the Monthly Reports (CDRL A001). The project team will work closely with CBEP regional leads, A&AS support staff, and CLS to ensure that all logistics requirements are coordinated and implemented according to the project schedule and contractual

requirements. The Metabiota Travel Coordinator will coordinate with the project team to assist in the request of travel requirements supporting this effort and will ensure that travel arrangements are secured, immediately following approval by the COR, and in line with the project schedule and execution requirements.

Sub-Phase 2.1: Film Narrative Development and Adaptation (Tasks 1,4)

Metabiota will select and engage a videography firm to produce the film, following sourcing of an appropriate vendor for this engagement. The project team will engage the CBEP regional leads to ensure the technical requirements are clearly determined and will select a service provider at best cost to the government, meeting the requirements identified. Upon engagement of the videography firm, Metabiota will transfer the existing, unedited video footage and interviews collected during the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) from 7-8 March 2016 to the firm in order to produce the film. The unedited video footage, interviews, and photographs captured during this event will provide the raw material to effectively and relevantly document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. The Metabiota team will work directly with CBEP regional leads and the videography firm to determine the narrative and produce the film.

Sub-Phase 2.2: Coordination for Material Shipment (Task 1)

Shipment of materials and final edited film, if deemed necessary, will be handled via CLS. The project team will deliver the final edited and PAO approved film utilizing the appropriate CLS forms (CDRL A0016 and associated forms) to the CBEP team for appropriate routing, adhering to contract timelines and deliverable schedule. The Metabiota team will work closely with CBEP, A&AS, and CLS staff members to coordinate and execute any logistical requirements, as needed.

Phase 3: Implementation (Tasks 1,4)

The Metabiota Project Team will develop and create a 2-5 minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) on March 7-8, 2016 in Amman, Jordan. The film will be produced in the English language and may include visual frames of speakers on stage, panning of audience, and snapshots of the discussion panels, poster session, and participants asking questions and engaging with speakers. The film may also include short interviews with conference organizers, Scientific Advisory Board members, speakers, presenters, and attendees concerning the importance, relevancy, and benefits of the conference, among other topics. The film will be produced utilizing the technical expertise of the film editors, Metabiota team, and CBEP regional leads to showcase the conference and highlight the scientific initiatives and engagements stemming from this event and CBEP efforts in the region. Suitable background music will be included, as well as sub-titles, if deemed necessary. Metabiota will ensure that the film is adjusted/edited according to guidelines received from CBEP, and other key stakeholders. CLS will be engaged to provide logistical support (CDRL A0016), should it be required for this effort. In addition, Metabiota will ensure PAO approval of the film, and will coordinate with the technical team to address any necessary changes prior to completion and final delivery of the product.

To support implementation efforts, the Metabiota PM will travel to Washington DC for meetings with CBEP regional leads and the project team to develop the narrative and review the video footage. The PM will participate in working sessions, brainstorming, and technical development of the film narrative during scheduled in person meetings to ensure execution of the narrative and completion of the project. In addition, the PM will meet with the videography firm to review performance and completion of tasks associated with this project.

Phase 4: Project Closeout (Task 1)

The project team will close out all activities associated with this project, to include final reporting, invoicing, and submission of all relevant CDRLs according to the outlined schedule. In addition, the project team will contribute to lessons learned conversations with CBEP detailing enhancements that could be made should this type of project be repeated, as necessary and requested by CBEP regional leads. Finally, unedited and edited film, and other relevant materials will be provided to CBEP.

Subject: RE: Metabiota AEP TD 009 NHLS BS&S Training South Africa
Date: Thursday, September 03, 2015 8:37:59 AM

H(b)(6)

Metabiota's proposal submitted on 02 September 2015 in support of Technical Directive 009 is hereby approved for implementation with a ceiling price of $335,608.

The Contractor should use its best efforts to perform the work specified in the Technical Directive within the estimated ceiling price. The Contractor should notify the Contracting Officer in writing whenever it has reason to believe that that costs for this Technical Directive are expected to go over the established ceiling price.

Cheers

(b)(6) and all concerned,

Apologies on the delay on getting this in, and the fact that it is not in the new format - this was 99% done when we received the new format, and rather than delay again, we felt it best to submit this.

Please let us know if there are any additional questions regarding this proposal.

Subject: RE: Metabiota AEP Budget and Technical Proposal for TD 014 Kenya Writing Workshop
Date: Friday, September 25, 2015 12:20:15 PM
Attachments: Approved_TD-14RevA_KE_Writing Workshop_16Sep2015.pdf

H(b)(6)

Please find attached, the approved TD-014RevA with ceiling price of $113,983 and a PoP of 9/25/2015-2/15/2016. Every effort should be made to perform the work specified in the Technical Directive within the estimated ceiling price. Metabiota should notify the Contracting Officer in writing whenever it has reason to believe the costs for this Technical Directive are expected to exceed the established ceiling price.

Cheers,
(b)(6)

(b)(6)

Please find our revised proposal for TD-014, which addresses the questions outlined below.

Please let me know if any additional information/clarification is required.

Best regards,
(b)(6)

TECHNICAL DIRECTIVE (TD)

1. CONTRACT NUMBER	2. CONTRACTOR	3a.TD NUMBER	3b.REV
HDTRA1 -14-c-0104	METABIOTA	14	A

4. TD TITLE	5. TOTAL TD ESTIMATE:
Development of a writing workshop to mentor selected participants of the One Health Zoonotic Diseases Workshop held in Kenya on March 2015.	HOURS: 394 DOLLARS: $ **$100,000.00**

6. CONTRACING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME (b)(6)	NAME (b)(6)
PHONE (b)(6) EMAIL (b)(6)	PHON EMAIL: (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE)

This revision to TD-14 provides additional guidance & clarification of the requirement to assist Metabiota in establishing a proposed implementation approach and budget for the period of performance. During the PoP, Metabiota is expected to:

a. Identify organizers of the Regional Conference on Zoonotic Diseases in Eastern Africa and collaborate with them to hold a 6-day writing workshop (not including venue, food, and travel logistics as this will be coordinated via CLS) for 20 participants. Metabiota should provide a PM and a SME1 for Project Coordination and Landscape Analysis. The hours required for this phase should not exceed 6 hours/week for two weeks each for the PM and SME1. Metabiota should reach out directly to (b)(6) the main POC of the One Health Workshop, to discuss [illegible] ed. Communication with Dr. Njenga should also include the discussion of the participants list, as the conference organizers have already identified them and will provide the names and draft manuscripts to Metabiota.

b. Coordinate with Kenyan collaborators to jointly identify no more than 2 Kenyan SMEs to participate in the writing workshop as well as pre- and post-workshop activities. For the first phase of Project Coordination and Landscape Analysis, the two Kenyan SMEs should also each not exceed 6 hours/week for two weeks. The writing coaches will provide mentorship to the participants and will help them convert their scientific data into a complete draft manuscript for a research paper to be submitted to a peer-review science journal. One manuscript will be developed per workshop participant. Metabiota will assist in the development of up to 20 papers/manuscripts. Additional communications regarding the SME assignments should occur during the activities described in a. and should be part of the not to exceed 6 hours/week.

c. Hypothesis Development and Article Framing- CBEP's expectation is that this workshop will provide the participants with the right skills and guidance to take their manuscripts to the next level, with the goal that that next level will be good enough for acceptance to a peer-reviewed journal. The SMEs will not need to contact the participants before the workshop due to the coordination through the Kenyan POCs and SMEs. Metabiota's SMEs (one from Metabiota and two Kenyans to be identified) will review the participants' manuscripts prior to the workshop. Each SME should not spend more than 20 hours total to complete the review and assessment of the manuscripts prior to the workshop as well as conduct any additional coordination among the SMEs. The SMEs will work together to determine if/how the manuscripts will be divided up as each SME may not need to conduct a detailed review of each manuscript. There may be additional SMEs identified for participation in all workshop activities (including pre- and post- workshop activities) by the Kenyan stakeholders but their time will not be funded by Metabiota. This should be discussed with the Kenyan POC noted above. PM oversight of the SME's review and coordination activities should not exceed 5 hours total.

d. Writing Workshop Implementation- The workshop outline should be as follows: 1) the main workshop will consist of 5 days (Monday-Friday) where the SME's will work together with the participants, 2) 1 day after the workshop for the SME's to finalize the review of the manuscripts, and 3) the travel days needed to travel between the U.S. and Kenya. PM participation during the workshop is acceptable. However, oversight should not necessitate as many hours as the SMEs efforts during the workshop, therefore Metabiota should propose PM hours planned to be spent only on this project, or provide sufficient clarification regarding PM tasks during the 6 working days to justify a full-time workload. The labor hours for each SME should not exceed 72 hours. PM hours are estimated at no more than 4 hours per day.

e. Paper Finalization and Publication Submission- CBEP and Metabiota will not be supporting or overseeing the submission of these manuscripts; for that reason, activities related to this should not be included in the proposed approach.

f. Post-workshop efforts- Post-workshop efforts will include the three SMEs (2 Kenyans and 1 Metabiota SME that participated in the workshop) spending no more than 20 hours each over 2-4 weeks to continue coordination with each other and potentially other SMEs (not funded via Metabiota) as well as finalize any needed review or revision of the manuscripts with the workshop participants. This may need to be divided between SMEs to stay within the 20 hour maximum. PM oversight of the SME's final review and coordination activities should not exceed 5 hours total.

g. For Materials and Supplies: CBEP expects participants to have relevant papers they have used in the past (to develop draft manuscripts papers and the presentations given at the One Health Conference). However, limited access to journals should be provided by Metabiota. The access per participant should be no more than 10 articles per person. This is an average and downloads should be managed by the PM and/or SMEs. A total number of 200 papers is authorized however this is the maximum which does not need to be met and should be used as needed per participant, not necessarily divided evenly if some participants do not require additional resources.

The period of performance for this effort will be from 18 September 2015 to 15 February 2016; however, CBEP anticipates the total time required to implement the requirement to be 20 weeks, including 2 weeks for Phase 1 (planning and SME identification), 3 weeks for Phase 2 (manuscript review and SME coordination), 1 week for Phase 3 (executing the workshop), and 4 weeks for Phase 4 (post-workshop coordination and manuscript review). Your technical approach, proposed budget, and basis of estimate for implementing this requirement is requested by 16 Sep 2016. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Technical Approach
Metabiota will use a phased technical approach to manage all tasks required for successful implementation of the project phases and to provide overall feedback and reporting on the proceedings outlining the accomplishment of objectives. The following phases are required for this project:

Phase 1: Programmatic Coordination and Training Landscape Review
Phase 2: SME Review and Coordination
Phase 3: Writing Workshop Implementation
Phase 4: Post-workshop review and Summary Report Development

Phase 1 – Programmatic Coordination and Landscape Analysis (16 Sep - 24-Sep. 30, 2015)

Objective: Establish a communication and coordination plan with the Kenyan Zoonotic Disease Unit (ZDU), Global Implementation Solutions (GIS), and Conference to initiate collaboration and conduct a landscape review of technical writing capacities and needs in the One Health sector in Kenya.

Process: Metabiota, with direction from DTRA CBEP, will engage (b)(6) the main POC from the Regional Conference on Zoonotic Diseases in Eastern Africa, an event that took place in Naivasha, Kenya, March 2015. Through this collaboration, Metabiota will develop an understanding of Kenya's technical writing capacities and needs in the One Health sector. Metabiota will receive the list of selected writing workshop participants from (b)(6) Metabiota will also receive recommendation from (b)(6) for two mutually agreed upon Kenya based SME 3 technical writing experts to be brought on as independent contractors for this effort.

Deliverables:

- Deliverable 1: Submission of contacts list to include Writing Workshop participants and Kenyan SME III technical writing experts

Phase 2 – Pre-Workshop Participant Manuscript Review (Nov. 2, 2015-Jan. 29, 2016)

Objective: Selected participants set to attend the Writing Workshop will provide draft manuscripts for review by subject matter experts prior to their attendance. Technical writing SMEs will be able to gain a specific and in-depth understanding of the content they can expect during the writing workshop before attending.

Process: Metabiota, in coordination with DTRA-CBEP and (b)(6) will request that the selected participants produce draft manuscripts for review by the identified technical writing SMEs. Each SME will spend a defined number of hours reviewing the materials, and gaining a more defined understanding of the participants' approach. The SMEs will not be in contact with the participants during this phase, but will communicate among themselves with the assistance of the program manager to ensure that manuscripts to be reviewed are divided up appropriately among the team.

Deliverables:

- Deliverable 1: Submission of participants' draft manuscripts to include hypotheses, writing concepts and an approach plan, along with statements of accessible, supporting data.

Phase 3– Writing Workshop Implementation (Feb. 8-13, 2016)

Objective: Conduct a six-day workshop on various aspects of technical writing in order to train and mentor twenty participants representing the Kenyan One Health research sector.

Process: Metabiota will coordinate with the SME mentors and participants to conduct the six-day training in Kenya. This training will include a five days of lecture and working group sessions to cover topics including but not limited to scientific paper formatting, styling, and general requirements; the ethics of journal publication and authorship; the inclusion of background research and citing references, and understanding the impact factor and journal submission organizational techniques. Each participant will have access to the coaches, and be able to work directly with the SMEs on their material. The sixth and final day will allow for collaboration between the SMEs to finalize the review of manuscripts before departing.

Deliverables:

- Deliverable 1: Submission of the Training Trip Report and After-Action Report detailing the overall training processes and lessons learned and the results of knowledge gained assessments.

Phase 4 – Post-Workshop Review and Summary Report Development (Feb. 14-29, 2016)

Objective: Develop final report and provide final manuscript review and post-workshop support to participants as needed.

Process: Metabiota will work jointly with the SME mentors and participants to provide technical and programmatic support during the post-workshop phase. SMEs will coordinate with each other to ensure that no effort goes wasted and that manuscript reviews are comprehensive and supportive of the intended skill enhancement of the writers. SMEs will be able to communicate with participants during this period. Once complete, Metabiota will develop a final report detailing the overall processes and lessons learned.

Deliverables:

- Deliverable 1: Final report detailing overall processes and lessons learned

Risk Management:

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
Cost						

Subject Matter Expert Subcontracting	Due to limited insight into participant profiles and research activities, additional costs and time-delays may occur to identify and coordinate the most appropriate SME coordination, which may impact the ability to conduct this activity in full.	3	3	Medium	As soon as Metabiota has a basic understanding of the participants' work, Metabiota will begin contacting necessary SMEs, refining the list as better understanding develops. Metabiota will attempt to reach basic agreement with SMEs as soon as possible and issue authorization to proceed while subcontracts are being put into place.
Programmatic labor hours	Following guidance from CBEP POC's, the current budget for Metabiota Program Management and Project Coordination hours are extremely low. As a result, and based on previous experience implementing overseas activities, there is significant risk for budget overrun.	5	5	(b)(4); (b)(6)	Maximize efficiency regarding approved labor hours through best practice, and notification to DTRA CBEP contracting officer of expectations to run over budget.
				Schedule	
Project Coordination	Kenya One Health Technical Writing Workshop involves a significant number of stakeholders and participants representing various organizations, putting implementation activities at risk of delay or cancellation.	5	2	Medium	Establish and hold regular calls with all stakeholders and identify multiple possible implementation dates. Identify critical components as early as possible and redirect efforts when it becomes clear that targeted implementation dates will not be achievable.
				Performance	
Political Instability	Sporadic violence in northeastern Kenya may lead to risks of being unable to safely complete in-country work	2	5	Medium	Coordinate closely with DTRA and AFRICOM to be aware of any potential risks to performers, and target a location for the workshop well away from risky areas.

(b)(4); (b)(6)

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$85,141
1003	MATERIALS	$7,880
1004	ODCs	$3,542
1005	TRAVEL	$17,420
TOTAL		**$113,983**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES):

Period of Performance

The Period of Performance for this effort is July 21, 2015 to February 29, 2016.

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As some of our Subject Matter Experts will be independent consultants the Metabiota PM will additionally oversee and ensure that all project personnel adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PM will provide management oversight of the project team, including independent consultants throughout the span of the project.

The Metabiota PM will oversee the coordination between the Kenyan stakeholders and the workshop planning team, and will ensure the project team captures and keeps in account stakeholder input regarding key information relevant to the planning of the workshop. The PM will travel to Kenya to

ensure the execution of the workshop proceeds smoothly and will provide oversight over all independent consultants. Lastly, the PM will provide oversight to ensure all required project closeout activities occur in a timely fashion.

Proposal Development - Phase 1:

Metabiota Subject Matter Expert I: The Metabiota SME I will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipat ng, managing, and communicating projects risks and recommended mitigation strategies to the funder.

Phase 2-4:

Subject Matter Expert III (2 total): We expect to identify two Kenya based SME III personnel with the support in large part from (b)(6) These SMEs will be fully qualified scientific experts with experience publishing in peer-reviewed journals. These SMEs will not require international travel, but will be compensated for domestic travel, and will be brought on as independent contractors to Metabiota.

The SMEs IIIs will each be assigned to work on reviewing manuscripts of the Writing workshop participants during phase 2. They will be tasked with workshop participation during phase 3, and final review during phase 4. These SMEs will be required to review relevant participant manuscripts closely during phase 2. This will require fully understanding the research that has been done, including a significant dive into the data collection and analysis that may have already been done to ensure that they utilize their time effectively during phase 3. During the workshop, SMEs will provide a mix of lectures discussing topics relevant to the authoring, editing, and publishing of scientific research, small group work reflecting those lectures, and one-on-one time with each of their assigned participants. Following the workshop, SMEs will provide follow-on mentoring to participants as they incorporate the lessons learned into the final drafts of their manuscript reviews and relevant reports during phase 4

Subject Matter Expert I (1 total): We expect to identify one US based Metabiota representative to serve as an SME I technical writer. This SME will be a fully qualified scientific expert with experience publishing in peer-reviewed journals.

The SME I will each be assigned to work on reviewing manuscripts of the Writing Workshop participants during phase 2 in concert with the SME 3s to avoid duplication of efforts. They will be tasked with workshop participation during phase 3, and final review during phase 4. This SME will be required to review relevant participant manuscripts closely during phase 2. This will require fully understanding the research that has been done, including a significant dive into the data collection and analysis that may have already been done to ensure that they utilize their time effectively during phase 3. During the workshop, SMEs will provide a mix of lectures discussing topics relevant to the authoring, editing, and publishing of scientific research, small group work reflecting those lectures, and one-on-one time with each of their assigned participants. Following the workshop, This SME will provide follow-on mentoring to participants as they incorporate the lessons learned into the final drafts of their manuscript reviews and relevant reports during phase 4.

Additional costs for direct labor supporting the AEP Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

Materials
We have budgeted for the possibility that we may need to provide access to scientific journal articles to the workshop participants while they are working on their manuscripts. Our estimate provides an average of 10 articles per participant at an estimated access price of $35 per article. It may well be the case that some of the Writing Workshop participants do not require the use of this many articles on average; in which case costs will not be incurred. Participants must have expressed support from an involved SME to facilitate the purchase of any scientific article. The budget for journal access may only be partially utilized.

We have also budgeted for a small quantity of office supplies to accommodate the printing of agendas, training materials, or workshop materials needed to successfully execute and support in-country project activities.

Lastly, we have budgeted for international communications ability for our project team while they are in country implementing the workshop. The costs budgeted here reflect activating a moderate calling plan for each traveler's cell phones. These charges also reflect the provision of USB modems and associated moderate data plans to both the travelers and in country SME IIIs. These items will only be purchased if the situation dictates the need (i.e. inability to access online communications outright), otherwise, these modems will not be procured.

Other Direct Costs
Per contract guidelines DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts
Subcontracts will be issued to SMEs, RDAs, and/or their home organizations as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel
Travel is requested to support the program manager 1 subject matter expert to Nairobi, Kenya to implement the writing workshop. The travel budget represents the estimated amount required; travel on the AEP contract is cost reimbursable.

Our travel budget assumes the workshop will be held on 6 consecutive days, with an additional day budgeted for set-up and coordination activities. If, through discussion with the Kenyan stakeholders, an alternative schedule is created or an alterative location is desired, travel costs may be impacted accordingly.

Kenyan SME III contractors will be provided with hotel, and per diem respective of their length of participation on this effort. Their cost for arriving to the venue will be covered independently; however, daily transport costs will be shared among the workshop team as a whole.

10. FUNDING AUTHORIZED THIS TD REV:

CLIN	COST CODE		COST	POP START	POP END
1002	LABOR	$	85,141	9/25/2015	2/15/2016

Subject: Re: Metabiota AEP Budget and Technical Proposal for TD 014 Kenya Writing Workshop

H(b)(6)

Two minor clarifications requested, based on CBEP review:

1. Please clarify the accuracy & rationale for 20 scratch cards for cell phone minutes for travelers while in Kenya. If this number is correct, then why 20, and whom are the cards for?

2. Please confirm that final manuscripts (in addition to the pre-workshop manuscripts), following the writing workshop and post-workshop follow-up & mentorship will be provided to CBEP as a means to evaluate the effectiveness of the workshop.

Cheers.

Please find attached our revised proposal for TD-014, which incorporates the changes outlined below.

I have included a signed PDF version, as well as a Word version, which has the embedded budget file. Also, please find two supplemental files
attached:

1. Comments Tracker, which captures our responses to the questions below; 2. Procurement Document, which provides supporting documentation for our materials costs.

Please let me know if you have any additional questions.

Best regards,

(b)(6)

On 9/14/15, 11:21 AM, (b)(6)

(b)(6)

H(b)(6)

Please find attached, revised technical direction for TD 14 (Kenya Writing Workshop). Additionally, below is feedback from the CBEP team on the proposal submitted in response to the original TD-14. Hopefully, the attached and below will provide additional necessary clarity on the expectations for implementing this requirement.

Comments:
1. For Phase 1-Project Coordination and Landscape Analysis: Metabiota proposed a PM (47 hours or approx. 16 hours/week) and a SME1 (42 hours or approx. 14 hours/week) for the coordination with relevant Kenyan stakeholders and the development and submission of a training landscape review. The PM will oversee the coordination whereas the SME1 will lead the coordination with relevant stakeholders and the development and submission of the training landscape review. The hours are proposed to be spread out among 3 weeks. The overall amount of maximum hours dedicated to this activity is excessive for the activities proposed, as this phase will comprise mostly phone calls and email coordination with Kenyan stakeholders to discuss the workshop and plans for preparation. Metabiota should adjust the hours required for this phase to not exceed 6 hours/week for two weeks

each for the PM and the SME1, and adjust the timeline proposed to complete these activities. Metabiota should reach out directly t(b)(6)
<mailto(b)(6) the main POC of the One Health Workshop, to discuss what the vision for the implementation of the workshop is and to identify 2 Kenyan SME3s and 1 SME1 from Metabiota to participate in the writing workshop. Communication with (b)(6) should also include the discussion of the participants list, as the conference organizers have already identified them and will provide the names and draft manuscripts to Metabiota.

2. For Phase 2 -Participant Identification and SME Matching: Metabiota proposed a PM (94 hours or approximately 13.4 hours/week for 7 weeks), a
SME1 (105 hours or 15 hours/week for 7 weeks) and a SME3 (101 hours or approximately 14.4 hours/week for 7 weeks). The conference organizers have already selected the 20 participants; therefore Metabiota should remove this phase from the proposal. Additional communications regarding the SME assignments should occur during Phase 1 and should be part of the not to exceed 6 hours/week. The hours allocated to this phase should be removed from the proposal. Total hours to be removed: 300 hours.

3. For Phase 3 -Hypothesis Development and Article Framing: Metabiota proposes a PM (109 hours or 8.4 hours/week for 13 weeks; 1 SME1 (218 hours or approx. 17 hours/week for 13 weeks), 2 SME2s (103 hours each or approx. 8 hours/week), 3 SME3s (103 hours each or approx. 8 hours/week for 13 weeks), and 5 RDAs (140 hours each or approx. 11 hours/week for 13 weeks). CBEP expectation is to provide the participants with the right skills to take their manuscripts to the next level, with the goal that that next level will be good enough for acceptance to a peer-reviewed journal. It is for that reason that these efforts were not requested in the letter of technical direction. The SMEs will not need to contact the participants before the workshop due to the coordination through the Kenyan POCs and SMEs. Metabiota's SMEs (one from Metabiota and two Kenyans to be identified) will review the participants' manuscripts prior to the workshop. Each SME should not spend more than 20 hours total to complete the review and assessment of the manuscripts prior to the workshop as well as conduct any additional coordination among the SMEs.
The SMEs will work together to determine if/how the manuscripts will be divided up as each SME may not need to conduct a detailed review of each manuscript. There may be additional SMEs identified for participation in all workshop activities (including pre- and post- workshop activities) by the Kenyan stakeholders but their time will not be funded by Metabiota.
PM oversight of the SME's review and coordination activities should not exceed 5 hours total.

4. For Phase 4-Writing Workshop Implementation: Metabiota proposed a PM
(72 hours), 1 SME1 (72 hours), 2 SME2s (72 hours each), and 3 SME3's (72 hours each). The TD specified Metabiota to develop a six day workshop but the dates proposed go beyond six days (Feb 1-14, 2016). The dates should be revised to reflect the following workshop outline: 1) the main workshop will consist of 5 days (Monday-Friday) where the SME's will work together with the participants, 2) 1 day after the workshop for the SME's to finalize the review of the manuscripts, and 3) the travel days needed to travel between the U.S. in Kenya. PM participation during the workshop is acceptable; however it is not clear what the PM will do full time during the workshop. Oversight should not necessitate as many hours as the SMEs efforts during the workshop, therefore Metabiota should reduce the number of PM hours to reflect those hours spend only on this project, or provide additional clarification regarding PM tasks during the 6 working days to justify a full-time workload. The labor hours for each SME should not exceed 72 hours.

5. For Phase 5- Paper Finalization and Publication Submission: Metabiota proposed a PM (49 hours or 5.4 hours/week for 9 weeks), 1 SME1 (97 hours or 11 hours/week for 9 weeks), 2 SME2's (72 hours each or 8 hours/week for 9 weeks), 3 SME3's (72 hours each or 8 hours/week for 9 weeks) and 5 RDA's (136 hours each). As stated in the TD, CBEP will not be supporting or overseeing the submission of these manuscripts; for that reason, this phase should be removed from the proposal. Post-workshop activities will be captured below in proposed Phase 6.

6. For Phase 6 -Post-submission Assistance and Summary Report
Development: Metabiota proposed a PM (10 hours), a SME1/Project Coordinator (10 hours), 2 SME2's (20 hours

each), and 3 SME3's (20 hours each). As stated in the TD, CBEP will not be overseeing the submission or the post-submission process for the participants thus this phase is not necessary and should be removed from the proposal. Post-workshop efforts will include the three SMEs spending no more than 20 hours each over 2-4 weeks to continue coordination with each other and potentially other SMEs (not funded via Metabiota) as well finalize any needed review or revision of the manuscripts with the workshop participants. Again, this may need to be divided between SMEs to stay within the 20 hour maximum. PM oversight of the SME's final review and coordination activities should not exceed 5 hours total.

7. For Materials and Supplies: Metabiota proposed the access of scientific articles from online journals. Metabiota proposed that each of the 20 participants will need access to 20 articles at a cost of $35 per article for a total cost of $14,000. CBEP agrees that the access to journals will be necessary but the maximum number of articles per participant proposed is excessive. CBEP expects participants to have relevant papers they have used in the past (to develop draft manuscripts papers and the presentations given at the One Health Conference).
Therefore, it seems more appropriate to lower the access per participant to no more than 10 articles per person. This is an average and downloads should be managed by the SMEs. A total number of 200 papers is authorized however this is the maximum, which does not need to be met, and should be used as needed per participant, not necessarily divided evenly if some participants do not require additional resources. This section should be revised to reflect this vision.

8. For Travel: Metabiota proposes a $43 service fee per traveler; it is unclear what this expense covers, and CBEP generally does not consider "service fee" an allowable expense. More information is needed to justify this fee.

9. For Communication: Metabiota proposes costs for international calling and data plans for each traveler at a cost of $300/person for a total cost of $2,100. More information is needed regarding the type of data plan to be purchased and the options that are available (e.g. quotes) for different plans available for a single 1-week trip to determine if these expenses are reasonable and appropriate. More justification is needed regarding the need for every single person to have a full plan (calling and data plan) including the proposed use (CBEP will only support the use of the mobile phones for activities directly related to the workshop, not other business).

Cheers,

(b)(6)

Subject: HDTRA1-14-C-0104 Technical Direction for the Implementation of an Epigenetics and Genomics of Infectious Diseases Workshop in the Middle East South Asia Region.

Dear (b)(6)

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to administer a two-day workshop in the Spring of 2016 on Epigenetics and Genomics of Infectious Diseases in the Middle East South Asia Region in accordance with SOW Section 4.3, Task 5. The workshop will include plenary talks, topic-focused sessions, poster sessions, and training sessions. The plenary talks will highlight recent advances in epigenetics, genetics, and the technologies and skills needed to study epigenetics. The topic-focused sessions will provide opportunities for participants to learn about specific areas of research, such as epigenetic regulation of host immune system genes by bacterial toxins. The poster sessions will allow scientists to identify prospective partners for research cooperation. Finally, the training sessions will describe processes of initiating and maintaining international scientific collaboration, grant writing, and risk analysis. A proposal and estimated budget not to exceed $488,040 for implementing this requirement is requested by 07 August 15.

Nothing in this letter shall constitute a contractual direction or affect the current negotiated cost, price or schedule contained in the contract. If the contractor believes there is an impact, the contractor must disregard that portion of the communication and immediately contact the contracting officer for direction.

Metabiota shall proceed with all coordination necessary to implement this task and communicate as needed with DTRA CBEP Points of Contacts listed below.

Subject: RE: Metabiota AEP TD013 Continuation of CHe Health Epi Training Uganda
Date: Friday, July 24, 2015 12:58:02 PM

(b)(6)

The Government is requesting that Metabiota provide a revised Technical proposal and ROM for TD-013. In general, CBEP concurs that some of the proposal elements submitted by Metabiota are technically necessary and appropriate for continued implementation of existing requirements during the Option Period. However, clarification and justification is necessary before activities can continue to ensure transparency and programmatic responsibility. Please ensure that Metabiota's revised proposal addresses the following questions:

1. Metabiota proposed a Period of Performance (PoP) from May 15- Dec. 31, 2015 and activities were to begin June 1. Can Metabiota clarify the number of hours associated with activities and costs incurred prior to proposal submission on July 6?

2. According to the labor matrix in the cost estimate, Metabiota is proposing labor hours for Program Manager, Trainer I, II, and III; SME I and III; and a Research and Data Analyst. However, in the Labor section of the technical proposal, Metabiota did not to provide a technical description of Trainer II, as well as SME I&II. In addition, the proposal provides a technical description of Scientific Mentor, but no labor hours are associated with this position in the cost estimate. Can Metabiota clarify each labor category required and ensure that it adequately aligns with the labor matrix in the cost estimate?

3. Metabiota is proposing 960 hours for the four in country trainers at a billable rate of $126.43. According to the latest memo from the US Embassy Kampala, in-country, Ministry of Health trainers are not to receive salary supplements. Therefore, CBEP requests clarification/justification for these labor hours.

4. The labor matrix includes labor hours for proposal development. Generally, proposal development hours are embedded in PMO/overhead costs and not included in the proposal. If CBEP decides not to move forward with the activity, does that mean the program still incurs the cost of proposal development? Please clarify.

5. The Labor Estimate page breaks down the cost and total hours for each labor category and whether or not they are FTEs. However, it does not mention how many FTEs or otherwise will support individual activities under each category. CBEP suggests an additional column to include quantities, where applicable.

6. Metabiota proposed and provided a technical description for a Program Manager. However, in the Labor Matrix, labor hour were included for three Program Managers. CBEP believes this is unreasonable and seeks clarification and justification for the need to include labor hours for three program managers.

7. In the travel estimate cost, Metabiota proposed ground transportation costs for (b)(6) separate from that of (b)(6) Can Metabiota clarify the need to include separate ground transportation costs to and from the trainings if the individuals will be attending the same training?

8. In the Component 1 section, under 'process' Metabiota proposed 4 trainings total with 3 trainers, however, in previous and later sections of the proposal, 4 individual trainers are listed. Can Metabiota provide clarification as to how many trainers will support this activity?

9. In the Component 1 section of the proposal, under 'process,' it is proposed that "Metabiota will coordinate with local partners to disseminate timely and accurate correspondences and Letters of Invitation (LOI) to all participants and trainers." CBEP understands this to be an activity supported by CDC. Can Metabiota better explain its role in this activity with CDC?

10. In the 'deliverables' section of Component 1, numbers 1, 2 & 3 are specific Project Management activities, not tangible deliverables. Can Metabiota clarify if there are deliverables to be associated with these activities?

11. Deliverable #1 under Component 2 is contradictory to Deliverable #4 in Component 1. If all final training related documentation is to be submitted during Component 1, what specific documentation will be developed during Component 2?

12. Deliverable #2 of Component 3 is redundant to Deliverable # 2 of Component 2. Can Metabiota explain how the After Action Report and the Training Trip Report will differ?

13. In the Execution section of the Management Approach, under 'project administration,' Metabiota proposed that "routine calls and communication will be held with DTRA CBEP regional leadership and Metabiota to provide status updates and ensure project implementation expectations are met." Can Metabiota explain when these calls will occur and how often?

Thank you.

Subject: Re: Metabiota's Budget and Technical Proposal for TD 008 Clinician Training Uganda
Date: Friday, July 10, 2015 5:47:04 PM
Attachments: Travel Costs Uganda Clinician Training Projected v5.xlsx

Dear (b)(6)

Per (b)(6) guidance regarding communications while he is on leave, I am submitting revisions to questions pertaining to TD-008 (Clinician Training in Uganda) below.

Please let me know if any further clarification is required.

Very respectfully,

(b)(6)

On 7/1/15, 2:58 PM, "Newman, Carl I CIV DTRA J3-7 (US)" <carl.i.newman.civ@mail.mil> wrote:

Hi (b)(6)

In general CBEP concurs that the proposal elements submitted by Metabiota are technically necessary and appropriate for continued implementation of existing requirements during the Option Period. However, clarification and justification of the below items is necessary before the approval can be provided.

1. According to the labor matrix provided in the proposal, Metabiota is proposing a total of 740 hours for two Program Managers (PMs); one each from Metabiota and the Alliance. Please clarify the distribution of hours is for the two PMs proposed, and the individual contributions from each for implementing the requirement.

(b)(6) (b)(6) Alliance Program Manager): Of the 740 PM hours proposed, 592 hours were proposed for his estimate is based actual hours charged for Clinician Training through the AEP base period. Moreover, the proposed hours will support the Alliance's management of in-country training and coordination with their local partner Walimu, as well as other Ugandan stakeholders. Additionally (b)(6) erves as the interface between Alliance and Metabiota as well as the interface between Alliance and Walimu. She is tasked with ensuring that the trainings stay within budget, on schedule, and within scope. She will also be responsible for the management of documentation and provision of deliverables – including monthly reporting and invoicing.

(b)(6) Metabiota Program Manager): Of the 740 PM hours proposed, 148 hours were proposed for (b)(6) This estimate is based actual hours charged for Clinician Training through the AEP base period. (b)(6) responsible for ensuring that all performers are compliant to the Department of Defense regulations (e.g. FAR). Additionally (b)(6) responsible for the managing submission of all programmatic deliverables (e.g. CDRLs), and is also tasked with monitoring the performance of the subcontractors (e.g., Alliance and Walimu), ensuring that the CLS requests are submitted for trainings, communication and approval of all travel requests from the subcontractor.

2. Metabiota proposed 5,180 hours for training material development, adaptation, and implementation; however, it is unclear how much of the proposed hours is for development, adaptation, or implementation. In particular, CBEP is of the understanding that training materials have been developed) and adapted for use in the 11 training events conducted in the AEP base year; leaving reproduction as the only activity required to implement the requirement. Please clarify the separate level of effort, for each proposed labor category, for training material development, adaptation, and implementation.

Program Management (Alliance)

Of the 5,180 hours proposed under Training Material Development, Adaptation, and Implementation, 1,036 hours were budgeted for Alliance Program Management, which will include management and oversight of all Alliance programmatic responsibilities. The remaining 4,144 hours were budgeted specifically for Development and Adaptation, and Implementation, as described below.

Development and Adaption (Alliance)

Training materials have been developed; however, as real-time feedback is received from ongoing trainings, the Alliance and Walimu are identifying potential gaps in information, which require some level of further development (or adaptation).

Of the hours proposed, ~444 hours were budgeted for further adaptation of training materials (see SME 3 narrative below). They will utilize course surveys and interview sessions with participants to adjust for regional relevance regarding the training materials. These activities will take place throughout the PoP and will be executed in real time.

Implementation (Alliance and Walimu)

Of the hours proposed, ~3700 hours were budgeted for implementation of training activities. Briefly, the (2) SME 2s and the (3) SME 1s will focus 100% of their labor on the implementation of the training materials; to include lecture session, workgroup exercises, pre and post testing of participants, and collection of the surveys. Of note, (b)(6) hours (1,332 SME 3 hours) were budgeted to support both adaptation and implementation activities, but included to the 3,700 hours for training implementation.

3. Metabiota proposed the need for SME 1, 2, & 3, but the technical description for each level SME is the same, and their individual involvement remains unclear. Additionally, there is no justification for the varied hours required for each SME. SMEs 1 &3 are allotted 1,776 hours while SME 2 is allotted only 592. Please clarify the number of individuals in each SME category and how each will individually contribute to implementing the requirement.

SME 3 (3 individuals):

(b)(6) hours are based upon a calculation of the technical requirements for assistance at each step of the introduction and implementation process for regional training events in Uganda.

In addition to their implementation responsibilities, SME 3s are tasked with the ongoing adaptation and re-development of training materials. These individuals bring a significant depth of clinical expertise and experience in clinical instruction, training, and mentoring. Their estimated labor breakdown is as follows:

(b)(6)
32 hrs
2 hrs
222 hrs

(b)(6) as spent the majority of his time, since 2006, working as a researcher, instructor, and clinician in Uganda. His primary research focus is on the management and pathogenesis of patients hospitalized with sepsis syndromes, primarily at two Ugandan government hospitals – Mulago National Referral Hospital and Masaka Regional Referral Hospital. In addition, he has been a consultant for WHO working and writing groups, which focus on improving the management of critically ill patients in austere settings. (b)(6) will bring hands-on regional experience and mentor local clinicians, in addition to serving as a core trainer, to the program.

(b)(6) s an emergency medicine doctor and is affiliated with Maimonides Medical Center. She received her medical degree from University of Michigan Medical School and has been in practice for 15 years. In addition to serving as a core trainer and mentor (b)(6) ill be involved in the continuing adaptation of the Quick Check+ training program by incorporation of regional knowledge from participants

(b)(6) erves as the Director of Research and Global Emergency Medicine at Carolinas Medical

Center. Since 2009 (b)(6) has provided leadership and support for the development of emergency medicine in Sub-Saharan Africa. This effort included training and bedside teaching of dozens of local physicians and nurses at Muhimbili National Hospital in Tanzania. Dr. Ruyon will provide clinical quality control expertise, planning, and training evaluation to the training program.

SME 2 (2 individuals):

(b)(6) hours are based upon the calculation of the instructional requirements for the training events. Their estimated labor breakdown is as follows:

(b)(6) 44 hrs (75%)
8 hrs (25%)

(b)(6) an assistant professor of clinical tropical medicine in Tulane's Department of Tropical Medicine, but is based in Lima, Peru. She has been working with the World Health Organization and spent part of September 2014 traveling to Sierra Leone to provide technical assistance in Ebola case management and training. In addition to functioning as a core trainer, she will continue to develop clinical training materials to improve the training and safety of health workers in Uganda in this program.

(b)(6) a pediatrician and is affiliated with multiple hospitals including Northridge Hospital Medical Center and Providence Holy Cross Medical Center. She received her medical degree from Allegheny University of the Health Sciences and has been in practice for 17 years. She has worked with the Alliance team since 2004, initially in the development, field-testing and scale up of the learning program in Uganda. (b)(6) involvement also will include training doctors, nurses, managers and auxiliary staff working at the district hospitals.

SME 1 (3 individuals/Local Nationals):

(b)(6) hours are based upon the number of proposed training event days, as they will serve as lead local trainers for the implementing Alliance partner in country "Walimu".

(b)(6) s a pediatrician and a public health specialist. He served as the Director of Health Services for the Ministry of Health Uganda. He has worked as a Lecturer in the Dept. of Pediatrics and child Health, Makerere University Uganda, and is the President of Uganda Medical Association. (b)(6) serves as a lead instructor for train the trainer (ToT) events and evaluates student's performances on clinical exercises.

(b)(6) are both local physicians and health specialist in Uganda. They will serve as lead trainers for regional trainings.

4. Metabiota allocated 148 hours to support travel and logistics management in the labor matrix under Research and Data Analyst (RDA). However, the budget narrative identifies the responsibility of RDAs as supporting the program's research, data entry , analysis, material and deliverable production & submission, organization of program documents, archiving materials, management of internal stakeholder meetings and execution. Additionally, the costs for direct labor supporting the Travel Coordinator (responsible for coordinating all AEP-related travel, as needed to execute programmatic requirements) are not required, as they are already included in the FFP CLIN 1001 - Program Management Office. Consequently, these costs should be removed from the proposal.

(b)(6) Research and Data Analyst, RDA) (b)(6) will be instrumental in supporting project coordination and objective completion for Metabiot (b)(6) will serve as a point of contact to facilitate daily communications with performance subcontractors, as has been required atsupporting the project's logistics, communications, and deliverable production. These hours are required for supporting the production, submission, and archiving of all program documents. In addition to these responsibilitie (b)(6) will regularly brief and coordinate with the program manager to ensure schedule adherence. Lastly (b)(6) ill liaise with Metabiota's Travel Coordinator to provide information garnered through communication with the Alliance and Walimu to support project implementation. Execution of all travel logistics (e.g., booking flights, ground transportation, lodging, securing visa's, etc.) falls within the scope of Metabiota's Travel Coordinator.

5. Metabiota mentions The Alliance and Walimu as partners for training implementation, however, the proposal does not provide details about the number of hours associated with any of the two partners. Please clarify the number of hours associated with the activities the Alliance and Walimu will be implementing.

The Breakdown of hours per phase and for each partner is listed below.

Phase 1 (PoP – 16 May - 31 August)

Alliance: 2073 hours
- 1036 hrs – Alliance Program Management
- 1037 hrs – SME – Hours budgeted for continued implementation / adaptation, as needed, of training materials

Walimu: 3108 hours
- Estimated hours required for implementing all scheduled trainings through August.

Phase 2 (PoP – 1 September 2015 - 28 February 2016)

Alliance: 2733 hours
- 1560 hrs – Alliance Program Management
- 1173 hrs – SME – Hours budgeted for continued implementation / adaptation, as needed, of training materials

Walimu: 4255 hours
- Estimated hours required for implementing all scheduled trainings through February.

Overall, Metabiota will be responsible for the contracting component of this effort – ensuring DTRA compliance of our in-country performers.

6. CLIN 1005 Travel Estimate Cost provides Per Diem rates of 250 for lodging and 90 for meals and incidentals. These rates are inconsistent with the regions of Uganda listed in the proposal where the actual trainings will take place (See training schedule in technical proposal). Please revise, in detail, the number of days that the team plans to spend in Kampala and other regions, as well as the applicable per diem rates.

The rates have been revised to conform to consistency with the respective regions. Please see that attached file entitled "Travel Costs Uganda Clinician Training".

7. Metabiota proposed 8 trips in total. These included 3 trips lasting 7 days with 2 persons per trip, and 5 trips lasting 14 days with 1 person per trip. However, it is unclear what the purpose of each trip is, who the travelers are (and their affiliation), the destination in Uganda for each trip, and why the trips differ in duration and number of travelers. Please clarify the proposed travel details, as the budget narrative is insufficient to determine if the proposed travel is reasonable and appropriate..

The eight trips proposed for Metabiota align with training events that occur in every location (two locations will be used as training grounds twice – Gulu and Mbarara). Metabiota will be visiting each training sight once to ensure the maintenance of compliance to DOD regulations at each site.

For each event, two travelers from Metabiota will attend, with one traveler from the Alliance. The specific purpose of attendance by Metabiota is to ensure programmatic oversight and execution. One program manager and one SME/Trainer will attend and provide daily reports on the training, which will be consolidated into each Training Trip Report (TTR). The Alliance will send a program manager to oversee the trainers and the coordination of each event.

The trips differ in length due to the trainings that will occur at each region. For example, many events include two regional sessions, and also a Train the Trainer session, and will be longer than an event that is only in-hospital training.

8. Metabiota provided an updated training schedule in Table 1 of the technical proposal, which lists information regarding each training. Eleven individual trainings were proposed; however, based on the current schedule, and assuming all travel paperwork has been submitted, CBEP determined that only 8 sessions can be implemented

before the end of the PoP. Please clarify the schedule and cost proposal to reflect what will be realistically implemented under the remaining time in the PoP.

The schedule and cost proposal include training events for May, June, and July, which have been previously scheduled and approved. At the time of proposal development and submission (10 June 2015), the May training events (2) had been completed and implementation of the first June training event had begun (8 June 2015). To this end, of the 11 scheduled training sessions for Phase 1, three were completed or underway, leaving eight remaining events. At this time, Training Event Plans have been submitted and approved for all remaining scheduled trainings shown in Table 1 of the Proposal.

9. Metabiota proposed purchase of equipment such as tablets, tethering for tablets and pulse oximeters. The procurement of pulse oximeters seems a necessary and adequate procurement, however CBEP requests clarification on the procurement of tablets and tethering. Is this government furnished property to be used for these trainings? Were these (or similar) items used during the eleven training sessions that were already implemented? Please clarify/justify the reason for the procurement of these items, as well as the intended disposition of this property once the PoP ends.

These items were used during training sessions that have been previously implemented. However, additional Tablets are procured for each new training site.

The provided tablets contain an eBook version of all training materials, including the VHF pocket guide, as well as applicable photos and charts, which were employed for the training event at each hospital. The tethering is required to discourage theft and illegal resale, as Uganda has a significant amount of criminal activity. The intended disposition of the property is that it remains with each designated hospital to support the technical collaboration needed for ongoing learning and back up, in addition to mentoring visits.

10. Metabiota proposed logistics support for five events. This is inconsistent with the number of sessions proposed in the schedule and what is remaining in the PoP for phase 1. Please clarify the number of training events that can reasonably implemented in the remaining PoP, and propose logistics support accordingly.

Phase 1 (16 May – 31 August) includes 11 unique training events occurring in 5 regions of Uganda. All trainings within the regions of Arua, Rwenzori, and Kabale have been or will be completed without the utilization of CLS, as was approved in the original proposal. Metabiota submitted their response to the Letter of Technical Direction 008 (Clinician Training in Uganda) on 10 June 2015. Due to the compressed timeframe associated with proposal development and submission, and to ensure continued implementation of training events prior to August, Metabiota budgeted for support of five training events (e.g., all June events). The aforementioned costs would cover logistical support services due to the compressed schedule of execution. Transitioning in-country logistical support to CLS in August allowed for compliance with regard to development and submission of the necessary CLS forms. CLS will be utilized for logistical support services of Mbarara and Gulu trainings, encompassing 4 trainings in two locations. Implementation of any/all Phase 2 training events would leverage CLS for in-country logistics support.

Cheers,

(b)(6)

Subject: Metabiota's Budget and Technical Proposal for TD 008 Clinician Training Uganda

Good Evening (b)(6)

Attached, please find Metabiota's budget and technical proposal in response to the above referenced Letter of Technical Direction sent by DTRA on June 08, 2015.

The Technical Direction provided an estimated Period of Performance end date of August 30, 2015. Metabiota intends to continue to engage IMAI-IMAIC (Alliance) for implementation. The total Rough Order of Magnitude is estimated at $1,207,176 for a Period of Performance of May 16, 2015 to August 30, 2015 (Included in attachment "Metabiota_AEP _Budget 1_TD008_Clinician_Training_Uganda_20150610").

The Alliance, has provided eleven (11) effective trainings under the AEP Contract and has designed a full training plan, which includes twenty-five (25) additional trainings for an estimated total thirty-six (36) training events. To capture the optimal effectiveness of the Clinician Training Program, Metabiota proposes a second Rough Order of Magnitude of $1,562,600 for a period of performance of September 1, 2015 to February 28, 2016 (included in attachment "Metabiota_AEP _Budget 2_TD008_Clinician_Training_Uganda_20150610").

Acceptance of the full training program as described in Metabiota's proposal would equate a base price of $1,207,176 and an option period price of $1,562,600. The total estimated price would be $2,769,776 for a Period of Performance of May 16, 2015 to February 28, 2016.

Please feel free to contact me with questions or concerns.

Thank you,

(b)(6)

Program Operations Manager

AEP Contracts Administrator

Subject: RE: Metabiota"s Budget and Technical Proposal for TD 008 Clinician Training Uganda
Date: Thursday, July 23, 2015 12:46:59 PM

(b)(6)

The Government is requesting that Metabiota provide a revised Technical proposal and ROM to include the revised travel costs and answers to the requested revisions. Metabiota's response to the original clarification questions for this Technical Directive only included updated travel costs and answers in the body of the attached email. It is difficult to assess whether the clarification questions were properly addressed in both the technical proposal and ROM (please see email below for reference).

Please let me know if you have any questions.

Thank you,

(b)(6) Contractor
Contract Specialist, TENICA

Subject: Re: Metabiota's Budget and Technical Proposal for TD 008 Clinician Training Uganda

Dear (b)(6)

Pe (b)(6) guidance regarding communications while he is on leave, I am submitting revisions to questions pertaining to TD-008 (Clinician Training in Uganda) below.

Please let me know if any further clarification is required.

Very respectfully,
(b)(6)

On 7/1/15, 2:58 PM, (b)(6)

Hi (b)(6)

In general CBEP concurs that the proposal elements submitted by Metabiota are technically necessary and appropriate for continued implementation of existing requirements during the Option Period. However, clarification and justification of the below items is necessary before the approval can be provided.

1. According to the labor matrix provided in the proposal, Metabiota is proposing a total of 740 hours for two

Program Managers (PMs); one each from Metabiota and the Alliance. Please clarify the distribution of hours is for the two PMs proposed, and the individual contributions from each for implementing the requirement.

(b)(6) Alliance Program Manager): Of the 740 PM hours proposed, 592 hours were proposed for (b)(6) This estimate is based actual hours charged for Clinician Training through the AEP base period. Moreover, the proposed hours will support the Alliance's management of in-country training and coordination with their local partner Walimu, as well as other Ugandan stakeholders. Additionally (b)(6) serves as the interface between Alliance and Metabiota as well as the interface between Allia he is tasked with ensuring that the trainings stay within budget, on schedule, and within scope. She will also be responsible for the management of documentation and provision of deliverables – including monthly reporting and invoicing.

(b)(6) Metabiota Program Manager): Of the 740 PM hours proposed, 148 hours were proposed for (b)(6) This estimate is based actual hours charged for Clinician Training through the AEP base period. (b)(6) responsible for ensuring that all performers are compliant to the Department of Defense regulations (e.g. FAR). Additionally (b)(6) responsible for the managing submission of all programmatic deliverables (e.g. CDRLs), and is also tasked with monitoring the performance of the subcontractors (e.g., Alliance and Walimu), ensuring that the CLS requests are submitted for trainings, communication and approval of all travel requests from the subcontractor.

2. Metabiota proposed 5,180 hours for training material development, adaptation, and implementation; however, it is unclear how much of the proposed hours is for development, adaptation, or implementation. In particular, CBEP is of the understanding that training materials have been developed) and adapted for use in the 11 training events conducted in the AEP base year; leaving reproduction as the only activity required to implement the requirement. Please clarify the separate level of effort, for each proposed labor category, for training material development, adaptation, and implementation.

Program Management (Alliance)

Of the 5,180 hours proposed under Training Material Development, Adaptation, and Implementation, 1,036 hours were budgeted for Alliance Program Management, which will include management and oversight of all Alliance programmatic responsibilities. The remaining 4,144 hours were budgeted specifically for Development and Adaptation, and Implementation, as described below.

Development and Adaption (Alliance)

Training materials have been developed; however, as real-time feedback is received from ongoing trainings, the Alliance and Walimu are identifying potential gaps in information, which require some level of further development (or adaptation).

Of the hours proposed, ~444 hours were budgeted for further adaptation of training materials (see SME 3 narrative below). They will utilize course surveys and interview sessions with participants to adjust for regional relevance regarding the training materials. These activities will take place throughout the PoP and will be executed in real time.

Implementation (Alliance and Walimu)

Of the hours proposed, ~3700 hours were budgeted for implementation of training activities. Briefly, the (2) SME 2s and the (3) SME 1s will focus 100% of their labor on the implementation of the training materials; to include lecture session, workgroup exercises, pre and post testing of participants, and collection of the surveys. Of note, (b)(6) hours (1,332 SME 3 hours) were budgeted to support both adaptation and implementation activities, but included to the 3,700 hours for training implementation.

3. Metabiota proposed the need for SME 1, 2, & 3, but the technical description for each level SME is the same, and their individual involvement remains unclear. Additionally, there is no justification for the varied hours required for each SME. SMEs 1 &3 are allotted 1,776 hours while SME 2 is allotted only 592. Please clarify the number of individuals in each SME category and how each will individually contribute to implementing the requirement.

SME 3 (3 individuals):

Drs. [redacted] hours are based upon a calculation of the technical requirements for assistance at each step of the introduction and implementation process for regional training events in Uganda.

In addition to their implementation responsibilities, SME 3s are tasked with the ongoing adaptation and re-development of training materials. These individuals bring a significant depth of clinical expertise and experience in clinical instruction, training, and mentoring. Their estimated labor breakdown is as follows:

[redacted] 332 hrs
222 hrs
222 hrs

[redacted] has spent the majority of his time, since 2006, working as a researcher, instructor, and clinician in Uganda. His primary research focus is on the management and pathogenesis of patients hospitalized with sepsis syndromes, primarily at two Ugandan government hospitals – Mulago National Referral Hospital and Masaka Regional Referral Hospital. In addition, he has been a consultant for WHO working and writing groups, which focus on improving the management of critically ill patients in austere settings. [redacted] will bring hands-on regional experience and mentor local clinicians, in addition to serving as a core trainer, to the program.

[redacted] is an emergency medicine doctor and is affiliated with Maimonides Medical Center. She received her medical degree from University of Michigan Medical School and has been in practice for 15 years. In addition to serving as a core trainer and mentor, [redacted] will be involved in the continuing adaptation of the Quick Check+ training program by incorporation of regional knowledge from participants

[redacted] serves as the Director of Research and Global Emergency Medicine at Carolinas Medical Center. Since 2009, [redacted] has provided leadership and support for the development of emergency medicine in Sub-Saharan Africa. This effort included training and bedside teaching of dozens of local physicians and nurses at Muhimbili National Hospital in Tanzania. [redacted] will provide clinical quality control expertise, planning, and training evaluation to the training program.

SME 2 (2 individuals):

[redacted] hours are based upon the calculation of the instructional requirements for the training events. Their estimated labor breakdown is as follows:

Dr [redacted] 4 hrs (75%)
Dr [redacted] 48 hrs (25%)

[redacted] is an assistant professor of clinical tropical medicine in Tulane's Department of Tropical Medicine, but is based in Lima, Peru. She has been working with the World Health Organization and spent part of September 2014 traveling to Sierra Leone to provide technical assistance in Ebola case management and training. In addition to functioning as a core trainer, she will continue to develop clinical training materials to improve the training and safety of health workers in Uganda in this program.

[redacted] is a pediatrician and is affiliated with multiple hospitals including Northridge Hospital Medical Center and Providence Holy Cross Medical Center. She received her medical degree from Allegheny University of the Health Sciences and has been in practice for 17 years. She has worked with the Alliance team since 2004, initially in the development, field-testing and scale up of the learning program in Uganda. [redacted] involvement also will include training doctors, nurses, managers and auxiliary staff working at the district hospitals.

SME 1 (3 individuals/Local Nationals):

[redacted] hours are based upon the number of proposed training event days, as they will serve as lead local trainers for the implementing Alliance partner in country "Walimu".

[redacted] is a pediatrician and a public health specialist. He served as the Director of Health Services for

the Ministry of Health Uganda. He has worked as a Lecturer in the Dept. of Pediatrics and child Health, Makerere University Uganda, and is the President of Uganda Medical Association. (b)(6) serves as a lead instructor for train the trainer (ToT) events and evaluates student's performances on clinical exercises.

(b)(6) are both local physicians and health specialist in Uganda. They will serve as lead trainers for regional trainings.

4. Metabiota allocated 148 hours to support travel and logistics management in the labor matrix under Research and Data Analyst (RDA). However, the budget narrative identifies the responsibility of RDAs as supporting the program's research, data entry , analysis, material and deliverable production & submission, organization of program documents, archiving materials, management of internal stakeholder meetings and execution. Additionally, the costs for direct labor supporting the Travel Coordinator (responsible for coordinating all AEP-related travel, as needed to execute programmatic requirements) are not required, as they are already included in the FFP CLIN 1001 - Program Management Office. Consequently, these costs should be removed from the proposal.

(b)(6) (Research and Data Analyst: RDA); (b)(6) will be instrumental in supporting project coordination and objective completion for Metabiota (b)(6) will serve as a point of contact to facilitate daily communications with performance subcontractors, as has been required atsupporting the project's logistics, communications, and deliverable production. These hours are required for supporting the production, submission, and archiving of all program documents. In addition to these responsibilities (b)(6) will regularly brief and coordinate with the program manager to ensure schedule adherence. Lastly (b)(6) will liaise with Metabiota's Travel Coordinator to provide information garnered through communication with the Alliance and Walimu to support project implementation. Execution of all travel logistics (e.g., booking flights, ground transportation, lodging, securing visa's, etc.) falls within the scope of Metabiota's Travel Coordinator.

5. Metabiota mentions The Alliance and Walimu as partners for training implementation, however, the proposal does not provide details about the number of hours associated with any of the two partners. Please clarify the number of hours associated with the activities the Alliance and Walimu will be implementing.

The Breakdown of hours per phase and for each partner is listed below.

Phase 1 (PoP – 16 May - 31 August)

Alliance: 2073 hours
- 1036 hrs – Alliance Program Management
- 1037 hrs – SME – Hours budgeted for continued implementation / adaptation, as needed, of training materials

Walimu: 3108 hours
- Estimated hours required for implementing all scheduled trainings through August.

Phase 2 (PoP – 1 September 2015 - 28 February 2016)

Alliance: 2733 hours
- 1560 hrs – Alliance Program Management
- 1173 hrs SME Hours budgeted for continued implementation / adaptation, as needed, of training materials

Walimu: 4255 hours
- Estimated hours required for implementing all scheduled trainings through February.

Overall, Metabiota will be responsible for the contracting component of this effort – ensuring DTRA compliance of our in-country performers.

6. CLIN 1005 Travel Estimate Cost provides Per Diem rates of 250 for lodging and 90 for meals and incidentals. These rates are inconsistent with the regions of Uganda listed in the proposal where the actual trainings will take place (See training schedule in technical proposal). Please revise, in detail, the number of days that the team plans to spend in Kampala and other regions, as well as the applicable per diem rates.

The rates have been revised to conform to consistency with the respective regions. Please see that attached file

entitled "Travel Costs Uganda Clinician Training".

7. Metabiota proposed 8 trips in total. These included 3 trips lasting 7 days with 2 persons per trip, and 5 trips lasting 14 days with 1 person per trip. However, it is unclear what the purpose of each trip is, who the travelers are (and their affiliation), the destination in Uganda for each trip, and why the trips differ in duration and number of travelers. Please clarify the proposed travel details, as the budget narrative is insufficient to determine if the proposed travel is reasonable and appropriate..

The eight trips proposed for Metabiota align with training events that occur in every location (two locations will be used as training grounds twice – Gulu and Mbarara). Metabiota will be visiting each training sight once to ensure the maintenance of compliance to DOD regulations at each site.

For each event, two travelers from Metabiota will attend, with one traveler from the Alliance. The specific purpose of attendance by Metabiota is to ensure programmatic oversight and execution. One program manager and one SME/Trainer will attend and provide daily reports on the training, which will be consolidated into each Training Trip Report (TTR). The Alliance will send a program manager to oversee the trainers and the coordination of each event.

The trips differ in length due to the trainings that will occur at each region. For example, many events include two regional sessions, and also a Train the Trainer session, and will be longer than an event that is only in-hospital training.

8. Metabiota provided an updated training schedule in Table 1 of the technical proposal, which lists information regarding each training. Eleven individual trainings were proposed; however, based on the current schedule, and assuming all travel paperwork has been submitted, CBEP determined that only 8 sessions can be implemented before the end of the PoP. Please clarify the schedule and cost proposal to reflect what will be realistically implemented under the remaining time in the PoP.

The schedule and cost proposal include training events for May, June, and July, which have been previously scheduled and approved. At the time of proposal development and submission (10 June 2015), the May training events (2) had been completed and implementation of the first June training event had begun (8 June 2015). To this end, of the 11 scheduled training sessions for Phase 1, three were completed or underway, leaving eight remaining events. At this time, Training Event Plans have been submitted and approved for all remaining scheduled trainings shown in Table 1 of the Proposal.

9. Metabiota proposed purchase of equipment such as tablets, tethering for tablets and pulse oximeters. The procurement of pulse oximeters seems a necessary and adequate procurement, however CBEP requests clarification on the procurement of tablets and tethering. Is this government furnished property to be used for these trainings? Were these (or similar) items used during the eleven training sessions that were already implemented? Please clarify/justify the reason for the procurement of these items, as well as the intended disposition of this property once the PoP ends.

These items were used during training sessions that have been previously implemented. However, additional Tablets are procured for each new training site.

The provided tablets contain an eBook version of all training materials, including the VHF pocket guide, as well as applicable photos and charts, which were employed for the training event at each hospital. The tethering is required to discourage theft and illegal resale, as Uganda has a significant amount of criminal activity. The intended disposition of the property is that it remains with each designated hospital to support the technical collaboration needed for ongoing learning and back up, in addition to mentoring visits.

10. Metabiota proposed logistics support for five events. This is inconsistent with the number of sessions proposed in the schedule and what is remaining in the PoP for phase 1. Please clarify the number of training events

that can reasonably implemented in the remaining PoP, and propose logistics support accordingly.

Phase 1 (16 May – 31 August) includes 11 unique training events occurring in 5 regions of Uganda. All trainings within the regions of Arua, Rwenzori, and Kabale have been or will be completed without the utilization of CLS, as was approved in the original proposal. Metabiota submitted their response to the Letter of Technical Direction 008 (Clinician Training in Uganda) on 10 June 2015. Due to the compressed timeframe associated with proposal development and submission, and to ensure continued implementation of training events prior to August, Metabiota budgeted for support of five training events (e.g., all June events). The aforementioned costs would cover logistical support services due to the compressed schedule of execution. Transitioning in-country logistical support to CLS in August allowed for compliance with regard to development and submission of the necessary CLS forms. CLS will be utilized for logistical support services of Mbarara and Gulu trainings, encompassing 4 trainings in two locations. Implementation of any/all Phase 2 training events would leverage CLS for in-country logistics support.

Cheers,

(b)(6)

Subject: Metabiota's Budget and Technical Proposal for TD 008 Clinician Training Uganda

Good Evening(b)(6)

Attached, please find Metabiota's budget and technical proposal in response to the above referenced Letter of Technical Direction sent by DTRA on June 08, 2015.

The Technical Direction provided an estimated Period of Performance end date of August 30, 2015. Metabiota intends to continue to engage IMAI-IMAIC (Alliance) for implementation. The total Rough Order of Magnitude is estimated at $1,207,176 for a Period of Performance of May 16, 2015 to August 30, 2015 (Included in attachment "Metabiota_AEP _Budget 1_TD008_Clinician_Training_Uganda_20150610").

The Alliance, has provided eleven (11) effective trainings under the AEP Contract and has designed a full training plan, which includes twenty-five (25) additional trainings for an estimated total thirty-six (36) training events. To capture the optimal effectiveness of the Clinician Training Program, Metabiota proposes a second Rough Order of Magnitude of $1,562,600 for a period of performance of September 1, 2015 to February 28, 2016 (included in attachment "Metabiota_AEP _Budget 2_TD008_Clinician_Training_Uganda_20150610").

Acceptance of the full training program as described in Metabiota's proposal would equate a base price of $1,207,176 and an option period price of $1,562,600. The total estimated price would be $2,769,776 for a Period of Performance of May 16, 2015 to February 28, 2016.

Please feel free to contact me with questions or concerns.

Thank you,

(b)(6)

Subject: Re: Moodle training schedule

Hi (b)(6)

Wonderful, thank you for sending this all over! And we confirm receipt of the invoice, thank you. We'll work on getting that paid ASAP this week.

Although you can't reserve and schedule our trainings until the invoice is paid – as a heads up, we're going to want to have the admin training during afternoon of 6/30. Would either 2-4 PM EDT or 3-5 PM EDT be feasible? The preferred dates and times for the course instructors and local staff support trainings will require a little more scheduling due to the time zone differences, so I'll send those over to you later this or next week.

Thank you,

(b)(6)

From: (b)(6)
Date: Monday, June 20, 2016 at 1:28 PM
To: (b)(6)
Subject: Moodle training schedule

(b)(6)

After our conversation on Friday, I was reminded that we bill for online Moodle training in 3-hour blocks of time. So rather than the 5 hours we discussed, I'm going to recommend 6 hours of online training to meet your needs with Moodle. If we don't use the extra hour, we can save it for trouble-shooting any issues that may come up after your program launches.

As discussed, I would recommend scheduling 2 hours for your course developers (perhaps with a 1 hour trouble-shooting session after they've begun developing course content), followed up by 2 hours with your course instructors, and 1 hour with your local support staff. Depending on your program deployment schedule, it may be wise to space out the training sessions so we can allow your developers some time to get the courses put together so we can train live using those courses with the instructors and support staff.

Would a week between each training session work with your new schedule? Our available training dates include: Mon 6/27 AM or PM, Wed 6/29 AM or PM, Thu 6.30 AM or PM, Tue-Fri 7/5-7/8 AM or PM, and Mon-Fri 7/11-7/15 AM or PM. If you would prefer dates past those suggested, please let me know what you have in mind so I can check our training calendar to confirm our availability.

I will have an invoice totaling $1,500 for 6 hours of custom, instructor-led online Moodle training sent to you today. Please note that we will need to receive payment in order to reserve and schedule your preferred dates/times on our training calendar.

Regards,

(b)(6)

Subject: Re: Request for review and approval TAF(b)(6) ne Health Epidemiology Uganda

Good afternoon,

Thank you for that clarification, and apologies for the miss steps. I have attached an updated Travel Authorization Form in support of TM(b)(6)
persons) from Metabiota in support of Cohort 9 Module 1 One Health Epidemiology training set to take place between October 16th-25th.

Thank you, and please let me know if I can clarify anything else.

Respectfully,

(b)(6)

Subject: Request for Travel Authorization – (b)(6) SEA PM to Washington DC in support of PACOM regional baseline analysis

Dear (b)(6)

I hope this email finds you well. Please find attached a request to authorize my travel to Washington DC from 23 August – 2 September in support of completing the PACOM regional landscape analysis. This travel will be executed under TD 007, and will support the following:

Facilitation and completion of the internal review, QAQC, and draft version of the PACOM regional landscape analysis, which will be presented and submitted to CBEP regional leadership on 2 September. My travel to DC will facilitate coordination with SME's, and project personnel, finalizing the draft submission, and supporting review, and editing of the compiled open-source research. This will include, review and completion of QAQC'd materials, as well as completing additional QAQC requirements to evaluate level of confidence in gathered data, weighting and quantifying data and materials, where appropriate, and completion of the risk / gap analysis. In addition, travel is requested to attend the bi-weekly meeting with regional leads in support of submitting the draft deliverables, presenting the analysis to date, providing status updates, and continued discussion on the way forward.

If you have any questions, or require further information, please let me know.

Thank you so much (b)(6)

Date: Tuesday, September 01, 2015 2:31:54 PM

Hi (b)(6)

Metabiota's proposal submitted on 12 August 2015, with revised budget submitted on 18 August 2015 in support of Technical Directive 013 is hereby approved for implementation with a ceiling price of $381,705.

The Contractor should use its best efforts to perform the work specified in the Technical Directive within the estimated ceiling price. The Contractor should notify the Contracting Officer in writing whenever it has reason to believe that that costs for this Technical Directive are expected to go over the established ceiling price.

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

This revision extends the Period of Performance (PoP) for TD-013 from 26 Feb 2016 to 15 November 2016 at no additional cost. This PoP extension is to provide enough time to continue implementation of the One Health Epidemiology training program in Uganda with the addition of a Cohort 11. Metabota should coordinate directly with the Technical POCs identified below. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below. No further changes to the previously approved proposal are required at this time.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES).

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN).

TECHNICAL DIRECTIVE (TD)

1. CONTRACT NUMBER	2. CONTRACTOR	3a.TD NUMBER	3b.REV
HDTRA1 -14-C-0104	METABIOTA	016	B

4. TD TITLE	5. TOTAL TD ESTIMATE.
Subject Matter Expertise in Geographic Information Systems (GIS) Modeling and Regional Single Nucleotide Polymorphisms (SNPs) at the Richard G. Lugar Center for Public Health Research in Georgia	HOURS: _____ DOLLARS: $ **$147,000**

6. CONTRACING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME (b)(6)
PHONE (b)(6) EMAIL (b)(6)	PHONE EMAIL (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE).

This revision extends the Period of Performance (PoP) for TD-016 from 15 May 2016 to 15 November 2016. This PoP extension is to continue providing expertise in geographic information systems (GIS) modeling and regional Single Nucleotide Polymorphisms (SNPs) at the Richard G. Lugar Center for Public Health Research in Georgia Metabiota should coordinate directly with the Technical POCs identified below Your technical approach as outlined in TD-016 Rev A with the exception of the 3 x 1 week of trips stipulated to support GG-27 (identified in box 8 paragraph 5 and box 9c under travel), proposed budget, and basis of estimate for continuing this requirement, not to exceed $147,000 is requested by 17 May 2016. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below. No further changes to the previously approved proposal are required at this time.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation
Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8 and leverages information gleaned from discussions with A&AS contractors. Originally, a key assumption for this effort was that the Georgian scientists are generally capable of conducting GIS analyses on their own. After discussions with some individuals familiar with the level of expertise in Georgia and the scientific goals sought to be accomplished in the stated projects, Metabiota believes that the Georgian scientists will require an increased level of support when conducting GIS analyses. It is anticipated that the plan for TD-016 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as SME I) time to identify the best path forward, required deliverables, anc any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:
From the information provided in Box 8, Metabiota assumes that these projects are ongoing affairs led by a third party. The Metabiota PM, PC, and GIS SME(s) will participate in communications with the CBR teams to understand what the mentoring and research needs are for each project. The Metabiota PM and PC will work with the GIS SME(s) to ensure that mentoring and research needs are met as best as possible using remote technologies. The Metabiota PM and PC will also work with the project teams to ensure that the GIS SME(s) provide inputs to project deliverables in a timely manner.

Mentoring:
Mentoring will consist of remote mentoring. After assessing the need for in-person GIS mentoring, the PM, PC, and primary GIS SME will work with the project teams to elucidate the specific goals, and requirements of each mentoring request to ensure that the mentoring visit is conducted efficiently and effectively. The primary GIS SME will work with the PM, PC, and appropriate stakeholders in each respective project to create a list of tasks to be accomplished by the Georgian scientists leading up to the mentoring visit, to create a list of topics for the primary GIS SME to be prepared to assist with during the mentoring visit, and to facilitate the communication and exchange of any necessary data or concepts both prior to and following each mentoring visit.

Reach-back support and Research collaboration:
Based on our updated understanding of the requirements and the proposed scope of the projects, Metabiota now expects to be required to provide significant GIS analysis support to the three projects, but does expect to place a significant focus on transitioning this expertise to the Georgians. Through regular communications with the respective project teams, Metabiota will be made aware of any additional subject matter expertise requests. The GIS SME will address these needs as they arise.

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

Table 1: Incremental funding requested for 16 May 2016 – 15 November 2016, per CLIN. Please note that labor rates have changed.

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$132,202.28
1003	MATERIALS	$0
1004	ODCs	$0
1005	TRAVEL	$0
TOTAL		**$132,202.28**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES):

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal

development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As some of our Subject Matter Experts and Research and Data Analysts may be independent consultants or subcontractors, the Metabiota PM will additionally oversee and ensure that all project personnel adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PM will provide management oversight of the project team, including subcontractors and independent consultants throughout the span of the project.

Metabiota Subject Matter Expert 1. The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM and will manage the GIS SME, including all subcontractors, to ensure all project requirements and deliverables are met and the program remains within scope, budget, and timeline.

The PC will coordinate with the project stakeholders to identify travel dates. The PC will participate in regular communications between the project stakeholders and the GIS SME. The PC will drive the coordination required to sufficiently gather the answers to the logistical questions that will arise in the planning and execution of requested travel for mentoring activities

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the GIS SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Subject Matter Expert 2: The SME 2 will serve as the primary GIS SME and research collaborator. The SME 2 will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each project and the GIS subject matter expertise needed. The SME 2 will provide remote mentoring and research collaborator support as directed by the respective project leads.

Research and Data Analysts (RDAs): It is anticipated that the SME 2 will employ multiple RDAs with GIS expertise to assist him in mentoring the Georgian scientists in the advanced GIS techniques proposed in the three research projects and to assist in performing data analysis, technical writing, and other research duties as needed.

Materials

No materials are expected to be procured for this effort.

Other Direct Costs

Per contract guidelines, DBA insurance is required for all personnel engaged on work conducted overseas. As no work will be physically conducted overseas, no additional funds are being requested.

Subcontracts

Subcontracts will be issued to SMEs, RDAs, and/or their home organizations as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget. Metabiota anticipates issuing a firm-fixed price level of effort (FFPLOE) contract to the GIS SME team as a mechanism for controlling costs, as Metabiota expects that the cost for the total number of hours worked by the SME2 and RDAs to far exceed the previously budgeted amount.

Travel

No travel is anticipated during the extended period of performance and thus no additional funds are being requested.

COOPERATIVE BIOLOGICAL RESEARCH
Project Proposal
GG-27 – Form A Science Plan

Version Date: 01 April 2015
Version Number: 40

Project Title

Regional Study of the Ecology of Anthrax Foci in Georgia and Azerbaijan (090110001)

Project Summary

Anthrax is a livestock-borne zoonotic disease that is endemic in the South Caucasus region. There is a lack of understanding of the regional epidemiology of this pathogen and the trans-boundary factors related to its persistence. It is hypothesized that both human and environmental factors affect migration of *Bacillus anthracis* strains across borders and through regions. The proposed study seeks a clearer understanding of these risk factors and the associated trans-boundary migration of *B. anthracis* through: 1) identification of regional foci and spatial risk factors of anthrax to improve surveillance and documentation of the disease; 2) evaluation of the genetic/molecular relationships of environmental *B. anthracis* isolates to better understand the organism's ability to persist in the environment and to allow for improved epidemiologic "trace-back" of human and livestock infections; 3) collaboration on regional issues related to the control and management of a re-emerging infectious disease by sharing local/regional predictions of risk and molecular profiles of the pathogen; and 4) training and outcomes of training throughout the project.

The study will use an interdisciplinary approach combining epidemiological and epizoological data analysis with laboratory efforts to achieve the research goals. Collaborators from both Georgia (GG) and Azerbaijan (AJ) will collect and test environmental samples (soil) for the presence of *B anthracis*. Sample collections will be targeted to known burial sites and areas of previous contamination, as evidenced by livestock outbreaks or human case records. Where identified, the molecular characteristics of the pathogen will be examined using multilocus variable number tandem repeat analysis (MLVA), as well as global and regional Single Nucleotide Polymorphisms (SNPs), including a well-established Georgian SNP typing panel. Spatial genetic pattern analysis and risk factor mapping will be conducted using geographic information systems (GIS).

This project will be a regional collaboration between research institutes in GG and AJ aimed at increasing the local and regional understanding of anthrax ecology, ecological risk factors, and the genetic relationships and distribution among Georgian and Azerbaijani *B. anthracis* strains. In turn, this regional collaboration will provide the potential for the cooperative development of strategies for the control and trans-boundary management of this disease. This project builds on an existing *B. anthracis* characterization project between Georgia and Turkey (GG TAP-10), and will also utilize any *B. anthracis* samples isolated from the Georgia-Azerbaijan border region under DTRA-funded projects GG-18 and GG TAP-7.

DETAILED PROJECT INFORMATION

Project Description (Introduction and Overview)

Anthrax is a bacterial zoonosis caused by *Bacillus anthracis* (*B. anthracis*), a spore-forming, soil-borne bacterium with a remarkable ability to persist in the environment. Found on nearly every continent, the disease is considered a re-emerging zoonotic disease, and despite the development of anthrax vaccines for animals and humans, the disease continues to be endemic in many countries, including Georgia and Azerbaijan.

Bacillus anthracis is a member of a highly diverse group of endospore-forming bacteria. The genus *Bacillus* contains at least 51 described species and many other species of uncertain taxonomic status. *B. anthracis*

has been classified as a "Category A" organism by the US Centers for Disease Control and Prevention (CDC) and is considered a potential weapon for bioterrorism.

Animal transmission of *B. anthracis* is classically defined as ingestion of soils, contaminated plants, or contaminated water, as well as mechanical transmission from flies [1-3]. The toxins produced by the vegetative bacterium are associated with virulence and differ from the toxins produced by other *Bacillus* species. Due to the environmental stability of spores, *B. anthracis* can remain viable in soil for many years and because its persistence does not necessarily depend on animal reservoirs [4], *B. anthracis* is extremely difficult to eradicate from endemic areas.

Anthrax has recently re-emerged as a veterinary and human public health concern in Georgia. In addition to expanding geographically, the number of reported human cases (355) from 2011-2013 has increased nearly three-fold over the previous three years and more than 40-fold since 1985-1987 [5, 6]. Moreover, approximately 2,000 *B. anthracis* foci are registered in Georgia, of which more than 20% are active (Dr. C. Machitidze, personal communication) illustrating endemicity throughout Georgia (Figures 1 and 2). Recent research has shown new areas of emergence and clustering around urban centers in Georgia, which contrasts the normal pattern of high infectivity associated with rural agriculture or remote areas [5, 6]. Despite the endemic nature of the disease in Georgia, few studies have been conducted on the distribution and genetic diversity of *B. anthracis* strains near the borders of the country.

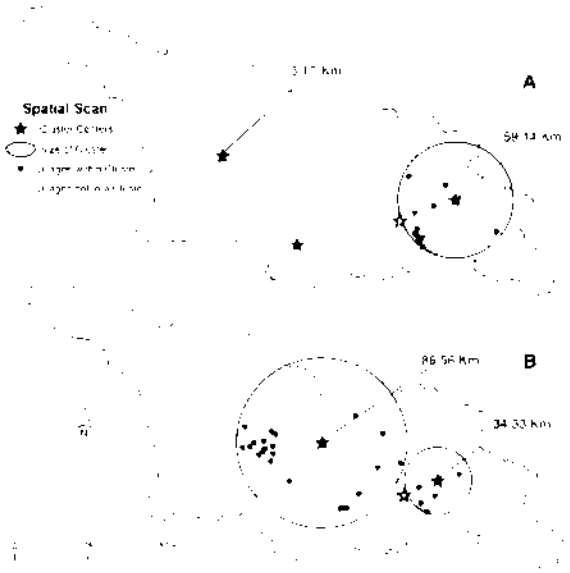

Figure 1. *Spatial Clustering of human cases of anthrax in Georgia. Panel A shows clusters during 2000-2004 and panel B shows clustering during 2005-2009. Figure provided by Ian Kracalik, University of Florida.*

Figure 2. *Preliminary map showing the geographic distribution of livestock anthrax cases in Georgia during 1881-2014. Light grey color represents sporadic zones (2-5 cases), dark grey represents endemic zones (6-14 cases), and red represents hyperendemic zones (> 15 cases). Figure provided by Ian Kracalik, University of Florida, University of Florida.*

In Azerbaijan, *B. anthracis* has been responsible for large outbreaks of anthrax in humans and livestock. Although reporting is more infrequent in Azerbaijan than in Georgia, anthrax has persisted for decades across a wide geographic expanse. The disease is considered to be sporadic in Azerbaijan although it is bordered by countries that are hyper-endemic [7], and recent evidence has shown that distribution of anthrax in Azerbaijan has undergone changes in its occurrence and spatial distribution [5]. Given the recent re-emergence of the disease in Georgia, there is growing concern over the status of the disease in Azerbaijan.

In 1996, Azerbaijan experienced more than 300 anthrax cases in sheep, and more than 70 human cases, prompting the initiation of a preemptive livestock vaccination campaign. Evidence suggests that the campaign was effective in reducing the burden of human disease [7]. However, recent human outbreaks have raised concerns over the re-emergence of the disease, especially given the relatively few reported livestock cases in relation to these human cases. Although the region is experiencing an increased number of anthrax cases, few scientific efforts have been made to link trans-boundary outbreaks of anthrax using molecular characterization and geographic modeling. Figure 3 illustrates the geographic distribution of reported human and livestock anthrax in Azerbaijan from 1940 – 1999 by decade. While more limited in geographic distribution, a number of *B. anthracis* isolates were mapped and genotyped using the Multiple Loci VNTR (Variable Nucleotide Tandem Repeat) Analysis (MLVA-25) and Single Nucleotide Repeat (SNR-4) typing systems (Figure 4).

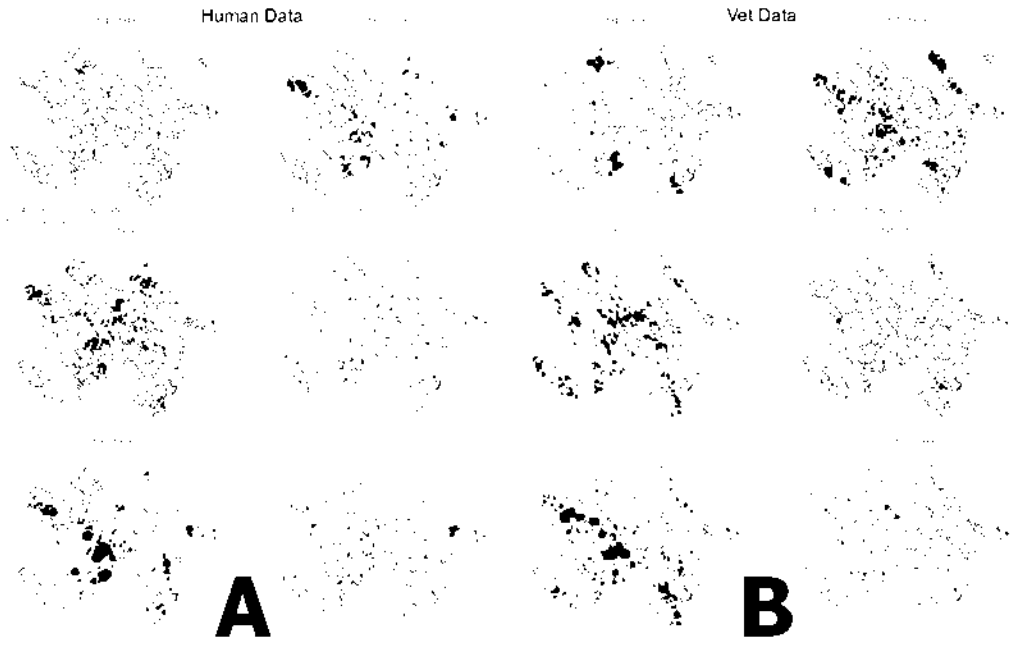

Figure 3. *Village-level reporting of anthrax outbreaks in Azerbaijan by decade in the human (A) and livestock (B) populations. Dot size represents number of years (within the decade) with outbreaks reported, with increasing size presenting a greater number of years with recorded outbreaks. Each decade from 1940 – 1990 is represented by a single map in either A or B for humans and livestock, respectively. Figure provided by Dr. Jason Blackburn, University of Florida.*

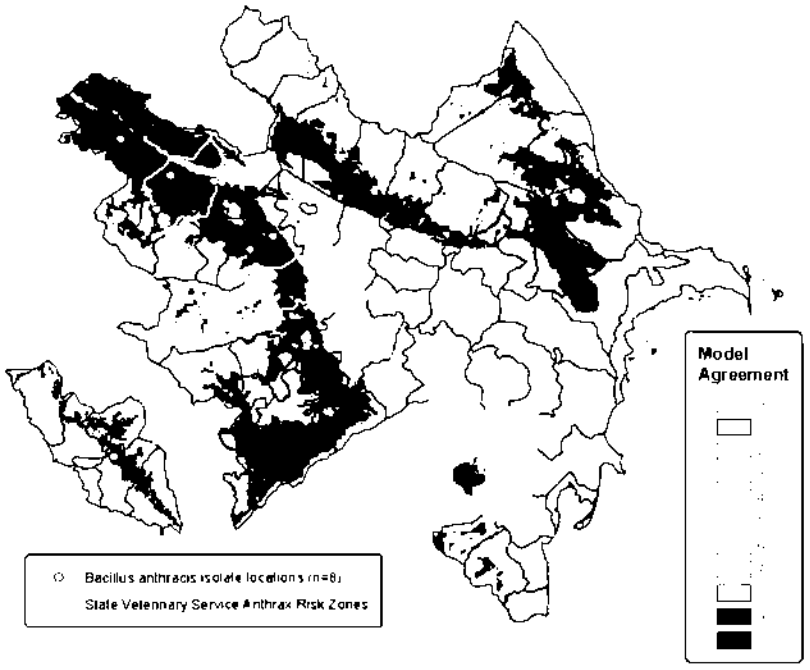

Figure 4. *Village-level locations (green dots) of human* B. anthracis *isolates from APS-Baku. These eight locations represent a total of 14 isolates genotyped. Locations are mapped over an ecological niche model-*

based estimate of the geographic distribution of B. anthracis *for Azerbaijan. Yellow outlines are those rayons defined as high risk for livestock anthrax by the AJ SVCS. Figure provided by* (b)(6) *University of Florida.*

In general, the geographic distribution of *B. anthracis* has been shown to be constrained by a combination of environmental factors such as temperature and precipitation [8, 9]. While soil pH of 6.0 or above (alkaline) and factors such as rich organic content and high calcium levels are generally considered to be suitable conditions for the persistence of *B. anthracis* [4]. Research has also suggested that specific ecological affinities may contribute to the geographic variation in the distribution of genotypes [9]. In Kazakhstan, a prediction of the current geographic distribution of *B. anthracis* was important not only for guiding the implementation of surveillance and livestock vaccination [10] but also as an indicator of how the geographic distribution of the organism may change in the future [11].

