The complex structure presented in this study makes BatCoV HKU4 the sixth coronavirus in the *Coronaviridae* family for which the receptor-recognition mode has been elucidated with complex structures, in addition to SARS-CoV (Li et al., 2005a), MERS-CoV (Lu et al., 2013; Wang et al., 2013), MHV (Peng et al., 2011), NL63 (Wu et al., 2009), and porcine respiratory coronavirus (Reguera et al., 2012). Among these, BatCoV HKU4 likely represents a coronavirus suboptimized for receptor adaptation, displaying micromolar affinity for hCD26. Compared to MERS-CoV, which recognizes the same hCD26 molecule as a receptor (Raj et al., 2013), HKU4-RBD and MERS-RBD form similar structures and engage hCD26 via similar binding modes. Nevertheless, the two viral ligands exhibit a difference in receptor binding affinity of three orders of magnitude. We noted that in the RBM region predominating the ligand binding interface with the receptor, the majority of the interface residues in MERS-RBD contribute more vdw contacts than the equivalent amino acids in HKU4-RBD. This demonstrates a much better adaptation to hCD26 for MERS-CoV than for BatCoV HKU4, which was further supported by our mutagenesis data. We therefore presented the molecular basis for the observed affinity variance and a structural explanation for the suboptimized hCD26 binding by BatCoV HKU4. This weak binding also raises the possibility for the presence of other high-affinity receptors for BatCoV HKU4. Nevertheless, the physical interaction between HKU4-RBD and hCD26 seems to favor a scenario in which BatCoV HKU4 has evolved to adapt to the human receptor. In this sense, we cannot rule out the possibility that this bat-derived virus has been exposed, at some stage, to humans or human tissues.

Though with slight differences, the BatCoVs HKU4 and HKU5 exhibit similar sequence identities to MERS-CoV in the RBD region (54.4% versus 52.9%). The marked difference between the HKU4-RBD and HKU5-RBD relative to MERS-RBD, however, lies in two sequence deletions in the HKU5-RBD. Both deletions are located in the external subdomain and in two regions corresponding to the scaffold strands b7 and b8 in the MERS/HKU4-RBD structure. The deletions would therefore alter the fold of HKU5-RBM and abolish its interaction with hCD26. Similar amino acid deletions that exclude the viral ligand from interacting with hACE2 have also been recorded for diverse SARS-like coronaviruses identified in bats (Ren et al., 2008). An intact full-length external subdomain is likely a prerequisite to maintain binding capacity for hCD26 or hACE2, in addition to preserving key interacting residues, such as K506 and E541 in HKU4-RBD.

EXPERIMENTAL PROCEDURES

Gene Construction and Protein Expression

The coding sequences for target proteins were separately cloned into the EcoRI and *Xho*I restriction sites of pFastBac1 vector for baculovirus expression (Bac-to-Bac baculovirus expression system, Invitrogen). For each protein, an N-terminal gp67 signal peptide and a C-terminal hexa-His were added to facilitate protein secretion and purification. Sf9 cells were used to package and amplify the baculovirus, and High5 cells were used to express the proteins, which were purified by nickel affinity chromatography and gel filtration. The proteins were then used for crystallization and SPR experiments.

To prepare the Fc chimeric proteins, the fragments were fused 5^{0}-terminally to a fragment coding for mouse Fc domain and ligated into the pCAGGS expression vector via the EcoRI and *Xho*I restriction sites. All fusion proteins were linked to the signal peptide of the MERS-CoV S protein. The proteins were transiently expressed in human embryonic kidney 293T (HEK293T)cells and purified by Protein A affinity chromatography and gel filtration. The purified proteins were then used for fluorescence-activated cell sorting (FACS)experiments (see Supplemental Experimental Procedures for detailed information).

Crystallization, Data Collection, and Structure Determination

For protein crystallization, monomeric HKU4-RBD was mixed with hCD26 at a 1:1 stoichiometry and crystallized by the sitting-drop vapor diffusion method at 4 C at 15 mg/ml in a buffer consisting of 0.1 M sodium citrate (pH 5.5) and 15%

PEG 6000. Diffraction data were collected with cryoprotected (in a reservoir solution containing 20% [v/v] glycerol) crystals at the Shanghai Synchrotron Radiation Facility (SSRF) BL17U. The complex structure was solved by molecular replacement using the structure of MERS-RBD/hCD26 (PDB: 4KR0) as the search model. For details, see Supplemental Experimental Procedures).

Binding Assays

Protein interactions were tested using both SPR analysis and FACS experiments. For the SPR assays, all proteins were exchanged into a buffer consisting of 10 mM HEPES (pH 7.4), 150 mM NaCl, and 0.005% v/v Tween 20. The indicated RBD proteins were immobilized onto CM5 chips and analyzed for real-time binding by flowing through gradient concentrations of hCD26 or hACE2.

For the cell sorting analysis, Huh7 or hCD26-transfected BHK cells were stained with different RBD-Fc fusion proteins and analyzed by flow cytometry. For the binding-block assay, Huh7 cells were incubated with an antibody (anti-hCD26 or anti-Flag; Sigma) or with the purified ectodomain protein (hCD26 or hACE2) before the addition of HKU4-RBD-mFc, then the cells were analyzed by cell sorting (for details, see Supplemental Experimental Procedures).

Pseudovirus Infection

BatCoV HKU4 pseudovirus particles were produced in HEK293T cells using a previously described method (Gao et al., 2013). For the pseudovirus infection, the virus particles were first treated with trypsin and then used to infect Huh7 cells in the presence or absence of the anti-hCD26 antibody. The luciferase activity was determined 48 hr postinfection using a GloMax 96 Microplate luminometer (Promega) (for details, see Supplemental Experimental Procedures).

ACCESSION NUMBERS

The atomic coordinate of the HKU4-RBD/hCD26 complex has been deposited in the Protein Data Bank with the PDB code 4QZV.

SUPPLEMENTAL INFORMATION

Supplemental Information includes Supplemental Experimental Procedures, three figures, and two tables and can be found with this article online at http://dx.doi.org/10.1016/j.chom.2014.08.009 .

AUTHOR CONTRIBUTIONS

G.F.G. and G.L. initiated and coordinated the project. G.F.G., G.L., Q.W., and J.Y. designed the experiments. Q.W. conducted the experiments with help from Y.Y., Y.X., P.H., Y.W., W.J., and Y.L. J.Q. solved the structure. J.W. and A.I. provided the reagents and helped with manuscript writing. P.C.Y.W. and K.-Y.Y. helped with the data analysis and manuscript writing. Q.W., G.L., J.Y., and G.F.G. analyzed the data. G.L., Q.W., and G.F.G. wrote the manuscript.

ACKNOWLEDGMENTS

This work was supported by the National Natural Science Foundation of China (NSFC, Grant No. 81290342), the China National Grand S&T Special Project (No. 2014ZX10004-001-006), and the Strategic Priority Research Program of the Chinese Academy of Sciences (Grant No. XDB08020100). We thank the staff at the Shanghai Synchrotron Radiation Facility (SSRF) and Tong Zhao at the Institute of Microbiology, Chinese Academy of Sciences for support. G.F.G. is a leading principal investigator of the NSFC Innovative Research Group (Grant No. 81321063).

Renewal Application Questions and Answers

Table of Contents

- What are renewals and where can I find basic information about them?
- How do I decide whether to apply as a renewal or submit a new application?
- Should my renewal use my original Specific Aims or should I write new Specific Aims?
- Can a PI submit two renewal applications to follow-up on a single R01?
- How should I time my renewal application?
- What should I consider when deciding whether to apply early with a renewal?
- Should I submit my renewal early if I do not have enough data at the earlier time?
- Can NIH fund a renewal before the existing grant ends?
- What happens to a fundable renewal application for a grant that ends the next fiscal year?

- What is the funding cap for renewals?
- To which grants does the funding cap apply?
- If the cap is 20 percent, how does NIAID determine the budget limit?
- For modular grants, can I round up to the next level if the cap has not been reached?
- The budget for my first R01 was low, $130,000; how much can I request for my new budget?
- If I ask for the cap amount for my first year, can I make a bigger request for subsequent years?
- If I request an amount within the cap level, I won't have enough funds for a new animal model—what should I do?
- Are modular R01 renewals affected by the budget cap?
- What should I do during this era of lean budgets?
- Must I keep the title of the grant unchanged when applying for a renewal?
- Does a grant renewal have to go to the same study section as its original R01?
- Can my renewal application be assigned to a different NIH institute than the one that funded my prior grant? If so, how should I make that request?
- What format should I use for the Research Plan section of an R01 renewal?
- I am preparing to submit a renewal application for an R01 grant. Where in the application do I include the progress report and how should I format it?
- Is the Progress Report Publication List part of the 12-page limit for the Research Strategy?
- Will resetting anniversary dates affect the timing of my renewal?
- Can you tell me about renewing a training grant?
- Is there a window of time that a PI can submit an application as a renewal? Must the original grant still be active?
- If I change some of the collaborating projects in my P01, is my submission considered to be a renewal or a new grant application?
- Do I need to submit a final progress report for my grant if I am applying for a renewal?
- What if my question wasn't answered here, or I'd like to suggest a question?

What are renewals and where can I find basic information about them?

A renewal application is a request for funding to continue your NIH-funded research. Before your project ends, you must again apply for support and undergo initial peer review.

Alternatively, you may submit a new application. The best approach depends on your circumstances—see the next question.

For information on renewals, go to NIAID's Apply for Renewal or Start Anew in the Strategy for NIH Funding.

How do I decide whether to apply as a renewal or submit a new application?

It's your choice. When deciding, consider your situation and the science; then contact your program officer for advice.

For example, it is advantageous to apply with a renewal if you have made progress and accomplished most or all of your Specific Aims, and you plan a logical continuation using the same funding mechanism.

Going in a new direction or expanding the scope of the research calls for a new application. Read more inApply for Renewal or Start Anew in our Strategy for NIH Funding.

Should my renewal use my original Specific Aims or should I write new Specific Aims?

Your renewal should have new or mostly new Specific Aims, given the expectation that most or all of your original aims have been achieved. Peer reviewers will take into account what you have accomplished when assessing the merits of your renewal application.

Also, a renewal should clearly link back to your previous grant's Specific Aims, showing progress without duplicating the aims of the previous grant. It's important to show that you successfully conducted relevant research, got results, and then will use those results to pursue the next set of experiments.

We suggest reading Apply for Renewal or Start Anew in our Strategy for NIH Funding.

Can a PI submit two renewal applications to follow-up on a single R01?

No, but you can submit one as a renewal, and another as a new application that's significantly different.

Be aware that there are different submission dates for new and renewal applications. You may also want to read our advice on renewals—go to Apply for Renewal or Start Anew in the Strategy for NIH Funding.

How should I time my renewal application?
Good planning is critical. Some people wait until the last possible receipt date to send in their renewal applications without a break in funding, though often it's best to apply earlier.

If you have sufficient data, you may consider submitting your application one or more review cycles early. Applying early gives you time to revise and resubmit if you do not get a fundable score.

For more guidance, read the Strategy for NIH Funding. Go to NIH's Review and Award Cycles table for receipt dates and funding timeframes.

What should I consider when deciding whether to apply early with a renewal?
If you are submitting a renewal application, reviewers expect to see data showing progress no matter when your application arrives.

Your timing hinges on your comfort level with your data and progress, the length of the grant, and the complexity of the project. Read more in the Strategy for NIH Funding.

Should I submit my renewal early if I do not have enough data at the earlier time?
No. Send in your application one or more review cycles early only if you have enough data to show progress.

The early approach does not apply to short awards or work progressing slowly. For more advice, read the Strategy for NIH Funding.

Can NIH fund a renewal before the existing grant ends?
No. Though you can submit your renewal application at any time, your renewal cannot be funded until shortly before the final grant year is about to end.

What happens to a fundable renewal application for a grant that ends the next fiscal year?
We will keep track of the application, and if it is within the next fiscal year's payline, we will make the award. Of course, you may also choose to resubmit.

What is the funding cap for renewals?
For the past several years—which we expect to continue—NIAID has limited the amount of money you can request for your renewal R01 to 20 percent more than the direct costs of the last noncompeting award.

The cap is part of NIAID's financial management plan. Go to our Paylines and Funding page for the latest information, and read Planning a Budget in the Strategy for NIH Funding for how NIAID calculates that cap.

To which grants does the funding cap apply?
The renewal cap applies only to R01 grants. Although sometimes NIAID requests an exception to a cap from our advisory Council, this is highly unusual, and you shouldn't expect it.

As always, we recommend discussing your options with your program officer.

If the cap is 20 percent, how does NIAID determine the budget limit?
Go to Planning a Budget in the Strategy for NIH Funding to see how we compute the cap.

For modular grants, can I round up to the next level if the cap has not been reached?
Yes, if the cap results in a number between modular increments, you round up to the next module.

The budget for my first R01 was low, $130,000; how much can I request for my new budget?
Here's an example. If you send in your application as a renewal, you are limited to 20 percent more than $130,000. This is a reasonable approach if you are pretty much continuing the same research you started with.

However, if your research has evolved in scope, you may want to apply with a new grant. In that case, change the title and abstract to include your new Specific Aims, so the focus of the application reflects the new scale of your research.

Because new investigators typically receive less money than more experienced grantees, the cap is often a problem for them. For more advice, contact your program officer, and read Strategies for Dealing With a Budget Cap in the Strategy for NIH Funding.

If I ask for the cap amount for my first year, can I make a bigger request for subsequent years?

No. All budgets are based on the first year budget. Modular grants get the same number of modules (same funding level) each year. Nonmodular grants may get a small increase or a decrease, depending on NIAID's financial management plan for that year.

You can request funds in excess of the cap for one-time costs, such as equipment. Go to Planning a Budget in the Strategy for NIH Funding and the Renewal Funding SOP for more information.

If I request an amount within the cap level, I won't have enough funds for a new animal model—what should I do?

You have several options. Regardless of Institute policy, you should request the resources needed for your research. Learn more in Strategies for Dealing With a Budget Cap in the Strategy for NIH Funding.

Are modular R01 renewals affected by the budget cap?

The cap affects all applications, modular or nonmodular, regardless of funding level.

What should I do during this era of lean budgets?

Keep in mind that it's harder to get funded in a lean budget year and that you may not get funded at the study section-approved level. Read more in When Funding Is Tight in the Strategy for NIH Funding.

Must I keep the title of the grant unchanged when applying for a renewal?

No. While it is often best to keep the same title, use a different title if it's a better fit.

If you do change the title, check the box indicating that your application is a renewal on the checklist (the last page) of the grant application, and enter your grant number. That way, NIH will know you are submitting a renewal with a new title.

Does a grant renewal have to go to the same study section as its original R01?

No. You can request any study section in your cover letter if it's relevant to the science. However, keep in mind that there's no guarantee your application will go there.

Can my renewal application be assigned to a different NIH institute than the one that funded my prior grant? If so, how should I make that request?

Although it's rare, grants can be funded in situations where the previous competitive segment was funded by another institute or center (IC). Check with a program officer in the other IC to see whether there is interest in your application before you submit the application.

Request that IC as the primary institute in your cover letter. If your application is able to fit a different IC's mission, you can work with your program officer to request a dual assignment if you didn't request it when you initially submitted the renewal application.

Many ICs will accept a transfer before review but not afterwards, so it's best to inquire whether there is interest in accepting the application at another IC before review.

If the assigned IC doesn't wish to fund the application, then a secondary IC can determine that it's important to their mission and request that the application moves to their IC. The secondary IC will generally only fund the application if the score is within their payline.

For more information, see the Request for Primary IC Assignment SOP.

What format should I use for the Research Plan section of an R01 renewal?

A Research Plan follows the same format and page limits for a renewal as a new application, with a few differences.

Instead of preliminary studies, include a Progress Report. You also include a Progress Report Publication List, information on Inventions and Patents, and a Planned Enrollment Report and Cumulative Inclusion Enrollment Report if you're conducting human subjects research.

See How to Fill Out the Forms in the Strategy for NIH Funding, and check the SF 424 Application Guide of the R01 funding opportunity announcement for further details.

I am preparing to submit a renewal application for an R01 grant. Where in the application package do I include the progress report and how should I format it?

NIH doesn't have a progress reporting form for renewal applications. You'll report progress in your Research Strategy. See a sample application that is a renewal, if you want to see how another PI did his.

For additional information, see How to Fill Out the Forms and Preliminary Studies or Progress Report in our Strategy for NIH Funding.

Is the Progress Report Publication List part of the 12-page limit for the Research Strategy?

No, it's not. The SF 424 (R&R) Application Guides state that the Progress Report Publication List should not be included in the Approach part of the Research Strategy. Therefore, it's not part of the 12-page limit for that section.

Instead, the Progress Report Publication List is a separate attachment for the PHS 398 Research Plan. The application guides don't specify a page limit for that attachment.

Will resetting anniversary dates affect the timing of my renewal?

Yes. NIAID does not reset grant dates every year. If we do, we let investigators know through our *NIAID Funding Newsletter*. Sign up to receive an email each time it is published at Subscribe to Email Alerts.

Can you tell me about renewing a training grant?

Go to Does NIAID have instructions for renewals of training grants? in the Training Grants questions and answers. Read Does my renewal application need to be as detailed as my original application? on that page.

Is there a window of time that a PI can submit an application as a renewal? Must the original grant still be active?

No. The grant need not be active and there is no time limit for a renewal application. However, reviewers will probably be concerned by major gaps.

If a significant amount of time has elapsed, indicate what you have done in the interim. Highlight any preliminary data you may have obtained, and show that your planned research is current with the latest science.

If I change some of the collaborating projects in my P01, is my submission considered to be a renewal or a new grant application?

See If I change some of the collaborating projects in my P01, is my submission a renewal or a new grant application? in the NIAID Investigator-Initiated Program Project (P01) Applications questions and answers.

Do I need to submit a final progress report for my grant if I am applying for a renewal?

See Do I need to submit a final progress report for my grant if I am applying for a renewal? in the Progress Reports questions and answers.

What if my question wasn't answered here, or I'd like to suggest a question?

Email deaweb@niaid.nih.gov with the title of this page or its URL and your question or comment. We answer questions by email and post them here. Thanks for helping us clarify and expand our knowledge base.

U.S. Government Gain-of-Function Deliberative Process and Research Funding Pause on Selected Gain-of-Function Research Involving Influenza, MERS, and SARS Viruses

Frequently Asked Questions

November 2014

What is "gain-of-function" research?

"Gain of function" refers to any modification of a biological agent that confers new or enhanced activity. Typically, researchers mutate or alter genes and examine the impact of these modifications on a particular property or trait of the organism. For example, some investigators can modify influenza viruses in ways that enhance pathogenicity and/or transmissibility in order to better understand the origins and nature of these traits at the molecular level, as well as their pathogenesis in susceptible hosts. Since influenza viruses constantly evolve in nature, these gain-of-function studies may help predict whether these viruses could evolve naturally over time to acquire these new or enhanced traits, and if so, how the viruses might affect hosts and the kinds of medical countermeasures that might be most effective. Some gain-of-function studies may entail biosafety and biosecurity risks that require unique risk assessment and mitigation measures.

Why is gain-of-function research undertaken?

Gain-of-function studies involving infectious agents help us understand the fundamental nature of host-pathogen interactions and can shed light on the potential for, and mechanisms of, evolution of viruses and other infectious agents to acquire certain properties. Greater insight into the biological processes that contribute to pathogenicity or transmissibility can provide a foundation for identifying and developing effective approaches to prevent or treat human or animal infections. Gain-of-function research may also enable assessment of the pandemic potential of emerging infectious agents, which could inform public health and preparedness efforts, including the development of effective medical countermeasures.

Why is the U.S. government[1] pausing the funding of certain types of gain-of-function studies at this time?

The occurrence this year of laboratory biosafety incidents at U.S. government research facilities have caused the federal government to re-assess the risk/benefit calculus underpinning funding decisions for a certain subset of gain-of-function research involving agents that pose a significant risk to public and animal health. The pause will allow the U.S. government, in partnership with the life sciences community, to conduct a comprehensive assessment of gain-of-function research with the explicit goal of developing a new policy framework to guide future funding decisions.

What is the scope of research covered by the funding pause?

During the pause, the U.S. government will not release new funding for gain-of-function research projects that reasonably may be anticipated to confer attributes to influenza[2], Middle East Respiratory Syndrome (MERS), or Severe Acute Respiratory Syndrome (SARS)

[1] http://www.whitehouse.gov/blog/2014/10/17/doing-diligence-assess-risks-and-benefits-life-sciences-gain-function-research

[2] Any influenza virus, not only highly pathogenic strains

viruses such that the resulting virus has enhanced pathogenicity and/or transmissibility (via the respiratory route) in mammals. This means that the U.S. government will not release new funding for experiments that meet the gain-of-function funding pause criteria. For the small subset of ongoing work that is determined to meet the gain-of-function funding pause criteria, the contract-funded work has been stopped and the grant-funded work is subject to a voluntary pause. The funding pause will not apply to characterization or testing of naturally occurring influenza, MERS, and SARS viruses, unless these tests reasonably are anticipated to increase transmissibility or pathogenicity.

Why is the funding pause limited to only research involving influenza, SARS, and MERS viruses?

These three viruses not only share the characteristic of being human health threats - causing in some instances significant morbidity and mortality - but they also have the potential to cause pandemics because they are transmitted easily by the respiratory route. A pandemic with any of these pathogens could have serious repercussions for health, security, and economics, both nationally and globally. While the U.S. government recognizes that understanding the pandemic potential of these organisms is one of the reasons investigators conduct gain-of-function studies, such experiments entail certain risks to individual and public safety and security. This year's federal laboratory incidents led the government to reassess the risk/benefit calculus underpinning funding decisions for a certain subset of gain of function research, and consequently pause funding for those high-risk gain of function experiments until a comprehensive review of the risks and benefits of gain of function studies could be completed.

How many ongoing research projects involving influenza, SARS, and MERS viruses entail experiments that fit the characteristics of those subject to the funding pause?

The National Institutes of Health (NIH) initially identified 18 projects that might entail experiments subject to the funding pause. Letters were sent to principal investigators on those projects to notify them of the funding pause and to request that they assess the applicability of the pause to their projects. Discussions between NIH and these investigators are currently ongoing and regard specific experimental details and research results in order to determine the applicability of the funding pause to those experiments. Therefore, the number of projects actually affected by the pause may change from the 18 currently identified.

What if I am not sure whether an experiment falls under the funding pause?

In cases where it is not clear whether an experiment involving influenza, MERS, or SARS virus would be subject to the pause, determinations will be made on a case-by-case basis by the funding agency. Investigators who have questions about whether an experiment may be subject to the pause should contact their funding agency.

Are experiments involving isolated genes of influenza, MERS, or SARS virus included in the funding pause?

No. The pause applies to research that would create viruses with certain attributes. If the research does not include production of infectious, replication-competent virus, then it would not be subject to the pause.

Are in silico or modeling studies of influenza, MERS, or SARS virus included in the funding pause?

Experiments *in silico* or modeling studies are not covered under the pause unless they also involve work with the actual viruses and meet the criteria.

Will influenza surveillance activities be affected by the funding pause?

The pause is not intended to affect influenza surveillance work generally, and the U.S. government is committed to ensuring the nation is prepared for seasonal and pandemic influenza. Influenza surveillance projects supported by the U.S. government should continue, unless these projects involve the manipulation of naturally occurring isolates such that the resulting viruses have enhanced transmissibility and/or pathogenicity.

What will occur during the pause?

During the pause, a deliberative process will be undertaken in which the potential benefits and risks of gain-of-function research will be evaluated by the life sciences community and federal government. The deliberative process will involve two distinct, but complementary, entities, and is explicitly structured to facilitate robust engagement between the federal government and life sciences community. The National Science Advisory Board for Biosecurity (NSABB) will serve as the official federal advisory body for providing advice on oversight of this area of dual use research, in keeping with federal rules and regulations.

Early in the deliberative process, the National Research Council (NRC) of the National Academies will be asked to convene a scientific symposium focused on the issues associated with gain-of-function. The NRC will also hold a second symposium later in the deliberative process, which will include a discussion of the NSABB draft recommendations regarding gain-of-function research.

The NSABB, informed by discussion at the NRC public consultations, will provide recommendations to the heads of all federal entities that conduct, support, or have an interest in life sciences research. The final NSABB recommendations as well as the outcomes of the NRC symposia will inform the development and adoption of a new U.S. government policy regarding gain-of-function research. The life sciences community will be encouraged to provide input through both the NRC and NSABB deliberative processes.

Will members of the life science community and public have opportunities to provide input to the NSABB and NRC discussions?

Yes. The NSABB and NRC proceedings will employ mechanisms to engage the life sciences community and public at large, who will be encouraged to provide input.

When will the funding pause end?

The funding pause will end when the U.S. government has adopted a federal policy to guide future funding decisions regarding gain-of-function studies on the basis of the deliberative process described above. The objective is for the pause not to be any longer than necessary, and the federal government has launched a process that is intended to take 12 months.

Is there a provision to allow gain-of-function research subject to the funding pause to proceed, for example, if the research is required for public health or national security purposes?

Yes, an exception from the funding pause may be granted by the head of the federal funding department or agency if that official determines in writing that the research is urgently necessary to protect public health or national security.

I believe that my research is indeed urgently necessary to protect public health or national security and should not be subject to the funding pause. What is the process for requesting and receiving an exception?

Principal investigators should begin by contacting the program or contract officer at the agency funding the research in question. Agency staff will then consider whether particular experiments are subject to the funding pause, and if so, whether they meet the exception criterion of being "urgently necessary to protect the public health or national security." If program staff believe the research in question may meet the exception criterion, the matter will then be referred to the Director of the department or agency that funds the research for a final evaluation and determination. Once the director makes a determination, agency staff will notify the investigator about the outcome of this evaluation in a timely way. While individual experiments and specific evaluation processes will vary, the U.S. government is committed to evaluating potential exceptions and making determinations as expeditiously as possible.

Is the funding pause related to ongoing efforts to respond to the Ebola outbreak in West Africa?

No. The research pause only affects release of new funding for gain-of-function research experiments that reasonably are anticipated to confer attributes to influenza, MERS, or SARS virus such that the resulting virus has enhanced pathogenicity and/or transmissibility via the respiratory route in mammals.

Department of Health and Human Services

Part 1. Overview Information

Participating Organization(s)	National Institutes of Health (NIH)
Components of Participating Organizations	National Institute of Allergy and Infectious Diseases (NIAID)
Funding Opportunity Title	**Centers of Excellence for Translational Research (CETR) (U19)**
Activity Code	U19 Research Program – Cooperative Agreements
Announcement Type	New
Related Notices	None
Funding Opportunity Announcement (FOA) Number	**RFA-AI-12-044**
Companion Funding Opportunity	None
Number of Applications	See Section III. 3. Additional Information on Eligibility.
Catalog of Federal Domestic Assistance (CFDA) Number(s)	93.855; 93.856
Funding Opportunity Purpose	The National Institute of Allergy and Infectious Diseases (NIAID) invites new applications from single institutions and consortia of institutions to participate in the Centers for Excellence in Translational Research (CETR) program. The purpose of this FOA is to support multidisciplinary translational research centers focused on generating, validating and advancing medical countermeasures to NIAID Emerging and Re-emerging Infectious Diseases.

Key Dates

Posted Date	November 23, 2012
Letter of Intent Due Date(s)	February 26, 2013
Application Due Date(s)	March 26, 2013
AIDS Application Due Date(s)	Not Applicable
Scientific Merit	July, 2013

Review	
Advisory Council Review	October, 2013
Earliest Start Date	March, 2014
Expiration Date	March 27, 2013
Due Dates for E.O. 12372	Not Applicable

Required Application Instructions

It is critical that applicants follow the instructions in the PHS 398 Application Guide except where instructed to do otherwise (in this FOA or in a Notice from the *NIH Guide for Grants and Contracts*). Conformance to all requirements (both in the Application Guide and the FOA) is required and strictly enforced. While some links are provided, applicants must read and follow all application instructions in the Application Guide as well as any program-specific instructions noted in Section IV. When the program-specific instructions deviate from those in the Application Guide, follow the program-specific instructions. **Applications that do not comply with these instructions may be delayed or not accepted for review.**

Looking ahead: NIH is committed to transitioning all grant programs to electronic submission using the SF424 Research and Related (R&R) format and is currently investigating solutions that will accommodate NIH's multi-project programs. NIH will announce plans to transition the remaining programs in the *NIH Guide to Grants and Contracts* and on NIH's Applying Electronically website.

Part 2. Full Text of Announcement

Section I. Funding Opportunity Description

Purpose

The National Institute of Allergy and Infectious Diseases (NIAID), National Institutes of Health (NIH), supports extramural research focused on understanding, controlling and preventing diseases caused by virtually all infectious agents. In response to threats presented by emerging infectious diseases and bioterrorism, the NIAID Division of Microbiology and Infectious Diseases (DMID) has established complementary research programs to facilitate development of medical countermeasures for certain pathogens and toxins.

With this FOA, NIAID invites applications to establish Centers of Excellence for Translational Research (CETR) focused on the development of medical countermeasures and associated platforms/technologies targeting NIAID Emerging and Re-emerging Infectious Diseases (http://www.niaid.nih.gov/topics/emerging/pages/list.aspx), which includes NIAID Category A, B and C Priority Pathogens. For the purposes of this FOA, "translational research" is defined as research and developmental activities focused on transforming basic science outcomes (knowledge, technologies, infrastructure, etc.) into

new and innovative approaches for prevention, diagnosis, and treatment of disease. Priority will be given to Centers that address the greatest clinical need. Emphasis will be placed on Centers that integrate current research knowledge and infrastructure with highly innovative and synergistic approaches to facilitate medical countermeasure development, and address related constraints, challenges or barriers to product development, licensure and usage. Clinical trials will not be supported under this program.

Background

The NIH and other agencies in the Department of Health and Human Services (DHHS) support development of medical countermeasures to protect the public from emerging infectious diseases and bioterrorist threats. In 2002, NIAID published the initial Strategic Plan for Biodefense Research (http://www3.niaid.nih.gov/topics/BiodefenseRelated/Biodefense/PDF/strategic_plan.pdf) and related research agendas (http://www3.niaid.nih.gov/topics/BiodefenseRelated/Biodefense/about/strategicplan.htm), outlining research and development objectives to address threats posed by Category A, B and C Priority Pathogens. A significant component of the Strategic Plan was the establishment of the Regional Centers of Excellence for Biodefense and Emerging Infectious Diseases Research (RCE) program (http://www.niaid.nih.gov/labsandresources/resources/rce/Pages/default.aspx). The RCE program was initiated in 2003, renewed in 2008, and currently supports 11 Centers nationwide (http://www.niaid.nih.gov/labsandresources/resources/rce/Pages/default.aspx). The goal of the RCE program was to establish and maintain appropriate infrastructure and multifaceted research and development activities to provide scientific information and translational research capacity to facilitate discovery and development of the next generation of therapeutics, vaccines, and diagnostics against bioterror agents and emerging infectious diseases.

In 2007, NIAID published an updated Strategic Plan for Biodefense Research (http://www.niaid.nih.gov/topics/BiodefenseRelated/Biodefense/Documents/biosp2007.pdf). The updated Strategic Plan is consistent with the DHHS Public Health Emergency Medical Countermeasure Enterprise (PHEMCE) Implementation Plan (http://www.hhs.gov/aspr/barda/phemce/enterprise/strategy/index.html), which outlined strategies for identifying medical countermeasure requirements and establishing priorities for their research, development and acquisition. The updated NIAID Strategic Plan continues to focus on translation of basic research to countermeasures, but with an emphasis shift from the “one bug-one drug” approach towards a more flexible, broad-spectrum approach. This approach is centered on development of countermeasures that are effective against multiple pathogens or toxins, development of technologies that can be widely applied to improve classes of products, and development of platforms that can reduce the time and cost of creating new products. The broad-spectrum approach recognizes the expanding range of biological threats and the limited resources available to address each individual threat. As one mechanism to achieve the goals of the updated Strategic Plan, the NIAID will establish the CETR program to facilitate innovative, interdisciplinary translational research efforts focused on countermeasure and/or related platform development.

The primary goals of the RCE program have been accomplished and the program will end in 2014. The CETR program will build upon the research and development accomplishments of the RCE program and other NIAID-supported programs, and is intended to complement and enhance ongoing translational and product development activities.

Research Objectives and Scope

The objective of this FOA is to establish a program of multi-project translational research Centers focused on advancing discovery, preclinical development, production, licensure and/or use of new or improved countermeasures (therapeutics, immunotherapeutics, vaccines, vaccine technologies, and medical diagnostics) or related technologies specific for NIAID Emerging and Re-emerging Infectious Diseases. Each Center will be organized around a single theme that addresses development and/or use of a targeted countermeasure or technology. NIAID anticipates considerable variety in Center themes and objectives, which can range from development of single or multiple countermeasures targeting a specific group of listed pathogens/toxins to development of new technologies or platforms that target a wide array of pathogens/toxins. Translational activities are anticipated to range from very early discovery-based efforts to late-stage preclinical development. Additionally, each Center must identify and address anticipated regulatory

barriers for the countermeasure or technology and propose research and/or strategies to overcome these barriers. This is particularly important for new classes of medical countermeasures for which there are no precedents for FDA approval.

Examples of translational research themes include, but are not limited to, the following areas:

- New or improved therapeutics against antibiotic-resistant pathogens.
- Development of a broad-spectrum countermeasure or technology.
- Countermeasures targeting intracellular pathogens.
- Development of a multivalent ("universal") or therapeutic vaccine.
- Host-targeted interventions as therapeutics.
- Development of broad-spectrum countermeasures against taxonomically-related viruses.
- Improved vaccine technologies or production platforms.
- Co-development of a therapeutic and diagnostic that have broad-spectrum activity.

Each application must clearly define the proposed Center theme and the range of activities being pursued, and the significance of the Center theme in regard to countermeasure development, public health need, and benefit to public health of a successful effort. Additionally, each application must detail how each Research Project contributes to the theme and objectives as well as project interdependence. Applications must outline expected synergies provided by the proposed center structure (see CETR Structure below). NIAID encourages Centers focused on development of medical countermeasures that are effective against a variety of pathogens and toxins, technologies that can be widely applied to improve classes of products, and platforms that can reduce the time and cost of creating new products. For this FOA, applications must focus translational activities towards development of one or more specific countermeasures or technologies as described below.

Note: For the purpose of this FOA, broad-spectrum is defined as a countermeasure which is effective against multiple infectious disease agents where one or more is on the list of NIAID Emerging and Re-emerging Infectious Diseases.

Note: Translational research themes supported by this program must target listed NIAID Emerging and Re-emerging Infectious Diseases. Accordingly, all Center research and development activities must utilize the virulent form of a listed human pathogen under appropriate biosafety conditions, or a CDC-approved excluded strain that is an attenuated form of the human pathogen.

Note: While clinical development strategies and/or clinical studies (e.g. sample collection, strain isolation, etc.) may be included within an overall project, this FOA will NOT support clinical trials; applications requesting support for clinical trials are nonresponsive to this FOA and will not be reviewed. Utilization of human-derived material in pre-clinical studies is encouraged.

In order to be responsive, projects must focus on the following countermeasures and/or technologies:

Therapeutics

This FOA will support the development of therapeutics, including immune-based and host-targeted

therapeutics, with special interest in broad-spectrum therapeutics and those targeting antimicrobial resistant pathogens and/or pathogens for which no standard clinical treatment exists.

Immune-based therapeutics may include both broad-spectrum (innate immunity, for example) and pathogen- or toxin-specific immunotherapeutics (antibodies, for example) that target listed pathogens/toxins. Of particular interest are immunotherapeutics that would enable prevention of infection or intoxication in the face of an immediate threat, protection of immunocompromised individuals, or post-exposure treatment to suppress infection and disease. NIAID encourages discovery and/or development of immunotherapeutics that directly affect pathogens/toxins and/or therapeutic approaches to stimulate non-specific immunity. Passive treatments may be especially valuable during the acute emergence of infectious diseases and may complement the use of antimicrobial drugs or vaccination programs to optimize protection.

This program will support discovery and development of therapeutics that target host-encoded functions required for infection, replication, spread and/or pathogenesis by one or more listed pathogens and potentially, additional non-listed pathogens. The development of therapeutics that target host-encoded functions provides a potential solution to emergence of microbial resistance and high developmental costs associated with treatments effective against only one microbe. Of particular interest are therapeutics that target specific host functions/pathways that are required for infection and pathogenesis by unrelated pathogens. For host-targeted intervention projects, applicants must clearly define the specific required host-pathogen interaction(s) for development of a corresponding targeted therapeutic(s).

Vaccines

This FOA will support the development of multivalent/universal vaccines and therapeutic vaccines. The development of monovalent vaccines against many listed pathogens and toxins is currently well represented within the NIAID emerging infectious diseases research portfolio. Accordingly, vaccine research supported by this FOA aligns with current HHS priorities that emphasize development of the following broad-spectrum vaccine forms targeting emerging diseases:

Multivalent/Universal Vaccines

For this FOA, multivalent or universal vaccines are defined as broad-spectrum vaccines that provide protection against a group of taxonomically related pathogens, or two or more unrelated pathogens. Vaccines characterized by broad-spectrum activity in this class include cross-protective forms, which induce an immune response against constant components of two or more microbes, and multiple component forms, which include elements that protect against microbes that are different, and may or may not be related. Examples of a multivalent/universal vaccine include a universal influenza vaccine and a multivalent vaccine that protects against both X and Y.

Therapeutic Vaccines

For this FOA, therapeutic vaccines are defined as those vaccines that can be delivered after disease onset to simplify, reduce, and/or shorten, or eliminate complicated treatment regimens, or reduce development of antimicrobial resistance. Examples of therapeutic vaccines include forms used for combination treatment of infections caused by *Mycobacterium tuberculosis* or *Burkholderia pseudomallei*.

Note: Applications for centers focused on development of a vaccine that cannot be classified as a multivalent/universal or therapeutic form are nonresponsive and will not be reviewed.

Vaccine Technologies

This FOA will support Center activities focused on discovery and/or development of innovative vaccine technologies (including adjuvants), particularly those that would improve vaccine effectiveness and/or simplify vaccine delivery to patient populations during a natural outbreak of an infectious disease or following the intentional release of an agent. Proposed projects must pair the candidate technology with one or more appropriately mature, well-characterized vaccine(s)/antigen(s) (except those pertinent to HIV) for which models and assays exist to allow evaluation of the technology. Applications focused on development of technologies such as delivery platforms, antigen targeting, adjuvants, stability and cold-chain minimization, production characterization or formulation methodologies are encouraged.

Note: While this FOA will not support the development of a candidate monovalent vaccine, a project focused on development of a new vaccine technology or production platform may use a validated or licensed monovalent vaccine as the demonstration and/or development platform.

Diagnostic Technologies

This FOA will support development of new and innovative integrated, sample-to-answer, rapid, easy-to-use, sensitive, and specific diagnostic platforms and/or technologies that address clinical priorities/needs/challenges pertinent to emerging infectious diseases. These medical diagnostics are to be targeted for use in clinical settings, including hospital-based clinical microbiology laboratories, point-of-care, and/or public health laboratories and will enable clinicians to rapidly provide the appropriate therapy

to patients. Applications must address methods for sample preparation, collection, and processing for the novel platform. The integrated medical diagnostic must be able to accept and process clinical sample volumes required for detection of targeted pathogen(s). Proposed novel, emerging diagnostic platforms may focus on detection of pathogen or host-specific targets. Successful projects will demonstrate the capability of the proposed platform to detect the targeted pathogens in valid infectious disease animal models (for in vivo technologies) or human clinical samples (for other technologies).

While it is not expected that proof-of-concept stage technologies should be ready for validation studies to enable FDA approval at the end of the project period, FDA approval would be an eventual long-term goal of projects supported under this program.

The following technologies/platforms are strongly encouraged:

Multiplex diagnostic technologies;

Technologies capable of identifying engineered or otherwise acquired genetic traits, such as patterns of antimicrobial resistance or enhanced virulence; and/or

Technologies that could be operational in non-traditional health care settings including rural and urban community health care clinics and temporary health care clinics (e.g., those established in response to a natural or man-made disaster).

Note: Applications focused on development of environmental, agricultural, industrial and/or workplace surveillance/detection technologies are nonresponsive and will not be reviewed.

CETR STRUCTURE

Each Center in the CETR program will be organized around a chosen theme focused on development and/or use of one or more countermeasures and/or technologies that target NIAID Emerging and Re-emerging infectious Diseases with the objective of translating research results to product development. Each Center will include individual Research Projects, an Administrative Core, and if necessary, Scientific Cores (see component descriptions below). NIAID anticipates considerable variety in Center themes and objectives, which can range from development of single or multiple countermeasures targeting a specific group of Emerging and Re-emerging Infectious Diseases to development of new technologies or platforms that target a wide array of pathogens/toxins. Additionally, translational activities are anticipated to range from very early discovery-based efforts to late-stage preclinical development.

As an example, a Center focused on discovery of new therapeutics that target select intracellular bacterial pathogens might have the following structure:

Research Project 1: Identification of Novel Therapeutic Targets in Pathogens

Research Project 2: Bioinformatic/Proteomic Approaches to Identify Essential Host Activities as Therapeutic Targets

Research Project 3: Screening for Small Molecule Effectors against Pathogen and Host Targets

Administrative Core

As a second example, a Center focused on an innovative broad-spectrum platform for production of vaccines might have the following structure:

Research Project 1: Production and Stabilization of a Smallpox Vaccine

Research Project 2: Production and Stabilization of Influenza Vaccines

Research Project 3: Production and Stabilization of a MRSA Vaccine

Administrative Core

Animal Model Core (Vaccine Efficacy Evaluation)

As a third example, a Center focused on development of countermeasures targeting a group of taxonomically related bacterial pathogens might have the following structure:

Research Project 1: Optimization and Preclinical Evaluation of Therapeutic X

Research Project 2: Optimization and Preclinical Evaluation of Immunotherapeutic Y

Research Project 3: Clinical Diagnostics for Targeted Bacteria and Antibiotic Resistance

Administrative Core

CETR COMPONENTS

Research Projects

Each Center must include at least three but not more than six interdependent translational Research Projects organized around the chosen theme; projects must focus on development and advancement of a new or improved medical countermeasure and/or associated platform/technology targeting one or more NIAID Emerging and Re-emerging Infectious Diseases. Each Research Project must contribute directly to the Center theme and objective(s). The Center Program Director/Principal Investigator (PD/PI) will monitor all Research Projects and promote efforts that foster integration, collaboration and synergy. Research Projects may be proposed for up to five years and each project leader must commit at least 1.2 calendar months effort to their project per year. Research Projects are expected to incorporate state-of-the-art technology and approaches and may include consortium arrangements for required activities. Applicants are encouraged to carefully consider the scope and range of research proposed and develop a Center that is coherent overall and consistent with available resources and personnel.

All Research Projects must include detailed project performance and timeline objectives (see Section IV. Application and Submission Information). Additionally, projects must identify and address anticipated regulatory barriers and propose research and/or strategies to overcome these barriers (see below). This is particularly important for new classes of medical countermeasures for which there are no precedents for FDA approval.

All Research Projects at the stage of preclinical product development must include a Product Development Strategy section (see Section IV. Application and Submission Information; Product Development Strategy). The Product Development Strategy must include both a Milestones and Timelines section detailing project performance and timeline objectives and a Product Development Plan. This plan should include the participation of consultants with expertise in technology transfer and the development of regulated products. Only those projects for which the mechanism of action of the candidate product is reasonably well understood, possible routes of administration and formulations suitable for scalable production identified, and assays to assess product quality that are well developed should be considered for support beyond Technology Readiness Level (TRL) 5 (https://www.medicalcountermeasures.gov/federal-initiatives/guidance/about-the-trls.aspx). In addition, animal models that are adequate to assess the ability of the product to induce a certain response and endpoints that will satisfy the Animal Rule (http://www.fda.gov/BiologicsBloodVaccines/SafetyAvailability/ProductSecurity/ucm110322.htm) should be identified and included for candidate products that may not be tested for efficacy in humans.

Administrative Core

Each Center must include an Administrative Core, under which all Center activities will be managed, coordinated, and supervised. A well-structured and run Administrative Core is integral to a Center's success, and should be clearly described in the application. The PD/PI must be the director of the Administrative Core and must commit at least 0.6 calendar months effort per year to these responsibilities, in addition to his/her Research Project activities. An Administrative Core Associate should be a research administrator responsible for the daily administration and fiscal management of the Center. It is recommended that the Administrative Core Associate devote a level of effort ranging from 3 to 6 person months to the execution of the administrative details of the Center projects and to managing the day-to-day operations within the Center. Any additional Administrative Core personnel must be clearly justified. The Administrative Core budget may not

exceed 5% of total direct costs requested.

The Administrative Core must include a Management Plan that identifies and discusses: the Administrative Core structure; the roles of Administrative Core personnel; the composition and duties of the Scientific Advisory Committee (see below); and the facilitation of communications throughout the Center and with NIAID staff. The plan should specifically address continual evaluation of research and development progress, communications, group meetings and teleconferences, presentation and publication of data, resource and model sharing, transmission of information and reagents, the identification and proposed resolution of problems and engagement of the NIAID Staff as appropriate. A description of how consortia (subcontracts) will be managed should be provided and should include how communications such as periodic meetings and conference calls will be organized, managed and documented. The plan should include a Core budget and should identify how research-related travel will be managed. The plan must also detail the process for periodic solicitation and review of CETR program-sponsored supplemental research applications (see Section IV. Application and Submission Information under Administrative Core: Supplemental Research Projects).

The PD/PI and Administrative Core staff are responsible for ensuring that all research activities are carried out in compliance with all federal and NIH regulations. A necessary component of a Center's success will be the availability of adequate access to BSL3/4 biocontainment facilities. Applicants must identify Research Projects that will require high level containment facilities and provide a description of facilities that are available currently or planned at consortium institutions. A table listing each activity that requires BSL3/4 access and the likely facilities to be used should be included. The PD/PI and Administrative Core staff are also responsible for ensuring that appropriate systems are in place to provide for biosafety and security of materials, data, facilities and resources, including compliance with regard to Select Agent Regulations, Biosafety in Microbiology and Biomedical Laboratories (BMBL) Guidelines, Centers for Disease Control and Prevention and the National Institutes of Health, fifth Edition (http://www.cdc.gov/od/ohs/biosfty/bmbl5/bmbl5toc.htm); U.S. Code of Federal Regulations 42 C.F.R. Part 73, 7 C.F.R. Part 331, and 9 C.F.R. Part 121 (http://www.cdc.gov/od/sap/).

Each Administrative Core **must** include the following components:

Scientific Advisory Committee

Each Center must establish a Scientific Advisory Committee that includes the PD/PI, some or all Research Project leaders, and at least 3 non-conflicted external advisors. For Centers engaged in preclinical product development activities, at least one of the external advisors must have demonstrated and relevant industry-level expertise. The Scientific Advisory Committee will be responsible for the annual scientific evaluation of all center research projects and Core activities. Additionally, the Scientific Advisory Committee will be responsible for soliciting and reviewing CETR program-sponsored Supplemental Research applications (see below).

Regulatory Expertise

All CETR program-supported countermeasure development must address anticipated regulatory requirements and challenges pertinent to Emerging and Re-emerging Infectious Diseases. Accordingly, each Center must include regulatory expertise appropriate for associated developmental activities. Regulatory expertise may be retained as defined effort or periodic consultation.

Programmatic Meetings

NIAID anticipates supporting an annual National CETR Program Meeting to highlight Center progress/activities, review progress, share knowledge of innovative technologies and methodologies, and encourage collaborations. The annual program meetings are expected to be attended by the PD/PI, some or all Research Project Leaders, Scientific Core Leaders, other appropriate key personnel and NIAID staff. These meetings are anticipated to be held at a location at/near Bethesda, MD or at another NIAID-approved site and will last for 1-2 days. Each Center application budget should include funds to travel and attend the annual meeting in Years 2-5 of the project period.

Each Center must participate in an annual reverse site visit to evaluate progress. The annual reverse site

visit will be attended by the PD/PI, 1-2 appropriate Project Leaders, and NIAID staff. These reverse site visits are anticipated to be held at a location at/near Bethesda, MD or at another NIAID-approved site and will last 1 day. Each Center application budget should include funds to travel and attend the reverse site visits in Years 1-4 of the project period.

Supplemental Research Projects

In order to facilitate development and/or improvement of innovative translational platforms/technologies, NIAID anticipates having funds to support a limited number of short-term (2-3 years) Supplemental Research Projects throughout the award period. The Supplemental Research Projects will begin in the second year of the CETR program with approved projects phased in to the parent award period. Under programmatic guidance, Centers will solicit and review applications for research projects that complement or facilitate specific theme objectives. Total funding of a Supplemental Research Project may not exceed $200,000 in total costs in any year and the Supplemental Research Project Leader must commit at least 1.2 person months per year to the effort.

Applicants may not submit in their applications descriptions of the projects that would be supported by the Supplemental Research program; these will be solicited and reviewed post-award. Applicants must include in the Administrative Core section a plan that outlines procedures for soliciting, reviewing and identifying the most meritorious Supplemental Research Project applications. Funding of Supplemental Research Projects will be determined by NIAID Program leadership based on Center recommendations, project merit, programmatic priorities and available funds. Do not include funds for Supplemental Research Projects in the budget.

Scientific Cores

A Center may include development and maintenance of one or more core resources/facilities that are essential for the activities of two or more Research Projects. A scientific core must provide a unique service that cannot be obtained through institutional or commercial means. Cores are intended to serve the needs of Center project researchers and they may not conduct research independent of the served Research Projects. The role of each core in overall Center research activities must be clearly described and justified. Additionally, plans for staffing, managing, and prioritizing use of the cores must be provided, as well as plans for determining fees to users if charging fees is necessary.

Section II. Award Information

Funding Instrument	Cooperative Agreement: A support mechanism used when there will be substantial Federal scientific or programmatic involvement. Substantial involvement means that, after award, NIH staff will assist, guide, coordinate, or participate in project activities.
Application Types Allowed	New The OER Glossary and the PHS 398 Application Guide provide details on these application types.
Funds Available and Anticipated Number of Awards	NIAID intends to commit $75 million in FY2014 to fund 10 to 20 awards.
Award Budget	Application budgets are limited to $4 million for FY2014 directs costs and need to reflect actual needs of the proposed project.
Award Project Period	Scope of the proposed project should determine the project period. The maximum period is 5 years.

NIH grants policies as described in the *NIH Grants Policy Statement* will apply to the applications submitted and awards made in response to this FOA.

Section III. Eligibility Information

1. Eligible Applicants

Eligible Organizations

Higher Education Institutions

- Public/State Controlled Institutions of Higher Education
- Private Institutions of Higher Education

The following types of Higher Education Institutions are always encouraged to apply for NIH support as Public or Private Institutions of Higher Education:

- Hispanic-serving Institutions
- Historically Black Colleges and Universities (HBCUs)
- Tribally Controlled Colleges and Universities (TCCUs)
- Alaska Native and Native Hawaiian Serving Institutions
- Asian American Native American Pacific Islander Serving Institutions (AANAPISIs)

Nonprofits Other Than Institutions of Higher Education

- Nonprofits with 501(c)(3) IRS Status (Other than Institutions of Higher Education)
- Nonprofits without 501(c)(3) IRS Status (Other than Institutions of Higher Education)

For-Profit Organizations

- Small Businesses
- For-Profit Organizations (Other than Small Businesses)

Governments

- State Governments
- County Governments
- City or Township Governments
- Special District Governments
- Indian/Native American Tribal Governments (Federally Recognized)
- Indian/Native American Tribal Governments (Other than Federally Recognized)
- Eligible Agencies of the Federal Government
- U.S. Territory or Possession

Other

- Independent School Districts
- Public Housing Authorities/Indian Housing Authorities
- Native American Tribal Organizations (other than Federally recognized tribal governments)
- Faith-based or Community-based Organizations
- Regional Organizations
- Non-domestic (non-U.S.) Entities (Foreign Institutions)

Foreign Institutions

Non-domestic (non-U.S.) Entities (Foreign Institutions) **are** eligible to apply.
Non-domestic (non-U.S.) components of U.S. Organizations **are** eligible to apply.
Foreign components, as defined in the *NIH Grants Policy Statement*, **are** allowed.

Required Registrations

Applicant organizations must complete the following registrations as described in the PHS 398 Application Guide to be eligible to apply for or receive an award. Applicants must have a valid Dun and Bradstreet

Universal Numbering System (DUNS) number in order to begin each of the following registrations.

- System for Award Management (SAM)– must maintain an active entity registration (formerly CCR registration), to be renewed at least annually. Use the Sam.gov "Manage Entity" function to manage your entity registrations. See the Grants Registration User Guide at SAM.gov for additional information.
- eRA Commons

All Program Directors/Principal Investigators (PD(s)/PI(s)) must also work with their institutional officials to register with the eRA Commons or ensure their existing eRA Commons account is affiliated with the eRA Commons account of the applicant organization.

All registrations must be completed by the application due date. Applicant organizations are strongly encouraged to start the registration process at least 6 weeks prior to the application due date.

Eligible Individuals (Program Director/Principal Investigator)

Any individual(s) with the skills, knowledge, and resources necessary to carry out the proposed research as the Program Director(s)/Principal Investigator(s) (PD(s)/PI(s)) is invited to work with his/her organization to develop an application for support. Individuals from underrepresented racial and ethnic groups as well as individuals with disabilities are always encouraged to apply for NIH support.

For institutions/organizations proposing multiple PDs/PIs, visit the Multiple Program Director/Principal Investigator Policy and submission details in the Senior/Key Person Profile (Expanded) Component of the PHS 398 Application Guide.

2. Cost Sharing

This FOA does not require cost sharing as defined in the *NIH Grants Policy Statement.*

3. Additional Information on Eligibility

Number of Applications

Applicant organizations may submit more than one application, provided that each application is scientifically distinct.

NIH will not accept any application that is essentially the same as one already reviewed within the past thirty-seven months (as described in the *NIH Grants Policy Statement*), except for submission:

- To an RFA of an application that was submitted previously as an investigator-initiated application but not paid;
- Of an investigator-initiated application that was originally submitted to an RFA but not paid; or
- Of an application with a changed grant activity code.

Section IV. Application and Submission Information

1. Address to Request Application Package

Applicants are required to prepare applications according to the current PHS 398 application forms in accordance with the PHS 398 Application Guide.

2. Content and Form of Application Submission

It is critical that applicants follow the instructions in the PHS 398 Application Guide, except where instructed in this funding opportunity announcement to do otherwise. Conformance to the requirements in the Application Guide is required and strictly enforced. Applications that are out of compliance with these instructions may be delayed or not accepted for review.

Letter of Intent

Although a letter of intent is not required, is not binding, and does not enter into the review of a subsequent application, the information that it contains allows IC staff to estimate the potential review workload and plan the review.

By the date listed in Part 1. Overview Information, prospective applicants are asked to submit a letter of intent that includes the following information:

- Descriptive title of proposed research
- Name(s), address(es), and telephone number(s) of the PD(s)/PI(s)
- Names of other key personnel
- Participating institution(s)
- Number and title of this funding opportunity

The letter of intent should be sent to:

Lynn Rust, Ph.D.
Division of Extramural Activities
National Institute of Allergy and Infectious Diseases (NIAID)
Room 3120, MSC-7616
6700-B Rockledge Drive
Bethesda, MD 20817-7616 (express mail), 20892-7616 (US mail)
Telephone: 301-402-3938
Email: lrust@mail.nih.gov

Application Submission

Applications must be prepared using the PHS 398 research grant application forms and instructions for preparing a research grant application. Submit a signed, typewritten original of the application, including the checklist, and three signed photocopies in one package to:

Center for Scientific Review
National Institutes of Health
6701 Rockledge Drive, Room 1040, MSC 7710
Bethesda, MD 20892-7710 (U.S. Postal Service Express or regular mail)
Bethesda, MD 20817 (for express/courier service; non-USPS service)

At the time of submission, two additional paper copies of the application and all copies of the Appendix files must be sent to:

Lynn Rust, Ph.D.
Division of Extramural Activities
National Institute of Allergy and Infectious Diseases (NIAID)
Room 3120, MSC-7616
6700-B Rockledge Drive
Bethesda, MD 20817-7616 (express mail), 20892-7616 (US mail)
Telephone: 301-402-3938
Email: lrust@mail.nih.gov

Page Limitations

All page limitations described in the PHS 398 Application Guide and must be followed , with the following exceptions or additional requirements:

- Overall Research Strategy is limited to 12 pages
- Research Projects are limited to 12 pages
- Product Development Strategy (limited to 12 pages; not included in the Research Strategy section)
- Administrative Core is limited to 12 pages
- Scientific Cores are limited to 6 pages

Supplemental Instruction for the Preparation of Multi-Project Applications

All instructions in the PHS 398 Application Guide must be followed, with the following additional instructions.

> The following section supplements the instructions found in Form PHS 398 for preparing a multi-project grant application. Additional instructions are required because the Form PHS 398 is designed primarily for individual, free-standing research project grant applications, and has no specific instructions for multi-project applications consisting of research projects interrelated by a common theme. All applications must be submitted on Form PHS 398. The multi-project grant application should be assembled and paginated as one complete document. Instructions for the Overall Component are presented first, followed by instructions for Research Projects, followed by instructions for Cores.

Instructions for Overall Component

Form Page 1. Face Page (Overall)

Complete this page as instructed in the Application Guide. This should be the first page of the entire application and all succeeding pages should be numbered consecutively.

Form Page 2. Summary, Relevance, Project/Performance Site,Senior/Key Peronnel, Other Signficant Contrbutor, and Human Embroyonic Stem Cells (Overall)

Description: Using Page 2 of Form 398; provide a succinct but accurate description (abstract) of the OVERALL multi-project application addressing the major, common theme of the program. Do not exceed the space provided.

Project/Performance Sites

List the performance sites where the research will be conducted.

Senior/Key Personnel (Overall)

Under "Key Personnel", list the PD/PI of the multi-project application, followed by the Project and Core Leaders of the component research projects and cores, and other key personnel and then other significant contributors.

Form Page 3. Table of Contents (Overall)

Do not use Form Page 3 of the PHS 398; a more comprehensive table of contents is needed for a multi-project application.

Bearing in mind that the application will be scientifically reviewed project by project and core by core, prepare a detailed Table of Contents that will enable reviewers to readily locate specific information pertinent to the overall application as well as to each component research project and core. A page reference should be included for the budget for each project and each core. Further, each research project should be identified by number (e.g. Project 1), title, and responsible Project Leader, and each Core should be identified by letter (e.g. Core A), title, and responsible Core Leader. The page location of a COMPOSITE BUDGET should be indicated in the "Table of Contents."

Form Page 4. Composite Budget (Overall)

Do not use Form Page 4 of PHS Form 398. Instead, using the suggested format presented below, prepare a Composite Budget for All Proposed Years of Support. (Justification for budget elements should not be presented here but in the individual budgets of the projects and cores.)

SAMPLE: Consolidated Direct Cost Budget for All Proposed Years of Support

Component	Year 1	Year 2	Year 3	Year 4	Year 5	All Years
Project 1. Invest.	125,000	130,000	135,200	140,608	146,232	677,040
Project 2. Study	125,000	130,000	135,200	140,608	146,232	677,040
Project 3. Develop.	100,000	104,000	108,160	112,486	116,985	541,631
Core A. Admin. Core.	50,000	52,000	54,080	56,243	58,493	270,816
Core B. DNA	25,000	50,000	52,000	54,080	56,243	237,323
Totals	425,000	466,000	484,640	504,025	524,185	2,403,850

Form Page 5.

Total Direct Costs for the Entire Budget Period (Overall)
Complete the Total Direct Cost line entries for all requested budget periods (years) and the Total Direct Cost for Entire Period of Support entry. Detailed budgets are required within the descriptions of each project and core (see below).

Biographical Sketch Format Page

Biographical sketches of all professional personnel for all components should be placed at the end of the application with the PD/PI first, followed by those of other key personnel in alphabetical order.

Resources Format Page

Do not complete. Essential information is to be presented in the individual research project and core sections of the application.

Center Program Overview Reseach Plan (Research Objectives and Strategic Plan) Overall

Specific Aims

List in priority order, the broad, long-range objectives and goals of the proposed Program. Concisely and realistically describe the hypothesis or hypotheses to be tested.

Overall Research Strategy

This narrative section summarizes the overall research plan for the multi-project application and is limited to (12) pages. The multi-project application should be viewed as a confederation of interrelated research projects, each capable of standing on its own scientific merit, but complementary to one another. This is an important section for it provides the group of investigators an opportunity to give conceptual wholeness to the overall program – by giving a statement of the general problem area and by laying out a broad strategy for attacking the problems. Applicants should define the Center theme and the range of activities being pursued, the significance of the Center theme in regard to countermeasure development, public health need, and benefit to public health of a successful effort. Additionally, discussions of how each Research Project contributes to the theme and objectives as well as project interdependence should be included. Applications should outline expected synergies provided by the proposed center and summarize the special features in the environment and/or resources that make this application strong or unique.

Resource Sharing Plan

Individuals are required to comply with the instructions for the Resource Sharing Plans (Data Sharing Plan, Sharing Model Organisms, and Genome Wide Association Studies (GWAS)) as provided in the PHS 398 Application Guide, with the following modification:

- All applications, regardless of the amount of direct costs requested for any one year, should address a

Data Sharing Plan.

Checklist

One Checklist, placed at the end of the Overall component, is to be submitted for the entire application.

Appendix Materials

Do not use the Appendix to circumvent page limits. Follow all instructions for the Appendix (please note all format requirements) as described in the PHS 398 Application Guide.

Instructions for Research Projects

A minimum of three and not more than six individual Research Projects are required.

For each individual Research Project, include:

- Face page (see special instructions, below)
- Description & Key personnel (PHS 398 Form Page 2)
- Table of Contents (PHS 398 Form Page 3)
- Budget Pages (PHS 398 Form Pages 4 and 5); with budget justifications
- Research Plan
- Resources

Cover Page (Reseach Projects)

The Face Page of the 398 Form should not be used as a cover page for individual research projects within a multi-project application. Instead, use the PHS 398 continuation page to create a "Cover Page" containing selected data about each individual research project. This Cover Page will demarcate each individual research project and should contain the following information items (these are a subset of the information provided on a PHS 398 Face Page):

- Project Number and Title: (e.g., 1. Preclinical Evaluation of HIV Microbicides)
- Name of Project Leader: (e.g., Jones, Roberta A.)
- Human Subjects: (Yes or No)
- If Yes:
- Exemption number, -or-
- IRB Approval Date (e.g., 12/13/2006,or "Pending"), and Federalwide Assurance (FWA) number
- Vertebrate Animals: (Yes or No)
- If Yes:
- IACUC Approval Date (e.g., 11/17/2006, or Pending) and Animal welfare assurance number:
- Proposed Period of Support:
- From: (mmddyy - e.g., 07/01/2007)
- To: (mmddyy - e.g., 06/30/2112)
- Costs Requested for Initial Budget Period: (e.g. 07/01/2007-06/30/2008)
- Direct Costs: (e.g., $ 150,000)
- Total Costs: (e.g., $162,000)
- Costs Requested for the Entire Budget Period: (e.g., 07/01/2007-06/30/2112)
- Direct Costs: (e.g., $700,000)
- Applicant Organization (full address)

Form Page 2. (Research Projects)

Provide a Description (abstract) of the research proposed in the individual research project according to the instructions on Form Page 2 of PHS Form 398. In addition, the abstract should contain a brief description of how the individual research project will contribute towards attainment of the multi-project Center objectives.

Project/Performance Sites (Research Projects)

List the performance sites where the research will be conducted.

Key Personnel (Research Projects)

Under "Key Personnel", list the Project Leader, followed by other key project personnel, and then other significant contributors.

Form Page 3. Table of Contents (Research Projects)

Prepare a Table of Contents for the research project using Form Page 3 of the PHS 398.

Form Page 4. and 5. Detailed Budget for Initial Budget Period (Research Projects)

Prepare a detailed budget and justification for the research project using Form Pages 4 and 5 of the PHS 398.

Individual Research Project Research Plan (Research Projects)

Specific Aims

List, in priority order, the broad long-range objectives and goals of the proposed project. Concisely and realistically describe the hypothesis or hypotheses to be tested. In addition, state the individual research project's relationship to the Program's goals and how it relates to other projects or cores.

Research Strategy

Use this section to describe how the proposed research will contribute to meeting the Center's goals and objectives and explain the rationale for selecting the methods to accomplish the specific aims. In addition to stating the biological significance of the research, indicate the project's relevance to the primary theme of the application.

Organize the Research Strategy in the specified order as stated in the PHS 398 Instructions, Section 5.5. Make sure to start each section with the appropriate section heading in order, Significance, Innovation, Approach, and include the appropriate information. Experimental details should be cited using the Bibliography and Reference Cited section and need not be detailed in the Research Strategy. Preliminary Studies for new projects must be included as part of the approach section, and must be contained within the page limits of the Research Strategy section.

For all Research Projects (within the Research Strategy page limit), describe the research design conceptual procedures, and analyses to be used to accomplish the specific aims of the project. Describe any new methodology and its advantage over existing methodologies. Describe any novel concepts, approaches, tools, or technologies for the proposed studies. Discuss associations with clinical project(s). Discuss the potential difficulties and limitations of the proposed procedures and alternative approaches to achieve the aims. As part of this section, provide a tentative sequence or timetable for the project. Describe how the research strategy is informed by an understanding of the regulatory process. Describe anticipated regulatory barriers and propose research and/or strategies to overcome these barriers. Note: Each project leader must commit at least 1.2 person months effort to their project per year.

Product Development Strategy

In addition to the instructions above for all research projects, research projects directly involved in preclinical development of a candidate product **must** also include the following two components in a clearly labeled separate section immediately following the Research Strategy.

Milestones and Timeline. Applicants are required to provide detailed project performance and timeline objectives in a section entitled "Milestones and Timeline." This section must be no more than 5 pages and must include:

- A clear description of all interim objectives (research and/or developmental milestones) to be achieved

during the course of the project. Applicants also must identify any impediments that could require a revision in the work plan or milestones with a discussion of alternative approaches.
- Detailed quantitative criteria by which milestone achievement will be assessed.
- A detailed schedule or timeline for the anticipated attainment of each milestone and the overall goal(s).
- Titles, abstracts, and status of patents and patent applications that are relevant to the project and are owned or licensed by the applicant.

Product Development Plan. Applicants are required to provide detailed development plans in a section entitled "Product Development Plan". This section must be no more than 7 pages and must include:

- A statement of the intended use/indication of the proposed product and biodefense/public health gap the product is intended to fill.
- A statement of the value of the project, including lay description of key technology objectives, innovation, and advantages compared to competing products, technologies, or services.
- A clear description of the goal(s) of the project, including one (or more) intermediate products (tools), final product(s) or stage(s) of product development to be completed during the award period. A specific product profile that is defined by licensing indication is not requested.

Additionally, the Product Development Plan must include descriptions pertaining to preclinical product development activities pertaining to the product proposed. For the purpose of this FOA, "preclinical" is defined as all activities beyond lead candidate identification or diagnostic assay/platform/prototype development or vaccine technology proof-of-principle. Please see below for a list of points to be discussed as part of the Product Development Plan based on the type of product proposed.

Product Development Plans for therapeutic, vaccine, or adjuvant projects should summarize:

- The performance specifications and features the product should have in order to provide immunological and/or therapeutic benefit (vaccines) or clinical, manufacturing and/or economic benefit (vaccine technologies).
- A description of the candidate product or lead series as it is currently configured.
- A description and developmental status of the assays for product release and characterization, including activity and efficacy.
- Data that support the characterization and selection of the candidate product for further development. Specifically for vaccines, a summary of data that demonstrates efficacy in in vitro assays and/or in vivo models for one or more of the selected agent(s). This includes: a detailed description of the assays and animal models, the choice of pathogen challenge, strain and route, and a rationale for the choice of animal model, pathogen challenge, strain and route, as well as for the outcome/endpoints selected; documentation that the animal infection experiments were performed under well-controlled experimental conditions.
- Discussions with FDA, if any, which are relevant to development activities for the candidate product/technology.

Product Development Plans for diagnostics projects should summarize:

- The performance specifications the product (diagnostic assay, method, technology, etc.) should have to demonstrate it is equivalent or superior to the gold standard for identifying the proposed agent(s), including clinical sensitivity in appropriate human samples, clinical specificity in appropriate human samples, analytical sensitivity (limit of detection), analytical reactivity (pathogen strains detected for each pathogen), analytical specificity (cross-reactivity), and analytical reproducibility (test replicates at different agent concentrations, at different sites, etc.). If no FDA-cleared test is available for the agent(s), the specifications should be equivalent to or exceed performance specifications of FDA-cleared tests for similar types of agent(s).
- Data that support the selection of the candidate product for further development, including an assessment of the present capacity of the diagnostic method, technology or assay to meet the performance specifications.
- Discussions with FDA, if any, which are relevant to development activities for the candidate product.

When appropriate and as part of the Product Development Plan, applicants must document compliance with guidelines that govern GLP, as defined by 21 CRF (58), and cGMP, as defined by 21 CRF (211), manufacturing and/or IND/IDE enabling studies that will be performed under the project award as they would be applicable to eventual product licensure in the U.S. Applications for projects involving cGMP manufacture should ensure inclusion of appropriate personnel to provide regulatory guidance before, during and after manufacture.

Resource Sharing Plan

Individuals are required to comply with the instructions for the Resource Sharing Plans (Data Sharing Plan, Sharing Model Organisms, and Genome Wide Association Studies (GWAS)) as provided in the PHS 398 Application Guide, with the following modification:

- All applications, regardless of the amount of direct costs requested for any one year, should address a Data Sharing Plan

Resources Format Page (Research Projects)

Provide information on resources available for the project. Describe how the scientific environment in which the research will be done contributes to the probability of success (e.g., institutional support, physical resources, and intellectual rapport.) For Early Stage Investigators, describe institutional investment in the success of the investigator. If there are multiple performance sites, describe the resources available at each site. Describe any special facilities used for working with biohazards or other potentially dangerous substances.

Biographical Sketch Format Page (Research Projects)

Do not repeat the biographical sketches of participating investigators since this information will be included at the end of the overall application (and therefore will be referenced in the Overall Table of Contents).

Instructions for Core(s)

Each Center must include an Administrative Core. Scientific Cores are optional.

For each individual Core, include:

- Cover page
- Description & Key personnel (PHS 398 Form Page 2)
- Table of Contents (PHS 398 Form Page 3)
- Budget Pages (PHS 398 Form Pages 4 and 5); with budget justifications
- Aministrative and Scientific Core Services Plan
- Resources Format Page

Cover Page (Cores)

The Face Page of the 398 Form should not be used as a cover page for cores within a multi-project application. Instead, use the 398 continuation page to create a "Cover Page" containing selected data about each individual core. This Cover Page will demarcate each core and should contain the following information items (which are a subset of the information provided on a Face Page - see PHS 398):

- Core Letter and Core Title: (e.g., A. Monoclonal Antibody Production Core)
- Name of Core Leader: (e.g., Smith, Robert A.)
- Human Subjects (Yes or No)
- If Yes,
- Exemption Number, -or-
- IRB Approval Date (e.g., 5/14/06, or Pending), and Federalwide Assurance (FWA) number
- Vertebrate Animals (Yes or No)
- If Yes,
- IACUC Approval Date (e.g., 4/15/07, or Pending), and Animal welfare assurance number

- Proposed Period of Support
- From: (mmddyy, e.g., 07/01/2007)
- To: (mmddyy, e.g., 06/30/2012)
- Costs Requested for Initial Budget Period
- Direct Costs (e.g. $50,000)
- Total Costs (e.g. $70,000)
- Costs Requested for the Entire Budget Period
- Direct Costs (e.g. $212,323)
- Total Costs (e.g. $297,252)
- Applicant Organization (ABC University; 111 Main Street; Anywhere, Else 99999)

Format Page 2. (Cores)

Provide a Description (abstract) of the core activities and services according to the instructions on Form Page 2 of the PHS 398. In addition, the abstract should contain a brief description of how the core services will contribute towards attainment of the objectives.

Project/Performance Sites (Cores)

List the performance sites where the core activities and services will be conducted.

Key Personnel (Cores)

Under "Key Personnel", list the Core Leader, followed by other key core personnel, and then other significant contributors. The PD/PI must be the director of the Administrative Core and must commit at least 0.6 person months effort per year to these responsibilities. An Administrative Core Associate should be a research administrator responsible for the daily administration and fiscal management of the Center. It is recommended that the Administrative Core Associate devote a level of effort ranging from 3 to 6 person months to the execution of the administrative details of the Center projects and to managing the day-to-day operations within the Center. Any additional Administrative Core personnel must be clearly justified.

Format Page 3. Table of Contents (Cores)

Prepare a Table of Contents for the core using page 3 of Form PHS 398.

Format Page 4. and 5. Budget Pages (Cores)

Prepare a detailed budget and justification for the core using Form Pages 4 and 5 of the PHS 398.

The Administrative Core budget may not exceed 5% of total direct costs requested. Requests for funds to support required travel may be included here.

Research Plan - Administrative and Scientific Cores

Specific Aims (Cores)

List in priority order, the broad, long-range objectives and goals of the proposed Administrative, or Scientific Cores. In addition, state the core's relationship to the Program's goals and how it relates to the individual Research Projects or other cores in the application.

Research Strategy for Admin Core (required)

The Administrative Core must include a Management Plan that identifies and discusses: the Administrative Core structure; the roles of Administrative Core personnel; the composition and duties of the Scientific Advisory Committee; and the facilitation of communications throughout the Center and with NIAID staff; and assurance that all research activities are carried out in compliance with all federal and NIH regulations. The plan should specifically address continual evaluation of research and development progress, communications, group meetings and teleconferences, presentation and publication of data, resource and model sharing, transmission of information and reagents, the identification and proposed

resolution of problems and engagement of the NIAID Staff as appropriate. A description of how consortia (subcontracts) will be managed should be provided and should include how communications such as periodic meetings and conference calls will be organized, managed and documented. The plan should include a Core budget and should identify how research-related travel will be managed. The plan must also detail procedures for anticipated solicitation and review of Supplemental Research Projects applications. All CETR program-supported countermeasure development must address anticipated regulatory requirements and challenges pertinent to Emerging and Re-emerging Infectious Diseases. Accordingly, each Center must include regulatory expertise appropriate for associated developmental activities. Regulatory expertise may be retained as defined effort or periodic consultation.

In addition for Supplemental Research Projects, describe the internal institutional plans and procedures to ensure that all projects supported from this award will comply fully with all applicable Federal regulations, policies, and guidelines for research involving human subjects, including the evaluation of risks and protections in project proposals, appropriate ethical oversight and funded projects, and plans for data and safety monitoring for clinical trials, if applicable. Total funding of a Supplemental Research Project may not exceed $200,000 in total costs in any year and the Supplemental Research Project Leader must commit at least 1.2 person months per year to the effort.

Research Strategy for Scientific Cores

Use this section to describe how the proposed core activities will contribute to meeting the Center's goals and objectives and explain the rationale for selection of the general methods and approaches proposed to accomplish the specific aims. In addition, this section should indicate the relevance of the core to the primary theme of the application. Provide details of the services or resources provided by the optional cores to at least two Research Projects and clarify how the optional cores are not duplicative of other services or facilities. Each Scientific Core should be headed by a Core Leader with at least 1.2 person months of effort committed to the Core.

Organize the section in the specified order as stated in the PHS 398 Application Guide. Make sure to start each section with the appropriate section heading in order, Significance, Innovation, Approach, and include the appropriate information. Experimental details should be cited using the Bibliography and Reference Cited section and need not be detailed in the Research Strategy. Preliminary Studies for new cores and progress reports for renewals must be included as part of the approach section and must be contained within the page limits of the Core Services Plan section.

Resource Sharing Plan (Cores)

Individuals are required to comply with the instructions for the Resource Sharing Plans (Data Sharing Plan, Sharing Model Organisms, and Genome Wide Association Studies (GWAS)) as provided in the PHS 398 Application Guide, with the following modification:

- All applications, regardless of the amount of direct costs requested for any one year, should address a Data Sharing Plan.

Biographical Sketch Format Page (Cores)

Do not repeat the biographical sketches of participating investigators since this information will be included at the end of the overall application (and therefore will be referenced in the Overall Table of Contents).

Resources Format Page (Cores)

Provide information on resources available for the core. Describe how the scientific environment in which the research will be done contributes to the probability of success (e.g., institutional support, physical resources, and intellectual rapport.) For Early Stage Investigators, describe institutional investment in the success of the investigator. If there are multiple performance sites, describe the resources available at each site. Describe any special facilities used for working with biohazards or other potentially dangerous substances. A table listing each activity that requires BSL3/4 access and the likely facilities to be used should be included.

Foreign Institutions

Foreign (non-U.S.) Institutions must follow policies described in the *NIH Grants Policy Statement*, and procedures for foreign institutions described throughout the PHS 398 Application Guide.

3. Submission Dates and Times

Part I. Overview Information contains information about Key Dates.

Information on the process of receipt and determining if your application is considered "on-time" is described in detail in the PHS 398 Application Guide.

Applicants may track the status of the application in the eRA Commons, NIH's electronic system for grants administration.

4. Intergovernmental Review (E.O. 12372)

This initiative is not subject to intergovernmental review.

5. Funding Restrictions

All NIH awards are subject to the terms and conditions, cost principles, and other considerations described in the *NIH Grants Policy Statement*.

Pre-award costs are allowable only as described in the *NIH Grants Policy Statement*.

6. Other Submission Requirements and Information

Applications must be received on or before the due dates in Part I. Overview Information. If an application is received after that date, it will not be reviewed.

Upon receipt, applications will be evaluated for completeness by the Center for Scientific Review and responsiveness by components of participating organizations, NIH. Applications that are incomplete and/or nonresponsive will not be reviewed.

Post Submission Materials

Applicants are required to follow the instructions for post-submission materials, as described in NOT-OD-10-115.

Section V. Application Review Information

1. Criteria

Only the review criteria described below will be considered in the review process. As part of the NIH mission, all applications submitted to the NIH in support of biomedical and behavioral research are evaluated for scientific and technical merit through the NIH peer review system.

Overall Impact - Overall

Reviewers will provide an overall impact score to reflect their assessment of the likelihood for the Center to exert a sustained, powerful influence on the research field(s) involved, in consideration of the following review criteria and additional review criteria (as applicable for the Center proposed).

- Does the application have a single clearly defined and scientifically justified theme?
- Does the application adequately explain the following:
  - Scientific merit of each Research Project and core?
  - The program as a whole? Significance of the overall program goals?
  - Scientific gains and synergy achieved by combining the component projects into a multiproject program beyond the gains achievable if each project were pursued independently?

- Are the overall program goals significant and focused on studies that increase knowledge needed to advance the translational activities of the center?
- How well does the overall program incorporate innovative concepts and approaches?
- Is the program as a whole cohesive and do the Research Projects and cores relate to a single common theme demonstrating cohesion, multidisciplinary interactions, coordination, and synergy?

Scored Review Criteria - Overall Individual Research Projects

Reviewers will consider each of the review criteria below in the determination of scientific merit, and give a separate score for each. An application does not need to be strong in all categories to be judged likely to have major scientific impact. For example, a project that by its nature is not innovative may be essential to advance a field.

Significance

Does the project address an important problem or a critical barrier to progress in the field? If the aims of the project are achieved, how will scientific knowledge, technical capability, and/or clinical practice be improved? How will successful completion of the aims change the concepts, methods, technologies, treatments, services, or preventative interventions that drive this field?

Investigator(s)

Are the PD(s)/PI(s), collaborators, and other researchers well suited to the project ? If Early Stage Investigators or New Investigators, or in the early stages of independent careers, do they have appropriate experience and training? If established, have they demonstrated an ongoing record of accomplishments that have advanced their field(s)? If the project is collaborative or multi-PD/PI, do the investigators have complementary and integrated expertise; are their leadership approach, governance and organizational structure appropriate for the project?

Innovation

Does the application challenge and seek to shift current research or clinical practice paradigms by utilizing novel theoretical concepts, approaches or methodologies, instrumentation, or interventions? Are the concepts, approaches or methodologies, instrumentation, or interventions novel to one field of research or novel in a broad sense? Is a refinement, improvement, or new application of theoretical concepts, approaches or methodologies, instrumentation, or interventions proposed?

Approach

Are the overall strategy, methodology, and analyses well-reasoned and appropriate to accomplish the specific aims of the project ? Are potential problems, alternative strategies, and benchmarks for success presented? If the project is in the early stages of development, will the strategy establish feasibility and will particularly risky aspects be managed?

If the project involves clinical research, are the plans for 1) protection of human subjects from research risks, and 2) inclusion of minorities and members of both sexes/genders, as well as the inclusion of children, justified in terms of the scientific goals and research strategy proposed?

Environment

Will the scientific environment in which the work will be done contribute to the probability of success? Are the institutional support, equipment and other physical resources available to the investigators adequate for the project proposed? Will the project benefit from unique features of the scientific environment, subject populations, or collaborative arrangements?

Additional Review Criteria - Overall Application, Individual Research Projects, and Cores

As applicable for the project proposed, reviewers will evaluate the following additional items while determining scientific and technical merit, and in providing an overall impact score, but will not give separate scores for these items.

For All Research Projects:

- Does the approach take into consideration the anticipated regulatory process and any anticipated regulatory barriers?
- For Research Projects engaged in preclinical product development activities;
  - Are the Milestones appropriate and feasible?
  - Does the Product Development Plan adequately address the specific areas described in the FOA? Is the proposed Product Development Plan feasible and appropriate for proposed and future product development?
- Is the Plan consistent with achieving the goals of this program?

Protections for Human Subjects

For research that involves human subjects but does not involve one of the six categories of research that are exempt under 45 CFR Part 46, the committee will evaluate the justification for involvement of human subjects and the proposed protections from research risk relating to their participation according to the following five review criteria: 1) risk to subjects, 2) adequacy of protection against risks, 3) potential benefits to the subjects and others, 4) importance of the knowledge to be gained, and 5) data and safety monitoring for clinical trials.

For research that involves human subjects and meets the criteria for one or more of the six categories of research that are exempt under 45 CFR Part 46, the committee will evaluate: 1) the justification for the exemption, 2) human subjects involvement and characteristics, and 3) sources of materials. For additional information on review of the Human Subjects section, please refer to the Human Subjects Protection and Inclusion Guidelines.

Inclusion of Women, Minorities, and Children

When the proposed project involves clinical research, the committee will evaluate the proposed plans for inclusion of minorities and members of both genders, as well as the inclusion of children. For additional information on review of the Inclusion section, please refer to the Human Subjects Protection and Inclusion Guidelines.

Vertebrate Animals

The committee will evaluate the involvement of live vertebrate animals as part of the scientific assessment according to the following five points: 1) proposed use of the animals, and species, strains, ages, sex, and numbers to be used; 2) justifications for the use of animals and for the appropriateness of the species and numbers proposed; 3) adequacy of veterinary care; 4) procedures for limiting discomfort, distress, pain and injury to that which is unavoidable in the conduct of scientifically sound research including the use of analgesic, anesthetic, and tranquilizing drugs and/or comfortable restraining devices; and 5) methods of euthanasia and reason for selection if not consistent with the AVMA Guidelines on Euthanasia. For additional information on review of the Vertebrate Animals section, please refer to the Worksheet for Review of the Vertebrate Animal Section.

Biohazards

Reviewers will assess whether materials or procedures proposed are potentially hazardous to research personnel and/or the environment, and if needed, determine whether adequate protection is proposed.

Resubmissions

Not Applicable

Renewals

Not Applicable

Revisions

Not Applicable

Additional Review Considerations - Overall Application, Individual Research Projects, and Cores

As applicable for the project proposed, reviewers will consider each of the following items, but will not give scores for these items, and should not consider them in providing an overall impact score.

Applications from Foreign Organizations

Reviewers will assess whether the project presents special opportunities for furthering research programs through the use of unusual talent, resources, populations, or environmental conditions that exist in other countries and either are not readily available in the United States or augment existing U.S. resources.

Select Agent Research

Reviewers will assess the information provided in this section of the application, including 1) the Select Agent(s) to be used in the proposed research, 2) the registration status of all entities where Select Agent(s) will be used, 3) the procedures that will be used to monitor possession use and transfer of Select Agent(s), and 4) plans for appropriate biosafety, biocontainment, and security of the Select Agent(s).

Resource Sharing Plans

Reviewers will comment on whether the following Resource Sharing Plans, or the rationale for not sharing the following types of resources, are reasonable: 1) Data Sharing Plan; 2) Sharing Model Organisms; and 3) Genome Wide Association Studies (GWAS).

Budget and Period of Support

Reviewers will consider whether the budget and the requested period of support are fully justified and reasonable in relation to the proposed research.

Scored Review Criteria – Cores

Reviewers will consider each of the review criteria below in the determination of scientific merit. An application does not need to be strong in all categories to be judged likely to have major scientific impact. For example, a core that by its nature is not innovative may be essential to advance a field.

Administrative Core

For the Administrative Core, is the administrative and organizational structure appropriate and adequate to achieve the goals of the proposed program? Is the Management Plan for fiscal accountability and communication within the program appropriate? Are the plans for coordination, problem identification and resolution, and the establishment of a strong collaborative environment for the program appropriate? Are plans for communication among the Centers adequate to facilitate collaborative activities? Do the PD/PI and Key Personnel commit sufficient time and effort to adequately manage the Program? Is the proposed membership on the Scientific Advisory Committee appropriate for the experience and expertise required for the planned scientific goals of the FOA? Are there adequate institutional plans and procedures to assure compliance with applicable federal regulations and NIH policies for the protection of human

research participants, including the evaluation of risks and protections in project proposals, appropriate ethical oversight of funded projects, and plans for monitoring data and safety in clinical research projects?

Scientific Core

For the Scientific Core(s), is it sufficiently justified? Does it support at least two Research Projects? Is the core adequately connected to the central focus of the overall program? Are the facilities or services provided by the core (including procedures, techniques, and quality control) high quality? Will the services be used effectively? Are the core leader and key personnel well qualified and is there an adequate commitment of time?

2. Review and Selection Process

Applications will be evaluated for scientific and technical merit by (an) appropriate Scientific Review Group(s) convened by NIAID, in accordance with NIH peer review policy and procedures, using the stated review criteria. Assignment to a Scientific Review Group will be shown in the eRA Commons.

As part of the scientific peer review, all applications:

- May undergo a selection process in which only those applications deemed to have the highest scientific and technical merit (generally the top half of applications under review) will be discussed and assigned an overall impact score.
- Will receive a written critique.

Appeals of initial peer review will not be accepted for applications submitted response to this FOA .

Applications will be assigned to the appropriate NIH Institute or Center and will compete for available funds with all other recommended applications submitted in response to this FOA . Following initial peer review, recommended applications will receive a second level of review by the National Advisory Allergy and Infectious Diseases Council I. The following will be considered in making funding decisions:

- Scientific and technical merit of the proposed project as determined by scientific peer review.
- Availability of funds.
- Relevance of the proposed project to program priorities.

3. Anticipated Announcement and Award Dates

After the peer review of the application is completed, the PD/PI will be able to access his or her Summary Statement (written critique) via the eRA Commons.

Information regarding the disposition of applications is available in the *NIH Grants Policy Statement*.

Section VI. Award Administration Information

1. Award Notices

If the application is under consideration for funding, NIH will request "just-in-time" information from the applicant as described in the *NIH Grants Policy Statement*.

A formal notification in the form of a Notice of Award (NoA) will be provided to the applicant organization for successful applications. The NoA signed by the grants management officer is the authorizing document and will be sent via email to the grantee's business official.

Awardees must comply with any funding restrictions described in Section IV.5. Funding Restrictions. Selection of an application for award is not an authorization to begin performance. Any costs incurred before receipt of the NoA are at the recipient's risk. These costs may be reimbursed only to the extent considered allowable pre-award costs.

Any application awarded in response to this FOA will be subject to the DUNS, SAM Registration, and

Transparency Act requirements as noted on the Award Conditions and Information for NIH Grants website.

Prior Approval of Supplemental Research Projects

Awardee-selected projects that involveclinical trials or studies involving greater than minimal risk to human subjects require prior approval by NIH prior to initiation.

- The awardee institution will provide NIH with written study protocols that address risks and protections for human subjects in accordance with NIH's Instructions for Preparing the Human Subjects Section of the Research Plan.
- The awardee institution will provide NIH with specific plans for data and safety monitoring, and will notify the IRB and NIH of serious adverse events and unanticipated problems, consistent with NIH DSMP policies.

2. Administrative and National Policy Requirements

All NIH grant and cooperative agreement awards include the *NIH Grants Policy Statement* as part of the NoA. For these terms of award, see the *NIH Grants Policy Statement* Part II: Terms and Conditions of NIH Grant Awards, Subpart A: General and Part II: Terms and Conditions of NIH Grant Awards, Subpart B: Terms and Conditions for Specific Types of Grants, Grantees, and Activities. More information is provided at Award Conditions and Information for NIH Grants.

Cooperative Agreement Terms and Conditions of Award

The following special terms of award are in addition to, and not in lieu of, otherwise applicable U.S. Office of Management and Budget (OMB) administrative guidelines, U.S. Department of Health and Human Services (DHHS) grant administration regulations at 45 CFR Parts 74 and 92 (Part 92 is applicable when State and local Governments are eligible to apply), and other HHS, PHS, and NIH grant administration policies.

The administrative and funding instrument used for this program will be the cooperative agreement, an "assistance" mechanism (rather than an "acquisition" mechanism), in which substantial NIH programmatic involvement with the awardees is anticipated during the performance of the activities. Under the cooperative agreement, the NIH purpose is to support and stimulate the recipients' activities by involvement in and otherwise working jointly with the award recipients in a partnership role; it is not to assume direction, prime responsibility, or a dominant role in the activities. Consistent with this concept, the dominant role and prime responsibility resides with the awardees for the project as a whole, although specific tasks and activities may be shared among the awardees and the NIH as defined below.

The PD(s)/PI(s) will have the primary responsibility for:

PD(s)/PI(s), will have the primary responsibility for coordinating the Projects and Cores within the overall Program. Specifically, the PD(s)/PI(s) have primary responsibility as described below.

The PD(s)/PI(s) will be responsible for defining the research objectives, approaches and details of the projects within the guidelines of the FOA and retains primary responsibility for the planning, directing, and executing the proposed scientific activities.

In addition, the PD(s)/PI(s) will be responsible for:

- Organizing and chairing annual site visit activities
- Making sure that the NIAID Data Release Guidelines (see below) are properly implemented by the personnel of the Research Projects and Cores
- Advertising the availability of the Program generated resources through outreach activities.
- Ensuring that results obtained from the Program are analyzed and published in a timely manner.
- Provide semi-annual progress reports in a format to be defined by the NIAID after award.

The multi-disciplinary and collaborative nature of the Programs funded under this FOA creates an extraordinary opportunity for information exchange and scientific advancement of translational research applied to infectious diseases research. Programs' investigators are expected to take advantage of this

opportunity by participating in both formal events established expressly for this purpose and informal investigator-initiated dialogues.

Federally Mandated Regulatory Requirements for Clinical Research

Each institution participating in clinical research is required to meet DHHS regulations for the protection of human subjects. At a minimum, this includes:

- Methods for assuring that each institution at which Program investigators are conducting clinical studies has registered with the Office of Human Research Protections (OHRP; http://www.hhs.gov/ohrp) and has a Federalwide Assurance; that study protocols are reviewed and approved by the responsible Institutional Review Board (IRB) prior to participant entry; that active protocols are reviewed at least annually by the IRB, and that amendments are approved by the IRB.
- Methods for assuring or documenting that each participant, or participant's parent/legal guardian, gives fully informed consent to participation in a research protocol prior to the initiation of the intervention.

Intellectual Property

The awardee is solely responsible for the timely acquisition of all appropriate propriety rights, including intellectual property rights, and all materials needed for the awardee to perform the project.

Before, during, and subsequent to the award, the U.S. Government is not required to obtain for the awardee any propriety rights, including intellectual property rights, or any materials needed by the awardee to perform the project.

The awardee is required to report to the U.S. Government all inventions made in the performance of the project, as specified by 35 U.S.C. Sect. 202 (Bayh-Dole Act).

Program Generated Data, Software and Other Resources

Awardees will retain custody of and have primary rights to the data and software developed under these awards, subject to Government rights of access consistent with current HHS, PHS, and NIH policies.

The Programs funded under this FOA are expected to follow the requirements and timelines described in the NIAID Data and Reagents Sharing and Release Guidelines (http://www.niaid.nih.gov/LabsAndResources/resources/dmid/gsc/Pages/data.aspx) as well as those in the Data Sharing Guiding Principles for the NIAID/DMID Systems Biology Program (http://www.niaid.nih.gov/LABSANDRESOURCES/RESOURCES/DMID/SB/Pages/DataReleaseGuidelines.aspx) Program-generated data and software should be made available through publicly accessible web and database sites, including the Web Portal, the BRCs (http://www.niaid.nih.gov/dmid/genomes/brc/default.htm), the NCBI (http://www.ncbi.nlm.nih.gov/) and/or other public repositories, as identified by the Steering Committee in consultation with the NIAID.

Program-generated data and software include, for example:

- all research data (both experimentally and computationally generated) and associated metadata;
- database schema and specifications;
- experimental protocols and Standard Operating Procedures (SOPs); and
- data analysis tools, models and algorithms generated under this contract, including model parameters and source code, complete use documentation and tutorials.

Whenever possible, the awardee shall provide software certified by the Open Source Initiative (http://www.opensource.org/licenses/), to guarantee the right of others to read, redistribute, modify, and freely use the software.

Program-generated novel reagents (e.g., expression vectors, mutant strains, libraries, protein clones), should be made available through NIAID-supported repositories, such as the NIAID BEI Resources (http://www.beiresources.org/) or in other repositories as identified by the Steering Committee in consultation with the NIAID.

Publications

The PD(s)/PI(s) will be responsible for the timely submission to the NIAID of all abstracts, manuscripts and reviews (co)authored by members of the grant and supported in whole or in part under this Cooperative Agreement. The PD(s)/PI(s) are requested to provide manuscripts to the NIAID Program staff prior to the submission to the Journal so that an up-to-date summary of program accomplishments can be maintained. Publications and oral presentations of work conducted under this Cooperative Agreement are the responsibility of the PD(s)/PI(s) and appropriate Research Project and Core Leaders and will require appropriate acknowledgement of NIAID support. Awardees are expected to make new information and materials known to the research community in a timely manner through publications, web announcements, and reports to the NIAID, or other mechanisms.

NIH staff have substantial programmatic involvement that is above and beyond the normal stewardship role in awards, as described below:

The role of the NIAID/NIH Project Scientist in the cooperative agreement is to support and encourage the recipient's activities by substantial involvement as partners and facilitators in the process without assuming responsibilities that remain with the PDs/PIs. The NIAID Project Scientist will work closely with the PD(s)/PI(s) and other Program member scientists to facilitate collaborations and to leverage the resources available to the Program.

The NIAID Project Scientist will monitor the progress of the Program, help coordinate research approaches among all Programs funded through the FOA, and contribute to the shaping of research projects or approaches as warranted. The NIAID Project Scientist will support and facilitate this process but will not direct it.

The NIAID Project Scientist will keep the Program informed about other ongoing studies supported by NIAID to avoid duplication of effort and encourage sharing/collaboration in infectious diseases research. The NIAID Project Scientist will coordinate access for the Program to other NIAID resources, as well as assist the research efforts of the Program by facilitating access to fiscal and intellectual resources provided by industry, private foundations, NIH intramural scientists and other federal government agencies as appropriate.

The NIAID Project Scientist will review and make funding recommendations for Supplemental Research Project applications.

The NIAID Project Scientist will retain the option to recommend withholding or reduction of support from any cooperative agreement that substantially fails to achieve its goals according to the milestones agreed to at the time of the award or fails to comply with the Terms and Conditions of the award.

Additionally, a NIAID program director will be responsible for the normal scientific and programmatic stewardship of the award and will be named in the award notice. The assigned program official may also serve as the NIAID Project Scientist.

Areas of Joint Responsibility include:

The NIAID Project Scientist will provide overall coordination across all funded Programs, will coordinate with the PD(s)/PI(s) and hold regular program-wide discussions to facilitate the achievement of program goals. In the event that some members of the Programs develop common research interests working groups may be formed to pursue collaborative activities.

Dispute Resolution:

Any disagreements that may arise in scientific or programmatic matters (within the scope of the award) between award recipients and the NIH may be brought to Dispute Resolution. A Dispute Resolution Panel composed of three members will be convened. It will have three members: a designee of the Steering Committee chosen without NIH staff voting, one NIH designee, and a third designee with expertise in the relevant area who is chosen by the other two; in the case of individual disagreement, the first member may be chosen by the individual awardee. This special dispute resolution procedure does not alter the awardee's right to appeal an adverse action that is otherwise appealable in accordance with PHS regulation 42 CFR Part 50,

Subpart D and DHHS regulation 45 CFR Part 16.

3. Reporting

When multiple years are involved, awardees will be required to submit the Non-Competing Continuation Grant Progress Report (PHS 2590 or RPPR) annually and financial statements as required in the *NIH Grants Policy Statement.* Progress reports should briefly describe status of Supplemental Research Projects, including data and safety monitoring, and should notify NIH of serious adverse events and unanticipated problems.

A final progress report, invention statement, and the expenditure data portion of the Federal Financial Report are required for closeout of an award, as described in the *NIH Grants Policy Statement*.

The Federal Funding Accountability and Transparency Act of 2006 (Transparency Act), includes a requirement for awardees of Federal grants to report information about first-tier subawards and executive compensation under Federal assistance awards issued in FY2011 or later. All awardees of applicable NIH grants and cooperative agreements are required to report to the Federal Subaward Reporting System (FSRS) available at www.fsrs.gov on all subawards over $25,000. See the *NIH Grants Policy Statement* for additional information on this reporting requirement.

Section VII. Agency Contacts

We encourage inquiries concerning this funding opportunity and welcome the opportunity to answer questions from potential applicants.

Section VIII. Other Information

Recently issued trans-NIH policy notices may affect your application submission. A full list of policy notices published by NIH is provided in the *NIH Guide for Grants and Contracts*. All awards are subject to the terms and conditions, cost principles, and other considerations described in the *NIH Grants Policy Statement*.

Authority and Regulations

Awards are made under the authorization of Sections 301 and 405 of the Public Health Service Act as amended (42 USC 241 and 284) and under Federal Regulations 42 CFR Part 52 and 45 CFR Parts 74 and 92.

BIOGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors.
Follow this format for each person. **DO NOT EXCEED FIVE PAGES.**

NAME:

eRA COMMONS USER NAME (credential, e.g., agency login):

POSITION TITLE:

EDUCATION/TRAINING *(Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.)*

INSTITUTION AND LOCATION	DEGREE *(if applicable)*	Completion Date MM/YYYY	FIELD OF STUDY

Please refer to the Biographical Sketch sample in order to complete sections A, B, C, and D of the Biographical Sketch.

BIOGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors.
Follow this format for each person. DO NOT EXCEED FIVE PAGES.

NAME:

eRA COMMONS USER NAME (credential, e.g., agency login):

POSITION TITLE:

EDUCATION/TRAINING *(Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.)*

INSTITUTION AND LOCATION	DEGREE *(if applicable)*	Completion Date MM/YYYY	FIELD OF STUDY

NOTE: The Biographical Sketch may not exceed five pages. Follow the formats and instructions below.

A. Personal Statement

Briefly describe why you are well-suited for your role in the project described in this application. The relevant factors may include aspects of your training; your previous experimental work on this specific topic or related topics; your technical expertise; your collaborators or scientific environment; and your past performance in this or related fields (you may mention specific contributions to science that are not included in Section C). Also, you may identify up to four peer reviewed publications that specifically highlight your experience and qualifications for this project. If you wish to explain impediments to your past productivity, you may include a description of factors such as family care responsibilities, illness, disability, and active duty military service.

B. Positions and Honors

List in chronological order previous positions, concluding with the present position. List any honors. Include present membership on any Federal Government public advisory committee.

C. Contribution to Science

Briefly describe up to five of your most significant contributions to science. For each contribution, indicate the historical background that frames the scientific problem; the central finding(s); the influence of the finding(s) on the progress of science or the application of those finding(s) to health or technology; and your specific role in the described work. For each of these contributions, reference up to four peer-reviewed publications or other non-publication research products (can include audio or video products; patents; data and research materials; databases; educational aids or curricula; instruments or equipment; models; protocols; and software or netware) that are relevant to the described contribution. The description of each contribution should be no longer than one half page including figures and citations. Also provide a URL to a full list of your published work as found in a publicly available digital database such as SciENcv or My Bibliography, which are maintained by the US National Library of Medicine.

SAMPLE

D. Research Support

List both selected ongoing and completed research projects for the past three years (Federal or non-Federally-supported). *Begin with the projects that are most relevant to the research proposed in the application.* Briefly indicate the overall goals of the projects and responsibilities of the key person identified on the Biographical Sketch. Do not include number of person months or direct costs.

SAMPLE

BIOGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors.
Follow this format for each person. **DO NOT EXCEED FIVE PAGES**.

NAME: Hunt, Morgan Casey

eRA COMMONS USER NAME (credential, e.g., agency login): huntmc

POSITION TITLE: Associate Professor of Psychology

EDUCATION/TRAINING *(Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.)*

INSTITUTION AND LOCATION	DEGREE *(if applicable)*	Completion Date MM/YYYY	FIELD OF STUDY
University of California, Berkeley	B.S	05/1990	Psychology
University of Vermont	Ph.D.	05/1996	Experimental Psychology
University of California, Berkeley	Postdoctoral	08/1998	Public Health and Epidemiology

A. Personal Statement

I have the expertise, leadership, training, expertise and motivation necessary to successfully carry out the proposed research project. I have a broad background in psychology, with specific training and expertise in ethnographic and survey research and secondary data analysis on psychological aspects of drug addiction. My research includes neuropsychological changes associated with addiction. As PI or co-Investigator on several university- and NIH-funded grants, I laid the groundwork for the proposed research by developing effective measures of disability, depression, and other psychosocial factors relevant to the aging substance abuser, and by establishing strong ties with community providers that will make it possible to recruit and track participants over time as documented in the following publications. In addition, I successfully administered the projects (e.g. staffing, research protections, budget), collaborated with other researchers, and produced several peer-reviewed publications from each project. As a result of these previous experiences, I am aware of the importance of frequent communication among project members and of constructing a realistic research plan, timeline, and budget. The current application builds logically on my prior work. During 2005-2006 my career was disrupted due to family obligations. However, upon returning to the field I immediately resumed my research projects and collaborations and successfully competed for NIH support.

SAMPLE

B. Positions and Honors

Positions and Employment

1998-2000	Fellow, Division of Intramural Research, National Institute of Drug Abuse, Bethesda, MD
2000-2002	Lecturer, Department of Psychology, Middlebury College, Middlebury, VT
2001-	Consultant, Coastal Psychological Services, San Francisco, CA
2002-2005	Assistant Professor, Department of Psychology, Washington University, St. Louis, MO
2007-	Associate Professor, Department of Psychology, Washington University, St. Louis, MO

Other Experience and Professional Memberships

1995-	Member, American Psychological Association
1998-	Member, Gerontological Society of America
1998-	Member, American Geriatrics Society
2000-	Associate Editor, Psychology and Aging
2003-	Board of Advisors, Senior Services of Eastern Missouri
2003-05	NIH Peer Review Committee: Psychobiology of Aging, ad hoc reviewer
2007-11	NIH Risk, Adult Addictions Study Section, members

Honors

2003	Outstanding Young Faculty Award, Washington University, St. Louis, MO
2004	Excellence in Teaching, Washington University, St. Louis, MO
2009	Award for Best in Interdisciplinary Ethnography, International Ethnographic Society

C. Contribution to Science

1. My early publications directly addressed the fact that substance abuse is often overlooked in older adults. However, because many older adults were raised during an era of increased drug and alcohol use, there are reasons to believe that this will become an increasing issue as the population ages. These publications found that older adults appear in a variety of primary care settings or seek mental health providers to deal with emerging addiction problems. These publications document this emerging problem but guide primary care providers and geriatric mental health providers to recognize symptoms, assess the nature of the problem and apply the necessary interventions. By providing evidence and simple clinical approaches, this body of work has changed the standards of care for addicted older adults and will continue to provide assistance in relevant medical settings well into the future. I served as the primary investigator or co-investigator in all of these studies.
    a. Gryczynski, J., Shaft, B.M., Merryle, R., & Hunt, M.C. (2002). Community based participatory research with late-life addicts. American Journal of Alcohol and Drug Abuse, 15(3), 222-238.
    b. Shaft, B.M., Hunt, M.C., Merryle, R., & Venturi, R. (2003). Policy implications of genetic transmission of alcohol and drug abuse in female nonusers. International Journal of Drug Policy, 30(5), 46-58.
    c. Hunt, M.C., Marks, A.E., Shaft, B.M., Merryle, R., & Jensen, J.L. (2004). Early-life family and community characteristics and late-life substance abuse. Journal of Applied Gerontology, 28(2),26-37.
    d. Hunt, M.C., Marks, A.E., Venturi, R., Crenshaw, W. & Ratonian, A. (2007). Community-based intervention strategies for reducing alcohol and drug abuse in the elderly. Addiction, 104(9), 1436-1606. PMCID: PMC9000292

2. In addition to the contributions described above, with a team of collaborators, I directly documented the effectiveness of various intervention models for older substance abusers and demonstrated the importance of social support networks. These studies emphasized contextual factors in the etiology and maintenance of addictive disorders and the disruptive potential of networks in substance abuse treatment. This body of work also discusses the prevalence of alcohol, amphetamine, and opioid abuse in older adults and how networking approaches can be used to mitigate the effects of these disorders.

    b. Hunt, M.C., Pour, B., Marks, A.E., Merryle, R. & Jensen, J.L. (2005). Aging out of methadone treatment. American Journal of Alcohol and Drug Abuse, 15(6), 134-149.

SAMPLE

c. Merryle, R. & Hunt, M.C. (2007). Randomized clinical trial of cotinine in older nicotine addicts. Age and Ageing, 38(2), 9-23. PMCID: PMC9002364

3. Methadone maintenance has been used to treat narcotics addicts for many years but I led research that has shown that over the long-term, those in methadone treatment view themselves negatively and they gradually begin to view treatment as an intrusion into normal life. Elderly narcotics users were shown in carefully constructed ethnographic studies to be especially responsive to tailored social support networks that allow them to eventually reduce their maintenance doses and move into other forms of therapy. These studies also demonstrate the policy and commercial implications associated with these findings.

D. Research Support

Ongoing Research Support

R01 DA942367 Hunt (PI) 09/01/08-08/31/16
Health trajectories and behavioral interventions among older substance abusers
The goal of this study is to compare the effects of two substance abuse interventions on health outcomes in an urban population of older opiate addicts.
Role: PI

R01 MH922731 Merryle (PI) 12/15/07-11/30/15
Physical disability, depression and substance abuse in the elderly
The goal of this study is to identify disability and depression trajectories and demographic factors associated with substance abuse in an independently-living elderly population.
Role: Co-Investigator

Faculty Resources Grant, Washington University 08/15/09-08/14/15
Opiate Addiction Database
The goal of this project is to create an integrated database of demographic, social and biomedical information for homeless opiate abusers in two urban Missouri locations, using a number of state and local data sources.
Role: PI

Completed Research Support

R21 AA998075 Hunt (PI) 01/01/11-12/31/13
Community-based intervention for alcohol abuse
The goal of this project was to assess a community-based strategy for reducing alcohol abuse among older individuals.
Role: PI

SAMPLE

ALL PERSONNEL REPORT

Place this form at the end of the signed original copy of the application. Do not duplicate.