Elucidation of the molecular characteristics and relationships between the Georgian and Azerbaijani *B. anthracis* strain populations will aid in the identification and tracking of strains and their origins. In addition, genetic data, when coupled with GIS, may provide a mechanism for a retrospective epidemiological trace-back and for studying transmission dynamics, both of which will contribute to in-depth knowledge of the distribution and ecology of *B. anthracis* in Georgia, Azerbaijan, and globally.

Within the scope of this project, we will perform phenotypic profiling of *B. anthrocis* isolated from burial/contaminated sites in Georgia and Azerbaijan including:

- characterization of bacterial and colonial morphology;
- capsule production;
- hemolytic activity;
- motility;
- specific phage sensitivity;
- penicillin sensitivity; and
- Direct Fluorescent Assay (DFA) for capsule and cell wall antigen detection.

The study will cover molecular characterization of all isolated and identified strains using subtyping with SNPs and multilocus variable number tandem repeat analysis (MLVA 25). The SNP analysis will include canonical global SNP markers (canSNPs), a newly developed Georgian regional SNP genotyping panel that is already in routine use at NCDC [12], and two unique SNPs discovered in Azerbaijani isolates (Van Ert, Nikolich, and Blackburn, unpublished).

The study will also focus on developing GIS and ecological niche modeling. Participants will work collaboratively with the University of Florida (UF) team to construct models that subdivide the geographic distribution of *B. anthracis* by phenotype/genotype. Spatial modeling will build on previously derived pathogen subtypes and environmental data sets for Georgia and Azerbaijan. From an ecological perspective, integrating genetic data to refine ecological models should provide more accurate ecological envelopes with which to define the geographic range of the pathogen. Such maps should be useful in identifying areas of risk for humans and determining surveillance vaccination priorities for livestock.

Scientific Goals

This project will be a regional collaboration between the Ministry of Health and the Ministry of Agriculture laboratories in both Georgia and Azerbaijan. The goal of this study is to improve local and regional understanding of anthrax ecology, ecological risk factors, and genetic relationships among Georgian and Azerbaijani *B. anthracis* strains. These goals will be achieved through the following activities:

1. Identification and mapping of *B. anthracis* foci distribution along the Georgia-Azerbaijan border using GIS; collaborative collection of samples from affected sites (burial, contaminated areas); positive confirmation of *B. anthracis* contamination at selected sites.

2. Molecular genetic characterization of isolated *B. anthracis* strains using SNPs (canSNPs, Georgian SNP panel, AJ SNPs) and MLVA-25 to compare Georgian and Azerbaijani isolates and discern genetic patterns.

3. Analysis and assessment of geographical and environmental data from selected sites using GIS to determine risk factors associated with the persistence of the disease

4. Mapping using GIS and collaborative interpretation of the distribution and prevalence of *B. anthracis* in the border regions of both countries and regionally.

5. As a non-research aim in this project, training with and between Georgian and Azerbaijani scientists will occur throughout the project.

Technical Approach and Methodology

AIM 1: *Identification and mapping of* B. anthracis *foci distribution in the Georgio-Azerbaijan border region using GIS; collaborative collection of samples from affected sites (burial, contaminated areas); positive confirmation of* B. anthracis *contamination at selected sites.*

RATIONALE

There are several known *B. anthracis* foci in the Georgia-Azerbaijan border region, although the exact location of the foci may be unknown; in many cases, historical records list the village where the case(s) occurred without specifying the exact location(s) within the village. Old and new *B. anthracis* foci along both sides of the border will be mapped using GIS. Mapping known foci will provide Georgian and Azerbaijani collaborators with a selection of sites to sample for the presence of *B. anthracis* and provide a more thorough description of *B. anthracis* distribution along the borders of Georgia and Azerbaijan.

APPROACH

Sites will be selected for environmental sampling based on historical data provided by NCDC in GG and SVCS in AJ. These sites will include known *B. anthracis* foci, animal burial sites, and livestock grazing and holding areas in and around the selected villages. Several soil samples will be collected from each site to maximize the potential for collection of *B. anthracis*. Samples will be analyzed for the presence of *B.*

anthracis using traditional bacteriological techniques; molecular methods will be used for confirmation and characterization of isolated strains.

Geographic distribution of *B. anthracis* along the Georgia-Azerbaijan border will be determined using GIS. All known historical foci in this area will be incorporated into a modern GIS system based on existing data and maps.

There are six regions in Georgia that border Azerbaijan (Lagodekhi, Dedoplistskaro, Sighnaghi, Sagarejo, Gardabani, and Marneuli). Based on case records from 2000-2013, human anthrax cases have been registered in 39 villages in the border region and 26 villages have recorded livestock cases. In addition, many of these villages have historical foci registered from 1881-2000 (data not shown, communication from Mr. Kracalik, UF). From these villages, 30 were selected for sampling based on their proximity to the border (Table 1).

There are seven rayons in Azerbaijan that border Georgia (Gazakh, Agstafa, Tovuz, Samukh, Gakh, Zagatala, and Balakan) and each of these rayons have recurring cases of both human and animal anthrax. In these rayons, 26 villages were selected for sampling based on historical case information and their proximity to the GG-AJ border. An additional four villages from the Shamkir rayon, which is adjacent to the border rayons and has had several recent recorded cases, were also selected. In total, 30 villages from eight rayons are proposed for sampling in Azerbaijan (Table 2).

To the extent possible, sample collection and laboratory diagnostic methods will be harmonized between institutes and countries in project Quarter 1. A detailed sample collection plan will be one of the main deliverables in this quarter of the project.

Soil sampling will be based on NCDC's procedures for soil collection. After the removal of the 3-5 cm uppermost layer, approximately 100-200 grams of soil will be collected to a maximal depth of 15-20 cm. Samples will be collected using a scoop and carefully transferred to labeled double plastic bags.

Field trips will be conducted in each region or rayon during the project, with each trip requiring sufficient duration to collect soil samples from all selected sites in the region. It is expected that sample collection will be seasonal and conducted during spring and summer. The sample collection teams in Georgia will conduct a total of 40 trips – 20 for NCDC and 20 for NFA. Each institute will visit all six regions. These trips will include three to four trips lasting approximately five days. The sample collection team from Azerbaijan will undertake a total of ten field trips to eight different rayons: four to Gakh, Zagatala, Balakan; three to Shamkir, Samukh; and three to Gazakh, Aghstafa, and Tovuz. The trips will be coordinated by representatives from Gakh Zonal Veterinary Laboratory (Gakh ZVL) with support from the local Gakh Regional Veterinary Office (Gakh RVO) to minimize the amount of travel time between the selected villages.

The villages enrolled in this study have been selected based on the historical record of known human or livestock anthrax cases derived from historical datasets (.e.g. derived under DTRA projects AJ-3 and GG-18, TAP-7) or ancillary datasets available to GG and AJ laboratories (see Tables 1 and 2). Without targeting known historical anthrax outbreak sites, it is possible and likely that *Bacillus anthracis* would not be detected in environmental samples selected through a completely random sampling scheme. Therefore,

we selected 30 villages from a total of 39 candidate villages across all 6 regions within 20 km of either side of the GG/AJ border. The 9 that were omitted fell outside of that 20 km limit. All villages have a history of human and animal anthrax cases. We assume that these villages are representative of the population living along the entire border. The villages are used by both permanent residents and pastoralists that travel through the townships.

Table 1. *Georgian villages in the GG-AJ border region that were selected for sampling, and the year of any recorded cases of human or animal anthrax between 1881 and 2013 [13] (NCDC unpublished data).*

	Khala-Tala	1948, 1952

Toward this, we propose to use a GIS-based approach to map historical data for the border region of AJ/GG and estimate the areas of greatest historical outbreaks. The objective of this study is not disease detection, but rather an environmental survey for detection and recovery of *Bacillus anthracis*. Confidence in the presence or absence of *B. anthracis* is similar to all ecological surveys; lack of detectable bacterium from a site is not unequivocal evidence of its absence. Rather, the goal is to sample in enough locations at an appropriate level to, on average, obtain a reasonable estimate of the distribution and isolation rate from the soil. This will allow us to classify or model the relationship of the local environment with the presence of the bacterium and to gain a cross-section of bacterial isolates to genetically characterize. The distribution of *B. anthracis* is known to be limited by ecological conditions such as soil pH, elevation, and temperature; keeping these factors in mind, we will select sites that are within the range of characteristics established in the literature and via expert opinion. GIS based maps will highlight areas with an alkaline soil pH >6.0 that are within low lying depressions or valleys that experience average annual temperatures between 20-37^0 C [14, 15]. (See Aim 3 below for details on the GIS process for estimating environmental conditions for the region).

The sampling plan is designed to provide a bias towards obtaining positive samples from the environment. This project is specifically aimed at isolating *B. anthracis*, so the selection of the actual sample site and sampling methodology within a grid, or a community within a grid cell, is likely to be influenced by local environmental conditions such as moist or alkaline (limestone) soil or the distribution of contemporary livestock within that community. Local climatological conditions (e.g. recent rains or drought) should be considered, as well as communication with local veterinary officials through the veterinary services engaged in the project from either GG or AJ, respectively, to identify known farms where either veterinary or human cases have been identified.

In total, approximately 3,000 soil samples will be collected from sites identified in Georgia and 3,000 in Azerbaijan. Safety at sample collection sites will be ensured by the use of standard personal protective equipment (PPE). We assumed the project will collect 50-100 soil samples per village or a total of 1500-3000 soils samples across all villages. Table 3 tabulates the minimum detection levels expressed as percentages for expected ranges in differences between Ba in Georgia and Ba in Azerbaijan. Note that we anticipate collecting 50-100 soil samples for each village that will permit minimum detection difference between sites of 4.2-7.0%. We will be able to detect even smaller differences as low as 1.0% to 0.7% with sample sizes >2,163.

Table 3. *Sample size calculations for recovering Bacillus anthracis from soils in study. Calculations are based on a fixed detection threshold for bacteria in soil and represent number of soils sample positive based on % of samples with detectable bacteria.*

	Minimum Detection Difference Levels (%)						
%	7.0%	5.0%	4.2%	3.0%	2.0%	1.0%	0.7%
N	50	90	100	242	536	2163	3000
Within Village	Detectable Range						
Across Village				Detectable Range			
	Assumptions: GG BA is 20% in soil; alpha=.05; Beta=.20

Sample collection from selected villages in Georgia will be the joint responsibility of NCDC and NFA. NCDC will collect 2,000 samples, which will be transferred to the NCDC Richard G. Lugar Center for Public Health Research (Lugar Center) for processing. NFA will collect an additional 1,000 samples from livestock grazing and holding areas in and around the selected villages. These samples will be transported to LMA for further investigation. There will be 50-100 samples collected from each village, dependent on the environment, topology, and affected areas. NCDC has an approved standard operating procedure (SOP) for soil sample collection (#A30-2; p-5) in place at the Lugar Center that will be shared with Azerbaijani institutes to harmonize methods. Soil sample processing will be carried out according to approved Threat Agent Detection and Response (TADR) algorithms.

Sample collection and processing at Azerbaijani sites will be the responsibility of the Ministry of Agriculture (MoA). However, the Azerbaijani Ministry of Health (MoH) and MoA will collaboratively collect field samples when possible and in response to human cases of anthrax. When a human case is reported to the Republican Anti-Plague Station (RAPS), the RAPS sends a request to the SVCS to arrange field collection. It is expected that there will be four sites selected in each village, with 25 samples taken per site.

Sample collection and transportation will be conducted according to established biosafety and biosecurity principles. Samples will be stored at 4°Celcius (C) until analysis.

Field trips will be carefully scheduled so that the detachment teams will be in the field when the probability of isolating *B. anthracis* is expected to be high (i.e., during the time(s) of year when the highest isolation rates of anthrax were noted in the locations during any previous surveillance activities). The surveillance programs will be flexible so that the teams can be redirected to another specified region in Georgia or Azerbaijan if very few strains are isolated in historically contaminated locations, and/or depending on the prevalence of *B. anthracis* at the sites during the surveillance periods. In addition, sample collection efforts also may be fine-tuned as initial GIS data is obtained and analyzed. In addition, any active cases that are received from these defined areas will be incorporated into this project.

All field teams will be required to label each specimen/sample and to make detailed entries in the logbook, which will include at a minimum:

- An identification number for each specimen/sample
- The date and time each specimen was collected
- The name of the person who collected the sample
- The location in which the sample was collected
    - Common name (village)
    - GPS coordinates
- The type/name of the sample

Sample Processing

All specimens received will be inventoried and processed according to DTRA-approved SOPs. Upon sample receipt, information will be recorded in the Electronic Integrated Disease Surveillance System (EIDSS), if appropriate. Barcode labels will be applied for laboratory identification and specimens will be aliquoted for

future testing. When immediate processing of specimens is not feasible, they will be stored (2-6°C) and processed within 48 hours post-collection. Freezing of the specimens will be avoided whenever possible because of the possible deleterious effect of freezing on bacterial recovery [16].

Laboratory Diagnostics: Bacteriological Testing

In compliance with established DTRA protocols, the samples will be processed at the receiving laboratory and transferred to the appropriate bacteriology laboratory for further testing. According to the TADR algorithm, bacteriology and molecular biology tests will be used for the identification and confirmation of *B. anthracis*. The samples will be screened for the presence of *B. anthracis* by isolating the bacterium on agar plates and using standard, well-accepted confirmation tests. The approved TADR algorithms currently used in Georgia and Azerbaijan are shown in Figure 5 and Figure 6, respectively.

Organisms will be isolated from environmental specimens using DTRA-approved protocols. Soil organisms will be isolated by mixing 25 grams of soil with 75 milliliters (mL) of sterile distilled water and shaking vigorously by hand. Samples will be left for 60 minutes at room temperature (approximately 22°C) to allow the soil to settle, then 1,000 microliters (µL) aliquots will be taken from the surface and placed in cryovials. Samples will be heat shocked at 65°C for 20 minutes to inactivate vegetative bacteria. After heat shock, 150 µL volumes will be spread over the surface of 5% (v/v) sheep blood agar plates and Polymyxin B - Lysozyme - EDTA - Thallous acetate Agar (PLET) agar plates, allowed to dry for five minutes at room temperature and then incubated at 37°C overnight. Following incubation, plates will be examined for the presence of colonies with characteristic *B. anthracis* colony morphology. Colonies exhibiting the characteristic "Medusa head" morphology with margins that resemble tangled, curly hair will be characterized further.

Suspected *B. anthracis* colonies will be confirmed using Gram staining; lysis by gamma phage; motility testing; detection of poly-D-glutamic acid capsule by DFA; and detection of cell wall-associated polysaccharide by DFA. Suspected *B. anthracis* isolates will be genetically confirmed using real-time polymerase chain reaction (PCR) analysis [17]. All bacteriological tests will, at a minimum, be carried out under Biosafety Level (BSL) 2 conditions using BSL- 3 practices and will be confirmed using ATCC control strains.

In Georgia, isolated and confirmed strains at LMA will be transferred to NCDC Lugar Center for further genetic characterization and will be placed within the NCDC culture collection. The established transfer protocol will be used to move samples between LMA and the Lugar Center.

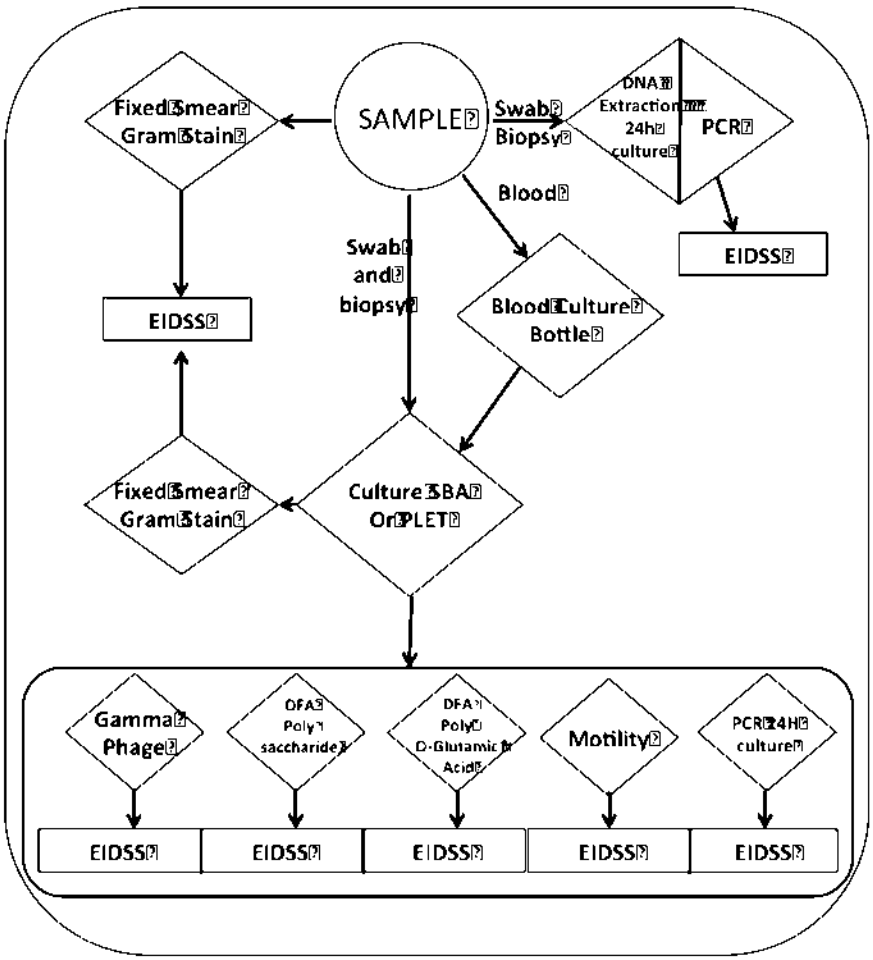

Figure 5. *Confirmatory laboratory tests for* B. anthracis*, TADR algorithm for Georgia, DTRA Approved 2008-present.*

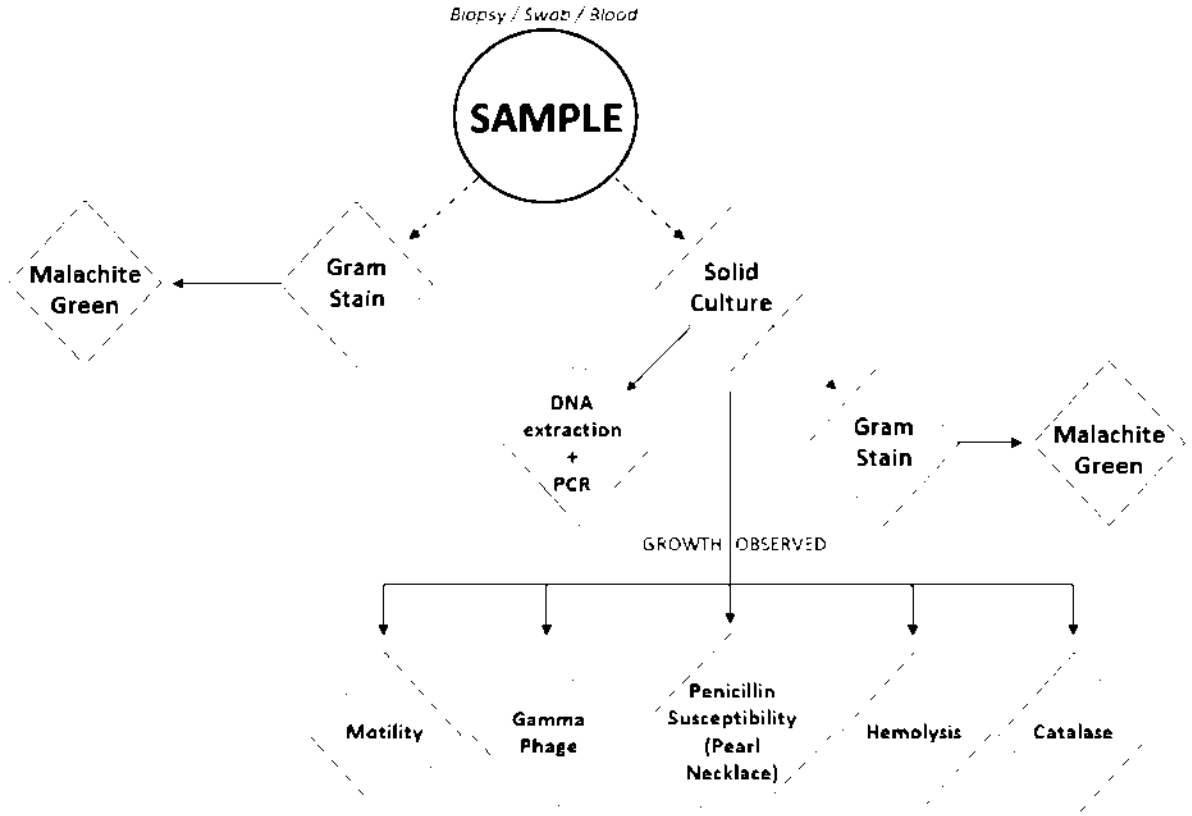

Figure 6. *Confirmatory laboratory tests for* B. anthracis, *MoA algorithm for Azerboijan. Confirmation testing can be performed at the ZVLs but is often sent to the RVL.*

AIM 2: ***Molecular genetic characterization of isolated*** **B. anthracis** ***strains using SNP (canSNPs, Georgian SNP panel, Azerbaijan SNPs) and MLVA-25 to compare Georgian and Azerbaijan isolates and discern genetic patterns.***

RATIONALE

Investigators at the NCDC and LMA in Georgia, as well as the SVCS and RVL in Azerbaijan will determine the basic genotypic properties of *B. anthracis* strains that are newly isolated from this study and compare the genetic relatedness of these strains. Some sampling of the border region was completed under the DTRA-funded projects GG-18 and GG TAP-7; any strains isolated from these samples will be utilized in this project. In addition, any new strains that are isolated in the border region as part of ongoing routine surveillance will be included for molecular characterization.

The MLVA-25 results from 14 AJ isolates were studied under the DTRA-funded project AJ-3. These isolates were genotyped and the results show that they were most closely related to Iranian *B. anthracis* strains, a southern neighbor with a well-documented history of anthrax. These strains also had a completely different lineage from published Georgian *B. anthracis* strain genotypes, the northern neighbor [12]. It is hypothesized that the Georgian and Azerbaijan isolates in the border region will show genetic diversity. Significant work has been done in a DTRA-funded Walter Reed Army Institute of Research (WRAIR) NCDC

strain characterization collaboration to implement global and regional SNP analysis of archival NCDC strains. The MLVA-25 analysis of NCDC strains through this collaboration will provide an initial basis of comparison for the previously typed Azerbaijani strains. Building on these results, the work planned in the proposed project will more fully characterize the genetic patterns of *B. anthracis* along the Georgia-Azerbaijan border region, explore the interface of genetic subtypes circulating in this region, and perhaps define natural boundaries between different lineages.

Genetic characterization of the strains will be a joint effort between regional collaborators led by NCDC with support by WRAIR/USAMRU-G. Molecular specialists from LMA in Georgia and two specialists from VCI and RVL in Azerbaijan will be trained on molecular characterization methodologies (SNP, MLVA) at the Lugar Center. Samples may be used for further molecular analysis and other future studies that are not within the scope of this project.

APPROACH

The NCDC project team estimates that the soil sampling proposed above will result in approximately 100 *B. anthracis* isolates from 3,000 soil samples. It is estimated that an additional 100 isolates will be collected as a result of soil sampling in Azerbaijan. Therefore, it is estimated that molecular characterization will be conducted on approximately 250 isolates, to account for any additional strains that may be isolated during routine surveillance activities.

All bacteriological manipulations and extraction of genetic material from Azerbaijani *B. anthracis* isolates will be conducted at the Gakh 7VL and genomic DNA will be transferred to the Lugar Center for molecular characterization. All procedures for molecular characterization of Georgian *B. anthracis* isolates will be conducted at the Lugar Center.

In order to complete the molecular characterization of isolates, a substantial amount of genomic DNA will be required. Pure culture isolates of suspected *B. anthracis* will be cultured on blood agar for 24 hours. Several loops of suspected cultures will be placed in 1.5 mL microcentrifuge tubes and heat killed, and then will be incubated for one hour in 50% v/v chloroform. Genomic DNA will be extracted using a commercially available extraction kit following the manufacturer's instructions for bacterial cultures. Purified DNA will be aliquoted and frozen for future analysis.

Sterility of samples will be determined using NCDC-approved SOPs in place at the Lugar Center. Sterility will be confirmed by removing 1-10% of the final volume and incubating in appropriate growth media. At Day +3, an aliquot will be streaked onto appropriate agar, incubated O/N, and the sterility culture will be re-incubated. At Day +7, the streaking procedure will be repeated. If no growth is observed at either time point then the preparation can be considered sterile. Primary and secondary containers will be decontaminated for 30 minutes with 1% sodium hypochlorite (NaOCl), and stored at -20°C. After sterility confirmation and surface decontamination, samples will be handled in BSL-2 containment.

Sterile DNA samples from *B. anthracis* isolates in Azerbaijan will be packaged using standard packaging SOPs and shipped to the NCDC Lugar Center following all local and regional shipping regulations. Prior to transport from Azerbaijan, DNA will be certified sterile according to the above process. Samples will be

used for genetic analysis performed through collaboration between NCDC Lugar Center staff and Azerbaijan supported by WRAIR/USAMRU-G.

Molecular analysis will include: a) use of real-time PCR assays for SNPs to determine major genetic groupings and regional genetic clusters; and b) use of Variable Number Tandem Repeat (VNTR) analysis to provide higher resolution genetic differentiation in an MLVA. Georgian and vaccine reference strains from the collection at the NCDC Lugar Center will be used as standards for comparison.

SNP Analysis

SNP analysis of *B. anthracis* has been established as an extremely valuable tool for molecular characterization of this species [18]. An SNP typing panel has previously been established at NCDC based on canonical and Georgia-specific SNPs. This type of analysis will be useful for the characterization of Azerbaijani isolates in addition to the comparison of Azerbaijani and Georgian isolates. Genetic characterization of isolated *B. anthracis* strains by SNP will include: canonical SNPs (canSNPs) to determine global phylogenetic grouping; the Georgian SNP panel to determine shared regional lineages; and Azerbaijan-based SNPs (Van Ert, Nikolich, Blackburn, unpublished) to determine if these specific SNPs are present in Georgian isolates.

VNTR Analysis

Multilocus VNTR analysis is used to characterize highly monomorphic pathogens such as *B. anthracis* and *Brucella* species [19]. A MLVA-25 technique will be utilized to analyze *B. anthracis* isolates to provide strain-level differentiation. These techniques were recently adapted for use on the ABI 3130xl platform available at the NCDC Lugar Center in the DTRA-funded WRAIR-NCDC strain characterization collaboration. This high-throughput technique allows many strains to be analyzed with relatively few reactions.

Training for the molecular genetic analyses needed to accomplish the objectives of this aim will be conducted in the Lugar Center in Tbilisi, Georgia. Specialists from the Georgian LMA and from SVCS and RVL in Azerbaijan will be trained in molecular characterization methodologies by NCDC and WRAIR/USAMRU-G subject matter experts (SMEs). The collaborators will assess skill levels of the specialists from each institution In Quarter 1 and determine a training plan for Quarter 2 and Quarter 3, including joint training to facilitate implementation toward the proposed aim. SOPs and training materials developed by NCDC and WRAIR will be leveraged for this project. Training will be integrated with new analysis/data collection where possible to expedite the project and will integrate data management and analysis/interpretation to meet project objectives. Software and computers already in place at NCDC and WRAIR/USAMRU-G will be used for planned analyses.

AIM 3: *Analysis and assessment of geographical and environmental data from selected sites using GIS to determine risk factors in persistence of the disease.*

RATIONALE

As discussed, anthrax is a widely distributed endemic disease in each Georgia and Azerbaijan, historically affecting nearly all territories within each country. Generally, the ecological conditions that support the persistence of *B. anthracis* can be defined on the landscape using statistical modeling approaches. For example, an ecological niche model based on several important ecological conditions that support pathogen persistence have been used to successfully describe the potential geographic distribution of the

bacterium in the United States and Kazakhstan [8, 9, 11]. Additionally, recent space-time human anthrax modeling efforts during the last decade (2000-2009) have confirmed that environmental drivers such as soil pH and cattle density are related to disease persistence in Georgian communities [6]. Preliminary ecological niche models based on historical data suggest that *B. anthracis*-suitable habitat is limited to a portion of the Azerbaijani landscape although additional modeling is needed to construct more robust estimations of the organism's distribution. Favorable climate conditions: abundance of humus in soil, cataclysms (flooding, soil displacement, earthquakes), and massive earth-moving construction work throughout the country likely increase the risk of disease occurrence in livestock and subsequent human exposure. Constructing updated ecological models of the distribution of *B. anthracis* in Azerbaijan and Georgia will provide crucial information regarding surveillance and risk.

APPROACH

As part of the study a set of risk models will be developed that first model anthrax presence/absence, using logistic regression, to determine if areas of disease reporting correspond to environmental covariates that predict presence. These environmental models, which take into account a number of environmental conditions, including, weather, temperature, and other factors, will also incorporate data on livestock density and agricultural practices to determine if anthrax is concentrated relative to zones of agricultural production. A GIS of livestock density developed from the Food and Agriculture Organization (FAO) data is in place for both countries [20]. In addition, databases on agricultural practices from Georgia are complete and will be developed for Azerbaijan by SVCS with assistance from the UF team.

In general, logistic regression can be used to identify factors that contribute to the log odds of a positive (presence) or negative (absence) event occurring and is written following Hosmer and Lemeshow [21]: $log\frac{p(x)}{1-p(x)} = \beta_0 + \beta_1 X_1 \ldots$, which can also be rewritten to solve for the probability of an event occurring bounded between values 0 and 1: $P(1) = \frac{\exp(\beta_0+\beta_1 X_1 \ldots)}{1+[\exp(\beta_0+\beta_1 X_1 \ldots)}$, where P is the probability of positively identifying a *B. anthracis* sample in the environment, β_0 is the intercept of the model and β_1 is the coefficient of the covariate X_1. In the case of *B. anthracis*, logistic regression can be used to model ecological characteristics such as soil pH and temperature that may support the presence of the bacterium in the environment, as previously described in Kazakhstan [15]. Field sampling strategies outlined in this study allow for flexibility in the spatial unit of the dependent variable (presence or absence of *B. anthracis*), i.e. samples can be modeled by transect, or grouped by village depending on the stability of the fitted model. Since environmental covariates are derived from remotely sensed satellite or interpolated weather station data, covariates are available in a gridded format (e.g. 1km x 1km spatial resolution). Given this data format, samples can also be assigned to a grid cell to provide another measure of a sampling unit, the selection of which ultimately depends on the success of the statistical modeling approach. The output of the model will represent the association of each covariate with the probability of positively identifying *B.* anthracis, and a spatial risk surface corresponding to the probability of the event for each combination of covariate grid cells. In some instances, the logistic model may not fit the data, which can be determined by a *past hac* statistical analyses such as the Hosmer and Lemeshow goodness-of-fit test [21]; this may lead to the adoption of other statistical models. If the logistic model is not a good fit for the data, other generalized linear modeling (GLM) approaches can be adopted that take into account a different distribution in the data through a link function. Poisson and negative binomial regression can both model the occurrence of counts (number of *B. anthracis* positive samples from field data or number of villages reporting outbreaks from historical databases), and in order to adjust for differences in collection effort, an offset in the model can be used to account for the total number of

sample collected at each spatial unit (i.e. transect, village, grid cell) [22]. In this manner the fitted values of the model will represent the natural log of $\frac{number\ of\ positive\ samples}{total\ number\ of\ samples}$ in relation to a linear combination of environmental covariates.

To overcome potential pitfalls related to our modeling choices due to the stringent assumptions of homogeneity in the variance and normally distributed residuals etc., we have also adopted ecological niche modeling methods that offer less rigorous assumptions. The Genetic Algorithm for Rule Set Production (GARP) [23] is a presence-only approach that requires known locality data to create a predicted geographic distribution of an organism based on a set of environmental parameters [24]. The approach has been used to model the predicted geographic distribution of anthrax across several landscapes [11, 25-28]. Briefly, GARP employs a pseudo-absence resampling algorithm to exhaustively sample locations from the landscape to compare to known occurrence points (here positive sampling locations). The algorithm them employs a set of computational rules based on the rules of genetics (e.g. insertions, deletions, mutation) to fit a randomly derived combination of covariates and rule-types (e.g. logistic regression functions or climate range envelopes) to pattern match non-random relationships between occurrence locations and covariates. Like the logistic or GLM approaches above, GARP then estimates rule success at predicting presence/pseudo-absence and projects those models onto the geographic landscape to predict the potential geographic distribution of the species being modeled, here *B. anthracis*. The modeling process is well described in the literature, specifically for *B. anthracis* see Blackburn et al. [26] and Mullins et al. [27].

Although the environmental conditions that support the pathogen are documented, it is not clear whether these factors are similar across Georgia and Azerbaijan. Research has suggested that different strains of *B. anthracis* may have certain ecological affinities related to soil conditions [29]. Creation of spatial risk models will allow for the differentiation of ecological conditions across the south Caucasus and will help to determine whether or not these are related to differences in molecular characteristics, when modeling efforts are coupled with the genetic analyses proposed here (SNP and MLVA-25 VNTR genotyping). In this study, we will use GG and AJ specific models and a combined model (treating both countries as a single landscape) to identify whether or not the ecological conditions that define risk hold constant between Georgia and Azerbaijan. This approach will then be repeated once isolates are defined by genotype (if sample sizes permit following guidance from Mullins et al. [27]).

In summary, these modeling approaches are proposed to estimate the potential geographic distribution of the pathogen across the shared region of GG/AJ border areas and compare those models to available models from either country, respectively (see Figure 4). We then aim to model specific genetic lineages, should data represent a sufficient sample size for spatial modeling. In each case, these models will be related to historical anthrax reporting to relate ecological conditions to risk. For that we propose to follow the modeling framework of Kracalik et al. [6] to define risk.

A regional model will determine if *B. anthracis* has a regional climate signal across genotypes or within lineages. Similar work comparing Kazakhstan, the US, and Italy shows similar lineages can have distinct environmental signatures on different landscapes [9]. The transition from Georgia's high mountain valleys to lowland Azerbaijan may provide a similar local effect to what we see across continents between the US and Kazakhstan. These efforts will yield new ecological niche models specific to AJ and GG *B. anthracis*

lineages that are not yet available. The regional risk model would be a first of its kind and provide spatial information for surveillance efforts and planned control activities.

Limitations

Modeling environmental risk factors in a logistic regression framework can take into account the sampling effort at each site, modeled as a binomial fraction $\frac{number\ of\ positive\ sample}{number\ of\ samples\ collected}$. The total effort at each site (number of samples collected) can also be used as an offset in a different GLM framework. Limitations to logistic regression include over dispersion (variance/mean >1) in the data due to variability in the probability of identifying positive samples as well as correlation among samples [21]. Given that the selection of villages and sampling sites is spatial in nature and based on historical data, accounting for spatial autocorrelation in the model residuals will likely be important [30]. By including measures of the variance between locations through the construction of a semi-variogram it is possible to account for bias or spatial dependence (non-randomness) in the location of sampling sites [31]. To overcome bias in ecological niche models, samplings sites can be filtered using a distances based approach to remove superfluous data and thereby limit over-fitting of the model [32].

AIM 4: *Mapping using GIS and collaborative interpretation of the distribution and prevalence of* B. anthracis *in the border regions of both countries and regionally.*

RATIONALE

GIS models of the geographic distribution of *B. anthracis* across the south Caucasus will provide a better understanding of anthrax transmission, disease ecology, and epidemiology for this international border area. The modeling described in Aim 3 will provide spatial estimates of the geographic distribution of the pathogen, while Aim 4 will provide spatial exploratory analyses. A substantial number of agriculturally-acquired human cases are registered annually in Georgia and the disease remains a significant threat to human health. Control of anthrax infections is a primary goal of the Public Health and the Veterinary Service in Georgia. Georgia currently has approximately 2,000 registered historical anthrax-affected areas [13], and recent reports indicate a worsening human anthrax situation [5], raising concerns over the disease re-emerging in historical foci or emerging in previously unreported areas. Similarly, in Azerbaijan (based on preliminary findings from the AJ-3 project) anthrax has persisted in human and livestock for decades. The re-emergence of the disease in neighboring Georgia has raised concerns over the spread of anthrax in Azerbaijan. This aim will employ available geospatial data (AJ-3, GG-18, and unpublished outbreak data (see Tables 1 and 2 above) to test for spatial clusters that may identify areas of significant disease reporting compared to spatially random distributions [25]. Such analyses can provide insights into prioritizing surveillance [25]. These analyses will use anthrax reporting data to better understand spatial patterns of outbreaks to augment results from soil sampling.

APPROACH

The Azerbaijani SVCS implements anthrax surveillance and control and conducts broad livestock vaccination annually. Hotspot analyses from historical human data from the RAPS in Baku illustrate high levels of agreement with risk zones defined by SVCS from a historical perspective, but do not necessarily agree with the most recent decades reported. Recent evidence from Azerbaijan further suggests that the distribution of anthrax has undergone changes in its occurrence and spatial distribution (shifting eastward), highlighting the need for further research [7]. This shift may be a result of changes in the

surveillance of post-Azerbaijani independence from the Soviet Union and may also reflect changes in the prevalence of anthrax as control and vaccination were established in recent years.

GIS analysis in Azerbaijan and Georgia (from DTRA-funded projects AJ-3 and GG-18, respectively) represent the first efforts to define areas on the landscape where *B. anthracis* might persist and, as suggested in other studies, can inform passive surveillance. For example, areas predicted to be at risk for anthrax with high model agreement should have regional diagnostic capacity for *B. anthracis* even if the disease is rarely seen. Regional hotspot analyses may assist in defining targeted control and surveillance priorities for livestock, which appears the most likely source of human disease in both countries. In the latter case, hotspots reflect known areas of repeated outbreaks. As stated above, MLVA-25 results from AJ isolates identified genotypes that were closely related to Iranian strains, and were a different lineage from published Georgian *B. anthracis* strains. More work is needed to evaluate these genetic and geographic relationships. Ultimately, linking these GIS-based models with high resolution genotyping will provide the Azerbaijani and Georgian public health systems with the ability to trace outbreaks and better define zones of risk.

Spatial analysis within this project will expand previous efforts to map anthrax in both countries. First, data from previous CBEP projects (GG-18, AJ-3; see Figures 1, 3 and unpublished data, see Tables 1 and 2) will be leveraged to develop maps of anthrax using spatial clustering analyses, such as A Multidirectional Optimal Ecotope-based Algorithm (AMOEBA) - a cluster geomorphology test that defines local spatial clusters of anthrax outbreaks [15]. Generally, spatial clusters, or hotspots, of disease can be defined as an excess of cases in space, time, or both space and time [33]. Broadly, these statistical methods can be categorized into global, local, and focal clustering. Global clustering tests are used to evaluate whether disease events are clustering over a study area, without identifying the location(s) associated with the clustering ,whereas local statistics can identify the geographic position and spatial scale of clusters [34]. Focal statistics, on the other hand, may be used to explore clustering of a disease around a specific location such as an environmental pollutant [35]. Local statistics encompass some of the commonly used distance-based statistics in spatial epidemiology such as the $G_i^*(d)$ statistics of Getis and Ord [36, 37], and the spatial scan statistics [38]. In each of these approaches, a hypothesis test is framed to compare whether or not spatial patterns of anthrax data differ from spatial randomness. In other words, we test if anthrax events are closer together in space that would be expected if the disease were randomly distributed across the study region.

In this study, spatial clustering analyses will be used for two primary purposes. First, spatial autocorrelation can violate the assumptions of the spatial modeling described in Aim 3. Techniques such as AMOEBA or the Getis and Order statistic can be employed to test for spatial autocorrelation in data to be modeled, allowing us to adequately address this in the models. Second, these techniques can be used to identify areas of greater than expected clustering of cases, which can inform surveillance priorities for the veterinary and public health services in each country.

To complete these GIS-related aims, ecological modeling and advanced GIS training will be conducted for GIS personnel at SVCS-AJ and (as needed) NCDC-GG. During project Quarter 1, collaborators from the UF will assess personnel skill levels from each institution and lay out a training plan for project Quarters 2

and 3. The UF will conduct a refresher training course at SVCS-Baku for AJ personnel within the first two quarters of the project. In addition to in-country training by UF, a series of two or three virtual meetings will be held with SVCS using Skype or GoToMeeting. These meetings will be interpreted in the local language.

For ecological and risk model training, a five-day training workshop will be held for GG and AJ participants at the Lugar Center GIS Lab. This will allow the engagement of all GIS partners in a single venue. The UF will conduct at least one additional site visit to Tbilisi and Baku later in the project, once field data are available for modeling. Training materials previously developed by the UF SEER Lab will be leveraged to provide skill development specific to the tasks of ecological niche modeling and risk modeling using either negative binomial count models or logistic regression. Training will accompany data development and organization to ensure that training specifically meets the project research objectives. During project Quarter 1, software access and computer hardware at SVCS-AJ will be assessed to ensure that appropriate software is available for the analyses planned.

AIM 5: ***As a non-research aim in this project, training with and between Georgian and Azerbaijani scientists will occur throughout the project.***

RATIONALE

Training is an important component of this regional project and the project teams from both Georgia and Azerbaijan will mutually benefit from collaboration, mentoring, and joint mentoring and training from the research collaborators, and from learning from each other. As part of this project, the approach listed below will outline the types of trainings that will be conducted and their outcomes.

APPROACH

The project teams will meet in the first quarter of this project (once in Georgia and once in Azerbaijan) to formulate and complete a detailed "Training Plan", which will be used throughout the entire project.

Table 4. *Trainings that will completed during this joint Georgian – Azerbaijan research project, this outline will be transformed into a detailed training plan during the first quarter of this project.*

Training	Provider	Number of trainees/ their affiliation	Location	Topics
BS&S Annual Refresher Training for Azerbaijan and for Georgia	BNI for AJ CH2M HILL for GG	AJ project participants from: SVCS, RVL, VCI, RAPS, Gakh ZVL	Baku RVL , AJ	Proper use of PPE in field and lab; Fit testing for N95 masks; Disinfection of vehicles and work area; Waste disposal in the field and laboratory; Risk assessment
			Gakh ZVL, AJ	
			NCDC, Lugar Center, GG	
			NFA, GG	
			LMA, GG	

Training	Provider	Number of trainees/ their affiliation	Location	Topics
BS&S field work training for Azerbaijan	US collaborators and Georgian participants	AJ project participants from: SVCS, RVL, VCI, RAPS, and Gakh ZVL	Field sites in Azerbaijan	BS&S in sample collection and transportation (Note: GG participants have already been trained and will provide training in this area jointly with US collaborators)
BSL-2 Advanced Techniques for Azerbaijan	US collaborator – WRAIR/USAMRU-G	AJ project participants from: SVCS, RVL, VCI, RAPS, and Gakh ZVL	Training will occur at the Baku RVL and the Gakh ZVL, Azerbaijan	Working with *B. anthracis* in the BSL-2 laboratory (Note: GG participants have already been trained in this area)
PCR & Bacteriology for Azerbaijan	RVL project participants	Gakh ZVL	Gakh ZVL, Azerbaijan	PCR; Bacteriology (Note: GG participants have already been trained in this area and the project team and U.S. collaborators agree that Georgian scientist as well as U.S. collaborator observation and coordination in the early stages will be required to ensure uniformity of procedures across the project)
Genotyping and analysis training in Georgia and in Azerbaijan	GG team and WRAIR/USAMRU-G	AJ participants from the RVL and VCI GG participants from the NCDC, LMA, and NFA	Lugar Center, Georgia	Single Nucleotide Polymorphism (SNP) analysis and Multiple Locus Variable number tandem repeat Analysis (MLVA-25), approximately 100 isolates of *B. anthracis* to be analyzed

Training	Provider	Number of trainees/ their affiliation	Location	Topics
GIS training	US-UF team	AJ participants from SVCS and VCI GG participants from the NCDC, LMA, and NFA	Azerbaijan and Georgia	Intermediate and Advanced GIS analysis with ArcGIS 10; GIS exploratory data analysis; Ecological modeling with niche models and logistic regression
Advanced GIS Ecological Niche Modeling	US-UF team	AJ participants from SVCS and VCI GG participants from the NCDC, LMA, and NFA	Lugar Center in Georgia	Advanced ecological niche modeling workshop for AJ / GG personnel conducting GIS work

Expected Results

Project results can be used to formulate targeted public health interventions aimed at increasing knowledge of the disease within specific demographics. At the same time, future efforts can focus on identified affected areas for livestock surveillance and control. In addition, this project will contribute to the formation of a regional research network, allowing scientists to benefit from the experience and knowledge of their colleagues through mentorship and collaboration. Such a network could also potentially contribute to the development of regional strategies for especially dangerous pathogens (EDP) surveillance and control. Enhanced surveillance efforts will facilitate development of cooperative disease control efforts in the region to further anticipate outbreaks and restrict transmission.

During the proposed study, Azerbaijani participants will be trained as needed in bacteriology, PCR detection, genetic characterization, and in biosafety and biosecurity by Georgian and US collaborators. Training will be conducted at the Lugar Center in NCDC and USAMRU-G laboratories. This project and the collaboration with Azerbaijani scientists will introduce the Lugar Center as a regional reference laboratory for *B. anthracis*.

A major goal of this project is to provide or expand sustainable skills and capacity in laboratory diagnostics and GIS for each AJ and GG partners. Toward this effort, this project will provide new or expanded capacity

in laboratory diagnostics for *Bacillus anthracis* to improve pathogen detection/disease diagnosis in each country, which can immediately improve anthrax testing. This will provide new or expanded capacity in molecular diagnostics, including PCR, to improve diagnostic efficiency and accuracy in each country. The capacity building proposed here will expand on the needed infrastructure and skills to maintain these techniques after the project is completed. The ecological modeling and GIS proposed will provide new or expanded geospatial analysis capacity and map making skills to better understand pathogen distributions and dissemination of modeling results to policy makers. Specifically, ecological niche model outputs are maps of the most likely habitats where the pathogen is likely to persist. These maps can be used to identify key areas for passive surveillance, such as notifying farmers and local veterinarians that anthrax is possible and ensuring that regional labs in these predicted areas have the reagents for culture or the operating procedure to submit samples to SVS or RAPS for diagnosis. Likewise, these maps can be used to direct vaccination campaigns into communities on both sides of the AJ/GG border to direct resources where control is most needed and most effective. All of these skills will be immediately applicable to other disease systems in each country, both human and veterinary. The ecological modeling techniques proposed in the study will be implemented with open source, free software, increasing the likelihood of future applications to other projects, as costs would be limited to computer hardware and personnel. Each AJ and GG have some commercial GIS software availability to maintain, but the proposed GIS will build on existing GIS lab capacity developed under previous DTRA CBR projects, limiting the need for infrastructure (beyond adequate computing power for desktop analyses).

Project Management

***Project Implementation*: Project management, reporting, and administration**				
Description of Deliverables		**Details**	**Responsible Party**	**Schedule**
(1)	Initial set up	Materials and equipment procurement	CH2M HILL	Y1Q1
	Setting up sample testing and sample planning	Project Sample Plan and training of project personnel; GIS mapping of sample test sites.	Project team	
(2)	Training on sampling handling	Soil sampling methods	GG and AJ Project teams	Y1Q2
(3)	Collecting environmental samples	Sample collection	NCDC, NFA, AJ teams	Y1Q2-Y1Q3
(4)	Training/mentoring of confirmatory tests	Assistance with implementing diagnostics. Will include follow-up assistance on an ongoing basis throughout project.	AEP, NCDC, WRAIR, AJ teams	Y1Q2-Q4
(5)	Training/mentoring of genotyping	Assistance with implementing genotyping. Will include follow-up assistance/mentoring on an ongoing basis throughout project.	AEP, NCDC, WRAIR, AJ teams	Y1Q2-Q4

Project Implementation: **Project management, reporting, and administration**				
Description of Deliverables		**Details**	**Responsible Party**	**Schedule**
(6)	Data analysis and interpretation; GIS training when needed	Provide baseline information on the project data, genotyping, and GIS	GG/AJ project teams and collaborators	Y1Q4
(7)	Collecting environmental samples	Soil collection	NCDC, NFA	Y2Q1-Y2Q3
(8)	Confirmatory tests, GIS, and genotyping	Ongoing project activities.	AEP, NCDC, WRAIR	Y2Q2-Q4
(9)	Data analysis and interpretation	Provide baseline information on the project data, genotyping, and GIS	NCDC, WRAIR/USAMRU-G	Y2Q4

This project focuses on study of anthrax foci and will be undertaken at the collaborator institutes. The Director of each institute will appoint a project sub-manager for the work to be performed at the institute. This work will be supported by an institute-specific budget to perform the tasks outlined in this project description. In addition, there will be an overall Project Manager at NCDC to serve as a point of contact for CBEP on the activities planned under this project. The main responsibility of the Project Manager is to ensure that all communications amongst the parties are supported and that data is effectively coordinated between the studies. The main duties of the Project Manager are as follows:

1. Project Reporting
   - Aggregate quarterly reports from participating institutes
   - Prepare a short executive summary of quarterly reports
   - Coordinate the preparation of results for presentation at DTRA meetings and international conferences
   - Facilitate publications in peer-reviewed journals

2. Scientific Leadership
   - Organize and lead quarterly/monthly project conference calls
   - Maintain communications with all international collaborators
   - Organize local meetings of the Georgian project participants to discuss the project progress
   - Participate in international conferences and meetings

Meeting Goals and Objectives of CBR Program

This proposal addresses all CBEP goals:

1. Utilize BSL-2 & BSL-3 laboratory capacity to achieve more advanced research objectives enabling discovery of the diversion or accidental release of biological materials.
2. Develop infectious disease baselines and identify new pathogen strains.
3. Establish a nationwide disease detection and surveillance system.

4. Long-term sustainment of the disease detection networks in Georgia and Azerbaijan.
5. Development of the Lugar Center as a regional reference laboratory.
6. Training of Georgian (LMA) and Azerbaijani collaborators on molecular characterization of an EDP.

BIOSAFETY AND BIOSECURITY OVERVIEW

All of the studies proposed in this application will adhere to the biosafety recommendations contained in the 5th edition of the Biosafety in Microbiological and Biomedical Laboratories (BMBL) Manual published jointly by the CDC and NIH (relevant text from the BMBL Manual is reproduced below for each pathogen).

Biosecurity

All samples will be kept in locked laboratories and locked refrigerators. Sample logbooks will be maintained and all samples and cultures will be kept under standard security measures as defined by CBEP.

Safety Issues

Safety at sample collection sites will be ensured by the use of standard PPE, including: Tyvek coveralls, boots (12 inches high), N95 respirators, safety goggles, disposable hats, and double gloves (inside pair taped to the sleeves of the coverall). Staff at the collection sites have been using PPE for many years, and are skilled in the safe handling of potentially infectious material.

Approximate Budget

Budget details are available in the project Form B.

Relevance to DOD Program Objectives

- Knowledge of regional pathogens: This study will increase the knowledge of the distribution of *B. anthracis* in under-studied geographic areas of natural and new foci in Georgia and Azerbaijan. It will also complement the existing *B. anthracis* characterization project between Georgia and Turkey (GG TAP-10) and help build a regional picture of *B. anthracis* diversity.

- Gainful employment of scientists: This project will provide gainful employment for scientists working with especially dangerous pathogens from both countries.

- Transparency and integration: This project will promote transparency and integration of Georgian/Azerbaijani scientists into the global science community through participation in international conferences and publication of scientific papers in international journals.

- Establish the Baseline of Pathogenic Organisms in the Environment: The enhanced surveillance program resulting from this project will generate new information on important EDPs which will be mapped and described in detail.

Relationship to other on-going, planned, and recently completed CBEP Projects

This study will serve as follow-on to the DTRA-funded CBR projects GG-18 and AJ-3, GG TAP-7, LMA/NFA "BA Foci in Georgia", and will be a concurrent, complementary study to the *B. anthracis* characterization project between Georgia and Turkey (GG TAP-10).

COOPERATIVE BIOLOGICAL RESEARCH
Project Proposal
GG-19 – Form A/Science Plan

Version Date: 12 April 2013

Project Title

Epidemiology and Ecology of Tularemia in Georgia

Project Summary

The overall scientific goals of this study are to study the epidemiology of human and animal tularemia in Georgia. We will accomplish this through several specific objectives. First, we will examine the seroprevalence of tularemia among exposed (people living in geographic areas known to be natural foci for Tularemia) and healthy individuals; we will estimate risk factors for seropositivity. In parallel, we will also establish active surveillance for human tularemia clinical cases with the goal of increasing the efficiency and diagnostic capability to identify the disease; we will collect isolates from human cases for comparison to both current environmental isolates and historical isolates (currently in the NCDC collection). From an environmental prevalence emphasis, we will establish active surveillance for *F. tularensis* in the environment including small rodents and associated vectors and to identify the sources of outbreaks among humans. This effort includes linking environmental and animal cases with human cases. Additionally, in all strains isolated we will evaluate diagnostics methods for detecting *F. tularensis*, and, monitor patterns of antimicrobial resistance with these isolates. There will be a bacteriophage component to this project that will study isolated *Francisella tularensis* strains strain by genomic sequencing, proteomics analysis and phage discovery (expanding our efforts from our discovery of lytic Francisella bacteriophage). The result of this project will be a more accurate assessment of the base-line prevalence and geographic distribution of *F. tularensis* pathogens in humans and animals; and an improved recognition and detection of the disease in this region. Both goals will be achieved by providing better laboratory diagnostics, enhanced GIS data, and modern laboratory-based characterizations for *F. tularensis*.

Detailed Project Information

Project Description (Introduction and Overview)

Background

Tularemia is a zoonotic infection caused by *Francisella tularensis* - a small, faintly staining, Gram-negative, non-motile, non-spore-forming, pleomorphic bacterium, typically appearing as short rods or coccoid forms[1]. *F. tularensis* is an aerobic bacterium and considered as a fastidious organism due to its requirement of Cysteine for enhanced growth. The geographical distribution of *F. tularensis* spans the entire Northern Hemisphere. At present, there are four recognized subspecies of *F. tularensis: tularensis, holarctica, mediaasiatica*, and *novicida*. Each subspecies is predominantly associated with a particular geographical distribution. *F. tularensis* subsp. *tularensis* is predominately found in North Amer ca, yet was recently recovered in central Europe. *F. tularensis* subsp. *holarctica* is found over much of the Northern Hemisphere, while *F. tularensis* subsp. *mediaasiatica* has only been isolated in Central Asian republics. *F. tularensis* subsp. *novicida* is rarely isolated and prior to 2003 appeared restricted to North America. *F. tularensis* is included among the top six agents showing potential for great adverse public health impact if used as a bioterrorism agent.

Georgia offers a unique opportunity to study the epidemiology of the *holarctica* subspecies as tularemia infections arising from this variant (type B) have been long established, further, there have been detailed investigations of widespread endemic foci in south and eastern Georgia. It is here that the current risk and potential for preventive measures is in need of assessment following the cessation of local vaccination and rodent control programs. Humans are accidental hosts; infection occurs following contact with infected animals or invertebrate vectors. After

incubation period of 2-10 days, patients usually develop fever, headache, malaise, and can be accompanied by ulcerative or popular skin lesion, lymphadenopathy, hepatosplenomegaly, pharyngitis, and etc[2]. Depending on the portal of entry of *Francisella* infection, six different clinical syndromes are identified[3]: Glandular tularemia, Ulceroglandular tularemia, Oropharyngeal tularemia, Oculoglandular tularemia, Pneumonia and influenza tularemia, and, Typhoid tularemia. Post-infectious syndromes with persistent neuropsychiatric disturbances and chronic fatigue syndrome have been described in patients who were untreated or received therapy during late phase of their disease.[4, 5, and 6]

Epidemiology of Tularemia

Tularemia outbreaks and epizootics occur sporadically in scattered but widespread regions in the Northern Hemisphere. While the geographic distribution of *F. tularensis* foci is reasonably documented, some local aspects of the epidemiology of tularemia remain unclear due to the difficulty in fully understanding the potential diversity of local reservoirs and modes of transmission of *F. tularensis* (Table 1). While there may be difficulty in knowing the risk factors that exist to identify individuals who may be infected, there is an extensive literature on the risk factors, vectors and reservoirs for the four epidemic types (I - IV) of tularemia, the common risk factors relate to outdoor activity in endemic areas, usually from tick and mosquito bites, handling infected hares or rodents, drinking contaminated water and aerosol exposure from moving rodent contaminated hay and laboratory accidents.

Table 1: Epidemic Characteristics of Tularemia

Origin of epidemic	Groups of the population exposed to the infection	Mode of infection	Predominant form of the disease and location of the bubóes	Time of origin of the outbreak	Source of infection	The principle methods of prophylaxis and eradication of the epidemic
Type I Epidemic resulting from wounds of mucous membrane infection – contact epidemic						
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Rodent control work or accidental disease outbreak	Persons engaged in this work	As above	As above	[illegible]	Mice, rodents	Attention to personal prophylaxis
Receiving materials, hides	Persons engaged in this work [illegible]	Contact with [illegible]	[illegible]	[illegible]	Mice, rodents	
Type II Epidemic in which the infection is transmitted by an arthropod vector (Vector-borne)						
[illegible]	Most often [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Type III Epidemic in which infection is contracted orally (water and food-borne epidemic)						
Contamination of water by the discharges of diseased rodents	[illegible]	The use of [illegible]	[illegible]	summer and autumn [illegible]	Mice, rodents [illegible]	Sanitation of water supplies, [illegible]
Contamination of foodstuffs by the discharges of diseased rodents	People consuming contaminated foodstuffs which have not been adequately cooked. In contrast to water, in the epidemic the risk of [illegible]	[illegible]	[illegible]	Autumn and winter	Mice, rodents	Protection of foodstuffs from the activities of rodents, extermination of rodents and prophylactic vaccination of [illegible]
Type IV Epidemic where infection is the result of inhalation of contaminated air (aspiration epidemic)						
[illegible]	[illegible]	[illegible]	[illegible]	Autumn and winter	Mice, rodents	[illegible]

F. tularensis transmission to man occurs in residents and travelers to these endemic areas in Georgia, where it would be expected to find cases following the bites of ticks, mosquitoes and rodents or from handling infected hares or skinning carcasses. Water-borne outbreaks have occurred in Georgia and elsewhere from drinking water from contaminated streams or wells especially at times of civil disruption and damage to supply systems and wells. Individual cases of pulmonary tularemia are documented in Georgia because of airborne infection after moving rodent-contaminated hay and when thrashing corn. Typhoid tularemia has been diagnosed during at least two waterborne outbreaks in Georgia. Additionally, the epidemiology of the disease can appear to have changed over time, necessitating continued study of the endemic foci in any particular country. This is due to two factors: under ascertainment of cases both through lack of clinical knowledge and access to diagnostic test facilities, and the fact that the clinical epidemiology of human infection appears complex since it relates to the route of transmission and a series of very different ecosystems that maintain the agent. Hence, the clinical presentation of the human disease is indicative of both the mode of transmission and often the source of infection. In Georgia, the literature and records describe predominately oropharyngeal tularemia acquired from drinking rodent contaminated water but local inquiry established that typhoid, pulmonary and influenza forms of the disease have also been diagnosed.

Geographic distribution

Tularemia outbreaks have been reported from many countries in the Northern Hemisphere, with particular prominence in Europe and Central Asia (Russia Federation, Kazakhstan, Turkmenistan, Turkey, Bulgaria, Rumania, Serbia, Sweden, Finland, Poland, Czechoslovakia, Hungary, Austria, Germany, Holland, Belgium, France, Portugal, Spain,), North America (USA, Canada) and Asia (Japan, China) [7-15]. Investigations of outbreaks and epizootics have identified a variety of animals and vectors responsible for transmission or maintaining the bacterium, depending on the region.

Molecular epidemiology studies have shed light on the geographic distribution of subspecies of *F. tularensis*. In North America, tularemia is primarily caused *by F. tularensis* subtype *tularensis* (type A), whereas subtype *holarctica* (type B) accounts for all known human cases in Europe and Asia and causes disease in North America[16-19]. Until the end of the 20th century, it was thought that type "A" occurred only in North America; however, it has been isolated in vectors (e.g., fleas and ticks) and rodents in Europe[20]. In Central Asia, *F. tularensis* subtype *mediaasiatica* has also been identified. While not associated with animal infection, *F. tularensis* subtype *novicida* has been identified as a cause of water-borne outbreaks in Europe (Spain), North American and a rare occurrence in Australia.[21]

Recent molecular epidemiology studies have shown the variable virulence of different genotypes. In general, type A is more the most virulent; however, this is solely due to strain A1b. A US study of genotypes has identified human infections with A1b to be the most virulent with the risk of infection estimated to be as high as 24%. Other genotypes have far less mortality risk (A1a (4%), A2 (0%), and type B (7%). No human cases of *mediaasiatica* have been identified.[22]

Incidence over time

Annual incidence rates of tularemia have limited value, as the disease typically occurs in outbreaks with relatively few sporadic cases being identified between outbreaks in endemic regions (the latter often due to ascertainment bias). Outbreaks may have hundreds of cases with no or few cases recognized in the years before and after resulting in highly unstable incidence rates over time. However some important incidence trends over time have occurred. Over the 20th century a dramatic drop in tularemia cases has occurred. The incidence peaked around World War II, reaching 100,000 annually in the former Soviet Union[23]. This high incidence was primary though to be due to exposure to food and water contaminated with rodent feces and carcasses. In the US, at its peak about 2,000 cases occurred just prior to World War II[24]. A large outbreak in Kosovo in 1999-2000 raised concern that *F. tularensis* may have been used as a biologic weapon.[25, 26]

The societal disruption associated with war was associated with the substantial incidence in the mid-20th century. The much lower current incidence is related to social order and the use of preventive behaviors to reduce exposure to infected arthropods (e.g., wearing long-pants), exposure to infected animals, water treatment and reduced rodent populations in food storage.

Modes of Transmission

Humans are infected by *F. tularensis* through noculation, ingestion, and inhalation. Sources of infection occur from bites from various terrestrial and aquatic mammals, arthropod vectors, and ingestion of contaminated food and water. Aerosolization of feces and carcasses has also been implicated in outbreaks. For example, an outbreak in Sweden was caused by inhalation of *F. tularensis* from hay contaminated by vole feces.[27] In Martha's Vineyard, an outbreak was thought to be a result of inhalation of *F. tularensis* caused by a lawnmower shedding an infected rabbit carcass.[28] Inhalation is of particular concern given the more severe symptoms associated with it. The bacterium can remain viable for weeks in water, soil, and carcasses providing an opportunity for sufficient exposure to result in human infection.

Mammals are thought to be important in the environmental spread of *F. tularensis;* however, they are not thought to be a natural reservoir for the bacterium. Mammals transmit the bacterium to humans directly through bites and scratches as well as through arthropod vectors and contamination of water and food sources. The list of mammals with documented *F. tularensis* infections is over 200, however a small group of mammals are thought to be particularly important in the transmission to humans and sustainability of the organism in the environment (several types of rodents (e.g., voles, mice), hares, rabbits, ground squirrels, beavers and muskrats).[29]

Understanding the rodent population is critical in understanding the potential for human outbreaks. The size of the rodent population needs to be considered. Multiple human outbreaks have occurred following the increased density of the rodent population in a particular region. In addition, human outbreaks of *F. tularensis* have followed from outbreaks in rodents.

Several arthropods have been implicated in the transmission of tularemia. Depending on the region, mosquitoes (*Aedes, Culex, and Anopheles*), horse flies (*Tabanidae*), and ticks (*Ixodidae* and others) are established vectors. While arthropod vectors commonly are functional vectors of *F. tularensis* transmission, their role full in disease sustainability or potential to act as disease reservoirs is not clear. Previously, Olsufjev and Rudnev (9) defined major "eco-types" of disease foci that perpetuate *F. tularensis* respective to landscape, reservoir, vector and season (Table 3).

Risk factors for infection

Infection occurs among men and women of all ages. The incidence for men is over twice that for women; this is thought to be a result of outdoor activities that put them at higher risk. Hunters, farmers, landscapers and others working or recreating outdoors are at highest risk for infection. Another potential occupational risk factor is laboratory work: however, laboratory protocols have prevented infection in recent decades.[32] Table 1 lists the major factors describing epidemiological and ecological factors involved in tularemia emergence, transmission, and maintenance.

***F. tularensis* as a potential bioterrorism agent**

F. tularensis is a Category A select agent that can cause severe and fatal disease in humans if an aerosol containing as few as 10-100 colony forming units (CFU) of the bacterium is inhaled.[33] Several countries have weaponized *F. tularensis* for use as a possible biological weapon. Thus, *F. tularensis* is now considered a potential bioterrorism agent.

Tularemia in Georgia

Routine monitoring and investigation of tularemia in Georgia began in the mid-1940s and the first identified case of tularemia in South Caucasus was registered in Georgia in 1946. Since then two main regions with naturally occurring foci of tularemia have been identified: one in the

mountainous Meskhet-Javakheti region[34] and another in the Kartl-Kakheti Valley[35]. The Meskhet-Javakheti focus covers the Ninotsminda, Akhalkalaki, Akhaltsikhe and Aspindza regions. The Kartl-Kakheti focus covers central and eastern part of Georgia. Epizootics of tularemia in the Meskhet-Javakheti focus were established dur ng 1963, 1977, 1979 and 1980, 1984 and they were identified for the first time in the Kartl-Kakheti focus during 1956. The largest outbreak of tularemia with more than 300 cases was registered in the Ninotsminda region (village Gandza) in 1984 caused by drinking contaminated water. The last documented outbreak of tularemia occurred in 2006[36]. The clinical presentations during these outbreaks involved mostly glandular and oropharyngeal forms. In several outbreaks, water was implicated as a source. Factors mediating the emergence of tularemia epidemics are outlined in Table 1. Historically cultures of *F. tularensis* were isolated from *Microtus arvalis* (common vole) and other rodents as well as from its fleas and ticks. Currently the pathogen repository at NCDC contains more than 90 isolates of *F. tularensis* that were isolated in Georgia during last 60 years. All of the Georgian isolates of *F. tularensis* that have been sub-speciated and belong to subtype *holarctica*.

During 2000-2008, 40 new cultures of *F. tularensis* were isolated by NCDC from natural focus areas in Georgia: 24 isolates from *D. marginatus* ticks, 1 - *H. sulcata* tick, 6 - *H. otophila* tick, 2 – *gamasid* mites, 3 - rodents, 4 – drinking water[37]. These observations suggest that tularemia is common in Georgia, and they emphasize the need to strengthen surveillance activities.
In the past preventive measures in Georgia included massive immunization of the population in natural foci, mainly this involved only the Meskhet-Javakheti region. The immunizations were conducted in this region every five years from 1956 until 1985 and involved 96,000 people in 1970. Since then, the numbers of infected individuals have decreased dramatically; however, no vaccinations were performed after 1985.

Table 2: Recent Isolation of *F. tularensis* in Georgia

Years	Strain	Source	Location	Isolation method
2009	*F. tularensis*	*D. marginatus*	Kaspi rayon	Culturing
	F. tularensis	*D. marginatus*	Kaspi rayon	Culturing
	F. tularensis	*D. marginatus*	Kaspi rayon	Culturing
2010	*F. tularensis*	*D. marginatus*	Kaspi rayon	Culturing
	F. tularensis	*D. marginatus*	Kaspi rayon	Culturing
	F. tularensis	*D. marginatus*	Kaspi rayon	Culturing
2011	*F. tularensis*	*D. marginatus*	Kaspi rayon	Culturing
	F. tularensis	*Hm. otophila*	Gori rayon	Culturing
	F. tularensis	*Hm. otophila*	Gori rayon	Culturing
	F. tularensis	*Hm. otophila*	Gori rayon	Culturing
	F. tularensis	*Hm. otophila*	Gori rayon	Culturing

Cooperative Biological Research, GG-18 highlights. The CBR project, GG-18 focused on an overall base-line study of *F. tularensis* in ticks and ectoparasites from 2008-2012. Molecular detection of *F. tularensis* target genes was performed in field samples with ectoparasite and rodent internals pool samples. In total, 271 ectoparasite pool samples were investigated on presence of *F. tularensis* genetic markers. Positive results were revealed in eight and undetermined in three DNA samples. Out of 138 rodent pool samples only eight DNA gave undetermined amplification. In total, 13 out of 18 isolate DNA samples were positive on both targets. From 11 samples (swabs and whole blood samples), no positive result was obtained.
In addition, Indel typing was completed. This allows for the characterization of isolates and relatedness grouping. Indel markers Ftind33, Ftind48 showed deletion for Georgian strains and LVS. Markers Ftind49, Ftind38, Ftind45, Ftind46, Ftind47, Ftind18, Ftind44, and Ftind50 revealed presence of insertion in Georgian isolates. Georgian strains together with LVS were typed as *F. tularensis* type B, *holarctica* and were placed in non-Japonica branch, East European

subclade – B.19 by Svensson et al. and B.12 by Vogler et al.2009 (Vogler AJ, Birdsell D, Price LB, Bowers JR, Beckstrom-Sternberg SM, et al. (2009) Phylogeography of *Francisella tularensis*: Global Expansion of a Highly Fit Clone. J Bacteriol). According to Svensson et.al. Deletions for LVS should be appeared in Ftind50 (LVS subclade), Ftind33 (East European subclade), Ftind48 (*F. tularensis* type B, non-Japonica branch) and Ftind47 (*F. tularensis* type B, *holarctica*). In our data, Ftind50 and Ftind47 revealed presence of insertions in Georgian isolates and LVS strains that was not in accordance with article data. It worth to be mentioned that Ftind47 marker had higher cross point (CP) and melt temperature (TM) compared to all other assays; it could be result of mutation in the region of interest. Ftind33 showed deletion in Georgian strains and LVS that could be considered as a logic result, but deletion appeared in SchuS4 strain DNA as well, that was used as a positive control in this test. In summary, the GG-18 project only looked at a diverse area of Georgia and was able to genotype only a few strains from the environment (non-human samples). Georgian strains along with the LVS strain, were typed as *F. tularensis* type B, *holarctica,* non-Japonica branch. In addition, the GG-18 project evaluated MLVA-25 and SNP typing on nine strains that were isolated from ectoparasite (Ixodae ticks) pools in Shida Kartli region. Isolated strains along with archival, LVS and SchuS4 reference DNA samples were typed using B.Br.012, B.Br.013 and 6 new SNP markers specific for *F. tularensis* spread in Georgia (B.Br.27-B.Br.32). These SNPs were discovered by whole genome comparisons and designed as canonical assays at Northern Arizona University (NAU) in previous studies (Phylogeography of *Francisella tularensis* subspecies holarctica from the country of Georgia, G, Chanturia, D. N Birdsell, M. Kekelidze, E. Zhgenti, G. Babuadze, N. Tsertsvadze, S. Tsanava, P. Imnadze, S. M Beckstrom-Sternberg, J. S Beckstrom-Sternberg, M. D Champion, S. Sinari, M. Gyuranecz, J. Farlow, A. H Pettus, E. L Kaufman, J. D Busch, T. Pearson, J. T Foster, A. J Vogler, D. M Wagner, P. Keim, BMC Microbiology 2011, 11:139).

The overall results of the GG-18 project, in relation to F. tularensis conclude that F. tularensis is in circulation of the same SNP group during last five years on a wide territory of the Shida Kartli region (as determined by isolation from only ectoparasites. This may reflect that this area could contain more active tularemia foci and emphasizes the need for a human seroprevalence study and preventive arrangements in the region, as proposed in this GG-19 project proposal.

Scientific Goals

This project is designed to provide the initial research and background information for the development of a comprehensive epidemiological surveillance project in Georgia and provide a base-line understanding of the geographic distribution of *F. tularensis* diseases in certain regions of this country. The research proposed will focus on at least two specific research priorities cited among the specific research priorities described in the CBEP Research Agenda (July 2011). In addition, we will perform basic research with all of the institutes with *F. tularensis*, which includes genotypic variations, bacteriophage research, and proteomic analysis of *F. tularensis* strains.

Aim 1: To study the seroprevalence of tularemia among exposed (people living in geographic areas known to be natural foci for tularemia) and not exposed healthy individuals and estimate risk factors for seropositivity.

Aim 2: To establish active surveillance for human tularemia clinical cases with the goal of increasing identification of the disease and collecting isolates from human cases for comparison to current environmental isolates and historical isolates.

Aim 3: To establish active surveillance for tularemia in the environment including small rodents and associated vectors and to identify the sources of tularemia outbreaks among humans. This effort includes inking environmental and animal cases with human cases.

Aim 4: To implement and evaluate diagnostic methods for tularemia and monitor patterns of antimicrobial resistance

Aim 5: To study isolated *Francisella tularensis* strains using DNA sequencing, proteomics analysis, and phage subtyping.

Technical Approach and Methodology

Aim 1: To study seroprevalence of tularemia among occupationally exposed and not exposed healthy individuals and estimate risk factors for seropositivity.

Rationale: The GG-18 project conclusions highly suggest that a human sero-prevalence study be conducted in Georgia in the *F. tularensis* active foci (as determined from ectoparasites). This study is incredibly important to determine area hot spots that may be attributed to human diseases caused by *F. tularensis*.

Approach: To address this hypothesis, a cross-sectional study design will be utilized for this aim. Study participants will be recruited from high-risk areas (hot spots) and other regions of Georgia for comparison. Study participants will be asked to complete an interview to identify risk factors for potential infection and provide a serum sample for antibody testing for *F. tularensis*. Up to 1000 patients will be screened in this Serosurvey over the three-year period.

Study Details:

- *High-risk areas:* High-risk areas identified with historical data and data obtained from the GG 18 project include Meskhet-Javakheti (Ninotsminda, Akhalkalaki, and Akhaltsikhe and Aspindza regions) and Kartl-Kakheti Valley (Eastern Georgia). Several villages historically known as hot spots for tularemia in these high prevalence areas will be the focus of data collection. Households in these villages will be randomly selected, and an adult individual in each selected household will be randomly selected for study participation. Eligible adults will meet the following criteria: 18 years and older, speak Georgian or Russian, lived in the region for at least 3 years consecutively, capable of providing informed consent, and willing to participate. Up to 500 patients will be enrolled in this study over the three-year period.
- *Low risk areas:* A comparison group of individuals with relatively low risk of infection and good health will be recruited. Individuals from low risk areas will be recruited from blood donors (State Blood Safety Program). Individuals will be selected from consecutive blood donors in these regions. Two further requirements need to be met: the number from each region will be pre-fixed, and frequency matching on age (in 10-year age groups) and gender will be required so that the distribution of high risk and low risk participants will be similar on age and gender. Up to 500 patients will be enrolled in this study over the three-year period.
- *Data collection:* Participants will be asked to complete an interviewer-administered questionnaire of risk factors for tularemia and provide a serum sample (high-risk group).
- *Blood samples:* Five ml venous blood will be drawn from consenting individuals recruited in high-risk areas and shipped to the laboratory of NCDC. All laboratory operational standards and biosafety requirements will be observed for sample shipment. NCDC is responsible for administering the State Blood Safety Program and within the framework blood donor samples are routinely sent to NCDC laboratory for ELISA testing on blood borne infections. De-identified samples will be used for tularemia serologic assays. Only an arbitrary linking code will be utilized to connect survey responses with blood test results. *F. tularensis* antibody tests in serum using microagglutination test (MAT) will be performed. The details of the laboratory test are discussed below. Any samples positive for *F. tularensis* antibodies will also be tested for *Brucella* antibodies to verify specificity of the test results for *F. tularensis* antibodies.
- *Questionnaire:* A standardized interviewer-administered questionnaire will be administered to all study participants by a trained interviewer. The questions will include demographic characteristics (e.g., age, gender, geographic region, occupation), exposure

to risk factors for tularemia (e.g., outdoor activities, hunting), history of vaccination against tularemia in the past, prevention measures (e.g., use of DEET), recent illness, and utilization of medical care. For individuals who have been diagnosed with tularemia, clinical symptoms will be ascertained and documented.

- *Data Management and Statistical Analyses*: Each individual will be assigned a study identification number. Once data is linked, all identifiers will be dropped and only the study ID will be utilized for linking the questionnaire responses with the laboratory test results. Data will be entered into SPSS and checked for quality and inconsistencies. The proportion of seropositive results (*Francisella tularensis*) will be computed separately for high risk and low risk individuals. Bivariate analyses will be conducted to compute the association between the seropositivity and other potential risk factors including age, gender, geographic region and type(s) of exposure. Multivariate analyses using logistic regression (outcome prevalence expected to be < 10%) will be conducted to identify independent predictors of seropositivity.

Aim 2: To establish active surveillance for human tularemia clinical cases with the goal of increasing the identification of the disease and collecting isolates from human cases for comparison to current environmental isolates and historical isolates.

Rationale: There has not been an active surveillance for human tularemia cases in Georgia in the past and all data has been obtained from ectoparasites to date. We suspect that several human clinical cases go undiagnosed and case studies are not accurate and need to be improved. We also hypothesize that *F. tularensis* case definitions can be improved to better diagnose this disease in humans.

Approach: To address this hypothesis, we plan to establish active surveillance for tularemia case finding in endemic areas in Georgia, such as Meskhet-Javakheti (Ninotsminda, Akhalkalaki, Akhaltsikhe and Aspindza regions) and Kartl-Kakheti Valley. The hospitals and primary care facilities in the tularemia hot spot regions will be involved. Regional referral hospitals and tertiary care hospitals will also be included in the study to recruit the patients potentially referred from above listed areas. The patients who will present to primary care centers or be admitted to the selected hospitals and meet the case definition for Tularemia (case definitions are described below) will be asked to participate in the study. Informed consent will be obtained prior to enrollment. Up to 1,000 patients will be enrolled in this study over the three-year period.

The following working case definitions will be used for different clinical forms of tularemia (Ulceroglandular, Glandular, Oculoglandular, Oropharyngeal, and Pneumonic):

a) *Ulceroglandular*,
Patient presenting with following clinical presentations:
- Fever > 38 C (oral temperature)
- Regional lymphadenitis (bubo)
- Skin lesion, which can present as ulcer, vesicular/pustule or popular lesions.

b) *Glandular*
Patient presenting with the following clinical presentations:
- Fever > 38 C (oral temperature)
- Regional lymphadenitis (bubo)

c) *Oculoglandular*
Patient presenting with following clinical presentations:
- Fever > 38 C (oral temperature)
- Severe unilateral conjunctivitis.
- Preauricular lymphadenitis

d) *Oropharyngeal*

Patient presenting with following clinical presentations:

- Fever > 38 C (oral temperature)
- Ulcerative-exudative stomatitis and pharyngitis, with or without tonsillar involvement
- Neck lymphadenitis

e) *Pulmonary and influenza*

Patient presenting with following clinical presentations:

- Fever > 38 C (oral temperature)
- Severe pneumonia
- Presentation from April to October of each year

The following set of laboratory investigations wil be performed for each specific clinical syndrome of Tularemia. These will include the tests to identify *F. tularensis* and additional tests will be performed to identify other pathogens, which can present with similar clinical syndrome (for the detailed description of methods refers to Laboratory Investigations chapter below):

a) Ulceroglandular
   1. Bacterial cultures of the blood, lymph node aspirate and skin lesion swabs.
   2. MAT
   3. PCR of lymph node aspirates and skin lesion swabs

b) Glandular
   1. Bacterial cultures of the blood, lymph node aspirate
   2. MAT
   3. PCR of lymph node aspirate

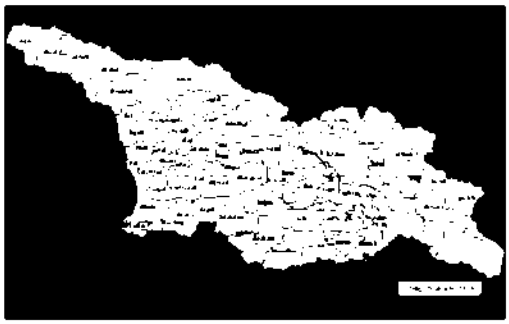
c) Oculoglandular
   1. Bacterial cultures of the blood, lymph node aspirate, ocular lesion swab
   2. MAT
   3. PCR of lymph node aspirate and lesion swab

d) Oropharyngeal
   1. Bacterial cultures of the blood, lymph node aspirate, oral lesion swab
   2. MAT
   3. PCR of lymph node aspirate and lesion swab

e) Pulmonary
   1. Bacterial cultures of the blood and respiratory secretions (sputum, tracheal aspirate, bronchoalveolar lavage as appropriate) or pleural fluid if available.
   2. MAT
   3. PCR of sputum, respiratory secretions, or pleural fluid, as appropriate.

Based on clinical presentations and laboratory investigations, we will define presumptive and confirmed cases according to WHO Guidelines on Tularemia: [38]

- **Presumptive cases** - suggestive clinical symptoms and a clinical sample that tests positive for tularemia by DNA detection or a single positive serum.



- **Confirmed cases** - the recovery of an isolate and identification of the culture as *F. tularensis,* or fourfold difference in titer of paired serum specimens.

All presumptive and confirmed cases will be documented in Electronic Disease Surveillance System (EIDSS) and the GIS database. Both presumptive and confirmed cases will be used to determine the incidence of tularemia.

Aim 3: To establish active surveillance for tularemia in the environment including small rodents and associated vectors and to identify the sources of tularemia outbreaks among humans and linking environmental and animal cases with human cases.

Rationale: We will define the types of endemic foci recorded in Georgia based on a historical analysis of strain database information and to select new representative areas that include the known three types of foci: steppe, meadow field and forest types (Table 3). The data that make up this hypothesis comes from the GG-18 project, which provided a broad base of information on ectoparasite data. However, the GG-18 data did reveal that additional environmental samples would need to be conducted, especially in endemic foci for this disease, and, environmental collection needs to coincide with human clinical studies. To this end, we will conduct environmental surveillance for *F. tularensis* in areas where historical outbreaks have been recorded and extensive field investigation undertaken of the environment (Figure 1).

Figure 1: Historical map showing the prevalence of Tularemia (highlighted in blue) in the Republic of Georgia.

Approach: Tick surveillance and rodent surveillance will be conducted to determine the current prevalence of *F. tularensis* in vectors and reservoirs to determine their impact on human disease risk. A historical review of isolation rates appertaining to the environmental sources of the NCDC database of strains will be undertaken to optimize recovery of *F. tularensis* from rodents, ticks, fleas, and related materials.

Table 3: Classification of tularemia foci in former USSR (from Olsufjev & Rudnev 1960)

Kind of foci	Main reservoir	Tick involved	Season of outbreaks
Meadow-field type	Microtus arvalis	Dermacentor pictus	Winter
Steppe (ravine) type	Voles, mice, hamsters, hares, etc	Main Dermacentor marginatus	Autumn and winter
Forest type	Red vole, Clethrionomys glareolus, forest mice, hares	Ixodes ricinus, I. trianguliceps	Tick season
Floodland-swamp type	Water rats	Dermacentor, Rhipicephalus, Ixodes sp	Season of water-rat hunting
Foothill type	Water rats (voles, etc)	Ixodes verrucosus	Summer
'Tungai' type	Hares, gerbils, mice and insectivores	Rhipicephalus pumilio	Season of hare hunting

There have been 13-recorded outbreaks of tularemia in five foci in Georgia. The largest outbreaks have been recorded from the central and south-central regions of Georgia: Meskhet-Javakheti (Ninotsminda, Akhalkalaki, Akhaltskhe, and Aspindza regions) and Shida-Kartli regions. These outbreaks included suspected water-borne and rodent-borne transmission. An additional historical outbreak occurred in the village of Zhemo Kedi, Kakheti region, in eastern

Georgia and involved children and the threshing of wheat. Table 4 (below) summarizes the temporal distribution of 442 isolates of *F. tularensis* in Georgia and the source data from rodents, arthropod, and other samples.

Table 4: Temporal analysis summary

Year	Many	Mouse	Rabbit	Asym	Shrew	Mole	Mouse	other	Dermacentor	Tick	Mosquito	Gamma	other	Cervus	Bird	water	wheat	Total
1950	1	1							1	1		1		2				7
1960	16	2		1			2	2				1	1	5				29
1970	57		3	4	3	1		2	5	7	1	7	1	19	1			120
1980	50	7		2	4	2	1	1	32	6	10	3	3	11		2		137
1990	21					3			47	12	4	2		13			2	102
2000	3			1					30		2	1	1	1		4		50
Total:	148	10	3	8	7	6	3	5	115	29	28	18	6	51	1	6	2	442

The NCDC database of historical isolates of *F. tularensis holartica* will be subject to a more detailed review of isolation rates from the field study records to determine the effective denominator that may indicate carriage and persistence in the approximately 60 different locations sampled since the 1950s. This database will also be used to map using GIS the approximate distributions of the 440 source related isolates

In conjunction with (b)(6) Vector Surveillance group at USAMRIID (and using the IACUC approved protocols through USAMRIID). the team, approximately four times per year, will conduct field expeditions in the *Francisella tularensis* focus areas. Field trips will last approximately 15 days per trip. Ticks will be collected off livestock (reference of use in Georgia) or by using tick drags and standard classification/taxonomy will be used to identify the ticks to species, followed by pooling according to species, location, and collection date. DNA from the tick pools will be isolated and real-time PCR analysis will be performed to screen the pools for the presence of *F. tularensis* (see Laboratory investigations, section g). Rodents will be collected using Sherman live-catch traps set in fields, in, and around houses. Collected rodents will be identified to species, checked for ectoparasites, and then processed to obtain blood as well as spleen and kidney tissues. Blood, tissue, and ectoparasite samples will be tested by real-time PCR *for F. tularensis* (see Laboratory Investigation). In total, it is estimated that 1,000 samples (ticks, tissue, etc) will be collected and processed per expedition, with a total estimate of about 5,000 specimens per year during the three-year period.