GRANT NUMBER

Always list the PD/PI(s). In addition, list all other personnel who participated in the project during the current budget period for at least one person month or more, regardless of the source of compensation (a person month equals approximately 160 hours or 8.3% of annualized effort). Use the following abbreviated categories for describing Role on Project:

- **PD/PI***
- **Co-Investigator**
- **Faculty**
- **Postdoctoral (scholar, fellow, or other postdoctoral position)***
- **Technician**
- **Staff Scientist (doctoral level)**
- **Statistician**
- **Graduate Student (research assistant)**
- **Non-student Research Assistant**
- **Undergraduate Student**
- **High School Student**
- **Consultant**
- **Other (please specify)**

If personnel are supported by a Reentry or Diversity Supplement please indicate such after the Role on Project, using the following abbreviations: RS - Reentry Supplement; DS - Diversity Supplement.

***Commons ID required for any personnel holding this Role on Project and for all individuals supported by a Reenty or Diversity Supplement. The Commons ID will be required in the future for all individuals with a graduate student, or undergraduate role. The Commons ID is strongly encouraged, but not required, for all other Project Personnel.**

Use Cal (calendar), Acad, or Summer to enter months devoted to project.

Commons ID*	Name	Degree(s)	SSN (last 4 digits)	Role on Project	DoB (MM /YY)	Cal	Acad	Summer

NIH Research Performance Progress Reports (RPPR)

Helpful Hints for the UW Research Community

This document is meant as a tool for research administrators to collect information from PIs for the new RPPR format and to give some tips/explanations for areas that look/feel different than eSNAP. It is not meant as a step-by-step tool for filling out the RPPR.

NIH has an RPPR Instruction Guide that explains every section in great detail as well as a very helpful Webcast which is posted on OSP website.

What makes RPPR different from eSNAP?

- ✓ RPPR data fields are specific to your grant type and grant number only. This means that all active sections are or can be relevant to your grant. Data fields not relevant to your grant will be grayed out or labeled "Not Applicable."
- ✓ After you have submitted the first RPPR, future applications will be pre-populated with information from other databases, proposals and previous progress reports. If you think that the pre-populated information is incorrect and the system does not allow you to change it, then you can either change it in the source database or contact the eRA Help Desk.
- ✓ Text boxes only accept rich text format. Do not enter any symbols. Scientific report on accomplishments is attached as a PDF document and can include symbols.
- ✓ If the question is not applicable to your grant or if you have no change or progress to report just select "noting to report."

A. Cover page

Approval for any PD/PI change will have to be received from the sponsor prior to recording it on RPPR.

A.4. Addresses, emails and phone numbers are pre-populated from the PI's eRA Commons profile. If you want to change this information please update your eRA Commons profile first and the information will automatically be updated on the RPPR.

Recipient ID: Please enter the eGC1 number (if any) for UW internal tracking.

B. Accomplishments

Important note - Each part of this section, B1-B6, has to be distinct and non-repetitive. All progress cannot be summarized in one text/word file.

B.1. What are the major goals of this project?

Major goals are the same as specific aims from the proposal document. These will only have to be entered the first year of submitting RPPR. In subsequent years this area will be pre-populated.

If there have been changes to the goals then written approval from the sponsor will have to be received prior to recording it on RPPR.

Even though maximum of 3 pages (or 8000 characters) of text is allowed in each text box, NIH strongly recommends not exceeding one page.

B.2. What was accomplished under these goals?

Publications are not reported in this section. Please do not add them in the text. They will not be recorded.

Uploadable PDF file. 6MB maximum limit, 2 pages preferred.

B.3. Are there any competitive revisions and administrative supplements related to this award? What are these? (ARRAs and other supplements belong here)

¼ page or 700 character limit.

B.4. What opportunities for training and professional development has the project provided?

Include participation in conferences, workshops, seminars, and/or mentoring not listed under major activities and accomplishments.

Response required for T, F, K, R25, R13, D43 and other training awards.

PDF attachment, no page limits.

B.5. Did your award include a requirement to disseminate information to any particular community? If so, please describe. "Routine" websites, press releases, scientific publications and the sharing of research resources do not apply.

3 page or 8000 character limit, 1 page preferred.

B.6. What do you plan to do for the next reporting period to accomplish the goals?

3 page or 8000 character limit, 1 page preferred.

C. Products

C.1. Are there publications or manuscripts accepted for publication in a journal or other publication (e.g., book, one-time publication, monograph) during the reporting period resulting directly from this award?

This is the only place to report on publications. Any publication information entered in other places will not be recorded as publications.

All publications reported in this section are drawn from MyNCBI site. The PIs MyNCBI account and eRA Commons accounts must be linked ("partnering accounts") otherwise the publications will not auto-populate into RPPR.

If your publication is not in compliance with the NIH Public Access Policy or in other words, does not have the PMCID number then you can still submit the RPPR and you have 10 business days to bring those publications into compliance in MyNCBI. It will automatically change their status on RPPR.

C.2. Website(s) or internet site(s) – list the URL for any site that disseminates the results of the research activities in the past reporting year and provide a short description.

Only for awards designed to create one or more websites.

3 page or 8000 character limit, 1 page preferred.

C.3. Technologies or techniques – identify technologies and techniques that have resulted from the research activities in the past reporting year.

Separate from accomplishments.

3 page or 8000 character limit, 1 page preferred.

C.4. Have inventions, patent applications and/or licenses resulted from the award during this reporting period?

If yes, has this information been previously provided to the PHS or to the official responsible for patent matters at the grantee organization?

C.5.a. Were there any other products developed under this project?

PDF attachment, no page limits. Do not repeat information provided earlier.

C.5.b. Resource Sharing plan – Does this award include a required resource sharing plan? If yes, please describe how data has been shared.

PDF attachment, no page limits.

D. Participants

D.1. Participant effort must be rounded to the nearest whole person month.

If a PD's/PI's effort is 0.4 or less then it should be marked as 0. NIH will compare it to the original proposal and will not consider the report non-compliant. Other participants should have at least one whole person month of effort.

If a person has an eRA Commons user ID then most of the information will populate automatically.

D.2.a. Will there be, in the next budget period, either (1) a reduction of 25% or more in the level of effort from what was approved by the agency for the PD/PI(s) or other senior/key personnel designated in the Notice of Award, or (2) a reduction in the level of effort below the minimum amount of effort required by the Notice of Award? If yes, please explain.

This is the only occasion in this report where significant change is allowed without separate prior approval from sponsor. Selecting "YES" is your request to the agency and the issuance of a subsequent year funding constitutes agency approval of the request.

¼ page, 700 characters limit.

D.2.b. Are there, or will there be, new senior/key personnel?

PDF attachment of biosketches.

D.2.c. Has there been a change in the active Other Support of senior/key personnel since the last reporting period?

Other Support will only be required if there has been a change.

PDF attachment, no page limits.

D.2.d. Are there, or will there be, new other significant contributors?

PDF attachment of biosketches.

D.2.e. Will there be a change in the MPI Leadership plan for the next budget period? If you had one.

Adding, removing or changing the makeup of the PIs requires prior approval. Any other changes to the Leadership Plan, do not require prior approval.

PDF attachment, no page limits.

E. Impact

E.1. What is the impact on the development of human resources?

Only applicable to education awards (D24, K30, R13, R25, RL5, T14, T36, U13, U2R)

E.2. Describe ways, if any, in which the project made an impact, or is likely to make an impact, on physical, institutional, and information resources that form infrastructure, including:

- physical resources (such as facilities, laboratories, or instruments);
- institutional resources (such as establishment or sustenance of societies or organizations); or
- information resources, electronic means for accessing such resources or for scientific communication, or the like.

3 page or 8000 character limit, 1 page preferred.

E.4. Has any money from this grant been spent in foreign countries?

Dollar amount and country.

F. Changes

F.1. Changes in approach and reasons for change

Only applicable to Education awards (D24, K30, R13, R25, RL5, T14, T36, U13, U2R)

F.2. Actual or anticipated challenges or delays and actions or plans to resolve them.

Only Significant challenges need to be reported.

3 page or 8000 character limit, 1 page preferred

F.3.a-F.3.d. Only significant deviations, unexpected outcomes, or changes in approved protocols to human subjects, vertebrate animals, biohazards and/or select agents need to be reported.

PDF attachment, no page limits.

G. Special reporting requirements

G.1. Special NoA and FOA reporting requirements

Link to the NoA Notice of Award link for easy reference.

G.2. Responsible Conduct of Research education received

Only applicable to K, F and other education awards

G.3. Mentor's report/sponsor comments

Only applicable to K, F awards

G.4.b. Inclusion enrollment data

If your grant supports human subjects and a clinical trial then the system will display one of two messages:

- *"The RPPR does not have any Inclusion Enrollment Reports or the report records have a status of Close"*
- *"You are required to complete Inclusion Enrollment Report for the following studies:[list of all protocols]"*

Follow their lead.

If you have questions about Inclusion Enrollment Report then contact your Program Official.

G.4.c. If it is a clinical trial it requires an NCT (ClinicalTrials.gov identifier) number.

G.5. Human subjects education requirement - Are there personnel on this project who are or will be newly involved in the design or conduct of human subjects research?

Details of their training

G.6. Human Embryonic Stem Cells

Requires hESC registration number from NIH registry. Link to the registry provided in the RPPR.

Has there been a change in the use of hESCs?

¼ page, 700 characters limit.

G.8. Is there a change in (primary) project performance sites?

If yes, provide addresses

G.9. Foreign component – NEW

Was significant scientific activity performed outside of the US, either by the grantee or by researcher employed by a foreign organization, whether or not grant funds were expended? The following grant related activities are considered significant and must be reported:

- involvement in human subjects or research with live vertebrate animals;
- extensive foreign travel by grantee project staff to collect data, or conduct surveys or sampling activities; or
- any grantee activity that may have an impact on U.S. foreign policy.

Provide organization name and country and short description

¼ page or 700 characters limit.

G.10. Estimated unobligated balance

G.10.a. It is anticipated that an estimated unobligated balance (including prior year carryover) will be greater than 25% of the current year's total approved budget? And total dollars.

G.10.b. Explanation for estimated unobligated balance

¼ page or 700 characters limit.

G.10.c If authorized to carry over balance describe how you are going to use it

½ page or 1300 character limit

G.11 Is program income anticipated during the next budget period?

Total amount in dollars and sources

G.12 Is there a change in performance sites that will affect F&A costs?

½ page or 1300 character limit

FOIA Request 44416

Redactable content (patentable or privileged, unpublished)

(1) File: 0114 email

Redactable:
(1) PDF pages 2-3: Spreadsheet of pOME constructs: remove rows containing the tag "Hypothetical" in the "Target type" column (applies to 3 Ebola and 2 KSHV constructs)
(2) Project 2, PDF page 11: References to sGP and ssGP and Lloviu in section C
(3) Project 2, PDF pages 12-13:
- (a) Paragraph referencing Ebola lacking sGP + ssGP
- (b) Paragraph referencing the testing of uncharacterized proteins from Lloviu virus
- (c) PDF page 13, Section G, point 4

(2) File: 0220 email

Redactable:
(1) Project 1: PDF pages 9-10: Text summarizing functional assay results (section C.2, spanning PDF pages 9-10), and Figure 1 on PDF page 10
(2) Project 2:
- (a) PDF page 11: Section C, points 3 and 4
- (b) All of section F, including figures, spanning PDF pages 13-15
- (c) PDF page 13: Section C, points beginning with "further investigated the induction of apoptosis..." and "generated a mutant Ebola virus..."
- (d) PDF page 13, Section D, reference to pOME103, hypothetical gene in the M segment of influenza virus
- (e) PDF page 15, Section G, text "no longer expressing sGP and ssGP"

(3) PDF pages 25-27: Spreadsheet of pOME constructs: remove rows containing the tag "Hypothetical" in the "Target type" column
- Applies to the following pOME constructs: 94-99, [129-132 misidentified as hypothetical], 137-156, 171-184

(4) PDF pages 28-29, Spreadsheet of pOME characterization data: remove entire chart (shows assay data)

(3) File: 1015 email

Redactable:
(1) PDF pages 2-22: Spreadsheet of pOME constructs: remove rows containing the tag "Hypothetical" in the "Type" column
- Applies to the following pOME constructs: 94-99, 137-156, 171-184, 203-204, 216-231

(2) Table on PDF pages 25-36: Contains functional assay information that has not yet been published; remove in its entirety

(3) Project 1: Text summarizing functional assay results (section C.2, spanning PDF pages 39-40), and all of the Figure page 40
(4) Project 2: Section 2, page 45, Text and table referencing hypothetical constructs (esp. PB2 100 references), Section 3, PDF pages 46-47, text and Figures 2-4

Funding Opportunity Purpose

The purpose of this interagency Funding Opportunity Announcement (FOA) is to invite the submission of grant applications that utilize agriculturally important domestic animal species to improve human health through the advancement of basic and translational research deemed highly relevant to both agricultural

and biomedical research. This initiative is designed to facilitate and encourage comparative medicine research studies through the careful selection and refinement of farm animal models that mimic human developmental, physiological and etiological processes to better understand the biology of fertility and infertility, normal and abnormal metabolism, developmental origin of diseases, and improve prevention and treatment of infectious diseases in both human and agriculturally important domestic animals. The anticipated outcomes include both the elucidation of fundamental information relevant for the improvement of human health and an increase in food animal production and improvement in animal health and product quality. It is envisioned that each application will address mission-relevant areas of both agencies.

Key Dates

Posted Date
July 12, 2016

Open Date (Earliest Submission Date)
August 27, 2016

Letter of Intent Due Date(s)
30 days prior to the application due date

Application Due Date(s)
September 27, 2016; September 27, 2017; September 27, 2018, by 5:00 PM local time of applicant organization. Alltypes of non-AIDS applications allowed for this funding opportunity announcement are due on these dates.

Applicants are encouraged to apply early to allow adequate time to make any corrections to errors found in the application during the submission process by the due date.

AIDS Application Due Date(s)
Not Applicable

Scientific Merit Review
February/March 2017, February/March 2018, February/March 2019

Advisory Council Review
May 2017, May 2018, May 2019

Earliest Start Date
July 2017, July 2018, July 2019

Expiration Date
September 28, 2018

Due Dates for E.O. 12372
Not Applicable

Required Application Instructions

It is critical that applicants follow the instructions in the SF424 (R&R) Application Guide, except where instructed to do otherwise (in this FOA or in a Notice from the ***NIH Guide for Grants and Contracts***). Conformance to all requirements (both in the Application Guide and the FOA) is required and strictly enforced. Applicants must read and follow all application instructions in the Application Guide as well as any program-specific instructions noted in Section IV. When the program-specific instructions deviate from those in the Application Guide, follow the program-specific instructions. **Applications that do not comply with these instructions may be delayed or not accepted for review.**

There are several options to submit your application to the agency through Grants.gov. You can use the ASSIST system to prepare, submit and track your application online. You can download an application package from Grants.gov, complete the forms offline, submit the completed forms to Grants.gov and track your application in eRA Commons. Or, you can use other institutional system-to-system solutions to prepare and submit your application to Grants.gov and track your application in eRA Commons. Learn more.

Apply Online Using ASSIST

Apply Using Downloadable Forms

Problems accessing or using ASSIST should be directed to the eRA Service Desk.
Problems downloading forms should be directed to Grants.gov Customer Support.

Section I. Funding Opportunity Description

Purpose

The purpose of this FOA is to facilitate new and innovative comparative medicine research that expands our knowledge of basic and translational strategies to ameliorate human and agricultural animal disease and developmental and metabolic disorders and improve reproductive efficiency. The focal point of the FOA will be to stimulate and strengthen the application of large domestic animal species for addressing and elucidating specific complex biological mechanisms important to both biomedicine and agriculture. New investigators (including Early-Stage Investigators), and PD(s)/PI(s) who received their first R01 under the previous program announcements (PAR-10-276; PAR-13-204) to the National Institutes of Health are highly encouraged to submit research grant applications projected to have a “dual benefit” for the improvement of health, nutrition, disease prevention, and reproduction in both humans and agriculturally important domestic animals.

Background

A look at the history of biomedical research reveals that agriculturally important domestic animal species such as the pig, sheep, cow, horse, and chicken have been central for the acquisition of basic fundamental knowledge regarding the physiology and pathophysiology of organ systems and the development of reproductive technologies. Despite these documented advances in biomedical research using domestic animal species, their utilization in this era of molecular biology, genomics, and proteomics has often been limited. However, with the recent elucidation of the genome of several of the domestic animal species (cow, horse, pig, chicken, and turkey) and their high gene conservation and similar chromosomal order to humans, these animals become superior genetic models for mapping, as well as the inference of genes associated with disease or physiological mechanisms. While research to curtail human disease is funded primarily by the NIH, the USDA-NIFA provides support for research aimed at improving human health by the provision of safe food with a high nutritive value.

During the past decade, two workshops, convened in 2004 and 2007, highlighted the need for greater interagency cooperation between the NIH and USDA-NIFA so as to better advocate for the utility of these animals as models to study high priority areas in both biomedical and agricultural research. Four priority topics (assisted reproduction/stem cell biology, metabolism with respect to obesity and nutrition, developmental origins of adult disease, and infectious disease) were chosen since it was envisioned that knowledge gained and advances in these areas could greatly benefit both biomedicine and animal agriculture.

In 2007, the American Medical Association and the American Veterinary Medical Association considered a “One Health” initiative (http://www.onehealthinitiative.com/taskForce.php) to strengthen ties and collaborative efforts between schools of medicine and veterinary science. The basis of this initiative was recognition of the mutualistic relationship humans, animals and ecosystems have in the maintenance of overall health. Recently in March 2015, the Division of Comparative Medicine, Office of Research Infrastructure Programs (ORIP) at NIH convened a workshop to assess the progress of the One Health initiative and suggest future steps. The meeting recognized the contribution of the two successful programs funded jointly by NIH and USDA-NIFA, i.e., "Ecology and Evolution of Infectious Diseases", and "Dual Purpose with Dual Benefit: Research in Biomedicine and Agriculture Using Agriculturally Important Domestic Animal Species". As such, “dual purpose for dual benefit” research utilizing domestic agricultural animals should not only further stimulate the progression of scientific knowledge towards multipurpose research endeavors, but it should also provide additional funding opportunities for investigators whose research has traditionally been in the domain of either NIH or USDA-NIFA.

Scientific Knowledge to be Achieved

Knowledge gained through comparative research using domestic agricultural animal models supported by this FOA will broaden the fundamental understanding of normal animal and human physiology but also the etiology of metabolic and infectious diseases in four main topic areas to advance the development of biomedical and agricultural interventions or therapies to improve both human health and farm animal health and production.

- ***Reproduction, Stem cell biology and Regenerative medicine***: Expand fundamental knowledge of processes that underlie human and animal reproduction by advancing our understanding of gametogenesis through the identification of molecular, physiological, and developmental mechanisms that regulate oogenesis and spermatogenesis; improve the efficiency of assisted reproductive technologies in human or cloning in farm animals; elucidate the molecular processes regulating reprogramming in early embryos, embryonic stem cells, induced pluripotent stem cells, and other lineage-specific stem cells, and in cloning (somatic cell nuclear transfer) to enhance tools and improve methods for cloning or the generation of transgenic animals; modify genetic traits of large animals using gene-editing technologies for selective breeding and generation of transgenic animals that mimic human diseases, or provide living, functional tissues to repair or replace tissue or organ functionality lost due to age, disease, damage or congenital defects in the human; characterize the core microbiome (including the metabolome of the microbiome) of the reproductive tract and study its impact on physiology and pathophysiology of reproduction.
- ***Metabolism***: Establish the contribution of specific cell types, such as the adipocyte, and central or peripheral factors in the metabolism of lipids and their role in modulating fat accretion in tissues and/or during specific developmental stages; identify genetic and/or exogenous factors, such as diet or hormones, and determine their role in predisposition to or the onset of obesity; characterize the role of gastrointestinal microbiome (including the metabolome of the microbiome) on host metabolism in the context of adipose deposition and obesity. An understanding of the metabolism and regulation of fat accretion will identify ways in which to improve meat quality, thus its nutritive value to humans, and concomitantly provide insight for the development of novel therapies to reduce the current global epidemic of obesity.
- ***Developmental origin of adult disease***: Investigate the role of placenta in health and disease of the mother and her fetus during pregnancy, postnatally in the offspring and during adulthood; Define in utero developmental programming events altered by maternal exposure to environment stressors (e.g. nutrition, drugs, temperature, pathogens, toxicants) or maternal health status (e.g. disease, obesity) that may be the origin of adult disease or may impair growth, fertility, meat quality, disease resistance, and other traits that are particularly important for agriculture; characterize the gestational and perinatal microbiomes (including the metabolomes of their microbiome) and study their relationship to growth, development, anti-microbial resistance, and to the origin of adult diseases. Quantifiable benefits to NIH and the USDA-NIFA will be the creation of innovative interventions that prevent or ameliorate disease and enhance desired traits to promote human and animal health, as well as economically important production traits for agriculture.
- ***Infectious diseases***: Elucidate the genes and physiological mechanisms that regulate resistance and/or susceptibility to infectious pathogens of human or agricultural animals which will allow for the selection and generation of pathogen-resistant animals; develop interventions that decrease or prevent the transmission of pathogens from animal reservoirs to humans; identify environmental

factors that contribute to the emergence of infectious pathogens to decrease or eradicate their occurrence; define organ or tissue-specific microbiome (including the metabolome of the microbiome) and its relationship to inflammation, immune response, infectious disease development, and antimicrobial resistance; develop genome editing strategies for treatment of infectious diseases. The prevention or eradication of infectious diseases substantially impacts human health and enables the generation of healthier, more superior farm animals.

Objectives

The main objective of this FOA is to stimulate and encourage investigations in the four areas identified as high priority issues to both biomedicine and agriculture through the use of pertinent domestic farm animal species that better mimic the specific human developmental, physiological or disease state. Knowledge gained will provide “dual benefit” to both human and agricultural animal species and advance applications for the improvement of health, productivity and reproductive efficiency. New Investigators, Early Stage Investigators, and PD(s)/PI(s) who received their first R01 under this program are strongly encouraged to apply.

Research and Experimental Approaches

This FOA has been established to encourage the use of domestic agricultural animal species to address four priority research areas of high impact to biomedicine and agriculture. Though research with rodent models has been useful, grasping a more complete fundamental understanding of specific biological questions and translating the knowledge gained to improve both animal and human health and reproduction require the use of models that more closely resemble each other developmentally and physiologically or that exhibit similar susceptibility to common infectious pathogens. The areas of investigation and experimental approaches may involve the characterization of animal models, elucidation of the etiology involved in disease or transmission of pathogens, a determination of environmental insults underlying developmental or epigenetic changes leading to pathophysiology, metabolic studies focused on obesity, or the identification of diagnostic tools (genetic markers, biomarkers, or antibodies). Genomic or proteomic approaches to pinpoint potential gene products or molecular mechanisms involved in the developmental, reproductive, or disease process being investigated are encouraged but findings and interpretations will require validation by cellular, systemic, or in vivo studies. Similarly, in vitro (cellular) studies with downstream functional in vivo (whole animal) studies will be crucial to demonstrate and verify the utility of the findings for applications that improve specific health or reproductive issues addressed. Efforts to address the identification of markers that will predict reproductive capacity of oocytes or embryos should involve non-invasive approaches. This research effort is expected to deepen the fundamental knowledge of biological mechanisms essential to both humans and farm animals, highlight the utility of domestic agricultural animals as more appropriate animal models for specific mechanistic studies, and encourage investigators with farm animal expertise to be involved in research benefiting both agriculture and biomedicine.

Research Scope

Examples of research topics considered appropriate to this FOA include, but are not limited to the following:

- Study ovarian function and dysfunction, including the mechanisms that regulate follicle endowment, follicular development, ovulation, development and function of the corpus luteum, and ovarian pathologies that affect fertility
- Establish or improve methods for the in vitro expansion of spermatogonial stem cells, their cryopreservation, and testicular repopulation that can be applied 1) as an alternative approach for male germplasm preservation, 2) towards regenerative medicine to alleviate detrimental male-inherited traits or gonadotoxic exposure, or 3) as an alternative transgenesis tool.
- Design studies to enhance the efficacy of assisted reproduction technology (ART) and reduce simultaneous multiple pregnancies in humans and thus, the risks associated with multiple births such as prematurity, small for gestational age, and improve the efficacy of in vitro conditions for the manipulation of oocytes by: Identifying molecular mechanisms that regulate oocyte and embryo competency; Pinpointing and validating biomarkers and other types of non-invasive hallmarks that may be used reliably to determine oocyte and embryo quality; Investigating the effect of current and novel in vitro oocyte maturation methods on embryo competency.
- Elucidate mechanisms that regulate nuclear reprogramming, including maintenance of genomic integrity and, the identification of factors in the in vitro milieu that trigger epigenetic changes to improve cloning or transgenesis methodologies.
- Establish the core microbiome (including the metabolome of the microbiome) of the reproductive tract, and design studies to understand the effect of altered microbiome on fertility and infertility.
- Improve or identify novel interventions to prevent or decrease the incidence of obesity in humans and to improve the carcass quality of farm animals by: Identifying central and peripheral factors involved in the regulation of energy balance and examining their role in nutrient utilization and/or feeding behavior with respect to obesity.
- Elucidate the biology of the adipocyte, including mechanisms that regulate lipid metabolism, generation of adipose tissue-derived cytokines (adipokines), and fat accretion
- Deciphering genetic, dietary or hormonal influences on the regulation of pre- or postnatal adiposity.
- Characterize the role of gastrointestinal microbiome (including the metabolome of the microbiome) on host metabolism in the context of obesity.
- Examine the impact of environmental factors, the mother's physical state, and placental structure and/or metabolism on in utero developmental programming of the embryo and fetus and their role in the etiology of subsequent pathogenesis in adulthood that 1) negatively impacts the ability to thrive or survive, 2) increases disease susceptibility and/or 3) decreases fertility and reproductive capacity in humans and farm animals through: the identification of fetal/placental developmental factor, placentation, or epigenetic changes influenced by exposure of the mother to specific environmental stressors (e.g. malnutrition, obesity, toxicants, drugs, temperature, disease) that alter development processes in the embryo and fetus and directly increase the incidence of disease susceptibility, pathogenesis, or decreased fertility and reproductive capacity in adulthood.
- Investigate the effects of specific nutrients on gene expression and the elucidation of genetic components that modulate unique responses (i.e. nutrigenomics) to determine its application for the prevention, alleviation or treatment of chronic disease or to enhance reproduction.
- Study the role of gestational and perinatal microbiomes (including the metabolomes of their microbiome) on growth, development, antimicrobial resistance, and to the origin of adult diseases.
- Identify interventions that halt the transmission of infectious diseases from animal reservoirs to abrogate disease in the hosts through: the elucidation of the factors and mechanisms that regulate

horizontal and vertical transmission of virulent infectious pathogens and the genetic factors that predispose susceptibility of a human or animal.
- The identification of determinants, such as human demographics and behavior, practices in technology, industry or agriculture and economic development that contribute to the emergence of eradicated and relatively new infectious pathogens.
- Define organ or tissue-specific microbiome (including the metabolome of the microbiome) and its relationship to inflammation, immune response, infectious development and antimicrobial resistance
- Develop genome-editing strategies for the treatment of infectious diseases
- The development of vaccines or novel therapies to block transmission and/or abrogate susceptibility.

See Section VIII. Other Information for award authorities and regulations.

Section II. Award Information

Funding Instrument

Grant: A support mechanism providing money, property, or both to an eligible entity to carry out an approved project or activity.

Application Types Allowed

New
Renewal
Resubmission
Revision
The OER Glossary and the SF424 (R&R) Application Guide provide details on these application types.

Funds Available and Anticipated Number of Awards

The number of awards is contingent upon NIH appropriations and the submission of a sufficient number of meritorious applications.

It is the intention of NIH and USDA-NIFA to independently fund grants, and funding in subsequent years will be the responsibility of the agency awarding the grant.

Award Budget

Application budgets are not limited but need to reflect the actual needs of the proposed project.

Award Project Period

The scope of the proposed project should determine the project period. The maximum project period is 5 years.

NIH grants policies as described in the ***NIH Grants Policy Statement*** will apply to the applications submitted and awards made in response to this FOA.

Section III. Eligibility Information

1. Eligible Applicants

Eligible Organizations

Higher Education Institutions

- Public/State Controlled Institutions of Higher Education
- Private Institutions of Higher Education

The following types of Higher Education Institutions are always encouraged to apply for NIH support as Public or Private Institutions of Higher Education:

  - Hispanic-serving Institutions
  - Historically Black Colleges and Universities (HBCUs)
  - Tribally Controlled Colleges and Universities (TCCUs)
  - Alaska Native and Native Hawaiian Serving Institutions
  - Asian American Native American Pacific Islander Serving Institutions (AANAPISIs)

Nonprofits Other Than Institutions of Higher Education

- Nonprofits with 501(c)(3) IRS Status (Other than Institutions of Higher Education)
- Nonprofits without 501(c)(3) IRS Status (Other than Institutions of Higher Education)

For-Profit Organizations

- Small Businesses
- For-Profit Organizations (Other than Small Businesses)

Governments

- State Governments
- County Governments
- City or Township Governments
- Special District Governments
- Indian/Native American Tribal Governments (Federally Recognized)
- Indian/Native American Tribal Governments (Other than Federally Recognized)
- Eligible Agencies of the Federal Government
- U.S. Territory or Possession

Other

- Independent School Districts
- Public Housing Authorities/Indian Housing Authorities
- Native American Tribal Organizations (other than Federally recognized tribal governments)
- Faith-based or Community-based Organizations
- Regional Organizations
- Non-domestic (non-U.S.) Entities (Foreign Institutions)

Foreign Institutions

Non-domestic (non-U.S.) Entities (Foreign Institutions) **are** eligible to apply.
Non-domestic (non-U.S.) components of U.S. Organizations **are** eligible to apply.
Foreign components, as defined in the ***NIH Grants Policy Statement***, **are** allowed.

Required Registrations

Applicant Organizations

Applicant organizations must complete and maintain the following registrations as described in the SF 424 (R&R) Application Guide to be eligible to apply for or receive an award. All registrations must be completed prior to the application being submitted. Registration can take 6 weeks or more, so applicants should begin the registration process as soon as possible. The NIH Policy on Late Submission of Grant Applications states that failure to complete registrations in advance of a due date is not a valid reason for a late submission.

- Dun and Bradstreet Universal Numbering System (DUNS) - All registrations require that applicants be issued a DUNS number. After obtaining a DUNS number, applicants can begin both SAM and eRA Commons registrations. The same DUNS number must be used for all registrations, as well as on the grant application.
- System for Award Management (SAM) (formerly CCR) – Applicants must complete and maintain an active registration, **which requires renewal at least annually**. The renewal process may require as much time as the initial registration. SAM registration includes the assignment of a Commercial and Government Entity (CAGE) Code for domestic organizations which have not already been assigned a CAGE Code.
    - NATO Commercial and Government Entity (NCAGE) Code – Foreign organizations must obtain an NCAGE code (in lieu of a CAGE code) in order to register in SAM.
- eRA Commons - Applicants must have an active DUNS number and SAM registration in order to complete the eRA Commons registration. Organizations can register with the eRA Commons as they are working through their SAM or Grants.gov registration. eRA Commons requires organizations to identify at least one Signing Official (SO) and at least one Program Director/Principal Investigator (PD/PI) account in order to submit an application.
- Grants.gov – Applicants must have an active DUNS number and SAM registration in order to complete the Grants.gov registration.

Program Directors/Principal Investigators (PD(s)/PI(s))

All PD(s)/PI(s) must have an eRA Commons account. PD(s)/PI(s) should work with their organizational officials to either create a new account or to affiliate their existing account with the applicant organization in eRA Commons. If the PD/PI is also the organizational Signing Official, they must have two distinct eRA Commons accounts, one for each role. Obtaining an eRA Commons account can take up to 2 weeks.

Eligible Individuals (Program Director/Principal Investigator)

Any individual(s) with the skills, knowledge, and resources necessary to carry out the proposed research as the Program Director(s)/Principal Investigator(s) (PD(s)/PI(s)) is invited to work with his/her organization to develop an application for support. Individuals from underrepresented racial and ethnic groups as well as individuals with disabilities are always encouraged to apply for NIH support.

For institutions/organizations proposing multiple PDs/PIs, visit the Multiple Program Director/Principal Investigator Policy and submission details in the Senior/Key Person Profile (Expanded) Component of the SF424 (R&R) Application Guide.

2. Cost Sharing

This FOA does not require cost sharing as defined in the ***NIH Grants Policy Statement***.

3. Additional Information on Eligibility

Number of Applications

Applicant organizations may submit more than one application, provided that each application is scientifically distinct.

The NIH will not accept duplicate or highly overlapping applications under review at the same time. This means that the NIH will not accept:

- A new (A0) application that is submitted before issuance of the summary statement from the review of an overlapping new (A0) or resubmission (A1) application.
- A resubmission (A1) application that is submitted before issuance of the summary statement from the review of the previous new (A0) application.
- An application that has substantial overlap with another application pending appeal of initial peer review (see NOT-OD-11-101).

Section IV. Application and Submission Information

1. Requesting an Application Package

Applicants must obtain the SF424 (R&R) application package associated with this funding opportunity using the "Apply for Grant Electronically" button in this FOA or following the directions provided at Grants.gov.

2. Content and Form of Application Submission

It is critical that applicants follow the instructions in the SF424 (R&R) Application Guide, including Supplemental Grant Application Instructions except where instructed in this funding opportunity announcement to do otherwise. Conformance to the requirements in the Application Guide is required and strictly enforced. Applications that are out of compliance with these instructions may be delayed or not accepted for review.

For information on Application Submission and Receipt, visit Frequently Asked Questions – Application Guide, Electronic Submission of Grant Applications.

Letter of Intent

Although a letter of intent is not required, is not binding, and does not enter into the review of a subsequent application, the information that it contains allows IC staff to estimate the potential review workload and plan the review.

By the date listed in Part 1. Overview Information, prospective applicants are asked to submit a letter of intent that includes the following information:

- Descriptive title of proposed activity
- Name(s), address(es), and telephone number(s) of the PD(s)/PI(s)
- Names of other key personnel
- Participating institution(s)
- Number and title of this funding opportunity

The letter of intent should be sent to:

Ravi (Neelakanta) Ravindranath, DVM, PhD
Fertility and Infertility Branch (FIB)
Eunice Kennedy Shriver National Institute of Child Health and Human Development (NICHD)
6100 Executive Boulevard, Rm8B01G, MSC 7510
Bethesda, MD 20892
Rockville, MD 20852 (for express/courier service; non-USPS service)
Telephone: 301-435-6889
Fax: 301-480-2389
Email: ravindrn@mail.nih.gov

Page Limitations

All page limitations described in the SF424 Application Guide and the Table of Page Limits must be followed.

Instructions for Application Submission

The following section supplements the instructions found in the SF424 (R&R) Application Guide and should be used for preparing an application to this FOA.

SF424(R&R) Cover

All instructions in the SF424 (R&R) Application Guide must be followed.

SF424(R&R) Project/Performance Site Locations

All instructions in the SF424 (R&R) Application Guide must be followed.

SF424(R&R) Other Project Information

All instructions in the SF424 (R&R) Application Guide must be followed.

SF424(R&R) Senior/Key Person Profile

All instructions in the SF424 (R&R) Application Guide must be followed.

R&R or Modular Budget

All instructions in the SF424 (R&R) Application Guide must be followed.

R&R Subaward Budget

All instructions in the SF424 (R&R) Application Guide must be followed.

PHS 398 Cover Page Supplement

All instructions in the SF424 (R&R) Application Guide must be followed.

PHS 398 Research Plan

All instructions in the SF424 (R&R) Application Guide must be followed, with the following additional instructions:

Resource Sharing Plan: Individuals are required to comply with the instructions for the Resource Sharing Plans as provided in the SF424 (R&R) Application Guide, with the following modification:

- All applications, regardless of the amount of direct costs requested for any one year, should address a Data Sharing Plan.

Appendix: Do not use the Appendix to circumvent page limits. Follow all instructions for the Appendix as described in the SF424 (R&R) Application Guide.

PHS Inclusion Enrollment Report

When conducting clinical research, follow all instructions for completing PHS Inclusion Enrollment Report as described in the SF424 (R&R) Application Guide.

PHS Assignment Request Form

All instructions in the SF424 (R&R) Application Guide must be followed.

Foreign Institutions

Foreign (non-U.S.) institutions must follow policies described in the ***NIH Grants Policy Statement***, and procedures for foreign institutions described throughout the SF424 (R&R) Application Guide.

3. Unique Entity Identifier and System for Award Management (SAM)

See Part 1. Section III.1 for information regarding the requirement for obtaining a unique entity identifier and for completing and maintaining active registrations in System for Award Management (SAM), NATO Commercial and Government Entity (NCAGE) Code (if applicable), eRA Commons, and Grants.gov

4. Submission Dates and Times

Part I. Overview Information contains information about Key Dates and times. Applicants are encouraged to submit applications before the due date to ensure they have time to make any application corrections that might be necessary for successful submission. When a submission date falls on a weekend or Federal holiday, the application deadline is automatically extended to the next business day.

Organizations must submit applications to Grants.gov (the online portal to find and apply for grants across all Federal agencies). Applicants must then complete the submission process by tracking the status of the application in the eRA Commons, NIH's electronic system for grants administration. NIH and Grants.gov systems check the application against many of the application instructions upon submission. Errors must be corrected and a changed/corrected application must be submitted to Grants.gov on or before the application due date and time. If a Changed/Corrected application is submitted after the deadline, the application will be considered late. Applications that miss the due date and time are subjected to the NIH Policy on Late Application Submission.

Applicants are responsible for viewing their application before the due date in the eRA Commons to ensure accurate and successful submission.

Information on the submission process and a definition of on-time submission are provided in the SF424 (R&R) Application Guide.

5. Intergovernmental Review (E.O. 12372)

This initiative is not subject to intergovernmental review.

6. Funding Restrictions

All NIH awards are subject to the terms and conditions, cost principles, and other considerations described in the ***NIH Grants Policy Statement***.

Pre-award costs are allowable only as described in the ***NIH Grants Policy Statement***.

NIFA awards are subject to the terms and conditions, cost principles, and other considerations described in 7 CFR 3430, Competitive and Noncompetitive Non-formula Grant Programs – General Grant Administrative Provisions.

Section 7132 of the Food, Conservation, and Energy Act of 2008 (Pub. L. 110-246) amended section 1462(a) of the National Agricultural Research, Extension, and Teaching Policy Act of 1977 (7 U.S.C. 3310(a)) on recovery of indirect costs. The recovery of indirect costs on awards made by USDA-NIFA under this program may not exceed the lesser of the institution's official negotiated indirect cost rate or the equivalent of 22 percent of total Federal funds awarded. If an applicant is selected for an award by USDA-NIFA, they will be instructed to resubmit their budget forms in accordance with this limitation.

Funds made available for grants under this FOA shall not be used for the construction of a new building or facility or the acquisition, expansion, remodeling, or alteration of an existing building or facility (including site grading and improvement, and architect fees).

7. Other Submission Requirements and Information

Applications must be submitted electronically following the instructions described in the SF424 (R&R) Application Guide. Paper applications will not be accepted.

Applicants must complete all required registrations before the application due date. Section III. Eligibility Information contains information about registration.

For assistance with your electronic application or for more information on the electronic submission process, visit Applying Electronically. If you encounter a system issue beyond your control that threatens your ability to complete the submission process on-time, you must follow the Guidelines for Applicants Experiencing System Issues. For assistance with application submission, contact the Application Submission Contacts in Section VII.

Important reminders:

All PD(s)/PI(s) must include their eRA Commons ID in the Credential field of the Senior/Key Person Profile Component of the SF424(R&R) Application Package**.** Failure to register in the Commons and to include a valid PD/PI Commons ID in the credential field will prevent the successful submission of an electronic application to NIH. See Section IIIof this FOA for information on registration requirements.

The applicant organization must ensure that the DUNS number it provides on the application is the same number used in the organization’s profile in the eRA Commons and for the System for Award Management. Additional information may be found in the SF424 (R&R) Application Guide.

See more tips for avoiding common errors.

Upon receipt, applications will be evaluated for completeness and compliance with application instructions by the Center for Scientific Review, NIH. Applications that are incomplete or non-compliant will not be reviewed.

Requests of $500,000 or more for direct costs in any year

Applicants requesting $500,000 or more in direct costs in any year (excluding consortium F&A) must contact a Scientific/ Research Contact at least 6 weeks before submitting the application and follow the Policy on the Acceptance for Review of Unsolicited Applications that Request $500,000 or More in Direct Costs as described in the SF424 (R&R) Application Guide.

Post Submission Materials

Applicants are required to follow the instructions for post-submission materials, as described in NOT-OD-13-030.

Section V. Application Review Information

1. Criteria

Only the review criteria described below will be considered in the review process. As part of the NIH mission, all applications submitted to the NIH in support of biomedical and behavioral research are evaluated for scientific and technical merit through the NIH peer review system.

Overall Impact

Reviewers will provide an overall impact score to reflect their assessment of the likelihood for the project to exert a sustained, powerful influence on the research field(s) involved, in consideration of the following review criteria and additional review criteria (as applicable for the project proposed).

Scored Review Criteria

Reviewers will consider each of the review criteria below in the determination of scientific merit, and give a separate score for each. An application does not need to be strong in all categories to be judged likely to have major scientific impact. For example, a project that by its nature is not innovative may be essential to advance a field.

Significance

Does the project address an important problem or a critical barrier to progress in the field? Is there a strong scientific premise for the project? If the aims of the project are achieved, how will scientific knowledge, technical capability, and/or clinical practice be improved? How will successful completion of the aims change the concepts, methods, technologies, treatments, services, or preventative interventions that drive this field?

Investigator(s)

Are the PD(s)/PI(s), collaborators, and other researchers well suited to the project? If Early Stage Investigators or New Investigators, or in the early stages of independent careers, do they have appropriate experience and training? If established, have they demonstrated an ongoing record of accomplishments that have advanced their field(s)? If the project is collaborative or multi-PD/PI, do the investigators have complementary and integrated expertise; are their leadership approach, governance and organizational structure appropriate for the project?

Innovation

Does the application challenge and seek to shift current research or clinical practice paradigms by utilizing novel theoretical concepts, approaches or methodologies, instrumentation, or interventions? Are the concepts, approaches or methodologies, instrumentation, or interventions novel to one field of

research or novel in a broad sense? Is a refinement, improvement, or new application of theoretical concepts, approaches or methodologies, instrumentation, or interventions proposed?

Approach

Are the overall strategy, methodology, and analyses well-reasoned and appropriate to accomplish the specific aims of the project? Have the investigators presented strategies to ensure a robust and unbiased approach, as appropriate for the work proposed? Are potential problems, alternative strategies, and benchmarks for success presented? If the project is in the early stages of development, will the strategy establish feasibility and will particularly risky aspects be managed? Have the investigators presented adequate plans to address relevant biological variables, such as sex, for studies in vertebrate animals or human subjects?

If the project involves human subjects and/or NIH-defined clinical research, are the plans to address 1) the protection of human subjects from research risks, and 2) inclusion (or exclusion) of individuals on the basis of sex/gender, race, and ethnicity, as well as the inclusion or exclusion of children, justified in terms of the scientific goals and research strategy proposed?

Environment

Will the scientific environment in which the work will be done contribute to the probability of success? Are the institutional support, equipment and other physical resources available to the investigators adequate for the project proposed? Will the project benefit from unique features of the scientific environment, subject populations, or collaborative arrangements?

Additional Review Criteria

As applicable for the project proposed, reviewers will evaluate the following additional items while determining scientific and technical merit, and in providing an overall impact score, but will not give separate scores for these items.

Protections for Human Subjects

For research that involves human subjects but does not involve one of the six categories of research that are exempt under 45 CFR Part 46, the committee will evaluate the justification for involvement of human subjects and the proposed protections from research risk relating to their participation according to the following five review criteria: 1) risk to subjects, 2) adequacy of protection against risks, 3) potential benefits to the subjects and others, 4) importance of the knowledge to be gained, and 5) data and safety monitoring for clinical trials.

For research that involves human subjects and meets the criteria for one or more of the six categories of research that are exempt under 45 CFR Part 46, the committee will evaluate: 1) the justification for the exemption, 2) human subjects involvement and characteristics, and 3) sources of materials. For additional information on review of the Human Subjects section, please refer to the Guidelines for the Review of Human Subjects.

Inclusion of Women, Minorities, and Children

When the proposed project involves human subjects and/or NIH-defined clinical research, the committee will evaluate the proposed plans for the inclusion (or exclusion) of individuals on the basis of sex/gender, race, and ethnicity, as well as the inclusion (or exclusion) of children to determine if it is justified in terms of the scientific goals and research strategy proposed. For additional information on

review of the Inclusion section, please refer to the Guidelines for the Review of Inclusion in Clinical Research.

Vertebrate Animals

The committee will evaluate the involvement of live vertebrate animals as part of the scientific assessment according to the following criteria: (1) description of proposed procedures involving animals, including species, strains, ages, sex, and total number to be used; (2) justifications for the use of animals versus alternative models and for the appropriateness of the species proposed; (3) interventions to minimize discomfort, distress, pain and injury; and (4) justification for euthanasia method if NOT consistent with the AVMA Guidelines for the Euthanasia of Animals. Reviewers will assess the use of chimpanzees as they would any other application proposing the use of vertebrate animals. For additional information on review of the Vertebrate Animals section, please refer to the Worksheet for Review of the Vertebrate Animal Section.

Biohazards

Reviewers will assess whether materials or procedures proposed are potentially hazardous to research personnel and/or the environment, and if needed, determine whether adequate protection is proposed.

Resubmissions

For Resubmissions, the committee will evaluate the application as now presented, taking into consideration the responses to comments from the previous scientific review group and changes made to the project.

Renewals

For Renewals, the committee will consider the progress made in the last funding period.

Revisions

For Revisions, the committee will consider the appropriateness of the proposed expansion of the scope of the project. If the Revision application relates to a specific line of investigation presented in the original application that was not recommended for approval by the committee, then the committee will consider whether the responses to comments from the previous scientific review group are adequate and whether substantial changes are clearly evident.

Additional Review Considerations

As applicable for the project proposed, reviewers will consider each of the following items, but will not give scores for these items, and should not consider them in providing an overall impact score.

Applications from Foreign Organizations

Reviewers will assess whether the project presents special opportunities for furthering research programs through the use of unusual talent, resources, populations, or environmental conditions that exist in other countries and either are not readily available in the United States or augment existing U.S. resources.

Select Agent Research

Reviewers will assess the information provided in this section of the application, including 1) the Select Agent(s) to be used in the proposed research, 2) the registration status of all entities where Select Agent(s) will be used, 3) the procedures that will be used to monitor possession use and transfer of

Select Agent(s), and 4) plans for appropriate biosafety, biocontainment, and security of the Select Agent(s).

Resource Sharing Plans

Reviewers will comment on whether the following Resource Sharing Plans, or the rationale for not sharing the following types of resources, are reasonable: (1) Data Sharing Plan; (2) Sharing Model Organisms; and (3) Genomic Data Sharing Plan (GDS).

Authentication of Key Biological and/or Chemical Resources:

For projects involving key biological and/or chemical resources, reviewers will comment on the brief plans proposed for identifying and ensuring the validity of those resources.

Budget and Period of Support

Reviewers will consider whether the budget and the requested period of support are fully justified and reasonable in relation to the proposed research.

2. Review and Selection Process

Applications will be evaluated for scientific and technical merit by (an) appropriate Scientific Review Group(s) convened by the Center for Scientific Review, in accordance with NIH peer review policy and procedures, using the stated review criteria. Assignment to a Scientific Review Group will be shown in the eRA Commons.

As part of the scientific peer review, all applications:

- May undergo a selection process in which only those applications deemed to have the highest scientific and technical merit (generally the top half of applications under review) will be discussed and assigned an overall impact score.
- Will receive a written critique.

Applications will be assigned on the basis of established PHS referral guidelines to the appropriate NIH Institute or Center. Applications will compete for available funds with all other recommended applications . Following initial peer review, recommended applications will receive a second level of review by the appropriate national Advisory Council or Board. The following will be considered in making funding decisions:

- Scientific and technical merit of the proposed project as determined by scientific peer review.
- Availability of funds.
- Relevance of the proposed project to program priorities.

For applications that are not awarded by NICHD, the written critique (Summary Statement) may be shared with appropriate staff at USDA for their consideration.

3. Anticipated Announcement and Award Dates

After the peer review of the application is completed, the PD/PI will be able to access his or her Summary Statement (written critique) via the eRA Commons. Refer to Part 1 for dates for peer review, advisory council review, and earliest start date.

Information regarding the disposition of applications is available in the ***NIH Grants Policy Statement***.

Section VI. Award Administration Information

1. Award Notices

If the application is under consideration for funding, NIH will request "just-in-time" information from the applicant as described in the ***NIH Grants Policy Statement***.

A formal notification in the form of a Notice of Award (NoA) will be provided to the applicant organization for successful applications. The NoA signed by the grants management officer is the authorizing document and will be sent via email to the grantee's business official.

Awardees must comply with any funding restrictions described in Section IV.5. Funding Restrictions. Selection of an application for award is not an authorization to begin performance. Any costs incurred before receipt of the NoA are at the recipient's risk. These costs may be reimbursed only to the extent considered allowable pre-award costs.

Any application awarded in response to this FOA will be subject to terms and conditions found on the Award Conditions and Information for NIH Grants website. This includes any recent legislation and policy applicable to awards that is highlighted on this website.

USDA-NIFA Award Notices:

Applicants selected for USDA-NIFA funding will be required to submit additional forms and documents as detailed in "A Guide for Preparation and Submission of NIFA Applications via Grants.gov (PDF)" (http://www.csrees.usda.gov/funding/grant_forms/adobe_grants_gov_instructions.pdf). All awards made from the USDA will be limited to an indirect cost cap of 22% of the total Federal funds awarded. Revised budgets will be requested if these guidelines are not met by an application to be awarded by USDA/NIFA.

USDA-NIFA award documents will provide pertinent instructions and information and shall include at a minimum the following:

1. Legal name and address of performing organization or institution to which the Director has issued an award under the terms of this FOA;

2. Title of project;

3. Name(s) and institution(s) of PDs chosen to direct and control approved projects;

4. Identifying award number assigned by the Department;

5. Award type, specifying whether the grant is a standard or continuation award;

6. Project period, specifying the amount of time the Department intends to support the project without requiring re-competition for funds, and that no-cost extensions of time beyond the five year performance period will be granted only in extenuating circumstances, require prior approval and will be contingent on a satisfactory merit review conducted by NIFA;

7. Total amount of Departmental financial assistance approved by the Director during the project period;

8. Legal authority(ies) under which the award is issued;

9. Appropriate Catalog of Federal Domestic Assistance (CFDA) number;

10. Applicable award terms and conditions
(see http://www.nifa.usda.gov/business/awards/awardterms.html to view NIFA award terms and conditions);

11. Approved budget plan for categorizing allocable project funds to accomplish the stated purpose of the award; and

12. Other information or provisions deemed necessary by NIFA to carry out its respective awarding activities or to accomplish the purpose of a particular award.

2. Administrative and National Policy Requirements

All NIH grant and cooperative agreement awards include the ***NIH Grants Policy Statement*** as part of the NoA. For these terms of award, see the ***NIH Grants Policy Statement*** Part II: Terms and Conditions of NIH Grant Awards, Subpart A: General and Part II: Terms and Conditions of NIH Grant Awards, Subpart B: Terms and Conditions for Specific Types of Grants, Grantees, and Activities. More information is provided at Award Conditions and Information for NIH Grants.

Recipients of federal financial assistance (FFA) from HHS must administer their programs in compliance with federal civil rights law. This means that recipients of HHS funds must ensure equal access to their programs without regard to a person's race, color, national origin, disability, age and, in some circumstances, sex and religion. This includes ensuring your programs are accessible to persons with limited English proficiency. HHS recognizes that research projects are often limited in scope for many reasons that are nondiscriminatory, such as the principal investigator's scientific interest, funding limitations, recruitment requirements, and other considerations. Thus, criteria in research protocols that target or exclude certain populations are warranted where nondiscriminatory justifications establish that such criteria are appropriate with respect to the health or safety of the subjects, the scientific study design, or the purpose of the research.

For additional guidance regarding how the provisions apply to NIH grant programs, please contact the Scientific/Research Contact that is identified in Section VII under Agency Contacts of this FOA. HHS provides general guidance to recipients of FFA on meeting their legal obligation to take reasonable steps to provide meaningful access to their programs by persons with limited English proficiency. Please see http://www.hhs.gov/ocr/civilrights/resources/laws/revisedlep.html. The HHS Office for Civil Rights also provides guidance on complying with civil rights laws enforced by HHS. Please see http://www.hhs.gov/ocr/civilrights/understanding/section1557/index.html; andhttp://www.hhs.gov/ocr/civilrights/understanding/index.html. Recipients of FFA also have specific legal obligations for serving qualified individuals with disabilities. Please seehttp://www.hhs.gov/ocr/civilrights/understanding/disability/index.html. Please contact the HHS Office for Civil Rights for more information about obligations and prohibitions under federal civil rights laws at http://www.hhs.gov/ocr/office/about/rgn-hqaddresses.html or call 1-800-368-1019 or TDD 1-800-537-7697. Also note it is an HHS Departmental goal to ensure access to quality, culturally competent care, including long-term services and supports, for vulnerable populations. For further guidance on providing culturally and linguistically appropriate services, recipients should review the National Standards for Culturally and Linguistically Appropriate Services in Health and Health Care athttp://minorityhealth.hhs.gov/omh/browse.aspx?lvl=2&lvlid=53.

USDA-NIFA Administrative and National Policy Requirements:

Several Federal statutes and regulations apply to USDA-NIFA grant applications considered for review and to project grants awarded under this program.

These include, but are not limited to:

7 CFR Part 1, subpart A—USDA implementation of the Freedom of Information Act.

7 CFR Part 3-USDA implementation of OMB Circular No. A-129, regarding debt collection

7 CFR Part 15, subpart A—USDA implementation of Title VI of the Civil Rights Act of 1964, as amended.

7 CFR Part 331 and 9 CFR Part 121—USDA implementation of the Agricultural Bioterrorism Protection Act of 2002.

7 CFR Part 3015—USDA Uniform Federal Assistance Regulations, implementing OMB directives (i.e., OMB Circular Nos. A-21 and A-122 (2 CFR Parts 220 and 230) and incorporating provisions of 31 U.S.C. 6301-6308 (formerly the Federal Grant and Cooperative Agreement Act of 1977, Pub. L. No. 95-224), as well as general policy requirements applicable to recipients of Departmental financial assistance.

7 CFR Part 3017—USDA implementation of Governmentwide Debarment and Suspension (Nonprocurement).

7 CFR Part 3018—USDA implementation of Restrictions on Lobbying. Imposes prohibitions and requirements for disclosure and certification related to lobbying on recipients of Federal contracts, grants, cooperative agreements, and loans.

7 CFR Part 3019—USDA implementation of OMB Circular A-110, Uniform Administrative Requirements for Grants and Other Agreements With Institutions of Higher Education, Hospitals, and Other Nonprofit Organizations (2 CFR Part 215).

7 CFR Part 3021—Governmentwide Requirements for Drug-Free Workplace (Financial Assistance).

7 CFR Part 3052—USDA implementation of OMB Circular No. A-133, Audits of States, Local Governments, and Nonprofit Organizations.

7 CFR Part 3407—NIFA procedures to implement the National Environmental Policy Act of 1969, as amended.

7 CFR 3430—Competitive and Noncompetitive Non-formula Grant Programs--General Grant Administrative Provisions.

29 U.S.C. 794 (section 504, Rehabilitation Act of 1973) and 7 CFR Part 15b (USDA implementation of statute) —prohibiting discrimination based upon physical or mental handicap in Federally assisted programs.

35 U.S.C. 200 et seq. —Bayh Dole Act, controlling allocation of rights to inventions made by employees of small business firms and domestic nonprofit organizations, including universities, in Federally assisted programs (implementing regulations are contained in 37 CFR Part 401). For additional information on NIFA patents, inventions and copyrights requirements, visit

http://www.nifa.usda.gov/business/awards/intellprop.html.

Cooperative Agreement Terms and Conditions of Award

Not Applicable

3. Reporting

When multiple years are involved, awardees will be required to submit the Research Performance Progress Report (RPPR) annually and financial statements as required in the NIH Grants Policy Statement.

A final progress report, invention statement, and the expenditure data portion of the Federal Financial Report are required for closeout of an award, as described in the ***NIH Grants Policy Statement***.

The Federal Funding Accountability and Transparency Act of 2006 (Transparency Act), includes a requirement for awardees of Federal grants to report information about first-tier subawards and executive compensation under Federal assistance awards issued in FY2011 or later. All awardees of applicable NIH grants and cooperative agreements are required to report to the Federal Subaward Reporting System (FSRS) available at www.fsrs.gov on all subawards over $25,000. See the ***NIH Grants Policy Statement*** for additional information on this reporting requirement.

USDA-NIFA Awards:

NIFA reports its awards on the new REEport system. Information is made available at https://portal.nifa.usda.gov/portal

For informational purposes, the “Federal Financial Report,” Form SF-425, consolidates into a single report the former Financial Status Report (SF-269 and SF-269A) and the Federal Cash Transactions Report (SF-272 and SF-272A). The NIFA Agency specific Terms and Conditions include the requirement that Form SF-425 is due on a quarterly basis no later than 30 days following the end of each reporting period. A final “Federal Financial Report,” Form SF-425, is due 90 days after the expiration date of this award.

Section VII. Agency Contacts

We encourage inquiries concerning this funding opportunity and welcome the opportunity to answer questions from potential applicants.

Application Submission Contacts

Section VIII. Other Information

Recently issued trans-NIH policy notices may affect your application submission. A full list of policy notices published by NIH is provided in the ***NIH Guide for Grants and Contracts***. All awards are subject to the terms and conditions, cost principles, and other considerations described in the NIH Grants Policy Statement.

Authority and Regulations

Awards are made under the authorization of Sections 301 and 405 of the Public Health Service Act as amended (42 USC 241 and 284) and under Federal Regulations 42 CFR Part 52 and 45 CFR Part 75.

Evaluation of Serological and Antigenic Relationships Between Middle Eastern Respiratory Syndrome Coronavirus and Other Coronaviruses to Develop Vaccine Platforms for the Rapid Response to Emerging Coronaviruses

Sudhakar Agnihothram,[1,2,a] Robin Gopal,[4,a] Boyd L. Yount Jr,[1,2] Eric F. Donaldson,[1,2] Vineet D. Menachery,[1,2] Rachel L. Graham,[1,2] Trevor D. Scobey,[1,2] Lisa E. Gralinski,[1,2] Mark R. Denison,[3] Maria Zambon,[4] and Ralph S. Baric[1,2]

[1]Department of Epidemiology and [2]Department of Microbiology and Immunology, University of North Carolina, Chapel Hill; [3]Department of Pediatrics and Microbiology and Immunology, Vanderbilt University, Nashville, Tennessee; and [4]Viral Zoonosis Unit, Public Health of England, London, United Kingdom

Background Middle East respiratory syndrome coronavirus (MERS-CoV) emerged in 2012, causing severe acute respiratory disease and pneumonia, with 44% mortality among 136 cases to date. Design of vaccines to limit the virus spread or diagnostic tests to track newly emerging strains requires knowledge of antigenic and serologic relationships between MERS-CoV and other CoVs.

Methods Using synthetic genomics and Venezuelan equine encephalitis virus replicons (VRPs) expressing spike and nucleocapsid proteins from MERS-CoV and other human and bat CoVs, we characterized the antigenic responses (using Western blot and enzyme-linked immunosorbent assay) and serologic responses (using neutralization assays) against 2 MERS-CoV isolates in comparison with those of other human and bat CoVs.

Results Serologic and neutralization responses against the spike glycoprotein were primarily strain specific, with a very low level of cross-reactivity within or across subgroups. CoV N proteins within but not across subgroups share cross-reactive epitopes with MERS-CoV isolates. Our findings were validated using a convalescent-phase serum specimen from a patient infected with MERS-CoV (NA 01) and human antiserum against SARS-CoV, human CoV NL63, and human CoV OC43.

Conclusions Vaccine design for emerging CoVs should involve chimeric spike protein containing neutralizing epitopes from multiple virus strains across subgroups to reduce immune pathology, and a diagnostic platform should include a panel of nucleocapsid and spike proteins from phylogenetically distinct CoVs.

Keywords MERS-CoV; Vaccine Design; Diagnostics; Serology; Synthetic Genomics.

Novel approaches are needed to respond rapidly to new emerging diseases, especially early in the epidemic, when prompt public health interventions can limit mortality and epidemic spread. Coronaviruses (CoVs) constitute a group of phylogenetically diverse enveloped viruses that have the largest plus-strand RNA genomes and replicate efficiently in most mammals [1, 2]. Human CoV (HCoV-229E, -OC43, -NL63, and -HKU 1) infections typically result in mild-to-severe upper and lower respiratory tract disease [3, 4]. SARS-CoV emerged in 2002–2003, causing acute respiratory distress syndrome with 10% mortality overall and up to 50% mortality among aged individuals [5]. Most recently, Middle East respiratory syndrome CoV (MERS-CoV) emerged in the Middle East in April 2012, manifesting as severe pneumonia, acute respiratory distress syndrome, and acute renal failure. The virus is still circulating and has caused 136 human infections with 58 deaths (mortality rate, approximately 44%) [6, 7].

Received 16 August 2013; accepted 11 October 2013; electronically published 18 November 2013.

[a]S.A. and R.G. contributed equally to this work.

Presented in part: MERS-CoV study group meeting, June 20–22 2013, Cairo, Egypt.

Phylogenetic analysis groups CoVs into 4 genera—Alphacoronavirus, Betacoronavirus, Gammacoronavirus, and Deltacoronavirus—and for many mammalian CoVs, bats are considered reservoirs [6, 8, 9]. SARS-CoVs closely related to bat CoV (BtCoV) HKU 3 [1, 10–12], whereas MERS-CoV is closely related to Pipistrellus BtCoV HKU 5 and Tylonycteris BtCoV HKU 4 [9]. However, the serologic and antigenic relationship between strains is unclear. Given the vast number of genetically distinct CoVs, well-defined serologic and virologic reagents are needed to rapidly track MERS-CoV and other CoV infections in natural populations and to optimize vaccine and therapeutic designs early in an outbreak setting, especially within and between phylogenetic subgroups.

The spike (S) and nucleocapsid (N) proteins are major immunogenic components of CoVs and are produced in abundant quantities during infection. The S protein is the principle determinant of protective immunity and cross-species transmission in CoV [11]. Antibodies against S protein protect from homologous and heterologous SARS-CoV challenge in vivo [13], whereas N protein–specific immune responses may offer limited protection especially against low-dose challenge [13]. Therefore, antibodies against S and N protein have diagnostic and therapeutic potential [14, 15].

In this article, we use alphavirus replicon vaccine vectors to express a panel of recombinant S and N proteins from distantly related alphacoronaviruses and betacoronaviruses, including MERS-CoV and other subgroup 2c CoVs. Using mouse polyclonal antisera and recombinant proteins, we compare the cross-reactivity and neutralization titers of these antisera between distantly related human and bat CoVs. Our results indicate that the S glycoprotein but not the N protein is the major determinant of the neutralizing antibody response to MERS-CoV; that the N proteins of CoVs only cross-react within but not between subgroups; that little if any cross-neutralization or cross-reactivity exists between the S proteins of CoVs within subgroup 2c or any other subgroup; and that cross-neutralization and cross-reactive patterns were validated with the convalescent-phase serum sample from a patient infected with MERS-CoV Hu/England-N1/2012 and a donor panel of human antisera against 3 different HCoVs. Our approach provides critical reagents, antisera, and recombinant virus vaccines that allow for rapid diagnosis of and intervention against MERS-CoV and other zoonotic CoVs that emerge in the future.

MATERIALS AND METHODS

Viruses, Cells, and Plaque Assays

MERS-CoV Hu/England-N1/2012 and MERS-CoV Hu/SA-N1/2012 were cultured on Vero 81 cells and grown in Opti-Mem (Gibco, Carlsbad, CA) with 5% fetal clone serum (Hyclone, South Logan, UT) and gentamicin/kanamycin (Gibco). Viral growth assays in Vero and Calu-3 cells were performed as previously described [16].

Generation of Polyclonal Mouse Antisera, Neutralization Assays, and Western and Northern Blot Analysis

Genes encoding the indicated S and N proteins were synthesized from Bio Basic (Ontario, Canada) and packaged into Venezuelan equine encephalitis virus replicon particles (VRPs). Following vaccination, mouse polyclonal sera were generated from BALB/c mice, and neutralization assays involving MERS-CoV strains and SARS-CoV were as described previously [17]. For Western blots, VRP or virus-infected cell lysates and controls were prepared as described before in detail [8], and these blots were probed using the indicated mouse polyclonal sera. Vero cells inoculated with MERS-CoV isolates were harvested 12 hours after infection by means of Trizol reagent (Invitrogen) and were used to perform Northern blots [18].

Enzyme-Linked Immunosorbent Assay (ELISA) and Blocking Assay

An ELISA using indicated virus-infected cell lysates or antigens expressed from VRPs was performed as described previously [19], and the reactivity of mouse or human serum was determined using a chemiluminescent substrate. Blocking ELISA was performed by sequentially reacting plate-bound MERS-CoV lysate antigen with convalescent-phase serum obtained from a patient with MERS, followed by mouse polyclonal serum raised against VRP-packaged MERS-CoV N or S proteins. Blocking was expressed as the percentage reduction in the reactivity of the mouse serum alone.

RESULTS

Molecular Characterization of MERS-CoV Hu/England-N1/2012

MERS-CoV Hu/England-N1/2012 (MERSEng 1) was isolated from a 49-year-old patient with severe respiratory illness and was transferred to London for treatment [7]. Twenty-nine mutations in MERSEng 1 at the amino acid level were identified and compared to the published sequence of MERS-CoV Hu/SA-N1/2012 (MERSSA 1; GenBank JX869059.2; Supplementary Figure S2). To identify whether these mutations altered virus growth, we analyzed the replication kinetics of the 2 isolates in Vero cells and a continuous epithelial cell line, Calu-3 (Figure 1A and 1B). Although the replication kinetics were slightly different between 2 isolates in Vero cells, peak viral titers were equivalent. In contrast, virus growth was markedly distinct in human Calu-3 cells and could have represented differences in strain-specific in vitro adaptation phenotypes or resulted from functional differences in the sensitivity to innate immune responses [20].

CoV replication and transcription involves production of a nested set of subgenomic messenger RNAs (mRNAs) [2], and

Downloaded from http://jid.oxfordjournals.org/ by guest on August 15, 2016

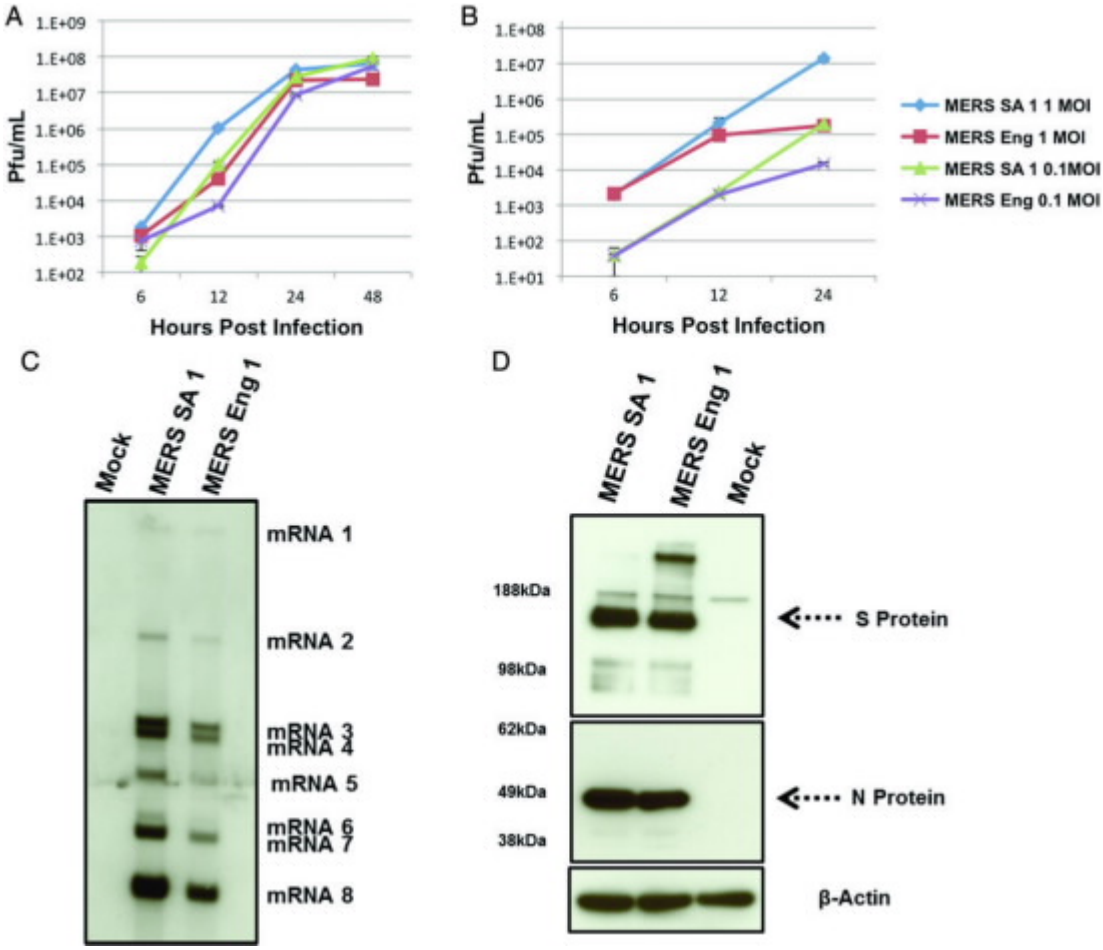

Figure 1. Growth of Middle East respiratory syndrome coronavirus (MERS-CoV) isolates at indicated multiplicity of infection (MOI) in Vero cells (A) and Calu-3 cells (B). Infected cultures were sampled in triplicate at times indicated, and viral titers (shown as plaque-forming units [PFU]/mL) were determined by plaque assay on Vero cells. Error bars indicate standard error of the mean. C, Northern blot analysis of RNA harvested 12 hours after infection from Vero cells infected with MERS-CoV isolates at a MOI of 5. D, Western blots of lysates harvested 12 hours after infection from Calu-3 2B4 cells infected with MERS-CoV isolates at a MOI of 5 that were probed with antisera to spike (S) and nucleocapsid (N) proteins. β-actin indicates loading control.

previous reports predicted 10 open reading frames in MERS SA 1 and MERS Eng 1 [9]. Northern blot analysis identified 8 subgenomic mRNAs after infection in both viruses (Figure 1C). The observed nested set of subgenomic mRNA expression is consistent with observations for other CoVs [2, 9]. The open reading frames encoded by each mRNA in these isolates are detailed in Supplementary Table 1.

Serologic Relationships Among MERS-CoV Strains

VRPs function as efficient expression and vaccine platforms for a variety of antigens [13, 21]. We generated VRPs expressing MERS SA 1 S and N proteins and then immunized mice. N protein–specific antiserum recognized a discrete 50-kDa band at the predicted molecular weight in lysates from Vero cells (Supplementary Figure 1A) and Calu-3 cells (Figure 1D) infected with VRP-N or with the 2 different MERS-CoV isolates. For the most part, similar expression patterns were evident between VRPs and viruses; however, the N protein of MERS Eng 1 had a slightly lower molecular weight, which was consistent with amino acid deletions at positions S391 and I392 (Supplementary Figure 2).

Mouse anti-S serum identified an approximately 180-kDa S protein in VRP-S– or MERS-CoV–infected Vero cells (Supplementary Figure 1A). The observed molecular weights were consistent with the sizes of the S proteins of other CoVs [2, 22]. We noted similar results in Calu-3 cells (Figure 1D), and interestingly, an increased amount of a higher-molecular-weight form of S protein (glycosylated dimer) was noted in MERS Eng 1 in both cell lines. Antiserum against MERS SA 1 S and N proteins also recognized MERS Eng 1 in ELISAs (data not shown), and N and S proteins recognized the MERS-CoV Jordan isolate (Supplementary Figure 1B).

Downloaded from http://jid.oxfordjournals.org/ by guest on August 15, 2016

Cross-neutralization Patterns Across Strains

Plaque reduction neutralization tests ($PRNT_{50}$) indicated complete neutralization of both MERS-CoV isolates ($PRNT_{50}$ titer, approximately 1:1400 for each; Figure 2A) and the MERS-CoV Jordan isolate (Supplementary Figure 1C) by VRP-S antiserum, whereas no neutralization was observed with N antiserum. Similar findings have been reported with SARS-CoV, as well as with other known human and animal CoVs [13, 23]. Interestingly, serum from aged mice vaccinated with VRP S showed a 6-fold reduction in $PRNT_{50}$ titers (approximately 1:200), indicating that immunosenescence attenuates vaccine responses to MERS-CoV antigens, as was noted with SARS-CoV vaccines [13, 17]. Using serum from NA 01 patient, ELISA demonstrated high reactivity of the patient's serum to N and S antigens of MERS SA 1 expressed from VRPs (Figure 2B and 2C). Titers of antibody against N protein in patient serum peaked 3–5 weeks after onset of illness (which occurred on 3 September 2012) and waned thereafter, but the antibodies were still detected up to 5 months after illness onset. Titers of antibody against S protein were consistent from 3 weeks to 5 weeks after illness onset, after which they remained detectable. Most importantly, patient serum collected on 16 November 2012 (which contained high titers against S protein) outcompeted the binding of mouse S antiserum to intact virus in a blocking assay (Figure 2D). These data suggest that different/overlapping epitopes are recognized by human and mouse antisera following virus or VRP-S infection.

Cross-reactive and Cross-neutralizing Antibody Responses Within and Across Alphacoronaviruses and Betacoronaviruses

MERS SA 1 and MERS Eng 1 are closely related to BtCoV HKU 5 and BtCoV HKU 4 (Figure 2E) [6, 9, 24]. To evaluate antigenic relationships with the subgroup 2c betacoronaviruses, VRPs expressing S and N proteins of BtCoV HKU 4.2 and BtCoV HKU 5.5 were inoculated into mice. Antisera against both HKU 4.2 and 5.5 N proteins recognized the N proteins of both MERS-CoV isolates, whereas MERS SA 1 N antisera also detected the VRP-expressed HKU 4.2 and 5.5 N proteins, as revealed by Western blot (Figure 3A and 3B). We obtained similar results using ELISA and immunofluorescence assays (data not shown). In contrast, there was little if any observable cross-reactivity observed between MERS SA 1 S antisera with the VRP-expressed S proteins of HKU 4.2 and HKU 5.5, whereas antisera to HKU 5.5 S protein but not HKU 4.2 S protein recognized the S proteins of both MERS-CoV isolates (Figure 3C and 3D). We also measured serologic relationships using ELISA, which captures cross-reactivity to conformational epitopes, and confirmed these antigenic relationships (Figure 6C). Consistent with results of serologic tests, antisera against HKU 4.2 and HKU 5.5 S proteins did not cross-neutralize the MERS-CoV isolates. These data indicate that the N protein but not the S glycoprotein are antigenically conserved within the subgroup 2c betacoronaviruses evaluated in this panel.

We then extended our analysis to the highly pathogenic SARS-CoV and related subgroup 2b betacoronaviruses. Polyclonal mouse sera to SARS-CoV or MERS SA 1 N or S proteins exhibited no cross-reactivity to the reciprocal strains (Figure 4A and 4B). We observed very low levels of cross-neutralization of MERS SA 1 by mouse antisera to SARS-CoV, using very high but not low concentrations of serum (Figure 4C), a finding that is consistent with a recent report [24]. Interestingly, ELISA results also showed very minimal cross-reactivity of the NA 01 patient sera obtained on 23 September 2012 to SARS-CoV S antigen (Figure 4D). Consistent with this observation, binding of mouse SARS-CoV S antiserum to SARS-CoV was not inhibited by NA01 patient sera in blocking assays (Figure 2D), indicating the absence of antibodies to SARS-CoV in the patient serum.

Consonant with these findings, no cross-reactivity was observed with antisera against the VRP-expressed N or S glycoproteins of BtCoV HKU 3 and 279 and the MERS-CoV isolates (Figure 5A–D). Furthermore, no cross-neutralization of MERS-CoV isolates by HKU 3 S antiserum was observed, although this serum has previously been shown to neutralize a synthetically resurrected HKU 3 variant encoding the SARS S glycoprotein receptor-binding domain [23]. Interestingly, we observed very low levels of cross-neutralization of SARS-CoV by BtCoV 279 S antiserum (Figure 4C).

To further elucidate the antigenic relationships between the S glycoproteins of alphacoronaviruses and the MERS-CoV isolates, we expressed and generated mouse antisera to BtCoV 1A and BtCoV HKU 2 (group 1b alphacoronaviruses), using the VRP platforms. Despite efficient recombinant S glycoprotein expression (Figure 7A and 7B), none of the recombinant S glycoproteins were recognized by MERS SA 1 S antisera. Antisera against BtCoV 1A and HKU 2 S glycoproteins had little if any cross-reactivity with and did not neutralize MERS-CoV (Figure 7A–C).

Antigenic Relationships Among the HCoVs

We next analyzed the antigenic relationships between VRP-derived mouse serum with the following representative HCoVs from each subgroup, using ELISA (Figure 6C): MERS Eng 1, from subgroup 2c; SARS-CoV, from subgroup 2b; HCoV-NL63, from subgroup 1b; and HCoV-OC43, from subgroup 2a. MERS Eng 1 was recognized by antisera targeting the N but not the S glycoprotein of viruses within the subgroup 2c betacoronaviruses. Likewise, SARS-CoV was only recognized by antisera to N but not S glycoproteins of viruses with the subgroup 2b betacoronaviruses. None of the antiserums screened reacted with HCoV-NL63 (subgroup 1b) or HCoV-OC43 (subgroup 2a). Although BtCoV HKU 2 is genetically close to HCoV-NL63, we did not observe any cross-reactivity within the S glycoprotein.

Serum from patients infected with SARS-CoV, HCoV-NL63, or HCoV-OC43 was screened against the N proteins from representative subgroup 2c and 2d betacoronaviruses. Consistent

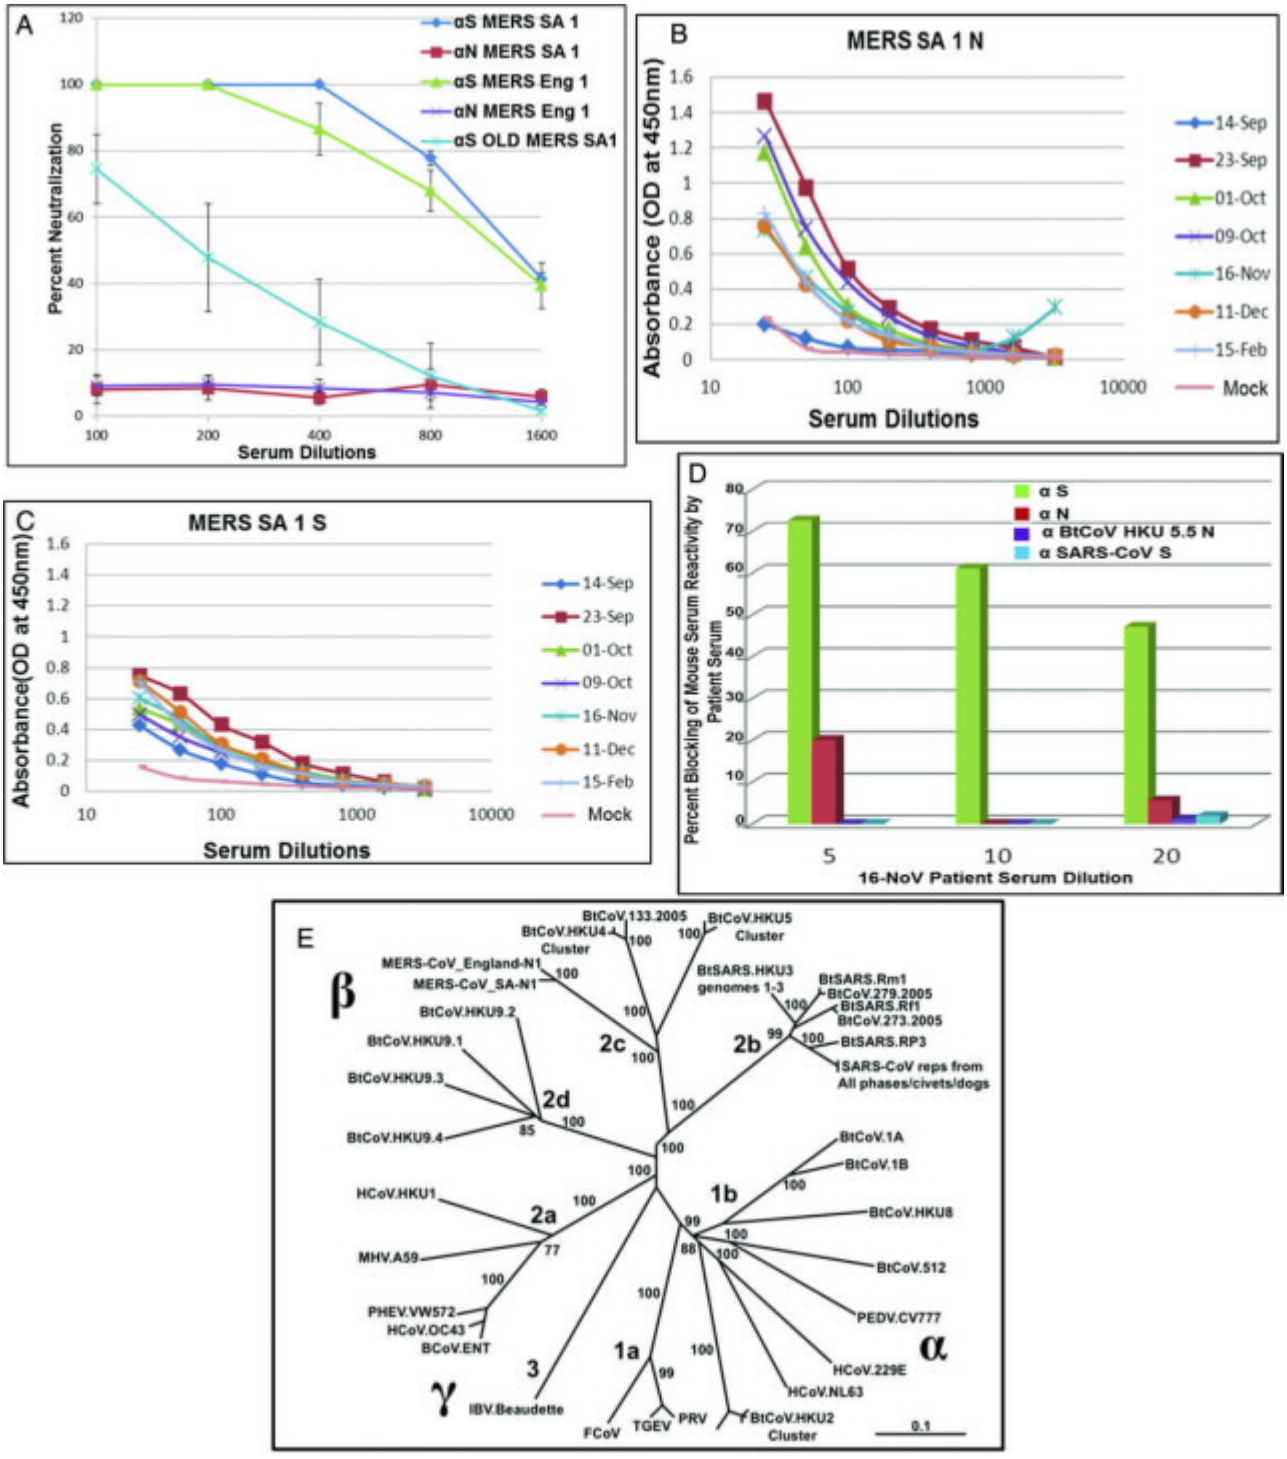

Figure 2. A, Serum from each of 4 young and aged mice immunized with Venezuelan equine encephalitis virus replicon particles (VRPs) expressing spike (S) or nucleocapsid (N) proteins were tested in a plaque reduction neutralization test to neutralize Middle East respiratory syndrome coronavirus (MERS-CoV) isolates. Error bars indicate standard error of the mean. B and C, NA01 patient sera collected at indicated dates after hospitalization were analyzed in an enzyme-linked immunosorbent assay using cell lysates expressing S and N antigens from VRPs. D, Indicated dilutions of NA01 patient sera collected on November 16, 2012 were screened with 1:800 dilutions of mouse antisera to S, N, bat CoV (BtCoV) HKU 5.5N, or SARS-CoV S in an in vitro competition assay for binding to MERS-CoV or SARS-CoV S. E. The full-length genome sequences of 51 CoVs were downloaded from GenBank or PATRIC, aligned with ClustalX, and phylogenetically compared by maximum likelihood estimation, using 100 bootstraps. The tree shows that CoVs are divided into 3 distinct phylogenetic groups, defined as α, β, and γ. This taxonomic nomenclature replaces the former group 1, 2, and 3 designations, respectively. Classical subgroup clusters are marked as 2a–2d for the β-CoVs and as 1a and 1b for the α-CoVs. The tree was generated using maximum likelihood estimation with the PhyML package. The scale bar represents nucleotide substitutions. Only nodes with bootstrap support of >70% are labeled. Accession numbers and definitions of various CoV strains will be provided upon request.

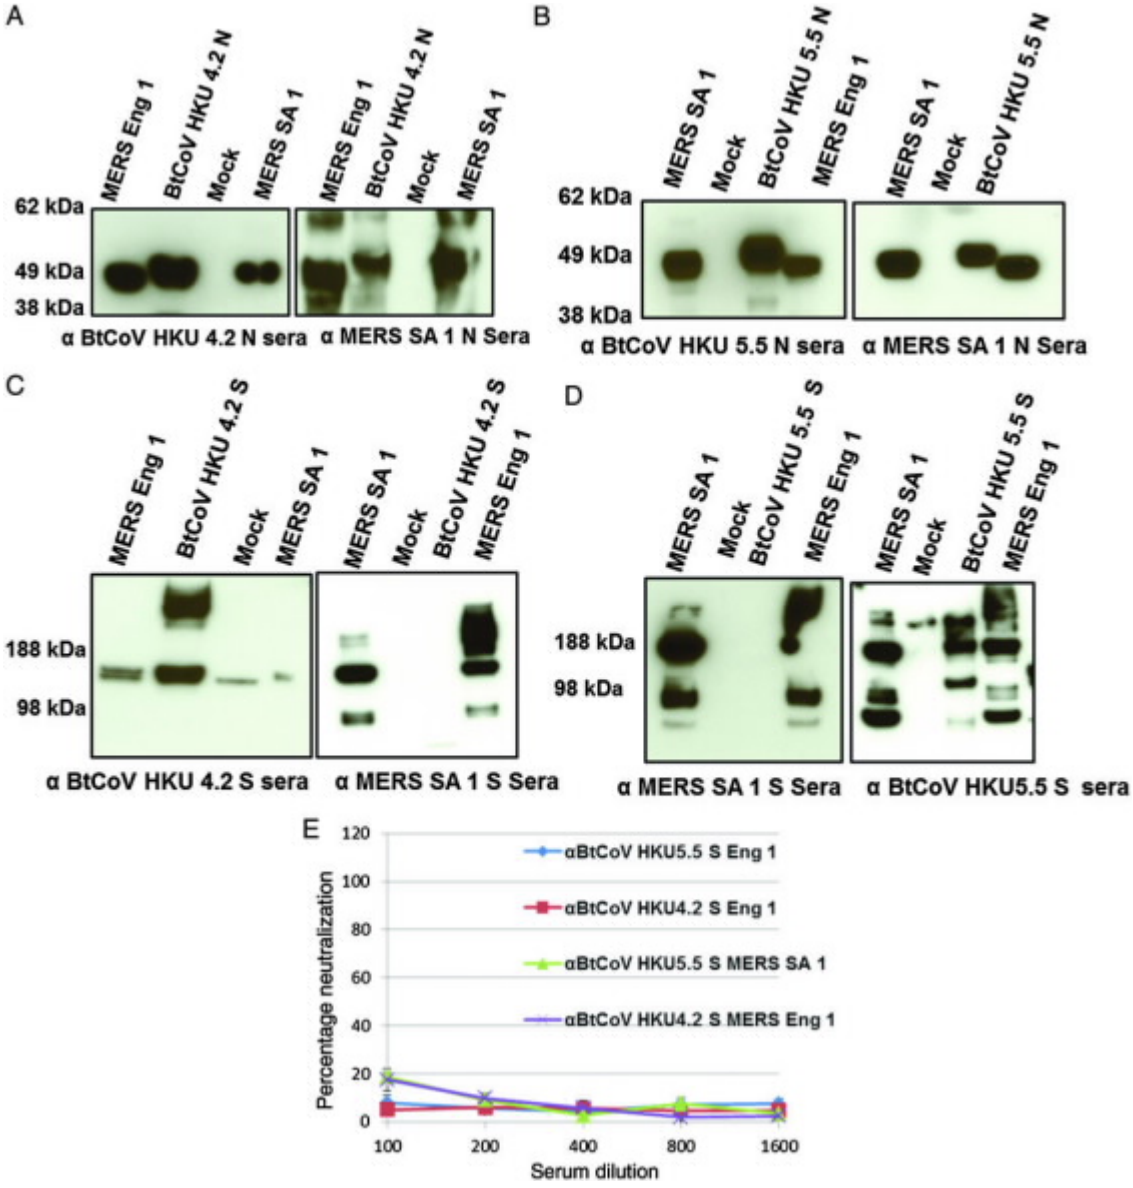

Figure 3. Western Blots showing cross-reactivity between nucleocapsid (N; A and B) and spike (S; C and D) proteins of Middle East respiratory syndrome coronavirus (MERS-CoV) isolates and N and S proteins of bat CoV (BtCoV) HKU 4.2 and HKU 5.5 (E). Plaque reduction neutralization tests showing absence of cross-neutralization of MERS-CoV isolates by antisera to BtCoV HKU 4.2 and 5.5 S proteins. Serum from groups of 4 mice immunized with Venezuelan equine encephalitis virus replicons was tested in this assay. Error bars indicate standard error of the mean. Note the cross-reactivity of antisera to BtCoV HKU 5.5 S protein to S proteins of MERS-CoV isolates (D) but the absence of cross-neutralization.

with our previous findings, human serum to SARS-CoV recognized BtCoV HKU 3N, BtCoV 279N, and SARS-CoV N (subgroup 2b) but did not recognize N proteins from other subgroups (Figure 6B). Similarly, there was no cross-reactivity of the human antisera from HCoV-NL63 (subgroup 1b) and HCoV-OC43 (subgroup 2a) infections with any of the viral antigens within the panel. Serum collected from the patient infected with MERS-CoV NA01 showed cross-reactive binding only to BtCoV HKU 5.5 N (subgroup 2c), and little if any cross-reactivity was noted outside the subgroup (Figure 6A), apart from very low, transient cross-detection of BtCoV 279N and from cross-reactivity to SARS-CoV S and N recombinant proteins on a single day (23 September 2012).

DISCUSSION

Emerging respiratory CoVs offer a considerable threat to the health of global populations and the economy. Platforms for generating well-characterized molecular reagents and recombinant viruses are needed to detect and control the emergence of

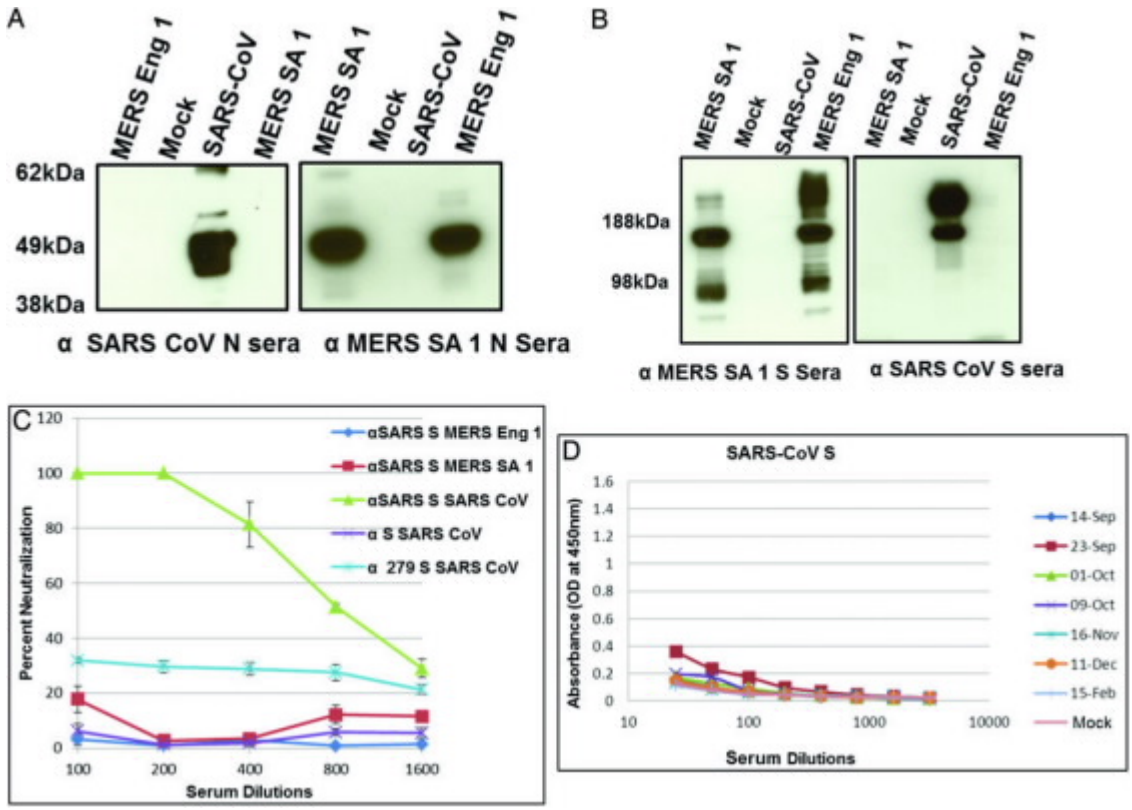

Figure 4. Western Blots showing no cross-reactivity between nucleocapsid (N; A) and spike (S; B) proteins of Middle East respiratory syndrome coronavirus (MERS-CoV) Vu isolates and SARS-CoV. C, Plaque reduction neutralization tests showing the absence of cross-neutralization of MERS-CoV Vu isolates by antisera to SARS-CoV S and of SARS-CoV by antisera to MERS-CoV/SA-1/2012 S protein and BtCoV 279 S protein. Note that antisera to SARS-CoV S neutralize SARS-CoV. Serum from groups of 4 mice immunized with Venezuelan equine encephalitis virus replicons was tested in this assay and error bars indicate standard error of the mean. D, Enzyme-linked immunosorbent assay results showing the absence of reactivity of NA01 patient sera to SARS-CoV S antigen.

new strains, especially early in an outbreak, before the development of type-specific serologic reagents and therapeutics. Here, we characterized the genome organization, subgenomic mRNA expression, and protein expression patterns of 2 isolates of MERS-CoV. Using alphavirus replicon particles and synthetic gene design, we assembled a panel of recombinant proteins from and donor antisera against phylogenetically distant alphacoronaviruses and betacoronaviruses to evaluate the antigenic relationships between strains and to inform vaccine design. MERS-CoV is a highly pathogenic respiratory CoV of humans, causing acute respiratory distress syndrome, with mortality rates approaching 44%. CoV primer sets were not successful in diagnosing the etiology of the Jordan outbreak in April 2012, demonstrating a critical need for paneled reagent sets of recombinant proteins and sera that allow for serologic evaluations of cases, contact cases, and asymptomatic infections, using Western blot or ELISA-based techniques [25]. This article is also the first report that describes the serologic characterization of MERS-CoV and CoV reagents. An advantage of the VRP platform is that it can also function as a vaccine vector, affording the rapid production of candidate vaccines against newly emerged strains [23]. Using SARS-CoV and MERS-CoV as models, we clearly demonstrated that S protein–based recombinant vaccines elicit robust neutralization responses in young and aged rodent models. Because VRP-S vectors against SARS-CoV protected young and aged animals [17], we have developed a recombinant S vectored vaccine that could likely prove successful in preventing heterologous MERS-CoV infection in aged individuals, but this remains to be tested.

MERS Eng 1 replicated to lower titers than SA1 in Calu-3 cells. As the 2 viruses have different passage histories in vitro, tissue culture adaptive mutations may account for these differences, as reported with many SARS-CoV isolates [26]. Alternatively, 29 amino acid differences have been described, most of which reside in the replicase polyprotein (Supplementary Figure 2) and may affect replication efficiency. In addition, the S glycoprotein of MERS Eng 1 differs from that of MERS SA 1 by 2 amino acids, L506F and Q1020H (Supplementary Figure 2), which may account for the increased amount of the higher-molecular-weight form of S protein in MERS Eng 1

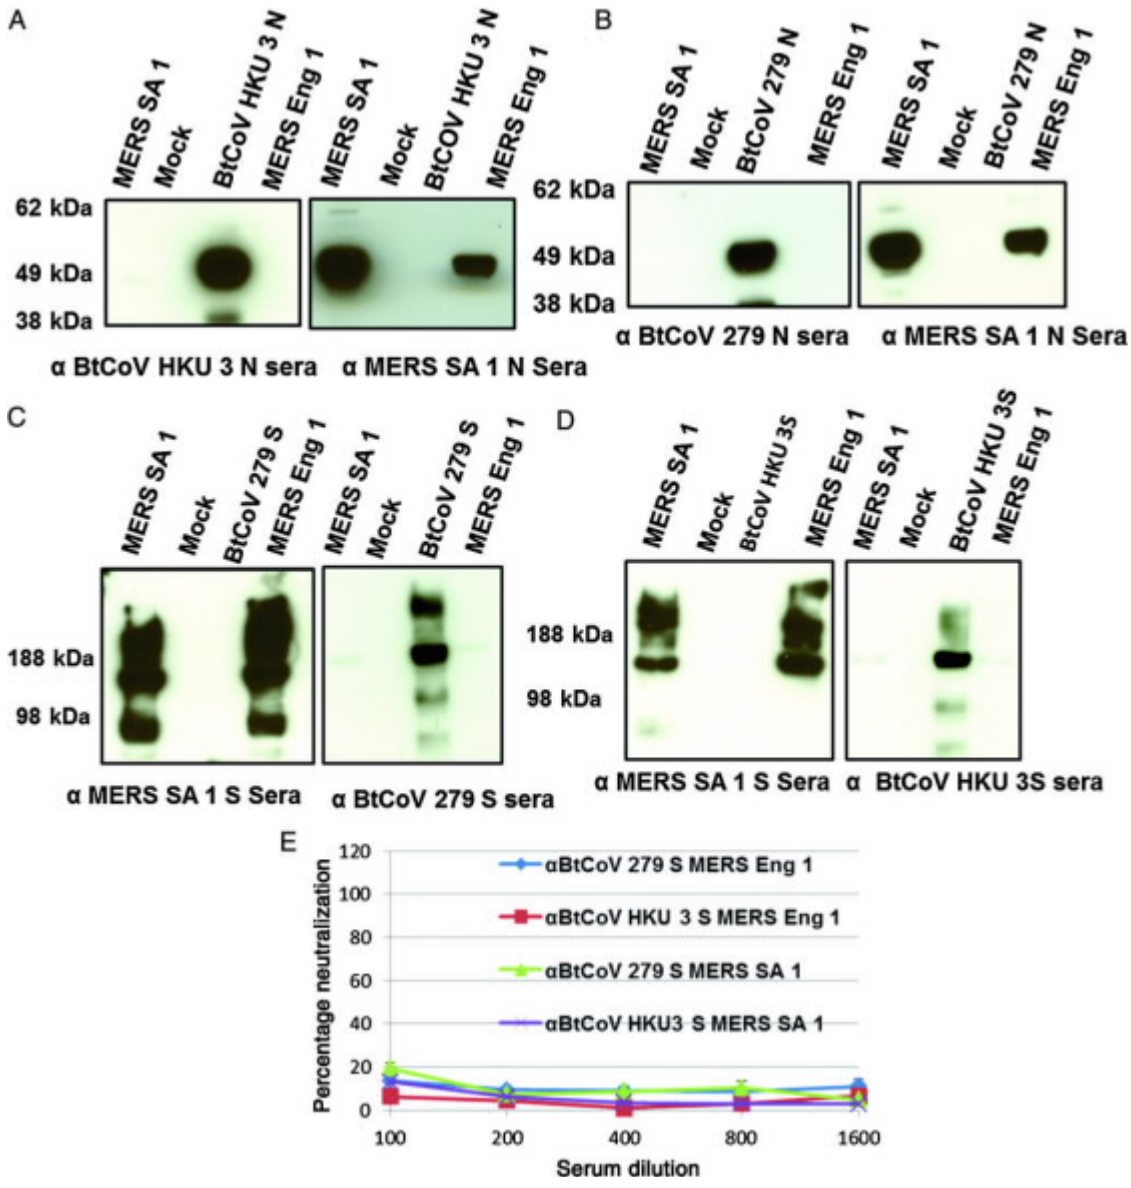

Figure 5. Western blots showing cross-reactivity between nucleocapsid (N; A and B) and spike (S; C and D) proteins of Middle East respiratory syndrome coronavirus (MERS-CoV) isolates and N and S proteins of BtCoV 279 and HKU3. E, Plaque reduction neutralization tests showing absence of cross-neutralization of MERS-CoV isolates by antisera to BtCoV 279 S and HKU3 S proteins. Serum from groups of 4 mice immunized with Venezuelan equine encephalitis virus replicons was tested in this assay. Error bars indicate standard error of the mean.

(Figure 1D and Supplementary Figure 1A). Recent studies indicate that TMPRSS2 likely plays important roles in viral entry by enhancing fusogenic potential through proteolytic processing of MERS-CoV S glycoprotein [22]. In addition, we identified a unique mutation, T1015N, in the MERS SA 1 isolate but not in the MERS Eng 1 isolate and showed that this mutation is responsible for increased in vitro fitness and for plaque morphology [20]. It is possible that the presence or absence of 1 or more of the S glycoprotein mutations in MERS Eng 1 may result in the slower growth phenotype in Calu3 cells.

Alphavirus VRPs have considerable potential as recombinant virus vaccine platforms in the absence of preexisting immunity [27–30]. We demonstrate efficient expression of several CoV S and N structural proteins both in vitro and in vivo, resulting in robust serologic responses in vaccinated mice. Antiserum to VRP-S glycoprotein but not to VRP-N protein neutralized both isolates of MERS-CoV. Furthermore, we and others have demonstrated that vaccine-induced immunopathology observed after challenge is minimized in VRP-S protein–based vaccines, partly because of the T-helper type 1–biased immune response

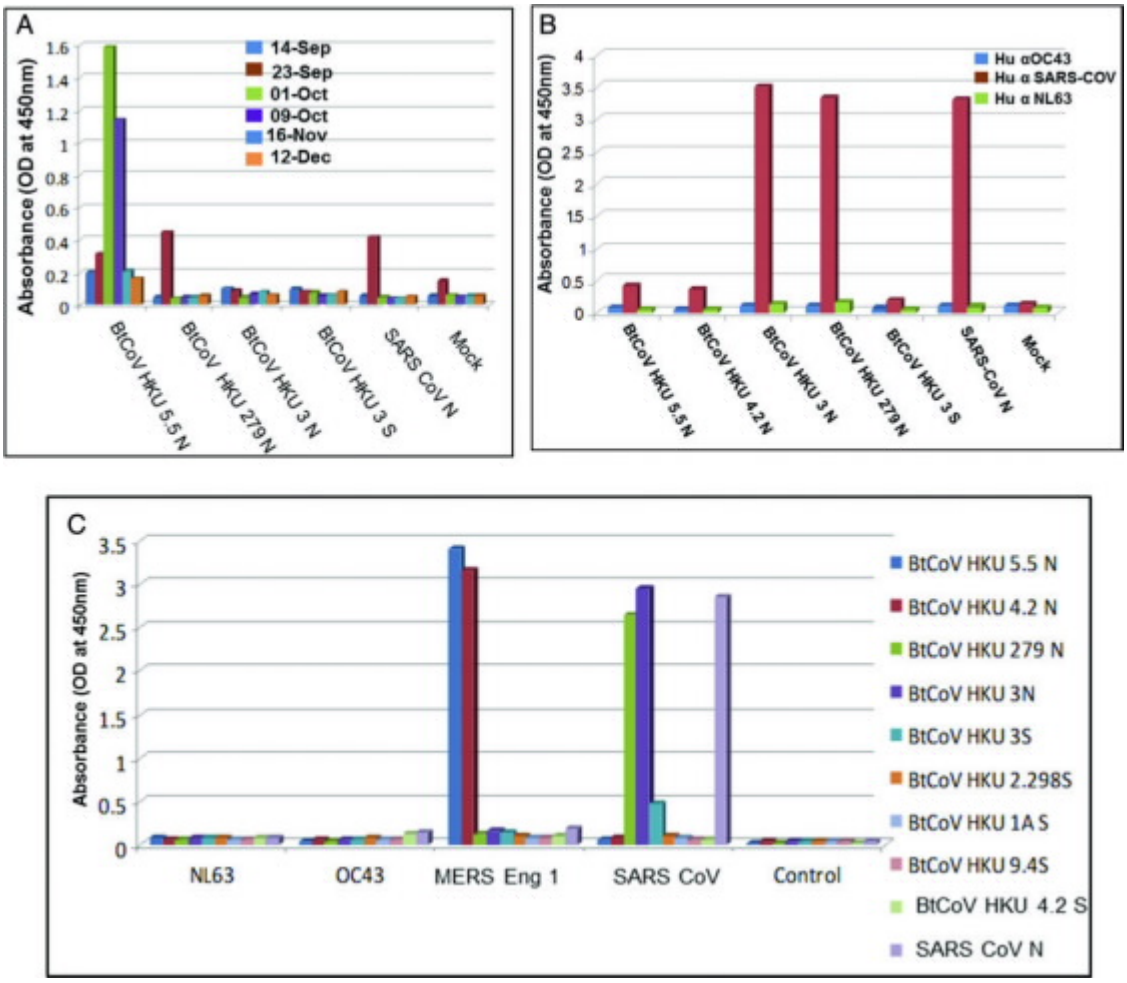

Figure 6. A, NA01 patient serum specimens collected at indicated dates were analyzed in an enzyme-linked immunosorbent assay (ELISA), using cell lysates expressing indicated antigens. B, Mouse antisera to the indicated antigens were screened in an ELISA. C, Human antisera to indicated CoVs were screened in an ELISA with cell lysates expressing indicated antigens.

and high neutralization titers elicited by VRP vectors [13, 31]. Importantly, vaccination of aged mice demonstrated that immunosenescence contributes to a reduction in the magnitude of the antibody response to MERS-CoV S glycoprotein, an important point to be considered in candidate vaccine designs. To date, wild-type and VRP 3526–coated VRP-S vaccines represent one of the few vaccine platforms that functioned well in aged animals, in addition to recombinant subunit–based vaccines and poxvirus-vectored vaccines [21, 32–34]. In SARS-CoV pathogenesis in aged animals, increased age-related susceptibility is linked to increased prostaglandin D2 expression; it remains uncertain whether increased prostaglandin D2 levels have contributed to reduced vaccine performance, as well [35]. Because we have not observed MERS-CoV replication in immunocompetent and immunocompromised mice, these vectors must be tested directly in primates [36]. The safety of the VRP platform has been demonstrated in high-risk human populations and immunosenescent nonhuman primates [27, 28, 37, 38], and we believe that these vectors will be efficacious in healthcare workers and target populations infected with MERS-CoV.

Our results indicate the presence of strongly cross-reactive epitopes in the N protein within a particular subgroup but not between subgroups. Under identical conditions, little cross-reactivity or conservation of cross-neutralizing epitopes was observed between S proteins within and across subgroups. Similar studies showing strong conservation of cross-reactive epitopes between N proteins, but to a lesser extent between S proteins of the subgroup 2a CoVs, has been reported [39, 40]. Importantly, the pattern of serological and antigenic relationship observed using the mouse antisera was recapitulated using the human antiserum to 4 different CoVs. Neutralization assays demonstrated little if any conservation of cross-neutralizing epitopes between S glycoproteins of CoVs within and across subgroups. In particular, the absence of cross-neutralization of MERS-CoV

Downloaded from http://jid.oxfordjournals.org/ by guest on August 15, 2016

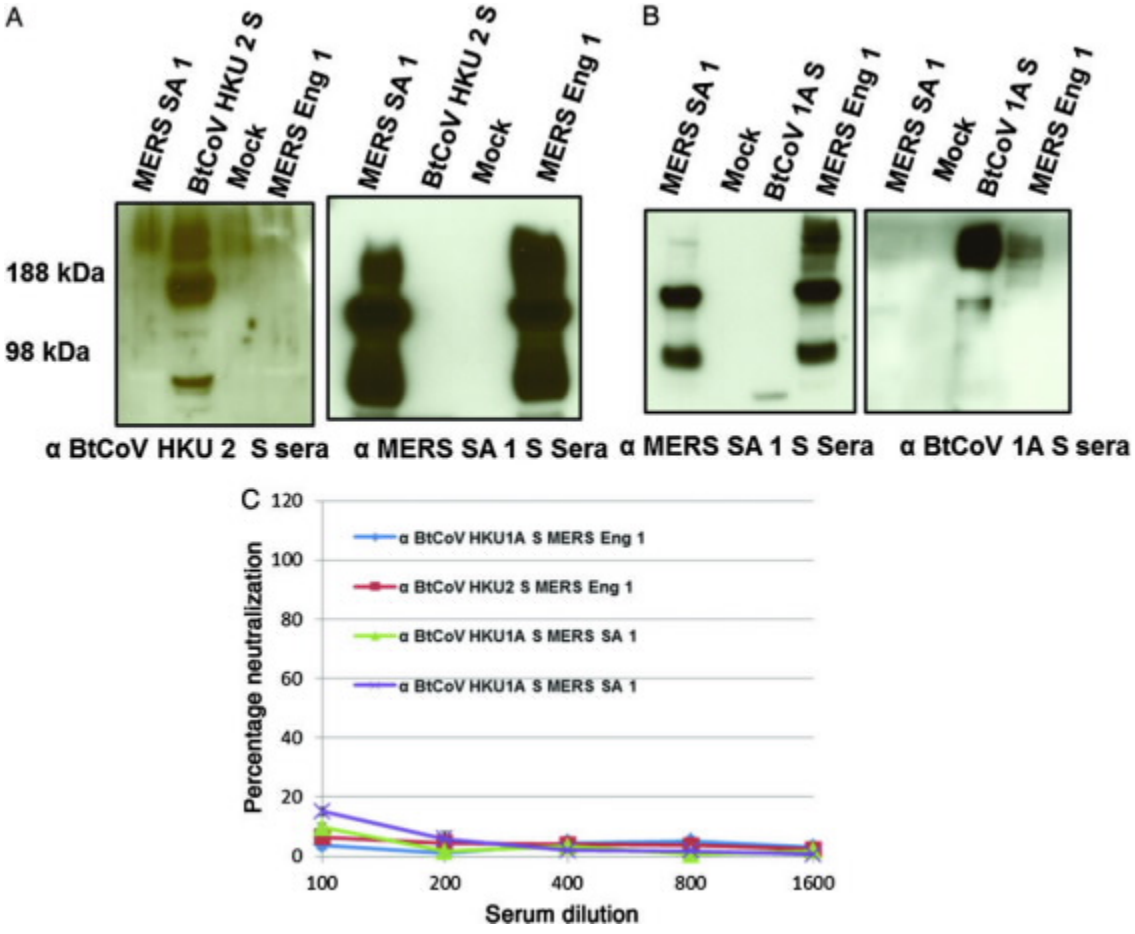

Figure 7. Western blots showing the cross-reactivity of spike (S) proteins of bat coronavirus (BtCoV) HKU2.298 (A) and BtCoV 1A (B) with Middle East respiratory syndrome coronavirus (MERS-CoV) HCoV isolates C, Plaque reduction neutralization tests showing the absence of cross-neutralization of MERS-CoV HCoV isolates by antisera. Serum from groups of 4 mice immunized with Venezuelan equine encephalitis virus replicons was tested in this assay. Error bars indicate standard error of the mean.

isolates by antiserum to HKU 4 or HKU 5 S glycoprotein and of SARS-CoV by antiserum to the HKU 3 or BtCoV 279 S glycoprotein suggests very limited conservation or, possibly, the deliberate masking of conserved cross-neutralizing sites within a subgroup. Although speculative, these cross-neutralization relationships suggest that at least 3 antigenically distinct CoVs could emerge from zoonotic viruses circulating within subgroup 1a/b, 2b, and 2c reservoirs and then simultaneously circulate in humans. These findings are evidence that vaccine design for any new emerging CoV should either focus on the development of chimeric S glycoproteins containing neutralizing epitopes from multiple strains within or across subgroups or on the development of new paradigms in structure-guided antigen design that improve the presentation of broadly neutralizing epitopes. Regions of S glycoprotein are interchangeable between CoVs within and across subgroups, rendering viable recombinant viruses [23]. Inclusion of N protein in such chimeric vaccines may broaden the protective response, although this remains to be tested using lethal challenge viruses. Such a vaccine might provide robust protection against several homologous and heterologous viruses within or across genoclusters.

After the SARS-CoV epidemic and in stark contrast to the situation with emerging influenza viruses such as influenza A (H7N9), the research and biomedical communities failed to develop broadly applicable biopreparedness platforms for rapid response against future emerging CoV threats. Because CoVs have demonstrated an accelerating pattern of zoonotic emergence since the 1980s [25, 41], our data indicate that an appropriate diagnostic platform should include a large panel of phylogenetically distinct CoV S and N structural proteins, which must be validated using larger panels of antisera against other HCoVs in the general population. While molecular-based platforms like polymerase chain reaction and deep sequencing offer clear advantages in early detection of active infections, public health response platforms would be

Downloaded from http://jid.oxfordjournals.org/ by guest on August 15, 2016

strengthened by the availability of recombinant proteins and subgroup- and type-specific antisera that can track subclinical infections, determine the prevalence of infection in populations, and identify hospital-acquired infections. A recent report identified subclinical cases of MERS-CoV infection through reverse-transcription polymerase chain reaction, and the screen using the panel of recombinant proteins described here would have provided more-specific information about the presence of other CoVs in these cases [42]. The VRP platform we describe not only yields high-level expression of key recombinant proteins across the alphacoronaviruses and betacoronaviruses tested, also provides the first candidate vaccine vectors with the potential to augment the T-helper type 1–based immune responses to MERS-CoV infection and to reduce associated immune pathology. The VRP 3526-associated approach is also applicable to improving the public health response to and the control of future outbreaks of other highly pathogenic emerging infectious diseases due to CoV in human populations.

Supplementary Data

Supplementary materials are available at The Journal of Infectious Diseases online (http://jid.oxfordjournals.org/). Supplementary materials consist of data provided by the author that are published to benefit the reader. The posted materials are not copyedited. The contents of all supplementary data are the sole responsibility of the authors. Questions or messages regarding errors should be addressed to the author.

Notes

Acknowledgments. We thank the University of North Carolina–Chapel Hill genome analysis facility and Dr Mark Heise at Carolina Vaccine Institute, for providing sequencing services and sharing laboratory space for animal experiments, respectively; Dr Michael Cooper at the Armed Forces Health Surveillance Center, Dr Emad Mohareb at Navy Medical Research Unit 3, and Dr Kanta Subbarao at the National Institute of Allergy and Infectious Diseases, for providing us with MERS-CoV-Hu/Jordan-N3/2012.

Financial support. This work was supported by the National Institutes of Allergy and Infectious Diseases, National Institute of Health (grants AI085524, AI057157, and U19 AI107810) and Public Health of England (formerly, Health Protection Agency, England).

Potential conflicts of interest. All authors: No reported conflicts.

All authors have submitted the ICMJE Form for Disclosure of Potential Conflicts of Interest. Conflicts that the editors consider relevant to the content of the manuscript have been disclosed.

PART I: OVERVIEW INFORMATION

- **Federal Agency Name** – Defense Advanced Research Projects Agency (DARPA), Biological Technologies Office
- **Funding Opportunity Title –** Pandemic Prevention Platform (P3)
- **Announcement Type –** Initial Announcement
- **Funding Opportunity Number –** HR001117S0019
- **Catalog of Federal Domestic Assistance Numbers (CFDA) – 12.910 Research and Technology Development**
- **Dates**
    - Posting Date: February 6, 2017
    - Proposal Abstract Due Date and Time: March 13, 2017 by 12:00 pm ET
    - Proposal Due Date and Time: May 1, 2017 by 5:00 pm ET
    - Any other relevant date(s): Washington D.C. Proposer's Day, February 22, 2017. San Diego Proposer's Day, March 2, 2017.

- **Concise description of the funding opportunity:** The P3 program will create an integrated platform that delivers pandemic prevention medical countermeasures within 60 days after identification of the pathogen.
- **Anticipated individual awards** - Multiple awards are anticipated.
- **Types of instruments that may be awarded** - Procurement contract, cooperative agreement, or other transaction.
- **Agency contact**
    - Points of Contact
      The BAA Coordinator for this effort may be reached at:
      P3@darpa.mil.
      DARPA/BTO

      Arlington, VA 22203-2114

PART II: FULL TEXT OF ANNOUNCEMENT

1. Funding Opportunity Description

This publication constitutes a Broad Agency Announcement (BAA) as contemplated in Federal Acquisition Regulation (FAR) 6.102(d)(2) and 35.016 and 2 CFR § 200.203. Any resultant award negotiations will follow all pertinent law and regulation, and any negotiations and/or awards for procurement contracts will use procedures under FAR 15.4, Contract Pricing, as specified in the BAA.

DARPA is soliciting innovative research proposals to develop an end-to-end platform capability for preventing a pandemic threat in <60 days. Recent advances in medical countermeasures have formed a strong foundation, enabling the creation of a true end-to-end pandemic prevention platform. However, experience gained from conventional responses to emerging infectious diseases (MERS, SARS, dengue, chikungunya, Ebola) has demonstrated that significant bottlenecks hinder the rapid response to an emerging infectious threat[1]. Current challenges include the ability to rapidly produce virus needed to test and evaluate therapies, to obtain high potency antibodies within the first weeks of an outbreak, or to scale delivery methods into humans to produce protective levels inside the patient.

1.1. PROGRAM OVERVIEW

Eliminating pandemic outbreaks and mitigating the impact of a potential high threat biological agent release are national security priorities. The U.S. military supports U.S. Government responses to public health emergencies such as Ebola, which can cause regional destabilization and spread through global travel. Warfighters must also operate in regions where diseases like chikungunya and dengue are endemic, and even seemingly mild challenges like seasonal influenza affect force readiness. In addition to these naturally occurring threats, terrorists and other potential adversaries have a growing palette of biological tools to engineer new biological threats. The threat of infectious agents on U.S. and global national security can be mitigated if the Department of Defense (DoD) has the capability to rapidly deploy and impart near-immediate immunity to military personnel and civilian populations for known and newly emerging pathogens.

Existing capabilities to respond to an outbreak and develop vaccines and therapeutics often take years or even decades to achieve results. The R&D process for identifying the protective antigens can take months for a simple variant of a known infectious agent, such as seasonal influenza, and years to decades for a newly discovered agent. In many cases, even decades of research have not led to the development of licensed vaccines for known infections. Further, manufacture of traditional vaccine products typically takes an additional six to nine months. Finally, even when effective vaccines are readily available, immunity in humans can take weeks

[1] Letter Report on Action Needed to Protect against Biological Attack; President's Council of Advisors on Science and Technology – Executive Office of the President. November 2016; https://www.whitehouse.gov/sites/default/files/microsites/ostp/PCAST/pcast_biodefense_letter_report_final.pdf

or months to establish. Recent examples of public health emergencies have demonstrated a national and global inability to develop effective preventive or therapeutic solutions in a relevant timescale when an infectious threat emerges. Reviews of recent outbreaks have repeatedly highlighted this capability gap; the significant delay in deployment of solutions during the West Africa Ebola outbreak is a recent example.

The goal of the Pandemic Prevention Platform (P3) program is to develop an integrated capability to deliver pandemic prevention countermeasures to humans in <60 days. The P3 program aims to revolutionize outbreak response capabilities to allow rapid discovery, characterization, production, and testing of efficacious medical countermeasures. **The P3 program aims to innovate in the following areas:**

1. Generation of virus stock (including viral unknowns).
2. Rapid evolution of antibody candidates.
3. Gene-encoded antibody delivery methods.

Foundational DARPA research investments in gene-encoded antibodies have demonstrated the feasibility and impact of this therapy for the rapid protection of a large population against emerging infectious disease threats. Gene-encoded antibodies have significant advantages over antibodies produced in mammalian cell lines because of their shortened timeline to manufacture and prolonged effect. The increased stability of gene-encoded products further strengthens readiness through improved robustness that enables stockpiling for extended periods of time and distribution in remote areas without the need for cold chain. Further, cutting-edge work in immune engineering can enable construction of critical human immune system components external to the body, thereby enabling higher throughput evolution and screening of antibody candidates. Collectively, these advances and others in the fields of molecular biology, immunology, and drug delivery strengthen the genesis of a functional pandemic prevention platform. DARPA investments that accelerate the early phases of medical countermeasure development will enable the US Government and DoD to effectively respond to public health emergencies due to infectious threats, thereby decreasing the likelihood that an outbreak becomes a pandemic.

Performer teams are required to functionally integrate the key innovations above, along with established technologies for finding antibodies and manufacturing medical countermeasures, into an end-to-end capability platform such that a product is available for human use in <60 days from the time of pathogen identification. The integrated platform must be adaptable to any virus, including unidentified agents. By functionally integrating innovative technologies, the response window will be reduced to an epidemiologically relevant timescale of <60 days. The proposed approach must be capable of delivering a prophylactic countermeasure to **prevent or halt** the spread of an infectious outbreak.

Due to significant advances in identifying antibody products for use in gene-encoded medical countermeasure, it is anticipated that the proposed approach will utilize an antibody format (bi- or multi-specific, single chain or full length, etc.). Alternatives to antibody approaches using biologics will be considered and may include, but are not limited to, proteins/peptides (natural

or non-natural) and oligonucleotides. While these approaches are appropriate, the time and performance metrics defined in Table 1 must be met, and additional metrics should be proposed to meet the unique features of the alternative technologies.

1.2. PROGRAM STRUCTURE

The P3 program will be a four-year effort aimed at developing an integrated platform that produces an effective medical countermeasure, ready for administration to patients, in <60 days after pathogen identification.

The platform will incorporate the following five objectives:

1. Grow virus.
2. Identify an antibody or biologic product that targets the virus for use in medical countermeasure.
3. Evolve the antibody or biologic product for increased potency.
4. Clinical grade product manufacturing.
5. Deliver the product to patients to induce protection in < 3 days following administration.

Previous DARPA investments through the Autonomous Diagnostics to Enable Prevention and Therapeutics (ADEPT) program have resulted in significant scientific and technical progress towards the ability to identify an antibody (Objective 2) and manufacturing a genetic construct (Objective 4) for the in-person production of an antibody. The three remaining objectives (Objectives 1, 3, and 5) will require significant technical innovation to make them suitable for a pandemic platform capable of a response in <60 days. These objectives represent the technical areas discussed in Section 1.3. Performer teams must propose an approach that addresses all three technical areas (TAs) while also integrating Objectives 2 and 4 into a functional response platform (antibody/biologic identification, development, and manufacturing). At the end of the four-year effort, the performer teams must maintain the platform for use in future pandemic response.

The proposed integrated platform must represent a prophylactic approach that will prevent or halt the spread of an outbreak as opposed to an approach that will primarily treat infected individuals, although countermeasures with both prophylactic and therapeutic functions are appropriate. The intent of the P3 program is not to fund significant investment in research into novel manufacturing technologies; therefore, proposers may want to consider pre-existing manufacturing technology. The proposing teams should have manufacturing capacity, or include subcontractors or contract manufacturing organizations capable of producing clinical (Good Manufacturing Practices) grade material for both first-in-human studies as well as the potential for scaled-up manufacture. To achieve all of the goals of the integrated platform, it is anticipated that proposer teams will consist of several members led by a prime contractor integrating team. The integrating prime contractor may choose to propose several solutions or teams for the initial phase of each technical area as a risk mitigation strategy. While this is

allowable within this program, the prime contractor must ensure that the effort still results in a functionally integrated platform.

The program timeline (Figure 1) is outlined below:

Platform development (months 1-30)

Platform development will focus on the technical and innovative development of each of the TAs. The performers will be required to meet specific metrics associated with each TA as outlined below in Section 1.3. Fulfillment of the metrics for each TA can occur independently of each other, but the performers will be required to test the entire end-to-end platform in capability demonstrations beginning in month 12.

Capability demonstrations on known pathogen and platform integration (months 12-40; overlapping with platform development)

As the P3 program requires functional platform integration, capability demonstrations (demos) will focus on demonstrating full end-to-end functionality and complete integration of the entire platform. To ensure the ability to produce a quality product with a regulatory path using this platform**, a clinical phase I safety trial is required during the course of the program.** The capability demonstration portion of the program will overlap with platform development to address the end-to-end capability throughout the TA innovation development phase. As part of the demos, the performers must demonstrate the end-to-end ability to complete the five objectives[2] and the ability to complete a Phase I clinical safety trial. Only one such trial will be funded per performer team, and while capability demonstrations are required before month 24 (Figure 1), clinical trial completion is not required until the end of the program.

A series of capability demonstrations of escalating difficulty will test platform functionality at months 12, 24, and 36 (Figure 1). Two of these capability demonstrations will utilize performer-defined pathogens. It is strongly encouraged that performer-selected pathogens in capability demonstrations 1 or 2 are of commercial interest to the performer group for use in the Phase I clinical safety trial. All proposals are required to make a compelling case for both pandemic potential and commercial interest of each pathogen selected for the capability demonstrations.

The first capability demonstration will occur at the end of month 12 of the program and will give performer groups the opportunity to test and validate an 'at-the-ready' pandemic prevention platform by integrating innovation areas (TA1-3) with existing technologies. Proposers should attempt to deliver a countermeasure tested in animals within 60 days. However, additional time (up to 90 days) will be allotted for the first demonstration to evaluate the progress of proposed approaches and gain an understanding of successes and bottlenecks.

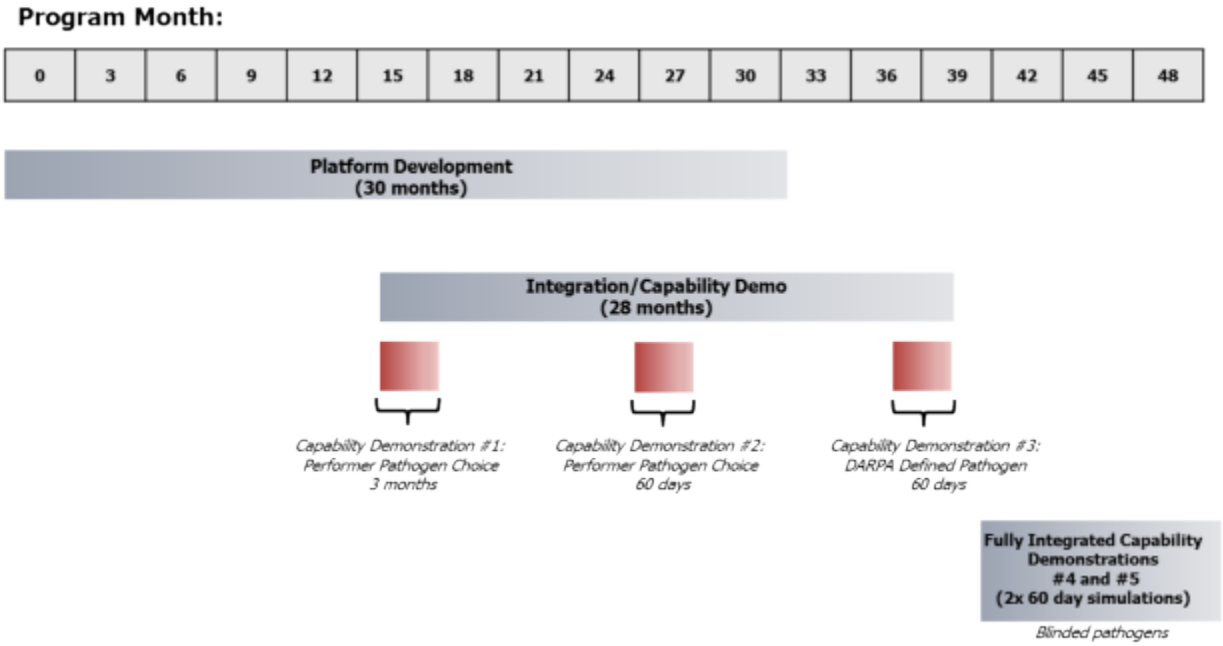
[2] 1. Grow virus
2. Identify an antibody or biologic product that targets the virus for use in medical countermeasure
3. Evolve the antibody or biologic product for increased potency
4. Clinical grade product manufacturing
5. Deliver the product to patients to induce protection in <3 days following administration

At approximately 24 months, performers will have 60 days to conduct a second capability demonstration with a second pathogen. Performer teams may elect to conduct the first two capability demonstrations using the same pathogen, or may choose two different pathogens. Finally, at 36 months, performers will conduct a third 60-day capability demonstration with a DARPA selected pathogen. The specific biosafety concerns for the third capability demonstration will be shared with performer teams at least 2 months in advance of test start date. Thus, performers will have at least a 60-day notice of the biosafety concerns of the pathogen to be tested, and 60 days to complete the capability demonstration. At least one of the capability demonstrations must demonstrate proof-of-concept GMP manufacturing capabilities of the product. The production of 20,000 doses will not be required during the course of the program but proposers must demonstrate the ability to scale proof-of-concept manufacture up to 20,000 doses during the platform development phase of the program (months 1-30).

Final capability demonstrations on blinded pathogen (months 40-48)

The final demonstrations of the P3 program will focus on demonstrating full end-to-end platform integration with blinded pathogens to simulate "real-world" events. There will be two capability demonstrations as part of the final demos. These capability demonstrations will each encompass 60 days and intend to demonstrate the end-to-end capability on blinded targets as defined by DARPA. Performers will be made aware of any biosafety concerns surrounding the pathogen greater than 12 months prior to the initiation of the demonstrations.

Figure 1. Program Timeline



1.3. TECHNICAL AREAS

Based on achievements and lessons learned in previous countermeasure development efforts (DARPA and across the scientific community), three Technical Areas (TA) have been identified in which specific investments may lead to breakthroughs for countermeasure development. These Technical Areas are:

1. On-demand platform to grow virus.
2. System to evolve antibodies: rapid creation of highly potent medical countermeasures.
3. Delivery of medical countermeasure(s): reproducible effects which lead to protective levels of product.

Functional integration of these technical areas along with antibody discovery and manufacturing is essential to achieving a medical countermeasure ready for first-in-human studies in <60 days.

TA1: On-demand platform to grow virus

A critical capability gap for rapidly addressing an emerging pathogen is growing sufficient quantities of that virus for initial testing. Specifically, a certain amount of virus is required (1) as 'bait' to pull antibody from complex mixture (serum) for discovery; (2) for testing the utility of gene-encoded antibodies in animal models; and (3) for running efficacy tests on selected antibodies. The effort to grow meaningful quantities of virus for testing is further complicated for previously unknown emerging viral threats; therefore, the growth platform developed in TA1 must be immediately adaptable, including for unidentified agents. Performers may opt to pursue various approaches including, but not limited to:

- Innovative ways to express virus from cell platforms through high-yield transfection strategies of rapidly generated recombinant genetic systems
- Engineering currently available cell types to grow virus
- Automating and optimizing the process of identifying a viral culture system, which is currently a manual and laborious process

Table 1 outlines metrics for this technical area.

Proposers must demonstrate the ability to achieve the goals and metrics defined in Table 1 (TA1) with five viruses. **The viruses must include at least one RNA virus, one DNA virus, and represent both (+)-sense and (-)-sense single stranded viral genomes.**

Proposers must provide the following in the proposal:

- The choice of study pathogens, demonstrating relevance to National Security and DoD force health protection
- The proposed methods for validation and completion for TA1, describing an adaptable platform able to grow a variety of different pathogens including unknown isolates
- The proposed transition plan describing the product/data pipeline from initial isolate input to final product deliverable to TA2/3 innovation teams

- The ability of the TA1 innovation, as part of the end-to-end platform, to address unknown pathogens

TA2: System to evolve antibodies

Current response capabilities are limited by their inability to rapidly identify highly potent and protective antibodies. Existing strategies have relied on obtaining antibodies from recently recovered patients. However, the body utilizes a broad polyclonal response targeting a number of distinct epitopes, sometimes of moderate potency, to eliminate the pathogen within days to weeks of initial infection. Conversely, antibody therapies are typically comprised of either a monoclonal or a minimal polyclonal mixture, thereby necessitating a stringent requirement for high potency. Recent experiences with Ebola have shown that months to years of antibody maturation inside the human body may be required to develop high-potency antibodies that are viable targets for therapy development. Innovation in TA2 is required to develop a platform technology for the rapid development of highly potent antibodies. It is anticipated that an *in vitro* antibody maturation platform may be required to achieve this goal; however, any approach meeting the time and quality metrics in Table 1 are encouraged. *In vitro* systems have the advantage of not being limited by the natural 'brakes' in the human body which slow the maturation process in order to prevent formation of autoimmunity or prolonged immune mediated pathology. The antibody evolution strategies should couple seamlessly with antibody discovery platforms using new technology or currently existing discovery platforms.

Potential technical innovations in the development of an *in vitro* antibody maturation platform include, but are not limited to:

- *In vitro* artificial immune system
- *In vitro* affinity maturation coupled to discovery technologies
- Computational approaches assisting in affinity maturation

Performers must demonstrate the ability to achieve the goals and metrics defined in TA2 (Table 1) by identifying and evolving highly potent antibodies against five viruses, representing at least one RNA virus, one DNA virus, and represent both (+)-sense and (-)-sense single stranded viral genomes. The antibody candidates generated can target some or all of the viruses selected in TA1.

Note: While the BAA focuses on antibody technology for TA2, proposals incorporating the use of other approaches will be considered as long as the program metrics defined in Table 1 are met.

Proposers must provide the following in the proposal:

- The choice of study pathogens, demonstrating relevance to National Security and DoD force health protection
- The proposed methods for validation and completion of TA2, demonstrating the ability to increase antibody/therapy potency greater than 100-fold during ex vivo maturation

- The detailed proposed method to define antibody/therapy potency and quantitative metrics of how potency will be measured
- The ability of the TA2 innovation, as part of the end-to-end platform, to address unknown pathogens
- The ability to integrate established technologies with key innovation areas (*e.g.*, antibody discovery)
- The proposed transition plan describing the product/data pipeline from initial antibody input to final product deliverable to TA3 innovation team

TA3: Deliver medical countermeasure(s)

Consistent countermeasure delivery has been a critical technical challenge for current gene-encoded antibody delivery platforms. The key bottleneck is delivering DNA or RNA such that it crosses the cell membrane for translation into a functional protein. The required metrics, defined in Table 1, must be achieved with a minimum of **five different genetic constructs**. Assessing differences in genetic backbone are appropriate, but they cannot be applied towards the five different genetic constructs metric (*e.g.*, different plasmids encoding the same antibody will be considered one genetic construct). Proposers must demonstrate the platform utility of their genetic constructs, with the ultimate goal of a genetic expression construct (backbone) that results in highly efficient expression in large animals or humans, regardless of the inserted gene of interest and without risking genome integration. Delivery of each of the five constructs must result in serum expression of at least 10 µg/mL in large animals. Proposers are also expected to articulate how their choice of constructs are expected to translate into a safe and effective response in humans as one of these constructs will be utilized in human clinical trials as part of the capability demonstrations. Additionally, protection must be demonstrated in animals (large or small models) for three different pathogens. While survival following lethal challenge is an ideal measure of protection from acute disease, oftentimes, lethal challenge models are not available. Performer teams must define quantitative metrics to determine protection in each animal model proposed. The constructs for expression in large animals and the protection models may be the same constructs. To ensure that the platform will be useful to **prevent or halt** the spread of an infectious outbreak at population scale, the performers must demonstrate the ability to achieve protection within 3 days of administration. Frequent administration of a medical countermeasure during an outbreak presents distribution and response complications; therefore, the number of doses in the final solution must be minimal, ideally a single administration. Finally, additional consideration will be given to proposals that address the use of antibody cocktails to prevent viral escape from a single monoclonal antibody and/or to provide cross-reactive protection against multiple strains/pathogens.

TA3 will encourage novel delivery approaches, including delivery mechanisms involving local electrical techniques (electroporation) or chemical approaches (liposomal or polymeric packaging of nucleic acid). Approaches that carry risk for genomic integration of the gene of interest and/or vector will not be considered; non-permanent, transient expression technologies are encouraged. Proposals are encouraged to utilize delivery methods that could

be most useful during an outbreak, even in austere settings. Although proposals utilizing intravenous administration are not excluded from consideration, proposers should be mindful of the practicality of field deployment of their solutions.

Performers must demonstrate the ability to achieve the goals and metrics defined in TA3 (Table 1) by attaining the specified serum concentration, protection from lethal challenge, and reproducibility in animal models for ultimate use in humans. Therefore, it is required that once the delivery technology is tested and validated in animal models, it will be tested in humans as part of phase I clinical studies.

Note: While the BAA focuses on gene-encoded antibody technology for TA3, proposals incorporating the use of other approaches will be considered as long as the appropriate program metrics defined in Table 1 are met.

Proposers must provide the following in the proposal:

- The proposed methods for validation and completion for TA3, describing an adaptable platform able to support the delivery of a variety of antibody genetic constructs seamlessly
- The detailed proposed method to define antibody/therapy potency and quantitative metrics of how will potency will be measured
- The detailed proposed study design of animal challenge model(s)
- The detailed proposed method to define protection, including quantitative metrics used to determine protection in each animal model proposed

Platform Integration and Testing

To ensure end-to-end functional platform integration, the performer will be required to transition the technological advances from the three TAs into capability demonstrations. A central component of this program will be the demonstration of an end-to-end platform functionality. The first capability demonstration will occur in month 12 of the program. Performer groups will be allotted 90 days to:

- Grow 10^{13} viral pathogen of their choice
- Discover pathogen specific antibodies
- Successfully transition both antibody/therapy and virus to the antibody evolution group
- Evolve antibody/therapy to 100-fold increased potency
- Deliver genetic sequence of highly potent antibody/therapy to the manufacturing group (data)
- Manufacture research grade material for animal studies
- Demonstrate both product delivery and protection from viral challenge in an animal model

At month 24, performers will conduct a capability demonstration with a pathogen of performer choice. At 36 months, performers will conduct a third 60-day capability demonstration with a DARPA selected pathogen. It is required that during one of the capability demonstrations, GMP manufacturing of clinical grade material will be completed for use in a human clinical trial. The proposal must include a discussion of the number of doses to be manufactured during the demonstration, and the time for manufacturing of these doses must fall within the 60-day timeline.

Using the lessons learned in the previous capability demonstrations, performers will conduct two final capability demonstrations with pathogens that are unidentified to the groups to simulate a "real–world" response to an unknown pathogen. The final deliverable will be the ability to produce at a minimum 1000 doses. The platform should be capable to scale-up manufacturing to 20,000 doses of gene-encoded antibody product for Phase I/II human clinical trials in <60 days, with a delivery platform able to achieve protective levels inside the body.

Finally, the proposal must include a discussion of where the capability platform will be located. It is anticipated that the platform will either be centrally located in one facility run by one of the performer teams, or that aspects of the platform will be physically located at different facilities which are integrated through a system of agreements allowing for the facile transfer of material between locations. In the latter case, the proposal must discuss the coordination and management of the decentralized platform.

Proposers must provide the following in the proposal:

- The proposed manufacturing plan, demonstrating the ability to GMP manufacture products in addition to being able to scale-up manufacturing and distribute 20,000 doses
- The proposed transition plan describing the product/data pipeline from receipt of pathogen and antibody input to final product
- The regulatory plan for phase I clinical safety trials

Table 1. Program metrics and milestones

Technical Metrics
TA 1: On-demand platform to grow virus 1. Amplify pathogen to a minimum 10^{13} infectious units (PFU or TCID50) within 72 hours post-inoculation 2. Pathogen genetic drift less than 0.1% after 5 successive culturing (growth) iterations (mutations per base pair per culturing cycle) 3. Progeny virus bio-identical to original isolate in lipid, protein, and carbohydrate content 4. Apply platform to five viruses representing at least one RNA virus, one DNA virus, and both (+)-sense and (-)-sense single stranded viral genomes

Technical Metrics
TA 2: System to evolve antibodies 1. Ready for use in less than 72 hours 2. Demonstrate the ability to couple antibody discovery capability with the antibody evolution capability either through new discovery technologies or physical coupling with existing technologies 3. Support rapid potency maturation improving antibody/therapy greater than 100-fold in under 8 days 4. Apply technology to mature five different antibodies/therapies targeting at a minimum three (3) different pathogens representing at least one RNA virus, one DNA virus, and both (+)-sense and (-)-sense single stranded viral genomes *While it is assumed that the development of antibody therapies may be necessary to achieve a protective countermeasure in <60 days, all innovative approaches that meet the time and quality metrics stated above will be considered.
TA 3: Deliver medical countermeasure(s) 1. Achieve greater than 10 µg/mL serum concentration of target medical countermeasure with peak production in <3 days post-injection in large animals 2. Minimally or low-invasive simple delivery method given at 1 delivery site 3. Demonstrate reproducible production (less than 10% variance in serum concentration) in large animals 4. Demonstrate 100% protection against performer defined pathogen challenge in animal models by day 3 post countermeasure administration 5. Demonstrate longevity of protection lasts for greater than 30 days *While it is assumed that the development of antibody therapies may be necessary to achieve a protective countermeasure in <60 days, all innovative approaches that meet the time and quality metrics stated above will be considered.
Platform Integration: All of the following metrics must be achieved within 60 days and must include full integration with the metrics for TA1-3: 1. Demonstrate the ability to identify a pathogen specific antibody/therapy for rapid affinity maturation in TA2 within 14 days 2. Demonstrate the ability to manufacture research grade genetic constructs for use in animal studies 3. Demonstrate the ability to manufacture clinical grade GMP material for human safety trials – this metric must be met for only one of the phase II demonstrations. The ability to scale-up manufacturing and distribution to 20,000 doses must also be

Technical Metrics
addressed as part of this metric 4. Demonstrate safety and efficacy in animal models and in human clinical trials

[1]Letter Report on Action Needed to Protect against Biological Attack; President's Council of Advisors on Science and Technology – Executive Office of the President. November 2016; https://www.whitehouse.gov/sites/default/files/microsites/ostp/PCAST/pcast_biodefense_letter_report_final.pdf

1.4. PROGRAM METRICS

In order for the Government to evaluate the effectiveness of a proposed solution in achieving the stated program objectives, proposers should note that the Government hereby promulgates the following program metrics that may serve as the basis for determining whether satisfactory progress is being made to warrant continued funding of the program. Although the program metrics are specified (Table 1, Section 1.3), proposers should note that the Government has identified these goals with the intention of bounding the scope of effort, while affording the maximum flexibility, creativity, and innovation in proposing solutions to the stated problem.

2. Award Information

2.1. GENERAL AWARD INFORMATION

Multiple awards are possible. The amount of resources made available under this BAA will depend on the quality of the proposals received and the availability of funds.

The Government reserves the right to select for negotiation all, some, one, or none of the proposals received in response to this solicitation and to make awards without discussions with proposers. The Government also reserves the right to conduct discussions if it is later determined to be necessary. If warranted, portions of resulting awards may be segregated into pre-priced options. Additionally, DARPA reserves the right to accept proposals in their entirety or to select only portions of proposals for award. In the event that DARPA desires to award only portions of a proposal, negotiations may be opened with that proposer. The Government reserves the right to fund proposals in phases with options for continued work, as applicable. The Government reserves the right to request any additional, necessary documentation once it makes the award instrument determination. Such additional information may include but is not limited to Representations and Certifications (see Section 6.B.2.3, "Representations and Certifications"). The Government reserves the right to remove proposers from award consideration should the parties fail to reach agreement on award terms, conditions, and/or cost/price within a reasonable time, and the proposer fails to timely provide requested additional information. Proposals identified for negotiation may result in a procurement contract, cooperative agreement, or other transaction, depending upon the nature of the work proposed, the required degree of interaction between parties, whether or not the research is classified as Fundamental Research, and other factors.

Proposers looking for innovative, commercial-like contractual arrangements are encouraged to consider requesting Other Transactions. To understand the flexibility and options associated with Other Transactions, consult www.darpa.mil/work-with-us/contract-management#OtherTransactions.

In all cases, the Government contracting officer shall have sole discretion to select award instrument type, regardless of instrument type proposed, and to negotiate all instrument terms and conditions with selectees. DARPA will apply publication or other restrictions, as necessary, if it determines that the research resulting from the proposed effort will present a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense. Any award resulting from such a determination will include a requirement for DARPA permission before publishing any information or results on the program. For more information on publication restrictions, see the section below on Fundamental Research.

2.2. FUNDAMENTAL RESEARCH

It is DoD policy that the publication of products of fundamental research will remain unrestricted to the maximum extent possible. National Security Decision Directive (NSDD) 189 defines fundamental research as follows:

> 'Fundamental research' means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

As of the date of publication of this BAA, the Government expects that program goals as described herein either cannot be met by proposers intending to perform fundamental research or the proposed research is anticipated to present a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense. Therefore, the Government anticipates restrictions on the resultant research that will require the awardee[3] to seek DARPA permission before publishing any information or results relative to the program.

Proposers should indicate in their proposal whether they believe the scope of the research included in their proposal is fundamental or not. While proposers should clearly explain the intended results of their research, the Government shall have sole discretion to select award instrument type and to negotiate all instrument terms and conditions with selectees. Appropriate clauses will be included in resultant awards for non-fundamental research to prescribe publication requirements and other restrictions, as appropriate. This clause can be found at www.darpa.mil/work-with-us/additional-baa.

For certain research projects, it may be possible that although the research being performed by the awardee is restricted research, a subawardee may be conducting fundamental research. In those cases, it is the awardee's responsibility to explain in their proposal why its subawardee's effort is fundamental research

3. Eligibility Information

3.1. ELIGIBLE APPLICANTS

All responsible sources capable of satisfying the Government's needs may submit a proposal that shall be considered by DARPA.

---

[3] As used throughout this BAA, awardee refers to anyone who might receive a prime award from the Government, including recipients of procurement contracts, grants, cooperative agreements, Other Transactions, or any type of award. Subawardee refers to anyone who might receive a subaward from a prime awardee.

3.1.1. Federally Funded Research and Development Centers (FFRDCs) and Government Entities

FFRDCs

FFRDCs are subject to applicable direct competition limitations and cannot propose to this BAA in any capacity unless they meet the following conditions: (1) FFRDCs must clearly demonstrate that the proposed work is not otherwise available from the private sector. (2) FFRDCs must provide a letter on official letterhead from their sponsoring organization citing the specific authority establishing their eligibility to propose to Government solicitations and compete with industry, and their compliance with the associated FFRDC sponsor agreement's terms and conditions. This information is required for FFRDCs proposing to be awardees or subawardees.

Government Entities

Government Entities (e.g., Government/National laboratories, military educational institutions, etc.) are subject to applicable direct competition limitations. Government entities must clearly demonstrate that the work is not otherwise available from the private sector and provide written documentation citing the specific statutory authority and contractual authority, if relevant, establishing their ability to propose to Government solicitations.

Authority and Eligibility

At the present time, DARPA does not consider 15 U.S.C. § 3710a to be sufficient legal authority to show eligibility. While 10 U.S.C.§ 2539b may be the appropriate statutory starting point for some entities, specific supporting regulatory guidance, together with evidence of agency approval, will still be required to fully establish eligibility. DARPA will consider FFRDC and Government entity eligibility submissions on a case-by-case basis; however, the burden to prove eligibility for all team members rests solely with the proposer.

3.1.2. Non-U.S. Organizations

Non-U.S. organizations and/or individuals may participate to the extent that such participants comply with any necessary nondisclosure agreements, security regulations, export control laws, and other governing statutes applicable under the circumstances.

3.2. ORGANIZATIONAL CONFLICTS OF INTEREST

FAR 9.5 Requirements

In accordance with FAR 9.5, proposers are required to identify and disclose all facts relevant to potential OCIs involving the proposer's organization and *any* proposed team member (subawardee, consultant). Under this Section, the proposer is responsible for providing this disclosure with each proposal submitted to the BAA. The disclosure must include the proposer's, and as applicable, proposed team member's OCI mitigation plan. The OCI mitigation plan must include a description of the actions the proposer has taken, or intends to take, to prevent the existence of conflicting roles that might bias the proposer's judgment and to prevent the proposer from having unfair competitive advantage. The OCI mitigation plan will

specifically discuss the disclosed OCI in the context of each of the OCI limitations outlined in FAR 9.505-1 through FAR 9.505-4.

Agency Supplemental OCI Policy

In addition, DARPA has a supplemental OCI policy that prohibits contractors/performers from concurrently providing Scientific Engineering Technical Assistance (SETA), Advisory and Assistance Services (A&AS) or similar support services and being a technical performer. Therefore, as part of the FAR 9.5 disclosure requirement above, a proposer must affirm whether the proposer or *any* proposed team member (subawardee, consultant) is providing SETA, A&AS, or similar support to any DARPA office(s) under: (a) a current award or subaward; or (b) a past award or subaward that ended within one calendar year prior to the proposal's submission date.

If SETA, A&AS, or similar support is being or was provided to any DARPA office(s), the proposal must include:

- The name of the DARPA office receiving the support;
- The prime contract number;
- Identification of proposed team member (subawardee, consultant) providing the support; and
- An OCI mitigation plan in accordance with FAR 9.5.

Government Procedures

In accordance with FAR 9.503, 9.504 and 9.506, the Government will evaluate OCI mitigation plans to avoid, neutralize or mitigate potential OCI issues before award and to determine whether it is in the Government's interest to grant a waiver. The Government will only evaluate OCI mitigation plans for proposals that are determined selectable under the BAA evaluation criteria and funding availability.

The Government may require proposers to provide additional information to assist the Government in evaluating the proposer's OCI mitigation plan.

If the Government determines that a proposer failed to fully disclose an OCI; or failed to provide the affirmation of DARPA support as described above; or failed to reasonably provide additional information requested by the Government to assist in evaluating the proposer's OCI mitigation plan, the Government may reject the proposal and withdraw it from consideration for award.

3.3. COST SHARING/MATCHING

Cost sharing is not required; however, it will be carefully considered where there is an applicable statutory condition relating to the selected funding instrument. Cost sharing is encouraged where there is a reasonable probability of a potential commercial application related to the proposed research and development effort.

For more information on potential cost sharing requirements for Other Transactions for Prototype, see http://www.darpa.mil/work-with-us/contract-management#OtherTransactions

3.4. COLLABORATIVE EFFORTS

Proposer's must have expertise in integration, microbiology, immunology, regulatory, medical product development and the GMP manufacturing of medical countermeasures for use in human subjects.

4. Application and Submission Information

4.1. ADDRESS TO REQUEST APPLICATION PACKAGE

This announcement, any attachments, and any references to external websites herein constitute the total solicitation. If proposers cannot access the referenced material posted in the announcement found at http://www.darpa.mil, contact the administrative contact listed herein.

4.2. CONTENT AND FORM OF APPLICATION SUBMISSION

All submissions, including abstracts and proposals must be written in English with type not smaller than 12-point font. Smaller font may be used for figures, tables, and charts. Copies of all documents submitted must be clearly labeled with the DARPA BAA number, proposer organization, and proposal title/proposal short title.

4.2.1. Proposal Abstract Format

Proposers are strongly encouraged to submit an abstract in advance of a proposal to minimize effort and reduce the potential expense of preparing an out of scope proposal. The abstract is a concise version of the proposal comprising a maximum of **8** pages including all figures, tables, and charts. The (optional) submission letter is not included in the page count. All pages shall be formatted for printing on 8-1/2 by 11-inch paper with font size not smaller than 12-point and standard 1-inch margins. Smaller font sizes may be used for figures, tables, and charts.

Submissions must be written in English.

The page limit does not include:

1. Official submission letter (optional)
2. Cover Sheet
3. Resumes
4. Bibliography (optional)

Abstracts must include the following components:

A. Cover Sheet (does not count towards page limit): Include the administrative and technical points of contact (name, address, phone, fax, email, lead organization). Also

include the BAA number, title of the proposed project, primary subcontractors, estimated cost, duration of the project, and the label "ABSTRACT."

B. Goals and Impact: Clearly describe what is being proposed and what difference it will make (qualitatively and quantitatively), including brief answers to the following questions:

1. What is the proposed work attempting to accomplish or do?
2. How is it done today? And what are the limitations?
3. What is innovative in your approach and how does it compare to SOA?
4. What are the key technical challenges in your approach and how do you plan to overcome these?
5. Who will care and what will the impact be if you are successful?
6. How much will it cost and how long will it take?

C. Technical Plan: All three technical areas (TA's) much be addressed in the proposal. Summarize your plan for accomplishing the program goals for all three of the technical areas. Outline and address all technical challenges inherent in the approach and possible solutions for overcoming potential problems. This section should provide appropriate specific milestones (quantitative, if possible) at intermediate stages of the project to demonstrate progress, and a brief plan for accomplishment of the milestones.

D. Management and Capabilities: It is expected that proposals will involve multidisciplinary teams covering all of the technical areas. These teams must be fully functionally integrated. Provide a brief summary of expertise of the team, including subcontractors and key personnel and how each member will be integrated into a fully functional team.

A principal investigator for the project must be identified, and a description of the team's organization. Teams are encouraged to identify a program manager to serve as a primary point of contact to communicate with the DARPA program manager and Contracting Officer Representative, coordinate effort across performer teams, organize regular performer meetings or discussions, and ensure timely completion of milestones and deliverables.

Include a description of the team's organization including roles and responsibilities. Describe the organizational experience in this area, existing intellectual property required to complete the project, and any specialized facilities to be used as part of the project. List Government-furnished materials or data assumed to be available. If desired, include a brief bibliography with links to relevant papers, reports, or resumes of key performers.

E. Cost and Schedule: Provide a cost estimate for resources over the proposed timeline of the project, broken down by major cost items (e.g. labor, materials, equipment). Include cost estimates for each potential subcontractor (may be a rough or of magnitude).

G. CVs/Resumes: Include resumes of key team members (resumes do not count toward page limit).

H. Bibliography: If desired include a brief bibliography not to exceed two pages.

4.2.2. Proposal Format

All full proposals must be in the format given below. Proposals shall consist of two volumes: 1) **Volume I, Technical and Management Proposal**, and 2) **Volume II, Cost Proposal.** All pages shall be printed on 8-1/2 by 11-inch paper with type not smaller than 12-point and standard 1-inch margins. Smaller font may be used for figures, tables and charts. The page limitation for full proposals includes all figures, tables, and charts. Volume I, Technical and Management Proposal, may include an attached bibliography of relevant technical papers or research notes (published and unpublished) which document the technical ideas and approach upon which the proposal is based. Copies of not more than three (3) relevant papers may be included with the submission. The bibliography and attached papers are not included in the page counts given below. The submission of other supporting materials along with the proposals is strongly discouraged and will not be considered for review. **The maximum page count for Volume 1 is 40 pages**. A submission letter is optional and is not included in the page count. Volume I should include the following components:

NOTE: Non-conforming submissions that do not follow the instructions herein may be rejected without further review.

a. Volume I, Technical and Management Proposal

Section I. Administrative

A. Cover Sheet (LABELED "PROPOSAL: VOLUME I"):

1. BAA number (HR001117S0019);
2. Technical area;
3. Lead organization submitting proposal (prime contractor);
4. Type of organization, selected from among the following categories: "LARGE BUSINESS," "SMALL DISADVANTAGED BUSINESS," "OTHER SMALL BUSINESS," "HBCU," "MI," "OTHER EDUCATIONAL," OR "OTHER NONPROFIT";
5. Proposer's reference number (if any);
6. Other team members (if applicable) and type of business for each;
7. Proposal title;

8. Technical point of contact (Program Manager or Principle Investigator) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax, e-mail;
9. Administrative point of contact (Contracting Officer) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax, e-mail;
10. Award instrument requested: cost-plus-fixed-free (CPFF), cost-contract-no fee, firm-fixed-price (FFP), other type of procurement contract (specify), cooperative agreement, or other transaction;
11. Place(s) and period(s) of performance;
12. Proposal validity period;
13. Total funds requested from DARPA, and the amount of cost share (if any); AND
14. Date proposal was submitted.

Information on award instruments is available at http://www.darpa.mil/work-with-us/contract-management.

B. Official Transmittal Letter.

Section II. Detailed Proposal Information

A. Executive Summary: Provide a synopsis of the proposed project, including answers to the following questions:

- What is the proposed work attempting to accomplish or do?
- How is it done today, and what are the limitations?
- What is innovative in your approach?
- What are the key technical challenges in your approach and how do you plan to overcome these?
- Who or what will be affected and what will be the impact if the work is successful?
- How much will it cost, and how long will it take?

B. Goals and Impact: Clearly describe what the team is trying to achieve and the difference it will make (qualitatively and quantitatively) if successful. Describe the innovative aspects of the project in the context of existing capabilities and approaches, clearly delineating the uniqueness and benefits of this project in the context of the state of the art, alternative approaches, and other projects from the past and present. Describe how the proposed project is revolutionary and how it significantly rises above the current state of the art. Describe the deliverables associated with the proposed project and any plans to commercialize the technology, transition it to a customer, or further the work.

C. Technical Plan: Outline and address technical challenges inherent in the approach and possible solutions for overcoming potential problems. This section should provide appropriate measurable milestones (quantitative if possible) at intermediate stages of the program to demonstrate progress, and a plan for achieving the milestones. The technical plan should demonstrate a deep understanding of the technical challenges and present a credible (even if risky) plan to achieve the program goal. Discuss mitigation of technical risk.

Proposals should also address the following specific criteria:

1. The choice of study pathogens, demonstrating relevance to National Security and DoD force health protection.
2. The proposed methods for validation and completion for TA1, describing an adaptable platform able to grow a variety of different pathogens including unknown isolates.
3. The proposed methods for validation and completion of TA2, demonstrating the ability to increase antibody potency greater than 100-fold during *ex vivo* maturation.
4. The detailed proposed method to define antibody/therapy potency and quantitative metrics of how will potency will be measured.
5. The detailed proposed study design of animal challenge model(s)
6. The detailed proposed method to define protection, including quantitative metrics used to determine protection in each animal model proposed.
7. The proposed manufacturing plan, demonstrating the ability to GMP manufacture products in addition to being able to scale-up manufacturing and distribute 20,000 doses.
8. The ability of the end-to-end platform to address unknown pathogens.
9. The ability to integrate established technologies with key innovation areas.
10. The proposed transition plan describing the product/data pipeline from initial input to final product.

D. Management Plan: Provide a summary of expertise of the team, including any subcontractors, and key personnel who will be doing the work. Resumes count against the proposal page count. Identify a principal investigator for the project. Provide a clear description of the team's organization including an organization chart that includes, as applicable: the programmatic relationship of team members; the unique capabilities of team members; the task responsibilities of team members, the teaming strategy among the team members; and key personnel with the amount of effort to be expended by each person during each year. Provide a detailed plan for coordination including explicit guidelines for interaction among

collaborators/subcontractors of the proposed effort. Include risk management approaches. Describe any formal teaming agreements that are required to execute this program.

E. Capabilities: Describe organizational experience in relevant subject area(s), existing intellectual property, specialized facilities, and any Government-furnished materials or information. Discuss any work in closely related research areas and previous accomplishments.

F. Statement of Work (SOW): The SOW should provide a detailed task breakdown, citing specific tasks and their connection to the interim milestones and program metrics. Each phase of the program should be separately defined. The SOW must not include proprietary information.

For each task/subtask, provide:

- A detailed description of the approach to be taken to accomplish each defined task/subtask.
- Identification of the primary organization responsible for task execution (prime contractor, subcontractor(s), consultant(s), by name).
- A measurable milestone, i.e., a deliverable, demonstration, or other event/activity that marks task completion. Include quantitative metrics.
- A definition of all deliverables (e.g., data, reports, software) to be provided to the Government in support of the proposed tasks/subtasks.

G. Schedule and Milestones: Provide a detailed schedule showing tasks (task name, duration, work breakdown structure element as applicable, performing organization), milestones, and the interrelationships among tasks. The task structure must be consistent with that in the SOW. Measurable milestones should be clearly articulated and defined in time relative to the start of the project.

<u>Section III. Additional Information</u> (Note: Does not count towards page limit)

A brief bibliography of relevant technical papers and research notes (published and unpublished) which document the technical ideas upon which the proposal is based. Copies of not more than three (3) relevant papers can be included in the submission.

a. Volume II, Cost Management Proposal

Cover Sheet (LABELED “PROPOSAL: VOLUME II”):

1. BAA number;
2. Technical area;

3. Lead Organization Submitting proposal;
4. Type of organization, selected among the following categories: "LARGE BUSINESS", "SMALL DISADVANTAGED BUSINESS", "OTHER SMALL BUSINESS", "HBCU", "MI", "OTHER EDUCATIONAL", OR "OTHER NONPROFIT";
5. Proposer's reference number (if any);
6. Other team members (if applicable) and type of business for each;
7. Proposal title;
8. Technical point of contact (Program Manager or Principal Investigator) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax (if available), electronic mail (if available);
9. Administrative point of contact (Contracting Officer) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax (if available), and electronic mail (if available);
10. Award instrument requested: cost-plus-fixed-free (CPFF), cost-contract-no fee, firm-fixed-price (FFP), other type of procurement contract (*specify*), cooperative agreement, or other transaction;
11. Place(s) and period(s) of performance;
12. Total proposed cost separated by basic award and option(s) (if any);
13. Name, address, and telephone number of the proposer's cognizant Defense Contract Management Agency (DCMA) administration office (*if known)*;
14. Name, address, and telephone number of the proposer's cognizant Defense Contract Audit Agency (DCAA) audit office (*if known*);
15. Date proposal was prepared;
16. DUNS number (http://www.dnb.com/get-a-duns-number.html);
17. Taxpayer ID number (https://www.irs.gov/Individuals/International-Taxpayers/Taxpayer-Identification-Numbers-TIN);
18. CAGE code (https://www.dlis.dla.mil/bincs/FAQ.aspx);
19. Proposal validity period

Note that non-conforming proposals may be rejected without review.

Proposers that do not have a Cost Accounting Standards (CAS) complaint accounting system considered adequate for determining accurate costs that are negotiating a cost- type procurement contract must complete an SF 1408. For more information on CAS compliance, see http://www.dcaa.mil/cas.html. To facilitate this process, proposers should complete the SF 1408 found at http://www.gsa.gov/portal/forms/download/115778 and submit the completed form with the proposal. To complete the form, check the boxes on the second page, then provide a narrative explanation of your accounting system to supplement the checklist on page one. For more information, see (http://www.dcaa.mil/preaward_accounting_system_adequacy_checklist.html).

The Government strongly encourages that the proposer provide a detailed cost breakdown to include:

(1) Total program cost broken down by major cost items to include:
   i. Direct Labor – Including individual labor categories with associated labor hours and direct labor rates. If selected for award, be prepared to submit supporting documentation to justify labor rates. (i.e., screenshots of HR databases, comparison to NIH or other web-based salary database);
   ii. Consultants – If consultants are to be used, proposer must provide a copy of the consultant's proposed SOW as well as a signed consultant agreement or other document which verifies the proposed loaded daily / hourly rate, hours and any other proposed consultant costs (e.g., travel);
   iii. Indirect Costs – Including Fringe Benefits, Overhead, General and Administrative Expense, Cost of Money, Fee, etc. (must show base amount and rate), if available, provide current Forward Pricing Rate Agreement or Forward Pricing Rate Proposal. If not available, provide 2 years historical data to include pool and expense costs used to generate the rates. For academia, provide DHHS or ONR negotiated rate package or, if calculated by other than a rate, provide University documentation identifying G&A and fringe costs by position;
   iv. Travel – Provide the purpose of the trip, number of trips, number of days per trip, departure and arrival destinations, number of people, estimated rental car and airfare costs, and prevailing per diem rates as determined by gsa.gov, etc.; Quotes must be supported by screenshots from travel websites;
   v. Other Direct Costs – Itemized with costs including tuition remission, animal per diem rates, health insurance/fee; back-up documentation is to be submitted to support proposed costs;
   vi. Equipment Purchases – Itemization with individual and total costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase (NOTE: For equipment purchases, include a letter stating why the proposer cannot provide the requested resources from its own funding), and;
   vii. Materials – Itemization with costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase.
(2) A summary of major program tasks by Government Fiscal Year (GFY = Oct 1 – Sep 30)
(3) A summary of total program costs by phase and task;
(4) A summary of projected funding requirements by month;
(5) An itemization of any information technology (IT) purchase (including a letter stating why the proposer cannot provide the requested resources from its own funding), as defined in FAR Part 2.101;

(6) An itemization of Subcontracts. **All subcontractor cost proposal documentation must be prepared at the same level of detail as that required of the prime.** Subcontractor proposals should include Interdivisional Work Transfer Agreements (IWTA) or evidence of similar arrangements (an IWTA is an agreement between multiple divisions of the same organization);
(7) The source, nature, and amount of any industry cost-sharing. Where the effort consists of multiple portions which could reasonably be partitioned for purposes of funding, these should be identified as options with separate cost estimates for each;
(8) Identification of pricing assumptions of which may require incorporation into the resulting award instrument (e.g., use of Government Furnished Property/Facilities/Information, access to Government Subject Matter Expert/s, etc.);
(9) Any Forward Pricing Rate Agreement, DHHS rate agreement, other such approved rate information, or such documentation that may assist in expediting negotiations (if available); and
(10) Proposers with a Government acceptable accounting system who are proposing a cost-type contract, must submit the DCAA document approving the cost accounting system.

4.2.3. Additional Proposal Information

Proprietary Markings

Proposers are responsible for clearly identifying proprietary information. Submissions containing proprietary information must have the cover page and each page containing such information clearly marked with a label such as "Proprietary" or "Company Proprietary." NOTE: "Confidential" is a classification marking used to control the dissemination of U.S. Government National Security Information as dictated in Executive Order 13526 and should not be used to identify proprietary business information.

Unclassified Submissions

DARPA anticipates that submissions received under this BAA will be unclassified. However, should a proposer wish to submit classified information, an *unclassified* email must be sent to the BAA mailbox requesting submission instructions from the Technical Office PSO. If a determination is made that the award instrument may result in access to classified information, a SCG and/or DD Form 254 will be issued by DARPA and attached as part of the award.

Human Research Subjects/Animal Use

Proposers that anticipate involving Human Research Subjects or Animal Use must comply with the approval procedures detailed at www.darpa.mil/work-with-us/additional-baa.

Human Subjects Research

All research selected for funding involving human subjects, to include use of human biological specimens and human data, must comply with the federal regulations for human subjects

protection. Further, research involving human subjects that is conducted or supported by the DoD must comply with 32 CFR 219, *Protection of Human Subjects* (and DoD Instruction 3216.02, *Protection of Human Subjects and Adherence to Ethical Standards in DoD-Supported Research* (http://www.dtic.mil/whs/directives/corres/pdf/321602p.pdf).

Institutions awarded funding for research involving human subjects must provide documentation of a current Assurance of Compliance with federal regulations for human subjects protection, such as a Department of Health and Human Services, Office of Human Research Protection Federal Wide Assurance (http://www.hhs.gov/ohrp). All institutions engaged in human subjects research, to include subcontractors, must also hold a valid assurance. In addition, all personnel involved in human subjects research must provide documentation of completion of human subjects research training.

For all proposed research that will involve human subjects in the first year or phase of the project, the institution must provide evidence of or a plan for review by an Institutional Review Board (IRB) upon final proposal submission to DARPA as part of their proposal, prior to being selected for funding. The IRB conducting the review must be the IRB identified on the institution's Assurance of Compliance with human subjects protection regulations. The protocol, separate from the proposal, must include a detailed description of the research plan, study population, risks and benefits of study participation, recruitment and consent process, data collection, and data analysis. It is recommended that you consult the designated IRB for guidance on writing the protocol. The informed consent document must comply with federal regulations (32 CFR 219.116). A valid Assurance of Compliance with human subjects protection regulations along with evidence of completion of appropriate human subjects research training by all investigators and personnel involved with human subjects research should accompany the protocol for review by the IRB.

In addition to a local IRB approval, a headquarters-level human subjects administrative review and approval is required for all research conducted or supported by the DoD. The Army, Navy, or Air Force office responsible for managing the award can provide guidance and information about their component's headquarters-level review process. Note that confirmation of a current Assurance of Compliance with human subjects protection regulations and appropriate human subjects research training is required before headquarters-level approval can be issued.

The time required to complete the IRB review/approval process varies depending on the complexity of the research and the level of risk involved with the study. The IRB approval process can last between one and three months, followed by a DoD review that could last between three and six months. Ample time should be allotted to complete the approval process. DoD/DARPA funding cannot be used toward human subjects research until ALL approvals are granted.

Animal Use

Award recipients performing research, experimentation, or testing involving the use of animals shall comply with the rules on animal acquisition, transport, care, handling, and use as outlined in: (i) 9 CFR parts 1-4, Department of Agriculture rules that implement the Animal Welfare Act of 1966, as amended, (7 U.S.C. § 2131-2159); (ii) National Institutes of Health Publication No. 86-23, "Guide for the Care and Use of Laboratory Animals" (8th Edition); and (iii) DoD Instruction 3216.01, “Use of Animals in DoD Programs.”

For projects anticipating animal use, proposals should briefly describe plans for Institutional Animal Care and Use Committee (IACUC) review and approval. Animal studies in the program will be expected to comply with the Public Health Service (PHS) Policy on Humane Care and Use of Laboratory Animals, available at http://grants.nih.gov/grants/olaw/olaw.htm.

All award recipients must receive approval by a DoD-certified veterinarian, in addition to an IACUC approval. No animal studies may be conducted using DoD/DARPA funding until the United States Army Medical Research and Materiel Command (USAMRMC) Animal Care and Use Review Office (ACURO) or other appropriate DoD veterinary office(s) grant approval. As a part of this secondary review process, the award recipient will be required to complete and submit an ACURO Animal Use Appendix, which may be found at http://mrmc.amedd.army.mil/index.cfm?pageid=research_protections.acuro_animalappendix.

Small Business Subcontracting Plan

Pursuant to Section 8(d) of the Small Business Act (15 U.S.C. § 637(d)) and FAR 19.702(a)(1), each proposer who submits a contract proposal and includes subcontractors might be required to submit a subcontracting plan with their proposal. The plan format is outlined in FAR 19.704.

Section 508 of the Rehabilitation Act (29 U.S.C. § 749d)/FAR 39.2

All electronic and information technology acquired or created through this BAA must satisfy the accessibility requirements of Section 508 of the Rehabilitation Act (29 U.S.C. § 749d)/FAR 39.2.

Intellectual Property

All proposers must provide a good faith representation that the proposer either owns or possesses the appropriate licensing rights to all intellectual property that will be utilized under the proposed effort.

For Procurement Contracts

Proposers responding to this BAA requesting procurement contracts will need to complete the certifications at DFARS 252.227-7017. See http://www.darpa.mil/work-with-us/additional-baa for further information. If no restrictions are intended, the proposer should state “none.” The table below captures the requested information:

Technical Data Computer Software To be Furnished With Restrictions	Summary of Intended Use in the Conduct of the Research	Basis for Assertion	Asserted Rights Category	Name of Person Asserting Restrictions
(LIST)	(NARRATIVE)	(LIST)	(LIST)	(LIST)

For All Non-Procurement Contracts

Proposers responding to this BAA requesting a Cooperative Agreement, Technology Investment Agreement, or Other Transaction for Prototypes shall follow the applicable rules and regulations governing these various award instruments, but, in all cases, should appropriately identify any potential restrictions on the Government's use of any Intellectual Property contemplated under the award instrument in question. This includes both Noncommercial Items and Commercial Items. Proposers are encouraged to use a format similar to that described in the section above. If no restrictions are intended, then the proposer should state "NONE."

System for Award Management (SAM) and Universal Identifier Requirements

All proposers must be registered in SAM unless exempt per FAR 4.1102. FAR 52.204-7, "System for Award Management" and FAR 52.204-13, "System for Award Management Maintenance" are incorporated into this BAA. See www.darpa.mil/work-with-us/additional-baa for further information.

4.2.4. Submission Information

DARPA will acknowledge receipt of all submissions and assign an identifying control number that should be used in all further correspondence regarding the submission. DARPA intends to use electronic mail correspondence regarding HR001117S0019. Submissions may not be submitted by fax or e-mail; any so sent will be disregarded.

Submissions will not be returned. An electronic copy of each submission received will be retained at DARPA and all other non-required copies destroyed. A certification of destruction may be requested, provided the formal request is received by DARPA within 5 days after notification that a proposal was not selected.

For (abstract and) proposal submission dates, see Part I., Overview Information. Submissions received after these dates and times may not be reviewed.

For Proposers Submitting Proposal Abstracts or Full Proposals Requesting Procurement Contracts or OTs through DARPA's BAA Submission Portal:

Abstracts and Full Proposals sent in response to HR001117S0019 may be submitted via DARPA's BAA Website (https://baa.darpa.mil). Visit the website to complete the two-step registration process. Submitters will need to register for an Extranet account (via the form at the URL listed above) and wait for two separate e-mails containing a username and temporary password. After accessing the Extranet, submitters may then create an account for the DARPA BAA website (via the "Register your Organization" link along the left side of the homepage), view submission instructions, and upload/finalize the abstract. Proposers using the DARPA BAA Website may encounter heavy traffic on the submission deadline date; it is highly advised that submission process be started as early as possible.

All unclassified concepts submitted electronically through DARPA's BAA Website must be uploaded as zip files (.zip or .zipx extension). The final zip file should be no greater than 50 MB in size. Only one zip file will be accepted per submission. Classified submissions and proposals requesting assistance instruments (cooperative agreements) should NOT be submitted through DARPA's BAA Website (https://baa.darpa.mil), though proposers will likely still need to visit https://baa.darpa.mil to register their organization (or verify an existing registration) to ensure the BAA office can verify and finalize their submission.

Technical support for BAA Website may be reached at BAAT_Support@darpa.mil, and is typically available during regular business hours, (9:00 AM- 5:00 PM EST Monday – Friday).

Proposers using the DARPA BAA Website may encounter heavy traffic on the submission deadline date; it is highly advised that submission process be started as early as possible.

For Full Proposals Requesting Cooperative Agreements:

Proposers requesting cooperative agreements may submit proposals through one of the following methods: (1) hard copy mailed directly to DARPA; or (2) electronic upload per the instructions at http://www.grants.gov/applicants/apply-for-grants.html. Cooperative agreement proposals may not be submitted through any other means. If proposers intend to use Grants.gov as their means of submission, then they must submit their entire proposal through Grants.gov; applications cannot be submitted in part to Grants.gov and in part as a hard-copy. Proposers using the Grants.gov do not submit paper proposals in addition to the Grants.gov electronic submission.

Grants.gov Submissions: Grants.gov requires proposers to complete a one-time registration process before a proposal can be electronically submitted. First time registration can take between three business days and four weeks. For more information about registering for Grants.gov, see http://www.darpa.mil/work-with-us/additional-baa.

Hard-copy Submissions: Proposers electing to submit cooperative agreement proposals as hard copies must complete the SF 424 R&R form (Application for Federal Assistance,) available on the Grants.gov website http://apply07.grants.gov/apply/forms/sample/RR_SF424_2_0-V2.0.pdf

Failure to comply with the submission procedures may result in the submission not being evaluated. DARPA will acknowledge receipt of complete submissions via email and assign control numbers that should be used in all further correspondence regarding proposals.

4.3. FUNDING RESTRICTIONS

Not Applicable

4.4. OTHER SUBMISSION REQUIREMENTS

Not Applicable.

5. Application Review Information

5.1. EVALUATION CRITERIA

Proposals will be evaluated using the following criteria, listed in descending order of importance:
5.1.1 Overall Scientific and Technical Merit; 5.1.2 Potential Contribution and Relevance to the DARPA Mission; and 5.1.3 Cost Realism.

5.1.1. Overall Scientific and Technical Merit

The proposed technical approach is innovative, feasible, achievable, and complete.

The proposed technical team has the expertise and experience to accomplish the proposed tasks. Task descriptions and associated technical elements provided are complete and in a logical sequence with all proposed deliverables clearly defined such that a final outcome that achieves the goal can be expected as a result of award. The proposal identifies major technical risks and planned mitigation efforts are clearly defined and feasible.

5.1.2. Potential Contribution and Relevance to the DARPA Mission

The potential contributions of the proposed effort are relevant to the national technology base. Specifically, DARPA's mission is to make pivotal early technology investments that create or prevent strategic surprise for U.S. National Security.

5.1.3. Cost Realism

The proposed costs are realistic for the technical and management approach and accurately reflect the technical goals and objectives of the solicitation. The proposed costs are consistent with the proposer's Statement of Work and reflect a sufficient understanding of the costs and level of effort needed to successfully accomplish the proposed technical approach. The costs for the prime proposer and proposed subawardees are substantiated by the details provided in the proposal (e.g., the type and number of labor hours proposed per task, the types and

quantities of materials, equipment and fabrication costs, travel and any other applicable costs and the basis for the estimates).

It is expected that the effort will leverage all available relevant prior research in order to obtain the maximum benefit from the available funding. For efforts with a likelihood of commercial application, appropriate direct cost sharing may be a positive factor in the evaluation. DARPA recognizes that undue emphasis on cost may motivate proposers to offer low-risk ideas with minimum uncertainty and to staff the effort with junior personnel in order to be in a more competitive posture. DARPA discourages such cost strategies.

5.2. REVIEW OF PROPOSALS

Review Process

It is the policy of DARPA to ensure impartial, equitable, comprehensive proposal evaluations based on the evaluation criteria listed in Section V.A. and to select the source (or sources) whose offer meets the Government's technical, policy, and programmatic goals.

DARPA will conduct a scientific/technical review of each conforming proposal. Conforming proposals comply with all requirements detailed in this BAA; proposals that fail to do so may be deemed non-conforming and may be removed from consideration. Proposals will not be evaluated against each other since they are not submitted in accordance with a common work statement. DARPA's intent is to review proposals as soon as possible after they arrive; however, proposals may be reviewed periodically for administrative reasons

Award(s) will be made to proposers whose proposals are determined to be the most advantageous to the Government, consistent with instructions and evaluation criteria specified in the BAA herein, and availability of funding.

Handling of Source Selection Information

DARPA policy is to treat all submissions as source selection information (see FAR 2.101 and 3.104), and to disclose their contents only for the purpose of evaluation. Restrictive notices notwithstanding, during the evaluation process, submissions may be handled by support contractors for administrative purposes and/or to assist with technical evaluation. All DARPA support contractors performing this role are expressly prohibited from performing DARPA-sponsored technical research and are bound by appropriate nondisclosure agreements. Subject to the restrictions set forth in FAR 37.203(d), input on technical aspects of the proposals may be solicited by DARPA from non-Government consultants/experts who are strictly bound by the appropriate non-disclosure requirements.

Federal Awardee Performance and Integrity Information (FAPIIS)

Per 41 U.S.C. § 2313, as implemented by FAR 9.103 and 2 CFR § 200.205, prior to making an award above the simplified acquisition threshold, DARPA is required to review and consider any information available through the designated integrity and performance system (currently

FAPIIS). Awardees have the opportunity to comment on any information about themselves entered in the database, and DARPA will consider any comments, along with other information in FAPIIS or other systems prior to making an award.

6. Award Administration Information

6.1. SELECTION NOTICES

As soon as the evaluation of a proposal is complete, the proposers will be notified that (1) the proposal has been selected for funding pending contract negotiations, or (2) the proposal has not been selected. These official notifications will be sent via email to the Technical POC identified on the proposal coversheet.

6.1.1. Proposal Abstracts

DARPA will respond to abstracts with a statement as to whether DARPA is interested in the idea. If DARPA does not recommend the proposer submit a full proposal, DARPA will provide feedback to the proposer regarding the rationale for this decision. Regardless of DARPA's response to an abstract, proposers may submit a full proposal. DARPA will review all full proposals submitted using the published evaluation criteria and without regard to any comments resulting from the review of an abstract.

6.1.2. Full Proposals

As soon as the evaluation of a proposal is complete, the proposer will be notified that (1) the proposal has been selected for funding pending award negotiations, in whole or in part, or (2) the proposal has not been selected. These official notifications will be sent via e-mail to the Technical POC and/or Administrative POC identified on the proposal coversheet.

6.2. ADMINISTRATIVE AND NATIONAL POLICY REQUIREMENTS

6.2.1. Meeting and Travel Requirements

There will be a program kickoff meeting in the Arlington, VA vicinity and all key participants are required to attend. Performers should also anticipate regular program-wide PI meetings and periodic site visits at the Program Manager's discretion to the Arlington, VA vicinity. Proposers shall include within the content of their proposal details and costs of any travel or meetings they deem to be necessary throughout the course of the effort, to include periodic status reviews by the government.

6.2.1. FAR and DFARS Clauses

Solicitation clauses in the FAR and DFARS relevant to procurement contracts and FAR and DFARS clauses that may be included in any resultant procurement contracts are incorporated herein and can be found at http://www.darpa.mil/work-with-us/additional-baa.

6.2.2. Controlled Unclassified Information (CUI) on Non-DoD Information Systems

Further information on Controlled Unclassified Information on Non-DoD Information Systems is incorporated herein can be found at http://www.darpa.mil/work-with-us/additional-baa.

6.2.3. Representations and Certifications

If a procurement contract is contemplated, prospective awardees will need to be registered in the SAM database prior to award and complete electronic annual representations and certifications consistent with FAR guidance at 4.1102 and 4.1201; the representations and certifications can be found at www.sam.gov. Supplementary representations and certifications can be found at www.darpa.mil/work-with-us/additional-baa.

.

6.2.4. Terms and Conditions

A link to the DoD General Research Terms and Conditions for Grants and Cooperative Agreements and supplemental agency terms and conditions can be found at www.darpa.mil/work-with-us/contract-management#GrantsCooperativeAgreements..

6.3. REPORTING

The number and types of reports will be specified in the award document, but will include as a minimum monthly financial status reports and monthly technical status reports. The reports shall be prepared and submitted in accordance with the procedures contained in the award document and mutually agreed on before award. Reports and briefing material will also be required as appropriate to document progress in accomplishing program metrics. A Final Report that summarizes the project and tasks will be required at the conclusion of the performance period for the award, notwithstanding the fact that the research may be continued under a follow-on vehicle.

6.4. ELECTRONIC SYSTEMS

6.4.1. Wide Area Work Flow (WAWF)

Performers will be required to submit invoices for payment directly to https://wawf.eb.mil, unless an exception applies. Performers must register in WAWF prior to any award under this BAA.

6.4.2. i-EDISON

The award document for each proposal selected for funding will contain a mandatory requirement for patent reports and notifications to be submitted electronically through i-Edison (http://public.era.nih.gov/iedison).

7. Agency Contacts

Administrative, technical or contractual questions should be sent via e-mail to P3@darpa.mil.

Points of Contact
The BAA Coordinator for this effort may be reached at:
P3@darpa.mil
DARPA/BTO
ATTN: HR001117S0019
675 North Randolph Street
Arlington, VA 22203-2114

8. Other Information

The Biological Technologies Office (BTO) of the Defense Advanced Research Projects Agency (DARPA) is sponsoring two Proposers Days for the planned proposer community in support of the Pandemic Prevention Platform (P3) program. A Proposers Day will be held on February 22, 2017 at the Crown Plaza Tysons Corner McLean Hotel in McLean, VA and another on March 2, 2017 at the Doubletree by Hilton Hotel San Diego Downtown in San Diego, CA. Advanced registration is required.

The Proposers Day objectives are:

- To introduce the science and technology community (industry, academia, and government) to the P3 program vision and goals;
- To facilitate interaction between investigators that may have capabilities to develop elements of interest and relevance to P3 goals; and
- To encourage and promote teaming arrangements among organizations that have the relevant expertise, research facilities and capabilities for executing research and development responsive to the P3 program goals.

The Proposers Day will include brief overview presentations by government personnel, an information session to respond to questions from participants, "lightning" talks (five minutes, one PowerPoint slide) and posters for potential proposers to highlight technical capability or interest to promote teaming, and private sidebar meetings with the DARPA government team and potential proposer teams that can be scheduled beforehand on the registration website.

Attendance at this event is not a requirement for submission of a proposal or selection for funding. Information relayed during the Proposers Day will be made available on the BTO section of the DARPA Opportunities page: http://www.darpa.mil/work-with-us/opportunities

Participants are required to register no later than **February 16, 2017 at 12:00 PM ET** for the Washington D.C. proposers day and no later than **February 24, 2017 at 12:00 PM ET** for the San Diego proposers day.

There will not be a registration fee for this workshop. Registration is limited by the venue capacity, and early registration is strongly recommended. **Teams are limited to two attendees**.

The registration cutoff date is **February 16, 2017** (Washington D.C.) or **February 24, 2017** (San Diego) or once attendance capacity is met, whichever comes first. **There will be no on-site registration.** Because it is expected that a diverse technical team will be essential to a successful program, it is strongly suggested that teams able to attend both workshops should do so to increase opportunities to network with other interested groups.

An online registration form, foreign national visit request form, and various other meeting details can be found at the registration website, http://www.cvent.com/d/9vqy52. All attendees are required to present government-issued photo identification upon entry to the event. Non-U.S. citizens are required to submit a DARPA Form 60 "Foreign National Visit Request," which is available on the registration website. The completed DARPA Form 60 must be uploaded to the registration website by **February 16, 2017** (McLean, VA) or **February 24, 2017** (San Diego, CA) at 12:00 PM ET.

9. APPENDIX 1 – Volume II checklist

Volume II, Cost Proposal
Checklist and Sample Templates

The following checklist and sample templates are provided to assist the proposer in developing a complete and responsive cost volume. Full instructions appear in Section 4.2.2 beginning on Page 24 of HR001117S0019. This worksheet must be included with the coversheet of the Cost Proposal.

1. Are all items from the Volume II, Cost Proposal cover sheet format section of **HR001117S0019** included on your Cost Proposal cover sheet?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]
   If reply is "No", please explain:

2. Does your Cost Proposal include (1) a summary cost buildup by Phase, (2) a summary cost buildup by Year, and (3) a detailed cost buildup of for each Phase that breaks out each task and shows the cost per month?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

3. Does your cost proposal (detailed cost buildup #3 above in item 2) show a breakdown of the major cost items listed below:
   Direct Labor (Labor Categories, Hours, Rates)
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Indirect Costs/Rates (i.e., overhead charges, fringe benefits, G&A)
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Materials and/or Equipment
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Subcontracts/Consultants
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Other Direct Costs
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Travel
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

4. Have you provided documentation for proposed costs related to travel, to include purpose of trips, departure and arrival destinations and sample airfare?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

5. Does your cost proposal include a complete itemized list of <u>all</u> material and equipment items to be purchased (a priced bill-of-materials (BOM))?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

6. Does your cost proposal include vendor quotes or written engineering estimates (basis of estimate) for <u>all</u> material and equipment with a unit price exceeding $5000?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

7. Does your cost proposal include a clear justification for the cost of labor (written labor basis-of-estimate (BOE)) providing rationale for the labor categories and hours proposed for each task?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

8. Do you have subcontractors/consultants? If YES, continue to question 9. If NO, skip to question 13.
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

9. Does your cost proposal include copies of all subcontractor/consultant technical (to include Statement of Work) and cost proposals?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

10. Do all subcontract proposals include the required summary buildup, detailed cost buildup, and supporting documentation (SOW, Bill-of-Materials, Basis-of-Estimate, Vendor Quotes, etc.)?
    ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

    If reply is "No", please explain:

11. Does your cost proposal include copies of consultant agreements, if available?
○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

12. If requesting a FAR-based contract, does your cost proposal include a tech/cost analysis for all proposed subcontractors?
○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

13. Have all team members (prime and subcontractors) who are considered a Federally Funded Research & Development Center (FFRDC), included documentation that clearly demonstrates work is not otherwise available from the private sector AND provided a letter on letterhead from the sponsoring organization citing the specific authority establishing their eligibility to propose to government solicitations and compete with industry, and compliance with the associated FFRDC sponsor agreement and terms and conditions.
○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

14. Does your proposal include a response regarding Organizational Conflicts of Interest?
○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

15. Does your proposal include a completed Data Rights Assertions table/certification?
○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

Pandemic Prevention Platform (P3)

COL Matthew Hepburn, MD
Program Manager, Biological Technologies Office (BTO)

Briefing for:

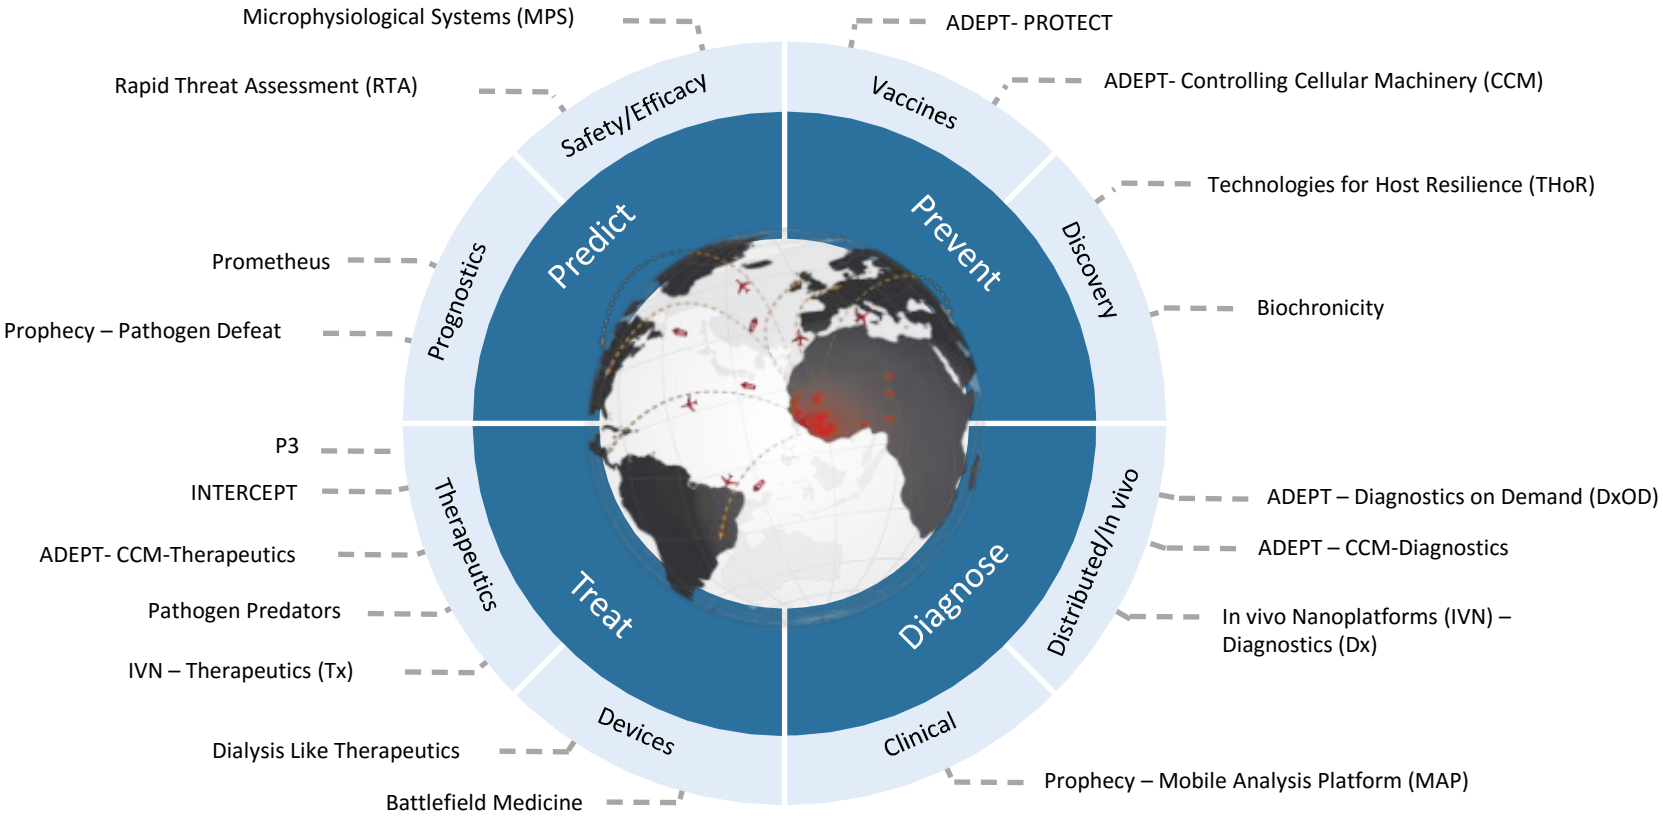
P3 Proposers Day

February 22, 2017

Approved for public release; distribution is unlimited.

BTO Vision for Pandemic Preparedness

Develop scalable operational technologies that have the capability to predict, prevent, diagnose, and treat pandemic infectious disease outbreaks



Approved for public release; distribution is unlimited.

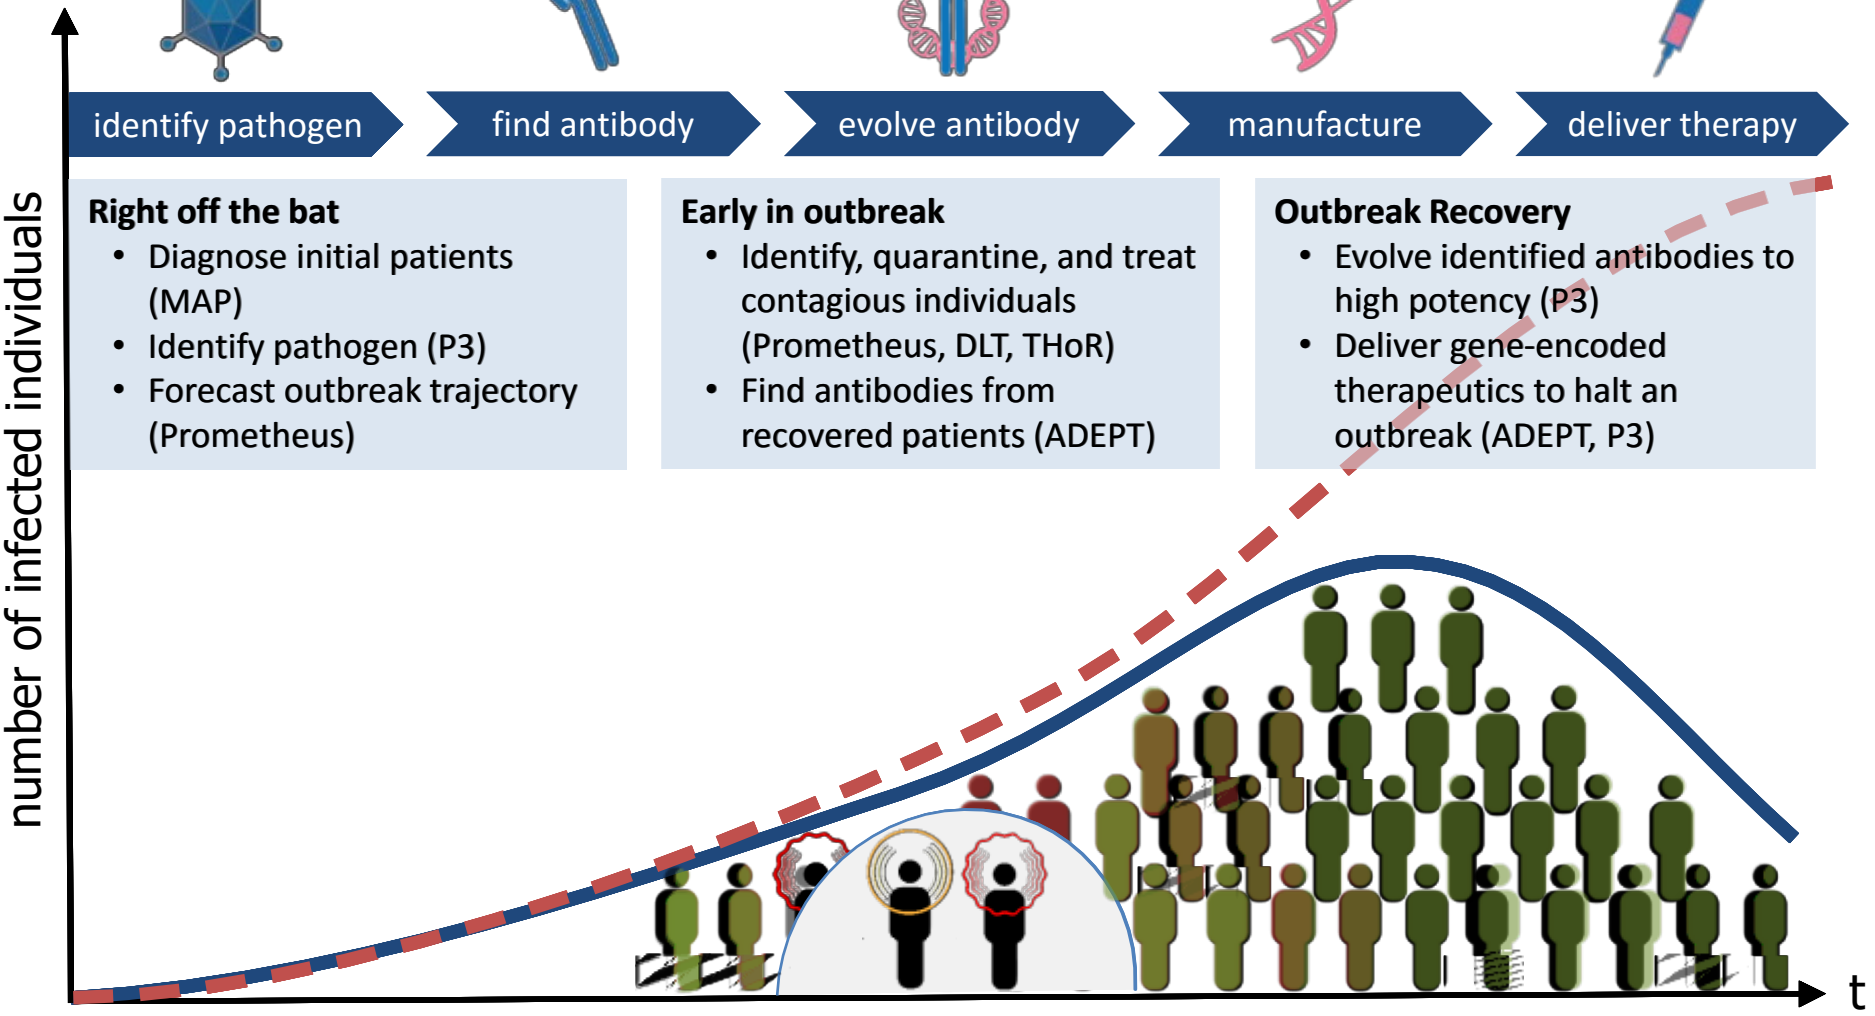
Pandemic Response Capabilities

identify pathogen → find antibody → evolve antibody → manufacture → deliver therapy

Right off the bat
- Diagnose initial patients (MAP)
- Identify pathogen (P3)
- Forecast outbreak trajectory (Prometheus)

Early in outbreak
- Identify, quarantine, and treat contagious individuals (Prometheus, DLT, THoR)
- Find antibodies from recovered patients (ADEPT)

Outbreak Recovery
- Evolve identified antibodies to high potency (P3)
- Deliver gene-encoded therapeutics to halt an outbreak (ADEPT, P3)



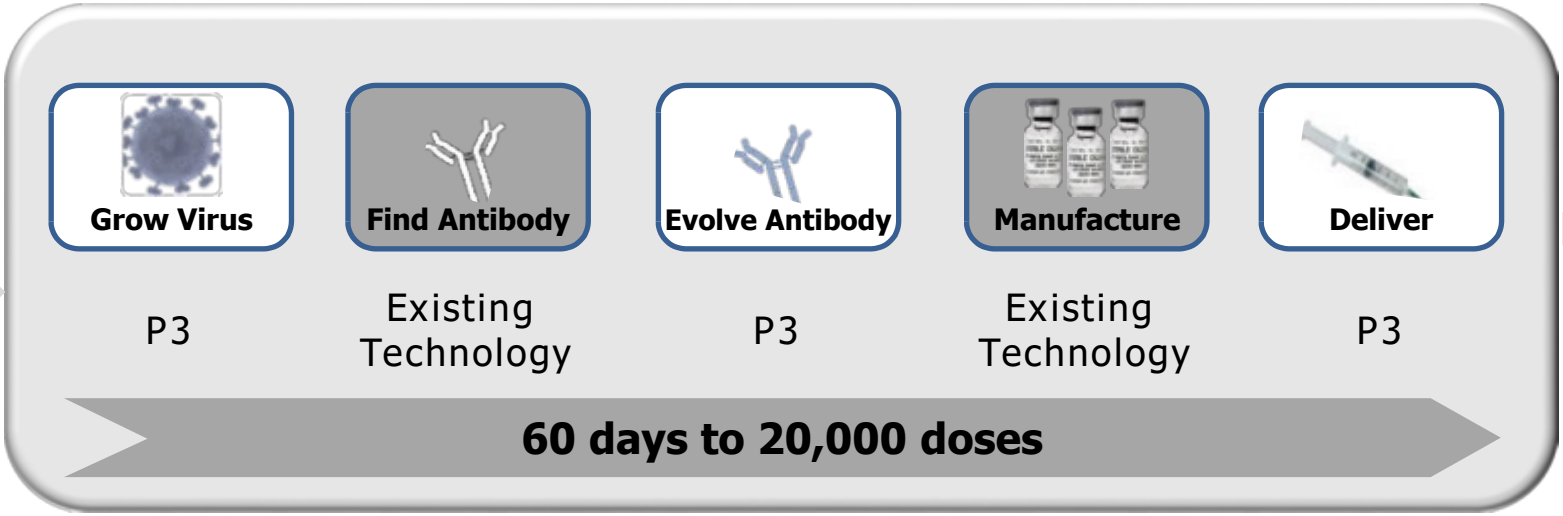
Manufacture and deliver gene-encoded antibody products for prophylaxis among at-risk populations

Approved for public release; distribution is unlimited.

Pandemic Prevention Platform (P3) Vision

Develop a functionally integrated platform to deliver pandemic prevention treatments in <60 days

Pandemic Outbreak
Any Virus



Treatment to Prevent Pandemic

Approved for public release; distribution is unlimited.

Capability Demonstrations

Grow Virus

Find Antibody

Evolve Antibody

Manufacture

Deliver

Grow enough virus for pre-clinical evaluation:

- Bait
- In vitro Testing and Evolution
- In vivo Testing and Evaluation

Identify an Antibody (or Countermeasure)

- Naïve or convalescent sample
- "Other" technology will be considered

Evolve Antibody (or Countermeasure)

- Increased potency (100-fold)
- Will be dependent on proposed pathogen

Research Grade Manufacturing

- Downstream in vivo testing

Clinical Grade Manufacturing

- 1000 doses for phase I clinical study – during **1** demo

Testing and Evaluation

- Test production and efficacy in small and large animals
- **1X** - Phase I safety study –

*<60 days does not apply to the Phase I study

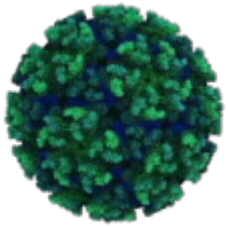
Complete the entire process, end-to-end, in <60 days

Approved for public release; distribution is unlimited.

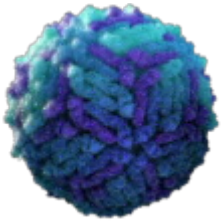
Program Considerations

- **Pathogen Selection**

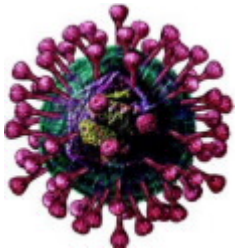
Example Pathogens:



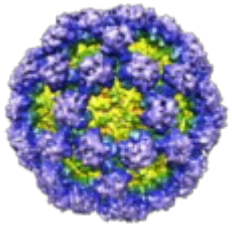
Chikungunya virus



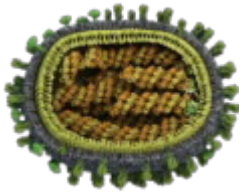
Dengue virus



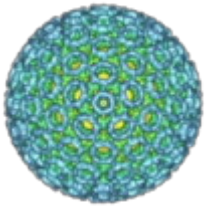
Coronavirus (MERS/SARS)



Noroviruses



Influenza virus

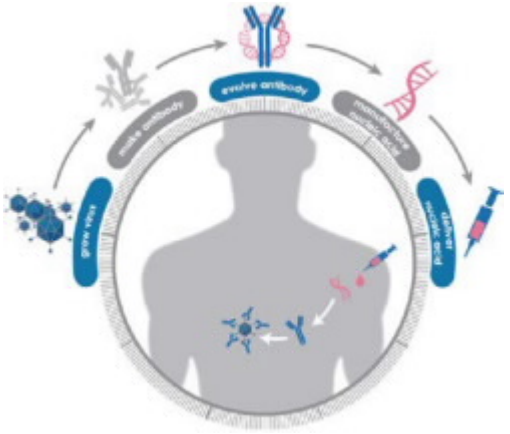


Rift Valley Fever virus

- **Milestones and Metrics**

Time

Quality



Process Logistics

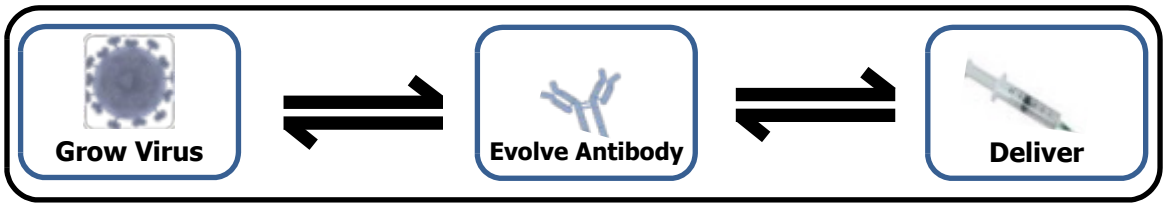
- **Approach and Teaming**

Approved for public release; distribution is unlimited.

Program Structure & Government Partners

Program Month:

0	3	6	9	12	15	18	21	24	27	30	33	36	39	42	45	48



Platform Development (30 months)

Capability Demo #1

Capability Demo #2

Capability Demo #3

End-to-End Platform Demo/Testing

Fully Integrated Capability Demonstrations #4 and #5 (2x 60 day simulations)

Blinded pathogens

Approved for public release; distribution is unlimited.

The purpose of Modification 2 to HR001117S0019, the Pandemic Prevention Platform (P3) Broad Agency Announcement, is to change the requirement for the quantity of virus that must be grown as part of the effort. Specifically, the requirement to grow 10^{13} infectious viral units is no longer applicable. The new requirement states that performers must demonstrate the ability to grow pathogen quantities that are sufficient to complete medical countermeasure development, including "bait" for antibody or countermeasure discovery as well as *in vitro* and *in vivo* assays to determine countermeasure efficacy.

The corresponding changes can be found on pages 12 and 13 of the BAA and are bolded below:

Platform Integration and Testing

To ensure end-to-end functional platform integration, the performer will be required to transition the technological advances from the three TAs into capability demonstrations. A central component of this program will be the demonstration of an end-to-end platform functionality. The first capability demonstration will occur in month 12 of the program. Performer groups will be allotted 90 days to:

- **Grow pathogen quantities sufficient to complete medical countermeasure discovery, testing, and evaluation**
- Discover pathogen-specific antibodies
- Successfully transition both antibody/therapy and virus to the antibody evolution group
- Evolve antibody/therapy to 100-fold increased potency
- Deliver genetic sequence of highly potent antibody/therapy to the manufacturing group (data)
- Manufacture research grade material for animal studies
- Demonstrate both product delivery and protection from viral challenge in an animal model

At month 24, performers will conduct a capability demonstration with a pathogen of performer choice. At 36 months, performers will conduct a third 60-day capability demonstration with a DARPA selected pathogen. It is required that during one of the capability demonstrations, GMP manufacturing of clinical grade material will be completed for use in a human clinical trial. The proposal must include a discussion of the number of doses to be manufactured during the demonstration, and the time for manufacturing of these doses must fall within the 60-day timeline.

Using the lessons learned in the previous capability demonstrations, performers will conducted two final capability demonstrations with pathogens that are unidentified to the groups to simulate a "real–world" response to an unknown pathogen. The final deliverable will be the ability to produce at a minimum 1000 doses. The platform should be capable to scale-up manufacturing to 20,000 doses of gene-encoded antibody product for Phase I/II human clinical trials in <60 days, with a delivery platform able to achieve protective levels inside the body.

Finally, the proposal must include a discussion of where the capability platform will be located. It is anticipated that the platform will either be centrally located in one facility run by one of the performer teams, or that aspects of the platform will be physically located at different facilities which are integrated through a system of agreements allowing for the facile transfer of material between locations. In the latter case, the proposal must discuss the coordination and management of the decentralized platform.

Proposers must provide the following in the proposal:

- The proposed manufacturing plan, demonstrating the ability to GMP manufacture products in addition to being able to scale-up manufacturing and distribute 20,000 doses
- The proposed transition plan describing the product/data pipeline from receipt of pathogen and antibody input to final product
- The regulatory plan for phase I clinical safety trials

Table 1. Program metrics and milestones

Technical Metrics
TA 1: On-demand platform to grow virus **1. Grow pathogen quantities sufficient to complete medical countermeasure discovery, testing, and evaluation** 2. Pathogen genetic drift less than 0.1% after 5 successive culturing (growth) iterations (mutations per base pair per culturing cycle) 3. Progeny virus bio-identical to original isolate in lipid, protein, and carbohydrate content 4. Apply platform to five viruses representing at least one RNA virus, one DNA virus, and both (+)-sense and (-)-sense single stranded viral genomes
TA 2: System to evolve antibodies. 1. Ready for use in less than 72 hours 2. Demonstrate the ability to couple antibody discovery capability with the antibody evolution capability either through new discovery technologies or physical coupling with existing technologies 3. Support rapid potency maturation improving antibody/therapy greater than 100-fold in under 8 days 4. Apply technology to mature five different antibodies/therapies targeting at a minimum three (3) different pathogens representing at least one RNA virus, one DNA virus, and both (+)-sense and (-)-sense single stranded viral genomes *While it is assumed that the development of antibody therapies may be necessary to achieve a protective countermeasure in <60 days, all innovative approaches that meet the time and quality metrics stated above will be considered.

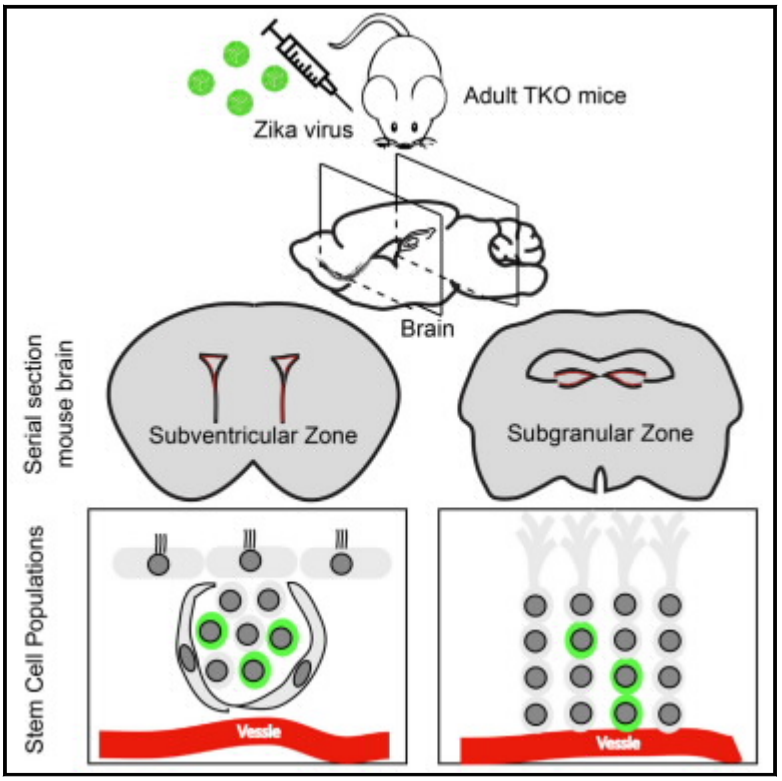
Technical Metrics
TA 3: Deliver medical countermeasure(s) 1. Achieve greater than 10 μg/mL serum concentration of target medical countermeasure with peak production in <3 days post-injection in large animals 2. Minimally or low-invasive simple delivery method given at 1 delivery site 3. Demonstrate reproducible production (less than 10% variance in serum concentration) in large animals 4. Demonstrate 100% protection against performer defined pathogen challenge in animal models by day 3 post countermeasure administration 5. Demonstrate longevity of protection lasts for greater than 30 days *While it is assumed that the development of antibody therapies may be necessary to achieve a protective countermeasure in <60 days, all innovative approaches that meet the time and quality metrics stated above will be considered.
Platform Integration: All of the following metrics must be achieved within 60 days and must include full integration with the metrics for TA1-3: 1. Demonstrate the ability to identify a pathogen specific antibody/therapy for rapid affinity maturation in TA2 within 14 days 2. Demonstrate the ability to manufacture research grade genetic constructs for use in animal studies 3. Demonstrate the ability to manufacture clinical grade GMP material for human safety trials – this metric must be met for only one of the phase II demonstrations. The ability to scale-up manufacturing and distribution to 20,000 doses must also be addressed as part of this metric 4. Demonstrate safety and efficacy in animal models and in human clinical trials

Brief Report

Cell Stem Cell

Zika Virus Infects Neural Progenitors in the Adult Mouse Brain and Alters Proliferation

Graphical Abstract



Highlights

- Zika virus (ZIKV) can infect neural progenitors in the adult mouse brain
- ZIKV-infected adult NPCs show evidence of cell death
- Cell proliferation is also impacted in ZIKV-infected adult NPC populations

Authors

Hongda Li, Laura Saucedo-Cuevas, Jose A. Regla-Nava, ..., Alexey V. Terskikh, Sujan Shresta, Joseph G. Gleeson

Correspondence

sujan@lji.org (S.S.), jogleeson@rockefeller.edu (J.G.G.)