For all presumptive and confirmed cases, an epidemiological investigation will be carried out. The patient will be interviewed and case investigation report form completed. Information collected on the case investigation form will include general patient information (e.g. age, sex, residence, etc) as well as collect information about the patient's activities (e.g. hunting), potential exposures (e.g. tick or mosquito bite, contact with rodents, etc), and location of potential exposure. Tick surveillance and rodent surveillance will be conducted around a patient's residence and farm (or work site), if applicable. For all presumptive and confirmed cases, an epidemiological investigation will be conducted to determine if a link exists between the human case(s) and those pathogens found in the vectors and reservoirs. Methods from Task 1 will be applied here. Genetic analysis will be used to link human and environmental isolates, see Aim 6.

Geographical Information System (GIS) analysis will be used to determine a risk assessment for exposure to environmental and animal sources of *F. tularensis*. This will be accomplished by using GIS software systems, specifically ESRI ARC Map/Editor. Global Positioning System (GPS) handheld units will be used to record the coordinates of the collection sites, number and species of arthropods collected, and collection site habitat data. The final output of the GIS analysis will be risk assessment maps. The risk assessment maps will be composed of multiple biotic and a-biotic layers, to include: current vector distributions broken down by species determined from the active surveillance, disease burden associated with the vectors collected and tested during the active surveillance, road and waterways, vegetation, elevation, and any historical data pertaining to Tularemia (Figure 1) and current data from imagery and weather services

Aim 4: To implement and evaluate the diagnostic methods for tularemia and to monitor antimicrobial resistance.

Rationale: Historically, culturing *F. tularensis* been difficult as it is a fastidious, slow-growing organism. Blood cultures are often negative, most likely because the initial infection has not progressed to the blood stream. The collection of multiple sample types (e.g. swab of ulcer, lymph node aspirate, and blood) from a patient will increase the likelihood of isolate recovery. In this protocol, we hypothesize that by taking a number of additional steps will be taken to increase the likelihood of culture recovery on agar media. These include collection and transport methods to provide for maintenance of viable organisms, culture initiation within 24 hours of the sample being taken from clinical cases, storage of environmental samples at -80°C to preserve viable organisms, increased incubation times of primary cultures (7-10 days) and the use of antibiotic media to allow for isolation of *F. tularensis* in the presence of other organisms. Typically, mice have been used to isolate *F. tula*rensis from contaminated samples as they are highly susceptible to *F. tularensis* and act as a filter to amplify this organism in the presence of other non-pathogenic organisms. The use of antibiotic media to isolate *F. tularensis* from contaminated samples alleviates the dependence on mice for the isolation of *F. tularensis*. Through this rationale, we proposed to work with our collaborators and our expertise in bacteriology to isolate *F. tularensis* from human clinical samples for the first time without the use of mice for propagation. Antimicrobial resistance will be checked and the cultures immediately destroyed.

Approach: The following approach will be taken to complete these study objectives in Aim 4:

Patient recruitment and evaluation: All tularemia-suspected patients recruited in the study will be tested by all appropriate laboratory methods as described in this document. The gold standard for laboratory confirmation will be either a four-fold rise in antibody titers using paired samples or isolation of *Francisella tularensis* in cultures. Sensitivity and specificity of other diagnostic tests including PCR will be calculated and compared to the gold standard. While the primary purpose of testing for a range of potential co-infections is related to research ethics, these studies will provide knowledge about the causes of infections among those negative for *F. tularensis.* Additionally, the presence of co-infections will provide insight into this potential risk factor for tularemia infection.

Sample collection and transportation: Clinical samples will be collected and shipped to the laboratories of NCDC observing all laboratory operational standards and biosafety requirements for sample collection and shipment and using new methods published by the Booz Allen Hamilton Biosafety and Biosecurity for Sample transport. The specimens will be delivered to the laboratory within 24 h under the standard conditions; environmental samples will be kept at -80C in the field and will be delivered to the laboratory periodically (based on the project schedule) under the standard conditions. Transport temperature conditions to the laboratory will be those recommended by the WHO Guidelines in order to ensure organisms remain viable during this process. All samples will be labeled clearly with all required information (name, ID, source, site, date etc.)[39]

Specimens will be considered acceptable for the various forms of human Tularemia syndromes as specified:

- Whole blood - for all clinical forms of illnesses. Two samples of venous blood will be obtained, preferably from separate sites and 30-60 minutes apart, comprising in total 20-30 ml, into bottles of a conventional aerobic blood culture system.
- Serum - for all clinical forms of illnesses. A first specimen will be collected as early in the course of infection as possible, followed by a second specimen taken in the convalescent period (at least 14 days later).
- Respiratory secretions/pleural fluid – for pneumonic form of illness. Bronchial/tracheal washes or aspirates, sputum, transthoraxic lung aspirates, or pleural fluid. Specimens will be

collected in screw-capped containers and transported to the laboratory as quickly as possible.

- Swabs – of visible lesions or affected areas will be collected for Ulceroglandular, Oculoglandular and Oropharyngeal forms of illness. For culture, a rayon-tipped plastic applicator and a tube-containing agar with charcoal will be used.
- Aspirates – from lymph nodes or lesions for Ulceroglandular, glandular, Oculoglandular and Oropharyngeal forms of illnesses will be collected with sterile needle and syringe and transferred aseptically into a sterile tube.

Specimens acceptable for the animal and environmental samples:

- Mammals – serum, aspirate, autopsy materials;
- Arthropods – ticks, fleas, mosquitoes;
- Environmental samples – soil, water, and rodent feces will only be collected in the context of an epidemiological investigation that indicates these as the potential exposure sources.

<u>Bacteriology:</u> Samples will be screened bacteriologically, by plating them on Cysteine heart agar enriched with chocolatized red blood cells (CHAB) which is a practical medium for culture of *F. tularensis* as the organism displays characteristic morphology and grows well on this media; Plating on Cysteine enriched Chocolate agar (CA) or Sheep Blood Agar (SBA) will be used to identify any possible existing co-infection. CHAB medium supplemented with antibiotics (CHAB-A) has been shown to significantly improve (81%) recovery rates from tissue sources contaminated or overgrown by other flora.[40] In specimens where the presence of mixed flora is likely, including respiratory and Oropharyngeal samples CHAB-A will be used For any primary samples were other bacterial growth is observed when the sample is cultured on non antibiotic CHAB media, the samples will be re-plated on antibiotic containing CHAB media for isolation of *F. tularensis*.

For blood culture, the automatic blood culture system will be used. This will allow for the amplification of small numbers of *F. tularensis* organisms in blood samples prior to culturing on media. Aliquots from positive blood culture bottles will be incubated on CHAB. Blood culture bottles will be maintained for 7-10 days.

All inoculated culture plates will be incubated at 35-37C for 7-10 days at 5% CO_2 and checked daily for growth. A portion of the clinical samples will be stored for any future testing (including additional culture work) that might be required. Bacterial isolates will be identified as *F. tularensis* using standard criteria, including morphology and biochemical tests, as recommended by the CDC.[41]

Differentiation of species and subspecies of *F. tularensis* will be based on growth characteristics, biochemical bio typing (Table 5) (Cysteine requirement: carbohydrate fermentation: maltose, sucrose, D-glucose, glycerol; citrulline ureidase production; oxidase production; H_2S production on TSI);[42] and molecular biotyping.

Table 5: Discriminating characteristics of *Francisella* species and subspecies

Characteristics	*F. tularensis* subspecies				*F. philomiragia*
	tularensis	*holarctica*	*mediaasiatica*	*novicida*	
Cysteine requirement	+	+	+	-	-
Maltose fermentation	+	+	-	+	+
Sucrose fermentation	-	-	-	+	+
D-glucose fermentation	+	+	-	+	+
Glycerol fermentation	+	-	+	+	-
Citrulline ureidase production	+	-	+	+	nd
Oxidase production	-	-	-	-	+
H_2S production	+	NA	NA	NA	NA

Note: "+" positive";-"negative; "nt" not tested; "NA" not available.

Antigen detection: Antigen detection is useful for either direct identification of *F. tularensis* in clinical/environmental specimens (direct fluorescent antibody (DFA)) or for confirmatory identification of isolates recovered in culture (slide agglutination or DFA).

- DFA staining using FITC-labeled rabbit antibody directed against whole killed *F. tularensis* cells (rapid assay for identification of *F. tularensis* in primary specimens or for confirmation of recovered isolates) will be used.[43]
- Slide agglutination will be used for the rapid conformation of recovered isolates. Slide agglutination assay is based on the interaction between high-titer anti-*F. tularensis* antibody and *F. tularensis*-specific antigens. A positive slide agglutination (clumping of cells) test is confirmatory for *F. tularensis*.

Serology: Serology is commonly used for confirmation of tularemia. Antibody responses against *F. tularensis* are generally detectable in patients 10-20 day's post-infection.[44]

- Microagglutination, the standard serological test for determining the presence of antibody to *F. tularensis*,[45] will be used in paired human serum specimens and/or in mammalian serum samples for conforming exposure (infection and vaccination) and for Sero-prevalence studies.
- Enzyme-linked immunosorbent assay (ELISA). We will be using ELISA methods as described elsewhere by N. Chitadze et al.[45] Once the ELISA protocols are developed, they will be submitted to CTR for BS&S review.

Antimicrobial susceptibility: Antibiotic susceptibility of the recovered isolate to the following antibiotic agents using CLSI breakpoints will be performed using the E-test method[47]: Streptomycin, Gentamycin, Tetracycline, Doxycycline, Chlorampenicol, Rifampicin, Ciprofloxacin, Levofloxacin, and Moxifloxacin.

Aim 5: To study isolated *Francisella tularensis* strains using DNA sequencing, proteomic analysis, and phage subtyping.

Rationale: The GG-18 CBR project (2008-2011) made great strides in characterizing a limited number of F. tularensis strains that were isolated from ectoparasites. The GG-18 project data suggested that there are several more questions that need to be answered about *F. tularensis*. The first is that the molecular characterization of F. tularensis strains is incomplete and there is an incomplete picture not only from human isolates (never been completed), but that there is a tremendous genetic diversity in *F. tularensis* strains from the limited number tested. This proposal will look to complete the genotyping picture in Georgia.

In addition, proteomic analysis of *F. tularensis* isolates under the GG-18 project indicates differences between selected isolates of *F. tularensis* on a proteome level. This knowledge is very

important, since differences on a genomic level quite often are "silent" and not expressed. It has been shown by decades of research with other pathogens that most of the in-consistently differentially expressed proteins are virulent factors and their knowledge of them could pave ways for better diagnostics and identification schemes. The same is true for the potential application of this potential data for the protection of civilian and military personnel. Under GG-18, the project team was able to increase the capabilities of the Georgian Institutes with the first real, full-scale (from identification of the proteins on 2-D gels) proteomic research in Georgia. We anticipate that continued research in this area will reveal a list of differentially expressed proteins, which will lead to future studies and projects and provide a better understanding of *F. tularensis* physiology and virulence.
Finally, until the GG-18 project, nowhere in the world has a bacteriophage been infective to and react to F. tularensis. The Eliava institute, over three years under GG-18 research, has isolated several key non-stable and reactive *F. tularensis* bacteriophage. This is hallmark and cutting-edge research, to, for the first time, isolate, and characterize stable *F. tularensis* bacteriophage. It is our hypothesis that this approach will yield such results.

Approach: We will take a multi-fold approach to address the hypotheses in this aim:

Molecular diagnostic of Francisella tularensis in clinical / environmental samples: For DNA extractions, some samples (sputum, bronchial and tracheal washings) will be specifically pre-treated with N-acetyl-L-Cysteine or other specialized reagents to liquefy the samples; and some tissue samples will be incubated in Qiagen tissue lyses buffer (ATL) at 56^{O}C until fully lysed, followed by DNA purification using Qiagen DNA Mini Kit. DNA extraction from ground tick and rodent samples will be performed using Qiagen DNA Blood and Tissue Mini Kit.

Real Time PCR analysis will be accomplished using Idaho Technology Kits: *F. tularensis* Target 1 and Target 2; and will be performed for all clinical samples, while environmental samples, such as tick pools and rodent tissues will be screened using the Real Time PCR multi-target primer set ISFtu2, tul4, and igIC[48].To avoid cross reactivity with ectoparasites endosymbionts, positive tick pool samples will be amplified using a 16S ribosomal RNA gene primer set, purified, and then sequenced and compared to other bacterial genomes in the NCBI database by BLAST analysis.[49,50]

The same approach will be used for positive clinical DNA samples to determine the species / subspecies of the disease agent. As it has already been determined, *the F. tularensis* present in Georgia belongs to the subspecies *holarctica* (type B), but very rarely in immunocompromised patients, disease can be caused by *Francisella tularensis* subsp. *novicida* or by *F. tularensis* subsp. *tularensis* (type A). While *F. tularensis* Type A and type B are easy to distinguish using routine PCR analysis, *F. tularensis* subsp. *novicida* can be confirmed only after sequencing. For clinical samples, PCR positivity will be compared with culture positivity, to determine the sensitivity of direct plating for identification of *F. tularensis.*

Molecular characterization of newly isolated F. tularensis strains: Newly isolated strains from environmental and human exposures will be characterized using different typing methods established at the NCDC of Georgia. Canonical SNP markers for *F. tularensis* B.Br.027[51] and MLVA-25 markers F.t.M3 and F.t.M4[52] will be used to characterize strains isolated. Besides, PCR positive clinical and tick/rodent DNA samples can be directly characterized before culture isolation with a rapid MLVA typing system using variable F.t.M3, F.t.M4 markers. The SNP typing methodology will be applied on the Real Time PCR cycler using the Sybr Green master mix, while PCR-based MLVA technique will be performed on Beckman Coulter Genetic Analysis System CEQ-8000.

All typing results will be added to the existing *F. tularensis* database and analyzed in compliance with phylogenetic, geographical, and epidemiological data. The DNA sequence of conserved *F. tularensis* housekeeping genetic markers (i.e., 16s RNA) will be determined at the CPHRL under the supervision of WRAIR and compared with archival and *in silico* database sequences in order

to augment diagnostic validation of species and subspecies determination. In addition, DNA sequencing of known molecular determinants conferring phenotypic variation within the *F. t. holarctica* subspecies will be performed to yield insight into the nature of molecular and phenotypic diversity within and across environmental and human-derived specimens.

Proteomic Studies: Different isolates of tularemia along with the reference live vaccine strain LVS will be cultivated in Heart Infusion Broth (HIB) medium until they will reach logarithmic growth. Bacterial cells will be collected by centrifugation, lysed in a buffer for 2-D electrophoresis, and incubated for 10 minutes at 95C. Lysates will be tested for sterility and further used in biochemical studies. The 2-D electrophoresis system from GE HEALTHCARE will be used. Iso-electrofocusing (IEF) will be carried out according to approved protocols that were developed under the CBR GG-18 project. In the pilot studies, we will test mainly two types of IEF strips: linear and non-linear strips with pH 3.0-10.0. SDS electrophoresis will be run using a gel apparatus system. Therefore, on one gel the strip with proteome of LVS tularemia samples will be loaded. Another five gels will be loaded with samples from the strains of interest. Gels will be silver stained without gluteraldehyde (in order not to interfere with mass spectrometry (MS) analysis) and images will be analyzed with 2-D Platinum software (GE Healthcare) to reveal differentially expressed bands. Only spots with more than two-fold of differences and showing consistent changes will be excised and subjected to MS analysis.

Comparative proteomic profiling of culture filtrate proteins of different Francisella tularensis strains: Bacteria secrete various substances as a means of coping with and surviving in hostile environments. Secreted proteins play important roles in bacterial survival strategies such as provisioning of nutrients, detoxification of the surrounding milieu, cell-to-cell communication, and modulation of host cell responses, and host-tissue colonization. They are also recognized as major virulence factors in the pathogenic process.[52] Therefore comparative characterizations of Georgian isolates of *Francisella tularensis* from this point is also of great importance. Selected isolates of *F. tularensis*, compared to the reference strain, will be cultivated in chemically defined Chamberlain medium. Culture filtrate proteins will be collected as described in the referenced methods.[53] 2-D electrophoresis and data analysis will carried out as described above for the tularemia proteome experiments and as used in the GG-18 project.

Phage typing as an additional tool for identification: Selective phage typing will be used as an additional differential diagnostic effort. This component will include subjecting aliquots of clinical sample material to a diagnostic panel of diverse selective phages to aid in identifying the presence of pathogens (*F. tularensis*, as well as Brucella for testing cross-reactivity) are included in the differential diagnostic regimen. Despite many efforts of scientists from different countries, there is still no report on the isolation of bacteriophage specific to *F. tularensis*. A limited number of documents presented by Russian scientists described isolation of Francisella bacteriophages, but no paper explains the stability and reliability of isolated phages. The Eliava Institute scientists have been working on the isolation of bacteriophage against vaccine strains of *F. tularensis* in the framework of the GG-18 project. To date, two bacteriophages with host bacterial strains from *P. aeruginosa* reveal lytic activity to the vaccine strain of Francisella, although the data need more detailed investigation and validation.

New Phage Discovery: Specimens, lytic for *F. tularensis* obtained from animal or environmental samples will be used to determine phage existence. Bacteriophages will be isolated by using standard enrichment techniques (Adams, 1961). A mixture of environmental samples (minced or grained) and appropriate bacterial cultures with different ratios will be incubated at relevant temperature for 12-24 hours. Suspensions will be centrifuged, filtered, and spotted on the lawn of corresponding bacterial strain. The plates then will be incubated during next 12-24 hours to detect clear zones of phage activity. The vaccine strain *F. tularensis* LVS (not a select agent) will be used for experiments for phage isolation. The agar overlay method will be used to enumerate formed phage plaques. The same approach will be used for phage isolation from the patient's blood sera. After several rounds of passages of isolated phage(s) on corresponding host bacterial strain, pure phage clones will be obtained. Isolated phages will be studied in detail,

particularly; we will study the morphology of phage particles, physiology (one-step growth properties), DNA characteristics, and structural proteins. Phages in high titer will be prepared and tested against bacterial collection of *F. tularensis* of the NCDC for determination of host range and specificity. Phages will be used for typing, as an additional test for diagnostic of bacterial strains of *F. tularensis*. The data will be evaluated on specificity and sensitivity and compared to the gold standard method for diagnostic of tularemia.

Expected Results

This project will:

- Estimate the public health burden of tularemia in Georgia
- Strengthen early identification and control capacity by:
    - Establishment, evaluation and validation of different diagnostic modalities
    - Fortification of the public health institutional and laboratory infrastructure and its response to tularemia outbreaks
    - Improving recognition of the disease and detection of risk factors for outbreaks
    - Strategic planning for disease control efforts to prevent outbreaks
- Describe the genotypic and phenotypic characteristics and antimicrobial resistance patterns
- Describe risk factors for transmission of tularemia
- Increase awareness among physicians, public health professionals as well as the general population regarding tularemia
- Implement and evaluate diagnostic methods for tularemia
- Provide better recognition and treatment will reduce the burden of disease and its concomitant socioeconomic impact. Enhanced surveillance will facilitate development of cooperative disease control efforts in the region to further anticipate outbreaks and contain transmission.

Human Subjects Considerations

As with all research projects we conduct, careful attention is being paid to maximize the benefit of the research to both the participants and community while minimizing harm. The Belmont Report is the framework utilized in developing study methods with constant focus on ethical considerations. Informed consent will be sought from all participants. The informed consent process will provide clear information about the study and emphasize participation is voluntary. In Georgia, making sure participation is voluntary is critical, as saying no is culturally difficult at times. Participants will also be clearly told that they can stop participation at any time. We expect substantial interest in participation given the benefits the study provides to participants.

The study has direct benefits to participants, as they will receive high quality laboratory tests to determine tularemia infection and potential co-infections. Such laboratory tests have limited availability in the country and typically are expensive. For those who have a negative test for *F. tularensis*, tests for co-infection will be valuable to provide an accurate diagnosis. This step is critical to maintain positive relations with participants and the community. To test only for *F. tularensis* and provide no insight into the cause of disease for those who are negative could results in a sense of being "used" for research by investigators. The community will benefit by knowing the existence of tularemia and the types of infections that are difficult to differentiate from tularemia.

All data will be kept by the NCDC in protected computers in protected offices. Only participants (and their physicians if consented) will be provided individual laboratory results. Confidentiality of information will be a high priority to protect participants for any form of discrimination.

NCDC will provide communities in the regions the study is conducted a report of the general findings without individual identifiers. This report will include information on the risk factors for

infection identified, the number of people infected, and general information on protective measures.

IRB review and hospital sites for sample collection from Human Subjects: As of January 2012, the main hospital system is being overhauled in Georgia. During this process, the actual hospital may be moved, closed, consolidated, or replaced. Therefore, final hospital site locations have not yet been determined for this project. Because of this issue, we will only describe the process for sample collection (below) and transport. Individual hospital locations will be added to this Form A as an appendix for the purposes of completing the facility assessments of a Biosafety and Biosecurity Review. Samples, once taken from consenting human subjects will be transported to the TADR network of ZDL's and LSS's laboratories for all testing and diagnostics. The hospitals only serve as a means to collect the specimen and receive informed consent. Individual IRB protocols will be written, reviewed, and approved once preliminary approval is obtained to begin the project. A separate biosafety and biosecurity review for the clinical protocols will be handled separately between clinical protocol completion and IRB approval.

Project Management

This project focuses on *F. tularensis* and will be undertaken at the collaborator institutes. The institute Director will appoint a Project Manager for the work to be performed at the institute. This work will be supported by an institute specific budget to perform the tasks outlined in this project description. In addition, there will be an overall Project Coordinator to serve as a point of contact for CBEP on the activities engaged under this project. The main task of the Project Coordinator is to ensure that all communications amongst the parties are supported and that coordination of data between the human and animal studies is working. The duties of the Project Coordinator are listed below.

1. Project Reporting
   - Consolidation of quarterly reports from participating institutes
   - Preparation of a short executive summary of quarterly reports
   - Leadership in preparation of project presentations and abstracts for conferences and international meetings
   - Facilitation of publications in peer reviewed journals

2. Scientific Leadership
   - Regular communications with U.S. Collaborators
   - Participation in Quarterly project calls (and monthly if time permits)
   - Organization of local meetings of the Georgian project participants to discuss the project progress
   - Participation in international conferences and meetings.

Meeting Goals and Objectives of CBR Program

This proposal addresses three CBEP goals:

1. strengthening dangerous pathogen detection and response networks
2. enabling discovery of the divers on or accidental release of biological materials
3. integrating host nation scientists and institutes with expertise in research and production into the international scientific community

The proposed study is important considering that *F. tularensis* species remains a significant veterinary and medical threat in Georgia. From a public health perspective, the development and application of more advance diagnostics could lead to a superior disease monitoring capability for the institute and function to enhance disease control efforts in Georgia. Detection and surveillance of these pathogens in natural foci areas will also permit an integrated understanding of pathogen circulation in the region. The design of the program is such that it requires significant

interaction with collaborators and scientists and institutes in the form of training, participation in U.S. scientific workshops and conferences and working in close contact with collaborating scientists in their laboratories.

Biosafety and Biosecurity Overview: All of the targeted bacterial pathogens are Class A agents of high bioterrorism importance and their handling is normally conducted under BL-3 safety conditions. All of the studies proposed in this application will adhere to the biosafety recommendations contained in the 5th edition of the Biosafety in Microbiological and Biomedical Laboratories (BMBL) Manual published jointly by the CDC and NIH (relevant text from the BMBL Manual is reproduced below for each pathogen). Samples may be processed in the field in mobile laboratories of the NCDC or in the NCDC's field stations. When the microbiological examination of those samples suggests that a targeted organism may be present, the samples will be transferred to the main laboratory at the NCDC for subsequent identification and processing using the biosafety recommendations for the targeted bacteria (From the 5th edition of the BMBL). Biosecurity: all samples will be kept in locked laboratories and locked refrigerators. Sample logbooks will be maintained and all samples and cultures will be kept under standard security measures as defined by CBEP.

F. tularensis: BSL-2 practices, containment equipment, and facilities are recommended for activities involving clinical materials of human or animal origin suspected or known to contain F. tularensis. Laboratory personnel should be informed of the possibility of tularemia as a differential diagnosis when samples are submitted for diagnostic tests. BSL-3 and ABSL-3 practices, containment equipment, and facilities are recommended for all manipulations of suspect cultures and animal necropsies. Preparatory work on cultures or contaminated materials for automated identification systems should be performed at BSL-3. Characterized strains of reduced virulence such as *F. tularensis* Type B (strain LVS) and *F. tularensis* subsp. *novicida* (strain U112) can be manipulated in BSL-2. Manipulation of reduced virulence strains at high concentrations should be conducted using BSL-3 practices.

Safety Issues: Safety at sample collection sites will be ensured by the use of standard personal protective equipment (PPE) as and where appropriate. We will use the following equipment: Tyvek coveralls, boots (12 in high), N95 respirators, safety goggles, disposable hats, and double gloves (inside pair taped to the sleeves of the coverall). Staff at the collection sites have been using PPE for many years, and are skilled in the safe handling of potentially infectious material. Samples for PCR analysis will be handled appropriately in Eppendorf tubes and heat inactivated at the earliest feasible time after sample collection and, as a result, the samples will be safe and non-infectious.

Pathogen	Biosafety Practices	Primary Barriers and Equipment	Facilities and Secondary Barriers
F. tularensis	- Standard Microbiological Practices - Limited and controlled access - Biohazard warning signs - "Sharps" precautions - Biosafety manual / SOP - Decontamination of all waste - Decontamination of laboratory clothing before laundering - Baseline serum	- Class I or II BSCs or other physical containment devices used for all open manipulation of agents - Protective laboratory clothing; gloves; respiratory protection as needed	- Laboratory bench and sink - Autoclave - Physical separation from access corridors - Self-closing, double-door access - Exhaust air not re-circulated - Negative airflow into laboratory

Approximate Budget

Additional details of the budget are in the Form B.

Relevance to DOD Program Objectives

- Knowledge of regional pathogens. This study will increase the knowledge of the epidemiology of *F. tularensis* in understudied geographic areas of natural and new foci's in Georgia and test hypotheses on the environmental conditions that promote tularemia outbreaks in-country.
- Gainful employment of scientists. This project will provide gainful employment for scientists working with especially dangerous pathogens.
- Transparency and integration. This project will promote transparency and integration of Georgian scientists into the global science community through participation in international conferences and publication of scientific papers in international journals.
- DOD has a significant requirement to establish the Baseline of Pathogenic Organisms in the Environment. This enhanced surveillance program resulting from this project will generate new information on important especially dangerous pathogens which will be mapped and described in detail.

Relationship to Other on-going, planned, and recently completed CBEP Projects

This study will serve as follow-on to the GG-18 project and links well with the ongoing Vector Surveillance studies in Georgia. The previous project, GG-18 demonstrated the presence of *F. tularensis* in Georgia and previously collected and new isolates and thousands of samples that could still be used on this project. CBEP encourages work to collect, review and analyze historical records of CBEP pathogens; to enter these data into an EIDSS-linked database that would allow rapid identification of unusual patterns of clustering of disease anywhere in the country.

COOPERATIVE BIOLOGICAL RESEARCH
Georgia
Project Proposal

Latest Revision: 09/11/2013
Project Number: GG-20_V24

Project Title

Prevalence, Epidemiological Surveillance, and Laboratory Analysis of *Coxiella burnetii* in Georgia

Project Summary

The overall goal of this study is to establish baseline information on the geographical distribution and prevalence of several zoonotic and veterinary diseases in Georgia. The project will mainly focus on *Coxiella burnetii* (etiologic agent of Q fever). This project is focused at the Laboratory for the Ministry of Agriculture (LMA) with some research (genotyping) being conducted with Walter Reed Army Institute for Research (WRAIR), at the Central Public Health Research Laboratory (CPHR, Tbilisi Georgia). The National Food Agency (NFA, Tbilisi, Georgia) will be responsible for field sampling and surveillance. This project will provide an opportunity to gather more information concerning the disease prevalence, distribution, and potential diagnostic assays that can be used to identify and detect this pathogenic agent.

In this study, the entire country of Georgia will be surveyed over a three-year period for the prevalence of *Coxiella burnetii*. Sample collection, epidemiological investigation, and *Coxiella* diagnostics will be used in each region of Georgia. Particular attention will be placed on regions with large animal populations and regions that are located at the border of other countries (it is presumed that many zoonotic diseases cross into Georgia). It is important to note that the presence of this pathogen will be examined using several different diagnostic techniques, including rapid tests and Polymerase Chain Reaction (PCR). This project is designed in two distinct parts: a) As a comprehensive surveillance study to establish baseline information on disease prevalence, resulting in a more accurate assessment of the geographic distribution of *Coxiella* in animals and improved recognition of the disease in this region. B) As a research study, to investigate specific questions regarding *Coxiella burnetii* genotypes in small ruminants and cattle in Georgia.

The successful implementation of this project will provide better recognition and understanding of the range, location, and frequency of Q fever in Georgia, which has never been examined before. Detailed characterization of *Coxiella* will provide a broader understanding of the differences in the disease/pathogen found in various areas of Georgia compared to other areas around the world. In addition, the ability to localize specific geographical areas will assist the LMA and NFA with potential future threats of proliferation of *Coxiella*, which may be the source of future epidemics. At the same time, state-of-the-art diagnostic and genetic technologies will be transferred to the Georgian collaborators, increasing their knowledge of the technologies available for such research and surveillance. In addition, the tools and expertise developed through the course of this project will be directly applicable to any other disease found in the country. Finally, enhanced surveillance capability will improve the relations with neighboring countries by facilitating cooperative disease control efforts. All of these goals will be achieved by providing better laboratory diagnostics, enhanced GIS data, and modern laboratory-based characterization of *Coxiella*.

Institutes

Primary Institute

Name: **Laboratory for the Ministry of Agriculture**
Street Address 65, Godziashvili St. City: Tbilisi
Region: Caucasus Country: Georgia Zip Code: 0109

Detailed Project Information

Project Description (Introduction and Overview)

Introduction

Q fever was first described in 1935 in Queensland, Australia, during an outbreak of a febrile illness of unknown origin (Query fever) among abattoir workers. It has been classified as a "Category "B" critical biological agent" by the Centers for Disease Control and Prevention and is considered a potential weapon for bioterrorism. Q fever is a public health concern throughout the world, and while Q fever is an OIE notifiable disease, it remains poorly reported and its surveillance is often neglected.

Q fever is a zoonotic bacterial disease resulting from infection by *Coxiella burnetii*. Domestic ruminants (cattle, sheep, and goats) are considered to be the main reservoir for the pathogen, which can infect a large variety of hosts, mammals (humans, ruminants, small rodents, dogs, and cats), birds, fish, reptiles, and arthropods; Q fever infections remain poorly understood and their prevalence is largely underestimated in both humans and animals. *Coxiella burnetii* is an obligate intracellular pathogen and has been traditionally placed it in the family Rickettsiaceae; however, recent phylogenetic studies have demonstrated that *C. burnetii* is more closely related to *Legionella* and *Francisella* than *Rickettsia*. Two different antigenic forms of *Coxiella burnetii* can be distinguished. The difference between phase I and phase II bacterial forms is found in the variation of the surface lipopolysaccharide (LPS) as classically described for enterobacteria. Only phase I bacteria have a complete LPS on their surface and are virulent bacteria. Phase I bacteria can be isolated from a naturally infected individual or from animals infected in a laboratory. On the other hand, phase II bacteria have an incomplete LP5 due to a spontaneous genetic

deletion of 25,992 base pairs and are non-virulent. Phase II bacteria occur during serial passage in an immunologically incompetent host, such as cell cultures or fertilized eggs.

The most important route of infection is inhalation of bacteria, particularly in contaminated dust, while the oral route is considered to be of secondary importance. Once inhaled or ingested, the extracellular form of *Coxiella burnetii* (or SCV after small-cell variant) attaches itself to a cell membrane and is internalized into the host cells. Phagolysosomes are formed by the fusion of phagosomes with cellular acidic lysosomes. The multiple intracellular phagolysosomes eventually fuse together, leading to the formation of a large unique vacuole. *Coxiella burnetii* has adapted to the phagolysosomes of eukaryotic cells and is capable of multiplying in the acidic vacuoles. In fact, acidity is necessary for its metabolism, and is needed for functions including nutrients assimilation and synthesis of nucleic acids and amino acids.

Epidemiological and Clinical Aspects

Under experimental conditions, inhalation of a single *C. burnetii* can produce infection and clinical disease in humans. However, similar studies have not been done in animals. Infected animals contaminate the environment by shedding *Coxiella burnetii* in milk, feces, urine, saliva, and very importantly in vaginal secretions, placenta, amniotic fluids, and other products of conception. *Coxiella burnetii* survives well in the environment and can spread by wind causing infections at a distance from the initial source of bacteria. In domestic ruminants, unpasteurized milk is the most frequent route of pathogen shedding. The World Organization for Animal Health (OIE) advises not to drink raw milk originating from infected farms. Further research is required to clarify the probability of infection by the oral route.

Q-fever in Animals

Cattle: Q fever is widespread in cattle across the globe, and its seroprevalence is thought to have increased in recent years. Often neglected in the differential diagnosis, Q fever can persist in a herd causing great financial losses. In cattle, Q fever is frequently asymptomatic. Clinically infected cows develop infertility and mastitis. In addition, *C. burnetii* was found to be significantly associated with placentitis. Unlike humans and experimentally infected cows, naturally infected cattle rarely present respiratory or cardiac signs. Epidemiological data has shown that cows are more frequently chronically infected than sheep with persistent shedding of bacteria as a result. The sites of chronic *Coxiella burnetii* infection are the uterus and the mammary glands of females. Moreover, heifers are less frequently infected than older animals, even in infected herds, making those a preferential group for effective vaccination programs.

Goats: Numerous studies have suggested that epizootics of Q fever in goats are related to outbreaks in humans. Indeed, in many countries, goats are the most common source of human infection due to their extensive raising and close contact with humans. Q fever in goats can induce pneumonia, abortions, stillbirth, and delivery of weak kids, the latter two clinical signs being the most frequently observed. Abortions occur principally nearing the end of the pregnancy. The frequency of occurrence of Q fever abortions in goats is more important than in sheep with up to 90% of females being affected. Shedding of *Coxiello burnetii* by infected goats is discontinuous. In naturally infected goats, shedding seems to be limited to the kidding season following infection.

Sheep: Sheep have a predisposition for abortion similar to goats. However, Q fever in sheep seldom causes chronic infections. Infected sheep, like goats, shed *Coxiella burnetii* in vaginal secretions, urine, feces, and to a lesser extent in milk. In naturally infected sheep, the bacterium has been isolated in

vaginal discharges after abortion and can be shed in subsequent pregnancies. In certain areas of the world, similar to goats, sheep are an important source of human infections.

Shedding in animals: In several studies, shedding of *Coxiella burnetii* in milk by infected cows can be as high as in 50% of infected animals and can be the most frequent positive sample for the bacterium, when compared to feces and vaginal mucus samples. Studying shedding profiles in animals in Georgia is extremely important, especially for understanding the involvement of small ruminant infected herds and transmission by an airborne route. These factors have been highlighted across Europe over the last 10 years as there have been several recent and large Q fever epidemics in the Netherlands and Europe since 2007. Taking into account the epidemiological importance of small ruminants and given the lack of reliable data on numbers of *C. burnetii* discharges (especially in Georgia), this study will be aimed at describing sheep and cattle responses to *C. burnetii* infection in an abortive context, in terms of antibody levels, shedding levels, and susceptibility.

Diagnostics

Detection of *Coxiella* infection will be based on collection of blood samples, milk samples, as well as swabs (as needed) from cattle, sheep, and goats and performing sero-surveys. In addition, blood cultures will be fixed using common molecular diagnostics reagents compatible with PCR amplification. If any culturing is planned at the Richard G. Lugar Center for Public Health Research (CPHR), additional Cooperative Threat Reduction (CTR) Biosafety and biosecurity (BS&S) review will be required. Polymerase chain reaction (PCR) and enzyme-linked immunosorbent assay (ELISA) performed on samples and a simple analysis of serum samples of at least 10% of the animals in a herd will provide a rapid and economical method for obtaining valuable information on the herd's infection status. In cows' milk, *Coxiella burnetii* can still be identified up to 32 months postpartum. Vaginal and fecal bacteria discharges seem to have a major impact on environmental contamination because of practices at kidding and effluent management.

Scientific Goals

This project is designed to provide the initial research and background information for the development of a comprehensive epidemiological surveillance project in Georgia and provide a baseline understanding of the geographic distribution of *C. burnetii* in certain regions of this country. The research proposed will focus on at least two specific research priorities cited in the CBEP Research Agenda (July 2011). In addition, we will perform basic research with all of the institutes with *C. burnetii*, which includes genotyping of variations through WRAIR at the CPHR.

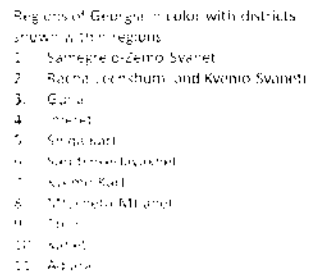
Aim 1: To study the sero-prevalence of *Coxiella burnetii* among exposed cattle and small ruminants across Georgia and understand epidemiological data risk factors related to sero-positivity.

Aim 2: To establish active surveillance and detection of cases of Q fever across Georgia with the goal of increasing the identification of the disease and collecting isolates from veterinary cases.

Aim 4: To implement and evaluate new diagnostic methods for Q fever in Georgia.

Aim 5: To study *Coxiella burnetii* using DNA sequencing and genotyping.

Technical Approach and Methodology



Overall Scientific Approach:
We will address each of the specific aims described above through an overall scientific plan, outlined in detail below.

Project Logistics
The duration of the project is 3 years. LMA (along with regional laboratories) will be accountable to the Ministry of Agriculture. The U.S. collaborators (WRAIR and the Univ. of California team) will assist the Georgian collaborators to promote and implement the project successfully. The CBEP GG will assist with program and project management and continued efforts under the CBEP GG program. The researchers will be focused on five main parts of this project:

I. Collection and in-the-field analysis of veterinary samples. In this area we will be utilizing OIE Standards for sampling animals, collection of samples, transport of samples and diagnostics in the laboratory.
II. Laboratory diagnostics, which will be carried out using modern methods and processes that are common to the CBEP program and using CBEP-sponsored laboratories, techniques will include: bacteriology, serology, and molecular diagnostics.
III. Epidemiological, geographic information system (GIS), and animal population genetics and susceptibility studies of ruminants and cattle in Georgia; and prevalence studies of this pathogen.
IV. Education and training of Georgian veterinarians and scientists in new methodologies and control measures for this pathogen.
V. This project will emphasize the geographical distribution of *Coxiella burnetii* and catalog animal reservoirs and disease prevalence. The overall approach of this project will be to combine sampling events over a 3 year period and compare molecular data between each event. The project will consist of several sampling expeditions each year in the spring and the fall across Georgia using the sampling scheme described in the technical methodology section.

1.1 *Preparation for Sample Collection:* In the first part of this project, CBEP GG will work with both NFA and LMA to review OIE standards for sampling, sample collection, safe handling, and processes used as part of the OIE standards for collection, transport, and evaluation of samples. In the first few months of the project, CBEP GG will mentor and train the LMA and NFA to update standard operating procedures and protocols using the OIE standards. Updating of CBEP related SOPs will be done for sample collection and handling of potentially dangerous diagnostic animal samples classified under UN 2814 and UN 2900, with regard to packing instructions given under UN 620 (IATA approved shipping guidelines). We will establish OIE guidelines and protocols by overlaying these protocols and meshing them with current Georgian procedures and CBEP algorithms for testing, handling, and sampling of veterinary pathogens

1.2 *Sample collection and Preparation:* The following sampling scheme will be used for this study. A team of three individuals (all 3 from NFA) will conduct sampling expeditions (training on field sampling and approach conducted by PNNL). The roles of the sampling team are:

a) Driver/ Veterinarian(NFA)
b) Veterinarian (NFA)
c) Epidemiology/GIS specialist (NFA)

1.2.1 *Sampling:* Sampling will take place across Georgia. Georgia is divided into 9 regions, 1 city, and 2 autonomous republics. These in turn are subdivided into 69 districts. For this study, the country will be divided into three major areas and the general premise will be to sample the first area (composed of 4 regions of Georgia) in year 1. Then, in year 2 the team will sample area 2 (composed of 4 regions of Georgia) and will also go back to area 1 and sample any 'hot spots'. Then, In year 3, the team will sample the third area of Georgia (composed of 3 regions in Georgia) and then go back to area 2 and sample any 'hot spots'. At the end of year three, the team will also go back to area 3 and re-sample any final 'hot spots' from that area. For safety and security, the autonomous region of independence, Abkhazia, will not be considered or sampled in this project. Throughout the year, the sampling will be conducted in the spring and fall of that year while animals are near the villages. Approximately 5,000 animals will be sampled in the first year; 2,500 sheep and goats (as evenly split as feasible) and 2,500 cattle. In years 2 and 3, each year an additional 5,000 animals will be samples in new regions (as described above) with an additional 1,000 samples (500 sheep and goats and 500 cattle) re-sampled from the 'hot spot' locations as identified by the data.

1.2.2 Year 1: Area 1: composed of the following regions: Racha-Lechkhumi and Kvemo Svaneti, Guria , Imereti, and Mtskheta-Mtianeti

1.2.3 Year 2: Area 2 and hot spots from area 1: Shida Kartli, Samtskhe-Javakheti, Kvemo Kartli, and Samegrelo- Zemo Svaneti

1.2.4 Year 3: Area 3 and hot spots from area 1 and 2: Tbilisi, Kakheti, and Adjara

1.3 *Sample collection and testing:* The NFA team (along with PNNL) will be equipped with Global Positioning System (GPS) units to record the physical location of each specimen. In addition, epidemiological information will be gathered and a questionnaire will be completed with the animal owners. At each sampling location, veterinarians will take blood (two vials (one red cap and one purple cap), milk (if applicable and available), and swabs. Swabs will only be collected sparingly and as needed to obtain a potentially better sample source for detecting the shedding of *Coxiella*. Samples are placed in biohazard bags as secondary containers using personal protective equipment (PPE) precautions to avoid contact with potentially infected material (see the "safety" section below). The epidemiologist will record all information and samples will be transported en masse back to the Laboratory Support Station (LSS) and Zonal Diagnostic Laboratory (ZDL) laboratories for that specific region of Georgia. Once all of the samples are accessioned, serological testing will be performed on one of the blood tubes from each animal, which will test for *Coxiella burnetii*. All positive and negative samples will then be packaged and sent to the LMA for further testing and analysis. The samples delivered to the LMA will be processed: e.g. serum preparation, extraction of nucleic acids for pathogen detection, and other diagnostics tests (described below).

1.4 *DNA Isolation and Purification*: In this study, animal samples will be used for extraction of nucleic acids for PCR analysis using DTRA approved protocols and reagents (conducted at the LMA). Specifically, we will prepare genomic deoxyribonucleic acid (DNA) and Ribonucleic Acid (RNA)

from each isolate in two ways: a) DNA will be extracted from swabs and milk by using Chelex resin: 200 µL of milk will be added to 400 µL of Chelex suspension; then, it will be incubated and shaken for 30 min at 56°C, followed by an incubation step for 8 min at 100°C. The clarified supernatant will be used for PCR and Single Nucleotide Polymorphism (SNP) genotyping. b) Genomic DNA from blood (for *C. burnetii*) will be isolated using Qiagen DNA mini kits following the manufacturer's instructions. Purified DNA will be aliquoted into individual Eppendorf tubes, cataloged to their source, and frozen for future molecular biological work. Genomic DNA will be quantified using pico green and spectrophotometric readings at A260/A280 before storage to assure that sufficient quantities of DNA have been prepared for future studies.

1.5 *PCR Detection of Coxiella burnetii species:*

Coxiello: DNA samples will be evaluated by PCR and all samples will tested by an in-house real-time PCR directed toward the *C. burnetii*–specific IS*1111a* element at the LMA ZDL laboratory. An inhibition control will be constructed by using the primers of the IS*1111a*element. PCR will be performed at the LMA using their in house Real Time PCR thermocycler. The mix used will consist of 400 nmol/L of primers and 200 nmol/L of probes in: 7 µL PerfeCTa Multiplex qPCR Supermix, uracil-n-glycosylase (2×) with Low Rox dye, 1 µL of inhibition control, 5 µL of sample, and 7 µL of water. An initial uracil DNA glycosylase (UDG) incubation is carried out for 5 min at 45°C and denaturation/activation for 60s at 95°C. This is followed by 40 cycles of denaturation for 10s at 95°C, and annealing for 30s at 60°C.

1.6 *SNP genotyping of Coxiella burnetii*: Recently, two DNA-based methods for typing *C. burnetii* were reported. Single Nucleotide Polymorphism (SNP) genotyping methods are based on single nucleotide variations in the DNA elements on multiple loci in the genome of *C. burnetii* and may be more discriminatory than multi-spacer, MLVA sequence typing. SNP genotyping can also be performed on *C. burnetii* strains or directly on DNA extracted from clinical samples. Several SNP markers have been described. The main drawback of genotyping from clinical samples is the variable quality and amount of DNA. These drawbacks influence the ease with which samples can be typed, resulting in partial genotypes; whether the missing values are caused by insufficient DNA concentrations and quality problems or by an absence of loci is unclear. If loci are absent, partial genotypes also are expected to be found in samples with high DNA loads. The high diversity indices for the SNP's of *C. burnetii*, as previously reported in the literature, indicate a high discriminating power, and this capability makes SNP typing suitable for distinguishing *C. burnetii* isolates. In this study, SNP typing will be performed by WRAIR scientists at the CPHR by using a selection of the SNP's described by Arricau-Bouvery *et al.* according to the analysis databases for genotyping http://minisatellites.u-psud.fr/MLVAnet/querypub1.php. The PCR amplification will be performed at the CPHR in a total volume of 25 µL containing 1× reaction buffer, 1 U True Start *Taq* DNA polymerase, 2 mmol/L $MgCl_2$, 0.2 mmol/L of each nucleotide (dATP, dGTP, dCTP, dUTP), 0.5 µmol/L of each primer, 0.5 U UDG, and 2–5 µL template. An initial UDG incubation will be carried out for 5 min at 37°C and denaturation/activation for 2 min at 95°C, followed by 40 cycles of denaturation for 30s at 95°C, annealing for 30s at 60/65°C, elongation for 30s at 72°C, with a final extension step for 5 min at 72°C completing the amplification. After the amplification, 0.5 U UDG inhibitor will be added to the PCR reactions to prevent further UDG activity. The SNP's will be determined based on the published and corrected annotation of the genome. Reproducibility was checked with positive controls. SNP patterns then be determined and compared to the publicly accessible SNP analysis databases for genotyping. DNA from the *C. burnetii* "Nine Mile" strain will be used as a reference. This work will be conducted by WRAIR with LMA molecular biologists.

1.7 *Shedding in sheep and cattle:* In this study, nine specific farms with animals that can be tracked and sampled will be chosen (three farms per year, for each of the three areas of Georgia) two per year for *Coxiella burnetii* shedding evaluation. Sampling of swabs will be performed by the NFA team on the day of kidding, and blood will be taken during the month following the kidding peak. Seroprevalence will be investigated using ELISA with a cutoff of 40% OD as recommended by the supplier and will be conducted by the LMA. In addition, a real-time IS1111-PCR will be used for quantification of vaginal bacterial shedding. DNA standards will be used in each qPCR run for an expression of cycle threshold (Ct) values in numbers of bacterial genome copies, but also for calibration to ensure reliable reproducibility, which is not obtained with the instrumental Ct values. According to the reproducibility of the assay for the weak quantities of *C. burnetii*, the animals giving less than 500 *C. burnetii* per swab will be considered as non-shedders. Animals will be defined as susceptible if found to be sero-negative and non-shedders. We will look for sero-positivity and sero-negativity, as well as the percentage of animals that abort during the season. The frequency of susceptible animals within the herd in relation to shedding and symptoms, as well as seronegative animals that shed bacteria will also be studied.

1.8 *Microbiology*: *Coxiella burnetii* is a gram-negative bacterium that causes the zoonotic disease Q fever. Traditionally considered an obligate intracellular agent, the requirement to be grown in tissue culture cells, embryonated eggs, or animal hosts has made it difficult to isolate strains and perform genetic studies on *C. burnetii*. However, it was recently demonstrated that the attenuated Nine Mile Phase 2 (NM2) *C. burnetii* strain would grow axenically (Not contaminated by or associated with any other living organisms. This is usually used in reference to pure cultures of microorganisms that are completely free of the presence of other organisms) in acidified citrate cysteine medium (ACCM) in a 2.5% oxygen environment. The current study will be undertaken to determine whether more virulent *C. burnetii* strains could be grown in ACCM, and whether virulence would be maintained after passage. The ACCM medium supports a 1000-fold expansion of strains of *C. burnetii*. To determine if passage in ACCM would maintain the virulence of *C. burnetii*, we will grow isolated strains for up to 26 weekly passages in ACCM. This section of the project (1.11) is reserved for future work at the CPHR. *This work must be conducted in a BSL-3 laboratory under BSL-3 working conditions. For this specific study, it is important to note that this section of the project is reserved for a separate Biosafety and Biosecurity review; separate protocols and Standard Operating Procedures (SOPS) are required and a separate DTRA-sponsored Biosafety and Biosecurity Review (BS&S) will be needed. The series of steps necessary to start this part of this project is triggered by a) collection of ample animal samples that can be confirmed positive, b) the need for research work as deemed necessary by the collaborators and investigators, and c) the availability of research space at WRAIR in the CPHR. Section 1.11 (C. burnetii microbiology) will not be considered as part of the initial review of this research proposal and at no time does microbiology and bacteriology occur in this proposal.*

1.9 *Geographic Information Systems*: Geographic Information Science (GISc) and Geographic Information Systems (GIS) continue to play an ever-increasing role in international research across disciplines. The application of spatial data management and spatial analyses intuitively fits into research agendas that focus on a wide variety of topics, such as resource management, health and disease surveillance, ecology, socio-environmental, and socio-economic patterns, to list a few. While the application grows, so too does the number of GIS techniques, computer applications and hardware, and GISc trained personnel. Disease studies readily lend themselves to GIS-based analyses because diseases are spatial in nature. Disease agent survival and transmission are linked to specific ecologies that promote the long-term survival and fitness of disease agents

(species' specific organisms that cause disease) and those reservoir or host populations that sustain the disease agents. We can evaluate geographic phenomena, such as microhabitats, that allow for the interaction of disease agents, vectors, and hosts. This is done through the integration of multiple disparate data sets, linked through a relational database. In GIS, the visualization component equates to digital map development. The disparate data sets used to develop a spatial visualization (map) of microhabitats might include satellite-derived precipitation maps, elevation maps, soil types, forest cover, etc. By evaluating each of these in a multivariate paradigm, a single map can be produced to evaluate the intersections in geographic space where appropriate environmental conditions exist to promote the target species or disease transmission cycle. In short, GIS is a methodology and digital infrastructure for evaluating data in space. This is done through integrating databases with map visualizations. With today's technology, databases are limited only by academic imagination. As long as we invest effort and forethought into our database infrastructure, we will be able to expand and scale our GIS applications to capture data on multiple diseases, disease ecosystems, and study designs. This can be done across scales from the local or microenvironment to national or regional macro scales. The LMA team will lead the GIS efforts; however, the NFA team will also work in concert with the LMA team to map areas which provide positive samples.

1.10 *Mapping and Modeling Disease Distributions:* The following descriptions detail the methods that can be employed to geo-locate (assign a geographic location to) existing samples when GPS units are not available. When GPS units are used, Garmin GPS units will be downloaded to MapSource software, exported as DWG files, imported to ArcGIS, and converted to geodatabase files. The method below can be defined by the spatial resolution of the data sets it can be used for: In order to develop a data set that can be employed with ecological modeling techniques for large geographic areas (continental or country level), existing samples can be assigned geographic locations from the village-level datasets. This will provide a relatively coarse description of locations. Nevertheless, these data are entirely appropriate for modeling with large cell-size grid sets of environmental data. For example, these data will be adequate for testing ecological niche and distributional models with 8x8 km gridded environmental data. This will match the resolution of analyses currently completed and/or ongoing for CBR projects in other CBEP engagement programs in other countries with collaborator (b)(6) and his team from Univ. of Florida.

1.11 *Space-Time Analysis:* Epidemiological investigations that include analyses of disease clusters may provide accurate assessments of risk (Jacquez 1996). Identifying areas with clusters or a raised incidence of health events can give insight into the transmission and ecology of a disease. Cluster detection methods are generally classified as being spatial, temporal, or a combination of both space and time (space-time or spatio-temporal). In general, spatial analyses assess the presence of clustering on the landscape whereas temporal analyses identify the possible grouping of events in time. In conjunction with others, these clustering techniques help facilitate the coordination of spatially targeted control measures (Caldas de Castro et al. 2007). Broadly speaking the presence or absence of clustering can be performed either retrospectively or prospectively. Thacker and Berkelman (1988) describe that the significant difference between retrospective studies, one-time analyses of information, and prospective surveillance is that the latter involves the continual collection of data. Retrospective analyses are often carried out as a one-time analysis of past data, after the onset of an outbreak. The types of analysis that use an accumulation of past events are valuable since they may reveal certain factors that may have contributed to the propagation of an illness. The prevalence of these techniques in the literature provides a valuable reference resource for analyzing the spatial (Kulldorff 1997) and/or temporal distribution (Wallenstein 1980) of past

health events. We will structure our data set development and GIS training sessions based on the following technique-specific criteria and software applications:

Statistical Technique	Cumulative Sum (CUSUM)
Hypotheses tested	H_0: There are no significant deviations from the baseline expectation established by calculating the average amount of time between false significant events H_1: There are significant deviations above baseline at specific time periods and in specific locations on the landscape
Required information for analysis	Time, location, some measure of population, confirmation/corroboration of pathogen isolation
Database requirements	Geolocation of outbreaks at point or aggregate level in a single column; sequential listing of the dates into2-digit format (e.g. 98 not 1998)
Statistical requirements	Multiple z-score calculations (one for each location and each time period; e.g. 100 sites over 10 years equals 10 z-scores for each of the 100 sites)
Software required	GeoSurveillance 1.1 (freeware); OpenStat and R (freeware)
Application to CBEP goals	Directly addresses the concept of disease baseline by evaluating methods for calculating space/time specific baselines and evaluating time/space specific deviations (increases or decreases) around the baseline

Statistical Technique	Space-time Clustering (SaTScan)
Hypotheses tested	H_0: There are no significant clusters in space or time, or in specific places at specific times H_1: There are significant spatial, temporal, or spatio-temporal

	clusters on the landscape
Required information for analysis	Time (date), location (as a point or polygon), confirmation/corroboration of pathogen isolation
Database requirements	A data set of geospatial locations, a data table of events in sequential time
Statistical requirements	Sequential events with equal intervals (months, years, or days); no conversions required (e.g. no need for standardized z-scores)
Software required	SaTScan (www.satscan.org; freeware – available at APS from AJ-3 PDG)
Application to CBEP goals	Directly identifies specific locations, populations, and time periods with significant increases in disease prevalence (or incidence); these data can then be evaluated with other parameterized predictive statistics (such as regression) to link environment (physical or socio-economic) to disease

Statistical Technique	**Local Moran's I (LISA analysis)**
Hypotheses tested	H_0: There are no significant clusters in space H_1: There are significant spatial clusters on the landscape
Required information for analysis	Disease event data aggregated to a gridded or political boundary. LISA are group-level statistics that evaluate spatial autocorrelation and require polygon data
Database requirements	A shapefile of contiguous polygons (either political boundaries like rayons or a grid file of squares or hexagons) with aggregated case numbers, incidence, or prevalence

Statistical requirements	Limited sample sizes present the problem of small numbers and it is useful to employ Shapiro-Wilk and evaluate normality
Software required	GeoDa (www.geodacenter.asu.edu; Freeware); also possible to employ ArcGIS 9.x Spatial Statistics Tool Box to run statistic
Application to CBEP goals	Directly identifies specific locations or regions with significantly more disease events ('hotspots') or fewer ('coldspots') than expected; also identifies spatial outliers of increased/decreased cases
Statistical Technique	**Predictive Ecological Niche Modeling**
Hypotheses tested	H_0: There are no significant ecological relationships to define a vector, host, or pathogen's distribution
	H_1: There are significant non-random relationships between the pathogen, host, or vector that can be applied to the landscape to predict the potential geographic distribution of the target species.
Required information for analysis	A point-level data set describing confirmed locations of the target species. A set of environmental variables describing landscape characteristics such as temperature, precipitation, altitude
Database requirements	An Excel file of location data for point events; A set of ASCII files containing gridded values of climate
Statistical requirements	No specific limitations; it is ideal to have 25 or more locality events and 5 or more environmental variables
Software required	DesktopGARP 1.1.6 (Freely available)

Application to CBEP goals	Directly identifies potential areas where the target species may be located on the landscape; particularly useful for understanding areas of persistence and for identifying new areas on the landscape where current surveillance efforts are not employed

Statistical Technique	**Principal Components Analysis (PCA)**
Hypotheses tested	H_0: There are no significant ecological relationships to define a vector, host, or pathogen's distribution H_1: There are significant non-random relationships between the pathogen, or host, or vector that can be applied to the landscape to describe differences between pathogen locations and the rest of the environment. (This can also be applied to risk factors or socio-economic data).
Required information for analysis	A point-level data set describing confirmed locations of the target species. A set of environmental variables describing landscape characteristics such as temperature, precipitation or altitude
Database requirements	An database file of location data for point events; A set of ASCII or Arc/Info Grid files containing gridded values of climate
Statistical requirements	Assumptions of correlation (normality, linearity) need to be evaluated
Software required	R or OpenStat (both free to download at APS)

Application to CBEP goals	Provides an exploratory technique for evaluating ecological or socio-economic components of EDPs

Anticipated Results

As we already mentioned, the country of Georgia does not have official statistics on *Coxiella*, but we do know that this disease exists in Georgia. Successful completion of this project will increase capabilities for detection and eradication of this disease in Georgia, improve the control of this disease, and hence positively affect animal health in Georgia. This will reduce economical loss, which is very important for this small country with a growing economy. The successful completion of this proposed project will help to establish, for the first time, a strong Georgian surveillance program for *Coxiella burnetii*, which may be used to monitor rigorously the emergence, prevalence, and dissemination of Q-fever, including cases that could be of increased public health and bioterrorism importance. In addition, this project will play a critical role in expanding Georgia's diagnostic capabilities for detecting *Coxiella*. Thus, we expect that the project will:

1. Establish well-equipped research laboratories in key Georgian institutions, which will significantly improve that country's veterinary health system, by enhancing the surveillance, detection, and research of this pathogen. GIS will be used to manage and visualize (map) the distribution of *Coxiella*. A master database will be shared between NFA and at LMA. This will consist of data from veterinary surveys, laboratory results as well as any epidemiological or diagnostics information. Throughout the project, the role of spatial analysis will expand from production of maps to advanced spatial and temporal modeling and statistical analysis of the data sets.

2. Generate databases (e.g., GIS) and other information crucial for developing diagnostic tools for accurately monitoring the emergence, prevalence, spread, seasonal migration patterns etc., of *Coxiella burnetii* in Georgia, and for predicting future disease demographics and occurrences. In addition, the data will be critical for developing science-based strategies for managing the potential dissemination of infection caused by *Coxiella*.

3. This project will train a new generation of Georgian scientists in modern biotechnology techniques, and more importantly, establish OIE guidelines and protocols by overlaying these protocols and meshing them with current Georgian procedures and CBEP algorithms for testing *Coxiella*.

4. Strongly contribute to the long-term sustainability of veterinary and animal health research in Georgia.

5. Provide peer-reviewed publications generated from this research. Proposed Publications include:
   a. Genotypic Diversity of *Coxiella burnetii* in the Republic of Georgia
   b. Molecular Epidemiology of *Coxiella burnetii* from Ruminants in Georgia
   c. *Coxiella burnetii* shedding and antibody responses in dairy goat herds in Georgia
   d. Development of tools for surveillance of *Coxiella burnetii* in domestic ruminants in Georgia

From the scientific perspective, we expect that the basic science studies in our program project will yield a large amount of novel data about *Coxiella* in Georgia, including the prevalence, genetic background, *in vitro* and *in vivo* properties, evolutionary traits, etc. Specific goals and expected outcomes are reviewed in the relevant sections throughout this proposal. In addition, this study will improve our understanding of the complex interrelationships between various animal and zoonotic diseases and co-infections in the environment.

Finally, and on a more general level, the project will:

1. Strengthen interactions and new collaborative ties between the collaborating Georgian institutions and researchers.

2. Provide infrastructure support for key scientific institutions in Georgia, and provide training and career advancement opportunities for its scientists.

3. Facilitate the transfer of sophisticated research approaches and techniques to the collaborating institutes in Georgia.

This project links several research studies into one cohesive research program that, taken together, will provide the ultimate output in data collection, analysis, and extrapolation. These three linking programs are:

1. Geographic Information Systems (GIS)
2. Genome research / sequencing and bioinformatics
3. Application of OIE standards and surveillance into current methodologies

Project Management

Project logistics will be managed by the CBEP-GG. This project is focused on *C. burnetii* and will be conducted at multiple institutes (WRAIR at the CPHR, the LMA, and NFA in Tbilisi, Georgia). Several LSS laboratories in the Threat Agent Detection and Response (TADR) network will also be utilized. This work will be supported by an institute specific budget to perform the tasks outlined in this project description. The duties of the Project Manager are listed below.

1. Project Reporting
   - Consolidation of quarterly reports from participating institutes
   - Preparation of a short executive summary of quarterly reports
   - Leadership in preparation of project presentations and abstracts for conferences and international meetings
   - Facilitation of publications in peer reviewed journals

2. Scientific Leadership
   - Regular communications with U.S. Collaborators
   - Participation in Quarterly Project Calls (and monthly if time permits)
   - Organization of local meetings of the Georgian project participants to discuss the project progress
   - Participants will present data and research findings at international conferences and meetings.

Meeting Goals and Objectives of CBR Program, Biosafety and Biosecurity

CBEP Goals: The proposed study is important considering that the *C. burnetii* species which will be explored in this project remains a largely unknown and potentially significant veterinary and medical threat in Georgia. From a veterinary and zoonotic public health perspective, the development and application of more advance diagnostics could lead to a superior disease monitoring capability for the institute and function to enhance disease control efforts in Georgia. Detection and surveillance of this pathogen in natural foci areas will also permit an integrated understanding of pathogen circulation in the region. The design of the program is such that it requires significant interaction between collaborators, scientists and institutes in the form of training, participation in U.S. scientific workshops and conferences, and working in close contact with collaborating scientists in their laboratories. This proposal addresses three CBEP goals:

- Strengthening dangerous pathogen detection and response networks
- Enabling discovery of the diversion or accidental release of biological materials
- Integrating host nation scientists and institutes with expertise in research and production into the International scientific community

Biosafety and Biosecurity Overview: Coxiella burnetii is a bacterial pathogen that is currently a Class B agent of high bioterrorism importance. The handling of this agent is normally conducted under BSL-3 safety conditions. All of the studies proposed in this application will adhere to the biosafety recommendations contained in the 5th edition of the Biosafety in Microbiological and Biomedical Laboratories (BMBL) Manual published jointly by the CDC and NIH (relevant text from the BMBL Manual is reproduced below for each pathogen). Samples may be processed in the field in mobile laboratories of the LMA and NFA or in the field stations. This project focuses on two areas of diagnostics: a) field diagnostics using rapid penside tests, and b) more in depth genetic and serological characterization.

Microbiology and Isolation: When the microbiological examination of those samples suggests that a targeted organism may be present, the samples will be transferred to the main laboratory at the LMA for processing, packaging, and cryopreservation. Part II of this project will examine the isolation and characterization of *Coxiella* using the biosafety recommendations for the targeted bacteria (From the fifth edition of the BMBL). All microbiological examination will occur in the future under BSL-3 conditions at the CPHR. This will be handled by implementing a separate biosafety and biosecurity review of this portion of the project after the CPHR BSL-3 laboratory is running and approved for use. Biosecurity: all samples will be kept in locked laboratories and locked refrigerators. Sample logbooks will be maintained and all samples and cultures will be kept under standard security measures as defined by CBEP.

Diagnostics samples containing suspect agents and OIE Standards: BSL-2 practices, containment equipment, and facilities are recommended for activities involving animal's samples and materials of animal origin suspected or known to contain *Coxiella burnetii*. Laboratory personnel should be informed of the possibility of Q-fever when samples are submitted for diagnostic tests See OIE standards located in the attached documents.

Safety Issues: Safety at sample collection sites will be ensured by the use of standard personal protective equipment (PPE) as and where appropriate. The following equipment will be used: Tyvek coveralls, boots (12 in high), N95 respirators, safety goggles, disposable hats, and double gloves (inside pair taped to the sleeves of the coverall). Staff at the collection sites have been using PPE for many years, and are skilled in the safe handling of potentially infectious material. Samples for PCR analysis will be handled appropriately

in Eppendorf tubes and heat inactivated at the earliest feasible time after sample collection and, as a result, the samples will be safe and non-infectious.

	Biosafety Level (Diagnostic Quantities)			
Pathogen	1	2	3	4
Diagnostic sample - blood		X		
Diagnostic sample - milk		X		
Diagnostic sample – swabs		X		
Microbiology of Coxiella (reserved for Part II of this study)			X	

Pathogen	Biosafety Practices	Primary Barriers and Equipment	Facilities and Secondary Barriers
C. burnetii	- Standard Microbiological Practices - Limited and controlled access - Biohazard warning signs - "Sharps" precautions - Biosafety manual / SOP - Decontamination of all waste - Decontamination of laboratory clothing before laundering - Baseline serum	- Class I or II BSCs or other physical containment devices used for all open manipulation of agents - Protective laboratory clothing; gloves; respiratory protection as needed	- Laboratory bench and sink - Autoclave - Physical separation from access corridors - Self-closing, double-door access - Exhaust air not re-circulated - Negative airflow into laboratory

Approximate Budget

Additional details of the budget are in the Form B.

Relevance to DoD Program Objectives

- Knowledge of *Coxiella*: This study will increase the knowledge of the epidemiology of *C. burnetii* in understudied geographic areas of natural and new foci in Georgia and test hypotheses on the environmental conditions that promote *C. burnetii* outbreaks in-country.
- Gainful employment of scientists: This project will provide gainful employment for scientists working with especially dangerous pathogens.

- Transparency and integration: This project will promote transparency and integration of Georgian scientists into the global science community through participation in international conferences and publication of scientific papers in international journals.
- DOD has a significant requirement to establish the Baseline of Pathogenic Organisms in the Environment. The enhanced surveillance program resulting from this project will generate new information on important especially dangerous pathogens which will be mapped and described in detail.

Relationship to Other on-going, planned, and recently completed CBEP Projects

In part, this study will serve as follow-on to the GG-18 project and links well with the ongoing Vector Surveillance studies in Georgia and with future proposed TADR activity projects and future CBR projects in queue for review. In addition, in GG-17, several hundred previously collected animal blood and milk samples could be used on this project for initial testing, training, and evaluation. CBEP encourages work to collect, review, and analyze historical records of CBEP pathogens; and CBEP encourages work related to utilizing the EIDSS-linked database that would allow rapid identification of unusual patterns of clustering of disease anywhere in the country.

TECHNICAL DIRECTIVE (TD)

1. CONTRACT NUMBER	2. CONTRACTOR	3a.TD NUMBER	3b.REV
HDTRA1 -14-c-0104	METABIOTA	16	

4. TD TITLE	5. TOTAL TD ESTIMATE:
Subject Matter Expertise in Geographic Information Systems (GIS) Modeling and Regional Single Nucleotide Polymorphisms (SNPs) at the Richard G. Lugar Center for Public Health Research in Georgia	HOURS: 520 DOLLARS: $ **$150,000.00**

6. CONTRACING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME (b)(6)
PHONE (b)(6) MAIL: (b)(6)	PHONE EMAIL: (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide expertise in geographic information systems (GIS) modeling and regional Single Nucleotide Polymorphisms (SNPs) at the Richard G. Lugar Center for Public Health Research in Georgia in accordance with SOW. Section 4.4, Task 2 and Task 4. This expertise should be provided by a scientist (SME I or SME II) with experience of working with Former Soviet Union (FSU) researchers and should focus on providing subject matter expertise in GIS modeling and regional SNPs for CBEP-funded research projects GG-19, GG-20 and GG-27.

For GG-19, this expertise should include guidance and mentorship of National Center for Disease Control (NCDC) staff on using GIS to determine a risk assessment for exposure to environmental and animal sources of *Francisella tularensis*, and should focus on producing risk assessment maps.

For GG-20, the expert should provide mentorship to Laboratory of Ministry of Agriculture (LMA) and National Food Agency (NFA) personnel on using GIS techniques to manage and visualize (map) the ecological niche and distribution models of *Coxiella burnetii* and conduct advanced spatial and temporal modeling and statistical analysis of datasets.

For GG-27, the expert should aid in the identification and selection of regional loci of *Bacillus anthracis* and the corresponding environmental sampling sites, conduct spatial genetic pattern analysis and risk factor mapping of *B. anthracis* using GIS, aid in the production of GIS models of the geographic distribution of *B. anthracis* across the south Caucasus, and serve as a subject matter expert on regional Single Nucleotide Polymorphisms (SNPs), including a well-established Georgian SNP typing panel. Mentorship activities should focus on providing guidance in stringent metrics and international standards in GIS and SNP data interpretation and analysis to NCDC, LMA and NFA scientists.

It is expected that implementation of this requirement will be approximately 13 weeks worth of effort consisting of (a) 3 x 1 week trips (detailed below), (b) up to 1 week before each trip for preparation activities, (c) up to 1 week after each trip for reporting and follow-up actions, and (d) up to 4 additional weeks of effort for coordination and remote reach-back support. The expert is expected to conduct two trips to Tbilisi, Georgia, to provide on-site mentorship to Georgian colleagues for GG-19, GG-20 and GG-27 research projects. Timing for these trips should be determined based on project needs. The expert is also expected to conduct a third trip to attend the regional GG-27/AJ TAP-11 kick-off meeting in Baku, Azerbaijan in October 2015.

The period of performance for this effort will be from 15 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $150,000 is requested by 4 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation

Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8 and leverages information gleaned from discussions with A&AS contractors. A key assumption for this effort is that the Georgian scientists are generally capable of conducting GIS analyses on their own. It is anticipated that the plan for TD-016 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as SME I) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:

From the information provided in Box 8, Metabiota assumes that these projects are ongoing affairs led by a third party. In order to effectively ensure that a GIS SME is available to provide the requested in-country mentoring, the Metabiota PM and PC will, upon approval of the TD, continue to engage relevant DTRA CBEP stakeholders to identify how, where, and when project status updates are communicated (for example, monthly teleconference, weekly email exchanges, etc.). Upon approval and receipt of additional information re: GG 19, 20, and 27, the Metabiota PM and PC will identify a GIS SME and work to establish a subcontract or independent consulting arrangement with the SME. The Metabiota PM, PC, and GIS SME will participate in these communications in order to understand when in-country mentoring activities will be required. The Metabiota PM and PC will work with the GIS SME to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or the appropriate DTRO (Tbilisi or Baku).

Mentoring:

Mentoring will consist of both in-country and remote mentoring. After assessing the need for in-person GIS mentoring, the PM, PC, and GIS SME will work with the project teams to elucidate the specific goals, and requirements of each mentoring request to ensure that the mentoring visit is conducted efficiently and effectively. The GIS SME will work with the PM, PC, and appropriate stakeholders in each respective project to create a list of tasks to be accomplished by the Georgian scientists leading up to the mentoring visit, to create a list of topics for the GIS SME to be prepared to assist with during the mentoring visit, and to facilitate the communication and exchange of any necessary data or concepts both prior to and following each mentoring visit.

Reach-back support:
Based on our understanding of the requirements, Metabiota does not expect to be required to provide primary GIS analysis support to any of the three projects, but does expect the GIS SME to be available to occasiona ly provide remote guidance or limited assistance with data analyses. Through regular communications with the respective project teams Metabiota will be made aware of any additional subject matter expertise requests. The GIS SME will address these needs as they arise.

Risk Management:
In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
Cost, Schedule, Performance, Quality						
Unable to communicate with DTRA CBEP technical POCs	The short turnaround combined with the holiday likely led to the non-response to Metabiota requests for communication and background materials on the three Georgia projects. Therefore, the proposal was developed without sufficient context into the true level of GIS subject matter expertise needed to accomplish project goals. Thus our proposed labor solution may be inadequate, impacting cost. It may also impact schedule, performance, and quality, as we may proceed to identify a SME who is incapable of meeting project requirements in a timely fashion or to the satisfaction of project stakeholders.	5	4	(b)(4); (b)(6)	Upon approval, continue efforts to contact DTRA Technical POCs and all other relevant stakeholders (for example, A&AS). During proposal development Metabiota has researched multiple possible SMEs who could potentially address project requirements.	**Med-High**
Schedule / Performance						
The TD indicates potential travel in October	TD was received on 1 September, and indicates travel for an unspecified window in October, placing Metabiota at risk for not meeting CDRL deadlines. Missing the CCR CDRL deadline may result in travel authorization being denied.	5	5	(b)(4); (b)(6)	Ask DTRA if Metabiota may proceed with project coordination activities sans approval; also ask for possibility of receiving formal exemption of meeting CCR deadlines for this first travel.	**Med-High**

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$123,504.43
1003	MATERIALS	$0.00
1004	ODCs	$1,753.69
1005	TRAVEL	$14,256.50
TOTAL		**$139,514.62**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES):

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Expert may be an independent consultants or subcontractor, the Metabiota PM will additionally provide management oversight of the project subcontractors (GIS SME) and the integration with other project stakeholders throughout the duration of this project. The PM will also ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the

acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Metabiota Subject Matter Expert 1: The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM and will manage the GIS SME, including all subcontractors, to ensure all project requirements and deliverables are met and the program remains within scope, budget, and timeline.

The PC will lead coordination with project stakeholders and will coordinate in-country mentorship dates. The PC will participate in regular communications between the project stakeholders and the GIS SME. The PC will coordinate with stakeholders in order to plan and execute logistical arrangements, and drive the coordination required to sufficiently gather the answers to the logistical questions that will arise in the planning and execution of requested travel for mentoring activities.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the GIS SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Subject Matter Expert 2: The SME 2 will serve as the GIS SME. The SME 2 will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each project, the needs and expectations of the Georgian scientists, and the GIS subject matter expertise needed. The SME 2 will provide both in-country and remote mentoring as directed by the respective project leads.

Materials
No materials are expected to be procured for this effort.

Other Direct Costs
Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts
Subcontracts will be issued to SMEs, RDAs, and/or their home organizations as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel
Travel is requested to support the GIS SME to Tbilisi, Georgia for two (2) one-week trips to provide mentoring as needed. Travel is also requested to support the GIS SME to Baku, Azerbaijan for one (1) one-week trip to attend the project kickoff of GG-27/AJ TAP-11. The travel budget represents the estimated amount required; precise numbers may vary depending on factors beyond Metabiota control. Travel on the AEP contract is cost reimbursable.

8. DESCRIPTION OF TD (NOT

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide expertise in grantsmanship at the Richard G. Lugar Center for Public Health Research and at the Laboratory of the Ministry of Agriculture in Georgia in accordance with SOW, Section 4.3, Task 3 and Section 4.5, Task 5. This expertise should be provided by a scientist (SME I or SME II) with experience in proposal development mentoring and should provide guidance in preparing and submitting grant proposals to the DTRA Broad Agency Announcement (BAA) or other competitive research solicitations. More specifically, the mentor should focus on providing mentorship in the following areas. (a) assist National Center for Disease Control (NCDC) researchers with accurate development of direct and indirect costs as part of the proposal preparation. (b) assist Laboratory of Ministry of Agriculture (LMA) personnel with proposal development and submission processes to include development of scientific hypotheses, analysis of research data, drafting of white papers and full proposals, and reviewing proposal evaluations and recommendations.

It is expected that implementation of this requirement will require approximately 13 weeks of effort consisting of 2 x 1 week trips to Tbilisi, Georgia, with additional time allotted for pre- and post-trip activities and follow-up actions, in order to provide on-site mentorship to Georgian colleagues. Timing for these trips should be determined based on project needs. An additional 7 weeks of effort is anticipated for coordination, document reviews, and remote reach-back support.

The period of performance for this effort will be from 21 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $150,000 is requested by 17 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES).

Proposal Development & Initiation:
Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8. A key assumption for this effort is that the Georgian scientists have their own research ideas which can be shaped into proposals. A second key assumption is that Metabiota Subject Matter Experts providing grantsmanship support will **not** be the primary drafters of any white papers or full proposals, but rather will only provide assistance in drafting said white papers and proposals. A third key assumption is that the Georgian scientists will not require any assistance in analysis of any data which may be presented in the proposals as preliminary work. It is anticipated that the plan for TD-017 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as Subject Matter Expert (SME) 1) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:
From the information provided in Box 8, Metabiota assumes that there are several relevant POCs at both NCDC and LMA which will be involved in the grantsmanship efforts. The Metabiota PM and PC will, upon approval of the TD, engage relevant DTRA CBEP and Lugar Center stakeholders to begin understanding what efforts they would like to work on. Upon approval and receipt of additional information, the Metabiota PM and PC will identify a grantsmanship subject matter expert (billed as SME 2) and work to either onboard them as a Metabiota employee or establish a subcontract or independent consulting arrangement with the VS. The Metabiota PM, PC, and SME 2 will participate in communications with stakeholders at NCDC and LMA in order to understand what mentoring activities will be required. The Metabiota PM and PC will work with the SME 2 to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or DTRO-Tbilisi.

In-Country Grantsmanship Mentoring
Mentoring will consist of in-country and remote mentoring. Based on our understanding of the requirements, Metabiota does not expect to be required to provide data analysis support to the NCDC or LMA scientists. In order to ensure the success of the in-country mentoring visits, the PM, PC, and SME 2 will work with the POCs at NCDC and LMA to establish a list of deliverables to be provided to Metabiota prior to any in-country mentoring. These deliverables may include budgetary data, drafts of proposed plans and SOPs, drafts of white papers and full proposals, and analyses of preliminary data complete with methodology. The PM and PC will maintain regular communications with the SME 2 to ensure that the SME 2 has all required resources for mentoring. After assessing the need for in-country mentoring, the SME 2 will implement the mentoring work plans, only assisting with actual proposal writing in cases of last resort.

Reach-back Support / Remote Mentoring
Based on our understanding of the requirements, Metabiota does not expect to be required to provide primary authorship support to any proposals but does expect the SME 2 to be available to occasionally provide remote editorial guidance and limited assistance with drafting of select passages. Through regular communications with the respective project teams, Metabiota will be made aware of any additional subject matter expertise requests. The SME 2 will address these needs as they arise.

Risk Management:
In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
			Cost			
Non response of DTRA CBEP technical POCs	The short turnaround led to only a brief communication with A&AS regarding clarification of requirements. Thus our proposed labor solution may be inadequate, impacting cost	5	4	(b)(4); (b)(6)	Upon approval, continue efforts to contact DTRA Technical POCs and all other relevant stakeholders	**Med-High**
			Performance			
Scientific research topics	We have no knowledge of what the breadth of scientific research topics is that NCOC and LMA are interested in pursuing. Funding probabilities are already low at most organizations, and while much of grantsmanship can be generalized, domain-specific knowledge can be key in some instances. Without knowing in advance what topics will be proposed, it seems highly likely that grantsmanship mentoring will not operate at maximum effectiveness.	5	3	**Med-High**	Identify grantsmanship SME with broad experiences in the biological sciences	**Med-High**

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN)

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$125,669
1003	MATERIALS	$1,842
1004	ODCs	$948
1005	TRAVEL	$8,273
TOTAL		**$136,732.08**

9c. TD SOLUTION BASIS OF ESTIMATE - DESCRIPTION (NOT TO EXCEED 2 PAGES)

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Expert may be an independent consultants or subcontractor, the Metabiota PM will additionally provide management oversight of the project subcontractors (microbiology SME) and the integration with other project stakeholders throughout the duration of this project. The PM will also ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Metabiota Subject Matter Expert 1: The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM. The PC will manage the SME 2, to include leading regular coordination calls with the SME 2, participating in regular communications between the proposal stakeholders and the grantsmanship SME, and coordinating with the SME 2 to ensure all project requirements and deliverables are met and the program remains within scope, budget,

and timeline. The PC will aid the PM and SME 2 in ensuring project startup and closeout are completed to the satisfaction of the funder.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the microbiology SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Subject Matter Expert 2: The SME 2 will serve as the grantsmanship SME. The SME 2 will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each proposal, the needs and expectations of the Georgian scientists, and the grantsmanship assistance needed. The SME 2 will provide mentoring as directed by the respective project leads.

Materials

We have budgeted for the purchase of up to 50 scientific journal articles for use in supporting the proposal writing efforts at a projected average cost of $35 per journal article.

Other Direct Costs

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts

Subcontracts will be issued to the SME 2 and/or their home organization as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel

Travel is requested to support the deployment of the SME 2 to Tbilisi, Georgia for two (2) one-week deployments. No additional travel is projected based on the requirements provided. The travel budget represents the estimated amount required; precise numbers may vary depending on factors beyond Metabiota control. Travel on the AEP contract is cost reimbursable.

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE)

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide expertise in grantsmanship at the Richard G. Lugar Center for Public Health Research and at the Laboratory of the Ministry of Agriculture in Georgia in accordance with SOW, Section 4.3, Task 3 and Section 4.5, Task 5. This expertise should be provided by a scientist (SME I or SME II) with experience in proposal development mentoring and should provide guidance in preparing and submitting grant proposals to the DTRA Broad Agency Announcement (BAA) or other competitive research solicitations. More specifically, the mentor should focus on providing mentorship in the following areas: (a) assist National Center for Disease Control (NCDC) researchers with accurate development of direct and indirect costs as part of the proposal preparation, (b) assist Laboratory of Ministry of Agriculture (LMA) personnel with proposal development and submission processes to include development of scientific hypotheses, analysis of research data, drafting of white papers and full proposals, and reviewing proposal evaluations and recommendations.

It is expected that implementation of this requirement will require approximately 13 weeks of effort consisting of 2 x 1 week trips to Tbilisi, Georgia, with additional time allotted for pre- and post-trip activities and follow-up actions, in order to provide on-site mentorship to Georgian colleagues. Timing for these trips should be determined based on project needs. An additional 7 weeks of effort is anticipated for coordination, document reviews, and remote reach-back support.

The period of performance for this effort will be from 21 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $150,000 is requested by 17 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation:

Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8. A key assumption for this effort is that the Georgian scientists have their own research ideas which can be shaped into proposals. A second key assumption is that Metabiota Subject Matter Experts providing grantsmanship support will **not** be the primary drafters of any white papers or full proposals, but rather will only provide assistance in drafting said white papers and proposals. A third key assumption is that the Georgian scientists will not require any assistance in analysis of any data which may be presented in the proposals as preliminary work. It is anticipated that the plan for TD-017 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as Subject Matter Expert (SME) 1) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:

From the information provided in Box 8, Metabiota assumes that there are several relevant POCs at both NCDC and LMA which will be involved in the grantsmanship efforts. The Metabiota PM and PC will, upon approval of the TD, engage relevant DTRA CBEP and Lugar Center stakeholders to begin understanding what efforts they would like to work on. Upon approval and receipt of additional information, the Metabiota PM and PC will identify a grantsmanship subject matter expert (billed as SME 2) and work to either onboard them as a Metabiota employee, or establish a subcontract or independent consulting arrangement with the VS. The Metabiota PM, PC, and SME 2 will participate in communications with stakeholders at NCDC and LMA in order to understand what mentoring activities will be required. The Metabiota PM and PC will work with the SME 2 to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or DTRO-Tbilisi.

In-Country Grantsmanship Mentoring

Mentoring will consist of in-country and remote mentoring. Based on our understanding of the requirements, Metabiota does not expect to be required to provide data analysis support to the NCDC or LMA scientists. In order to ensure the success of the in-country mentoring visits, the PM, PC, and SME 2 will work with the POCs at NCDC and LMA to establish a list of deliverables to be provided to Metabiota prior to any in-country mentoring. These deliverables may include budgetary data, drafts of proposed plans and SOPs, drafts of white papers and full proposals, and analyses of preliminary data complete with methodology. The PM and PC will maintain regular communications with the SME 2 to ensure that the SME 2 has all required resources for mentoring. After assessing the need for in-country mentoring, the SME 2 will implement the mentoring work plans, only assisting with actual proposal writing in cases of last resort.

Reach-back Support / Remote Mentoring:

Based on our understanding of the requirements, Metabiota does not expect to be required to provide primary authorship support to any proposals, but does expect the SME 2 to be available to occasionally provide remote editorial guidance and limited assistance with drafting of select passages. Through regular communications with the respective project teams, Metabiota will be made aware of any additional subject matter expertise requests. The SME 2 will address these needs as they arise.