In Brief

Li et al. show that peripheral ZIKV exposure in a mouse model can infect adult neural stem cells in the brain, leading to cell death and reduced proliferation. Thus, in addition to impacting fetal development, ZIKV infection may also have negative effects on the adult brain.

SUMMARY

Zika virus (ZIKV)-related neuropathology is an important global health concern. Several studies have shown that ZIKV can infect neural stem cells in the developing brain, but infection in the adult brain has not been examined. Two areas in the adult mouse brain contain neural stem cells: the subventricular zone of the anterior forebrain and the subgranular zone of the hippocampus. Here, using 6-week-old mice triply deficient in interferon regulatory factor (IRF) as a model, we show that blood-borne ZIKV administration can lead to pronounced evidence of ZIKV infection in these adult neural stem cells, leading to cell death and reduced proliferation. Our data therefore suggest that adult as well as fetal neural stem cells are vulnerable to ZIKV neuropathology. Thus, although ZIKV is considered a transient infection in adult humans without marked long-term effects, there may in fact be consequences of exposure in the adult brain.

Recent world attention has been drawn to a global Zika virus (ZIKV) outbreak and its link with devastating cases of microcephaly and Guillain-Barre syndrome. ZIKV infection is spreading rapidly within the Americas after originating from an outbreak in Brazil (Campos et al., 2015). Mounting evidence suggests that ZIKV infection in pregnant women can cause congenital abnormalities as well as fetal demise (Calvet et al., 2016; Cugola et al., 2016; Miner et al., 2016; Wu et al., 2016). Initial case descriptions of microcephaly and spontaneous abortions have been supported by evidence of viral RNA and antigen in the brains of congenitally infected fetuses and newborns (Martines et al., 2016; Mlakar et al., 2016).

The radial-glial-derived cortical neural stem cells (NSCs) in the fetal brain appear to be especially impacted by ZIKV infection, either through greater susceptibility to the viral infection or virus-induced cytotoxicity. This same population is affected by inherited forms of microcephaly, suggesting that loss of these cells is responsible for the microcephaly after ZIKV infection. Indeed recent work demonstrated that ZIKV can infect human cortical NSCs and attenuate their growth and survival, when applied directly to either monolayer culture (Tang et al., 2016) or cerebral organoids or neurospheres (Dang et al., 2016; Garcez et al., 2016; Nowakowski et al., 2016; Qian et al., 2016). Vertical transmission from ZIKV-infected murine dams to fetuses yielded virus in brain and histopathological evidence of cytotoxicity, supporting direct infection of NSCs. Effects of ZIKV on the placenta and secondary effects on brain may have also contributed (Miner et al., 2016).

Many vector-borne flaviviruses have to overcome host type I IFN responses to replicate and cause disease in vertebrates. Wild-type mice are resistant to parenteral infection with dengue virus (DENV), and unlike in human cells where the virus is able to block type I and type II IFN receptor signaling, murine cells do not show the same block (Aguirre et al., 2012; Ashour et al., 2010; Yu et al., 2012). Therefore, similar to DENV mouse models, current ZIKV models utilize mice lacking one or more components of the IFN signaling. These models include the use of the IFN regulatory factor (IRF) transcription factors IRF-3, -5, and -7 triple knockout strain (aka IRF-TKO) (Zellweger and Shresta, 2014), which lacks type I IFN production. These mouse models appear to reproduce key features of human ZIKV infection, including viremia and neuronal tissue tropism, and are proving to be valuable for answering fundamental questions about ZIKV pathogenesis.

In the adult brain, neurogenesis contracts after birth to just the anterior subventricular zone (SVZ) of the forebrain and the subgranular zone (SGZ) of the hippocampal dentate gyrus. These restricted niches contain progenitor cells that divide to produce neurons or glia, depending upon intrinsic and environmental cues. Neurogenic niches are characterized by a comparatively high vascular density and proximity to cerebrospinal fluid (CSF) (Stolp and Molnár, 2015), allowing not just communication through signaling molecules but also proximity to circulating viruses.

To identify direct target cells of ZIKV in the adult CNS, we infected 5- to 6-week-old *Irf3*$^{ff/ff}$ *Irf5*$^{ff/ff}$ *Irf7*$^{ff/ff}$ TKO mice with an Asian lineage ZIKV strain (FSS13025, 2010 Cambodian isolate) via retro-orbital injection (see Supplemental Experimental Procedures for section of strain rationale). Retro-orbital

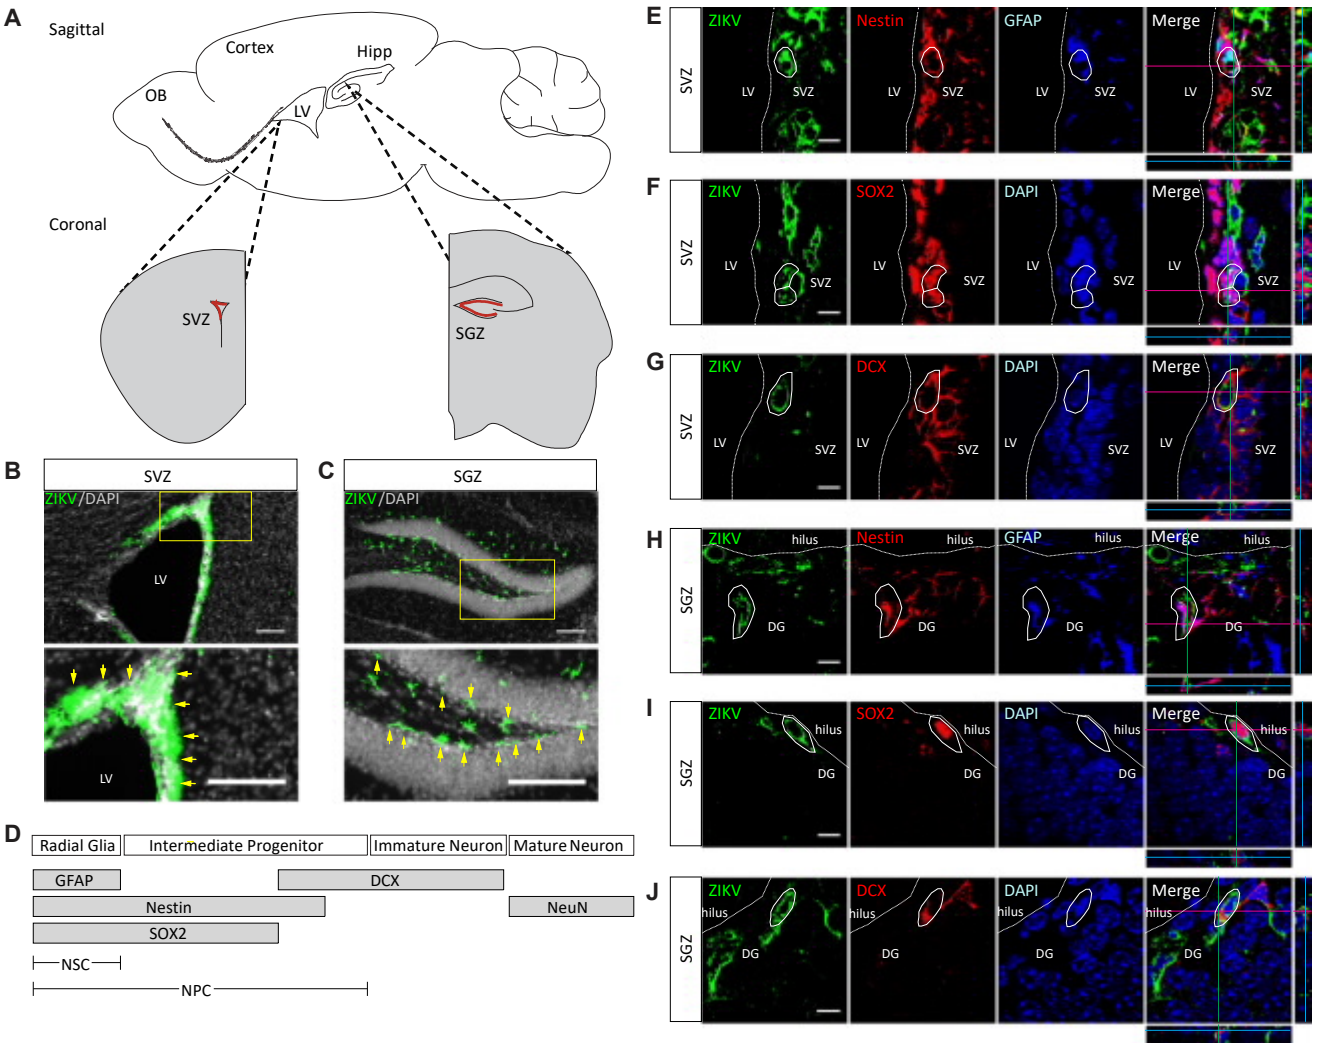

Figure 1. Systemic ZIKV Can Infect Neural Progenitor Cells in the Adult Brain

(A) Schematic of stem cell niches in adult mouse brain. Neural progenitor cells (NPCs) located in the subventricular zone (SVZ) in the anterior forebrain (red) adjacent to the cerebral ventricles contribute new neurons to the olfactory bulb. NPCs in the subgranular zone (SGZ) in the dorsal forebrain (red) contribute new neurons to the hippocampal dentate gyrus. LV, lateral ventricle; OB, olfactory bulb; Hipp, hippocampus.

(B and C) Adult TKO mice were infected with ZIKV and then sacrificed, their brains were serially sectioned, and they were immunostained for ZIKV envelope protein (green). Evidence of ZIKV was found in the SVZ and SGZ, with less expression elsewhere in adult brain. High-power inset below with arrows (yellow) highlights immunoreactive cells. LV, lateral ventricle. Scale bar, 100 mm.

(D) Marker expression during neural stem cell (NSC) differentiation from radial glia to mature neuron.

(E–J) Confocal images and orthogonal projection of SVZ and SGZ regions co-stained for GFAP, Nestin, SOX2, and DCX with ZIKV envelop protein, evidencing ZIKV in NPCs and immature neuron populations. White circle outlines: infected cells. LV, lateral ventricle; SVZ, subventricular zone; DG, dentate gyrus. Scale bar, 10 mm.

injection was selected as a method to introduce virus into the peripheral circulation, rather than direct introduction into the brain, to model the blood-borne route of arbovirus transmission. In results similar to those of a previous report, TKO mice were vulnerable to ZIKV infection (Lazear et al., 2016) and began to exhibit ruffled fur and lethargy as evidence for viral illness by 3–4 days post-infection (DPI) and developed evidence of hindlimb weakness by 6 DPI.

To examine the potential for virus infection in the brain, we screened serial coronal sections of whole brain from infected and mock-treated mice with the monoclonal 4G2 antibody that reacts with the flavivirus-specific family envelope protein. We observed dramatic immunoreactivity in proximity to the SVZ of the anterior forebrain, as well as the SGZ of the hippocampus (Figures 1A–1C), the two regions in mouse that maintain stem cell populations throughout adulthood, in infected (but not mock-infected) mice. In contrast there was less immunoreactivity in other regions of the brain under these conditions (Figures S1A–S1C), suggesting a particular tropism of the virus for proliferative regions of the brain. Quantification across major brain regions showed statistically significant selective vulnerability to these proliferative zones (Figure S1D).

(legend on next page)

In adult SVZ and SGZ, radial-glia-like NSCs give rise to intermediate progenitor cells (IPCs), which then migrate to final destinations, where they express developmental-dependent markers and integrate into neuronal circuitry (Figure 1D, see Supplemental Information). For the remainder of this paper, neural progenitor cell (NPC) is used to refer to both NSCs and IPCs. To identify which cells were positive for 4G2, we co-stained them with different cell type markers. We detected the presence of ZIKV in GFAP- and Nestin-expressing NSCs, SOX2-expressing IPCs, and DCX-expressing immature neurons (Figures 1E–1J). 4G2 reactivity in sagittal sections confirmed ZIKV-infected DCX+ cells along the rostral migratory stream (Figure S1E). Consistent with previous reports where ZIKV was introduced directly into newborn and juvenile brain (Bell et al., 1971), we detected 4G2 reactivity in NeuN-expressing neurons and S100b-expressing astrocytes (Figures S2A–S2D), but much less than that in SOX2+ or DCX+ cells (Figures S2F and S2G). We rarely observed 4G2 reactivity in NG2-expressing oligodendrocytes (Figures S2E). We conclude that ZIKV has tropism for proliferative NPCs and immature neurons over terminal-differentiated cell population in the adult brain.

ZIKV infection can lead to caspase-3 (CASP3) activation in both NPCs differentiated from human ESCs/IPSCs and embryonic mouse brain (Cugola et al., 2016; Miner et al., 2016). In order to determine whether systemic ZIKV infection can induce cell death in adult NPC populations, we stained for cleaved (i.e., activated) CASP3 in NPC niches. Mock-infected TKO mice showed scant evidence of CASP3+ cells. In contrast abundant CASP3+ cells were detected in ZIKV-infected brains within these neurogenic niches (Figures 2A–2D), and were also usually positive for Nestin. Similarly, the ZIKV staining colocalized with CASP3 in NPCs in the SVZ and SGZ (Figures S2I and S2J), suggesting that ZIKV infection can induce apoptotic cell death in adult NPCs in these regions.

We assessed the impact of systemic ZIKV infection on cell proliferation in niches in adult brain using the thymidine analog EdU and a series of cell-cycle markers. We performed EdU pulse-labeling in TKO mice 6 days after ZIKV or mock infection. Quantitative analysis at 2 hr after EdU injection showed that, in both neurogenic regions, although the brain size and volume of the SGZ and SVZ was not notably different (Figure S2H), ZIKV-infected mice had approximately a 4- to 5-fold reduction in the number of EdU+ cells per section, compared with mock (Figures 2E and 2H).

Consistent with the EdU-labeling results, there were many fewer cells positive for the proliferation marker Ki67 in the SVZ and SGZ, which was reduced by approximately 2- to 3-fold (Figures 2F and 2I). Similarly, there were many fewer cells positive for the mitotic marker phospho-Histone H3 in the SVZ and SGZ, reduced by approximately 2- to 4-fold (Figures 2G and 2J). Results were statistically significant and consistent across the three infected and three mock-infected animals. These results indicate that ZIKV infection leads to decreased NPC proliferation in the adult SGZ and SVZ.

Here we demonstrate that ZIKV exposure in adult mice shows infection of brain with a predilection for neurogenic niches and is associated with cellular apoptosis and reduction of cellular proliferation. Based upon the presence of the ZIKV antigen following exposure, we conclude that the virus was able to infect SVZ and SGZ niche cells to a much greater degree than non-neurogenic regions. This infection correlated with evidence of apoptosis and reduced numbers of cells evidencing DNA synthesis or proliferation. However, the relative contribution of these features, as well as the long-term effects, on the NPC niches remains unknown. Our results suggest that ZIKV infection can enter the adult brain and lead to neuropathology in mammals.

The degree to which IFN-deficient mice model the extent and severity of flavivirus infection in humans is unknown. We recognize that healthy humans may be able to mount an effective antiviral response and prevent entry into the CNS, but it remains a possibility that some immunocompromised humans and even some apparently healthy humans may be susceptible in ways modeled by the TKO mice. It will be important to determine the extent of involvement of stem cell niches with less immunocompromised strains of mice. Brain inflammation in general, including IFN-a induction, can lead to reduction in adult neurogenesis (Kaneko et al., 2006; Kohman and Rhodes, 2013), and therefore the interaction between ZIKV infection and IFN signaling pathway and its impact on adult neurogenesis merit further investigation.

There are several caveats to our study, representing a single viral strain, single mouse strain, and single time point analysis. First, ZIKV infection can downregulate expression of neural progenitor markers like Nestin and SOX2 (Tang et al., 2016) and thus our analysis may underestimate the proportion of infected cells co-expressing these markers. Second, infected NPCs could have divided or differentiated between infection and harvest, and therefore future time course studies could be important. Third, we noticed that some ZIKV-infected cells in non-neurogenic regions of the brain, such as the hilus of the hippocampus (Figure S1B2), were not positive for NPC markers. Further examination will help identify whether these cells represent microglia or infiltrating neutrophils (Aliota et al., 2016) or some other cell type.

CNS involvement associated with other flavivirus infections in adults is receiving increasing attention. Although DENV infection

Figure 2. ZIKV-Infected Adult NPCs Undergo Cell Death and Show Reduced Proliferation

(A and C) Representative images of SVZ (A) or SGZ (C) region from ZIKV-infected brains showing more CASP3+ cells (arrows) compared to regions in mock-infected brains. Scale bar, 100 mm.

(B and D) Quantification of the number of CASP3+ cells relative to mock-infected brains. All data represent means ± SEM, n = 3 animals for each group. Student's t test, *p < 0.05, **p < 0.01.

(E) Adult TKO mice were infected with ZIKV or mock, injected with EdU after 6 days, then sacrificed after 2 hr. ZIKV-infected animals show reduced incorporation of EdU in both SVZ and SGZ, indicating reduced entry into S-phase. Scale bar, 100 mm.

(F) Reduced Ki67 staining in ZIKV-infected mice in both SVZ and SGZ, indicating reduced cell proliferation. Scale bar, 100 mm.

(G) Reduced phospho-histone H3 (pH3) staining in ZIKV-infected mice in both SVZ and SGZ, indicating reduced mitotic cells. Scale bar, 100 mm.

(H–J) Stereological quantification of the number of EdU+, Ki67+, and pH3+ cells in each mouse was performed in every sixth section of the entire brains from three pairs of ZIKV and mock-infected animals. All data represent means ± SEM, n = 3 animals for each group. Student's t test, *p < 0.05, **p < 0.01.

in humans usually produces a self-limited illness, CNS involvement is now considered criteria for severe dengue in the World Health Organization (WHO) classification (http://www.who.int/tdr/publications/documents/dengue-diagnosis.pdf), other criteria for which include but are not limited to cerebrospinal fluid viremia and encephalitis or meningoencephalitis, and was detected in nearly half of fatal dengue cases (Araújo et al., 2012). Approximately 1:150 cases of West Nile infection show neuroinvasive disease or encephalitis, with potential manifestations of flaccid paralysis, extrapyramidal findings, coarse tremor, myoclonus, and substantial cognitive difficulties. ZIKV can produce neurological findings to include demyelinating polyneuropathy and brachial plexopathy and recently acute meningoencephalitis (Carteaux et al., 2016). It will be important to evaluate the areas damaged following ZIKV CNS infection in humans, especially in neurogenic regions, and consider potential consequences on neurocognition.

Neurotropic viruses can gain entry into the CNS and cause disease through different means (Luethy et al., 2016), but how ZIKV gains entry into the brain remains unknown. Current models include entry of the virus directly across the blood-brain barrier (BBB), across synapses from peripheral nerves, or through entry of infected microglia. Once across the BBB, the means of entry into NPCs may be through specific transmembrane receptors, such as the candidate AXL receptor (Miner and Diamond, 2016; Nowakowski et al., 2016). The means by which infection leads to NPC death is also under active study. We hypothesize that the particular cell death in NPCs may be p53 mediated, in keeping with current models of human microcephaly (Pilaz et al., 2016; Tang et al., 2016).

Infection of NPCs in stem cell niches may relate to the emergent cases of ZIKA-linked GBS, an acute post-infectious immune-mediated polyradiculoneuropathy. The dramatically increased GBS incidence in ZIKV endemic regions (Watrin et al., 2016) and evidence of acute ZIKV infection in GBS patients from these regions (Beckham et al., 2016) suggests a causal relationship. A broad range of antibodies directed to neuronal glycolipids, possibly emerging from cross-reaction to viral proteins or release of neural antigens from damaged cells, are observed in some GBS cases. Although identified in many non-ZIKV-related GBS cases, less than 50% of sera at admission from ZIKV-related GBS showed significant auto-antibodies to glycolipids, and moreover complementary analysis did not show any competition between the glycolipid GA1 and ZIKV proteins, suggesting absence of antigenic mimicry (Beckham et al., 2016). Our data suggest that ZIKV-infected NPCs could release neural antigens as a possible source of auto-antibodies, although we cannot rule out that other neural cells are the target relevant to GBS.

A recent study using radioactive carbon dating reported a striking annual turnover rate of 1.75% in the human dentate gyrus, where approximately 700 new neurons are added every day from the SGZ to the pool of excitatory granule neuron population to support plasticity (Spalding et al., 2013). Furthermore, hippocampal neurogenesis deficits have been linked to cognitive deficits characteristic of depression (Patrício et al., 2013) and Alzheimer's disease (Demars et al., 2010; Rodríguez et al., 2011). SGZ neurogenesis is critical in rodents for hippocampal-dependent contextual conditioning learning (Saxe et al., 2006; Winocur et al., 2006), longer-term spatial memory (Deng et al., 2009), and pattern separation (Clelland et al., 2009; Sahay et al., 2011). Whether there are long-term effects of ZIKV on adult neurogenesis or cognition in rodents or humans will be an important question for the future.

SUPPLEMENTAL INFORMATION

Supplemental Information for this article includes two figures and Supplemental Experimental Procedures and can be found with this article online at http://dx.doi.org/10.1016/j.stem.2016.08.005 .

AUTHOR CONTRIBUTIONS

H.L. and L.S.-C. performed histological assessment and statistics; J.A.R.-N., N.S., and W.T. performed mouse breeding and infections; and G.C. and W.T. performed animal surgery and perfusions. H.L., L.S.-C., S.S., and J.G.G. designed the experiments and wrote the paper. A.V.T assisted with experimental design and edited the manuscript. S.S. and J.G.G supervised the project.

REQUEST FOR QUOTATION/PROPOSAL (RFQ/P)

GENERAL PROVISIONS

We would like to take this opportunity to remind suppliers of our commitment to conduct business with uncompromising integrity. This commitment is clearly established in Leidos' Code of Conduct. Leidos expects suppliers to conduct themselves in a manner consistent with the principles of our code of conduct. In addition, we strongly encourage our suppliers to have proactive and meaningful ethics programs established within their organizations. We want our suppliers to understand, foster, and mirror the ethical conduct we expect from our employees in all business transactions. If you believe that Leidos or any of its employees or agents has acted improperly or unethically, please report such behavior to the Leidos ethics HOTLINE (855) 7LEIDOS.

1. **LATE OFFERS.** Formal offers, amendments, or requests for withdrawal of offers received after the date specified for submittal may not be considered.

2. **ALTERNATE PROPOSALS.** In addition to the offer solicited herein, the offeror is invited to submit an alternate proposal, which may be advantageous to Leidos ("Leidos" or "Buyer").

3. **DISCLOSURE OF PARTICIPANTS.** All lower-tier subcontractors must be disclosed with the proposal.

4. **COMPLETENESS.** All information required by RFQ/P must be supplied to constitute a responsive bid. Non-responsive offers may not be considered.

5. **BRAND NAMES.** Brand names and part numbers, when used, are for reference to indicate the performance or quality desired. Equal items will be considered provided that the offeror describes the article. Offers for equal items shall state the brand name and part number, or level of quality. The determination of the Buyer as to what items are equal shall be final and conclusive. When brand name, part number, or level of quality is not stated by the offeror, it is understood the offer is exactly as specified.

6. **COUNTERFEIT PRODUCTS.** For purposes of this clause, Goods are any tangible items, including without limitation the lowest level of separately identifiable items, such as parts, articles, components, and assemblies. "Counterfeit Goods" are Goods that are or contain items misrepresented as having been designed, produced, and/or sold by an authorized manufacturer and seller, including without limitation unauthorized copies, replicas, or substitutes. The term also includes authorized Goods that have reached a design life limit or have been damaged beyond possible repair, but are altered and misrepresented as acceptable.

   Offeror agrees and shall ensure that Counterfeit Goods are not delivered to Leidos. Goods delivered to Leidos or incorporated into other Goods and delivered to Leidos shall be new and shall be procured directly from the Original Component Manufacturer (OCM)/Original Equipment Manufacturer (OEM), or through an OCM/OEM authorized distributor chain. If requested by Leidos, bidder shall provide OCM/OEM documentation that authenticates products. Offeror shall report suspected or confirmed counterfeit items into the Government-Industry Data Exchange Program (GIDEP).

7. **NET PRICES.** Offered prices, unless otherwise specified, must be net, including transportation and handling charges, which shall be set forth as a separate line item on quotation/proposal. Transportation charges must be fully prepaid by offeror to destination, and subject only to cash discount for prompt payment of invoices.
   a. Prices should be quoted as "Unit" prices; do not quote "Lot" prices.
   b. Provide pricing schedule based on specified price breaks, if any.
   c. If applicable, furnish published price list with offer.

8. **EVALUATION.** Buyer reserves the right: (1) to award on the basis of individual items, or groups of items, or on the entire list of items; (2) to reject any or all offers, or any part thereof; (3) to waive any informality in the offers; and (4) to accept the offer that is in the best interest of Leidos. The Buyer's decision shall be final.

9. **NO BID.** In the event an offer cannot be submitted for the specified requirements as set forth in the RFQ/P, please provide an explanation as to why you are unable to bid on these requirements.

10. **TAXES.** Buyer may be exempt from the payment of any federal excise or any state sales tax. The price offered must be net, exclusive of taxes. However, when under established trade practice, any federal excise tax is included in the list price, offeror may quote the list price and shall show separately the amount of federal tax, either as a flat sum or as a percentage of the list price, which shall be deducted by Buyer.

11. **AWARD.** The order will be awarded to the lowest responsible and responsive offeror complying with all the provisions of the RFQ/P, provided the offered price is reasonable and is in the best interest of Buyer. The Buyer reserves the right to reject the offer of an offeror who has previously failed to perform properly or complete on time, contacts of similar nature, or the offer of an offeror who, under investigation shows is not in position to perform the order.

12. **ACCEPTANCE.** A written award mailed (or otherwise furnished) to the successful offeror shall be deemed to result in a binding contract without further action by either party.

13. **SERVICE LIFE.** When applicable, all offerors will state their company policy regarding the return of defective and unserviceable items or products as well as the minimum service life of the offered item or product.

14. **DELIVERY.** When applicable, all shipments are to be made F.O.B. to a specific destination as specified, or prepaid. Collect shipments can be accepted only with proper advance notification, and only with specific approval from the Buyer.

15. **PACKING SLIPS OR DELIVERY TICKETS.** When applicable, all shipments or deliveries shall be accompanied by Packing Slips or Delivery Tickets in duplicate and shall contain the following information for each item delivered:
    a. Purchase Order Number
    b. Item Number
    c. Description or Part Number
    d. Quantity Ordered
    e. Quantity Shipped
    f. Name of the Supplier
    g. The above requirement is extremely important when accepting shipments. Offerors are cautioned that failure to comply with these conditions shall be considered sufficient reason for refusal to accept the goods.

16. **LIABILITY.** Leidos is not obligated to pay for any expenses incurred as a result of your efforts to respond to this solicitation. Moreover, Leidos will not, by virtue of this solicitation, become obligated to award a purchase order. Leidos reserves the right to subsequently award the effort described herein to a respondent determined to be in compliance with the guidelines and in the overall best interest of Leidos and its customer.

    Leidos will not accept confidential or proprietary information without a signed Non-Disclosure Agreement. All information provided by you in response to this solicitation will remain the property of the Leidos.

    The Offeror shall hold Buyer, its officers, agents, servants, and employees, harmless from liability of any nature or kind because of use of any copyrighted, or uncopyrighted compositions; secret process, patented or unpatented invention; articles or appliances furnished or used under this bid, and agrees to defend, at Offeror's expense, any and all actions brought against Buyer, or itself because of the unauthorized use of such articles.

17. **GENERAL.** Any Purchase Order or Subcontract issued as a result of this Request for Quote/Proposal is subject to Buyer's Terms and Conditions regardless of offeror's terms and conditions submitted with the proposal. Specific exceptions are to be noted as part of offeror's proposal and if incorporated into Buyer's Purchase Order or Subcontract will become binding on the parties.

18. **TERMS and CONDITIONS.** This prospective order is subject to all attachments in this solicitation to include, but not limited to: Statement of Work (when applicable); Leidos' standard terms and conditions; Federal terms and Conditions, agency clauses, and/or any specific Customer clauses included; Supplier Representations and Certifications.

19. GRATUITIES. By acknowledgment of response to this RFQ/P, the offeror hereby certifies that no gratuities were offered by the offeror or solicited by any Leidos employee either directly or indirectly. Any situation where a gratuity is solicited should be reported immediately to the Leidos SVP, Contracts, Procurement and Pricing at 571-526-7051.

SUBCONTRACT AGREEMENT
FIRM FIXED PRICE (Federal)

SELLER:	**SUBCONTRACT NO:**
ADDRESS:	**DEFENSE PRIORITY ALLOCATION SYSTEM (DPAS) RATING:**
	FIRM FIXED PRICE:

INTRODUCTION

This Subcontract, effective **[Insert Date],** is made between Leidos, Inc. (hereinafter known as "Leidos" or "Buyer"), and **[insert Seller's name]** (hereinafter known as "Seller"). The work to be performed by Seller under this Subcontract will support Leidos' work under Prime Contract No. **[insert Prime Contract No.];** Task/Delivery Order No. **[insert Task Order No. if applicable]** that has been issued by **[insert agency's name]**. The work defined in Attachment I (Statement of Work and Schedule) shall be performed on a Firm Fixed Price basis in accordance with this Schedule A (Specific Terms and Conditions), and any document referenced herein.

SCHEDULE A – SPECIFIC TERMS AND CONDITIONS

1.0 PERIOD OF PERFORMANCE

The term of this Subcontract shall commence upon the effective date above and shall terminate on **[Insert Date].**

2.0 PRICE

The total, firm fixed price for the work to be performed under this Subcontract is **[Insert $ Amount]**. Unless the price of this Subcontract is amended in writing by mutual agreement of the parties, Leidos is not obligated to compensate Seller beyond the total price defined herein. The price set forth herein includes all applicable Federal, State and local taxes and duties including, but not limited to, sales, use and value-added taxes, arising out of or relating to Seller's delivery of goods or services to Leidos, or Seller's performance of this Subcontract.

3.0 INVOICES

Invoices shall be submitted to Leidos in accordance with Article 4.0 and shall contain the following information: LEIDOS as the billed-to name and address (11955 Freedom Drive, Reston, VA 20190), Seller's name and remit-to address, subcontract number, labor categories, project labor categories (as applicable), hourly rates, labor hours, and extended dollar totals by category. Material and other direct costs detail shall be separated from labor costs. Invoices will be delivered electronically to [Insert Buyer/SCA Name] at [Insert Buyer/SCA Email Address]. Invoices shall be submitted individually per email and the email's subject must be in the following format: Subcontract #, Invoice #, Invoice Amount.

Invoices shall clearly reference a unique invoice number on each invoice and the date of the invoice. Invoices shall include, as applicable, the "Amount Previously Billed" and the "Amount of this Invoice."

3.1 MINIMUM LABOR CATEGORY QUALIFICATION REQUIREMENTS [USE THIS ARTICLE IF APPLICABLE]

The following statement shall be included in all invoices that include costs for labor categories that are subject to minimum labor category qualification requirements for education, employment, licensing and/or professional certification for subcontractor personnel:

> "Seller has reviewed the qualifications of the individuals whose labor costs are being invoiced hereunder and hereby certify that all individuals meet the minimum labor category qualification requirements for education, employment, licensing and/ or professional certification for the specific labor categories for which his or her work is being billed."

Seller agrees that if this subcontract includes minimum labor category qualification requirements, Seller shall not invoice Leidos for any labor until subcontractor first verifies that each individual proposed to work satisfies the minimum labor category qualification requirements for each labor category. In instances where an individual does not meet all the minimum labor category qualification requirements, but Seller believes the individual is qualified to perform the work, Seller must request and receive a written approval from Buyer waiving some or all of the minimum labor category qualification requirements prior to permitting the individual to start work.

Seller agrees to promptly notify Leidos if it discovers, subsequent to assigning an individual to perform on a subcontract with minimum labor category qualification requirements, that a subcontractor employee does not meet one or more of the applicable minimum labor category qualification requirements.

Seller agrees to refund to Leidos all monies paid for any individual performing on a subcontract with minimum labor category qualification requirements where it is determined that the individual does not meet one or more of the applicable minimum labor category qualification requirements.

4.0 PAYMENT

Payment shall be made in accordance with the milestone schedule provided herein, Payment terms are Net 45 Days after acceptance of the delivered items or services and receipt of a proper invoice, unless otherwise specified in this Subcontract. Leidos may make any adjustments in Seller's invoices due to shortages, late delivery, rejections, or other failure to comply with the requirements of this Subcontract before payment. Cash Discounts will be taken from date of acceptance of delivered items, or date of a proper invoice, whichever is later. Progress, interim, or milestone payments shall not constitute final acceptance. Leidos may offset against any payment hereunder any amount owed to Leidos by Seller.

Milestone No.	Milestone Description	Due/Delivery Date	Payment Amount

Seller may select Automated Clearing House Credits ("ACH funds transfer"), as the means of settlement. With regard to such ACH funds transfer, a payment from Leidos to Seller shall be considered timely with respect to any payment due date contained herein if the ACH funds transfer is completed no later than four (4) business days after such payment due date. Leidos shall not be in breach of these terms and conditions, or suffer any loss of discount or other penalty, with respect to an ACH funds transfer that was initiated properly and timely by Leidos to the extent its completion is delayed because of failure or delay by the ACH funds transfer system, the operation of an ACH funds transfer system rule which could not be anticipated by Leidos, or rejection by the Seller's bank.

4.1 DELIVERY

Goods and services shall be delivered in accordance with Attachment I – Statement of Work and the Milestone Schedule provided in Section 4.0. Time is of the essence. All goods furnished under this Subcontract shall be delivered FOB Destination. Delivery shall not be deemed complete until all goods have been received and accepted by Leidos, notwithstanding delivery to any carrier. Services shall be deemed delivered after they have been performed, received, and accepted by Leidos.

5.0 AUDIT

At any time before final payment under this Subcontract, Leidos may request audit of the invoices or vouchers and supporting documentation. Seller shall accommodate any such Leidos request, but may request that Leidos and Seller execute a non-disclosure agreement to provide for the confidentiality of the information that is exchanged. Each payment previously made shall be subject to reduction to the extent of amounts, on preceding vouchers, that are found by Leidos not to have been properly payable and shall also be subject to reduction for overpayments or to increase for underpayments. Upon receipt and approval of the voucher designated by Seller as the "completion voucher" and supporting documentation, and upon compliance by Seller with all terms of this Subcontract, Leidos shall pay any balance due Seller.

5.1 REPRESENTATIONS AND CERTIFICATIONS

Seller attests to the accuracy of the Representations and Certifications incorporated into this order as attachment IV. The Seller shall provide immediate written notice to Leidos if, at any time prior to subcontract closeout, the Seller learns that its (i) certifications were erroneous; (ii) has become erroneous by reason of changed circumstances; or (iii) has been notified of any system deficiencies and/or related internal control structure or business system(s) that would affect its ability to report hours delivered accurately and completely, and bill costs according to FAR Part 31, Contract Cost Principles and Procedures. Failure to provide the required notice shall be a material breach of this Agreement and shall be grounds for immediate termination thereof by Leidos, in addition to any other remedies that may be available at law or in equity. Seller shall be responsible for submitting all periodic certifications to the cognizant Leidos Contractual POC when required by the referenced FAR regulation or when required by the terms of this agreement.

6.0 TECHNICAL AND CONTRACTUAL REPRESENTATIVES

The following authorized representatives are hereby designated for this Subcontract:

SELLER:		**LEIDOS:**	
TECHNICAL:	_____	TECHNICAL:	_____
PHONE:	_____	PHONE	_____
EMAIL:	_____	EMAIL:	_____

CONTRACTUAL:		CONTRACTUAL:	
PHONE:		PHONE:	
EMAIL:		EMAIL:	

All notices or other written communication required or permitted to be given under any provision of this Subcontract shall be in writing and shall be deemed to have been given by the notifying party if delivered by hand, facsimile (with confirmed receipt), electronic media (with confirmed receipt) or mailed by an overnight delivery service, to the receiving party's above-identified contractual representative.

7.0 PERSONNEL

(a) If applicable, personnel performing under this Subcontract shall meet or exceed the minimum qualification and experience requirements specified in Attachment II, Labor Categories/Qualifications.

(b) Seller shall designate "Key Personnel" who are essential to the successful completion and execution of this Subcontract. Key Personnel shall perform all work necessary for the timely and quality completion of the task to which they are assigned. Seller may not substitute or replace a Key Personnel without Leidos' prior written approval. Seller's Key Personnel are: **[INSERT NAMES HERE].**

(c) Leidos reserves the right to direct the removal of any individual assigned to this Subcontract.

8.0 WARRANTY

In addition to any other warranties specified herein or provided by the manufacturer, Seller warrants that; 1) the services provided under this Subcontract shall be performed with that degree of skill and judgment normally exercised by recognized professional firms performing services of the same or substantially similar nature; and 2) that any goods delivered under this Subcontract will be new, unless otherwise specified, and **[FOR A PERIOD OF X YEARS]** following acceptance be free from defects in design, material and workmanship. All goods and services will conform to applicable specifications, drawings, and standards of quality and performance. In the event of any breach of the foregoing warranties, Seller shall, at its own expense, at Leidos' election either: (1) re-perform the non-conforming services and/or correct the non-conforming goods to conform to this standard; or (2) refund to Leidos that portion of the amounts received by Seller attributable to the non-conforming services and/or goods. All warranties of Seller shall inure to the benefit of both Leidos and Leidos' customers. The foregoing warranties shall survive any delivery, inspection, acceptance or payment by Leidos.

9.0 INDEMNIFICATION

(a) Seller shall indemnify, defend and hold Leidos and Leidos' customers harmless from and against any and all damages, losses, liabilities and expenses (including reasonable attorneys' fees) arising out of or relating to any claims, causes of action, lawsuits or other proceedings, regardless of legal theory, that result, in whole or in part, from Seller's (or any of Seller's subcontractors, suppliers, employees, agents or representatives): (i) intentional misconduct, negligence, or fraud, (ii) breach of any representation, warranty or covenant made herein,; (iii) breach of the confidentiality or disclosure provisions herein; or (v) violation of any law or regulation. Notwithstanding the foregoing, Seller's obligations under this Article shall not apply to the extent that a claim is finally determined by a court of competent jurisdiction to be caused by the negligence or willful misconduct of Leidos.

(b) Leidos shall promptly notify Seller of any claim that is covered by this indemnification provision and shall authorize representatives of Seller to settle or defend any such claim or suit and to take charge of any litigation in connection therewith.

9.1 INFRINGEMENT INDEMNITY

Seller shall indemnify, defend and hold Leidos and Leidos' customers, as well as their respective officers, directors, employees and agents (collectively, the "Indemnified Parties"), harmless from and against any claim, suit or proceeding ("Claim") asserting that the goods or services, or any part thereof, furnished under this Subcontract, or the use (including resale) thereof, constitutes an infringement of any patent, trademark, trade secret, copyright or other intellectual property right, and Seller shall pay all damages and costs awarded against and reasonable expenses incurred by the Indemnified Parties in connection with such claim, including reasonable attorneys' fees. In the event such goods or services or use thereof are enjoined in whole or in part, Seller shall at its expense and Leidos' or its customer's option undertake one of the following: (i) obtain for Leidos and its customer the right to continue the use of such goods or services; (ii) in a manner acceptable to Leidos and its customer, substitute equivalent goods or services or make modifications thereto so as to avoid such infringement and extend this indemnity thereto; or (iii) refund to Leidos an amount equal to the purchase price for such goods or services plus any excess costs or expenses incurred in obtaining substitute goods or services from another source.

Notwithstanding the foregoing paragraph, when this Subcontract is performed under the Authorization and Consent of the U.S. Government to infringe U.S. patents, Seller's liability for infringement of such patents in such performance shall be limited to the extent of the obligation of Leidos to indemnify the U.S. Government.

10.0 INSURANCE

Without prejudice to Seller's liability to indemnify Leidos as stated in any Indemnification provision contained in this Subcontract, Seller shall procure at its expense and maintain for the duration of this Subcontract, and ensure that any of its subcontractors used in connection with this Subcontract procure and maintain, the insurance policies required below.

(a) **Workers' Compensation:** Coverage for statutory obligations imposed by laws of any State in which the work is to be performed. Where applicable, Seller shall provide evidence of coverage for the United States Longshore & Harborworkers' Act (USL&H) coverage for employees engaged in work on or near navigable waters of the United States, and Defense Base Act (DBA) including all employees working on U.S. Government contracts outside the United States. Such policy(ies) shall be endorsed to provide a waiver of subrogation in favor of Leidos, its directors, officers and employees, and Leidos' customer where required by Leidos' Prime Contract with its customer. Employer's Liability coverage of $1 million each accident shall also be maintained.

(b) **Commercial General Liability:** Coverage for third party bodily injury and property damage, including products and completed operations, contractual liability, and independent contractors' liability with limits not less than $1,000,000 per occurrence and $2,000,000 in the aggregate. Such policy(ies) shall be endorsed to name Leidos, its directors, officers and employees, and Leidos' customer where required by Leidos' Prime Contract with its customer, as Additional Insureds.

(c) **Business Automobile Liability**: Coverage for use of all owned, non-owned, and hired vehicles with limits of not less than $1,000,000 per accident combined single limit for bodily injury and property damage liability. Such policy(ies) shall be endorsed to name Leidos, its directors, officers and employees, and Leidos' customer where required by Leidos' Prime Contract with its customer, as Additional Insureds.

(d) **Professional Liability / Errors and Omissions:** If seller is performing any professional services, coverage for damages (including financial loss) caused by any acts, errors and omissions arising out of Seller's performance or failure to perform professional services with limits of not less than $1,000,000 per claim.

The Additional Insured coverages above shall be primary and non-contributing with respect to any other insurance that may be maintained by Leidos and notwithstanding any provision contained herein, the Seller, and its employees, agents, representatives, consultants, subcontractors and suppliers, are not insured by Leidos, and are not covered under any policy of insurance that Leidos has obtained or has in place.

Any self-insured retentions, deductibles and exclusions in coverage in the policies required under this Article shall be assumed by, for the account of, and at the sole risk of Seller. In no event shall the liability of Seller or any subcontractors be limited to the extent of any of insurance or the minimum limits required herein.

Prior to commencement of any work, and within 15 days of any policy renewal that occurs while any work is on-going under this Subcontract, Seller shall provide Leidos evidence of the insurance coverage required above, including evidence of additional insured status and waivers of subrogation where required. Failure of Buyer to demand such evidence or to identify any deficiency in the insurance provided shall not be construed as or deemed to be a waiver of Seller's, or its subcontractors', obligations to maintain the above insurance coverages.

11.0 LEIDOS FURNISHED ITEMS AND INTELLECTUAL PROPERTY

(a) All items furnished, loaned or bailed by Leidos to Seller hereunder, or purchased, or otherwise acquired by Seller for the performance of and specifically charged to Leidos under this Subcontract (collectively, the "Items"), are the property of Leidos (or, as directed by Leidos pursuant to the terms of its prime contract, the U.S. Government). Upon completion, expiration or termination of this Subcontract, Seller shall return all Items in good condition (reasonable wear only accepted) together with all spoiled and surplus Items to Leidos. In lieu of the return of Items to Leidos, Seller shall make such other disposition of all Items as directed in writing by Leidos. Seller agrees to replace, at its expense, all such Items not returned in accordance with this Section or returned in other than good condition. Seller shall not charge Leidos for any storage, maintenance or return of any Items. Except as provided for in any flow down clauses, Seller shall bear all risk of loss for all Items in Seller's possession or for which Seller is responsible. Seller also agrees to use any designs, data or other things contained or embodied in Items provided to or utilized by Seller under this Subcontract in accordance with any restrictive legends placed on such Items by Leidos or any third party. If Leidos furnishes any material (including but not limited to any computer software or other data) for fabrication pursuant to this Subcontract, Seller agrees: (i) not to substitute any other material for such fabrication without Leidos' prior written consent and (ii) that title to such material shall not be affected by incorporation in or attachment to any other property.

(b) Seller understands and agrees that each of the Intellectual Property-related clauses specified in Schedule B, which may include (but are not limited to) FAR 52.227-1, 52.227-11, 52.227-14, 52.227-15 and 52.227-16 (and/or DFARS 252.227-7013, 252.227-7014 and 252.227-7015 if Leidos' prime contract is with the DOD), are incorporated herein as though fully set forth and shall take precedence over any other terms in this Subcontract. For avoidance of doubt, Seller hereby grants to Leidos such intellectual property rights as Leidos needs in order to perform its obligations to Leidos' U.S. Government customers. Seller shall not assert any

intellectual property right provided to the U.S. Government in a manner inconsistent with Leidos' contract obligations to Leidos' U.S. Government customers.

(c) To the extent that Seller provides any commercial computer software under this Agreement, the Parties agree that any normal commercial terms governing such commercial items shall govern use of such commercial items, except to the extent that such normal commercial terms shall conflict or be inconsistent with applicable federal law or regulation. In the case of any conflict or inconsistency, the applicable federal law or regulation shall take precedence over any conflicting or inconsistent commercial term. The Parties further agree that the use of any commercial terms shall be contingent upon the acceptance of any commercial computer software by the U.S. Government. In addition, the Parties agree that to the extent that the U.S. Government is the end user of any commercial computer software provided by Seller, Leidos shall have the right to perform Leidos' contract obligations to its U.S. Government Customers using that commercial computer software.

11.1 GOVERNMENT PROPERTY REQUIREMENTS (AS APPLICABLE)

When Government Property is applicable to this subcontract, unless otherwise specified, any property acquired under this subcontract shall become Government property. Seller shall i) certify to the completion of a physical inventory (all government equipment and materials) and the results thereof NLT October 10, annually or as otherwise required by the agency applicable property clause incorporated in the Schedule B Part II; ii) submit disposition requests when Government property is no longer required on the subcontract; iii) report any loss, damage, destruction or theft of Government property immediately after discovery; and iv) comply with close out of all Government property requirements to include, but not limited to submission of a final Government property report, final inventory report, and certification of the inventory condition code. All notices and required written communication shall be sent to subkproperty@leidos.com.

If Seller does not have a Government approved property system, Seller shall also comply with the following: i) Document receipt of Government property accountable to this subcontract (A copy of the signed packing slip or other documentation received with the property, including issue signature, must be forwarded within 30 days of receipt, report any item fabricated for use on the subcontract which is to be retained by the Seller, and annotate the receipt documentation with any Government property ID numbers with which the property is tagged; ii) Submit an annual (year ending June 30) physical inventory of Government equipment and material by July 31 that includes the Control number, Noun description, Model number (if applicable), Part number (if applicable), Serial number, unit price, date of last use for taggable property and inventories for material items should also include the quantity of line items and a total price; iii) Immediately report changes to the information provided to Leidos upon receipt of Government property; iv) Store and maintain property to protect it against deteriorating agents, adverse environments, damage and theft; v) Allow site access upon request to facilitate property surveillance activities required by Leidos' prime contract; vi) Obtain advanced approval from Leidos for the acquisition of any non-deliverable, which would not be consumable or expendable property and movement of Government property from authorized plants.

Unless otherwise authorized in writing, Government property is to be utilized only on the subcontract for which it is acquired or furnished. Property which is no longer being utilized should be reported when it becomes excess to the Seller's requirements.

12.0 DISCLOSURE

During the term of this Subcontract and for a period of three (3) years thereafter, Seller shall not disclose information concerning work under this Subcontract to any third party, unless such disclosure is required by law or necessary for the performance of this Subcontract. No news releases, public announcement, denial or confirmation of any part of the subject matter of this Subcontract or any phase of any program hereunder shall be made without prior written consent of Leidos which shall not be unreasonably withheld.

13.0 COMPLIANCE WITH LAW

Seller agrees to comply with the applicable provisions of any federal, state or local law or ordinance and all orders, rules and regulations issued thereunder. To the extent that performance of this Agreement requires that Seller's employees be deployed outside the United States ("Deployed Personnel"), Seller shall at all times be responsible for its Deployed Personnel's compliance with applicable local, state, and host nation laws, and Seller shall bear all risks, costs, damages or liabilities that may result from any non-compliance. Should Seller wish that its Deployed Personnel be authorized to carry a weapon, Seller: (1) shall forward a request to the Contracting Officer (or other authorized Government official) for approval; (2) shall comply with the requirements of all Government instructions, regulations, directives, orders, and policies pertaining to the possession and use of weapons by contractor personnel; (3) shall bear all risks, costs, damages or liabilities that may result from the possession or use of weapons by its Deployed Personnel, and (3) shall indemnify Leidos for any and all claims or liabilities that may arising from or relating to such weapons use or possession. Seller acknowledges and agrees that Leidos neither authorizes or requires Seller's Deployed Personnel to possess weapons.

14.0 COUNTERFEIT PRODUCTS

For purposes of this clause, Goods are any tangible items delivered under this Agreement, including without limitation the lowest level of separately identifiable items, such as parts, articles, components, and assemblies. "Counterfeit Goods" are Goods that are or contain items misrepresented as having been designed, produced, and/or sold by an authorized manufacturer and seller, including without limitation unauthorized copies, replicas, or substitutes. The term also includes authorized Goods that have reached a design life limit or have been damaged beyond possible repair, but are altered and misrepresented as acceptable.

Seller agrees and shall ensure that Counterfeit Goods are not delivered to Buyer. Goods delivered to Buyer or incorporated into other Goods and delivered to Buyer shall be new and shall be procured directly from the Original Component Manufacturer (OCM)/Original Equipment Manufacturer (OEM), or through an OCM/OEM authorized distributor chain. Work shall not be acquired from independent distributors or brokers unless approved in advance in writing by Buyer. When requested by Buyer, Seller shall provide OCM/OEM documentation that authenticates traceability of the affected items to the applicable OCM/OEM.

In the event that Work delivered under this Agreement constitutes or includes Counterfeit Goods, Seller shall, at its expense, promptly replace such Counterfeit Goods with authentic Goods conforming to the requirements of this Agreement. Notwithstanding any other provision in this Agreement, Seller shall be liable for all costs relating to the removal and replacement of Counterfeit Goods, including without limitation Buyer's costs of removing Counterfeit Goods, of reinserting replacement Goods, and of any testing necessitated by the reinstallation of Goods after Counterfeit Goods have been exchanged. Seller shall include equivalent provisions in lower tier subcontracts for the delivery of items that will be included in or furnished as Goods to Buyer.

14.1 CONFLICT MINERALS

Leidos fully supports the goals and objectives of Section 1502 of the Dodd-Frank Wall Street Reform and Consumer Protection Act (the "Act") which aims to prevent the use of certain "Conflict Minerals" that directly or indirectly finance or benefit armed groups in the Democratic Republic of the Congo (DRC) or its adjoining countries (as defined in the Act). It is the expectation of Leidos that all our suppliers have a policy to reasonably assure that the tantalum, tin, tungsten and gold ("3TG") in the products they manufacture are conflict free. In connection with that policy, Leidos expects our suppliers to undertake appropriate due diligence measures to determine if the 3TG materials in their products are being sourced from certified conflict-free smelters validated as compliant with the Conflict-Free Smelter Program (CFS) protocol and found on the CFS Compliant Smelter List. By accepting this order, Seller agrees to participate in future due diligence surveys from Leidos. Leidos routinely evaluates our relationship with our suppliers and will consider the extent to which a supplier has failed to comply with these responsibilities under the Act. If it is determined that a supplier's efforts are deficient, we may take appropriate action, including terminating our relationship with the supplier.

15.0 EXPORT CONTROL COMPLIANCE

Seller shall comply with all applicable U.S. export laws and regulations, including International Traffic in Arms Regulations ("ITAR") and the Export Administration Regulations ("EAR"). The subject technology of this Subcontract (including data, services, software and hardware provided hereunder, defined as "Controlled Technology") may be controlled under these laws and regulations and may not be exported or re-exported without prior authorization in accordance with ITAR and EAR. Access to Controlled Technology by Foreign Persons as defined by 22CFR120.16 may require an export authorization. Seller shall have full responsibility for obtaining any export licenses or authorization required to fulfill its obligations under this Subcontract.

15.1 ENDING TRAFFICKING IN PERSONS

As required by FAR 22.1701, FAR 22.1702, FAR 22.1703, and FAR 22.1704, and, where applicable, Defense Federal Acquisition Regulation Supplement (DFARS), employees, consultants, subcontractors, vendors, and agents performing any work under this Subcontract shall not: (i) engage in or support trafficking in persons; (ii) procure commercial sex acts; (iii) use forced labor in the performance of the contract; (iv) destroy, conceal, confiscate, or otherwise deny access by an employee to the employee's identity documents, such as passports or driver's licenses; (v) use misleading or fraudulent recruitment practices during the recruitment of employees, or fail to disclose information about the key terms and conditions of employment, including wages and fringe benefits, the location of work, living conditions and housing (if housing is provided or arranged), any significant costs to be charged to the employee, and, if applicable, the hazardous nature of the work; (vi) use recruiters that do not comply with local labor laws; (vii) charge recruitment fees to employees; (vii) fail to provide or reimburse return transportation costs upon the end of employment for non-national employees brought into a country for the purpose of working on a U.S. government contract or subcontract; (viii) provide or arrange housing that fails to meet the host country housing and safety standards; and (ix) fail to provide a written agreement if required by law or contract, in the employee's native language at least five days before the employee parts from his or her country of origin.

Seller shall immediately report suspected violations of these requirements to the Leidos Hotline at 855-753-4367. Incidents of suspected human trafficking activity may also be made to the Global Human Trafficking Hotline at 1-844-888-FREE and help@befree.org.

Should Seller violate any of these requirements set forth in FAR Subpart 22.17 during the course of performance under this Subcontract, Buyer may terminate performance of work under this Subcontract in whole or in part. Upon request, Seller shall provide information to Buyer demonstrating its compliance with these requirements, including, where applicable, a compliance plan and any corrective actions implemented as a result of any violations of these requirements.

16.0 ORGANIZATIONAL CONFLICT OF INTEREST

Seller represents and warrants that its performance of this Subcontract does not constitute and will not create an organizational conflict of interest (OCI) as defined in FAR Part 9.5 or under any other applicable OCI clause or regulation. If during the course of performance, Seller becomes aware of any actual or potential organizational conflict of interest caused by its performance of this Subcontract, Seller shall promptly notify Leidos in writing of the nature of such actual or potential organizational conflict of interest.

17.0 CHANGES

Seller shall assert its right to an adjustment under the applicable Changes clause within 20 days from the date of receipt of the written order. Failure to agree to any adjustment will be a dispute under the Disputes clause of this Subcontract, provided, however, that nothing in this clause excuses the Seller from proceeding with the work as changed without interruption and without awaiting settlement of any such dispute.

18.0 RESERVED

19.0 GOVERNING LAW

This Subcontract shall be governed by and construed in accordance with the laws of the Commonwealth of Virginia.

20.0 DISPUTES

(a) Leidos and Seller agree to enter into negotiations to resolve any dispute arising out of or relating to this Subcontract. Both parties agree to negotiate in good faith to attempt to reach a mutually agreeable settlement within a reasonable amount of time.

(b) Subject to the disputes provision set forth in Schedule B, if negotiations are unsuccessful, the parties agree that the sole and exclusive venue for any legal proceeding arising out of or relating to this Subcontract shall be in the state or federal courts of the Commonwealth of Virginia. The parties expressly submit to the jurisdiction of the state and federal courts of the Commonwealth of Virginia and agree that any party that unsuccessfully challenges the enforceability of this forum selection clause shall reimburse the other party all reasonable attorneys' fees and costs incurred in defending such unsuccessful challenge.

21.0 SUBCONTRACT CLOSEOUT

If Seller has applied indirect rates to any material, travel and/or other direct cost, Seller shall submit the Attachment V, Closeout Package that can be downloaded from www.leidos.com/suppliers, with a completion invoice bearing the statement "COMPLETION INVOICE" within 90 days of completion of the work. Seller shall also submit its Final invoice within 60 days of subcontract end, or 60 after receipt of final indirect rates when applicable. The Final invoice shall reflect any final audited indirect rate adjustments for the period(s) of performance bearing the statement, "This FINAL INVOICE was prepared using final audited rates as applicable to material, travel and/or other direct costs."

If indirect rates do not apply, Seller shall submit the Attachment V, Closeout Package with a FINAL invoice bearing the statement "FINAL INVOICE" within 60 days of completion of the work.

Leidos may unilaterally close-out this Subcontract

22.0 ASSIGNMENTS AND SUBCONTRACTS

This Agreement may not be assigned, novated or otherwise transferred by operation of law or otherwise by Seller without prior written consent from Leidos, which consent shall not be unreasonably withheld; provided, however, that Leidos may deny consent where it is in Leidos' best interest to do so. Any change of control of Seller shall be deemed an assignment of this Agreement that requires the prior written consent of Leidos. For purposes of this Agreement, "change of control" means any merger, consolidation, sale of all or substantially all of Seller's assets or sale of a substantial block of Seller's stock. Any such assignment, novation or transfer not in accordance with this provision shall be a material breach of this Agreement and shall be grounds for immediate termination thereof by Leidos, in addition to any other remedies that may be available at law or in equity.

Seller shall obtain prior written consent before subcontracting any portion of the work covered in this agreement that was not disclosed at the time of Seller's proposal. Further, Seller shall notify the Buyer's Contractual POC in writing if the Seller changes the amount of any lower-tier subcontract effort such that, the sum of lower-tier subcontractor(s) performance exceeds 70 percent of the total cost of work to be performed by Seller under the Agreement. The notification shall identify the revised percentage of

Seller's effort and shall include verification that the Seller will provide added value as related to the work to be performed by the lower-tier subcontractor(s).

23.0 GENERAL RELATIONSHIP

Leidos shall be solely responsible for all liaison and coordination with Leidos' customer as it affects the applicable prime contract and this Subcontract. Seller's communications with Leidos' customer shall be limited to those necessary for the Seller's performance under this Subcontract. Any other communications between Seller and Leidos' customer requires the prior written approval of Leidos.

Seller is an independent contractor in all respects with regard to this Subcontract. Nothing contained in this Subcontract shall be deemed or construed to create a partnership, joint venture, agency, or other relationship other than that of contractor and customer.

24.0 NON-WAIVER OF RIGHTS

The failure of either party to insist upon strict performance of any of the terms and conditions in the Subcontract, or to exercise any rights or remedies, shall not be construed as a waiver of its rights to assert any of the same or to rely on any such terms or conditions at any time thereafter. The invalidity in whole or in part of any term or condition of this subcontract shall not affect the validity of other parts hereof.

25.0 STANDARDS OF BUSINESS ETHICS & CONDUCT

Leidos is committed to conducting its business fairly, impartially and in an ethical and proper manner. These characteristics make it imperative that Leidos employees adhere to a particularly high ethical standard in accordance with Leidos' Code of Conduct, which may be viewed at www.leidos.com. Leidos' expectation is that Seller also will conduct its business fairly, impartially and in an ethical and proper manner, consistent with the principles of the Leidos Code of Conduct. In addition, Leidos strongly encourages that Seller have proactive and meaningful ethics and compliance programs established within your organization. As evidence of our commitment, should Seller wish to review Leidos' ethics training for your organization, request a copy through Buyer's contractual point of contact. Leidos expects the Seller to understand, foster, and mirror the ethical conduct expected from our employees in all business transactions. If Seller has cause to believe that Leidos or any employee or agent of Leidos has acted improperly or unethically under this agreement/order, Seller shall report such behavior to the Leidos Ethics Hotline (855) 7LEIDOS. Leidos provides its Code of Conduct for informational purposes only, and makes no representations as to its appropriateness for use outside of Leidos.

26.0 DPAS PRIORITY RATING

If so identified, this Subcontract is a "rated order" certified for national defense use, and Seller's signature constitutes acceptance of requirements under the Defense Priorities and Allocation System Regulation (15 C.F.R. Part 700).

27.0 ORDER OF PRECEDENCE

The documents listed below are hereby incorporated by reference. In the event of an inconsistency or conflict between or among the provisions of this Subcontract, the inconsistency shall be resolved by giving precedence in the following order:

1. Schedule A: Specific Terms and Conditions (Rev. **[Insert Date]**)
2. Schedule B: U.S. Government Terms and Conditions, Part I – FAR Clauses (Rev. **[Insert Date]**)
3. Schedule B: Contract Clauses, Part II Clauses - **[Agency]**, (Rev. **[Insert Date]**)
4. Attachment I: Statement of Work (Rev. **[Insert Date]**)
5. Attachment II: Labor Categories/Qualification. **[Reserve if N/A]**
6. Attachment III: Small Business Subcontracting Plan **[Reserve if N/A]**.
7. Attachment IV: Seller's Representations and Certifications
8. Attachment V: Closeout Package (provided for at www.leidos.com/suppliers)

28.0 SURVIVAL

If this Subcontract expires, is completed, or is terminated, Seller shall not be relieved of those obligations contained in the following articles: 1.0, 2.0, 4.0, 4.1, 5.0, 5.1, 6.0, 8.0, 9.0, 9.1, 10.0, 11.0, 12.0, 13.0, 17.0, 19.0, 20.0, 23.0, 24.0, 26.0, 27.0, and 28.0.

29.0 ENTIRE AGREEMENT

The parties hereby agree that this Subcontract shall constitute the entire agreement and understanding between the parties hereto and shall supersede and replace any and all prior or contemporaneous representations, agreements or understandings of any kind, whether written or oral, relating to the subject matter hereof. In witness whereof, the duly authorized representatives of Leidos and the Seller have executed this Subcontract on the dates shown below.

By Seller's signature of this Subcontract, Seller certifies to the best of its knowledge and belief that no Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress on its behalf in connection with the awarding of this subcontract.

Seller further certifies the organization or any of its Principals are not presently debarred, suspended, proposed for debarment or declared ineligible for the award of contracts by any Federal agency. In the event the Seller is proposed or debarred by any Federal agency during the performance term of this subcontract, Seller shall notify the Leidos contractual representative immediately in writing.

SCHEDULE B – PART I – FAR CLAUSES

U.S. GOVERNMENT TERMS and CONDITIONS (FEDERAL – NON-COMMERCIAL ITEMS)

1. SCHEDULE B DEFINITIONS

Schedule B Definitions shall apply to all Schedule B terms incorporated into this subcontract (e.g., Part I, Part II). In the U.S. Government clauses contained in the Schedule B document(s), unless the context of the clause requires otherwise, the term "Contractor" shall mean Seller, the term "Contract" shall mean the Subcontract or Purchase Order, and the terms "Government," "Contracting Officer" and equivalent phrases shall mean Leidos and Leidos' Contractual Representative, respectively. It is intended that these clauses shall apply to Seller in such manner as is necessary to reflect the position of Seller as a subcontractor to Leidos, to insure Seller's obligations to Leidos and to the United States Government, and to enable Leidos to meet its obligations under its Prime Contract and the Subcontract. All references to Subcontract shall include purchase orders and unless otherwise stated, all definitions defined by FAR 2.101 shall be applied to the terms referenced herein.

2. DISPUTES

Notwithstanding any provisions herein to the contrary:

(a) If a decision relating to the Prime Contract is made by the Contracting Officer and such decision is also related to this Subcontract, said decision, if binding upon Leidos under the Prime Contract shall in turn be binding upon Leidos and Seller with respect to such matter; provided, however, that if Seller disagrees with any such decision made by the Contracting Officer and Leidos elects not to appeal such decision, Seller shall have the right reserved to Leidos under the Prime Contract with the Government to prosecute a timely appeal in the name of Leidos, as permitted by the Prime Contract or by law, Seller to bear its own legal and other costs. If Leidos elects not to appeal any such decision, Leidos agrees to notify Seller in a timely fashion after receipt of such decision and to assist Seller in its prosecution of any such appeal in every reasonable manner. If Leidos elects to appeal any such decision of the Contracting Officer, Leidos agrees to furnish Seller promptly with a copy of such appeal. Any decision upon appeal, if binding upon Leidos, shall in turn be binding upon Seller. Pending the making of any decision, either by the Contracting Officer or on appeal, Seller shall proceed diligently with performance of this Subcontract.

(b) If, as a result of any decision or judgment which is binding upon Seller and Leidos, as provided above, Leidos is unable to obtain payment or reimbursement from the Government under the Prime Contract for, or is required to refund or credit to the Government, any amount with respect to any item or matter for which Leidos has reimbursed or paid Seller, Seller shall, on demand, promptly repay such amount to Leidos. Additionally, pending the final conclusion of any appeal hereunder, Seller shall, on demand, promptly repay any such amount to Leidos. Leidos' maximum liability for any matter connected with or related to this Subcontract which was properly the subject of a claim against the Government under the Prime Contract shall not exceed the amount of Leidos' recovery from the Government.

(c) If this Subcontract is issued by Leidos under a Government subcontract rather than a Prime Contract, and if Leidos has the right under such Government subcontract to appeal a decision made by the Contracting Officer under the Prime Contract in the name of the Prime Contractor (or if Leidos is subject to any arbitrator's decision under the terms of its subcontract), and said decision is also related to this Subcontract, this Disputes Clause shall also apply to Seller in a manner consistent with its intent and similar to its application had this Subcontract been issued by Leidos under a Prime Contract with the Government.

(d) Seller agrees to provide certification that data supporting any claim made by Seller hereunder is made in good faith and that the supporting data is accurate and complete to the best of Seller's knowledge or belief, all in accordance with the requirements of the Contract Disputes Act of 1978 (41 USC 601-613) and implementing regulations. If any claim of Seller is determined to be based upon fraud or misrepresentation, Seller agrees to defend, indemnify and hold Leidos harmless for any and all liability, loss, cost or expense resulting therefrom.

(e) Any dispute not addressed in paragraph (a) above, will be subject to the disputes clause of Schedule A of the Subcontract or PO terms and conditions.

3. INDEMNIFICATION - COST OR PRICING DATA - COST ACCOUNTING STANDARDS – OTHER

Seller agrees to indemnify and hold Leidos harmless to the full extent of any cost or price reduction, plus interest, effected by Leidos' customer, which may result from (i) certified cost or pricing data submitted by Seller or its lower-tier subcontractors which is not accurate, current or complete as certified by Seller; (ii) the failure by Seller or its lower-tier subcontractors to disclose and consistently follow applicable cost accounting practices and standards or otherwise comply with pertinent parts of the FAR, applicable agency supplements thereto, and standards and regulations promulgated by the Cost Accounting Standards Board. Seller further agrees to indemnify, defend, and hold Buyer harmless from and against any losses, liabilities, offsets and expenses (including reasonable attorney's fees) arising out of or relating to Seller's failure to comply with (i) the provisions of the Anti-Kickback Act or FAR 52.203-7; or (ii) 52.203-13, Contractor Code of Business Ethics and Conduct, if applicable to this Subcontract.

4. CONTRACT COST PRINCIPLES AND PROCEDURES

Seller agrees that to the extent applicable, costs allocated to this Subcontract shall be in full compliance with Subpart 31.2 of FAR (Subpart 31.3 for Educational Institutions) and the applicable agency supplements thereto, if any, set forth in Part II hereof. In the event such compliance is not maintained, Seller agrees to compensate Leidos to the full extent of any prices or costs, including any penalties or interest that are determined by Leidos' customer to be unallowable or unreasonable or not allocable, under Leidos' contract with its customer.

5. FAR CLAUSES APPLICABLE TO THIS SUBCONTRACT

The U.S. Government terms or clauses in FAR Subpart 52.2 referenced herein are incorporated and made a part of this Subcontract, unless:

(a) The description is preceded by a selection box (☐), the FAR clause (and its alternate) shall only apply when selected;

(b) Unless otherwise specified for performance applicability; or

(c) A value (e.g., >$150k) is identified. Clauses are applicable when the subcontract ceiling value (to include all options) exceeds the specified values at the time of award or after modification unless otherwise specified. Note: References to "SAT" refers to the "Simplified Acquisition Threshold" as defined by FAR 2.101 and will be the threshold that is current on the date of the Subcontract award.

To the extent that the Prime Contract or higher-tier subcontract under which this Subcontract is issued, is modified (to include a newer version of any such clause), the date of the modified version of the clause as it appears in such Prime Contract or higher-tier subcontract shall be controlling and said version shall be incorporated herein.

SECTION I: APPLICABLE TO ALL - FEDERAL STANDARD & FEDERAL COMMERCIAL ITEMS	
52.203-6	Restrictions on Subcontractor Sales to the Government (>**SAT**) (**Alternate I** applies to Commercial Items)
52.203-7	Anti-Kickback Procedures (except paragraph (c) (1)) - (>$150k)

52.246-16	Responsibility for Supplies (Applies to supply Awards)

52.247-3	Capability to Perform a Contract for the Relocation of a Federal Office (Applies when performance involves moving a Federal office)
52.247-63	Preference for U.S. Flag Air Carriers (Applies for the use of International Air Transportation)
52.248-1	Value Engineering ☐ **Alternate II** (Applies if VECP requirement is required by the SOW)

Clauses below are applicable at the specified subcontract type only. [1]T&M/LH = T&M subcontracts where indirect rates are not applied to materials [2]CR = Cost reimbursable subcontracts (e.g., CPFF) including any T&M subcontracts where indirect rates are applied to the materials portion		**T&M[1]/LH**	**CR[2]**	**FFP**
52.215-15	Pension Adjustments and Asset Reversions	X	X	
52.215-17	Waiver of Facilities Capital Cost of Money (Applies if FCCM was not proposed by the Subcontractor nor included in the subsequent subcontract award)		X	
52.216-7	Allowable Cost and Payment **Alternate II** (Applies to Educational Institutions) **Alternate IV** (Applies to non-profit organizations other than Educational Institutions)	X	X	
52.222-2	Payment for Overtime Premiums -Subparagraph (a) Add "0"	X	X	
52.229-10	State of New Mexico Gross Receipts and Compensating Tax (Applies to the acquisition of tangible personal property and title to such property passes directly to and vests in the United States upon delivery)	X	X	
52.232-20	Limitation of Cost (Applies when subcontract is fully-funded)		X	
52.232-22	Limitation of Funds (Applies when subcontract is incrementally funded)		X	
52.232-32	Performance-Based Payments (Applies when negotiated payment amounts are performance-based)			X
52.242-1	Notice of Intent to Disallow Costs	X	X	
52.243-1	Changes - Fixed Price - **Alternate II** **Alternate III** (Applies to Architect-Engineer Services) **Alternate IV** (Applies to Transportation Services)			X
52.243-2	Changes - Cost-Reimbursement - **Alternate II**		X	
52.243-3	Changes – Time and Material – Labor Hour	X		
52.246-2	Inspection of Supplies - Fixed Price (Applies to the purchase of supplies)			X
52.246-3	Inspection of Supplies – Cost Reimbursement		X	
52.246-4	Inspection of Services - Fixed-Price (Applies to services)			X
52.246-5	Inspection of Services - Cost-Reimbursement		X	
52.246-6	Inspection - Time-and- Material and Labor-Hour	X		
52.246-7	Inspection of Research and Development – Fixed-Price			X
52.246-8	Inspection of Research and Development - Cost-Reimbursement (Applies to R&D with fee) **Alternate I** (Applies to R&D awards without fee)		X	
Termination clauses 52.249-2 through -6 are modified to require termination proposals to be submitted within 30 days (in lieu of 1 year)				
52.249-2	Termination for Convenience (Fixed-Price)			X
52.249-3	Termination for Convenience (Applies to dismantling, demolition, or removal of improvements Awards)			X
52.249-5	Termination for Convenience (Applies to Educational and Other Nonprofit Institutions)			X
52.249-6	Termination (Cost-Reimbursement)		X	
52.249-6	Termination (Cost-Reimbursement) – Alternate IV	X		
52.249-7	Termination (Applies to Fixed-Price Architect-Engineer)			X
52.249-8	Default (Fixed-Price) **Alternate I** – (Applies to Transportation Services)			X

SCHEDULE B – PART II – DOD FAR SUPPLEMENTS
APPLICABLE TO ALL DEPARTMENT OF DEFENSE (DOD) ORDERS – NON COMMERCIAL ITEMS

1. DFAR SUPPLEMENT CLAUSES APPLICABLE TO THIS SUBCONTRACT

All references herein to "DFAR Supplement" or "DFAR SUPP" shall mean the Department of Defense Supplement to the Federal Acquisition Regulation. The clauses in DFAR Supplement Subpart 252.2 referenced herein are incorporated and made a part of this Subcontract, unless the Description is preceded by a selection box (☐), the FAR clause (and its alternate) shall only apply when selected. To the extent that the Prime Contract or higher-tier subcontract under which this Subcontract is issued, is modified (to include a newer version of any such clause), the date of the modified version of the clause as it appears in such Prime Contract or higher-tier subcontract shall be controlling and said version shall be incorporated herein.

2. CONTRACTOR MANPOWER REPORTING

☒ If selected, Seller shall report ALL subcontractor labor hours required for performance of services provided under this subcontract via the Government's secure data collection site. Seller is required to completely fill in all required data fields using the following web address: http://www.ecmra.mil/. Reporting inputs will be for the subcontract labor executed during the period of performance of this subcontract, during each Government fiscal year (FY), which runs October 1 through September 30. While inputs may be reported any time during the FY, all data shall be reported no later than October 31 of each calendar year. Subcontractors may direct questions to the help desk at help desk at: http://www.ecmra.mil.

SECTION I: APPLICABLE TO ALL – DOD STANDARD & COMMERCIAL ITEMS	
252.203-7000	Requirements Relating to Compensation of Former DOD Officials
252.204-7012	Safeguarding Covered Defense Information and Cyber Incident Reporting (Applies when seller is providing operationally critical support, or for which performance will involve a covered contractor information system) Seller shall provide the cognizant Leidos contractual representative, notification of any incident report number, that has been submitted (for any tier) in accordance with 252.204-7012.
☐ 252.204-7014	Limitations on the Use or Disclosure of Information by Litigation Support Contractors
252.204-7015	Notice of Authorized Disclosure of Information for Litigation Support
252.211-7003	Item Unique Identification and Valuation *(when Government Property applies)*
252.211-7007	Reporting of Government-Furnished Property, subsection (d). (When Government Property applies)
252.222-7007	Representation Regarding Combating Trafficking in Persons
252.225-7001	Buy American Act and Balance of Payments Program (Applies unless 252.225-7021, 252.225-7036 or 252.225-7045 is selected) **Alternate I** (Applies to support of operations in Afghanistan)
252.225-7008	Restriction on Acquisition of Specialty Metals
252.225-7009	Restriction on Acquisition of Certain Articles Containing Specialty Metals
252.225-7012	Preference for Certain Domestic Commodities
252.225-7015	Restriction on Acquisition of Hand or Measuring Tools (Applies to supply orders for delivery of measuring and hand tools)
252.225-7017	Photovoltaic Devices (Applies if order results in DoD ownership of photovoltaic devices)
☐ 252.225-7021	Trade Agreements **Alternate II** (Applies to support of operations in Afghanistan)
252.225-7028	Exclusionary Policies and Practices of Foreign Governments (for purchase of supplies and services for international military education training and FMS)
☐ 252.225-7036	Buy American Act – Free Trade Agreement-Balance of Payments Program ☐ Alternate I ☐ Alternate II ☐ Alternate III ☐ Alternate IV ☐ Alternate V
252.225-7038	Restriction on Acquisition of Air Circuit Breakers (Applies for orders or subcontract performance that require air circuit breakers for naval vessels)
225.225-7039	Defense Contractors Performing Private Security Functions Outside the United States (Services only when performance is OCONUS)

252.225-7040	Contractor Personnel Authorized to Accompany U.S. Armed Forces Deployed Outside the United States (Services only. Applies when performance is OCONUS and personnel are authorized to accompany US Armed Forces)
☐ 252.225-7045	Balance of Payments Program – Construction Material Under Trade Agreements ☐ Alternate I ☐ Alternate II ☐ Alternate III
252.225-7048	Export Controlled Items
252-226-7001	Utilization of Indian Organizations, Indian-Owned Economic Enterprises, and Native Hawaiian Small Business Concerns **(>$500K)**
252.227-7013	Rights in Technical Data - Noncommercial Items **Alternate II** (Applies when subcontractor support is for the development or delivery of a vessel design or any useful article embodying a vessel design)
252.227-7015	Technical Data – Commercial Items (Applies to the delivery of technical data pertaining to commercial items, components or processes) **Alternate I** (Applies to the development or delivery of a vessel design or any useful article embodying a vessel design)
252.227-7019	Validation of Asserted Restrictions -Computer Software (Applies to the delivery of computer software)
252.227-7037	Validation of Restrictive Markings on Technical Data (Applies for the delivery of technical data)
252.236-7013	Requirement for Competition Opportunity for American Steel Producers, Fabricators, and Manufacturers (Applies to subcontractor support that includes the acquisition of steel as a construction material)
252.237-7010	Prohibition on Interrogation of Detainees by Contractor Personnel (Services only, when performance includes interaction with detainees)
252.237-7019	Training for Contractor Personnel Interacting with Detainees ((Services only, when performance includes interaction with detainees)
252.239-7018	Supply Chain Risk
252.244-7000	Subcontracts for Commercial Items
252.246-7003	Notification of Potential Safety Issues
252.246-7004	Safety of Facilities, Infrastructure, and Equipment for Military Operations (Applies when subcontractor support is for the construction, installation, repair, maintenance, or operation of facilities, infrastructure, or for equipment configured for occupancy, planned for use by DoD military or civilian personnel during military operations)
252.246-7007	Contractor Counterfeit Electronic Part Detection and Avoidance System (applicable to the acquisition of electronic parts or assemblies containing electronic parts)
252.247-7003	Pass-Through of Motor Carrier Fuel Surcharge Adjustment to the Cost Bearer **(**Applies to subcontracts that include the use of motor carriers, brokers, or freight forwarders)
252.247-7023	Transportation of Supplies by Sea
252.247-7024	Notice of Transportation of Supplies by Sea

SECTION II: APPLICABLE TO DOD ORDERS FOR NON-COMMERCIAL ITEMS	
252.203-7001	Prohibition on Persons Convicted of Fraud or Other Defense-Contract Related Felonies - Commercial items exempt (**>$150k**)
252.203-7002	Requirement to Inform Employees of Whistleblower Rights
252.203-7004	Display of Online Posters - Commercial items exempt **(>$5.5M)**
252.204-7000	Disclosure of Information
252.204-7009	Limitations on the Use or Disclosure of Third-Party Contractor Reported Cyber Incident Information (Applies when performance requires safeguarding covered defense information and cyber incident reporting)
252.209-7004	Subcontracting with Firms that are Owned or Controlled by the Government of a Terrorist Country
☐ 252.211-7000	Acquisition Streamlining **(>$1.5M)**
252.215-7000	Pricing Adjustments (Applies when 52.215-11, 52.215-12, or 52.215-13 are applicable)
252.219-7003	Small Business Subcontracting Plan - Small businesses exempt **(>$700K)**
252.219-7004	Small Business Subcontracting Plan (Test Program) - Small businesses exempt **(>$700K)**
☐ 252.222-7000	Restrictions on Employment of Personnel (services only)
252.222-7006	Restrictions On The Use Of Mandatory Arbitration Agreements
252.223-7001	Hazard Warning Labels (Applies to support involving hazardous material)

252.223-7002	Safety Precautions for Ammunition and Explosives (Applies to support involving ammunition or explosives)
252.223-7003	Change in Place of Performance *(Applies to support involving* Ammunition or Explosives)
252.225-7004	Report of Intended Performance Outside the United States and Canada – OCONUS performance only **(>$700K)**
252.225-7007	Prohibition on Acquisition of United States Munitions List Items from Communist Chinese Military Companies (Applies for items covered by the US Munitions List)
252.225-7013	Duty-Free Entry
252.225-7016	Restriction on Acquisition of Ball and Roller Bearings (Commercial items exempt)
252.225-7043	Antiterrorism/Force Protection Policy for Defense Contractors Outside the United States (Applies to OCONUS performance)
252.227-7014	Rights in Noncommercial Computer Software and Noncommercial Computer Software Documentation (Applies to the delivery of computer software or computer software documentation)
252.227-7016	Rights in Bid or Proposal Information
☐ 252.227-7020	Rights in Special Works
☐ 252.227-7021	Rights in Data - Existing Works
☐ 252.227-7022	Government Rights (Unlimited)
☐ 252.227-7023	Drawings and Other Data to Become Property of Government
252.227-7025	Limitations on the Use or Disclosure of Government-Furnished Information Marked w/ Restrictive Legends (Applies if subcontractor is provided with technical data marked with another parties' restrictive legends)
252.227-7030	Technical Data - Withholding of Payment
252.227-7033	Rights in Shop Drawings (Applies to construction orders)
252.228-7005	Accident Reporting & Investigation Involving Aircraft, Missiles, and Space Launch Vehicles
252.231-7000	Supplemental Cost Principles
252.235-7002	Animal Welfare (Services only. Applies to research of live vertebrate animals)
252.235-7003	Frequency Authorization (Services only, for the development, production, construction, testing, or operation of a device for which a radio frequency authorization is required)
252.237-7023	Continuation of Essential Contractor Services (If Subcontract provides "Essential contractor service")
252.239-7000	Protection Against Compromising Emanations (Applies when information technology requires protection against compromising emanations.
252.239-7010	Cloud Computing Services (Applies when order involves cloud services)
252.239-7016	Telecommunications Security Equipment, Devices, Techniques and Services (Applies to orders securing telecommunications)
252.245-7001	Reports of Government Property (when government property applies)
252.246-7001	Warranty of Data **Alternate II** (Applies to Fixed-Price subcontracts)
252.249-7002	Notification of Anticipated Contract Termination or Reduction - Services only (**>$150k**)

Schedule C – HR001117S0019 DARPA Additional BAA Requirements/Clauses

Proprietary Markings

Proposers are responsible for clearly identifying proprietary information. Submissions containing proprietary information must have the cover page and each page containing such information clearly marked with a label such as "Proprietary" or "Company Proprietary." NOTE: "Confidential" is a classification marking used to control the dissemination of U.S. Government National Security Information as dictated in Executive Order 13526 and should not be used to identify proprietary business information.

Unclassified Submissions

DARPA anticipates that submissions received under this BAA will be unclassified. However, should a proposer wish to submit classified information, an *unclassified* email must be sent to the BAA mailbox requesting submission instructions from the Technical Office PSO. If a determination is made that the award instrument may result in access to classified information, a SCG and/or DD Form 254 will be issued by DARPA and attached as part of the award.

Human Research Subjects/Animal Use

Proposers that anticipate involving Human Research Subjects or Animal Use must comply with the approval procedures detailed at www.darpa.mil/work-with-us/additional-baa. protection. Further, research involving human subjects that is conducted or supported by the DoD must comply with 32 CFR 219, *Protection of Human Subjects* (and DoD Instruction 3216.02, *Protection of Human Subjects and Adherence to Ethical Standards in DoD-Supported Research* (http://www.dtic.mil/whs/directives/corres/pdf/321602p.pdf). Institutions awarded funding for research involving human subjects must provide documentation of a current Assurance of Compliance with federal regulations for human subjects protection, such as a Department of Health and Human Services, Office of Human Research Protection Federal Wide Assurance (http://www.hhs.gov/ohrp). All institutions engaged in human subjects research, to include subcontractors, must also hold a valid assurance. In addition, all personnel involved in human subjects research must provide documentation of completion of human subjects research training. For all proposed research that will involve human subjects in the first year or phase of the project, the institution must provide evidence of or a plan for review by an Institutional Review Board (IRB) upon final proposal submission to DARPA as part of their proposal, prior to being selected for funding. The IRB conducting the review must be the IRB identified on the institution's Assurance of Compliance with human subjects protection regulations. The protocol, separate from the proposal, must include a detailed description of the research plan, study population, risks and benefits of study participation, recruitment and consent process, data collection, and data analysis. It is recommended that you consult the designated IRB for guidance on writing the protocol. The informed consent document must comply with federal regulations (32 CFR 219.116). A valid Assurance of Compliance with human subjects protection regulations along with evidence of completion of appropriate human subjects research training by all investigators and personnel involved with human subjects research should accompany the protocol for review by the IRB.

In addition to a local IRB approval, a headquarters-level human subjects administrative review and approval is required for all research conducted or supported by the DoD. The Army, Navy, or Air Force office responsible for managing the award can provide guidance and information about their component's headquarters-level review process. Note that confirmation of a current Assurance of Compliance with human subjects protection regulations and appropriate human subjects research training is required before headquarters-level approval can be issued. The time required to complete the IRB review/approval process varies depending on the complexity of the research and the level of risk involved with the study. The IRB approval process can last between one and three months, followed by a DoD review that could last between three and six months. Ample time should be allotted to complete the approval process. DoD/DARPA funding cannot be used toward human subjects research until ALL approvals are granted.

Human Subjects Research and Animal Use

Human Subjects Research

All research selected for funding involving human subjects, to include use of human biological specimens and human data, must comply with the federal regulations for human subjects protection. Further, research involving human subjects that is conducted or supported by the DoD must comply with 32 CFR 219, Protection of Human Subjects (and DoD Instruction 3216.02, Protection of Human Subjects and Adherence to Ethical Standards in DoD-Supported Research (http://www.dtic.mil/whs/directives/corres/pdf/321602p.pdf).

Institutions awarded funding for research involving human subjects must provide documentation of a current Assurance of Compliance with federal regulations for human subjects protection, such as a Department of Health and Human Services, Office of Human Research Protection Federal Wide Assurance (http://www.hhs.gov/ohrp). All institutions engaged in human subjects research, to include subcontractors, must also hold a valid assurance. In addition, all personnel involved in human subjects research must provide documentation of completion of human subjects research training.

For all proposed research that will involve human subjects in the first year or phase of the project, the institution must provide evidence of or a plan for review by an Institutional Review Board (IRB) upon final proposal submission to DARPA as part of their proposal, prior to being selected for funding. The IRB conducting the review must be the IRB identified on the institution's Assurance of Compliance with human subjects protection regulations. The protocol, separate from the proposal, must include a detailed description of the research plan, study population, risks and benefits of study participation, recruitment and consent process, data collection, and data analysis. It is recommended that you consult the designated IRB for guidance on writing the protocol. The informed consent document must comply with federal regulations (32 CFR 219.116). A valid Assurance of Compliance with human subjects protection regulations along with evidence of completion of appropriate human subjects research training by all investigators and personnel involved with human subjects research should accompany the protocol for review by the IRB.

In addition to a local IRB approval, a headquarters-level human subjects administrative review and approval is required for all research conducted or supported by the DoD. The Army, Navy, or Air Force office responsible for managing the award can provide guidance and information about their component's headquarters-level review process. Note that confirmation of a current Assurance of Compliance with human subjects protection regulations and appropriate human subjects research training is required before headquarters-level approval can be issued.
The time required to complete the IRB review/approval process varies depending on the complexity of the research and the level of risk involved with the study. The IRB approval process can last between one and three months, followed by a DoD review that could last between three and six months. Ample time should be allotted to complete the approval process. DoD/DARPA funding cannot be used toward human subjects research until ALL approvals are granted.

Animal Use

Award recipients performing research, experimentation, or testing involving the use of animals shall comply with the rules on animal acquisition, transport, care, handling, and use as outlined in: (i) 9 CFR parts 1-4, Department of Agriculture rules that implement the Animal Welfare Act of 1966, as amended, (7 U.S.C. § 2131-2159); (ii) National Institutes of Health Publication No. 86-23, "Guide for the Care and Use of Laboratory Animals" (8th Edition); and (iii) DoD Instruction 3216.01, "Use of Animals in DoD Programs."

For projects anticipating animal use, proposals should briefly describe plans for Institutional Animal Care and Use Committee (IACUC) review and approval. Animal studies in the program will be expected to comply with the Public Health Service (PHS) Policy on Humane Care and Use of Laboratory Animals, available at http://grants.nih.gov/grants/olaw/olaw.htm.

All award recipients must receive approval by a DoD-certified veterinarian, in addition to an IACUC approval. No animal studies may be conducted using DoD/DARPA funding until the United States Army Medical Research and Materiel Command (USAMRMC) Animal Care and Use Review Office (ACURO) or other appropriate DoD veterinary office(s) grant approval. As a part of this secondary review process, the award recipient will be required to complete and submit an ACURO Animal Use Appendix, which may be found at http://mrmc.amedd.army.mil/index.cfm?pageid=research_protections.acuro_animalappendix.

Intellectual Property

All proposers must provide a good faith representation that the proposer either owns or possesses the appropriate licensing rights to all intellectual property that will be utilized under the proposed effort.

For Procurement Contracts

Proposers responding to this BAA requesting procurement contracts will need to complete the certifications at DFARS 252.227-7017. See http://www.darpa.mil/work-with-us/additional-baa for further information. If no restrictions are intended, the proposer should state "none." The table below captures the requested information:

Technical Data Computer Software To be Furnished With Restrictions	Summary of Intended Use in the Conduct of the Research	Basis for Assertion	Asserted Rights Category	Name of Person Asserting Restrictions
(LIST)	(NARRATIVE)	(LIST)	(LIST)	(LIST)

For All Non-Procurement Contracts

Proposers responding to this BAA requesting a Cooperative Agreement, Technology Investment Agreement, or Other Transaction for Prototypes shall follow the applicable rules and regulations governing these various award instruments, but, in all cases, should appropriately identify any potential restrictions on the Government's use of any Intellectual Property contemplated under the award instrument in question. This includes both Noncommercial Items and Commercial Items. Proposers are encouraged to use a format similar to that described in the section above. If no restrictions are intended, then the proposer should state "NONE."

Controlled Unclassified Information (CUI) on Non-DoD Information Systems

In addition to classified information, certain types of unclassified information also require application of access and distribution controls and protective measures for a variety of reasons. This information is referred to collectively as Controlled Unclassified Information (CUI). DoD CUI includes, but is not limited to: For Official Use Only (FOUO), Law Enforcement Sensitive (LES), DoD Unclassified Controlled Nuclear Information (DoD UCNI), and Limited Distribution, as well as some categories developed by other executive branch agencies. For further information, consult DoDM 5200.01, Volume 4, "DoD Information Security Program: Controlled Unclassified Information (CUI)."

All non-DoD entities doing business with DARPA are expected to adhere to the following procedural safeguards, in addition to any other relevant federal or DoD specific procedures, for submission of any proposals to DARPA and any potential business with DARPA:

- Do not process DARPA CUI on publicly available computers or post DARPA CUI to publicly available webpages or websites that have access limited only by domain or Internet protocol restriction.
- Ensure that all DARPA CUI is protected by a physical or electronic barrier when not under direct individual control of an authorized user and limit the transfer or DARPA CUI to subcontractors or teaming partners with a need to know and commitment to this level of protection.
- Ensure that DARPA CUI on mobile computing devices is identified and encrypted and all communications on mobile devices or through wireless connections are protected and encrypted.
- Overwrite media that has been used to process DARPA CUI before external release or disposal. Proposers with questions regarding CUI should contact the DARPA Security and Intelligence Directorate at (703) 526-1581.

Publication Restrictions on Non-Fundamental Research

National Security Decision Directive (NSDD) 189 defines fundamental research as follows:

"Fundamental research" means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

The following clause or similar language will be included in all awards where the resultant research will not be considered fundamental research and there will be restrictions on publication:

"There shall be no dissemination or publication, except within and between the contractor and any subcontractors, of information developed under this contract or contained in the reports to be furnished pursuant to this contract without prior written approval of DARPA's Public Release Center (DARPA/PRC). All technical reports will be given proper review by appropriate authority to determine which distribution statement is to be applied prior to the initial distribution of these reports by the contractor. With regard to subcontractor proposals for fundamental research, papers resulting from unclassified fundamental research are exempt from prepublication controls and this review requirement, pursuant to DoD Instruction 5230.27 dated October 6, 1987.

When submitting material for written approval for open publication, the contractor/awardee must submit a request for public release to the DARPA/PRC and include the following information: (1) Document Information: document title, document author, short plain-language description of technology discussed in the material (approx. 30 words), number of pages (or minutes of video), and document type (e.g., briefing, report, abstract, article, or paper); (2)

Event Information: event type (conference, principal investigator meeting, article, or paper), event date, desired date for DARPA's approval; (3) DARPA Sponsor: DARPA program manager, DARPA office, and contract number; and (4) Contractor/Awardee's Information: POC name, e-mail, and phone. Allow three weeks for processing. Due dates under three weeks require a justification. Unusual electronic file formats may require additional processing time. Requests may be sent either via email to public_release_center@darpa.mil or by mail to 675 North Randolph Street, Arlington VA 22203-2114, telephone (571) 218-4235. Refer to the following for link for information about DARPA's public release process: http://www.darpa.mil/work-with-us/contract-management/public-release.

SUMMARY OF PROPOSED COSTS

DARPA-P3

Offeror:
Date:

INSTRUCTIONS: Fill in additional information for Direct Labor Costs in Columns E, F and G. Add columns to Include escalation if necessary. If subcontractor agreements are Firm Fixed Price they can be listed as ODCs. If subs are direct labor, include costs here. The subtotal column is intended to provide the rate without fee included so it can be identified as a separate amounnt in the award. The rates in the total column will be used to compare the proposed rates to the base contract maximum rates, which include fee. The Offeror is responsible for ensuring mathematical calculations are correct.

SUMMARY OF DIRECT LABOR COSTS (INCLUDING BUILDUP)

April 7, 2017

Subject: Formal Request for Proposal (RFP)
In response refer to RFP No. LEIDOS-DARPA-P3 _____(Your Company Name)

References: DARPA-HR001117S0019

Team Member:

You are requested to submit a **Firm Fixed Price** proposal in response to this Request for Proposal (RFP). The Statement of Work (SOW) and Specifications will be provided shortly in an amendment to this RFP. Your proposal must be in accordance with the terms, conditions, and special provisions included herein with this RFP. You must complete and return the Suppliers Reps and Certs (Attachment G) and the pricing template (Attachment H). On the last page of this letter is a Proposal Check List for you to use to ensure that all required documentation has been included in your proposal.

Your response is due by 2:00 PM (EST) on Wednesday, April 19, 2017.

PROPOSAL INSTRUCTIONS AND INFORMATION

Leidos is not obligated to pay for any expenses incurred as a result of your efforts to respond to this solicitation. Moreover, Leidos will not, by virtue of this RFP, become obligated to award a subcontract. Leidos reserves the right to subsequently award the effort described herein to one or more respondents determined to be in the overall best interest of Leidos.

All confidential or proprietary information shall be provided in accordance with the Non-Disclosure Agreement (NDA). All information provided by you in response to this solicitation will remain the property of **Leidos unless agreed to otherwise in an NDA.**

You are cautioned to strictly adhere to the enclosed proposal instructions, with particular attention to the form, format, and content of your proposal. Failure to do so may result in our decision to eliminate your proposal from further consideration. However, alternative proposals, which contain products or services which meet the functional requirements will be considered as separate proposals.

I. PROPOSAL COVER LETTER

Leidos requires a Proposal Cover Letter. Your cover letter must contain all of the following:

- ✓ Dated on or before Wednesday, April 19, 2017;
- ✓ Signed by an official within your organization authorized to legally bind your Company;
- ✓ State any exceptions taken to the terms and conditions of the SOW or "Draft" Subcontract Agreement (Schedule A, Schedule B Part I and Schedule B Part II) or any of its attachments;
- ✓ State a Proposal Validity Period of one hundred and eighty (180) days.

II. STATEMENT OF WORK

The Statement of Work (SOW) will be provided later.

III. Draft Subcontract Agreement and Required Clauses

It is anticipated that the effort set forth in this RFP will be performed on a Firm Fixed (FFP) basis. Any resultant award will include all clauses required by Leidos' Prime Contract, all clauses required by law on the date of execution of the Subcontract, and any other mutually agreeable clauses, provisions and terms and conditions, including:

- "Draft" Firm Fixed (FFP) Subcontract: Schedule A (Attachment C)
- Subcontract: Schedule B Part I – FAR Flow-down clauses (Attachment D)
- Subcontract: Schedule B Part II – DFAR Flow-down clauses (Attachment E)
- Subcontract: Schedule C – DARPA Unique Prime Contract Flowdown and Specific Requirements (Attachment F)

IV. Period of Performance

The P3 program will be approximately a four-year (4) effort from date of award.

V. CERTIFICATE OF INSURANCE

The insurance requirements set forth in Leidos' Schedule A may exceed your company's current insurance levels. Please cross-reference your company's current insurance policy with the Leidos requirements. Please provide a copy of your company's Certificate of Insurance. Upon award of a subcontract by Leidos, it is required that Leidos be named as additionally insured with your insurance provider. (No Waivers will be granted).

VI. Cost/Price Proposal

Per Section II of the DARPA-P3 BAA – Detailed Proposal Information the following cost/pricing detailed breakdown is required:

The cost/price proposal **MUST** be submitted in sufficient detail and must provide such supporting documentation as appropriate and necessary to permit proper evaluation and analysis.

1. Labor Rates

SAMPLE:

Labor Categories	Total Labor Hours	Labor Rate	Fringe Rate %	Overhead Rate %	G&A Rate %	Fee %	Fully Burdened Labor Rate	Total Price per Labor Category
Administrative Assistant	345							
Clinical Nurse Specialist	657							
Technical Writer I	565							
Total	**1468**							

2. **Indirect Costs** – Including Fringe Benefits, Overhead, General and Administrative Expense, Cost of Money, Fee, etc. (must show base amount and rate), if available, provide current Forward Pricing Rate Agreement or Forward Pricing Rate Proposal. If not available, provide 2 years historical data to include pool and expense costs used to generate the rates. For academia, provide DHHS or ONR negotiated rate package or, if calculated by other than a rate, provide University documentation identifying G&A and fringe costs by position;

3. **Travel:**

All proposed travel must be in accordance with:

GSA website: (CONUS): http://www.gsa.gov/portal/content/101518

Defense Travel Management website: (OCONUS):
http://www.defensetravel.dod.mil/site/perdiemCalc.cfm

All other cost (i.e. airfare and rental car) must have supporting documentation.

Trips must be identified by:

a. Departure and Arrival Destinations
b. Number employees per trip
c. Number of Trips per Period
d. Number of Days/Nights per trip
e. Estimated car rental costs
f. Estimated airfare costs

All Travel costs must be supported with screenshots from the travel websites.

4. **Other Direct Costs (ODC's)**

Subcontractor must provide a list of ODC's that will be procured for this requirement and pricing documentation.

Other Direct Costs – Itemized with costs including tuition remission, animal per diem rates, health insurance/fee; back-up documentation is to be submitted to support proposed costs;

Equipment Purchases – Itemization with individual and total costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase (NOTE: For equipment purchases, include a letter stating why the proposer cannot provide the requested resources from its own funding), and;

Materials – Itemization with costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase.

All Proposed ODC's must be supported with screenshots from websites or other documentation.

This level of detail must be provided for FFP subcontracts.

VII. Cost Realism

DARPA intends to perform a Cost Realism analysis on this proposal.

Cost Realism Definition:
The proposed costs are realistic for the technical and management approach and accurately reflect the technical goals and objectives of the solicitation. The proposed costs are consistent with the proposer's Statement of Work and reflect a sufficient understanding of the costs and level of effort needed to successfully accomplish the proposed technical approach. The costs for the prime proposer and proposed subawardees are substantiated by the details provided in the proposal (e.g., the type and number of labor hours proposed per task, the types and quantities of materials, equipment and fabrication costs, travel and any other applicable costs and the basis for the estimates).

It is expected that the effort will leverage all available relevant prior research in order to obtain the maximum benefit from the available funding. For efforts with a likelihood of commercial application, appropriate direct cost sharing may be a positive factor in the evaluation. DARPA recognizes that undue emphasis on cost may motivate proposers to offer low-risk ideas with minimum uncertainty and to staff the effort with junior personnel in order to be in a more competitive posture. DARPA discourages such cost strategies.

VIII. Past Performance:

Subcontractor should provide __2___ past performance references that closely match the RFP requirement. Template is attached.

IX. REPRESENTATIONS AND CERTIFICATIONS & VENDOR MASTER TEMPLATE

Please complete the Supplier Representations and Certifications (Attachment G).

X. PROPOSAL VALIDITY PERIOD

Your proposal shall be valid for a period of one hundred and twenty (180) days.

XI. Proposal Submittal Requirements

1. Due Date: On or before 2:00 p.m. (EST) on Wednesday, April 19, 2017.

2. Method of Submission: One (1) electronic copy to: kristen.k.trump@leidos.com and Michael.a.younkins@leidos.com.

XII. ORGANIZATIONAL CONFLICTS OF INTEREST

FAR 9.5 Requirements - https://www.acquisition.gov/far/html/Subpart%209_5.html

In accordance with FAR 9.5, proposers are required to identify and disclose all facts relevant to potential OCIs involving the proposer's organization and any proposed team member. Under this Section, the proposer is responsible for providing this disclosure with each proposal submitted to the BAA. The

disclosure must include the proposer's, and as applicable, proposed team member's OCI mitigation plan. The OCI mitigation plan must include a description of the actions the proposer has taken, or intends to take, to prevent the existence of conflicting roles that might bias the proposer's judgment and to prevent the proposer from having unfair competitive advantage. The OCI mitigation plan will 18 HR001117S0019, Pandemic Prevention Platform (P3) specifically discuss the disclosed OCI in the context of each of the OCI limitations outlined in FAR 9.505-1 through FAR 9.505-4.

DARPA Agency Supplemental OCI Policy

In addition, DARPA has a supplemental OCI policy that prohibits contractors/performers from concurrently providing Scientific Engineering Technical Assistance (SETA), Advisory and Assistance Services (A&AS) or similar support services and being a technical performer. Therefore, as part of the FAR 9.5 disclosure requirement above, a proposer must affirm whether the proposer or any proposed team member is providing SETA, A&AS, or similar support to any DARPA office(s) under: (a) a current award or subaward; or (b) a past award or subaward that ended within one calendar year prior to the proposal's submission date.

If SETA, A&AS, or similar support is being or was provided to any DARPA office(s), the proposal must include:

- The name of the DARPA office receiving the support;
- The prime contract number;
- Identification of proposed team member (subawardee, consultant) providing the support; and
- An OCI mitigation plan in accordance with FAR 9.5.

Additional Requirements:

a. Identification of technical data previously delivered to the Government IAW DFARS 252.227-7028.
b. Provide permission for Leidos to use your LOGO
c. If you are a Large Business – you must provide a Small Business Subcontracting Plan with your proposal
d. All Subcontractors who are considered a Federally Funded Research & Development Center (FFRDC), must include documentation that clearly demonstrates work is not otherwise available from the private sector AND provided a letter on letterhead from the sponsoring organization citing the specific authority establishing their eligibility to propose to government solicitations and compete with industry, and compliance with the associated FFRDC sponsor agreement and terms and conditions.

Your proposal must be received by Leidos by Wednesday, April 19, 2017 and include a validity period of **180 days** from the due date. Please direct any questions, in writing, regarding this RFP to the undersigned.

Proposals will be evaluated against the following evaluation criteria: Award shall be made to the best value proposal considering price, schedule, technically acceptable proposal and appropriate facilities.

RESPONDING TO THIS REQUEST FOR PROPOSAL CERTIFIES THAT NO GRATUITIES WERE OFFERED BY THE SUPPLIER OR SOLICITED BY ANY LEIDOS EMPLOYEE. IF A GRATUITY WAS SOLICITED, IT SHOULD BE REPORTED IMMEDIATELY TO MR. KIM DENVER, SR. VICE PRESIDENT, AT (571) 526-7051. PLEASE REVIEW LEIDOS' CODE OF ETHICS AT https://www.leidos.com/sites/default/files/CodeOfConduct.pdf.

Attachment 1: RFP/RFQ Enclosures

ATTACHMENTS - RFP/RFQ ENCLOSURES

A.	Statement/Scope of Work and Schedule (TBD)
B.	RFQP General Provisions
C.	Schedule A – Federal - FFP
D.	Schedule B Part I – Federal Non-Commercial Items
E.	Schedule B Part II – DOD Non-Commercial Items
F.	Schedule C – DARPA Unique Prime Contract Flowdown Clauses and Requirements
G.	Supplier Reps and Certs
H.	Pricing Template (Sample)
I.	Past Performance Template

SUBMIT WITH YOUR PROPOSAL

1. Certificate of Insurance in accordance with Section 10.0 of the Subcontract Agreement – Schedule A, Federal, FFP IDIQ (Rev 2015-08) or Evidence of Coverage
2. Letter of Commitment on company letterhead
3. One electronic copy of the technical proposal
4. One electronic copy of the price proposal

Specific Terms and Conditions and Contract Clauses

It should be noted that any purchase order/subcontract resulting from this proposal shall include specific terms and conditions and contract clauses, which are listed by FAR reference, and which are identified herein as Attachment C, D, E, F respectively. All clauses required by the Prime Contract, all clauses required by law on the date of execution of the subcontract, and any mutually agreeable clauses, terms and conditions will be negotiated at time of award.

PROPOSAL CHECK LIST

1. Pricing Detail
    a. Forward Pricing Rate Agreement or Forward Pricing Rate Proposal
    b. If “a” above is not available – 2 Years of Historical Data to Include Pool and Expense Costs Used to Generate the Rates
    c. If Academia – Provide DHHS or ONR Negotiated Rates
    d. Salary Breakdown with all Indirect Rates
    e. Travel Breakdown and Documentation
    f. ODC Breakdown (Materials and Supplies)and Documentation (Description, Make, Model, quantity and Price per unit)
    g. Equipment Breakdown and Documentation (Description, Make, Model, quantity and price per unit)
    h. Suppliers Reps and Certs – Completed and Signed

2. OCI Certification

3. Past Performance

4. FFRDC Documentation

5. LOGO (High resolution jpeg) and permission for Leidos to use for proposal

6. Certificate of Insurance – will be required at time of award

7. Review Attachment C – Schedule A – Federal – FFP document, Schedule B Part I and II. These documents do not have to be returned by April 19, 2017 – however you do need to submit it within 15 days after the requested proposal date with any redlines.

Identification and Assertion of Restrictions on the Government's Use, Release, or Disclosure of Technical Data or Computer Software.

The Subcontractor asserts for itself, or the persons identified below, that the Government's rights to use, release, or disclose the following technical data or computer software should be restricted:

Technical Data or Computer Software to be Furnished With Restrictions*	Basis for Assertion**	Asserted Rights Category***	Name of Person Asserting Restrictions****
(LIST)*****	(LIST)	(LIST)	(LIST)

*For technical data (other than computer software documentation) pertaining to items, components, or processes developed at private expense, identify both the deliverable technical data and each such item, component, or process. For computer software or computer software documentation identify the software or documentation.

**Generally, development at private expense, either exclusively or partially, is the only basis for asserting restrictions. For technical data, other than computer software documentation, development refers to development of the item, component, or process to which the data pertain. The Government's rights in computer software documentation generally may not be restricted. For computer software, development refers to the software. Indicate whether development was accomplished exclusively or partially at private expense. If development was not accomplished at private expense, or for computer software documentation, enter the specific basis for asserting restrictions.

***Enter asserted rights category (e.g., government purpose license rights from a prior contract, rights in SBIR data generated under another contract, limited, restricted, or government purpose rights under this or a prior contract, or specially negotiated licenses).

****Corporation, individual, or other person, as appropriate.

*****Enter “none” when all data or software will be submitted without restrictions.

Re: Organizational Conflicts of Interest Certification (RFP No. LEIDOS-DARPA-P3)

Dear Ms. Trump:

We have reviewed the FAR 9.5 requirements. This is to affirm that [redacted] has no potential organizational conflicts of interest involving [redacted] and any proposed team member.

If you have any questions, please contact [redacted] or [redacted]. Thank you for your consideration of this proposal.

Sincerely,

[redacted]

[redacted]

SCHEDULE B – PART I – FAR CLAUSES

U.S. GOVERNMENT TERMS and CONDITIONS (FEDERAL – NON-COMMERCIAL ITEMS)

1. SCHEDULE B DEFINITIONS

Schedule B Definitions shall apply to all Schedule B terms incorporated into this subcontract (e.g., Part I, Part II). In the U.S. Government clauses contained in the Schedule B document(s), unless the context of the clause requires otherwise, the term "Contractor" shall mean Seller, the term "Contract" shall mean the Subcontract or Purchase Order, and the terms "Government," "Contracting Officer" and equivalent phrases shall mean Leidos and Leidos' Contractual Representative, respectively. It is intended that these clauses shall apply to Seller in such manner as is necessary to reflect the position of Seller as a subcontractor to Leidos, to insure Seller's obligations to Leidos and to the United States Government, and to enable Leidos to meet its obligations under its Prime Contract and the Subcontract. All references to Subcontract shall include purchase orders and unless otherwise stated, all definitions defined by FAR 2.101 shall be applied to the terms referenced herein.

2. DISPUTES

Notwithstanding any provisions herein to the contrary:

(a) If a decision relating to the Prime Contract is made by the Contracting Officer and such decision is also related to this Subcontract, said decision, if binding upon Leidos under the Prime Contract shall in turn be binding upon Leidos and Seller with respect to such matter; provided, however, that if Seller disagrees with any such decision made by the Contracting Officer and Leidos elects not to appeal such decision, Seller shall have the right reserved to Leidos under the Prime Contract with the Government to prosecute a timely appeal in the name of Leidos, as permitted by the Prime Contract or by law, Seller to bear its own legal and other costs. If Leidos elects not to appeal any such decision, Leidos agrees to notify Seller in a timely fashion after receipt of such decision and to assist Seller in its prosecution of any such appeal in every reasonable manner. If Leidos elects to appeal any such decision of the Contracting Officer, Leidos agrees to furnish Seller promptly with a copy of such appeal. Any decision upon appeal, if binding upon Leidos, shall in turn be binding upon Seller. Pending the making of any decision, either by the Contracting Officer or on appeal, Seller shall proceed diligently with performance of this Subcontract.

(b) If, as a result of any decision or judgment which is binding upon Seller and Leidos, as provided above, Leidos is unable to obtain payment or reimbursement from the Government under the Prime Contract for, or is required to refund or credit to the Government, any amount with respect to any item or matter for which Leidos has reimbursed or paid Seller, Seller shall, on demand, promptly repay such amount to Leidos. Additionally, pending the final conclusion of any appeal hereunder, Seller shall, on demand, promptly repay any such amount to Leidos. Leidos' maximum liability for any matter connected with or related to this Subcontract which was properly the subject of a claim against the Government under the Prime Contract shall not exceed the amount of Leidos' recovery from the Government.

(c) If this Subcontract is issued by Leidos under a Government subcontract rather than a Prime Contract, and if Leidos has the right under such Government subcontract to appeal a decision made by the Contracting Officer under the Prime Contract in the name of the Prime Contractor (or if Leidos is subject to any arbitrator's decision under the terms of its subcontract), and said decision is also related to this Subcontract, this Disputes Clause shall also apply to Seller in a manner consistent with its intent and similar to its application had this Subcontract been issued by Leidos under a Prime Contract with the Government.

(d) Seller agrees to provide certification that data supporting any claim made by Seller hereunder is made in good faith and that the supporting data is accurate and complete to the best of Seller's knowledge or belief, all in accordance with the requirements of the Contract Disputes Act of 1978 (41 USC 601-613) and implementing regulations. If any claim of Seller is determined to be based upon fraud or misrepresentation, Seller agrees to defend, indemnify and hold Leidos harmless for any and all liability, loss, cost or expense resulting therefrom.

(e) Any dispute not addressed in paragraph (a) above, will be subject to the disputes clause of Schedule A of the Subcontract or PO terms and conditions.

3. INDEMNIFICATION - COST OR PRICING DATA - COST ACCOUNTING STANDARDS – OTHER

Seller agrees to indemnify and hold Leidos harmless to the full extent of any cost or price reduction, plus interest, effected by Leidos' customer, which may result from (i) certified cost or pricing data submitted by Seller or its lower-tier subcontractors which is not accurate, current or complete as certified by Seller; (ii) the failure by Seller or its lower-tier subcontractors to disclose and consistently follow applicable cost accounting practices and standards or otherwise comply with pertinent parts of the FAR, applicable agency supplements thereto, and standards and regulations promulgated by the Cost Accounting Standards Board. Seller further agrees to indemnify, defend, and hold Buyer harmless from and against any losses, liabilities, offsets and expenses (including reasonable attorney's fees) arising out of or relating to Seller's failure to comply with (i) the provisions of the Anti-Kickback Act or FAR 52.203-7; or (ii) 52.203-13, Contractor Code of Business Ethics and Conduct, if applicable to this Subcontract.

4. CONTRACT COST PRINCIPLES AND PROCEDURES

Seller agrees that to the extent applicable, costs allocated to this Subcontract shall be in full compliance with Subpart 31.2 of FAR (Subpart 31.3 for Educational Institutions) and the applicable agency supplements thereto, if any, set forth in Part II hereof. In the event such compliance is not maintained, Seller agrees to compensate Leidos to the full extent of any prices or costs, including any penalties or interest that are determined by Leidos' customer to be unallowable or unreasonable or not allocable, under Leidos' contract with its customer.

5. FAR CLAUSES APPLICABLE TO THIS SUBCONTRACT

The U.S. Government terms or clauses in FAR Subpart 52.2 referenced herein are incorporated and made a part of this Subcontract, unless:

(a) The description is preceded by a selection box (☐), the FAR clause (and its alternate) shall only apply when selected;

(b) Unless otherwise specified for performance applicability; or

(c) A value (e.g., >$150k) is identified. Clauses are applicable when the subcontract ceiling value (to include all options) exceeds the specified values at the time of award or after modification unless otherwise specified. Note: References to "SAT" refers to the "Simplified Acquisition Threshold" as defined by FAR 2.101 and will be the threshold that is current on the date of the Subcontract award.

To the extent that the Prime Contract or higher-tier subcontract under which this Subcontract is issued, is modified (to include a newer version of any such clause), the date of the modified version of the clause as it appears in such Prime Contract or higher-tier subcontract shall be controlling and said version shall be incorporated herein.

SECTION I: APPLICABLE TO ALL - FEDERAL STANDARD & FEDERAL COMMERCIAL ITEMS	
52.203-6	Restrictions on Subcontractor Sales to the Government (>**SAT**) (**Alternate I** applies to Commercial Items)
52.203-7	Anti-Kickback Procedures (except paragraph (c) (1)) - (>$150k)
52.203-12	Limitation on Payments to Influence Certain Federal Transactions (>$150k)
52.203-13	Contractor Code of Business Ethics and Conduct (Applies when POP >120 days; and >**$5.5M**)

52.203-17	Contractor Employee Whistleblower Rights and Requirements to Inform Employees or Whistle Blower Rights (>**SAT**)
52.203-19	Prohibition on Requiring Certain Internal Confidentiality Agreements or Statements
52.204-9	Personal Identity Verification of Contractor Personnel (Applies when support requires routine access to Federally-controlled facilities or Federally-controlled information systems)
52.204-21	Basic Safeguarding of Covered Contractor Information Systems (Applies when the subcontractor may have Federal contract information residing in or transiting through its information system)
52.209-6	Protecting the Governments Interest When Subcontracting with Contractors Debarred, Suspended, or Proposed for Debarment (>$35k)
☐ 52.217-6	Option for Increased Quantity (Add " " for, "the period of time in which the Contracting Officer has to exercise the option)
☐ 52.217-7	Option for Increased Quantity—Separately Priced Line Item (Add " " for, "the period of time in which the Contracting Officer has to exercise the option)
☐ 52.217-8	Option to Extend Services (Add " " for, "the period of time within which the Contracting Officer may exercise the option.")
☐ 52.217-9	Option to Extend the Term of the Contract (Subparagraph (a) Add " " for, "the period of time within which the Contracting Officer may exercise the option," and, add " " for the number of days for written notice. Subparagraph (c) Add " " for the duration (specified in months or years) for total duration of this contract.)
52.219-8	Utilization of Small Business Concerns
52.219-9	Small Business Subcontracting Plan (>$700k; n/a to small business concern)
52.222-3	Convict Labor
52.222-4	Contract Work Hours and Safety Standards —Overtime Compensation (Applies to subcontracts that may require or involve the employment of laborers and mechanics)
52.222-17	Non-displacement of Qualified Workers (>**SAT**)
52.222-20	Walsh-Healey Public Contracts Act (Applies when manufacturing or furnishing materials, supplies, articles, or equipment and performed within the United States, Puerto Rico or the U.S. Virgin Islands; and >$15k)

52.222-21	Prohibition of Segregated Facilities
52.222-26	Equal Opportunity
52.222-35	Equal Opportunity for Veterans (>$150k).
52.222-36	Affirmative Action for Workers with Disabilities (>$15k)
52.222-37	Employment Reports on Special Disabled Veterans, Veterans of the Vietnam Era and Other Eligible Veterans (>$150k)
52.222-40	Notification of Employee Rights Under the National Labor Relation Acts (>$10,000 and subcontract will be performed wholly or partially in the United States)
52.222-41	Service Contract Labor Standards
52.222-42	Statement of Equivalent Rates for Federal Hires
52.222-43	Fair Labor Standards Act and Service Contract Act – Price Adjustment (Applies to Multiple Year and Option Contracts)
52.222-44	Fair Labor Standards Act and Service Contract Act – Price Adjustment
52.222-50	Combating Trafficking in Persons
FAR 52.222-41 through -44 are inapplicable if either FAR 52.222-51 or -53 is selected.	
☐ 52.222-51	Exemption from the Application of the Service Contract Act of Contracts for Maintenance, Calibration or Repair of Certain Equipment – Requirements
☐ 52.222-53	Exemption from the Application of the Service Contract Act to Contracts for Certain Services – Requirements
52.222-54	Employment Eligibility Verification (>$3,500, n/a if performance is wholly OCONUS)
52.222-55	Minimum Wages Under Executive Order 13658 (Applies to orders subject to the Service Contract Labor Standards statute or the Wage Rate Requirements (Construction) statute, and are to be performed in whole or in part in the United States)
52.222-56	Certification Regarding Trafficking in Persons Compliance Plan (Provision applies to non-COTS >$500K)
52.223-9	Estimate of Percentage of Recovered Material Content for EPA Designated Items (Applies to Awards that involve the use of EPA –designated items)
52.223-15	Energy Efficiency in Energy – Consuming Products
52.223-16	IEEE 1680 Standard for the Environmental Assessment of Personal Computer Products ☐ **Alternate I**
52.223-18	Encouraging Contractor Policies to Ban Text While Driving (>$3,500)
52.225-1	Buy American Act – Supplies (Applies unless 52.225-3 (with its alternates when applicable) or 52.222-5 is selected)
☐ 52.225-3	Buy American Act – Free Trade Agreements – Israeli Trade Act ☐ **Alternate I** ☐ **Alternate II** ☐ **Alternate III**
☐ 52.225-5	Trade Agreements
52.225-13	Restrictions on Certain Foreign Purchases
52.225-26	Contractors Performing Private Security Functions Outside the United States (Applies to support of combat operations or other significant military operations)
52.226-6	Promoting Excess Food Donation to on Profit Organizations (Applies when manufacturing or furnishing materials, supplies, articles, or equipment and performed within the United States, Puerto Rico or the U.S. Virgin Islands; and >$25k)
52.239-1	Privacy or Security Safeguards
52.244-6	Award of Commercial Items
52.245-1	Government Property (Applies when Government Property is applicable to the subcontract) ☐ **Alternate I** – Responsibility and Liability for Government Property (n/a to cost-reimbursement type Awards)

52.247-64	Preference for Privately Owned U.S. Flag Commercial Vessels (Applies to ocean transfer of supplies) ☐ **Alternate I**
	Service Contract Reporting Requirements: First-tier subcontracts for services (including construction) valued at or above the thresholds set forth in 4.1703(a)(2) shall annually by October 15th provide a report to the Leidos Contractual POC that includes subcontract number, subcontractor name and DUNS number and the number of direct-labor hours expended on the services performed during the previous Government fiscal year (October 1-September 30). The subcontractor shall be advised that this information will be made available to the public as required by section 743 of Division C of the Consolidated Appropriations Act, 2010.

SECTION II: APPLICABLE TO FEDERAL ORDERS FOR NON-COMMERCIAL ITEMS

52.203-3	Gratuities
52.203-5	Covenant Against Contingent Fees
52.203-8	Cancellation, Rescission, and Recovery of Funds for Illegal or Improper Activity
52.203-10	Price or Fee Adjustment for Illegal or Improper Activity
52.203-14	Display of Hotline Poster(s) (>**$5.5M**)
52.204-2	Security Requirements (Applies to services where access to classified information is required) **Alternate I** (Applies to R&D or Educational Institutions) **Alternate II** (Applies to Architect Engineering Awards)
52.204-4	Printed or Copied Double-Sided on Recycled Paper
52.208-8	Required Sources for Helium and Helium Usage Data (Applies when support involves a major helium requirement)
52.211-5	Material Requirements
Negotiated Awards where the ceiling value exceeds the threshold in FAR 15.403-4(a)(1):	
52.214-26	Audit and Records-Sealed Bidding
52.214-28	Subcontractor Cost or Pricing Data - Modifications - Sealed Bidding
52.215-11	Price Reduction for Defective Cost or Pricing Data -Modifications
52.215-13	Subcontractor Cost or Pricing Data – Modifications
52.215-15	Pension Adjustments and Asset Reversions
52.215-21	Requirements for Cost or Pricing Data or Information Other Than Cost or Pricing Data – Modifications
Negotiated Awards where the ceiling value exceeds the threshold in FAR 15.403-4(a)(1) and when Buyer's submission of Certified Cost and Pricing Data was required.	
52.214-27	Price Reduction for Defective Cost or Pricing Data Modifications – Sealed Bidding
52.215-10	Price Reduction for Defective Cost or Pricing Data
52.215-12	Subcontractor Cost or Pricing Data
52.215-18	Reversion or Adjustment of Plans for Post-Retirement Benefits (PRB) Other Than Pensions
52.215-19	Notification of Ownership Changes
52.215-20	Requirements for Cost or Pricing Data or Information Other Than Cost or Pricing Data
52.215-2	Audit and Records-Negotiation (>SAT current at the time of award)
52.215-14	Integrity of Unit Prices (except paragraph (b)) (>SAT current at the time of award; except architect engineer services, utility services, services where supplies are not required, and petroleum products)
52.215-23	Limitations on Pass-Through Charges (Applicable to CR awards for non-DOD; and >SAT current at the time of award. If DoD, applies to all order types when >$750k)
52.217-8	Option to Extend Services
52.217-9	Option to Extend the Term of the Contract
52.219-16	Liquidated Damages – Subcontracting Plan (>$700k and when 52.219-9 is applicable)
52.222-1	Notice to the Government of Labor Disputes
52.222-38	Compliance with Veteran's Employment Reporting Requirements
52.223-3	Hazardous Material Identification and Material Safety Data (Applies to support of DOD programs involving Hazardous Material) **Alternate I** (Applies to support of Federal Civilian programs involving Hazardous Material)
52.223-5	Pollution Prevention and Right-to-Know Information (including **Alternate I and II**) - (Applies when performance is on a Federal facility)
52.223-6	Drug-Free Workplace
52.223-7	Notice of Radioactive Materials (Applies to subcontract performance containing use of radioactive materials)
52.223-11	Ozone – Depleting Substances (Applies to work containing ozone depleting substances)
52.224-1	Privacy Act Notification (Applies to awards for redesign, development, or operation of records on individuals that is subject to Privacy Act of 1974)
52.224-2	Privacy Act (Applies to awards for redesign, development, or operation of records on individuals that is subject to Privacy Act of 1974)
☐ 52.225-3	Buy American Act – Free Trade Agreements – Israeli Trade Act ☐ **Alternate I** ☐ **Alternate II** ☐ **Alternate III**
52.225-8	Duty-Free Entry

52.225-19	Contractor Personnel in a Designated Operational Area or Supporting a Diplomatic or Consular Mission Outside the United States (Applies to OCONUS performance)
52.227-1	Authorization and Consent **Alternate I** (Applies R&D awards) **Alternate II** (Applies when support involves communication services with a common carrier and the services are unregulated and not priced by a tariff schedule set by a regulatory body)
52.227-2	Notice and Assistance Regarding Patent and Copyright Infringement (>SAT current at the time of award)
52.227-3	Patent Indemnity
52.227-9	Refund of Royalties (Applies when royalties reported during negotiation of the subcontract >$250)
52.227-10	Filing of Patent Applications - Classified Subject Matter
52.227-11	Patent Rights - Ownership by the Contractor (Applies when support is experimental, developmental, or research performed by a small business or nonprofit organization)
52.227-13	Patent Rights – Ownership by the Government (Applies to experimental, developmental, or research work)
52.227-14	Rights in Data – General ☐ **Alternate I** ☐ **Alternate II** ☐ **Alternate III** ☐ **Alternate IV** ☐ **Alternate V**
☐ 52.227-17	Rights in Data - Special Works
☐ 52.227-18	Rights in Data - Existing Work
52.227-19	Commercial Computer Software License (Applies to any Computer Commercial Software delivered by Seller)
52.227-21	Technical Data Declaration, Revision & Withholding of Payment Major Systems (Applies when supporting the acquisition of a major system)
52.227-22	Major System - Minimum Rights (Applies when supporting the acquisition of Major Systems)
52.227-23	Rights to Proposal Data (Technical)
52.228-3	Worker's Compensation Insurance - DBA (Inapplicable when 52.228-4 is selected and OCONUS performance)
☐ 52.228-4	Worker's Compensation and War-Hazard Insurance Overseas (Applies to OCONUS performance)
52.228-5	Insurance - Work on a Government Installation (Applies when subcontract performance is on a Government installation)
52.229-3	Federal, State, and Local Taxes
52.229-6	Taxes - Foreign Fixed-Price Contracts (Applies to fixed-price OCONUS performance)
52.229-8	Taxes - Foreign Cost-Reimbursement Contracts (Applies to cost-reimbursement OCONUS performances)
52.230-X clauses apply (when selected) to negotiated awards >$750k at the time of award only.	
☒ 52.230-2	Cost Accounting Standards (except paragraph (b))
☐ 52.230-3	Disclosure and Consistency of Cost Accounting Practices (except p. (b))
☐ 52.230-4	Disclosure and Consistency of Cost Accounting Practices—Foreign Concerns
☐ 52.230-5	Cost Accounting Standards-Educational Institution (except para (b))
☐ 52.230-6	Administration of Cost Accounting Standards
52.232-16	Progress Payments (Notwithstanding paragraph 1. above, in paragraph 52.232-16(d),"Government" means the "U.S. Government" except in subdivision (d)(2)(iv).
52.232-17	Interest
52.232-40	Providing Accelerated Payments to Small Business Subcontractors (Applies to small businesses)
52.233-3	Protest After Award
52.234-1	Industrial Resources Developed Under Defense Production Act Title III (Applies to major systems and supply contracts)
52.234-4	Earned Value Management System (Applies when use of an Earned Value Management System (EVMS) is required by the subcontract)
52.237-2	Protection of Government Buildings, Equipment and Vegetation (Applies when services are not performed on Seller site)

52.249-8	Default (Fixed-Price) **Alternate I** – (Applies to Transportation Services)			X

SCHEDULE B – PART II – DOD FAR SUPPLEMENTS
APPLICABLE TO ALL DEPARTMENT OF DEFENSE (DOD) ORDERS – NON COMMERCIAL ITEMS

1. DFAR SUPPLEMENT CLAUSES APPLICABLE TO THIS SUBCONTRACT

All references herein to "DFAR Supplement" or "DFAR SUPP" shall mean the Department of Defense Supplement to the Federal Acquisition Regulation. The clauses in DFAR Supplement Subpart 252.2 referenced herein are incorporated and made a part of this Subcontract, unless the Description is preceded by a selection box (☐), the FAR clause (and its alternate) shall only apply when selected. To the extent that the Prime Contract or higher-tier subcontract under which this Subcontract is issued, is modified (to include a newer version of any such clause), the date of the modified version of the clause as it appears in such Prime Contract or higher-tier subcontract shall be controlling and said version shall be incorporated herein.

2. CONTRACTOR MANPOWER REPORTING

☒ If selected, Seller shall report ALL subcontractor labor hours required for performance of services provided under this subcontract via the Government's secure data collection site. Seller is required to completely fill in all required data fields using the following web address: http://www.ecmra.mil/. Reporting inputs will be for the subcontract labor executed during the period of performance of this subcontract, during each Government fiscal year (FY), which runs October 1 through September 30. While inputs may be reported any time during the FY, all data shall be reported no later than October 31 of each calendar year. Subcontractors may direct questions to the help desk at help desk at: http://www.ecmra.mil.

SECTION I: APPLICABLE TO ALL – DOD STANDARD & COMMERCIAL ITEMS	
252.203-7000	Requirements Relating to Compensation of Former DOD Officials
252.204-7012	Safeguarding Covered Defense Information and Cyber Incident Reporting (Applies when seller is providing operationally critical support, or for which performance will involve a covered contractor information system) Seller shall provide the cognizant Leidos contractual representative, notification of any incident report number, that has been submitted (for any tier) in accordance with 252.204-7012.
☐ 252.204-7014	Limitations on the Use or Disclosure of Information by Litigation Support Contractors
252.204-7015	Notice of Authorized Disclosure of Information for Litigation Support
252.211-7003	Item Unique Identification and Valuation *(when Government Property applies)*
252.211-7007	Reporting of Government-Furnished Property, subsection (d). (When Government Property applies)
252.222-7007	Representation Regarding Combating Trafficking in Persons
252.225-7001	Buy American Act and Balance of Payments Program (Applies unless 252.225-7021, 252.225-7036 or 252.225-7045 is selected) **Alternate I** (Applies to support of operations in Afghanistan)
252.225-7008	Restriction on Acquisition of Specialty Metals
252.225-7009	Restriction on Acquisition of Certain Articles Containing Specialty Metals
252.225-7012	Preference for Certain Domestic Commodities
252.225-7015	Restriction on Acquisition of Hand or Measuring Tools (Applies to supply orders for delivery of measuring and hand tools)
252.225-7017	Photovoltaic Devices (Applies if order results in DoD ownership of photovoltaic devices)
☐ 252.225-7021	Trade Agreements **Alternate II** (Applies to support of operations in Afghanistan)
252.225-7028	Exclusionary Policies and Practices of Foreign Governments (for purchase of supplies and services for international military education training and FMS)
☐ 252.225-7036	Buy American Act – Free Trade Agreement-Balance of Payments Program ☐ Alternate I ☐ Alternate II ☐ Alternate III ☐ Alternate IV ☐ Alternate V
252.225-7038	Restriction on Acquisition of Air Circuit Breakers (Applies for orders or subcontract performance that require air circuit breakers for naval vessels)
225.225-7039	Defense Contractors Performing Private Security Functions Outside the United States (Services only when performance is OCONUS)

252.225-7040	Contractor Personnel Authorized to Accompany U.S. Armed Forces Deployed Outside the United States (Services only. Applies when performance is OCONUS and personnel are authorized to accompany US Armed Forces)
☐ 252.225-7045	Balance of Payments Program – Construction Material Under Trade Agreements ☐ Alternate I ☐ Alternate II ☐ Alternate III
252.225-7048	Export Controlled Items
252-226-7001	Utilization of Indian Organizations, Indian-Owned Economic Enterprises, and Native Hawaiian Small Business Concerns **(>$500K)**
252.227-7013	Rights in Technical Data - Noncommercial Items **Alternate II** (Applies when subcontractor support is for the development or delivery of a vessel design or any useful article embodying a vessel design)
252.227-7015	Technical Data – Commercial Items (Applies to the delivery of technical data pertaining to commercial items, components or processes) **Alternate I** (Applies to the development or delivery of a vessel design or any useful article embodying a vessel design)
252.227-7019	Validation of Asserted Restrictions -Computer Software (Applies to the delivery of computer software)
252.227-7037	Validation of Restrictive Markings on Technical Data (Applies for the delivery of technical data)
252.236-7013	Requirement for Competition Opportunity for American Steel Producers, Fabricators, and Manufacturers (Applies to subcontractor support that includes the acquisition of steel as a construction material)
252.237-7010	Prohibition on Interrogation of Detainees by Contractor Personnel (Services only, when performance includes interaction with detainees)
252.237-7019	Training for Contractor Personnel Interacting with Detainees ((Services only, when performance includes interaction with detainees)
252.239-7018	Supply Chain Risk
252.244-7000	Subcontracts for Commercial Items
252.246-7003	Notification of Potential Safety Issues
252.246-7004	Safety of Facilities, Infrastructure, and Equipment for Military Operations (Applies when subcontractor support is for the construction, installation, repair, maintenance, or operation of facilities, infrastructure, or for equipment configured for occupancy, planned for use by DoD military or civilian personnel during military operations)
252.246-7007	Contractor Counterfeit Electronic Part Detection and Avoidance System (applicable to the acquisition of electronic parts or assemblies containing electronic parts)
252.247-7003	Pass-Through of Motor Carrier Fuel Surcharge Adjustment to the Cost Bearer **(**Applies to subcontracts that include the use of motor carriers, brokers, or freight forwarders)
252.247-7023	Transportation of Supplies by Sea
252.247-7024	Notice of Transportation of Supplies by Sea

SECTION II: APPLICABLE TO DOD ORDERS FOR NON-COMMERCIAL ITEMS	
252.203-7001	Prohibition on Persons Convicted of Fraud or Other Defense-Contract Related Felonies - Commercial items exempt (**>$150k**)
252.203-7002	Requirement to Inform Employees of Whistleblower Rights
252.203-7004	Display of Online Posters - Commercial items exempt **(>$5.5M)**
252.204-7000	Disclosure of Information
252.204-7009	Limitations on the Use or Disclosure of Third-Party Contractor Reported Cyber Incident Information (Applies when performance requires safeguarding covered defense information and cyber incident reporting)
252.209-7004	Subcontracting with Firms that are Owned or Controlled by the Government of a Terrorist Country
☐ 252.211-7000	Acquisition Streamlining **(>$1.5M)**
252.215-7000	Pricing Adjustments (Applies when 52.215-11, 52.215-12, or 52.215-13 are applicable)
252.219-7003	Small Business Subcontracting Plan - Small businesses exempt **(>$700K)**
252.219-7004	Small Business Subcontracting Plan (Test Program) - Small businesses exempt **(>$700K)**
☐ 252.222-7000	Restrictions on Employment of Personnel (services only)
252.222-7006	Restrictions On The Use Of Mandatory Arbitration Agreements
252.223-7001	Hazard Warning Labels (Applies to support involving hazardous material)

252.223-7002	Safety Precautions for Ammunition and Explosives (Applies to support involving ammunition or explosives)
252.223-7003	Change in Place of Performance *(Applies to support involving* Ammunition or Explosives)
252.225-7004	Report of Intended Performance Outside the United States and Canada – OCONUS performance only **(>$700K)**
252.225-7007	Prohibition on Acquisition of United States Munitions List Items from Communist Chinese Military Companies (Applies for items covered by the US Munitions List)
252.225-7013	Duty-Free Entry
252.225-7016	Restriction on Acquisition of Ball and Roller Bearings (Commercial items exempt)
252.225-7043	Antiterrorism/Force Protection Policy for Defense Contractors Outside the United States (Applies to OCONUS performance)
252.227-7014	Rights in Noncommercial Computer Software and Noncommercial Computer Software Documentation (Applies to the delivery of computer software or computer software documentation)
252.227-7016	Rights in Bid or Proposal Information
☐ 252.227-7020	Rights in Special Works
☐ 252.227-7021	Rights in Data - Existing Works
☐ 252.227-7022	Government Rights (Unlimited)
☐ 252.227-7023	Drawings and Other Data to Become Property of Government
252.227-7025	Limitations on the Use or Disclosure of Government-Furnished Information Marked w/ Restrictive Legends (Applies if subcontractor is provided with technical data marked with another parties' restrictive legends)
252.227-7030	Technical Data - Withholding of Payment
252.227-7033	Rights in Shop Drawings (Applies to construction orders)
252.228-7005	Accident Reporting & Investigation Involving Aircraft, Missiles, and Space Launch Vehicles
252.231-7000	Supplemental Cost Principles
252.235-7002	Animal Welfare (Services only. Applies to research of live vertebrate animals)
252.235-7003	Frequency Authorization (Services only, for the development, production, construction, testing, or operation of a device for which a radio frequency authorization is required)
252.237-7023	Continuation of Essential Contractor Services (If Subcontract provides "Essential contractor service")
252.239-7000	Protection Against Compromising Emanations (Applies when information technology requires protection against compromising emanations.
252.239-7010	Cloud Computing Services (Applies when order involves cloud services)
252.239-7016	Telecommunications Security Equipment, Devices, Techniques and Services (Applies to orders securing telecommunications)
252.245-7001	Reports of Government Property (when government property applies)
252.246-7001	Warranty of Data **Alternate II** (Applies to Fixed-Price subcontracts)
252.249-7002	Notification of Anticipated Contract Termination or Reduction - Services only (**>$150k**)

Schedule C – HR001117S0019 DARPA Additional BAA Requirements/Clauses

Proprietary Markings

Proposers are responsible for clearly identifying proprietary information. Submissions containing proprietary information must have the cover page and each page containing such information clearly marked with a label such as "Proprietary" or "Company Proprietary." NOTE: "Confidential" is a classification marking used to control the dissemination of U.S. Government National Security Information as dictated in Executive Order 13526 and should not be used to identify proprietary business information.

Unclassified Submissions

DARPA anticipates that submissions received under this BAA will be unclassified. However, should a proposer wish to submit classified information, an *unclassified* email must be sent to the BAA mailbox requesting submission instructions from the Technical Office PSO. If a determination is made that the award instrument may result in access to classified information, a SCG and/or DD Form 254 will be issued by DARPA and attached as part of the award.

Human Research Subjects/Animal Use

Proposers that anticipate involving Human Research Subjects or Animal Use must comply with the approval procedures detailed at www.darpa.mil/work-with-us/additional-baa. protection. Further, research involving human subjects that is conducted or supported by the DoD must comply with 32 CFR 219, *Protection of Human Subjects* (and DoD Instruction 3216.02, *Protection of Human Subjects and Adherence to Ethical Standards in DoD-Supported Research* (http://www.dtic.mil/whs/directives/corres/pdf/321602p.pdf). Institutions awarded funding for research involving human subjects must provide documentation of a current Assurance of Compliance with federal regulations for human subjects protection, such as a Department of Health and Human Services, Office of Human Research Protection Federal Wide Assurance (http://www.hhs.gov/ohrp). All institutions engaged in human subjects research, to include subcontractors, must also hold a valid assurance. In addition, all personnel involved in human subjects research must provide documentation of completion of human subjects research training. For all proposed research that will involve human subjects in the first year or phase of the project, the institution must provide evidence of or a plan for review by an Institutional Review Board (IRB) upon final proposal submission to DARPA as part of their proposal, prior to being selected for funding. The IRB conducting the review must be the IRB identified on the institution's Assurance of Compliance with human subjects protection regulations. The protocol, separate from the proposal, must include a detailed description of the research plan, study population, risks and benefits of study participation, recruitment and consent process, data collection, and data analysis. It is recommended that you consult the designated IRB for guidance on writing the protocol. The informed consent document must comply with federal regulations (32 CFR 219.116). A valid Assurance of Compliance with human subjects protection regulations along with evidence of completion of appropriate human subjects research training by all investigators and personnel involved with human subjects research should accompany the protocol for review by the IRB.

In addition to a local IRB approval, a headquarters-level human subjects administrative review and approval is required for all research conducted or supported by the DoD. The Army, Navy, or Air Force office responsible for managing the award can provide guidance and information about their component's headquarters-level review process. Note that confirmation of a current Assurance of Compliance with human subjects protection regulations and appropriate human subjects research training is required before headquarters-level approval can be issued. The time required to complete the IRB review/approval process varies depending on the complexity of the research and the level of risk involved with the study. The IRB approval process can last between one and three months, followed by a DoD review that could last between three and six months. Ample time should be allotted to complete the approval process. DoD/DARPA funding cannot be used toward human subjects research until ALL approvals are granted.

Human Subjects Research and Animal Use

Human Subjects Research

All research selected for funding involving human subjects, to include use of human biological specimens and human data, must comply with the federal regulations for human subjects protection. Further, research involving human subjects that is conducted or supported by the DoD must comply with 32 CFR 219, Protection of Human Subjects (and DoD Instruction 3216.02, Protection of Human Subjects and Adherence to Ethical Standards in DoD-Supported Research (http://www.dtic.mil/whs/directives/corres/pdf/321602p.pdf).

Institutions awarded funding for research involving human subjects must provide documentation of a current Assurance of Compliance with federal regulations for human subjects protection, such as a Department of Health and Human Services, Office of Human Research Protection Federal Wide Assurance (http://www.hhs.gov/ohrp). All institutions engaged in human subjects research, to include subcontractors, must also hold a valid assurance. In addition, all personnel involved in human subjects research must provide documentation of completion of human subjects research training.

For all proposed research that will involve human subjects in the first year or phase of the project, the institution must provide evidence of or a plan for review by an Institutional Review Board (IRB) upon final proposal submission to DARPA as part of their proposal, prior to being selected for funding. The IRB conducting the review must be the IRB identified on the institution's Assurance of Compliance with human subjects protection regulations. The protocol, separate from the proposal, must include a detailed description of the research plan, study population, risks and benefits of study participation, recruitment and consent process, data collection, and data analysis. It is recommended that you consult the designated IRB for guidance on writing the protocol. The informed consent document must comply with federal regulations (32 CFR 219.116). A valid Assurance of Compliance with human subjects protection regulations along with evidence of completion of appropriate human subjects research training by all investigators and personnel involved with human subjects research should accompany the protocol for review by the IRB.

In addition to a local IRB approval, a headquarters-level human subjects administrative review and approval is required for all research conducted or supported by the DoD. The Army, Navy, or Air Force office responsible for managing the award can provide guidance and information about their component's headquarters-level review process. Note that confirmation of a current Assurance of Compliance with human subjects protection regulations and appropriate human subjects research training is required before headquarters-level approval can be issued.
The time required to complete the IRB review/approval process varies depending on the complexity of the research and the level of risk involved with the study. The IRB approval process can last between one and three months, followed by a DoD review that could last between three and six months. Ample time should be allotted to complete the approval process. DoD/DARPA funding cannot be used toward human subjects research until ALL approvals are granted.

Animal Use

Award recipients performing research, experimentation, or testing involving the use of animals shall comply with the rules on animal acquisition, transport, care, handling, and use as outlined in: (i) 9 CFR parts 1-4, Department of Agriculture rules that implement the Animal Welfare Act of 1966, as amended, (7 U.S.C. § 2131-2159); (ii) National Institutes of Health Publication No. 86-23, "Guide for the Care and Use of Laboratory Animals" (8th Edition); and (iii) DoD Instruction 3216.01, "Use of Animals in DoD Programs."

For projects anticipating animal use, proposals should briefly describe plans for Institutional Animal Care and Use Committee (IACUC) review and approval. Animal studies in the program will be expected to comply with the Public Health Service (PHS) Policy on Humane Care and Use of Laboratory Animals, available at http://grants.nih.gov/grants/olaw/olaw.htm.

All award recipients must receive approval by a DoD-certified veterinarian, in addition to an IACUC approval. No animal studies may be conducted using DoD/DARPA funding until the United States Army Medical Research and Materiel Command (USAMRMC) Animal Care and Use Review Office (ACURO) or other appropriate DoD veterinary office(s) grant approval. As a part of this secondary review process, the award recipient will be required to complete and submit an ACURO Animal Use Appendix, which may be found at http://mrmc.amedd.army.mil/index.cfm?pageid=research_protections.acuro_animalappendix.

Intellectual Property

All proposers must provide a good faith representation that the proposer either owns or possesses the appropriate licensing rights to all intellectual property that will be utilized under the proposed effort.

For Procurement Contracts

Proposers responding to this BAA requesting procurement contracts will need to complete the certifications at DFARS 252.227-7017. See http://www.darpa.mil/work-with-us/additional-baa for further information. If no restrictions are intended, the proposer should state "none." The table below captures the requested information:

Technical Data Computer Software To be Furnished With Restrictions	Summary of Intended Use in the Conduct of the Research	Basis for Assertion	Asserted Rights Category	Name of Person Asserting Restrictions
(LIST)	(NARRATIVE)	(LIST)	(LIST)	(LIST)

For All Non-Procurement Contracts

Proposers responding to this BAA requesting a Cooperative Agreement, Technology Investment Agreement, or Other Transaction for Prototypes shall follow the applicable rules and regulations governing these various award instruments, but, in all cases, should appropriately identify any potential restrictions on the Government's use of any Intellectual Property contemplated under the award instrument in question. This includes both Noncommercial Items and Commercial Items. Proposers are encouraged to use a format similar to that described in the section above. If no restrictions are intended, then the proposer should state "NONE."

Controlled Unclassified Information (CUI) on Non-DoD Information Systems

In addition to classified information, certain types of unclassified information also require application of access and distribution controls and protective measures for a variety of reasons. This information is referred to collectively as Controlled Unclassified Information (CUI). DoD CUI includes, but is not limited to: For Official Use Only (FOUO), Law Enforcement Sensitive (LES), DoD Unclassified Controlled Nuclear Information (DoD UCNI), and Limited Distribution, as well as some categories developed by other executive branch agencies. For further information, consult DoDM 5200.01, Volume 4, "DoD Information Security Program: Controlled Unclassified Information (CUI)."

All non-DoD entities doing business with DARPA are expected to adhere to the following procedural safeguards, in addition to any other relevant federal or DoD specific procedures, for submission of any proposals to DARPA and any potential business with DARPA:

- Do not process DARPA CUI on publicly available computers or post DARPA CUI to publicly available webpages or websites that have access limited only by domain or Internet protocol restriction.
- Ensure that all DARPA CUI is protected by a physical or electronic barrier when not under direct individual control of an authorized user and limit the transfer or DARPA CUI to subcontractors or teaming partners with a need to know and commitment to this level of protection.
- Ensure that DARPA CUI on mobile computing devices is identified and encrypted and all communications on mobile devices or through wireless connections are protected and encrypted.
- Overwrite media that has been used to process DARPA CUI before external release or disposal. Proposers with questions regarding CUI should contact the DARPA Security and Intelligence Directorate at (703) 526-1581.

Publication Restrictions on Non-Fundamental Research

National Security Decision Directive (NSDD) 189 defines fundamental research as follows:

"Fundamental research" means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

The following clause or similar language will be included in all awards where the resultant research will not be considered fundamental research and there will be restrictions on publication:

"There shall be no dissemination or publication, except within and between the contractor and any subcontractors, of information developed under this contract or contained in the reports to be furnished pursuant to this contract without prior written approval of DARPA's Public Release Center (DARPA/PRC). All technical reports will be given proper review by appropriate authority to determine which distribution statement is to be applied prior to the initial distribution of these reports by the contractor. With regard to subcontractor proposals for fundamental research, papers resulting from unclassified fundamental research are exempt from prepublication controls and this review requirement, pursuant to DoD Instruction 5230.27 dated October 6, 1987.

When submitting material for written approval for open publication, the contractor/awardee must submit a request for public release to the DARPA/PRC and include the following information: (1) Document Information: document title, document author, short plain-language description of technology discussed in the material (approx. 30 words), number of pages (or minutes of video), and document type (e.g., briefing, report, abstract, article, or paper); (2)

Event Information: event type (conference, principal investigator meeting, article, or paper), event date, desired date for DARPA's approval; (3) DARPA Sponsor: DARPA program manager, DARPA office, and contract number; and (4) Contractor/Awardee's Information: POC name, e-mail, and phone. Allow three weeks for processing. Due dates under three weeks require a justification. Unusual electronic file formats may require additional processing time. Requests may be sent either via email to public_release_center@darpa.mil or by mail to 675 North Randolph Street, Arlington VA 22203-2114, telephone (571) 218-4235. Refer to the following for link for information about DARPA's public release process: http://www.darpa.mil/work-with-us/contract-management/public-release.

April 7, 2017

Subject: Formal Request for Proposal (RFP)
In response refer to RFP No. LEIDOS-DARPA-P3 _____(Your Company Name)

References: DARPA-HR001117S0019

Team Member:

You are requested to submit a **Firm Fixed Price** proposal in response to this Request for Proposal (RFP). The Statement of Work (SOW) and Specifications will be provided shortly in an amendment to this RFP. Your proposal must be in accordance with the terms, conditions, and special provisions included herein with this RFP. You must complete and return the Suppliers Reps and Certs (Attachment G) and the pricing template (Attachment H). On the last page of this letter is a Proposal Check List for you to use to ensure that all required documentation has been included in your proposal.

Your response is due by 2:00 PM (EST) on Wednesday, April 19, 2017.

PROPOSAL INSTRUCTIONS AND INFORMATION

Leidos is not obligated to pay for any expenses incurred as a result of your efforts to respond to this solicitation. Moreover, Leidos will not, by virtue of this RFP, become obligated to award a subcontract. Leidos reserves the right to subsequently award the effort described herein to one or more respondents determined to be in the overall best interest of Leidos.

All confidential or proprietary information shall be provided in accordance with the Non-Disclosure Agreement (NDA). All information provided by you in response to this solicitation will remain the property of **Leidos unless agreed to otherwise in an NDA.**

You are cautioned to strictly adhere to the enclosed proposal instructions, with particular attention to the form, format, and content of your proposal. Failure to do so may result in our decision to eliminate your proposal from further consideration. However, alternative proposals, which contain products or services which meet the functional requirements will be considered as separate proposals.

I. PROPOSAL COVER LETTER

Leidos requires a Proposal Cover Letter. Your cover letter must contain all of the following:

- ✓ Dated on or before Wednesday, April 19, 2017;
- ✓ Signed by an official within your organization authorized to legally bind your Company;
- ✓ State any exceptions taken to the terms and conditions of the SOW or "Draft" Subcontract Agreement (Schedule A, Schedule B Part I and Schedule B Part II) or any of its attachments;
- ✓ State a Proposal Validity Period of one hundred and eighty (180) days.

II. STATEMENT OF WORK

The Statement of Work (SOW) will be provided later.

III. Draft Subcontract Agreement and Required Clauses

It is anticipated that the effort set forth in this RFP will be performed on a Firm Fixed (FFP) basis. Any resultant award will include all clauses required by Leidos' Prime Contract, all clauses required by law on the date of execution of the Subcontract, and any other mutually agreeable clauses, provisions and terms and conditions, including:

- "Draft" Firm Fixed (FFP) Subcontract: Schedule A (Attachment C)
- Subcontract: Schedule B Part I – FAR Flow-down clauses (Attachment D)
- Subcontract: Schedule B Part II – DFAR Flow-down clauses (Attachment E)
- Subcontract: Schedule C – DARPA Unique Prime Contract Flowdown and Specific Requirements (Attachment F)

IV. Period of Performance

The P3 program will be approximately a four-year (4) effort from date of award.

V. CERTIFICATE OF INSURANCE

The insurance requirements set forth in Leidos' Schedule A may exceed your company's current insurance levels. Please cross-reference your company's current insurance policy with the Leidos requirements. Please provide a copy of your company's Certificate of Insurance. Upon award of a subcontract by Leidos, it is required that Leidos be named as additionally insured with your insurance provider. (No Waivers will be granted).

VI. Cost/Price Proposal

Per Section II of the DARPA-P3 BAA – Detailed Proposal Information the following cost/pricing detailed breakdown is required:

The cost/price proposal **MUST** be submitted in sufficient detail and must provide such supporting documentation as appropriate and necessary to permit proper evaluation and analysis.

1. Labor Rates

SAMPLE:

Labor Categories	Total Labor Hours	Labor Rate	Fringe Rate %	Overhead Rate %	G&A Rate %	Fee %	Fully Burdened Labor Rate	Total Price per Labor Category
Administrative Assistant	345							
Clinical Nurse Specialist	657							
Technical Writer I	565							
Total	**1468**							

2. **Indirect Costs** – Including Fringe Benefits, Overhead, General and Administrative Expense, Cost of Money, Fee, etc. (must show base amount and rate), if available, provide current Forward Pricing Rate Agreement or Forward Pricing Rate Proposal. If not available, provide 2 years historical data to include pool and expense costs used to generate the rates. For academia, provide DHHS or ONR negotiated rate package or, if calculated by other than a rate, provide University documentation identifying G&A and fringe costs by position;

3. **Travel:**

All proposed travel must be in accordance with:

GSA website: (CONUS): http://www.gsa.gov/portal/content/101518

Defense Travel Management website: (OCONUS):
http://www.defensetravel.dod.mil/site/perdiemCalc.cfm

All other cost (i.e. airfare and rental car) must have supporting documentation.

Trips must be identified by:

a. Departure and Arrival Destinations
b. Number employees per trip
c. Number of Trips per Period
d. Number of Days/Nights per trip
e. Estimated car rental costs
f. Estimated airfare costs

All Travel costs must be supported with screenshots from the travel websites.

4. **Other Direct Costs (ODC's)**

Subcontractor must provide a list of ODC's that will be procured for this requirement and pricing documentation.

Other Direct Costs – Itemized with costs including tuition remission, animal per diem rates, health insurance/fee; back-up documentation is to be submitted to support proposed costs;

Equipment Purchases – Itemization with individual and total costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase (NOTE: For equipment purchases, include a letter stating why the proposer cannot provide the requested resources from its own funding), and;

Materials – Itemization with costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase.

All Proposed ODC's must be supported with screenshots from websites or other documentation.

This level of detail must be provided for FFP subcontracts.

VII. Cost Realism

DARPA intends to perform a Cost Realism analysis on this proposal.

Cost Realism Definition:
The proposed costs are realistic for the technical and management approach and accurately reflect the technical goals and objectives of the solicitation. The proposed costs are consistent with the proposer's Statement of Work and reflect a sufficient understanding of the costs and level of effort needed to successfully accomplish the proposed technical approach. The costs for the prime proposer and proposed subawardees are substantiated by the details provided in the proposal (e.g., the type and number of labor hours proposed per task, the types and quantities of materials, equipment and fabrication costs, travel and any other applicable costs and the basis for the estimates).

It is expected that the effort will leverage all available relevant prior research in order to obtain the maximum benefit from the available funding. For efforts with a likelihood of commercial application, appropriate direct cost sharing may be a positive factor in the evaluation. DARPA recognizes that undue emphasis on cost may motivate proposers to offer low-risk ideas with minimum uncertainty and to staff the effort with junior personnel in order to be in a more competitive posture. DARPA discourages such cost strategies.

VIII. Past Performance:

Subcontractor should provide __2___ past performance references that closely match the RFP requirement. Template is attached.

IX. REPRESENTATIONS AND CERTIFICATIONS & VENDOR MASTER TEMPLATE

Please complete the Supplier Representations and Certifications (Attachment G).

X. PROPOSAL VALIDITY PERIOD

Your proposal shall be valid for a period of one hundred and twenty (180) days.

XI. Proposal Submittal Requirements

1. Due Date: On or before 2:00 p.m. (EST) on Wednesday, April 19, 2017.

2. Method of Submission: One (1) electronic copy to: kristen.k.trump@leidos.com and Michael.a.younkins@leidos.com.

XII. ORGANIZATIONAL CONFLICTS OF INTEREST

FAR 9.5 Requirements - https://www.acquisition.gov/far/html/Subpart%209_5.html

In accordance with FAR 9.5, proposers are required to identify and disclose all facts relevant to potential OCIs involving the proposer's organization and any proposed team member. Under this Section, the proposer is responsible for providing this disclosure with each proposal submitted to the BAA. The

disclosure must include the proposer's, and as applicable, proposed team member's OCI mitigation plan. The OCI mitigation plan must include a description of the actions the proposer has taken, or intends to take, to prevent the existence of conflicting roles that might bias the proposer's judgment and to prevent the proposer from having unfair competitive advantage. The OCI mitigation plan will 18 HR001117S0019, Pandemic Prevention Platform (P3) specifically discuss the disclosed OCI in the context of each of the OCI limitations outlined in FAR 9.505-1 through FAR 9.505-4.

DARPA Agency Supplemental OCI Policy

In addition, DARPA has a supplemental OCI policy that prohibits contractors/performers from concurrently providing Scientific Engineering Technical Assistance (SETA), Advisory and Assistance Services (A&AS) or similar support services and being a technical performer. Therefore, as part of the FAR 9.5 disclosure requirement above, a proposer must affirm whether the proposer or any proposed team member is providing SETA, A&AS, or similar support to any DARPA office(s) under: (a) a current award or subaward; or (b) a past award or subaward that ended within one calendar year prior to the proposal's submission date.

If SETA, A&AS, or similar support is being or was provided to any DARPA office(s), the proposal must include:

- The name of the DARPA office receiving the support;
- The prime contract number;
- Identification of proposed team member (subawardee, consultant) providing the support; and
- An OCI mitigation plan in accordance with FAR 9.5.

Additional Requirements:

a. Identification of technical data previously delivered to the Government IAW DFARS 252.227-7028.
b. Provide permission for Leidos to use your LOGO
c. If you are a Large Business – you must provide a Small Business Subcontracting Plan with your proposal
d. All Subcontractors who are considered a Federally Funded Research & Development Center (FFRDC), must include documentation that clearly demonstrates work is not otherwise available from the private sector AND provided a letter on letterhead from the sponsoring organization citing the specific authority establishing their eligibility to propose to government solicitations and compete with industry, and compliance with the associated FFRDC sponsor agreement and terms and conditions.

Your proposal must be received by Leidos by Wednesday, April 19, 2017 and include a validity period of **180 days** from the due date. Please direct any questions, in writing, regarding this RFP to the undersigned.

Proposals will be evaluated against the following evaluation criteria: Award shall be made to the best value proposal considering price, schedule, technically acceptable proposal and appropriate facilities.

RESPONDING TO THIS REQUEST FOR PROPOSAL CERTIFIES THAT NO GRATUITIES WERE OFFERED BY THE SUPPLIER OR SOLICITED BY ANY LEIDOS EMPLOYEE. IF A GRATUITY WAS SOLICITED, IT SHOULD BE REPORTED IMMEDIATELY TO MR. KIM DENVER, SR. VICE PRESIDENT, AT (571) 526-7051. PLEASE REVIEW LEIDOS' CODE OF ETHICS AT https://www.leidos.com/sites/default/files/CodeOfConduct.pdf.

Attachment 1: RFP/RFQ Enclosures

ATTACHMENTS - RFP/RFQ ENCLOSURES

A.	Statement/Scope of Work and Schedule (TBD)
B.	RFQP General Provisions
C.	Schedule A – Federal - FFP
D.	Schedule B Part I – Federal Non-Commercial Items
E.	Schedule B Part II – DOD Non-Commercial Items
F.	Schedule C – DARPA Unique Prime Contract Flowdown Clauses and Requirements
G.	Supplier Reps and Certs
H.	Pricing Template (Sample)
I.	Past Performance Template

SUBMIT WITH YOUR PROPOSAL

1. Certificate of Insurance in accordance with Section 10.0 of the Subcontract Agreement – Schedule A, Federal, FFP IDIQ (Rev 2015-08) or Evidence of Coverage
2. Letter of Commitment on company letterhead
3. One electronic copy of the technical proposal
4. One electronic copy of the price proposal

Specific Terms and Conditions and Contract Clauses

It should be noted that any purchase order/subcontract resulting from this proposal shall include specific terms and conditions and contract clauses, which are listed by FAR reference, and which are identified herein as Attachment C, D, E, F respectively. All clauses required by the Prime Contract, all clauses required by law on the date of execution of the subcontract, and any mutually agreeable clauses, terms and conditions will be negotiated at time of award.

PROPOSAL CHECK LIST

1. Pricing Detail
    a. Forward Pricing Rate Agreement or Forward Pricing Rate Proposal
    b. If “a” above is not available – 2 Years of Historical Data to Include Pool and Expense Costs Used to Generate the Rates
    c. If Academia – Provide DHHS or ONR Negotiated Rates
    d. Salary Breakdown with all Indirect Rates
    e. Travel Breakdown and Documentation
    f. ODC Breakdown (Materials and Supplies)and Documentation (Description, Make, Model, quantity and Price per unit)
    g. Equipment Breakdown and Documentation (Description, Make, Model, quantity and price per unit)
    h. Suppliers Reps and Certs – Completed and Signed

2. OCI Certification

3. Past Performance

4. FFRDC Documentation

5. LOGO (High resolution jpeg) and permission for Leidos to use for proposal

6. Certificate of Insurance – will be required at time of award

7. Review Attachment C – Schedule A – Federal – FFP document, Schedule B Part I and II. These documents do not have to be returned by April 19, 2017 – however you do need to submit it within 15 days after the requested proposal date with any redlines.

REQUEST FOR QUOTATION/PROPOSAL (RFQ/P)

GENERAL PROVISIONS

We would like to take this opportunity to remind suppliers of our commitment to conduct business with uncompromising integrity. This commitment is clearly established in Leidos' Code of Conduct. Leidos expects suppliers to conduct themselves in a manner consistent with the principles of our code of conduct. In addition, we strongly encourage our suppliers to have proactive and meaningful ethics programs established within their organizations. We want our suppliers to understand, foster, and mirror the ethical conduct we expect from our employees in all business transactions. If you believe that Leidos or any of its employees or agents has acted improperly or unethically, please report such behavior to the Leidos ethics HOTLINE (855) 7LEIDOS.

1. **LATE OFFERS.** Formal offers, amendments, or requests for withdrawal of offers received after the date specified for submittal may not be considered.

2. **ALTERNATE PROPOSALS.** In addition to the offer solicited herein, the offeror is invited to submit an alternate proposal, which may be advantageous to Leidos ("Leidos" or "Buyer").

3. **DISCLOSURE OF PARTICIPANTS.** All lower-tier subcontractors must be disclosed with the proposal.

4. **COMPLETENESS.** All information required by RFQ/P must be supplied to constitute a responsive bid. Non-responsive offers may not be considered.

5. **BRAND NAMES.** Brand names and part numbers, when used, are for reference to indicate the performance or quality desired. Equal items will be considered provided that the offeror describes the article. Offers for equal items shall state the brand name and part number, or level of quality. The determination of the Buyer as to what items are equal shall be final and conclusive. When brand name, part number, or level of quality is not stated by the offeror, it is understood the offer is exactly as specified.

6. **COUNTERFEIT PRODUCTS.** For purposes of this clause, Goods are any tangible items, including without limitation the lowest level of separately identifiable items, such as parts, articles, components, and assemblies. "Counterfeit Goods" are Goods that are or contain items misrepresented as having been designed, produced, and/or sold by an authorized manufacturer and seller, including without limitation unauthorized copies, replicas, or substitutes. The term also includes authorized Goods that have reached a design life limit or have been damaged beyond possible repair, but are altered and misrepresented as acceptable.

   Offeror agrees and shall ensure that Counterfeit Goods are not delivered to Leidos. Goods delivered to Leidos or incorporated into other Goods and delivered to Leidos shall be new and shall be procured directly from the Original Component Manufacturer (OCM)/Original Equipment Manufacturer (OEM), or through an OCM/OEM authorized distributor chain. If requested by Leidos, bidder shall provide OCM/OEM documentation that authenticates products. Offeror shall report suspected or confirmed counterfeit items into the Government-Industry Data Exchange Program (GIDEP).

7. **NET PRICES.** Offered prices, unless otherwise specified, must be net, including transportation and handling charges, which shall be set forth as a separate line item on quotation/proposal. Transportation charges must be fully prepaid by offeror to destination, and subject only to cash discount for prompt payment of invoices.
   a. Prices should be quoted as "Unit" prices; do not quote "Lot" prices.
   b. Provide pricing schedule based on specified price breaks, if any.
   c. If applicable, furnish published price list with offer.

8. **EVALUATION.** Buyer reserves the right: (1) to award on the basis of individual items, or groups of items, or on the entire list of items; (2) to reject any or all offers, or any part thereof; (3) to waive any informality in the offers; and (4) to accept the offer that is in the best interest of Leidos. The Buyer's decision shall be final.

9. **NO BID.** In the event an offer cannot be submitted for the specified requirements as set forth in the RFQ/P, please provide an explanation as to why you are unable to bid on these requirements.

10. **TAXES.** Buyer may be exempt from the payment of any federal excise or any state sales tax. The price offered must be net, exclusive of taxes. However, when under established trade practice, any federal excise tax is included in the list price, offeror may quote the list price and shall show separately the amount of federal tax, either as a flat sum or as a percentage of the list price, which shall be deducted by Buyer.

11. **AWARD.** The order will be awarded to the lowest responsible and responsive offeror complying with all the provisions of the RFQ/P, provided the offered price is reasonable and is in the best interest of Buyer. The Buyer reserves the right to reject the offer of an offeror who has previously failed to perform properly or complete on time, contacts of similar nature, or the offer of an offeror who, under investigation shows is not in position to perform the order.

12. **ACCEPTANCE.** A written award mailed (or otherwise furnished) to the successful offeror shall be deemed to result in a binding contract without further action by either party.

13. **SERVICE LIFE.** When applicable, all offerors will state their company policy regarding the return of defective and unserviceable items or products as well as the minimum service life of the offered item or product.

14. **DELIVERY.** When applicable, all shipments are to be made F.O.B. to a specific destination as specified, or prepaid. Collect shipments can be accepted only with proper advance notification, and only with specific approval from the Buyer.

15. **PACKING SLIPS OR DELIVERY TICKETS.** When applicable, all shipments or deliveries shall be accompanied by Packing Slips or Delivery Tickets in duplicate and shall contain the following information for each item delivered:
    a. Purchase Order Number
    b. Item Number
    c. Description or Part Number
    d. Quantity Ordered
    e. Quantity Shipped
    f. Name of the Supplier
    g. The above requirement is extremely important when accepting shipments. Offerors are cautioned that failure to comply with these conditions shall be considered sufficient reason for refusal to accept the goods.

16. **LIABILITY.** Leidos is not obligated to pay for any expenses incurred as a result of your efforts to respond to this solicitation. Moreover, Leidos will not, by virtue of this solicitation, become obligated to award a purchase order. Leidos reserves the right to subsequently award the effort described herein to a respondent determined to be in compliance with the guidelines and in the overall best interest of Leidos and its customer.

    Leidos will not accept confidential or proprietary information without a signed Non-Disclosure Agreement. All information provided by you in response to this solicitation will remain the property of the Leidos.

    The Offeror shall hold Buyer, its officers, agents, servants, and employees, harmless from liability of any nature or kind because of use of any copyrighted, or uncopyrighted compositions; secret process, patented or unpatented invention; articles or appliances furnished or used under this bid, and agrees to defend, at Offeror's expense, any and all actions brought against Buyer, or itself because of the unauthorized use of such articles.

17. **GENERAL.** Any Purchase Order or Subcontract issued as a result of this Request for Quote/Proposal is subject to Buyer's Terms and Conditions regardless of offeror's terms and conditions submitted with the proposal. Specific exceptions are to be noted as part of offeror's proposal and if incorporated into Buyer's Purchase Order or Subcontract will become binding on the parties.

18. **TERMS and CONDITIONS.** This prospective order is subject to all attachments in this solicitation to include, but not limited to: Statement of Work (when applicable); Leidos' standard terms and conditions; Federal terms and Conditions, agency clauses, and/or any specific Customer clauses included; Supplier Representations and Certifications.

19. GRATUITIES. By acknowledgment of response to this RFQ/P, the offeror hereby certifies that no gratuities were offered by the offeror or solicited by any Leidos employee either directly or indirectly. Any situation where a gratuity is solicited should be reported immediately to the Leidos SVP, Contracts, Procurement and Pricing at 571-526-7051.

I. OVERVIEW OF THE FUNDING OPPORTUNITY

Program Announcement for the Department of Defense

Defense Health Program

Congressionally Directed Medical Research Programs

Peer Reviewed Medical Research Program

Focused Program Award

Announcement Type: Initial

Funding Opportunity Number: W81XWH-17-PRMRP-FPA

Catalog of Federal Domestic Assistance Number: 12.420 Military Medical Research and Development

SUBMISSION AND REVIEW DATES AND TIMES

- **Pre-Application Submission Deadline:** 5:00 p.m. Eastern time (ET), July 20, 2017
- **Invitation to Submit an Application:** August 2017
- **Application Submission Deadline:** 11:59 p.m. ET, October 26, 2017
- **End of Application Verification Period:** 5:00 p.m. ET, October 31, 2017
- **Peer Review:** December 2017
- **Programmatic Review:** February 2018

This Program Announcement must be read in conjunction with the General Application Instructions, version 20170516. The General Applications Instructions document is available for downloading from the Grants.gov funding opportunity announcement by selecting the "Package" tab, clicking "Preview," and then selecting "Download Instructions."

II. DETAILED INFORMATION ABOUT THE FUNDING OPPORTUNITY

II.A. Program Description

Applications to the Fiscal Year 2017 (FY17) Peer Reviewed Medical Research Program (PRMRP) are being solicited for the Defense Health Agency (DHA) J9, Research and Development Directorate, by the U.S. Army Medical Research Acquisition Activity (USAMRAA) using delegated authority provided by United States Code, Title 10, Section 2358 (10 USC 2358). As directed by the Office of the Assistant Secretary of Defense for Health Affairs (OASD[HA]), the DHA manages the Defense Health Program (DHP) Research, Development, Test, and Evaluation (RDT&E) appropriation. The execution management agent for this Program Announcement is the Congressionally Directed Medical Research Programs (CDMRP). The PRMRP was initiated in 1999 to provide support for military health-related research of exceptional scientific merit. Appropriations for the PRMRP from FY99 through FY16 totaled $1.371 billion. The FY17 appropriation is $300 million (M).

The vision of the FY17 PRMRP is to improve the health and well-being of all military Service members, Veterans, and beneficiaries. The PRMRP challenges the scientific and clinical communities to address at least one of the FY17 Topic Areas with original ideas that foster new directions along the entire spectrum of research and clinical care. The program seeks applications in laboratory, clinical, behavioral, epidemiologic, and other areas of research to advance knowledge in disease etiology, improve prevention, detection, diagnosis, treatment, and quality of life for those affected by a relevant disease or condition, and to develop and validate clinical care or public health guidelines.

II.A.1. FY17 PRMRP Topic Areas

All applications for PRMRP funding must specifically address at least one of the Topic Areas as directed by Congress and must be directly relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries. If the proposed research does not specifically address at least one of the FY17 PRMRP Topic Areas, the Government will administratively withdraw the application. The Government reserves the right to reassign the application's Topic Area if submitted under an inappropriate Topic Area. The FY17 PRMRP Topic Areas are listed below.

- Acute Lung Injury
- Antimicrobial Resistance
- Arthritis
- Burn Pit Exposure
- Chronic Migraine and Post-Traumatic Headache
- Congenital Heart Disease
- Constrictive Bronchiolitis
- Diabetes
- Diarrheal Diseases
- Dystonia
- Early Trauma Thermal Regulation
- Eating Disorders

- Emerging Infectious Diseases
- Epidermolysis Bullosa
- Focal Segmental Glomerulosclerosis
- Fragile X
- Guillain-Barré Syndrome
- Hepatitis B and C
- Hereditary Angioedema
- Hydrocephalus
- Immunomonitoring of Intestinal Transplants
- Inflammatory Bowel Diseases
- Influenza
- Integrative Medicine
- Interstitial Cystitis
- Malaria
- Metals Toxicology
- Mitochondrial Disease
- Musculoskeletal Disorders
- Nanomaterials for Bone Regeneration
- Non-Opioid Pain Management
- Pancreatitis
- Pathogen-Inactivated Dried Cryoprecipitate
- Polycystic Kidney Disease
- Post-Traumatic Osteoarthritis
- Pulmonary Fibrosis
- Respiratory Health
- Rett Syndrome
- Rheumatoid Arthritis
- Scleroderma
- Sleep Disorders
- Spinal Muscular Atrophy
- Sustained-Release Drug Delivery
- Tinnitus
- Tuberculosis
- Vaccine Development for Infectious Disease
- Vascular Malformations
- Women's Heart Disease

Research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding. ***Applicants should select the FY17 PRMRP Program Announcement most appropriate to the stage of the proposed research.*** Areas of Encouragement related to the FY17 PRMRP Topic Areas have been identified by the Department of Defense (DoD), the Department of Veterans Affairs (VA), and other relevant stakeholders (Appendix 2). Applicants are urged to read and consider these Areas of Encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an Area of Encouragement on this list.***

II.B. Award Information

The PRMRP Focused Program Award mechanism is intended to optimize research and accelerate the solution for a critical question related to at least one of the Congressionally directed FY17 PRMRP Topic Areas through a synergistic, multidisciplinary research program. The anticipated total costs budgeted for the entire period of performance for an FY17 PRMRP Focused Program Award will not exceed **$10M**. Refer to Section II.D.5, Funding Restrictions, for detailed funding information.

Key aspects of this award include:

Overarching Challenge: Focused Program Award applications must describe a unifying, overarching challenge that will be addressed by a set of research projects. The overarching challenge must be relevant to a critical problem or question in the field of research and/or patient care in at least one of the FY17 PRMRP Topic Areas.

Research Projects: Applications shall include multiple, distinct research projects led by individual project leaders that address complementary aspects of the overarching challenge. Applicants are strongly encouraged to submit a minimum of four research projects; additional studies are allowed. While individual projects must be capable of standing on their own high scientific merits, they must also be interrelated and synergistic with the other proposed projects and advance a solution beyond what would be possible through individual efforts. The exploration of multiple hypotheses or viewpoints of the same line of questioning is encouraged. This award mechanism is not intended to support a series of research projects that are dependent on the success of any other project. Each project should propose a unique approach to addressing the overarching challenge and be capable of producing research findings with potential to impact the field and/or patient care. Individual research projects may range from exploratory, hypothesis-developing studies through small-scale clinical trials (i.e., up to and including Phase II or equivalent). There should be a clear intent to progress toward translational/ clinical work over the course of the effort.

Implementation: The research strategy to address the overarching challenge must be supported by a detailed plan that identifies critical milestones; outlines the knowledge, resources, and technical innovations that will be utilized to achieve the milestones; and explains how the outcomes will be translated to patients. A robust statistical plan and statistical expertise should be included where applicable. A plan for assessing individual project performance and progress toward addressing the overarching challenge must be included in the implementation plan. Plans to include an External Advisory Board are encouraged; however, applicants must be careful to avoid potential conflicts of interest (COIs) during review of the application by ensuring no contact with, recruiting of, or naming of specific members in the application. For multi-institutional collaborations, plans for communication and data transfer among the collaborating institutions, as well as how data, specimens, and/or imaging products obtained during the study will be handled, must be included. An intellectual and material property plan agreed to by participating organizations is required in the application's supporting documentation.

Research Team: The overall effort will be led by a Principal Investigator (PI) with demonstrated success in leading large, focused projects. The PI is required to devote a minimum

of 20% effort to this award. The PI should create an environment that fosters and supports collaboration and innovation in a way that engages all members of the team in all aspects of the research plan. The research team assembled by the PI should be highly qualified and multidisciplinary, with identified project leaders for each of the complementary and synergistic research projects. The resources and expertise brought to the team by each project leader should combine to create a robust, synergistic collaboration. The PRMRP Science Officer assigned to a resulting award must be invited to participate in periodic research team meetings. The plan for such meetings should be noted in the application.

Milestone Meeting: The PI will be required to present an update on progress toward accomplishing the goals of the award at a Milestone Meeting to be held in the National Capital Region after the conclusion of Year 2 of the period of performance. The PI may bring up to three additional members of the research team to the meeting. The Milestone Meeting will be attended by members of the PRMRP Programmatic Panel, CDMRP staff, and the USAMRAA Grants Officer.

Military Relevance: Relevance to the healthcare needs of military Service members, Veterans, and beneficiaries is a key feature of this award. Investigators are encouraged to consider the following characteristics as examples of how a project may demonstrate military relevance:

- Explanation of how the project addresses an aspect of the target disease/condition that has direct relevance to military Service members, Veterans, or other military health system beneficiaries

- Description of how the knowledge, information, products, or technologies gained from the proposed research could be implemented in a dual-use capacity to benefit the civilian population and also address a military need

- Use of military or Veteran populations or datasets in the proposed research, if appropriate to the proposed research project

- Involvement of military consultants (Army, Air Force) or specialty leaders (Navy, Marine Corps) to the Surgeons General in a relevant specialty area

PIs are strongly encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with the DoD or VA is also encouraged. A list of websites that may be useful in identifying additional information about ongoing DoD and VA areas of research interest or potential opportunities for collaboration within the FY17 PRMRP Topic Areas can be found in Appendix 3.

Use of Active Duty Military and VA Populations: If the proposed research plan involves access to active duty military and/or VA patient populations or resources, the PI is responsible for establishing such access. If possible, access to target active duty military and/or VA patient populations/resources should be confirmed at the time of application submission by inclusion of a letter of support, signed by the lowest ranking person with approval authority, for studies involving active duty military Service members, Veterans, military- and/or VA-controlled study materials, and military and/or VA databases. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until

the PI has demonstrated support for and access to the relevant population(s) and/or resources. Note that access to a Veteran population for clinical studies may only be obtained by either collaboration with a VA investigator where the VA investigator has a substantial role in the research or by advertising to the general public.

Research Involving Human Anatomical Substances, Human Subjects, or Human Cadavers: All DoD-funded research involving new and ongoing research with human anatomical substances, human subjects, or human cadavers must be reviewed and approved by the U.S. Army Medical Research and Materiel Command (USAMRMC) Office of Research Protections (ORP), Human Research Protection Office (HRPO) prior to research implementation. This administrative review requirement is in addition to the local Institutional Review Board (IRB) or Ethics Committee (EC) review. Local IRB/EC approval at the time of submission is ***not*** required. The HRPO is mandated to comply with specific laws and requirements governing all research involving human anatomical substances, human subjects, or human cadavers that is supported by the DoD. These laws and requirements will necessitate information in addition to that supplied to the IRB/EC. ***Allow a minimum of 2 to 3 months for HRPO regulatory review and approval processes***. When possible, protocols should be written for research with human subjects and/or human anatomical substances that are specific to the DoD-supported effort outlined in the submitted application. Submission to HRPO of protocols covering more than the scope of work in the DoD-funded award will require HRPO review of the entire protocol as DoD-supported research and may include extensive modifications to meet DoD human subjects protection requirements. Refer to the General Application Instructions, Appendix 1, and the Human Subject Resource Document available on the electronic Biomedical Research Application Portal (eBRAP) "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) for additional information.

A clinical trial is defined as a prospective accrual of patients (human subjects) in whom an intervention (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the subject of that intervention or interaction.

Research Involving Animals: All projects should adhere to a core set of standards for rigorous study design and reporting to maximize the reproducibility and translational potential of preclinical research. The standards are described in Landis, S.C., et al. A call for transparent reporting to optimize the predictive value of preclinical research. *Nature* 2012, 490:187-191 (www.nature.com/nature/journal/v490/n7419/full/nature11556.html). While these standards are written for preclinical studies, the basic principles of randomization, blinding, sample-size estimation, and data handling derive from well-established best practices in clinical studies. Applicants should consult the ARRIVE (Animal Research: Reporting *In Vivo* Experiments) guidelines to ensure relevant aspects of rigorous animal research are adequately planned for and, ultimately, reported. The ARRIVE guidelines can be found at http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf

All DoD-funded research involving new and ongoing research with animals must be reviewed and approved by the USAMRMC ORP Animal Care and Use Review Office (ACURO), in addition to the local Institutional Animal Care and Use Committee (IACUC) of record. IACUC

approval at the time of submission is ***not*** required. Specific documents relating to the use of animals in the proposed research will be requested **if the application is selected for funding**. The ACURO must review and approve all animal use prior to the start of working with animals, including amendments to ongoing projects. PIs must submit the institutional animal use protocol, IACUC approval of that protocol, and a version of the animal use appendix titled "Research Involving Animals." ***Allow at least 2 to 3 months for ACURO regulatory review and approval processes for animal studies.*** Refer to the General Application Instructions, Appendix 1, for additional information.

The CDMRP intends that information, data, and research resources generated under awards funded by this Program Announcement be made available to the research community (which includes both scientific and consumer advocacy communities) and to the public at large. For additional guidance, refer to the General Application Instructions, Appendix 2, Section K.

Awards will be made no later than September 30, 2018. For additional information refer to Section II.F.1, Federal Award Notices.

II.C. Eligibility Information

II.C.1. Eligible Applicants

II.C.1.a. Organization: All organizations, including international organizations, are eligible to apply.

Government Agencies within the United States: Local, state, and Federal Government agencies are eligible to the extent that applications do not overlap with their fully funded internal programs. Such agencies are required to explain how their applications do not overlap with their internal programs.

As applications for this Program Announcement may be submitted by extramural and intramural organizations, these terms are defined below.

Extramural Organization: An eligible non-DoD organization. Examples of extramural organizations include academia, biotechnology companies, foundations, Government, and research institutes. *Extramural Submission: Application submitted by a non-DoD organization to Grants.gov.*

Intramural DoD Organization: A DoD laboratory, DoD military treatment facility, and/or DoD activity embedded within a civilian medical center. *Intramural Submission: Application submitted by a DoD organization for an intramural investigator who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility or in a DoD activity embedded within a civilian medical center.*

Note: Applications from an intramural organization or from an extramural non-DoD Federal organization may be submitted through a research foundation.

The USAMRAA makes awards to eligible organizations, not to individuals.

II.C.1.b. Principal Investigator:

- The PI must be an independent investigator at or above the level of Full Professor (or equivalent).
    - Project leaders for each of the complementary and synergistic research projects must be at or above the level of Assistant Professor (or equivalent).

An eligible PI, regardless of ethnicity, nationality, or citizenship status, must be employed by, or affiliated with, an eligible organization.

The CDMRP encourages all PIs to participate in a digital identifier initiative through Open Researcher and Contributor ID, Inc. (ORCID). Registration for a unique ORCID identifier can be done online at http://orcid.org/.

II.C.2. Cost Sharing

Cost sharing/matching is not an eligibility requirement.

II.C.3. Other

Extramural organizations must be able to access **.gov** and **.mil** websites in order to fulfill the financial and technical deliverable requirements of the award and submit invoices for payment.

There are no limitations on the number of applications for which an investigator may be named as a PI.

For general information on required qualifications for award recipients, refer to the General Application Instructions, Appendix 3.

Refer to Section II.H.2, Administrative Actions, for a list of administrative actions that may be taken if a pre-application or application does not meet the administrative, eligibility, or ethical requirements defined in this Program Announcement.

II.D. Application and Submission Information

Submission of applications that are essentially identical or propose essentially the same research project to different funding opportunities within the same program and fiscal year is prohibited and will result in administrative withdrawal of the duplicative application(s). ***As an exception, applicants may submit a research project described in their FY17 PRMRP Focused Program Award to the Discovery Award (Funding Opportunity Number: W81XWH-17-PRMRP-DA), Investigator-Initiated Research Award (Funding Opportunity Number: W81XWH-17-PRMRP-IIRA), and/or Clinical Trial Award (Funding Opportunity Number: W81XWH-17-PRMRP-CTA); however, accepting multiple awards to support the same project will not be allowed.***

Extramural Submission is defined as an application submitted by a non-DoD organization to Grants.gov.

Intramural Submission is defined as an application submission by a DoD organization for an intramural investigator, who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility, or working in a DoD activity embedded within a civilian medical center.

II.D.1. Address to Request Application Package

Submitting Extramural and Intramural Organizations: Pre-application content and forms can be accessed at eBRAP (https://eBRAP.org).

Submitting Extramural Organizations: Full application packages can be accessed at Grants.gov.

Submitting Intramural DoD Organizations: Full application packages can be accessed at eBRAP.org.

Contact information for the CDMRP Help Desk and the Grants.gov Contact Center can be found in Section II.G, Federal Awarding Agency Contacts.

II.D.2. Content and Form of the Application Submission

Submission is a two-step process requiring both ***pre-application*** and ***full application*** as indicated below. The submission process should be started early to avoid missing deadlines. There are no grace periods.

Pre-application Submission: All pre-applications for both extramural and intramural organizations must be submitted through eBRAP (https://eBRAP.org/).

eBRAP is a multifunctional web-based system that allows PIs to submit their pre-applications electronically through a secure connection, to view and edit the content of their pre-applications and full applications, to receive communications from the CDMRP, and to submit documentation during award negotiations and period of performance.

Full Application Submission: Full applications must be submitted through the online portals as described below.

***Submitting Extramural Organizations*:** Full applications from extramural organizations must be submitted through Grants.gov. Applications submitted by extramural organizations (e.g., research foundations) on behalf of intramural DoD or other Federal organizations or investigators will be considered extramural submissions.

Submitting Intramural DoD Organizations: Intramural DoD organizations may submit full applications to either eBRAP or Grants.gov. Intramural DoD organizations that are unable to submit to Grants.gov should submit through eBRAP. Intramural DoD organizations with the capability to submit through Grants.gov may submit following the instructions for extramural submissions through Grants.Gov or may submit to eBRAP. Applications from extramural organizations, including non-DoD Federal organizations, received through eBRAP will be withdrawn. See definitions in Section II.C.1, Eligible Applicants.

For both Extramural and Intramural applicants: A key feature of eBRAP is the ability of an organization's representatives and PIs to view and modify the full application submissions associated with them. eBRAP will validate full application files against the specific Program Announcement requirements and discrepancies will be noted in an email to the PI and in the Full Application Files tab in eBRAP. It is the applicant's responsibility to review all application components for accuracy as well as ensure proper ordering as specified in this Program Announcement.

The application title, eBRAP log number, and all information for the PI, Business Official(s), performing organization, and contracting organization must be consistent throughout the entire pre-application and application submission process. Inconsistencies may delay application processing and limit or negate the ability to view, modify, and verify the application in eBRAP. If any changes need to be made, the applicant should contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 prior to the application deadline.

II.D.2.a. Step 1: Pre-Application Submission Content

During the pre-application process, each submission is assigned a unique log number by eBRAP. This unique eBRAP log number will be needed during the full application submission process.

To begin the pre-application process, first select whether the submitting organization is extramural or intramural, then confirm your selection or cancel. **Incorrect selection of extramural or intramural submission type may result in delays in processing.**

If an error has been made in the selection of extramural versus intramural and the pre-application submission deadline has passed, the PI or Business Official must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

All pre-application components must be submitted by the PI through eBRAP (https://eBRAP.org/). Because the invitation to submit an application is based on the contents of the pre-application, investigators should not change the title or research objectives after the pre-application is submitted.

PIs and organizations identified in the pre-application should be the same as those intended for the subsequent application submission. If any changes are necessary after submission of the pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

The pre-application consists of the following components, which are organized in eBRAP by separate tabs (refer to the General Application Instructions, Section II.B, for additional information on pre-application submission):

- **Tab 1 – Application Information**

  Select the FY17 PRMRP Topic Area addressed by the proposed research. If the proposed research project is aligned with more than one FY17 PRMRP Topic Area, select the Topic Area of highest relevance as the required first choice.

- **Tab 2 – Application Contacts**

  Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration (the "person to be contacted on matters involving this application" in Block 5 of the Grants.gov SF424 (R&R) Form for extramural submissions). The Business Official must be either selected from the eBRAP list or invited in order for the pre-application to be submitted.

  Select the performing organization (site at which the PI will perform the proposed work) and the contracting organization (organization submitting on behalf of the PI, which corresponds to Block 5 on the Grants.gov SF424 (R&R) Form for extramural submissions), and click on "*Add Organizations to this Pre-application.*" The organizations must be either selected from the eBRAP drop-down list or invited in order for the pre-application to be submitted.

  It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-application submission is needed.

- **Tab 3 – Collaborators and Key Personnel**

  Enter the name, organization, and role of all collaborators and key personnel associated with the application.

  FY17 PRMRP Programmatic Panel members should not be involved in any pre-application or application. For questions related to Panel members and pre-applications or applications, refer to Section II.H.2.c, Withdrawal, or contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

  To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in pre-application or application preparation, research, or other duties for submitted pre-applications or applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Pre-applications or applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- **Tab 4 – Conflicts of Interest**

  List all individuals other than collaborators and key personnel who may have a COI in the review of the application (including those with whom the PI has a personal or professional relationship). Refer to the General Application Instructions, Appendix 3, Section C, for further information regarding COIs.

- **Tab 5 – Pre-Application Files**

  Note: Upload documents as individual PDF files unless otherwise noted. eBRAP will not allow a file to be uploaded if the number of pages exceeds the limit specified below.

- **Preproposal Narrative (five-page limit):** The Preproposal Narrative page limit applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Preproposal Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the pre-application.

  The Preproposal Narrative should include the following:

  - **Topic Area:** Describe how the proposed program relates to at least one of the FY17 PRMRP Topic Areas. If applicable, describe how the proposed research program addresses an FY17 PRMRP Area of Encouragement (Appendix 2).

  - **Overarching Challenge:** Describe the unifying challenge or question to be addressed and how it is relevant to a critical problem or question in the field of research and/or patient care in at least one of the FY17 PRMRP Topic Area(s). Clearly articulate the rationale for the overarching challenge; include relevant preliminary data and literature citations.

  - **Research Strategy:** The FY17 PRMRP Focused Program Award strongly encourages a minimum of four individual but complementary research projects addressing the overarching challenge. For each proposed project, state the hypothesis to be tested, the specific aims, and the objectives to be reached. Briefly describe the experimental approach. Describe how the projects are interrelated to and synergistic with each other and align with the overarching challenge.

  - **Impact:** Describe the potential short-term and long-term impact of the proposed research on at least one of the FY17 PRMRP Topic Areas and its related research field(s), and patient population(s). Explain how the effort is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

  - **Research Team:** Briefly describe the composition, expertise, and organization of the research team. Identify the project leaders and describe each team member's role in the projects, with additional emphasis on the leadership role of the PI. Briefly describe how these features will facilitate the success of the key aspects of the projects.

  - **Clinical Trial (if applicable):** If the proposed research includes a clinical trial(s), briefly state the clinical intervention(s), subject population(s), and the type and phase of the clinical trial(s). Describe the objectives of the clinical trial(s), how it addresses the overarching challenge, and how it complements the other proposed projects. ***Only small-scale (i.e., up to and including Phase II or equivalent) clinical trials are allowed.***

- **Pre-Application Supporting Documentation:** The items to be included as supporting documentation for the pre-application ***must be uploaded as individual files*** and are limited to the following:

- References Cited (one-page limit): List the references cited (including URLs if available) in the Preproposal Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, reference title, and reference source, including volume, chapter, page numbers, and publisher, as appropriate).

- List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols used in the Preproposal Narrative.

- Key Personnel Biographical Sketches (five-page limit per individual). ***All biographical sketches should be uploaded as a single combined file.*** Biographical sketches should be used to demonstrate background and expertise through education, positions, publications, and previous work accomplished.

- **Tab 6 – Submit Pre-Application**

  This tab must be completed for the pre-application to be accepted and processed.

Pre-Application Screening

Pre-Application Screening Criteria

To determine the technical merits of the pre-application and the relevance to the mission of the DHP and the PRMRP, pre-applications will be screened based on the following criteria:

- **Overarching Challenge:** How well the unifying challenge or question addresses a critical problem or question in the field of research and/or patient care of one or more FY17 PRMRP Topic Area(s). How well the rationale supports the overarching challenge.

- **Research Strategy:** How well a hypothesis and specific aims are defined for each proposed project and to what extent each project's approach will address them. How well the proposed projects complement each other and synergistically address the overarching challenge to advance a solution beyond what would be possible through individual efforts.

- **Impact:** Whether the potential immediate and long-range outcome(s)/product(s) (intellectual and/or material) of the proposed research, if successful, will impact a central critical problem or question in the field of research and/or patient care in the FY17 PRMRP Topic Area(s) addressed. To what degree the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Research Team:** To what degree the background and expertise of the PI, project leaders, and key personnel are appropriate with respect to their abilities to successfully complete the projects and the extent to which the PI is well prepared and committed to lead the research team and proposed projects.

Notification of Pre-Application Screening Results

Following the pre-application screening, PIs will be notified as to whether or not they are invited to submit applications; however, they will not receive feedback (e.g., a critique of strengths and

weaknesses) on their pre-application. The estimated time frame for notification of invitation to submit an application is indicated in Section I, Overview of the Funding Opportunity. Invitations to submit a full application are based on the Pre-Application Screening Criteria listed above.

II.D.2.b. Step 2: Full Application Submission Content

Applications will not be accepted unless the PI has received notification of invitation.

All contributors and administrators to the application must use matching compatible versions of Adobe software when editing and preparing application components. The use of different software versions will result in corruption of the submitted file. Refer to the General Application Instructions, Section III, for details on compatible Adobe software.

The CDMRP cannot make allowances/exceptions to its policies for submission problems encountered by the applicant organization using system-to-system interfaces with Grants.gov.

Each application submission must include the completed full application package for this Program Announcement. The full application package is submitted by the Authorized Organizational Representative through Grants.gov (http://www.grants.gov/) for extramural organizations or through eBRAP (https://ebrap.org/) for intramural organizations. See Table 1 below for more specific guidelines.

II.D.2.b.i. Full Application Guidelines

Extramural organizations, including non-DoD Federal agencies, must submit full applications through Grants.gov. Submissions of extramural applications through eBRAP may be withdrawn.

Table 1. Full Application Submission Guidelines

Extramural Submissions	Intramural DoD Submissions
Application Package Location	
Download application package components for W81XWH-17-PRMRP-FPA from Grants.gov (http://www.grants.gov).	Download application package components for W81XWH-17-PRMRP-FPA from eBRAP (https://ebrap.org).
Full Application Package Components	
SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.	**Tab 1 – Summary:** Provide a summary of the application information. **Tab 2 – Application Contacts:** This tab will be pre-populated by eBRAP; add Authorized Organizational Representative.

Extramural Submissions	Intramural DoD Submissions
Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Research & Related Senior/Key Person Profile (Expanded) • Research & Related Budget • Project/Performance Site Location(s) Form • R&R Subaward Budget Attachment(s) Form (if applicable)	**Tab 3 – Full Application Files:** Upload files under each Application Component in eBRAP. Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Key Personnel • Budget • Performance Sites **Tab 4 – Application and Budget Data:** Review and edit proposed project start date, proposed end date, and budget data pre-populated from the Budget Form.
Application Package Submission	
Submit package components to Grants.gov (https://www.grants.gov/). If either the Project Narrative or the budget fails eBRAP validation or if the Project Narrative or the budget need to be modified, an updated Grants.gov application package must be submitted via Grants.gov as a "Changed/Corrected Application" with the previous Grants.gov Tracking ID prior to the application submission deadline.	**Submit package components to eBRAP (https://ebrap.org).** **Tab 5 – Submit/Request Approval Full Application:** After all components are uploaded and prior to the full application submission deadline, enter your password in the space provided "Enter Your Password Here" and press the "Submit Full Application" button. eBRAP will notify your Resource Manager/Comptroller or equivalent Business Official by email to log into eBRAP to review and to approve prior to the application submission deadline.
Application Verification Period	
The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.	After eBRAP has processed the full application, the organizational Resource Manager/ Comptroller or equivalent Business Official and PI(s) will receive an email notification of this status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.
Further Information	
Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.	Refer to the General Application Instructions, Section IV, for further information regarding eBRAP requirements.

The organization's Business Official or Authorized Organization Representative (or Resource Manager/Comptroller) should approve/verify the full application submission prior to the application verification deadline.

Application viewing, modification, and verification in eBRAP are strongly recommended, but not required. ***The Project Narrative and Budget cannot be changed after the application submission deadline.*** Prior to the full application deadline, a corrected or modified full application package may be submitted. Other application components may be changed until the end of the application verification period. After the end of the application verification period, the full application cannot be modified.

Material submitted after the end of the application verification period, unless specifically requested by the Government, will not be forwarded for processing.

The full application package must be submitted using the unique eBRAP log number to avoid delays in application processing.

II.D.2.b.ii. Full Application Submission Components:

- **Extramural Applications Only –**

  SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.

- **Extramural and Intramural Applications –**

  Attachments:

  Each attachment to the full application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Application Instructions, Appendix 4.

  For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or incorrect file names that contain characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some circumstances. Individual attachments may not exceed 20 MB and the file size for the entire full application package may not exceed 200 MB.

  - **Attachment 1: Project Narrative (40-page limit):** Upload as "ProjectNarrative.pdf." The page limit of the Project Narrative applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Project Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the application.

    Describe the proposed project in detail using the outline below.

Overall Program: Provide a description of the comprehensive effort using the following outline. Applicants are strongly encouraged to submit a minimum of four research projects; additional studies are allowed. Emphasize areas of synergy throughout the narrative.

- **Overarching Challenge:** Describe the unifying, overarching challenge or question to be addressed and how it is relevant to a critical problem or question in the field of research and/or patient care in one or more FY17 PRMRP Topic Areas. Clearly articulate the rationale for the overarching challenge; include relevant literature citations. Clearly describe how the proposed research projects are interrelated and synergistic and will advance toward a solution through a multidisciplinary research program. Describe how each project will address the overarching challenge in a unique but complementary way and how the combined efforts of the projects will address the overarching challenge more effectively than if the projects were conducted independently.

- **Leadership:** Describe how the PI's research experience, leadership skills, and commitment to making an impact in his/her field of research and/or patient care demonstrate substantial qualifications to coordinate this collaborative effort. Describe the PI's demonstrated success in leading large, focused projects and outline the PI's responsibilities during the conduct of the award. Discuss the qualifications of the research team being brought together by the PI and how the assembled expertise will create a robust, synergistic collaboration necessary to address the overarching challenge and enable the success of the proposed research.

- **Implementation Plan and Environment:** Provide an overall strategic plan for completing the proposed projects that identifies critical milestones. Outline the knowledge, expertise, and technical innovations that the investigative team will utilize to make decisions, allocate resources, and accomplish the milestones. Describe and/or provide evidence that the research can be initiated without delay once the award is made. Present an overall management plan to facilitate consistent and intensive interactions by all team members, including aspects such as adherence to regulatory requirements, administrative support, and oversight to accelerate translation of the projects' outcomes to patients and/or for clinical use. Describe the research environment(s) and how the facilities and resources will support the research requirements and the collaboration. Outline shared resources and/or cores that will be created and/or leveraged through the award. Describe plans for communication, data transfer among the collaborating institutions, and how data, specimens, and/or imaging products obtained during the study will be handled. If applicable, describe how Standard Operating Procedures will be created, reviewed, implemented, and modified during the course of the award. Describe how individual project performance will be assessed during the course of the award, including progression toward defined milestones, realization of study objectives, and addressing the overarching challenge. If an External Advisory Board (EAB) is to be utilized, describe the role of the board and the expertise to be sought in its members. To avoid potential COIs in the review of the application, potential candidates for an EAB should not be contacted, recruited, or named during the application process.

Research Plan: Provide the following details for each proposed research project, organizing each project clearly and separately. Start each project on a separate page:

- **Title:** Provide a title for each project.

- **Project Leader:** Identify the project leader and any key personnel, as appropriate, describing each person's qualifications and specific contributions to the project.

- **Background:** Briefly describe the ideas and reasoning on which the proposed work is based. Provide sufficient preliminary data to support the feasibility of work proposed. If the project is exploratory/hypothesis-developing, preliminary data are not required. For each project, the leader must demonstrate logical reasoning and provide a sound scientific rationale for the proposed project as established through a critical review and analysis of published literature. If proposing translational or clinical research, it is important to describe the project showing proof of concept and, if applicable, efficacy in an in-vivo system(s) to support the translational feasibility and promise of the approach.

- **Hypothesis/Objective:** State the hypothesis to be tested and/or the objective(s) to be reached.

- **Specific Aims:** Concisely explain each project's specific aims. The specific aims should align with the overall goal of the program and associated tasks described in the Statement of Work.

- **Research Strategy:** Describe the experimental design, methods, and analyses, in sufficient detail for analysis. Provide a description of how the study will be controlled and how the study variables will be measured. If the project is a clinical trial, define the primary and secondary endpoints and how they will be assessed. Explain how the research strategy will address the overarching challenge and meet appropriate milestones. Address potential problem areas and present alternative methods and approaches. Clearly describe the statistical plan and the rationale for the statistical methodology as well as an appropriate power analysis, if applicable. If animal studies are proposed, describe how they will be conducted in accordance with the ARRIVE guidelines (http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf). Justify how the model system or human subjects/samples are appropriate to the proposed research project. If human subjects or human biological samples will be used, describe the study population and include a detailed plan for the recruitment of human subjects or the acquisition of samples. Describe the availability of the proposed study population and past successes in recruiting similar populations. If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe how access to the population(s)/dataset(s) will be obtained. If applicable, describe how data will be reported and how it will be assured that the documentation will support a regulatory filing with the U.S. Food and Drug Administration (FDA).

- **Statistical Plan:** Clearly describe a statistical plan appropriate to the type of study; provide the rationale for the statistical methodology. Define the number of samples and/or subjects (animal and/or human) to be used, and include a power analysis to demonstrate that the sample size is appropriate to meet the objectives of the study.

- **Impact:** Describe the anticipated outcome(s)/product(s) (intellectual and/or material) that will be directly attributed to the results of the proposed research. Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable.

- **Clinical Trial (if applicable):** ***Only small-scale (e.g., up to and including Phase II or equivalent) clinical trials are allowed.*** Provide detailed plans for initiating and conducting the clinical trial during the course of this award. As appropriate, outline a plan for applying for and obtaining Investigational New Drug/Investigational Device Exemption (IND/IDE) status (or other FDA approvals). Describe the type of clinical trial to be performed (e.g., prospective, randomized, controlled) and indicate the phase of trial and/or class of device, as appropriate. Outline the regulatory strategy. Provide preclinical and/or clinical evidence to support the safety of the intervention.

    - Identify the intervention to be tested and describe the projected outcomes. Describe how the proposed intervention compares with currently available interventions and/or standards of care. Include a discussion of any current clinical use of the intervention under investigation, and/or details of its study in clinical trials for other indications (as appropriate).

    - Describe the methods that will be used to recruit a sample of human subjects from the accessible population (e.g., convenience, simple random, stratified random). Provide information on and justification for the inclusion and exclusion criteria.

    - Describe the process for obtaining informed consent and any screening procedures required to determine eligibility for study participation.

    - Describe the human subject-to-group assignment process (e.g., randomization, block randomization, stratified randomization, age-matched controls, alternating group, or other procedures), if applicable. Explain the specific actions to accomplish the group assignment (e.g., computer assignment, use of table of random numbers). If multiple site studies are involved, state the approximate number of subjects to be enrolled at each site.

    - Provide evidence to document the availability of and access to all critical reagents, including the intervention itself, if applicable, for the duration of the proposed trial.

    - Describe how quality control will be addressed. Describe how compliance with Good Laboratory Practices (GLP), Good Manufacturing Practices (GMP), and Good Clinical Practices (GCP) guidelines will be established, monitored, and maintained, as applicable.

- Describe the composition of the clinical trial team. Provide details on how the team (including investigator(s), study coordinator, and statistician) possesses the appropriate expertise in conducting clinical trials.

- **Attachment 2: Supporting Documentation:** Combine and upload as a single file named "Support.pdf." Start each document on a new page. If documents are scanned to PDF, the lowest resolution (100 to 150 dpi) should be used. The Supporting Documentation attachment should not include additional information such as figures, tables, graphs, photographs, diagrams, chemical structures, or drawings. These items should be included in the Project Narrative. Any additional material viewed as an extension of the Project Narrative will be removed or may result in administrative withdrawal of the application.

  There are no page limits for any of these components unless otherwise noted. Include only those components described below; inclusion of items not requested will result in the removal of those items or may result in administrative withdrawal of the application.

  - References Cited: List the references cited (including URLs, if available) in the Project Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, title of reference, source of reference, volume, chapter, page numbers, and publisher, as appropriate).

  - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

  - Facilities, Existing Equipment, and Other Resources: Describe the facilities and equipment available for performance of the proposed project and any additional facilities or equipment proposed for acquisition at no cost to the award. Indicate whether or not Government-furnished facilities or equipment are proposed for use. If so, reference should be made to the original or present Government award under which the facilities or equipment items are now accountable. There is no form for this information.

  - Publications and/or Patents: Include a list of relevant publication URLs and/or patent abstracts. If publications are not publicly available, then copies of up to eight published manuscripts may be included in Attachment 2. Extra items will not be reviewed.

  - Letters of Organizational Support: Provide a letter (or letters, if applicable), signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. Letters of support not requested in the Program Announcement, such as those from members of Congress, do not impact application review or funding decisions.

  - Letters of Collaboration: Provide a signed letter from each collaborating individual or organization that will demonstrate that the PI has the support or resources necessary for the proposed work. If an investigator at an intramural organization is

named as a collaborator on an application submitted through an extramural organization, the application must include a letter from the collaborator's Commander or Commanding Officer at the intramural organization that authorizes the collaborator's involvement.

- Letters of Commitment (if applicable): If the proposed study involves use of a commercially produced investigational drug, device, or biologic, provide a letter of commitment from the commercial entity indicating availability of the product for the duration of the study, support for the proposed phase of research, and support for the indication to be tested.

- Letters Confirming Access to Military or VA Patient Populations or Resources (if applicable): If the proposed research plan involves access to active duty military and/or VA patient populations or resources, include a letter of support, signed by the lowest ranking person with approval authority, confirming such access. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resources.

- Intellectual Property: Information can be found in Code of Federal Regulations, Title 2, Part 200.315 (2 CFR 200.315), "Intangible Property."

  - Intellectual and Material Property Plan (if applicable): Provide a plan for resolving intellectual and material property issues among participating organizations.

- Data and Research Resources Sharing Plan: Describe how data and resources generated during the performance of the project will be shared with the research community. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- **Attachment 3: Technical Abstract (one-page limit):** Upload as "TechAbs.pdf." The technical abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Clarity and completeness within the space limits of the technical abstract are highly important. Describe the proposed research effort including the following elements:

  - **Overarching Challenge:** Identify the unifying, overarching challenge or question that will be addressed by the research plan and describe how it relates to a critical problem or question in one or more of the FY17 PRMRP Topic Areas.

  - **Background:** Briefly articulate the rationale for the overarching challenge and the proposed research.

- **Research Plan:** Provide a brief description of the studies proposed, including hypotheses, objectives, and scientific approach.

- **Impact:** Briefly describe the potential short-term and long-term impact of the results of the proposed research on at least one of the FY17 PRMRP Topic Areas and its related research field(s) and patient population(s).

- **Military Relevance:** Explain how the effort is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Attachment 4: Lay Abstract (one-page limit):** Upload as "LayAbs.pdf." The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***. Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  State the FY17 PRMRP Topic Area(s) addressed by the proposed research program. Include a comprehensive overview of the effort that can be ***readily understood by readers without a background in science or medicine.*** Clearly describe the central critical problem or question to be addressed and the ultimate applicability and impact of the research. Do not duplicate the technical abstract.

- **Attachment 5: Statement of Work (SOW) (eight-page limit):** Upload as "SOW.pdf." The suggested SOW format and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm). For the Focused Program Award mechanism, use the SOW format example titled "SOW for Collaborative Projects ." The SOW must be in PDF format prior to attaching.

  The SOW should include a list of major tasks that support the proposed specific aims, followed by a series of subtasks outlined related to the major tasks and milestones within the period of performance. The SOW should describe only the work for which funding is being requested by this application and, as applicable, should also:

  Include the name(s) of the key personnel and contact information for each study site/ subaward site.

  Indicate the number (and type, if applicable) of research subjects (animal or human) and/or human anatomical samples projected or required for each task and at each site. Refer to the General Application Instructions, Appendix 1, for additional information regarding regulatory requirements.

  Briefly state the methods to be used.

  For studies with prospective accrual of human subjects, indicate quarterly enrollment targets.

Identify cell line(s) and commercial or organizational source(s) to be used. If human anatomical substances (including cell lines) will be used, specify whether or not identifiable information is accessible to the research team by any means.

If applicable, indicate timelines required for regulatory approvals relevant to human subjects research (e.g., IND/IDE applications) by the FDA or other Government agency.

- **Attachment 6: Impact Statement (two-page limit): Upload as "Impact.pdf."**

  - Explain why the proposed program is important and relevant to understanding the cause or progression of the disease or condition, and/or to developing improvements in prevention, detection, diagnosis, treatment, or quality of life in the FY17 PRMRP Topic Area(s) addressed. Describe how the overarching challenge addresses a central critical problem or question in the relevant Topic Area(s). If applicable, describe how the project addresses an FY17 PRMRP Area of Encouragement (Appendix 2). In addition to articulating the potential impact of the overall program, address the potential impact of each individual project. Explain how the various projects' outcomes will ultimately be translated to patients.

  - ***Describe the short-term impact:*** Detail the anticipated outcome(s)/product(s) (intellectual and/or material) that will be directly attributed to the results of the proposed research.

  - ***Describe the long-term impact:*** Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable. Explain the long-range vision for how the research will impact the field of study and/or patient care.

- **Attachment 7: Military Relevance Statement (one-page limit): Upload as "MilRel.pdf."**

  - Describe how the proposed effort is responsive to the healthcare needs of military Service members, Veterans, and/or beneficiaries. Provide information about the incidence and/or prevalence of the disease or condition to be studied in the general population as well as in military Service members, Veterans, and/or beneficiaries.

  - If active duty military, military families, and/or Veteran population(s) or dataset(s) will be used in the proposed research project, describe the population(s)/dataset(s) and the appropriateness of the population(s)/dataset(s) for the proposed study. If a non-military population will be used for the proposed research project, explain how the population simulates the targeted population (i.e., military Service members, Veterans, and/or beneficiaries).

  - If applicable, show how the proposed research project aligns with DoD and/or VA areas of research interest and/or patient care. Provide a description of how the knowledge, information, products, or technologies gained from the research could be implemented in a dual-use capacity to benefit the civilian population and address a military need, as appropriate.

- **Attachment 8: Transition Plan and Regulatory Strategy (three-page limit): Upload as "Transition.pdf."**

  - Provide information on the methods and strategies proposed to move the product or knowledge outcomes of the program to the next phases of development and to eventual clinical use. Articulate this information for the overall effort as well as the individual projects. Applicants are encouraged to work with their organization's Technology Transfer Office (or equivalent) to develop the transition plan. The transition plan should include the components listed below, as appropriate:

  - A description of the outcomes expected upon completion of the proposed research efforts. Outcomes should be specific, measurable, and should include the intended end user.

  - Details of the funding strategy that will be used to bring the outcomes to the next phase of development and/or delivery to market or incorporation into patient care (e.g., specific potential industry partners, specific funding opportunities to be applied for).

  - Details of the development plan and FDA regulatory strategy, to include considerations for compliance with GMP, GLP, and GCP guidelines (if appropriate).

  - For knowledge outcomes, a description of how the knowledge will be further developed, disseminated, and incorporated into clinical/patient care.

  - A description of collaborations and other resources that will be used to provide continuity of development.

  - A brief schedule and milestones for bringing the outcomes to the next phase of development (e.g., further research, clinical trials, transition to industry, delivery to the market, incorporation into clinical practice, approval by the FDA).

  - If applicable, ownership rights and/or access to the intellectual property necessary for the development and/or commercialization of products or technologies supported with this award and the Government's ability to access such products or technologies in the future.

- **Attachment 9: Data and Research Resource Sharing Plan (one-page limit): Upload as "Sharing.pdf."**

  - Describe how data and resources generated during the performance of the proposed research projects will be shared with the research community. This includes cases where pre-existing data or research resources will be utilized and/or modified during the course of the proposed projects. Specifically describe a plan to make animal models, tissue samples, and other resources developed as part of the proposed research projects available to the scientific community. If there are limitations associated with a pre-existing agreement for the original data or research resources that preclude subsequent sharing, the applicant should explain this in the data- and/or

research resource-sharing plan. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- In preparing requested budgets, applicants may include anticipated costs associated with data- and research resource-sharing (i.e., making a large dataset available to the public or developing an important resource for the scientific community).

- **Attachment 10: IND/IDE Documentation:** ***Only applicable for applications that include a clinical trial(s).*** If submitting multiple documents, start each document on a new page. **Combine and upload as a single file named "IND-IDE.pdf."** The IND/IDE Documentation Form located on the eBRAP website may ***not*** be used in place of this information:

  - State whether the trial(s) requires regulation by the FDA. If FDA regulation is required, describe the planned indication for the proposed product and whether an IND/IDE is necessary.

  - If an IND or IDE application is required, indicate when it was submitted to the FDA and provide an explanation of the status of the IND or IDE application (e.g., past the critical 30-day period, pending response to questions raised by the Agency, on clinical hold). If the IND or IDE application has not been submitted to the FDA yet, provide a detailed timeline with appropriate milestones for application preparation and submission. Identify any consultants or experts who will assist in the regulatory application, if applicable, and include a copy of any curricula vitae or biographical sketches in the Key Personnel Biographical Sketches section of the application. Provide a summary of previous meetings with the FDA on development of this product, if appropriate. A copy of the Agency meeting minutes should be included if available. Provide copies of communications from the FDA relevant to the most recent status of the IND or IDE application.

  - If an IND or IDE is not required for the proposed trial(s), or if it qualifies for an abbreviated IDE, provide evidence in the form of communication from the FDA or the IRB of record to that effect. Devices qualifying for an abbreviated IDE must comply with the abbreviated IDE requirements but do not require the submission of an IDE application to the FDA.

- **Attachment 11: DoD Military Budget Form(s), if applicable: Upload as "MFBudget.pdf."** If a military facility (military health system facility, research laboratory, treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center) will be a collaborator in performance of the project, complete the DoD Military Budget Form, available for download on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm), including a budget justification, for each military facility as instructed. The costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

- **Extramural and Intramural Applications –**

  Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

  - PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf." The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The National Institutes of Health Biographical Sketch may also be used. All biographical sketches should be submitted in the portable document format (PDF) that is not editable.

  - PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

  - Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."

  - Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

  Research & Related Budget: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.4, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.3, for detailed information.

  Budget Justification (no page limit): Upload as "BudgetJustification.pdf." The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

  Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.4, for detailed information.

- **Extramural Applications Only –**

  R&R Subaward Budget Attachment(s) Form (if applicable): Refer to the General Application Instructions, Section III.A.6, for detailed information.

  - **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.6, for detailed information.)