Risk Management:
In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
			Cost			
Non-response of DTRA CBEP technical POCs	The short turnaround led to only a brief communication with A&AS regarding clarification of requirements. Thus our proposed labor solution may be inadequate, impacting cost.	5	4	(b)(4); (b)(6)	Upon approval, continue efforts to contact DTRA Technical POCs and all other relevant stakeholders.	**Med-High**
			Performance			
Scientific research topics	We have no knowledge of what the breadth of scientific research topics is that NCDC and LMA are interested in pursuing. Funding probabilities are already low at most organizations, and while much of grantsmanship can be generalized, domain-specific knowledge can be key in some instances. Without knowing in advance what topics will be proposed, it seems highly likely that grantsmanship mentoring will not operate at maximum effectiveness.	5	3	**Med-High**	Identify grantsmanship SME with broad experiences in the biological sciences.	**Med-High**

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN)

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$125,669
1003	MATERIALS	$1,842
1004	ODCs	$948
1005	TRAVEL	$8,273
TOTAL		**$136,732.08**

9c. TD SOLUTION BASIS OF ESTIMATE DESCRIPTION (NOT TO EXCEED 2 PAGES):

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Expert may be an independent consultants or subcontractor, the Metabiota PM will additionally provide management oversight of the project subcontractors (microbiology SME) and the integration with other project stakeholders throughout the duration of this project. The PM will also ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Metabiota Subject Matter Expert 1: The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipat ng, managing, and communicating project risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM. The PC will manage the SME 2, to include leading regular coordination calls with the SME 2, participating in regular communications between the proposal stakeholders and the grantsmanship SME, and coordinating with the SME 2 to ensure all project requirements and deliverables are met and the program remains within scope, budget,

and timeline. The PC will aid the PM and SME 2 in ensuring project startup and closeout are completed to the satisfaction of the funder.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the microbiology SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Subject Matter Expert 2: The SME 2 will serve as the grantsmanship SME. The SME 2 will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each proposal, the needs and expectations of the Georgian scientists, and the grantsmanship assistance needed. The SME 2 will provide mentoring as directed by the respective project leads.

Materials

We have budgeted for the purchase of up to 50 scientific journal articles for use in supporting the proposal writing efforts at a projected average cost of $35 per journal article.

Other Direct Costs

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts

Subcontracts will be issued to the SME 2 and/or their home organization as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel

Travel is requested to support the deployment of the SME 2 to Tbilisi, Georgia for two (2) one-week deployments. No additional travel is projected based on the requirements provided. The travel budget represents the estimated amount required; precise numbers may vary depending on factors beyond Metabiota control. Travel on the AEP contract is cost reimbursable.

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide expertise in grantsmanship at the Richard G. Lugar Center for Public Health Research and at the Laboratory of the Ministry of Agriculture in Georgia in accordance with SOW, Section 4.3, Task 3 and Section 4.5, Task 5. This expertise should be provided by a scientist (SME I or SME II) with experience in proposal development mentoring and should provide guidance in preparing and submitting grant proposals to the DTRA Broad Agency Announcement (BAA) or other competitive research solicitations. More specifically, the mentor should focus on providing mentorship in the following areas: (a) assist National Center for Disease Control (NCDC) researchers with accurate development of direct and indirect costs as part of the proposal preparation, (b) assist Laboratory of Ministry of Agriculture (LMA) personnel with proposal development and submission processes to include development of scientific hypotheses, analysis of research data, drafting of white papers and full proposals, and reviewing proposal evaluations and recommendations.

It is expected that implementation of this requirement will require approximately 13 weeks of effort consisting of 2 x 1 week trips to Tbilisi, Georgia, with additional time allotted for pre- and post-trip activities and follow-up actions, in order to provide on-site mentorship to Georgian colleagues. Timing for these trips should be determined based on project needs. An additional 7 weeks of effort is anticipated for coordination, document reviews, and remote reach-back support.

The period of performance for this effort will be from 21 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $150,000 is requested by 17 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation:

Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8. A key assumption for this effort is that the Georgian scientists have their own research ideas which can be shaped into proposals. A second key assumption is that Metabiota Subject Matter Experts providing grantsmanship support will not be the primary drafters of any white papers or full proposals, but rather will only provide assistance in drafting said white papers and proposals. A third key assumption is that the Georgian scientists will not require any assistance in analysis of any data which may be presented in the proposals as preliminary work. It is anticipated that the plan for TD-017 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as Subject Matter Expert (SME) 1) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:

From the information provided in Box 8, Metabiota assumes that there are several relevant POCs at both NCDC and LMA which will be involved in the grantsmanship efforts. The Metabiota PM and PC will, upon approval of the TD, engage relevant DTRA CBEP and Lugar Center stakeholders to begin understanding what efforts they would like to work on. Upon approval and receipt of additional information, the Metabiota PM and PC will identify a grantsmanship subject matter expert (billed as SME 2) and work to either onboard them as a Metabiota employee, or establish a subcontract or independent consulting arrangement with the VS. The Metabiota PM, PC, and SME 2 will participate in communications with stakeholders at NCDC and LMA in order to understand what mentoring activities will be required. The Metabiota PM and PC will work with the SME 2 to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or DTRO Tbilisi.

In-Country Grantsmanship Mentoring

Mentoring will consist of in-country and remote mentoring. Based on our understanding of the requirements, Metabiota does not expect to be required to provide data analysis support to the NCDC or LMA scientists. In order to ensure the success of the in-country mentoring visits, the PM, PC, and SME 2 will work with the POCs at NCDC and LMA to establish a list of deliverables to be provided to Metabiota prior to any in-country mentoring. These deliverables may include budgetary data, drafts of proposed plans and SOPs, drafts of white papers and full proposals, and analyses of preliminary data complete with methodology. The PM and PC will maintain regular communications with the SME 2 to ensure that the SME 2 has all required resources for mentoring. After assessing the need for in-country mentoring, the SME 2 will implement the mentoring work plans, only assisting with actual proposal writing in cases of last resort.

Reach-back Support / Remote Mentoring:

Based on our understanding of the requirements, Metabiota does not expect to be required to provide primary authorship support to any proposals, but does expect the SME 2 to be available to occasionally provide remote editorial guidance and limited assistance with drafting of select passages. Through regular communications with the respective project teams, Metabiota will be made aware of any additional subject matter expertise requests. The SME 2 will address these needs as they arise.

Risk Management:
In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
			Cost			
Non-response of DTRA CBEP technical POCs	The short turnaround led to only a brief communication with A&AS regarding clarification of requirements. Thus our proposed labor solution may be inadequate, impacting cost.	5	4	(b)(4); (b)(6)	Upon approval, continue efforts to contact DTRA Technical POCs and all other relevant stakeholders.	**Med-High**
			Performance			
Scientific research topics	We have no knowledge of what the breadth of scientific research topics is that NCDC and LMA are interested in pursuing. Funding probabilities are already low at most organizations, and while much of grantsmanship can be generalized, domain-specific knowledge can be key in some instances. Without knowing in advance what topics will be proposed, it seems highly likely that grantsmanship mentoring will not operate at maximum effectiveness.	5	3	**Med-High**	Identify grantsmanship SME with broad experiences in the biological sciences.	**Med-High**

Fort Belvoir, VA 22060-6201

TECHNICAL DIRECTIVE (TD)

1. CONTRACT NUMBER	2. CONTRACTOR	3a.TD NUMBER	3b.REV
HDTRA1-14-C-0104	METABIOTA	18	

4. TD TITLE	5. TOTAL TD ESTIMATE:
On-site Expertise in Genomic Research Activities at the Richard G. Lugar Center for Public Health Research in Georgia	HOURS: 1432 DOLLARS: $ **$380,000.00**

6. CONTRACING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME: (b)(6)
PHONE: (b)(6) EMAIL: (b)(6)	PHONE: EMAIL: (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide on-site expertise in genomic research activities at the Richard G. Lugar Center for Public Health Research in Georgia in accordance with SOW Section 4.2, Task 2, Section 4.4, Task 4, Section 4.5. Task 5, and Section 4.6. Task 6. This expertise can be provided by a visiting scientist and/or scientific mentor and should focus on providing subject matter expertise in genomic research for CBEP-funded research projects or related follow-on work conducted at the Lugar Center. This expertise should include guidance and mentorship on designing and implementing experimental procedures, troubleshooting methodology and data analysis methods for on-going research projects at the Lugar Center. Additionally, the expert should assist by providing guidance and mentorship in operations of the Genomics Center at the Lugar Center.

Mentorship activities should focus on providing guidance in stringent metrics and international standards in genomic data collection, analysis and interpretation. Additionally, on-site personnel should provide mentorship to Georgian colleagues in comprehending and applying core concepts and methodologies in comparative genomics for use in building applied biosurveillance research proposals. The research mentor should assist Georgian researchers with manuscript preparation of CBEP-funded research in genomics for submission to peer-reviewed scientific journals. This on-site interaction should facilitate motivation towards independent knowledge-building inquiry and critical thinking skills needed for future sustainable research.

The period of performance for this effort will be from 21 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $380,000 is requested by 17 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation:

Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8. A key assumption for this effort is that the Georgian scientists are generally capable of conducting genomics and bioinformatics analyses on their own but that the requested support personnel will occasionally be asked to directly perform genomic and bioinformatics analyses. A second key assumption for this effort is that it is expected to be a full-time expat position. It is anticipated that the plan for TD-018 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as Subject Matter Expert (SME) I) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:

From the information provided in Box 8. Metabiota assumes that the unspecified CBEP-funded research projects are ongoing affairs led by third parties. In order to effectively ensure that an appropriate genomics subject matter expert (genomics SME, billed as a Visiting Scientist/VS) is available to provide the requested mentoring, the Metabiota PM and PC will, upon approval of the TD, continue to engage relevant DTRA CBEP and Lugar Center stakeholders to identify how, where, and when project status updates are communicated (for example, monthly teleconferences, weekly email exchanges, etc.) and what the onboarding and daily requirements are for working at the Lugar Center. Upon approval and receipt of additional information, the Metabiota PM and PC will identify a VS and work to either onboard them as a Metabiota employee, or establish a subcontract or independent consulting arrangement with the VS. The Metabiota PM, PC, and VS will participate in project communications in order to understand what mentoring activities will be required. The Metabiota PM and PC will work with the VS to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or DTRO-Tbilisi.

Mentoring and Performance of both Genomics and Bioinformatics Analyses and Operational Oversight of the Genomics Center:

Mentoring will consist of in-country mentoring. Based on our understanding of the requirements, Metabiota does not expect to be required to provide primary genomics analysis support to the various projects being conducted at the Lugar Center. The PM and PC will maintain regular communications with the VS to ensure that the VS has all required resources for mentoring. After assessing the need for genomics mentoring, the VS will work with the PM, PC, and other appropriate stakeholders to develop mentoring work plans. The VS will then implement the mentoring work plans, only assisting with actual analyses and scientific writing when necessary. Additionally, the VS will provide oversight over the operations of the genomics center. The VS will work with Lugar Center POCs to identify candidates for mentorship in operating the genomics center, and work with the PM, PC, and Lugar Center stakeholders to develop and execute a strategy for developing these candidates' abilities to operate the genomic center without guidance.

Risk Management:

In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to

include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix:

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
			Cost, Schedule, Performance, Quality			
Non-response of DTRA CBEP technical POCs	The short turnaround led to only a brief communication with A&AS regarding clarification of requirements and background materials. Thus our proposed labor solution may be inadequate, impacting cost. It may also impact schedule, performance, and quality, as we may proceed to identify a SME who is incapable of meeting project requirements in a timely fashion or to the satisfaction of project stakeholders.	5	4	(b)(4); (b)(6)	Upon approval, continue efforts to contact DTRA Technical POCs and all other relevant stakeholders (for example A&AS). During proposal development Metabiota has researched multiple possible SMEs who could potentially address project requirements.	**Med-High**
			Cost			
SME identification	We assume that an appropriate VS/SM cannot be located who already lives in Georgia (or is a Georgian living elsewhere) and have thus built in time to get the VS/SM onboarded and over to Georgia. Should a VS/SM be identified who does not require the onboarding process (travel trainings, submission of documents) mentorship may begin sooner, and drive up total labor costs beyond those projected.	3	5	**Med-High**	Notify DTRA as soon as possible as to what the projected date will be for hitting 75% and exhaustion of funds on CLIN1001 for this effort.	**Med-High**
			Schedule / Performance			
Travel requirements	We assume that an appropriate VS/SM cannot be located who already lives in Georgia (or is a Georgian living elsewhere) and have thus built in time to get the VS/SM onboarded and over to Georgia. If mentorship needs are required prior to late November, it may be difficult to meet those needs unless a VS/SM is identified who is already resident to Georgia.	3	5	**Med-High**	Clarify travel requirements for extended TDY postings with DTRA, and ask for an exemption to 45-day window if it still holds.	**Med-High**

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$361,460
1003	MATERIALS	$4,579
1004	ODCs	$14,180
1005	TRAVEL	$4,217
TOTAL		**$384,436**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES)

Labor

Costs for direct labor to support this activity is required for the following personnel:

All phases:

Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of

DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Expert may be an independent consultant or subcontractor, the Metabiota PM will additionally provide management oversight of the genomics SME and the integration with other project stakeholders throughout the duration of this project. The PM will also ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work

Metabiota Subject Matter Expert 1: The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipat ng, managing and communicating project risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM. The PC will manage the genomics SME, to include leading regular coordination calls with the genomics SME, participating in regular communications between the project stakeholders and the genomics SME, and coordinating with the genomics SME to ensure all project requirements and deliverables are met and the program remains within scope, budget, and timeline. The PC will aid the PM and VS in ensuring project startup and closeout are completed to the satisfaction of the funder.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the genomics SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Project Coordination & Mentorship phases only:
Visiting Scientist: The VS will serve as the genomics SME. The VS will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each project, the needs and expectations of the Georgian scientists, and the genomics subject matter expertise needed. The VS will provide mentoring as directed by the respective project leads. The VS will also provide oversight and management of the Genomics Center at the Lugar Center.

Materials
We expect to procure a modern laptop capable of running the same genomics and bioinformatics software being used at the Lugar Center. We also will need to procure the appropriate bioinformatics software and standard productivity software as well. As we have not received information detailing the TD-specific items, we have inserted placeholder numbers here.

Other Direct Costs
Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts
Subcontracts will be issued to the VS and/or their home organization as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel
Travel is requested to support the deployment of the VS to Tbilisi, Georgia for the initial deployment travel and final return. No additional travel is projected based on the requirements provided The travel budget represents the estimated amount required: precise numbers may vary depending on factors beyond Metabiota control. Travel on the AEP contract is cost reimbursable. Also of note, lodging at GSA rates for Tbilisi, Georgia have included to this budget. It is assumed that the TBD VS will require some time to identify long term lodging (length of assignment), which would by covered by his expat uplift.

Subject: RE: TD-019 Georgia Microbiology Vistity Scientist/Scientific Mentor
Date: Wednesday, September 23, 2015 4:40:34 PM
Attachments: CTR-CBEP_AEP_TD-019_GG Microbiology VS-SM 150917_approved.pdf

H (b)(6)

Please find attached, the approved TD-019 with ceiling price of $382,331 and a PoP of 9/23/2015-5/15/2016. Every effort should be made to perform the work specified in the Technical Directive within the estimated ceiling price. Metabiota should notify the Contracting Officer in writing whenever it has reason to believe the costs for this Technical Directive are expected to exceed the established ceiling price.

Cheers,

TECHNICAL DIRECTIVE (TD)

1. CONTRACT NUMBER	2. CONTRACTOR	3a.TD NUMBER	3b.REV
HDTRA1-14-C-0104	METABIOTA	19	

4. TD TITLE	5. TOTAL TD ESTIMATE:
On-site Expertise in Microbiology Research Activities at the Richard G. Lugar Center for Public Health Research in Georgia	HOURS: 1432 DOLLARS: $ **$380,000.00**

6. CONTRACING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME (b)(6)
PHONE: (b)(6) EMAIL: (b)(6)	PHON EMAIL: (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide on-site expertise in microbiology research activities at the Richard G. Lugar Center for Public Health Research in Georgia in accordance with SOW Section 4.2. Task 2, Section 4.4. Task 4, Section 4.5, Task 5, and Section 4.6. Task 6. This expertise can be provided by a visiting scientist and/or scientific mentor and should focus on providing subject matter expertise in microbial research for CBEP-funded research projects conducted at the Lugar Center. The expertise should include guidance and mentorship on designing and implementing experimental procedures, troubleshooting methodology, and analyzing data for on-going research projects at the Lugar Center. The expert should provide technical and scientific assistance in the conduct of research projects and implementation of new diagnostics, new technology and sustainability initiatives. Additionally, the expert should assist to improve communications and integration between Georgian institutes and with international agencies collaborating on Lugar Center research efforts.

Mentorship activities should focus on providing guidance in stringent metrics and international standards in data collection, analysis and data interpretation. Additionally, the research mentor should assist Georgian researchers with manuscript preparation of CBEP-funded research for submission to peer-reviewed scientific journals. This on-site interaction should facilitate motivation towards independent knowledge-building inquiry and critical thinking skills needed for future sustainable research.

The period of performance for this effort will be from 21 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $380,000 is requested by 17 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation:

Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8. A key assumption for this effort is that the Georgian scientists are generally capable of conducting microbiological analyses on their own but that the requested support personnel will occasionally be asked to directly perform microbiological analyses. A second key assumption for this effort is that it is expected to be a full-time expat position. It is anticipated that the plan for TD-019 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as Subject Matter Expert (SME) I) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:

From the information provided in Box 8, Metabiota assumes that the unspecified CBEP-funded research projects are ongoing affairs led by third parties. In order to effectively ensure that an appropriate microbiology subject matter expert (microbiology SME, billed as a Visiting Scientist/VS) is available to provide the requested mentoring, the Metabiota PM and PC will, upon approval of the TD, continue to engage relevant DTRA CBEP and Lugar Center stakeholders to identify how, where, and when project status updates are communicated (for example, monthly teleconference, weekly email exchanges, etc.) and what the onboarding and daily requirements are for working at the Lugar Center. Upon approval and receipt of additional information, the Metabiota PM and PC will identify a VS and work to either onboard them as a Metabiota employee, or establish a subcontract or independent consulting arrangement with the VS. The Metabiota PM, PC, and VS will participate in project communications in order to understand what mentoring activities will be required. The Metabiota PM and PC will work with the VS to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or DTRO-Tbilisi.

Mentoring and Performance of Microbiological Research:

Mentoring will be conducted in-country based on our understanding of the requirements. Metabiota does not expect to be required to provide primary microbiological analysis support to the various projects being conducted at the Lugar Center. The PM and PC will maintain regular communications with the VS to ensure that the VS has all required resources for mentoring. After assessing the need for microbiology mentoring, the VS will work with the PM, PC, and other appropriate stakeholders to develop mentoring work plans. The VS will then implement the mentoring work plans, only assisting with actual analyses and scientific writing when necessary. Additionally, the VS will provide oversight over the operations of the genomics center. The VS will work with Lugar Center POCs to identify candidates for mentorship in operating the genomics center, and work with the PM and PC to develop a strategy for developing these candidates' abilities to operate the genomic center without guidance.

Risk Management:

In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to

include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
			Cost, Schedule, Performance, Quality			
Non-response of DTRA CBEP technical POCs	The short turnaround led to only a brief communication with A&AS regarding clarification of requirements and background materials. Thus our proposed labor solution may be inadequate, impacting cost. It may also impact schedule, performance, and quality, as we may proceed to identify a SME who is incapable of meeting project requirements in a timely fashion or to the satisfaction of project stakeholders.	5	4	(b)(4); (b)(6)	Upon approval, continue efforts to contact DTRA Technical POCs and all other relevant stakeholders (for example A&AS). During proposal development Metabiota has researched multiple possible SMEs who could potentially address project requirements.	**Med-High**
			Cost			
SME identification	We assume that an appropriate VS/SM cannot be located who already lives in Georgia (or is a Georgian living elsewhere) and have thus built in time to get the VS/SM on boarded and over to Georgia. Should a VS/SM be identified who does not require the onboarding process (travel trainings submission of documents), mentorship may begin sooner, and drive up total labor costs beyond those projected.	3	5	**Med-High**	Notify DTRA as soon as possible as to what the projected date will be for hitting 75% and exhaustion of funds on CLIN1001 for this effort.	**Med-High**
			Schedule / Performance			
Travel requirements	We assume that an appropriate VS/SM cannot be located who already lives in Georgia (or is a Georgian living elsewhere) and have thus built in time to get the VS/SM on boarded and over to Georgia. If mentorship needs are required prior to late November, it may be difficult to meet those needs unless a VS/SM is identified who is already resident to Georgia.	3	5	**Med-High**	Clarify travel requirements for extended TDY postings with DTRA, and ask for an exemption to 45-day window if it still holds.	**Med-High**

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$361,460
1003	MATERIALS	$2,474
1004	ODCs	$14,180
1005	TRAVEL	$4,217
TOTAL		**$382,330**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES)

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Expert may be an independent consultants or subcontractor the Metabiota PM will additionally provide management oversight of the project subcontractors (microbiology SME) and the integration with other project stakeholders throughout the duration of this project. The PM will also ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Metabiota Subject Matter Expert 1: The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM. The PC will manage the microbiology SME, to include leading regular coordination calls with the microbiology SME, participating in regular communications between the project stakeholders and the microbiology SME, and coordinating with the microbiology SME to ensure all project requirements and deliverables are met and the program remains within scope, budget, and timeline. The PC will aid the PM and VS in ensuring project startup and closeout are completed to the satisfaction of the funder.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the microbiology SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Visiting Scientist: The VS will serve as the microbiology SME. The VS will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each project, the needs and expectations of the Georgian scientists, and the microbiological subject matter expertise needed. The VS will provide mentoring as directed by the respective project leads.

Materials
We expect to procure a modern laptop complete with standard productivity software for use by the VS. The cost number provided here represents an estimate of the costs, and may vary depending on factors beyond Metabiota control.

Other Direct Costs
Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts
Subcontracts will be issued to the VS and/or their home organization as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel
Travel is requested to support the deployment of the VS to Tbilisi, Georgia for the initial deployment travel and final return, including a period of up to 1 week (7 days) for securing permanent lodging arrangements. No additional travel is projected based on the requirements provided. The travel budget represents the estimated amount required based on USG lodging and per diem rates; precise numbers may vary depending on factors beyond Metabiota control. Travel on the AEP contract is cost reimbursable. As noted, lodging at GSA rates for Tbilisi, Georgia have included to this budget. It is assumed that the TBD VS will require some time to identify long term lodging (length of assignment), which would by covered by his expat uplift.

TECHNICAL DIRECTIVE (TD)

1. CONTRACT NUMBER	2. CONTRACTOR	3a.TD NUMBER	3b.REV
HDTRA1-14-C-0104	METABIOTA	19	

4. TD TITLE	5. TOTAL TD ESTIMATE.
On-site Expertise in Microbiology Research Activities at the Richard G. Lugar Center for Public Health Research in Georgia	HOURS. 1432 DOLLARS: $ **$380,000.00**

6. CONTRACING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME (b)(6)
PHONE (b)(6) EMAIL. (b)(6)	PHONE EMAIL. (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE)

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide on-site expertise in microbiology research activities at the Richard G. Lugar Center for Public Health Research in Georgia in accordance with SOW Section 4.2, Task 2, Section 4.4, Task 4, Section 4.5, Task 5, and Section 4.6, Task 6. This expertise can be provided by a visiting scientist and/or scientific mentor and should focus on providing subject matter expertise in microbial research for CBEP-funded research projects conducted at the Lugar Center. The expertise should include guidance and mentorship on designing and implementing experimental procedures, troubleshooting methodology, and analyzing data for on-going research projects at the Lugar Center. The expert should provide technical and scientific assistance in the conduct of research projects and implementation of new diagnostics, new technology and sustainability initiatives. Additionally, the expert should assist to improve communications and integration between Georgian institutes and with international agencies collaborating on Lugar Center research efforts

Mentorship activities should focus on providing guidance in stringent metrics and international standards in data collection, analysis and data interpretation. Additionally, the research mentor should assist Georgian researchers with manuscript preparation of CBEP-funded research for submission to peer-reviewed scientific journals. This on-site interaction should facilitate motivation towards independent knowledge-building inquiry and critical thinking skills needed for future sustainable research.

The period of performance for this effort will be from 21 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $380,000 is requested by 17 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation:

Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8. A key assumption for this effort is that the Georgian scientists are generally capable of conducting microbiological analyses on their own but that the requested support personnel will occasionally be asked to directly perform microbiological analyses. A second key assumption for this effort is that it is expected to be a full-time expat position. It is anticipated that the plan for TD-019 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as Subject Matter Expert (SME) I) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:

From the information provided in Box 8, Metabiota assumes that the unspecified CBEP-funded research projects are ongoing affairs led by third parties. In order to effectively ensure that an appropriate microbiology subject matter expert (microbiology SME, billed as a Visiting Scientist/VS) is available to provide the requested mentoring, the Metabiota PM and PC will, upon approval of the TD, continue to engage relevant DTRA CBEP and Lugar Center stakeholders to identify how, where, and when project status updates are communicated (for example, monthly teleconference, weekly email exchanges, etc.) and what the onboarding and daily requirements are for working at the Lugar Center. Upon approval and receipt of additional information, the Metabiota PM and PC will identify a VS and work to either onboard them as a Metabiota employee, or establish a subcontract or independent consulting arrangement with the VS. The Metabiota PM, PC, and VS will participate in project communications in order to understand what mentoring activities will be required. The Metabiota PM and PC will work with the VS to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or DTRO-Tbilisi.

Mentoring and Performance of Microbiological Research:

Mentoring will be conducted in-country based on our understanding of the requirements. Metabiota does not expect to be required to provide primary microbiological analysis support to the various projects being conducted at the Lugar Center. The PM and PC will maintain regular communications with the VS to ensure that the VS has all required resources for mentoring. After assessing the need for microbiology mentoring, the VS will work with the PM, PC, and other appropriate stakeholders to develop mentoring work plans. The VS will then implement the mentoring work plans, only assisting with actual analyses and scientific writing when necessary. Additionally, the VS will provide oversight over the operations of the genomics center. The VS will work with Lugar Center POCs to identify candidates for mentorship in operating the genomics center, and work with the PM and PC to develop a strategy for developing these candidates' abilities to operate the genomic center without guidance.

Risk Management:

In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to

include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk
			Cost, Schedule, Performance, Quality			
Non-response of DTRA CBEP technical POCs	The short turnaround led to only a brief communication with A&AS regarding clarification of requirements and background materials. Thus our proposed labor solution may be inadequate, impacting cost. It may also impact schedule, performance, and quality, as we may proceed to identify a SME who is incapable of meeting project requirements in a timely fashion or to the satisfaction of project stakeholders.	5	4	(b)(4); (b)(6)	Upon approval, continue efforts to contact DTRA Technical POCs and all other relevant stakeholders (for example, A&AS). During proposal development Metabiota has researched multiple possible SMEs who could potentially address project requirements.	**Med-High**
			Cost			
SME identification	We assume that an appropriate VS/SM cannot be located who already lives in Georgia (or is a Georgian living elsewhere) and have thus built in time to get the VS/SM on boarded and over to Georgia. Should a VS/SM be identified who does not require the onboarding process (travel trainings, submission of documents), mentorship may begin sooner, and drive up total labor costs beyond those projected	3	5	**Med-High**	Notify DTRA as soon as possible as to what the projected date will be for hitting 75% and exhaustion of funds on CLIN1001 for this effort.	**Med-High**
			Schedule / Performance			
Travel requirements	We assume that an appropriate VS/SM cannot be located who already lives in Georgia (or is a Georgian living elsewhere) and have thus built in time to get the VS/SM on boarded and over to Georgia. If mentorship needs are required prior to late November, it may be difficult to meet those needs unless a VS/SM is identified who is already resident to Georgia.	3	5	**Med-High**	Clarify travel requirements for extended TDY postings with DTRA, and ask for an exemption to 45-day window if it still holds.	**Med-High**

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$361,460
1003	MATERIALS	$2,474
1004	ODCs	$14,180
1005	TRAVEL	$4,217
TOTAL		**$382,330.30**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES;

Labor
Costs for direct labor to support this activity is required for the following personnel:

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Expert may be an independent consultants or subcontractor, the Metabiota PM will additionally provide management oversight of the project subcontractors (microbiology SME) and the integration with other project stakeholders throughout the duration of this project. The PM will also ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Metabiota Subject Matter Expert 1: The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipat ng, managing, and communicating project risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM. The PC will manage the microbiology SME, to include leading regular coordination calls with the microbiology SME, participating in regular communications between the project stakeholders and the microbiology SME, and coordinating with the microbiology SME to ensure all project requirements and deliverables are met and the program remains within scope, budget, and timeline. The PC will aid the PM and VS in ensuring project startup and closeout are completed to the satisfaction of the funder.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the microbiology SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Visiting Scientist: The VS will serve as the microbiology SME. The VS will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each project, the needs and expectations of the Georgian scientists, and the microbiological subject matter expertise needed. The VS will provide mentoring as directed by the respective project leads.

Materials
We expect to procure a modern laptop complete with standard productivity software for use by the VS. The cost number provided here represents an estimate of the costs, and may vary depending on factors beyond Metabiota control.

Other Direct Costs
Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts
Subcontracts will be issued to the VS and/or their home organization as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel
Travel is requested to support the deployment of the VS to Tbilisi, Georgia for the initial deployment travel and final return, including a period of up to 1 week (7 days) for securing permanent lodging arrangements. No additional travel is projected based on the requirements provided. The travel budget represents the estimated amount required based on USG lodging and per diem rates; precise numbers may vary depending on factors beyond Metabiota control. Travel on the AEP contract is cost reimbursable. As noted, lodging at GSA rates for Tbilisi, Georgia have included to this budget. It is assumed that the TBD VS will require some time to identify long term lodging (length of assignment), which would by covered by his expat uplift.

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE).

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide on-site expertise in microbiology research activities at the Richard G. Lugar Center for Public Health Research in Georgia in accordance with SOW Section 4.2, Task 2, Section 4.4, Task 4, Section 4.5, Task 5, and Section 4.6, Task 6. This expertise can be provided by a visiting scientist and/or scientific mentor and should focus on providing subject matter expertise in microbial research for CBEP-funded research projects conducted at the Lugar Center. The expertise should include guidance and mentorsh p on designing and implementing experimental procedures, troubleshooting methodology, and analyzing data for on-going research projects at the Lugar Center. The expert should provide technical and scientific assistance in the conduct of research projects and implementation of new diagnostics, new technology and sustainability initiatives. Additionally, the expert should assist to improve communications and integration between Georgian institutes and with international agencies collaborating on Lugar Center research efforts.

Mentorship activities should focus on providing guidance in stringent metrics and international standards in data collection, analysis and data interpretation. Additionally, the research mentor should assist Georgian researchers with manuscript preparation of CBEP-funded research for submission to peer-reviewed scientific journals. This on-site interaction should facilitate motivation towards independent knowledge-building inquiry and critical thinking skills needed for future sustainable research.

The period of performance for this effort will be from 21 September 2015 to 15 May 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $380,000 is requested by 17 September 2015. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Proposal Development & Initiation:

Metabiota developed a project plan and implementation strategy, which aligns with narrative from Box 8. A key assumption for this effort is that the Georgian scientists are generally capable of conducting microbiological analyses on their own but that the requested support personnel will occasionally be asked to directly perform microbiological analyses. A second key assumption for this effort is that it is expected to be a full-time expat position. It is anticipated that the plan for TD-019 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as Subject Matter Expert (SME) I) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Project Coordination:

From the information provided in Box 8, Metabiota assumes that the unspecified CBEP-funded research projects are ongoing affairs led by third parties. In order to effectively ensure that an appropriate microbiology subject matter expert (microbiology SME, billed as a Visiting Scientist/VS) is available to provide the requested mentoring, the Metabiota PM and PC will, upon approval of the TD, continue to engage relevant DTRA CBEP and Lugar Center stakeholders to identify how, where, and when project status updates are communicated (for example, monthly teleconference, weekly email exchanges, etc.) and what the onboarding and daily requirements are for working at the Lugar Center. Upon approval and receipt of additional information, the Metabiota PM and PC will identify a VS and work to either onboard them as a Metabiota employee, or establish a subcontract or independent consulting arrangement with the VS. The Metabiota PM, PC, and VS will participate in project communications in order to understand what mentoring activities will be required. The Metabiota PM and PC will work with the VS to ensure that all necessary documentation required prior to travel is completed correctly and submitted on time, and that all trip reports are filed on time. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS and/or DTRO-Tbilisi.

Mentoring and Performance of Microbiological Research:

Mentoring will be conducted in-country based on our understanding of the requirements. Metabiota does not expect to be required to provide primary microbiological analysis support to the various projects being conducted at the Lugar Center. The PM and PC will maintain regular communications with the VS to ensure that the VS has all required resources for mentoring. After assessing the need for microbiology mentoring, the VS will work with the PM, PC, and other appropriate stakeholders to develop mentoring work plans. The VS will then implement the mentoring work plans, only assisting with actual analyses and scientific writing when necessary. Additionally, the VS will provide oversight over the operations of the genomics center. The VS will work with Lugar Center POCs to identify candidates for mentorship in operating the genomics center, and work with the PM and PC to develop a strategy for developing these candidates' abilities to operate the genomic center without guidance.

Risk Management:

In order to maintain our course of action and guarantee project implementation that will reduce regional risk and forward DTRA CBEP's mission, Metabiota must overcome the obstacles included (but not limited to) those listed in the Risk Management Matrix shown below. Identifying and acknowledging the risks associated with not implementing this activity, as well as capturing the risks associated with conducting and completing it, to

include contingency planning and course correction measures will lead to overall regional risk reduction, as outlined in the Risk Management Matrix.

Risk Factor	Description	Likelihood	Severity	Risk Rating	Mitigation	Residual Risk

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES):

Labor

Costs for direct labor to support this activity is required for the following personnel:

All phases:

Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Expert may be an independent consultants or subcontractor, the Metabiota PM will additionally provide management oversight of the project subcontractors (microbiology SME) and the integration with other project stakeholders throughout the duration of this project. The PM will also ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Metabiota Subject Matter Expert 1: The Metabiota SME 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to the funder. The PC will regularly communicate the project status with the PM. The PC will manage the microbiology SME, to include leading regular coordination calls with the microbiology SME, participating in regular communications between the project stakeholders and the microbiology SME, and coordinating with the microbiology SME to ensure all project requirements and deliverables are met and the program remains within scope, budget, and timeline. The PC will aid the PM and VS in ensuring project startup and closeout are completed to the satisfaction of the funder.

The Metabiota PC will aid the PM in ensuring that all personnel adhere to operational requirements imposed by DoD or DTRA CBEP standard operating procedures. As the microbiology SME may be unfamiliar with DoD contracting, the Metabiota PC will assist the SME and/or their organization with adhering to DoD contracting requirements, to include developing Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PC will provide continuing management oversight over the subcontractors and independent consultants throughout the span of the project.

Visiting Scientist: The VS will serve as the microbiology SME. The VS will participate in regular project coordination communications (teleconferences, emails) to ensure that they understand the context of each project, the needs and expectations of the Georgian scientists, and the microbiological subject matter expertise needed. The VS will provide mentoring as directed by the respective project leads.

Materials

We expect to procure a modern laptop complete with standard productivity software for use by the VS. The cost number provided here represents an estimate of the costs, and may vary depending on factors beyond Metabiota control.

Other Direct Costs

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Subcontracts

Subcontracts will be issued to the VS and/or their home organization as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the appropriate labor categories in CLIN 1002 and materials in CLIN 1003 of the budget.

Travel

Travel is requested to support the deployment of the VS to Tbilisi, Georgia for the initial deployment travel and final return, including a period of up to 1 week (7 days) for securing permanent lodging arrangements. No additional travel is projected based on the requirements provided. The travel budget represents the estimated amount required based on USG lodging and per diem rates; precise numbers may vary depending on factors beyond Metabiota control. Travel on the AEP contract is cost reimbursable. As noted, lodging at GSA rates for Tbilisi, Georgia have included to this budget. It is assumed that the TBD VS will require some time to identify long term lodging (length of assignment), which would by covered by his expat uplift.

Dea (b)(6)

Please find our response to your questions/comments below:

1. Under Key Assumption 7: It assumes the participants engaged are not Ugandan government officials, and therefore fall outside of the U.S. Ambassador's memo (8 April 2015) outlining compensation of Ugandan Government personnel. However, many of the partners involved in the project are part of the UG government and will have to follow the US Ambassador's memo guidelines. In the risk management chart (page 3), the issue is addressed by stating Metabiota will work with the regional partners to ensure that we follow the memo's guidelines and will communicate this to the participants. It is our understanding that if the training or the sampling is outside the home district of the UG government employee, they can receive a stipend (maximum of 140k shillings).

Metabiota: Narrative for Assumption 7 has been changed to the following: "Metabiota recognizes guidelines regarding compensation of Ugandan government personnel, as outlined in the Ambassador's memo (8 April 2015). Metabiota has developed a basis of estimate that plans for the highest cost scenario (e.g., no Ugandan government personnel). Upon receiving names and affiliations of all project participants, Metabiota will work with DTRA CBEP to adjust the basis of estimate accordingly."

2. Clarification needed on the role of (b)(6) as technical resources and SMEs. Task 3 indicates that qualified Ugandan partners will be utilized, but the supplemental information contains the CVs of Kenyan partners. Is there a reason why Ugandan collaborators are not being utilized in the training?

Metabiota: Box 8, Phase Two suggests that Metabiota would provide up to 3 SMEs, including 1-2 from Metabiota and one Ugandan non-governmental SME (I.e. AFENET). (b)(6) have extensive regional experience, including efforts in Uganda, in veterinary sciences, surveillance, and diagnostics, making them ideal MetabiotaSMEs.

Box 8, Phase Three suggests Metabiota engage no more than five medium-level trainers, preferably from Uganda, to assist in pilot studies. Further, that the trainers may be a mix of Metabiota and Ugandan trainers. Metabiota has every intention to identify and use four medium-level trainers from Uganda. However, for the sake of consistency in integration, as well as technical expertise, we felt it would be helpful if one of the SME's from Task 2, also supported efforts for Task 3.

3. Clarification also needed on the role of (b)(6) With the identification of (b)(6) as regional SMEs, it is unclear what role (b)(6) will play in identifying SMEs.

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide grantsmanship training and subject matter expert (SME) assistance for the coordination of project design, research proposal development, and implementation of a pilot biosurveillance study in Uganda, in accordance with SOW section 4.4, 4.5 and 4.6, Tasks 4, 5 and 6.

Coordination of such efforts shall focus on the following topics: Ecological and bio-surveillance for Rift Valley fever (RVF) among domestic and wild animal populations in Uganda; Exploring the distribution and characteristics of avian influenza (AI) viruses in migratory waterfowl and poultry in Uganda; and Genetic and epidemiological insights into the occurrence of peste des petits ruminants virus (PPRV) among sheep, goats, cattle, and wildlife in northern Uganda.

The project design and research proposal(s) to be coordinated by Metabiota shall emphasize bio-surveillance of RVF, PPRV, and AI in Uganda and how the collection of this data would help enhance the surveillance capabilities of the country at the national level. It shall also include assistance in the development of standard operating procedures (SOPs) for the projects (e.g., biosafety/biosecurity, sample collection/handling/transport, laboratory analysis, data analysis) with the goal of enhancing local capabilities and developing the skills necessary for the early detection and prevalence determination of RVF, AI, and PPR. Metabiota will perform the following activities during the period of performance:

1. Phase One: Metabiota shall collaborate with CBEP's Ugandan research partners and coordinate with them to develop a work plan for implementation of all of the activities noted below, including project design (development of a research plan) and development of a high-quality, competitive research proposal or proposals (more details below). Metabiota should provide a PM and a SME1 to manage this coordination. The SME1 and PM should reach out directly to the POCs listed below to discuss their vision for the development of a research grant and to discuss additional SME support needed. Ugandan partners on this project are SMEs in various areas and their skills/expertise should be leveraged in accomplishing the goals of this project. The Metabiota PM and SME1 should also review the concept notes already developed by the collaborators that describe their research interests. The SME1 hours required for this should not exceed 25 hours total for maximum 3-5 weeks of coordination. PM oversight should not exceed 25 hours total for this phase.

   Ugandan collaborators should include personnel from the following institutions/organizations:
   a. The National Animal Disease Diagnostics and Epidemiology Centre (NADDEC). POC (b)(6) (b)(6)
   b. The National Livestock Resources Research Institute (NaLIRRI). POC (b)(6) (b)(6)
   c. The African Field Epidemiology Network (AFENET). POC (b)(6)
   d. The Ministry of Health, Division of Veterinary Public Health (MoH-DVPH). POC (b)(6) (b)(6) (b)(6) contact
   e. The Uganda Wildlife Authority. POC
   f. CDC- POC (b)(6)
   g. The Ministry of Health, Uganda Virus Research Institute (MoH-UVRI). POC (b)(6) (b)(6)
   h. Ministry of Agriculture, Animal Industry and Fisheries (MAAIF). (b)(6) (b)(6)

   Phase One deliverables: Work plan with project design and timeline with clear roles and responsibilities

2. Phase Two: Metabiota shall assist the collaborators identified in Phase 1 with the development of a detailed research plan (experimental design) and research proposal(s), including budget, for epidemiologic studies/bio-surveillance research of RVF, AI, and PPR in Uganda based on the needs and research interests of the identified collaborators. These needs are already described in three concept notes developed by the Ugandan collaborators. The determination of whether one joint proposal or separate proposals will be developed will be made in partnership with Ugandan collaborators. The research plan shall include comprehensive descriptions of the hypothesis and research questions; development of a list of materials

and supplies to accomplish the research studies; and SOPs planned for the collection of samples, including field, laboratory, and data analytics, as well as a discussion of biosafety and biosecurity risks and mitigations (e.g. infectious sample transport and handling). CBEP expectation is for Metabiota to provide the collaborators with SME support (Metabiota and Ugandan SMEs) to inform the development of the proposal(s) that the Ugandan collaborators will write. Metabiota is not expected to write the grant proposal, but to provide oversight regarding the development of hypotheses, research design, and the research proposal writing process. The concept notes are well-developed, but will need to be strengthened to provide additional detail on sample size calculations, sample analysis procedures, data analysis methods, and other specifics to make them competitive research proposals. Metabiota should support the Ugandan collaborators in exploring potential funding options, not only DTRA, and assist them in tailoring their proposal(s) to specific funding opportunities.

To complete this task, Metabiota should provide up to 3 SMEs, including 1-2 from Metabiota and one Ugandan non-governmental SME (i.e. AFENET). Each SME should spend no more than 60 hours total over a maximum of 6 weeks to provide input/feedback and grantsmanship expertise to the research plan (experimental design) and the research proposal(s) developed by the Ugandan collaborators. PM oversight of the SMEs' review and coordination of activities should not exceed 30 hours total for Phase Two.

Phase Two deliverables: Project proposal(s) with budgets and SOPs

3. Phase Three: After completion of activities described in Phase 2, Metabiota shall also provide technical expertise to train stakeholders and work with them to conduct small pilot studies in Uganda to test the SOPs developed for the larger surveillance studies in the proposal(s) to determine their effectiveness and the viability of the project design on a smaller scale. Metabiota shall provide no more than 5 medium-level trainers to assist in the pilot studies. Trainers may be a mix of Metabiota and Ugandan trainers or mostly/all Ugandan trainers, which would be viewed as a strong approach to enhance sustainability of CBEP's investment. The training should consist of one in-country activity as well as continued coordination via email, phone, webinar, or a similar lower-cost communication/coordination mechanism throughout the pilot study period.

    Phase Three, Part One: Preparation and coordination in advance of the in-country training and pilot studies should take no more than 6 weeks, and may begin during Phase Two to maximize efficiency, especially for the definition of the scope and timelines for the pilot studies and the procurement of materials needed for the pilot studies. Coordination will be between Metabiota and all the POCs listed above, as well as identified SMEs/trainers, if different from the above. Training materials should be discussed and obtained during this phase. The training materials will be developed from the project proposal and SOP documents, existing training materials owned/obtained by the Ugandan collaborators, and additional supplemental material as needed. If Metabiota and Ugandan collaborators agree that some necessary training materials do not already exist and need to be developed, the team may work together to augment existing materials. A PM, SME1, and a maximum of 5 medium-level trainers would be an appropriate mix to accomplish the efforts in this phase. Trainers should have expertise in the Ugandan public health, veterinary, and wildlife systems as well as local research methods and processes. Not all people need to participate in all tasks at all times during this planning and coordination, and resources should be conserved to include only the necessary individuals at each step. SME1 hours during Phase Three, Part One should not exceed 40 hours: 55 hours if training materials need to be developed. Hours per trainer for preparation and coordination should not exceed 10 hours; 25 hours if they need to participate in development of training materials. PM hours dedicated to oversight of this planning and preparation should not exceed 30 hours.

    Phase Three, Part Two: The in-country training shall be conducted over a period of 10 working days (5 days per week for 2 separate weeks and should include no more than 20 trainees, to be identified by the Ugandan collaborators, across the 3 pilot studies). The training may be conducted as one comprehensive event, providing overarching skills, knowledge and guidance in a way that it will benefit all three projects; or it may be divided into sections for more focused training on the individual projects; or it may be a combination, with some parts together and some break-out or working group sessions that are more specific. Metabiota should collaborate with the Ugandan POCs and trainers to determine the best approach. The PM, SME1 and trainers' time should not exceed 10 hours per day of training. One day before or after the training for in-person coordination for the pilot studies would be appropriate and should not exceed 8 hours of labor each for the PM, SME1, trainers, and pilot study project leads. It would be acceptable for the trainers and pilot study project leads to be the same people in some cases, as appropriate. PM level of effort should be less than the SME1 given oversight vs. implementation role.

    Phase Three, Part Three: Metabiota will provide management oversight and support to the Ugandan partners in implementation of three pilot field studies. The Ugandan collaborators are in the process of receiving appropriate permits and sample collection can only commence following DTRA Research Oversight Board (ROB) approvals. This activity shall include the procurement of materials and supplies required for the pilot studies, not to exceed $100,000. Metabiota shall work with the Ugandan partners to identify the most efficient, cost-effective way to

procure materials and supplies. Pilot study project leads and field technicians' level of effort should not exceed 680 hours over 8 weeks for pilot study implementation and oversight. There should be no more than 3 pilot study project leads and 11 technicians total supported by Metabiota for all three pilot studies. PM and SME1 hours dedicated to pilot study implementation guidance and oversight should not exceed 60 hours over 8 weeks. PM level of effort should be less than the SME1 given oversight vs. technical SME support role.

The following information and study objectives are provided for reference for proposal development (longer term objectives) and pilot study design/implementation (shorter term objectives). The concept notes developed by the Ugandan collaborators are attached for more detail. The pilot studies should focus on validating the SOPs developed as part of the longer-term study design and proposal development in Phase 2, and on conducting sample collection, lab analysis, and data analysis on a small subset of the various animal populations noted below.

Study 1 - The portion of the project regarding ecological and biosurveillance for Rift Valley Fever (RVF) among domestic and wild animal populations In Uganda shall address the following objectives:

a. Determine the inter-epidemic seroprevalence of RVF in a sample population of relevant domestic animals and wildlife in study areas with clearly identified serotypes. Training in this area should establish better methods for the biosurveillance of epizootic and zoonotic diseases in Uganda.
b. Create/improve contingency plans for RVF outbreaks ready for implementation at the central and local district levels through collaboration with a Ugandan government representative specializing in disease prevention and control as well as outbreak containment in Uganda.

Study 2 - The portion of the project focused on exploring the distribution and characteristics of avian influenza viruses (AIVs) in migratory waterfowl and poultry in Uganda shall include these specific objectives:

a. Establish temporal and spatial distribution and prevalence of AIVs in a sample population of waterfowl and domestic poultry in Uganda.

Study 3 - The portion of the project regarding the genetic and epidemiological insights into the occurrence of peste des petits ruminants virus (PPRV) among sheep, goats, and cattle in northern Uganda shall include these objectives:

a. Determine the prevalence of PPRV in wild animal species in the Kidepo Valley National Park and in goats, sheep, and cattle in Nakapiripirit district of Uganda.
b. Use of RT-PCR to detect the presence of PPRV and competitive ELISA to determine the presence of specific PPRV antibodies.
c. Development of a questionnaire to obtain data on existing control measures, livestock movement patterns, PPRV vaccination practices and prevalence, and other relevant epidemiological and surveillance factors.

For the pilot studies, an appropriate scope would include the following:

Study 1 - Pilot study will include no more than 1,000 serum samples collected from 768 domestic animals (cattle, sheep and goat) and 232 wild animal ruminant and porcine species. Laboratory analysis will be limited to serology (ELISA). Data analysis will include determination of RVF antibody seroprevalence. ELISA will be conducted at the CDC lab at UVRI with participation as appropriate by relevant project collaborators.

Study 2 - Pilot study will include no more than 1,000 serum samples collected from two distinct locations with measurably high levels of interface between the wild birds, domestic poultry, and humans. Samples should be collected from approximately 590 domestic poultry and 410 wild poultry, split evenly between both locations. Laboratory analysis will be limited to ELISA for Influenza A viruses and PCR-based molecular analyses, both to be conducted at NADDEC.

Study 3 - Pilot study will include no more than 1,000 serum samples collected each from two distinct locations. The samples should be from approximately 232 cattle and 768 sheep or goats split evenly between the two locations. Development and piloting a questionnaire to assess PPRV risk factors such as vaccination practices, livestock movement and PPRV control measures will be part of the study. Laboratory analysis will be limited to serological and molecular techniques and data analysis will include determination of PPRV antibody seroprevalence and risk factors for PPRV. ELISA and PPR will be conducted at NADDEC. Metabiota shall not pay for Ugandan government collaborators' time for activities completed as part of their normal job/position and role within their institution. Time shall not be paid to government collaborators for Phase One or Phase Two. Ugandan government collaborators can be compensated for time if they are included as trainers, pilot study project leads, and field technicians for Phase Three. AFENET is not a government organization. CDC will not be compensated for time related to this project. All other POCs listed above are Ugandan government collaborators.

Travel costs for Ugandan participants related to the training event and field studies should only include ground transport, lodging, and per diem costs for participants working a distance of greater than one hour travel time from their home, and any requested ground transport, lodging, or per diem payments shall be cleared with CBEP prior to making commitments to cover these costs. Local participants in the training and field work (living one hour or less from the location of their work that day) will not have travel, lodging, or per diem costs covered.

Phase Three deliverables: Pilot studies implemented; PCR and ELISA results provided to CBEP; results and analyses developed into a pilot project summary of conclusions per project and provided to CBEP; and summary of conclusions provided to the Ugandan national authorities for disease surveillance and control.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES).

Phase 0: Proposal Development & Initiation (Task 1: March 7-9, 2016)

Metabiota developed a project plan and implementation strategy that aligns with narrative from Box 8. It is anticipated that the plan for TD-022 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as a Research and Data Analyst (RDA)) time to identify the optimal strategy, including required deliverables and other programmatic requirements, which may be a part of project implementation

The Metabiota PM and PC coordinated with (b)(6) abiota's Executive Vice President (EVP) in charge of Science Integration and communication with our regional scientific networks to identify the appropriate SMEs in grantsmanship, experimental design, and biosurveillance to develop and augment project work plans and training materials. Ultimately, this measure was taken to ensure our technical and cost solutions were of the highest quality and sustainable, respectively.

Key assumptions:

1. Metabiota received unofficial communication supporting an extension of its contract from May 16, 2016 to November 15, 2016, this technical response has been developed with the key assumption that this additional time will be allotted to this project.
2. Metabiota assumes DTRA CBEP representatives will provide Metabiota with the concept notes referred to in Box 8 upon the approval of this TD.
3. Metabiota assumes that DTRA CBEP representatives involved in the development of this technical direction will be available for a kick-off meeting to discuss any associated historical engagement with the research collaborators and their respective needs and constraints.
4. Metabiota assumes changes to the budget (e.g., labor categories) will be acceptable to DTRA. An RDA was added to provide flexibility when implementing; however, this has not affected the overall project budget.
5. Metabiota assumes our response should align with narrative from Box 8, which does not align with the figures provided in Box 5.
6. Metabiota assumes that there will be a need to develop training materials during phase 3 part 1 in preparation for phase 3 part 2, and has incorporated the necessary LOE into this technical proposal.
7. Metabiota recognizes guidelines regarding compensation of Ugandan government personnel, as outlined in the Ambassador's memo (8 April 2015). Metabiota has developed a basis of estimate that plans for the highest cost scenario (e.g., no Ugandan government personnel). Upon receiving names and affiliations of all project participants, Metabiota will work with DTRA CBEP to adjust the basis of estimate accordingly.

Phase 1: Work Plan Development (Task 1: March 21-April 22, 2016)

Upon approval of the TD, Metabiota will engage DTRA CBEP to ensure a mutual understanding of project goals and objectives is realized, as well as to obtain the concept notes referred to in Box 8. Metabiota will additionally engage with the eight Ugandan collaborators provided in Box 8 as well as other key stakeholders to obtain additional information such as possible existing work plans, research plans, and training materials for grantsmanship and standard operating procedures for related biosurveillance activities. The Metabiota PM, PC, and SMEs will participate in regular project communications with stakeholders to ensure mutual understanding of project goals, actions, and status.

Metabiota SMEs will conduct a review of the concept notes referred to in Box 8 to establish a baseline for outreach to the identified Ugandan stakeholders. Metabiota will then conduct a series of data calls with these Ugandan stakeholders in order for the SMEs familiarize themselves with the current capabilities and needs of the identified stakeholders, and to identify an appropriate path forward for the work plan. This work plan will identify a timeline of implementation and key milestones and goals for both the development of a detailed research plan (from which, Pilot training and design study will be extracted), as well as development of research proposals (ex. number of proposal submissions, drafts of white papers, etc.). The work plan will include activities providing grantsmanship support, mentorship, and subject matter expertise to key Ugandan stakeholders throughout proposal development, Pilot training and study design and ver fication, and proposal editing and submission process. Metabiota will submit the work plan draft(s) to DTRA CBEP for review and approval.

Phase 2: Research Plan and Proposal Development (Tasks 1, 4: April 25-June 24, 2016)

Metabiota SMEs will execute the work plan as approved by DTRA CBEP in Phase 1. In doing so, Metabiota will coordinate with the identified Ugandan stakeholders to support the development of a detailed research plan as well as research proposals for epidemiologic studies/bio-surveillance research of RVF, AI, and PPR based on the needs and research interests identified in Phase 1.

Metabiota SMEs will provide support to the Ugandan stakeholders to develop a comprehensive research plan, which will include a detailed list of materials and supplies needed to accomplish the research studies. Moreover, the research plan will include detailed SOPs planned for the collection of samples, including field, laboratory, and data analytics as well as identification of biosafety and biosecurity risks and associated mitigation methods. From this overarching research plan, the Metabiota SMEs and Ugandan stakeholders will develop up to three (3) pilot study plans to test the SOPs developed in the research proposals for their effectiveness and viability of project design. In doing so, the Metabiota SMEs will provide support, mentorship, and expertise in the development, strengthening, and tailoring of these research plans through the submission proves while the Ugandan stakeholders are expected to write and finalize these plans based on the guidance they are provided. Metabiota will submit the final research plan(s), research proposals (including financials) and proposed SOPs for DTRA CBEP's review and approval.

Phase 3, Part 1: Preparation end Coordination for In-country Training and Pilot Studies (Tasks 1, 3, 4: March 28-Aug 11, 2016)

Metabiota will coordinate with the Ugandan stakeholders to identify the most appropriate participants for both training and Pilot study activities. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured for the SMEs and FLNs as needed. The Metabiota PM and PC will work with the projec: teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS via the DTRA CBEP Technical Point of Contact.

Metabiota will coordinate with the Ugandan Stakeholders to identify training needs as discussed in Phase 1 and further identified in Phase 2 SOP development. To meet these needs, Metabiota will reuse existing training materials and SOPs for applicable biosurveillance activities as much as possible. However, due to the limited information currently available regarding the intended pilot research plans, Metabiota expects to use SMEs to adapt and develop training materials for effective delivery of training. Metabiota SMEs will develop new materials, which may including slide presentations, videos, etc. to effectively leverage the learning environment. Metabiota will also develop, as appropriate, pre-tests and post-tests for monitoring and evaluation purposes. Training materials, after development and adaptation, will be delivered to DTRA CBEP for technical review and Public Affairs Office approval.

Phase 3, Part 2: Conduction of In-country Training (Task 1, 3, 4: August 4-24, 2016)
Metabiota SMEs will execute a 10-day training activity for up to 20 participants who will be taking part in the three identified pilot studies followed by a 1-day pilot study coordination day with the pilot study leads. Metabiota anticipates a mix of lecture and hands-on training being necessary, however, Metabiota SMEs will adjust the training approach based on the Stakeholder feedback obtained in Phase 1. Metabiota SMEs will be available for virtual "office hours" and to answer written communications from participants as needed throughout the conduction of pilot studies. Metabiota SMEs will also conduct pre-/post- training testing and evaluations and provide feedback to the participants on their performance. FLNs will be used to facilitate training activities to the extent possible.

Phase 3 Part 3: Conduction of Pilot Studies (Tesk 1, 4, 6: August 18-Oct 26, 2016)
Metabiota SMEs will coordinate with the pilot study leads for the conduction of three pilot field studies, involving up to three pilot study leads and 11 technicians over a period of 8 weeks. Metabiota SMEs will be available for virtual "office hours" and to answer written communications from all participants as needed throughout the conduction of the pilot studies. Metabiota will provide management oversight and support for the conduction of these pilot studies, and will support the Ugandan collaborators in obtaining all required approvals for project continuation, including but not limited to ROB approvals. Metabiota will coordinate with all Stakeholders to identify the necessary materials required to conduct all pilot effort(s). Inclusive of this, Metabiota will provide any necessary support (SME or logistical) to in-country participants when navigating the procurement process. All materials will be identified and procured with sustainment in mind. Metabiota will submit pilot study summaries, including individual pilot study results, analyses, and conclusions as well as a summary of implementation conclusions to DTRA CBEP for communication to the Ugandan national authorities for disease surveillance and control.

Final Project Report
Metabiota PM, PC, and SMEs will all contribute inputs to a final report relaying all actions taken for project implementation through all phases, lessons learned, and identifying next step opportunities upon completion of all deliverables. Results of pre- and post- testing and evaluations from training will also be provided to DTRA CBEP.

Monitoring and Evaluation
In order to develop a comprehensive approach to continuous monitoring and evaluation of this project throughout implementation, Metabiota has developed a comprehensive monitoring and evaluation plan which can be found in the attached Appendix A (Supplemental Information) Part 5.

Risk Management:
In order to anticipate and overcome obstacles included (but not limited to) those listed in Risk Management Matrix found in the attached Supplemental Information Part 2, Metabiota has identified and captured the risks associated with implementing this activity, including contingency planning and course correction measures which will lead to overall regional risk reduction, as outlined in the attached Risk Management Matrix.

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$111,755
1003	MATERIALS	$105,270
1004	ODCs	$3,680
1005	TRAVEL	$32,931

9c. TD SOLUTION BASIS OF ESTIMATE DESCRIPTION (NOT TO EXCEED 2 PAGES):

All phases:
Task 1 - Project Coordination: Metabiota will provide consistent and cohesive technical and administrative leadership, direction, program management, implementation oversight, and coordination of all project activities.

Metabiota Program Manager (PM): The Metabiota PM will provide direct oversight of the planning and execution of the program, ensuring all objectives are met in accordance with the project SOW maintaining scope, budget, and timeline. The PM will ensure completion of DTRA CBEP goals at the country and regional level in direct support of this activity and the DTRA CBEP mission throughout the lifecycle of the project, and will ensure project close out. To guarantee that all requirements are met, the PM will manage the RDA to ensure all day-to-day activities for the project are completed on time, and to the quality required by DTRA CBEP.

Metabiota Project Coordinator: The Metabiota RDA will act as a Project Coordinator (PC) throughout the planning and execution of project objectives. The PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to CBEP and other stakeholders. The PC will regularly communicate the project status with the PM. The PC will manage the SMEs and FLNs and lead coordination with the Ugandan Stakeholders, to include leading regular coordination calls with the project team and assist in participant coordination.

Note* - Metabiota recognizes that the RDA labor category was not included to Box 8 of this TD. Upon review of internal support (e.g., Project Coordinators) and to allow greater project implantation flexibility, Metabiota has proposed the use of an RDA instead of a SME 1 for all project coordination. Importantly, while hours have been added for project coordination, the overall cost for the Project Coordinator role remains unchanged between RDA and SME 1.

A key requirement to ensure effective program initiation, execution, and closeout is ensuring clear communication between all project stakeholders. To ensure the project in managed according to CBEP standards, the PM and PC will be responsible for the following:

Initiation and Program Integration: The PM, with PC support, developed the project proposal to include the project timeline, identification and integration of project requirements, deliverables, subcontractors, SMEs, and trainers to ensure project success. Upon acceptance of the proposal, the

PM will hold a kick-off meeting with team members and partners to review the project plan and schedule, establish routine communication to support project implementation, initiate education on the contract requirements, and begin project implementation. Routine communication with all stakeholders will ensure that all deliverables, including required CDRLs, are met and submitted according to the project schedule and contract requirements.

The PM and PC will work closely with Ugandan POC's identified in Box 8 (Phase 1) to understand their respective vision for this effort, including the development of a work plan for implementing all identified activities. In addition, the PM and PC will coordinate communication between Ugandan POC's and the identified grantsmanship/BSV SME's (e.g., project team members) to ensure alignment of project plans with DTRA CBEP goals when developing the research project design and high-quality and competitive research proposal(s) (Phase 2). Lastly, the PM and PC will coordinate all aspects of training implementation (Phase 3), to include identification and appropriate engagement of FLNs, to include a Study Leads and Study Technicians, to support in-country training and BSV pilot studies (Phase 3) by interfacing regularly (see Communication Management) with project personnel to ensure that in-country and overall project objectives and requirements are met in full. The PM will ensure that FLNs are engaged according to contract and project requirements, and have the experience, background, and skills necessary to support training implementation. FLNs are budgeted at the AFRICOM FLN I rate.

The PM will ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include; overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Project Close out: The Metabiota PM and PC will oversee project closeout, to include completion of grant proposals, wrap-up of training, and finalization and submission of all identified deliverables, including final reports. The PM will also ensure the conclusion of subcontracts and other employment agreements.

Additional communication strategies and programmatic safeguards, including 1) Human Resources Management, 2) Communications Management, 3) Risk Management, 4) Schedule Management, 5) Cost Management, 6) Quality Management, and 7) Technical Resource Management can be found in Appendix A (Supplemental Information).

Task 3 – Qualified Trainers (QT): Metabiota will provide financial support to in-country Qualified Trainers (Phase Three, Parts One and Two) via subcontracts of independent consultant agreements with the yet to be identified trainers. Metabiota recognizes the importance of identifying Ugandan nationals to fill these roles in order to foster relationships and build regional capacity. Metabiota will work with all project stakeholders to identify the appropriate trainers. Currently, it is presumed that all qualified trainers will be billed at the AFRICOM FLN 1 rate.

Task 4 - Subject Matter Experts (SMEs): Metabiota will provide ongoing technical support and expertise through the use of SMEs, to include the development of 1) a work plan for implementing all identified activities, 2) project design, and 3) development of high-quality and competitive research proposal(s). Metabiota SMEs engaged for this effort will provide expertise and input on the development and revision of existing training materials, development and revision of SOPs, as well as mentoring of study participants in grantsmanship and BSV training activities. SMEs will predominately operate remotely throughout Phases 1, 2, and most of Phase 3 and will thus provide mentorship through regular written communication and video teleconferencing with project participants, as necessary. Importantly, the SMEs for this effort are Kenyan nationals and geographically situated in Nairobi, Kenya which will ease operating delays due to time zone differences. Moreover, the identified SMEs possess excellent operational knowledge of East Africa and capabilities in technical writing, biosurveillance techniques, and one health concepts related to infectious disease research. For Phase Three, Part Two, SMEs will implement the training efforts and will work in partnership with FLN project participants to administer the courses, provide QA/QC of all materials, engage trainees in capacity building and scientific discussions supporting training concepts and implementation, and assist in the development of a gap analysis report. SMEs on this effort will be performing the functions of both SMEs and Qualified Trainers (QTs). In line with government guidance, the SMEs will be billing at the SME I labor rate, which is the equivalent cost of QT I.

Metabiota will subcontract Africa Biomedical Laboratories (ABL; Nairobi, Kenya) for SME support of this effort. The use of regionally accessible, African Nationals helps to build regional capabilities and networks, and ensures overall project success

Task 6 – Research Activity Projects: Metabiota will provide financial support to Study Leads and Study Technicians (Phase Three, Part Three) via subcontracts of independent consultant agreements with the yet to be identified participants. Metabiota will work with all project stakeholders to identify the appropriate project participants. It is currently presumed that all project participants will be billed at the AFRICOM FLN 1 rate.

Note* - Metabiota is aware of guidance provided by the US Ambassador to Uganda regarding salary support to Government of Uganda personnel. If the Trainers, Study Leads, or Study Technicians are direct employees of the Ugandan Government (e.g., Ministry of Health, Agriculture, Wildlife, etc.), Metabiota will adjust their engagement strategy to reflect the Ambassadors guidelines. The budget for this project will be impacted accordingly.

Reach back programmatic support to include finance, accounting, and contracts, will be provided as part of CLIN 1001 (FFP) and will not be separately invoiced.

Materials

As defined in Box 8 (Phase Three, Part Three) this activity shall include the procurement of materials and supplies required for the pilot studies, not to exceed $100,000. Metabiota will work with the Ugandan partners to identify the most sustainable, efficient, cost-effective way to procure materials and supplies for executing BSV pilot studies. The identification of sustainable supplies will be critical for continuing BSV-related activities, which will be described in greater detail within newly developed grant proposals (Phase Two). Any materials procured by Metabiota will be shipped via CLS. If materials can be secured and provided to the trainers/trainees locally or online, shipping will not be required. Additionally, Metabiota will work with SMEs based in Kenya to help identify sustainable and reliable vendors of biomedical supplies.

Given the nature of this effort (e.g., BSV), Metabiota anticipates the need to procure personal protective equipment such as Tyvek suits, gloves, goggles, booties, and N95 respirators, as well as consumables and other paraphernalia such as chlorine, plastic wash basins, buckets, disinfectant sprayers, and anti-fog spray will also be procured. A final list of materials required for this effort will be identified in coordination with all project stakeholders.

Following discussions with all project stakeholders, and if warranted, USB internet devices and internet access cards will be procured and provided to project participants in-country to ensure they have access to a stable internet connection during remote coordination and training sessions, which are included to all phases of this effort. USB internet devices will be procured and tested in-country to avoid shipping charges and to ensure they are

operational on the ground. USB internet devices and access cards will be monitored by the FLNs to ensure they are used for project purposes only, and are maintained according to equipment/material guidelines for the duration of the course.

General office supplies will be procured to support in-country training activities and routine project needs for the execution of the training courses. Office supplies will be procured locally and will include, but may not be limited to, pens, paper, thumb drives, binders, etc.

Metabiota will conduct market research and ensure the best value is secured, maintaining quality and technical requirements for all procurement of goods. Metabiota will coordinate directly with CLS and third-country vendors for all necessary shipping requirements, and will work closely with CLS and DTRO to ensure customs clearance requirements are met and goods delivered according to project timelines and CDRL requirements. Metabiota will ensure cost management for all procured supplies and will coordinate directly with CBEP and CLS to support additional requirements for the hands-on training events to include such items as printing of the developed and adapted training materials, training certificates for participants, and translation services, if needed.

Other Direct Costs

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project working abroad. DBA insurance will be applied for labor costs incurred overseas. DBA will be applied to the PM, SMEs/Trainers, FLNs, and other contractors, engaged on this effort, for the duration of the program. Metabiota maintains a blanket DBA policy for all personnel and will add the SMEs and FLNs, and other performers meeting DBA requirements, to this policy as they are engaged. A rate of (b)(6) their total compensation will be billed to the project on a monthly basis. A reconciliation of the total DBA will be performed prior to final invoicing to ensure accuracy of the charges, in accordance with total hours worked. Final invoicing will be adjusted, if necessary, to reflect the final DBA allocation numbers.

Subcontracts

Subcontracts will be issued to SMEs, FLNs, and/or their home organization(s) as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the labor or materials budgets.

Travel

Travel is requested to support the Program Manager, SME, and qualified Ugandan trainers to Kampala, Uganda to implement training efforts for project participants (Phase Three, Part Two). The travel budget represents the estimated amount required; travel on the AEP contract is cost reimbursable.

All Metabiota personnel slated to travel are current with regard to ISOPREP, SERE, and AT/FP trainings, as required by CBEP. Additionally, the SME's leveraged for this effort are Kenyan Nationals and therefore do not require the aforementioned travel trainings/documents.

Our travel budget assumes training will be held in Kampala over the course of two weeks, including one day before or after for in-person coordination, as described in Phase Three, Part Two of this proposal. If, through discussion with the Ugandan stakeholders, an alternative schedule is created or an alterative location is desired, travel costs may be impacted accordingly

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to provide grantsmanship training and subject matter expert (SME) assistance for the coordination of project design, research proposal development, and implementation of a pilot biosurveillance study in Uganda, in accordance with SOW section 4.4, 4.5 and 4.6, Tasks 4, 5 and 6.

Coordination of such efforts shall focus on the following topics: Ecological and bio-surveillance for Rift Valley fever (RVF) among domestic and wild animal populations in Uganda; Exploring the distribution and characteristics of avian influenza (AI) viruses in migratory waterfowl and poultry in Uganda; and Genetic and epidemiological insights into the occurrence of peste des petits ruminants virus (PPRV) among sheep, goats, cattle, and wildlife in northern Uganda.

The project design and research proposal(s) to be coordinated by Metabiota shall emphasize bio-surveillance of RVF, PPRV, and AI in Uganda and how the collection of this data would help enhance the surveillance capabilities of the country at the national level. It shall also include assistance in the development of standard operating procedures (SOPs) for the projects (e.g., biosafety/biosecurity, sample collection/handling/transport, laboratory analysis, data analysis) with the goal of enhancing local capabilities and developing the skills necessary for the early detection and prevalence determination of RVF, AI, and PPR. Metabiota will perform the following activities during the period of performance:

1. Phase One: Metabiota shall collaborate with CBEP's Ugandan research partners and coordinate with them to develop a work plan for implementation of all of the activities noted below, including project design (development of a research plan) and development of a high-quality, competitive research proposal or proposals (more details below). Metabiota should provide a PM and a SME1 to manage this coordination. The SME1 and PM should reach out directly to the POCs listed below to discuss their vision for the development of a research grant and to discuss additional SME support needed. Ugandan partners on this project are SMEs in various areas and their skills/expertise should be leveraged in accomplishing the goals of this project. The Metabiota PM and SME1 should also review the concept notes already developed by the collaborators that describe their research interests. The SME1 hours required for this should not exceed 25 hours total for maximum 3-5 weeks of coordination. PM oversight should not exceed 25 hours total for this phase.

   Ugandan collaborators should include personnel from the following institutions/organizations:
   a. The National Animal Disease Diagnostics and Epidemiology Centre (NADDEC). POC (b)(6)
   b. (b)(6) k Resources Research Institute (NaLIRRI). POC (b)(6) (b)(6)
   c. The African Field Epidemiology Network (AFENET). POC (b)(6)
   d. The Ministry of Health, Division of Veterinary Public Health (MoH-DVPH). (b)(6) (b)(6)
   e. The Uganda Wildlife Authority. POC (b)(6)
   f. CDC- POC Dr. (b)(6)
   g. The Ministry of Health, Uganda Virus Research Institute (MoH-UVRI). POC (b)(6) (b)(6)
   h. Ministry of Agriculture, Animal Industry and Fisheries (MAAIF). (b)(6) contact (b)(6)

   Phase One deliverables: Work plan with project design and timeline with clear roles and responsibilities

2. Phase Two: Metabiota shall assist the collaborators identified in Phase 1 with the development of a detailed research plan (experimental design) and research proposal(s), including budget, for epidemiologic studies/bio-surveillance research of RVF, AI, and PPR in Uganda based on the needs and research interests of the identified collaborators. These needs are already described in three concept notes developed by the Ugandan collaborators. The determination of whether one joint proposal or separate proposals will be developed will be made in partnership with Ugandan collaborators. The research plan shall include comprehensive descriptions of the hypothesis and research questions; development of a list of materials

and supplies to accomplish the research studies; and SOPs planned for the collection of samples, including field, laboratory, and data analytics, as well as a discussion of biosafety and biosecurity risks and mitigations (e.g. infectious sample transport and handling). CBEP expectation is for Metabiota to provide the collaborators with SME support (Metabiota and Ugandan SMEs) to inform the development of the proposal(s) that the Ugandan collaborators will write. Metabiota is not expected to write the grant proposal, but to provide oversight regarding the development of hypotheses, research design, and the research proposal writing process. The concept notes are well-developed, but will need to be strengthened to provide additional detail on sample size calculations, sample analysis procedures, data analysis methods, and other specifics to make them competitive research proposals. Metabiota should support the Ugandan collaborators in exploring potential funding options, not only DTRA, and assist them in tailoring their proposal(s) to specific funding opportunities.

To complete this task, Metabiota should provide up to 3 SMEs, including 1-2 from Metabiota and one Ugandan non-governmental SME (i.e. AFENET). Each SME should spend no more than 60 hours total over a maximum of 6 weeks to provide input/feedback and grantsmanship expertise to the research plan (experimental design) and the research proposal(s) developed by the Ugandan collaborators. PM oversight of the SMEs' review and coordination of activities should not exceed 30 hours total for Phase Two.

Phase Two deliverables: Project proposal(s) with budgets and SOPs

3. Phase Three: After completion of activities described in Phase 2, Metabiota shall also provide technical expertise to train stakeholders and work with them to conduct small pilot studies in Uganda to test the SOPs developed for the larger surveillance studies in the proposal(s) to determine their effectiveness and the viability of the project design on a smaller scale. Metabiota shall provide no more than 5 medium-level trainers to assist in the pilot studies. Trainers may be a mix of Metabiota and Ugandan trainers or mostly/all Ugandan trainers, which would be viewed as a strong approach to enhance sustainability of CBEP's investment. The training should consist of one in-country activity as well as continued coordination via email, phone, webinar, or a similar lower-cost communication/coordination mechanism throughout the pilot study period.

   Phase Three, Part One: Preparation and coordination in advance of the in-country training and pilot studies should take no more than 6 weeks, and may begin during Phase Two to maximize efficiency, especially for the definition of the scope and timelines for the pilot studies and the procurement of materials needed for the pilot studies. Coordination will be between Metabiota and all the POCs listed above, as well as identified SMEs/trainers, if different from the above. Training materials should be discussed and obtained during this phase. The training materials will be developed from the project proposal and SOP documents, existing training materials owned/obtained by the Ugandan collaborators, and additional supplemental material as needed. If Metabiota and Ugandan collaborators agree that some necessary training materials do not already exist and need to be developed, the team may work together to augment existing materials. A PM, SME1, and a maximum of 5 medium-level trainers would be an appropriate mix to accomplish the efforts in this phase. Trainers should have expertise in the Ugandan public health, veterinary, and wildlife systems as well as local research methods and processes. Not all people need to participate in all tasks at all times during this planning and coordination, and resources should be conserved to include only the necessary individuals at each step. SME1 hours during Phase Three, Part One should not exceed 40 hours; 55 hours if training materials need to be developed. Hours per trainer for preparation and coordination should not exceed 10 hours; 25 hours if they need to participate in development of training materials. PM hours dedicated to oversight of this planning and preparation should not exceed 30 hours.

   Phase Three, Part Two: The in-country training shall be conducted over a period of 10 working days (5 days per week for 2 separate weeks and should include no more than 20 trainees, to be identified by the Ugandan collaborators, across the 3 pilot studies). The training may be conducted as one comprehensive event, providing overarching skills, knowledge and guidance in a way that it will benefit all three projects; or it may be divided into sections for more focused training on the individual projects; or it may be a combination, with some parts together and some break-out or working group sessions that are more specific. Metabiota should collaborate with the Ugandan POCs and trainers to determine the best approach. The PM, SME1 and trainers' time should not exceed 10 hours per day of training. One day before or after the training for in-person coordination for the pilot studies would be appropriate and should not exceed 8 hours of labor each for the PM, SME1, trainers, and pilot study project leads. It would be acceptable for the trainers and pilot study project leads to be the same people in some cases, as appropriate. PM level of effort should be less than the SME1 given oversight vs. implementation role.

   Phase Three, Part Three: Metabiota will provide management oversight and support to the Ugandan partners in implementation of three pilot field studies. The Ugandan collaborators are in the process of receiving appropriate permits and sample collection can only commence following DTRA Research Oversight Board (ROB) approvals. This activity shall include the procurement of materials and supplies required for the pilot studies, not to exceed $100,000. Metabiota shall work with the Ugandan partners to identify the most efficient, cost-effective way to

procure materials and supplies. Pilot study project leads and field technicians' level of effort should not exceed 680 hours over 8 weeks for pilot study implementation and oversight. There should be no more than 3 pilot study project leads and 11 technicians total supported by Metabiota for all three pilot studies. PM and SME1 hours dedicated to pilot study implementation guidance and oversight should not exceed 60 hours over 8 weeks. PM level of effort should be less than the SME1 given oversight vs. technical SME support role.

The following information and study objectives are provided for reference for proposal development (longer term objectives) and pilot study design/implementation (shorter term objectives). The concept notes developed by the Ugandan collaborators are attached for more detail. The pilot studies should focus on validating the SOPs developed as part of the longer-term study design and proposal development in Phase 2, and on conducting sample collection, lab analysis, and data analysis on a small subset of the various animal populations noted below.

Study 1 - The portion of the project regarding ecological and biosurveillance for Rift Valley Fever (RVF) among domestic and wild animal populations In Uganda shall address the following objectives:

a. Determine the inter-epidemic seroprevalence of RVF in a sample population of relevant domestic animals and wildlife in study areas with clearly identified serotypes. Training in this area should establish better methods for the biosurveillance of epizootic and zoonotic diseases in Uganda.
b. Create/improve contingency plans for RVF outbreaks ready for implementation at the central and local district levels through collaboration with a Ugandan government representative specializing in disease prevention and control as well as outbreak containment in Uganda.

Study 2 - The portion of the project focused on exploring the distribution and characteristics of avian influenza viruses (AIVs) in migratory waterfowl and poultry in Uganda shall include these specific objectives:

a. Establish temporal and spatial distribution and prevalence of AIVs in a sample population of waterfowl and domestic poultry in Uganda.

Study 3 - The portion of the project regarding the genetic and epidemiological insights into the occurrence of peste des petits ruminants virus (PPRV) among sheep, goats, and cattle in northern Uganda shall include these objectives:

a. Determine the prevalence of PPRV in wild animal species in the Kidepo Valley National Park and in goats, sheep, and cattle in Nakapiripirit district of Uganda.
b. Use of RT-PCR to detect the presence of PPRV and competitive ELISA to determine the presence of specific PPRV antibodies.
c. Development of a questionnaire to obtain data on existing control measures, livestock movement patterns, PPRV vaccination practices and prevalence, and other relevant epidemiological and surveillance factors.

For the pilot studies, an appropriate scope would include the following:

Study 1 - Pilot study will include no more than 1,000 serum samples collected from 768 domestic animals (cattle, sheep and goat) and 232 wild animal ruminant and porcine species. Laboratory analysis will be limited to serology (ELISA). Data analysis will include determination of RVF antibody seroprevalence. ELISA will be conducted at the CDC lab at UVRI with participation as appropriate by relevant project collaborators.

Study 2 - Pilot study will include no more than 1,000 serum samples collected from two distinct locations with measurably high levels of interface between the wild birds, domestic poultry, and humans. Samples should be collected from approximately 590 domestic poultry and 410 wild poultry, split evenly between both locations. Laboratory analysis will be limited to ELISA for Influenza A viruses and PCR-based molecular analyses, both to be conducted at NADDEC.

Study 3 - Pilot study will include no more than 1,000 serum samples collected each from two distinct locations. The samples should be from approximately 232 cattle and 768 sheep or goats split evenly between the two locations. Development and piloting a questionnaire to assess PPRV risk factors such as vaccination practices, livestock movement and PPRV control measures will be part of the study. Laboratory analysis will be limited to serological and molecular techniques and data analysis will include determination of PPRV antibody seroprevalence and risk factors for PPRV. ELISA and PPR will be conducted at NADDEC. Metabiota shall not pay for Ugandan government collaborators' time for activities completed as part of their normal job/position and role within their institution. Time shall not be paid to government collaborators for Phase One or Phase Two. Ugandan government collaborators can be compensated for time if they are included as trainers, pilot study project leads, and field technicians for Phase Three. AFENET is not a government organization. CDC will not be compensated for time related to this project. All other POCs listed above are Ugandan government collaborators.

Travel costs for Ugandan participants related to the training event and field studies should only include ground transport, lodging, and per diem costs for participants working a distance of greater than one hour travel time from their home, and any requested ground transport, lodging, or per diem payments shall be cleared with CBEP prior to making commitments to cover these costs. Local participants in the training and field work (living one hour or less from the location of their work that day) will not have travel, lodging, or per diem costs covered.

Phase Three deliverables: Pilot studies implemented; PCR and ELISA results provided to CBEP; results and analyses developed into a pilot project summary of conclusions per project and provided to CBEP; and summary of conclusions provided to the Ugandan national authorities for disease surveillance and control.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES).

Phase 0: Proposal Development & Initiation (Task 1: March 7-9, 2016)

Metabiota developed a project plan and implementation strategy that aligns with narrative from Box 8. It is anticipated that the plan for TD-022 is considered a living document and it is expected that revisions to the plan will be necessary following stakeholder meetings. During proposal development, Metabiota expects to use Program Manager (PM) and Project Coordinator (PC, billed as a Research and Data Analyst (RDA)) time to identify the optimal strategy, including required deliverables and other programmatic requirements, which may be a part of project implementation.

The Metabiota PM and PC coordinated with (b)(6) Metabiota's Executive Vice President (EVP) in charge of Science Integration and communication with our regional scientific networks to identify the appropriate SMEs in grantsmanship, experimental design, and biosurveillance to develop and augment project work plans and training materials. Ultimately, this measure was taken to ensure our technical and cost solutions were of the highest quality and sustainable, respectively.

Key assumptions:

1. Metabiota received unofficial communication supporting an extension of its contract from May 16, 2016 to November 15, 2016, this technical response has been developed with the key assumption that this additional time will be allotted to this project.
2. Metabiota assumes DTRA CBEP representatives will provide Metabiota with the concept notes referred to in Box 8 upon the approval of this TD.
3. Metabiota assumes that DTRA CBEP representatives involved in the development of this technical direction will be available for a kick-off meeting to discuss any associated historical engagement with the research collaborators and their respective needs and constraints.
4. Metabiota assumes changes to the budget (e.g., labor categories) will be acceptable to DTRA. An RDA was added to provide flexibility when implementing; however, this has not affected the overall project budget.
5. Metabiota assumes our response should align with narrative from Box 8, which does not align with the figures provided in Box 5.
6. Metabiota assumes that there will be a need to develop training materials during phase 3 part 1 in preparation for phase 3 part 2, and has incorporated the necessary LOE into this technical proposal.
7. Metabiota recognizes guidelines regarding compensation of Ugandan government personnel, as outlined in the Ambassador's memo (8 April 2015). Metabiota has developed a basis of estimate that plans for the highest cost scenario (e.g., no Ugandan government personnel). Upon receiving names and affiliations of all project participants, Metabiota will work with DTRA CBEP to adjust the basis of estimate accordingly.

Phase 1: Work Plan Development (Task 1: March 21-April 22, 2016)

Upon approval of the TD, Metabiota will engage DTRA CBEP to ensure a mutual understanding of project goals and objectives is realized, as well as to obtain the concept notes referred to in Box 8. Metabiota will additionally engage with the eight Ugandan collaborators provided in Box 8 as well as other key stakeholders to obtain additional information such as possible existing work plans, research plans, and training materials for grantsmanship and standard operating procedures for related biosurveillance activities. The Metabiota PM, PC, and SMEs will participate in regular project communications with stakeholders to ensure mutual understanding of project goals, actions, and status.

Metabiota SMEs will conduct a review of the concept notes referred to in Box 8 to establish a baseline for outreach to the identified Ugandan stakeholders. Metabiota will then conduct a series of data calls with these Ugandan stakeholders in order for the SMEs familiarize themselves with the current capabilities and needs of the identified stakeholders, and to identify an appropriate path forward for the work plan. This work plan will identify a timeline of implementation and key milestones and goals for both the development of a detailed research plan (from which, Pilot training and design study will be extracted), as well as development of research proposals (ex. number of proposal submissions, drafts of white papers, etc.). The work plan will include activities providing grantsmanship support, mentorship, and subject matter expertise to key Ugandan stakeholders throughout proposal development, Pilot training and study design and verification, and proposal editing and submission process. Metabiota will submit the work plan draft(s) to DTRA CBEP for review and approval.

Phase 2. Research Plan and Proposal Development (Tasks 1, 4. April 25-June 24, 2016)

Metabiota SMEs will execute the work plan as approved by DTRA CBEP in Phase 1. In doing so, Metabiota will coordinate with the identified Ugandan stakeholders to support the development of a detailed research plan as well as research proposals for epidemiologic studies/bio-surveillance research of RVF, AI, and PPR based on the needs and research interests identified in Phase 1.

Metabiota SMEs will provide support to the Ugandan stakeholders to develop a comprehensive research plan, which will include a detailed list of materials and supplies needed to accomplish the research studies. Moreover, the research plan will include detailed SOPs planned for the collection of samples, including field, laboratory, and data analytics as well as identification of biosafety and biosecurity risks and associated mitigation methods. From this overarching research plan, the Metabiota SMEs and Ugandan stakeholders will develop up to three (3) pilot study plans to test the SOPs developed in the research proposals for their effectiveness and viability of project design. In doing so, the Metabiota SMEs will provide support, mentorship, and expertise in the development, strengthening, and tailoring of these research plans through the submission proves while the Ugandan stakeholders are expected to write and finalize these plans based on the guidance they are provided. Metabiota will submit the final research plan(s), research proposals (including financials) and proposed SOPs for DTRA CBEP's review and approval.

Phase 3, Part 1: Preparation and Coordination for In-country Training and Pilot Studies (Tasks 1, 3, 4: March 28-Aug 11, 2016)

Metabiota will coordinate with the Ugandan stakeholders to identify the most appropriate participants for both training and Pilot study activities. The Metabiota Travel Coordinator will coordinate with the project team to ensure that transportation and lodging arrangements are secured for the SMEs and FLNs as needed. The Metabiota PM and PC will work with the project teams to ensure any need for translation, interpretation, or other logistical requirements are adequately anticipated and communicated to CLS via the DTRA CBEP Technical Point of Contact.

Metabiota will coordinate with the Ugandan Stakeholders to identify training needs as discussed in Phase 1 and further identified in Phase 2 SOP development. To meet these needs, Metabiota will reuse existing training materials and SOPs for applicable biosurveillance activities as much as possible. However, due to the limited information currently available regarding the intended pilot research plans, Metabiota expects to use SMEs to adapt and develop training materials for effective delivery of training. Metabiota SMEs will develop new materials, which may including slide presentations, videos, etc. to effectively leverage the learning environment. Metabiota will also develop, as appropriate, pre-tests and post-tests for monitoring and evaluation purposes. Training materials, after development and adaptation, will be delivered to DTRA CBEP for technical review and Public Affairs Office approval.

Phase 3, Part 2: Conduction of In-country Training (Task 1, 3, 4: August 4-24, 2016)
Metabiota SMEs will execute a 10-day training activity for up to 20 participants who will be taking part in the three identified pilot studies followed by a 1-day pilot study coordination day with the pilot study leads. Metabiota anticipates a mix of lecture and hands-on training being necessary, however, Metabiota SMEs will adjust the training approach based on the Stakeholder feedback obtained in Phase 1. Metabiota SMEs will be available for virtual "office hours" and to answer written communications from participants as needed throughout the conduction of pilot studies. Metabiota SMEs will also conduct pre-/post- training testing and evaluations and provide feedback to the participants on their performance. FLNs will be used to facilitate training activities to the extent possible.

Phase 3 Part 3: Conduction of Pilot Studies (Task 1, 4, 6: August 18-Oct 26, 2016)
Metabiota SMEs will coordinate with the pilot study leads for the conduction of three pilot field studies, involving up to three pilot study leads and 11 technicians over a period of 8 weeks. Metabiota SMEs will be available for virtual "office hours" and to answer written communications from all participants as needed throughout the conduction of the pilot studies. Metabiota will provide management oversight and support for the conduction of these pilot studies, and will support the Ugandan collaborators in obtaining all required approvals for project continuation, including but not limited to ROB approvals. Metabiota will coordinate with all Stakeholders to identify the necessary materials required to conduct all pilot effort(s). Inclusive of this, Metabiota will provide any necessary support (SME or logistical) to in-country participants when navigating the procurement process. All materials will be identified and procured with sustainment in mind. Metabiota will submit pilot study summaries, including individual pilot study results, analyses, and conclusions as well as a summary of implementation conclusions to DTRA CBEP for communication to the Ugandan national authorities for disease surveillance and control.

Final Project Report
Metabiota PM, PC, and SMEs will all contribute inputs to a final report relaying all actions taken for project implementation through all phases, lessons learned, and identifying next step opportunities upon completion of all deliverables. Results of pre- and post- testing and evaluations from training will also be provided to DTRA CBEP.

Monitoring and Evaluation
In order to develop a comprehensive approach to continuous monitoring and evaluation of this project throughout implementation, Metabiota has developed a comprehensive monitoring and evaluation plan which can be found in the attached Appendix A (Supplemental Information) Part 5.

Risk Management.
In order to anticipate and overcome obstacles included (but not limited to) those listed in Risk Management Matrix found in the attached Supplemental Information Part 2, Metabiota has identified and captured the risks associated with implementing this activity, including contingency planning and course correction measures which will lead to overall regional risk reduction, as outlined in the attached Risk Management Matrix.

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN).

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$111,755
1003	MATERIALS	$105,270
1004	ODCs	$3,600
1005	TRAVEL	$32,931

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES).

All phases:
Task 1 - Project Coordination: Metabiota will provide consistent and cohesive technical and administrative leadership, direction, program management, implementation oversight, and coordination of all project activities.

Metabiota Program Manager (PM): The Metabiota PM will provide direct oversight of the planning and execution of the program, ensuring all objectives are met in accordance with the project SOW maintaining scope, budget, and timeline. The PM will ensure completion of DTRA CBEP goals at the country and regional level in direct support of this activity and the DTRA CBEP mission throughout the lifecycle of the project, and will ensure project close out. To guarantee that all requirements are met, the PM will manage the RDA to ensure all day-to-day activities for the project are completed on time, and to the quality required by DTRA CBEP.

Metabiota Project Coordinator: The Metabiota RDA will act as a Project Coordinator (PC) throughout the planning and execution of project objectives. The PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to CBEP and other stakeholders. The PC will regularly communicate the project status with the PM. The PC will manage the SMEs and FLNs and lead coordination with the Ugandan Stakeholders, to include leading regular coordination calls with the project team and assist in participant coordination

Note* - Metabiota recognizes that the RDA labor category was not included to Box 8 of this TD. Upon review of internal support (e.g., Project Coordinators) and to allow greater project implantation flexibility, Metabiota has proposed the use of an RDA instead of a SME 1 for all project coordination. Importantly, while hours have been added for project coordination, the overall cost for the Project Coordinator role remains unchanged between RDA and SME 1.

A key requirement to ensure effective program initiation, execution, and closeout is ensuring clear communication between all project stakeholders. To ensure the project in managed according to CBEP standards, the PM and PC will be responsible for the following:

Initiation and Program Integration: The PM, with PC support, developed the project proposal to include the project timeline, identification and integration of project requirements, deliverables, subcontractors, SMEs, and trainers to ensure project success. Upon acceptance of the proposal, the

PM will hold a kick-off meeting with team members and partners to review the project plan and schedule, establish routine communication to support project implementation, initiate education on the contract requirements, and begin project implementation. Routine communication with all stakeholders will ensure that all deliverables, including required CDRLs, are met and submitted according to the project schedule and contract requirements.

The PM and PC will work closely with Ugandan POC's identified in Box 8 (Phase 1) to understand their respective vision for this effort, including the development of a work plan for implementing all identified activities. In addition, the PM and PC will coordinate communication between Ugandan POC's and the identified grantsmanship/BSV SME's (e.g., project team members) to ensure alignment of project plans with DTRA CBEP goals when developing the research project design and high-quality and competitive research proposal(s) (Phase 2). Lastly, the PM and PC will coordinate all aspects of training implementation (Phase 3), to include identification and appropriate engagement of FLNs, to include a Study Leads and Study Technicians, to support in-country training and BSV pilot studies (Phase 3) by interfacing regularly (see Communication Management) with project personnel to ensure that in-country and overall project objectives and requirements are met in full. The PM will ensure that FLNs are engaged according to contract and project requirements, and have the experience, background, and skills necessary to support training implementation. FLNs are budgeted at the AFRICOM FLN I rate.

The PM will ensure that all project personnel (Metabiota and subcontractors) adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include; overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work.

Project Close out: The Metabiota PM and PC will oversee project closeout, to include completion of grant proposals, wrap-up of training, and finalization and submission of all identified deliverables, including final reports. The PM will also ensure the conclusion of subcontracts and other employment agreements.

Additional communication strategies and programmatic safeguards, including 1) Human Resources Management, 2) Communications Management, 3) Risk Management, 4) Schedule Management, 5) Cost Management, 6) Quality Management, and 7) Technical Resource Management can be found in Appendix A (Supplemental Information).

Task 3 – Qualified Trainers (QT): Metabiota will provide financial support to in-country Qualified Trainers (Phase Three, Parts One and Two) via subcontracts of independent consultant agreements with the yet to be identified trainers. Metabiota recognizes the importance of identifying Ugandan nationals to fill these roles in order to foster relationships and build regional capacity. Metabiota will work with all project stakeholders to identify the appropriate trainers. Currently, it is presumed that all qualified trainers will be billed at the AFRICOM FLN 1 rate.

Task 4 - Subject Matter Experts (SMEs). Metabiota will provide ongoing technical support and expertise through the use of SMEs, to include the development of 1) a work plan for implementing all identified activities, 2) project design, and 3) development of high-quality and competitive research proposal(s). Metabiota SMEs engaged for this effort will provide expertise and input on the development and revision of existing training materials, development and revision of SOPs, as well as mentoring of study participants in grantsmanship and BSV training activities. SMEs will predominately operate remotely throughout Phases 1, 2, and most of Phase 3 and will thus provide mentorship through regular written communication and video teleconferencing with project participants, as necessary. Importantly, the SMEs for this effort are Kenyan nationals and geographically situated in Nairobi, Kenya which will ease operating delays due to time zone differences. Moreover, the identified SMEs possess excellent operational knowledge of East Africa and capabilities in technical writing, biosurveillance techniques, and one health concepts related to infectious disease research. For Phase Three, Part Two, SMEs will implement the training efforts and will work in partnership with FLN project participants to administer the courses, provide QA/QC of all materials, engage trainees in capacity building and scientific discussions supporting training concepts and implementation, and assist in the development of a gap analysis report. SMEs on this effort will be performing the functions of both SMEs and Qualified Trainers (QTs). In line with government guidance, the SMEs will be billing at the SME I labor rate, which is the equivalent cost of QT I.

Metabiota will subcontract Africa Biomedical Laboratories (ABL; Nairobi, Kenya) for SME support of this effort. The use of regionally accessible, African Nationals helps to build regional capabilities and networks, and ensures overall project success.

Task 6 – Research Activity Projects. Metabiota will provide financial support to Study Leads and Study Technicians (Phase Three, Part Three) via subcontracts of independent consultant agreements with the yet to be identified participants. Metabiota will work with all project stakeholders to identify the appropriate project participants. It is currently presumed that all project participants will be billed at the AFRICOM FLN 1 rate.

Note* - Metabiota is aware of guidance provided by the US Ambassador to Uganda regarding salary support to Government of Uganda personnel. If the Trainers, Study Leads, or Study Technicians are direct employees of the Ugandan Government (e.g., Ministry of Health, Agriculture, Wildlife, etc.), Metabiota will adjust their engagement strategy to reflect the Ambassadors guidelines. The budget for this project will be impacted accordingly.

Reach back programmatic support to include finance, accounting, and contracts, will be provided as part of CLIN 1001 (FFP) and will not be separately invoiced.

Materials

As defined in Box 8 (Phase Three, Part Three) this activity shall include the procurement of materials and supplies required for the pilot studies, not to exceed $100,000. Metabiota will work with the Ugandan partners to identify the most sustainable, efficient, cost-effective way to procure materials and supplies for executing BSV pilot studies. The identification of sustainable supplies will be critical for continuing BSV-related activities, which will be described in greater detail within newly developed grant proposals (Phase Two). Any materials procured by Metabiota will be shipped via CLS. If materials can be secured and provided to the trainers/trainees locally or online, shipping will not be required. Additionally, Metabiota will work with SMEs based in Kenya to help identify sustainable and reliable vendors of biomedical supplies.

Given the nature of this effort (e.g., BSV), Metabiota anticipates the need to procure personal protective equipment such as Tyvek suits, gloves, goggles, booties, and N95 respirators, as well as consumables and other paraphernalia such as chlorine, plastic wash basins, buckets, disinfectant sprayers, and anti-fog spray will also be procured. A final list of materials required for this effort will be identified in coordination with all project stakeholders.

Following discussions with all project stakeholders, and if warranted, USB internet devices and internet access cards will be procured and provided to project participants in-country to ensure they have access to a stable internet connection during remote coordination and training sessions, which are included to all phases of this effort. USB internet devices will be procured and tested in-country to avoid shipping charges and to ensure they are

operational on the ground. USB internet devices and access cards will be monitored by the FLNs to ensure they are used for project purposes only, and are maintained according to equipment/material guidelines for the duration of the course.

General office supplies will be procured to support in-country training activities and routine project needs for the execution of the training courses. Office supplies will be procured locally and will include, but may not be limited to, pens, paper, thumb drives, binders, etc.

Metabiota will conduct market research and ensure the best value is secured, maintaining quality and technical requirements for all procurement of goods. Metabiota will coordinate directly with CLS and third-country vendors for all necessary shipping requirements, and will work closely with CLS and DTRO to ensure customs clearance requirements are met and goods delivered according to project timelines and CDRL requirements. Metabiota will ensure cost management for all procured supplies and will coordinate directly with CBEP and CLS to support additional requirements for the hands-on training events to include such items as printing of the developed and adapted training materials, training certificates for participants, and translation services, if needed.

Other Direct Costs

Per contract guidelines, DBA insurance is required for all personnel engaged on the AEP project working abroad. DBA insurance will be applied for labor costs incurred overseas. DBA will be applied to the PM, SMEs/Trainers, FLNs, and other contractors, engaged on this effort, for the duration of the program. Metabiota maintains a blanket DBA policy for all personnel and will add the SMEs and FLNs, and other performers meeting DBA requirements, to this policy as they are engaged. (b)(6) f their total compensation will be billed to the project on a monthly basis. A reconciliation of the total DBA will be performed prior to final invoicing to ensure accuracy of the charges, in accordance with total hours worked. Final invoicing will be adjusted, if necessary, to reflect the final DBA allocation numbers.

Subcontracts

Subcontracts will be issued to SMEs, FLNs, and/or their home organization(s) as needed for the labor necessary for this effort, as well as any materials and supplies they will procure in support of this effort. Costs are captured under the labor or materials budgets.

Travel

Travel is requested to support the Program Manager, SME, and qualified Ugandan trainers to Kampala, Uganda to implement training efforts for project participants (Phase Three, Part Two). The travel budget represents the estimated amount required; travel on the AEP contract is cost reimbursable.

All Metabiota personnel slated to travel are current with regard to ISOPREP, SERE, and AT/FP trainings, as required by CBEP. Additionally, the SME's leveraged for this effort are Kenyan Nationals and therefore do not require the aforementioned travel trainings/documents.

Our travel budget assumes training will be held in Kampala over the course of two weeks, including one day before or after for in-person coordination, as described in Phase Three, Part Two of this proposal. If, through discussion with the Ugandan stakeholders, an alternative schedule is created or an alterative location is desired, travel costs may be impacted accordingly.

Metabiota: As part of our internal management strategy, (b)(4); (b)(6) leads scientific integration across all programs and communication with our regional scientific networks, which includes Africa Biomedical Laboratories (b)(4); (b)(6) . Within AEP, upon receiving a new TD, we engage leadership, including (b)(4); (b)(6) to identify appropriate scientific personnel. In this instance, Mary was engaged upon receipt of the TD and ABL was identified as the most appropriate SME's for this effort. In light of this, the narrative should have been written in past tense. Importantly (b)(4); (b)(6) time is not billed to AEP.

Additionally, I have attached updated narrative to Box 9 of our TD-022 response. All adjusted narrative has been highlighted yellow.

If you have any additional questions, please let me know if you have any additional questions.

Kind regards.
(b)(6)

Good evening (b)(6)

Attached please find both a word version and a signed PDF version of our updated TD response for TD-024.

We have made the requested deletions in the first ask.

We have left in the TD Response Development LOE as that activity is part of the TD and has never been part of the PMO. If this is a new direction I suggest we convene a leadership meeting to discuss.

For the 3rd ask we've reviewed all activities that would be at a significantly reduced risk done in person and have

Film Narrative of Epigenetics and Genomics of Infectious Diseases in the Middle East and South Asia.	HOURS **160** DOLLARS: $ **$60,000**

6. CONTRACTING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME: (b)(6)
PHONE (b)(6) EMAIL: (b)(6)	PHONE: EMAIL: (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to develop a Film Narrative of Epigenetics and Genomics of Infectious Diseases in the Middle East, South Asia and CBEP collaborations in the CENTOM Region in accordance with SOW section 4.3, Task 3.

Metabiota shall develop a 2-5-minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, which was held at the Royal Scientific Society (RSS) on March 7-8, 2016 in Amman, Jordan. The visual narrative (2-5 minutes) objectives are to document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. Metabiota shall develop the specific script in coordination with CBEP CENTCOM regional managers. The footage and interviews that Metabiota has from the conference can be utilized for the visual narrative. The visual narrative should be completed by June 30 2016. Total costs for the narrative shall not exceed $60,000.

Deliverables:

- A short film narrative of 2-5 minutes on 3 DVDs. Final film must go through Public Affairs Office (PAO) approval at DTRA.

The period of performance for this effort will be from May 1 to June 30 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $60,000.00 is requested by 19 April. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Phase 1: Proposal Development & Initiation (Task 1)

Metabiota developed a project plan and implementation strategy that aligns with the narrative from Box 8. It is anticipated that the plan for TD-24 is considered a living document, and it is expected that revisions to the plan may be necessary following stakeholder meetings. During proposal development, Metabiota will use Program Manager (PM) and Project Coordinator (PC, billed as a Subject Matter Expert 1) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Metabiota assumes the following:

1. The PoP assigned to this project will allow enough time for PAO approval of the final video. However, if PAO approval extends beyond the project timeframe, Metabiota will work with AEP regional leadership and the COR to adjust the PoP or allow for final approval of the video outside of the project timeframe, as appropriate and within contractual compliance;
2. Production services required for this project will be complete within 3 weeks allowing enough time for PAO approval of the final video. Should services required extend past this timeframe, Metabiota will work with the CBEP CENTCOM regional leads (and COR, if necessary) to adjust the schedule accordingly;
3. Box 8 of TD-24 states that this project will be completed in accordance with section 4.3, Task 3, which refers to Qualified Trainers (QTs). Based on the requirements, Metabiota has replaced Qualified Trainers with Task 4- Subject Matter Experts. Metabiota assumes this will be acceptable in the execution of the project and engagement of SMEs for this effort.

Project Coordination (Task 1)

The Project team will be led by an experienced Program Manager (PM) (b)(6), and supported by a highly effective Project Coordinator (PC) (b)(6) MPA, to cover Task 1 – Project Coordination. The PM and PC were selected for this project, because they implemented TD-07 the Middle East South Asia Epigenetics and Genomics of Infectious Disease Conference and have the historical knowledge to effectively and efficiently manage the requirements identified for TD-24. In addition, Metabiota will engage (b)(6) from Gryphon Scientific LLC (b)(6) assist in narrative development as a SME under Task 4 (b)(6) the PI and senior TD-07, working closely with (b)(6) (b)(6)

Note: The Metabiota PM confirms subcontractor knowledge of the contractual requirements prior to TD approval.

Phase 2: Preparation (Task 1)

Upon TD approval, the PM will establish routine communications with project team members and CBEP to initiate project implementation. The PM will hold a kick-off meeting within 5 days of approval, with participation from the AEP PMO, project team members and key CBEP stakeholders to review project requirements and ensure a mutual understanding of project goals and objectives is realized. The PM, with assistance from the PC, will identify and engage the videography firm required to execute production of the video. The PM will lead coordination and integration of the project team with CBEP stakeholders to develop the narrative and complete the film.

The project team will ensure that all necessary documentation required pr or to initiating tasks is completed correctly and submitted on time, including CTR CLS Form (CDRL A016) and the Monthly Reports (CDRL A001). The project team will work closely with CBEP regional leads, A&AS support staff, and CLS to ensure that all logistics requirements are coordinated and implemented according to the project schedule and contractual

requirements. The Metabiota Travel Coordinator will coordinate with the project team to assist in the request of travel requirements supporting this effort and will ensure that travel arrangements are secured, immediately following approval by the COR, and in line with the project schedule and execution requirements.

Sub-Phase 2.1: Film Narrative Development and Adaptation (Tasks 1,4)

Metabiota will select and engage a videography firm to produce the film, following sourcing of an appropriate vendor for this engagement. The project team will engage the CBEP regional leads to ensure the technical requirements are clearly determined and will select a service provider at best cost to the government, meeting the requirements identified. Upon engagement of the videography firm, Metabiota will transfer the existing, unedited video footage and interviews collected during the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) from 7-8 March 2016 to the firm in order to produce the film. The unedited video footage, interviews, and photographs captured during this event will provide the raw material to effectively and relevantly document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. The Metabiota team will work directly with CBEP regional leads and the videography firm to determine the narrative and produce the film.

Sub-Phase 2.2: Coordination for Material Shipment (Task 1)

Shipment of materials and final edited film, if deemed necessary, will be handled via CLS. The project team will deliver the final edited and PAO approved film utilizing the appropriate CLS forms (CDRL A0016 and associated forms) to the CBEP team for appropriate routing, adhering to contract timelines and deliverable schedule. The Metabiota team will work closely with CBEP, A&AS, and CLS staff members to coordinate and execute any logistical requirements as needed.

Phase 3: Implementation (Tasks 1,4)

The Metabiota Project Team will develop and create a 2-5 minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) on March 7-8 2016 in Amman, Jordan. The film will be produced in the English language and may include visual frames of speakers on stage panning of audience, and snapshots of the discussion panels, poster session, and participants asking questions and engaging with speakers. The film may also include short interviews with conference organizers, Scientific Advisory Board members, speakers, presenters, and attendees concerning the importance, relevancy, and benefits of the conference, among other topics. The film will be produced utilizing the technical expertise of the film editors, Metabiota team, and CBEP regional leads to showcase the conference and highlight the scientific initiatives and engagements stemming from this event and CBEP efforts in the region. Suitable background music will be included, as well as sub-titles if deemed necessary. Metabiota will ensure that the film is adjusted/edited according to guidelines received from CBEP, and other key stakeholders. CLS will be engaged to provide logistical support (CDRL A0016), should it be required for this effort. In addition, Metabiota will ensure PAO approval of the film, and will coordinate with the technical team to address any necessary changes prior to completion and final delivery of the product.

To support implementation efforts, the Metabiota PM will travel to Washington DC for meetings with CBEP regional leads and the project team to develop the narrative and review the video footage. The PM will participate in working sessions, brainstorming, and technical development of the film narrative during scheduled in person meetings to ensure execution of the narrative and completion of the project. In addition, the PM will meet with the videography firm to review performance and completion of tasks associated with this project.

Phase 4: Project Closeout (Task 1)

The project team will close out all activities associated with this project, to include final reporting, invoicing, and submission of all relevant CDRLs according to the outlined schedule. In addition, the project team will contribute to lessons learned conversations with CBEP detailing enhancements that could be made should this type of project be repeated, as necessary and requested by CBEP regional leads. Finally, unedited and edited film, and other relevant materials will be provided to CBEP.

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$36,810.04
1003	MATERIALS	$10,695.43
1004	ODCs	$0
1005	TRAVEL	$2,372.50
TOTAL		**$49,877.97**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES

Labor

Costs for direct labor to support this activity is required for the following personnel:

Metabiota Program Manager (PM): The Metabiota PM will provide direct oversight of the planning and execution of the program, ensuring all objectives are met in accordance with the project SOW maintaining scope, budget, and timeline. The PM will ensure completion of CBEP goals in direct support of this activity and the CBEP mission throughout the lifecycle of the project, and will ensure project close out. To guarantee that all requirements are met, the PM will manage the SME 1 to ensure day-to-day activities for the project are completed on time, and to the quality required by CBEP. The PM will participate in routine conference calls and other forms of communication with CBEP regional leads and SMEs to ensure project execution. The PM will oversee the subcontractors on this effort, to include the services provided by the videography company in execution of the film. The PM will ensure all contract CDRLs are met and delivered according to the project timeline, and contract requirements.
LOE: 72 hours

Metabiota Project Coordinator: A SME 1 will act as a Project Coordinator (PC) throughout the planning, execution and close out of project objectives and activities. The PC will support the planning and execution of CBEP objectives towards the completion of project goals by participating in proposal development, stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to CBEP and other stakeholders. The PC will regularly communicate the project status with the PM. The PC will participate in routine project communications, to include leading regular coordination calls with the project team, CBEP, the videography company, and other key stakeholders.
LOE: 52 hours

SME 3 (b)(6) from Gryphon Scientific will be engaged to support technical development of the film narrative for this project. Having coordinated the MEGA Epigenetics and Genomics of Infectious Diseases Conference with the Metabiota team, she is critical in ensuring the conference message is received and communicated through the film. (b)(6) will work directly with Metabiota and CBEP to develop the narrative, review the footage, and provide subject matter expertise to the team and the production services in development and execution of the film. Should edits or revisions be required following CBEP and PAO guidelines, (b)(6) will participate in editing and refining the narrative to be delivered in the

final product (b)(6) will be responsible for all monthly reporting and deliverables assigned to the Gryphon subcontract by Metabiota in execution of this projec
LOE: 80 hours

Reachback programmatic support to include finance, accounting, and contracts, will be provided as part of CLIN 1001 (FFP) and will not be separately invoiced.

Materials
Training Materials: Two (2) external hard drives will be procured to store the photos, raw video footage, and the final edited video.

Production Services: Metabiota will engage a videography firm to produce the short video for this effort. This will include identification of sound bites, completion of film transcripts, editing, and production of the video.

Metabiota will conduct market research and ensure the best price is secured, maintaining quality and technical requirements for all procurement of goods. Metabiota will coordinate directly with CLS for all shipping requirements, and will ensure cost management for all procured supplies, as necessary to complete the scope of this effort.

Subcontracts
The subcontract with Gryphon Scientific will be modified to include labor hours and materials required for implementation of this project. Costs are captured under the labor and materials budgets.

Travel
Travel costs will be cost reimbursable and provide best cost to the government following JTR regulations. Travel is requested for the PM to meet with the project team, Gryphon SME, CBEP, the videography company, and other key stakeholders to support the execution of Phase 3, and ensure development of the film narrative and completion of the project. The PM will travel to Washington DC to take part in in person meetings, brainstorming activities, narrative development and review of film footage and sound bites developed by the videography company supporting this project.

reduced the PM's trip to DC to 3 days, the minimal time we believe we could execute those activities.

Thank you for your consideration and we look forward to your reply.

V/R,

(b)(6)

There are some comments/clarifications regarding labor and travel support:

Block 9a, under Phase 2: Preparation (Task 1):
(2) Please remove the formal communications plan, schedule and risk register. It is not clear on the need; therefore, please remove.

Block 9b, under Labor Breakout tab embedded within the spread sheet :
(1) Please remove TD proposal development costs under labor breakout. It includes 8.0 hours for PM and 8.0 hours for SME1. This should be removed as it is part of the FFP PMO.

Blocks 9b & c, under Travel Budget embedded within the spread sheet and Travel section:
(3) Please reduced PM travel time. The proposed PM (80 hrs) no longer supports a 7-day trip to DC. A 1-2 day trip plus phone/email coordination that includes 40 working hours plus 2 days travel should be sufficient to accomplish the objective (PM 56 hrs).

Please advise if/how these impact Metabiota's proposed approach and costs.

Subject: Re: Technical Direction 007 PACOM Regional Landscape Analysis
Date: Sunday, June 21, 2015 9:01:04 AM
Attachments: Screen Shot 2015-06-21 at 8.39.02 AM.png

Hi (b)(6)

I apologize for the confusion. When we provided the RoM we were still in no-mans land on labor categories and structure of the T&M so we took a guess at what the labor categories would be and included them in the attached RoM for the T&M portion of the regional landscape analysis (May-the end of August) (I just took a screenshot to avoid having everyone scroll through the entire proposal). During the FFP period we did not have a mechanism in our old accounting system to separate time by activity or the appropriate labor categories for some of our junior researchers so their work came out of overhead. For those who qualified for the Task area focused labor categories we had under the previous contract and justified the high rates. I would estimate that about the equivalent to a quarter of a scientific mentor, a full time SME, and a half time research collaborator would be specific to the PACOM effort.

I believe our rates for the T&M are actually better than our guess in February, but the addition of the PM category and the continued (albeit ramped down) support into Sept and October account for why we are a bit higher than our guess back then.

The international communications are for me (during the WHO APSED TAG meeting I am attending with Lt Col Leba), and for our researchers who reside within the region or are traveling there on other projects.

I hope this clears things up a bit.

Best,

(b)(6)

***Costs from Feb-April included in FFP proposal submitted to DTRA**

(b)(6)

Subject: Re: Technical Direction 007 PACOM Regional Landscape Analysis

Thanks (b)(6)

We will dig into the proposal this week, but a couple of quick questions that I had after a cursory review are:

1. This effort is a continuation of work started in Feb 2015 that had a ROM budget of $800K, and the same PoP end date. What is the level of effort (by LCAT) already completed for this effort from initiation in Feb to the Option Period award date?

2. Why are material costs proposed for international travel communications, when there is no international travel proposed?

Cheers,

(b)(6)

Subject: RE: Technical Direction 011 TAP 4 Ukraine
Date: Tuesday, September 01, 2015 2:51:33 PM

H(b)(6)

Metabiota's proposal submitted on 31 August 2015 in support of Technical Directive 011 is hereby approved for implementation with a ceiling price of $116,880.

The Contractor should use its best efforts to perform the work specified in the Technical Directive within the estimated ceiling price. The Contractor should notify the Contracting Officer in writing whenever it has reason to believe that that costs for this Technical Directive are expected to go over the established ceiling price.

Cheers,
(b)(6)

Subject: RE: Technical Direction 012 Continued Implementation of Research Activity Project UP-2
Date: Wednesday, September 23, 2015 4:39:23 PM
Attachments: CTR-CBEP_AEP_TD-012RevA_UP2_17Sep2105_approved.pdf

Hi (b)(6)

Please find attached, the approved TD-012RevA with ceiling price of $264,788 and a PoP of 5/16/2015-9/30/2015. Every effort should be made to perform the work specified in the Technical Directive within the estimated ceiling price. Metabiota should notify the Contracting Officer in writing whenever it has reason to believe the costs for this Technical Directive are expected to exceed the established ceiling price.

Cheers,
(b)(6)

CIV
Subject: Re: Technical Direction 012 Continued Implementation of Research Activity Project UP-2

(b)(6)

Please find attached our response to TD-017. Of note, I have included an unsigned Word document, due to the imbedded Excel file, and a signed PDF Document.

Please note the CRDF subcontract was originally to be billed under ODCs on the FFP portion of the AEP contract. With the move to the T&M, incorporating These costs as labor even at the lowest labor category would cause the price to skyrocket, so we are only registering a fraction of the hours worked ? enough to cover the costs of the Ukrainian labor and all management fees.

We look forward to any comments and feedback re: this proposal.

Best regards,

(b)(6)

TECHNICAL DIRECTIVE (TD)

1. CONTRACT NUMBER	2. CONTRACTOR	3a.TD NUMBER	3b.REV
HDTRA1 -14-c-0104	METABIOTA	12	A

4. TD TITLE	5. TOTAL TD ESTIMATE:
Continued implementation of Research Activity Project UP-2 (Ukraine Project 2)	HOURS: _____ DOLLARS: $ **$225,000.00**

6. CONTRACING OFFICER REPRESENTATIVE	7. CONTRACTOR POC
NAME: (b)(6)	NAME: (b)(6)
PHONE (b)(6) EMAIL: (b)(6)	PHONE: EMAIL: (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

This revision changes the end date for the period of performance for this effort to 30 September 2015 and establishes a not to exceed value of $225.000.00 for implementation activities from 16 May 2015 through 30 September 2015.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Technical Approach

Metabiota will use a phased technical approach to manage all tasks required for successful implementation of the project phases and to provide overall feedback and reporting on the proceedings outlining the accomplishment of objectives. To achieve these purposes, Metabiota will support activities within three specific project goal categories to learn from the history of these zoonoses while also proactively managing any future threats. These goals and their corresponding tasks are organized to provide long-term, sustainable teams across UP institutes to maintain this and future efforts. Please note the Priority and Task numbers (below) track with the approved UP-2 proposal submitted 5 September 2014 (AEP base year).

Phase 1: Active surveillance for tick-borne diseases, specifically tularemia caused by *Francisella tularensis*
- Priority 1: Task 2.3: PCR and culture diagnostic efforts for *F. tularensis*

Phase 2: Surveillance and environmental sampling for *Bacillus anthracis*
- Priority 2: Task 3.1: Investigating recent and ongoing anthrax outbreaks
- Priority 2: Subtask 3.1.1: Sampling Blood from Animals without Clinical Symptoms (e.g., wild boar)
- Priority 4: Task 3.2: Laboratory analyses for *B. anthracis* for UP-2

Phase 3: GIS, remote sensing, and micro/molecular diagnostics
- Priority 1 (*F. tularensis)*: Task 4.3.1: Space-time Analyses for historical and field data
- Priority 1 (*F. tularensis)*: Task 4.3.2: Remote Sensing
- Priority 1 (*B. anthracis)*: Task 4.2: Ecological Niche Modeling experiments

Process: To achieve these goals, Metabiota provided various logistic, coordination, and performer support across all phases and all stakeholders. Specifically, Metabiota provided support for Subject Matter Expertise to conduct GIS mapping activities with the Institute of Veterinary Medicine (IVM) in July, 2015, materials and equipment support and biosafety cabinet recertification to the IVM, Volyn Oblast Laboratory Center of the State Sanitary and Epidemiological Services of Ukraine (VOLC), and the Ukrainian Center for Disease Control and monitoring of the Ministry of Health of Ukraine (UCDC), and process support and coordination for all stakeholders including identifying critical process requirements to conduct in-country travel and research activities, such as Animal Care and Use Review Office (ACURO).

Moreover, in support of achieving all objectives through Phases 1-3, Metabiota provided support for Ukrainian UP-2 collaborators to conduct research activities via a subcontract with CRDF Global.

Deliverables:
Metabiota:
- Supported the development and submission of animal care and use Review Office (ACURO) applications
- Issued sub-contractual agreements with Kansas State University in support of research activities
- Conducted procurement activities for laboratory equipment and supplies at VOLC, IVM, and UCDC
- Coordinated Biosafety Cabinet re-certification at VOLC, IVM, and UCDC
- Supported stakeholders from the University of Florida to conduct GIS mapping activities at IVM in late July 2015

Metabiota-supported Ukrainian Research Scientists:
UCDC
- Collected tick samples in Volyn oblast in May 2015, which were received and registered. In total, 1862 ticks were delivered and subsequently grouped into 140 pools
- Field material collected during previous iterations of UP-2 was tested for tularemia, including samples from 64 rodents (256 organs/tests) and 171 tick pools (171 tests). All results were negative
- Biological samples were tested using PCR (320 tests: 43 rodents (43 organs / 90 tests) and 115 tick pools (230 tests). Besides, 206 DNA samples (35 rodent spleens and 171 tick pools) were isolated. Studies will be finished in the 4th Quarter. 8 samples showed doubtful results and will be retested in the next quarter

VOLC
- Assessed supply needs for personal protective equipment, including gowns, respirators, gloves, etc., as well as laboratory materials, needed for research and needed for transportation of biological specimens
- Conducted field collection of ticks (1862), which were grouped according to their species into test tubes (25 ticks per tube), and then into

140 pools for delivery to the UCDC EDP laboratory.

IVM

- Developed ecological niche models of *B. anthracis* using GARP (Genetic algorithm for rule set production), in a resolution 16 and 8 km^2
- Developed count models of *B. anthracis* using Negative Binomial Regression in a resolution 16 km^2 and on rayon level
- Conducted soil sampling expedition preparation, including: choice of places selection, getting permissions and coordination with the local veterinary service of Ukraine
- Prepared and reviewed SOPs for soil sampling, materials decontamination and sera testing with ELISA test kit
- Designed and choose primers for PCR testing of soil samples for anthrax pathogen detection

Significant work remains to complete all UP-2 objectives, including sample collection and processing, assay validation, GIS-related analyses, and associated manuscript preparations. As of 1 October 2015, these activities will be implemented under the BTRIC TO-4 contract.

9b. BUDGET (USE EMBEDDED TABS FOR BUDGET BREAKDOWN):

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$127,154
1003	MATERIALS	$135,002
1004	ODCs	$2,632
1005	TRAVEL	$0
TOTAL		**$264,788**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES):

Period of Performance

The Period of Performance for this effort is May 16, 2015 to September 30, 2015.

Direct Labor

All phases:
Metabiota Program Manager: The Metabiota PM will provide oversight of the planning and execution of program objectives towards the completion of DTRA CBEP goals at the regional level and will lead communication with DTRA CBEP for this activity. The PM will do so by participating in proposal development and maintaining oversight of stakeholder and subcontractor coordination and project execution, including anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder. The PM will ensure Metabiota and other DTRA CBEP subcontractors meet all project requirements and deliverables while ensuring the program remains within scope, budget, and timeline. The PM will lead communication with DTRA CBEP for this activity.

As our Subject Matter Experts were independent consultants, the Metabiota PM will additionally oversee and ensure that all project personnel adhere to DoD and DTRA CBEP standard operating procedures and operational requirements to include overseeing the development of Statements of Work (SOW) and appropriate budgets under the T&M mechanism, the acquisition of Defense Base Act insurance, and any other requirements which may be applicable to the work. The Metabiota PM will provide management oversight of the project team, including independent consultants throughout the span of the project.

Metabiota Trainer 1: The Metabiota Trainer 1 will act as a Project Coordinator (PC) throughout the planning and execution of project objectives, as well as participating in proposal development. The Metabiota PC will lead the planning and execution of DTRA CBEP objectives towards the completion of project goals. The PC will do so by participating in proposal development and leading stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating projects risks and recommended mitigation strategies to the funder.

Additional costs for direct labor supporting the AEP Director and Travel Coordinator are not required, as they are already included in the FFP CLIN 1001 – Program Management Office.

For the efficient and effective project implementation it is requested to engage the following experts.

Institutional Financial Support (IFS)

Importantly, the original CRDF subcontract was to be billed under ODCs under the FFP portion of the AEP contract. With the move to the T&M, incorporating these costs as labor even at the lowest labor category would cause the price to skyrocket, so we are only registering a fraction of the hours worked – enough to cover the costs of the Ukrainian labor and all management fees.

CRDF Global is an independent nonprofit organization that promotes international science collaborations and full-service grant administration. Metabiota will engage CRDF Global for disbursement of funds to Ukrainian project recipients as well as grant payments to institutions participating in the UP-2 project. CRDF will provide Metabiota with transparent monitoring and detailed reporting of the grant payments.

Via CRDF, Metabiota will provide grant payments to the below institutes to support salaries of participating scientists.

IFS of the Ukrainian Centers for Disease Control (UCDC) and IFS of Volyn Oblast Lab Center (VOLC) personnel – In order to achieve the project's goals and objectives related *F. tularensis* research, it is anticipated that 14 UCDC and eight VOLC personnel will require salary support.

The workload identified for the UCDC staff is based on their previous engagement in the UP-2 Project Development Grant (PDG) and nearly two years of work on the project under the BTRIC. The reimbursement rates are consistent with local norms, prevailing market rates paid under similar projects.

IFS of the Institute of Veterinary Medicine (IVM) personnel - For achieving project goals and corresponding objectives related to *B. anthracis*

research, it is anticipated that staffing of IVM will include up to 15 people.

The reimbursement rates are consistent with local norms, prevailing market rates paid under similar projects.

Materials & Supplies

The detailed list of materials and supplies that are needed to carry out proposed research. their quantity, unit cost and corresponding catalog number are indicated in the project budget. The unit cost is estimated on the basis of the price that the manufacture or vendor provided at their websites. If the specific item's price is unavailable in open sources, the cost is budgeted as an average quote from local vendors. All materials and supplies are defined by the following categories at the corresponding organization.

- ***Materials & Supplies for Laboratories at UCDC*** Within the framework of the project it is expected to obtain up to 3000 samples (both tick pools and rodent's organs) for testing by PCR and bacteriology. Provided costs are required to support research materials, supplies and consumables needed to carry out laboratory analysis at UCDC. Such supplies include, Personal Protection Equipment (PPE) needed to provide biosafety standards (relates to tasks 2.1. 2.2, and 2.3). reagents and supplies for DNA extraction and PCR (relates to task 2.3), reagents and supplies for bacteriological culture (task 2.3), general laboratory and office supplies (i.e., copier paper. writing tools, binding supplies, copier supplies, postage, toners cartridge, other miscellaneous supplies, etc.) that will be used by staff to carry out daily activities on the project and relates to all tasks.
- ***Materials & Supplies for Laboratory at VOLC.*** Provided costs are required for research materials. supplies and consumables needed to carry out sample processing at VOLC (Tasks 2.1, 2.2). Such supplies include items like PPE. dissection tools, disinfectants, vials and tubes. general laboratory supplies that are needed for sample processing, storage, and disposal of used materials.
- ***Materials & Supplies for Tularemia field efforts.*** Provided costs are required for research materials, supplies and consumables needed to carry out field collection efforts. Such supplies include items for setting up field activity, collecting samples clean up, and miscellaneous (drinking water, first aid kits. Insect repellent, etc.).
- ***Materials & Supplies for IVM Laboratories.*** 1000 boar serum and 300 field samples will be provided for testing. Provided costs are required for research materials. supplies and consumables needed to carry out anthrax efforts in the proposed research (tasks 3.1 and 3.2). These supplies will include PPE. needed to provide biosafety standards; sample handling. storage, and dispensing; reagents and supplies for PCR, ELISA, and bacteriology; and other laboratory supplies that that will be used by staff to carry out daily activities.
- ***Materials & Supplies for anthrax field efforts.*** Provided costs are required for research materials, supplies and consumables needed to carry out the proposed research and include item for safety sample collection. transportation, and storage, as well provide BS&S standards.
- ***Biosafety Cabinet (BSC) Re-certification.*** In order to safely manipulate samples collected in the field, all BSC's in all project laboratories required annual re-certification, which was supported via this project.

Other Direct Costs

Per contract guidelines DBA insurance is required for all personnel engaged on the AEP project. DBA insurance will be secured for all staff for the period of performance for this engagement.

Kansas State University Subcontract

Direct Labor

Labor rates have been designed to capture KSU overhead costs including indirects and fees.

KSU Subject Matter Expert 3 – Senior personnel salary is requested for the KSU project Principal Investigator, (b)(6) contribution to the project will be; 1) supervision of the completion of the land cover mapping component of the project, 2) lead field excursion to Volyn Oblast, Ukraine to complete validation of land cover mapping component, 3) supervise and contribute to creation of biophysical data layers to support pathogen distribution mapping.

KSU Research and Data Analyst – Graduate student salary is requested to support one research assistant throughout the project. The research assistant will have a 9-month appointment. Duties of the research assistant will include: 1) assist with production of final product and archiving of land cover maps, 2) acquire remote sensing data and assist PI Goodin in creat ng biophysical layers, and 3) other tasks as directed by the project PI.

Materials

Supplies funds will be used to cover annual license costs for the ENVI and Arc-GIS software packages, both of which will be used extensively in this research. The license fee is determined based on estimates of computing needed using each of the two software packages, as a percentage of the total cost of departmental and university site\seat lice

Subject: Re: Technical Direction 012 Continued Implementation of Research Activity Project UP-2

(b)(6)

Attached please find the revised UP-2 proposal. As before, this one was 99% complete before receiving the new format yesterday.

There are 4 files attached:
1. Comment tracker (Excel file).
2. Budget (Excel file).
3. Technical proposal (management approach, technical approach, budget narrative). This incorporated the following file by reference upon the original submission.
4. Standalone budget narrative. The original inclusion by reference did not update this file. Here, I have updated this file to remove incongruities like relying on CLS for transportation.

As you are aware, UP-2 travel is currently in flux, and today we submitted the response to the RFP for Foreign Local National labor rates. Metabiota will be happy to amend the budget estimates for both travel and labor should it be necessary moving forward, but hope these factors will not be an obstacle to moving forward with approval of TD-012.

Best regards,

(b)(6)

Metabiota, Inc.

(b)(6)

(b)(6)

On 8/25/15, 10:54 AM (b)(6)
(b)(6)

H (b)(6)

I am remiss in not getting this back to you sooner. Long story short, additional information/clarification (as noted below) is required before the team can approve the proposal.

1. Direct Labor - The role of the proposed graduate students is not clear. They are proposed for 2000 hours of direct labor, but the exact nature of the work being done, support being provided, or the expertise that would contribute to the project objectives is not described.

2. Materials - The proposal indicates that new tires are required for the TADR Response Vehicle in order to use the TRV to travel to remote regions; however, it is not clear if Metabiota is proposing to replace those tires - no amount is specified for that expense in the budget.

3. Travel - The purpose of graduate student travel is not clear. They are proposed for two trips, but there is no clear justification as to why the graduate students are required to travel (same issues as for Direct Labor).

Cheers

Re: FAR 52.244-2 SUBCONTRACTS – Consent to Subcontract with the American Association for the Advancement of Science (AAAS), Academic Engagement Partnership (AEP). Cooperative Threat Reduction (CTR) Contract No. HDTRA1-14-C-0104

Dear (b)(6)

Per FAR 52.244-2 Subcontracts, Metabiota, Inc. (Metabiota) requests Consent to Subcontract with the American Association for the Advancement of Science to support AEP Technical Directive 025. Included with today's request are the following items:

- Draft Subcontract Agreement
- Sole Source Justification
- Price Negotiation Memorandum (PNM)

We will provide a comprehensive subcontractor budget once finalized.

Description of services to be subcontracted:
The subcontractor shall provide training materials appropriate for a one-week proposal-writing workshop in Ethiopia. These materials will be delivered to Metabiota seven weeks prior to the workshop. The subcontractor shall travel to Ethiopia to deliver the one-week workshop.

Following workshop completion, the subcontractor will provide remote mentorship to the Ethiopian scientists. Over 15 weeks, the subcontractor will guide and provide feedback to the scientists on the development of a white paper and full proposal. The subcontractor will also assist the scientists in responding to any comments or requests for revisions regarding the white paper received during this time.

Type of subcontract to be used. Time and Materials.

Proposed Subcontractor. American Association for the Advancement of Science.

Proposed subcontract price. A preliminary estimation total of $51,249.09 USD.

If you have questions or need additional information, I may be reached at (b)(6) (b)(6)

Sincerely,

(b)(6)

CONTRACT SUMMARY

Metabiota, Inc. Contract No.:	2016-11-DTRA
Performance Period:	TBD
Contract Type:	Time & Materials (T&M)
Contract Value:	$51,249.09
Project Title:	American Association of the Advancement of Science (AAAS)
Metabiota, Inc. Project Manager:	(b)(6)

AGREEMENT

This Subcontract ("Subcontract") is dated and effective as of May 11, 2016, (between **Metabiota, Inc.** (herein referred to as "Metabiota" or "Prime Contractor"), a California corporation, located at 425 California Street, Suite 200, San Francisco, CA, 94104 and **American Association of the Advancement of Science (AAAS)** located at 1200 New York Ave NW, Washington DC 20005 (herein referred to as "AAAS" or "Subcontractor"). Metabiota and the Subcontractor are each a "Party" and together are the "Parties".

WHEREAS, the Prime Contractor was awarded Contract No. HDTRA1-14-C-0104 for the Academic Engagement Program (AEP) by the Defense Threat Reduction Agency (DTRA); and,

WHEREAS, the Prime Contractor desires to purchase certain services from the Subcontractor for the Client; and,

WHEREAS, the Subcontractor is willing to provide services to the Prime Contractor in accordance with the terms and conditions set forth in this Subcontract.

NOW, THEREFORE, the parties hereby agree as follows:

Article 1. Subcontract Services

1.1 Statement of Work. The Subcontractor shall provide all necessary and qualified personnel, equipment, material and facilities to perform the services (hereinafter, the "Work") as set forth in Attachment A—Scope of Work, which shall include the production of the deliverables ("Deliverables"), attached hereto and incorporated herein by this reference.

1.2 Reporting. The Subcontractor shall submit reports in accordance with the deliverables as described in Attachment A, and as reference in Section 2.3.

The Prime Contractor may request additional information regarding the Subcontractor reports, for which the Subcontractor shall use reasonable best efforts to promptly address. The Prime Contractor will not consider award renewals for Subcontractors who fail to meet reporting requirements on a timely basis.

Article 2. Price, Contract Type, and Payment

2.1 Price and Contract Type. This Subcontract is a Time & Materials Contract Type. The ceiling price of $S1,249.09 is fully funded.

2.2 Labor Rate Table. Subcontractor sha l bill hourly, based on the labor rates and qualifications listed in the table below. Subcontractor shall provide back-up documentation detailing hours worked by position level, according to the Labor Categories and Rate Table below and Attachment B.

Labor Category	Labor Description	Total Hours	Rate	Total Costs
(b)(4); (b)(6)	Terminal degree and relevant experience (minimum of 10 years) in a specific and scarcely populated field.	(b)(4); (b)(6)		
	Terminal degree and relevant experience (minimum of 5 years) in a specific and scarcely populated field.			

(b)(4); (b)(6)	To support indirect costs associated with travel only. For all allowable travel costs, a management fee of (b)(4); (b)(6) nd an indirect cost rate of hall be provided.	(b)(4); (b)(6)		
MATERIALS				$0.00
ODC				$0.00
TRAVEL				$8,979.00
TOTAL CONTRACT PRICE				(b)(4); (b)(6)

2.3 Travel Costs. As per Article 11, Prime Contractor shall coordinate travel and incur any travel costs required for project goals, excepting commute between home and work locations.

If the Prime Contractor is unable to coordinate Subcontractor travel, the following guidelines shall be applied: Subcontractor shall submit Requests for Travel to Prime Contractor in writing at least 75 days prior to international travel and 30 days prior to domestic travel. Requests must include a detailed itinerary for Prime Contractor approval. Travel Costs must be approved in writing before any costs are incurred and would be invoiced separately, with supporting documentation (receipts). Detailed expense reports including itemized receipts must be submitted for reimbursement. No travel cost will be reimbursed without valid receipt. Travel includes airfare, ground transportation, accommodations, and Meals and Incidental Expenses (M&IE). Per diem rates shall be in accordance with Part 301-11 of U.S. Government Federal Travel Regulation (FTR), as per Article 2.2.2 and Federal Acquisition Regulation (FAR) 31.205.46. As per FAR 252.216-9005, there is no fee (profit) on travel costs permitted.

2.4 Invoicing. The Subcontractor shall submit invoices and timesheets monthly, no later than the tenth (10^{th}) of the month to invoices@metabiota.com. The invoices shall contain the following information as shown in Attachment C:

- Reference the subcontract number 2016-11-DTRA
- Unique invoice number
- Invoice date
- Period of Performance
- Total invoice amount
- Cumulative invoice amount
- Name and address of Subcontractor (mailing address if different)
- Subcontract value and funding (in US Dollars)
- Signed by an authorized official of the Subcontractor
- A certification that reads substantially as follows: "The undersigned hereby certifies that the amount being invoiced represents only those amounts properly payable in accordance with the terms and conditions of the Subcontract Agreement and the official financial records"
- Invoices may be submitted via email to the following addresses listed below: **invoices@metabiota.com.**

2.5 Payment. Prime Contractor shall remit payments to the Subcontractor within 30 days of receipt of a valid invoice. Payments shall be made in US Dollars via ACH or Wire to:

Bank Name:	(b)(4); (b)(6)
Bank Address:	
Bank Code:	
Account Number:	
ABA Routing No:	

Article 3. Nature of the Relationship

The Subcontractor and Prime Contractor acknowledge that although the Subcontractor may perform services pursuant to Prime Contractor's general instructions, the Subcontractor in all matters is and shall be deemed to be an independent contractor and the employees or agents of the Subcontractor shall not be or be deemed to be employees or agents of Prime Contractor for any purpose.

The Subcontractor is responsible and liable for the payment of all local sales, use, gross receipts, ad valorem, property, excise or other taxes that may be applicable to this Agreement.

This Agreement does not require either party to enter into further contractual or other relationships with the other. This Agreement does not create a partnership, joint venture, agency, or other business relationship.

Article 4. Period of Performance

4.1 Period of Performance. The period of performance under this Subcontract shall be from May 18, 2016 – November 15, 2016.

4.2 This Subcontract may be terminated for convenience by either party by providing written notice to the other party thirty (30) calendar days in advance of a specified date of termination.

4.3 This Subcontract may be terminated by Prime Contractor upon written notice in the event of substantial failure by the Subcontractor to perform in accordance with the terms of this Agreement. In the event that the Subcontractor shall default in the performance of any obligation to be performed by it under this Agreement and shall fail to correct such default within ten (10) calendar days following written notice thereof from Prime Contractor. The Prime Contractor may hold in abeyance further payments to the Subcontractor and/or terminate this Agreement by written notice to the Subcontractor specifying the date of termination. Following a termination for default of this Agreement, Subcontractor shall be compensated for all completed Services to the extent that Prime Contractor is reimbursed by the Client for the Subcontractor's services.

4.4 Performance by the Subcontractor may be terminated by Prime Contractor at any time by written notice to the Subcontractor in the event that Prime Contractor's funding is terminated.

4.5 In the event of termination, Prime Contractor will reimburse the Subcontractor for allowable Subcontract Costs up to and including non-cancelable obligations properly incurred prior to the date of termination, provided such costs are allowable do not exceed the stated maximum amount payable.

Article 5. Confidentiality

In order to facilitate the Subcontract Services, Prime Contractor may disclose to the Subcontractor information that it considers confidential or proprietary ("Confidential Information"). Confidential or proprietary information is defined as any information disclosed by one Party (the "Disclosing Party") to the other Party (the "Receiving Party") in a written or tangible shall be marked as "Confidential" or "Proprietary", or if disclosed orally or visually, identified as confidential and/or proprietary at the time of disclosure (which is reduced to writing and so marked within a reasonable time, not to exceed sixty (60) days, thereafter). The Subcontractor will hold in confidence any Confidential Information disclosed by Prime Contractor, and will not use Confidential Information for any purpose except in furtherance of the Subcontract Services. The Subcontractor will take reasonable and prudent precautions to protect the Confidential Information disclosed by Prime Contractor pursuant to this Subcontract. This obligation of confidentiality shall not, however, apply to information which: (i) was known to the Subcontractor and was not proprietary to Prime Contractor prior to the time of disclosure, as demonstrated by competent written evidence; (ii) was part of the public domain prior to the time of disclosure; (iii) becomes part of the public domain after the time of disclosure other than through any act or omission of the Subcontractor in breach of this Subcontract; (iv) is independently developed by the Subcontractor or those employees, contractors, and other researchers directly engaged by the Subcontractor without access to, use of, or regard to the Confidential Information disclosed to it by Prime Contractor. The above confidentiality and non-use obligations shall expire five (5) years following the conclusion of the Subcontract Services hereunder.

Article 6. Data, Publications and Copyrights

6.1 Subcontractor's researchers are free to publish the results of research supported thereunder, however, Subcontractor's Principal Investigator shall supply a copy of any such publication(s) or reports to Prime Contractor's Program Manager sixty (60) days prior to release.

b. Subject to its legal ability to do so, Subcontractor hereby grants Prime Contractor license to use data created in the performance of this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

d. Subject to its legal ability to do so, Subcontractor hereby grants to Prime Contractor an irrevocable, royalty-free, non-transferable, non-exclusive right and license to reproduce, make derivative works, display, and perform publicly any copyrightable or copyrighted material (including any computer software and its documentation and/ or database) developed and delivered under this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

e. Use of Name. Except as otherwise required by applicable law, regulation or order of a governmental agency or court of competent jurisdiction, Farlow shall not use the name of METABIOTA or METABIOTA's directors, officers, employees or representatives in any advertising, news release or other publication, without the prior express written consent from METABIOTA.

Article 7. Authorship and Specimen Ownership

7.1 Publication and Specimen Collections. Authorship on all resulting publications (reports, articles, books, etc.) produced under this Subcontract shall include people from both field and laboratory groups represented by Prime Contractor and Subcontractor only insofar as they contributed to the publication in a substantive way. Prior to initiation of writing any publications, the responsibilities for authorship for any given publication will be agreed upon by consensus of all parties. However, if a consensus by all parties is not reached within a reasonable period of time Subcontractor's Principal Investigator shall be free to publish independently and agrees to acknowledge Prime Contractor and/or give acknowledgment to Prime Contractor's scientists in publications or presentations, as scientifically appropriate. The Subcontractor's Principal Investigator and Subcontractor shall include Prime Contractor's scientists as co-authors on such publications, insofar as they provide any direct contributions to the work. All reports, articles, or books produced under this Subcontract shall conform to Attachment D – Mandatory Flow Down. Nothing in this contract limits the right of Subcontractor to produce derivative work products with the materials or data produced in the execution of this contract with the exception of the terms in this Agreement that require Prime Contractor's consent to use of name. The derivative work performed by the Subcontractor shall be at the risk of the Subcontractor exclusively.

7.2 Specimen Ownership. Inasmuch as applicable, for all resulting specimens collected under Subcontract, Prime Contractor, to the extent required to meet Prime Contractor's obligations under the Prime Agreement, shall retain an unlimited license to use, disclose, reproduce, and prepare derivative works, in any manner and or any purpose, and to have or permit others to do so.

Article 8. Miscellaneous Terms

8.1 Assignment. Subcontractor shall not assign, transfer or Subcontract its rights, interest, or obligations hereunder without the prior written consent of Prime Contractor and modification to this Subcontract.

8.2 Modifications. The terms and conditions of this Subcontract may be changed by mutual agreement of the parties. In the event that the Government modifies the terms and/or conditions of the Prime Agreement, Prime Contractor reserves the right to unilaterally modify the terms and/or conditions of this Subcontract to reflect the Government's modifications and, thereafter, to negotiate an adjustment, to the extent any such unilateral modification increases the Subcontractor's cost of performance, which modification shall be mutually agreed upon by Prime Contractor and the Subcontractor.

8.3 No Waivers. The failure of Prime Contractor to exercise any of its rights under this Subcontract shall not be deemed to be a waiver of such rights.

8.4 Force Majeure. Neither party shall be held liable or responsible to the other party nor be deemed to have defaulted under or breached this Agreement for failure or delay in fulfilling or performing any obligation under this Agreement the extent, and for so long as, such failure or delay is caused by or results from causes beyond the reasonable control of the affected party including but not limited to fires, earthquakes, floods, embargoes, wars, acts of war (whether war is declared or not), insurrections, riots, civil disturbances, strikes, lockouts or other labor disturbances, acts of God or any acts, omissions, or delays in acting by any governmental authority or the other party.

8.5 Export Control. Both parties will comply with any applicable export regulations, including the Export Administration Regulation and the International Traffic in Arms Regulation, in the conduct of the project. Neither party will transmit to the other any technical data, commodity, or technical assistance controlled under the export regulations without first securing the consent of the receiving party and modification of this agreement signed by the authorized official for each party.

8.6 Entire Subcontract. This Subcontract and its Attachments supersedes any prior or contemporaneous oral or written understandings or communications between the parties and constitutes the entire Subcontract of the parties with respect to its subject matter. This Subcontract may not be amended or modified, except in a writing signed by both parties.

8.7 Governing Law. This Subcontract shall be governed by the laws of the State of California.

8.8 No Liability. To the maximum extent permitted by applicable law, in no event shall Prime Contractor and Subcontractor be liable to the other party under any theory including contract and tort (both negligence and strict products liability) for any special, incidental, indirect, or consequential damages whatsoever (including, without limitation, damages for loss of business profit, business interruption, loss of business information, loss of goodwill) arising out of or relating to the Project. In addition, Prime Contractor and Subcontractor shall not be liable for losses, damages, claims, or other liabilities arising out of the other party's activities. It is expressly understood that Prime Contractor, by entering into this Subcontract, has no obligation to provide other or additional support to the Subcontractor for the purposes of this project or any other purposes.

8.9 Indemnification. The parties agree to defend, indemnify and hold one another, their officers, employees and agents harmless from and against any and all liability, loss, expense, attorneys' fees, or claims for injury or damages directly resulting from the performance of this Agreement but only in proportion to and to the extent such liability, loss, expense, attorneys' fees, or claims for injury or damages are caused by or result from the negligent or intentional acts or omissions of the indemnifying party.

8.10 Severability. The illegality or invalidity of any provisions of this Subcontract shall not impair, affect or invalidate the other provisions of this Subcontract.

8.11 Protection of Research Subjects. If human or animal subjects are used in the conduct of the work performed under this Subcontract, the Subcontractor's protocol must be approved by the Subcontractor's office

for the protection of research subjects in accordance with federal regulations, including 45 C.F.R. Part 46, the Office for Human Research Protections (OHRP), 9 C.F.R. Subchapter A under the Animal Welfare Act, and submitted to Prime Contractor.

8.12 Defense Base Act Insurance. Subcontractor shall be required to obtain Defense Base Act Insurance (DBA) in accordance with FAR clause 52.228-4 Workers Compensation and War Hazard Insurance Overseas. DBA insurance will be funded and provided for the Subcontractor by the Prime Contractor (Metabiota). Subcontractor shall provide all pertinent information to Prime Contractor in order to obtain adequate coverage.

Article 9. Attachments

This following Attachments to this Subcontract are incorporated by reference: Attachment A - Scope of Work and Deliverables, Attachment B – Labor Categories and Rates Table, Attachment C – T&M Invoice Template, and Attachment D – Mandatory Flow Down.

Article 10. Administrative and Technical Contacts

The following individuals shall serve as contacts for communications regarding this Subcontract:

Metabiota will directly cover lodging, DBA insurance, and relevant in-country logistics expenses

Project Summary:
AAAS will support two teams of Ethiopian researchers in the development of two research proposals purposed for ultimate submission to DTRA BAA Thrust Area 6. This will be accomplished through a 1 week grants writing workshop held in Addis Ababa, Ethiopia followed by a three month long remote mentorship period during which time AAAS will provide feedback and guidance to the scientists on drafts of their proposals.

Phase 1 Workshop Preparation

AAAS will provide materials for the 1-week workshop including PowerPoint presentations, instructor notes, and any additional materials intended for distribution during the workshop. It is anticipated that AAAS may need to create up to 25% new material in order to tailor the materials to the regional scientific landscape and add specific information on proposal submission to DTRA BAA Thrust Area 6.

It is expected that AAAS possesses existing grants writing workshop materials which will be the basis for this adaptation. AAAS will be expected to provide information to Metabiota regarding technical and logistical needs during the workshop. AAAS will also be expected during this time to engage the leaders of each team for the purpose of concept development.

Phase 2 – Technical Writing and Grantsmanship Workshop Implementation

Following workshop materials development and PAO approval, AAAS will conduct a 1-week technical writing and grantsmanship workshop in Addis Ababa, Ethiopia. This workshop will include the delivery of lectures on topics relevant to technical writing, grantsmanship, and specifically to DTRA BAA Thrust Area 6. The workshop will also involve facilitating small group work based on this content. AAAS will direct and guide the workshop participants in the drafting of research proposals as part of the workshop, and will assist both EPHI and NAHDIC led teams in the development and build out of concepts as relevant or necessary.

Phase 3 BAA Materials Development

AAAS will provide remote support to the POCs for each proposal development team in their development of an abstract and white paper suitable for submission to DTRA BAA Thrust Area 6. Upon receipt from the POCs, the SMEs will review the drafts of these documents and provide feedback via telephone, email or skype. Following white paper submission by the proposal development teams, AAAS will support the teams in their development of full proposals.

Phase 4 - Project Closeout and White Paper Response Assistance

AAAS will assist the proposal development teams in responding to comments or requests for revision received in response to white paper submission.

Task 1: Communication

1. The subcontractor will submit at minimum bi-weekly progress reports or as requested by the project manager (PM).
2. The subcontractor will participate in scheduled project conference calls, and will provide insight to include project status, metrics, challenges, and overall implementation reporting.
3. The subcontractor will maintain a record of hours worked and work performed for submission to Metabiota on a biweekly basis.

Task 2: Materials Development

1. The subcontractor will develop training materials appropriate for a 5-day grant writing workshop in Ethiopia on or prior to July 3, 2016 for submission to DTRA CBEP for PAO approval.

Task 3: Delivery of Grantsmanship Workshop

1. The subcontractor will deliver a 5-day grant writing workshop in Ethiopia including lectures and small group discussions
2. The Subcontractor will submit of a summary of the training event for inclusion in a Training Trip Report (TTR) as described under this funding mechanism. The Subcontractor will submit information to the Metabiota PC in support of the TTR no later than 3 days after the training event.

Task 4: Post-Workshop Mentorship and Proposal Development

1. The subcontractor will provide the proposal development teams with written feedback and guidance regarding their abstracts, white papers, and full proposals.
2. The subcontractor will support both NAHDIC and EPHI led teams, respectively, to ensure submission of white papers.
3. The subcontractor will support both NAHDIC and EPHI led teams, respectively, with the development of a full proposals.
4. The Subcontractor will prepare a final report including all actions taken for project implementation through all phases, lessons learned, and identifying next step opportunities upon completion of all deliverables.

Project Deliverables: (these tie with the tasks listed above)

Task	Deliverable	Description	Delivery Date
1	1.1 Progress Reports	The subcontractor will contribute to all monthly progress reporting activity at the request of the PM.	Monthly (Due the last day of each month)
1	1.2 Meeting attendance	The subcontractor will be represented at all regular conference calls deemed relevant by Metabiota to express accomplishments, metrics, risks or barriers to task completion or overall project implementation.	Bi-weekly
1	1.3 Time and Progress Report	The subcontractor will submit bi-weekly reports including an hourly timesheet for each 2-week period and a brief summary of all work performed for those hours. The template for this report will be provided.	Bi-weekly
2	2.2 Workshop Materials	The subcontractor will submit materials for a 5-day grants writing workshop.	Jul 3, 2016
3	3.1 Workshop Delivery	The subcontractor will travel to Ethiopia and deliver a 5-day grants writing workshop	Jul 29, 2016
3	3.2 Post-Training Report	The subcontractor will submit a training summary for the TTR, which will include pre and post-test results and evaluations.	3 days post completion of travel
4	4.1 Post-workshop Mentorship	The subcontractor will provide written feedback to the proposal development teams regarding their draft proposal materials.	Nov 15, 2016
4	4.2 Final Project Report	The subcontractor submit a post-action report relaying all actions taken for implementation of all phases, lessons learned, and identifying next step opportunities upon completion of all deliverables.	Nov 15, 2016

Attachment B – Labor Categories and Rate Table

Ceiling Price
The total ceiling price shall be **$ 51,249.09**.

Payment Schedule
Payments shall be made on a monthly basis.

Labor Rate Table:

Labor Category	Labor Description	Total Hours	Rate	Total Costs
(b)(4); (b)(6)	Terminal degree and relevant experience (minimum of 10 years) in a specific and scarcely populated field.	(b)(4); (b)(6)		
	Terminal degree and relevant experience (minimum of 5 years) in a specific and scarcely populated field.			
	To support indirect costs associated with travel only. For all allowable travel costs, a management fee of (b)(4); (b)(6)			
MATERIALS				$0.00
ODC				$0.00
TRAVEL				$8,979.00
TOTAL CONTRACT PRICE				(b)(4); (b)(6)

Metabiota will directly cover lodging, DBA insurance, and relevant in-country logistics expenses

Currency Type
Payments shall be made in U.S. Dollars.

CLAUSES INCORPORATED BY FULL TEXT

252.216-9005 PROFIT OR FEE ON TRAVEL COSTS (JUL 2008)
Travel shall not be a profit or fee bearing cost element.

252.203-9000 Prohibition on the Use of Senior Mentors (JUNE 2010)
(a) The use of senior mentors by the Defense Threat Reduction Agency (DTRA) enhances the readiness of the Agency across a wide range of strategic, operational, joint, functional, technical, management and development mission areas. The relevant prior service, joint force experience, and unique expertise of these senior consultants provide senior leadership with valuable insights and contribute to the continuous improvement of the Agencies' operations.

(b) For the purposes of this clause, Senior Mentor is defined as a retired flag, general or other military officers (O-6) or retired senior civilian official (Senior Executive Service (SES), Senior Level (SL), Scientific and Professional (ST)) who provides expert experience-based mentoring, teaching, training, advice, and recommendations to senior military officers, staffs and students as they participate in war games, warfighting courses, operational planning, operational exercises, and decision-making exercises.

(c) In accordance with Secretary of Defense Memorandum entitled "Policy on Senior Mentors" dated April 1, 2010, DTRA will hire all senior mentors as highly qualified experts (HQE) under 5 U.S.C. 9903. This policy balances the need for DTRA to secure the specialized knowledge required for these operational exercises with the need to hire such experts in a manner that promotes public trust and confidence.

(d) The Contractor shall not include the use of senior mentors in bids or proposals for services/supplies offered to DTRA.

(e) The Contractor shall include the substance of this clause in all subcontracts.

252.216-9003 CONSULTANTS (OCT 1998)
Services of consultants shall be at rates and for periods approved in advance by the Contracting Officer. Requests for approval shall be submitted to the Contracting Officer sufficiently in advance of the need to use a consultant under this Contract. The request shall include (a) a copy of the proposed consultant agreement, (b) a brief biography of the consultant, and (c) an indication of the area(s) in which consultant's expertise will be utilized and why it is essential for

contract performance. In addition, significant deviations from the dollar amount approved for consultant services, or changes in the consultants to be utilized, must likewise be approved in advance upon submission of adequate justification.

52.217-6 OPTION FOR INCREASED QUANTITY (MAR 1989)
The Government may increase the quantity of supplies called for in the Schedule at the unit price specified. The Contracting Officer may exercise the option by written notice to the Contractor within 60 days. Delivery of the added items shall continue at the same rate as the like items called for under the contract, unless the parties otherwise agree.

52.219-9 SMALL BUSINESS SUBCONTRACTING PLAN (JULY 2013)
(a) This clause does not apply to small business concerns.

(b) Definitions. As used in this clause--

"Alaska Native Corporation (ANC)" means any Regional Corporation, Village Corporation, Urban Corporation, or Group Corporation organized under the laws of the State of Alaska in accordance with the Alaska Native Claims Settlement Act, as amended (43 U.S.C. 1601, et seq.) and which is considered a minority and economically disadvantaged concern under the criteria at 43 U.S.C. 1626(e)(1). This definition also includes ANC direct and indirect subsidiary corporations, joint ventures, and partnerships that meet the requirements of 43 U.S.C. 1626(e)(2).

"Commercial item" means a product or service that satisfies the definition of commercial item in section 2.101 of the Federal Acquisition Regulation.

"Commercial plan" means a subcontracting plan (including goals) that covers the offeror's fiscal year and that applies to the entire production of commercial items sold by either the entire company or a portion thereof (e.g., division, plant, or product line).

"Electronic Subcontracting Reporting System (eSRS)" means the Governmentwide, electronic, web-based system for small business subcontracting program reporting. The eSRS is located at http://www.esrs.gov.

"Indian tribe" means any Indian tribe, band, group, pueblo, or community, including native villages and native groups (including corporations organized by Kenai, Juneau, Sitka, and Kodiak) as defined in the Alaska Native Claims Settlement Act (43 U.S.C.A. 1601 et seq.), that is recognized by the Federal Government as eligible for services from the Bureau of Indian Affairs in accordance with 25 U.S.C. 1452(c). This definition also includes Indian-owned economic enterprises that meet the requirements of 25 U.S.C. 1452(e).

"Individual contract plan" means a subcontracting plan that covers the entire contract period (including option periods), applies to a specific contract, and has goals that are based on the offeror's planned subcontracting in support of the specific contract except that indirect costs incurred for common or joint purposes may be allocated on a prorated basis to the contract.

"Master plan" means a subcontracting plan that contains all the required elements of an individual contract plan, except goals, and may be incorporated into individual contract plans, provided the master plan has been approved.

"Subcontract" means any agreement (other than one involving an employer-employee relationship) entered into by a Federal Government prime Contractor or subcontractor calling for supplies or services required for performance of the contract or subcontract.

(c) The offeror, upon request by the Contracting Officer, shall submit and negotiate a subcontracting plan, where applicable, that separately addresses subcontracting with small business concerns, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business concerns, small disadvantaged business, and with women-owned small business concerns. If the offeror is submitting an individual contract plan, the plan must separately address subcontracting with small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns with a separate part for the basic contract and separate parts for each option (if any). The plan shall be included in and made a part of the resultant contract. The subcontracting plan shall be negotiated within the time specified by the Contracting Officer. Failure to submit and negotiate the subcontracting plan shall make the offeror ineligible for award of a contract.

(d) The offeror's subcontracting plan shall include the following:

(1) Goals, expressed in terms of percentages of total planned subcontracting dollars, for the use of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns as subcontractors. The offeror shall include all subcontracts that contribute to contract performance, and may include a proportionate share of products and services that are normally allocated as indirect costs. In accordance with 43 U.S.C. 1626:

(i) Subcontracts awarded to an ANC or Indian tribe shall be counted towards the subcontracting goals for small business and small disadvantaged business (SDB) concerns, regardless of the size or Small Business Administration certification status of the ANC or Indian tribe.

(ii) Where one or more subcontractors are in the subcontract tier between the prime contractor and the ANC or Indian tribe, the ANC or Indian tribe shall designate the appropriate contractor(s) to count the subcontract towards its small business and small disadvantaged business subcontracting goals.

(A) In most cases, the appropriate Contractor is the Contractor that awarded the subcontract to the ANC or Indian tribe.

(B) If the ANC or Indian tribe designates more than one Contractor to count the subcontract toward its goals, the ANC or Indian tribe shall designate only a portion of the total subcontract award to each Contractor. The sum of the amounts designated to various Contractors cannot exceed the total value of the subcontract.

(C) The ANC or Indian tribe shall give a copy of the written designation to the Contracting Officer, the prime Contractor, and the subcontractors in between the prime Contractor and the ANC or Indian tribe within 30 days of the date of the subcontract award.

(D) If the Contracting Officer does not receive a copy of the ANC's or the Indian tribe's written designation within 30 days of the subcontract award, the Contractor that awarded the subcontract to the ANC or Indian tribe will be considered the designated Contractor.

(2) A statement of --

(i) Total dollars planned to be subcontracted for an individual contract plan; or the offeror's total projected sales, expressed in dollars, and the total value of projected subcontracts to support the sales for a commercial plan;

(ii) Total dollars planned to be subcontracted to small business concerns (including ANC and Indian tribes);

(iii) Total dollars planned to be subcontracted to veteran-owned small business concerns;

(iv) Total dollars planned to be subcontracted to service-disabled veteran-owned small business;

(v) Total dollars planned to be subcontracted to HUBZone small business concerns;

(vi) Total dollars planned to be subcontracted to small disadvantaged business concerns (including ANC's and Indian tribes); and

(vii) Total dollars planned to be subcontracted to women-owned small business concerns.

(3) A description of the principal types of supplies and services to be subcontracted, and an identification of the types planned for subcontracting to --

(i) Small business concerns,

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns, and

(vi) Women-owned small business concerns.

(4) A description of the method used to develop the subcontracting goals in paragraph (d)(1) of this clause.

(5) A description of the method used to identify potential sources for solicitation purposes (e.g., existing company source lists, the System for Award Management (SAM), veterans service organizations, the National Minority Purchasing Council Vendor Information Service, the Research and Information Division of the Minority Business Development Agency in the Department of Commerce, or small, HUBZone, small disadvantaged, and women-owned small business trade associations). A firm may rely on the information contained in SAM as an accurate representation of a concern's size and ownership characteristics for the purposes of maintaining a small, veteran-owned small, service-disabled veteran-owned small, HUBZone small, small disadvantaged, and women-owned small business source list. Use of SAM as its source list does not relieve a firm of its responsibilities (e.g., outreach, assistance, counseling, or publicizing subcontracting opportunities) in this clause.

(6) A statement as to whether or not the offeror included indirect costs in establishing subcontracting goals, and a description of the method used to determine the proportionate share of indirect costs to be incurred with --

(i) Small business concerns (including ANC and Indian tribes);

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns (including ANC and Indian tribes); and

(vi) Women-owned small business concerns.

(7) The name of the individual employed by the offeror who will administer the offeror's subcontracting program, and a description of the duties of the individual.

(8) A description of the efforts the offeror will make to assure that small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns have an equitable opportunity to compete for subcontracts.

(9) Assurances that the offeror will include the clause of this contract entitled "Utilization of Small Business Concerns" in all subcontracts that offer further subcontracting opportunities, and that the offeror will require all subcontractors (except small business concerns) that receive subcontracts in excess of $650,000 ($1.5 million for construction of any public facility with further subcontracting possibilities) to adopt a plan similar to the plan that complies with the requirements of this clause.

(10) Assurances that the offeror will --

(i) Cooperate in any studies or surveys as may be required;

(ii) Submit periodic reports so that the Government can determine the extent of compliance by the offeror with the subcontracting plan;

(iii) Submit the Individual Subcontract Report (ISR) and/or the Summary Subcontract Report (SSR), in accordance with paragraph (l) of this clause using the Electronic Subcontracting Reporting System (eSRS) at http://www.esrs.gov. The reports shall provide information on subcontract awards to small business concerns (including ANCs and Indian tribes that are not small businesses), veteran-owned small business concerns, service-disabled veteran-owned small business concerns, HUBZone small business concerns, small disadvantaged business concerns (including ANCs and Indian tribes that have not been certified by the Small Business Administration as small disadvantaged businesses), women-owned small business concerns, and Historically Black Colleges and Universities and Minority Institutions. Reporting shall be in accordance with this clause, or as provided in agency regulations;

(iv) Ensure that its subcontractors with subcontracting plans agree to submit the ISR and/or the SSR using eSRS;

(v) Provide its prime contract number, its DUNS number, and the e-mail address of the offeror's official responsible for acknowledging receipt of or rejecting the ISRs, to all first-tier subcontractors with subcontracting plans so they can enter this information into the eSRS when submitting their ISRs; and

(vi) Require that each subcontractor with a subcontracting plan provide the prime contract number, its own DUNS number, and the e-mail address of the subcontractor's official responsible for acknowledging receipt of or rejecting the ISRs, to its subcontractors with subcontracting plans.

(11) A description of the types of records that will be maintained concerning procedures that have been adopted to comply with the requirements and goals in the plan, including establishing source lists; and a description of the offeror's efforts to locate small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns and award subcontracts to them. The records shall include at least the following (on a plant-wide or company-wide basis, unless otherwise indicated):

(i) Source lists (e.g., SAM), guides, and other data that identify small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns.

(ii) Organizations contacted in an attempt to locate sources that are small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, or women-owned small business concerns.

(iii) Records on each subcontract solicitation resulting in an award of more than $150,000, indicating --

(A) Whether small business concerns were solicited and if not, why not;

(B) Whether veteran-owned small business concerns were solicited and, if not, why not;

(C) Whether service-disabled veteran-owned small business concerns were solicited and, if not, why not;

(D) Whether HUBZone small business concerns were solicited and, if not, why not;

(E) Whether small disadvantaged business concerns were solicited and if not, why not;

(F) Whether women-owned small business concerns were solicited and if not, why not; and

(G) If applicable, the reason award was not made to a small business concern.

(iv) Records of any outreach efforts to contact --

(A) Trade associations;

(B) Business development organizations;

(C) Conferences and trade fairs to locate small, HUBZone small, small disadvantaged, and women-owned small business sources; and

(D) Veterans service organizaions.

(v) Records of internal guidance and encouragement provided to buyers through --

(A) Workshops, seminars, training, etc., and

(B) Monitoring performance to evaluate compliance with the program's requirements.

(vi) On a contract-by-contract basis, records to support award data submitted by the offeror to the Government, including the name, address, and business size of each subcontractor. Contractors having commercial plans need not comply with this requirement.

(e) In order to effectively implement this plan to the extent consistent with efficient contract performance, the Contractor shall perform the following functions:

(1) Assist small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns by arranging solicitations, time for the preparation of bids, quantities, specifications, and delivery schedules so as to facilitate the participation by such concerns.

Where the Contractor's lists of potential small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business subcontractors are excessively long, reasonable effort shall be made to give all such small business concerns an opportunity to compete over a period of time.

(2) Provide adequate and timely consideration of the potentialities of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns in all "make-or-buy" decisions.

(3) Counsel and discuss subcontracting opportunities with representatives of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business firms.

(4) Confirm that a subcontractor representing itself as a HUBZone small business concern is identified as a certified HUBZone small business concern by accessing the SAM database or by contacting SBA.

(5) Provide notice to subcontractors concerning penalties and remedies for misrepresentations of business status as small, veteran-owned small business, HUBZone small, small disadvantaged or women-owned small business for the purpose of obtaining a subcontract that is to be included as part or all of a goal contained in the Contractor's subcontracting plan.

(6) For all competitive subcontracts over the simplified acquisition threshold in which a small business concern received a small business preference, upon determination of the successful subcontract offeror, the Contractor must inform each unsuccessful small business subcontract offeror in writing of the name and location of the apparent successful offeror prior to award of the contract.

(f) A master plan on a plant or division-wide basis that contains all the elements required by paragraph (d) of this clause, except goals, may be incorporated by reference as a part of the subcontracting plan required of the offeror by this clause; provided --

(1) The master plan has been approved;

(2) The offeror ensures that the master plan is updated as necessary and provides copies of the approved master plan, including evidence of its approval, to the Contracting Officer; and

(3) Goals and any deviations from the master plan deemed necessary by the Contracting Officer to satisfy the requirements of this contract are set forth in the individual subcontracting plan.

(g) A commercial plan is the preferred type of subcontracting plan for contractors furnishing commercial items. The commercial plan shall relate to the offeror's planned subcontracting generally, for both commercial and Government business, rather than solely to the Government contract. Once the Contractor's commercial plan has been approved, the Government will not require another subcontracting plan from the same Contractor while the plan remains in effect, as

long as the product or service being provided by the Contractor continues to meet the definition of a commercial item. A Contractor with a commercial plan shall comply with the reporting requirements stated in paragraph (d)(10) of this clause by submitting one SSR in eSRS for all contracts covered by its commercial plan. This report shall be acknowledged or rejected in eSRS by the Contracting Officer who approved the plan. This report shall be submitted within 30 days after the end of the Government's fiscal year.

(h) Prior compliance of the offeror with other such subcontracting plans under previous contracts will be considered by the Contracting Officer in determining the responsibility of the offeror for award of the contract.

(i) A contract may have no more than one plan. When a modification meets the criteria in 19.702 for a plan, or an option is exercised, the goals associated with the modification or option shall be added to those in the existing subcontract plan.

(j) Subcontracting plans are not required from subcontractors when the prime contract contains the clause at 52.212-5, Contract Terms and Conditions Required to Implement Statutes or Executive Orders--Commercial Items, or when the subcontractor provides a commercial item subject to the clause at 52.244-6, Subcontracts for Commercial Items, under a prime contract.

(k) The failure of the Contractor or subcontractor to comply in good faith with --

(1) The clause of this contract entitled "Utilization Of Small Business Concerns;" or

(2) An approved plan required by this clause, shall be a material breach of the contract.

(l) The Contractor shall submit ISRs and SSRs using the web-based eSRS at http://www.esrs.gov. Purchases from a corporation, company, or subdivision that is an affiliate of the prime Contractor or subcontractor are not included in these reports. Subcontract award data reported by prime Contractors and subcontractors shall be limited to awards made to their immediate next-tier subcontractors. Credit cannot be taken for awards made to lower tier subcontractors, unless the Contractor or subcontractor has been designated to receive a small business or small disadvantaged business credit from an ANC or Indian tribe. Only subcontracts involving performance in the United States or its outlying areas should be included in these reports with the exception of subcontracts under a contract awarded by the State Department or any other agency that has statutory or regulatory authority to require subcontracting plans for subcontracts performed outside the United States and its outlying areas.

(1) ISR. This report is not required for commercial plans. The report is required for each contract containing an individual subcontract plan.

(i) The report shall be submitted semi-annually during contract performance for the periods ending March 31 and September 30. A report is also required for each contract within 30 days of contract completion. Reports are due 30 days after the close of each reporting period, unless otherwise directed by the Contracting Officer. Reports are required when due, regardless of

whether there has been any subcontracting activity since the inception of the contract or the previous reporting period.

(ii) When a subcontracting plan contains separate goals for the basic contract and each option, as prescribed by FAR 19.704(c), the dollar goal inserted on this report shall be the sum of the base period through the current option; for example, for a report submitted after the second option is exercised, the dollar goal would be the sum of the goals for the basic contract, the first option, and the second option.

(iii) The authority to acknowledge receipt or reject the ISR resides--

(A) In the case of the prime Contractor, with the Contracting Officer; and

(B) In the case of a subcontract with a subcontracting plan, with the entity that awarded the subcontract.

(2) SSR.

(i) Reports submitted under individual contract plans--

(A) This report encompasses all subcontracting under prime contracts and subcontracts with the awarding agency, regardless of the dollar value of the subcontracts.

(B) The report may be submitted on a corporate, company or subdivision (e.g. plant or division operating as a separate profit center) basis, unless otherwise directed by the agency.

(C) If a prime Contractor and/or subcontractor is performing work for more than one executive agency, a separate report shall be submitted to each executive agency covering only that agency's contracts, provided at least one of that agency's contracts is over $650,000 (over $1.5 million for construction of a public facility) and contains a subcontracting plan. For DoD, a consolidated report shall be submitted for all contracts awarded by military departments/agencies and/or subcontracts awarded by DoD prime Contractors. However, for construction and related maintenance and repair, a separate report shall be submitted for each DoD component.

(D) For DoD and NASA, the report shall be submitted semi-annually for the six months ending March 31 and the twelve months ending September 30. For civilian agencies, except NASA, it shall be submitted annually for the twelve month period ending September 30. Reports are due 30 days after the close of each reporting period.

(E) Subcontract awards that are related to work for more than one executive agency shall be appropriately allocated.

(F) The authority to acknowledge or reject SSRs in eSRS, including SSRs submitted by subcontractors with subcontracting plans, resides with the Government agency awarding the prime contracts unless stated otherwise in the contract.

(ii) Reports submitted under a commercial plan--

(A) The report shall include all subcontract awards under the commercial plan in effect during the Government's fiscal year.

(B) The report shall be submitted annually, within thirty days after the end of the Government's fiscal year.

(C) If a Contractor has a commercial plan and is performing work for more than one executive agency, the Contractor shall specify the percentage of dollars attributable to each agency from which contracts for commercial items were received.

(D) The authority to acknowledge or reject SSRs for commercial plans resides with the Contracting Officer who approved the commercial plan.

(iii) All reports submitted at the close of each fiscal year (both individual and commercial plans) shall include a Year-End Supplementary Report for Small Disadvantaged Businesses. The report shall include subcontract awards, in whole dollars, to small disadvantaged business concerns by North American Industry Classification System (NAICS) Industry Subsector. If the data are not available when the year-end SSR is submitted, the prime Contractor and/or subcontractor shall submit the Year-End Supplementary Report for Small Disadvantaged Businesses within 90 days of submitting the year-end SSR. For a commercial plan, the Contractor may obtain from each of its subcontractors a predominant NAICS Industry Subsector and report all awards to that subcontractor under its predominant NAICS Industry Subsector.