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov as Attachment 11. (Refer to the General Application Instructions, Section III.A.7, for detailed information.) Intramural DoD Collaborator(s) costs per year

should be included on the Grants.gov Research and Related Budget form under subaward costs. **DoD Military Budget Form:** A military facility collaborating in the performance of the project should be treated as a subaward for budget purposes. However, do not complete the Grants.Gov R&R Subaward Budget Attachment Form; instead, complete the DoD Military Budget Form (Attachment 11) to show all direct and indirect costs. The costs per year should be included on the Grants.gov Research & Related Budget Form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

II.D.3. Dun and Bradstreet Universal Numbering System (DUNS) Number and System for Award Management (SAM)

Applicant organizations and all subrecipient organizations must have a DUNS number to submit applications to Grants.gov. The applicant organization must also be registered in the Entity Management functional area of the SAM with an "Active" status to submit applications through the Grants.gov portal. Verify the status of the applicant's organization's Entity registration in SAM well in advance of the application submission deadline. Allow 3 to 4 weeks to complete the entire SAM registration process. If an applicant has not fully complied with the requirements by the time the Federal awarding agency is ready to make a Federal award, the Federal awarding agency may determine that the applicant is not qualified to receive a Federal award and use that determination as a basis for making a Federal award to another applicant. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.

II.D.4. Submission Dates and Times

All submission dates and times are indicated in Section I, Overview of the Funding Opportunity. Pre-application and application submissions are required. The pre-application and application submission process should be started early to avoid missing deadlines. There are no grace periods. Failure to meet either of these deadlines will result in submission rejection.

Applicant Verification of Full Application Submission in eBRAP

Prior to the end of the application verification period, PIs and organizational representatives can review and modify in eBRAP certain components of a submitted application. Following retrieval and processing of the full application, eBRAP will notify the organizational representatives and PI by email to log into eBRAP to review, modify, and verify the full application submission. eBRAP will validate retrieved files against the specific Program Announcement requirements and discrepancies will be noted in both the email and in the Full Application Files tab in eBRAP. eBRAP does not confirm the accuracy of file content. It is the applicant's responsibility to review all application components and ensure proper ordering as specified in the Program Announcement. ***If either the Project Narrative or the budget fails eBRAP validation or needs to be modified, an updated full application package must be submitted prior to the application submission deadline.*** The Project Narrative and Budget Form cannot be changed after the application submission deadline.

II.D.5. Funding Restrictions

The maximum period of performance is **4** years.

The anticipated total costs budgeted for the entire period of performance will not exceed **$10M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. No budget will be approved by the Government exceeding **$10M** total costs or using an indirect cost rate exceeding the organization's negotiated rate.

All direct and indirect costs of any subaward or contract must be included in the total direct costs of the primary award.

The applicant may request the entire maximum funding amount for a project that may have a period of performance less than the maximum **4** years.

For this award mechanism, direct costs must be requested for:

Travel costs for the PI and up to three additional members of the research team to attend a 1-day Milestone Meeting to be held in the National Capital Area during the award period of performance. This meeting will be held to provide a presentation on progress. Costs associated with travel to this meeting should be included in Year 3 of the budget. These travel costs are in addition to those allowed for annual scientific/technical meetings.

May be requested for (not all-inclusive):

- Salary
- Research supplies
- Equipment
- Research-related subject costs
- Clinical research costs
- Support for multidisciplinary collaborations, including travel
- Travel costs for up to four investigators to travel to one scientific/technical meeting per year in addition to the required meeting described above

Extramural (non-Federal) awards will consist solely of assistance agreements (Cooperative Agreements and Grants). For extramural awards with an intragovernmental component, direct transfer of funds from an extramural award recipient to a DoD or other Federal agency is not allowed except under very limited circumstances. Funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intragovernmental only funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intramural applicants are responsible for coordinating through their agency's procedures the use

of contractual or assistance funding awards or other appropriate agreements to support extramural collaborators.

Refer to the General Application Instructions, Section III.A.4, for budget regulations and instructions for the Research & Related Budget. ***For Federal agencies or organizations collaborating with Federal agencies, budget restrictions apply as are noted in the General Application Instructions, Section III.A.4***.

The CDMRP expects to allot approximately $60M of the $300M FY17 appropriation to fund approximately six Focused Program Award applications, depending on the quality and number of applications received. Funding of applications received in response to this Program Announcement is contingent upon the availability of Federal funds for this program.

II.D.6. Other Submission Requirements

Refer to the General Application Instructions, Appendix 4, for detailed formatting guidelines.

II.E. Application Review Information

II.E.1. Criteria

II.E.1.a. Peer Review

To determine technical merit, all applications will be evaluated according to the following scored criteria, which are of equal importance:

Scored Review Criteria for the Overall Program:

- **Overall Impact**
    - To what extent the overarching challenge impacts a critical problem or question in the designated FY17 PRMRP Topic Area(s).
    - To what degree the proposed program could, if successful, make a significant impact on the lives of relevant patient populations in the short term or long term.
    - How well the research projects are integrated, complement each other, and provide a synergistic, multidisciplinary approach to solving a critical problem.
    - How well the research program will, if successful:
        - Make important scientific advances in the relevant field of research
        - Promote greater understanding of the causes and progression of the relevant disease(s)/condition(s), or
        - Promote the development of improvements in prevention, detection, diagnosis, treatment, or quality of life

- **Implementation Plan**
    - How the proposed projects are supported by a detailed plan that identifies critical milestones and explains how these milestones will be achieved.
    - How well resources and/or cores that will be created or leveraged will be utilized and shared.
    - To what extent the plans to assess individual project performance during the course of the award are appropriate.
    - How well the overall management plan will facilitate consistent and intensive interactions by all team members in the projects.
    - How the proposed plans for communication, data and specimen collection, data transfer, and periodic meetings are appropriate and robust.
    - To what extent the plans for creating, reviewing, implementing, and modifying Standard Operating Procedures are appropriate, if applicable.
- **Leadership and Environment**
    - To what degree the PI is experienced in successfully leading large, focused projects and is therefore well-positioned to lead the research team in achieving the overarching goal of the proposed effort.
    - How well the PI demonstrates experience, leadership skills, and commitment to making an impact in the relevant field of research and/or patient care.
    - Whether the PI will devote a minimum of 20% effort to this award.
    - To what degree the scientific environment(s) is appropriate for the proposed research.
    - How well the research requirements are supported by the availability of and accessibility to facilities and resources (including patient populations, samples, and collaborative arrangements).
    - To what degree the quality and extent of organizational support are appropriate for the proposed research.
- **Transition Plan and Regulatory Strategy**
    - The degree to which the strategy proposed to bring the outcomes to the next level of development, including funding, milestones, and schedule, is realistic.
    - Whether appropriate collaborations and other resources for providing continuity of development are established and/or well described.
    - How the regulatory strategy and development plan are appropriate and well described.

- How well the application identifies intellectual property ownership, and whether there is sufficient evidence of a plan to resolve intellectual and material property issues, if applicable.

- Whether the applicant has demonstrated that they have access to all intellectual property rights necessary for development and commercialization and evidence that the Government has the ability to access such products or technologies, if applicable.

- If applicable, whether data will be appropriately reported and documented to support a regulatory filing with the FDA.

Scored Review Criteria for Individual Research Projects <u>without</u> a clinical trial:

- **Impact**

  - To what extent the individual project impacts the overarching challenge.

  - To what degree the individual project could, if successful, make a significant impact on the lives of relevant patient populations in the short term or long term.

  - How well the individual project will, if successful, make important scientific advances in the relevant field of research.

- **Research Strategy and Feasibility**

  - How well the scientific rationale supports the research and its feasibility, as demonstrated by a critical review and analysis of the literature, the presentation of preliminary data (where applicable), and logical reasoning.

  - How well the hypothesis, objectives, and aims are developed.

  - To what degree the experimental approach, methods, endpoints, and analyses support completion of the aims and are designed to achieve rigorous and reproducible results.

  - How well the choice of model (animal, cell line, or other) is justified and whether it is appropriate.

  - If applicable, to what degree the statistical plan and power analysis, including sample size projections, are appropriate for the proposed project.

  - Whether there is sufficient evidence to support availability and accessibility of the populations, samples, or other resources required for the study, if applicable.

  - How well potential problems are acknowledged and alternative approaches are addressed.

- **Personnel**

  - To what degree the project team's background and expertise are appropriate with respect to its ability to perform the proposed work, including whether there is evidence of

sufficient expertise for all aspects of the work and whether there is evidence of strong commitment to the projects.

- To what degree the levels of effort are appropriate for successful conduct of the proposed work.

Scored Review Criteria for Individual Research Projects <u>with</u> clinical trials:

- **Impact**
  - To what extent the individual project impacts the overarching challenge.
  - How well the individual project will, if successful, make important scientific advances in the relevant field of research.
  - How well the sample population represents the targeted patient population that might benefit from the proposed intervention.
  - How the potential outcomes of the proposed clinical trial will provide/improve short-term benefits for individuals.
  - How significantly the long-term benefits for implementation of the intervention may impact patient care and/or quality of life.
- **Research Strategy and Feasibility**
  - How well the scientific rationale supports the research and its feasibility, as demonstrated by a critical review and analysis of the literature, the presentation of preliminary data, and logical reasoning.
  - How well the hypothesis and/or objectives and specific aims are developed.
  - To what degree the experimental approach, methods, endpoints, and analyses support completion of the aims and are designed to achieve rigorous and reproducible results.
  - To what degree the statistical plan and power analysis, including sample size projections, are appropriate for the proposed trial and any proposed correlative studies.
  - How well the application demonstrates the availability of and access to the appropriate patient population(s), as well as the ability to accrue a sufficient number of subjects.
  - How well potential problems and delays (e.g., slow accrual, attrition) are acknowledged and alternative approaches are addressed.
- **Clinical Strategy**
  - How the intervention compares with currently available interventions and/or standards of care.

- Whether there is evidence of support, indicating availability of the intervention from its source, for the duration of the proposed clinical trial (if applicable).
- To what degree the PI has provided preclinical and/or clinical evidence to support the safety of the intervention.
- How well the inclusion and exclusion criteria meet the needs of the proposed clinical trial.
- The degree to which the informed consent, screening, and retention processes for human subjects will meet the needs of the proposed clinical trial.
- Whether a member of the study team holds the IND/IDE for the indication proposed or whether the timeline proposed for obtaining the IND/IDE is appropriate (if applicable).
- For investigator-sponsored INDs, whether there is evidence of appropriate institutional support, including capabilities to ensure monitoring as required by the FDA.
- Whether plans to comply with GMP, GLP, and GCP guidelines are appropriate.
- Whether measures are described to ensure the consistency of dosing of active ingredients for nutritional supplements (if applicable).

- **Personnel**
  - To what degree the project team's background and expertise are appropriate with respect to its ability to perform the proposed work, including whether there is evidence of sufficient expertise for all aspects of the work and whether there is evidence of strong commitment to the projects.
  - How well the project leader has assembled an appropriate and robust clinical team with the combined backgrounds and expertise needed to enable successful conduct of the clinical trial.
  - To what degree the levels of effort are appropriate for successful conduct of the proposed work.

In addition, the following unscored criteria will also contribute to the overall evaluation of the application:

- **Data and Resource Sharing**
  - To what degree the plan for sharing of project data and research resources is appropriate and reasonable to facilitate use by the wider research community.
- **Budget**
  - Whether the budget is appropriate for the proposed research and within the limitations of this Program Announcement.

- **Environment**
    - If applicable, to what degree the intellectual and material property plan is appropriate.
- **Application Presentation**
    - To what extent the writing, clarity, and presentation of the application components influence the review.

II.E.1.b. Programmatic Review

To make funding recommendations and select the application(s) that, individually or collectively, will best achieve the program objectives, the following criteria are used by programmatic reviewers:

- Ratings and evaluations of the peer reviewers
- Relevance to the mission of the DHP and FY17 PRMRP, as evidenced by the following:
    - Adherence to the intent of the award mechanism
    - Military relevance
    - Program portfolio composition
    - Relative impact

II.E.2. Application Review and Selection Process

All applications are evaluated by scientists, clinicians, and consumers in a two-tier review process. The first tier is peer review of applications against established criteria for determining technical merit. Each application is evaluated for its own merit, independent of other applications. The second tier is a programmatic review that makes recommendations for funding to the Commanding General, USAMRMC, on behalf of the DHA and the OASD(HA), based on technical merit, the relevance to the mission of the DHP and PRMRP, the specific intent of the award mechanism, and to other specified evaluation criteria in the Program Announcement. Programmatic review is a comparison-based process in which applications with scientific and technical merit compete in a common pool. ***The highest-scoring applications from the first tier of review are not automatically recommended for funding. Funding recommendations depend on various factors as described in Section II.E.1.b, Programmatic Review.*** Additional information about the two-tier process used by the CDMRP can be found at http://cdmrp.army.mil/about/fundingprocess.

All CDMRP review processes are conducted confidentially to maintain the integrity of the merit-based selection process. Panel members sign a statement that application and evaluation information will not be disclosed outside the panel. Violations of confidentiality can result in the dissolving of a panel(s) and other corrective actions. In addition, personnel at the applicant or collaborating organizations are prohibited from contacting persons involved in the review

process to gain protected evaluation information or to influence the evaluation process. Violations of these prohibitions will result in the administrative withdrawal of the organization's application. Violations by panel members or applicants that compromise the confidentiality of the review process may also result in suspension or debarment from Federal awards. Furthermore, the unauthorized disclosure of confidential information of one party to another third party is a crime in accordance with 18 USC 1905.

II.E.3. Integrity and Performance Information

Prior to making an assistance agreement award where the Federal share is expected to exceed the simplified acquisition threshold (currently $150,000) over the period of performance, the Federal awarding agency is required to review and consider any information about the applicant that is available in the Federal Awardee Performance and Integrity Information System (FAPIIS).

An applicant, at its option, may review FAPIIS, accessible through SAM, and submit comments to FAPIIS on any information about itself that a Federal awarding agency previously entered and is currently available in FAPIIS.

The Federal awarding agency will consider any comments by the applicant, in addition to other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics and record of performance under Federal awards when determining a recipient's qualification prior to award, according to the qualification standards of the Department of Defense Grant and Agreement Regulations (DoDGAR), Section 22.415.

II.E.4. Anticipated Announcement and Federal Award Dates

All application review dates and times are indicated in Section I, Overview of the Funding Opportunity.

Each PI and organization will receive email notification of posting of the funding recommendation in eBRAP. Each PI will receive a peer review summary statement on the strengths and weaknesses of the application.

II.F. Federal Award Administration Information

II.F.1. Federal Award Notices

Awards will be made no later than September 30, 2018. Refer to the General Application Instructions, Appendix 2, for additional award administration information.

Awards are made to organizations, not to individual PIs. The types of awards made under the Program Announcement will be assistance agreements (grants or cooperative agreements). The level of involvement on the part of DoD during project performance is the key factor in determining whether to award a grant or cooperative agreement.

Extramural Organizations: An assistance agreement (grant or cooperative agreement) is appropriate when the Federal Government transfers a "thing of value," to a "state, local

government," or "other recipient," to carry out a public purpose of support or stimulation authorized by a law of the United States, instead of acquiring property or service for the direct benefit and use of the U.S. Government. An assistance agreement can take the form of a grant or cooperative agreement. If "no substantial involvement" on the part of the funding agency is anticipated, a grant award will be made (31 USC 6304). Conversely, if substantial involvement on the part of the funding agency is anticipated, a cooperative agreement will be made (31 USC 6305). Substantial involvement may include collaboration, participation, or intervention in the research to be performed under the award. The award type, along with the start date, will be determined during the negotiation process.

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the USAMRAA will contact the business official authorized to negotiate on behalf of the PI's organization.

Only an appointed USAMRAA Grants Officer may obligate the Government to the expenditure of funds. No commitment on the part of the Government should be inferred from discussions with any other individual. The award document signed by the Grants Officer is the official authorizing documents.

Intramural Organizations: Awards to Federal Government organizations (to include intramural DoD organizations) will be executed through the Military Interdepartmental Purchase Request (MIPR) or Funding Authorization Document (FAD) process. Transfer of funds is contingent upon appropriate safety and administrative approvals. Intramural applicants and collaborators are reminded to coordinate receipt and commitment of funds through their respective resource managers (RM).

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the CDMRP will contact the business official authorized to negotiate on behalf of the PI's organization.

II.F.1.a. Award Transfers

Changes in PI are not allowed, except under extenuating circumstances that will be evaluated on a case-by-case basis and at the discretion of the Grants Officer. An organizational transfer of an award will not be allowed in the last year of the (original) period of performance or any extension thereof.

The organizational transfer of an award supporting a clinical trial is strongly discouraged and in most cases will not be allowed. Approval of a transfer request will be on a case-by-case basis at the discretion of the Grants Officer.

Refer to the General Application Instructions, Appendix 2, Section B, for general information on organization or PI changes.

II.F.2. Administrative and National Policy Requirements

Applicable requirements in the DoDGAR found in 32 CFR, Chapter 1, Subchapter C, and 2 CFR, Chapter XI, apply to grants and cooperative agreements resulting from this Program Announcement.

Refer to the General Application Instructions, Appendix 2, for general information regarding administrative requirements.

Refer to the General Application Instructions, Appendix 5, for general information regarding national policy requirements.

Refer to full text of the USAMRAA General Research Terms and Conditions for Institutions of Higher Education, Hospitals, and Non-Profit Organizations and the USAMRAA General Research Terms and Conditions with For-Profit Organizations for further information.

II.F.3. Reporting

Refer to the General Application Instructions, Appendix 2, Section A, for general information on reporting requirements. Annual progress reports as well as a final progress report will be required.

Quarterly technical progress reports will be required. In addition to written progress reports, in-person presentations may be requested.

Award Chart: Complete the Award Chart template, a one-page PowerPoint file that must be downloaded from the CDMRP eBRAP System at https://ebrap.org/eBRAP/public/Program.htm, and submit to eBRAP at the time of award.

Award Expiration Transition Plan: Complete the Transition Plan template, a one-page Word document that must be submitted with the Final Progress Report. The Transition Plan must outline if and how the research supported by this award will progress, and include source(s) of funding, either known or pending.

Awards resulting from this Program Announcement will incorporate additional reporting requirements related to recipient integrity and performance matters. Recipient organizations that have Federal contract, grant, and cooperative agreement awards with a cumulative total value greater than $10,000,000 are required to provide information to FAPIIS about certain civil, criminal, and administrative proceedings that reached final disposition within the most recent 5-year period and that were connected with performance of a Federal award. Recipients are required to disclose semiannually information about criminal, civil, and administrative proceedings as specified in the applicable Terms and Conditions. The applicable Terms and Conditions for institutions of higher education, hospitals, and nonprofit organizations are available in OAR Article I, Section B, in July 2016 R&D General Terms and Conditions. The applicable Terms and Conditions for for-profit organizations are available in Section 34 of the February 2017 USAMRAA General Research Terms and Conditions with For-Profit Organizations.

II.G. Federal Awarding Agency Contacts

II.G.1. CDMRP Help Desk

Questions related to Program Announcement content or submission requirements as well as questions related to the pre-application or intramural application submission through eBRAP should be directed to the CDMRP Help Desk, which is available Monday through Friday from 8:00 a.m. to 5:00 p.m. ET. Response times may vary depending upon the volume of inquiries.

Phone: 301-682-5507

Email: help@eBRAP.org

II.G.2. Grants.gov Contact Center

Questions related to extramural application submission through Grants.gov portal should be directed to the Grants.gov Contact Center, which is available 24 hours a day, 7 days a week (closed on U.S. Federal holidays). Note that the CDMRP Help Desk is unable to provide technical assistance with Grants.gov submission.

Phone: 800-518-4726; International 1-606-545-5035

Email: support@grants.gov

Sign up on Grants.gov for "send me change notification emails" by following the link on the Synopsis page for the Program Announcement or by responding to the prompt provided by Grants.gov when first downloading the Grants.gov application package. If the Grants.gov application package is updated or changed, the original version of the application package may not be accepted by Grants.gov.

II.H. Other Information

II.H.1. Program Announcement and General Application Instructions Versions

Questions related to this Program Announcement should refer to the Program name, the Program Announcement name, and the Program Announcement version code 20170516b. The Program Announcement numeric version code will match the General Applications Instructions version code 20170516.

II.H.2. Administrative Actions

After receipt of pre-applications or applications, the following administrative actions may occur:

II.H.2.a. Rejection

The following will result in administrative rejection of the pre-application:

- Preproposal Narrative is missing.

The following will result in administrative rejection of the application:

- Submission of an application for which a letter of invitation was not received.
- Project Narrative exceeds page limit.
- Project Narrative is missing.
- Budget is missing.
- Submission of the same research project to different Funding Opportunities within the same program and fiscal year. Refer to Section II.D, Application and Submission Information, for exceptions.

II.H.2.b. Modification

- Pages exceeding the specific limits will be removed prior to review for all documents other than the Project Narrative.
- Documents not requested will be removed.

II.H.2.c. Withdrawal

The following may result in administrative withdrawal of the pre-application or application:

- An FY17 PRMRP Programmatic Panel member is named as being involved in the research proposed or is found to have assisted in the pre-application or application processes including, but not limited to, concept design, application development, budget preparation, and the development of any supporting documentation. ***A list of the FY17 PRMRP Programmatic Panel members can be found at http://cdmrp.army.mil/prmrp/panels/panels17.shtml***.
- The application fails to conform to this Program Announcement description to the extent that appropriate review cannot be conducted.
- Inclusion of URLs, with the exception of links in References Cited and Publication and/or Patent Abstract sections.
- Page size is larger than 8.5 inches x 11.0 inches (approximately 21.59 cm x 27.94 cm).
- To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in the preparation, research or other duties for submitted applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the

CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- Personnel from applicant or collaborating organizations are found to have contacted persons involved in the review process to gain protected evaluation information or to influence the evaluation process.
- Applications from extramural organizations, including non-DoD Federal agencies, received through eBRAP may be withdrawn.
- Applications submitted by an intramural DoD organization may be withdrawn if the intramural organization cannot coordinate the use of contractual, assistance, or other appropriate agreements to provide funds to extramural collaborators.
- The proposed research project does not address at least one of the Congressionally directed FY17 PRMRP Topic Areas.
- An application for which the PI does not meet the eligibility criteria will be withdrawn.

II.H.2.d. Withhold

Applications that appear to involve research misconduct will be administratively withheld from further consideration pending organizational investigation. The organization will be required to provide the findings of the investigation to the USAMRAA Grants Officer for a determination of the final disposition of the application.

II.H.3. Application Submission Checklist

Application Components	Action	Completed
SF424 (R&R) Application for Federal Assistance **(Extramural submissions only)**	Complete form as instructed.	
Summary (Tab 1) and Application Contacts (Tab 2) **(Intramural submissions only)**	Complete these tabs as instructed.	
Attachments	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf."	
	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf."	
	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf."	
	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf."	
	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf."	
	Impact Statement: Upload as Attachment 6 with file name "Impact.pdf."	
	Military Relevance: Upload as Attachment 7 with file name "MilRel.pdf."	
	Transition Plan and Regulatory Strategy: Upload as Attachment 8 with file name "Transition.pdf."	
	Data and Research Resources Sharing Plan: Upload as Attachment 9 with file name "Sharing.pdf."	
	IND/IDE Documentation: Upload as Attachment 10 with file name "IND-IDE.pdf," if applicable.	
	DoD Military Budget Form(s): Upload as Attachment 11 with file name "MFBudget.pdf," if applicable.	
Research & Related Senior/Key Person Profile (Expanded)	Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field.	
	Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field.	
	Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field.	
	Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field.	

Application Components	Action	Completed
Research & Related Budget **(Extramural submissions only)**	Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field.	
Budget **(Intramural submissions only)**	Complete the DoD Military Budget Form and justification.	
Project/Performance Site Location(s) Form	Complete form as instructed.	
R&R Subaward Budget Attachment(s) Form, if applicable	Complete form as instructed.	
Additional Application Components	**Action**	**Completed**
Confidential Letters of Recommendation	Confirm upload to eBRAP.

APPENDIX 2
AREAS OF ENCOURAGEMENT

Applications addressing any of the FY17 PRMRP Topic Areas are of interest to the program. ***Any aspect of research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding.*** Areas of encouragement related to the FY17 PRMRP Topic Areas have been identified by the Department of Defense, Department of Veterans Affairs, and other relevant stakeholders. Applicants are urged to read and consider these areas of encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an area of encouragement in this list.***

Acute Lung Injury

- Research on the etiology and prevention of acute respiratory distress syndrome caused by the host's or immune system's responses to infectious disease or septic shock.
- Preventive techniques, novel and/or innovative detection technologies, and therapeutics to reduce the incidence and/or severity of acute respiratory distress syndrome and/or other lung injury secondary to trauma, transfusion, burns, hemorrhagic shock, inhalation, and/or oxygen exposure.
- Development of a clinical laboratory-based device for manufacturing/amplification of stem cells to treat acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Clinical studies to test cellular therapies in the treatment of acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Metrics to associate the health outcomes of acute lung injury with physiological and physical performance, as well as the psychological health of military Service members.
- Strategies to stabilize and support the safe transport of patients with lung injury in order to optimize therapeutic interventions.
- Studies to identify the prevalence and associated morbidity and mortality of blast overpressure lung injury in forward operating environments.

Antimicrobial Resistance

- Identification and evaluation of novel and/or innovative antifungals against resistant fungal infections, particularly for use as topical therapies for wounds and for surgical and post-surgical therapies.
- Identification of novel and/or innovative targets for multi-drug resistant pathogens.
- Development of novel and/or innovative interventions, diagnostics, and treatment for multi-drug-resistant pathogens.
- Development of novel and/or innovative therapies that interrupt biofilm production in wound infections and infected hardware models.
- Development and testing of treatment protocols and/or diagnostic tests to limit prescribing antibiotics for conditions that are commonly viral in nature or conditions that would resolve themselves without antibiotic treatment (e.g., sinusitis, bronchitis, viral upper respiratory infections, and acute gastroenteritis).

- Development of rapid, rugged, sensitive, and specific diagnostics for antimicrobial resistance in remote environments.
- Research to improve understanding of the impact of travelers' diarrhea, as well as antibiotic treatment for the colonization of multi-drug-resistant organisms.

Arthritis

- Studies that define the risk of contracting septic arthritis; reactive arthritis; arthritis caused by a gastrointestinal, genitourinary, or viral infection (e.g., Lyme disease, Campylobacter, chikungunya); and other arthritis types in active duty military personnel.
- Research toward the development of clinical practice guidelines to prevent, identify, and treat arthritis, particularly that resulting from traumatic injury, surgery, and/or infectious diseases.
- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Strategies for repairing focal cartilage defects using cell-based therapies.
- Research quantifying the impacts of obesity, weight loss, physical fitness (all components—cardiovascular, strength, flexibility, balance), and dietary factors on the development of or prevention/risk reduction of arthritis.
- Identification and/or validation of biomarkers for early psoriatic arthritis.
- Basic and translational research to identify treatments to mitigate and/or reverse osteoarthritis, particularly in the knee, hip, ankle, and shoulder.
- Studies to examine using existing regenerative medicine techniques and therapies to treat osteoarthritis, including dose response information and the frequency and timing of application.
- Development of novel and/or innovative treatments or combination therapies for psoriatic arthritis.

Burn Pit Exposure

- Research on the etiology and treatment of adverse health events related to military deployment to Iraq and Afghanistan that are associated with exposure to airborne hazards and open pit burning of solid waste and other materials.
- Toxicological studies to ascertain the toxicity of natural dust, burn pit combustion products and interactions between pollutants, as well as their mechanisms of action.
- Characterization of emissions from open air burns, burn boxes, and incinerators.
- Development and validation of instruments for assessing levels of exposure to airborne hazards for use in research and for occupational and environmental exposure monitoring.

Chronic Migraine and Post-Traumatic Headache

- Research to investigate, develop, and validate biomarkers that are useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache.
- Epidemiological/natural history studies to characterize specific types of post-traumatic headache, the pathobiology of these headaches (such as the role of cortical spreading

depression acutely after injury as a risk factor for chronic headaches of a migrainous type), and the risk factors that might predispose people to certain types of post-traumatic headache.

- Double-blind, placebo-controlled trials in the post-traumatic headache population in order to determine whether similar phenotypes in primary headache disorders and post-traumatic headache will respond similarly to treatment.
- Research on the optimal approaches to effective management of co-occurring psychological health disorders and acute and chronic pain management for chronic migraine and post-traumatic headache, with a focus on assessing and eliminating adverse outcomes and decreasing polypharmacy.
- Research on the utility of the Patient-Centered Medical Home model of care for patients with chronic migraine or post-traumatic headache.
- Research on the treatment and prevention of acute flares of chronic migraine and post-traumatic headaches with an emphasis on non-opioid medications.
- Evaluation of the use of mechanical stimulation and/or other non-pharmaceutical treatments to reduce acute and chronic migraines and headaches.
- Precision medicine research to investigate, develop, and validate biomarkers that are not only useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache, but can also identify individual responses to treatment.
- Evaluation of the differences in etiology, diagnosis, treatment plan, and prevention of migraine headaches between men and women.

Congenital Heart Disease

- Population-based and outcomes-based research projects to assess the health outcomes of individuals with congenital heart disease across their life spans.
- Research on tissue engineering approaches to patches, grafts, and transplantation that provide structural support, restore native activity, allow for tissue growth, and prevent the need for reoperation.
- Research to improve understanding of the causes of congenital heart defects, including genomic, proteomic, and metabolomic profiling.
- Research on transition of the care of congenital heart disease patients from pediatric to adult providers.
- Research both on the risk of neurologic injury and on enhanced neuroprotection before, during, and after surgery for congenital heart disease.
- Research to design and implement disease-in-a-dish and/or microfluidic models with an established phenotype to increase the efficacy of finding novel and/or innovative drug targets, screen existing drugs, perform cardiotoxicity testing, and/or uncover pathogenesis.

Constrictive Bronchiolitis

- Clinical assessments to determine the prevalence and severity of constrictive bronchiolitis and related respiratory diseases in previously deployed military Service members and/or Veterans.

- Development and testing of less invasive and non-invasive approaches for diagnosing constrictive bronchiolitis.
- Research to develop novel and/or innovative therapeutics to slow or reverse the progression of constrictive bronchiolitis.
- Development and/or validation of animal models for constrictive bronchiolitis.
- Research to understand the role of environmental exposures, including mineralized dust and other particulates, in the etiology of constrictive bronchiolitis.

Diabetes

- Development of biomarkers to identify and monitor at-risk individuals and assess treatment response.
- Research on interventions to prevent diabetes complications, including diabetic retinopathy and diabetic neuropathy.
- Research to better understand the heterogeneity of diabetes.
- Research on the transplantation of allogenic or autologous pancreatic islet cells for long-term natural insulin production, including current good manufacturing practices for cell line development.
- Identification and/or evaluation of interventions to reduce the development of diabetes among individuals meeting the clinical criteria for pre-diabetes.
- Development and evaluation of an inpatient glycemic management program with strategies to improve in-hospital dysglycemia, improve short-term and long-term morbidity/mortality, reduce the cost of health care, and promote a seamless transition of care between inpatient and outpatient arenas.
- Research to design and implement disease-in-a-dish and/or microfluidic models to model pancreatic islets to uncover pathogenesis and improve the efficiency of drug discovery.

Diarrheal Diseases

- Development and testing of vaccines, including multi-pathogen combination approaches, against the most common causes of bacterial and viral travelers' diarrhea, including *Campylobacter jejuni, Shigella,* and Enterotoxigenic *E. coli*.
- Development and evaluation of antibiotic and non-antibiotic therapies to treat all-cause travelers' diarrhea to improve the time to clinical cure, minimize resistance acquisition, and mitigate the chronic health consequences of these infections.
- Research to improve understanding of host responses and develop therapies to treat acute bacterial and viral infections that are associated with travel and may lead to chronic functional bowel and rheumatologic disorders.
- Development of evidence necessary to demonstrate the need, impact, and potential market value of a therapeutic for post-infectious functional bowel disorders to include preventive, treatment, or vaccine technology strategies.
- Development and evaluation of point-of-care diagnostics for acute diarrheal illness that distinguishes between bacterial, viral, protozoal, and toxin-mediated etiologies and leads to actionable public health or individual management interventions.

- Investigations into the relationship between existing gastrointestinal flora (microbiome) and the susceptibility, duration, and severity of diarrheal disease, as well as the impacts of dietary modification and/or probiotic use.
- Research to identify, reduce, or eliminate sources of infection causing diarrheal diseases.

Dystonia

- Research on the risk, incidence, and etiology of generalized dystonia, focal dystonia, multifocal dystonia, segmental dystonia, and/or hemidystonia.
- Research on interventions to prevent, slow the progression of, or treat dystonia.
- Research to improve identification of delayed onset dystonia following traumatic brain injury.

Early Trauma Thermal Regulation

- Research into regional cooling for different environments, including prolonged care, as a therapeutic for secondary ischemic injury (e.g., head with traumatic brain injury, limb with tourniquet).
- Development of a tunable support mechanism for thermal homeostasis for use in prolonged field care, extended evacuation, or unmanned evacuation.
- Development and evaluation of a novel and/or innovative technology and techniques to reduce the impact of hypothermia.
- Research to determine the benefits of invasive warming/cooling during patient movement.
- Research to validate the attenuating effects of (early) external head cooling on concussive brain injuries.
- Research into therapeutic cooling or targeted temperature management as a neuroprotective treatment for traumatic brain injury.

Eating Disorders

- Investigations into the prevalence, diagnosis, and treatment patterns of eating disorders in Service members and their families, including potential relationships with military-unique behaviors or conditions.
- Assessment of patterns of comorbidity between eating disorders and other mental health conditions, including an examination of whether eating disorders are more likely to precede or follow the development of other mental health conditions.
- Studies to identify the most effective treatments (and order of treatment) for patients with an eating disorder and a comorbid disorder.
- Research to advance the understanding of the biological, genetic, and environmental factors that influence eating disorders.
- Studies to elucidate risk factors for the onset or recurrence of eating disorders.
- Research to develop screening tools and valid biomarkers that accurately identify individuals with binge eating disorder versus healthy controls in order to monitor at-risk populations and tailor treatments for disordered eating.

- Research to better understand subclinical disordered eating and other specified feeding and eating disorders and the potential for these to develop into full-blown eating disorders.

Emerging Infectious Diseases

- Methods to minimize risk from arboviruses among military Service members and their families deployed to/living in high-risk areas, including personal protective equipment and environmental controls.
- Investigation of revaccination strategies and identification of correlates of protection for currently available vaccines (especially mumps).
- Targeted vector management of *Aedes aegypti, Anopheline sp.* and related mosquito species, including focus areas on novel and/or innovative adult surveillance devices, pathogen identification, spatial repellents, and barrier treatments.
- Research toward understanding the potential influence of dietary intake as a potential repellent to mosquito vectors and vector behavior.
- Evaluation of non-vaccine prophylactics or therapeutics to prevent/treat dengue or Zika virus disease.
- Characterization of health emergency relevant infectious disease threats in West Africa.
- Development of biomarker-guided clinical management strategies for severe infectious disease in the austere African setting.
- Validation of airborne and droplet precaution recommendations in the medical transport environment.
- Development of new testing methods for emerging pathogens and pathogen reduction technologies for blood-borne pathogens, including Zika, malaria, dengue, and others, in blood products.
- Modeling of epidemics and development of strategies to counter risks in emerging infectious diseases.
- Rapid, rugged, sensitive, and specific screening and diagnostics, including biomarkers for infectious threats such as Zika and other clinically relevant bacterial, viral, or protozoal pathogens in clinical samples or blood products that can be transmitted sexually or by blood transmission.
- Development of broad-acting detection systems to identify emerging members of a known viral family (for example, a broad Coronavirus panel that can detect Middle Eastern Respiratory Syndrome).
- Determination of the human health effects, host preference, vector competence, and co-infection status of the dengue, chikungunya, Zika, and Mayaro viruses in *Aedes aegypti* and related mosquito species.

Epidermolysis Bullosa

- Research to provide further insight into those cellular pathways that might be corrected or bypassed that otherwise promote the development of squamous cell carcinomas in recessive dystrophic and junctional epidermolysis bullosa.

- Research, including randomized controlled clinical trials, focused on systemic drugs that prevent, delay the onset, or modify the aggressiveness of squamous cell carcinoma in patients with recessive and junctional epidermolysis bullosa.
- Research, including clinical trials, focused on medications (topical or systemic) or dressings that might enhance wound healing in inherited epidermolysis bullosa.

Focal Segmental Glomerulosclerosis

- Development of a curative therapy or treatments to delay or halt the progression of focal segmental glomerulosclerosis and/or prevent post-transplantation recurrence.
- Research to determine the efficacy of medications used off-label (outside the FDA-approved indication) to treat focal segmental glomerulosclerosis.
- Research to improve understanding of the causes of primary and secondary focal segmental glomerulosclerosis, especially genetic mutations.
- Development of non-invasive methods to diagnose focal segmental glomerulosclerosis and its variants.
- Research on the impact of dietary modifications on the progression of renal disease.

Fragile X

- Research to advance the understanding of the pathophysiology of fragile X syndrome.
- Identification and validation of functional measures of the manifestations of fragile X syndrome across the life span.
- Identification and testing of novel and/or innovative targets for fragile X syndrome therapeutics.
- Development and evaluation of novel, innovative, or existing therapeutics for the treatment of fragile X syndrome.

Guillain-Barré Syndrome

- Research to elucidate the characteristics of various exposures (e.g., viruses, bacteria, vaccinations, surgery) associated with Guillain-Barré syndrome and their effects on the immune system.
- Research on the immune system cell types and molecular mechanisms responsible for the disease pathology of Guillain-Barré syndrome.
- Research to prevent or reduce the effects of residual weakness, relapse of muscle weakness, and other neurological symptoms of Guillain-Barré syndrome to improve patients' quality of life and increase their independence.
- Development of new treatments and refinement of existing treatments for Guillain-Barré syndrome.

Hepatitis B and C

- Research on vaccination options for those persons unable to mount immunity to the hepatitis B virus.

- Development of strategies for reliable, non-invasive, early detection of hepatitis-related liver disease and hepatocellular carcinoma.
- Research on strategies to promote reversal of liver fibrosis and/or assess the associated clinical and pathological outcomes.
- Natural history or other studies to establish risk indicators of progression from asymptomatic or inactive chronic hepatitis infection to symptomatic disease and parameters for the initiation and duration of disease treatment.
- Clinical studies to evaluate combination or curative therapies for treatment of hepatitis infection.
- Identification and reduction of hepatitis in blood products for transfusion.
- Research on strategies to reduce vertical (mother-to-child) transmission of hepatitis B virus and hepatitis C virus.
- Development of a vaccine against hepatitis C.
- Development of treatment protocols for patients with hepatitis B and C co-infections.

Hereditary Angioedema

- Research to improve early diagnosis of hereditary angioedema.
- Evaluation of existing, innovative, or novel therapeutics in pediatric hereditary angioedema patients.
- Research toward development of a cure for hereditary angioedema.
- Development and/or validation of novel and/or innovative therapeutic strategies for the treatment and/or prevention of hereditary angioedema attacks.

Hydrocephalus

- Research on the etiology, prevention, diagnosis, and treatment of post-traumatic hydrocephalus.
- Discovery or validation of novel and/or innovative therapies and therapeutic targets for the treatment of hydrocephalus and its sequelae, including therapies directed at myelin regeneration and repair.
- Research on approaches to lessening the impact of brain damage caused by hydrocephalus.
- Development or validation of biomarkers and imaging techniques, particularly multimodal approaches, to aid in diagnosis, prognosis, and monitoring of therapeutic efficacy.
- Research on the prevention of shunt failure.
- Studies to better understand the causes and/or pathogenesis of hydrocephalus.
- Development or validation of improved hydrocephalus model systems.

Immunomonitoring of Intestinal Transplants

- Studies to elucidate the role of the mucosal immune system, other host-derived factors, or gut microbiota-derived factors in maintaining intestinal transplant viability.

- Development and evaluation of intestinal implant strategies that circumvent the induction of immunity against the transplant through the use of autologous stem cells or organoids derived from intestinal stem cells.
- Development and evaluation of evidence-based approaches that focus on dampening the regional immune response against intestinal transplants without inducing global immune suppression.
- Development and evaluation of implant-associated materials (e.g., scaffolds) with anti-inflammatory properties that protect the intestinal transplant from immune attack.
- Development and evaluation of strategies for inducing and maintaining populations of anti-inflammatory regulatory immune cell populations at the transplant site.
- Studies to improve immunomonitoring of recipient immune responses after intestinal transplantation, with a focus on prospective leukocyte profiling, to aid in diagnosis and treatment of immunological and immunosuppression-related complications.
- Development and/or validation of precise, real-time implanted monitoring devices to improve individualized patient outcomes after intestinal transplantation.

Inflammatory Bowel Diseases

- Clinical studies in human subjects directed toward understanding how acute enteric infections may trigger chronic bowel diseases with acute and sub-acute inflammatory bowel disease, including systems biology approaches.
- Mechanistic studies in animal models designed to understand how enteric infection may trigger inflammatory bowel disease, including genomic, microbiomic, and immune mechanisms.
- Epidemiological studies of post-infectious acute and sub-acute inflammatory bowel diseases that define risk and provide estimates of illness-associated disability, health care costs, and symptom duration from a military health system and societal perspective.
- Studies to understand the interaction between acute/chronic stress and infection and the development of inflammatory bowel disease.
- Research to explore whether the travel patterns of active duty personnel increase the risk of developing inflammatory bowel disease by means of exposure to changes in intestinal microflora.
- Research to better characterize the association between the use of drugs, such as isotretinoin and long-term doxycycline, and the development of inflammatory bowel disease.
- Research on the role of diet in the development and progression of inflammatory bowel disease.
- Research on the influence of the microbiome on inflammatory bowel disease.
- Research on hyperbaric oxygen treatment of inflammatory bowel disease.
- Research on treatment strategies for patients whose inflammatory bowel disease is refractory to standard care medications or who positively respond to standard care medications, but become nonresponsive over time.

Influenza

- Development of a diagnostic test for influenza drug resistance.
- Development and testing of a universal influenza vaccine.
- Development and evaluation of novel, innovative, and/or combination influenza therapies.
- Research to improve the understanding of host responses to influenza infection and the mechanisms of drug resistance.
- Research on the factors that contribute to and/or reduce the risk of the emergence of zoonotic and pandemic influenza viruses.

Integrative Medicine

- Research on the use of integrative medicine strategies, such as meditation, tai chi, acupuncture, and/or herbal medicine/nutritional supplementation, to improve the psychological health and quality of life in cancer patients and survivors.
- Research on the use of integrative medicine in treatment and management of chronic pain disorders, including comparative efficacy studies relative to standard of care.
- Rigorous longitudinal studies of integrative medicine approaches for enhancing resilience and treating psychological health issues and co-occurring disorders.
- Precision medicine research to investigate, develop, and validate biomarkers that can help determine an individual's response to integrative medicine treatments for pain.
- Development of outcomes tools and measures to evaluate the effectiveness of integrative medicine pain management approaches.
- Definitive studies to determine the effectiveness of self-care, meditation-based treatments, courses, and training programs in improving resiliency to stress in a military environment; in austere operational platforms such as submarines and small-deck ships; or in combat-fatigued military health care providers.

Interstitial Cystitis

- Studies that define the risk, prevalence, and operational impact of interstitial cystitis among active duty personnel.
- Identification of biological markers for making a definitive diagnosis of interstitial cystitis.
- Evaluation and assessment of novel and/or innovative treatment options for interstitial cystitis patients, including intravesical therapy.
- Research on the etiology of interstitial cystitis to inform targeted therapy development.

Malaria

- Investigation of mechanisms of drug resistance in malaria, to include host and pathogen, against drugs used for treatment and prophylaxis.
- Development of a vaccine that induces high levels of long-lived, broadly protective immunity against *Plasmodium falciparum* and/or *P. vivax*.
- Operational research to optimize application of existing malaria drugs to reduce impact of artemisinin resistant *P. falciparum* in military forces.

- Operational research to optimize deployment of pharmacovigilance systems to ensure capture of adverse events related to malaria chemoprophylaxis and treatment.
- Operational research to assess efficacy and spread of artemisinin combination therapies across the Greater Mekong Subregion's military forces.
- Development of malaria prophylactic regimens that encourage higher compliance and methods to monitor compliance in deployed Service members.
- Identification of novel and/or innovative malaria drug targets for blood and liver stage malaria parasites.
- Development of new, or improvement of existing, strategies for culturing relapsing malaria parasites, with emphasis on *Plasmodium vivax, P. ovale,* and *P. cynomolgi* in vitro.
- Development, testing, and evaluation of spatial repellents to provide protection against Anopheline vectors.
- Identification of a correlate of immunity against malaria and development of a surrogate test of protection.
- Structurally optimize validated malaria antigens by engineering protective epitopes to elicit specific and enhanced immune responses.

Metals Toxicology

- Identification and validation of biomarkers to evaluate military Service members' acute exposure to toxic metals in an operational environment and predict potential consequent health risks and associated health outcomes.
- Retrospective studies to evaluate risk and exposure among workers at industrial facilities.
- Research on the toxicity of metal combinations and the interaction between different metal components.
- Research on the additive effects of multiple exposures to metal(s).
- Research on underlying diet quality and micronutrient sufficiency and the risk for metals toxicity.
- Research on the toxicity of metal-based engineered nanomaterials.

Mitochondrial Disease

- Research on the basic biology and physiology of mitochondria to better understand the pathology of primary mitochondrial diseases.
- Development of improved tools and animal models to study primary mitochondrial disease and evaluate therapeutics.
- Identification and testing of non-invasive techniques and biomarkers to monitor mitochondrial function, aid in diagnosis, and/or evaluate therapeutic efficacy.
- Research on novel and/or innovative treatments to alleviate symptoms or slow down the progression of mitochondrial diseases.

Musculoskeletal Disorders

- Research to increase understanding, diagnosis, prevention, and/or treatments of chronic overuse musculoskeletal disorders.
- Research on measures (e.g., clinical biomarkers, novel/innovative interventions, therapeutics) to diagnose, predict, reduce the incidence of, or optimize health outcomes in military training- and Service-related musculoskeletal disorders.
- Research on the validation and/or optimization of rehabilitation strategies for Service-related musculoskeletal disorders.
- Research to prevent, control, and/or optimize musculoskeletal health outcomes for work-related musculoskeletal disorders.
- Research on lower back pain strategies to prevent surgery and recurrence of symptoms, identify factors that predict optimal treatment response for different patients, and encourage self-management as a treatment.
- Research to determine whether tailored psychosocial education interventions are effective in improving psychological resilience to musculoskeletal pain.
- Research on standardized approaches for early identification and prevention of chronic musculoskeletal pain.

Nanomaterials for Bone Regeneration

- Research on nanomaterials-based methods to facilitate recruitment of endogenous cell populations for enhanced bone regeneration and osseointegration.
- Technologies addressing segmental/large bone defects in craniomaxillofacial and/or load-bearing regions.
- Development of controlled release/extended release of growth factors for bone regeneration.
- Development of technologies that repair the soft tissue envelope to enhance bone regeneration.

Non-Opioid Pain Management

- Research on pain management strategies for patients with limited access to skilled providers and resources, including battlefield, prolonged field, transport, and other resource-limited environments.
- Development of population-based outcomes, tools, and measures to evaluate the effectiveness of pain management approaches across time and environments.
- Research on treatments for chronic pain management, particularly in complex patients (i.e., chronic, high-utilization, polypharmacy patients).
- Research to increase understanding of and preventative treatments for conversion of acute to chronic pain.
- Research that provides evidence of which pain management strategies work for whom and under what conditions.
- Research to identify and address biopsychosocial aspects of pain to reduce or eliminate the use of opioid pain medication(s).

- Comparative studies evaluating the efficacy of different pain management strategies, including complementary and alternative medicine approaches.
- Identification and development of non-opioid pain management techniques that promote positive psychological health-related outcomes.
- Development of non-opioid pain medicine that can be given via inhalation or intramuscularly, submucosally, or intravenously on the battlefield to provide adequate relief of pain without affecting the cardiorespiratory systems.
- Research on case management strategies designed to optimize the effectiveness of pain clinics, support use of non-opioid pain therapies, and reduce dependence on opioid therapies.
- Research that will directly obtain an FDA analgesic indication for oral transmucosal or intramuscular ketamine.

Pancreatitis

- Retrospective studies to determine the risk and incidence of pancreatitis among former and current active duty personnel.
- Development and testing of novel and/or innovative therapeutics for acute and/or chronic pancreatitis.
- Research on the basic biology and physiology of the pancreas to better understand the etiology and pathology of pancreatitis.

Pathogen-Inactivated Dried Cryoprecipitate

- Development or validation of technology to produce pathogen-reduced dried cryoprecipitate in military or civilian donor centers that is acceptable for FDA licensure in support of combat or contingency operations.

Polycystic Kidney Disease

- Development of improved treatment strategies for polycystic kidney disease, including approaches to identify and monitor patients at higher risk for progressing to end-stage renal disease.
- Research on the underlying pathobiology and molecular mechanisms of polycystic kidney disease, including studies of genetic factors, cyst formation and growth, the role of cilia, and factors that modify disease progression and/or severity.
- Research on the lifestyle factors that may modify the progression of polycystic kidney disease.

Post-Traumatic Osteoarthritis

- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Research into cell-based approaches for treatment or prevention of post-traumatic osteoarthritis.
- Studies to evaluate and develop best practices for multidisciplinary team approaches and treatment algorithms for post-traumatic osteoarthritis.

- Development or validation of novel and/or innovative approaches to restoring joint stability after injury.
- Sustained release, intra-articular injectable steroidal, non-steroidal, or disease-modifying therapies that offer two or more months of symptomatic relief of pain and/or inflammation in a single injection.
- Research on therapies that target multiple phases of the cellular response pathways that are implicated in the development of post-traumatic osteoarthritis, including cell death, inflammation, matrix changes, and changes in catabolic and anabolic responses.
- Development and/or validation of predictive models for early onset post-traumatic osteoarthritis in extremity-injured patients for the purpose of tailoring rehabilitation programs toward prevention, delay, or mitigation of onset.

Pulmonary Fibrosis

- Retrospective studies to determine the risk and incidence of pulmonary fibrosis among military Service members, including Veterans.
- Identification of biomarkers of pulmonary injury or early predictors of interstitial lung disease.
- Research into the pathobiology and molecular mechanisms underlying the development of pulmonary fibrosis.
- Development and/or testing of novel and/or innovative treatments to delay or modify the progression of pulmonary fibrosis.
- Development and/or validation of improved tools and animal models to study pulmonary fibrosis and evaluate therapeutics.

Respiratory Health (excludes lung cancer and mesothelioma)

- Research on the causes, treatment, and prevention of chronic obstructive pulmonary disease (COPD), including identification and validation of biomarkers and disease phenotypes, as well as employing personalized medicine in clinical research and disease management.
- Research investigating the treatment of patients with chronic mild hypoxia.
- Research on the cause, treatment, and prevention of respiratory symptoms and ailments possibly associated with deployed and redeployed military personnel, including acute eosinophilic pneumonia, asthma, allergies, and other chronic lung diseases and breathing problems.
- Research to evaluate the impact of deployment on the prevalence and severity of respiratory disease in military Service members and Veterans.
- Development and/or validation of methods to detect volatile organic hydrocarbons from the breath of individuals exposed to toxic chemicals or other agents that can cause lung injury, which can be utilized for diagnosis and prognosis of lung injury or disease.
- Identification of biochemical, physiological, or combined biomarkers for evaluating risk or extent of injury from either acute or long-term toxic occupational or environmental exposures.

- Research investigating exposure rates, detection, and treatment of diseases related to inhalation of mold and fungi, such as coccidioidomycosis.

Rett Syndrome

- Identification and/or validation of novel and/or innovative biological targets for the treatment of Rett syndrome.
- Development and testing of interventions to improve the neurological symptoms of Rett syndrome.
- Research to understand the relationship between genetic mutations, physical traits, and symptoms in individuals with Rett syndrome.
- Research on the pathobiology of the MeCP2 gene and protein.
- Research to understand Rett syndrome's commonalities with and differences from classic autism and regressive autism.

Rheumatoid Arthritis

- Research to better understand the relationship between genetic risk and environmental triggers, such as infection or smoking, in developing rheumatoid arthritis.
- Studies that identify or validate biomarkers or personalized medicine strategies that allow for individualized medication choice based on the patient's underlying biology or disease state.
- Research on the long-term use of immunosuppressants in patients with rheumatoid arthritis and the likelihood of developing infections.
- Research to establish activity recommendations following joint replacement for maximal joint life.

Scleroderma

- Research on the molecular mechanisms and pathogenesis of scleroderma.
- Development and/or testing of novel and/or innovative therapies and identification of novel and/or innoavtive therapeutic targets in scleroderma.
- Research on biomarkers and other approaches to diagnose scleroderma, monitor disease progression, and/or assess response to treatment.
- Epidemiologic studies investigating the impact of localized scleroderma (morphea) on duty performance, use of personal protective equipment, and deployability.
- Research on the efficacy of newer immunosuppressive agents, including biologics and small molecule inhibitors, in the treatment of morphea and scleroderma (systemic sclerosis).
- Research on the efficacy of UVA1 for topical treatment in localized scleroderma and systemic sclerosis.

Sleep Disorders

- Research on how the disruption of normal sleep and circadian biological rhythms adversely affects the physical and psychological health, safety, performance, and productivity of military and civilian populations.
- Studies to assess sleep disturbance and clinical sleep disorders in female military personnel.

- Research on the association between sleep disorders and post-traumatic stress disorder, traumatic brain injury, depression, and/or anxiety and suicidal behaviors.
- Research to assess clinical algorithms that improve adherence to continuous positive airway pressure (CPAP).
- Investigations into non-CPAP-based treatment regimens that enhance readiness and deployability in active duty military personnel.
- Research focused on investigating how psychiatric disorders (post-traumatic stress disorder in particular), combined with the disruption/degradation of sleep quality, impact long-term physical health through changes in hormonal physiology.
- Development and/or testing of non-pharmacological treatments for sleep disorders.
- Research on the impact of sleep deprivation on the efficacy of psychological treatments for post-traumatic stress disorder, depression, and other mood disorders.
- Research on the prevention and/or mitigation of sleep disorders that are associated with long aeromedical evacuation flights for both clinical team members and patients.
- Development of tools and technologies that allow rapid and objective measurement of Service member performance in the face of fragmented sleep and/or sleep maintenance difficulty.
- Research examining the broader effects of Warfighters' sleep disorders on the sleep, behavioral health, and productivity of their family members, as well as the readiness of their military unit.

Spinal Muscular Atrophy

- Research into phenotyping the spinal muscular atrophy disease state.
- Research into which molecular deficiency imposed by a deficiency of SMN, a motor neuron protein, causes motor neuron deficits.
- Exploration of the form and function of SMN-depleted neuromuscular junctions at ultrastructural (e.g., dysregulation of endocytosis), transcriptomic, and proteomic levels, particularly the mildest SMN reduction that leads to consistent quantifiable motor neuron loss.
- Research to find non-SMN-altering spinal muscular atrophy modifying genes in cellular, small animal, and human models that may lead to identification of novel and/or innovative therapeutic targets.
- Research to further understand SMN gene regulation and post-transcriptional mechanisms leading to synergistic SMN-repleting approaches, as well as to determine whether boosting SMN induction maximizes efficacy.
- Research to determine whether SMN can be repleted to physiologic levels in all cells in the spinal muscular atrophy model immediately post-natally and whether there is a limit to the therapeutic response.
- Clinical research to determine what clinical findings persist even with treatment; whether these findings are related to drug timing, dosage, biodistribution, or a combination of factors; and whether these factors are modifiable.

- Research involving dietary/nutritional studies in spinal muscular atrophy to identify the optimal anabolic diet.
- Research to determine mitochondrial involvement and astrocytic and other non-neuronal contributions to motor neuron vulnerability.

Sustained-Release Drug Delivery

- Development of technology that can provide a sustained-release delivery of drugs for a minimum of 1 week or more. Potential applications of this technology could include long-acting therapies for post-traumatic stress, opiate dependence, low-dose pain control, allergies, attention deficit/hyperactivity disorder, chemoprophylaxis, and other conditions.
- Research into the use of printable, sustained-release scaffolds for predictable delivery of prescription and non-prescription medications.
- Research into novel and/or innovative approaches to developing bioavailable and sustained-release oral formulations of intravenous broad-spectrum fungicidal and anti-microbial medications.

Tinnitus

- Research to understand the mechanisms of tinnitus, its relationship to noise-induced hearing loss, and progression to chronic tinnitus, with the focus on developing interventions for tinnitus.
- Research to increase knowledge of the prevalence, incidence, natural history, and occupational and sex-related differences of tinnitus and its possible relation to individual blast/noise exposures.
- Research to understand the operational readiness impacts of tinnitus on the military.
- Development and validation of objective tools/methods to diagnose and characterize tinnitus (e.g., imaging techniques to identify functional and structural changes in the brain, biomarkers of resiliency, and susceptibility to tinnitus).
- Identification of novel and/or innovative therapies for interventions to prevent, manage, and treat tinnitus, including behavioral approaches, new uses for existing drugs, nutritional and pharmaceutical strategies, and acoustic, electrical, and other stimulation technologies.

Tuberculosis

- Development of a diagnostic assay that can be used at the point of care to rapidly and accurately diagnose tuberculosis.
- Development of novel and/or innovative tuberculosis vaccines or optimization of current tuberculosis vaccines.
- Identification and/or validation of biomarkers that can be used to assess vaccine efficacy and protection against tuberculosis disease.
- Research to understand, diagnose, or treat multi-drug-resistant tuberculosis or extensively drug-resistant tuberculosis.
- Research to determine the appropriate precautions to use for transport of active tuberculosis patients.

- A sustained release formulation of anti-tuberculosis drugs that would facilitate long-term treatment and reduce the emergence of resistance due to poor compliance.

Vaccine Development for Infectious Disease

- Development of a therapeutic vaccine and/or other strategies to achieve HIV remission.
- Evaluation of passive immunization strategies to use in conjunction with dengue and Zika vaccinations.
- Research leading to a better understanding of the immune mechanisms involved in clearance of the dengue and Zika viruses and the mechanisms of immune enhancement that lead to more severe clinical disease.
- Development of flexible vaccine technologies that can be used to rapidly respond to emerging and re-emerging infectious diseases threats.
- Evaluation of humoral and cellular immune responses after vaccination compared to natural infection.
- Development of a safe, effective dengue human challenge model for clinical trials.
- Development of a non-human primate model to study Zika virus-induced microcephaly/fetal neuropathology as a tool to measure the safety and efficacy of vaccines and antivirals.
- Development and fielding of vaccines to prevent U.S. Service members from becoming ill from endemic disease exposure during operational deployments. This includes, but is not limited to, arthropod-borne diseases (Zika virus, dengue, chikungunya, hantavirus hemorrhagic fever with renal/pulmonary syndrome, rickettsioses, and trypanosomiasis), leptospirosis, HIV, norovirus, Middle East Respiratory Syndrome coronavirus, schistosomiasis, leishmaniasis, Nipah virus, Lassa fever, and West Nile fever.

Vascular Malformations

- Studies into the natural history, genetics, and pathogenesis of vascular malformations.
- Research to discover or develop novel and/or innovative therapeutic targets and treatments to regress or prevent vascular malformations.
- Research to improve methods to diagnose and manage vascular malformations.
- Development of non-invasive or minimally invasive technologies or approaches for the control of internal bleeding associated with vascular malformations.
- Studies to identify risk and/or establish standard practices for the treatment of hemorrhage from brain arteriovenous malformations.
- Research on the prevention or treatment of complications associated with vascular malformations such as pain, infection, seizures, tissue breakdown, tissue overgrowth, or airway obstruction.
- Studies to elucidate the progression of vascular malformations in disease-in-a-dish/microfluidic models for the purpose of identifying novel and/or innovative drug targets, screening existing drugs, and/or elucidating the pathogenesis of the disease.

Women's Heart Disease

- Retrospective studies to determine the risk and incidence of heart disease among former and current female active duty personnel, including Reservists and National Guard members.
- Research focused on elucidating the potential relationship between post-traumatic stress disorder and women's heart disease.
- Identification of sex-specific approaches to increase the effectiveness of diagnosis, treatment, and/or cardiac rehabilitation programs.
- Research on factors to predict and prevent the long-term impacts of gestational diabetes, gestational hypertension, and preeclampsia on the cardiovascular health of women.
- Research on trauma-induced cardiac arrest secondary to hemorrhage and polytrauma in the female population.

APPENDIX 3
DOD AND VA WEBSITES

PIs are encouraged to integrate and/or align their research projects with Department of Defense (DoD) and/or Department of Veterans Affairs (VA) research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. Below is a list of websites that may be useful in identifying additional information about DoD and VA areas of research interest, ongoing research or potential opportunities for collaboration within the FY17 PRMRP Topic Areas.

RENAISSANCE®
CHICAGO O'HARE SUITES HOTEL

8500 West Bryn Mawr Ave
Chicago, IL 60631
(773) 380-9600

HOW TO GET TO THE CHICAGO RENAISSANCE O'HARE SUITES HOTEL:

BUS/SHUTTLE FROM O'HARE INT'L AIRPORT: From your gate go to Baggage Claim. Follow the signs labeled "Bus/Shuttle Center" to the nearest underground pedestrian walkway. In the elevator press the Bus/Shuttle Center button. Once in the center, wait by Door 2. The vans arrive every 30 minutes between 6:00am-11:00pm. Beyond then, to request pickup, please call the hotel at ***773/380-9600***. ******Please note when guest arrive in the International Terminals and need shuttle transportation they must call for pick-up the shuttle bus does not run in that area, guests may utilize the courtesy phone at 5E and a shuttle will be dispatched******

DRIVING FROM O'HARE INT'L AIRPORT: Take I-90 East, exit at Cumberland Ave South. Turn right at West Bryn Mawr Ave. The hotel is a ½ mile down on your right midway down the block.

DRIVING FROM MIDWAY AIRPORT: Go North on Cicero Avenue to I-55 South to I-294 North. Remain on I-294 North to I-90 Ease (toward Chicago not O'Hare). Exit at Cumberland Ave South. Turn right at West Bryn Mawr Ave. The hotel is a ½ mile down on your right midway down the block.

DRIVING FROM DOWNTOWN CHICAGO (EAST): Take the Kennedy Expressway (I-90 West) towards O'Hare. Exit at Cumberland Ave South. Merge over to the far right lane. The next light is Bryn Mawr. Turn right at West Bryn Mawr Ave. The hotel is a ½ mile down on your right midway down the block.

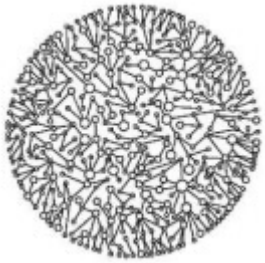
DRIVING FROM THE WEST: Take the Northwest Tollway (I-90 East) past O'Hare International Airport. Exit at Cumberland Ave South. Turn right at West Bryn Mawr Ave. The hotel is a ½ mile down on your right midway down the block.

DRIVING FROM THE NORTH: Take the Tri-State (I-294 South) to I-90 East (toward Chicago: not O'Hare). Exit at Cumberland Ave South. Turn right at West Bryn Mawr Ave. The hotel is a ½ mile down on your right midway down the block.

DRIVING FROM THE SOUTH: Take the Tri-State (I-294 North) to I-90 East (toward Chicago: not O'Hare). Exit at Cumberland South. Turn right at West Bryn Mawr Ave. The hotel is a ½ mile down on your right midway down the block.

Annual Programmatic Meeting

National Institute of Allergy and Infectious Diseases (NIAID)
Systems Biology for Infectious Diseases (SBID) Research
May 7th – 10th, 2017
Renaissance Chicago O'Hare Suites



INSTRUCTIONS FOR SPEAKERS

The organizers sincerely appreciate your participation in this meeting. Due to the high level of interest in this meeting and the sizeable number of speakers on the agenda, it is very important that you plan your presentation (including transition to and from the lectern and time for questions) to fit within your allotted time. Session chairs have been asked to keep the presentations on schedule and may curtail your presentation if it exceeds the allotted time.

LOGISTICS

Prior to Your Talk

1. Slides must be saved in either **PowerPoint** or **PDF** format.
2. **All presentations must be saved on a memory stick and loaded onto the presentation laptop before 8:30 am CDT on the morning of the presentation.** The presentation laptop will be available in the Renaissance Ballroom during the Welcome Reception on Sunday evening (6:00 pm – 7:30 pm CDT, May 7th); from 7:30 am – 8:15 am CDT each day of the meeting (May 8th – May 10th); or during any lunch, dinner or refreshment break.

Day of Your Talk

3. Please be in **Renaissance Ballroom** at least 5 minutes before the start of your session.
4. At the beginning of your session, the session Chair(s) will stand at the lectern, introduce herself/himself, and announce the title of the session.
5. PLENARY SESSION SPEAKERS: Session Chair(s) will introduce you and your presentation title before the start of your talk.
6. FLASH PRESENTATION SPEAKERS: Given the very short length of Flash Presentation talks, speakers should plan to introduce yourself and your presentation title.

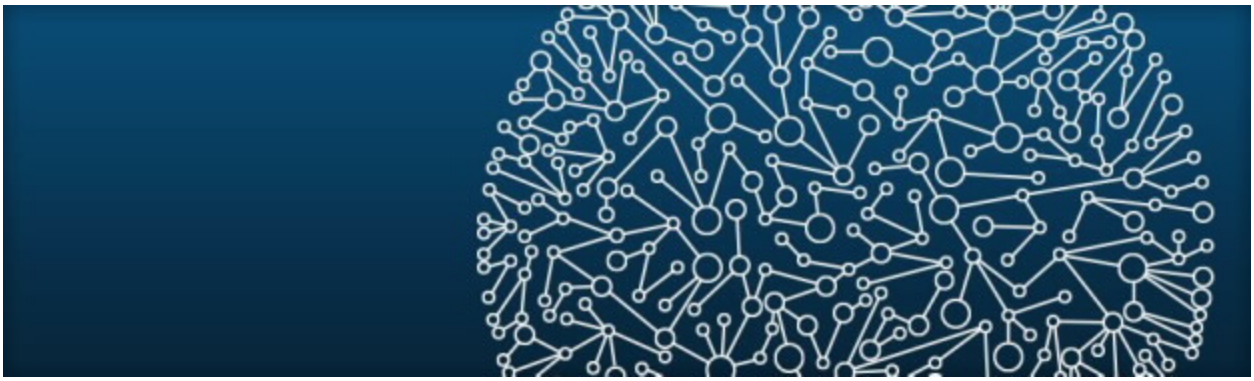
During Your Talk

7. If you experience problems accessing your slides, the moderator and/or a technical support staff member will be available to assist you.
8. **We ask that you please adhere strictly to the time allotted for your presentation.** Chair(s) will time each presentation and will notify you when 5 minutes are remaining (Plenary Session speakers only).
9. Your presentation will be projected (by a laptop connected to a projector) onto a single screen adjacent to the lectern. You will operate the laptop and advance the slides.
10. A laser pointer will be provided to help you emphasize key points.
11. If time remains at the conclusion of your talk, the Chair will open the floor for questions and/or discussion.

After Your Talk

12. Return to your seat and be ready to return to the stage at the end of the session.
13. At the end of the session, return to the stage for a panel discussion and Q&A.

If you have any questions, please do not hesitate to contact
Amie Eisfeld (amie.eisfeld@wisc.edu) or Amy Kuehn (aeschuster@wisc.edu).



Annual Programmatic Meeting

National Institute of Allergy and Infectious Diseases (NIAID)
Systems Biology for Infectious Diseases (SBID) Research

May 7-10, 2017
Chicago, IL

Meeting Information and Abstract Book

General Information

Venue
Renaissance Chicago O'Hare Suites
8500 West Bryn Mawr Avenue
Chicago, Illinois 60631 USA
Phone: +1-773-380-9600
http://www.marriott.com/hotels/travel/chibr-renaissance-chicago-ohare-suites-hotel/

Airport Shuttle
From your gate, go to Baggage Claim. Follow the signs labeled "Bus/Shuttle Center" to the nearest underground pedestrian walkway. In the elevator press the Bus/Shuttle Center button. Once in the center, wait by Door 2. The vans arrive every 30 minutes between 6:00 am and 11:00 pm. Beyond then, to request pickup, please call the hotel at 773-380-9600.

Meeting Location
Renaissance Ballroom

Registration
Please stop at the Registration Table in front of the Renaissance Ballroom on Sunday Evening during the Welcome Reception (6:00 pm – 7:30 pm) or any other time during the meeting.

Internet Access
Wi-Fi login credentials will be made available to all meeting participants for use in the Renaissance Ballroom.

Presenters
Presentations should be saved on a memory stick and loaded onto the presentation laptop by 8:30 am on the morning of the presentation.

Posters
The Poster Session will be held in the Renaissance Ballroom on Tuesday afternoon. Participants are encouraged to hang posters upon arrival on Sunday or Monday. Poster numbers are indicated in the table on page 74.

Happy Hour
The hotel hosts a happy hour on Monday through Thursday evenings (5:30 pm – 7:30 pm) in the hotel lobby. Complimentary cocktails are available.

Agenda

Sunday, May 7, 2017	
Time	**Agenda Item**
01:00 pm - 06:00 pm	Arrival and Check-In
06:00 pm - 07:30 pm	**Welcome Reception**

Monday, May 8, 2017	
Time	**Agenda Item**
07:30 am - 08:30 am	**Breakfast**

WORKSHOP - Modeling and Data Dissemination Working Groups

08:30 am - 09:25 am	Modeling Case Study 1 Christian Forst (FluDyNeMo) and Richard Scheurmann (ViPR/IRD)
09:25 am - 10:20 am	Modeling Case Study 2 Katrina Waters (OMICS-LHV) and Chris Plaisier (OMICS4TB)
10:20 am - 10:30 am	**Refreshment Break**
10:30 am - 10:45 am	Data Dissemination Updates: PATRIC + OMICS4TB
10:45 am - 11:15 am	Data Dissemination Updates: ViPR/IRD + FluDyNeMo, FluOMICS, OMICS-LHV
11:15 am - 11:30 am	Data Dissemination Updates: EuPath + MaHPIC
11:30 am - 12:00 pm	Discussion of the potential for joint publication(s) on data and model sharing by the SysBio Centers and BRCs
12:00 pm - 01:00 pm	**Lunch**

OPENING REMARKS

01:00 pm - 01:05 pm	Welcome and Meeting Overview Yoshi Kawaoka (OMICS-LHV)
01:05 pm - 01:30 pm	NIAID Overview: Accomplishments and Future Directions of the Systems Biology Program Marciela DeGrace (NIAID)

Monday, May 8, 2017 (cont.)	
Time	**Agenda Item**
PLENARY SESSION 1 - Progress Overviews - Virology Centers	
01:30 pm - 02:00 pm	OMICS-LHV Yoshi Kawaoka
02:00 pm - 02:30 pm	Fluomics Adolfo Garcia-Sastre
02:30 pm - 03:00 pm	FluDyNeMo Elodie Ghedin
03:00 pm - 03:30 pm	**Refreshment Break**
PLENARY SESSION 2 - Progress Overviews - Malaria and TB Centers	
03:30 pm - 04:00 pm	MaHPIC Mary Galinski and Jessie Kissinger
04:00 pm - 04:30 pm	OMICS4TB David Sherman
04:30 pm - 04:45 pm	**Panel-Led Discussion for All Centers**
PLENARY SESSION 3 - Research Highlights: Extended Talks - Part 1 **Moderators: Andrew Patterson and Brian Brunk**	
04:45 pm - 05:05 pm	Trim14 Mediates the Innate Immune Response to SARS-CoV Infection Lisa Gralinski (OMICS-LHV)
05:05 pm - 05:25 pm	Systems-based analysis of RIG-I-dependent signaling identifies KHSRP as an inhibitor of RIG-I receptor activation Sumit Chanda (FluOMICS)
05:25 pm - 05:45 pm	A blood-based transcriptional signature in a novel murine tuberculosis model predicts risk of human tuberculosis progression Kevin Urdhal (OMICS4TB)
05:45 pm - 06:00 pm	**Panel-Led Discussion**
06:00 pm - 08:00 pm	**Dinner**

Tuesday, May 9, 2017	
Time	**Agenda Item**
07:30 am - 08:30 am	**Breakfast**

PLENARY SESSION 4 - Research Highlights: Extended Talks - Part 2
Moderators: Raul Andino and Michelle Schwalbe

08:30 am - 08:50 am	Glycomic Analysis of Host-Response Reveals New Potential Mechanisms Governing Severity Lara Mahal (FluDyNeMo)
08:50 am - 09:10 am	A TRIP into the Wilds of TB Pathogenesis Tige Rustad (OMICS4TB)
09:10 am - 09:30 am	The nuclear RNA exosome is co-opted to enhance host:viral RNA hybrids that propel influenza virus ribogenesis and infectivity Ivan Marazzi (FluOMICS)
09:30 am - 09:50 am	Global Mapping of Molecular Networks Revealed by Integrative Omics Analysis Highlights Potential Mechanisms in a Non-Human Primate Model of Malaria Mark Styczynski (MaHPIC)
09:50 am - 10:15 am	**Panel-Led Discussion**
10:15 am - 10:40 am	**Refreshment Break**

PLENARY SESSION 5 - Pilot, Supplement and Collaborative Project Highlights - Part 1
Moderators: Andy Pekosz and Michael Zhang

10:40 am - 10:55 am	Human Ebola Virus Disease Pathogenesis Revealed by Multi-Platform 'Omics Analysis Amie Eisfeld (OMICS-LHV)
10:55 am - 11:10 am	A Comparative Study of Molecular Responses to Influenza Infection in Mice, Ferrets and Humans Christian Forst (FluDyNeMo)
11:10 am - 11:25 am	A Novel Method for tracking Host Transcriptome Stability in the Context of an Active Viral Infection Kris White (FluOMICS)
11:25 am - 11:40 am	Multi-omics signatures of disease progression and protective immunity in RhCMV/MTB-vaccinated macaques after MTB challenge Daniel Zak (OMICS4TB)
11:40 am - 12:00 pm	**Panel-Led Discussion**
12:00 pm - 01:00 pm	**Lunch**

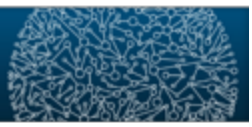
Tuesday, May 9, 2017 (cont.)	
Time	**Agenda Item**
PLENARY SESSION 6 - Research Highlights: Short Talks (selected from poster abstracts) **Moderators: Michael Gribskov and Shannon McWeeney**	
01:00 pm - 01:15 pm	Modeling host-parasite blood-stage interactions in malaria-infected rhesus macaques Luis Fonseca (MaHPIC)
01:15 pm - 01:30 pm	Lipid Signatures of Survival in Humans Infected with Ebola Virus during the Sierra Leone Outbreak Jennifer Kyle (OMICS-LHV)
01:30 pm - 01:45 pm	Microbial community composition and functions in the nasopharynx of patients infected with influenza viruses Lingdi Zhang (FluDyNeMo)
01:45 pm - 02:00 pm	Systematic Assessment of Drug Susceptibility in *Mycobacterium tuberculosis* Shuyi Ma (OMICS4TB)
02:00 pm - 02:15 pm	High-resolution metabolomics of plasma from human malaria cases reveals differences based on stage and species of the malaria parasite Regina Joice Cordy (MaHPIC)
FLASH PRESENTATIONS FROM POSTERS	
02:15 pm - 02:17 pm	Transcription factor induction in *Mycobacterium tuberculosis* identifies infection stress phenotypes Marshall J Davis (OMICS4TB)
02:17 pm - 02:19 pm	Single-cell analyses reveal the effects of cell cycle on influenza virus replication Chang Wang (FluDyNeMo)
02:19 pm - 02:21 pm	Identification and Analysis of Ebola Virus and Host Protein Interactions Danielle Westhoff-Smith (OMICS-LHV)
02:21 pm - 02:23 pm	A Multi-Omic Data Analysis Platform for Mining & Visualization of Host-Viral Response Lindsey Anderson (OMICS-LHV)
02:23 pm - 02:25 pm	Destroying the “Non-self”: Defining Influenza A Viral Endonuclease Mechanisms for Host Shutoff Kelsey Haas (FluOMICS)
02:25 pm - 02:27 pm	Analysis of Multi-omics Datasets Using Human Genome-Scale Metabolic Network Mingyuan Tian (OMICS-LHV)
02:27 pm - 02:29 pm	Effects of Influenza Infection on the Respiratory Mycobiome in Ferrets Yixuan Ma (FluDyNeMo)
02:29 pm - 02:31 pm	Modeling the Interplay between Viral Replication, Immune Response and Pathogenic Outcomes in the Mouse Lung Paritosh Pande (OMICS-LHV)

Tuesday, May 9, 2017 (cont.)	
Time	**Agenda Item**
FLASH PRESENTATIONS FROM POSTERS	
02:31 pm - 02:33 pm	RNAi Screen to Identify Ebola-Host PPI Partners Modulating Host Cell Responses Makoto Kuroda (OMICS-LHV)
02:33 pm - 02:35 pm	Universal full-length genomic amplification of Zika virus facilitates sequencing and reverse genetics Tsui-wen Chou (FluDyNeMo)
02:35 pm - 02:37 pm	A system-level transcriptional regulatory model reveals regulation underlying intracellular growth of *Mycobacterium tuberculosis* Eliza Peterson (OMICS4TB)
02:37 pm - 02:39 pm	Compounds Identified by a System Biology Approach Regulate the Pathogenicity of Influenza A Virus Shufang Fan (OMICS-LHV)
02:39 pm - 02:41 pm	Comprehensive Pan-Virus, Pan-OMICS Data Analysis for Discovery of Common and Unique Host Responses Hugh Mitchell (OMICS-LHV)
02:45 pm - 03:15 pm	**Panel-Led Discussion**
03:15 pm - 05:00 pm	**POSTER SESSION** **Refreshment Break**
PLENARY SESSION 7 - Modeling and Data Working Groups: Summary of Activities	
05:00 pm - 05:20 pm	Modeling Summary
05:20 pm - 05:40 pm	Data Dissemination Summary
05:40 pm - 06:00 pm	**Panel-Led Discussion**
06:00 pm - 08:00 pm	**Dinner**

Wednesday, May 10, 2017	
Time	**Agenda Item**
07:30 am - 08:30 am	**Breakfast**
PLENARY SESSION 8 - Pilot, Supplement and Collaborative Project Highlights - Part 2 **Moderators: Stephen Smale and Michael Gillette**	
08:30 am - 08:45 am	Host transcription and genome 3D structure perturbation by influenza A NS1 protein Sven Heinz (FluOMICS)
08:45 am - 09:00 am	Discovery of network motifs mediating the transition to dormancy in *Mycobacterium tuberculosis* Eliza Peterson (OMICS4TB)
09:00 am - 09:15 am	The Epigenetic Landscape during Coronavirus Infection Alexandra Schafer (OMICS-LHV)
09:15 am - 09:30 am	Deciphering influenza virus-host interactions using single-cell RNA sequencing Bin Zhou (FluDyNeMo)
09:30 am - 09:45 am	*Plasmodium knowlesi* – Macaque Infection Models and Systems Biology Mary Galinski (MaHPIC)
09:45 am - 10:00 am	**Panel-Led Discussion**
10:00 am - 10:20 am	**Refreshment Break**
PLENARY SESSION 9 - Research Highlights: Extended Talks - Part 3 **Moderators: Ishwar Chandramouliswaran and Richard Scheuermann**	
10:20 am - 10:40 am	Influenza virus networks of pathogenesis inferred from the integration of multiple large-scale datasets David Jimenez-Morales (FluOMICS)
10:40 am - 11:00 am	Multi-omics modeling of different clinical manifestation of *Plasmodium vivax* infection Shuzhao Li (MaHPIC)
11:00 am - 11:20 pm	Integration of Transcriptomic, Epigenetic and Glycomic Data in Ferret Models of Influenza Infection Reveals Coordinated Molecular Responses Elodie Ghedin (FluDyNeMo)
11:20 am - 11:35 am	**Panel-Led Discussion**
11:35 am - 12:00 pm	Final Remarks
12:00 pm - 1:00 pm	**Lunch**

Wednesday, May 10, 2017 (cont.)	
Time	**Agenda Item**
EXECUTIVE SESSION	
01:00 pm - 2:30 pm	NIAID personnel, Steering Committee members, and SB Center PIs and PMs
CLOSED SESSION	
02:30 pm - 4:00 pm	NIAID personnel and Steering Committee members

Plenary Session Abstracts



Note: Abstracts for each Plenary Session are listed in the order they appear in the agenda.

PLENARY SESSION 3
Presentation Type: Research Highlight Talk
Center: OmicsLHV

Trim14 Mediates the Innate Immune Response to SARS-CoV Infection

Lisa E. Gralinski[1], Vineet D. Menachery[1], Jacob Kocher[1], Michael S. Diamond[2], Yoshihiro Kawaoka[3] and Ralph S. Baric[1]

[1]Department of Epidemiology, University of North Carolina at Chapel Hill, Chapel Hill, NC, USA; [2]Washington University School of Medicine, St. Louis, MO 63110, USA; [3]Department of Pathobiological Sciences, University of Wisconsin-Madison, Madison, WI, 53711, USA

Identifying host factors important for viral pathogenesis may reveal new targets for antiviral treatment. Members of the tripartite motif (TRIM) family of proteins play important roles in innate immunity and antiviral defenses to a broad range of viruses. We identified TRIM14 as an interferon stimulated gene based in IFN-beta treatment of Calu3 airway epithelial cells. TRIM14 expression increased over time in Calu3 cells infected with Severe Acute Respiratory Syndrome (SARS) Coronavirus but decreased in cells infected with Middle East Respiratory Syndrome (MERS) Coronavirus. Expression is also upregulated in the lungs of SARS-CoV infected mice in a dose-dependent manner. We next examined the potential antiviral role of TRIM14 by examining its effect on SARS-CoV and MERS-CoV virus replication. siRNA knockdown of TRIM14 resulted in a modest decrease in SARS-CoV titer at 24 hours post infection but no change in MERS-CoV titers. To examine the role of this gene in and *in vivo* infection, CRISPR/Cas9-mediated TRIM14 knockout mice were generated on a C57BL/6J background and infected with SARS-CoV. Knockout mice were more susceptible to SARS-CoV infection as measured by increased weight loss and higher titers in the lung at days two and four post infection. Importantly, TRIM14 knockout mice had lower levels of MCP-1/CCL2, G-CSF and RANTES/CCL5 proteins in their lungs than C57BL/6J control mice at two days post infection. Together these data indicate that the host anti-viral response to SARS-CoV infection is impaired in the absence of TRIM14, possibly due to impaired NF-kB signaling.

PLENARY SESSION 3
Presentation Type: Research Highlight Talk
Center: FluOmics

Systems -based analysis of RIG -I-dependent signaling identifies KHSRP as an inhibitor of RIG -I receptor activation

Stephen Soonthornvacharin [1,2,3], Ariel Rodriguez -Frandsen1 [,2], Yingyao Zhou [4], Felipe Galvez [1,2], Nicholas J. Huffmast er[1,2], Shashank Tripathi [5,6], Vinod R. M. T. Retinoic acid -inducible gene I (RIG -I) receptor recognizes 5′ -triphosphorylated RNA and triggers a signaling cascade that results in the induction of type -I interferon (IFN) - dependent responses. Its precise regulation represents a pivotal balance between antiviral defenses and autoimmunity. To elucidate the cellular cofactors that regulate RIG -I signaling, we performed two global RNA interference analyses to identify both positive and negative regulatory nodes operating on the signaling pathway during virus infection. These factors were integrated with e xperimentally and computationally derived interactome data to build a RIG -I protein interaction network. Our analysis revealed diverse cellular processes, including the unfolded protein response, Wnt signaling and RNA metabolism, as critical cellular compo nents governing innate responses to non -self RNA species. Importantly, we identified K -Homology Splicing Regulatory Protein (KHSRP) as a negative regulator of this pathway. We find that KHSRP associates with the regulatory domain of RIG -I to maintain the r eceptor in an inactive state and attenuate its sensing of viral RNA (vRNA). Consistent with increased RIG -I antiviral signaling in the absence of KHSRP, viral replication is reduced when KHSRP expression is knocked down both in vitro and in vivo. Taken tog ether, these data indicate that KHSRP functions as a checkpoint regulator of the innate immune response to pathogen challenge. The authors acknowledge support from the National Institutes of Health (U19 AI106754 and P50 GM085764).

A blood-based transcriptional signature in a novel murine tuberculosis model predicts risk of human tuberculosis progression

Courtney Plumlee, Jared Delahaye, Sara Cohen, Benjamin Gern, Jackie Braun, Jessica Farrow-Johnson, Tige Rustad, David Sherman, Daniel Zak, and Kevin Urdahl

Center for Infectious Disease Research (formerly Seattle Biomedical Research Institute), Seattle, Washington

Tuberculosis (TB) is a highly heterogeneous human disease that develops in some, but not all, individuals who inhale aerosolized water droplets containing small numbers of *Mycobacterium tuberculosis* (Mtb). Using advanced machine-learning algorithms, we discovered a blood transcriptional signature that identifies Mtb-exposed individuals in the process of progressing to active TB up to 18 months before they exhibit clinical symptoms. This signature may help prevent TB disease by identifying high risk individuals who could benefit from early intervention, but is limited because it fails to identify ~30% of TB progressors and does not reveal insights into the diverse outcome-governing pathways within the Mtb-infected lung that underlie TB progression. To develop a tractable system that would enable blood-based signatures to be linked to mechanistic pathways occurring within the lung, we pioneered a novel murine TB model that recapitulates key aspects of human Mtb infection. We find that mice infected with a physiologic, ultra-low dose (ULD) (i.e., 1-3 CFUs) of aerosolized Mtb exhibit a broad range of outcomes, with bacterial burdens ranging from less than 10 to ~10^6 CFUs within individual lungs. Mice that contain Mtb exhibit Mtb well-circumscribed granulomatous structures that share many features with human Mtb granulomas. Furthermore, we have identified two distinct early blood transcriptional signatures that distinguish “controller” and “progressor” mice. Remarkably, these mouse-derived signatures predict TB risk in human populations as well as our previously identified human-derived signature, confirming the model’s relevance to human disease. This finding brings the unmatched tools and tractability of the mouse system to bear on questions central to TB pathogenesis in a clinically relevant model. This project was funded in part with funds from the National Institute of Allergy and Infectious Diseases, National Institutes of Health, grant U19AI106761.

Influenza is a major public health concern, causing an annual death rate of about 7.5% in the United States together with pneumonia (www.cdc.gov/flu/weekly/nchs.htm). Clinical outcomes of influenza vary significantly ranging from mild infections treatable at home to severe infections leading to hospitalization and death. The major molecular drivers of specific influenza outcomes are not known. Influenza infection is initiated in the upper airway through adhesion of viral hemagglutinin (HA) to specific glycan receptors found on the surface of the upper respiratory tract (α2,6-linked sialic acids in humans and ferrets). Propagation of the virus requires cleavage from sialic acid containing receptors through expression of a sialidase (neuraminidase), the current target of anti-viral therapies. Glycosylation patterns are not static, although there is limited data on how glycosylation changes post-infection. Using a ferret model, we identified specific glycan changes that map onto the pathology of influenza with our lectin microarray analysis. We discovered that high mannose levels vary significantly among uninfected, moderately, and severely infected ferret samples. This motif represents a new infection associated molecular pattern on host cells, which may guide immune responses via the lectin-mediated complement system (MBL2), leading to the immune storm associated with severity.

A TRIP into the Wilds of TB Pathogenesis

Tige Rustad[1], Jessica Farrow-Johnson[1], Jenny Lohmiller[1], David Sherman[1,2]

[1]Center for Infectious Disease Research, Seattle, WA; [2]Department of Pathobiology, University of Washington, Seattle, Washington

M. tuberculosis adapts to the shifting micro-environmental stresses encountered during infection by triggering nuanced bacterial responses that are primarily mediated through a complex network of transcriptional changes. To design more effective TB therapies, we must understand the systems-scale consequences of these stress response networks under different conditions. One way to probe the function and control of these adaptations is by perturbing the transcription factors (TFs) that translate environmental signals into transcriptional responses that have evolve to generate adaptive phenotypes. To do this we have developed a novel **T**F- **r**egulon **i**nduction **p**henotypic (TRIP) screen to identify MTB regulons that influence clinically relevant bacterial phenotypes. In combination with a previously generated transcriptional regulatory network, TRIP screens have identified bacterial regulons critical for growth and survival in the mouse lung. To confirm that these phenotypes are specific to adaptation to the host we assessed the phenotype of these TFs in log phase in vitro culture and found twelve TFs with a log or greater larger defect in the mouse. We expect that integrating stress response phenotypes with TFs and their gene networks at a genome-scale will advance efforts to understand TB pathogenesis and develop faster acting interventions.

The nuclear RNA exosome is an essential multi-subunit complex that controls RNA homeostasis. Congenital mutations in exosome genes are associated with neurodegenerative diseases. Here, we show that transient depletion of nuclear RNA exosome subunits in epithelial cells inhibits influenza virus replication. Similarly, viral biogenesis was suppressed in cells derived from mice with conditional ablation of the RNA exosome subunit Exosc3. Furthermore, patient-derived cells with a congenital EXOSC3 mutation were less susceptible to influenza virus infection. Using proteomics and next generation sequencing during infection, we show that the viral polymerase complex (PA, PB2, PB1) co-opts the nuclear RNA exosome complex and cellular RNAs en route to 3' end degradation. Mechanistically, the nuclear RNA exosome coordinates the initial steps of viral transcription with RNAPII at host promoters. Exosome deficiency uncouples chromatin targeting of the viral polymerase complex and the formation of cellular:viral RNA hybrids, which are essential RNA intermediates that license transcription of antisense genomic viral RNAs.

Overall, we discovered a critical nexus between an essential component of the influenza virus (polymerase) and an essential component of the cell (exosome), alteration of which leads to breakage of host-pathogen symmetry and a lose-lose scenario (viral impairment and neurodegeneration).

Global Mapping of Molecular Networks Revealed by Integrative Omics Analysis Highlights Potential Mechanisms in a Non-Human Primate Model of Malaria

Mark Styczynksi

Malaria is a complex disease affecting multiple organs, and the systemic host response to the disease is not well-understood on a molecular level; hence, unveiling mechanisms across molecular layers is crucial for systematically characterizing pathology in affected organs. Here, we report an integrative analysis of transcriptomics, metabolomics, and lipidomics in peripheral blood (PB) and in bone marrow (BM) using a Non-Human Primate (NHP) animal model infected with *Plasmodium cynomolgi* (a model for *Plasmodium vivax* infection in humans) over 100 days. We developed a framework to integrate multiple longitudinal "omics" data types that accounts for potential nonlinear relationships among the heterogeneous data types using a mutual information-based machine learning approach. An atlas of tissue-specific (PB and BM) network modules of malaria was generated. These modules implicated the mTOR pathway and PD1 as being involved in the host response; correlation of these modules with immunological profiles and clinical traits identified associations to a distinct subset of immune cells. These results were corroborated by the analysis of transcriptional and metabolic data from an infection of the same host organism by a different malaria parasite, as well by the analysis of existing transcriptional data for human malarial infections. Importantly, some of the findings identified by this integrative approach were too weak to detect with analyses of the individual omics datasets, highlighting the utility of our integrative approach. To our knowledge, this is the first report of large-scale, longitudinal multi-omics experimental datasets generated using a NHP malaria model. This global multi-omics map of malaria pathology provides a unique resource for malaria study, and illustrates the power of integrative multi-omics analysis to characterize key processes in malaria.

Ebola virus (EBOV) causes high mortality in humans, yet the mechanisms of EBOV disease (EVD) pathogenesis remain ill-defined. To clarify how host responses contribute to EVD, we performed multi-platform 'omics analysis of peripheral blood mononuclear cells and plasma from EVD patients. Our results indicate that EVD signatures overlap with those of sepsis, suggest that pancreatic enzymes contribute to tissue damage in fatal EVD, and show that EBOV infection induces aberrant neutrophils whose activity may explain hallmarks of fatal EVD. Moreover, integrated biomarker prediction identified putative biomarkers from different platforms that differentiated survivors and fatalities early after infection. This work reveals novel insights into EVD pathogenesis, suggests an effective approach for biomarker identification, and provides an important community resource for further analysis of human EVD severity. This project was funded in part by an administrative supplement to grant U19AI106772, provided by the National Institute of Allergy and Infectious Diseases, National Institutes of Health.

[6]Center for Genomics & Systems Biology, Department of Biology, and College of Global Public Health, New York University, NY*

Influenza A viruses infect a number of mammalian hosts, but not all respond similarly to the infection. To better understand the core molecular responses and identify unique aspects in each species, we performed a comparative study of the transcriptomic data derived from human blood cells, human primary epithelial cells, ferret blood and lung tissues, and mouse lung tissues infected with influenza A virus. Differential expression analysis revealed interferon signaling as the most common molecular pathway activated across all 3 organisms and different tissues. Not surprisingly, *Rig-I (DDX5), IFITM3, MX1/MX2, OASL,* and *OAS3* were among the most differentially expressed genes (DEGs) in all three organisms. Surprisingly, the inter-organismal immune system level response was better conserved than intra-organism response (i.e., when comparing different tissues from the same species). For example, we observed better overlap of DEGs between almost any combination of human blood, ferret lung and blood, as well as mouse lung data without human cell data, than with human cell data included. Immune functions, such as cytokine/chemokine, IFN, and toll like receptor signaling dominate most of the significant intersections of the DEG signatures. The DEGs unique to mouse were enriched for the cytochrome P450 detoxification pathway genes. Similarly, the human host seemed to possess unique antigen processing and presentation functions not observed in mice or ferrets. Highly conserved co-expression network modules across all organisms included well-known functions, such as cell-cycle, interferon signaling, protein metabolism, cellular localization, and cell activation. Only a limited number of small modules were found to be unique to each species, such as a human specific SOX3/VIK-1(ZNF655) module or a T-cell relevant semaphorin module in ferrets. However, a more detailed network analysis based on comparative node degree analysis and module differential connectivity presented a slightly different picture. Some coexpressed gene modules with potentially similar functions, based on gene set enrichment analysis as well as correlations to infection related traits, showed different connectivity between different organisms. For example, a module with a reciprocal DNA recombination function that was relevant for antigen repertoire generation, seemed important in ferrets but differently connected in human cells. In summary, our comparative multiscale analysis revealed molecular processes common to the 3 organisms as well as specific to each during influenza infection. Our cross-organism comparative study provides insights into the adaptability of the virus to different organisms and to the spectrum of host-defense mechanisms.

A Novel Method for tracking Host Transcriptome Stability in the Context of an Active Viral Infection

Kris White, Pablo Abreu, Benjamin tenOever and Adolfo Garcia-Sastre

Department of Microbiology, Icahn School of Medicine at Mount Sinai, New York, NY 10029, USA.

The stability of the host transcriptome during a viral infection has been the subject of limited studies to date. The main obstacle being the lack of tools to probe this essential host function during an active viral infection. Actinomycin D is commonly used to separate mRNA transcription from mRNA stability for study, but this drug also inhibits viral infection. Here we describe for the first time a method which can track host mRNA stability on a transcriptomics scale during influenza A virus infection. To do this we transfected human A549 cells with purified polyA+ mRNA from a separate species, in this case Gallus Gallus (DF1 cells). Do to the fact that Gallus Gallus mRNA is not transcribed within A549 cells, this allowed us to track the abundance of the transfected Gallus Gallus transcriptome as a function of mRNA stability. Following mRNA transfection, we infected the A549 cells with H5N1 (Halo) influenza virus and tracked mRNA stability compared to mock infected cells via illumine sequencing. Our data analysis technique was developed to ensure that the significant homology between the species did not impair the conclusions. Raw reads were first aligned to the human genome. Those reads which aligned were discarded and those which did not were used in de novo genome guided assembly of the Gallus Gallus transcriptome. In our analysis we found that influenza A infection has a global stabilizing effect on mRNA, with 76.66% of mapped transcripts showing increased stability over time in infected cells compared to mock. We have also identified pathways in which mRNA stability is specifically targeted by influenza A virus.

Multi-omics signatures of disease progression and protective immunity in RhCMV/MTB-vaccinated macaques after MTB challenge: Supplement to OTB U19 AI106761

Daniel Zak[1], Smitha Shankar[1], Jackie Braun[1], Joe Valvo[1], Lynn Amon[1], Scott Hansen[2], Alan Aderem[1], Louis Picker[2]

[1]Center for Infectious Disease Research, Seattle, WA 98109; [2]Oregon Health and Science University, Portland, OR 97239

The immune responses that a vaccine must induce to protect against tuberculosis (TB) disease are presently unknown. Rhesus cytomegalovirus (RhCMV) has emerged as a novel vaccine vector capable of inducing long-lived mucosal effector memory T cell responses and has demonstrated protective efficacy against SIV and MTB in rigorous non-human primate (NHP) challenge models. In two supplements to the Omics for TB (OTB) program (U19 AI106761), we have undertaken multi-omics (transcriptomics, metabolomics, and proteomics) analysis of peripheral blood samples from two independent MTB challenge trials evaluating RhCMV vectors expressing MTB antigens (RhCMV/MTB). In both trials, RhCMV/MTB-vaccinated NHPs exhibited significantly reduced TB disease compared to controls. Multi-omics analysis of post-vaccination/pre-challenge samples from these trials has potential to reveal correlates of protective immunity against MTB and analysis of post-challenge samples can reveal correlates of TB disease progression and refinement of multi-omics signatures of risk identified from analysis of human cohorts. Currently, we have completed whole blood transcriptomics (RNA-Seq) analysis of the first study and plasma metabolomics (Metabolon DiscoveryHD4) and plasma proteomics (Somalogic SOMAscan) analyses of the 2nd trial. Transcriptomics of the 2nd trial and metabolomics of the 1st trial are underway (supported by independent programs). RNA-Seq of the 1st trial revealed a signature present on the day of MTB challenge that correlates with vaccine-induced protection against extrapulmonary TB, observed months later at necropsy. This signature involves genes in IL-1B, Oxidative stress, and Hypoxia pathways, with expression of PTX3, NALP3, IL-1B, NRF2, and HIF1A on the day of challenge being protective. Interferon response-associated genes, which we have shown are associated with risk for tuberculosis disease progression in humans, were absent from the protection signature. While we are currently blinded to the protection status of animals from the 2nd trial, analysis of proteomic and metabolomic responses of the unvaccinated NHPs to MTB challenge revealed responses consistent with signatures of TB disease risk that we identified in human cohorts. These include robust induction of circulating STAT1 and GAPDH proteins as well as cortisol and 3−ureidopropionate during TB progression. Ongoing analyses include cross-platform and cross-trial prediction and integration to identify robust signatures of protection and disease.

Modeling host-parasite blood-stage interactions in malaria-infected rhesus macaques

Luis L. Fonseca[1,2], Chester Joyner[1,3], The MaHPIC Consortium[1], Alberto Moreno[1,3], John W. Barnwell[1,4], Mary R. Galinski[1,3] and Eberhard O. Voit[1,2]

[1]Malaria Host–Pathogen Interaction Center, Emory Vaccine Center, Yerkes National Primate Research Center, Emory University, Atlanta 30322,USA; [2]The Wallace H. Coulter Department of Biomedical Engineering, Georgia Institute of Technology and Emory University, Atlanta 30332, USA; [3]Division of Infectious Diseases, Department of Medicine, Emory University, Atlanta 30322,USA; [4]Malaria Branch, Division of Parasitic Diseases and Malaria, Centers for Disease Control and Prevention, Atlanta 30329, USA.

Malaria is globally the most deadly parasitic disease in humans, and the long-time coexistence with malaria has left indelible marks in the human genome that are the causes of a variety of genetic disorders. Although anemia is a common clinical complication of malaria, the root causes and mechanisms involved in the pathogenesis of malarial anemia are unclear and difficult to study in humans. Non-human primate (NHP) model systems enable the mechanistic study and quantification of underlying causative factors of malarial anemia, and particularly the onset of severe anemia.

Data obtained in the course of *Plasmodium coatneyi* and *P. cynomolgi* infections in malaria-naïve rhesus macaques (*Macaca mulatta*), were used to parameterize a discrete recursive model of the host-parasite blood-stage interactions. The model accounts for reticulocytes, red blood cells (RBCs), and infected RBCs and, using a mechanistic approach, allows predictions regarding the effects of varying levels of erythropoietic output, reticulocyte lifespan, RBC removal, and the immune response against the parasite.

Through optimization of the model parameters against the readouts of each individual macaque, we were able to infer the macaque's temporal response against the infection. Analysis of these results showed that: removal of RBCs occurs primarily by bystander effect and not by parasite invasion; in *P. cynomolgi*, reticulocytes were prematurely released before infection patency, which may be correlated with this parasite's preference for reticulocytes; and, under healthy conditions, rhesus reticulocytes have a lifespan in circulation of 24h, similar to humans.
We will show how the model has evolved and where it will go in the future.

This project has been funded in whole or in part with Federal funds from the National Institute of Allergy and Infectious Diseases; National Institutes of Health, Department of Health and Human Services [Contract No. HHSN272201200031C] and the National Center for Research Resources [ORIP/OD P51OD011132].

Lipid Signatures of Survival in Humans Infected with Ebola Virus during the Sierra Leone Outbreak

Jennifer E. Kyle[1], Jason P. Wendler[1], Kristin E. Burnum-Johnson[1], Amie. J. Eisfeld[2], Pete J. Halfmann[2], Kelly G. Stratton[3], Cameron P. Casey[1], Karl K. Weitz[1], Richard D. Smith[1], Yoshihiro Kawaoka[2,4,5], Katrina M.Waters[1], Thomas O. Metz[1]

[1]Biological Sciences Division, Pacific Northwest National Laboratory, Richland, WA, 99352, USA; [2]Department of Pathobiological Sciences, University of Wisconsin-Madison, Madison, WI, 53711, USA; [3] Applied Statistics & Computational Modeling, Pacific Northwest National Laboratory, Richland, WA 99352, USA; [4]Division of Virology, Department of Microbiology and Immunology, Institute of Medical Science, University of Tokyo, Tokyo, 108-8639, Japan; [5]International Research Center for Infectious Diseases, Institute of Medical Science, University of Tokyo, Tokyo 108-8639, Japan

Much of what is known about EBOV pathogenicity has been elucidated from *in vitro* and *in vivo* models. This includes the role of lipids. Here we show plasma lipidomics of human EBOV disease (EVD) reveals striking trends in patients that survived compared with fatalities. Samples were obtained from 11 EVD survivors, 9 EVD fatalities, and 7 healthy Sierra Leonean volunteers. Plasma lipids were extracted and subjected to liquid chromatography-tandem mass spectrometry. A total of 423 lipids were identified and quantified across 4 lipid categories and 19 subclasses. Subclass trends include decreased diacylglycerophophocholine (PC), lyso-PC (LPC) and diacylglycerophophoinositol (PI) lipids among fatalities compared to survivors, whereas diacylglycerophophoethanolamine (PE), diacylglycerophophoserine (PS), and diacylglycerophophoglycerol (PG) were increased. Of the lipids that underwent the greatest change (> 5 log2 fold change (FC)), ceramides (CER) that contained 16:0 or 18:0 fatty acids increased in those that succumbed over EVD progression, whereas PIs containing 18:3 or 20:3 fatty acids increased in those that survived. Of the 41 lipids above this 5-FC cutoff, 50% were PC and LPCs, 9.5% CER, 9.5% PI, and 7% PS, with a p-value of at least 10E-4. Certain PS lipids (e.g., PS(18:0_18:1)) also revealed a trend for survivors vs fatalities.

Multi-organ dysfunction with EVD is well-known. Here we show the probable impact of liver dysfunction on the lipidome, along with other signatures of EVD pathogenesis. The decrease in PC and LPC suggests the liver is not actively secreting VLDL. The increase in CER containing 16:0 and 18:0 fatty acids over time indicates apoptosis is more prevalent in those that succumbed. Taken together these lipid signatures are also reminiscent of choline deficiency (resulting from nutrient deprivation); however, the apoptosis signature along with the increase in PSs and PEs may also result from virus pathogenesis. Lastly, PIs containing 18:3 or 20:3 fatty acids were noted to increase in survivors. 18:3 (n-6) is a precursor to 20:3 (n-6), which has anti-inflammatory and anti-proliferative roles. This study was funded by an administrative supplement to grant U19AI106772, provided by the National Institute of Allergy and Infectious Diseases, National Institutes of Health (USA).

The human upper respiratory tract is a reservoir of diverse microbial communities that include bacteria that can become pathogenic. Influenza virus infection can alter the respiratory tract microbiota and increase susceptibility to the colonization from these pathogenic bacteria. The emergence and spread of antibiotic resistance strains of respiratory bacteria is a significant global burden and contributes to mortality associated with influenza virus and bacteria co-infection. To determine how the microbiome of the upper respiratory tract is affected by influenza virus infections (nvH1N1, H3N2, or influenza B virus) and antibiotic treatment, we analyzed nasopharyngeal samples from index and contact cases part of an influenza household transmission study in Nicaragua. We used metatranscriptome analysis and 16S rRNA target gene sequencing to characterize the microbial community structure and gene expression profile. From the metatranscriptome data, we found that half of our subjects (15/35) carried *Streptococcus*, and that all samples had significant expression of different classes of antibiotic resistance genes. By unsupervised clustering of 16S rRNA data, samples partitioned into 3 community types and we identified several genes as differentially expressed between the 3 partitions. These included cardiolipin synthase, which is associated with daptomycin resistance, and phenicol resistance genes. We integrated host transcriptome and metatranscriptome data to understand the interactions between the host, the virus and the microbiome, as well as the role antibiotic resistance genes play in the interactions.

Systematic Assessment of Drug Susceptibility in *Mycobacterium tuberculosis*

Shuyi Ma[1,2], Tige R. Rustad[1,2], and David R. Sherman[1,2]

[1]Center for Infectious Disease Research, formerly Seattle Biomedical Research Institute, Seattle WA, USA; [2]Pathobiology Program, Department of Global Health, University of Washington, Seattle WA, USA

Designing optimal combination TB therapies requires a systems-level understanding of *M. tuberculosis* (MTB) response to drugs under different conditions. We probed the effects of perturbing of genetic context on MTB drug response by harnessing a genome-scale experimental screening strategy. We exposed a comprehensive pooled library of transcription factor (TF) overexpression mutant strains to 8 clinically relevant anti-TB agents and identified drug-specific sets of regulators that influence MTB susceptibility. In the case of isoniazid (INH), we identified susceptibility-altering TFs, which included a regulator previously known to confer decreased susceptibility to INH (Rv1909c, *furA*). We successfully validated another TF (Rv1963c, *mce3R*), which increased susceptibility to INH when overexpressed. To further probe mechanisms underlying *mce3R* hypersusceptibility, we combined known mce3R regulon information with MTB drug response transcriptomes and identified putative effector genes. We selected one of its repressed target genes, Rv1469, as potentially contributing to mce3R's increased INH susceptibility. Functional testing with the Rv1469 transposon knockout strain confirmed our hypothesis. Integrating drug response phenotypes with TFs and their gene networks at a genome-scale advances efforts to design TB therapies by enabling systematic interrogation of new mechanisms and informing rational design of complementary drug combinations.