52.244-2 SUBCONTRACTS (OCT 2010)
(a) Definitions. As used in this clause--

Approved purchasing system means a Contractor's purchasing system that has been reviewed and approved in accordance with Part 44 of the Federal Acquisition Regulation (FAR).

Consent to subcontract means the Contracting Officer's written consent for the Contractor to enter into a particular subcontract.

Subcontract means any contract, as defined in FAR Subpart 2.1, entered into by a subcontractor to furnish supplies or services for performance of the prime contract or a subcontract. It includes, but is not limited to, purchase orders, and changes and modifications to purchase orders.

(b) When this clause is included in a fixed-price type contract, consent to subcontract is required only on unpriced contract actions (including unpriced modifications or unpriced delivery orders), and only if required in accordance with paragraph (c) or (d) of this clause.

(c) If the Contractor does not have an approved purchasing system, consent to subcontract is required for any subcontract that

(1) Is of the cost-reimbursement, time-and-materials, or labor-hour type; or

(2) Is fixed-price and exceeds—

(i) For a contract awarded by the Department of Defense, the Coast Guard, or the National Aeronautics and Space Administration, the greater of the simplified acquisition threshold or 5 percent of the total estimated cost of the contract; or

(ii) For a contract awarded by a civilian agency other than the Coast Guard and the National Aeronautics and Space Administration, either the simplified acquisition threshold or 5 percent of the total estimated cost of the contract.

(d) If the Contractor has an approved purchasing system, the Contractor nevertheless shall obtain the Contracting Officer's written consent before placing the following subcontracts:

Subcontracts or Consultants (for Consultants see DTRA 252 216-9003 in Section H)

(e)(1) The Contractor shall notify the Contracting Officer reasonably in advance of placing any subcontract or modification thereof for which consent is required under paragraph (b), (c), or (d) of this clause, including the following information:

(i) A description of the supplies or services to be subcontracted.

(ii) Identification of the type of subcontract to be used.

(iii) Identification of the proposed subcontractor.

(iv) The proposed subcontract price.

(v) The subcontractor's current, complete, and accurate certified cost or pricing data and Certificate of Current Cost or Pricing Data, if required by other contract provisions.

(vi) The subcontractor's Disclosure Statement or Certificate relating to Cost Accounting Standards when such data are required by other provisions of this contract.

(vii) A negotiation memorandum reflecting—

(A) The principal elements of the subcontract price negotiations;

(B) The most significant considerations controlling establishment of initial or revised prices;

(C) The reason certified cost or pricing data were or were not required;

(D) The extent, if any, to which the Contractor did not rely on the subcontractor's certified cost or pricing data in determining

the price objective and in negotiating the final price;

(E) The extent to which it was recognized in the negotiation that the subcontractor's certified cost or pricing data were not accurate, complete, or current; the action taken by the Contractor and the subcontractor; and the effect of any such defective data on the total price negotiated;

(F) The reasons for any significant difference between the Contractor's price objective and the price negotiated; and

(G) A complete explanation of the incentive fee or profit plan when incentives are used. The explanation shall identify each critical performance element, management decisions used to quantify each incentive element, reasons for the incentives, and a summary of all trade-off possibilities considered.

(2) The Contractor is not required to notify the Contracting Officer in advance of entering into any subcontract for which consent is not required under paragraph (c), (d), or (e) of this clause.

(f) Unless the consent or approval specifically provides otherwise, neither consent by the Contracting Officer to any subcontract nor approval of the Contractor's purchasing system shall constitute a determination—

(1) Of the acceptability of any subcontract terms or conditions;

(2) Of the allowability of any cost under this contract; or

(3) To relieve the Contractor of any responsibility for performing this contract.

(g) No subcontract or modification thereof placed under this contract shall provide for payment on a cost-plus-a-percentage-of-cost basis, and any fee payable under cost-reimbursement type subcontracts shall not exceed the fee limitations in FAR 15.404-4(c)(4)(i).

(h) The Contractor shall give the Contracting Officer immediate written notice of any action or suit filed and prompt notice of any claim made against the Contractor by any subcontractor or vendor that, in the opinion of the Contractor, may result in litigation related in any way to this contract, with respect to which the Contractor may be entitled to reimbursement from the Government.

(i) The Government reserves the right to review the Contractor's purchasing system as set forth in FAR Subpart 44.3.

(j) Paragraphs (c) and (e) of this clause do not apply to the following subcontracts, which were evaluated during negotiations:

(End of clause)

252.203-9005, Implementation of Contractor Code of Business Ethics and Conduct (Dec 2008)

In accordance with FAR clause 52.203-13, Contractor Code of Business Ethics and Conduct, the designated "agency Office of the Inspector General" is the DoD OIG at the following address:

Office of the Inspector General
United States Department of Defense
Investigative Policy and Oversight
Contractor Disclosure Program
400 Army Navy Drive, Suite 1037
Arlington, VA 22202-4704
Toll Free Telephone: 866-429-8011

252.204-9001 UNIVERSITIES DISCLOSURE OF INFORMATION (JUL 2009)

(a) The Contractor shall not release to anyone outside the Contractor's organization any unclassified information, regardless of medium (e.g. film, tape, document) pertaining to any part of this contract or any program related to this contract, unless the information results from fundamental research, as defined below:

> "Fundamental research" as used in this clause, means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

(b) The Contractor shall confer and consult with DTRA on technical aspects of its research and submit technical documents intended for publication to the cognizant DTRA technical representative(s) for review, a minimum of 45 days prior to publication or other dissemination. The purpose of the DTRA review period is to ensure the government ample opportunity to provide comments and suggestions for the researchers' consideration.

252.204-9004 IMPLEMENTATION OF DISCLOSURE OF INFORMATION (JUN 2007)
In accordance with DFARS 252.204-7000 Disclosure of Information, any information to be released shall be submitted at least 45 days before the proposed release date, for security and policy review. Submit one copy to each below:

(a) Office of Public Affairs, DTRA/DIR/COS/PA, 8725 John J. Kingman Dr, MS 6201, Ft Belvoir VA 22060-6201.

SOLE SOURCE JUSTIFICATION FORM

- This form must accompany Subcontract Request Forms whenever a sole source purchase is requested. (*)

1. Vendor proposed as a Sole Source: The American Association for the Advancement of Science
2. Please check all applicable categories below and provide additional information where indicated.
   - ☐ a. The requested product is an integral repair part or accessory compatible with existing equipment.
     - Existing Equipment Description: _____
     - Manufacturer/Model Number: _____
     - Age of the Equipment: _____ Current Value: _____
     - Asset or Original PO Number: _____
   - ☐ b. The requested product has unique design/performance specifications or quality requirements, which are essential to my research or teaching needs and are not available in comparable products.
   - ☐ c. The requested product is essential in maintaining research continuity and/or to remain in compliance with established university standards. (Check applicable category below.)
     - ☐ Requested product is being used in continuing research experiments.
     - ☐ I am collaborating with other investigators who have used this product and for compatibility of research results, I must also use it.
     - ☐ I have standardized the requested product and the use of another brand/model would require considerable time and funding to evaluate.
   - ☐ d. The requested product is one with which I and/or my staff have specialized training/extensive expertise, and retraining would incur substantial cost in time/money.
   - ☐ e. The requested provider of services has unique or exclusive capabilities that no other provider has.
   - ☒ f. Other factors are involved. (Provide detailed explanation below.)
3. Provide a detailed explanation for categories checked in 2a. through 2f. above. **(Make certain to include applicable information such as the activity, deliverables, supplies and/or services being procured, and where the work will be performed. Attach additional sheets if necessary.)**

Phase 1: Workshop Preparation

The technical writing workshop will require materials covering various aspects of proposal writing adapted to the regional scientific landscape. AAAS has developed a curriculum on grantsmanship and technical writing adapted for use in workshops in 17 countries for over 4,200 researchers. The curriculum is informed by experience with thousands of proposals from non-native English speakers submitted to review by American scientists (analogous to the DTRA CBEP funding mechanism). No other grantsmanship curriculum exists that is specifically designed to teach in a cross-cultural setting with such a depth of insight into the challenges faced by applicants from emerging economies.

The materials will need to be adapted and submitted for PAO approval with a very short turnaround time. A version of this curriculum has been tailored for use in CBEP grantsmanship workshops for nearly 200 researchers in Georgia and Azerbaijan from 2012-2015. The core materials have been reviewed by DTRA on several occasions, so review of materials adapted for Ethiopia will likely be straightforward. Through measured long-term impacts, the curriculum has proven highly effective for the CBEP researchers who are frequently not in academia. The curriculum provided by AAAS is the only existing material appropriate for the Ethiopian technical writing workshop that could be identified.

Phase 2: Workshop Implementation

The workshop implementation will require trainers that are experienced in delivering the grantsmanship materials as well as familiar with challenges particular to scientists in operating in emerging economies seeking funding from international agencies. AAAS has extensive experience delivering these materials and has delivered workshops or held STEM consultations in Algeria, Morocco, Egypt, Cote d'Ivoire, Nigeria, Kenya, and Rwanda. AAAS also has a proven track record of successful and sustainable implementation as evidenced by the number of successful proposal submissions following workshop implementation. For example, the total value of funded proposals resulting from a workshop for CBEP in Tblisi, Georgia in 2012 was $105,000 (bringing more funding into the Georgian CBEP community within 10 months than the cost of workshop implementation). AAAS is the only entity that has proven capabilities successfully implementing the identified materials.

Phases 3 and 4: BAA Materials Development and White Paper Response Assistance

The mentorship phase following the workshop requires SMEs that are experienced in proposal development and capable of guiding teams of international researchers remotely. The AAAS workshop instructors and mentors have written successful research proposals and STEM program proposals funded by NSF, NIH, USAID, Los Alamos National Labs, the Ford Foundation, the U.S. Department of State, the U.S. Department of Energy, the Henry Luce Foundation, the European Commission, and the United Nations. At least one AAAS workshop instructor has written substantive sections of large proposals submitted to DTRA for STEM-security related international program funding. AAAS has worked remotely with researchers to develop thousands of technical documents, including research proposals from non-native English speakers for review in the U.S. AAAS has also led and coordinated the development and editing of technical white papers by teams of individual researchers each remotely located. AAAS is therefore uniquely well positioned to offer guidance to Ethiopian researchers on proposal writing for submission to the DTRA BAA.

4. Was an evaluation of other equipment, products, or services completed? ☐ YES ☒ NO.
   If yes, please attach the results of the evaluation.

5. List below the names of each individual who was involved in making the recommendation to sole source this purchase.
   (b)(6)

(*) It is the intent of Metabiota, Inc. to maintain competitive bidding, however sole source selections may sometimes be necessary. Subcontract Requests for goods and services that are to be purchased from a specific vendor or limited to a specific brand, where substitutes to the suggested vendor or brand are unacceptable, must be accompanied by a written justification explaining the circumstances that make alternatives unacceptable. ***The principal investigator, program manager, or director must sign the justification.*** *The individual signing the justification must disclose in writing whether or not he/she has a potential or actual conflict of interest. Metabiota employees who have a business relationship or financial interest (including that of a near relative) in the suggested vendor, who are conducting research for the suggested vendor, or who have received or anticipate receiving gifts, honorarium, or research grants from the suggested vendor must disclose the conflict of interest.*

The Contracts Manager will determine whether the justification is appropriate. Sole source justifications are to be supported by factual statements that shall pass an internal or Federal audit. It is the salient features of a product that make it a sole source.

5. I certify that I have read the above statement, that the information entered on this form is factual and that a signed copy of this Sole Source Justification document, and any associated disclosure statements, will be kept on file with the Contracts department.

PRICE NEGOTIATION MEMORANDUM
METABIOTA, INC.

GENERAL INFORMATION:

Contractor name	American Association for the Advancement of Science
Proposal number	HDTRA1-14-C-0104

DESCRIPTION OF THE CONTRACT ACTION:

Description of the work (provide a brief summary of the general scope of the work encompassed by the action):
AAAS will collaborate with Metabiota to provide grantsmanship, technical writing, and training administration to the AEP team from 1 June 2016 – 15 November 2016. AAAS will provide remote and on-site grantsmanship mentoring, editorial guidance, implementation of mentoring work plans, and identification of future mentorship stakeholder needs.

This collaboration will build a long-term partnership between key research and technical centers in Ethiopia and will nourish hypothesis-driven and translational research programs that result in sustainable funding and potential academic publications.

NEGOTIATING PARTIES:

Identify the name position, organization and phone number/email of each person representing the contractor and the Government in the negotiation. Indicate the date(s) of the negotiation.

Contractor	Name	Position	Organization	Phone/Email
Metabiota, Inc.	(b)(6)		Metabiota, Inc.	(b)(6)
Metabiota, Inc.			Metabiota, Inc.	
Metabiota, Inc.			Metabiota, Inc.	
AAAS			AAAS	

COST ANALYSIS:

METABIOTA

The proposed subcontract is a sole source Time and Materials (T&M) contract evaluated upon completed technical and cost proposal from AAAS to provide subject matter expertise and support to overall operational activities in the Metabiota AEP contract that have a technical writing and grantsmanship component. The T&M contract issued to AAAS was determined to be the most appropriate mechanism for these services based on the fair and reasonable pricing submitted by the subcontractor and the Metabiota team's determination that this would be the most effective means to ensure efficient performance in the best interest of the government.

This determination was made following an internal review of the subcontractor's hourly rates by labor category by Metabiota's financial, contract, and technical departments to determine overall reasonableness of the cost. The rates provided by the subcontractor were reasonable compared to those of other service providers with similar contract tasks and levels of experience and expertise. Additionally, the rate structure presented by Watermark is substantially comparable to and fits within Metabiota's own rate structure with the US government client.

Labor Category	Description	Rate
(b)(4); (b)(6)	Possess unique credentials that provides expert advisor/contributions in complex and critical efforts. Must be skilled in providing unique, subject matter expertise in specific functional, technical, professional or policy areas. Responsibilities include: conducting sophisticated assessments of complex problems in areas of expertise; designing approaches to problems, analyzes and evaluating the work of others, and applying broad understanding of the state of the practice. Broadly recognized as authoritative, trusted sources of expertise within their community of practice.	(b)(4); (b)(6)

Re: FAR 52.244-2 SUBCONTRACTS – Consent to Subcontract with Global Viral Academic Engagement Partnership (AEP), Cooperative Threat Reduction (CTR) Contract No. HDTRA1-14-C-0104

Dea(b)(6)

Per FAR 52.244-2 Subcontracts, Metabiota, Inc. (Metabiota) requests Consent to Subcontract with Global Viral to support Technical Direction 001 Implementation of Personal Protective Equipment (PPE) Donning and Doffing Biosafety Training in Cameroon approved via email on 23 July 2015. Included with today's request are the following items:

- Draft Subcontract Agreement
- Sole Source Justification

We will provide a comprehensive subcontractor budget once finalized.

Description of services to be subcontracted.

- Collaboration with Stakeholders including monthly meetings.
- Review and adapt training materials.
- Participate in training implementation.

Type of subcontract to be used. Time and Materials

Proposed Subcontractor. Global Viral

Proposed subcontract price. A preliminary estimation total of $9,710.80 USD

If you have questions or need additional information, I may be reached at 301.335.2982 or urichelieu@metabiota.com.

Sincerely,

METABIOTA

AGREEMENT

This Subcontract ("Subcontract") is dated and effective as of the July 1, 2015 ("Effective Date"), between **Metabiota, Inc.** (herein referred to as "Metabiota" or "Prime Contractor"), a California corporation, located at 425 California Street, Suite 200, San Francisco, CA, 94104 and **Global Viral** at 425 California Street, Suite 200, San Francisco, CA, 94104 (herein referred to as the "Subcontractor"). Metabiota and the Subcontractor are each a "Party" and together are the "Parties".

WHEREAS, the Prime Contractor was awarded Contract No. HDTRA1-14-C-0104 for the Academic Engagement Program (AEP) (the "Prime Agreement") by the Defense Threat Reduction Agency (DTRA) ("Client"); and,

WHEREAS, the Prime Contractor desires to purchase certain services from the Subcontractor for the Client; and,

WHEREAS, the Subcontractor is willing to provide services to the Prime Contractor in accordance with the terms and conditions set forth in this Subcontract.

NOW, THEREFORE, the parties hereby agree as follows:

Article 1. Subcontract Services

1.1 Statement of Work. The Subcontractor shall provide all necessary and qualified personnel, equipment, material and facilities to perform the services (hereinafter, the "Work") as set forth in Attachment A—Scope of Work, which shall include the production of the deliverables ("Deliverables"), attached hereto and incorporated herein by this reference.

1.2 Reporting. The Subcontractor shall submit reports in accordance with the deliverables as described in Attachment A, and as reference in Section 2.3.

The Prime Contractor may request additional information regarding the Subcontractor reports, for which the Subcontractor shall use reasonable best efforts to promptly address. The Prime Contractor will not consider award renewals for Subcontractors who fail to meet reporting requirements on a timely basis.

Article 2. Price, Contract Type, and Payment

2.1 Price and Contract Type. This Subcontract is a **Time & Materials Contract Type.** The ceiling price is **$10,000.00** and the contract is fully funded at **$9,710.80.**

2.2 Labor Rate Table. Subcontractor shall bill hourly, based on the labor rates and qualifications listed in the table below. Subcontractor shall provide back-up documentation detailing hours worked by position level, according to the Labor Categories and Rate Table below and Attachment B.

LABOR CATEGORY	DESCRIPTION	QUALIFICATION	HOURLY RATE
(b)(4); (b)(6)	Develops and revises training courses and prepares appropriate training catalogs. Trains personnel by conducting formal classroom courses, workshops and seminars.	Must have educational background or required level of experience performing training development or instruction; 1-3 years experience in related fields.	(b)(4); (b)(6)
	Under the supervision of the Senior Trainer, develops and revises training courses and	Must have educational background or required	

	prepares appropriate training catalogs.	level of experience performing training development or instruction; 4-6 years experience in system development, training, or related fields.	

2.3 Travel Costs. As per Article 11. Prime Contractor shall coordinate travel and incur any travel costs.

If the Prime Contractor is unable to coordinate Subcontractor travel, the following guidelines shall be applied: Subcontractor shall submit Requests for Travel to Prime Contractor in writing at least 60 days prior to international travel and 30 days prior to domestic travel. Requests must include a detailed itinerary for Prime Contractor approval. Travel Costs must be approved in writing before any costs are incurred and would be invoiced separately, with supporting documentation (receipts). Detailed expense reports including itemized receipts must be submitted for reimbursement. No travel cost will be reimbursed without valid receipt. Travel includes airfare, ground transportation, accommodations, and Meals and Incidental Expenses (M&IE). Per diem rates shall be in accordance with Part 301-11 of U.S. Government Federal Travel Regulation (FTR), as per Article 2.2.2 and Federal Acquisition Regulation (FAR) 31.205.46. As per FAR 252.216-9005, there is no fee (profit) on travel costs permitted.

2.4 Invoicing. The Subcontractor shall submit invoices monthly, no later than the tenth (10th) of the month to invoices@metabiota.com. The invoices shall contain the following information:

- Reference the subcontract number **2015-14-DTRA**.
- Unique invoice number
- Invoice date
- Period of Performance
- Total invoice amount
- Cumulative invoice amount
- Name and address of Subcontractor (mailing address if different)
- Subcontract value and funding (in US Dollars)
- Signed by an authorized official of the Subcontractor
- A certification that reads substantially as follows: "The undersigned hereby certifies that the amount being invoiced represents only those amounts properly payable in accordance with the terms and conditions of the Subcontract Agreement and the official financial records"
- Invoices may be submitted via email to the following addresses listed below: **invoices@metabiota.com**

2.5 Payment. Prime Contractor shall remit payments to the Subcontractor within30 days of receipt of a valid invoice.Payments shall be made in US Dollars via ACH or Wire to:

Bank Name: (b)(4); (b)(6)
Bank Address:
Account Holder
Account No:
ABA Routing No

Article 3. Nature of the Relationship

The Subcontractor and Prime Contractor acknowledge that although the Subcontractor may perform services pursuant to Prime Contractor's general instructions, the Subcontractor in all matters is and shall be deemed to be an independent contractor and the employees or agents of the Subcontractor shall not be or be deemed to be employees or agents of Prime Contractor for any purpose.

The Subcontractor is responsible and liable for the payment of all local sales, use, gross receipts, ad valorem, property, excise or other taxes that may be applicable to this Agreement.

This Agreement does not require either party to enter into further contractual or other relationships with the other. This Agreement does not create a partnership, joint venture, agency, or other business relationship.

Article 4. Period of Performance

4.1 Period of Performance. The period of performance under this Subcontract shall be from ***June 1, 2015 to December 31, 2015.***

4.2 This Subcontract may be terminated for convenience by either party by providing written notice to the other party thirty (30) calendar days in advance of a specified date of termination.

4.3 This Subcontract may be terminated by Prime Contractor upon written notice in the event of substantial failure by the Subcontractor to perform in accordance with the terms of this Agreement. In the event that the Subcontractor shall default in the performance of any obligation to be performed by it under this Agreement and shall fail to correct such default within ten (10) calendar days following written notice thereof from Prime Contractor. The Prime Contractor may hold in abeyance further payments to the Subcontractor and/or terminate this Agreement by written notice to the Subcontractor specifying the date of termination. Following a termination for default of this Agreement, Subcontractor shall be compensated for all completed Services to the extent that Integrating Subcontractor is reimbursed by Prime Contractor for the Subcontractor's services.

4.4 Performance by the Subcontractor may be terminated by Prime Contractor at any time by written notice to the Subcontractor in the event that Prime Contractor's funding is terminated.

4.5 In the event of termination, Prime Contractor will reimburse the Subcontractor for allowable Subcontract Costs up to and including non-cancelable obligations properly incurred prior to the date of termination, provided such costs are allowable do not exceed the stated maximum amount payable.

Article 5. Confidentiality

In order to facilitate the Subcontract Services, Prime Contractor may disclose to the Subcontractor information that it considers confidential or proprietary ("Confidential Information"). Confidential or proprietary information is defined as any information disclosed by one Party (the "Disclosing Party") to the other Party (the "Receiving Party") in a written or tangible shall be marked as "Confidential" or "Proprietary", or if disclosed orally or visually, identified as confidential and/or proprietary at the time of disclosure (which is reduced to writing and so marked within a reasonable time, not to exceed sixty (60) days, thereafter). The Subcontractor will hold in confidence any Confidential Information disclosed by Prime Contractor, and will not use Confidential Information for any purpose except in furtherance of the Subcontract Services. The Subcontractor will take reasonable and prudent precautions to protect the Confidential Information disclosed by Prime Contractor pursuant to this Subcontract. This obligation of confidentiality shall not, however, apply to information which: (i) was known to the Subcontractor and was not proprietary to Prime Contractor prior to the time of disclosure, as demonstrated by competent written evidence; (ii) was part of the public domain prior to the time of disclosure; (iii) becomes part of the public domain after the time of disclosure other than through any act or omission of the Subcontractor in breach of this Subcontract; (iv) is independently developed by the Subcontractor or those employees, contractors, and other researchers directly engaged by the Subcontractor without access to, use of, or regard to the Confidential Information disclosed to it by Prime Contractor. The above confidentiality and non-use obligations shall expire five (5) years following the conclusion of the Subcontract Services hereunder.

Article 6. Data, Publications and Copyrights

6.1 Subcontractor's researchers are free to publish the results of research supported thereunder, however, Subcontractor's Principal Investigator shall supply a copy of any such publication(s) or reports to Prime Contractor's Program Manager sixty (60) days prior to release.

b. Subject to its legal ability to do so, Subcontractor hereby grants Prime Contractor license to use data created in the performance of this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

d. Subject to its legal ability to do so, Subcontractor hereby grants to Prime Contractor an irrevocable, royalty-free, non-transferable, non-exclusive right and license to reproduce, make derivative works, display, and perform publicly any copyrightable or copyrighted material (including any computer software and its documentation and/ or database) developed and delivered under this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

e. Use of Name. Except as otherwise required by applicable law, regulation or order of a governmental agency or court of competent jurisdiction, Global Viral shall not use the name of METABIOTA or METABIOTA's directors, officers, employees or representatives in any advertising, news release or other publication, without the prior express written consent from METABIOTA.

Article 7. Authorship and Specimen Ownership

7.1 Publication and Specimen Collections. Authorship on all resulting publications (reports, articles, books, etc.) produced under this Subcontract shall include people from both field and laboratory groups represented by Prime Contractor and Subcontractor only insofar as they contributed to the publication in a substantive way. Prior to initiation of writing any publications, the responsibilities for authorship for any given publication will be agreed upon by consensus of all parties. However, if a consensus by all parties is not reached within a reasonable period of time Subcontractor's Principal Investigator shall be free to publish independently and agrees to acknowledge Prime Contractor and/or give acknowledgment to Prime Contractor's scientists in publications or presentations, as scientifically appropriate. The Subcontractor's Principal Investigator and Subcontractor shall include Prime Contractor's scientists as co-authors on such publications, insofar as they provide any direct contributions to the work. All reports, articles, or books produced under this Subcontract shall conform to Attachment D – Mandatory Flow Down. Nothing in this contract limits the right of Subcontractor to produce derivative work products with the materials or data produced in the execution of this contract with the exception of the terms in this Agreement that require Prime Contractor's consent to use of name. The derivative work performed by the Subcontractor shall be at the risk of the Subcontractor exclusively.

7.2 Specimen Ownership. Inasmuch as applicable, for all resulting specimens collected under Subcontract, Prime Contractor, to the extent required to meet Prime Contractor's obligations under the Prime Agreement, shall retain an unlimited license to use, disclose, reproduce, and prepare derivative works, in any manner and or any purpose, and to have or permit others to do so.

Article 8. Miscellaneous Terms

8.1 Assignment. Subcontractor shall not assign, transfer or Subcontract its rights, interest, or obligations hereunder without the prior written consent of Prime Contractor and modification to this Subcontract.

8.2 Modifications. The terms and conditions of this Subcontract may be changed by mutual agreement of the parties. In the event that the Government modifies the terms and/or conditions of the Prime Agreement, Prime Contractor reserves the right to unilaterally modify the terms and/or conditions of this Subcontract to reflect the Government's modifications and, thereafter, to negotiate an adjustment, to the extent any such unilateral modification increases the Subcontractor's cost of performance, which modification shall be mutually agreed upon by Prime Contractor and the Subcontractor.

8.3 No Waivers. The failure of Prime Contractor to exercise any of its rights under this Subcontract shall not be deemed to be a waiver of such rights.

8.4 Force Majeure. Neither party shall be held liable or responsible to the other party nor be deemed to have defaulted under or breached this Agreement for failure or delay in fulfilling or performing any obligation under this Agreement the extent, and for so long as, such failure or delay is caused by or results from causes beyond the reasonable control of the affected party including but not limited to fires, earthquakes, floods, embargoes, wars, acts of war (whether war is declared or not), insurrections, riots, civil disturbances, strikes, lockouts or other labor disturbances, acts of God or any acts, omissions, or delays in acting by any governmental authority or the other party.

8.5 Export Control. Both parties will comply with any applicable export regulations, including the Export Administration Regulation and the International Traffic in Arms Regulation, in the conduct of the project. Neither party will transmit to the other any technical data, commodity, or technical assistance controlled under the export regulations without first securing the consent of the receiving party and modification of this agreement signed by the authorized official for each party.

8.6 Entire Subcontract. This Subcontract and its Attachments supersedes any prior or contemporaneous oral or written understandings or communications between the parties and constitutes the entire Subcontract of the parties with respect to its subject matter. This Subcontract may not be amended or modified, except in a writing signed by both parties.

8.7 Governing Law. This Subcontract shall be governed by the laws of the State of California.

8.8 No Liability. To the maximum extent permitted by applicable law, in no event shall Prime Contractor and Subcontractor be liable to the other party under any theory including contract and tort (both negligence and strict products liability) for any special, incidental, indirect, or consequential damages whatsoever (including, without limitation, damages for loss of business profit, business interruption, loss of business information, loss of goodwill) arising out of or relating to the Project. In addition, Prime Contractor and Subcontractor shall not be liable for losses, damages, claims, or other liabilities arising out of the other party's activities. It is expressly understood that Prime Contractor, by entering into this Subcontract, has no obligation to provide other or additional support to the Subcontractor for the purposes of this project or any other purposes.

8.9 Indemnification. The parties agree to defend, indemnify and hold one another, their officers, employees and agents harmless from and against any and all liability, loss, expense, attorneys' fees, or claims for injury or damages directly resulting from the performance of this Agreement but only in proportion to and to the extent such liability, loss, expense, attorneys' fees, or claims for injury or damages are caused by or result from the negligent or intentional acts or omissions of the indemnifying party.

8.10 Severability. The illegality or invalidity of any provisions of this Subcontract shall not impair, affect or invalidate the other provisions of this Subcontract.

8.11 Protection of Research Subjects. If human or animal subjects are used in the conduct of the work performed under this Subcontract, the Subcontractor's protocol must be approved by the Subcontractor's office for the protection of research subjects in accordance with federal regulations, including 45 C.F.R. Part 46, the Office for Human Research Protections (OHRP), 9 C.F.R. Subchapter A under the Animal Welfare Act, and submitted to Prime Contractor.

8.12 Defense Base Act Insurance. Subcontractor shall be required to obtain Defense Base Act Insurance (DBA) in accordance with FAR clause 52.228-4 Workers Compensation and War Hazard Insurance Overseas.

Article 9. Attachments

This following Attachments to this Subcontract are incorporated by reference: Attachment A - Scope of Work and Deliverables, Attachment B – Labor Categories and Rates Table, Attachment C – T&M Invoice Template, and Attachment D – Mandatory Flow Down.

METABIOTA

Attachment A - Scope of Work and Deliverables

Project Summary:
Metabiota will support the Republic of Cameroon's Ministry of Defense (MOD) by conducting country-specific, high value biosafety and biosecurity (BS&S) trainings, with a focus on personal protective equipment (PPE) donning and doffing and the clinical recognition of viral hemorrhagic fever (VHF). The project team, including Global Viral and other subcontractors, will collaborate to conduct this activity through a phased approach from July 1-Nov. 15, 2015. Implementation phases will include a focus on initiation and coordination, training landscape review development, adaptation of training materials, and training conduction for key MOD employees. This collaboration will enable Cameroon to manage the risk of accidental or intentional release of emerging infectious disease (EID) exposure, and mitigating the effects of such an outbreak. This activity will cultivate an advancement of knowledge concerning the safe response and management of VHF incidences, security threats due to improper handling of pathogens of security concern, and an understanding of the pathogens of concern within the region for members of Cameroon's MOD.

In order to conduct this activity, Global Viral will act in the role of Project Team member.

Schedule/Timeline: This activity will take place July 1-Dec. 31, 2015.

Phase	Q3 2015			Q4 2015		
	July	Aug	Sept	Oct	Nov	Dec
Phase 1: Project Initiation and Coordination						
Phase 2: Training Landscape Development						
Phase 3: Training Material Adaptation						
DTRA Review of Training Materials						
Phase 4: Training Implementation						
Submission of Final Report						

Scope of Work:
Task 1: Phase 1 Project Initiation and Coordination (July 1-Nov. 15, 2015)

1. Collaboration Initiation and Maintenance: Metabiota, Global Viral, and other subcontractors (the Project Team) will develop a communication and coordination plan for the duration of this activity. The Project Team will initiate collaboration with the Cameroon MOD and other stakeholders as appropriate based on expertise and established network. The project team will hold regular (monthly minimum) conference calls to initiate and maintain coordination, and ensure the project remains within scope, budget, and timeline.
2. Logistics Coordination: The Project Team will coordinate with CLS throughout the duration of this activity for participant travel and training logistics, and equipment shipment.

Task 2: Phase 2 Training Landscape Development (July 1-Aug. 31, 2015)

3. Training Materials Review: The Project Team will conduct a comprehensive review of the existing PPE and VHF training materials, will assess current stakeholder needs, and identify training and knowledge gaps. Global Viral will submit their initial assessment of the training environment in Cameroon and content of existing training materials to Metabiota by Aug. 31, 2015.
4. Training Materials Recommendations: Based upon the results of the training materials review and environment assessment, the Project Team will identify areas for modifications based on their knowledge of Cameroon's needs, capacity, and materials content suitability.
5. PPE and VHF Training Landscape Review Report: The Project Team will develop and submit a training landscape review report based upon their assessment of training materials and modification recommendations, training environment assessment, and MOD stakeholder input to DTRA CBEP.

Task 3: Phase 3 Training Material Adaptation and Approval (August 1-Sept. 30, 2015)

6. Training Materials Modification: Metabiota, with the support provided by the Project Team, will facilitate the implementation of recommended modifications to the existing PPE and VHF training materials and translation. A final draft of the materials will be completed by Aug. 31. The Project Team will inform Metabiota of any changes to content that differs from submitted recommendations in addition to providing regular updates regarding the incorporations of modifications and review processes.
7. Modified Training Materials Approval Facilitation: Metabiota, with support provided by the Project Team, will submit the modified training materials to DTRA CBEP for review and approval.
8. Training Planning Development: The Project Team will develop a training plan, including schedule, agenda, and participant criteria for the PPE and VHF training and related pre/post testing and evaluations.

Task 4: Phase 4 Training Implementation (October-November, 2015)

9. Participant Identification: The Project Team will coordinate with the MOD to identify the most suitable participants to take part in the training based on the established participant criteria for training activities.
10. Announcement and Invitation: Metabiota, in coordination with the Project Team, will announce and distribute invitations to selected training participants and ensure those selected have supervisory approval to participate in all training stages in full.
11. Training Logistics: Metabiota will coordinate with DTRA CBEP and CLS, with the support of the Project Team, to ensure participant transportation and training logistics are prepared for training activities.
12. Training Conduction: The Project Team will conduct the training over a period of 3-4 days, including pre- and post-testing and evaluations.
13. Training Trip Report: Global Viral will provide Metabiota with post-training reports within 30 days of completion. Global Viral will submit Training Trip Reports to Metabiota within 5 days of the completion of travel, to be submitted to the primary funder.

Task 5: Final Project Reports

14. Global Viral Project Report: Following the completion of all activities and deliverables, Global Viral will submit a final project report relaying all actions taken for the implementation of all phases, lessons learned, and identifying next step opportunities upon completion of all deliverables.
15. Final Project Report: Following the completion of all project phases, with support of the Project Team, Metabiota will develop and submit a final project report to the primary funder, including the results of knowledge assessments, post-action reports, lessons learned, and recommended next steps.

METABIOTA

Project Deliverables:

Task	Deliverable	Description	Delivery Date
2.	2.1 Training Materials Landscape Review	Global Viral will submit an initial assessment of training materials and the Cameroon training environment, in addition to training materials modification recommendations.	Aug. 31, 2015
3.	3.1 Modified Training Materials	Global Viral, in support of the Project Team, will modify and review the training materials per the finalized recommendations.	Aug. 31, 2015
3.	3.2 Training Plan Development	Global Viral, in support of the Project Team, will submit training plan, including training schedule, agenda, and participant criteria.	Oct. 15, 2015
4.	4.1 Participant Selection	Global Viral and the Project Team will submit the final participant list at least 3 weeks prior to the scheduled training.	Oct. 15, 2015
4.	4.4 Post-Training Report	Global Viral will submit post-training reports, including pre- and post-test results and evaluations	5 days after the completion of travel
1-4.	1-4.1 Task 1-4 Progress Reports	Global Viral will contribute to a monthly progress report conference call relaying activities conducted and status of efforts, accomplishments, metrics, risks or barriers to task completion or overall project implementation.	Monthly (Due the last day of each month)
1-4	1-4.2 Staff Timesheet and Invoicing	Global Viral will submit monthly labor and materials invoices, including a detailed hour-based timesheet.	Monthly (Due the last day of each month)
1-4.	1-4.3 Final Project Report	Global Viral will submit a post-action report relaying all actions taken for implementation of all phases, lessons learned, and identifying next step opportunities upon completion of all deliverables.	Dec. 31, 2015

CLAUSES INCORPORATED BY FULL TEXT

252.216-9005 PROFIT OR FEE ON TRAVEL COSTS (JUL 2008)
Travel shall not be a profit or fee bearing cost element.

252.203-9000 Prohibition on the Use of Senior Mentors (JUNE 2010)
(a) The use of senior mentors by the Defense Threat Reduction Agency (DTRA) enhances the readiness of the Agency across a wide range of strategic, operational, joint, functional, technical, management and development mission areas. The relevant prior service, joint force experience, and unique expertise of these senior consultants provide senior leadership with valuable insights and contribute to the continuous improvement of the Agencies' operations.

(b) For the purposes of this clause, Senior Mentor is defined as a retired flag, general or other military officers (O-6) or retired senior civilian official (Senior Executive Service (SES), Senior Level (SL), Scientific and Professional (ST)) who provides expert experience-based mentoring, teaching, training, advice, and recommendations to senior military officers, staffs and students as they participate in war games, warfighting courses, operational planning, operational exercises, and decision-making exercises.

(c) In accordance with Secretary of Defense Memorandum entitled "Policy on Senior Mentors" dated April 1, 2010, DTRA will hire all senior mentors as highly qualified experts (HQE) under 5 U.S.C. 9903. This policy balances the need for DTRA to secure the specialized knowledge required for these operational exercises with the need to hire such experts in a manner that promotes public trust and confidence.

(d) The Contractor shall not include the use of senior mentors in bids or proposals for services/supplies offered to DTRA.

(e) The Contractor shall include the substance of this clause in all subcontracts.

252.216-9003 CONSULTANTS (OCT 1998)
Services of consultants shall be at rates and for periods approved in advance by the Contracting Officer. Requests for approval shall be submitted to the Contracting Officer sufficiently in advance of the need to use a consultant under this Contract. The request shall include (a) a copy of the proposed consultant agreement, (b) a brief biography of the consultant, and (c) an indication of the area(s) in which consultant's expertise will be utilized and why it is essential for contract performance. In addition, significant deviations from the dollar amount approved for consultant services, or changes in the consultants to be utilized, must likewise be approved in advance upon submission of adequate justification.

52.217-6 OPTION FOR INCREASED QUANTITY (MAR 1989)
The Government may increase the quantity of supplies called for in the Schedule at the unit price specified. The Contracting Officer may exercise the option by written notice to the Contractor within 60 days. Delivery of the added items shall continue at the same rate as the like items called for under the contract, unless the parties otherwise agree.

52.219-9 SMALL BUSINESS SUBCONTRACTING PLAN (JULY 2013)
(a) This clause does not apply to small business concerns.

(b) Definitions. As used in this clause--

"Alaska Native Corporation (ANC)" means any Regional Corporation, Village Corporation, Urban Corporation, or Group Corporation organized under the laws of the State of Alaska in accordance with the Alaska Native Claims Settlement Act, as amended (43 U.S.C. 1601, et seq.) and which is considered a minority and economically disadvantaged concern under the criteria at 43 U.S.C. 1626(e)(1). This definition also includes ANC direct and indirect subsidiary corporations, joint ventures, and partnerships that meet the requirements of 43 U.S.C. 1626(e)(2).

"Commercial item" means a product or service that satisfies the definition of commercial item in section 2.101 of the Federal Acquisition Regulation.

"Commercial plan" means a subcontracting plan (including goals) that covers the offeror's fiscal year and that applies to the entire production of commercial items sold by either the entire company or a portion thereof (e.g., division, plant, or product line).

"Electronic Subcontracting Reporting System (eSRS)" means the Governmentwide, electronic, web-based system for small business subcontracting program reporting. The eSRS is located at http://www.esrs.gov.

"Indian tribe" means any Indian tribe, band, group, pueblo, or community, including native villages and native groups (including corporations organized by Kenai, Juneau, Sitka, and Kodiak) as defined in the Alaska Native Claims Settlement Act (43 U.S.C.A. 1601 et seq.), that is recognized by the Federal Government as eligible for services from the Bureau of Indian Affairs in accordance with 25 U.S.C. 1452(c). This definition also includes Indian-owned economic enterprises that meet the requirements of 25 U.S.C. 1452(e).

"Individual contract plan" means a subcontracting plan that covers the entire contract period (including option periods), applies to a specific contract, and has goals that are based on the offeror's planned subcontracting in support of the specific contract except that indirect costs incurred for common or joint purposes may be allocated on a prorated basis to the contract.

"Master plan" means a subcontracting plan that contains all the required elements of an individual contract plan, except goals, and may be incorporated into individual contract plans, provided the master plan has been approved.

"Subcontract" means any agreement (other than one involving an employer-employee relationship) entered into by a Federal Government prime Contractor or subcontractor calling for supplies or services required for performance of the contract or subcontract.

(c) The offeror, upon request by the Contracting Officer, shall submit and negotiate a subcontracting plan, where applicable, that separately addresses subcontracting with small business concerns, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business concerns, small disadvantaged business, and with women-owned small business concerns. If the offeror is submitting an individual contract plan, the plan must separately address subcontracting with small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns with a separate part for the basic contract and separate parts for each option (if any). The plan shall be included in and made a part of the resultant contract. The subcontracting plan shall be negotiated within the time specified by the Contracting Officer. Failure to submit and negotiate the subcontracting plan shall make the offeror ineligible for award of a contract.

(d) The offeror's subcontracting plan shall include the following:

(1) Goals, expressed in terms of percentages of total planned subcontracting dollars, for the use of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns as subcontractors. The offeror shall include all subcontracts that contribute to contract performance, and may include a proportionate share of products and services that are normally allocated as indirect costs. In accordance with 43 U.S.C. 1626:

(i) Subcontracts awarded to an ANC or Indian tribe shall be counted towards the subcontracting goals for small business and small disadvantaged business (SDB) concerns, regardless of the size or Small Business Administration certification status of the ANC or Indian tribe.

(ii) Where one or more subcontractors are in the subcontract tier between the prime contractor and the ANC or Indian tribe, the ANC or Indian tribe shall designate the appropriate contractor(s) to count the subcontract towards its small business and small disadvantaged business subcontracting goals.

(A) In most cases, the appropriate Contractor is the Contractor that awarded the subcontract to the ANC or Indian tribe.

(B) If the ANC or Indian tribe designates more than one Contractor to count the subcontract toward its goals, the ANC or Indian tribe shall designate only a portion of the total subcontract award to each Contractor. The sum of the amounts designated to various Contractors cannot exceed the total value of the subcontract.

(C) The ANC or Indian tribe shall give a copy of the written designation to the Contracting Officer, the prime Contractor, and the subcontractors in between the prime Contractor and the ANC or Indian tribe within 30 days of the date of the subcontract award.

(D) If the Contracting Officer does not receive a copy of the ANC's or the Indian tribe's written designation within 30 days of the subcontract award, the Contractor that awarded the subcontract to the ANC or Indian tribe will be considered the designated Contractor.

(2) A statement of --

(i) Total dollars planned to be subcontracted for an individual contract plan; or the offeror's total projected sales, expressed in dollars, and the total value of projected subcontracts to support the sales for a commercial plan;

(ii) Total dollars planned to be subcontracted to small business concerns (including ANC and Indian tribes);

(iii) Total dollars planned to be subcontracted to veteran-owned small business concerns;

(iv) Total dollars planned to be subcontracted to service-disabled veteran-owned small business;

(v) Total dollars planned to be subcontracted to HUBZone small business concerns;

(vi) Total dollars planned to be subcontracted to small disadvantaged business concerns (including ANCs and Indian tribes); and

(vii) Total dollars planned to be subcontracted to women-owned small business concerns.

(3) A description of the principal types of supplies and services to be subcontracted, and an identification of the types planned for subcontracting to --

(i) Small business concerns,

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns, and

(vi) Women-owned small business concerns.

(4) A description of the method used to develop the subcontracting goals in paragraph (d)(1) of this clause.

(5) A description of the method used to identify potential sources for solicitation purposes (e.g., existing company source lists, the System for Award Management (SAM), veterans service organizations, the National Minority Purchasing Council Vendor Information Service, the Research and Information Division of the Minority Business Development Agency in the Department of Commerce, or small, HUBZone, small disadvantaged, and women-owned small business trade associations). A firm may rely on the information contained in SAM as an accurate representation of a concern's size and ownership characteristics for the purposes of maintaining a small, veteran-owned small, service-disabled veteran-owned small, HUBZone small, small disadvantaged, and women-owned small business source list. Use of SAM as its source list does not relieve a firm of its responsibilities (e.g., outreach, assistance, counseling, or publicizing subcontracting opportunities) in this clause.

(6) A statement as to whether or not the offeror included indirect costs in establishing subcontracting goals, and a description of the method used to determine the proportionate share of indirect costs to be incurred with --

(i) Small business concerns (including ANC and Indian tribes);

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns (including ANC and Indian tribes); and

(vi) Women-owned small business concerns.

(7) The name of the individual employed by the offeror who will administer the offeror's subcontracting program, and a description of the duties of the individual.

(8) A description of the efforts the offeror will make to assure that small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns have an equitable opportunity to compete for subcontracts.

(9) Assurances that the offeror will include the clause of this contract entitled "Utilization of Small Business Concerns" in all subcontracts that offer further subcontracting opportunities, and that the offeror will require all subcontractors (except small business concerns) that receive subcontracts in excess of $650,000 ($1.5 million for construction of any public facility with further subcontracting possibilities) to adopt a plan similar to the plan that complies with the requirements of this clause.

(10) Assurances that the offeror will --

(i) Cooperate in any studies or surveys as may be required;

(ii) Submit periodic reports so that the Government can determine the extent of compliance by the offeror with the subcontracting plan;

(iii) Submit the Individual Subcontract Report (ISR) and/or the Summary Subcontract Report (SSR), in accordance with paragraph (l) of this clause using the Electronic Subcontracting Reporting System (eSRS) at http://www.esrs.gov. The reports shall provide information on subcontract awards to small business concerns (including ANCs and Indian tribes that are not small businesses), veteran-owned small business concerns, service-disabled veteran-owned small business concerns, HUBZone small business concerns, small disadvantaged business concerns (including ANCs and Indian tribes that have not been certified by the Small Business Administration as small disadvantaged businesses), women-owned small business concerns, and Historically Black Colleges and Universities and Minority Institutions. Reporting shall be in accordance with this clause, or as provided in agency regulations;

(iv) Ensure that its subcontractors with subcontracting plans agree to submit the ISR and/or the SSR using eSRS;

(v) Provide its prime contract number, its DUNS number, and the e-mail address of the offeror's official responsible for acknowledging receipt of or rejecting the ISRs, to all first-tier subcontractors with subcontracting plans so they can enter this information into the eSRS when submitting their ISRs; and

(vi) Require that each subcontractor with a subcontracting plan provide the prime contract number, its own DUNS number, and the e-mail address of the subcontractor's official responsible for acknowledging receipt of or rejecting the ISRs, to its subcontractors with subcontracting plans.

(11) A description of the types of records that will be maintained concerning procedures that have been adopted to comply with the requirements and goals in the plan, including establishing source lists; and a description of the offeror's efforts to locate small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns and award subcontracts to them. The records shall include at least the following (on a plant-wide or company-wide basis, unless otherwise indicated):

(i) Source lists (e.g., SAM), guides, and other data that identify small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns.

(ii) Organizations contacted in an attempt to locate sources that are small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, or women-owned small business concerns.

(iii) Records on each subcontract solicitation resulting in an award of more than $150,000, indicating --

(A) Whether small business concerns were solicited and if not, why not;

(B) Whether veteran-owned small business concerns were solicited and, if not, why not;

(C) Whether service-disabled veteran-owned small business concerns were solicited and, if not, why not;

(D) Whether HUBZone small business concerns were solicited and, if not, why not;

(E) Whether small disadvantaged business concerns were solicited and if not, why not;

(F) Whether women-owned small business concerns were solicited and if not, why not; and

(G) If applicable, the reason award was not made to a small business concern.

(iv) Records of any outreach efforts to contact --

(A) Trade associations;

(B) Business development organizations;

(C) Conferences and trade fairs to locate small, HUBZone small, small disadvantaged, and women-owned small business sources; and

(D) Veterans service organizations.

(v) Records of internal guidance and encouragement provided to buyers through --

(A) Workshops, seminars, training, etc., and

(B) Monitoring performance to evaluate compliance with the program's requirements.

(vi) On a contract-by-contract basis, records to support award data submitted by the offeror to the Government, including the name, address, and business size of each subcontractor. Contractors having commercial plans need not comply with this requirement.

(e) In order to effectively implement this plan to the extent consistent with efficient contract performance, the Contractor shall perform the following functions:

(1) Assist small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns by arranging solicitations, time for the preparation of bids, quantities, specifications, and delivery schedules so as to facilitate the participation by such concerns. Where the Contractor's lists of potential small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business subcontractors are excessively long, reasonable effort shall be made to give all such small business concerns an opportunity to compete over a period of time.

(2) Provide adequate and timely consideration of the potentialities of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns in all "make-or-buy" decisions.

(3) Counsel and discuss subcontracting opportunities with representatives of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business firms.

(4) Confirm that a subcontractor representing itself as a HUBZone small business concern is identified as a certified HUBZone small business concern by accessing the SAM database or by contacting SBA.

(5) Provide notice to subcontractors concerning penalties and remedies for misrepresentations of business status as small, veteran-owned small business, HUBZone small, small disadvantaged or women-owned small business for the purpose of obtaining a subcontract that is to be included as part or all of a goal contained in the Contractor's subcontracting plan.

(6) For all competitive subcontracts over the simplified acquisition threshold in which a small business concern received a small business preference, upon determination of the successful subcontract offeror, the Contractor must inform each unsuccessful small business subcontract offeror in writing of the name and location of the apparent successful offeror prior to award of the contract.

(f) A master plan on a plant or division-wide basis that contains all the elements required by paragraph (d) of this clause, except goals, may be incorporated by reference as a part of the subcontracting plan required of the offeror by this clause; provided --

(1) The master plan has been approved;

(2) The offeror ensures that the master plan is updated as necessary and provides copies of the approved master plan, including evidence of its approval, to the Contracting Officer; and

(3) Goals and any deviations from the master plan deemed necessary by the Contracting Officer to satisfy the requirements of this contract are set forth in the individual subcontracting plan.

(g) A commercial plan is the preferred type of subcontracting plan for contractors furnishing commercial items. The commercial plan shall relate to the offeror's planned subcontracting generally, for both commercial and Government business, rather than solely to the Government contract. Once the Contractor's commercial plan has been approved, the Government will not require another subcontracting plan from the same Contractor while the plan remains in effect, as long as the product or service being provided by the Contractor continues to meet the definition of a commercial item. A Contractor with a commercial plan shall comply with the reporting requirements stated in paragraph (d)(10) of this clause by submitting one SSR in eSRS for all contracts covered by its commercial plan. This report shall be acknowledged or rejected in eSRS by the Contracting Officer who approved the plan. This report shall be submitted within 30 days after the end of the Government's fiscal year.

(h) Prior compliance of the offeror with other such subcontracting plans under previous contracts will be considered by the Contracting Officer in determining the responsibility of the offeror for award of the contract.

(i) A contract may have no more than one plan. When a modification meets the criteria in 19.702 for a plan, or an option is exercised, the goals associated with the modification or option shall be added to those in the existing subcontract plan.

(j) Subcontracting plans are not required from subcontractors when the prime contract contains the clause at 52.212-5, Contract Terms and Conditions Required to Implement Statutes or Executive Orders--Commercial Items, or when the subcontractor provides a commercial item subject to the clause at 52.244-6, Subcontracts for Commercial Items, under a prime contract.

(k) The failure of the Contractor or subcontractor to comply in good faith with --

(1) The clause of this contract entitled "Utilization Of Small Business Concerns;" or

(2) An approved plan required by this clause, shall be a material breach of the contract.

(l) The Contractor shall submit ISRs and SSRs using the web-based eSRS at http://www.esrs.gov. Purchases from a corporation, company, or subdivision that is an affiliate of the prime Contractor or subcontractor are not included in these reports. Subcontract award data reported by prime Contractors and subcontractors shall be limited to awards made to their immediate next-tier subcontractors. Credit cannot be taken for awards made to lower tier subcontractors, unless the Contractor or subcontractor has been designated to receive a small business or small disadvantaged business credit from an ANC or Indian tribe. Only subcontracts involving performance in the United States or its outlying areas should be included in these reports with the exception of subcontracts under a contract awarded by the State Department or any other agency that has statutory or regulatory authority to require subcontracting plans for subcontracts performed outside the United States and its outlying areas.

(1) ISR. This report is not required for commercial plans. The report is required for each contract containing an individual subcontract plan.

(i) The report shall be submitted semi-annually during contract performance for the periods ending March 31 and September 30. A report is also required for each contract within 30 days of contract completion. Reports are due 30 days after the close of each reporting period, unless otherwise directed by the Contracting Officer. Reports are required when due, regardless of whether there has been any subcontracting activity since the inception of the contract or the previous reporting period.

(ii) When a subcontracting plan contains separate goals for the basic contract and each option, as prescribed by FAR 19.704(c), the dollar goal inserted on this report shall be the sum of the base period through the current option; for example, for a report submitted after the second option is exercised, the dollar goal would be the sum of the goals for the basic contract, the first option, and the second option.

(iii) The authority to acknowledge receipt or reject the ISR resides--

(A) In the case of the prime Contractor, with the Contracting Officer; and

(B) In the case of a subcontract with a subcontracting plan, with the entity that awarded the subcontract.

(2) SSR.

(i) Reports submitted under individual contract plans--

(A) This report encompasses all subcontracting under prime contracts and subcontracts with the awarding agency, regardless of the dollar value of the subcontracts.

(B) The report may be submitted on a corporate, company or subdivision (e.g. plant or division operating as a separate profit center) basis, unless otherwise directed by the agency.

(C) If a prime Contractor and/or subcontractor is performing work for more than one executive agency, a separate report shall be submitted to each executive agency covering only that agency's contracts, provided at least one of that agency's contracts is over $650,000 (over $1.5 million for construction of a public facility) and contains a subcontracting plan. For DoD, a consolidated report shall be submitted for all contracts awarded by military departments/agencies and/or subcontracts awarded by DoD prime Contractors. However, for construction and related maintenance and repair, a separate report shall be submitted for each DoD component.

(D) For DoD and NASA, the report shall be submitted semi-annually for the six months ending March 31 and the twelve months ending September 30. For civilian agencies, except NASA, it shall be submitted annually for the twelve month period ending September 30. Reports are due 30 days after the close of each reporting period.

(E) Subcontract awards that are related to work for more than one executive agency shall be appropriately allocated.

(F) The authority to acknowledge or reject SSRs in eSRS, including SSRs submitted by subcontractors with subcontracting plans, resides with the Government agency awarding the prime contracts unless stated otherwise in the contract.

(ii) Reports submitted under a commercial plan--

(A) The report shall include all subcontract awards under the commercial plan in effect during the Government's fiscal year.

(B) The report shall be submitted annually, within thirty days after the end of the Government's fiscal year.

(C) If a Contractor has a commercial plan and is performing work for more than one executive agency, the Contractor shall specify the percentage of dollars attributable to each agency from which contracts for commercial items were received.

(D) The authority to acknowledge or reject SSRs for commercial plans resides with the Contracting Officer who approved the commercial plan.

(iii) All reports submitted at the close of each fiscal year (both individual and commercial plans) shall include a Year-End Supplementary Report for Small Disadvantaged Businesses. The report shall include subcontract awards, in whole dollars, to small disadvantaged business concerns by North American Industry Classification System (NAICS) Industry Subsector. If the data are not available when the year-end SSR is submitted, the prime Contractor and/or subcontractor shall submit the Year-End Supplementary Report for Small Disadvantaged Businesses within 90 days of submitting the year-end SSR. For a commercial plan, the Contractor may obtain from each of its subcontractors a predominant NAICS Industry Subsector and report all awards to that subcontractor under its predominant NAICS Industry Subsector.

52.244-2 SUBCONTRACTS (OCT 2010)
(a) Definitions. As used in this clause--

Approved purchasing system means a Contractor's purchasing system that has been reviewed and approved in accordance with Part 44 of the Federal Acquisition Regulation (FAR).

Consent to subcontract means the Contracting Officer's written consent for the Contractor to enter into a particular subcontract.

Subcontract means any contract, as defined in FAR Subpart 2.1, entered into by a subcontractor to furnish supplies or services for performance of the prime contract or a subcontract. It includes, but is not limited to, purchase orders, and changes and modifications to purchase orders.

(b) When this clause is included in a fixed-price type contract, consent to subcontract is required only on unpriced contract actions (including unpriced modifications or unpriced delivery orders), and only if required in accordance with paragraph (c) or (d) of this clause.

(c) If the Contractor does not have an approved purchasing system, consent to subcontract is required for any subcontract that—

(1) Is of the cost-reimbursement, time-and-materials, or labor-hour type; or

(2) Is fixed-price and exceeds—

(i) For a contract awarded by the Department of Defense, the Coast Guard, or the National Aeronautics and Space Administration, the greater of the simplified acquisition threshold or 5 percent of the total estimated cost of the contract; or

(ii) For a contract awarded by a civilian agency other than the Coast Guard and the National Aeronautics and Space Administration, either the simplified acquisition threshold or 5 percent of the total estimated cost of the contract.

(d) If the Contractor has an approved purchasing system, the Contractor nevertheless shall obtain the Contracting Officer's written consent before placing the following subcontracts:

Subcontracts or Consultants (for Consultants see DTRA 252 216-9003 in Section H)

(e)(1) The Contractor shall notify the Contracting Officer reasonably in advance of placing any subcontract or modification thereof for which consent is required under paragraph (b), (c), or (d) of this clause, including the following information:

(i) A description of the supplies or services to be subcontracted.

(ii) Identification of the type of subcontract to be used.

(iii) Identification of the proposed subcontractor.

(iv) The proposed subcontract price.

(v) The subcontractor's current, complete, and accurate certified cost or pricing data and Certificate of Current Cost or Pricing Data, if required by other contract provisions.

(vi) The subcontractor's Disclosure Statement or Certificate relating to Cost Accounting Standards when such data are required by other provisions of this contract.

(vii) A negotiation memorandum reflecting—

(A) The principal elements of the subcontract price negotiations;

(B) The most significant considerations controlling establishment of initial or revised prices;

(C) The reason certified cost or pricing data were or were not required;

(D) The extent, if any, to which the Contractor did not rely on the subcontractor's certified cost or pricing data in determining the price objective and in negotiating the final price;

(E) The extent to which it was recognized in the negotiation that the subcontractor's certified cost or pricing data were not accurate, complete, or current; the action taken by the Contractor and the subcontractor; and the effect of any such defective data on the total price negotiated;

(F) The reasons for any significant difference between the Contractor's price objective and the price negotiated; and

(G) A complete explanation of the incentive fee or profit plan when incentives are used. The explanation shall identify each critical performance element, management decisions used to quantify each incentive element, reasons for the incentives, and a summary of all trade-off possibilities considered.

(2) The Contractor is not required to notify the Contracting Officer in advance of entering into any subcontract for which consent is not required under paragraph (c), (d), or (e) of this clause.

(f) Unless the consent or approval specifically provides otherwise, neither consent by the Contracting Officer to any subcontract nor approval of the Contractor's purchasing system shall constitute a determination—

(1) Of the acceptability of any subcontract terms or conditions;

(2) Of the allowability of any cost under this contract; or

(3) To relieve the Contractor of any responsibility for performing this contract.

(g) No subcontract or modification thereof placed under this contract shall provide for payment on a cost-plus-a-percentage-of-cost basis, and any fee payable under cost-reimbursement type subcontracts shall not exceed the fee limitations in FAR 15.404-4(c)(4)(i).

(h) The Contractor shall give the Contracting Officer immediate written notice of any action or suit filed and prompt notice of any claim made against the Contractor by any subcontractor or vendor that, in the opinion of the Contractor, may result in litigation related in any way to this contract, with respect to which the Contractor may be entitled to reimbursement from the Government.

(i) The Government reserves the right to review the Contractor's purchasing system as set forth in FAR Subpart 44.3.

(j) Paragraphs (c) and (e) of this clause do not apply to the following subcontracts, which were evaluated during negotiations:

(End of clause)

252.203-9005, Implementation of Contractor Code of Business Ethics and Conduct (Dec 2008)

In accordance with FAR clause 52.203-13, Contractor Code of Business Ethics and Conduct, the designated "agency Office of the Inspector General" is the DoD OIG at the following address:

Office of the Inspector General
United States Department of Defense
Investigative Policy and Oversight
Contractor Disclosure Program
400 Army Navy Drive, Suite 1037
Arlington, VA 22202-4704
Toll Free Telephone: 866-429-8011

252.204-9001 UNIVERSITIES DISCLOSURE OF INFORMATION (JUL 2009)

(a) The Contractor shall not release to anyone outside the Contractor's organization any unclassified information, regardless of medium (e.g. film, tape, document) pertaining to any part of this contract or any program related to this contract, unless the information results from fundamental research, as defined below:

> "Fundamental research" as used in this clause, means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

(b) The Contractor shall confer and consult with DTRA on technical aspects of its research and submit technical documents intended for publication to the cognizant DTRA technical representative(s) for review, a minimum of 45 days prior to publication or other dissemination. The purpose of the DTRA review period is to ensure the government ample opportunity to provide comments and suggestions for the researchers' consideration.

252.204-9004 IMPLEMENTATION OF DISCLOSURE OF INFORMATION (JUN 2007)
In accordance with DFARS 252.204-7000 Disclosure of Information, any information to be released shall be submitted at least 45 days before the proposed release date, for security and policy review. Submit one copy to each below:

(a) Office of Public Affairs, DTRA/DIR/COS/PA, 8725 John J. Kingman Dr, MS 6201, Ft Belvoir VA 22060-6201.
(b) Contracting Officer
(c) Program Manager

METABIOTA

SOLE SOURCE JUSTIFICATION FOR GLOBAL VIRAL

Personal Protective Equipment (PPE) Donning and Doffing Biosafety Training and Viral Hemorrhagic Fever (VHF)

FAR Part 13.106 requires soliciting among a reasonable number (generally, three) of sources to promote competition to the maximum extent practical. Solicitations may only be limited to one source if it is determined that it is the only source reasonably available. If only one source is solicited, the contract file must be documented to explain the absence of competition.

1. **Identify the activity, deliverables, and where the work will be preformed.**
    a. Metabiota will support the Republic of Cameroon's Ministry of Defense (MOD) by conducting country-specific, high value biosafety and biosecurity (BS&S) trainings, with a focus on personal protective equipment (PPE) donning and doffing and the clinical recognition of viral hemorrhagic fever (VHF). In support of this, Global Viral will take part in the project team in order to collaborate to conduct this activity through a phased approach from July 1-Nov. 15, 2015. Implementation phases will include a focus on initiation and coordination, training landscape review development, adaptation of training materials, and training conduction for key MOD employees. This collaboration will enable Cameroon to manage the risk of accidental or intentional release of emerging infectious disease (EID) exposure, and mitigating the effects of such an outbreak. This activity will cultivate an advancement of knowledge concerning the safe response and management of VHF incidences, security threats due to improper handling of pathogens of security concern, and an understanding of the pathogens of concern within the region for members of Cameroon's MOD.
2. **Describe supplies and/or services being procured**
    a. Global Viral will provide SME, stakeholder coordination, and in-country logistic support for this activity. Details of their tasks and deliverables can be found in Attachment 1_SOW_Global Viral_Cameroon PPE Training Program
3. **Rationale supporting the sole source acquisition. (NOTE: You are not trying to justify or select the best source; that is done competitively. You must justify that there is only one source.)**
    a. Global Viral is a leading organization for the conduction of medical and infectious disease research and trainings in Cameroon, particularly with the MOD, and is singular in their ability to carry out the necessary requirements for this effort. Their technical expertise is unsurpassed in Cameroon and their established relationships with key Cameroon MOD stakeholders makes them the only viable option to achieve the standard of training required by the US government.
    b. As time constraints associated with completing this activity, it was deemed unfeasible to identify, educate and engage another subcontractor to obtain this expertise. Therefore, Metabiota has chosen to proceed with Global Viral, using a sole source justification, and completing a full, and immediate review of their proposal to issue a T&M that would allow Metabiota to engage and complete the training in the required time period. Global Viral's proposal was determined to be fair and reasonable rates comparing to similar standard requirements.

Re: FAR 52.244-2 SUBCONTRACTS – Consent to Subcontract with Attimo
Academic Engagement Partnership (AEP), Cooperative Threat Reduction (CTR)
Contract No. HDTRA1-14-C-0104

Dear Ms. Simpson:
Per FAR 52.244-2 Subcontracts, Metabiota, Inc. (Metabiota) requests Consent to Subcontract with Attimo Group LLC, DBA Attimo Research and Development to support TD-17 Georgia Grantsmanship Support and Mentorship. Included with today's request are the following items:

- Draft Subcontract Agreement
- Sole Source Justification
- Price Negotiation Memorandum (PNM)

We will provide a comprehensive subcontractor budget once finalized.

Description of services to be subcontracted.

- Complete grantsmanship and mentorship necessary for successful proposal submissions to DTRA CBEP Broad Agency Announcement (BAA) or other competitive research solicitations including: development of white papers; proposal preparation, editing, and submission; the development of accurate direct and indirect cost projections; the identification and articulation of scientific hypotheses; research data framing; and reviewing and responding to proposal evaluations and recommendations;
- Complete two (2) one-week visits to Tbilisi, Georgia to provide on-site mentorship, assess the need for in-country grantsmanship mentoring, implement mentoring work plans, and assist with actual proposal writing as-needed
- Complete any additional reporting requirements, as necessary, and requested by DTRA.

Type of subcontract to be used. *Time and Materials.*

Proposed Subcontractor. Attimo Group LLC, DBA Attimo Research and Development.

Proposed subcontract price. A preliminary estimation total of $88,000 USD.

If you have questions or need additional information, I may be reached a (b)(6) or (b)(6)

Sincerely,

(b)(6)
Contracts Administrator

METABIOTA

AGREEMENT

This Subcontract ("Subcontract") is dated and effective as of the October 8, 2015 ("Effective Date"), between **Metabiota, Inc.** (herein referred to as "Metabiota" or "Prime Contractor"), a California corporation, located at 1 Sutter Street, Suite 600, San Francisco, CA, 94104 and **Attimo Group LLC** at 2000 Kraft Drive, Suite 1108, Blacksburg, VA 24060 (herein referred to as the "Subcontractor"). Metabiota and the Subcontractor are each a "Party" and together are the "Parties".

WHEREAS, the Prime Contractor was awarded Contract No. HDTRA1-14-C-0104 for the Academic Engagement Program (AEP) (the "Prime Agreement") by the Defense Threat Reduction Agency (DTRA) ("Client"); and,

WHEREAS, the Prime Contractor desires to purchase certain services from the Subcontractor for the Client; and,

WHEREAS, the Subcontractor is willing to provide services to the Prime Contractor in accordance with the terms and conditions set forth in this Subcontract.

NOW, THEREFORE, the parties hereby agree as follows:

Article 1. Subcontract Services

1.1 Statement of Work. The Subcontractor shall provide all necessary and qualified personnel, equipment, material and facilities to perform the services (hereinafter, the "Work") as set forth in Attachment A—Scope of Work, which shall include the production of the deliverables ("Deliverables"), attached hereto and incorporated herein by this reference.

1.2 Reporting. The Subcontractor shall submit reports in accordance with the deliverables as described in Attachment A, and as reference in Section 2.3.

The Prime Contractor may request additional information regarding the Subcontractor reports, for which the Subcontractor shall use reasonable best efforts to promptly address. The Prime Contractor will not consider award renewals for Subcontractors who fail to meet reporting requirements on a timely basis.

Article 2. Price, Contract Type, and Payment

2.1 Price and Contract Type. This Subcontract is a **Time & Materials Contract Type.** The ceiling price of **$88,000.00** is fully funded.

2.2 Labor Rate Table. Subcontractor shall bill hourly, based on the labor rates and qualifications listed in the table below. Subcontractor shall provide back-up documentation detailing hours worked by position level, according to the Labor Categories and Rate Table below and Attachment B.

TD 017 Grantsmanship Support and Mentorship in Georgia			
Staff	Rate	Unit	Total
SME 2	$150.00	520	$78,000.00
Travel (cost reimbursable)	$5,000.00	2	$10,000.00
		Grand Total	**$88,000.00**

3

2.3 Travel Costs. As per Article 11, Prime Contractor shall coordinate travel and incur any travel costs.

If the Prime Contractor is unable to coordinate Subcontractor travel, the following guidelines shall be applied: Subcontractor shall submit Requests for Travel to Prime Contractor in writing at least 75 days prior to international travel and 30 days prior to domestic travel. Requests must include a detailed itinerary for Prime Contractor approval. Travel Costs must be approved in writing before any costs are incurred and would be invoiced separately, with supporting documentation (receipts). Detailed expense reports including itemized receipts must be submitted for reimbursement. No travel cost will be reimbursed without valid receipt. Travel includes airfare, ground transportation, accommodations, and Meals and Incidental Expenses (M&IE). Per diem rates shall be in accordance with Part 301-11 of U.S. Government Federal Travel Regulation (FTR), as per Article 2.2.2 and Federal Acquisition Regulation (FAR) 31.205.46. As per FAR 252.216-9005, there is no fee (profit) on travel costs permitted.

2.4 Invoicing. The Subcontractor shall submit invoices monthly, no later than the tenth (10th) of the month to invoices@metabiota.com. The invoices shall contain the following information:

- Reference the subcontract number **2015-22-DTRA**.
- Unique invoice number
- Invoice date
- Period of Performance
- Total invoice amount
- Cumulative invoice amount
- Name and address of Subcontractor (mailing address if different)
- Subcontract value and funding (in US Dollars)
- Signed by an authorized official of the Subcontractor
- A certification that reads substantially as follows: "The undersigned hereby certifies that the amount being invoiced represents only those amounts properly payable in accordance with the terms and conditions of the Subcontract Agreement and the official financial records"
- Invoices may be submitted via email to the following addresses listed below: **invoices@metabiota.com**

2.5 Payment. Prime Contractor shall remit payments to the Subcontractor within30 days of receipt of a valid invoice.Payments shall be made in US Dollars via ACH or Wire to:

Bank Name:	First Bank and Trust
Bank Address:	Pepper's Ferry Road, Christiansburg, VA. 24073
Account Name:	Attimo Research and Development
Account Number:	110005244
ABA Routing No:	051404464

Article 3. Nature of the Relationship

The Subcontractor and Prime Contractor acknowledge that although the Subcontractor may perform services pursuant to Prime Contractor's general instructions, the Subcontractor in all matters is and shall be deemed to be an independent contractor and the employees or agents of the Subcontractor shall not be or be deemed to be employees or agents of Prime Contractor for any purpose.

The Subcontractor is responsible and liable for the payment of all local sales, use, gross receipts, ad valorem, property, excise or other taxes that may be applicable to this Agreement.

This Agreement does not require either party to enter into further contractual or other relationships with the other. This Agreement does not create a partnership, joint venture, agency, or other business relationship.

Article 4. Period of Performance

4.1 Period of Performance. The period of performance under this Subcontract shall be from ***October 8, 2015 to May 15, 2016.***

4.2 This Subcontract may be terminated for convenience by either party by providing written notice to the other party thirty (30) calendar days in advance of a specified date of termination.

4.3 This Subcontract may be terminated by Prime Contractor upon written notice in the event of substantial failure by the Subcontractor to perform in accordance with the terms of this Agreement. In the event that the Subcontractor shall default in the performance of any obligation to be performed by it under this Agreement and shall fail to correct such default within ten (10) calendar days following written notice thereof from Prime Contractor. The Prime Contractor may hold in abeyance further payments to the Subcontractor and/or terminate this Agreement by written notice to the Subcontractor specifying the date of termination. Following a termination for default of this Agreement, Subcontractor shall be compensated for all completed Services to the extent that Prime Contractor is reimbursed by the Client for the Subcontractor's services.

4.4 Performance by the Subcontractor may be terminated by Prime Contractor at any time by written notice to the Subcontractor in the event that Prime Contractor's funding is terminated.

4.5 In the event of termination, Prime Contractor will reimburse the Subcontractor for allowable Subcontract Costs up to and including non-cancelable obligations properly incurred prior to the date of termination, provided such costs are allowable do not exceed the stated maximum amount payable.

Article 5. Confidentiality

In order to facilitate the Subcontract Services, Prime Contractor may disclose to the Subcontractor information that it considers confidential or proprietary ("Confidential Information"). Confidential or proprietary information is defined as any information disclosed by one Party (the "Disclosing Party") to the other Party (the "Receiving Party") in a written or tangible shall be marked as "Confidential" or "Proprietary", or if disclosed orally or visually, identified as confidential and/or proprietary at the time of disclosure (which is reduced to writing and so marked within a reasonable time, not to exceed sixty (60) days, thereafter). The Subcontractor will hold in confidence any Confidential Information disclosed by Prime Contractor, and will not use Confidential Information for any purpose except in furtherance of the Subcontract Services. The Subcontractor will take reasonable and prudent precautions to protect the Confidential Information disclosed by Prime Contractor pursuant to this Subcontract. This obligation of confidentiality shall not, however, apply to information which: (i) was known to the Subcontractor and was not proprietary to Prime Contractor prior to the time of disclosure, as demonstrated by competent written evidence; (ii) was part of the public domain prior to the time of disclosure; (iii) becomes part of the public domain after the time of disclosure other than through any act or omission of the Subcontractor in breach of this Subcontract; (iv) is independently developed by the Subcontractor or those employees, contractors, and other researchers directly engaged by the Subcontractor without access to, use of, or regard to the Confidential Information disclosed to it by Prime Contractor. The above confidentiality and non-use obligations shall expire five (5) years following the conclusion of the Subcontract Services hereunder.

Article 6. Data, Publications and Copyrights

6.1 Subcontractor's researchers are free to publish the results of research supported thereunder, however, Subcontractor's Principal Investigator shall supply a copy of any such publication(s) or reports to Prime Contractor's Program Manager sixty (60) days prior to release.

b. Subject to its legal ability to do so, Subcontractor hereby grants Prime Contractor license to use data created in the performance of this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

d. Subject to its legal ability to do so, Subcontractor hereby grants to Prime Contractor an irrevocable, royalty-free, non-transferable, non-exclusive right and license to reproduce, make derivative works, display, and perform publicly any copyrightable or copyrighted material (including any computer

software and its documentation and/ or database) developed and delivered under this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

e. Use of Name. Except as otherwise required by applicable law, regulation or order of a governmental agency or court of competent jurisdiction, Attimo shall not use the name of METABIOTA or METABIOTA's directors, officers, employees or representatives in any advertising, news release or other publication, without the prior express written consent from METABIOTA.

Article 7. Authorship and Specimen Ownership

7.1 Publication and Specimen Collections. Authorship on all resulting publications (reports, articles, books, etc.) produced under this Subcontract shall include people from both field and laboratory groups represented by Prime Contractor and Subcontractor only insofar as they contributed to the publication in a substantive way. Prior to initiation of writing any publications, the responsibilities for authorship for any given publication will be agreed upon by consensus of all parties. However, if a consensus by all parties is not reached within a reasonable period of time Subcontractor's Principal Investigator shall be free to publish independently and agrees to acknowledge Prime Contractor and/or give acknowledgment to Prime Contractor's scientists in publications or presentations, as scientifically appropriate. The Subcontractor's Principal Investigator and Subcontractor shall include Prime Contractor's scientists as co-authors on such publications, insofar as they provide any direct contributions to the work. All reports, articles, or books produced under this Subcontract shall conform to Attachment D – Mandatory Flow Down. Nothing in this contract limits the right of Subcontractor to produce derivative work products with the materials or data produced in the execution of this contract with the exception of the terms in this Agreement that require Prime Contractor's consent to use of name. The derivative work performed by the Subcontractor shall be at the risk of the Subcontractor exclusively.

7.2 Specimen Ownership. Inasmuch as applicable, for all resulting specimens collected under Subcontract, Prime Contractor, to the extent required to meet Prime Contractor's obligations under the Prime Agreement, shall retain an unlimited license to use, disclose, reproduce, and prepare derivative works, in any manner and or any purpose, and to have or permit others to do so.

Article 8. Miscellaneous Terms

8.1 Assignment. Subcontractor shall not assign, transfer or Subcontract its rights, interest, or obligations hereunder without the prior written consent of Prime Contractor and modification to this Subcontract.

8.2 Modifications. The terms and conditions of this Subcontract may be changed by mutual agreement of the parties. In the event that the Government modifies the terms and/or conditions of the Prime Agreement, Prime Contractor reserves the right to unilaterally modify the terms and/or conditions of this Subcontract to reflect the Government's modifications and, thereafter, to negotiate an adjustment, to the extent any such unilateral modification increases the Subcontractor's cost of performance, which modification shall be mutually agreed upon by Prime Contractor and the Subcontractor.

8.3 No Waivers. The failure of Prime Contractor to exercise any of its rights under this Subcontract shall not be deemed to be a waiver of such rights.

8.4 Force Majeure. Neither party shall be held liable or responsible to the other party nor be deemed to have defaulted under or breached this Agreement for failure or delay in fulfilling or performing any obligation under this Agreement the extent, and for so long as, such failure or delay is caused by or results from causes beyond the reasonable control of the affected party including but not limited to fires, earthquakes, floods, embargoes, wars, acts of war (whether war is declared or not), insurrections, riots, civil disturbances, strikes, lockouts or other labor disturbances, acts of God or any acts, omissions, or delays in acting by any governmental authority or the other party.

8.5 Export Control. Both parties will comply with any applicable export regulations, including the Export Administration Regulation and the International Traffic in Arms Regulation, in the conduct of the project. Neither party will transmit to the other any technical data, commodity, or technical assistance controlled under the export regulations without first securing the consent of the receiving party and modification of this agreement signed by the authorized official for each party.

8.6 Entire Subcontract. This Subcontract and its Attachments supersedes any prior or contemporaneous oral or written understandings or communications between the parties and constitutes the entire Subcontract of the parties with respect to its subject matter. This Subcontract may not be amended or modified, except in a writing signed by both parties.

8.7 Governing Law. This Subcontract shall be governed by the laws of the State of California.

8.8 No Liability. To the maximum extent permitted by applicable law, in no event shall Prime Contractor and Subcontractor be liable to the other party under any theory including contract and tort (both negligence and strict products liability) for any special, incidental, indirect, or consequential damages whatsoever (including, without limitation, damages for loss of business profit, business interruption, loss of business information, loss of goodwill) arising out of or relating to the Project. In addition, Prime Contractor and Subcontractor shall not be liable for losses, damages, claims, or other liabilities arising out of the other party's activities. It is expressly understood that Prime Contractor, by entering into this Subcontract, has no obligation to provide other or additional support to the Subcontractor for the purposes of this project or any other purposes.

8.9 Indemnification. The parties agree to defend, indemnify and hold one another, their officers, employees and agents harmless from and against any and all liability, loss, expense, attorneys' fees, or claims for injury or damages directly resulting from the performance of this Agreement but only in proportion to and to the extent such liability, loss, expense, attorneys' fees, or claims for injury or damages are caused by or result from the negligent or intentional acts or omissions of the indemnifying party.

8.10 Severability. The illegality or invalidity of any provisions of this Subcontract shall not impair, affect or invalidate the other provisions of this Subcontract.

8.11 Protection of Research Subjects. If human or animal subjects are used in the conduct of the work performed under this Subcontract, the Subcontractor's protocol must be approved by the Subcontractor's office for the protection of research subjects in accordance with federal regulations, including 45 C.F.R. Part 46, the Office for Human Research Protections (OHRP), 9 C.F.R. Subchapter A under the Animal Welfare Act, and submitted to Prime Contractor.

8.12 Defense Base Act Insurance. Subcontractor shall be required to obtain Defense Base Act Insurance (DBA) in accordance with FAR clause 52.228-4 Workers Compensation and War Hazard Insurance Overseas. DBA insurance will be funded and provided for the Subcontractor by the Prime Contractor (Metabiota). Subcontractor shall provide all pertinent information to Prime Contractor in order to obtain adequate coverage.

Article 9. Attachments

This following Attachments to this Subcontract are incorporated by reference: Attachment A - Scope of Work and Deliverables, Attachment B – Labor Categories and Rates Table, Attachment C – T&M Invoice Template, and Attachment D – Mandatory Flow Down.

Article 10. Administrative and Technical Contacts

The following individuals shall serve as contacts for communications regarding this Subcontract:

METABIOTA

Attachment A - Scope of Work and Deliverables

Project Summary:

Metabiota will support the Richard G. Lugar Center for Public Health Research of the Ministry of Agriculture in Georgia by providing subject matter expertise for grant proposal development to the National Center for Disease Control (NCDC) and Laboratory of Ministry of Agriculture (LMA). The project team, including subject matter experts provided by Attimo Group LLC, will collaborate to conduct this activity through from October 8, 2015-May 15, 2016. This activity will provide expertise in the following knowledge areas required for proposal submission to DTRA CBEP Broad Agency Announcement (BAA) or other competitive research solicitations: development of white papers; proposal preparation, editing, and submission; the development of accurate direct and indirect cost projections; the identification and articulation of scientific hypotheses; research data framing; and reviewing and responding to proposal evaluations and recommendations. Attimo will provide remote and on-site grantsmanship mentoring, editorial guidance, implementation of mentoring work plans, and identification of future mentorship stakeholder needs.

This collaboration will build a long-term partnership between key research and technical centers in Georgia and will nourish hypothesis-driven and translational research programs that result in sustainable funding and academic publications.

In order to conduct of this activity, Attimo Group LLC will act in the role of Project Team member and subject matter experts (SMEs).

Schedule/Timeline: This activity will take place Oct. 8, 2015-May 15, 2016.

Scope of Work:

Task 1: Project Coordination

1. NCDC and LMA Stakeholder Identification and Collaboration: the SMEs will identify key collaborators at NCDC and LMA. Through this coordination, the SMEs, stakeholders, and Metabiota will identify efforts for collaboration through this activity. The Project Team will then identify the level and type of mentoring activities that are required for the identified efforts.

2. Communication: The SMEs will develop a communication and coordination plan for the duration of this activity. The project team will hold regular (monthly) conference calls to initiate and maintain coordination, and ensure the project remains within scope, budget, and timeline.

3. Preparation: The SMEs will provide Metabiota with all contingent deliverables prior to any onsite travel and support. Such deliverables include, but are not limited to: Training Event Plan drafts (due 75 days prior to travel), Country Clearance Request (CCR) and Travel Approval Forms (TAF) (due 60 days prior to travel), and Traveler Trip Reports (due 5 days post-travel). SMEs will also relay any logistics needs, including the need for venues, participant travel, or interpretation/translation requirements to Metabiota no later than 60 days prior to scheduled activities.

4. Reports and Invoices: The SMEs will provide monthly invoices and reports detailing actions taken for implementation, challenges and lessons learned, and identifying next steps. The SMEs will provide a final project report, providing an overview of project implementation, overarching lessons learned, and identified next steps.

Task 2: In-Country and Remote Grantsmanship Mentoring

1. Mentorship Work Plan Development: SMEs will familiarize themselves with the current capabilities of identified Georgian stakeholders and identify an appropriate path forward with mentorship, including identifying a timeline of implementation and key milestones and goals (ex. number of proposal submissions, drafts of white papers, etc.). The mentorship work plan will include activities providing grantsmanship support, mentorship, and subject matter expertise to key NCDC and LMA stakeholders throughout the proposal development, protocol verification, and the proposal editing and submission process. SMEs will deliver this mentorship work plan to Metabiota for review and approval by Nov. 15, 2015.

2. Mentorship Work Plan Execution: The SMEs will implement the mentoring work plans, including providing expertise, mentorship, and guidance in the following topics: development of white papers; proposal preparation, editing, and submission; the development of accurate direct and indirect cost projections; the identification and articulation of scientific hypotheses; research data framing; and reviewing and responding to proposal evaluations and recommendations. The SMEs will provide deliverables to Metabiota, including white paper and proposal drafts, as outlined in the Mentorship Work Plan schedule.

3. On-site Mentorship: The SMEs will conduct two, one-week onsite mentorship visits to Tbilisi, Georgia. During these visits, the SME will provide mentorship, assess future mentorship types and needs, initiate and maintain mentorship work plans, and provide assistance with proposal writing as needed.

Task 3: Research-back SME Support

1. Authorship Support: The SME (SME 2) will provide occasional remote editorial guidance and limited assistance with drafting of select passages.
2. Additional SME Support Identification: The SMEs will regularly communicate status and anticipated SME support needs to Metabiota. If needs exceed those identified in the mentorship plan, the SMEs will provide Metabiota with a change request, including details regarding the source of need, proposed expansion to mentorship plan, and time and cost estimates to this expansion prior to the initiation of any additional mentorship to stakeholders.

Project Deliverables:

Task	Deliverable	Description	Delivery Date
1.	1.3.1 Travel Preparations	The SMEs will submit pre-travel preparation materials (TEP, CCR, TAF)	TEP due 75 days prior to scheduled travel. CCR and TAF due 60 days prior to travel
1.	1.3.2 Logistics	The SMEs will submit logistics needs (venue, participant	Due 60 days prior to scheduled activity

	Needs	travel, interpretation/translation). preparation materials (TEP, CCR, TAF)	
1.	1.3.3 Training Trip Reports	The SME will submit post-training trip reports (TTR)	5 days after the completion of travel
1.	1.4.Monthly Progress Reports	The SMEs will submit monthly progress reports relaying activities conducted and status of efforts, accomplishments, metrics, risks or barriers to task completion or overall project implementation.	Monthly (Due the last day of each month)
1.	1.4.2 Timesheets and Invoicing	The SMEs will submit monthly labor and materials invoices, including hour-based labor invoicing.	Monthly (Due the last day of each month)
1.	1.4.3 Final Project Report	The SMEs will submit a post-action report relaying all actions taken for implementation of all phases, lessons learned, and identifying next step opportunities upon completion of all deliverables.	April 30, 2016
2.	2.1.1 Mentorship Work Plan	The SMEs will submit the complete mentorship work plans for all mentorship activities	November 15, 2015
2.	2.1.2 Mentorship Work Plan Deliverables	The SMEs will submit all identified deliverables from the mentorship work plan per the approved schedule	TBD (All submission complete by April 30, 2016)

PRICE NEGOTIATION MEMORANDUM

METABIOTA, INC./Attimo Group LLC

GENERAL INFORMATION:

Contractor name	Attimo Group LLC, DBA Attimo Research and Development
Proposal number	DTRA1-14-C-0104, TD-017
Proposal date	October 1, 2015
Proposal amount	$88,000.00
Negotiated amount	$88,000.00
Date negotiation completed	October 8, 2015

DESCRIPTION OF THE CONTRACT ACTION:

Purpose of negotiation (e.g., negotiate a new contract on sole source basis, definitization of a change order, negotiate an equitable adjustment):

- Proposed total price and time on a Time and Materials contract with Attimo Group LLC for a new contract on sole source basis on contract No. HDTRA1-14-C-0104. This PNM documents the proposed effort to support TD-017 as described in the SOW to implement Grantsmanship Support and Mentorship in Georgia. Participants in the subcontracting process are as follows:

Metabiota, Inc.	Attimo Group LLC
(b)(6)	(b)(6)

Description of the work (provide a brief summary of the general scope of the work encompassed by the action):

Metabiota will support the Richard G. Lugar Center for Public Health Research of the Ministry of Agriculture in Georgia by providing subject matter expertise for grant proposal development to the National Center for Disease Control (NCDC) and Laboratory of Ministry of Agriculture (LMA). The project team, including subject matter experts provided by Attimo Group LLC, will collaborate to conduct this activity through from Sept. 21, 2015-May 15, 2016. This activity will provide expertise in the following knowledge areas required for proposal submission to DTRA CBEP Broad Agency Announcement (BAA) or other competitive research solicitations: development of white papers; proposal preparation, editing, and submission; the development of accurate direct and indirect cost projections; the identification and articulation of scientific hypotheses; research data framing; and reviewing and responding to proposal evaluations and recommendations. Attimo will provide remote and on-site grantsmanship mentoring, editorial guidance, implementation of mentoring work plans, and identification of future mentorship stakeholder needs.

This collaboration will build a long-term partnership between key research and technical centers in Georgia and will nourish hypothesis-driven and translational research programs that result in sustainable funding and academic publications.

CURRENT STATUS OF CONTRACTOR'S SYSTEMS:

Indicate any change in the status of the contractor's systems, (e.g., purchasing, estimating, accounting and material management and accounting system) since execution of the prenegotiation objectives memorandum. If the status has changed indicate the impact on negotiations. **N/A**

Indicate any change in the status of the contractor's disclosure statement describing the contractor's cost accounting practices and procedures, and the date of the disclosure (FAR 30.202). If the status has changed since execution of the prenegotiation memorandum indicate the impact on negotiations. **N/A**

COST OR PRICING DATA:

Cost or pricing data was ___ was not _**X**_ required and obtained along with a Certificate of Current Cost and Pricing Data, which was executed by the contractor on__N/A_____.

Cost or pricing data was ___ was not __**X**_ relied on in negotiating the contract price.

Where certified cost or pricing data was not obtained based on an exception listed in FAR 15.403-1, indicate the exception.

Certified cost or pricing data was not obtained per FAR 15.403-1 (a) - Certified cost or pricing data shall not be obtained for acquisitions at or below the simplified acquisition threshold.

COST ANALYSIS:

The proposed subcontract is a sole source Time and Materials (T&M) contract evaluated upon completed technical and cost proposal from Attimo Group LLC to provide subject matter expertise and support to conduct Grantsmanship Support and Mentorship in Georgia. The T&M contract issued to Attimo Group LLC was determined to be the most appropriate mechanism for these services based on the fair and reasonable pricing submitted by the subcontractor and the Metabiota team's determination that this would be the most effective means to ensure efficient performance in the best interest of the government.

This determination was made following an internal review of the subcontractor's budget by Metabiota's financial, contract, and technical departments to determine overall reasonableness of the cost. The budget provided by the subcontractor included standard labor and overhead pricing for services. The subcontractor's indirect rate and fees are incorporated into the labor rates presented to Metabiota, and thus have been, by extension deemed to be reasonable. Rates were reasonable compared to those of other service providers with similar contract tasks and levels of experience and expertise; indeed the

rate structure presented by Attimo is substantially comparable to Metabiota's own rate structure with the US government client.

Cost Element	Contractor Proposed	Negotiation Objective	Negotiated Amount
1. Direct Labor	$78,000.00	$78,000.00	$78,000.00
2. Labor Overhead	$0.00	$0.00	$0.00
3. Equipment	$0.00	$0.00	$0.00
4. Material	$0.00	$0.00	$0.00
5. Material Overhead	$0.00	$0.00	$0.00
6. Travel	$10,000.00	$10,000.00	$10,000.00
7. Consultants	$0.00	$0.00	$0.00
8. Subcontracts	$0.00	$0.00	$0.00
9. Other Direct Costs	$0.00	$0.00	$0.00
Subtotal	$0.00	$0.00	$0.00
10. G&A (0%)	$0.00	$0.00	$0.00
11. Total Price	$88,000.00	$88,000.00	$88,000.00

NEGOTIATED OBJECTIVES TABLE

SIGNIFICANT FACTS AND IMPACTS BY OTHERS:
Determination to subcontract with Attimo Group LLC was deemed to be the most effective way to successfully conduct the training for the following reasons:

1. Attimo Group is a leader in mentorship and research support in the region and has established connections and established trust with the recipients of support, and is thereby singular in their ability to carry out the necessary requirements for this effort, particularly with the limited timeline for implementation completion. Metabiota has chosen to proceed with Attimo Group using a sole source justification, particularly as their cost proposal was determined to be fair and reasonable rates compared to similar standard requirements and their historical rates.
2. As time constraints associated with completing this activity, it was deemed unfeasible to identify, educate and engage another subcontractor to obtain this expertise. Therefore, Metabiota has chosen to proceed with Attimo Group LLC, using a sole source justification, and completing a full, and immediate review of their proposal to issue a T&M that would allow Metabiota to engage and complete the activity in the required time period.

SOLE SOURCE JUSTIFICATION FORM

- This form must accompany Subcontract Request Forms whenever a sole source purchase is requested. (*)

1. Vendor proposed as a Sole Source: Attimo Group LLC, DBA Attimo Research and Development
2. Please check all applicable categories below and provide additional information where indicated.
   - ☐ a. The requested product is an integral repair part or accessory compatible with existing equipment.
     - Existing Equipment Description: _____
     - Manufacturer/Model Number: _____
     - Age of the Equipment: _____ Current Value: _____
     - Asset or Original PO Number: _____
   - ☒ b. The requested product has unique design/performance specifications or quality requirements, which are essential to my research or teaching needs and are not available in comparable products.
   - ☒ c. The requested product is essential in maintaining research continuity and/or to remain in compliance with established university standards. (Check applicable category below.)
     - ☐ Requested product is being used in continuing research experiments.
     - ☐ I am collaborating with other investigators who have used this product and for compatibility of research results, I must also use it.
     - ☐ I have standardized the requested product and the use of another brand/model would require considerable time and funding to evaluate.
   - ☐ d. The requested product is one with which I and/or my staff have specialized training/extensive expertise, and retraining would incur substantial cost in time/money.
   - ☒ e. The requested provider of services has unique or exclusive capabilities that no other provider has.
   - ☐ f. Other factors are involved. (Provide detailed explanation below.)
3. Provide a detailed explanation for categories checked in 2a. through 2f. above. **(Make certain to include applicable information such as the activity, deliverables, supplies and/or services being procured, and where the work will be performed. Attach additional sheets if necessary.)**

   Attimo Group LLC has supported an array of research and capacity building activities with the Richard G. Lugar Center for Public Health Research of the Ministry of Agriculture in Georgia for a number of years, including direct research support with the National Center for Disease Control (NCDC) and Laboratory of Ministry of Agriculture (LMA), who are the intended recipients of mentorship and SME support through this activity. As such, Attimo Group is a leader in mentorship and research support in the region and has established connection and established trust with the recipients of support, and is thereby singular in their ability to carry out the necessary requirements for this effort, particularly with the limited timeline for implementation completion. Metabiota has chosen to proceed with Attimo Group using a sole source justification, particularly as their cost proposal was determined to be fair and reasonable rates compared to similar standard requirements and their historical rates.

4. Was an evaluation of other equipment, products, or services completed? ☐ YES ☒ NO.
   If yes, please attach the results of the evaluation.
5. List below the names of each individual who was involved in making the recommendation to sole source this purchase.

   (b)(6)

(*) It is the intent of Metabiota, Inc. to maintain competitive bidding, however sole source selections may sometimes be necessary. Subcontract Requests for goods and services that are to be purchased from a specific vendor or limited to a specific brand, where substitutes to the suggested vendor or brand are unacceptable, must be accompanied by a written justification explaining the circumstances that make alternatives unacceptable. ***The principal investigator, program manager, or director must sign the justification.*** *The individual signing the justification must disclose in writing whether or not he/she has a potential or actual conflict of interest. Metabiota employees who have a business relationship or financial interest (including that of a near relative) in the suggested vendor, who are conducting research for the suggested vendor, or who have received or anticipate receiving gifts, honorarium, or research grants from the suggested vendor must disclose the conflict of interest.*

The Contracts Manager will determine whether the justification is appropriate. Sole source justifications are to be supported by factual statements that shall pass an internal or Federal audit. It is the salient features of a product that make it a sole source.

5. I certify that I have read the above statement, that the information entered on this form is factual and that a signed copy of this Sole Source Justification document, and any associated disclosure statements, will be kept on file with the Contracts department

Re: FAR 52.244-2 SUBCONTRACTS – Consent to Subcontract with Watermark
Academic Engagement Partnership (AEP), Cooperative Threat Reduction (CTR)
Contract No. HDTRA1-14-C-0104

Dear (b)(6)

Per FAR 52.244-2 Subcontracts, Metabiota, Inc. (Metabiota) requests Consent to Subcontract with Watermark Risk International, LLC to support TD-21 Iraq Field Epidemiology Training Program (FETP) Support. Included with this request are the following items:

- Draft Subcontract Agreement
- Price Negotiation Memorandum (PNM)

Metabiota will provide a comprehensive subcontractor budget once finalized.

Description of services to be subcontracted.
Watermark will provide subject matter expertise and programmatic support to Metabiota related to biosafety & biosecurity, biorisk management, and general risk management principles for overall Academic Engagement Partnership program implementation. Watermark's team will provide this support from the period of 1 February 2016 – 15 Nov 2016.

Type of subcontract to be used. *Time and Materials.*

Proposed Subcontractor. Watermark Risk International, LLC.

Proposed subcontract price. A preliminary estimation total TBD.

If you have questions or need additional information, I may be reached at (b)(6)
(b)(6)

Sincerely,

(b)(6)

Contract Value:	TBD
Project Title:	**Biorisk Management Support for Metabiota AEP**
Metabiota, Inc. Project Manager:	(b)(6)

METABIOTA

AGREEMENT

This Subagreement ("Subagreement") is dated and effective as of the 10th of February 2016, between **Metabiota, Inc.** (herein referred to as "Metabiota" or "Prime Contractor"), a California corporation, located at 425 California Street, Suite 200, San Francisco, CA, 94104 and Watermark Risk International, LLC at 4023 Maple Avenue, Suite 100, Fairfax, VA 22032 (herein referred to as the "Subrecipient"). (Metabiota and the Subrecipient are each a "Party" and together are the "Parties").

WHEREAS, Prime Contractor was awarded Cooperative Agreement No. HDTRA-14-0104 (the "Prime Agreement") by the Academic Engagement Partnership (AEP), to implement the project, Biorisk Management Support for Metabiota AEP and,

WHEREAS, the Prime Contractor desires to purchase certain services from the Subrecipient for the Client; and,

WHEREAS, the Subrecipient is willing to provide services to the Prime Contractor in accordance with the terms and conditions set forth in this Subagreement.

NOW, THEREFORE, the parties hereby agree as follows:

Article 1. Subagreement Services

1.1 Statement of Work. The Subrecipient shall provide all necessary and qualified personnel, equipment, material and facilities to perform the services (hereinafter, the "Work") as set forth in Attachment A—Scope of Work.

1.2 Reporting. Prior to submission of an invoice, the Subrecipient shall submit a progress report to the Prime Contractor so that performance may be evaluated. The Prime Contractor may request additional information regarding the Subrecipient reports, for which the Subrecipient shall use reasonable best efforts to promptly address. The Prime Contractor will not consider award renewals for Subrecipients who fail to meet reporting requirements on a timely basis.

Article 2. Price, Contract Type, and Payment

2.1 Price. This Subagreement is a **Time and Materials Contract Type**. The ceiling price is **TBD** and is fully funded. The detailed budget may be found in Attachment B – Budget .

2.2 Invoicing and Payment. The Subrecipient shall submit invoices within five (5) calendar days of completion of deliverables as described in Attachment A. Prime Contractor shall remit payment to the Subrecipient within forty-five (45) days of receipt of a valid invoice.
The invoices shall contain the following information:

- Identify the milestone for which payment is requested in accordance with the Scope of Work. A sample invoice may be found in Attachment C – Invoice Template.
- Reference the Subagreement number 2016-01-DTRA.
- Invoice number
- Invoice date
- Name and address of Subrecipient (mailing address if different)
- Subagreement value and funding (in US Dollars)
- Signed by an authorized official of the Subrecipient
- A certification that reads substantially as follows: "The undersigned hereby certifies that the amount being invoiced represents only those amounts properly payable in accordance with the terms and conditions of the Subagreement and the official financial records".
- Invoices may be submitted via email or mail to the following addresses listed below:
  invoices@metabiota.com
  or

METABIOTA

Accounts Payable
Metabiota, Inc.
425 California Street, Suite 200
San Francisco, CA 94104

Payments shall be made in US Dollars via ACH or Wire to:
Bank Name: US Bank NA
Bank Address: 719 South Kansas Avenue, Topeka, KS 66603
Account Holder: State of Kansas KSU EFT
Account No: 145592399680
ABA Routing No: 101000187

Article 3. Nature of the Relationship

The Subrecipient and Prime Contractor acknowledge that although the Subrecipient may perform services pursuant to Prime Contractor's general instructions, the Subrecipient in all matters is and shall be deemed to be an independent contractor and the employees or agents of the Subrecipient shall not be or be deemed to be employees or agents of Prime Contractor for any purpose.

The Subrecipient is responsible and liable for the payment of all local sales, use, gross receipts, ad valorem, property, excise or other taxes that may be applicable to this Agreement.

This Agreement does not require either party to enter into further contractual or other relationships with the other. This Agreement does not create a partnership, joint venture, agency, or other business relationship.

Article 4. Period of Performance

4.1 Period of Performance. The period of performance under this Subagreement shall be from ***01 February 2016- 15 November 2016.***

4.2 This Subagreement may be terminated for convenience by either party by providing written notice to the other party thirty (30) calendar days in advance of a specified date of termination.

4.3 This Subagreement may be terminated by Prime Contractor upon written notice in the event of substantial failure by the Subrecipient to perform in accordance with the terms of this Agreement. In the event that the Subrecipient shall default in the performance of any obligation to be performed by it under this Agreement and shall fail to correct such default within ten (10) calendar days following written notice thereof from Prime Contractor. The Prime Contractor may hold in abeyance further payments to the Subrecipient and/or terminate this Agreement by written notice to the Subrecipient specifying the date of termination. Following a termination for default of this Agreement, Subrecipient shall be compensated for all completed Services to the extent that Integrating Subrecipient is reimbursed by Prime Contractor for the Subrecipient's services.

4.4 Performance by the Subrecipient may be terminated by Prime Contractor at any time by written notice to the Subrecipient in the event that Prime Contractor's funding is terminated.

4.5 In the event of termination, Prime Contractor will reimburse the Subrecipient for allowable Subagreement Costs up to and including non-cancelable obligations properly incurred prior to the date of termination, provided such costs are allowable do not exceed the stated maximum amount payable.

Article 5. Confidentiality

In order to facilitate the Subagreement Services, Prime Contractor may disclose to the Subrecipient information that it considers confidential or proprietary ("Confidential Information"). Confidential or proprietary information is defined as any information disclosed by one Party (the "Disclosing Party") to the other Party (the "Receiving Party") in a written or tangible form and shall be marked as

"Confidential" or "Proprietary", or if disclosed orally or visually, identified as confidential and/or proprietary at the time of disclosure (which is reduced to writing and so marked within a reasonable time, not to exceed sixty (60) days, thereafter). The Subrecipient will hold in confidence any Confidential Information disclosed by Prime Contractor, and will not use Confidential Information for any purpose except in furtherance of the Subagreement Services. The Subrecipient will take reasonable and prudent precautions to protect the Confidential Information disclosed by Prime Contractor pursuant to this Subagreement. This obligation of confidentiality shall not, however, apply to information which: (i) was known to the Subrecipient and was not proprietary to Prime Contractor prior to the time of disclosure, as demonstrated by competent written evidence; (ii) was part of the public domain prior to the time of disclosure; (iii) becomes part of the public domain after the time of disclosure other than through any act or omission of the Subrecipient in breach of this Subagreement; (iv) is independently developed by the Subrecipient or those employees, contractors, and other researchers directly engaged by the Subrecipient without access to, use of, or regard to the Confidential Information disclosed to it by Prime Contractor. The above confidentiality and non-use obligations shall expire five (5) years following the conclusion of the Subagreement Services hereunder.

Article 6. Data, Publications and Copyrights

6.1 Subrecipient's researchers are free to publish the results of research supported thereunder, however, Subrecipient's Principal Investigator shall supply a copy of any such publication(s) or reports to Prime Contractor's Principal Investigator sixty (60) days prior to release.

b. Subject to its legal ability to do so, Subrecipient hereby grants Prime Contractor license to use data created in the performance of this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

d. Subject to its legal ability to do so, Subrecipient hereby grants to Prime Contractor an irrevocable, royalty-free, non-transferable, non-exclusive right and license to reproduce, make derivative works, display, and perform publicly any copyrightable or copyrighted material (including any computer software and its documentation and/ or database) developed and delivered under this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

Article 7. Authorship and Specimen Ownership

7.1 Publication and Specimen Collections. Authorship on all resulting publications (reports, articles, books, etc.) produced under this Subagreement shall include people from both field and laboratory groups represented by Prime Contractor and Subrecipient. Prior to initiation of writing any publications, the responsibilities for authorship for any given publication will be agreed upon by consensus of all parties. However, if a consensus by all parties is not reached within a reasonable period of time Subrecipient's Principal Investigator shall be free to publish independently and agrees to acknowledge Prime Contractor and/or give acknowledgment to Prime Contractor's scientists in publications or presentations, as scientifically appropriate. The Subrecipient's Principal Investigator and Subrecipient shall include Prime Contractor's scientists as co-authors on such publications, based on any direct contributions they make to the work.

7.2 Specimen Ownership. For all resulting specimens collected under Subagreement, Prime Contractor, to the extent required to meet Prime Contractor's obligations under the Prime Agreement, shall retain an unlimited license to use, disclose, reproduce, and prepare derivative works, in any manner and or any purpose, and to have or permit others to do so.

Article 8. Miscellaneous Terms

8.1 Assignment. Subrecipient shall not assign, transfer or Subagreement its rights, interest, or obligations hereunder without the prior written consent of Prime Contractor and modification to this Subagreement.

8.2 Modifications. The terms and conditions of this Subagreement may be changed by mutual agreement of the parties. In the event that the Government modifies the terms and/or conditions of the Prime Agreement, Prime Contractor reserves the right to unilaterally modify the terms and/or conditions of this

Subagreement to reflect the Government's modifications and, thereafter, to negotiate an adjustment, to the extent any such unilateral modification increases the Subrecipient's cost of performance, which modification shall be mutually agreed upon by Prime Contractor and the Subrecipient.

8.3 No Waivers. The failure of Prime Contractor to exercise any of its rights under this Subagreement shall not be deemed to be a waiver of such rights.

8.4 Force Majeure. Neither party shall be held liable or responsible to the other party nor be deemed to have defaulted under or breached this Agreement for failure or delay in fulfilling or performing any obligation under this Agreement the extent, and for so long as, such failure or delay is caused by or results from causes beyond the reasonable control of the affected party including but not limited to fires, earthquakes, floods, embargoes, wars, acts of war (whether war is declared or not), insurrections, riots, civil disturbances, strikes, lockouts or other labor disturbances, acts of God or any acts, omissions, or delays in acting by any governmental authority or the other party.

8.5 Export Control. Both parties will comply with any applicable export regulations, including the Export Administration Regulation and the International Traffic in Arms Regulation, in the conduct of the project. Neither party will transmit to the other any technical data, commodity, or technical assistance controlled under the export regulations without first securing the consent of the receiving party and modification of this agreement signed by the authorized official for each party.

8.6 Entire Subagreement. This Subagreement and its Attachments supersedes any prior or contemporaneous oral or written understandings or communications between the parties and constitutes the entire Subagreement of the parties with respect to its subject matter. This Subagreement may not be amended or modified, except in a writing signed by both parties.

8.7 Governing Law. This Subagreement shall be governed by the laws of the State of California.

8.8 No Liability. To the maximum extent permitted by applicable law, in no event shall Prime Contractor and Subrecipient be liable to other party under any theory including contract and tort (both negligence and strict products liability) for any special, incidental, indirect, or consequential damages whatsoever (including, without limitation, damages for loss of business profit, business interruption, loss of business information, loss of goodwill) arising out of or relating to the Project. In addition, Prime Contractor and Subrecipient shall not be liable for losses, damages, claims, or other liabilities arising out of other party's activities. It is expressly understood that Prime Contractor, by entering into this Subagreement, has no obligation to provide other or additional support to the Subrecipient for the purposes of this project or any other purposes.

8.9 Indemnification. The parties agree to defend, indemnify and hold one another, their officers, employees and agents harmless from and against any and all liability, loss, expense, attorneys' fees, or claims for injury or damages directly resulting from the performance of this Agreement but only in proportion to and to the extent such liability, loss, expense, attorneys' fees, or claims for injury or damages are caused by or result from the negligent or intentional acts or omissions of the indemnifying party.

8.10 Severability. The illegality or invalidity of any provisions of this Subagreement shall not impair, affect or invalidate the other provisions of this Subagreement.

8.11 Protection of Research Subjects. If human or animal subjects are used in the conduct of the work performed under this Subagreement, the Subrecipient's protocol must be approved by the Subrecipient's office for the protection of research subjects in accordance with federal regulations, including 45 C.F.R. Part 46, the Office for Human Research Protections (OHRP), 9 C.F.R. Subchapter A under the Animal Welfare Act, and submitted to Prime Contractor.

METABIOTA

Attachment A - Scope of Work

Statement of Work

Summary:
Watermark will provide subject matter expertise and programmatic support to Metabiota related to biosafety & biosecurity, biorisk management, and general risk management principles for overall Academic Engagement Partnership program implementation. Watermark's team will provide this support from the period of 1 February 2016 – 15 Nov 2016.

Scope of Work:
Task 1: Administrative Coordination

1. Communication: The SME(s) will participate in conference calls and email communications with the Metabiota AEP program management team as needed. When requested SME(s) will provide inputs to minutes and action item lists resulting from said communications.
2. Preparation: The SMEs will provide Metabiota with all contingent deliverables prior to any onsite travel and support. Such deliverables include, but are not limited to: Training Event Plan drafts (due 75 days prior to travel), Country Clearance Request (CCR) and Travel Approval Forms (TAF) (due 60 days prior to travel), and Traveler Trip Reports (due 5 days post-travel). SMEs will also relay any logistics needs, including the need for venues, participant travel, or interpretation/translation requirements to Metabiota no later than 60 days prior to scheduled activities.
3. Reports and Invoices: The SME(s) will provide monthly invoices and reports detailing the actions taken and support provided.

Task 2: Biosafety/Biosecurity/Biorisk management/General risk management Subject Matter Expertise

1. General: Watermark will provide requested expertise to Metabiota to inform discussions with the DTRA client, requirements definition, proposal development, review of technical materials, or other tasks as needed. Expertise will be provided either verbally or in written form, as requested by Metabiota.
2. Studies and Analyses: Watermark will conduct program- and portfolio-wide studies as needed to determine BS&S/BRM implications of current and future initiatives and develop requirements for mitigation; infrastructure and capacity assessments, gap analyses and provide associated recommendations.
3. ***Option to be exercised at Metabiota's discretion*** – Training: Watermark will execute training activities associated with BS&S/BRM subject matter including but not limited to training and exercise planning and development; review, modification and development of training content; and course and exercise delivery.

Option to be exercised at Metabiota's discretion – Task 3: Travel to support Task 2
Watermark has the right to refuse travel to locations that present an undue security risk to

team members; however, Watermark must inform Metabiota of that refusal no later than 2 weeks after the destination country has been identified.

1. Watermark SMEs will complete all DoD-required training and documentation including AT/FP training, SERE training, and ISOPREP documentation.
2. Watermark SMEs will complete all required and recommended medical preparations prior to travel.
3. Watermark SMEs will travel as needed to support Task 2. Travel destinations and schedules will be determined through coordination with the Metabiota AEP program management team.

Deliverables:

Deliverable	Task	Description	Delivery Date
1. General written notes	1.1		48 hours after request
2. Monthly progress reports	1.3	Watermark will submit monthly progress reports relaying activities conducted and status of efforts, accomplishments, metrics, risks or barriers to task completion or overall project implementation.	Monthly (Due the last day of each month)
3. Timesheets and Invoicing	1.3	Watermark will submit one invoice per month for labor incurred, materials purchased, and travel costs. Labor shall be invoiced by labor category.	Monthly (Due the last day of each month)
4. Travel Preparations	1.2, 2.3, 3.1	The SMEs will submit pre-travel preparation materials (TEP, CCR, TAF)	TEP due 75 days prior to scheduled travel. CCR and TAF due 60 days prior to travel
5. Training Trip Reports	1.3, 3.3	The SME will submit post-training trip reports (TTR)	5 days after the completion of travel
6. Reports and Analyses	2.1, 2.2		As needed
7. Training and Exercise Documentation	2.2, 2.3		As needed

CLAUSES INCORPORATED BY FULL TEXT

252.216-9005 PROFIT OR FEE ON TRAVEL COSTS (JUL 2008)
Travel shall not be a profit or fee bearing cost element.

252.203-9000 Prohibition on the Use of Senior Mentors (JUNE 2010)
(a) The use of senior mentors by the Defense Threat Reduction Agency (DTRA) enhances the readiness of the Agency across a wide range of strategic, operational, joint, functional, technical, management and development mission areas. The relevant prior service, joint force experience, and unique expertise of these senior consultants provide senior leadership with valuable insights and contribute to the continuous improvement of the Agencies' operations.

(b) For the purposes of this clause, Senior Mentor is defined as a retired flag, general or other military officers (O-6) or retired senior civilian official (Senior Executive Service (SES), Senior Level (SL), Scientific and Professional (ST)) who provides expert experience-based mentoring, teaching, training, advice, and recommendations to senior military officers, staffs and students as they participate in war games, warfighting courses, operational planning, operational exercises, and decision-making exercises.

(c) In accordance with Secretary of Defense Memorandum entitled "Policy on Senior Mentors" dated April 1, 2010, DTRA will hire all senior mentors as highly qualified experts (HQE) under 5 U.S.C. 9903. This policy balances the need for DTRA to secure the specialized knowledge required for these operational exercises with the need to hire such experts in a manner that promotes public trust and confidence.

(d) The Contractor shall not include the use of senior mentors in bids or proposals for services/supplies offered to DTRA.

(e) The Contractor shall include the substance of this clause in all subcontracts.

252.216-9003 CONSULTANTS (OCT 1998)
Services of consultants shall be at rates and for periods approved in advance by the Contracting Officer. Requests for approval shall be submitted to the Contracting Officer sufficiently in advance of the need to use a consultant under this Contract. The request shall include (a) a copy of the proposed consultant agreement, (b) a brief biography of the consultant, and (c) an indication of the area(s) in which consultant's expertise will be utilized and why it is essential for contract performance. In addition, significant deviations from the dollar amount approved for consultant services, or changes in the consultants to be utilized, must likewise be approved in advance upon submission of adequate justification.

52.217-6 OPTION FOR INCREASED QUANTITY (MAR 1989)
The Government may increase the quantity of supplies called for in the Schedule at the unit price specified. The Contracting Officer may exercise the option by written notice to the Contractor within 60 days. Delivery of the added items shall continue at the same rate as the like items called for under the contract, unless the parties otherwise agree.

52.219-9 SMALL BUSINESS SUBCONTRACTING PLAN (JULY 2013)
(a) This clause does not apply to small business concerns.

(b) Definitions. As used in this clause--

"Alaska Native Corporation (ANC)" means any Regional Corporation, Village Corporation, Urban Corporation, or Group Corporation organized under the laws of the State of Alaska in accordance with the Alaska Native Claims Settlement Act, as amended (43 U.S.C. 1601, et seq.) and which is considered a minority and economically disadvantaged concern under the criteria at 43 U.S.C. 1626(e)(1). This definition also includes ANC direct and indirect subsidiary corporations, joint ventures, and partnerships that meet the requirements of 43 U.S.C. 1626(e)(2).

"Commercial item" means a product or service that satisfies the definition of commercial item in section 2.101 of the Federal Acquisition Regulation.

"Commercial plan" means a subcontracting plan (including goals) that covers the offeror's fiscal year and that applies to the entire production of commercial items sold by either the entire company or a portion thereof (e.g., division, plant, or product line).

"Electronic Subcontracting Reporting System (eSRS)" means the Governmentwide, electronic, web-based system for small business subcontracting program reporting. The eSRS is located at http://www.esrs.gov.

"Indian tribe" means any Indian tribe, band, group, pueblo, or community, including native villages and native groups (including corporations organized by Kenai, Juneau, Sitka, and Kodiak) as defined in the Alaska Native Claims Settlement Act (43 U.S.C.A. 1601 et seq.), that is recognized by the Federal Government as eligible for services from the Bureau of Indian Affairs in accordance with 25 U.S.C. 1452(c). This definition also includes Indian-owned economic enterprises that meet the requirements of 25 U.S.C. 1452(e).

"Individual contract plan" means a subcontracting plan that covers the entire contract period (including option periods), applies to a specific contract, and has goals that are based on the offeror's planned subcontracting in support of the specific contract except that indirect costs incurred for common or joint purposes may be allocated on a prorated basis to the contract.

"Master plan" means a subcontracting plan that contains all the required elements of an individual contract plan, except goals, and may be incorporated into individual contract plans, provided the master plan has been approved.

"Subcontract" means any agreement (other than one involving an employer-employee relationship) entered into by a Federal Government prime Contractor or subcontractor calling for supplies or services required for performance of the contract or subcontract.

(c) The offeror, upon request by the Contracting Officer, shall submit and negotiate a subcontracting plan, where applicable, that separately addresses subcontracting with small business concerns, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business concerns, small disadvantaged business, and with women-owned small business concerns. If the offeror is submitting an individual contract plan, the plan must separately address subcontracting with small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns with a separate part for the basic contract and separate parts for each option (if any). The plan shall be included in and made a part of the resultant contract. The subcontracting plan shall be negotiated within the time specified by the Contracting Officer. Failure to submit and negotiate the subcontracting plan shall make the offeror ineligible for award of a contract.

(d) The offeror's subcontracting plan shall include the following:

(1) Goals, expressed in terms of percentages of total planned subcontracting dollars, for the use of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns as subcontractors. The offeror shall include all subcontracts that

contribute to contract performance, and may include a proportionate share of products and services that are normally allocated as indirect costs. In accordance with 43 U.S.C. 1626:

(i) Subcontracts awarded to an ANC or Indian tribe shall be counted towards the subcontracting goals for small business and small disadvantaged business (SDB) concerns, regardless of the size or Small Business Administration certification status of the ANC or Indian tribe.

(ii) Where one or more subcontractors are in the subcontract tier between the prime contractor and the ANC or Indian tribe, the ANC or Indian tribe shall designate the appropriate contractor(s) to count the subcontract towards its small business and small disadvantaged business subcontracting goals.

(A) In most cases, the appropriate Contractor is the Contractor that awarded the subcontract to the ANC or Indian tribe.

(B) If the ANC or Indian tribe designates more than one Contractor to count the subcontract toward its goals, the ANC or Indian tribe shall designate only a portion of the total subcontract award to each Contractor. The sum of the amounts designated to various Contractors cannot exceed the total value of the subcontract.

(C) The ANC or Indian tribe shall give a copy of the written designation to the Contracting Officer, the prime Contractor, and the subcontractors in between the prime Contractor and the ANC or Indian tribe within 30 days of the date of the subcontract award.

(D) If the Contracting Officer does not receive a copy of the ANC's or the Indian tribe's written designation within 30 days of the subcontract award, the Contractor that awarded the subcontract to the ANC or Indian tribe will be considered the designated Contractor.

(2) A statement of --

(i) Total dollars planned to be subcontracted for an individual contract plan; or the offeror's total projected sales, expressed in dollars, and the total value of projected subcontracts to support the sales for a commercial plan;

(ii) Total dollars planned to be subcontracted to small business concerns (including ANC and Indian tribes);

(iii) Total dollars planned to be subcontracted to veteran-owned small business concerns;

(iv) Total dollars planned to be subcontracted to service-disabled veteran-owned small business;

(v) Total dollars planned to be subcontracted to HUBZone small business concerns;

(vi) Total dollars planned to be subcontracted to small disadvantaged business concerns (including ANCs and Indian tribes); and

(vii) Total dollars planned to be subcontracted to women-owned small business concerns.

(3) A description of the principal types of supplies and services to be subcontracted, and an identification of the types planned for subcontracting to --

(i) Small business concerns,

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns, and

(vi) Women-owned small business concerns.

(4) A description of the method used to develop the subcontracting goals in paragraph (d)(1) of this clause.

(5) A description of the method used to identify potential sources for solicitation purposes (e.g., existing company source lists, the System for Award Management (SAM), veterans service organizations, the National Minority Purchasing Council Vendor Information Service, the Research and Information Division of the Minority Business Development Agency in the Department of Commerce, or small, HUBZone, small disadvantaged, and women-owned small business trade associations). A firm may rely on the information contained in SAM as an accurate representation of a concern's size and ownership characteristics for the purposes of maintaining a small, veteran-owned small, service-disabled veteran-owned small, HUBZone small, small disadvantaged, and women-owned small business source list. Use of SAM as its source list does not relieve a firm of its responsibilities (e.g., outreach, assistance, counseling, or publicizing subcontracting opportunities) in this clause.

(6) A statement as to whether or not the offeror included indirect costs in establishing subcontracting goals, and a description of the method used to determine the proportionate share of indirect costs to be incurred with --

(i) Small business concerns (including ANC and Indian tribes);

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns (including ANC and Indian tribes); and

(vi) Women-owned small business concerns.

(7) The name of the individual employed by the offeror who will administer the offeror's subcontracting program, and a description of the duties of the individual.

(8) A description of the efforts the offeror will make to assure that small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns have an equitable opportunity to compete for subcontracts.

(9) Assurances that the offeror will include the clause of this contract entitled "Utilization of Small Business Concerns" in all subcontracts that offer further subcontracting opportunities, and that the offeror will require all subcontractors (except small business concerns) that receive subcontracts in excess of $650,000 ($1.5 million for construction of any public facility with further subcontracting possibilities) to adopt a plan similar to the plan that complies with the requirements of this clause.

(10) Assurances that the offeror will --

(i) Cooperate in any studies or surveys as may be required;

(ii) Submit periodic reports so that the Government can determine the extent of compliance by the offeror with the subcontracting plan;

(iii) Submit the Individual Subcontract Report (ISR) and/or the Summary Subcontract Report (SSR), in accordance with paragraph (l) of this clause using the Electronic Subcontracting Reporting System (eSRS) at http://www.esrs.gov. The reports shall provide information on subcontract awards to small business concerns (including ANCs and Indian tribes that are not small businesses), veteran-owned small business concerns, service-disabled veteran-owned small business concerns, HUBZone small business concerns, small disadvantaged business concerns (including ANCs and Indian tribes that have not been certified by the Small Business Administration as small disadvantaged businesses), women-owned small business concerns, and Historically Black Colleges and Universities and Minority Institutions. Reporting shall be in accordance with this clause, or as provided in agency regulations;

(iv) Ensure that its subcontractors with subcontracting plans agree to submit the ISR and/or the SSR using eSRS;

(v) Provide its prime contract number, its DUNS number, and the e-mail address of the offeror's official responsible for acknowledging receipt of or rejecting the ISRs, to all first-tier subcontractors with subcontracting plans so they can enter this information into the eSRS when submitting their ISRs; and

(vi) Require that each subcontractor with a subcontracting plan provide the prime contract number, its own DUNS number, and the e-mail address of the subcontractor's official responsible for acknowledging receipt of or rejecting the ISRs, to its subcontractors with subcontracting plans.

(11) A description of the types of records that will be maintained concerning procedures that have been adopted to comply with the requirements and goals in the plan, including establishing source lists; and a description of the offeror's efforts to locate small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns and award subcontracts to them. The records shall include at least the following (on a plant-wide or company-wide basis, unless otherwise indicated):

(i) Source lists (e.g., SAM), guides, and other data that identify small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns.

(ii) Organizations contacted in an attempt to locate sources that are small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, or women-owned small business concerns.

(iii) Records on each subcontract solicitation resulting in an award of more than $150,000, indicating --

(A) Whether small business concerns were solicited and if not, why not;

(B) Whether veteran-owned small business concerns were solicited and, if not, why not;

(C) Whether service-disabled veteran-owned small business concerns were solicited and, if not, why not;

(D) Whether HUBZone small business concerns were solicited and, if not, why not;

(E) Whether small disadvantaged business concerns were solicited and if not, why not;

(F) Whether women-owned small business concerns were solicited and if not, why not; and

(G) If applicable, the reason award was not made to a small business concern.

(iv) Records of any outreach efforts to contact --

(A) Trade associations;

(B) Business development organizations;

(C) Conferences and trade fairs to locate small, HUBZone small, small disadvantaged, and women-owned small business sources; and

(D) Veterans service organizaions.

(v) Records of internal guidance and encouragement provided to buyers through --

(A) Workshops, seminars, training, etc., and

(B) Monitoring performance to evaluate compliance with the program's requirements.

(vi) On a contract-by-contract basis, records to support award data submitted by the offeror to the Government, including the name, address, and business size of each subcontractor. Contractors having commercial plans need not comply with this requirement.

(e) In order to effectively implement this plan to the extent consistent with efficient contract performance, the Contractor shall perform the following functions:

(1) Assist small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns by arranging solicitations, time for the preparation of bids, quantities, specifications, and delivery schedules so as to facilitate the participation by such concerns. Where the Contractor's lists of potential small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business subcontractors are excessively long, reasonable effort shall be made to give all such small business concerns an opportunity to compete over a period of time.

(2) Provide adequate and timely consideration of the potentialities of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns in all "make-or-buy" decisions.

(3) Counsel and discuss subcontracting opportunities with representatives of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business firms.

(4) Confirm that a subcontractor representing itself as a HUBZone small business concern is identified as a certified HUBZone small business concern by accessing the SAM database or by contacting SBA.

(5) Provide notice to subcontractors concerning penalties and remedies for misrepresentations of business status as small, veteran-owned small business, HUBZone small, small disadvantaged or women-owned small business for the purpose of obtaining a subcontract that is to be included as part or all of a goal contained in the Contractor's subcontracting plan.

(6) For all competitive subcontracts over the simplified acquisition threshold in which a small business concern received a small business preference, upon determination of the successful subcontract offeror, the Contractor must inform each unsuccessful small business subcontract offeror in writing of the name and location of the apparent successful offeror prior to award of the contract.

(f) A master plan on a plant or division-wide basis that contains all the elements required by paragraph (d) of this clause, except goals, may be incorporated by reference as a part of the subcontracting plan required of the offeror by this clause; provided --

(1) The master plan has been approved;

(2) The offeror ensures that the master plan is updated as necessary and provides copies of the approved master plan, including evidence of its approval, to the Contracting Officer; and

(3) Goals and any deviations from the master plan deemed necessary by the Contracting Officer to satisfy the requirements of this contract are set forth in the individual subcontracting plan.

(g) A commercial plan is the preferred type of subcontracting plan for contractors furnishing commercial items. The commercial plan shall relate to the offeror's planned subcontracting generally, for both commercial and Government business, rather than solely to the Government contract. Once the Contractor's commercial plan has been approved, the Government will not require another subcontracting plan from the same Contractor while the plan remains in effect, as long as the product or service being provided by the Contractor continues to meet the definition of a commercial item. A Contractor with a commercial plan shall comply with the reporting requirements stated in paragraph (d)(10) of this clause by submitting one SSR in eSRS for all contracts covered by its commercial plan. This report shall be acknowledged or rejected in eSRS by the Contracting Officer who approved the plan. This report shall be submitted within 30 days after the end of the Government's fiscal year.

(h) Prior compliance of the offeror with other such subcontracting plans under previous contracts will be considered by the Contracting Officer in determining the responsibility of the offeror for award of the contract.

(i) A contract may have no more than one plan. When a modification meets the criteria in 19.702 for a plan, or an option is exercised, the goals associated with the modification or option shall be added to those in the existing subcontract plan.

(j) Subcontracting plans are not required from subcontractors when the prime contract contains the clause at 52.212-5, Contract Terms and Conditions Required to Implement Statutes or Executive Orders--Commercial Items, or when the subcontractor provides a commercial item subject to the clause at 52.244-6, Subcontracts for Commercial Items, under a prime contract.

(k) The failure of the Contractor or subcontractor to comply in good faith with --

(1) The clause of this contract entitled "Utilization Of Small Business Concerns;" or

(2) An approved plan required by this clause, shall be a material breach of the contract.

(l) The Contractor shall submit ISRs and SSRs using the web-based eSRS at http://www.esrs.gov. Purchases from a corporation, company, or subdivision that is an affiliate of the prime Contractor or subcontractor are not included in these reports. Subcontract award data reported by prime Contractors and subcontractors shall be limited to awards made to their immediate next-tier subcontractors. Credit cannot be taken for awards made to lower tier subcontractors, unless the Contractor or subcontractor has been designated to receive a small business or small disadvantaged business credit from an ANC or Indian tribe. Only subcontracts involving performance in the United States or its outlying areas should be included in these reports with the exception of subcontracts under a contract awarded by the State Department or any other agency that has statutory or regulatory authority to require subcontracting plans for subcontracts performed outside the United States and its outlying areas.

(1) ISR. This report is not required for commercial plans. The report is required for each contract containing an individual subcontract plan.

(i) The report shall be submitted semi-annually during contract performance for the periods ending March 31 and September 30. A report is also required for each contract within 30 days of contract completion. Reports are due 30 days after the close of each reporting period, unless otherwise directed by the Contracting Officer. Reports are required when due, regardless of whether there has been any subcontracting activity since the inception of the contract or the previous reporting period.

(ii) When a subcontracting plan contains separate goals for the basic contract and each option, as prescribed by FAR 19.704(c), the dollar goal inserted on this report shall be the

sum of the base period through the current option; for example, for a report submitted after the second option is exercised, the dollar goal would be the sum of the goals for the basic contract, the first option, and the second option.

(iii) The authority to acknowledge receipt or reject the ISR resides--

(A) In the case of the prime Contractor, with the Contracting Officer; and

(B) In the case of a subcontract with a subcontracting plan, with the entity that awarded the subcontract.

(2) SSR.

(i) Reports submitted under individual contract plans--

(A) This report encompasses all subcontracting under prime contracts and subcontracts with the awarding agency, regardless of the dollar value of the subcontracts.

(B) The report may be submitted on a corporate, company or subdivision (e.g. plant or division operating as a separate profit center) basis, unless otherwise directed by the agency.

(C) If a prime Contractor and/or subcontractor is performing work for more than one executive agency, a separate report shall be submitted to each executive agency covering only that agency's contracts, provided at least one of that agency's contracts is over $650,000 (over $1.5 million for construction of a public facility) and contains a subcontracting plan. For DoD, a consolidated report shall be submitted for all contracts awarded by military departments/agencies and/or subcontracts awarded by DoD prime Contractors. However, for construction and related maintenance and repair, a separate report shall be submitted for each DoD component.

(D) For DoD and NASA, the report shall be submitted semi-annually for the six months ending March 31 and the twelve months ending September 30. For civilian agencies, except NASA, it shall be submitted annually for the twelve month period ending September 30. Reports are due 30 days after the close of each reporting period.

(E) Subcontract awards that are related to work for more than one executive agency shall be appropriately allocated.

(F) The authority to acknowledge or reject SSRs in eSRS, including SSRs submitted by subcontractors with subcontracting plans, resides with the Government agency awarding the prime contracts unless stated otherwise in the contract.

(ii) Reports submitted under a commercial plan--

(A) The report shall include all subcontract awards under the commercial plan in effect during the Government's fiscal year.

(B) The report shall be submitted annually, within thirty days after the end of the Government's fiscal year.

(C) If a Contractor has a commercial plan and is performing work for more than one executive agency, the Contractor shall specify the percentage of dollars attributable to each agency from which contracts for commercial items were received.

(D) The authority to acknowledge or reject SSRs for commercial plans resides with the Contracting Officer who approved the commercial plan.

(iii) All reports submitted at the close of each fiscal year (both individual and commercial plans) shall include a Year-End Supplementary Report for Small Disadvantaged Businesses. The report shall include subcontract awards, in whole dollars, to small disadvantaged business concerns by North American Industry Classification System (NAICS) Industry Subsector. If the data are not available when the year-end SSR is submitted, the prime Contractor and/or subcontractor shall submit the Year-End Supplementary Report for Small Disadvantaged Businesses within 90 days of submitting the year-end SSR. For a commercial plan, the Contractor may obtain from each of its subcontractors a predominant NAICS Industry Subsector and report all awards to that subcontractor under its predominant NAICS Industry Subsector.

52.244-2 SUBCONTRACTS (OCT 2010)
(a) Definitions. As used in this clause--

Approved purchasing system means a Contractor's purchasing system that has been reviewed and approved in accordance with Part 44 of the Federal Acquisition Regulation (FAR).

Consent to subcontract means the Contracting Officer's written consent for the Contractor to enter into a particular subcontract.

Subcontract means any contract, as defined in FAR Subpart 2.1, entered into by a subcontractor to furnish supplies or services for performance of the prime contract or a subcontract. It includes, but is not limited to, purchase orders, and changes and modifications to purchase orders.

(b) When this clause is included in a fixed-price type contract, consent to subcontract is required only on unpriced contract actions (including unpriced modifications or unpriced delivery orders), and only if required in accordance with paragraph (c) or (d) of this clause.

(c) If the Contractor does not have an approved purchasing system, consent to subcontract is required for any subcontract that—

(1) Is of the cost-reimbursement, time-and-materials, or labor-hour type; or

(2) Is fixed-price and exceeds—

(i) For a contract awarded by the Department of Defense, the Coast Guard, or the National Aeronautics and Space Administration, the greater of the simplified acquisition threshold or 5 percent of the total estimated cost of the contract; or

(ii) For a contract awarded by a civilian agency other than the Coast Guard and the National Aeronautics and Space Administration, either the simplified acquisition threshold or 5 percent of the total estimated cost of the contract.

(d) If the Contractor has an approved purchasing system, the Contractor nevertheless shall obtain the Contracting Officer's written consent before placing the following subcontracts:

Subcontracts or Consultants (for Consultants see DTRA 252 216-9003 in Section H)

(e)(1) The Contractor shall notify the Contracting Officer reasonably in advance of placing any subcontract or modification thereof for which consent is required under paragraph (b), (c), or (d) of this clause, including the following information:

(i) A description of the supplies or services to be subcontracted.

(ii) Identification of the type of subcontract to be used.

(iii) Identification of the proposed subcontractor.

(iv) The proposed subcontract price.

(v) The subcontractor's current, complete, and accurate certified cost or pricing data and Certificate of Current Cost or Pricing Data, if required by other contract provisions.

(vi) The subcontractor's Disclosure Statement or Certificate relating to Cost Accounting Standards when such data are required by other provisions of this contract.

(vii) A negotiation memorandum reflecting—

(A) The principal elements of the subcontract price negotiations;

(B) The most significant considerations controlling establishment of initial or revised prices;

(C) The reason certified cost or pricing data were or were not required;

(D) The extent, if any, to which the Contractor did not rely on the subcontractor's certified cost or pricing data in determining
the price objective and in negotiating the final price;

(E) The extent to which it was recognized in the negotiation that the subcontractor's certified cost or pricing data were not accurate, complete, or current; the action taken by the Contractor and the subcontractor; and the effect of any such defective data on the total price negotiated;

(F) The reasons for any significant difference between the Contractor's price objective and the price negotiated; and

(G) A complete explanation of the incentive fee or profit plan when incentives are used. The explanation shall identify each critical performance element, management decisions used to quantify each incentive element, reasons for the incentives, and a summary of all trade-off possibilities considered.

(2) The Contractor is not required to notify the Contracting Officer in advance of entering into any subcontract for which consent is not required under paragraph (c), (d), or (e) of this clause.

(f) Unless the consent or approval specifically provides otherwise, neither consent by the Contracting Officer to any subcontract nor approval of the Contractor's purchasing system shall constitute a determination—

(1) Of the acceptability of any subcontract terms or conditions;

(2) Of the allowability of any cost under this contract; or

(3) To relieve the Contractor of any responsibility for performing this contract.

(g) No subcontract or modification thereof placed under this contract shall provide for payment on a cost-plus-a-percentage-of-cost basis, and any fee payable under cost-reimbursement type subcontracts shall not exceed the fee limitations in FAR 15.404-4(c)(4)(i).

(h) The Contractor shall give the Contracting Officer immediate written notice of any action or suit filed and prompt notice of any claim made against the Contractor by any subcontractor or vendor that, in the opinion of the Contractor, may result in litigation related in any way to this contract, with respect to which the Contractor may be entitled to reimbursement from the Government.

(i) The Government reserves the right to review the Contractor's purchasing system as set forth in FAR Subpart 44.3.

(j) Paragraphs (c) and (e) of this clause do not apply to the following subcontracts, which were evaluated during negotiations:

(End of clause)

252.203-9005, Implementation of Contractor Code of Business Ethics and Conduct (Dec 2008)

In accordance with FAR clause 52.203-13, Contractor Code of Business Ethics and Conduct, the designated "agency Office of the Inspector General" is the DoD OIG at the following address:

Office of the Inspector General
United States Department of Defense
Investigative Policy and Oversight
Contractor Disclosure Program
400 Army Navy Drive, Suite 1037
Arlington, VA 22202-4704
Toll Free Telephone: 866-429-8011

252.204-9001 UNIVERSITIES DISCLOSURE OF INFORMATION (JUL 2009)

(a) The Contractor shall not release to anyone outside the Contractor's organization any unclassified information, regardless of medium (e.g. film, tape, document) pertaining to any part of this contract or any program related to this contract, unless the information results from fundamental research, as defined below:

> "Fundamental research" as used in this clause, means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

(b) The Contractor shall confer and consult with DTRA on technical aspects of its research and submit technical documents intended for publication to the cognizant DTRA technical representative(s) for review, a minimum of 45 days prior to publication or other dissemination. The purpose of the DTRA review period is to ensure the government ample opportunity to provide comments and suggestions for the researchers' consideration.

252.204-9004 IMPLEMENTATION OF DISCLOSURE OF INFORMATION (JUN 2007)

METABIOTA

PRICE NEGOTIATION MEMORANDUM
METABIOTA, INC.

GENERAL INFORMATION:

Contractor name	Watermark Risk Management International, LLC
Proposal number	HDTRA1-14-C-0104

DESCRIPTION OF THE CONTRACT ACTION:

Description of the work (provide a brief summary of the general scope of the work encompassed by the action):
Watermark will collaborate with Metabiota to provide additional BS&S and bio-risk management expertise to the AEP team from 1 February 2016 – 15 November 2016. Watermark will provide remote and on-site grantsmanship mentoring, editorial guidance, implementation of mentoring work plans, and identification of future mentorship stakeholder needs.

This collaboration will build a long-term partnership between key research and technical centers in Georgia and will nourish hypothesis-driven and translational research programs that result in sustainable funding and academic publications.

NEGOTIATING PARTIES:

Identify the name position, organization and phone number/email of each person representing the contractor and the Government in the negotiation. Indicate the date(s) of the negotiation.

Contractor	Name	Position	Organization	Phone/Email
(b)(6)				
LLC			LLC	

METABIOTA

COST ANALYSIS:

The proposed subcontract is a sole source Time and Materials (T&M) contract evaluated upon completed technical and cost proposal from Watermark to provide subject matter expertise and support to overall operational activities in the Metabiota AEP contract that have a biosafety, biosecurity, or Biorisk management component. The T&M contract issued to Watermark was determined to be the most appropriate mechanism for these services based on the fair and reasonable pricing submitted by the subcontractor and the Metabiota team's determination that this would be the most effective means to ensure efficient performance in the best interest of the government.

This determination was made following an internal review of the subcontractor's hourly rates by labor category by Metabiota's financial, contract, and technical departments to determine overall reasonableness of the cost. The rates provided by the subcontractor were reasonable compared to those of other service providers with similar contract tasks and levels of experience and expertise. Additionally, the rate structure presented by Watermark is substantially comparable to and fits within Metabiota's own rate structure with the US government client.

Labor Category	Description	Rate
Research and Data Analyst	Provides research support on all tasks. Provide meeting support. Maintain documentation of all research activities. Conduct secondary research and document findings. Attend and document collaborative meetings.	$57.66
Subject Matter Expert 1	Possess unique credentials that provides expert advisor/contributions in complex and critical efforts. Must be skilled in providing unique, subject matter expertise in specific functional, technical, professional or policy areas. Responsibilities include: conducting sophisticated assessments of complex problems in areas of expertise; designing approaches to problems, analyzes and evaluating the work of others, and applying broad understanding of the state of the practice. Broadly recognized as authoritative, trusted sources of expertise within their community of practice.	$108.12
Subject Matter Expert 2	Possess unique credentials in an esoteric field that are not readily accessible either nationally or worldwide. Acts as an advisor and provides support to complex and critical efforts that require scarce and highly specific investigative or leadership capability. Requires the ability to understand underlying business, management, scientific, technical, programmatic, operational, and policy issues, and to provide expert analysis, assessment, and recommended courses of action for major programs/projects. Develop novel, multi-disciplinary approaches to complex and difficult problems and may analyze and evaluate the work of others, applying broad understanding of the state of the practice.	$121.09

Re: FAR 52.244-2 SUBCONTRACTS – Consent to Subcontract with University Research Co.
Academic Engagement Partnership (AEP), Cooperative Threat Reduction (CTR)
Contract No. HDTRA1-14-C-0104

Dear (b)(6)

Per FAR 52.244-2 Subcontracts, Metabiota, Inc. (Metabiota) requests Consent to Subcontract with University Research Co., LLC. to support the Iraq Field Epidemiology Training Program Support as defined in the TD-21 issued on 18 February 2016. Included with today's request are the following items:

- Draft Subcontract Agreement
- Competing proposals that were considered for this project
- Price Negotiation Memorandum (PNM)

We will provide a comprehensive subcontractor budget once finalized.

Description of services to be subcontracted.

- Three (3) Foreign Local National Trainers, located in Iraq, to facilitate remote online training courses, deliver a one-week Hands-On-Training course to participants, and provide subject matter expertise;
- One (1) Training & Procurement Coordinator, located in Iraq, to support in-country operations for the FLN training team, including on-the-ground coordination of event planning and execution, general assistance to the FLN Trainers, and management of locally procured materials for the Hands-On-Training activities, if deemed necessary;
- One (1) Operations Manager, based in US headquarters, to provide overhead management, assist FLN trainers in day-to-day activities, support Training & Procurement Coordinator with procurement guidance, ensure contract compliance, and manage overall operational tasks on behalf of the subcontractor;
- Complete any additional reporting requirements, as necessary, and requested by DTRA.

Type of subcontract to be used. *Time and Materials*
Proposed Subcontractor. University Research Co., LLC.
Proposed subcontract price. A preliminary estimation total of $62,184 USD

If you have questions or need additional information, I may be reached at (b)(6) (b)(6)

Sincerely,

(b)(6)

METABIOTA

AGREEMENT

This Subcontract ("Subcontract") is dated and effective as of June 15, 2016, (between **Metabiota, Inc.** (herein referred to as "Metabiota" or "Prime Contractor"), a California corporation, located at 425 California Street, Suite 200, San Francisco, CA, 94104 and **University Research Co. LLC (URC)** located at 7501 Wisconsin Ave, 12th Floor, Bethesda, MD 20814 (herein referred to as "URC" or "Subcontractor"). Metabiota and the Subcontractor are each a "Party" and together are the "Parties".

WHEREAS, the Prime Contractor was awarded Contract No. HDTRA1-14-C-0104 for the Academic Engagement Program (AEP) by the Defense Threat Reduction Agency (DTRA); and,

WHEREAS, the Prime Contractor desires to purchase certain services from the Subcontractor for the Client; and,

WHEREAS, the Subcontractor is willing to provide services to the Prime Contractor in accordance with the terms and conditions set forth in this Subcontract.

NOW, THEREFORE, the parties hereby agree as follows:

Article 1. Subcontract Services

1.1 Statement of Work. The Subcontractor shall provide all necessary and qualified personnel, equipment, material and facilities to perform the services (hereinafter, the "Work") as set forth in Attachment A—Scope of Work, which shall include the production of the deliverables ("Deliverables"), attached hereto and incorporated herein by this reference.

1.2 Reporting. The Subcontractor shall submit reports in accordance with the deliverables as described in Attachment A, and as referenced in Section 2.3.

The Prime Contractor may request additional information regarding the Subcontractor reports, for which the Subcontractor shall use reasonable best efforts to promptly address. The Prime Contractor will not consider award renewals for Subcontractors who fail to meet reporting requirements on a timely basis.

Article 2. Price, Contract Type, and Payment

2.1 Price and Contract Type. This Subcontract is a Time & Materials Contract Type. The ceiling price of $62,184.00 is fully funded.

2.2 Labor Rate Table. Subcontractor shall bill hourly, based on the labor rates and qualifications listed in the table below. Subcontractor shall provide back-up documentation detailing hours worked by position level, according to the Labor Categories and Rate Table below and Attachment B.

Position	Labor Description	Labor Category	Total Units	Rate	Total Costs
Foreign Local Trainer 1	Terminal degree (e.g., MD/DO, DVM, PhD, Doctorate, Master's) or minimum 10 years experience in a relevant technical field such as veterinary medicine; human medicine; epidemiology; public health; microbiology; molecular biology; laboratory biological safety and security.	FLN III	400 Hours	$48.20	$19,280
Foreign Local Trainer 2	Terminal degree or 5-7 years experience in a relevant technical field such as veterinary medicine; human medicine; epidemiology; public health;	FLN III	800 Hours	$40.16	$32,128

	microbiology; molecular biology; laboratory biological safety and security.				
Foreign Local Trainer Coordinator	Terminal degree or 3-5 years experience in a relevant technical field such as veterinary medicine; human medicine; epidemiology; public health; microbiology; molecular biology; laboratory biological safety and security.	FLN III	100 Hours	$37.50	$3,750
Program Operations Manager	US-based with terminal degree and 3-5 years relevant experience in a specific and scarcely populated field.	SME I	50 Hours	$97.68	$4,884
	Sub-Total				$60,042
	MATERIALS				
Telephone/ Fax/ Internet		6 Months		$125	$750
Office Supplies		6 Months		$75	$450
Printing/ Reproduction		6 Months		$100	$600
	Sub-Total				$1,800
	G&A on Materials (19.00%)				$342
	ODC				$0.00
	TRAVEL				$0.00
	TOTAL CONTRACT PRICE				$62,184

*Metabiota will directly cover airfare, lodging, and logistics expenses, should they be required *

2.3 Travel Costs. As per Article 11, As per Article 11, Prime Contractor shall coordinate travel and incur any travel costs.

If the Prime Contractor is unable to coordinate Subcontractor travel, the following guidelines shall be applied: Subcontractor shall submit Requests for Travel to Prime Contractor in writing at least 60 days prior to international travel and 30 days prior to domestic travel. Requests must include a detailed itinerary for Prime Contractor approval. Travel Costs must be approved in writing before any costs are incurred and would be invoiced separately, with supporting documentation (receipts). Detailed expense reports including itemized receipts must be submitted for reimbursement. No travel cost will be reimbursed without valid receipt. Travel includes airfare, ground transportation, accommodations, and Meals and Incidental Expenses (M&IE). Per diem rates shall be in accordance with Part 301-11 of U.S. Government Federal Travel Regulation (FTR), as per Article 2.2.2 and Federal Acquisition Regulation (FAR) 31.205.46. As per FAR 252.216-9005, there is no fee (profit) on travel costs permitted.

2.4 Invoicing. The Subcontractor shall submit one invoice after completion of all work under this agreement, no later than 30 days following completion of work to invoices@metabiota.com. The invoice shall contain the following information as shown in Attachment C:

- Reference the subcontract number 2016-13-DTRA
- Unique invoice number
- Invoice date
- Period of Performance
- Total invoice amount
- Cumulative invoice amount
- Name and address of Subcontractor (mailing address if different)
- Subcontract value and funding (in US Dollars)
- Signed by an authorized official of the Subcontractor

- A certification that reads substantially as follows: **"The undersigned hereby certifies that the amount being invoiced represents only those amounts properly payable in accordance with the terms and conditions of the Subcontract Agreement and the official financial records"**
- Invoices may be submitted via email to the following addresses listed below: **invoices@metabiota.com.**

2.5 Payment. Prime Contractor shall remit payments to the Subcontractor within 30 days of receipt of a valid invoice. Payments shall be made in US Dollars via ACH or Wire to:

Bank Name:	Capital One Bank
Bank Address:	7501 Wisconsin Avenue, 12th Floor, Bethesda, MD 20814, USA
Account Holder:	University Research Co., LLC
Account No:	500-434084-6
ABA Routing No:	255071981
IBAN/ Swift Code:	HIBKUS44

Article 3. Nature of the Relationship

The Subcontractor and Prime Contractor acknowledge that although the Subcontractor may perform services pursuant to Prime Contractor's general instructions, the Subcontractor in all matters is and shall be deemed to be an independent contractor and the employees or agents of the Subcontractor shall not be or be deemed to be employees or agents of Prime Contractor for any purpose.

The Subcontractor is responsible and liable for the payment of all local sales, use, gross receipts, ad valorem, property, excise or other taxes that may be applicable to this Agreement.

This Agreement does not require either party to enter into further contractual or other relationships with the other. This Agreement does not create a partnership, joint venture, agency, or other business relationship.

Article 4. Period of Performance

4.1 Period of Performance. The period of performance under this Subcontract shall be from June 15, 2016 – November 15, 2016.

4.2 This Subcontract may be terminated for convenience by either party by providing written notice to the other party thirty (30) calendar days in advance of a specified date of termination.

4.3 This Subcontract may be terminated by Prime Contractor upon written notice in the event of substantial failure by the Subcontractor to perform in accordance with the terms of this Agreement. In the event that the Subcontractor shall default in the performance of any obligation to be performed by it under this Agreement and shall fail to correct such default within ten (10) calendar days following written notice thereof from Prime Contractor. The Prime Contractor may hold in abeyance further payments to the Subcontractor and/or terminate this Agreement by written notice to the Subcontractor specifying the date of termination. Following a termination for default of this Agreement, Subcontractor shall be compensated for all completed Services to the extent that Prime Contractor is reimbursed by the Client for the Subcontractor's services.

4.4 Performance by the Subcontractor may be terminated by Prime Contractor at any time by written notice to the Subcontractor in the event that Prime Contractor's funding is terminated.

4.5 In the event of termination, Prime Contractor will reimburse the Subcontractor for allowable Subcontract Costs up to and including non-cancelable obligations properly incurred prior to the date of termination, provided such costs are allowable do not exceed the stated maximum amount payable.

Article 5. Confidentiality

In order to facilitate the Subcontract Services, Prime Contractor may disclose to the Subcontractor information that it considers confidential or proprietary ("Confidential Information"). Confidential or proprietary information is defined as any information disclosed by one Party (the "Disclosing Party") to the other Party (the "Receiving Party") in a written or tangible shall be marked as "Confidential" or "Proprietary", or if disclosed orally or visually, identified as confidential and/or proprietary at the time of disclosure (which is reduced to writing and so marked within a reasonable time, not to exceed sixty (60) days, thereafter). The Subcontractor will hold in confidence any Confidential Information disclosed by Prime Contractor, and will not use Confidential Information for any purpose except in furtherance of the Subcontract Services. The Subcontractor will take reasonable and prudent precautions to protect the Confidential Information disclosed by Prime Contractor pursuant to this Subcontract. This obligation of confidentiality shall not, however, apply to information which: (i) was known to the Subcontractor and was not proprietary to Prime Contractor prior to the time of disclosure, as demonstrated by competent written evidence; (ii) was part of the public domain prior to the time of disclosure; (iii) becomes part of the public domain after the time of disclosure other than through any act or omission of the Subcontractor in breach of this Subcontract; (iv) is independently developed by the Subcontractor or those employees, contractors, and other researchers directly engaged by the Subcontractor without access to, use of, or regard to the Confidential Information disclosed to it by Prime Contractor. The above confidentiality and non-use obligations shall expire five (5) years following the conclusion of the Subcontract Services hereunder.

Article 6. Data, Publications and Copyrights

6.1 Subcontractor's researchers are free to publish the results of research supported thereunder, however, Subcontractor's Principal Investigator shall supply a copy of any such publication(s) or reports to Prime Contractor's Program Manager sixty (60) days prior to release.

b. Subject to its legal ability to do so, Subcontractor hereby grants Prime Contractor license to use data created in the performance of this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

d. Subject to its legal ability to do so, Subcontractor hereby grants to Prime Contractor an irrevocable, royalty-free, non-transferable, non-exclusive right and license to reproduce, make derivative works, display, and perform publicly any copyrightable or copyrighted material (including any computer software and its documentation and/ or database) developed and delivered under this Agreement to the extent required to meet Prime Contractor's obligations under the Prime Agreement.

e. Use of Name. Except as otherwise required by applicable law, regulation or order of a governmental agency or court of competent jurisdiction, Farlow shall not use the name of METABIOTA or METABIOTA's directors, officers, employees or representatives in any advertising, news release or other publication, without the prior express written consent from METABIOTA.

Article 7. Authorship and Specimen Ownership

7.1 Publication and Specimen Collections. Authorship on all resulting publications (reports, articles, books, etc.) produced under this Subcontract shall include people from both field and laboratory groups represented by Prime Contractor and Subcontractor only insofar as they contributed to the publication in a substantive way. Prior to initiation of writing any publications, the responsibilities for authorship for any given publication will be agreed upon by consensus of all parties. However, if a consensus by all parties is not reached within a reasonable period of time Subcontractor's Principal Investigator shall be free to publish independently and agrees to acknowledge Prime Contractor and/or give acknowledgment to Prime Contractor's scientists in publications or presentations, as scientifically appropriate. The Subcontractor's Principal Investigator and Subcontractor shall include Prime Contractor's scientists as co-authors on such publications, insofar as they provide any direct contributions to the work. All reports, articles, or books produced under this Subcontract shall conform to Attachment D – Mandatory Flow Down. Nothing in this contract limits the right of Subcontractor to produce derivative work products with the materials or data produced in the execution of this contract with the exception of the terms in this Agreement that require

Prime Contractor's consent to use of name. The derivative work performed by the Subcontractor shall be at the risk of the Subcontractor exclusively.

7.2 Specimen Ownership. Inasmuch as applicable, for all resulting specimens collected under Subcontract, Prime Contractor, to the extent required to meet Prime Contractor's obligations under the Prime Agreement, shall retain an unlimited license to use, disclose, reproduce, and prepare derivative works, in any manner and or any purpose, and to have or permit others to do so.

Article 8. Miscellaneous Terms

8.1 Assignment. Subcontractor shall not assign, transfer or Subcontract its rights, interest, or obligations hereunder without the prior written consent of Prime Contractor and modification to this Subcontract.

8.2 Modifications. The terms and conditions of this Subcontract may be changed by mutual agreement of the parties. In the event that the Government modifies the terms and/or conditions of the Prime Agreement, Prime Contractor reserves the right to unilaterally modify the terms and/or conditions of this Subcontract to reflect the Government's modifications and, thereafter, to negotiate an adjustment, to the extent any such unilateral modification increases the Subcontractor's cost of performance, which modification shall be mutually agreed upon by Prime Contractor and the Subcontractor.

8.3 No Waivers. The failure of Prime Contractor to exercise any of its rights under this Subcontract shall not be deemed to be a waiver of such rights.

8.4 Force Majeure. Neither party shall be held liable or responsible to the other party nor be deemed to have defaulted under or breached this Agreement for failure or delay in fulfilling or performing any obligation under this Agreement the extent, and for so long as, such failure or delay is caused by or results from causes beyond the reasonable control of the affected party including but not limited to fires, earthquakes, floods, embargoes, wars, acts of war (whether war is declared or not), insurrections, riots, civil disturbances, strikes, lockouts or other labor disturbances, acts of God or any acts, omissions, or delays in acting by any governmental authority or the other party.

8.5 Export Control. Both parties will comply with any applicable export regulations, including the Export Administration Regulation and the International Traffic in Arms Regulation, in the conduct of the project. Neither party will transmit to the other any technical data, commodity, or technical assistance controlled under the export regulations without first securing the consent of the receiving party and modification of this agreement signed by the authorized official for each party.

8.6 Entire Subcontract. This Subcontract and its Attachments supersedes any prior or contemporaneous oral or written understandings or communications between the parties and constitutes the entire Subcontract of the parties with respect to its subject matter. This Subcontract may not be amended or modified, except in a writing signed by both parties.

8.7 Governing Law. This Subcontract shall be governed by the laws of the State of California.

8.8 No Liability. To the maximum extent permitted by applicable law, in no event shall Prime Contractor and Subcontractor be liable to the other party under any theory including contract and tort (both negligence and strict products liability) for any special, incidental, indirect, or consequential damages whatsoever (including, without limitation, damages for loss of business profit, business interruption, loss of business information, loss of goodwill) arising out of or relating to the Project. In addition, Prime Contractor and Subcontractor shall not be liable for losses, damages, claims, or other liabilities arising out of the other party's activities. It is expressly understood that Prime Contractor, by entering into this Subcontract, has no obligation to provide other or additional support to the Subcontractor for the purposes of this project or any other purposes.

8.9 Indemnification. The parties agree to defend, indemnify and hold one another, their officers, employees and agents harmless from and against any and all liability, loss, expense, attorneys' fees, or claims for injury or damages directly resulting from the performance of this Agreement but only in proportion to and to the extent such liability, loss, expense, attorneys' fees, or claims for injury or damages are caused by or result from the negligent or intentional acts or omissions of the indemnifying party.

8.10 Severability. The illegality or invalidity of any provisions of this Subcontract shall not impair, affect or invalidate the other provisions of this Subcontract.

8.11 Protection of Research Subjects. If human or animal subjects are used in the conduct of the work performed under this Subcontract, the Subcontractor's protocol must be approved by the Subcontractor's office for the protection of research subjects in accordance with federal regulations, including 45 C.F.R. Part 46, the Office for Human Research Protections (OHRP), 9 C.F.R. Subchapter A under the Animal Welfare Act, and submitted to Prime Contractor.

8.12 Defense Base Act Insurance. Subcontractor shall be required to obtain Defense Base Act Insurance (DBA) in accordance with FAR clause 52.228-4 Workers Compensation and War Hazard Insurance Overseas. DBA insurance will be funded and provided for the Subcontractor by the Prime Contractor (Metabiota). Subcontractor shall provide all pertinent information to Prime Contractor in order to obtain adequate coverage.

8.13 Limits on URC Support for Certain Research Subject Areas. In keeping with the purpose of DTRA BAA Thrust Area 6, URC will support only the development of funding proposals that have a purely civilian focus; without outcomes that could substantively contribute to use in weapons of mass destruction or military applications; and that propose research of a quality and nature suitable for publication in academic journals.

Article 9. Attachments

This following Attachments to this Subcontract are incorporated by reference: Attachment A - Scope of Work and Deliverables, Attachment B – Labor Categories and Rates Table, Attachment C – T&M Invoice Template, and Attachment D – Mandatory Flow Down.

Article 10. Administrative and Technical Contacts

The following individuals shall serve as contacts for communications regarding this Subcontract:

Attachment A - Scope of Work and Deliverables

Order 01 – Scope of Work

Period of Performance: 15 June 2016 – 15 November 2016

Position/Labor Category/Title: Foreign Local Expert (FLN) support for Iraq Field Epidemiology and BS&S Training

Budget: $62,184.00

Position	Labor Description	Labor Category	Total Units	Rate	Total Costs
Foreign Local Trainer 1	Terminal degree (e.g., MD/DO, DVM, PhD, Doctorate, Master's) or minimum 10 years experience in a relevant technical field such as veterinary medicine; human medicine; epidemiology; public health; microbiology; molecular biology; laboratory biological safety and security.	FLN III	400 Hours	$48.20	$19,280
Foreign Local Trainer 2	Terminal degree or 5-7 years experience in a relevant technical field such as veterinary medicine; human medicine; epidemiology; public health; microbiology; molecular biology; laboratory biological safety and security.	FLN III	800 Hours	$40.16	$32,128
Foreign Local Trainer Coordinator	Terminal degree or 3-5 years experience in a relevant technical field such as veterinary medicine; human medicine; epidemiology; public health; microbiology; molecular biology; laboratory biological safety and security.	FLN III	100 Hours	$37.50	$3,750
Program Operations Manager	US-based with terminal degree and 3-5 years relevant experience in a specific and scarcely populated field.	SME I	50 Hours	$97.68	$4,884
	Sub-Total				$60,042
	MATERIALS				
Telephone/ Fax/ Internet		6 Months		$125	$750
Office Supplies		6 Months		$75	$450
Printing/ Reproduction		6 Months		$100	$600
	Sub-Total				$1,800
	G&A on Materials (19.00%)				$342
	ODC				$0.00
	TRAVEL				$0.00
	TOTAL CONTRACT PRICE				$62,184

*Metabiota will directly cover airfare, lodging, and logistics expenses, should they be required *

METABIOTA

Project Summary:
Through the CBEP AEP program, this activity will support the enhancement of existing Iraqi capacity for the conduction of field epidemiology, standardization and implementation of biosafety and biosecurity practices. The project will be conducted via remote/online mentorship and training, as well as a single hands-on engagement. At the direction of Metabiota, URC will provide US-based and foreign local national (FLN) support to Metabiota related to epidemiology, biosafety & biosecurity, and general risk management principles for the Iraq Field Epidemiology Training Program Support Course project. FLNs will support, facilitate and coordinate three separate 6-week remote/ online training programs, one 1-week NBERP Familiarization virtual workshop, and one 3-week gap analysis report. In addition, FLNs will facilitate, coordinate and deliver a one 1-week hands-on training course. The US-based Operations Manager will provide overhead management to FLN's, coordinate communication between FLN's and Metabiota, support day-to-day activities, ensure compliance, and manage overall operational tasks.

Schedule/Timeline: This activity will take place June 15th 2016 – November 15th 2016. Each monthly progress report will be completed the last day of each month.

Phase	**Q2 2016**			**Q3 2016**			**Q4 2016**		
	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Phase 1: Learning Management System Familiarization									
Phase 2: Support Remote Delivery of Epidemiology Course #1									
Phase 3: Support Remote Delivery of Epidemiology Course #2 and simulateous Biosafety & Bio-security Course #1									
Phase 4: Deliver Hands-on-Training									
Phase 5: Support Delivery of NBERP Familiarization Workshop									
Phase 6: Support Delivery of Remote Gap Analysis									

Time Line and LOE estimates:

Dates	**Phase**	**Estimated LOE**
June 15 – October 31	General Project Coordination	800-950 hours
June 15 – Sept 30	LMS Implementation	100- 150 hours
October 2 – 6	Hands-On Course Delivery	100 hours
October 9 – 13	NBERP Familiarization Workshop	100 hours
October 16 – November 3	Gap Analysis	100-200 hours

METABIOTA

Task 1: Administrative Coordination:

1. Communication: The FLN(s) and SME will participate in conference calls and email communications with the Prime Contractor Program Manager (PM), Project Coordinator (PC), in-country stakeholders, and remote instructors as needed. When requested, FLN(s) will provide inputs to minutes and action item lists resulting from said communications.
2. Preparation: The FLNs will assist the Prime Contractor PM and PC to develop and complete all contingent deliverables prior to and following training events. Such deliverables include, but are not limited to: Training Trip Report, After Action Report, Post Training Assessment (due 5 days' post-event), and Pre and Post Tests. FLN(s) will coordinate with Prime Contractor PM, PC, and in-country stakeholders as needed, including but not limited to assisting in the facilitation of the appropriate ministerial approvals prior to event implementation.
3. Reports and Invoices: The FLN(s) will provide monthly invoices and reports detailing the actions taken and support provided.

Task 2: Information Technology, Epidemiology, and/ or Biosafety/ Biosecurity/ Biorisk management/ General risk management subject matter expertise:

1. Information Technology: URC FLN's will partake in learning management system (LMS) training program. With support from Prime Contractor PC, FLN(s) will assist participants in troubleshooting, using, and downloading training materials from the online LMS.
2. Training Implementation: URC FLNs will support the training program through multiple methods listed below. FLN(s) will be available between sessions to answer questions via telephone and email communications from participants. FLN(s) will also provide overall course feedback and observations of student participation and engagement to Metabiota.
    a. During the three 6-week remote/ online mentorship and in-depth training programs, URC FLNs will support the virtual instructors and facilitate the training as-needed, including but not limited to explaining technical epidemiology and biosafety and biosecurity terms and concepts, occasional translation of technical terminology between English and Arabic, and general coordination of training events. Each week of the remote program may include up to 2 lecture sessions to be agreed upon in coordination with Prime Contractor Management Team.
    b. URC FLN(s) may execute and deliver training activities during the 1-week hands-on training course, which will emphasize the key points of the remote epidemiology and BS&S trainings and include practical exercises such as PPE donning and doffing.
    c. ***Optional, to be executed at discretion of Metabiota*:** URC FLN(s) will assist in the coordination of local participants during their familiarization with the National Biological Emergency Response Plan draft. URC FLN(s) will also support the Metabiota team in the virtual gap analysis.
3. Monitoring and Evaluation: Throughout the training program, FLN(s) may provide feedback to participants on their performance. FLN(s) will monitor participants during the training process, facilitate working groups, and keep courses on task and on schedule. FLN(s) will also assist in the development, delivery and collection of pre- and post-tests prior to and immediately following each training cohort.

4. ***Optional, to be executed at discretion of Metabiota*:** URC to support in-country procurement, to include coordination with local vendors, procurement of training materials and supplies, coordination of receipt and transfer of supplies to training event venue.

Project Deliverables:

Deliverable	Task	Description	Delivery Date
1. General written notes	1.1	Notes, minutes, and action items from calls, meetings, or other communications.	48 hours after request
2. Administrative requirements	1.2	Assist in the development, identification and coordination of administrative requirements with the Prime Contractor PM and PC.	No later than 60 days prior to event
3. Monthly Progress Reports	1.3	Submit monthly progress reports to Prime Contractor PM and PC relaying activities conducted and status of efforts, accomplishments, metrics, risks or barriers to task completion or overall project implementation.	Monthly (Due the last day of each month)
4. Timesheets and Invoicing	1.3	Submit one invoice per month for labor incurred. Include labor hours per individual and labor category, and receipts for any materials procured.	Monthly (Due the last day of each month)
5. Labor Projections	1.3	Submit monthly labor projections for all personnel working on the project	Due the 20th day of the previous month
6. After Action, Training Trip report and Post-training Assessment	1.2, 2.2	Submit inputs to post-training reports, including the After Action Report, Training Trip Report, and Post-Training Assessment.	Due 5 days' post-event
7. Monitoring and evaluation	1.2, 2.3	Distribute and collect pre- and post-tests prior to and following each training cohort.	Due 5 days' post-event
8. Reports and Analyses	1.3, 2.2	Complete any additional reporting requirements, as necessary, and requested by the Funder, within the resources provided by the Subcontract.	As needed

CLAUSES INCORPORATED BY FULL TEXT

252.216-9005 PROFIT OR FEE ON TRAVEL COSTS (JUL 2008)
Travel shall not be a profit or fee bearing cost element.

252.203-9000 Prohibition on the Use of Senior Mentors (JUNE 2010)
(a) The use of senior mentors by the Defense Threat Reduction Agency (DTRA) enhances the readiness of the Agency across a wide range of strategic, operational, joint, functional, technical, management and development mission areas. The relevant prior service, joint force experience, and unique expertise of these senior consultants provide senior leadership with valuable insights and contribute to the continuous improvement of the Agencies' operations.

(b) For the purposes of this clause, Senior Mentor is defined as a retired flag, general or other military officers (O-6) or retired senior civilian official (Senior Executive Service (SES), Senior Level (SL), Scientific and Professional (ST)) who provides expert experience-based mentoring, teaching, training, advice, and recommendations to senior military officers, staffs and students as they participate in war games, warfighting courses, operational planning, operational exercises, and decision-making exercises.

(c) In accordance with Secretary of Defense Memorandum entitled "Policy on Senior Mentors" dated April 1, 2010, DTRA will hire all senior mentors as highly qualified experts (HQE) under 5 U.S.C. 9903. This policy balances the need for DTRA to secure the specialized knowledge required for these operational exercises with the need to hire such experts in a manner that promotes public trust and confidence.

(d) The Contractor shall not include the use of senior mentors in bids or proposals for services/supplies offered to DTRA.

(e) The Contractor shall include the substance of this clause in all subcontracts.

252.216-9003 CONSULTANTS (OCT 1998)
Services of consultants shall be at rates and for periods approved in advance by the Contracting Officer. Requests for approval shall be submitted to the Contracting Officer sufficiently in advance of the need to use a consultant under this Contract. The request shall include (a) a copy of the proposed consultant agreement, (b) a brief biography of the consultant, and (c) an indication of the area(s) in which consultant's expertise will be utilized and why it is essential for contract performance. In addition, significant deviations from the dollar amount approved for consultant services, or changes in the consultants to be utilized, must likewise be approved in advance upon submission of adequate justification.

52.217-6 OPTION FOR INCREASED QUANTITY (MAR 1989)
The Government may increase the quantity of supplies called for in the Schedule at the unit price specified. The Contracting Officer may exercise the option by written notice to the Contractor within 60 days. Delivery of the added items shall continue at the same rate as the like items called for under the contract, unless the parties otherwise agree.

52.219-9 SMALL BUSINESS SUBCONTRACTING PLAN (JULY 2013)
(a) This clause does not apply to small business concerns.

(b) Definitions. As used in this clause--

"Alaska Native Corporation (ANC)" means any Regional Corporation, Village Corporation, Urban Corporation, or Group Corporation organized under the laws of the State of Alaska in accordance with the Alaska Native Claims Settlement Act, as amended (43 U.S.C. 1601, et seq.) and which is considered a minority and economically disadvantaged concern under the criteria at 43 U.S.C. 1626(e)(1). This definition also includes ANC direct and indirect subsidiary corporations, joint ventures, and partnerships that meet the requirements of 43 U.S.C. 1626(e)(2).

"Commercial item" means a product or service that satisfies the definition of commercial item in section 2.101 of the Federal Acquisition Regulation.

"Commercial plan" means a subcontracting plan (including goals) that covers the offeror's fiscal year and that applies to the entire production of commercial items sold by either the entire company or a portion thereof (e.g., division, plant, or product line).

"Electronic Subcontracting Reporting System (eSRS)" means the Governmentwide, electronic, web-based system for small business subcontracting program reporting. The eSRS is located at http://www.esrs.gov.

"Indian tribe" means any Indian tribe, band, group, pueblo, or community, including native villages and native groups (including corporations organized by Kenai, Juneau, Sitka, and Kodiak) as defined in the Alaska Native Claims Settlement Act (43 U.S.C.A. 1601 et seq.), that is recognized by the Federal Government as eligible for services from the Bureau of Indian Affairs in accordance with 25 U.S.C. 1452(c). This definition also includes Indian-owned economic enterprises that meet the requirements of 25 U.S.C. 1452(e).

"Individual contract plan" means a subcontracting plan that covers the entire contract period (including option periods), applies to a specific contract, and has goals that are based on the offeror's planned subcontracting in support of the specific contract except that indirect costs incurred for common or joint purposes may be allocated on a prorated basis to the contract.

"Master plan" means a subcontracting plan that contains all the required elements of an individual contract plan, except goals, and may be incorporated into individual contract plans, provided the master plan has been approved.

"Subcontract" means any agreement (other than one involving an employer-employee relationship) entered into by a Federal Government prime Contractor or subcontractor calling for supplies or services required for performance of the contract or subcontract.

(c) The offeror, upon request by the Contracting Officer, shall submit and negotiate a subcontracting plan, where applicable, that separately addresses subcontracting with small business concerns, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business concerns, small disadvantaged business, and with women-owned small business concerns. If the offeror is submitting an individual contract plan, the plan must separately address subcontracting with small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns with a separate part for the basic contract and separate parts for each option (if any). The plan shall be included in and made a part of the resultant contract. The subcontracting plan shall be negotiated within the time specified by the Contracting Officer. Failure to submit and negotiate the subcontracting plan shall make the offeror ineligible for award of a contract.

(d) The offeror's subcontracting plan shall include the following:

(1) Goals, expressed in terms of percentages of total planned subcontracting dollars, for the use of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns as subcontractors. The offeror shall include all subcontracts that contribute to contract performance, and may include a proportionate share of products and services that are normally allocated as indirect costs. In accordance with 43 U.S.C. 1626:

(i) Subcontracts awarded to an ANC or Indian tribe shall be counted towards the subcontracting goals for small business and small disadvantaged business (SDB) concerns, regardless of the size or Small Business Administration certification status of the ANC or Indian tribe.

(ii) Where one or more subcontractors are in the subcontract tier between the prime contractor and the ANC or Indian tribe, the ANC or Indian tribe shall designate the appropriate contractor(s) to count the subcontract towards its small business and small disadvantaged business subcontracting goals.