Malaria-causing parasites *Plasmodium falciparum* and *Plasmodium vivax* cause the highest morbidity and mortality of the *Plasmodium* species that infect humans. High-resolution metabolomics was performed on plasma samples from adults with *P. vivax*, *P. falciparum*, and those co-infected with the two species, alongside healthy and febrile non-malarial cases from the Kanchanaburi and Tak provinces of Thailand. Comparative analyses revealed specific metabolites and metabolic pathways that differentiated the groups. Global metabolic differences were observed in the plasma metabolome of malaria-infected individuals compared to non-malaria-infected individuals. These changes included increased levels of multiple classes of lipids in the plasma of individuals with malaria. Within the malaria cases, differences were also observed in the plasma of individuals harboring different developmental stages of the parasite (e.g. asexual and sexual stages). These findings suggest that specific processes involved in parasite development and in clinical disease progression are associated with global shifts in the host metabolic profile during malaria infection.

Host transcription and genome 3D structure perturbation b y influenza A NS1 protein

Sven Heinz [1], Mathew Urbanowski [2], Max Chang [1], Michael Hayes [1], Lorane Texari [1], Alexander Rialdi [2], Kris White [2], Ivan Marazzi [2,3], Randolf Albrecht [2], Megan Shaw [2], Adolfo Garcia -Sastre [2,3,4], Christopher Benner [1]

[1]Department of Medicine, University of California, San Diego, La Jolla, CA 92093, USA; [2]Department of Microbiology, Icahn School of Medicine at Mount Sinai, New York, New York, USA; [3]Global Health and Emerging Pathogens Institute, Icahn School of Medicine at Mount Sinai, New York, New York, USA; [4]Department of Medicine, Division of Infectious Diseases, Icahn School of Medicine at Mount Sinai, New York, NY 10029, USA

The spatial organization of the genome within the nucleus plays a crucial role in transcription and epigenetic reg ulation by organizing sets of regulatory elements into domains and contributing to cellular identity. Influenza A (IA) infection induces dramatic changes in genome 3D organization in the nuclei of host cells. Using Hi -C, a sequencing -based method that capt ures chromosome conformation, we found early -onset loss of genome structure following IA infection in both primary human tracheobronchial epithelial cells (HTBE) and monocyte -derived macrophages (MDM). In many cases CTCF -anchored loops were lost, resulting in dissolution of topologically associated domains (TADs). Transcriptome analysis by RNA -seq indicated that IA -induced loss of genome 3D interactions occurs where defects in transcription termination at 3' UTRs of highly transcribed genes leads to RNA pol ymerase II (Pol II) elongating hundreds of kilobases past the transcription termination sites observed in uninfected cells. Genome -wide RNA polymerase II location analysis by ChIP -Seq revealed striking dysregulation of all aspects of transcription, from in itiation to elongation to transcription termination, as early as 6 h post -infection.

The IA non -structural protein 1 (NS1) is known to inhibit transcript cleavage and polyadenylation by interacting with and inactivating the host factor CPSF30, the 30 kDa subunit of cleavage and polyadenylation specificity factor of the host cell. Infection of MDM with NS1 -deficient IA and transient short -term overexpression of NS1 protein in THP -1 cells established that NS1 is necessary and sufficient for the striking glob al effects of IA infection on transcription and host 3D genome structure. Transfection with NS1 variants bearing mutations that abolish its interaction with CPSF30 demonstrated that these properties of NS1 are mediated by its interactions with CPSF30. Our data indicate that NS1 compromises all stages of gene transcription of a large number of host genes, and that transcription through structural domain boundaries severely impacts host genome 3D structure and function. These results reinforce the potential o f targeting the NS1 -CPSF30 interaction as a promising strategy for pharmaceutical intervention during IA infection.

Discovery of network motifs mediating the transition to dormancy in *Mycobacterium tuberculosis*

Abrar Abidi[1], Eliza Peterson[1], Christopher Plaisier[1], Nitin Baliga[1]

[1]*Institute for Systems Biology, Seattle, WA*

Transcription factors (TFs) modulate the expression of their downstream target genes through the simple functions of activation or repression. Over time, evolution has joined these simple functions into new emergent behaviors by linking together TFs into sub-circuits known as network motifs. Presumably, these TF-TF interactions have evolved because they are capable of providing behaviors that are advantageous to the organism: increase (or decrease) of response times, filter noise, add robustness, or act as a switch between different cell states. The transition between cell states is critically important to *Mycobacterium tuberculosis* (MTB) during the transition into a dormant phenotype. This lead us to hypothesize that network motifs control this transition into dormancy through regulation of a temporal genetic program. Using the genome-wide ChIP-seq dataset that was generated by the Omics4TB group, we have discovered a certain class of network motif, known as the feedforward loop (FFL), that involves many genes which are known to be differentially expressed during hypoxia or aeration. Focusing on hypoxia-induced dormancy, we have identified a circuit model that controls this crucial cell state transition. We ran extensive permutation tests to confirm the significance of the network motifs and used our Environment and Gene Regulatory Influence Network (EGRIN) model to confirm conditional associations. Further validation of our circuit model requires high-resolution expression measurements during MTB's transition into and out of hypoxia. However, the prevailing experimental strategy for this transition has limited user control which restricts the resolution of the time-course data. To address this problem, we have designed a far more sophisticated and precise experimental setup that allows us to control the oxygen content and continuously monitor dissolved oxygen levels. This approach will allow us to collect the appropriate expression measurements that will then be compared to the theoretical model that is described by our network motif structure. Future studies will also involve the perturbation of critical nodes and observation of changes in cell states (expression profiles and dormancy phenotype) as a result of the re-wired regulatory circuit.

The Epigenetic Landscape during Coronavirus Infection

Alexandra Schäfer[1], Vineet D. Menachery[1], Katrina M. Waters[2], Amy C. Sims[1], Timothy P. Sheahan[1], and Ralph S. Baric [1]

[1]Department of Epidemiology, University of North Carolina at Chapel Hill, Chapel Hill, NC; [2]Biological Sciences Division, Pacific Northwest National Laboratory, Richland, WA

Coronaviruses comprise a large group of emerging human and animal pathogens, including the highly pathogenic SARS-CoV and MERS-CoV strains. The molecular mechanisms regulating emerging coronavirus pathogenesis are complex and include virus-host interactions associated with entry, replication, egress and innate immune control. The current study was designed to identify host epigenetic processes that play a crucial role in controlling transcriptional regulatory networks that antagonize or promote SARS-CoV and MERS-CoV infection and pathogenesis.
More recently, a growing body of evidence supports the hypothesis that viruses, even lytic RNA viruses that replicate in the cytoplasm, have developed intricate, highly evolved, and well-coordinated processes that are designed to regulate the host epigenome, and control host innate immune antiviral defense processes, thereby promoting robust virus replication and pathogenesis. To test this hypothesis, we used ChIP-Seq to study the histone modification status of immune response genes during the early course of SARS-CoV and MERS-CoV infection. In addition to ChIP-Seq, we used MeDIP-Seq to evaluate the role of MHC expression after MERS-CoV infection, defining alternative yet complementary approaches for eliciting global gene expression control. We identified significant epigenetic signature differences regarding histone modification and STAT1-binding patterns that correlate with expression outcomes genome-wide. The study revealed that infection with SARS-CoV results in enrichment of H3K4me3 incorporation and STAT1 binding of ISG promoters. In contrast, MERS-CoV infection alters the histone modification patterns of ISG towards the repressive H3K27me3 and inhibits binding of STAT1, causing a repressed state of transcription and thereby inhibiting the expression of those genes early during infection. MeDIP-Seq analysis suggested that DNA methylation rather than histone modification plays a crucial role in MERS-CoV mediated antagonism of antigen presentation genes. By combining measures of epigenome reorganization with transcriptomic and proteomic datasets, we articulate a spatial-temporal data integration approach to identify regulatory genomic clusters and regions that play a crucial role in the host's innate immune response, thereby defining a new viral antagonism mechanism following emerging coronavirus infection.

Deciphering influenza virus -host interactions using single -cell RNA sequencing

Bin Zhou [1], Chang Wang [1], Erming Wang [2], Minghui Wang [2], Wissam Hanou [2], Tsui-wen Chou [1], Melissa Smith [2], Robert Sebra [2], Bin Zhang [2], and Elodie Ghedin [1,3]

The interaction between the virus and host factors ultimately determines the outcome of an infection and the fate of the disease. At the single -cell level, whether an infection is productive or abortive depends both on the composition of the viral particle and the state of the cell it infects. While the genetic heterogeneity of the influenza virus population ("quasi-species") has been studied in the context of viral replication efficiency, the heterogeneity of the infected cells has rarely been analyzed. We infected human A549 cells and canine MDCK cells with multiple influenza A strains and compared virus yields at the single -cell level. The results showed that even within a relatively homogeneous cell line (compared to primary cultures), the viral yields are highly variable from cell to cell. To determine the underlying mechanisms for this variability, we used single -cell RNA sequencing to simultaneously quantify viral replication and profile the cellular transcriptome in both cell lines. Hundreds to thousands of differentially expressed genes were identified under various experimental conditions, some of which were undiscoverable by conventional population -level bulk RNA sequencing. We also performed network analyses, including weighted gene co-expression network analysis (WGCNA), to identify key drivers involved in influenza virus replication. By establishing a correlation between viral replication and the host transcriptome at a single -cell resolution, we were able to identify a) factors that support high vs. low virus replication in a single cell infection; b) shared and unique host factors related to the different replication competence of various viral strains; c) host responses that lead to the different capacity of each cell line (MDCK vs. A549) to support viral replication; and d) effects of infected cells on the neighboring uninfected cells. This study paves the way and assures a bright future of applying the single -cell sequencing strategy to animal models and primary human tissues to better understand disease progress and severity.

Plasmodium knowlesi – Macaque Infection Models and Systems Biology

Mary R. Galinski [1], Juan B. Gutierrez [2], Rabindra Tirouvanziam [1], Regina Joice Cordy [1], Ebru Karpuzoglu Belgin [1], Jeremy D. DeBarry [2], Mustafa Nural [2], Shuzhao Li [1], Mark Styczynski [3], Luis L. Fonseca [3], Eberhard O. Voit [3], Alberto Moreno [1], Jessica C. Kissinger [2] and the MaHPIC Consortium [1,2,3]

[1]Emory University, Atlanta, GA, USA; [2]University of Georgia, Athens, GA, USA; [3]Georgia Institute of Technology, Atlanta, GA, USA

The MaHPIC has developed collaborative systems biology experiments with the Defense Advanced Research Project Agency (DARPA) to study *Plasmodium knowlesi* infections in two species of macaques. *Plasmodium knowlesi* infection of *Macaca mulatta* (rhesus macaques) is highly virulent and typically deadly. In contrast, *P. knowlesi* infection in *Macaca fascicularis* (long-tailed macaques) is mild and typically self-controlled. In our recent infection studies, we have observed mild disease in *M. fascicularis*, with reduced hemoglobin levels and altered blood chemistry, followed by recovery without antimalarial treatment. Compared to rhesus macaques infected with *P. knowlesi*, these animals developed comparatively low parasitemias that plateaued and then resolved into a chronic state. The MaHPIC has planned to investigate the basic differences in the pathogenesis and immune responses in these hosts through the analysis and integration of multi-omic datasets generated over the course of longitudinal infections. The DARPA collaboration has enabled the addition of telemetry for real-time continuous physiological assessments of temperature, activity levels, heart rate and blood pressure, targeted proteomics and metabolomics, and pathology analysis of tissues upon necropsy. The DARPA goals are complementary and additive, being focused on identifying the underlying mechanisms of host resilience shown by the *M. fascicularis*, and aiming to develop host-directed therapies that can induce this resilience in individuals that would otherwise become severely ill. This project has been funded in whole or in part with Federal funds from the National Institute of Allergy and Infectious Diseases; National Institutes of Health, Department of Health and Human Services [Contract No. HHSN272201200031C], DARPA [Contract No. W911NF-16-C-0008], and the National Center for Research Resources [ORIP/OD P51OD011132].

Influenza A virus (IAV) has a large social and economical impact worldwide. The lack of effective treatments demands an ambitious strategy to facilitate therapeutic intervention. With the goal of identifying and validating groups of genes involved in early IAV infection and pathogenesis, the FluOMICs consortium is employing a systems biology approach to compare three clinically relevant influenza virus strains that differ in virulence (H1N1, H3N2, H5N1), in both mice and humans. To enable the comparison and identify events that explain the diverse outcomes between IAV strains, we have generated a wide variety of large-scale -OMICS datasets, including transcriptomics, proteomics (protein abundance, phosphorylation, ubiquitination), and metabolomics (lipids and polar metabolites). Altogether, we quantified the functional activity of more than 6,000 genes/proteins at multiple time points during the course of infection, providing an unprecedented, detailed view of the infection landscape. For example, the phosphoproteome allowed us to infer a map of kinase activity unveiling key differences between strains. We found that JAK2, an important mediator for signaling events in both innate and adaptive immunity, increases activity during the course of H1N1 infection, while remaining invariant during H5N1 infection. In contrast, the RAF family of kinases involved in the regulation of cell growth and differentiation, increased their activity specifically during H5N1 infection. Moreover, functional analysis of the ubiquitome suggests more prominent ubiquitination-mediated degradation of immune signaling proteins during H5N1 infection. Finally, following a network module identification approach, we have developed an integrative analysis for the detection of active subnetworks that predict pathogenicity. This approach is based on the identification within the network of correlation patterns, densely connected regions, and clusters with significant changes in expression levels. As a result, the collection of predicted pathogenic modules represents an integrated -OMICS signature of pathogenicity. Ongoing perturbation experiments will refine the predicted signatures of pathogenesis.

This work is supported by the National Institutes of Health National Institute of Allergy and Infectious Diseases under grant U19 AI106754 (Flu-OMICs). The Modeling Core is directed by Nevan Krogan.

Peripheral blood is the most common access to understand the blood chemistry and immune response during an infection. Recent advancement in flow cytometry, transcriptomics and metabolomics brings rich information from the analysis of peripheral blood samples. Our group has developed computational tools in this area, including blood transcription modules for transcriptomics analysis and mummichog for metabolomics analysis. We combined these novel tools with a controlled human malaria infection trial, which consisted of patients that were naïve or semi-immune to *Plasmodium vivax* infection. The blood transcription modules revealed that the two groups of patients had different expression of interferon related genes, neutrophil and NK signatures at baseline; they went on with distinct kinetic profiles after infection. The metabolomics data also indicated different responses in amino acid pathways and lipid metabolism between the two groups. We have recently developed a new framework of “multiscale, multifactorial response network” (MMRN) to integrate different modalities in immune response. Current efforts are under way to integrate multi-omics data in malaria infection using this MMRN approach.

This project has been funded in whole or in part with Federal funds from the National Institute of Allergy and Infectious Diseases; National Institutes of Health, Department of Health and Human Services [Contract No. HHSN272201200031C] and the National Center for Research Resources [ORIP/OD P51OD011132].

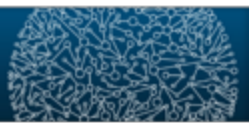
Integration of Transcriptomic, Epigenetic and Glycomic Data in Ferret Models of Influenza Infection Reveals Coordinated Molecular Responses

Christian V. Forst[1], Won-min Song[1], Minghui Wang[1], Bin Zhou[2], Adam Geber[2], Lauren Lashua[2], Xianxiao Zhou[1], Chalise Bloom[3], Tsui-Wen Chou[2], Guy Mason[2], Christopher Vaiana[4], Lawrence Meche[4], Brian Kasper[4], Clayton Wiley[5], Stephanie Bissel[5], Eric Schadt[1], Alyson Kelvin[6], Lara Mahal[4], Ted Ross[3], Bin Zhang[1$] and Elodie Ghedin[2]

[1]Department of Genetics and Genomic Sciences, Icahn Institute of Genomics and Multiscale Biology, Icahn School of Medicine at Mount Sinai, NY; [2]Center for Genomics & Systems Biology, Department of Biology, and College of Global Public Health, New York University, NY; [3]Center for Vaccines and Immunology, University of Georgia, GA; [4]Department of Chemistry, New York University, NY; [5]Department of Pathology, University of Pittsburgh School of Medicine, Pittsburgh, PA; [6]Immune Diagnostics and Research, and University Health Network, Toronto, ON

To build predictive models of influenza severity, we developed a large cohort of multi-Omics and physiological data from 48 ferrets in two distinct sampling studies of 24 ferrets each, including a sequential study following individual ferrets from pre-infection day until day 8, and a serial/longitudinal study, where different animals were infected and samples collected at different time points. For the serial study of both lower and upper lungs, ANOVA time-series analysis identified 8,366 mRNAs, 38 long non-coding RNAs (lncRNAs), 99 miRNAs, 6 glycans and 3 cytokines with significant responses across the time course. Most prominent molecular targets include well known host-defense genes such as *IFIT3*, *IFIT1*, *OAS1*, *Rig-I* (*DDX58*), *IFI44* and *MX1*/*MX2*, miRNA *mir*-1271 and lncRNA ENSMPUT00000020969 as well as snRNA *RN7SK*. Chemokines CXCL10, CCL2 and lectin Calsepa also showed differential expression. The Jonckheere trend analysis revealed that *APLNR*, *WNT5B*, *WIF1* and *PVRIG* were among the most significantly upregulated targets along the time-course while *PARP14*, *GCA*, *SAMD9L* and *TRIM5* were down-regulated. We further employed Multiscale Embedded Gene Co-expression Network Analysis (MEGENA) to identify highly coexpressed modules in the upper and lower lung locations. We rank ordered the modules in each location based on their response to the infections, i.e., the enrichment for the differentially expressed genes, microRNAs and lncRNAs. The top ranked modules in both locations were associated with the interferon signaling, cell-cycle and ribosome pathways. However, the lower lung was more responsive as it had far more network modules significantly enriched by the differentially expressed molecules (37.9%) than the upper lung (11.4%), indicating a higher infection rate in the lower lung. A similar big difference between upper and lower lung was observed based on the module-trait correlations, i.e., more modules in the lower lung were significantly correlated with traits than those in the upper lung. This study further identified well-known as well as promising novel key-drivers and pathways for further investigation in the fight against influenza infections.

Poster Abstracts



Notes

Poster abstracts have been organized into the following sections:

- Models and Biosignatures of Infectious Disease
- Single Cell Analyses
- Perturbation and Validation Studies
- New Tools
- Collaborations

Poster numbers for the Tuesday Poster Session are provided at the beginning of each poster abstract section, and all poster numbers are listed together on page 74.

Analysis of Multi -omics D atasets Using Human Genome -Scale Metabolic Network

Mingyuan Tian [1], Jennifer Reed [1]

[1]*Chemical and Biological Engineering, University of Wisconsin -Madison , US*

The reconstructed human genome -scale metabolic network is a powerful tool to analyze multi -omics dataset, including transcriptomic, proteomic, metabolomic and lipidomic data. The most recent human metabolic reconstruction, *iHsa* contains 2315 genes, 8263 reactions, and 5620 metabolites. We performed flux coupling a nalysis and metabolite coupling analysis on *iHsa* to identify metabolic modules containing reactions (and their associated genes) and/or metabolites . These modules contain metabolites and reactions where reaction flux or metabolite production changes in one reaction or metabolite imply similar flux or production changes in all other members of the module . Reactions in the module were then converted to genes via gene -protein -reaction associations in the reconstructed network.

We identified 330 gene modules, which account for 1050 genes . Each gene module includes genes whose associated reaction fluxes are coupled due to the topology of human genome -scale metabolic network . Functional enrichment analysis was then performed using these gene modules. Enrichment analysis for transcriptomic data in peripheral blood mononuclear cell s from Ebola patients found that pathways involved with heparan sulfate proteoglycan, a glycosaminoglycan utilized by filo viruses to attach to host cells, were significantly differentiall y expressed at the early stage of infection between survivors and non -survivors.

This project was funded by the National Institute of Allergy and Infectious Diseases, National Institutes of Health, grant U19AI106772 .

Influenza virus is a negative-strand RNA virus that infects cells of the respiratory tract and leads to significant morbidity and mortality. In order to identify more effective antiviral targets, a multi-laboratory OMICs collaboration (FluOMICs) was formed in order to determine virus-dependent host pathways that could be targeted to prevent influenza infection or replication. Metabolomics is an emerging systems biology approach that provides a global view of changes in endogenous small molecules including amino acids, nucleic acids, and glycolytic intermediates involved in cellular function and signaling. We analyzed changes in cellular metabolism associated with influenza infection with a global profiling platform that uses hydrophilic interaction liquid chromatography-mass spectrometry (HILIC-MS). In addition, we have developed an in-house bioinformatics platform, Metabolomics Identification through Orthologous Datasets (MIDTOD), to increase the throughput of our platform and facilitate the integration of metabolomics with proteomics and genomics. This software processes metabolomic data using MSstats and the output, including metabolite identifications, are automatically linked to alterations in the genome and proteome. Using this approach, we have analyzed human cells and mice infected with the H1N1, H5N1, and H3N2 strains of influenza virus. We find both time-dependent and strain-dependent changes in glycerophospholipid metabolism, one carbon metabolism associated with methylation, and amino acid metabolism. Our data suggest that dynamic changes in host metabolism occur after infection and provide new targets for therapeutic intervention.

Modeling the Interplay between Viral Replication, Immune Response and Pathogenic Outcomes in the Mouse Lung

Paritosh Pande[1], Dennis Thomas[1], Hugh Mitchell[1], Jason Wendler[1], Jeremy Teuton[1], Ben Ziehr[2], Shiho Chiba[2], Amy Sims[3], Amie Eisfeld[2], and Katrina Waters[1]

[1]Biological Sciences Division, Pacific Northwest National Laboratory, Richland, WA, USA; [2]Influenza Research Institute, Department of Pathobiological Sciences, University of Wisconsin-Madison, Madison, WI, 53711, USA; [3]Department of Epidemiology, University of North Carolina at Chapel Hill, Chapel Hill, NC, USA

Mathematical models describing the kinetics of viral infections are useful in furthering our understanding of the dynamics of viral infections by providing quantitative insights into the mechanisms of the infection and the interactions between the infection and the host immune response. The knowledge gleaned from such models can not only provide a quantitative understanding of the underlying biological phenomena but could also aid in predicting the differences in host-response to different strains, and to generate and test hypotheses about antiviral mechanisms. We are currently developing mechanistic mathematical models to study the dynamics of Influenza A virus (IAV) and Severe Acute Respiratory Syndrome virus (SARS-CoV) infection in an *in vivo* mouse model. We first compare the dynamics of IAV and SARS-CoV based on the biologically relevant parameters of a target cell-limited model of viral kinetics proposed by Baccam *et al*. To further investigate the specific role of various components of the immune system, and to elucidate the differences in the host-response to low pathogenic and high pathogenic strains of IAV, we report the development of a more detailed and complex computational model, which integrates inflammatory, humoral, and cellular response of the immune system. Additionally, we also propose to use machine learning approaches to identify the critical host factors associated with phenotype, leading towards the development of parsimonious models to better understand the individual sub-processes of the overall complex model. We believe that our modeling approach will not only provide quantitative insights into the known mechanisms of immune response to viral infections, but will also enable generation of novel hypotheses pertaining to the role of various key elements, such as, host genetic factors, immunosenescence, and coinfection in viral infection kinetics, which would in turn be used for designing further validation experiments. Highly pathogenic viruses are a serious public health threat due to their propensity for genetic variability and evolutionary drive to manipulate host pathways to their advantage. In order to determine the most effective intervention strategies, the host-response system must be thoroughly characterized and molecular networks used to identify targets which interrupt the pathogenesis program Comparing the host response of several lethal viruses in a side-by-side manner demonstrates the value of this strategy as the unique and common cellular programs required for virus replication and pathogenesis are revealed. We have collected data from Influenza virus, West Nile Virus, MERS coronavirus, SARS coronavirus and Ebola virus, from in vivo, ex vivo and in vitro biological systems, with transcriptomics, proteomics, metabolomics and lipidomics measurements performed in parallel. To identify important patterns in these large datasets, we employed a functional enrichment approach that ranks features by significance from differential expression statistics, rather than using an arbitrary significance cutoff, thereby increasing consistency in our analysis. By representing the results of this approach visually, we can identify critical host factors common to multiple viruses, which helps in identifying potential pan-virus therapy approaches. Additionally, the comparison allows the identification of unique responses to individual viruses whose importance is not evident from studying a single virus in isolation, thus providing insight into virus-specific host interactions. We also compared results from multiple OMICs data types in the same experimental condition, which allows for a more complete picture of the host response than is available from a single data type (e.g. transcriptomics) because multiple lines of evidence can be combined to increase confidence in our findings. Here we identify metabolic pathway perturbations that span multiple conditions and virus types and that are supported by multiple OMICs platforms. We also highlight responses unique to individual viruses that provides candidate critical host factors on a virus-specific level. This study was funded by grant U19AI106772, provided by the National Institute of Allergy and Infectious Diseases, National Institutes of Health (USA).

A system-level transcriptional regulatory model reveals regulation underlying intracellular growth of *Mycobacterium tuberculosis*

Eliza JR Peterson[1], Aaron Brooks[1], David J. Reiss[1], Wei-Ju Wu[1], Abrar Abidi[1], Amardeep Kaur[1], Nitin S. Baliga[1]

[1]*Institute for Systems Biology, Seattle, WA*

We present the most detailed transcriptional regulatory network model of the bacterium, *Mycobacterium tuberculosis* (MTB), responsible for today's deadliest infectious disease. MTB is an extraordinarily successful pathogen, infecting one-third of the world's population, and the success of MTB is largely due to adaptations that allow for persistence within the host. The regulatory mechanisms underlying these adaptations in MTB (and most microbes) are poorly understood. To address this problem, we have developed a generalized framework for inferring mechanistically detailed, and predictive Environment and Gene Regulatory Influence Network (**EGRIN**) models. In addition, for MTB we have developed an **EGRIN 2.0** model that is a statistical ensemble of multiple context-specific EGRIN models. The ensemble of EGRIN models was mined for co-regulated modules or 'corems' – recurring associations among genes, gene regulatory elements (GREs), transcription factors (TFs), environmental factors, and the environmental conditions affiliated with those associations. Importantly, the MTB EGRIN 2.0 model extends well beyond the standard static regulatory network model to predict dynamic, context-dependent regulation. Exploring the EGRIN 2.0 model, we identified corems with predicted regulation by MtrA (Rv3246c). MtrA is the response regulator of the essential two-component signal transduction system, MtrAB, which has not been extensively investigated. Model predictions of target genes and environmental conditions has led to further experiments (transcriptomics, ChIP-seq, MtrA perturbation strains, lipid analyses) that suggest MtrAB functions during intracellular growth, by regulating modifications of cell wall structure. Moreover, it is likely the phosphorylation status of MtrA is dependent on environmental conditions and is constitutively active under low pH. Future studies could identify small molecules that inhibit MtrA phosphorylation and thus inhibit intracellular growth of MTB.

The immune response in women is generally more robust than in men. Consequently, women are often less compromised by infections and more responsive to vaccination. The exact mechanisms underlying women's privileged immune response are not well understood. In this study, we developed a multi-scale network analysis framework to decipher the difference in influenza infection and vaccination response between females and males. We integrated data from multiple experimental readouts, including transcription and immunological responses. We found vast sex differences at all levels, from physiological traits to gene expression and to functional gene networks. We revealed stronger and more specific responses to influenza infection and vaccination in females compared to males. For example, more than twice as many genes are significantly responding across the time-series in females compared to males. The unique molecular response in females involves specific adaptive immune system functions, including early B/T-cell activation that strongly associates with immune cell response and virus neutralization titers. In contrast, males show a more moderate innate immune response enriched for generic cellular processes due to later up-regulated immunoglobulins. We further identified sex-specific gene coexpression and regulatory networks and their key regulators as novel predictive biomarkers and putative targets for augmenting vaccine responses and/or for therapeutic intervention. Most top ranked gene co-expression modules in the female networks are related to the immune response while there are very few immune related modules in the male networks that are correlated to phenotypic traits. Key causal regulators of the sex-specific modules provide additional insight into the mechanisms underlying sex differences in the response to infection and vaccination. Therefore, this study depicts a global landscape of gender differences at the level of gene expression and gene regulation in response to influenza infection and vaccination.

Influenza infection activates a number of host defense pathways, including the innate and adaptive immune responses, and the induction of cytokines and activation of apoptosis. To decode the complexity of the molecular responses to influenza infection and vaccination, we developed multiscale systems biology approaches to model and validate high order molecular interactions and the signaling of host responses. We first developed a spectrum of distinct differential analysis techniques to identify molecular signatures. These include i) significant response analysis (SRA) and significant Jonckheere trend analysis (JTA) for single time-series datasets; and ii) differential response analysis (DRA) for 2 time series datasets under 2 conditions, such as infections with different viruses, during the temporal development of transcriptional or protein expression in response to infection. To further identify higher-order molecular interactions, we developed novel multiscale coexpression network analysis approaches including Multiscale Embedded Gene coExpression Network Analysis (MEGENA) and multiScale Weighted Interaction Network Analysis (SWINA) by integrating multi-resolution clustering, planar filtering and weighted coexpression techniques. To quantify the changes in molecular interactions between 2 scenarios, we developed differential correlation and network analyses. These novel systems biology approaches were applied to multiple influenza infection and vaccination cohorts to systematically identify key signatures, intrinsic networks and causal regulators of host responses to virus in multiple model systems. We identified the dedicator of cytokinesis 5 (*DOCK5*) as a novel host factor involved in viral replication. CRISPR/Cas9 knockout of *DOCK5* significantly reduced influenza virus replication, indicating that *DOCK5* is required in the viral life cycle. We also revealed fundamental gene network structures and key regulators in influenza vaccination, as well as age-dependent molecular responses to influenza vaccination. Such multiscale systems biology approaches are completely data-driven and present global and unbiased maps of regulatory relationships involving hundreds of thousands of interactions, with significantly improved power to uncover novel host-virus pathways and driver genes.

The elderly are more prone to infectious diseases and experience greater disease severity. Vaccine response is also poor, providing suboptimal protection in an older population. To characterize the age-related molecular responses to vaccination, we employed our multiscale network analysis approach to several transcriptomic datasets for multi-year studies of influenza vaccine response. We separated participants into 2 groups including a group with subjects 40 years old or younger, and a group with participants of 60 years old or older. A number of differentially expressed genes (DEGs) between the “young” and “elderly” groups were typical immune response genes such as *STAT1, GBP1/2/4*, chemokine *CXCL10*, immunglobulins (*IGHA1, IGHM, IGL,* and *IGLL1*), complement regulatory factor *SERPING1*, FC fragment of IgG receptor 1b (*FCGR1B*), and a TNF receptor *TNFRSF17*. However, the two groups have a wide difference in the number of DEGs between the pre-vaccination time point and any other post-vaccination time point. The “young” group had 30 times more DEGs than the ”elderly” group. The most prominent DEGs specific to the young group included IFN responsive *PARP9*, *IFIT2/3*, ER-stress responding *FBXO6*, vesicle transporting *VAMP5*, and proteasomal genes (*PSME1*, *PSMB8/9*). We further performed gene coexpression network analysis to identify high-order modular structures of gene-gene interactions in each group and then rank ordered each set of modules based on their enrichment for the DEG signatures. The top ranked modules were conserved between the two groups and they were associated with inferferon signaling, cell-cycle, and mRNA processing, indicating that co-regulation is better conserved between the age groups. However, a number of functional modules were specific to each group. For example, modules associated with *ATP6V* mediated vacuolar trafficking, the spliceosome, and the *GAB1* signalosome, were exclusive to the young group. In summary, this study systematically identified age-dependent gene signatures, networks and key regulators in response to influenza vaccination and thus paves the way for developing high-performance predictive models of influenza vaccine response.

Severe anemia accounts for a large portion of the complications associated with malaria. This phenomenon is multifactorial, and the mechanisms that cause it remain elusive. A multi-omic approach comprised of immunology, transcriptomics, metabolomics, lipidomics, and proteomics was used to study five *M. mulatta* infected with *P. cynomolgi*. This experiment resulted in one death, two severe infections, and 2 mild infections. The constraints of small cohorts, noisy and incomplete data, different sampling rates between platforms, and technical variability pose tremendous challenges to the integration of these data sets. Our group designed the SKED framework (Scientific Knowledge Extracted from Data) to simplify data harmonization, reproducibility of results, and reusability of analytic tools. Using data primitives (a small set of minimalistic data structures to which all data sets can be reduced), we were able to: (i) generate novel, reusable, and reproducible methods that aid in the detection of subtle signals usually ignored by traditional bioinformatics methods, and (ii) identify novel innate immunity mechanisms by which a malaria infection results in severe anemia. Particularly, we discovered that TLR3 and RIG-I pathways in macrophages and dendritic cells, conventionally linked to host antiviral responses, are upregulated in severe malaria. These pathways cross-talk, and their interaction had not been clearly implicated before in severe malaria. Associated with the activation of these pathways are changes in the protein effector proteins IL1, EP1, MX1, MX2, OAS1-3, and PML. In conclusion, the SKED framework allowed us to simplify the process of multi-omic data analysis, and fine-tune analytical methods to discern subtle signals that had been previously ignored. The biological knowledge obtained with these methods will advance knowledge both in the world of malaria, and in the field of quantitative biology. Despite their shared ancestry, different strains of influenza A virus (IAV) display extraordinary divergence in both their replicative potential and pathogenic outcome. We hypothesize that this diversity and the propensity to manifest as severe disease is linked directly to differential engagement of the host response during early infection. To test this hypothesis, we employed a multi-OMICs approach to map changes to the host cell transcriptome, proteome, and metabolome during the course of infection with three different IAV strains both *in vivo* and *ex vivo*. Critically, we found that while changes to host gene expression were highly correlated between strains during early infection, changes in post-translational modifications were highly strain specific. H5N1 IAV, for example, resulted in the specific dephosphorylation of several small GTPase signaling modules. Predictive modeling of phosphorylated peptide motifs mapped these differences to a few specific kinases, whose activity changes in a strain specific manner during the course of infection. While changes to the host ubiquitome are similarly as strain-specific, these changes cannot yet be mapped back to the activity of specific E3 ligases. However, concurrent measurement of mRNA and protein abundance has allowed for the identification of key cellular targets marked for degradation. Furthermore, protein interaction mapping across the proteome of these three viruses suggests critical host-pathogen interfaces that may initiate these downstream processes and ultimately dictate both infection and pathogenesis. As proteomic capabilities continue to evolve, we believe that these approaches will be critical for understanding the molecular mechanisms of disease, identifying actionable biomarkers, and developing the next generation of small molecule therapeutics.

Destroying the "Non-self": Defining Influenza A Viral Endonuclease Mechanisms for Host Shutoff

Kelsey Haas, Michael McGregor, David Jimenez-Morales, Judd Hultquist and Nevan Krogan

Department of Cellular & Molecular Pharmacology, University of California – San Francisco; Quantitative Biosciences Institute, University of California – San Francisco; J. David Gladstone Institutes, San Francisco, California

Viruses cannot replicate outside of a host cell and are efficient at infecting and converting cells into virus-producing factories. Influenza A Virus (IAV), a commonly encountered respiratory virus, shuts down host gene transcription and translation to prioritize viral gene translation. The resulting accumulation of viral proteins and global reduction of host proteins is termed host shutoff. One IAV protein that mediates host shutoff is viral endonuclease, PA-X. In infected cells, PA-X selectively reduces host mRNA levels while viral mRNA levels remain high. It is unclear how PA-X discriminates between host and viral mRNAs to target host mRNA for degradation. We hypothesize that PA-X selectively targets host mRNA by interacting with host transcription machinery and mRNA processing factors. To determine the host factors that interact with PA-X, we adopted a two-pronged systems biology approach relying on (1) quantitative functional genomics to identify functional host interactors and (2) proteomics to identify physical interactors of PA-X. We found a subset of transcription, mRNA processing and mRNA decay proteins that are functional and physical interactors of PA-X. We are validating the host factors' role in PA-X mediated host shutoff using a high-throughput mRNA degradation assay in IAV-infected cells. Understanding how PA-X discerns host and viral mRNA can provide deeper insight into IAV pathogenicity, facilitate development of novel antiviral therapeutics, and highlight key themes for recognizing "self" and "non-self" molecules. This work is supported by the National Science Foundation under grant 1650113 to K.H. and the National Institutes of Health National Institute of Allergy and Infectious Diseases under grant U19 AI106754 to N.K.

During viral infections mRNA translation is key in determining whether viral replication or the innate immune response will be successful. Current omics technologies interrogate either end of mRNA translation, through microarrays or proteomics. However, relying on mRNA and protein abundance misses a critical level of control, mRNA translation, as mRNA abundance doesn't always correlate with protein abundance. To define the complement of mRNAs undergoing translation during influenza infection we performed polysome fractionation followed by deep sequencing, polysome fractionation splits mRNAs based on their level of translation. The extent of translation for an mRNA is dependent on the number of ribosomes bound to the mRNA. mRNAs bound by few ribosomes are considered to be in monosomes, while mRNAs bound by many ribosomes and translated the most are associated with polysomes. To determine the efficiency of mRNA translation for each mRNA observed by deep sequencing we measured the distribution of that mRNA between monosomes and polysomes relative to its cytoplasmic abundance. The resulting ratio represents the level of translation for each mRNA or its Translation Efficiency (TE). This approach yields not only sequencing data on mRNA splicing, transcription start site usage and total abundance, but also how that data correlates to the efficiency of mRNA translation for each mRNA. Comparing the TE of mRNAs from mock and influenza infected cells provides a method to investigate the effect of influenza infection on the level of translation for every cellular mRNA. With this data we hope to answer questions related to the extent of host shut off during influenza infection and which if any host mRNAs are selected for increased mRNA translation during infection. Interestingly, we also observed significant changes in which mRNA isoforms are expressed during infection, specifically for mRNAs related to the immune response. Leveraging mRNA sequencing technology to interrogate the efficiency of mRNA translation provides a unique vantage point to observe how viral infection alters global mRNA translation.

The fungal composition—also called the mycobiome—in the respiratory tract has been associated with health and disease due to its interactions with the bacterial population and the host. We used a ferret model of influenza infection to survey the changes that occur in the influenza-associated respiratory mycobiome over the course of the infection. Nasal washes and bronchoalveolar lavages (BAL) were collected prior to and throughout infection. Target gene sequencing of the internal transcribed spacer (ITS) region was used to profile the mycobiome composition. Our analysis shows that the respiratory mycobiota changed significantly over the course of the infection with fungal features associated with differences pre-infection and post-infection. We also observed differences in the composition between the BAL and nasal washes, reflective of upper respiratory and lower respiratory tract variations. We evaluated the association between the mycobiome and disease severity based on physiological and pathological scores. This research contributes to a broader knowledge of the respiratory microbial environment in the context of a virus infection.

Severe cases of influenza infection are often associated with secondary bacterial co-infections with opportunistic pathogens, such as *Staphylococcus aureus*, *Streptococcus pneumoniae* and *Streptococcus pyogenes*. To understand the role of the respiratory microbiome in determining disease severity in influenza, we characterized the microbiota in respiratory samples from ferrets infected with nvH1N1. We collected samples pre-infection and at multiple time points post-infection for two sets of experiments. In one experiment nasal washes were collected longitudinally for the same ferrets (N=33); in the second design animals were sacrificed at each time point (N=48) so that bronchoalveolar lavages (BAL), lung tissue, as well as nasal washes were collected. Target gene sequencing of the 16S rRNA V4 hypervariable region and of the internal transcribed spacer 1 (ITS1) was performed to profile the bacterial and fungal compositions, respectively. Total RNA extracted from lung tissue was also used for metatranscriptome sequencing to profile microbial gene expression. Our analysis shows that there was, as expected, drastic modulation of the respiratory microbiota over the course of the infection, with a decrease in diversity. More importantly, we observed a significant difference in community structure before infection between ferrets who developed severe disease and those with mild disease, indicating that the microbiota can potentially be predictive of disease severity. We identified specific bacteria and fungi that were characteristic of these differences and were key species in cross-kingdom microbial interaction networks. Using the metatranscriptome data we identified co-expression modules that consisted of host and microbial genes, providing further evidence of the association between microbial functions and the host immune response to the viral infection. This study integrates different microbiome data layers and provides new insight into the modeling of disease severity in influenza infection.

Influenza strain specificity and microbiome function influences mortality in infants

Alyson A. Kelvin[1], Adnan Khan[1], David Kelvin[1], Luoling Xu[1], Amber Farooqui[1]

[1]Division of Experimental Therapeutics, Toronto General Hospital Research Institute, University Health Network, Toronto, Ontario, Canada; Institute of Medical Science, Faculty of Medicine, University of Toronto, Toronto, Ontario, Canada

Infants are highly susceptible to severe respiratory disease following influenza virus infection but the mechanisms of disease severity and the role of the microbiome are poorly understood. Previously, we developed a mother-infant dyad model using ferrets to explore the host-pathogen dynamics of influenza infection in infants and their mothers and to understand influenza pathogenesis in the infant age group. We found that infection with pandemic 2009 H1N1 virus in infant ferrets led to severe disease and mortality as well as viral transmission to the mother causing infection in her respiratory tract and her mammary glands. Here we investigate the interplay of the microbiome and the influenza virus with the aim of uncovering mechanisms leading to mortality and severe disease in the infant age group. Metagenomic analysis showed differential changes in microbial species in infant ferret lungs compared to those in adults during 2009 H1N1 infection. Infants had higher frequencies of staphylococcus species whereas adults had increased streptococcus species after infection suggesting a role for the host microbiome in influenza severity. We went on to further investigate the role of the microbiome during influenza infection in infants by treating infant ferrets with the antibiotic clavamox (amoxicillin derivative) to manipulate the resident microbial species. We then infected clavamox treated infant ferrets with an influenza B virus, B/Brisbane/60/2008 (B/Bris), at (10^6 TCID50). We have previously shown that B/Bris causes a mild disease in ferrets compared to pandemic 2009 H1N1 strains. During B/Bris infection untreated infants had minimal weight loss and small temperature increases. Moreover, untreated infants regained a typical growth curve within days of inoculation and had 100% survival at the end of the study (day 14 post-infection). Infants treated with clavamox and infected with the same inoculum of B/Bris developed severe disease and 60% of treated-infected infants a reached weight cut-off or succumbed to disease. We are currently analyzing the microbial changes in concert with host transcriptome analysis of immune responses to dissect the role of microbial species in influenza pathogenesis in infants. These results suggest a role of the microbiome in influenza disease severity and mortality in infants.

Single-cell analyses reveal the effects of cell cycle on influenza virus replication

Chang Wang[1], Bin Zhou[1] and Elodie Ghedin[1,2]

[1]Center for Genomics and Systems Biology, Department of Biology, New York University, [2]College of Global Public Health, New York University, New York, New York 10003, USA

Replication of the influenza virus relies on numerous cellular functions that are related to the host cell cycle. Systematic yeast two-hybrid arrays, RNA interference screenings, and biochemical assays have suggested a link between influenza virus replication and host cell cycle regulation. Although population heterogeneity, including cell-to-cell variation due to different phases of the cell cycle, may have confounded the detection and interpretation of the observation, results from these population-level analyses warranted an in-depth investigation of cellular mechanisms associated with cell cycle control upon viral infection. Fast-evolving single-cell technologies have enabled the assessment of gene expression with respect to different cell states. A recent single-cell viral replication study suggested independence between the host cell cycle and virus replication due to the absence of a correlation between cell size and virus titers. However, without gene expression profiling and identification of cell states, the relationship between virus replication and host cell cycle at the single-cell level remains elusive. Here we performed single-cell transcriptome profiling of individual cells to elucidate the disruption of the host cell cycle in response to viral exposure in the early infection stage. We quantified virus replication and host response in parallel by using A549 cells infected with two influenza A virus strains (PR8 and H1N1pdm09). Differential expression analyses and co-expression network reconstruction identified several cell-cycle related genes that control phase transitions in the host cell and are involved in the cellular response to infection. The regulated expression of some of these genes with respect to virus replication are likely to be mediated by other genes that are involved in homeostatic and metabolic regulation, and represent an indirect regulatory link to the cell cycle. Results from this study allow a better understanding of the host-virus interaction, and the casual relationship between virus replication and cell cycles.

Development of Parallel Microscopic Determination of Fitness; a time-lapse microscopy platform for *Mycobacterium tuberculosis*

Magdalena Donczew, Kyle Minch, Bailey Marshall, and David R. Sherman

Center for Infectious Disease Research, Seattle, WA, 98109

With 10.4 million new cases of active disease annually and 30% of the world latently infected, tuberculosis (TB) disease is a major public health crisis and, despite decades of research, treatment options remain suboptimal. To augment current laboratory approaches to TB research, we developed a new time-lapse microscopy platform called Parallel Microscopic Determination of Fitness (PMDF). PMDF allows us to assay hundreds to thousands of individual MTB microcolonies per experiment by tracking growth of individual cells. In each experiment we are able to measure median growth rate, death rate and the extent of heterogeneity of response across the population. To better understand MTB responses to drug treatments we treated cells with a range of concentrations of anti-tubercular agents. Using this approach, we have identified drug-and strain-specific bacterial behaviors that are providing insight into important MTB physiological responses.

In situ localization and distribution of differentially expressed innate immune genes during influenza infection in ferret lungs

Stephanie J Bissel[1,3], Guoji Wang[1], Chalise E Bloom[2], Ted M Ross[2,3], Clayton A Wiley[1,3]

[1] Department of Pathology, University of Pittsburgh, Pittsburgh, PA; [2] Center for Vaccines and Immunology and Department of Infectious Diseases, University of Georgia, Athens, GA; [3]FluDyNeMo Center

Influenza infection triggers an innate immune response in ferret lung tissue. To probe abundance, cell type and regional distribution of innate immune gene expression during infection, lungs from newly weaned and young adult ferrets infected with pandemic H1N1 2009 influenza A virus were probed to visualize RNA *in situ* at a single cell level. This approach provides morphological context of dynamic gene expression changes occurring over the course of influenza infection (0, 1, 3, 5, 8 and 14 days post-infection) in the context of age and severity of disease. Differentially expressed innate immune genes were chosen based on published gene expression profiles. Gene expression will be correlated with distribution of virus. Differential clinical outcome to influenza infection between young adult and newly weaned ferrets can be related to differential local innate immune response. This project was funded in part with funds from the National Institute of Allergy and Infectious Diseases, National Institutes of Health, grant U01AI111598.

Analysis of in vivo dynamics of H5N1 influenza virus infection in mice using fluorescent reporter viruses

Guojun Wang [1], Ying Chen [1,4], Michael Schotsaert [1], Adolfo Garcia-Sastre [1,2,3]

[1]Department of Microbiology, Icahn School of Medicine at Mount Sinai, New York, NY 10029, USA; [2]Global Health and Emerging Pathogens Institute, Icahn School of Medicine at Mount Sinai, New York, NY 10029, USA; [3]Department of Medicine, Division of Infectious Diseases, Icahn School of Medicine at Mount Sinai, New York, NY 10029, USA; [4]College of Animal Science and Technology, Guangxi University, No.100 Daxue Road, Nanning 530004, China

Influenza A virus is a major pathogen responsible for human and animal health. Highly pathogenic avian influenza viruses (HPAIVs), like H5N1, continue to evolve in nature and repeatedly infect humans, threatening public health. However, cells types infected in vivo by H5N1 are poorly understood. The ability to visualize influenza viruses offer powerful tool to study influenza virus replication, tropism and pathogenesis. Here, we infected mice with H5N1GFP virus and tracked the dynamics of H5N1 virus infection progression in mice by flow cytometry. In myeloid panel, we found high level of GFP-postive cells, such as epithelial cells, alveolar macrophages, DCs, eosinophils, and neutrophils, and reached the peak at 3 dpi. In addition, a significant proportion of NK cells, T cells and B cells were GFP postive, suggesting highly infection of these cells. Our results demonstrate high levels of immune cells harboring H5N1 influenza virus antigen during viral infection, which furthers our knowledge of infection of H5N1 influenza virus in mammals.

Transcription factor induction in *Mycobacterium tuberculosis* identifies infection stress phenotypes

Marshall J. Davis[1,2], Jessica Farrow-Johnson[1], Jessica Winkler[1], Kyle J. Minch[1], Tige R. Rustad[1], David R. Sherman[1,2*]

[1]Center for Infectious Disease Research, Seattle, WA, USA, 98109; [2]Pathobiology Program, University of Washington, Department of Global Health, Seattle, WA, USA 98195

We have developed a systematic method to evaluate the regulatory role of each transcription factor (TF) in Mycobacterium tuberculosis during infection. We created a TF-induction (TFI) library by cloning 207 of the estimated 214 MTB TFs into an anhydrotetracycline-inducible expression vector and transforming these into wildtype H37Rv to create a panel of merodiploid strains. The resultant mutants conditionally perturb effector gene expression in coordinated groups defined by direct binding of the TF in promoter regions. In comparison to gene knockout systems, this method also preserves complex downstream interactions over an extended period between the regulatory network and effector gene outputs driven by the initial binding of the induced regulator. To identify novel roles for TF-effector gene interactions in response to infection we combined all TFI mutants into a pooled culture and subjected the system to various stress conditions including infection of THP-1 cells, C57BL/6 mice, and a hypoxia/reaeration time course. The relative growth defects promoted by TF-induction were quantified by PCR amplification and high-throughput sequencing of each mutant's unique genetic tag. Eight induction mutants displayed growth defects in macrophages greater than when these same regulators were induced in vitro, and five TFs possess a defect specific to their adaptation to hypoxia and reaeration. These phenotypic data complement and inform our ongoing gene expression, TF-binding site, and growth defect studies, contributing to a functional genetic regulatory network of the MTB adaptation to infection. Regulators possessing defects across multiple screened infectious contexts are of particular interest moving forward. The causal interactions driving specific phenotypes will be pursued based on established function and potentially novel interactions indicated by our published gene expression and TF-binding site data.

Despite encoding only seven known structural proteins, Ebola virus causes severe infections resulting in mortality rates as high as 90% depending on the species of Ebola virus. Due to its limited number of encoded proteins, Ebola virus must associate with cellular proteins to efficiently replicate and cause disease. To gain a better understanding of the functional interactions between host and Ebola virus proteins, we performed immunoprecipitation using tagged viral proteins followed by mass spectrometry to identify host-virus protein interactions. We identified 550 cellular proteins that interact with at least one tagged Ebola virus protein. 198 cellular proteins were eliminated from further analysis based on non-specific interactions and known toxicity due to knock-down by RNA inference. The remaining 350 cellular proteins were evaluated for their role in Ebola virus replication in human liver cells (Huh 7.0 cells) by use of a set of four small interfering RNAs (siRNAs) against each cellular target. We identified 53 host proteins that are essential for virus replication (i.e those whose knockdown decrease virus titers relative to control siRNA treatment) and 43 host proteins with anti-viral functions (i.e those whose knockdown increased titers relative to control siRNA treatment). Among those factors necessary for virus replication are microtubule components that interact with Ebola virus nucleoprotein as well as components of the spliceosome that interact with the RNA-dependent RNA polymerase. Ongoing experiments seek to further define the role and function of the host factors in the Ebola virus life cycle as well as identify novel Ebola anti-viral compounds.

Viruses exploit multiple host cellular machinery for their efficient replication though a protein-protein interaction (PPI) with host proteins. Ebola virus encodes at least seven structural proteins, some of which have been reported to suppress antiviral responses, causing severe infections. To better understand viral and cellular determinants that could affect cellular events governing replication and pathogenicity of Ebola virus, we previously identified 351 host proteins exhibiting PPI with Ebola protein(s) by performing immunoprecipitation using tagged viral proteins and mass spectrometry. Here, we performed two RNAi screens using a set of 4 siRNAs targeting the 351 Ebola-host PPI partners to determine whether these target proteins can modulate cellular signaling (i.e., inflammatory and apoptosis signaling pathways). To evaluate knockdown effects on inflammatory signaling mediated by NF-□B, we assessed TNF-induced NF-□B activation by using a hepatocyte cell line (IHH) stably expressing an NF-□B-dependent luciferase reporter gene. We found 20 genes whose knockdown induced more than 5-fold change in NF-□B activation. Knockdown effects on apoptosis signaling were assessed by measuring staurosporine-induced caspase3/7 activation in HeLa S3 cells. We found 22 genes whose knockdown caused more than 2-fold change in caspase3/7 activation after staurosporine treatment. Further studies of these target proteins will provide a new insight into the role and function of the PPI partners and provide a potential cellular target for antiviral compounds.

Compounds Identified by a System Biology Approach Regulate the Pathogenicity of Influenza A Virus

Shufang Fan[1], Amie J. Eisfeld[1], Takeo Gorai[1], Tiago Lopes[1,2,3], Gabriele Neumann[1] and Yoshihiro Kawaoka[1,2,3]

[1]Influenza Research Institute, Department of Pathobiological Sciences, University of Wisconsin-Madison School of Veterinary Medicine, Madison, Wisconsin, USA; [2]Department of Special Pathogens, International Research Center for Infectious Diseases, Institute of Medical Science, University of Tokyo, Tokyo 108-8639, Japan; [3]International Research Center for Infectious Diseases, Institute of Medical Science, University of Tokyo, Tokyo 108-8639, Japan

Influenza A viruses (IAVs) cause seasonal epidemics with significant global morbidity and mortality and substantial economic burdens, and sporadic pandemics in which these effects are typically more severe. Two classes of antiviral drugs are available for treatment of human IAV infections: adamantans, which impair viral M2 ion channel activity, and neuraminidase inhibitors, such as oseltamavir and zanamivir. However, the emergence of IAV mutants that are resistant to the antiviral activity of one or both drug classes is a significant problem. Previously, using a systems biology approach, we identified host factors whose knockdown dramatically affected influenza virus replication, suggesting that drugs that block the expression of these factors may interfere with influenza virus disease outcome. Here, we used an in-house computational drug discovery pipeline to identify more than three hundred drugs that have putative roles on regulating the activity or the expression of these host factors, screened these drugs for effects on single-cycle and multiple-cycle IAV replication, and calculated the median inhibitory concentration (IC_{50}) and the median cytotoxic concentration (CC_{50}) *in vitro*. Finally, we focused on fourteen high priority compounds with strong antiviral function and limited cytotoxicity *in vitro*, for which detailed information is available on pharmacological usages in humans and mice, and we assessed the effects of these drugs on pathogenicity of a 2009 pandemic H1N1 (pH1N1) virus in mice. Three compounds protected mice against pH1N1 pathogenicity, while 4 compounds increased pH1N1 pathogenicity. Current work is focused on determining how these drugs affect host response networks and identifying the mechanisms through which they affect pH1N1 pathogenicity. *This project is funded in whole with funds from the National Institute of Allergy and Infectious Diseases, National Institutes of Health, grant U19AI106772.*

Systematic Assessment of Drug Susceptibility in *Mycobacterium tuberculosis*

Shuyi Ma[1,2], Tige R. Rustad[1,2], and David R. Sherman[1,2]

[1]Center for Infectious Disease Research, formerly Seattle Biomedical Research Institute, Seattle WA, USA; [2]Pathobiology Program, Department of Global Health, University of Washington, Seattle WA, USA

Designing optimal combination TB therapies requires a systems-level understanding of *M. tuberculosis* (MTB) response to drugs under different conditions. We probed the effects of perturbing of genetic context on MTB drug response by harnessing a genome-scale experimental screening strategy. We exposed a comprehensive pooled library of transcription factor (TF) overexpression mutant strains to 8 clinically relevant anti-TB agents and identified drug-specific sets of regulators that influence MTB susceptibility. In the case of isoniazid (INH), we identified susceptibility-altering TFs, which included a regulator previously known to confer decreased susceptibility to INH (Rv1909c, *furA*). We successfully validated another TF (Rv1963c, *mce3R*), which increased susceptibility to INH when overexpressed. To further probe mechanisms underlying *mce3R* hypersusceptibility, we combined known mce3R regulon information with MTB drug response transcriptomes and identified putative effector genes. We selected one of its repressed target genes, Rv1469, as potentially contributing to mce3R's increased INH susceptibility. Functional testing with the Rv1469 transposon knockout strain confirmed our hypothesis. Integrating drug response phenotypes with TFs and their gene networks at a genome-scale advances efforts to design TB therapies by enabling systematic interrogation of new mechanisms and informing rational design of complementary drug combinations.

Investigation of West Nile virus replication and pathogenesis by *in vivo* transcriptomics

Laura A. VanBlargan[1], Hugh D. Mitchell[2], Qing Tan[1], Allison M. Thompson[2], Amie J. Eisfeld[3], Katrina M. Waters[2], Larissa B. Thackray[1], and Michael S. Diamond[1]

[1]Washington University School of Medicine, St. Louis, MO 63110, USA; [2]Pacific Northwest National Laboratory, Richland, WA, 99352, USA; [3]University of Wisconsin-Madison, Madison, WI 53711, USA

The outcome of West Nile virus (WNV) infection in humans ranges from asymptomatic, to mild fever, to potentially fatal, neurological disease. Determinants of WNV disease outcome remain incompletely defined but include advanced age, immunocompromised status, and genetic polymorphisms in several innate immune molecules. To gain a better understanding of WNV pathogenesis *in vivo*, we generated transcriptome datasets from draining lymph nodes (after subcutaneous inoculation) and brain tissues (after intracranial inoculation) at 1, 2, 4, or 6 days post-infection from mice infected with a virulent WNV strain or attenuated mutant. In draining lymph nodes, the number of differentially expressed genes (DEGs)(>1.5 fold, $P<0.05$) relative to mock infection peaked at day 2 for both strains (>6,800 genes). In the cerebral cortex, the number of DEGs peaked at day 6 for the virulent strain (>14,700 genes), but at day 2 for the attenuated strain (>7,100 genes). DEGs were prioritized for further analyses with a network inference approach that employed five network metrics to rank potential regulatory genes based on their topological position in tissue-specific networks, followed by gene set enrichment analysis. Several genes prioritized by this approach have been implicated previously in the control of viral pathogenesis (including IFIT1, Rsad2, and Oas1a), but the majority of prioritized genes have not yet been characterized in the context of virus infections. This novel list of genes is being used to guide *in vitro* and *in vivo* investigations of WNV replication and pathogenesis, including studies employing ectopic expression or CRISPR/Cas9-mediated depletion of target genes. Initial CRISPR/Cas9 experiments have identified several potential pro-viral host genes that are currently undergoing further validation and characterization.

Comparative siRNA screen identifies conserved and strain-specific host factors for Influenza A virus replication

Laura Martin-Sancho and Sumit K. Chanda

Infectious and Inflammatory Disease Center, Sanford Burnham Prebys Medical Discovery Institute, 10901 North Torrey Pines Road. La Jolla, California, USA

Influenza A virus (IAV) is a major public health burden, responsible for annual epidemics and sporadic pandemics that cause millions of deaths worldwide. The genome of IAV consists of eight single-stranded, negative-sense RNA segments, which encode up to 14 known viral proteins. To complete its infectious life cycle, IAV must not only exploit cellular factors for replication but also evade host immune responses. In recent years, large-scale loss-of-function screens have identified several host factors essential for IAV replication. However, most of these screens did not attempt to identify restriction factors or to investigate the presence of strain-specific factors. Here we carried out comparative genome-wide siRNA screens in THP-1 cells infected with the seasonal IAV strain H3N2, and the highly pathogenic H5N1. In addition to novel strain-specific restriction factors, we also identified factors that affected both strains, including IRF9, STAT2 or ADAP2. This comparative siRNA screen will provide new insights into the role of cellular restriction factors in viral adaptation, improving our knowledge of viral infection and will appoint novel target candidates for drug therapy.

Influenza virus infections are a major cause of respiratory disease in humans. Influenza A viruses (IAV) are responsible for annual epidemics and occasional pandemics with potentially fatal outcome. The differences in the severity of the disease among individuals infected by IAV could be due to pre-existing health conditions, genetic factors, differences in the virulence of the circulating viruses or a combination of these elements. Thus, a comprehensive understanding of viral-host interactions, host innate immune responses and viral evasion strategies is pivotal to understand viral pathogenesis.

In recent years, genome-wide loss-of-function screens have identified several host factors required for IAV replication. However, these screens did not attempt to identify restriction factors or to investigate the presence of conserved and strain-specific host factors. In order to identify key early genes involved in the restriction of IAV infection, we have performed functional genomic cDNA overexpression as well as siRNA knockdown screens with a set of around 1000 interferon-stimulated genes (ISGs) in primary human respiratory epithelial HTBE cells. Furthermore, we hypothesize that strains of IAV with different levels of virulence interact with the host in a strain-specific fashion. Therefore, we infected the HTBE cells with two IAV strains of different pathogenicity (a seasonal H3N2 and the highly pathogenic H5N1) with the aim to identify cellular factors that influence viral replication and are common to or exclusive of these IAV strains. The screens were performed in the presence and absence of Type I IFN with the objective to pinpoint proteins involved in the IFN-mediated immune response or with restriction activity *per se*, respectively. We have identified several proteins that restrict H5N1 replication, whereas for the H3N2 virus we identified factors that restrict replication as well as proteins that increase its replication. We have selected some of these hits for further characterization and we are currently performing functional studies in order to identify the step in the viral life cycle affected as well as the mechanism of action for these IAV restriction factors.

PPMO -knockdown of cellular genes inhibits influenza virus infections

David S tein [1], Eva Böttcher -Friebertsh äuser [2], Shashank Tripathi [3], Hong Moulton [1], Adolfo García -Sastre [3]

[1]Oregon State University, Corvallis, OR ; [2]Philipps University, Marburg, Germany ; [3]Ichan School of Medicine at Mt. Sinai, New York, NY

Diminishing the expressi on of a specific host gene during viral infection can help elucidate its involvement in virus growth and pathogenesis. We used antisense peptide -conjugated morpholino oligomers (PPMO) to reduce the expression of the cellular genes TMPRSS2 and UBR4, then ev aluated the effect on influenza virus growth. A PPMO (T -ex5) designed to interfere with pre -mRNA splicing of TMPRSS2 was effective at inhibiting the HA cleavage of several influenza A viruses known to infect humans. Treatment of Calu -3 airway epithelial c ell line with T -ex5 markedly reduced the growth and spread of H1N1 and H3N2 viruses, at concentrations that were not cytotoxic to uninfected cells under similar conditions. In influenza -infected mice, PPMO -knockdown of UBR4 resulted in reduced virus growth in the lungs, while increasing overall survivorship. These studies further establish TMPRSS2 and UBR4 as important to viral replication and pathogenesis, and demonstrate the efficacy of PPMO as effective knockdown reagents for in vitro and in vivo studies .

Ion Mobility Separations: A Paradigm Shift in Mass-Spectrometry-based Omics Analyses

Thomas O. Metz[1], Kristin E. Burnum-Johnson[1], Ryan S. Renslow[1], Jason P. Wendler[1], Amie J. Eisfeld[2], Yoshi Kawaoka[2,3,4], Erin S. Baker[1], Richard D. Smith[1]

[1]Biological Sciences Division, Pacific Northwest National Laboratory, Richland, WA, 99352, USA; [2]Department of Pathobiological Sciences, University of Wisconsin-Madison, Madison, WI, 53711, USA; [3]Division of Virology, Department of Microbiology and Immunology, Institute of Medical Science, University of Tokyo, Tokyo, 108-8639, Japan; [4]International Research Center for Infectious Diseases, Institute of Medical Science, University of Tokyo, Tokyo 108-8639, Japan

Ion mobility (IM) provides gas-phase separation of ionized molecules based on their size and shape. IM separations occur on a time scale of milliseconds, and can be easily nested between conventional liquid chromatography (LC) and mass spectrometry (MS), allowing for greater coverage of sample constituents for the same LC separation, or for decreasing the LC separation length (or time) needed while maintaining the same measurement coverage. Importantly, IM separations are much more repeatable than LC, facilitating reliable molecular feature alignment across multiple samples, and improving the ability to identify species.

An exciting aspect of IM-MS measurements is the ability to directly measure the chemistry and composition of molecules, based on their collision cross section (CCS) and accurate mass information, respectively. Through innovations in computational chemistry, we have overcome a significant, long standing obstacle in the field of metabolomics: the absence of methods for accurate and comprehensive identification of small molecules without relying on data from analysis of authentic chemical standards. A paradigm shift in metabolomics, we are developing reference libraries of predicted CCS to use in conjunction with very high accuracy mass information provided by MS for metabolites to enable 'standards-free' metabolomics. Additionally, we have developed a new approach that performs both discovery and targeted monitoring (DTM) in a single analysis using LC-IM-MS, providing an effective convergence of the attractive properties (i.e. sensitivity, confidence of identifications, and accuracy of quantification) of these powerful approaches. In DTM, heavy labeled target peptides are spiked into tryptic digests and both the labeled and unlabeled peptides are detected using LC-IM-MS. Compared with conventional LC-MS, DTM yields greater proteome coverage and detects lower abundance species, and also achieves detection limits similar to targeted selected reaction monitoring measurements. We initially applied LC-IM-MS in proteomics analyses of blood plasma from individuals with EBOV disease (EVD), including 11 EVD survivors, 9 EVD fatalities, and 7 healthy Sierra Leonean volunteers. LC-IM-MS provided 2-3-fold higher numbers of protein identifications compared to the conventional LC-MS.

A Multi-Omic Data Analysis Platform for Mining & Visualization of Host-Viral Response

Lindsey Anderson[1], Hugh Mitchell[1], Kelly Stratton[2], Markus Kobold[2], Bobbie-Jo Webb-Robertson[2], and Katrina Waters[1]

[1]Biological Sciences Division, Pacific Northwest National Laboratory, Richland, WA, USA; [2]Computing & Analytics Division, Pacific Northwest National Laboratory, Richland, WA, USA

The advent of high-throughput OMICs technologies has made available large quantities of data, transforming molecular biology into a remarkably data-rich science. Researchers now find themselves having to deal with huge datasets and face challenges extracting and interpreting the wealth of information hidden in these data. As such, computational approaches for data mining, integration and interpretation are often the limiting factor in discovery-based science, and standardized approaches for data normalization and statistical processing are critical for cross-experiment and cross-system comparisons. In an effort to mediate these challenges, we are leveraging an interactive statistical web-based software platform, PMart (http://pmart.azurewebsites.net/pmart), which was developed to enable the analysis and exploration of publicly available cancer proteomics datasets for biomarker discovery. The PMart Virology tool uses pre-loaded OMICS-LHV data (transcriptomic, proteomic, metabolomic, and lipidomic data) in standardized format for subsequent integration, statistical and/or visual analytics. A user-friendly, web-based interface allows for expansive and customizable navigation of host-response data, unbiased to species, tissue type, viral strain, time point, and/or condition. The tool will incorporate workflows for functional enrichment analysis along with visualizations of the results, identifying pathways and processes that are perturbed across data types or across different viruses. The workflows will provide functional annotation clustering, to interrogate broad or narrow functional categories, as well as view the expression behavior of features associated with individual pathways. In addition, links will be included for exploring interactive metabolic pathway-specific maps to gain useful insights into the biochemical context of critical host factors. This software platform is designed to facilitate the re-analysis of multi-omics data for new hypothesis generation, thus providing significant benefit to those interested in mining a public repository without having to download raw data files and reprocess them. The data and enrichment pipelines used to demonstrate this web-based platform were funded by grant U19AI106772, provided by the National Institute of Allergy and Infectious Diseases, National Institutes of Health (USA).

Strategies for Supporting Systems Biology Data Management and Cyberinfrastructure

Jeremy D. DeBarry[1], Jay Humphrey[1], Nicolas Lackman[1], Mustafa Nural[1], Suman B. Pakala[1], Jessica C. Kissinger[123], Mary R. Galinski[4], The MaHPIC Consortium[4]

[1]Institute of Bioinformatics, [2]Center for Tropical and Emerging Global Diseases, [3]Department of Genetics University of Georgia, Athens, GA 30602; [4]Emory Vaccine Center, Yerkes National Primate Research Center, Emory University, Atlanta, GA, USA

Because systems biology is, by nature, transdisciplinary, its success requires the effective integration of people and ideas as much as data and technologies. It follows that successful systems biology data management requires facilitating communication, education, and a host of other sociological factors, in addition to establishing and maintaining a system of hardware and software. This is challenging, because the same essential diversity that makes systems biology projects possible is also a potential hindrance, due to an inherent 'Tower of Babel' scenario where no two groups speak quite the same language, with a dangerous and contrasting array of mental imagery associated with technical words and phrases. This affects all aspects of communication, from the biological to the computational. Any group that agrees to serve as the computational and 'informatics' support team for a large transdisciplinary project should expect to be called upon to meet these challenges by producing a set of 'Rosetta Stones' to guide the effort and provide a unifying force to counteract the most dangerous illusion of team communication, namely, that it has taken place at all. We will discuss the strategies developed by the Malaria Host-Pathogen Interaction Center to identify and solve issues that run the gamut from the technical to the sociological, and from experimental design to public data deposition.

This project has been funded in whole or in part with Federal funds from the National Institute of Allergy and Infectious Diseases; National Institutes of Health, Department of Health and Human Services [Contract No. HHSN272201200031C] and the National Center for Research Resources [ORIP/OD P51OD011132].

Universal full-length genomic amplification of Zika virus facilitates sequencing and re verse genetics

Tsui-wen Chou[1], Boya Zhao[1], Chang Wang[1], Bin Zhou[1], and Elodie Ghedin[1,2]

[1]Center for Genomics and Systems Biology, Department of Biology, New York University; [2]College of Global Public Health, New York University, New York, New York

Zika virus contains a single-stranded positive-sense RNA genome of ~10,800 nucleotides long. It was first isolated in monkeys and mosquitos in the 1940's in Uganda. It was then confirmed in human infections in the 1950's and spread to equatorial Africa and to Asia in the following decades. The current widespread Zika outbreak in the Americas is caused by strains of the Asian lineage. Genome sequencing is crucial for monitoring the evolution and understanding the biology of the Zika virus. However, the 2 currently widely used genomic amplification methods have severe limitations. The first method uses a random priming strategy to amplify all RNA molecules in a sample, including both host and viral RNAs. It is not a scalable high-throughput method as the viral RNAs constitute only a small percentage of the total RNA, thus requiring a deep sequencing approach to capture a limited number of virus sequences. The second method uses a large number (34-36) of viral sequence-specific primers to amplify short overlapping regions of ~400 bp to cover the whole genome. It suffers from uneven coverage of different regions and is vulnerable to strain variations, inherent to a rapid spreading and evolving virus. We developed a full-length genomic amplification method using only two primers targeting the conserved sequences in the 5' and 3' terminal regions of the Zika genome making this approach universally applicable to all Zika strains of both African and Asian lineages. Multiple optimizations—from RNA isolation to reverse transcription to PCR—were performed to increase the sensitivity and robustness of the assay. The long amplicons were successfully sequenced on the Illumina platform for assembly of full-length genome sequences of the Zika virus. This full-length amplicon approach is particularly appropriate for single-molecule sequencing techniques, such as Oxford Nanopore and PacBio, and could be used for haplotyping mutations of individual viral genomes. In addition, we further developed this method to generate recombinant Zika viruses directly from PCR products, averting the many difficulties in the time-consuming process of cloning. For its usefulness in sequencing and reverse genetics, this universal genomic amplification method will accelerate the surveillance and research on Zika disease.

Novel reassortant swine influenza viruses with H1N1/2009 human pandemic and Eurasian Avian-origin genes in Guangxi, China

Ying Chen[1,4], Guojun Wang[4], Adolfo García-Sastre[2,3,4]

[1]College of Animal Science and Technology, Guangxi University, No.100 Daxue Road, Nanning 530004, China; [2] Department of Medicine, Division of infectious Disease, [3]and Global Health and Emerging Pathogens Institute, [4]Department of Medicine, Division Icahn School of Medicine at Mount Sinai, New York, New York,10029, USA

After the multiple introductions and reassortments of H1N1/2009 human pandemic viruses (H1N1/2009) into pig population, the genetic diversity of swine influenza viruses has increasing significantly in China. We report the isolation and genetic analysis of 11 novel reassortant H1N1 and H3N2 viruses, 2 whole Eurasian avian-like (EA-like) and 1 H1N1/2009-origin virus from pigs in Guangxi during 2013 to 2015. Phylogenetic analysis showed that these novel reassortant variants contained the surface genes (HA and NA gene) derived from EA-like H1N1 or seasonal human-like H3N2, H1N1/2009-origin internal genes (PB2, PB1, PA and NP) and classical swine-origin NS genes. Notably, the novel EA-like H1N1 viruses owned different M genes, either from H1N1/2009 or EA-like lineage, which were associated with the human infection, implying the potential zoonosis between swine to human. Besides, the persistence and prevalence of human-like H3N2 reassortant viruses with H1N1/2009-origin internal genes and classical swine-origin NS genes will increase the human adaptation with the potential pandemic. Further investigation will help to assess the potential risk of these novel reassortant viruses to humans.

Collaborations

Poster	Presenter	Title
34	Peterson	Collaborative research in Mycobacterium tuberculosis stemming from the SysBio of Infectious Disease Program

Presentation Type: Poster
Center: Omics4TB
Section: Collaborations
Poster 34

Eliza Peterson[1], Serdar Turkarslan[1], Nitin Baliga[1]

[1]*Institute for Systems Biology, Seattle, WA*

The large-scale data sets and predictive models generated by the Omics4TB group have created community-wide resources for studying TB. In addition to publications that facilitate exposure of these resources, the Omics4TB group has developed web portals for gathering Program resources and enabling access to the scientific community. The web portals have been viewed by more than 10,000 users in over 100 countries and many of these users have reached out to us seeking advice and/or collaboration. Among these users, we have pursued further research endeavors with four TB groups (in four countries). In collaboration with Tanya Parish (Infectious Disease Research Institute, Seattle, WA), we have generated promoter reporter strains of specific transcription factor (TF) target genes that are involved in tolerance to antitubercular treatment. Using these strains we are developing a screening assay to identify small-molecules that inhibit the tolerance TFs and synergize with antitubercular treatment. We are also working with Mario Alberto Flores-Valdez (State Center for Research and Assistance in Technology and Science, Jalisco, Mexico) to characterize transcriptional changes in an MTB mutant that has attenuated outcome during mouse infection. Del Besra (University of Birmingham, Birmingham, UK) also reached out to us to better understand the transcriptional network of PhoP, a response regulator found with mutations in an MTB strain that is resistant to a novel antibiotic. Finally, we are also working with Lindsay Eltis (University of Biritsh Columbia, Vancouver, Canada), who is primarily interested in MTB pathways responsible for the degradation of aromatic compounds and steroids, particularly cholesterol. MTB has the unique capability of utilizing host-derived cholesterol as both an energy source and as a precursor molecule for the biosynthesis of cell wall fatty acids. Collaborating with Prof. Eltis, we have used our regulatory network models to predict additional enzymes involved in cholesterol degradation, which his group is working to experimentally validate. These four research projects are just an example of the large and increasing impact the SysBio of Infectious Disease Program has had on the broader scientific community.

Menu

Breakfast:

- Chilled orange, apple, cranberry and grapefruit juices
- Hand-cut seasonal fruit
- Assorted breads and coffee cakes
- Variety of organic yogurt and granola

Mid-Morning Breaks:

- Seasonal whole fruit
- Whole roasted almonds
- Assorted granola bars
- Watermelon-lime, strawberry-lemon, and ginger-mango shots

Mid-Afternoon Breaks:

- Fresh-baked brownies
- Hummus with toasted pita bread
- Seasonal berries
- Artisan cheese and crackers

Throughout the Day:

- Assorted soft drinks
- Iced teas
- Mineral water
- Coffee and tea

Lunches and Dinners:

Day	Meal	Type	Selections
Sunday	Dinner	Hor d'oeuvres	Fruit display[1]
Sunday	Dinner	Hor d'oeuvres	Garden fresh vegetable crudites[1]
Sunday	Dinner	Hor d'oeuvres	Warm spinach artichoke dip with toasted pita chips
Sunday	Dinner	Hor d'oeuvres	Vietnamese spring roll with fresh mint, soy and sweet chili sauce
Sunday	Dinner	Hor d'oeuvres	Pork pot stickers with soy chili sauce
Sunday	Dinner	Hor d'oeuvres	Peanut chicken satay
Monday	Lunch	Buffet	Garden salad with croutons and parmesan cheese
Monday	Lunch	Buffet	Potato salad
Monday	Lunch	Buffet	Soup du jour
Monday	Lunch	Buffet	Artisan sandwich rolls; cheddar, Swiss and provolone cheeses; condiments
Monday	Lunch	Buffet	Sandwich fillers: chicken salad (with cranberries and cashews), shaved roast beef with horseradish cream, grilled veggies, or roast turkey
Monday	Lunch	Buffet	Fresh-baked cookies and brownies
Monday	Dinner	Station	Salad Station[1]
Monday	Dinner	Station	Quesadilla Station[1]
Monday	Dinner	Station	Pasta Station[1]
Tuesday	Lunch	Buffet	Tossed green salad
Tuesday	Lunch	Buffet	Tomato and mozzarella salad
Tuesday	Lunch	Buffet	Herb-seared chicken with Cipolline onions and jus lie
Tuesday	Lunch	Buffet	Grilled flat iron steak, wild mushroom ragout
Tuesday	Lunch	Buffet	Roasted Yukon potatoes with fresh herbs
Tuesday	Lunch	Buffet	Green beans with toasted almond butter
Tuesday	Lunch	Buffet	Cheesecake: chocolate chip, raspberry and cappuccino
Tuesday	Dinner	Hor d'oeuvres	Garden fresh vegetable crudites[1]
Tuesday	Dinner	Hor d'oeuvres	International and domestic cheese[1]
Tuesday	Dinner	Hor d'oeuvres	Tomato and mozzarella bruschetta
Tuesday	Dinner	Hor d'oeuvres	Smoked salmon on toasted pita, dill cream, micro-celery greens
Tuesday	Dinner	Hor d'oeuvres	Mini Beef Wellington
Tuesday	Dinner	Hor d'oeuvres	Andouille sausage in puff pastry
Wednesday	Lunch	Buffet	Garden salad with croutons and parmesan cheese
Wednesday	Lunch	Buffet	Quinoa and roasted vegetable salad
Wednesday	Lunch	Buffet	Beluga lentil salad
Wednesday	Lunch	Buffet	Wraps (turkey club with bacon; roast beef with horseradish cream and marinated onions; or spring mix, grilled veggies, avocado and whole wheat tortilla)
Wednesday	Lunch	Buffet	Flash fried potato chips with Southport onion dip
Wednesday	Lunch	Buffet	Oatmeal raisin cookies
Wednesday	Lunch	Buffet	Lemon blueberry parfaits

[1]Additional Details:
Hor d'oeuvres:
Garden fresh vegetable crudites Seasonal raw vegetables served with a variety of dipping sauces
Fruit display Sliced seasonal and tropical fruits with berries and dipping sauces
International and domestic cheese Camembert with Calvados (apple brandy), Caprino Cremoso with truffle, Blue Affine, and Pleasant Ridge Reserve, garnished with seasonal fruit and assorted crackers
Stations:
Salad Station Caesar salad (romaine lettuce, parmesan cheese, croutons and Caesar dressing) Mesclun green salad (assorted salad greens, shredded carrots, cucumber, cherry tomato and Balsamic dressing)
Quesadilla Station Made to order: soft tortillas and choice of fajita-marinated beef or chicken, farmer's cheese and cilantro Served with: salsa, sour cream, guacamole
Pasta Station Pastas: wild mushroom ravioli, cavatappi (helical tubes) or bowtie Sauces: roasted garlic cream, bolognese or pesto cream Served with: shaved asiago and parmesan cheeses and fresh-baked garlic breadsticks

I. OVERVIEW OF THE FUNDING OPPORTUNITY

Program Announcement for the Department of Defense

Defense Health Program

Congressionally Directed Medical Research Programs

Peer Reviewed Medical Research Program

Focused Program Award

Announcement Type: Initial

Funding Opportunity Number: W81XWH-17-PRMRP-FPA

Catalog of Federal Domestic Assistance Number: 12.420 Military Medical Research and Development

SUBMISSION AND REVIEW DATES AND TIMES

- **Pre-Application Submission Deadline:** 5:00 p.m. Eastern time (ET), July 20, 2017
- **Invitation to Submit an Application:** August 2017
- **Application Submission Deadline:** 11:59 p.m. ET, October 26, 2017
- **End of Application Verification Period:** 5:00 p.m. ET, October 31, 2017
- **Peer Review:** December 2017
- **Programmatic Review:** February 2018

This Program Announcement must be read in conjunction with the General Application Instructions, version 20170516. The General Applications Instructions document is available for downloading from the Grants.gov funding opportunity announcement by selecting the "Package" tab, clicking "Preview," and then selecting "Download Instructions."

II. DETAILED INFORMATION ABOUT THE FUNDING OPPORTUNITY

II.A. Program Description

Applications to the Fiscal Year 2017 (FY17) Peer Reviewed Medical Research Program (PRMRP) are being solicited for the Defense Health Agency (DHA) J9, Research and Development Directorate, by the U.S. Army Medical Research Acquisition Activity (USAMRAA) using delegated authority provided by United States Code, Title 10, Section 2358 (10 USC 2358). As directed by the Office of the Assistant Secretary of Defense for Health Affairs (OASD[HA]), the DHA manages the Defense Health Program (DHP) Research, Development, Test, and Evaluation (RDT&E) appropriation. The execution management agent for this Program Announcement is the Congressionally Directed Medical Research Programs (CDMRP). The PRMRP was initiated in 1999 to provide support for military health-related research of exceptional scientific merit. Appropriations for the PRMRP from FY99 through FY16 totaled $1.371 billion. The FY17 appropriation is $300 million (M).

The vision of the FY17 PRMRP is to improve the health and well-being of all military Service members, Veterans, and beneficiaries. The PRMRP challenges the scientific and clinical communities to address at least one of the FY17 Topic Areas with original ideas that foster new directions along the entire spectrum of research and clinical care. The program seeks applications in laboratory, clinical, behavioral, epidemiologic, and other areas of research to advance knowledge in disease etiology, improve prevention, detection, diagnosis, treatment, and quality of life for those affected by a relevant disease or condition, and to develop and validate clinical care or public health guidelines.

II.A.1. FY17 PRMRP Topic Areas

All applications for PRMRP funding must specifically address at least one of the Topic Areas as directed by Congress and must be directly relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries. If the proposed research does not specifically address at least one of the FY17 PRMRP Topic Areas, the Government will administratively withdraw the application. The Government reserves the right to reassign the application's Topic Area if submitted under an inappropriate Topic Area. The FY17 PRMRP Topic Areas are listed below.

- Acute Lung Injury
- Antimicrobial Resistance
- Arthritis
- Burn Pit Exposure
- Chronic Migraine and Post-Traumatic Headache
- Congenital Heart Disease
- Constrictive Bronchiolitis
- Diabetes
- Diarrheal Diseases
- Dystonia
- Early Trauma Thermal Regulation
- Eating Disorders

- Emerging Infectious Diseases
- Epidermolysis Bullosa
- Focal Segmental Glomerulosclerosis
- Fragile X
- Guillain-Barré Syndrome
- Hepatitis B and C
- Hereditary Angioedema
- Hydrocephalus
- Immunomonitoring of Intestinal Transplants
- Inflammatory Bowel Diseases
- Influenza
- Integrative Medicine
- Interstitial Cystitis
- Malaria
- Metals Toxicology
- Mitochondrial Disease
- Musculoskeletal Disorders
- Nanomaterials for Bone Regeneration
- Non-Opioid Pain Management
- Pancreatitis
- Pathogen-Inactivated Dried Cryoprecipitate
- Polycystic Kidney Disease
- Post-Traumatic Osteoarthritis
- Pulmonary Fibrosis
- Respiratory Health
- Rett Syndrome
- Rheumatoid Arthritis
- Scleroderma
- Sleep Disorders
- Spinal Muscular Atrophy
- Sustained-Release Drug Delivery
- Tinnitus
- Tuberculosis
- Vaccine Development for Infectious Disease
- Vascular Malformations
- Women's Heart Disease

Research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding. ***Applicants should select the FY17 PRMRP Program Announcement most appropriate to the stage of the proposed research.*** Areas of Encouragement related to the FY17 PRMRP Topic Areas have been identified by the Department of Defense (DoD), the Department of Veterans Affairs (VA), and other relevant stakeholders (Appendix 2). Applicants are urged to read and consider these Areas of Encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an Area of Encouragement on this list.***

II.B. Award Information

The PRMRP Focused Program Award mechanism is intended to optimize research and accelerate the solution for a critical question related to at least one of the Congressionally directed FY17 PRMRP Topic Areas through a synergistic, multidisciplinary research program. The anticipated total costs budgeted for the entire period of performance for an FY17 PRMRP Focused Program Award will not exceed **$10M**. Refer to Section II.D.5, Funding Restrictions, for detailed funding information.

Key aspects of this award include:

Overarching Challenge: Focused Program Award applications must describe a unifying, overarching challenge that will be addressed by a set of research projects. The overarching challenge must be relevant to a critical problem or question in the field of research and/or patient care in at least one of the FY17 PRMRP Topic Areas.

Research Projects: Applications shall include multiple, distinct research projects led by individual project leaders that address complementary aspects of the overarching challenge. Applicants are strongly encouraged to submit a minimum of four research projects; additional studies are allowed. While individual projects must be capable of standing on their own high scientific merits, they must also be interrelated and synergistic with the other proposed projects and advance a solution beyond what would be possible through individual efforts. The exploration of multiple hypotheses or viewpoints of the same line of questioning is encouraged. This award mechanism is not intended to support a series of research projects that are dependent on the success of any other project. Each project should propose a unique approach to addressing the overarching challenge and be capable of producing research findings with potential to impact the field and/or patient care. Individual research projects may range from exploratory, hypothesis-developing studies through small-scale clinical trials (i.e., up to and including Phase II or equivalent). There should be a clear intent to progress toward translational/ clinical work over the course of the effort.

Implementation: The research strategy to address the overarching challenge must be supported by a detailed plan that identifies critical milestones; outlines the knowledge, resources, and technical innovations that will be utilized to achieve the milestones; and explains how the outcomes will be translated to patients. A robust statistical plan and statistical expertise should be included where applicable. A plan for assessing individual project performance and progress toward addressing the overarching challenge must be included in the implementation plan. Plans to include an External Advisory Board are encouraged; however, applicants must be careful to avoid potential conflicts of interest (COIs) during review of the application by ensuring no contact with, recruiting of, or naming of specific members in the application. For multi-institutional collaborations, plans for communication and data transfer among the collaborating institutions, as well as how data, specimens, and/or imaging products obtained during the study will be handled, must be included. An intellectual and material property plan agreed to by participating organizations is required in the application's supporting documentation.

Research Team: The overall effort will be led by a Principal Investigator (PI) with demonstrated success in leading large, focused projects. The PI is required to devote a minimum

of 20% effort to this award. The PI should create an environment that fosters and supports collaboration and innovation in a way that engages all members of the team in all aspects of the research plan. The research team assembled by the PI should be highly qualified and multidisciplinary, with identified project leaders for each of the complementary and synergistic research projects. The resources and expertise brought to the team by each project leader should combine to create a robust, synergistic collaboration. The PRMRP Science Officer assigned to a resulting award must be invited to participate in periodic research team meetings. The plan for such meetings should be noted in the application.

Milestone Meeting: The PI will be required to present an update on progress toward accomplishing the goals of the award at a Milestone Meeting to be held in the National Capital Region after the conclusion of Year 2 of the period of performance. The PI may bring up to three additional members of the research team to the meeting. The Milestone Meeting will be attended by members of the PRMRP Programmatic Panel, CDMRP staff, and the USAMRAA Grants Officer.

Military Relevance: Relevance to the healthcare needs of military Service members, Veterans, and beneficiaries is a key feature of this award. Investigators are encouraged to consider the following characteristics as examples of how a project may demonstrate military relevance:

- Explanation of how the project addresses an aspect of the target disease/condition that has direct relevance to military Service members, Veterans, or other military health system beneficiaries

- Description of how the knowledge, information, products, or technologies gained from the proposed research could be implemented in a dual-use capacity to benefit the civilian population and also address a military need

- Use of military or Veteran populations or datasets in the proposed research, if appropriate to the proposed research project

- Involvement of military consultants (Army, Air Force) or specialty leaders (Navy, Marine Corps) to the Surgeons General in a relevant specialty area

PIs are strongly encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with the DoD or VA is also encouraged. A list of websites that may be useful in identifying additional information about ongoing DoD and VA areas of research interest or potential opportunities for collaboration within the FY17 PRMRP Topic Areas can be found in Appendix 3.

Use of Active Duty Military and VA Populations: If the proposed research plan involves access to active duty military and/or VA patient populations or resources, the PI is responsible for establishing such access. If possible, access to target active duty military and/or VA patient populations/resources should be confirmed at the time of application submission by inclusion of a letter of support, signed by the lowest ranking person with approval authority, for studies involving active duty military Service members, Veterans, military- and/or VA-controlled study materials, and military and/or VA databases. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until

the PI has demonstrated support for and access to the relevant population(s) and/or resources. Note that access to a Veteran population for clinical studies may only be obtained by either collaboration with a VA investigator where the VA investigator has a substantial role in the research or by advertising to the general public.

Research Involving Human Anatomical Substances, Human Subjects, or Human Cadavers: All DoD-funded research involving new and ongoing research with human anatomical substances, human subjects, or human cadavers must be reviewed and approved by the U.S. Army Medical Research and Materiel Command (USAMRMC) Office of Research Protections (ORP), Human Research Protection Office (HRPO) prior to research implementation. This administrative review requirement is in addition to the local Institutional Review Board (IRB) or Ethics Committee (EC) review. Local IRB/EC approval at the time of submission is ***not*** required. The HRPO is mandated to comply with specific laws and requirements governing all research involving human anatomical substances, human subjects, or human cadavers that is supported by the DoD. These laws and requirements will necessitate information in addition to that supplied to the IRB/EC. ***Allow a minimum of 2 to 3 months for HRPO regulatory review and approval processes***. When possible, protocols should be written for research with human subjects and/or human anatomical substances that are specific to the DoD-supported effort outlined in the submitted application. Submission to HRPO of protocols covering more than the scope of work in the DoD-funded award will require HRPO review of the entire protocol as DoD-supported research and may include extensive modifications to meet DoD human subjects protection requirements. Refer to the General Application Instructions, Appendix 1, and the Human Subject Resource Document available on the electronic Biomedical Research Application Portal (eBRAP) "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) for additional information.

A clinical trial is defined as a prospective accrual of patients (human subjects) in whom an intervention (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the subject of that intervention or interaction.

Research Involving Animals: All projects should adhere to a core set of standards for rigorous study design and reporting to maximize the reproducibility and translational potential of preclinical research. The standards are described in Landis, S.C., et al. A call for transparent reporting to optimize the predictive value of preclinical research. *Nature* 2012, 490:187-191 (www.nature.com/nature/journal/v490/n7419/full/nature11556.html). While these standards are written for preclinical studies, the basic principles of randomization, blinding, sample-size estimation, and data handling derive from well-established best practices in clinical studies. Applicants should consult the ARRIVE (Animal Research: Reporting *In Vivo* Experiments) guidelines to ensure relevant aspects of rigorous animal research are adequately planned for and, ultimately, reported. The ARRIVE guidelines can be found at http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf

All DoD-funded research involving new and ongoing research with animals must be reviewed and approved by the USAMRMC ORP Animal Care and Use Review Office (ACURO), in addition to the local Institutional Animal Care and Use Committee (IACUC) of record. IACUC

approval at the time of submission is ***not*** required. Specific documents relating to the use of animals in the proposed research will be requested **if the application is selected for funding**. The ACURO must review and approve all animal use prior to the start of working with animals, including amendments to ongoing projects. PIs must submit the institutional animal use protocol, IACUC approval of that protocol, and a version of the animal use appendix titled "Research Involving Animals." ***Allow at least 2 to 3 months for ACURO regulatory review and approval processes for animal studies.*** Refer to the General Application Instructions, Appendix 1, for additional information.

The CDMRP intends that information, data, and research resources generated under awards funded by this Program Announcement be made available to the research community (which includes both scientific and consumer advocacy communities) and to the public at large. For additional guidance, refer to the General Application Instructions, Appendix 2, Section K.

Awards will be made no later than September 30, 2018. For additional information refer to Section II.F.1, Federal Award Notices.

II.C. Eligibility Information

II.C.1. Eligible Applicants

II.C.1.a. Organization: All organizations, including international organizations, are eligible to apply.

Government Agencies within the United States: Local, state, and Federal Government agencies are eligible to the extent that applications do not overlap with their fully funded internal programs. Such agencies are required to explain how their applications do not overlap with their internal programs.

As applications for this Program Announcement may be submitted by extramural and intramural organizations, these terms are defined below.

Extramural Organization: An eligible non-DoD organization. Examples of extramural organizations include academia, biotechnology companies, foundations, Government, and research institutes. *Extramural Submission: Application submitted by a non-DoD organization to Grants.gov.*

Intramural DoD Organization: A DoD laboratory, DoD military treatment facility, and/or DoD activity embedded within a civilian medical center. *Intramural Submission: Application submitted by a DoD organization for an intramural investigator who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility or in a DoD activity embedded within a civilian medical center.*

Note: Applications from an intramural organization or from an extramural non-DoD Federal organization may be submitted through a research foundation.

The USAMRAA makes awards to eligible organizations, not to individuals.

II.C.1.b. Principal Investigator:

- The PI must be an independent investigator at or above the level of Full Professor (or equivalent).
    - Project leaders for each of the complementary and synergistic research projects must be at or above the level of Assistant Professor (or equivalent).

An eligible PI, regardless of ethnicity, nationality, or citizenship status, must be employed by, or affiliated with, an eligible organization.

The CDMRP encourages all PIs to participate in a digital identifier initiative through Open Researcher and Contributor ID, Inc. (ORCID). Registration for a unique ORCID identifier can be done online at http://orcid.org/.

II.C.2. Cost Sharing

Cost sharing/matching is not an eligibility requirement.

II.C.3. Other

Extramural organizations must be able to access **.gov** and **.mil** websites in order to fulfill the financial and technical deliverable requirements of the award and submit invoices for payment.

There are no limitations on the number of applications for which an investigator may be named as a PI.

For general information on required qualifications for award recipients, refer to the General Application Instructions, Appendix 3.

Refer to Section II.H.2, Administrative Actions, for a list of administrative actions that may be taken if a pre-application or application does not meet the administrative, eligibility, or ethical requirements defined in this Program Announcement.

II.D. Application and Submission Information

Submission of applications that are essentially identical or propose essentially the same research project to different funding opportunities within the same program and fiscal year is prohibited and will result in administrative withdrawal of the duplicative application(s). ***As an exception, applicants may submit a research project described in their FY17 PRMRP Focused Program Award to the Discovery Award (Funding Opportunity Number: W81XWH-17-PRMRP-DA), Investigator-Initiated Research Award (Funding Opportunity Number: W81XWH-17-PRMRP-IIRA), and/or Clinical Trial Award (Funding Opportunity Number: W81XWH-17-PRMRP-CTA); however, accepting multiple awards to support the same project will not be allowed.***

Extramural Submission is defined as an application submitted by a non-DoD organization to Grants.gov.

Intramural Submission is defined as an application submission by a DoD organization for an intramural investigator, who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility, or working in a DoD activity embedded within a civilian medical center.

II.D.1. Address to Request Application Package

Submitting Extramural and Intramural Organizations: Pre-application content and forms can be accessed at eBRAP (https://eBRAP.org).

Submitting Extramural Organizations: Full application packages can be accessed at Grants.gov.

Submitting Intramural DoD Organizations: Full application packages can be accessed at eBRAP.org.

Contact information for the CDMRP Help Desk and the Grants.gov Contact Center can be found in Section II.G, Federal Awarding Agency Contacts.

II.D.2. Content and Form of the Application Submission

Submission is a two-step process requiring both ***pre-application*** and ***full application*** as indicated below. The submission process should be started early to avoid missing deadlines. There are no grace periods.

Pre-application Submission: All pre-applications for both extramural and intramural organizations must be submitted through eBRAP (https://eBRAP.org/).

eBRAP is a multifunctional web-based system that allows PIs to submit their pre-applications electronically through a secure connection, to view and edit the content of their pre-applications and full applications, to receive communications from the CDMRP, and to submit documentation during award negotiations and period of performance.

Full Application Submission: Full applications must be submitted through the online portals as described below.

***Submitting Extramural Organizations*:** Full applications from extramural organizations must be submitted through Grants.gov. Applications submitted by extramural organizations (e.g., research foundations) on behalf of intramural DoD or other Federal organizations or investigators will be considered extramural submissions.

Submitting Intramural DoD Organizations: Intramural DoD organizations may submit full applications to either eBRAP or Grants.gov. Intramural DoD organizations that are unable to submit to Grants.gov should submit through eBRAP. Intramural DoD organizations with the capability to submit through Grants.gov may submit following the instructions for extramural submissions through Grants.Gov or may submit to eBRAP. Applications from extramural organizations, including non-DoD Federal organizations, received through eBRAP will be withdrawn. See definitions in Section II.C.1, Eligible Applicants.

For both Extramural and Intramural applicants: A key feature of eBRAP is the ability of an organization's representatives and PIs to view and modify the full application submissions associated with them. eBRAP will validate full application files against the specific Program Announcement requirements and discrepancies will be noted in an email to the PI and in the Full Application Files tab in eBRAP. It is the applicant's responsibility to review all application components for accuracy as well as ensure proper ordering as specified in this Program Announcement.

The application title, eBRAP log number, and all information for the PI, Business Official(s), performing organization, and contracting organization must be consistent throughout the entire pre-application and application submission process. Inconsistencies may delay application processing and limit or negate the ability to view, modify, and verify the application in eBRAP. If any changes need to be made, the applicant should contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 prior to the application deadline.

II.D.2.a. Step 1: Pre-Application Submission Content

During the pre-application process, each submission is assigned a unique log number by eBRAP. This unique eBRAP log number will be needed during the full application submission process.

To begin the pre-application process, first select whether the submitting organization is extramural or intramural, then confirm your selection or cancel. **Incorrect selection of extramural or intramural submission type may result in delays in processing.**

If an error has been made in the selection of extramural versus intramural and the pre-application submission deadline has passed, the PI or Business Official must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

All pre-application components must be submitted by the PI through eBRAP (https://eBRAP.org/). Because the invitation to submit an application is based on the contents of the pre-application, investigators should not change the title or research objectives after the pre-application is submitted.

PIs and organizations identified in the pre-application should be the same as those intended for the subsequent application submission. If any changes are necessary after submission of the pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

The pre-application consists of the following components, which are organized in eBRAP by separate tabs (refer to the General Application Instructions, Section II.B, for additional information on pre-application submission):

- **Tab 1 – Application Information**

  Select the FY17 PRMRP Topic Area addressed by the proposed research. If the proposed research project is aligned with more than one FY17 PRMRP Topic Area, select the Topic Area of highest relevance as the required first choice.

- **Tab 2 – Application Contacts**

  Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration (the "person to be contacted on matters involving this application" in Block 5 of the Grants.gov SF424 (R&R) Form for extramural submissions). The Business Official must be either selected from the eBRAP list or invited in order for the pre-application to be submitted.

  Select the performing organization (site at which the PI will perform the proposed work) and the contracting organization (organization submitting on behalf of the PI, which corresponds to Block 5 on the Grants.gov SF424 (R&R) Form for extramural submissions), and click on "*Add Organizations to this Pre-application.*" The organizations must be either selected from the eBRAP drop-down list or invited in order for the pre-application to be submitted.

  It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-application submission is needed.

- **Tab 3 – Collaborators and Key Personnel**

  Enter the name, organization, and role of all collaborators and key personnel associated with the application.

  FY17 PRMRP Programmatic Panel members should not be involved in any pre-application or application. For questions related to Panel members and pre-applications or applications, refer to Section II.H.2.c, Withdrawal, or contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

  To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in pre-application or application preparation, research, or other duties for submitted pre-applications or applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Pre-applications or applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- **Tab 4 – Conflicts of Interest**

  List all individuals other than collaborators and key personnel who may have a COI in the review of the application (including those with whom the PI has a personal or professional relationship). Refer to the General Application Instructions, Appendix 3, Section C, for further information regarding COIs.

- **Tab 5 – Pre-Application Files**

  Note: Upload documents as individual PDF files unless otherwise noted. eBRAP will not allow a file to be uploaded if the number of pages exceeds the limit specified below.

- **Preproposal Narrative (five-page limit):** The Preproposal Narrative page limit applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Preproposal Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the pre-application.

  The Preproposal Narrative should include the following:

  - **Topic Area:** Describe how the proposed program relates to at least one of the FY17 PRMRP Topic Areas. If applicable, describe how the proposed research program addresses an FY17 PRMRP Area of Encouragement (Appendix 2).

  - **Overarching Challenge:** Describe the unifying challenge or question to be addressed and how it is relevant to a critical problem or question in the field of research and/or patient care in at least one of the FY17 PRMRP Topic Area(s). Clearly articulate the rationale for the overarching challenge; include relevant preliminary data and literature citations.

  - **Research Strategy:** The FY17 PRMRP Focused Program Award strongly encourages a minimum of four individual but complementary research projects addressing the overarching challenge. For each proposed project, state the hypothesis to be tested, the specific aims, and the objectives to be reached. Briefly describe the experimental approach. Describe how the projects are interrelated to and synergistic with each other and align with the overarching challenge.

  - **Impact:** Describe the potential short-term and long-term impact of the proposed research on at least one of the FY17 PRMRP Topic Areas and its related research field(s), and patient population(s). Explain how the effort is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

  - **Research Team:** Briefly describe the composition, expertise, and organization of the research team. Identify the project leaders and describe each team member's role in the projects, with additional emphasis on the leadership role of the PI. Briefly describe how these features will facilitate the success of the key aspects of the projects.

  - **Clinical Trial (if applicable):** If the proposed research includes a clinical trial(s), briefly state the clinical intervention(s), subject population(s), and the type and phase of the clinical trial(s). Describe the objectives of the clinical trial(s), how it addresses the overarching challenge, and how it complements the other proposed projects. ***Only small-scale (i.e., up to and including Phase II or equivalent) clinical trials are allowed.***

- **Pre-Application Supporting Documentation:** The items to be included as supporting documentation for the pre-application ***must be uploaded as individual files*** and are limited to the following:

- References Cited (one-page limit): List the references cited (including URLs if available) in the Preproposal Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, reference title, and reference source, including volume, chapter, page numbers, and publisher, as appropriate).

- List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols used in the Preproposal Narrative.

- Key Personnel Biographical Sketches (five-page limit per individual). ***All biographical sketches should be uploaded as a single combined file.*** Biographical sketches should be used to demonstrate background and expertise through education, positions, publications, and previous work accomplished.

- **Tab 6 – Submit Pre-Application**

  This tab must be completed for the pre-application to be accepted and processed.

Pre-Application Screening

Pre-Application Screening Criteria

To determine the technical merits of the pre-application and the relevance to the mission of the DHP and the PRMRP, pre-applications will be screened based on the following criteria:

- **Overarching Challenge:** How well the unifying challenge or question addresses a critical problem or question in the field of research and/or patient care of one or more FY17 PRMRP Topic Area(s). How well the rationale supports the overarching challenge.

- **Research Strategy:** How well a hypothesis and specific aims are defined for each proposed project and to what extent each project's approach will address them. How well the proposed projects complement each other and synergistically address the overarching challenge to advance a solution beyond what would be possible through individual efforts.

- **Impact:** Whether the potential immediate and long-range outcome(s)/product(s) (intellectual and/or material) of the proposed research, if successful, will impact a central critical problem or question in the field of research and/or patient care in the FY17 PRMRP Topic Area(s) addressed. To what degree the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Research Team:** To what degree the background and expertise of the PI, project leaders, and key personnel are appropriate with respect to their abilities to successfully complete the projects and the extent to which the PI is well prepared and committed to lead the research team and proposed projects.

Notification of Pre-Application Screening Results

Following the pre-application screening, PIs will be notified as to whether or not they are invited to submit applications; however, they will not receive feedback (e.g., a critique of strengths and

weaknesses) on their pre-application. The estimated time frame for notification of invitation to submit an application is indicated in Section I, Overview of the Funding Opportunity. Invitations to submit a full application are based on the Pre-Application Screening Criteria listed above.

II.D.2.b. Step 2: Full Application Submission Content

Applications will not be accepted unless the PI has received notification of invitation.

All contributors and administrators to the application must use matching compatible versions of Adobe software when editing and preparing application components. The use of different software versions will result in corruption of the submitted file. Refer to the General Application Instructions, Section III, for details on compatible Adobe software.

The CDMRP cannot make allowances/exceptions to its policies for submission problems encountered by the applicant organization using system-to-system interfaces with Grants.gov.

Each application submission must include the completed full application package for this Program Announcement. The full application package is submitted by the Authorized Organizational Representative through Grants.gov (http://www.grants.gov/) for extramural organizations or through eBRAP (https://ebrap.org/) for intramural organizations. See Table 1 below for more specific guidelines.

II.D.2.b.i. Full Application Guidelines

Extramural organizations, including non-DoD Federal agencies, must submit full applications through Grants.gov. Submissions of extramural applications through eBRAP may be withdrawn.

Table 1. Full Application Submission Guidelines

Extramural Submissions	Intramural DoD Submissions
Application Package Location	
Download application package components for W81XWH-17-PRMRP-FPA from Grants.gov (http://www.grants.gov).	Download application package components for W81XWH-17-PRMRP-FPA from eBRAP (https://ebrap.org).
Full Application Package Components	
SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.	**Tab 1 – Summary:** Provide a summary of the application information. **Tab 2 – Application Contacts:** This tab will be pre-populated by eBRAP; add Authorized Organizational Representative.

Extramural Submissions	Intramural DoD Submissions
Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Research & Related Senior/Key Person Profile (Expanded) • Research & Related Budget • Project/Performance Site Location(s) Form • R&R Subaward Budget Attachment(s) Form (if applicable)	**Tab 3 – Full Application Files:** Upload files under each Application Component in eBRAP. Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Key Personnel • Budget • Performance Sites **Tab 4 – Application and Budget Data:** Review and edit proposed project start date, proposed end date, and budget data pre-populated from the Budget Form.
Application Package Submission	
Submit package components to Grants.gov (https://www.grants.gov/). If either the Project Narrative or the budget fails eBRAP validation or if the Project Narrative or the budget need to be modified, an updated Grants.gov application package must be submitted via Grants.gov as a "Changed/Corrected Application" with the previous Grants.gov Tracking ID prior to the application submission deadline.	**Submit package components to eBRAP (https://ebrap.org).** **Tab 5 – Submit/Request Approval Full Application:** After all components are uploaded and prior to the full application submission deadline, enter your password in the space provided "Enter Your Password Here" and press the "Submit Full Application" button. eBRAP will notify your Resource Manager/Comptroller or equivalent Business Official by email to log into eBRAP to review and to approve prior to the application submission deadline.
Application Verification Period	
The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.	After eBRAP has processed the full application, the organizational Resource Manager/ Comptroller or equivalent Business Official and PI(s) will receive an email notification of this status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.
Further Information	
Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.	Refer to the General Application Instructions, Section IV, for further information regarding eBRAP requirements.

The organization's Business Official or Authorized Organization Representative (or Resource Manager/Comptroller) should approve/verify the full application submission prior to the application verification deadline.

Application viewing, modification, and verification in eBRAP are strongly recommended, but not required. ***The Project Narrative and Budget cannot be changed after the application submission deadline.*** Prior to the full application deadline, a corrected or modified full application package may be submitted. Other application components may be changed until the end of the application verification period. After the end of the application verification period, the full application cannot be modified.