(A) In most cases, the appropriate Contractor is the Contractor that awarded the subcontract to the ANC or Indian tribe.

(B) If the ANC or Indian tribe designates more than one Contractor to count the subcontract toward its goals, the ANC or Indian tribe shall designate only a portion of the total subcontract award to each Contractor. The sum of the amounts designated to various Contractors cannot exceed the total value of the subcontract.

(C) The ANC or Indian tribe shall give a copy of the written designation to the Contracting Officer, the prime Contractor, and the subcontractors in between the prime Contractor and the ANC or Indian tribe within 30 days of the date of the subcontract award.

(D) If the Contracting Officer does not receive a copy of the ANC's or the Indian tribe's written designation within 30 days of the subcontract award, the Contractor that awarded the subcontract to the ANC or Indian tribe will be considered the designated Contractor.

(2) A statement of --

(i) Total dollars planned to be subcontracted for an individual contract plan; or the offeror's total projected sales, expressed in dollars, and the total value of projected subcontracts to support the sales for a commercial plan;

(ii) Total dollars planned to be subcontracted to small business concerns (including ANC and Indian tribes);

(iii) Total dollars planned to be subcontracted to veteran-owned small business concerns;

(iv) Total dollars planned to be subcontracted to service-disabled veteran-owned small business;

(v) Total dollars planned to be subcontracted to HUBZone small business concerns;

(vi) Total dollars planned to be subcontracted to small disadvantaged business concerns (including ANCs and Indian tribes); and

(vii) Total dollars planned to be subcontracted to women-owned small business concerns.

(3) A description of the principal types of supplies and services to be subcontracted, and an identification of the types planned for subcontracting to --

(i) Small business concerns,

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns, and

(vi) Women-owned small business concerns.

(4) A description of the method used to develop the subcontracting goals in paragraph (d)(1) of this clause.

(5) A description of the method used to identify potential sources for solicitation purposes (e.g., existing company source lists, the System for Award Management (SAM), veterans service organizations, the National Minority Purchasing Council Vendor Information Service, the Research and Information Division of the Minority Business Development Agency in the Department of Commerce, or small, HUBZone, small disadvantaged, and women-owned small business trade associations). A firm may rely on the information contained in SAM as an accurate representation of a concern's size and ownership characteristics for the purposes of maintaining a small, veteran-owned small, service-disabled veteran-owned small, HUBZone small, small disadvantaged, and women-owned small business source list. Use of SAM as its source list does not relieve a firm of its responsibilities (e.g., outreach, assistance, counseling, or publicizing subcontracting opportunities) in this clause.

(6) A statement as to whether or not the offeror included indirect costs in establishing subcontracting goals, and a description of the method used to determine the proportionate share of indirect costs to be incurred with --

(i) Small business concerns (including ANC and Indian tribes);

(ii) Veteran-owned small business concerns;

(iii) Service-disabled veteran-owned small business concerns;

(iv) HUBZone small business concerns;

(v) Small disadvantaged business concerns (including ANC and Indian tribes); and

(vi) Women-owned small business concerns.

(7) The name of the individual employed by the offeror who will administer the offeror's subcontracting program, and a description of the duties of the individual.

(8) A description of the efforts the offeror will make to assure that small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns have an equitable opportunity to compete for subcontracts.

(9) Assurances that the offeror will include the clause of this contract entitled "Utilization of Small Business Concerns" in all subcontracts that offer further subcontracting opportunities, and that the offeror will require all subcontractors (except small business concerns) that receive subcontracts in excess of $650,000 ($1.5 million for construction of any public facility with further subcontracting possibilities) to adopt a plan similar to the plan that complies with the requirements of this clause.

(10) Assurances that the offeror will --

(i) Cooperate in any studies or surveys as may be required;

(ii) Submit periodic reports so that the Government can determine the extent of compliance by the offeror with the subcontracting plan;

(iii) Submit the Individual Subcontract Report (ISR) and/or the Summary Subcontract Report (SSR), in accordance with paragraph (l) of this clause using the Electronic Subcontracting Reporting System (eSRS) at http://www.esrs.gov. The reports shall provide information on subcontract awards to small business concerns (including ANCs and Indian tribes that are not small businesses), veteran-owned small business concerns, service-disabled veteran-owned small business concerns, HUBZone small business concerns, small disadvantaged business concerns (including ANCs and Indian tribes that have not been certified by the Small Business Administration as small disadvantaged businesses), women-owned small business concerns, and Historically Black Colleges and Universities and Minority Institutions. Reporting shall be in accordance with this clause, or as provided in agency regulations;

(iv) Ensure that its subcontractors with subcontracting plans agree to submit the ISR and/or the SSR using eSRS;

(v) Provide its prime contract number, its DUNS number, and the e-mail address of the offeror's official responsible for acknowledging receipt of or rejecting the ISRs, to all first-tier subcontractors with subcontracting plans so they can enter this information into the eSRS when submitting their ISRs; and

(vi) Require that each subcontractor with a subcontracting plan provide the prime contract number, its own DUNS number, and the e-mail address of the subcontractor's official responsible for acknowledging receipt of or rejecting the ISRs, to its subcontractors with subcontracting plans.

(11) A description of the types of records that will be maintained concerning procedures that have been adopted to comply with the requirements and goals in the plan, including establishing source lists; and a description of the offeror's efforts to locate small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns and award subcontracts to them. The records shall include at least the following (on a plant-wide or company-wide basis, unless otherwise indicated):

(i) Source lists (e.g., SAM), guides, and other data that identify small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns.

(ii) Organizations contacted in an attempt to locate sources that are small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, or women-owned small business concerns.

(iii) Records on each subcontract solicitation resulting in an award of more than $150,000, indicating --

(A) Whether small business concerns were solicited and if not, why not;

(B) Whether veteran-owned small business concerns were solicited and, if not, why not;

(C) Whether service-disabled veteran-owned small business concerns were solicited and, if not, why not;

(D) Whether HUBZone small business concerns were solicited and, if not, why not;

(E) Whether small disadvantaged business concerns were solicited and if not, why not;

(F) Whether women-owned small business concerns were solicited and if not, why not; and

(G) If applicable, the reason award was not made to a small business concern.

(iv) Records of any outreach efforts to contact --

(A) Trade associations;

(B) Business development organizations;

(C) Conferences and trade fairs to locate small, HUBZone small, small disadvantaged, and women-owned small business sources; and

(D) Veterans service organizaions.

(v) Records of internal guidance and encouragement provided to buyers through --

(A) Workshops, seminars, training, etc., and

(B) Monitoring performance to evaluate compliance with the program's requirements.

(vi) On a contract-by-contract basis, records to support award data submitted by the offeror to the Government, including the name, address, and business size of each subcontractor. Contractors having commercial plans need not comply with this requirement.

(e) In order to effectively implement this plan to the extent consistent with efficient contract performance, the Contractor shall perform the following functions:

(1) Assist small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns by arranging solicitations, time for the preparation of bids, quantities, specifications, and delivery schedules so as to facilitate the participation by such concerns. Where the Contractor's lists of potential small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business subcontractors are excessively long, reasonable effort shall be made to give all such small business concerns an opportunity to compete over a period of time.

(2) Provide adequate and timely consideration of the potentialities of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns in all "make-or-buy" decisions.

(3) Counsel and discuss subcontracting opportunities with representatives of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business firms.

(4) Confirm that a subcontractor representing itself as a HUBZone small business concern is identified as a certified HUBZone small business concern by accessing the SAM database or by contacting SBA.

(5) Provide notice to subcontractors concerning penalties and remedies for misrepresentations of business status as small, veteran-owned small business, HUBZone small, small disadvantaged or women-owned small business for the purpose of obtaining a subcontract that is to be included as part or all of a goal contained in the Contractor's subcontracting plan.

(6) For all competitive subcontracts over the simplified acquisition threshold in which a small business concern received a small business preference, upon determination of the successful subcontract offeror, the Contractor must inform each unsuccessful small business subcontract offeror in writing of the name and location of the apparent successful offeror prior to award of the contract.

(f) A master plan on a plant or division-wide basis that contains all the elements required by paragraph (d) of this clause, except goals, may be incorporated by reference as a part of the subcontracting plan required of the offeror by this clause; provided --

(1) The master plan has been approved;

(2) The offeror ensures that the master plan is updated as necessary and provides copies of the approved master plan, including evidence of its approval, to the Contracting Officer; and

(3) Goals and any deviations from the master plan deemed necessary by the Contracting Officer to satisfy the requirements of this contract are set forth in the individual subcontracting plan.

(g) A commercial plan is the preferred type of subcontracting plan for contractors furnishing commercial items. The commercial plan shall relate to the offeror's planned subcontracting generally, for both commercial and Government business, rather than solely to the Government contract. Once the Contractor's commercial plan has been approved, the Government will not require another subcontracting plan from the same Contractor while the plan remains in effect, as long as the product or service being provided by the Contractor continues to meet the definition of a commercial item. A Contractor with a commercial plan shall comply with the reporting requirements stated in paragraph (d)(10) of this clause by submitting one SSR in eSRS for all contracts covered by its commercial plan. This report shall be acknowledged or rejected in eSRS by the Contracting Officer who approved the plan. This report shall be submitted within 30 days after the end of the Government's fiscal year.

(h) Prior compliance of the offeror with other such subcontracting plans under previous contracts will be considered by the Contracting Officer in determining the responsibility of the offeror for award of the contract.

(i) A contract may have no more than one plan. When a modification meets the criteria in 19.702 for a plan, or an option is exercised, the goals associated with the modification or option shall be added to those in the existing subcontract plan.

(j) Subcontracting plans are not required from subcontractors when the prime contract contains the clause at 52.212-5, Contract Terms and Conditions Required to Implement Statutes or Executive Orders--Commercial Items, or when the subcontractor provides a commercial item subject to the clause at 52.244-6, Subcontracts for Commercial Items, under a prime contract.

(k) The failure of the Contractor or subcontractor to comply in good faith with --

(1) The clause of this contract entitled "Utilization Of Small Business Concerns;" or

(2) An approved plan required by this clause, shall be a material breach of the contract.

(l) The Contractor shall submit ISRs and SSRs using the web-based eSRS at http://www.esrs.gov. Purchases from a corporation, company, or subdivision that is an affiliate of the prime Contractor or subcontractor are not included in these reports. Subcontract award data reported by prime Contractors and subcontractors shall be limited to awards made to their immediate next-tier subcontractors. Credit cannot be taken for awards made to lower tier subcontractors, unless the Contractor or subcontractor has been designated to receive a small business or small disadvantaged business credit from an ANC or Indian tribe. Only subcontracts involving performance in the United States or its outlying areas should be included in these reports with the exception of subcontracts under a contract awarded by the State Department or any other agency that has statutory or regulatory authority to require subcontracting plans for subcontracts performed outside the United States and its outlying areas.

(1) ISR. This report is not required for commercial plans. The report is required for each contract containing an individual subcontract plan.

(i) The report shall be submitted semi-annually during contract performance for the periods ending March 31 and September 30. A report is also required for each contract within 30 days of contract completion. Reports are due 30 days after the close of each reporting period, unless otherwise directed by the Contracting Officer. Reports are required when due, regardless of whether there has been any subcontracting activity since the inception of the contract or the previous reporting period.

(ii) When a subcontracting plan contains separate goals for the basic contract and each option, as prescribed by FAR 19.704(c), the dollar goal inserted on this report shall be the sum of the base period through the current option; for example, for a report submitted after the second option is exercised, the dollar goal would be the sum of the goals for the basic contract, the first option, and the second option.

(iii) The authority to acknowledge receipt or reject the ISR resides--

(A) In the case of the prime Contractor, with the Contracting Officer; and

(B) In the case of a subcontract with a subcontracting plan, with the entity that awarded the subcontract.

(2) SSR.

(i) Reports submitted under individual contract plans--

(A) This report encompasses all subcontracting under prime contracts and subcontracts with the awarding agency, regardless of the dollar value of the subcontracts.

(B) The report may be submitted on a corporate, company or subdivision (e.g. plant or division operating as a separate profit center) basis, unless otherwise directed by the agency.

(C) If a prime Contractor and/or subcontractor is performing work for more than one executive agency, a separate report shall be submitted to each executive agency covering only that agency's contracts, provided at least one of that agency's contracts is over $650,000 (over $1.5 million for construction of a public facility) and contains a subcontracting plan. For DoD, a consolidated report shall be submitted for all contracts awarded by military departments/agencies and/or subcontracts awarded by DoD prime Contractors. However, for construction and related maintenance and repair, a separate report shall be submitted for each DoD component.

(D) For DoD and NASA, the report shall be submitted semi-annually for the six months ending March 31 and the twelve months ending September 30. For civilian agencies, except NASA, it shall be submitted annually for the twelve month period ending September 30. Reports are due 30 days after the close of each reporting period.

(E) Subcontract awards that are related to work for more than one executive agency shall be appropriately allocated.

(F) The authority to acknowledge or reject SSRs in eSRS, including SSRs submitted by subcontractors with subcontracting plans, resides with the Government agency awarding the prime contracts unless stated otherwise in the contract.

(ii) Reports submitted under a commercial plan--

(A) The report shall include all subcontract awards under the commercial plan in effect during the Government's fiscal year.

(B) The report shall be submitted annually, within thirty days after the end of the Government's fiscal year.

(C) If a Contractor has a commercial plan and is performing work for more than one executive agency, the Contractor shall specify the percentage of dollars attributable to each agency from which contracts for commercial items were received.

(D) The authority to acknowledge or reject SSRs for commercial plans resides with the Contracting Officer who approved the commercial plan.

(iii) All reports submitted at the close of each fiscal year (both individual and commercial plans) shall include a Year-End Supplementary Report for Small Disadvantaged Businesses. The report shall include subcontract awards, in whole dollars, to small disadvantaged business concerns by North American Industry Classification System (NAICS) Industry Subsector. If the data are not available when the year-end SSR is submitted, the prime Contractor and/or subcontractor shall submit the Year-End Supplementary Report for Small Disadvantaged Businesses within 90 days of submitting the year-end SSR. For a commercial plan, the Contractor may obtain from each of its subcontractors a predominant NAICS Industry Subsector and report all awards to that subcontractor under its predominant NAICS Industry Subsector.

52.244-2 SUBCONTRACTS (OCT 2010)
(a) Definitions. As used in this clause--

Approved purchasing system means a Contractor's purchasing system that has been reviewed and approved in accordance with Part 44 of the Federal Acquisition Regulation (FAR).

Consent to subcontract means the Contracting Officer's written consent for the Contractor to enter into a particular subcontract.

Subcontract means any contract, as defined in FAR Subpart 2.1, entered into by a subcontractor to furnish supplies or services for performance of the prime contract or a subcontract. It includes, but is not limited to, purchase orders, and changes and modifications to purchase orders.

(b) When this clause is included in a fixed-price type contract, consent to subcontract is required only on unpriced contract actions (including unpriced modifications or unpriced delivery orders), and only if required in accordance with paragraph (c) or (d) of this clause.

(c) If the Contractor does not have an approved purchasing system, consent to subcontract is required for any subcontract that—

(1) Is of the cost-reimbursement, time-and-materials, or labor-hour type; or

(2) Is fixed-price and exceeds—

(i) For a contract awarded by the Department of Defense, the Coast Guard, or the National Aeronautics and Space Administration, the greater of the simplified acquisition threshold or 5 percent of the total estimated cost of the contract; or

(ii) For a contract awarded by a civilian agency other than the Coast Guard and the National Aeronautics and Space Administration, either the simplified acquisition threshold or 5 percent of the total estimated cost of the contract.

(d) If the Contractor has an approved purchasing system, the Contractor nevertheless shall obtain the Contracting Officer's written consent before placing the following subcontracts:

Subcontracts or Consultants (for Consultants see DTRA 252 216-9003 in Section H)

(e)(1) The Contractor shall notify the Contracting Officer reasonably in advance of placing any subcontract or modification thereof for which consent is required under paragraph (b), (c), or (d) of this clause, including the following information:

(i) A description of the supplies or services to be subcontracted.

(ii) Identification of the type of subcontract to be used.

(iii) Identification of the proposed subcontractor.

(iv) The proposed subcontract price.

(v) The subcontractor's current, complete, and accurate certified cost or pricing data and Certificate of Current Cost or Pricing Data, if required by other contract provisions.

(vi) The subcontractor's Disclosure Statement or Certificate relating to Cost Accounting Standards when such data are required by other provisions of this contract.

(vii) A negotiation memorandum reflecting—

(A) The principal elements of the subcontract price negotiations;

(B) The most significant considerations controlling establishment of initial or revised prices;

(C) The reason certified cost or pricing data were or were not required;

(D) The extent, if any, to which the Contractor did not rely on the subcontractor's certified cost or pricing data in determining
the price objective and in negotiating the final price;

(E) The extent to which it was recognized in the negotiation that the subcontractor's certified cost or pricing data were not accurate, complete, or current; the action taken by the Contractor and the subcontractor; and the effect of any such defective data on the total price negotiated;

(F) The reasons for any significant difference between the Contractor's price objective and the price negotiated; and

(G) A complete explanation of the incentive fee or profit plan when incentives are used. The explanation shall identify each critical performance element, management decisions used to quantify each incentive element, reasons for the incentives, and a summary of all trade-off possibilities considered.

(2) The Contractor is not required to notify the Contracting Officer in advance of entering into any subcontract for which consent is not required under paragraph (c), (d), or (e) of this clause.

(f) Unless the consent or approval specifically provides otherwise, neither consent by the Contracting Officer to any subcontract nor approval of the Contractor's purchasing system shall constitute a determination—

(1) Of the acceptability of any subcontract terms or conditions;

(2) Of the allowability of any cost under this contract; or

(3) To relieve the Contractor of any responsibility for performing this contract.

(g) No subcontract or modification thereof placed under this contract shall provide for payment on a cost-plus-a-percentage-of-cost basis, and any fee payable under cost-reimbursement type subcontracts shall not exceed the fee limitations in FAR 15.404-4(c)(4)(i).

(h) The Contractor shall give the Contracting Officer immediate written notice of any action or suit filed and prompt notice of any claim made against the Contractor by any subcontractor or vendor that, in the opinion of the Contractor, may result in litigation related in any way to this contract, with respect to which the Contractor may be entitled to reimbursement from the Government.

(i) The Government reserves the right to review the Contractor's purchasing system as set forth in FAR Subpart 44.3.

(j) Paragraphs (c) and (e) of this clause do not apply to the following subcontracts, which were evaluated during negotiations:

(End of clause)

252.203-9005, Implementation of Contractor Code of Business Ethics and Conduct (Dec 2008)

In accordance with FAR clause 52.203-13, Contractor Code of Business Ethics and Conduct, the designated "agency Office of the Inspector General" is the DoD OIG at the following address:

Office of the Inspector General
United States Department of Defense
Investigative Policy and Oversight
Contractor Disclosure Program
400 Army Navy Drive, Suite 1037
Arlington, VA 22202-4704
Toll Free Telephone: 866-429-8011

252.204-9001 UNIVERSITIES DISCLOSURE OF INFORMATION (JUL 2009)

(a) The Contractor shall not release to anyone outside the Contractor's organization any unclassified information, regardless of medium (e.g. film, tape, document) pertaining to any part of this contract or any program related to this contract, unless the information results from fundamental research, as defined below:

> "Fundamental research" as used in this clause, means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

(b) The Contractor shall confer and consult with DTRA on technical aspects of its research and submit technical documents intended for publication to the cognizant DTRA technical representative(s) for review, a minimum of 45 days prior to publication or other dissemination. The purpose of the DTRA review period is to ensure the government ample opportunity to provide comments and suggestions for the researchers' consideration.

252.204-9004 IMPLEMENTATION OF DISCLOSURE OF INFORMATION (JUN 2007)
In accordance with DFARS 252.204-7000 Disclosure of Information, any information to be released shall be submitted at least 45 days before the proposed release date, for security and policy review. Submit one copy to each below:

(a) Office of Public Affairs, DTRA/DIR/COS/PA, 8725 John J. Kingman Dr, MS 6201, Ft Belvoir VA 22060-6201.

H(b)(6)

Thanks to both you and Carlyle for speaking with me on Monday evening. After internal discussion, we have concerns about whether there is enough information and clarity of path forward for CRDF Global to submit a full proposal. The lack of important information that Metabiota is waiting to receive from DTRA about program activities and expected outcomes – which wi l impact the budget and the timeline – makes it difficult to put together a quality proposal.

I propose that we break the work into two phases:

- Phase 1: CRDF Global completes the search for qualified epidemiologists to support the Iraq Field Epidemiology Training Program Support Course. I will continue to provide Metabiota with names/CVs as soon as I find options. Metabiota may consider contacting/interviewing these individuals directly to see if they are available/interested in the work.
- Phase 2: Once Metabiota identifies the best FLN(s) and receives final instructions from DTRA regarding the Iraq Field Epidemiology Training Program Support Course activities, CRDF Global and Metabiota can undertake next steps – in a fully informed way – to develop a contract/SOW and complete the work.

Hopefully we can make a decision on this proposal ASAP. If it is acceptable to you, a simple contract for Phase 1 is attached.

I understand that you are operating on a very tight timeline. I am attaching CVs of FLNs (see list below) that I believe would be a good fit for the Iraq Field Epidemiology Training Program Support Course.

In-country Options	Justification
(b)(6)	Currently a Field Epidemiologist with the Zoonotic Disease Section of the MOH in Baghdad. He completed a DTRA-sponsored fellowship (IBFP), spending a couple of months working at the CDC and University of Georgia identifying and characterizing *Salmonella enterica* through serotyping and whole genome sequencing.
	Currently works in the Zoonotic diseases section of Iraqi MoH, Center for Disease Control in Baghdad. He completed a DTRA-sponsored fellowship (ISFP) at the University of Rochester. He has very strong communication skills as evidenced by an impressive presentation to CRDF Global and DTRA in 2015.
	Senior level employee at the University of al-Qadisiyah, just outside of Baghdad. While his CV denotes a technical aspect, his main university role is of an administrator. He would easily be able to fill the FLN/SME role with his experience and his high-level communication skills.

Virtual Options	Justification
(b)(6)	Professor of epidemiology and animal health at the Jordan University of Science and Technology (JUST) in Irbid, Jordan. He has worked globally, in a variety of different capacities, with OIE, FAO, IDB and other international organizations. (b)(6) has conducted virtual trainings in the past and has a great track record working with CRDF Global. Received his Ph.D from Purdue University.

If you have any questions, please do not hesitate to ask. I look forward to hearing from you soon.

Thank you,
Dane

Subject: Re: Quick Chat re: Iraq Epi Trainings

Hi (b)(6)

To answer your question from our phone call earlier, we would want to communicate directly with the FLN's on the project as needed, but we'd also like to have a CRDF Project Coordinator, or POC, involved who would communicate with the FLN's daily and coordinate their activities. Does that make sense? (b)(6) could probably explain this better if you have any additional questions, please feel free to reach out to her at (b)(6)

Thanks,
Emily

Dea (b)(6)

Thank you for your patience as we've worked with our partners and consultants here and in Iraq to put together support for the virtual and in-person trainings. We have confirmation from a consultant whom we would put forward at a rate of $165/hour. This rate is inclusive of all American Councils' overseas and domestic U.S. staffing/consulting costs. Based on initial discussions with you we estimate that the total number of billable consultant hours would equal about 577.

Consultant 1: PhD from major U.S. university in Food Science, Masters in Agriculture, focus on Biotech and Food Science. Certification in hazard training and hazard analysis. Iraqi national.

Consultant 2: We are still working to identify a logistics/support consultant but anticipate being able to do that shortly. The hour calculation above includes limited support from this consultant.

Please note that costs such as travel, accommodation, per diem, etc are not included in the hourly rate.

Let us know what you think.

Best, (b)(6)

AGREEMENT TERMS & CONDITIONS

I. DEFINITIONS

"CRDF Global" – CRDF Global is a registered trade name of the U.S. Civilian Research & Development Foundation.

"Program" – The specific activity for which support is to be provided by CRDF Global.

"Sponsor" – The organization providing funding in support of the Program.

II. GENERAL RESPONSIBILITIES

The Sponsor hereby seeks CRDF Global services to provide logistical and administrative support for the Program described in Appendix A. The Sponsor hereby agrees to abide by the terms of this agreement including the payment of all relevant expenses as provided herein. CRDF Global agrees to provide logistical and administrative support services as set forth in Appendix A on behalf of the Sponsor.

IV. ELIGIBILITY

CRDF Global offers these services for civilian scientific research, educational and charitable activities of a pre-commercial nature. Programs may be basic or applied research. Programs may involve prototype development or process engineering, but may not include commercial manufacturing, sales or marketing. Programs with the aim of the development or improvement of a technology for military application are not eligible. Non-research activities that are eligible for consideration include a range of educational and training activities, environmental conservation and remediation programs, infrastructure development programs (e.g. donation of computers or other equipment) and other related activities.

CRDF Global reserves the right to decline this service to any organization, in connection with any program which CRDF Global, in its sole discretion, deems to be incompatible with CRDF Global's organizational mission or program guidelines and procedures.

V. CRDF GLOBAL EXPENSES

For services provided by CRDF Global hereunder, the Sponsor agrees to pay CRDF Global staff labor, staff benefits and associated indirect costs. CRDF Global staff personnel costs will include coordination, communications and report compilation. Fringe benefits associated with personnel costs include health and life insurance, leave and all mandatory payroll taxes. CRDF Global is responsible for remittance of all mandatory payroll taxes.

VI. PAYMENT TERMS

CRDF Global will invoice the Sponsor on a monthly basis for reimbursement of costs incurred. The Sponsor will reimburse CRDF Global within 30 days of the date of invoice.

VII. NO OTHER RELATIONSHIP

Neither party under this agreement may be considered an official representative, agent, or employee of the other party nor may either party represent itself as such. The relationship between the parties shall be determined solely by the terms contained herein.

VIII. SUSPENSION AND TERMINATION

Either party may suspend or terminate service, in whole or in part, for any reason by providing at least 10 calendar days written notice to the other Party. In the event of suspension or termination, settlement payments or adjustments will be made on the basis of costs incurred and non-cancellable commitments as of the date of suspension or termination. CRDF Global will provide a final financial report to the Sponsor within 30 days of the date of termination.

IX. EXPORT CONTROL COMPLIANCE CERTIFICATION

Each party hereby acknowledges that the rights and obligations of this Agreement are subject to the laws and regulations of the United States relating to the export of products and technical information. Without limitation, each party shall comply with all such applicable laws and regulations.

X. CONFIDENTIALITY AND PUBLIC ANNOUNCEMENT

All aspects of this agreement, except financial aspects and information designated ***in writing at the time of acceptance*** by the Sponsor, are considered accessible to the public. CRDF Global may include the name of the Sponsor in published lists of clients in program materials and reports. Information on specific Programs such as abstracts, technical results, or other detail will only be used in public materials upon written approval of the Sponsor.

XI. REPORTING

CRDF Global will provide a final programmatic and financial report to the Sponsor detailing activities supported, payments received from the Sponsor, logistical support activities conducted on behalf of the Sponsor and expenses incurred during the performance period.

XII. FORCE MAJEURE

Neither party shall be liable in any way for delays or failure to perform any provision of this Agreement if such failure is caused by reason of strikes, lockouts, market shortages of labor or materials, acts of God,

interruptions of transportation or communication services, or any other cause, condition or circumstances beyond the control of the parties, including, the changing of any rules, law or regulation of any government or any bureau or department, or any sovereign act prohibiting performance of a party. The term of this Agreement will, upon agreement of the parties, be extended by the period of such delay. The agreement of a party to an extension of time for the performance of any obligation by another party pursuant to this paragraph will not be unreasonably withheld. This paragraph does not affect the ability of either party to terminate this Agreement as otherwise provided herein.

XIII. LIABILITY

Each party hereby indemnifies and agrees to defend and hold harmless the other, its officers, directors, employees and agents, and their successors and assigns from and against any and all claims, demands, and actions and any liabilities, damages, expenses (including reasonable attorneys' fees and litigation costs) resulting from, arising out of, or related to each party's respective performance of this Agreement or the representations or warranties made by the applicable party herein, except if, and to the extent, due to the negligent, willful or intentional misconduct of either Party, its officers, employees or agents. In addition, except as prohibited by applicable law, the Parties assume their own respective liability that may be incurred, including attorney's fees, in defending any action as a result of performance under this Agreement to the extent such liability is a result of the party's negligent, willful or intentional misconduct. The parties' obligations under this section shall survive the termination, for any reason, of this Agreement.

XIV. SEVERABILITY

In the event that any provision of these terms and conditions shall for any reason be held to be invalid or unenforceable by an adjudicative body of competent jurisdiction, the remaining terms and conditions shall continue in full force and effect and shall be interpreted as if such provision had never been contained herein.

XV. GOVERNING LAW

This Agreement, including the decision to arbitrate and any decision by an arbitrator, shall be governed by and construed in accordance with the laws of the Commonwealth of Virginia, without regard to the conflicts of law principles thereof.

AGREEMENT FOR CRDF GLOBAL SERVICES
APPENDIX A: SCOPE OF WORK

I. Background

CRDF Global is a nonprofit organization authorized by the U.S. Congress and established in 1995 by the National Science Foundation. This unique organization promotes international scientific and technical collaboration through grants, technical resources, training, and services. CRDF Global is based in Arlington, Virginia with offices in Moscow, Russia; Kyiv, Ukraine; Almaty, Republic of Kazakhstan; and Amman, Jordan.

II. CRDF Global Services: Research & Identification Services, Iraqi Epidemiologist/Biologist FLN

CRDF Global will conduct research into candidates for an Iraqi Epidemiologist/Biologist Foreign Local National (FLN) position. (hereafter referred to as "Contractor"), according to the Contractor scope of work provided by the Sponsor. CRDF Global will provide a list of potential candidates to the Sponsor, and, as directed, will contact candidates to determine interest in the Iraq Field Epidemiology Training Program Support Course contract position.

Deliverable	Task	Description	Delivery Date
1. CV's	1.1	Provide Sponsor with CV's and resumes of epidemiologists that speak both Arabic and English to assist with in-person and online trainings.	As Received
2. Reports	1.2	Complete any additional reporting requirements, as necessary, and requested by the Sponsor, within the resources provided by the Agreement.	As needed

The Sponsor agrees that it will not hire or attempt to hire any candidates recommended under this Agreement except as facilitated by CRDF Global and authorized via a written modification to this Agreement, signed by both Parties.

All services will be provided by CRDF Global's representative office in Arlington, VA.

III. Budget

CRDF Global will provide services for the Research & Identification Services, Iraqi Epidemiologist/Biologist FLN with the reimbursement of CRDF Global Staff Personnel Costs, Fringe Benefits and General and Administrative and Office Support Costs of up to **USD $1,847.00**.

APPENDIX B: PROJECT BUDGET

PRICE NEGOTIATION MEMORANDUM
METABIOTA, INC./UNIVERSITY RESEARCH CO. LLC

GENERAL INFORMATION:

Contractor name	University Research Co., LLC (URC)
Proposal number	2016-13-DTRA
Proposal date	April 15, 2016
Proposal amount	$97,714
Negotiated amount	$62,184
Date negotiation completed	May 31, 2016

DESCRIPTION OF THE CONTRACT ACTION:

Purpose of negotiation (e.g., negotiate a new contract on sole source basis, definitization of a change order, negotiate an equitable adjustment):

Proposed total price and time on a Time and Materials contract with URC for a new contract on competitive basis to contract No. HDTRA1-14-C-0104. This PNM documents the proposed effort to support Tasks 1, 3 & 4 - Project Coordination, Qualified Trainers and Subject Matter Experts, as described in the SOW to support training event facilitation, preparation and execution. Participants in the subcontracting process are as follows:

Metabiota, Inc,	University Research Co., LLC
(b)(6)	

Description of the work (provide a brief summary of the general scope of the work encompassed by the action):

URC will provide foreign local national (FLN) support to facilitate, coordinate and implement the Iraq Field Epidemiology Training Program Support Course project. URC FLNs will support, facilitate and coordinate three separate 6-week remote/ online training programs, one 1-week NBERP Familiarization virtual workshop, and one 3-week a gap analysis report. In addition, FLNs will facilitate, coordinate and deliver one 1-week hands-on training course. URC US-based Operations Manager will provide overhead management to FLN's, coordinate communication between FLN's and Metabiota, support day-to-day activities, ensure compliance, and manage overall operational tasks.

APPROVALS AND COMPLIANCES:

Identify authority to negotiate___ (b)(6)

METABIOTA

CURRENT STATUS OF CONTRACTOR'S SYSTEMS:

Indicate any change in the status of the contractor's systems, (e.g., purchasing, estimating, accounting and material management and accounting system) since execution of the prenegotiation objectives memorandum. If the status has changed indicate the impact on negotiations. **N/A**

Indicate any change in the status of the contractor's disclosure statement describing the contractor's cost accounting practices and procedures, and the date of the disclosure (FAR 30.202). If the status has changed since execution of the prenegotiation memorandum indicate the impact on negotiations. **N/A**

COST OR PRICING DATA:

Cost or pricing data was ___ was not _**X**__ required and obtained along with a Certificate of Current Cost and Pricing Data which was executed by the contractor on_____.

Cost or pricing data was ___ was not __**X**_ relied on in negotiating the contract price.

Where certified cost or pricing data was not obtained based on an exception listed in FAR 15.403-1, indicate the exception.

Certified cost or pricing data was not obtained per FAR 15.403-1 (a) - Certified cost or pricing data shall not be obtained for acquisitions at or below the simplified acquisition threshold.

COST ANALYSIS:

The proposed subcontract was a competitive bid Time and Materials (T&M) contract evaluated upon completed technical and cost proposal from URC to support the facilitation, coordination and delivery of remote and hands-on course activities in field epidemiology biosafety & biosecurity, and general risk management principles. The T&M issued to URC was determined to be the most appropriate mechanism for this procurement based on the fair and reasonable pricing submitted by the subcontractor and the Metabiota team's determination that this would be the most effective means to ensure efficient performance in the best interest of the government. This determination was made following an internal review of the subcontractor's budget by Metabiota's financial, contract, and technical departments in comparison to two competitive proposals to determine overall reasonableness of the cost. The budget provided by the subcontractor was reasonable compared to that of other service providers with similar contract tasks and levels of experience and expertise. In addition, the subcontractor's FLN rates are comparable to Metabiota's own rate structure and are deemed to be reasonable considering the added security costs for operating within a country amid political unrest.

METABIOTA

Cost Element	Contractor Proposed	Negotiation Objective	Negotiated Amount
(b)(4); (b)(6)			

NEGOTIATED OBJECTIVES TABLE

SIGNIFICANT FACTS AND IMPACTS BY OTHERS:

Indicate the most significant facts or considerations controlling the establishment of the prenegotiation objectives.

Determination to subcontract with URC was deemed to be the most effective way to successfully conduct the training for the following reasons:

1. URC has over 50 years' experience supporting scientific activities with extensive expertise in implementing training activities and providing organizational and strategic planning support. Regionally, URC has supported primary health care programs in Iraq since 2007 in the form of program management and local oversight. Specifically, URC supported DTRA CBEP and the BTRIC in both Iraq and Afghanistan through developing, translating and delivering CBEP-approved epidemiology trainings. Their proven track record with supporting and delivering scientific training events globally and regionally, combined with a wide network of academic researchers, university partners, and scientific communities, made URC a top candidate to provide local technical support.
2. URC was the sole bidder with qualified epidemiologists and physicians currently in-country, employed, and available to support this endeavor immediately. Their PhD-level expertise, backgrounds in field epidemiology, and previous experience both participating in the CDC Field Epidemiology Training Program and delivering DTRA CBEP training and workshops made them the only viable option to implement the proposed FETP Support program at the standards required by the US government.

To the extent such direction has a significant effect on the action, a discussion and quantification of the impact of the direction given by Congress, other agencies, higher-level

officials (i.e., officials who would not normally exercise authority during the award and review process for the instant contract action). **N/A**

TRIP #	
Project/Phase #	AEP. TD-016
Purpose:	Travel to Tbilisi, Georgia to attend meetings regarding CBR projects GG-19, GG-20, and GG-27.
SOW / Task	(b)(6) will participate in meetings with US and Georgian collaborators, serving as GIS subject matter experts for the three CBR projects. (b)(6) will also spend time with the Georgian GIS team, focusing on mentoring them through data clean up and analyses for the various projects as well as laying the foundation for future publications based on the data that has been collected (or yet to be collected, depending on the project).
Desired Outcome	The majority of the trip will be spent working with GG scientists on each project. GG-19 objective is to identify work plan for completing ecological niche modeling and historical tularemia mapping to complete previously started efforts. GG-20 objective is to map positive and negative Q-fever data to develop a predictive model. GG-27 will be a kickoff meeting laying out a GIS plan for year 1. UF GIS Tech will be introduced to complete future site visits and support projects as GIS SME with Blackburn.

This submission of the Monthly Report (Contract Data Requirements List; CDRL A001 encompasses implementation of Academic Engagement Partnership (AEP) program activities in accordance with Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) contract HDTRA1-14-C-0104 for 10/01/15-10/31/15.

Technical Directives

AFRICOM

TD 001 Viral Hemorrhagic Fever (VHF) & Personal Protective Equipment (PPE) Donning and Doffing- Cameroon

Objectives
Increase the capacity for Cameroonian responders to mitigate the hazards posed by emerging outbreak and other biosafety threats through biosafety training in the appropriate techniques for donning and doffing personal protective ensembles.

Period of Performance: 05/16/15 11/06/15
Total Estimated Budget: $125,975.00
Estimated Expenditure: $74,591.00
Technical Direction Status: Approved

Completed Activities

- Metabiota revised training materials in response to DTRA/A&AS comments. The revised training materials were submitted and accepted. The training materials were then sent simultaneously for public affairs approval and translation into French.
- Metabiota filed a Country Clearance Request for the November PPE training event.
- Metabiota drafted and filed a travel authorization request, which was approved.
- Metabiota drafted a CLS form for logistics of the November PPE training event and handed it off to DTRA/A&AS.
- Metabiota DC engaged in regular communications with the overseas personnel to discuss and work through training event logistics.
- Metabiota drafted letters to the US Embassy and Cameroon Ministry of Defense for DTRA to assist with obtaining information for Leahy vetting.

Upcoming Activities

- PPE training event slated for November is likely to be postponed. Metabiota will work with DTRA to identify alternative dates once Leahy vetting is completed.
- Metabiota is reviewing CLS-translated training materials for accuracy.

Challenges
MinDef has said no additional information will be provided on participants. DTRA and A&AS are working with US Embassy on the path forward. This will likely result in postponement of training until late January at the earliest.

Detailed Invoice by Technical Directive

TD 001 Viral Hemorrhagic Fever (VHF) & Personal Protective Equipment (PPE) Donning and Doffing- Cameroon

Objectives

Increase the capacity for Cameroonian responders to mitigate the hazards posed by emerging outbreak and other biosafety threats through biosafety training in the appropriate techniques for donning and doffing personal protective ensembles.

Period of Performance: 05/16/15 - 12/31/15

TOTAL	$125,975.08	$56,439.04	$69,536.04

CLIN 1002 – Labor

Costs for direct labor to support this activity during this period was required for the following personnel:

Program Manager: 50.50 hours

(b)(6) ompleted proposal development, including development of the overall project budget and the drafting of text for both the technical and management approaches. He oversaw development of project plan, led subcontract development, assisted subcontractor understanding of implications of T&M mechanism, and negotiated of labor rates (b)(6) provided overall coordination of the training event, including communications with DTRA A&AS and the subcontractor team in Cameroon.

Trainer 1: 28 hours

(b)(6) ssisted with development subcontractor training deliverables. She developed the project schedule, and prepared Training Event Plans for implementation. She participated in calls with DTRA/A&AS to assist PM in ensuring all relevant information was delivered.

Trainer 2: 217 hours

(b)(6) prepared data for proposal development, to include assisting with the development of the overall training plan and drafting of text for the technical approach. He initiated development of SOWs for subcontractors and ICs. and assisted the PM in coordinating with the subcontractors during the process ensuring compliance with DoD and training requirements.

(b)(6) rovided remote support and on-the-ground support, respectively, for the meeting with Ministry of Defense. He also worked with Program Staff on subcontract development, to include revision and negotiation of SOW and labor rates. providing on-the-ground support in Cameroon for

meeting with the Ministry of Defense and gathering information necessary for the tailoring of training materials.

Trainer 3: 12.5 hours

(b)(6) provided expertise and historical data for proposal development, to include assisting with the development of the overall training plan and drafting of text for the technical approach. She provided integration with other Metabiota training efforts to ensure uniformity across the program.

Scientific Mentor: 24 hours

(b)(6) egan adaptation of the training materials provided by DTRA. In particular (b)(6) began tailoring the VHF training materials to include diseases more likely to be relevant in Cameroon than Azerbaijan. PPE training materials are being similarly addressed, and updated with photographs of the specific PPE that will be used. A draft agenda was developed, and is currently being revised.

CLIN 1003 – Materials and Supplies

No material costs have been incurred.

CLIN 1004 – ODCs

DBA insurance is being acquired for all Metabiota personnel or subcontractors working outside of the United States but this cost has not been finalized or invoiced at this time.

CLIN 1005 – Travel

No travel costs have been incurred at this time.

TD 002 Sample Collection and Diagnostics Training on Middle East Respiratory Syndrome (MERS-Coronavirus) in Camels and Bats - Kazakhstan

Objectives

To advance scientific study and experimentation and increase worldwide knowledge of safe sample collection and laboratory diagnostics through detailed training sessions both in labs and in the field. The training will focus on safe sample collection and laboratory diagnostics for Middle East Respiratory Syndrome (MERS-CoV) in camels and bats supporting enhanced biosafety and biosurveillance efforts in the region.

Period of Performance: 06/01/2015 - 09/30/2015

CLIN 1002 – Labor

TD 002 MERS-COV Training Kazakhstan			
CLIN	Total ROM	Total Invoiced	Total Remaining
1002	$193,010.00	$128,607.70	$64,402.30
1003	$69,578.14	$13,524.01	$56,054.13

TOTAL	$391,055.86	$186,958.38	$204,097.48

Costs for direct labor to support this activity during this period was required for the following personnel:

Program Manager: 205

Metabiota SEA Program Manager, (b)(6) conducted activities during this time period that included preparation and coordination of the training events to include management of deliverables, logistics, procurement, tracking of project requirements, and implementation of the first training event from 29 July – 5 July 2015. In addition, activities included coordination with Qualified Trainers, in country collaborators, CBEP regional and country personnel, and project team members to ensure CDRL submissions and project requirements were met.

Trainer 1: 364 hours

(b)(6) conducted activities during this time period that included assisting in training coordination and submission of CDRL requirements to CBEP following review of training documents, participating in routine conference calls with Qualified Trainers, and in-country collaborators, procurement of materials and supplies, and logistical support to ensure the training was conducting according to the assigned schedule. Duke NUS Trainers, (b)(6) (b)(6) onducted activities during this time period that included, assisting senior trainers in facilitating the training event, to include adaptation of materials, syllabus input, procurement of materials and supplies, preparation of bat bags for sample collection and, execution of the training event from 29 June – 05 July 2015, during which they provided lecture and practicum training to participants.

Trainer 2: 120 hours

procurement of laboratory materials and supplies, optimization of assays for the laboratory training scheduled later in the year, coordination with in-country partners, and Metabiota personnel to facilitate the June training event. (b)(6) traveled to Kazakhstan to conduct the training course, which included, delivering classroom training and conducting and overseeing field sampling activities, to include facilitation of scientific engagement.

Trainer 3: 124 hours

Duke NUS Trainer 3, (b)(6) raveled to Kazakhstan to conduct the training course, which included, delivering classroom training and conducting and overseeing field sampling activities, to include facilitation of scientific engagement. Trainer (b)(6) provided expertise finalizing training materials.

Research and Data Analyst: 83 hours

Metabiota Research and Data Analyst, (b)(6) was brought into this project following recognition that the short time frame required for execution of the event, and that meeting all deliverables to successfully implement the training would require additional project coordination support. (b)(6) hours were reduced on the project to allow her more time to focus on the PACOM regional baseline analysis, and this provided a cost savings to the Government by utilizing an employee billable at a lower rate. (b)(6) has conducted activities during this time period that include overall project coordination supporting travel for project personnel, review and submission of deliverables, project scheduling, establishing routine communications with trainers and in-country partners as well as tracking deliverables, and routine administrative support.

CLIN 1003 – Materials and Supplies

Materials and supplies costs were incurred during this period to support the field surveillance training and BSL2 laboratory practices event held in Almaty, Kazakhstan from 29 June – 05 July 2015. Materials and supplies were procured locally by TMC and by Metabiota personnel. Materials and supplies purchased at this time included field supplies, such as GPS, lanterns, rechargeable batteries, flashlights, field chairs and tables, and headlamps. Other supplies included consumables such as pipettes, pipette tips, tubes and holders, sharp boxes, gloves, and tape. Additional supplies procured included materials for transport and storage of collected samples, PPE, and decon materials such as biohazard bags, sharps containers, etc. In accordance with contract compliance, costs incurred for unforeseen customs clearance fees were not billed to the Government. These costs were absorbed by Metabiota in order to successfully execute the training in the short suspense required. Once the team was on the ground and conducted the pre-site assessments, it was determined that additional materials and supplies were necessary to ensure safety was maintained during sampling activities. These materials included a ladder to access the site, safety harnesses, additional PPE, and decon supplies. Additional materials procured were necessary to maintain personal safety for all participants throughout the field sampling events.

In addition, costs were incurred for fit testing services and local procurement services. This was required to fit N95 masks on all trainees participating in the field sampling portion of the event. Fit testing services were provided by local contractor TMC, and supported the technical implementation provided by (b)(6) of Metabiota.

CLIN 1004 – ODCs

Per contract guidelines DBA insurance is required for all personnel engaged on the AEP project. DBA insurance was purchased for Duke NUS trainers supporting this activity for the entire period of

performance, as they are based in Singapore. This insurance also covered their travel to Almaty, Kazakhstan in support of the June-July training event.

CLIN 1005 – Travel

Travel expenses incurred during this period are for costs to support execution of the field surveillance training conducted in Almaty, Kazakhstan from 29 June to 5 July. Costs include airfare, per diem, hotel, and transportation costs for (b)(6) eputy Director of the AEP program and (b)(6) Southeast Asia Program Manager to oversee and execute implementation of the training.

Additional costs incurred were for the airfare, per diem, hotel, and transportation to support the six Qualified Trainers traveling from Duke NUS to conduct training activities for this effort.

THIS ENDORSEMENT CHANGES THE POLICY. PLEASE READ IT CAREFULLY.

Named Insured			Endorsement Number
Metabiota, Inc			010
Policy Symbol: ENI	Policy Number: D37429193 001	Policy Period: December 22, 2014 to December 22, 2015	Effective Date of Endorsement: June 01, 2015
Issued By (Name of Insurance Company): ACE American Insurance Company			

AMENDMENT TO SCHEDULE IN DEFENSE BASE ACT CONTRACT AND/OR PROJECT ENDORSEMENT

This endorsement modifies insurance provided under the following:

DEFENSE BASE ACT WORKERS COMPENSATION AND EMPLOYERS LIABILITY INSURANCE POLICY

The Schedule of the DEFENSE BASE ACT COVERAGE ENDORSEMENT is amended to read as follows:

Schedule

Contract Name/Number/Country(s) or Project Name & Country(s)
In consideration of additional premium charge of $2,345 travel to Kazakhstan from 06/01/2015 to 09/30/2015 under currently scheduled contract is afforded coverage as of the effective date of this endorsement. This travel is completed by Third Country Nationals and coverage is afforded for the same. A rate of $3.50 applied. Payroll of $67,005 is added to the policy. It is further agreed this additional premium charge is fully earned and the minimum earned premium is amended to read $47,247. Policy payroll now totals $1,349,909.

All other terms and conditions of this policy remain unchanged.

TD 002 Sample Collection and Diagnostics Training on Middle East Respiratory Syndrome (MERS-Coronavirus) in Camels and Bats - Kazakhstan

Objectives

To advance scientific study and experimentation and increase worldwide knowledge of safe sample collection and laboratory diagnostics through detailed training sessions both in labs and in the field. The training will focus on safe sample collection and laboratory diagnostics for Middle East Respiratory Syndrome (MERS-CoV) in camels and bats supporting enhanced biosafety and biosurveillance efforts in the region.

Period of Performance: 05/16/2015 - 01/31/2016

CLIN	Total ROM	Total Invoiced	Total Remaining
1002	$193,010.00	$197,956.15	$4,946.15

TOTAL	$391,055.86	$273,504.57	$117,551.29

CLIN 1002 – Labor

Program Manager: 147 hours

(b)(6) oversaw the administration and management of the project, to include submission of all deliverables required for implementation of the field and laboratory training courses. Deliverable submissions included the after-action report from the field surveillance training, and required CLS forms for foreign travel, in-country travel, logistical requirements, translation and interpretation support, to facilitate execution of the December laboratory training. As well, she continued coordination with CBEP, CLS, and project team members for customs clearance of internationally procured materials and supplies, to include rescheduling the training from September to December to account for the lead time required to allow the shipments to reach IVM. She also completed CDRL 11 following the receipt of templates and country specific information from CBEP, and submitted them for translation and final execution with the end-user.

In addition, she continued coordination with CBEP, Duke NUS trainers, IVM scientists and project managers to ensure the December training event was coordinated and on track for implementation. This included holding routine conference calls with all involved, securing laboratory clearance for all participants and trainers, procurement of local materials and supplies, execution of the MoU with Metabiota and IVM governing the overall execution of the project, and facilitating regional travel to anti-plague stations ensuring governmental and local buy-in for participant attendance.

Trainer 1: 55 hours

DUKE NUS provided trainer 1 hours in order to prepare and finalize the training materials submitted for PAO approval, translation, and printing in support of the December laboratory event. In addition, Martin Linster supported coordination of international supply shipments of reagents to Kazakhstan through

coordination with Metabiota and CLS personnel, as well as optimizing the assays required for use during the laboratory practicum component of the training. Trainer 1 hours were also utilized to assist with coordination of the rescheduled training, and submission of required CDRLs.

Trainer 2: 166 hours

(b)(6) coordinated directly with Metabiota to provide institutional data in order to finalize the subcontract agreement with Metabiota. They prepared financial projections and progress reports for the Duke NUS team, feeding into the monthly reporting requirements submitted to CBEP. They also provided subject matter expertise to develop, review, and submit the final training materials required for the December event. They participated in routine communications and emails with Metabiota project personnel, and IVM scientists to finalize all coordination and travel needs for the December training event, to include finalizing travel and scheduling requirements, coordination of international shipments, optimization of assays for use at the training, and development and review of locally procured consumables required for the event.

Trainer 3: 12 hours

(b)(6) provided oversight and subject matter expertise to prepare and finalize the training materials required for the December laboratory training event.

Research and Data Analyst: 143.5 hours

(b)(6) continued to support the program manager in facilitating communication and collaboration with key CBEP personnel, in-country partners, Duke-NUS Qualified Trainers (QTs) and CLS to support finalization of logistical requirements for the training event, such as procurement, shipment, venue selection, air and ground transportation, interpretation, translation, printing, etc. She coordinated with the program team to assist in providing necessary information and coordination with trainers, and in-country partners for custom's clearance requirements identified by CLS and DTRO. She supported coordination with CLS to finalize translation, printing, and shipment of the training materials. She also worked closely with the program manager and travel coordinator to track and manage travel requirements necessary in the rescheduling of the training event.

CLIN 1003 – Materials and Supplies

Material and supply costs incurred during this period are for bat surveillance equipment and consumables purchased by Metabiota from third-country suppliers to support the June-July training course. In addition, supply costs include reagents procured for the December laboratory training event that will be shipped by CLS to Kazakhstan.

CLIN 1004 – ODCs

DBA costs were incurred for (b)(6) to attend the field surveillance training event held from June-July.

CLIN 1005 – Travel

Travel costs invoiced are inclusive of costs that were not invoiced in May-July in support of the June-July field surveillance training held in Almaty. Travel costs invoiced in this period include per diem, transportation, and visa expenses for Duke NUS trainers, as well as costs incurred by the Metabiota program manager during the pre-coordination travel to Washington DC prior to departure to Kazakhstan to facilitate the training event.

Travel costs incurred during this period also include the change fees to airfare purchased in support of the laboratory training that was rescheduled from September to December to allow for custom's clearance of internationally procured supplies.

TRANSACTION SUMMARY

Original Transaction: Jun 22, 2015	$481.10

PRICE DETAILS

Base Fare (x1)	$434.42
Federal Excise Tax	$32.58
Domestic Taxes and Fees	
Segment Fee	$4.00
Passenger Facility Charge	$4.50
September 11th Security Fee	$5.60
Total for 1 person	**$481.10**

BAGGAGE INFORMATION

Guests are welcome to bring aboard: one (1) personal item and one (1) carry on item that does not exceed 20 pounds. A checked bags may have a maximum size of 62 linear inches, which is calculated by adding the length plus the width plus the height.

Main Cabin Guests are invited to check one (1) bag up to ten (10) bags up to 50 pounds for a fee of $25 each. Main Cabin Select Guests and Guests who purchase the fully refundable Main Cabin fare are invited to check one (1) bag up to 50 pounds free of charge and nine (9) more up to 50pounds for a fee of $25 each. First Class Cabin guests are welcome to check two (2) bags up to 50 pounds free of charge and eight (8) more up to 50 pounds for $25 each.

And on behalf of the TSA, when traveling with gels or liquids, remember the 3-1-1 rule. First: bottles may only be 3 oz. or smaller in size. Second: they must be carried in only one 1 quart plastic bag. If you need to bring anything else, pack it in your checked luggage. We'd hate to see you lose anything when going through security.

FARE RULES AND RESTRICTIONS

For all fare levels, upgrade charges are inclusive of applicable taxes and fees. Fares and availability are not guaranteed until purchase. Security regulations may require us to provide government agencies access to data you disclose to us.

If you need to adjust your schedule, you can make changes and cancellations via our website until 30 minutes prior to departure time or contact our call center until departure. Change/cancel fees may apply.

If you think you'll miss your flight or simply need to cancel, you have until your flight's departure time to notify us and get a credit minus a cancel fee or a refund if a refundable fare was purchased. If you don't contact our call center or inform our ticket counter that you will miss your flight, we will enforce our no show rules.

Upon failure to check in, Virgin America will cancel that flight reservation and all subsequent segments for continuing or return flights. On non-

HDTRA1-14-C-0104	METABIOTA	24	

4. TD TITLE	5. TOTAL TO ESTIMATE
Film Narrative of Epigenetics and Genomics of Infectious Diseases in the Middle East and South Asia	HOURS 160 DOLLARS $ $60,000

6. CONTRACTING OFFICER REPRESENTATIVE	7. CONTRACTOR PM
NAME (b)(6)	NAME (b)(6)
PHONE: 703-767-9137 EMAIL (b)(6)	PHONE 202-412-3970 EMAIL (b)(6)

8. DESCRIPTION OF TD (NOT TO EXCEED 1 PAGE):

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) grants technical direction to Metabiota to develop a Film Narrative of Epigenetics and Genomics of Infectious Diseases in the Middle East, South Asia and CBEP collaborations in the CENTOM Region in accordance with SOW section 4.3, Task 3

Metabiota shall develop a 2-5-minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, which was held at the Royal Scientific Society (RSS) on March 7-8, 2016 in Amman, Jordan. The visual narrative (2-5 minutes) objectives are to document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. Metabiota shall develop the specific script in coordination with CBEP CENTCOM regional managers. The footage and interviews that Metabiota has from the conference can be utilized for the visual narrative. The visual narrative should be completed by June 30, 2016. Total costs for the narrative shall not exceed $60,000.

Deliverables:

- A short film narrative of 2-5 minutes on 3 DVDs. Final film must go through Public Affairs Office (PAO) approval at DTRA.

The period of performance for this effort will be from May 1 to June 30, 2016. Your technical approach, proposed budget, and basis of estimate for implementing this requirement, not to exceed $60,000.00 is requested by 19 April. Please note that the current Metabiota contract does not allow for logistical support services, such as translation, shipping & customs clearance, conference services, etc. These requirements will be coordinated through CLS and the in-country DTRO (as appropriate) by the CBEP POCs below.

9a. PROPOSED SOLUTION (NOT TO EXCEED 2 PAGES):

Phase 1: Proposal Development & Initiation (Task 1)

Metabiota developed a project plan and implementation strategy that aligns with the narrative from Box 8. It is anticipated that the plan for TD-24 is considered a living document, and it is expected that revisions to the plan may be necessary following stakeholder meetings. During proposal development, Metabiota will use Program Manager (PM) and Project Coordinator (PC, billed as a Subject Matter Expert 1) time to identify the best path forward, required deliverables, and any other programmatic requirements which can reasonably be expected to be a part of this project.

Metabiota assumes the following:

1. The PoP assigned to this project will allow enough time for PAO approval of the final video. However, if PAO approval extends beyond the project timeframe, Metabiota will work with AEP regional leadership and the COR to adjust the PoP or allow for final approval of the video outside of the project timeframe, as appropriate and within contractual compliance;
2. Production services required for this project will be complete within 3 weeks allowing enough time for PAO approval of the final video. Should services required extend past this timeframe, Metabiota will work with the CBEP CENTCOM regional leads (and COR, if necessary) to adjust the schedule accordingly;
3. Box 8 of TD-24 states that this project will be completed in accordance with section 4.3, Task 3, which refers to Qualified Trainers (QTs). Based on the requirements, Metabiota has replaced Qualified Trainers with Task 4- Subject Matter Experts. Metabiota assumes this will be acceptable in the execution of the project and engagement of SMEs for this effort.

Project Coordination (Task 1)

The Project team will be led by an experienced Program Manager (PM), Carlyle Golloglv, and supported by a highly effective Project Coordinator (PC), Emily Varanay, MPA, to cover Task 1 – Project Coordination. The PM and PC were selected for this project, because they implemented TD-07 the Middle East South Asia Epigenetics and Genomics of Infectious Disease Conference and have the historical knowledge to effectively and efficiently manage the requirements identified for TD-24. In addition, Metabiota will engage Dr. Kavita Berger, PhD, from Gryphon Scientific LLC to assist in narrative development as a SME under Task 4. Dr. Berger was the PI and senior technical implementer on TD-07, working closely with Ms. Gollogly and Ms. Varanay.

Note: The Metabiota PM confirms subcontractor knowledge of the contractual requirements prior to TD approval.

Phase 2: Preparation (Task 1)

Upon TD approval, the PM will establish routine communications with project team members and CBEP to initiate project implementation. The PM will hold a kick-off meeting within 5 days of approval, with participation from the AEP PMO, project team members and key CBEP stakeholders to review project requirements and ensure a mutual understanding of project goals and objectives is realized. The PM and PC will review the project communications plan, schedule, risk register and other items critical to support project implementation during the kickoff. The PM, with assistance from the PC, will identify and engage the videography firm required to execute production of the video. The PM will lead coordination and integration of the project team with CBEP stakeholders to develop the narrative and complete the film.

The project team will ensure that all necessary documentation required prior to initiating tasks is completed correctly and submitted on time, including CTR CLS Form (CDRL A016) and the Monthly Reports (CDRL A001). The project team will work closely with CBEP regional leads, A&AS support

Commented [TREC1]: Recommended redactions (entire document)

Exemption 6: USG personnel names and contact info

staff, and CLS to ensure that all logistics requirements are coordinated and implemented according to the project schedule and contractual requirements. The Metabiota Travel Coordinator will coordinate with the project team to assist in the request of travel requirements supporting this effort and will ensure that travel arrangements are secured, immediately following approval by the COR and in line with the project schedule and execution requirements.

Sub-Phase 2.1: Film Narrative Development and Adaptation (Tasks 1,4)

Metabiota will select and engage a videography firm to produce the film, following sourcing of an appropriate vendor for this engagement. The project team will engage the CBEP regional leads to ensure the technical requirements are clearly determined and will select a service provider at best cost to the government, meeting the requirements identified. Upon engagement of the videography firm, Metabiota will transfer the existing, unedited video footage and interviews collected during the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) from 7-8 March 2016 to the firm in order to produce the film. The unedited video footage, interviews, and photographs captured during this event will provide the raw material to effectively and relevantly document the Jordan conference and describe other science initiatives and the outcomes of CBEP's engagements in the Middle East and South Asia. The Metabiota team will work directly with CBEP regional leads and the videography firm to determine the narrative and produce the film.

Sub-Phase 2.2: Coordination for Material Shipment (Task 1)

Shipment of materials and final edited film, if deemed necessary, will be handled via CLS. The project team will deliver the final edited and PAO approved film utilizing the appropriate CLS forms (CDRL A0016 and associated forms) to the CBEP team for appropriate routing, adhering to contract timelines and deliverable schedule. The Metabiota team will work closely with CBEP, A&AS, and CLS staff members to coordinate and execute any logistical requirements, as needed.

Phase 3: Implementation (Tasks 1,4)

The Metabiota Project Team will develop and create a 2-5 minute film narrative of the Middle East and South Asia Conference on Epigenetics and Genomics of Infectious Diseases, held at the Royal Scientific Society (RSS) on March 7-8, 2016 in Amman, Jordan. The film will be produced in the English language and may include visual frames of speakers on stage, panning of audience, and snapshots of the discussion panels, poster session, and participants asking questions and engaging with speakers. The film may also include short interviews with conference organizers, Scientific Advisory Board members, speakers, presenters, and attendees concerning the importance, relevancy, and benefits of the conference, among other topics. The film will be produced utilizing the technical expertise of the film editors, Metabiota team, and CBEP regional leads to showcase the conference and highlight the scientific initiatives and engagements stemming from this event and CBEP efforts in the region. Suitable background music will be included, as well as sub-titles, if deemed necessary. Metabiota will ensure that the film is adjusted/edited according to guidelines received from CBEP, and other key stakeholders. CLS will be engaged to provide logistical support (CDRL A0016), should it be required for this effort. In addition, Metabiota will ensure PAO approval of the film, and will coordinate with the technical team to address any necessary changes prior to completion and final delivery of the product.

To support implementation efforts, the Metabiota PM will travel to Washington DC for meetings with CBEP regional leads and the project team to develop the narrative and review the video footage. The PM will participate in working sessions, brainstorming, and technical development of the film narrative during scheduled in person meetings to ensure execution of the narrative and completion of the project. In addition, the PM will meet with the videography firm to review performance and completion of tasks associated with this project.

Phase 4: Project Closeout (Task 1)

The project team will close out all activities associated with this project, to include final reporting, invoicing, and submission of all relevant CDRLs according to the outlined schedule. In addition, the project team will contribute to lessons learned conversations with CBEP detailing enhancements that could be made should this type of project be repeated, as necessary and requested by CBEP regional leads. Finally, unedited and edited film and other relevant materials will be provided to CBEP.

9b. BUDGET (USE EMBEDDED TAB'S FOR BUDGET BREAKDOWN)

CLIN	DESCRIPTION	TOTAL
1002	LABOR	$38,933
1003	MATERIALS	$10,695
1004	ODC's	$0
1005	TRAVEL	$2,993
TOTAL		**$52,620.93**

9c. TD SOLUTION BASIS OF ESTIMATE – DESCRIPTION (NOT TO EXCEED 2 PAGES)

Labor

Costs for direct labor to support this activity is required for the following personnel.

Metabiota Program Manager (PM). The Metabiota PM will provide direct oversight of the planning and execution of the program, ensuring all objectives are met in accordance with the project SOW maintaining scope, budget, and timeline. The PM will ensure completion of CBEP goals in direct support of this activity and the CBEP mission throughout the lifecycle of the project, and will ensure project close out. To guarantee that all requirements are met, the PM will manage the SME 1 to ensure day-to-day activities for the project are completed on time, and to the quality required by CBEP. The PM will participate in routine conference calls and other forms of communication with CBEP regional leads and SMEs to ensure project execution. The PM will oversee the subcontractors on this effort, to include the services provided by the videography company in execution of the film. The PM will ensure all contract CDRLs are met and delivered according to the project timeline, and contract requirements.
LOE: 80 hours

Metabiota Project Coordinator. A SME 1 will act as a Project Coordinator (PC) throughout the planning, execution and close out of project objectives and activities. The PC will support the planning and execution of CBEP objectives towards the completion of project goals by participating in proposal development, stakeholder and subcontractor coordination and project execution, including assisting the PM in anticipating, managing, and communicating project risks and recommended mitigation strategies to CBEP and other stakeholders. The PC will regularly communicate the project status with the PM. The PC will participate in routine project communications, to include leading regular coordination calls with the project team, CBEP, the videography company, and other key stakeholders.
LOE: 60 hours

SME 3: Dr. Kavita Berger from Gryphon Scientific will be engaged to support technical development of the film narrative for this project. Having coordinated the MESA Epigenetics and Genomics of Infectious Diseases Conference with the Metabiota team, she is critical in ensuring the conference message is received and communicated through the film. Dr. Berger will work directly with Metabiota and CBEP to develop the narrative, review the footage, and provide subject matter expertise to the team and the production services in development and execution of the film. Should

edits or revisions be required following CBEP and PAO guidelines. Dr. Berger will participate in editing and refining the narrative to be delivered in the final product. Dr. Berger will be responsible for all monthly reporting and deliverables assigned to the Gryphon subcontract by Metabiota in execution of this project.
LOE: 80 hours

Reachback programmatic support to include finance, accounting, and contracts will be provided as part of CLIN 1001 (FFP) and will not be separately invoiced.

Materials
Training Materials: Two (2) external hard drives will be procured to store the photos, raw video footage, and the final edited video

Production Services: Metabiota will engage a videography firm to produce the short video for this effort. This will include identification of sound bites completion of film transcripts, editing, and production of the video

Metabiota will conduct market research and ensure the best price is secured, maintaining quality and technical requirements for all procurement of goods. Metabiota will coordinate directly with CLS for all shipping requirements and will ensure cost management for all procured supplies, as necessary to complete the scope of this effort

Subcontracts
The subcontract with Gryphon Scientific will be modified to include labor hours and materials required for implementation of this project. Costs are captured under the labor and materials budgets.

Travel
Travel costs will be cost reimbursable and provide best cost to the government following JTR regulations. Travel is requested for the PM to meet with the project team, Gryphon SME, CBEP, the videography company, and other key stakeholders to support the execution of Phase 3, and ensure development of the film narrative and completion of the project. The PM will travel to Washington DC to take part in in person meetings, brainstorming activities, narrative development and review of film footage and sound bites developed by the videography company supporting this project.

TOTAL	$488,040.04	$22,610.85	$465,429.19

CLIN 1002 – Labor

Following conversations with DTRA CBEP programmatic and contact personnel it was determined that labor costs will not be billed between the period of 2 June and 22 July, as the technical directive had not yet been approved. Costs for direct labor to support this activity was required for the following personnel, supporting proposal development and execution of activities once authorized by the Government:

Program Manager: 13 hours

Metabiota SEA Program Manager, (b)(6) conducted activities during this time period that included proposal development, contracting packages, and coordination with partner organizations to complete the technical and cost proposal. Once approved, (b)(6) engaged in overseeing project personnel in the execution of requirements for implementing the workshop, managing project deliverables, including submission of requirements to CBEP, tracking project requirements, interacting and reporting to CBEP personnel providing project visibility and coordination, financial monitoring, coordination and management of Gryphon Scientific personnel, and coordination with RSS.

Research and Data Analysts: 74 hours

Metabiota Research and Data Analyst, (b)(6) conducted activities during this time period that included supporting proposal development and contract packages in response to the technical directive. Once approved, she was responsible for project coordination for this activity. Activities included day-to-day coordination of the project, routine communication with collaborators, processing of project documents, tracking and review of CDRLs, and travel and logistical support for the pre-coordination meeting scheduled in October. Additional activities included, supporting contractual requirements for engaging Gryphon Scientific and developing the project schedule.

Gryphon's (b)(6) conducted activities during this time period that included identifying experts working in relevant fields and on relevant research through literature review, and assisting in preparation

of workshop documents. Gryphon's (b)(6) conducted activities during this time period that included preparation of sub-contract materials for submission to Metabiota and review of the final sub-contracts package for execution.

Subject Matter Expert 3: 30 hours

Gryphon's (b)(6) conducted activities during this time period that included coordination with Metabiota personnel to support completion and review of Gryphon's proposal for this project and contracting requirements, once authorized. She also conducted initial review and development of conference materials, participating in routine communications and conference calls with Metabiota and RSS personnel, and development of the project schedule and CDRL requirements in coordination with Metabiota project personnel.

Subject Matter Expert 1: 59.5 hours

Gryphon's (b)(6) expertise in regional planning were utilized during this time period that included initiation of conference planning, design of the conference logo, project scheduling, and participation in routine communications with Metabiota personnel to initiate project activities. Additional activities included communications with vendors to provide website and graphics support for this event.

CLIN 1003 – Materials and Supplies

Materials and supplies costs were not incurred during this invoice period.

CLIN 1004 – ODCs

ODC costs were not incurred during this invoice period.

CLIN 1005 – Travel

Travel costs were not incurred during this invoice period.

CLIN 1002 – Labor

Program Manager: 194 hours

(b)(6) provided oversight, administration, and coordination in direct support of project execution. She participated in the pre-coordination visit to RSS facilities in Amman, Jordan in October to work with Gryphon and RSS SME's supporting logistical requirements for the conference, finalization of the conference agenda, speakers, and coordination with US Embassy personnel to ensure they have oversight on the project. She worked with the team to implement the MESA conference meeting and outreach event on September 29, successfully communicating conference objectives and information to USG and regional embassy partners. She Prepared and submitted a revised project proposal with an extended period of performance (POP) until May 2016 and revised budget to account for the extended POP. The purpose of this extension is to guarantee a successful implementation of the project. The extended project proposal has been accepted. She facilitated and directed regular programmatic meetings to ensure deliverables were met, to include weekly calls with CBEP and CLS team members and regional leads, and bi-weekly calls with RSS and Gryphon SMEs. She continued coordination with all project partners to ensure timely submission of CDRL requirements, to include a system for submission of CLS travel forms, JKO training for USG attendees, vetting, and other requirements for smooth execution of travel needs. She worked with Gryphon and CBEP to complete and receive approval on the press release for this event, and launch of the conference website.

Research and Data Analysts: 302 hours

(b)(6) ontinued supporting the project by providing daily administration and project coordination needs keeping all team members up to date on requirements and ensuring the project timeline and deliverable submissions are met. She coordinated with Gryphon SMEs to provide travel tracking and support to invited conference speakers and confirmed participants. She coordinated routine calls with key team members, participated in advisory board calls, tracked contract requirements for

Gryphon, and assisted in development of logistical requirements for submission to CBEP and CLS. She provided assistance in finalizing all coordination needs of the MESA conference meeting and outreach event in September, and attended the event. She also assisted in preparing the revised proposal. Emily coordinated regular programmatic meetings.
Pam Murphy provided administrative support for the completion of the subcontract, and submission of Gryphon financial reporting and invoicing.
(b)(6) assisted with revisions of the conference agenda, website requirements, as well as tracking, and review of submitted abstracts. She directly supported Gryphon SME's in execution of technical requirements needed in development of materials and conference outreach.

Subject Matter Expert 3: 122.5 hours

(b)(6) provided technical expertise and project coordination as the lead for Gryphon Scientific. She facilitated the appointment of a scientific advisory board, and continues to coordinate with the board, CBEP, and Metabiota to review and finalize the conference agenda and abstracts for participant selection. She worked with her team to develop an application, review, and selection process for receipt of scientific abstracts, and continues to work with the team to implement this process and secure all participants for the event. She continued conference outreach and securing speakers to facilitate the event. She worked with the team to finalize the conference website, and press release, further supporting facilitation of the event. She assisted in facilitation of the outreach reception held in September and attended the pre-coordination visit with (b)(6). She also participated in regular project meetings to ensure ongoing coordination of the conference.

Subject Matter Expert 1: 309.5 hours

(b)(6) provided routine technical expertise in direct support of the conference. They supported (b)(6) n coordinating all aspects of the project to include development of the website, securing speakers, development of the agenda, abstract reviews, and logistical requirements. They assisted in reaching out to partners for attendance at the outreach event in September, and attended the event. They participated in routine project meetings and calls, and coordinated directly with the scientific advisory board and team members to ensure all scientific personnel were secured for the even (b)(6) attended the pre-coordination meetings in Jordan with (b)(6) and continues to support logistical needs on the project.

CLIN 1003 – Materials and Supplies

Material and supply costs were not incurred during this period.

CLIN 1004 – ODCs

DBA costs were incurred during this period in support of the pre-coordination trip to Jordan in October.

CLIN 1005 – Travel

Travel costs are inclusive of the pre-coordination trip to Jordan conducted in October.

Dear (b)(6)

I hope this email finds you well.

Please find attached a travel request for (b)(6) to travel to Amman, Jordan from 09-13 October 2015 in support of the Epigenomics Workshop to be held in Jordan in March 2016 under the TD004.

This travel is being requested to support a pre-coordination meeting with RSS, the in-country partner in Jordan, to ensure the in-country logistics are moving forward and are operationally on track for the March WS.

If you have any questions, or require further information, please let me know.

Kind regards,
(b)(6)

Subject: TD-006 Cancellation
Date: Tuesday, August 18, 2015 1:53:45 PM

Hi (b)(6)

This email serves to officially notify you that DTRA has decided to cancel the currently unapproved TD-006.

(b)(6)
Deputy Chief Scientist
Cooperative Biological Engagement Program
Cooperative Threat Reduction
Defense Threat Reduction Agency
(b)(6)

TD 006 Nipah Research Activity Project-Canceled

Objectives

Further CBEP Cooperative Biological Research (CBR) objectives through; identification of reservoir and host range for Nipah or related viruses; examination of the seroprevalance of Nipah in bats, peridomestic animals and humans, and understanding the risk factors for cross species transmission in the Philippines.

Period of Performance: 06/01/2015 – 09/30/2015

CLIN	Total ROM	Total Invoiced	Total Remaining
1002	$11,985.82	$6,913.29	$5,072.53
1003			$0.00
1004			$0.00
1005			$0.00
TOTAL	$11,985.82	$6,913.29	$5,072.53

This technical directive was canceled on 18 August 2015. Following conversations with DTRA CBEP programmatic and contract personnel, it was determined that only labor costs associated with developing the proposal in response to the technical directive(s) would be billed to the Government. No other costs were incurred.

CLIN 1002 – Labor

Costs for direct labor to support this activity were incurred for the following personnel:

Program Manager: 24 hours

Metabiota Program Manager, (b)(6) worked with the Research Institute of Tropical Medicine (RITM) and Duke-NUS to request and prepare requirements necessary for proposal development and submission in response to the Technical Directive and Revised Technical Directive received for this activity. In support of this effort, (b)(6) participated in routine conference calls with SMEs and RCs from each institute to garner the necessary information required for the submission. In addition, she coordinated with CBEP regional personnel to ascertain project requirements, to include revised directives, and understanding of project objectives and end-states to accurately respond to the directive. In addition, (b)(6) developed the technical and cost proposal submitted to CBEP in support of this activity.

Research and Data Analysts: 46.50 hours

To complete these efforts, (b)(6) was supported by Metabiota Research and Data Analysts (b)(6) (b)(6) coordinated directly with identified SMEs and RCs from RITM and Duke-NUS to develop subcontract requests and packages in support of technical proposal development. They scheduled and participated in routine conference calls and communication with the collaborators to support development of the technical and cost proposal. In addition, they assisted in proposal development.

CLIN 1003 – Materials and Supplies
Costs were not incurred under CLIN 1003, as this technical directive was canceled.

CLIN 1004 – ODCs
Costs were not incurred under CLIN 1004, as this technical directive was canceled.

CLIN 1005 – Travel
Costs were not incurred under CLIN 1005, as this technical directive was canceled.

TD 006 Nipah Research Activity Project-Canceled

Objectives

Further CBEP Cooperative Biological Research (CBR) objectives through; identification of reservoir and host range for Nipah or related viruses; examination of the seroprevalance of Nipah in bats, peridomestic animals and humans, and understanding the risk factors for cross species transmission in the Philippines.

Period of Performance: 06/01/2015 09/30/2015

CLIN	Total ROM	Total Invoiced	Total Remaining
1002	$11,985.82	$11,985.82	$0.00
1003			$0.00
1004			$0.00
1005			$0.00
TOTAL	$11,985.82	$11,985.82	$0.00

This technical directive was canceled on 18 August 2015. Following conversations with DTRA CBEP programmatic and contract personnel, it was determined that only labor costs associated with developing the proposal in response to the technical directive(s) would be billed to the Government. No other costs were incurred.

CLIN 1002 – Labor

Program Manager: 21 hours

(b)(6) provided oversight, management, and directly responded to the revised technical direction. She coordinated with in country partners to ensure cost savings to the government and coordinated with the CBEP Regional and program leadership to discuss the plan for this TD prior to its cancellation. Upon Cancellation she informed the partners and finalized close out activities.

Research and Data Analysts: 28 hours

(b)(6) provided administrative review and coordination of the proposal efforts in response to the revised technical direction. They assisted with close out coordination.

CLIN 1003 – Materials and Supplies

Costs were not incurred under CLIN 1003, as this technical directive was canceled.

CLIN 1004 – ODCs

Costs were not incurred under CLIN 1004, as this technical directive was canceled.

CLIN 1005 – Travel

Costs were not incurred under CLIN 1005, as this technical directive was canceled.

CLIN 1002 – Labor

Metabiota's support of this effort is based on the solid expertise and cadre of exceptional researchers and SMEs the organization has on hand, and has engaged to support this project. Critical to developing an informed, targeted, and useable analysis is the reliance on field-specific expertise to inform and drive the regional assessment using risk analytics, scientific rigor and in-depth research analysis coupled with QA/QC measures to provide an informative, pointed landscape of the PACOM region that will support CBEP's 5+ year strategic plan and programmatic metrics. SMEs from a variety of disciplines have been and will be engaged to support this project to ensure all aspects of the analysis are captured to include the disease landscape, political and economic environment, legislation and governmental requirements, cultural, religious and behavioral practices, geographical and environmental issues, security concerns, and the interstices and overlapping confluence of aspects that make this a multi-faceted assessment recognizing and addressing a dynamic and changing landscape. Key to the development of this framework is driving it to an end state that will support CBEP's long-term mission in this area of operation. Metabiota's diverse team is dedicated to supporting this endeavor and bringing this project to completion. The experience of Metabiota's project management team, lead by (b)(6) is focused on achieving the desired end state and has built out the required labor to support this endeavor through rigorous recruiting and recognition of qualified experts. Team members supporting this effort are providing various levels of effort depending on their expertise and the required support needed to address specific components of the analysis. Utilizing a flexible schedule, and a cadre of team members, Metabiota can ramp up or down activity levels to address, build and support the needs required to complete this effort.

Costs for direct labor to support this activity were incurred for the following personnel:

Program Manager: 238 Hours

Metabiota SEA Program Manager, Carlyle Gollogly oversaw and executed the project to include management of the cost, schedule and performance. In addition, she provided direct management and oversight of all project personnel to include labor and reporting, driving the project to completion.

Subject Matter Experts 1: 1078.5 Hours

Metabiota Subject Matter Expert 1, Alex Vann oversaw the day-to-day activities of the project, as the key POC in Washington DC, supporting (b)(6) in the overall execution of this work. She coordinated daily with project staff, CBEP regional and country leadership to ensure they were provided routine visibility on the project to include coordination of in-person meetings, weekly reports, and analysis updates. (b)(6) provided experience and development, review, and adaptation of research documents and deliverables, as well as general research activities and facilitation of scientific collaboration.

Subject Matter Experts 2: 486 Hours

(b)(6)

(b)(6) provided experience and development, review, and adaptation of research documents and deliverables, as well as general research activities and facilitation of scientific collaboration. This team utilized experience in risk management, environmental studies, GIS, cultural anthropology, veterinary sciences and other related disciplines to conduct open source research, validating collected data, develop pathogen profiles, socio-economic, behavioral, and cultural components of the landscape, and provide critical scientific writing and editing skills to ensure document flow and mapping of information. The originally proposed TBD Soft Sciences labor hours were divided between (b)(6)

Subject Matter Experts 3: 508.50 Hours

(b)(6)

(b)(6) provided extensive experience and development, review, adaptation of research documents and deliverables, data and mapping visualization support, as well as general research activities and facilitation of scientific collaboration. Experts at this level bring a breadth of regional and international experience to the project specifically focused in their areas of expertise to include microbiology, virology, health informatics, medical anthropology, and data analytics. This team provides QA/QC measures to validate the data, as well as being a critical part of the team in collecting and driving the strict research aspects of this assessment.

Research and Data Analysts: 911 Hours

Research and Data Analysts, (b)(6)

(b)(6) conducted general research activities and assist in document review and editing. This team made up the general open research group of the project and provided research to support the analysis support SMEs in developing and building out the assessment. They also edited and referenced citations, ensuring that the document flow and citations were correct.

CLIN 1003 – Materials and Supplies

Materials and supplies costs incurred during this period include graphic services provided by Spot On Marketing. Services provided during this period included, maps, stylization, and development of the document framework for the regional landscape analysis to provide CBEP with a highly professional finished product.

Skype communication costs were incurred during this period to support communications with the project team and SMEs working on PACOM both CONUS and OCONUS.

In addition, template vector maps were procured to support graphic design and regionally specific maps required for the final deliverable of the regional baseline analysis, supporting the narrative framework and qualitative research.

CLIN 1004 – ODCs

Per contract guidelines DBA insurance is required for all personnel engaged on the AEP project traveling or working overseas. DBA insurance was purchased for (b)(6) during his travel to Manila, Philippines in support of attendance at the APSED meeting.

CLIN 1005 – Travel

At the request of DTRA (b)(6) Southeast Asia Program Manager traveled to New Orleans to attend PACOM meetings, as well as the American Society for Microbiology (ASM) General Meeting and to conduct working groups with DTRA CBEP Regional Leadership.

Travel was authorized for (b)(6) Southeast Asia Program Manager, and Alex Vann, SME I, to travel to Cebu, Philippines to attend the Asia-Pacific Biosafety Association (A-PBA) 10th Anniversary Conference and meetings with CBEP Regional Leads and other stakeholders in support of completing the PACOM baseline analysis. After booking the trip and registering for the conference, the trip was canceled due to the CCR not being approved. Costs are billed for bookings and reservations that were partially refunded upon cancellation. These include conference and airline processing fees for cancelation– no costs are billed for fully refunded bookings or expenses.

(b)(6) Deputy Director of the AEP Program traveled to Manila, Philippines to attend the World Health Organization Western Pacific Regional Office (WHO/WPRO) Technical Assistance Group (TAG) meeting on the Asia Pacific Strategy for Emerging Diseases (APSED).

TD 007 Regional Baseline Assessment

Objectives

Characterize the region based on the disease landscape, organic regional capabilities, and external factors that impact CBEP objectives, identify needs and areas of overlap with other stakeholders, and provide overarching strategic guidance & goals to CBEP PACOM Country Managers in the development of country engagement strategies.

Period of Performance: 05/16/2015 – 10/31/2015

CLIN	TOTAL COST	Total Invoiced	Total Remaining
1002	$802,669.00	$834,630.44	$31,961.43
1003	$27,711.00	$6,844.11	$20,866.89
1004	$8,452.33	$160.61	$8,291.72
1005	$11,656.82	$8,842.56	$2,814.26
TOTAL	$850,489.15	$850,477.71	$11.44

CLIN 1002 – Labor

Program Manager: 178 Hours

(b)(6) provided program oversight coordinating all team members in regular meetings to ensure submission of required deliverables and finalization of the regional baseline analysis. She participated in routine communications and meetings with the project team, CBEP leadership, and SMEs to finalize the analysis.

Subject Matter Experts 1: 1057.5 Hours

(b)(6) provided oversight and coordination as a team leader and facilitated completion of deliverables and required research and development of all materials in support of the regional baseline analysis. She directly coordinated with all project personnel, tracked data and research requirements, and compiled all information for submission at established deadlines. She participated and coordinated routine project meetings with CBEP personnel and project team members.

Additional SME 1 hours were used to complete pathogen profiles, continue research and compilation of data supporting the regional baseline analysis. The team assisted with revisions to Vol 1 and II following comments received by CBEP to drive towards completion of the analysis. In addition, the team provided editing, referencing, graphics, and compilation support to the overall project.

Subject Matter Experts 2: 285.5 Hours

Subject Matter Expert 2 hours were spent in review and finalization of pathogen profiles, stakeholder profiles, likelihood and severity factors, and overall data completion and narrative required for the baseline analysis. They provided overall research support to the project and provided data to the project coordinator for inclusion in the final report.

Subject Matter Experts 3: 339.50 Hours

Subject Matter Expert 3 hours were spent to finalize and review Volume II materials and provide critical input in Volume I. Following receipt of comments by CBEP and required revisions to meet the project expectations, senior level SMEs were brought in to provide additional QAQC of data and deliverables,

provided editing and additional research analysis, ensuring all CBEP requirements were met and the analysis would meet the final objectives.

Research and Data Analysts: 1179 Hours

Research and Data Analysts provided base data and backup documentation to the Subject Matter Experts for interpretation and review. They provided editing and administrative services in addition to assisting with compilation of all data, graphics, and basic research conducted in support of the project.

CLIN 1003 – Materials and Supplies

Material costs invoiced include the materials for completing the printed and electronic copies of the regional baseline analysis draft deliverables delivered to CBEP at the scheduled submission and review dates. Communication and Internet costs for (b)(6) were incurred for remote attendance at meetings and to facilitate project requirements.

CLIN 1004 – ODCs

No ODC Costs were incurred during this period.

CLIN 1005 – Travel

Travel costs included in the invoice reflect costs incurred by team members originally scheduled to attend the APBA conference. However, as travel was canceled all costs were refunded and not charged to the government outside of fees for airfare and conference processing costs.

Travel invoiced also includes costs for (b)(6) to travel to DC in order to coordinate with team members in finalization and presentation of the draft and final deliverables on the regional analysis, as well as to participate in in person meetings with DTRA CBEP.