Material submitted after the end of the application verification period, unless specifically requested by the Government, will not be forwarded for processing.

The full application package must be submitted using the unique eBRAP log number to avoid delays in application processing.

II.D.2.b.ii. Full Application Submission Components:

- **Extramural Applications Only –**

  SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.

- **Extramural and Intramural Applications –**

  Attachments:

  Each attachment to the full application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Application Instructions, Appendix 4.

  For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or incorrect file names that contain characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some circumstances. Individual attachments may not exceed 20 MB and the file size for the entire full application package may not exceed 200 MB.

  - **Attachment 1: Project Narrative (40-page limit):** Upload as "ProjectNarrative.pdf." The page limit of the Project Narrative applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Project Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the application.

    Describe the proposed project in detail using the outline below.

Overall Program: Provide a description of the comprehensive effort using the following outline. Applicants are strongly encouraged to submit a minimum of four research projects; additional studies are allowed. Emphasize areas of synergy throughout the narrative.

- **Overarching Challenge:** Describe the unifying, overarching challenge or question to be addressed and how it is relevant to a critical problem or question in the field of research and/or patient care in one or more FY17 PRMRP Topic Areas. Clearly articulate the rationale for the overarching challenge; include relevant literature citations. Clearly describe how the proposed research projects are interrelated and synergistic and will advance toward a solution through a multidisciplinary research program. Describe how each project will address the overarching challenge in a unique but complementary way and how the combined efforts of the projects will address the overarching challenge more effectively than if the projects were conducted independently.

- **Leadership:** Describe how the PI's research experience, leadership skills, and commitment to making an impact in his/her field of research and/or patient care demonstrate substantial qualifications to coordinate this collaborative effort. Describe the PI's demonstrated success in leading large, focused projects and outline the PI's responsibilities during the conduct of the award. Discuss the qualifications of the research team being brought together by the PI and how the assembled expertise will create a robust, synergistic collaboration necessary to address the overarching challenge and enable the success of the proposed research.

- **Implementation Plan and Environment:** Provide an overall strategic plan for completing the proposed projects that identifies critical milestones. Outline the knowledge, expertise, and technical innovations that the investigative team will utilize to make decisions, allocate resources, and accomplish the milestones. Describe and/or provide evidence that the research can be initiated without delay once the award is made. Present an overall management plan to facilitate consistent and intensive interactions by all team members, including aspects such as adherence to regulatory requirements, administrative support, and oversight to accelerate translation of the projects' outcomes to patients and/or for clinical use. Describe the research environment(s) and how the facilities and resources will support the research requirements and the collaboration. Outline shared resources and/or cores that will be created and/or leveraged through the award. Describe plans for communication, data transfer among the collaborating institutions, and how data, specimens, and/or imaging products obtained during the study will be handled. If applicable, describe how Standard Operating Procedures will be created, reviewed, implemented, and modified during the course of the award. Describe how individual project performance will be assessed during the course of the award, including progression toward defined milestones, realization of study objectives, and addressing the overarching challenge. If an External Advisory Board (EAB) is to be utilized, describe the role of the board and the expertise to be sought in its members. To avoid potential COIs in the review of the application, potential candidates for an EAB should not be contacted, recruited, or named during the application process.

Research Plan: Provide the following details for each proposed research project, organizing each project clearly and separately. Start each project on a separate page:

- **Title:** Provide a title for each project.

- **Project Leader:** Identify the project leader and any key personnel, as appropriate, describing each person's qualifications and specific contributions to the project.

- **Background:** Briefly describe the ideas and reasoning on which the proposed work is based. Provide sufficient preliminary data to support the feasibility of work proposed. If the project is exploratory/hypothesis-developing, preliminary data are not required. For each project, the leader must demonstrate logical reasoning and provide a sound scientific rationale for the proposed project as established through a critical review and analysis of published literature. If proposing translational or clinical research, it is important to describe the project showing proof of concept and, if applicable, efficacy in an in-vivo system(s) to support the translational feasibility and promise of the approach.

- **Hypothesis/Objective:** State the hypothesis to be tested and/or the objective(s) to be reached.

- **Specific Aims:** Concisely explain each project's specific aims. The specific aims should align with the overall goal of the program and associated tasks described in the Statement of Work.

- **Research Strategy:** Describe the experimental design, methods, and analyses, in sufficient detail for analysis. Provide a description of how the study will be controlled and how the study variables will be measured. If the project is a clinical trial, define the primary and secondary endpoints and how they will be assessed. Explain how the research strategy will address the overarching challenge and meet appropriate milestones. Address potential problem areas and present alternative methods and approaches. Clearly describe the statistical plan and the rationale for the statistical methodology as well as an appropriate power analysis, if applicable. If animal studies are proposed, describe how they will be conducted in accordance with the ARRIVE guidelines (http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf). Justify how the model system or human subjects/samples are appropriate to the proposed research project. If human subjects or human biological samples will be used, describe the study population and include a detailed plan for the recruitment of human subjects or the acquisition of samples. Describe the availability of the proposed study population and past successes in recruiting similar populations. If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe how access to the population(s)/dataset(s) will be obtained. If applicable, describe how data will be reported and how it will be assured that the documentation will support a regulatory filing with the U.S. Food and Drug Administration (FDA).

- **Statistical Plan:** Clearly describe a statistical plan appropriate to the type of study; provide the rationale for the statistical methodology. Define the number of samples and/or subjects (animal and/or human) to be used, and include a power analysis to demonstrate that the sample size is appropriate to meet the objectives of the study.

- **Impact:** Describe the anticipated outcome(s)/product(s) (intellectual and/or material) that will be directly attributed to the results of the proposed research. Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable.

- **Clinical Trial (if applicable):** ***Only small-scale (e.g., up to and including Phase II or equivalent) clinical trials are allowed.*** Provide detailed plans for initiating and conducting the clinical trial during the course of this award. As appropriate, outline a plan for applying for and obtaining Investigational New Drug/Investigational Device Exemption (IND/IDE) status (or other FDA approvals). Describe the type of clinical trial to be performed (e.g., prospective, randomized, controlled) and indicate the phase of trial and/or class of device, as appropriate. Outline the regulatory strategy. Provide preclinical and/or clinical evidence to support the safety of the intervention.

    - Identify the intervention to be tested and describe the projected outcomes. Describe how the proposed intervention compares with currently available interventions and/or standards of care. Include a discussion of any current clinical use of the intervention under investigation, and/or details of its study in clinical trials for other indications (as appropriate).

    - Describe the methods that will be used to recruit a sample of human subjects from the accessible population (e.g., convenience, simple random, stratified random). Provide information on and justification for the inclusion and exclusion criteria.

    - Describe the process for obtaining informed consent and any screening procedures required to determine eligibility for study participation.

    - Describe the human subject-to-group assignment process (e.g., randomization, block randomization, stratified randomization, age-matched controls, alternating group, or other procedures), if applicable. Explain the specific actions to accomplish the group assignment (e.g., computer assignment, use of table of random numbers). If multiple site studies are involved, state the approximate number of subjects to be enrolled at each site.

    - Provide evidence to document the availability of and access to all critical reagents, including the intervention itself, if applicable, for the duration of the proposed trial.

    - Describe how quality control will be addressed. Describe how compliance with Good Laboratory Practices (GLP), Good Manufacturing Practices (GMP), and Good Clinical Practices (GCP) guidelines will be established, monitored, and maintained, as applicable.

- Describe the composition of the clinical trial team. Provide details on how the team (including investigator(s), study coordinator, and statistician) possesses the appropriate expertise in conducting clinical trials.

- **Attachment 2: Supporting Documentation:** Combine and upload as a single file named "Support.pdf." Start each document on a new page. If documents are scanned to PDF, the lowest resolution (100 to 150 dpi) should be used. The Supporting Documentation attachment should not include additional information such as figures, tables, graphs, photographs, diagrams, chemical structures, or drawings. These items should be included in the Project Narrative. Any additional material viewed as an extension of the Project Narrative will be removed or may result in administrative withdrawal of the application.

  There are no page limits for any of these components unless otherwise noted. Include only those components described below; inclusion of items not requested will result in the removal of those items or may result in administrative withdrawal of the application.

  - References Cited: List the references cited (including URLs, if available) in the Project Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, title of reference, source of reference, volume, chapter, page numbers, and publisher, as appropriate).

  - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

  - Facilities, Existing Equipment, and Other Resources: Describe the facilities and equipment available for performance of the proposed project and any additional facilities or equipment proposed for acquisition at no cost to the award. Indicate whether or not Government-furnished facilities or equipment are proposed for use. If so, reference should be made to the original or present Government award under which the facilities or equipment items are now accountable. There is no form for this information.

  - Publications and/or Patents: Include a list of relevant publication URLs and/or patent abstracts. If publications are not publicly available, then copies of up to eight published manuscripts may be included in Attachment 2. Extra items will not be reviewed.

  - Letters of Organizational Support: Provide a letter (or letters, if applicable), signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. Letters of support not requested in the Program Announcement, such as those from members of Congress, do not impact application review or funding decisions.

  - Letters of Collaboration: Provide a signed letter from each collaborating individual or organization that will demonstrate that the PI has the support or resources necessary for the proposed work. If an investigator at an intramural organization is

named as a collaborator on an application submitted through an extramural organization, the application must include a letter from the collaborator's Commander or Commanding Officer at the intramural organization that authorizes the collaborator's involvement.

- Letters of Commitment (if applicable): If the proposed study involves use of a commercially produced investigational drug, device, or biologic, provide a letter of commitment from the commercial entity indicating availability of the product for the duration of the study, support for the proposed phase of research, and support for the indication to be tested.

- Letters Confirming Access to Military or VA Patient Populations or Resources (if applicable): If the proposed research plan involves access to active duty military and/or VA patient populations or resources, include a letter of support, signed by the lowest ranking person with approval authority, confirming such access. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resources.

- Intellectual Property: Information can be found in Code of Federal Regulations, Title 2, Part 200.315 (2 CFR 200.315), "Intangible Property."

  - Intellectual and Material Property Plan (if applicable): Provide a plan for resolving intellectual and material property issues among participating organizations.

- Data and Research Resources Sharing Plan: Describe how data and resources generated during the performance of the project will be shared with the research community. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- **Attachment 3: Technical Abstract (one-page limit):** Upload as "TechAbs.pdf." The technical abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Clarity and completeness within the space limits of the technical abstract are highly important. Describe the proposed research effort including the following elements:

  - **Overarching Challenge:** Identify the unifying, overarching challenge or question that will be addressed by the research plan and describe how it relates to a critical problem or question in one or more of the FY17 PRMRP Topic Areas.

  - **Background:** Briefly articulate the rationale for the overarching challenge and the proposed research.

- **Research Plan:** Provide a brief description of the studies proposed, including hypotheses, objectives, and scientific approach.

- **Impact:** Briefly describe the potential short-term and long-term impact of the results of the proposed research on at least one of the FY17 PRMRP Topic Areas and its related research field(s) and patient population(s).

- **Military Relevance:** Explain how the effort is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Attachment 4: Lay Abstract (one-page limit):** Upload as "LayAbs.pdf." The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***. Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  State the FY17 PRMRP Topic Area(s) addressed by the proposed research program. Include a comprehensive overview of the effort that can be ***readily understood by readers without a background in science or medicine.*** Clearly describe the central critical problem or question to be addressed and the ultimate applicability and impact of the research. Do not duplicate the technical abstract.

- **Attachment 5: Statement of Work (SOW) (eight-page limit):** Upload as "SOW.pdf." The suggested SOW format and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm). For the Focused Program Award mechanism, use the SOW format example titled "SOW for Collaborative Projects ." The SOW must be in PDF format prior to attaching.

  The SOW should include a list of major tasks that support the proposed specific aims, followed by a series of subtasks outlined related to the major tasks and milestones within the period of performance. The SOW should describe only the work for which funding is being requested by this application and, as applicable, should also:

  Include the name(s) of the key personnel and contact information for each study site/ subaward site.

  Indicate the number (and type, if applicable) of research subjects (animal or human) and/or human anatomical samples projected or required for each task and at each site. Refer to the General Application Instructions, Appendix 1, for additional information regarding regulatory requirements.

  Briefly state the methods to be used.

  For studies with prospective accrual of human subjects, indicate quarterly enrollment targets.

Identify cell line(s) and commercial or organizational source(s) to be used. If human anatomical substances (including cell lines) will be used, specify whether or not identifiable information is accessible to the research team by any means.

If applicable, indicate timelines required for regulatory approvals relevant to human subjects research (e.g., IND/IDE applications) by the FDA or other Government agency.

- **Attachment 6: Impact Statement (two-page limit): Upload as "Impact.pdf."**

  - Explain why the proposed program is important and relevant to understanding the cause or progression of the disease or condition, and/or to developing improvements in prevention, detection, diagnosis, treatment, or quality of life in the FY17 PRMRP Topic Area(s) addressed. Describe how the overarching challenge addresses a central critical problem or question in the relevant Topic Area(s). If applicable, describe how the project addresses an FY17 PRMRP Area of Encouragement (Appendix 2). In addition to articulating the potential impact of the overall program, address the potential impact of each individual project. Explain how the various projects' outcomes will ultimately be translated to patients.

  - ***Describe the short-term impact:*** Detail the anticipated outcome(s)/product(s) (intellectual and/or material) that will be directly attributed to the results of the proposed research.

  - ***Describe the long-term impact:*** Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable. Explain the long-range vision for how the research will impact the field of study and/or patient care.

- **Attachment 7: Military Relevance Statement (one-page limit): Upload as "MilRel.pdf."**

  - Describe how the proposed effort is responsive to the healthcare needs of military Service members, Veterans, and/or beneficiaries. Provide information about the incidence and/or prevalence of the disease or condition to be studied in the general population as well as in military Service members, Veterans, and/or beneficiaries.

  - If active duty military, military families, and/or Veteran population(s) or dataset(s) will be used in the proposed research project, describe the population(s)/dataset(s) and the appropriateness of the population(s)/dataset(s) for the proposed study. If a non-military population will be used for the proposed research project, explain how the population simulates the targeted population (i.e., military Service members, Veterans, and/or beneficiaries).

  - If applicable, show how the proposed research project aligns with DoD and/or VA areas of research interest and/or patient care. Provide a description of how the knowledge, information, products, or technologies gained from the research could be implemented in a dual-use capacity to benefit the civilian population and address a military need, as appropriate.

- **Attachment 8: Transition Plan and Regulatory Strategy (three-page limit): Upload as "Transition.pdf."**

  - Provide information on the methods and strategies proposed to move the product or knowledge outcomes of the program to the next phases of development and to eventual clinical use. Articulate this information for the overall effort as well as the individual projects. Applicants are encouraged to work with their organization's Technology Transfer Office (or equivalent) to develop the transition plan. The transition plan should include the components listed below, as appropriate:

  - A description of the outcomes expected upon completion of the proposed research efforts. Outcomes should be specific, measurable, and should include the intended end user.

  - Details of the funding strategy that will be used to bring the outcomes to the next phase of development and/or delivery to market or incorporation into patient care (e.g., specific potential industry partners, specific funding opportunities to be applied for).

  - Details of the development plan and FDA regulatory strategy, to include considerations for compliance with GMP, GLP, and GCP guidelines (if appropriate).

  - For knowledge outcomes, a description of how the knowledge will be further developed, disseminated, and incorporated into clinical/patient care.

  - A description of collaborations and other resources that will be used to provide continuity of development.

  - A brief schedule and milestones for bringing the outcomes to the next phase of development (e.g., further research, clinical trials, transition to industry, delivery to the market, incorporation into clinical practice, approval by the FDA).

  - If applicable, ownership rights and/or access to the intellectual property necessary for the development and/or commercialization of products or technologies supported with this award and the Government's ability to access such products or technologies in the future.

- **Attachment 9: Data and Research Resource Sharing Plan (one-page limit): Upload as "Sharing.pdf."**

  - Describe how data and resources generated during the performance of the proposed research projects will be shared with the research community. This includes cases where pre-existing data or research resources will be utilized and/or modified during the course of the proposed projects. Specifically describe a plan to make animal models, tissue samples, and other resources developed as part of the proposed research projects available to the scientific community. If there are limitations associated with a pre-existing agreement for the original data or research resources that preclude subsequent sharing, the applicant should explain this in the data- and/or

research resource-sharing plan. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- In preparing requested budgets, applicants may include anticipated costs associated with data- and research resource-sharing (i.e., making a large dataset available to the public or developing an important resource for the scientific community).

- **Attachment 10: IND/IDE Documentation:** ***Only applicable for applications that include a clinical trial(s).*** If submitting multiple documents, start each document on a new page. **Combine and upload as a single file named "IND-IDE.pdf."** The IND/IDE Documentation Form located on the eBRAP website may ***not*** be used in place of this information:

  - State whether the trial(s) requires regulation by the FDA. If FDA regulation is required, describe the planned indication for the proposed product and whether an IND/IDE is necessary.

  - If an IND or IDE application is required, indicate when it was submitted to the FDA and provide an explanation of the status of the IND or IDE application (e.g., past the critical 30-day period, pending response to questions raised by the Agency, on clinical hold). If the IND or IDE application has not been submitted to the FDA yet, provide a detailed timeline with appropriate milestones for application preparation and submission. Identify any consultants or experts who will assist in the regulatory application, if applicable, and include a copy of any curricula vitae or biographical sketches in the Key Personnel Biographical Sketches section of the application. Provide a summary of previous meetings with the FDA on development of this product, if appropriate. A copy of the Agency meeting minutes should be included if available. Provide copies of communications from the FDA relevant to the most recent status of the IND or IDE application.

  - If an IND or IDE is not required for the proposed trial(s), or if it qualifies for an abbreviated IDE, provide evidence in the form of communication from the FDA or the IRB of record to that effect. Devices qualifying for an abbreviated IDE must comply with the abbreviated IDE requirements but do not require the submission of an IDE application to the FDA.

- **Attachment 11: DoD Military Budget Form(s), if applicable: Upload as "MFBudget.pdf."** If a military facility (military health system facility, research laboratory, treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center) will be a collaborator in performance of the project, complete the DoD Military Budget Form, available for download on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm), including a budget justification, for each military facility as instructed. The costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

- **Extramural and Intramural Applications –**

  Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

  - PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf." The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The National Institutes of Health Biographical Sketch may also be used. All biographical sketches should be submitted in the portable document format (PDF) that is not editable.

  - PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

  - Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."

  - Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

  Research & Related Budget: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.4, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.3, for detailed information.

  Budget Justification (no page limit): Upload as "BudgetJustification.pdf." The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

  Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.4, for detailed information.

- **Extramural Applications Only –**

  R&R Subaward Budget Attachment(s) Form (if applicable): Refer to the General Application Instructions, Section III.A.6, for detailed information.

  - **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.6, for detailed information.)

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov as Attachment 11. (Refer to the General Application Instructions, Section III.A.7, for detailed information.) Intramural DoD Collaborator(s) costs per year

should be included on the Grants.gov Research and Related Budget form under subaward costs. **DoD Military Budget Form:** A military facility collaborating in the performance of the project should be treated as a subaward for budget purposes. However, do not complete the Grants.Gov R&R Subaward Budget Attachment Form; instead, complete the DoD Military Budget Form (Attachment 11) to show all direct and indirect costs. The costs per year should be included on the Grants.gov Research & Related Budget Form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

II.D.3. Dun and Bradstreet Universal Numbering System (DUNS) Number and System for Award Management (SAM)

Applicant organizations and all subrecipient organizations must have a DUNS number to submit applications to Grants.gov. The applicant organization must also be registered in the Entity Management functional area of the SAM with an "Active" status to submit applications through the Grants.gov portal. Verify the status of the applicant's organization's Entity registration in SAM well in advance of the application submission deadline. Allow 3 to 4 weeks to complete the entire SAM registration process. If an applicant has not fully complied with the requirements by the time the Federal awarding agency is ready to make a Federal award, the Federal awarding agency may determine that the applicant is not qualified to receive a Federal award and use that determination as a basis for making a Federal award to another applicant. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.

II.D.4. Submission Dates and Times

All submission dates and times are indicated in Section I, Overview of the Funding Opportunity. Pre-application and application submissions are required. The pre-application and application submission process should be started early to avoid missing deadlines. There are no grace periods. Failure to meet either of these deadlines will result in submission rejection.

Applicant Verification of Full Application Submission in eBRAP

Prior to the end of the application verification period, PIs and organizational representatives can review and modify in eBRAP certain components of a submitted application. Following retrieval and processing of the full application, eBRAP will notify the organizational representatives and PI by email to log into eBRAP to review, modify, and verify the full application submission. eBRAP will validate retrieved files against the specific Program Announcement requirements and discrepancies will be noted in both the email and in the Full Application Files tab in eBRAP. eBRAP does not confirm the accuracy of file content. It is the applicant's responsibility to review all application components and ensure proper ordering as specified in the Program Announcement. ***If either the Project Narrative or the budget fails eBRAP validation or needs to be modified, an updated full application package must be submitted prior to the application submission deadline.*** The Project Narrative and Budget Form cannot be changed after the application submission deadline.

II.D.5. Funding Restrictions

The maximum period of performance is **4** years.

The anticipated total costs budgeted for the entire period of performance will not exceed **$10M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. No budget will be approved by the Government exceeding **$10M** total costs or using an indirect cost rate exceeding the organization's negotiated rate.

All direct and indirect costs of any subaward or contract must be included in the total direct costs of the primary award.

The applicant may request the entire maximum funding amount for a project that may have a period of performance less than the maximum **4** years.

For this award mechanism, direct costs must be requested for:

Travel costs for the PI and up to three additional members of the research team to attend a 1-day Milestone Meeting to be held in the National Capital Area during the award period of performance. This meeting will be held to provide a presentation on progress. Costs associated with travel to this meeting should be included in Year 3 of the budget. These travel costs are in addition to those allowed for annual scientific/technical meetings.

May be requested for (not all-inclusive):

- Salary
- Research supplies
- Equipment
- Research-related subject costs
- Clinical research costs
- Support for multidisciplinary collaborations, including travel
- Travel costs for up to four investigators to travel to one scientific/technical meeting per year in addition to the required meeting described above

Extramural (non-Federal) awards will consist solely of assistance agreements (Cooperative Agreements and Grants). For extramural awards with an intragovernmental component, direct transfer of funds from an extramural award recipient to a DoD or other Federal agency is not allowed except under very limited circumstances. Funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intragovernmental only funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intramural applicants are responsible for coordinating through their agency's procedures the use

of contractual or assistance funding awards or other appropriate agreements to support extramural collaborators.

Refer to the General Application Instructions, Section III.A.4, for budget regulations and instructions for the Research & Related Budget. ***For Federal agencies or organizations collaborating with Federal agencies, budget restrictions apply as are noted in the General Application Instructions, Section III.A.4***.

The CDMRP expects to allot approximately $60M of the $300M FY17 appropriation to fund approximately six Focused Program Award applications, depending on the quality and number of applications received. Funding of applications received in response to this Program Announcement is contingent upon the availability of Federal funds for this program.

II.D.6. Other Submission Requirements

Refer to the General Application Instructions, Appendix 4, for detailed formatting guidelines.

II.E. Application Review Information

II.E.1. Criteria

II.E.1.a. Peer Review

To determine technical merit, all applications will be evaluated according to the following scored criteria, which are of equal importance:

Scored Review Criteria for the Overall Program:

- **Overall Impact**
    - To what extent the overarching challenge impacts a critical problem or question in the designated FY17 PRMRP Topic Area(s).
    - To what degree the proposed program could, if successful, make a significant impact on the lives of relevant patient populations in the short term or long term.
    - How well the research projects are integrated, complement each other, and provide a synergistic, multidisciplinary approach to solving a critical problem.
    - How well the research program will, if successful:
        - Make important scientific advances in the relevant field of research
        - Promote greater understanding of the causes and progression of the relevant disease(s)/condition(s), or
        - Promote the development of improvements in prevention, detection, diagnosis, treatment, or quality of life

- **Implementation Plan**
    - How the proposed projects are supported by a detailed plan that identifies critical milestones and explains how these milestones will be achieved.
    - How well resources and/or cores that will be created or leveraged will be utilized and shared.
    - To what extent the plans to assess individual project performance during the course of the award are appropriate.
    - How well the overall management plan will facilitate consistent and intensive interactions by all team members in the projects.
    - How the proposed plans for communication, data and specimen collection, data transfer, and periodic meetings are appropriate and robust.
    - To what extent the plans for creating, reviewing, implementing, and modifying Standard Operating Procedures are appropriate, if applicable.
- **Leadership and Environment**
    - To what degree the PI is experienced in successfully leading large, focused projects and is therefore well-positioned to lead the research team in achieving the overarching goal of the proposed effort.
    - How well the PI demonstrates experience, leadership skills, and commitment to making an impact in the relevant field of research and/or patient care.
    - Whether the PI will devote a minimum of 20% effort to this award.
    - To what degree the scientific environment(s) is appropriate for the proposed research.
    - How well the research requirements are supported by the availability of and accessibility to facilities and resources (including patient populations, samples, and collaborative arrangements).
    - To what degree the quality and extent of organizational support are appropriate for the proposed research.
- **Transition Plan and Regulatory Strategy**
    - The degree to which the strategy proposed to bring the outcomes to the next level of development, including funding, milestones, and schedule, is realistic.
    - Whether appropriate collaborations and other resources for providing continuity of development are established and/or well described.
    - How the regulatory strategy and development plan are appropriate and well described.

- How well the application identifies intellectual property ownership, and whether there is sufficient evidence of a plan to resolve intellectual and material property issues, if applicable.

- Whether the applicant has demonstrated that they have access to all intellectual property rights necessary for development and commercialization and evidence that the Government has the ability to access such products or technologies, if applicable.

- If applicable, whether data will be appropriately reported and documented to support a regulatory filing with the FDA.

Scored Review Criteria for Individual Research Projects <u>without</u> a clinical trial:

- **Impact**

  - To what extent the individual project impacts the overarching challenge.

  - To what degree the individual project could, if successful, make a significant impact on the lives of relevant patient populations in the short term or long term.

  - How well the individual project will, if successful, make important scientific advances in the relevant field of research.

- **Research Strategy and Feasibility**

  - How well the scientific rationale supports the research and its feasibility, as demonstrated by a critical review and analysis of the literature, the presentation of preliminary data (where applicable), and logical reasoning.

  - How well the hypothesis, objectives, and aims are developed.

  - To what degree the experimental approach, methods, endpoints, and analyses support completion of the aims and are designed to achieve rigorous and reproducible results.

  - How well the choice of model (animal, cell line, or other) is justified and whether it is appropriate.

  - If applicable, to what degree the statistical plan and power analysis, including sample size projections, are appropriate for the proposed project.

  - Whether there is sufficient evidence to support availability and accessibility of the populations, samples, or other resources required for the study, if applicable.

  - How well potential problems are acknowledged and alternative approaches are addressed.

- **Personnel**

  - To what degree the project team's background and expertise are appropriate with respect to its ability to perform the proposed work, including whether there is evidence of

sufficient expertise for all aspects of the work and whether there is evidence of strong commitment to the projects.

- To what degree the levels of effort are appropriate for successful conduct of the proposed work.

Scored Review Criteria for Individual Research Projects <u>with</u> clinical trials:

- **Impact**
  - To what extent the individual project impacts the overarching challenge.
  - How well the individual project will, if successful, make important scientific advances in the relevant field of research.
  - How well the sample population represents the targeted patient population that might benefit from the proposed intervention.
  - How the potential outcomes of the proposed clinical trial will provide/improve short-term benefits for individuals.
  - How significantly the long-term benefits for implementation of the intervention may impact patient care and/or quality of life.
- **Research Strategy and Feasibility**
  - How well the scientific rationale supports the research and its feasibility, as demonstrated by a critical review and analysis of the literature, the presentation of preliminary data, and logical reasoning.
  - How well the hypothesis and/or objectives and specific aims are developed.
  - To what degree the experimental approach, methods, endpoints, and analyses support completion of the aims and are designed to achieve rigorous and reproducible results.
  - To what degree the statistical plan and power analysis, including sample size projections, are appropriate for the proposed trial and any proposed correlative studies.
  - How well the application demonstrates the availability of and access to the appropriate patient population(s), as well as the ability to accrue a sufficient number of subjects.
  - How well potential problems and delays (e.g., slow accrual, attrition) are acknowledged and alternative approaches are addressed.
- **Clinical Strategy**
  - How the intervention compares with currently available interventions and/or standards of care.

- Whether there is evidence of support, indicating availability of the intervention from its source, for the duration of the proposed clinical trial (if applicable).
- To what degree the PI has provided preclinical and/or clinical evidence to support the safety of the intervention.
- How well the inclusion and exclusion criteria meet the needs of the proposed clinical trial.
- The degree to which the informed consent, screening, and retention processes for human subjects will meet the needs of the proposed clinical trial.
- Whether a member of the study team holds the IND/IDE for the indication proposed or whether the timeline proposed for obtaining the IND/IDE is appropriate (if applicable).
- For investigator-sponsored INDs, whether there is evidence of appropriate institutional support, including capabilities to ensure monitoring as required by the FDA.
- Whether plans to comply with GMP, GLP, and GCP guidelines are appropriate.
- Whether measures are described to ensure the consistency of dosing of active ingredients for nutritional supplements (if applicable).

- **Personnel**
  - To what degree the project team's background and expertise are appropriate with respect to its ability to perform the proposed work, including whether there is evidence of sufficient expertise for all aspects of the work and whether there is evidence of strong commitment to the projects.
  - How well the project leader has assembled an appropriate and robust clinical team with the combined backgrounds and expertise needed to enable successful conduct of the clinical trial.
  - To what degree the levels of effort are appropriate for successful conduct of the proposed work.

In addition, the following unscored criteria will also contribute to the overall evaluation of the application:

- **Data and Resource Sharing**
  - To what degree the plan for sharing of project data and research resources is appropriate and reasonable to facilitate use by the wider research community.
- **Budget**
  - Whether the budget is appropriate for the proposed research and within the limitations of this Program Announcement.

- **Environment**
    - If applicable, to what degree the intellectual and material property plan is appropriate.
- **Application Presentation**
    - To what extent the writing, clarity, and presentation of the application components influence the review.

II.E.1.b. Programmatic Review

To make funding recommendations and select the application(s) that, individually or collectively, will best achieve the program objectives, the following criteria are used by programmatic reviewers:

- Ratings and evaluations of the peer reviewers
- Relevance to the mission of the DHP and FY17 PRMRP, as evidenced by the following:
    - Adherence to the intent of the award mechanism
    - Military relevance
    - Program portfolio composition
    - Relative impact

II.E.2. Application Review and Selection Process

All applications are evaluated by scientists, clinicians, and consumers in a two-tier review process. The first tier is peer review of applications against established criteria for determining technical merit. Each application is evaluated for its own merit, independent of other applications. The second tier is a programmatic review that makes recommendations for funding to the Commanding General, USAMRMC, on behalf of the DHA and the OASD(HA), based on technical merit, the relevance to the mission of the DHP and PRMRP, the specific intent of the award mechanism, and to other specified evaluation criteria in the Program Announcement. Programmatic review is a comparison-based process in which applications with scientific and technical merit compete in a common pool. ***The highest-scoring applications from the first tier of review are not automatically recommended for funding. Funding recommendations depend on various factors as described in Section II.E.1.b, Programmatic Review.*** Additional information about the two-tier process used by the CDMRP can be found at http://cdmrp.army.mil/about/fundingprocess.

All CDMRP review processes are conducted confidentially to maintain the integrity of the merit-based selection process. Panel members sign a statement that application and evaluation information will not be disclosed outside the panel. Violations of confidentiality can result in the dissolving of a panel(s) and other corrective actions. In addition, personnel at the applicant or collaborating organizations are prohibited from contacting persons involved in the review

process to gain protected evaluation information or to influence the evaluation process. Violations of these prohibitions will result in the administrative withdrawal of the organization's application. Violations by panel members or applicants that compromise the confidentiality of the review process may also result in suspension or debarment from Federal awards. Furthermore, the unauthorized disclosure of confidential information of one party to another third party is a crime in accordance with 18 USC 1905.

II.E.3. Integrity and Performance Information

Prior to making an assistance agreement award where the Federal share is expected to exceed the simplified acquisition threshold (currently $150,000) over the period of performance, the Federal awarding agency is required to review and consider any information about the applicant that is available in the Federal Awardee Performance and Integrity Information System (FAPIIS).

An applicant, at its option, may review FAPIIS, accessible through SAM, and submit comments to FAPIIS on any information about itself that a Federal awarding agency previously entered and is currently available in FAPIIS.

The Federal awarding agency will consider any comments by the applicant, in addition to other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics and record of performance under Federal awards when determining a recipient's qualification prior to award, according to the qualification standards of the Department of Defense Grant and Agreement Regulations (DoDGAR), Section 22.415.

II.E.4. Anticipated Announcement and Federal Award Dates

All application review dates and times are indicated in Section I, Overview of the Funding Opportunity.

Each PI and organization will receive email notification of posting of the funding recommendation in eBRAP. Each PI will receive a peer review summary statement on the strengths and weaknesses of the application.

II.F. Federal Award Administration Information

II.F.1. Federal Award Notices

Awards will be made no later than September 30, 2018. Refer to the General Application Instructions, Appendix 2, for additional award administration information.

Awards are made to organizations, not to individual PIs. The types of awards made under the Program Announcement will be assistance agreements (grants or cooperative agreements). The level of involvement on the part of DoD during project performance is the key factor in determining whether to award a grant or cooperative agreement.

Extramural Organizations: An assistance agreement (grant or cooperative agreement) is appropriate when the Federal Government transfers a "thing of value," to a "state, local

government," or "other recipient," to carry out a public purpose of support or stimulation authorized by a law of the United States, instead of acquiring property or service for the direct benefit and use of the U.S. Government. An assistance agreement can take the form of a grant or cooperative agreement. If "no substantial involvement" on the part of the funding agency is anticipated, a grant award will be made (31 USC 6304). Conversely, if substantial involvement on the part of the funding agency is anticipated, a cooperative agreement will be made (31 USC 6305). Substantial involvement may include collaboration, participation, or intervention in the research to be performed under the award. The award type, along with the start date, will be determined during the negotiation process.

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the USAMRAA will contact the business official authorized to negotiate on behalf of the PI's organization.

Only an appointed USAMRAA Grants Officer may obligate the Government to the expenditure of funds. No commitment on the part of the Government should be inferred from discussions with any other individual. The award document signed by the Grants Officer is the official authorizing documents.

Intramural Organizations: Awards to Federal Government organizations (to include intramural DoD organizations) will be executed through the Military Interdepartmental Purchase Request (MIPR) or Funding Authorization Document (FAD) process. Transfer of funds is contingent upon appropriate safety and administrative approvals. Intramural applicants and collaborators are reminded to coordinate receipt and commitment of funds through their respective resource managers (RM).

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the CDMRP will contact the business official authorized to negotiate on behalf of the PI's organization.

II.F.1.a. Award Transfers

Changes in PI are not allowed, except under extenuating circumstances that will be evaluated on a case-by-case basis and at the discretion of the Grants Officer. An organizational transfer of an award will not be allowed in the last year of the (original) period of performance or any extension thereof.

The organizational transfer of an award supporting a clinical trial is strongly discouraged and in most cases will not be allowed. Approval of a transfer request will be on a case-by-case basis at the discretion of the Grants Officer.

Refer to the General Application Instructions, Appendix 2, Section B, for general information on organization or PI changes.

II.F.2. Administrative and National Policy Requirements

Applicable requirements in the DoDGAR found in 32 CFR, Chapter 1, Subchapter C, and 2 CFR, Chapter XI, apply to grants and cooperative agreements resulting from this Program Announcement.

Refer to the General Application Instructions, Appendix 2, for general information regarding administrative requirements.

Refer to the General Application Instructions, Appendix 5, for general information regarding national policy requirements.

Refer to full text of the USAMRAA General Research Terms and Conditions for Institutions of Higher Education, Hospitals, and Non-Profit Organizations and the USAMRAA General Research Terms and Conditions with For-Profit Organizations for further information.

II.F.3. Reporting

Refer to the General Application Instructions, Appendix 2, Section A, for general information on reporting requirements. Annual progress reports as well as a final progress report will be required.

Quarterly technical progress reports will be required. In addition to written progress reports, in-person presentations may be requested.

Award Chart: Complete the Award Chart template, a one-page PowerPoint file that must be downloaded from the CDMRP eBRAP System at https://ebrap.org/eBRAP/public/Program.htm, and submit to eBRAP at the time of award.

Award Expiration Transition Plan: Complete the Transition Plan template, a one-page Word document that must be submitted with the Final Progress Report. The Transition Plan must outline if and how the research supported by this award will progress, and include source(s) of funding, either known or pending.

Awards resulting from this Program Announcement will incorporate additional reporting requirements related to recipient integrity and performance matters. Recipient organizations that have Federal contract, grant, and cooperative agreement awards with a cumulative total value greater than $10,000,000 are required to provide information to FAPIIS about certain civil, criminal, and administrative proceedings that reached final disposition within the most recent 5-year period and that were connected with performance of a Federal award. Recipients are required to disclose semiannually information about criminal, civil, and administrative proceedings as specified in the applicable Terms and Conditions. The applicable Terms and Conditions for institutions of higher education, hospitals, and nonprofit organizations are available in OAR Article I, Section B, in July 2016 R&D General Terms and Conditions. The applicable Terms and Conditions for for-profit organizations are available in Section 34 of the February 2017 USAMRAA General Research Terms and Conditions with For-Profit Organizations.

II.G. Federal Awarding Agency Contacts

II.G.1. CDMRP Help Desk

Questions related to Program Announcement content or submission requirements as well as questions related to the pre-application or intramural application submission through eBRAP should be directed to the CDMRP Help Desk, which is available Monday through Friday from 8:00 a.m. to 5:00 p.m. ET. Response times may vary depending upon the volume of inquiries.

Phone: 301-682-5507

Email: help@eBRAP.org

II.G.2. Grants.gov Contact Center

Questions related to extramural application submission through Grants.gov portal should be directed to the Grants.gov Contact Center, which is available 24 hours a day, 7 days a week (closed on U.S. Federal holidays). Note that the CDMRP Help Desk is unable to provide technical assistance with Grants.gov submission.

Phone: 800-518-4726; International 1-606-545-5035

Email: support@grants.gov

Sign up on Grants.gov for "send me change notification emails" by following the link on the Synopsis page for the Program Announcement or by responding to the prompt provided by Grants.gov when first downloading the Grants.gov application package. If the Grants.gov application package is updated or changed, the original version of the application package may not be accepted by Grants.gov.

II.H. Other Information

II.H.1. Program Announcement and General Application Instructions Versions

Questions related to this Program Announcement should refer to the Program name, the Program Announcement name, and the Program Announcement version code 20170516b. The Program Announcement numeric version code will match the General Applications Instructions version code 20170516.

II.H.2. Administrative Actions

After receipt of pre-applications or applications, the following administrative actions may occur:

II.H.2.a. Rejection

The following will result in administrative rejection of the pre-application:

- Preproposal Narrative is missing.

The following will result in administrative rejection of the application:

- Submission of an application for which a letter of invitation was not received.
- Project Narrative exceeds page limit.
- Project Narrative is missing.
- Budget is missing.
- Submission of the same research project to different Funding Opportunities within the same program and fiscal year. Refer to Section II.D, Application and Submission Information, for exceptions.

II.H.2.b. Modification

- Pages exceeding the specific limits will be removed prior to review for all documents other than the Project Narrative.
- Documents not requested will be removed.

II.H.2.c. Withdrawal

The following may result in administrative withdrawal of the pre-application or application:

- An FY17 PRMRP Programmatic Panel member is named as being involved in the research proposed or is found to have assisted in the pre-application or application processes including, but not limited to, concept design, application development, budget preparation, and the development of any supporting documentation. ***A list of the FY17 PRMRP Programmatic Panel members can be found at http://cdmrp.army.mil/prmrp/panels/panels17.shtml***.
- The application fails to conform to this Program Announcement description to the extent that appropriate review cannot be conducted.
- Inclusion of URLs, with the exception of links in References Cited and Publication and/or Patent Abstract sections.
- Page size is larger than 8.5 inches x 11.0 inches (approximately 21.59 cm x 27.94 cm).
- To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in the preparation, research or other duties for submitted applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the

CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- Personnel from applicant or collaborating organizations are found to have contacted persons involved in the review process to gain protected evaluation information or to influence the evaluation process.
- Applications from extramural organizations, including non-DoD Federal agencies, received through eBRAP may be withdrawn.
- Applications submitted by an intramural DoD organization may be withdrawn if the intramural organization cannot coordinate the use of contractual, assistance, or other appropriate agreements to provide funds to extramural collaborators.
- The proposed research project does not address at least one of the Congressionally directed FY17 PRMRP Topic Areas.
- An application for which the PI does not meet the eligibility criteria will be withdrawn.

II.H.2.d. Withhold

Applications that appear to involve research misconduct will be administratively withheld from further consideration pending organizational investigation. The organization will be required to provide the findings of the investigation to the USAMRAA Grants Officer for a determination of the final disposition of the application.

II.H.3. Application Submission Checklist

Application Components	Action	Completed
SF424 (R&R) Application for Federal Assistance **(Extramural submissions only)**	Complete form as instructed.	
Summary (Tab 1) and Application Contacts (Tab 2) **(Intramural submissions only)**	Complete these tabs as instructed.	
Attachments	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf."	
	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf."	
	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf."	
	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf."	
	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf."	
	Impact Statement: Upload as Attachment 6 with file name "Impact.pdf."	
	Military Relevance: Upload as Attachment 7 with file name "MilRel.pdf."	
	Transition Plan and Regulatory Strategy: Upload as Attachment 8 with file name "Transition.pdf."	
	Data and Research Resources Sharing Plan: Upload as Attachment 9 with file name "Sharing.pdf."	
	IND/IDE Documentation: Upload as Attachment 10 with file name "IND-IDE.pdf," if applicable.	
	DoD Military Budget Form(s): Upload as Attachment 11 with file name "MFBudget.pdf," if applicable.	
Research & Related Senior/Key Person Profile (Expanded)	Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field.	
	Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field.	
	Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field.	
	Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field.	

Application Components	Action	Completed
Research & Related Budget **(Extramural submissions only)**	Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field.	
Budget **(Intramural submissions only)**	Complete the DoD Military Budget Form and justification.	
Project/Performance Site Location(s) Form	Complete form as instructed.	
R&R Subaward Budget Attachment(s) Form, if applicable	Complete form as instructed.	
Additional Application Components	**Action**	**Completed**
Confidential Letters of Recommendation	Confirm upload to eBRAP.	

APPENDIX 1
ACRONYM LIST

ACURO	Animal Care and Use Review Office
CDMRP	Congressionally Directed Medical Research Programs
CFR	Code of Federal Regulations
DHA	Defense Health Agency
DHP	Defense Health Program
DoD	Department of Defense
DoDGAR	Department of Defense Grant and Agreement Regulations
DUNS	Data Universal Numbering System
eBRAP	Electronic Biomedical Research Application Portal
EC	Ethics Committee
ET	Eastern Time

SOW	Statement of Work
USAMRAA	U.S. Army Medical Research Acquisition Activity
USAMRMC	U.S. Army Medical Research and Materiel Command
USC	United States Code
VA	Department of Veterans Affairs

APPENDIX 2
AREAS OF ENCOURAGEMENT

Applications addressing any of the FY17 PRMRP Topic Areas are of interest to the program. ***Any aspect of research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding.*** Areas of encouragement related to the FY17 PRMRP Topic Areas have been identified by the Department of Defense, Department of Veterans Affairs, and other relevant stakeholders. Applicants are urged to read and consider these areas of encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an area of encouragement in this list.***

Acute Lung Injury

- Research on the etiology and prevention of acute respiratory distress syndrome caused by the host's or immune system's responses to infectious disease or septic shock.
- Preventive techniques, novel and/or innovative detection technologies, and therapeutics to reduce the incidence and/or severity of acute respiratory distress syndrome and/or other lung injury secondary to trauma, transfusion, burns, hemorrhagic shock, inhalation, and/or oxygen exposure.
- Development of a clinical laboratory-based device for manufacturing/amplification of stem cells to treat acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Clinical studies to test cellular therapies in the treatment of acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Metrics to associate the health outcomes of acute lung injury with physiological and physical performance, as well as the psychological health of military Service members.
- Strategies to stabilize and support the safe transport of patients with lung injury in order to optimize therapeutic interventions.
- Studies to identify the prevalence and associated morbidity and mortality of blast overpressure lung injury in forward operating environments.

Antimicrobial Resistance

- Identification and evaluation of novel and/or innovative antifungals against resistant fungal infections, particularly for use as topical therapies for wounds and for surgical and post-surgical therapies.
- Identification of novel and/or innovative targets for multi-drug resistant pathogens.
- Development of novel and/or innovative interventions, diagnostics, and treatment for multi-drug-resistant pathogens.
- Development of novel and/or innovative therapies that interrupt biofilm production in wound infections and infected hardware models.
- Development and testing of treatment protocols and/or diagnostic tests to limit prescribing antibiotics for conditions that are commonly viral in nature or conditions that would resolve themselves without antibiotic treatment (e.g., sinusitis, bronchitis, viral upper respiratory infections, and acute gastroenteritis).

- Development of rapid, rugged, sensitive, and specific diagnostics for antimicrobial resistance in remote environments.
- Research to improve understanding of the impact of travelers' diarrhea, as well as antibiotic treatment for the colonization of multi-drug-resistant organisms.

Arthritis

- Studies that define the risk of contracting septic arthritis; reactive arthritis; arthritis caused by a gastrointestinal, genitourinary, or viral infection (e.g., Lyme disease, Campylobacter, chikungunya); and other arthritis types in active duty military personnel.
- Research toward the development of clinical practice guidelines to prevent, identify, and treat arthritis, particularly that resulting from traumatic injury, surgery, and/or infectious diseases.
- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Strategies for repairing focal cartilage defects using cell-based therapies.
- Research quantifying the impacts of obesity, weight loss, physical fitness (all components—cardiovascular, strength, flexibility, balance), and dietary factors on the development of or prevention/risk reduction of arthritis.
- Identification and/or validation of biomarkers for early psoriatic arthritis.
- Basic and translational research to identify treatments to mitigate and/or reverse osteoarthritis, particularly in the knee, hip, ankle, and shoulder.
- Studies to examine using existing regenerative medicine techniques and therapies to treat osteoarthritis, including dose response information and the frequency and timing of application.
- Development of novel and/or innovative treatments or combination therapies for psoriatic arthritis.

Burn Pit Exposure

- Research on the etiology and treatment of adverse health events related to military deployment to Iraq and Afghanistan that are associated with exposure to airborne hazards and open pit burning of solid waste and other materials.
- Toxicological studies to ascertain the toxicity of natural dust, burn pit combustion products and interactions between pollutants, as well as their mechanisms of action.
- Characterization of emissions from open air burns, burn boxes, and incinerators.
- Development and validation of instruments for assessing levels of exposure to airborne hazards for use in research and for occupational and environmental exposure monitoring.

Chronic Migraine and Post-Traumatic Headache

- Research to investigate, develop, and validate biomarkers that are useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache.
- Epidemiological/natural history studies to characterize specific types of post-traumatic headache, the pathobiology of these headaches (such as the role of cortical spreading

depression acutely after injury as a risk factor for chronic headaches of a migrainous type), and the risk factors that might predispose people to certain types of post-traumatic headache.

- Double-blind, placebo-controlled trials in the post-traumatic headache population in order to determine whether similar phenotypes in primary headache disorders and post-traumatic headache will respond similarly to treatment.
- Research on the optimal approaches to effective management of co-occurring psychological health disorders and acute and chronic pain management for chronic migraine and post-traumatic headache, with a focus on assessing and eliminating adverse outcomes and decreasing polypharmacy.
- Research on the utility of the Patient-Centered Medical Home model of care for patients with chronic migraine or post-traumatic headache.
- Research on the treatment and prevention of acute flares of chronic migraine and post-traumatic headaches with an emphasis on non-opioid medications.
- Evaluation of the use of mechanical stimulation and/or other non-pharmaceutical treatments to reduce acute and chronic migraines and headaches.
- Precision medicine research to investigate, develop, and validate biomarkers that are not only useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache, but can also identify individual responses to treatment.
- Evaluation of the differences in etiology, diagnosis, treatment plan, and prevention of migraine headaches between men and women.

Congenital Heart Disease

- Population-based and outcomes-based research projects to assess the health outcomes of individuals with congenital heart disease across their life spans.
- Research on tissue engineering approaches to patches, grafts, and transplantation that provide structural support, restore native activity, allow for tissue growth, and prevent the need for reoperation.
- Research to improve understanding of the causes of congenital heart defects, including genomic, proteomic, and metabolomic profiling.
- Research on transition of the care of congenital heart disease patients from pediatric to adult providers.
- Research both on the risk of neurologic injury and on enhanced neuroprotection before, during, and after surgery for congenital heart disease.
- Research to design and implement disease-in-a-dish and/or microfluidic models with an established phenotype to increase the efficacy of finding novel and/or innovative drug targets, screen existing drugs, perform cardiotoxicity testing, and/or uncover pathogenesis.

Constrictive Bronchiolitis

- Clinical assessments to determine the prevalence and severity of constrictive bronchiolitis and related respiratory diseases in previously deployed military Service members and/or Veterans.

- Development and testing of less invasive and non-invasive approaches for diagnosing constrictive bronchiolitis.
- Research to develop novel and/or innovative therapeutics to slow or reverse the progression of constrictive bronchiolitis.
- Development and/or validation of animal models for constrictive bronchiolitis.
- Research to understand the role of environmental exposures, including mineralized dust and other particulates, in the etiology of constrictive bronchiolitis.

Diabetes

- Development of biomarkers to identify and monitor at-risk individuals and assess treatment response.
- Research on interventions to prevent diabetes complications, including diabetic retinopathy and diabetic neuropathy.
- Research to better understand the heterogeneity of diabetes.
- Research on the transplantation of allogenic or autologous pancreatic islet cells for long-term natural insulin production, including current good manufacturing practices for cell line development.
- Identification and/or evaluation of interventions to reduce the development of diabetes among individuals meeting the clinical criteria for pre-diabetes.
- Development and evaluation of an inpatient glycemic management program with strategies to improve in-hospital dysglycemia, improve short-term and long-term morbidity/mortality, reduce the cost of health care, and promote a seamless transition of care between inpatient and outpatient arenas.
- Research to design and implement disease-in-a-dish and/or microfluidic models to model pancreatic islets to uncover pathogenesis and improve the efficiency of drug discovery.

Diarrheal Diseases

- Development and testing of vaccines, including multi-pathogen combination approaches, against the most common causes of bacterial and viral travelers' diarrhea, including *Campylobacter jejuni, Shigella,* and Enterotoxigenic *E. coli*.
- Development and evaluation of antibiotic and non-antibiotic therapies to treat all-cause travelers' diarrhea to improve the time to clinical cure, minimize resistance acquisition, and mitigate the chronic health consequences of these infections.
- Research to improve understanding of host responses and develop therapies to treat acute bacterial and viral infections that are associated with travel and may lead to chronic functional bowel and rheumatologic disorders.
- Development of evidence necessary to demonstrate the need, impact, and potential market value of a therapeutic for post-infectious functional bowel disorders to include preventive, treatment, or vaccine technology strategies.
- Development and evaluation of point-of-care diagnostics for acute diarrheal illness that distinguishes between bacterial, viral, protozoal, and toxin-mediated etiologies and leads to actionable public health or individual management interventions.

- Investigations into the relationship between existing gastrointestinal flora (microbiome) and the susceptibility, duration, and severity of diarrheal disease, as well as the impacts of dietary modification and/or probiotic use.
- Research to identify, reduce, or eliminate sources of infection causing diarrheal diseases.

Dystonia

- Research on the risk, incidence, and etiology of generalized dystonia, focal dystonia, multifocal dystonia, segmental dystonia, and/or hemidystonia.
- Research on interventions to prevent, slow the progression of, or treat dystonia.
- Research to improve identification of delayed onset dystonia following traumatic brain injury.

Early Trauma Thermal Regulation

- Research into regional cooling for different environments, including prolonged care, as a therapeutic for secondary ischemic injury (e.g., head with traumatic brain injury, limb with tourniquet).
- Development of a tunable support mechanism for thermal homeostasis for use in prolonged field care, extended evacuation, or unmanned evacuation.
- Development and evaluation of a novel and/or innovative technology and techniques to reduce the impact of hypothermia.
- Research to determine the benefits of invasive warming/cooling during patient movement.
- Research to validate the attenuating effects of (early) external head cooling on concussive brain injuries.
- Research into therapeutic cooling or targeted temperature management as a neuroprotective treatment for traumatic brain injury.

Eating Disorders

- Investigations into the prevalence, diagnosis, and treatment patterns of eating disorders in Service members and their families, including potential relationships with military-unique behaviors or conditions.
- Assessment of patterns of comorbidity between eating disorders and other mental health conditions, including an examination of whether eating disorders are more likely to precede or follow the development of other mental health conditions.
- Studies to identify the most effective treatments (and order of treatment) for patients with an eating disorder and a comorbid disorder.
- Research to advance the understanding of the biological, genetic, and environmental factors that influence eating disorders.
- Studies to elucidate risk factors for the onset or recurrence of eating disorders.
- Research to develop screening tools and valid biomarkers that accurately identify individuals with binge eating disorder versus healthy controls in order to monitor at-risk populations and tailor treatments for disordered eating.

- Research to better understand subclinical disordered eating and other specified feeding and eating disorders and the potential for these to develop into full-blown eating disorders.

Emerging Infectious Diseases

- Methods to minimize risk from arboviruses among military Service members and their families deployed to/living in high-risk areas, including personal protective equipment and environmental controls.
- Investigation of revaccination strategies and identification of correlates of protection for currently available vaccines (especially mumps).
- Targeted vector management of *Aedes aegypti, Anopheline sp.* and related mosquito species, including focus areas on novel and/or innovative adult surveillance devices, pathogen identification, spatial repellents, and barrier treatments.
- Research toward understanding the potential influence of dietary intake as a potential repellent to mosquito vectors and vector behavior.
- Evaluation of non-vaccine prophylactics or therapeutics to prevent/treat dengue or Zika virus disease.
- Characterization of health emergency relevant infectious disease threats in West Africa.
- Development of biomarker-guided clinical management strategies for severe infectious disease in the austere African setting.
- Validation of airborne and droplet precaution recommendations in the medical transport environment.
- Development of new testing methods for emerging pathogens and pathogen reduction technologies for blood-borne pathogens, including Zika, malaria, dengue, and others, in blood products.
- Modeling of epidemics and development of strategies to counter risks in emerging infectious diseases.
- Rapid, rugged, sensitive, and specific screening and diagnostics, including biomarkers for infectious threats such as Zika and other clinically relevant bacterial, viral, or protozoal pathogens in clinical samples or blood products that can be transmitted sexually or by blood transmission.
- Development of broad-acting detection systems to identify emerging members of a known viral family (for example, a broad Coronavirus panel that can detect Middle Eastern Respiratory Syndrome).
- Determination of the human health effects, host preference, vector competence, and co-infection status of the dengue, chikungunya, Zika, and Mayaro viruses in *Aedes aegypti* and related mosquito species.

Epidermolysis Bullosa

- Research to provide further insight into those cellular pathways that might be corrected or bypassed that otherwise promote the development of squamous cell carcinomas in recessive dystrophic and junctional epidermolysis bullosa.

- Research, including randomized controlled clinical trials, focused on systemic drugs that prevent, delay the onset, or modify the aggressiveness of squamous cell carcinoma in patients with recessive and junctional epidermolysis bullosa.
- Research, including clinical trials, focused on medications (topical or systemic) or dressings that might enhance wound healing in inherited epidermolysis bullosa.

Focal Segmental Glomerulosclerosis

- Development of a curative therapy or treatments to delay or halt the progression of focal segmental glomerulosclerosis and/or prevent post-transplantation recurrence.
- Research to determine the efficacy of medications used off-label (outside the FDA-approved indication) to treat focal segmental glomerulosclerosis.
- Research to improve understanding of the causes of primary and secondary focal segmental glomerulosclerosis, especially genetic mutations.
- Development of non-invasive methods to diagnose focal segmental glomerulosclerosis and its variants.
- Research on the impact of dietary modifications on the progression of renal disease.

Fragile X

- Research to advance the understanding of the pathophysiology of fragile X syndrome.
- Identification and validation of functional measures of the manifestations of fragile X syndrome across the life span.
- Identification and testing of novel and/or innovative targets for fragile X syndrome therapeutics.
- Development and evaluation of novel, innovative, or existing therapeutics for the treatment of fragile X syndrome.

Guillain-Barré Syndrome

- Research to elucidate the characteristics of various exposures (e.g., viruses, bacteria, vaccinations, surgery) associated with Guillain-Barré syndrome and their effects on the immune system.
- Research on the immune system cell types and molecular mechanisms responsible for the disease pathology of Guillain-Barré syndrome.
- Research to prevent or reduce the effects of residual weakness, relapse of muscle weakness, and other neurological symptoms of Guillain-Barré syndrome to improve patients' quality of life and increase their independence.
- Development of new treatments and refinement of existing treatments for Guillain-Barré syndrome.

Hepatitis B and C

- Research on vaccination options for those persons unable to mount immunity to the hepatitis B virus.

- Development of strategies for reliable, non-invasive, early detection of hepatitis-related liver disease and hepatocellular carcinoma.
- Research on strategies to promote reversal of liver fibrosis and/or assess the associated clinical and pathological outcomes.
- Natural history or other studies to establish risk indicators of progression from asymptomatic or inactive chronic hepatitis infection to symptomatic disease and parameters for the initiation and duration of disease treatment.
- Clinical studies to evaluate combination or curative therapies for treatment of hepatitis infection.
- Identification and reduction of hepatitis in blood products for transfusion.
- Research on strategies to reduce vertical (mother-to-child) transmission of hepatitis B virus and hepatitis C virus.
- Development of a vaccine against hepatitis C.
- Development of treatment protocols for patients with hepatitis B and C co-infections.

Hereditary Angioedema

- Research to improve early diagnosis of hereditary angioedema.
- Evaluation of existing, innovative, or novel therapeutics in pediatric hereditary angioedema patients.
- Research toward development of a cure for hereditary angioedema.
- Development and/or validation of novel and/or innovative therapeutic strategies for the treatment and/or prevention of hereditary angioedema attacks.

Hydrocephalus

- Research on the etiology, prevention, diagnosis, and treatment of post-traumatic hydrocephalus.
- Discovery or validation of novel and/or innovative therapies and therapeutic targets for the treatment of hydrocephalus and its sequelae, including therapies directed at myelin regeneration and repair.
- Research on approaches to lessening the impact of brain damage caused by hydrocephalus.
- Development or validation of biomarkers and imaging techniques, particularly multimodal approaches, to aid in diagnosis, prognosis, and monitoring of therapeutic efficacy.
- Research on the prevention of shunt failure.
- Studies to better understand the causes and/or pathogenesis of hydrocephalus.
- Development or validation of improved hydrocephalus model systems.

Immunomonitoring of Intestinal Transplants

- Studies to elucidate the role of the mucosal immune system, other host-derived factors, or gut microbiota-derived factors in maintaining intestinal transplant viability.

- Development and evaluation of intestinal implant strategies that circumvent the induction of immunity against the transplant through the use of autologous stem cells or organoids derived from intestinal stem cells.
- Development and evaluation of evidence-based approaches that focus on dampening the regional immune response against intestinal transplants without inducing global immune suppression.
- Development and evaluation of implant-associated materials (e.g., scaffolds) with anti-inflammatory properties that protect the intestinal transplant from immune attack.
- Development and evaluation of strategies for inducing and maintaining populations of anti-inflammatory regulatory immune cell populations at the transplant site.
- Studies to improve immunomonitoring of recipient immune responses after intestinal transplantation, with a focus on prospective leukocyte profiling, to aid in diagnosis and treatment of immunological and immunosuppression-related complications.
- Development and/or validation of precise, real-time implanted monitoring devices to improve individualized patient outcomes after intestinal transplantation.

Inflammatory Bowel Diseases

- Clinical studies in human subjects directed toward understanding how acute enteric infections may trigger chronic bowel diseases with acute and sub-acute inflammatory bowel disease, including systems biology approaches.
- Mechanistic studies in animal models designed to understand how enteric infection may trigger inflammatory bowel disease, including genomic, microbiomic, and immune mechanisms.
- Epidemiological studies of post-infectious acute and sub-acute inflammatory bowel diseases that define risk and provide estimates of illness-associated disability, health care costs, and symptom duration from a military health system and societal perspective.
- Studies to understand the interaction between acute/chronic stress and infection and the development of inflammatory bowel disease.
- Research to explore whether the travel patterns of active duty personnel increase the risk of developing inflammatory bowel disease by means of exposure to changes in intestinal microflora.
- Research to better characterize the association between the use of drugs, such as isotretinoin and long-term doxycycline, and the development of inflammatory bowel disease.
- Research on the role of diet in the development and progression of inflammatory bowel disease.
- Research on the influence of the microbiome on inflammatory bowel disease.
- Research on hyperbaric oxygen treatment of inflammatory bowel disease.
- Research on treatment strategies for patients whose inflammatory bowel disease is refractory to standard care medications or who positively respond to standard care medications, but become nonresponsive over time.

Influenza

- Development of a diagnostic test for influenza drug resistance.
- Development and testing of a universal influenza vaccine.
- Development and evaluation of novel, innovative, and/or combination influenza therapies.
- Research to improve the understanding of host responses to influenza infection and the mechanisms of drug resistance.
- Research on the factors that contribute to and/or reduce the risk of the emergence of zoonotic and pandemic influenza viruses.

Integrative Medicine

- Research on the use of integrative medicine strategies, such as meditation, tai chi, acupuncture, and/or herbal medicine/nutritional supplementation, to improve the psychological health and quality of life in cancer patients and survivors.
- Research on the use of integrative medicine in treatment and management of chronic pain disorders, including comparative efficacy studies relative to standard of care.
- Rigorous longitudinal studies of integrative medicine approaches for enhancing resilience and treating psychological health issues and co-occurring disorders.
- Precision medicine research to investigate, develop, and validate biomarkers that can help determine an individual's response to integrative medicine treatments for pain.
- Development of outcomes tools and measures to evaluate the effectiveness of integrative medicine pain management approaches.
- Definitive studies to determine the effectiveness of self-care, meditation-based treatments, courses, and training programs in improving resiliency to stress in a military environment; in austere operational platforms such as submarines and small-deck ships; or in combat-fatigued military health care providers.

Interstitial Cystitis

- Studies that define the risk, prevalence, and operational impact of interstitial cystitis among active duty personnel.
- Identification of biological markers for making a definitive diagnosis of interstitial cystitis.
- Evaluation and assessment of novel and/or innovative treatment options for interstitial cystitis patients, including intravesical therapy.
- Research on the etiology of interstitial cystitis to inform targeted therapy development.

Malaria

- Investigation of mechanisms of drug resistance in malaria, to include host and pathogen, against drugs used for treatment and prophylaxis.
- Development of a vaccine that induces high levels of long-lived, broadly protective immunity against *Plasmodium falciparum* and/or *P. vivax*.
- Operational research to optimize application of existing malaria drugs to reduce impact of artemisinin resistant *P. falciparum* in military forces.

- Operational research to optimize deployment of pharmacovigilance systems to ensure capture of adverse events related to malaria chemoprophylaxis and treatment.
- Operational research to assess efficacy and spread of artemisinin combination therapies across the Greater Mekong Subregion's military forces.
- Development of malaria prophylactic regimens that encourage higher compliance and methods to monitor compliance in deployed Service members.
- Identification of novel and/or innovative malaria drug targets for blood and liver stage malaria parasites.
- Development of new, or improvement of existing, strategies for culturing relapsing malaria parasites, with emphasis on *Plasmodium vivax, P. ovale,* and *P. cynomolgi* in vitro.
- Development, testing, and evaluation of spatial repellents to provide protection against Anopheline vectors.
- Identification of a correlate of immunity against malaria and development of a surrogate test of protection.
- Structurally optimize validated malaria antigens by engineering protective epitopes to elicit specific and enhanced immune responses.

Metals Toxicology

- Identification and validation of biomarkers to evaluate military Service members' acute exposure to toxic metals in an operational environment and predict potential consequent health risks and associated health outcomes.
- Retrospective studies to evaluate risk and exposure among workers at industrial facilities.
- Research on the toxicity of metal combinations and the interaction between different metal components.
- Research on the additive effects of multiple exposures to metal(s).
- Research on underlying diet quality and micronutrient sufficiency and the risk for metals toxicity.
- Research on the toxicity of metal-based engineered nanomaterials.

Mitochondrial Disease

- Research on the basic biology and physiology of mitochondria to better understand the pathology of primary mitochondrial diseases.
- Development of improved tools and animal models to study primary mitochondrial disease and evaluate therapeutics.
- Identification and testing of non-invasive techniques and biomarkers to monitor mitochondrial function, aid in diagnosis, and/or evaluate therapeutic efficacy.
- Research on novel and/or innovative treatments to alleviate symptoms or slow down the progression of mitochondrial diseases.

Musculoskeletal Disorders

- Research to increase understanding, diagnosis, prevention, and/or treatments of chronic overuse musculoskeletal disorders.
- Research on measures (e.g., clinical biomarkers, novel/innovative interventions, therapeutics) to diagnose, predict, reduce the incidence of, or optimize health outcomes in military training- and Service-related musculoskeletal disorders.
- Research on the validation and/or optimization of rehabilitation strategies for Service-related musculoskeletal disorders.
- Research to prevent, control, and/or optimize musculoskeletal health outcomes for work-related musculoskeletal disorders.
- Research on lower back pain strategies to prevent surgery and recurrence of symptoms, identify factors that predict optimal treatment response for different patients, and encourage self-management as a treatment.
- Research to determine whether tailored psychosocial education interventions are effective in improving psychological resilience to musculoskeletal pain.
- Research on standardized approaches for early identification and prevention of chronic musculoskeletal pain.

Nanomaterials for Bone Regeneration

- Research on nanomaterials-based methods to facilitate recruitment of endogenous cell populations for enhanced bone regeneration and osseointegration.
- Technologies addressing segmental/large bone defects in craniomaxillofacial and/or load-bearing regions.
- Development of controlled release/extended release of growth factors for bone regeneration.
- Development of technologies that repair the soft tissue envelope to enhance bone regeneration.

Non-Opioid Pain Management

- Research on pain management strategies for patients with limited access to skilled providers and resources, including battlefield, prolonged field, transport, and other resource-limited environments.
- Development of population-based outcomes, tools, and measures to evaluate the effectiveness of pain management approaches across time and environments.
- Research on treatments for chronic pain management, particularly in complex patients (i.e., chronic, high-utilization, polypharmacy patients).
- Research to increase understanding of and preventative treatments for conversion of acute to chronic pain.
- Research that provides evidence of which pain management strategies work for whom and under what conditions.
- Research to identify and address biopsychosocial aspects of pain to reduce or eliminate the use of opioid pain medication(s).

- Comparative studies evaluating the efficacy of different pain management strategies, including complementary and alternative medicine approaches.
- Identification and development of non-opioid pain management techniques that promote positive psychological health-related outcomes.
- Development of non-opioid pain medicine that can be given via inhalation or intramuscularly, submucosally, or intravenously on the battlefield to provide adequate relief of pain without affecting the cardiorespiratory systems.
- Research on case management strategies designed to optimize the effectiveness of pain clinics, support use of non-opioid pain therapies, and reduce dependence on opioid therapies.
- Research that will directly obtain an FDA analgesic indication for oral transmucosal or intramuscular ketamine.

Pancreatitis

- Retrospective studies to determine the risk and incidence of pancreatitis among former and current active duty personnel.
- Development and testing of novel and/or innovative therapeutics for acute and/or chronic pancreatitis.
- Research on the basic biology and physiology of the pancreas to better understand the etiology and pathology of pancreatitis.

Pathogen-Inactivated Dried Cryoprecipitate

- Development or validation of technology to produce pathogen-reduced dried cryoprecipitate in military or civilian donor centers that is acceptable for FDA licensure in support of combat or contingency operations.

Polycystic Kidney Disease

- Development of improved treatment strategies for polycystic kidney disease, including approaches to identify and monitor patients at higher risk for progressing to end-stage renal disease.
- Research on the underlying pathobiology and molecular mechanisms of polycystic kidney disease, including studies of genetic factors, cyst formation and growth, the role of cilia, and factors that modify disease progression and/or severity.
- Research on the lifestyle factors that may modify the progression of polycystic kidney disease.

Post-Traumatic Osteoarthritis

- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Research into cell-based approaches for treatment or prevention of post-traumatic osteoarthritis.
- Studies to evaluate and develop best practices for multidisciplinary team approaches and treatment algorithms for post-traumatic osteoarthritis.

- Development or validation of novel and/or innovative approaches to restoring joint stability after injury.
- Sustained release, intra-articular injectable steroidal, non-steroidal, or disease-modifying therapies that offer two or more months of symptomatic relief of pain and/or inflammation in a single injection.
- Research on therapies that target multiple phases of the cellular response pathways that are implicated in the development of post-traumatic osteoarthritis, including cell death, inflammation, matrix changes, and changes in catabolic and anabolic responses.
- Development and/or validation of predictive models for early onset post-traumatic osteoarthritis in extremity-injured patients for the purpose of tailoring rehabilitation programs toward prevention, delay, or mitigation of onset.

Pulmonary Fibrosis

- Retrospective studies to determine the risk and incidence of pulmonary fibrosis among military Service members, including Veterans.
- Identification of biomarkers of pulmonary injury or early predictors of interstitial lung disease.
- Research into the pathobiology and molecular mechanisms underlying the development of pulmonary fibrosis.
- Development and/or testing of novel and/or innovative treatments to delay or modify the progression of pulmonary fibrosis.
- Development and/or validation of improved tools and animal models to study pulmonary fibrosis and evaluate therapeutics.

Respiratory Health (excludes lung cancer and mesothelioma)

- Research on the causes, treatment, and prevention of chronic obstructive pulmonary disease (COPD), including identification and validation of biomarkers and disease phenotypes, as well as employing personalized medicine in clinical research and disease management.
- Research investigating the treatment of patients with chronic mild hypoxia.
- Research on the cause, treatment, and prevention of respiratory symptoms and ailments possibly associated with deployed and redeployed military personnel, including acute eosinophilic pneumonia, asthma, allergies, and other chronic lung diseases and breathing problems.
- Research to evaluate the impact of deployment on the prevalence and severity of respiratory disease in military Service members and Veterans.
- Development and/or validation of methods to detect volatile organic hydrocarbons from the breath of individuals exposed to toxic chemicals or other agents that can cause lung injury, which can be utilized for diagnosis and prognosis of lung injury or disease.
- Identification of biochemical, physiological, or combined biomarkers for evaluating risk or extent of injury from either acute or long-term toxic occupational or environmental exposures.

- Research investigating exposure rates, detection, and treatment of diseases related to inhalation of mold and fungi, such as coccidioidomycosis.

Rett Syndrome

- Identification and/or validation of novel and/or innovative biological targets for the treatment of Rett syndrome.
- Development and testing of interventions to improve the neurological symptoms of Rett syndrome.
- Research to understand the relationship between genetic mutations, physical traits, and symptoms in individuals with Rett syndrome.
- Research on the pathobiology of the MeCP2 gene and protein.
- Research to understand Rett syndrome's commonalities with and differences from classic autism and regressive autism.

Rheumatoid Arthritis

- Research to better understand the relationship between genetic risk and environmental triggers, such as infection or smoking, in developing rheumatoid arthritis.
- Studies that identify or validate biomarkers or personalized medicine strategies that allow for individualized medication choice based on the patient's underlying biology or disease state.
- Research on the long-term use of immunosuppressants in patients with rheumatoid arthritis and the likelihood of developing infections.
- Research to establish activity recommendations following joint replacement for maximal joint life.

Scleroderma

- Research on the molecular mechanisms and pathogenesis of scleroderma.
- Development and/or testing of novel and/or innovative therapies and identification of novel and/or innoavtive therapeutic targets in scleroderma.
- Research on biomarkers and other approaches to diagnose scleroderma, monitor disease progression, and/or assess response to treatment.
- Epidemiologic studies investigating the impact of localized scleroderma (morphea) on duty performance, use of personal protective equipment, and deployability.
- Research on the efficacy of newer immunosuppressive agents, including biologics and small molecule inhibitors, in the treatment of morphea and scleroderma (systemic sclerosis).
- Research on the efficacy of UVA1 for topical treatment in localized scleroderma and systemic sclerosis.

Sleep Disorders

- Research on how the disruption of normal sleep and circadian biological rhythms adversely affects the physical and psychological health, safety, performance, and productivity of military and civilian populations.
- Studies to assess sleep disturbance and clinical sleep disorders in female military personnel.

- Research on the association between sleep disorders and post-traumatic stress disorder, traumatic brain injury, depression, and/or anxiety and suicidal behaviors.
- Research to assess clinical algorithms that improve adherence to continuous positive airway pressure (CPAP).
- Investigations into non-CPAP-based treatment regimens that enhance readiness and deployability in active duty military personnel.
- Research focused on investigating how psychiatric disorders (post-traumatic stress disorder in particular), combined with the disruption/degradation of sleep quality, impact long-term physical health through changes in hormonal physiology.
- Development and/or testing of non-pharmacological treatments for sleep disorders.
- Research on the impact of sleep deprivation on the efficacy of psychological treatments for post-traumatic stress disorder, depression, and other mood disorders.
- Research on the prevention and/or mitigation of sleep disorders that are associated with long aeromedical evacuation flights for both clinical team members and patients.
- Development of tools and technologies that allow rapid and objective measurement of Service member performance in the face of fragmented sleep and/or sleep maintenance difficulty.
- Research examining the broader effects of Warfighters' sleep disorders on the sleep, behavioral health, and productivity of their family members, as well as the readiness of their military unit.

Spinal Muscular Atrophy

- Research into phenotyping the spinal muscular atrophy disease state.
- Research into which molecular deficiency imposed by a deficiency of SMN, a motor neuron protein, causes motor neuron deficits.
- Exploration of the form and function of SMN-depleted neuromuscular junctions at ultrastructural (e.g., dysregulation of endocytosis), transcriptomic, and proteomic levels, particularly the mildest SMN reduction that leads to consistent quantifiable motor neuron loss.
- Research to find non-SMN-altering spinal muscular atrophy modifying genes in cellular, small animal, and human models that may lead to identification of novel and/or innovative therapeutic targets.
- Research to further understand SMN gene regulation and post-transcriptional mechanisms leading to synergistic SMN-repleting approaches, as well as to determine whether boosting SMN induction maximizes efficacy.
- Research to determine whether SMN can be repleted to physiologic levels in all cells in the spinal muscular atrophy model immediately post-natally and whether there is a limit to the therapeutic response.
- Clinical research to determine what clinical findings persist even with treatment; whether these findings are related to drug timing, dosage, biodistribution, or a combination of factors; and whether these factors are modifiable.

- Research involving dietary/nutritional studies in spinal muscular atrophy to identify the optimal anabolic diet.
- Research to determine mitochondrial involvement and astrocytic and other non-neuronal contributions to motor neuron vulnerability.

Sustained-Release Drug Delivery

- Development of technology that can provide a sustained-release delivery of drugs for a minimum of 1 week or more. Potential applications of this technology could include long-acting therapies for post-traumatic stress, opiate dependence, low-dose pain control, allergies, attention deficit/hyperactivity disorder, chemoprophylaxis, and other conditions.
- Research into the use of printable, sustained-release scaffolds for predictable delivery of prescription and non-prescription medications.
- Research into novel and/or innovative approaches to developing bioavailable and sustained-release oral formulations of intravenous broad-spectrum fungicidal and anti-microbial medications.

Tinnitus

- Research to understand the mechanisms of tinnitus, its relationship to noise-induced hearing loss, and progression to chronic tinnitus, with the focus on developing interventions for tinnitus.
- Research to increase knowledge of the prevalence, incidence, natural history, and occupational and sex-related differences of tinnitus and its possible relation to individual blast/noise exposures.
- Research to understand the operational readiness impacts of tinnitus on the military.
- Development and validation of objective tools/methods to diagnose and characterize tinnitus (e.g., imaging techniques to identify functional and structural changes in the brain, biomarkers of resiliency, and susceptibility to tinnitus).
- Identification of novel and/or innovative therapies for interventions to prevent, manage, and treat tinnitus, including behavioral approaches, new uses for existing drugs, nutritional and pharmaceutical strategies, and acoustic, electrical, and other stimulation technologies.

Tuberculosis

- Development of a diagnostic assay that can be used at the point of care to rapidly and accurately diagnose tuberculosis.
- Development of novel and/or innovative tuberculosis vaccines or optimization of current tuberculosis vaccines.
- Identification and/or validation of biomarkers that can be used to assess vaccine efficacy and protection against tuberculosis disease.
- Research to understand, diagnose, or treat multi-drug-resistant tuberculosis or extensively drug-resistant tuberculosis.
- Research to determine the appropriate precautions to use for transport of active tuberculosis patients.

- A sustained release formulation of anti-tuberculosis drugs that would facilitate long-term treatment and reduce the emergence of resistance due to poor compliance.

Vaccine Development for Infectious Disease

- Development of a therapeutic vaccine and/or other strategies to achieve HIV remission.
- Evaluation of passive immunization strategies to use in conjunction with dengue and Zika vaccinations.
- Research leading to a better understanding of the immune mechanisms involved in clearance of the dengue and Zika viruses and the mechanisms of immune enhancement that lead to more severe clinical disease.
- Development of flexible vaccine technologies that can be used to rapidly respond to emerging and re-emerging infectious diseases threats.
- Evaluation of humoral and cellular immune responses after vaccination compared to natural infection.
- Development of a safe, effective dengue human challenge model for clinical trials.
- Development of a non-human primate model to study Zika virus-induced microcephaly/fetal neuropathology as a tool to measure the safety and efficacy of vaccines and antivirals.
- Development and fielding of vaccines to prevent U.S. Service members from becoming ill from endemic disease exposure during operational deployments. This includes, but is not limited to, arthropod-borne diseases (Zika virus, dengue, chikungunya, hantavirus hemorrhagic fever with renal/pulmonary syndrome, rickettsioses, and trypanosomiasis), leptospirosis, HIV, norovirus, Middle East Respiratory Syndrome coronavirus, schistosomiasis, leishmaniasis, Nipah virus, Lassa fever, and West Nile fever.

Vascular Malformations

- Studies into the natural history, genetics, and pathogenesis of vascular malformations.
- Research to discover or develop novel and/or innovative therapeutic targets and treatments to regress or prevent vascular malformations.
- Research to improve methods to diagnose and manage vascular malformations.
- Development of non-invasive or minimally invasive technologies or approaches for the control of internal bleeding associated with vascular malformations.
- Studies to identify risk and/or establish standard practices for the treatment of hemorrhage from brain arteriovenous malformations.
- Research on the prevention or treatment of complications associated with vascular malformations such as pain, infection, seizures, tissue breakdown, tissue overgrowth, or airway obstruction.
- Studies to elucidate the progression of vascular malformations in disease-in-a-dish/microfluidic models for the purpose of identifying novel and/or innovative drug targets, screening existing drugs, and/or elucidating the pathogenesis of the disease.

Women's Heart Disease

- Retrospective studies to determine the risk and incidence of heart disease among former and current female active duty personnel, including Reservists and National Guard members.
- Research focused on elucidating the potential relationship between post-traumatic stress disorder and women's heart disease.
- Identification of sex-specific approaches to increase the effectiveness of diagnosis, treatment, and/or cardiac rehabilitation programs.
- Research on factors to predict and prevent the long-term impacts of gestational diabetes, gestational hypertension, and preeclampsia on the cardiovascular health of women.
- Research on trauma-induced cardiac arrest secondary to hemorrhage and polytrauma in the female population.

APPENDIX 3
DOD AND VA WEBSITES

PIs are encouraged to integrate and/or align their research projects with Department of Defense (DoD) and/or Department of Veterans Affairs (VA) research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. Below is a list of websites that may be useful in identifying additional information about DoD and VA areas of research interest, ongoing research or potential opportunities for collaboration within the FY17 PRMRP Topic Areas.

I. OVERVIEW OF THE FUNDING OPPORTUNITY

Program Announcement for the Department of Defense

Defense Health Program

Congressionally Directed Medical Research Programs

Peer Reviewed Medical Research Program

Investigator-Initiated Research Award

Announcement Type: Initial

Funding Opportunity Number: W81XWH-17-PRMRP-IIRA

Catalog of Federal Domestic Assistance Number: 12.420 Military Medical Research and Development

SUBMISSION AND REVIEW DATES AND TIMES

- **Pre-Application Submission Deadline:** 5:00 p.m. Eastern time (ET), July 13, 2017
- **Invitation to Submit an Application:** August 2017
- **Application Submission Deadline:** 11:59 p.m. ET, October 18, 2017
- **End of Application Verification Period:** 5:00 p.m. ET, October 23, 2017
- **Peer Review:** December 2017
- **Programmatic Review:** February 2018

This Program Announcement must be read in conjunction with the General Application Instructions, version 20170516. The General Applications Instructions document is available for downloading from the Grants.gov funding opportunity announcement by selecting the "Package" tab, clicking "Preview," and then selecting "Download Instructions."

II. DETAILED INFORMATION ABOUT THE FUNDING OPPORTUNITY

II.A. Program Description

Applications to the Fiscal Year 2017 (FY17) Peer Reviewed Medical Research Program (PRMRP) are being solicited for the Defense Health Agency (DHA) J9, Research and Development Directorate, by the U.S. Army Medical Research Acquisition Activity (USAMRAA) using delegated authority provided by United States Code, Title 10, Section 2358 (10 USC 2358). As directed by the Office of the Assistant Secretary of Defense for Health Affairs (OASD[HA]), the DHA manages the Defense Health Program (DHP) Research, Development, Test, and Evaluation (RDT&E) appropriation. The execution management agent for this Program Announcement is the Congressionally Directed Medical Research Programs (CDMRP). The PRMRP was initiated in 1999 to provide support for military health-related research of exceptional scientific merit. Appropriations for the PRMRP from FY99 through FY16 totaled $1.371 billion. The FY17 appropriation is $300 million (M).

The vision of the FY17 PRMRP is to improve the health and well-being of all military Service members, Veterans, and beneficiaries. The PRMRP challenges the scientific and clinical communities to address at least one of the FY17 Topic Areas with original ideas that foster new directions along the entire spectrum of research and clinical care. The program seeks applications in laboratory, clinical, behavioral, epidemiologic, and other areas of research to advance knowledge in disease etiology, improve prevention, detection, diagnosis, treatment, and quality of life for those affected by a relevant disease or condition, and to develop and validate clinical care or public health guidelines.

II.A.1. FY17 PRMRP Topic Areas

All applications for PRMRP funding must specifically address at least one of the Topic Areas as directed by Congress and must be directly relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries. If the proposed research does not specifically address at least one of the FY17 PRMRP Topic Areas, the Government will administratively withdraw the application. The Government reserves the right to reassign the application's Topic Area if submitted under an inappropriate Topic Area. The FY17 PRMRP Topic Areas are listed below.

- Acute Lung Injury
- Antimicrobial Resistance
- Arthritis
- Burn Pit Exposure
- Chronic Migraine and Post-Traumatic Headache
- Congenital Heart Disease
- Constrictive Bronchiolitis
- Diabetes
- Diarrheal Diseases
- Dystonia
- Early Trauma Thermal Regulation
- Eating Disorders

- Emerging Infectious Diseases
- Epidermolysis Bullosa
- Focal Segmental Glomerulosclerosis
- Fragile X
- Guillain-Barré Syndrome
- Hepatitis B and C
- Hereditary Angioedema
- Hydrocephalus
- Immunomonitoring of Intestinal Transplants
- Inflammatory Bowel Diseases
- Influenza
- Integrative Medicine
- Interstitial Cystitis
- Malaria
- Metals Toxicology
- Mitochondrial Disease
- Musculoskeletal Disorders
- Nanomaterials for Bone Regeneration
- Non-Opioid Pain Management
- Pancreatitis
- Pathogen-Inactivated Dried Cryoprecipitate
- Polycystic Kidney Disease
- Post-Traumatic Osteoarthritis
- Pulmonary Fibrosis
- Respiratory Health
- Rett Syndrome
- Rheumatoid Arthritis
- Scleroderma
- Sleep Disorders
- Spinal Muscular Atrophy
- Sustained-Release Drug Delivery
- Tinnitus
- Tuberculosis
- Vaccine Development for Infectious Disease
- Vascular Malformations
- Women's Heart Disease

Research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding. ***Applicants should select the FY17 Program Announcement most appropriate to the stage of the proposed research.*** Areas of Encouragement related to the FY17 PRMRP Topic Areas have been identified by the Department of Defense (DoD), the Department of Veterans Affairs (VA), and other relevant stakeholders (Appendix 2). Applicants are urged to read and consider these Areas of Encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an Area of Encouragement on this list.***

II.B. Award Information

The PRMRP Investigator-Initiated Research Award is intended to support studies that will make an important contribution toward research and/or patient care for a disease or condition related to at least one of the Congressionally directed FY17 PRMRP Topic Areas.

The rationale for a research idea may be derived from a laboratory discovery, population-based studies, a clinician's first-hand knowledge of patients, or anecdotal data. Applications must include relevant data that support the rationale for the proposed study. These data may be unpublished or from the published literature.

Impact: The Investigator-Initiated Research Award is designed to support research with the potential to yield highly impactful data that could lead to critical discoveries or major advancements. It is the responsibility of the Principal Investigator (PI) to clearly articulate the project's potential immediate and long-range outcome(s)/product(s) (knowledge and/or materiel) and how they will impact a central critical problem or question in the field of research and/or patient care in the FY17 PRMRP Topic Area(s) addressed.

Research projects may focus on any phase of research from basic laboratory research through translational research, including preclinical studies in animal models and human subjects, as well as correlative studies associated with an existing clinical trial. Research involving human subjects and human anatomical substances is permitted; ***however, this award may not be used to conduct clinical trials.*** A clinical trial is defined as a prospective accrual of patients (human subjects) in whom an intervention (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the subject of that intervention or interaction. For more information on how to distinguish clinical research from clinical trials, see the Human Subject Resource Document at https://ebrap.org/eBRAP/public/Program.htm. PIs seeking funding for a clinical trial should apply to the FY17 PRMRP Clinical Trial Award mechanism (W81XWH-17-PRMRP-CTA).

The anticipated direct costs budgeted for the entire period of performance for a single PI FY17 PRMRP IIRA award will not exceed **$1.2M**. The anticipated direct costs budgeted for the entire period of performance for an FY17 PRMRP IIRA award with the Partnering PI Option will not exceed **$1.5M**. Refer to Section II.D.5, Funding Restrictions, for detailed funding information.

Military Relevance: Relevance to the healthcare needs of military Service members, Veterans, and beneficiaries is a key feature of this award. Investigators are encouraged to consider the following characteristics as examples of how a project may demonstrate military relevance:

- Explanation of how the project addresses an aspect of the target disease/condition that has direct relevance to military Service members, Veterans, or other military health system beneficiaries
- Description of how the knowledge, information, products, or technologies gained from the proposed research could be implemented in a dual-use capacity to benefit the civilian population and also address a military need

- Use of military or Veteran populations or datasets in the proposed research, if appropriate to the proposed research project

- Involvement of military consultants (Army, Air Force) or specialty leaders (Navy, Marine Corps) to the Surgeons General in a relevant specialty area

PIs are encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with the DoD or VA is also encouraged. A list of websites that may be useful in identifying additional information about ongoing DoD and VA areas of research interest or potential opportunities for collaboration within the FY17 PRMRP Topic Areas can be found in Appendix 3.

Partnering PI Option: As a method to bring new perspectives in addressing the critical problem or question and facilitate progress in the field through collaborative efforts, the FY17 PRMRP is offering a Partnering PI Option for this award mechanism. The results of this partnering project should significantly advance the research beyond what would be possible through individual efforts. The Partnering PI Option is structured so that two investigators, each of whom will be designated as a PI, work synergistically on a single project. Each PI should bring complementary skills and perspectives to the research project. Developing the research plan should involve a reciprocal flow of ideas and information between the partners. The application should clearly demonstrate that both PIs have equal intellectual input into the des ign of the project and will devote equivalent levels of effort to the conduct of the project. Each PI must demonstrate that he/she possesses the research experience and resources to function as a PI and must also exhibit an appropriate level of authority and responsibility to direct the project supported by the awards. ***New and multi-institutional collaborative efforts are strongly encouraged.*** PIs should include plans for communication between investigators at different organizations, if applicable. Additionally, participating organizations must be willing to resolve potential intellectual and material property issues and to remove any barriers that might interfere with achieving high levels of cooperation to ensure successful completion of the proposed research project. As noted above, collaborations with DoD or VA researchers and clinicians are encouraged.

For the application process, one PI will be identified as the Initiating PI and will be responsible for the majority of the administrative tasks associated with application submission. The other PI will be identified as the Partnering PI. Initiating and Partnering PIs each have different submission requirements as described in Section II.D.2.b, Full Application Submission Content. If recommended for funding, each PI will receive his/her own award. ***A separate application submission is required for each partner, even if both PIs are at the same organization.*** Additional collaborators may be included in the application without being designated as PIs.

Applications submitted under the Partnering PI Option are allowed to request a higher direct cost budget than applications submitted with a single PI (see Section II.D.5, Funding Restrictions, for details). Costs should be divided as evenly as possible between both partners unless appropriately justified, but no more than 75% (or no less than 25%) of the proposed direct costs may be requested by a single partner. Submission of a Partnership Statement, Attachment 8, is required for applications submitted under the Partnering PI Option.

Use of Active Duty Military and VA Populations: If the proposed research plan involves access to active duty military and/or VA patient populations or resources, the PI is responsible for establishing such access. If possible, access to target active duty military and/or VA patient populations/resources should be confirmed at the time of application submission by inclusion of a letter of support, signed by the lowest ranking person with approval authority, for studies involving active duty military Service members, Veterans, military- and/or VA-controlled study materials, and military and/or VA databases. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resources. Note that access to a Veteran population for clinical studies may only be obtained by either collaboration with a VA investigator where the VA investigator has a substantial role in the research or by advertising to the general public.

Research Involving Human Anatomical Substances, Human Subjects, or Human Cadavers: All DoD-funded research involving new and ongoing research with human anatomical substances, human subjects, or human cadavers must be reviewed and approved by the U.S. Army Medical Research and Materiel Command (USAMRMC) Office of Research Protections (ORP), Human Research Protection Office (HRPO) prior to research implementation. This administrative review requirement is in addition to the local Institutional Review Board (IRB) or Ethics Committee (EC) review. Local IRB/EC approval at the time of submission is ***not*** required. The HRPO is mandated to comply with specific laws and requirements governing all research involving human anatomical substances, human subjects, or human cadavers that is supported by the DoD. These laws and requirements will necessitate information in addition to that supplied to the IRB/EC. ***Allow a minimum of 2 to 3 months for HRPO regulatory review and approval processes***. When possible, protocols should be written for research with human subjects and/or human anatomical substances that are specific to the DoD-supported effort outlined in the submitted application. Submission to HRPO of protocols covering more than the scope of work in the DoD-funded award will require HRPO review of the entire protocol as DoD-supported research and may include extensive modifications to meet DoD human subjects protection requirements. Refer to the General Application Instructions, Appendix 1, and the Human Subject Resource Document available on the electronic Biomedical Research Application Portal (eBRAP) "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) for additional information.

Research Involving Animals: All projects should adhere to a core set of standards for rigorous study design and reporting to maximize the reproducibility and translational potential of preclinical research. The standards are described in Landis, S.C., et al. A call for transparent reporting to optimize the predictive value of preclinical research. *Nature* 2012, 490:187-191 (www.nature.com/nature/journal/v490/n7419/full/nature11556.html). While these standards are written for preclinical studies, the basic principles of randomization, blinding, sample-size estimation, and data handling derive from well-established best practices in clinical studies. Applicants should consult the ARRIVE (Animal Research: Reporting *In Vivo* Experiments) guidelines to ensure relevant aspects of rigorous animal research are adequately planned for and, ultimately, reported. The ARRIVE guidelines can be found at http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf.

All DoD-funded research involving new and ongoing research with animals must be reviewed and approved by the USAMRMC ORP Animal Care and Use Review Office (ACURO), in addition to the local Institutional Animal Care and Use Committee (IACUC) of record. IACUC approval at the time of submission is ***not*** required. Specific documents relating to the use of animals in the proposed research will be requested **if the application is selected for funding**. The ACURO must review and approve all animal use prior to the start of working with animals, including amendments to ongoing projects. PIs must submit the institutional animal use protocol, IACUC approval of that protocol, and a version of the animal use appendix titled "Research Involving Animals." ***Allow at least 2 to 3 months for ACURO regulatory review and approval processes for animal studies.*** Refer to the General Application Instructions, Appendix 1, for additional information.

The CDMRP intends that information, data, and research resources generated under awards funded by this Program Announcement be made available to the research community (which includes both scientific and consumer advocacy communities) and to the public at large. For additional guidance, refer to the General Application Instructions, Appendix 2, Section K.

Awards will be made no later than September 30, 2018. For additional information refer to Section II.F.1, Federal Award Notices.

II.C. Eligibility Information

II.C.1. Eligible Applicants

II.C.1.a. Organization: All organizations, including international organizations, are eligible to apply.

Government Agencies within the United States: Local, state, and Federal Government agencies are eligible to the extent that applications do not overlap with their fully funded internal programs. Such agencies are required to explain how their applications do not overlap with their internal programs.

As applications for this Program Announcement may be submitted by extramural and intramural organizations, these terms are defined below.

Extramural Organization: An eligible non-DoD organization. Examples of extramural organizations include academia, biotechnology companies, foundations, Government, and research institutes. *Extramural Submission: Application submitted by a non-DoD organization to Grants.gov.*

Intramural DoD Organization: A DoD laboratory, DoD military treatment facility, and/or DoD activity embedded within a civilian medical center. *Intramural Submission: Application submitted by a DoD organization for an intramural investigator who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility or in a DoD activity embedded within a civilian medical center.*

Note: Applications from an intramural organization or from an extramural non-DoD Federal organization may be submitted through a research foundation.

The USAMRAA makes awards to eligible organizations, not to individuals.

II.C.1.b. Principal Investigator:

- Investigators at or above the level of Assistant Professor (or equivalent) are eligible to submit applications.
    - **Partnering PI Option:** Investigators at or above the level of Assistant Professor (or equivalent) that bring complementary skills and perspectives to the research project.

An eligible PI, regardless of ethnicity, nationality, or citizenship status, must be employed by, or affiliated with, an eligible organization.

The CDMRP encourages all PIs to participate in a digital identifier initiative through Open Researcher and Contributor ID, Inc. (ORCID). Registration for a unique ORCID identifier can be done online at http://orcid.org/.

II.C.2. Cost Sharing

Cost sharing/matching is not an eligibility requirement.

II.C.3. Other

Extramural organizations must be able to access **.gov** and **.mil** websites in order to fulfill the financial and technical deliverable requirements of the award and submit invoices for payment.

There are no limitations on the number of applications for which an investigator may be named as a PI or Partnering PI.

For general information on required qualifications for award recipients, refer to the General Application Instructions, Appendix 3.

Refer to Section II.H.2, Administrative Actions, for a list of administrative actions that may be taken if a pre-application or application does not meet the administrative, eligibility, or ethical requirements defined in this Program Announcement.

II.D. Application and Submission Information

Submission of applications that are essentially identical or propose essentially the same research project to different funding opportunities within the same program and fiscal year is prohibited and will result in administrative withdrawal of the duplicative application(s). As an exception, applicants may submit the research project described in their Investigator-Initiated Research Award application as part of an application to the FY17 PRMRP Focused Program Award (W81XWH-17-PRMRP-FPA); however, accepting multiple awards to support the same project will not be allowed.

Extramural Submission is defined as an application submitted by a non-DoD organization to Grants.gov.

Intramural Submission is defined as an application submission by a DoD organization for an intramural investigator, who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility, or working in a DoD activity embedded within a civilian medical center.

II.D.1. Address to Request Application Package

Submitting Extramural and Intramural Organizations: Pre-application content and forms can be accessed at eBRAP (https://eBRAP.org).

Submitting Extramural Organizations: Full application packages can be accessed at Grants.gov.

Submitting Intramural DoD Organizations: Full application packages can be accessed at eBRAP.org.

Contact information for the CDMRP Help Desk and the Grants.gov Contact Center can be found in Section II.G, Federal Awarding Agency Contacts.

II.D.2. Content and Form of the Application Submission

Submission is a two-step process requiring both ***pre-application*** and ***full application*** as indicated below. The submission process should be started early to avoid missing deadlines. There are no grace periods.

Pre-application Submission: All pre-applications for both extramural and intramural organizations must be submitted through eBRAP (https://eBRAP.org/).

eBRAP is a multifunctional web-based system that allows PIs to submit their pre-applications electronically through a secure connection, to view and edit the content of their pre-applications and full applications, to receive communications from the CDMRP, and to submit documentation during award negotiations and period of performance.

Full Application Submission: Full applications must be submitted through the online portals as described below.

Submitting Extramural Organizations: Full applications from extramural organizations must be submitted through Grants.gov. Applications submitted by extramural organizations (e.g., research foundations) on behalf of intramural DoD or other Federal organizations or investigators will be considered extramural submissions.

Submitting Intramural DoD Organizations: Intramural DoD organizations may submit full applications to either eBRAP or Grants.gov. Intramural DoD organizations that are unable to submit to Grants.gov should submit through eBRAP. Intramural DoD organizations with the capability to submit through Grants.gov may submit following the instructions for extramural

submissions through Grants.Gov or may submit to eBRAP. Applications from extramural organizations, including non-DoD Federal organizations, received through eBRAP will be withdrawn. See definitions in Section II.C.1, Eligible Applicants.

eBRAP allows intramural organizations to submit full applications following pre-application submission.

For both Extramural and Intramural applicants: A key feature of eBRAP is the ability of an organization's representatives and PIs to view and modify the full application submissions associated with them. eBRAP will validate full application files against the specific Program Announcement requirements and discrepancies will be noted in an email to the PI and in the Full Application Files tab in eBRAP. It is the applicant's responsibility to review all application components for accuracy as well as ensure proper ordering as specified in this Program Announcement.

The application title, eBRAP log number, and all information for the PI, Business Official(s), performing organization, and contracting organization must be consistent throughout the entire pre-application and application submission process. Inconsistencies may delay application processing and limit or negate the ability to view, modify, and verify the application in eBRAP. If any changes need to be made, the applicant should contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 prior to the application deadline.

The Investigator-Initiated Research Award mechanism is structured to accommodate two PIs. One PI will be identified as the Initiating PI and will be responsible for the majority of the administrative tasks associated with application submission. The other PI will be identified as the Partnering PI. Initiating and Partnering PIs each have different submission requirements; however, both PIs should contribute significantly to the development of the proposed research project including the Project Narrative, Statement of Work, and other required components.

The Initiating PI must complete the pre-application submission process and submit the contact information for the Partnering PI. The Partnering PI will then be notified of the pre-application submission separately by email. ***The Partnering PI must follow the link in this email in order to associate his/her full application package with that of the Initiating PI. After following the link, the Partnering PI must verify their contact information, organization, and designation as an extramural or intramural submission within eBRAP.*** If not previously registered, the Partnering PI must register in eBRAP. A new pre-application based on this research project should not be initiated by the Partnering PI. Do not delay completing these steps. If they are not completed, the Partnering PI will not be able to view and modify his/her application during the verification period in eBRAP.

II.D.2.a. Step 1: Pre-Application Submission Content

During the pre-application process, each submission is assigned a unique log number by eBRAP. This unique eBRAP log number will be needed during the full application submission process.

To begin the pre-application process, first select whether the submitting organization is extramural or intramural, then confirm your selection or cancel. **Incorrect selection of extramural or intramural submission type may result in delays in processing.**

If an error has been made in the selection of extramural versus intramural and the pre-application submission deadline has passed, the PI or Business Official must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

All pre-application components must be submitted by the PI (for single PI applicants) or Initiating PI (for applicants submitting under the Partnering PI Option) through eBRAP (https://eBRAP.org/). Because the invitation to submit an application is based on the contents of the pre-application, investigators should not change the title or research objectives after the pre-application is submitted.

PIs and organizations identified in the pre-application should be the same as those intended for the subsequent application submission. If any changes are necessary after submission of the pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

The pre-application consists of the following components, which are organized in eBRAP by separate tabs (refer to the General Application Instructions, Section II.B, for additional information on pre-application submission):

- **Tab 1 – Application Information**

  Select the FY17 PRMRP Topic Area addressed by the proposed research. If the proposed research project is aligned with more than one FY17 PRMRP Topic Area, select the Topic Area of highest relevance as the required first choice.

- **Tab 2 – Application Contacts**

  Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration (the "person to be contacted on matters involving this application" in Block 5 of the Grants.gov SF424 (R&R) Form of extramural submissions). The Business Official must be either selected from the eBRAP list or invited in order for the pre-application to be submitted.

  Select the performing organization (site at which the PI will perform the proposed work) and the contracting organization (organization submitting on behalf of the PI, which corresponds to Block 5 on the Grants.gov SF424 (R&R) Form of extramural submissions), and click on "*Add Organizations to this Pre-application.*" The organizations must be either selected from the eBRAP drop-down list or invited in order for the pre-application to be submitted.

It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-application submission is needed.

- **Tab 3 – Collaborators and Key Personnel**

  Enter the name, organization, and role of all collaborators and key personnel associated with the application.

  FY17 PRMRP Programmatic Panel members should not be involved in any pre-application or application. For questions related to Panel members and pre-applications or applications, refer to Section II.H.2.c, Withdrawal, or contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

  The Initiating PI must enter the contact information for the Partnering PI in the Partnering PI section.

  To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in pre-application or application preparation, research, or other duties for submitted pre-applications or applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Pre-applications or applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage conflicts of interest (COIs) are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- **Tab 4 – Conflicts of Interest (COIs).**

  List all individuals other than collaborators and key personnel who may have a COI in the review of the application (including those with whom the PI has a personal or professional relationship). Refer to the General Application Instructions, Appendix 3, Section C, for further information regarding COIs.

- **Tab 5 – Pre-Application Files.**

  Note: Upload documents as individual PDF files unless otherwise noted. eBRAP will not allow a file to be uploaded if the number of pages exceeds the limit specified below.

  - **Preproposal Narrative (four-page limit):** The Preproposal Narrative page limit applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Preproposal Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the pre-application.

The Preproposal Narrative should include the following:

- **Topic Area:** Describe how the proposed project relates to at least one of the FY17 PRMRP Topic Areas. If applicable, describe how the proposed research project addresses an FY17 PRMRP Area of Encouragement (Appendix 2).
- **Research Idea:** Clearly articulate the rationale for the project by presenting the ideas and reasoning behind the proposed research; include relevant literature citations.
- **Research Strategy:** State the hypothesis to be tested and the objective(s) to be reached. State the project's specific aims and briefly describe the experimental approach. If applying under the Partnering PI Option, describe how the collaborative effort will provide synergy and enhance the research.
- **Impact:** Describe the potential short-term and long-term impact of the results of the proposed study on at least one of the FY17 PRMRP Topic Areas, and its related research field(s) and/or patient population(s).
- **Military Relevance:** Explain how the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Pre-Application Supporting Documentation:** The items to be included as supporting documentation for the pre-application ***must be uploaded as individual files*** and are limited to the following:
  - References Cited (one-page limit): List the references cited (including URLs if available) in the Preproposal Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, reference title, and reference source, including volume, chapter, page numbers, and publisher, as appropriate).
  - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols used in the Preproposal Narrative.
  - Key Personnel Biographical Sketches (five-page limit per individual). ***All biographical sketches should be uploaded as a single combined file.*** Biographical sketches should be used to demonstrate background and expertise through education, positions, publications, and previous work accomplished.

- **Tab 6 – Submit Pre-Application.**

  This tab must be completed for the pre-application to be accepted and processed.

Pre-Application Screening

Pre-Application Screening Criteria

To determine the technical merits of the pre-application and the relevance to the mission of the DHP and the PRMRP, pre-applications will be screened based on the following criteria:

- **Research Idea:** How well the rationale for the research idea is supported by presented background information.

- **Research Strategy:** How well the specific aims and proposed methodology support the research idea and objectives. If applying under the Partnering PI Option, how the partnership will advance the research beyond what would be possible through individual efforts.

- **Impact:** Whether the potential immediate and long-range outcome(s)/product(s) (knowledge and/or materiel) of the proposed research, if successful, will impact a central critical problem or question in the field of research and/or patient care in the FY17 PRMRP Topic Area(s) addressed.

- **Programmatic Relevance:** Whether the proposed research idea supports the objectives of the PRMRP. To what degree the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

Notification of Pre-Application Screening Results

Following the pre-application screening, PIs (or Initiating PIs, if applying under the Partnering PI Option) will be notified as to whether or not they are invited to submit applications; however, they will not receive feedback (e.g., a critique of strengths and weaknesses) on their pre-application. The estimated time frame for notification of invitation to submit an application is indicated in Section I, Overview of the Funding Opportunity. Invitations to submit a full application are based on the Pre-Application Screening Criteria listed above.

II.D.2.b. Step 2: Full Application Submission Content

Applications will not be accepted unless the PI or Initiating PI has received notification of invitation.

All contributors and administrators to the application must use matching compatible versions of Adobe software when editing and preparing application components. The use of different software versions will result in corruption of the submitted file. Refer to the General Application Instructions, Section III, for details on compatible Adobe software.

The CDMRP cannot make allowances/exceptions to its policies for submission problems encountered by the applicant organization using system-to-system interfaces with Grants.gov.

Each application submission must include the completed full application package for this Program Announcement. The full application package is submitted by the Authorized Organizational Representative through Grants.gov (http://www.grants.gov/) for extramural

organizations or through eBRAP (https://ebrap.org/) for intramural organizations. See Table 1 below for more specific guidelines.

II.D.2.b.i. Full Application Guidelines

Extramural organizations, including non-DoD Federal agencies, must submit full applications through Grants.gov. Submissions of extramural applications through eBRAP may be withdrawn.

Table 1. Full Application Submission Guidelines

Extramural Submissions	Intramural DoD Submissions
Application Package Location	
Download application package components for W81XWH-17-PRMRP-IIRA from Grants.gov (https://www.grants.gov).	Download application package components for W81XWH-17-PRMRP-IIRA from eBRAP (https://ebrap.org).
Full Application Package Components	
SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.	**Tab 1 – Summary:** Provide a summary of the application information. **Tab 2 – Application Contacts:** This tab will be pre-populated by eBRAP; add Authorized Organizational Representative.
Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Research & Related Senior/Key Person Profile (Expanded) • Research & Related Budget • Project/Performance Site Location(s) Form • R&R Subaward Budget Attachment(s) Form (if applicable)	**Tab 3 – Full Application Files:** Upload files under each Application Component in eBRAP. Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Key Personnel • Budget • Performance Sites **Tab 4 – Application and Budget Data:** Review and edit proposed project start date, proposed end date, and budget data pre-populated from the Budget Form.
Application Package Submission	
Submit package components to Grants.gov (https://www.grants.gov). If either the Project Narrative or the budget fails eBRAP validation or if the Project Narrative or the budget need to be modified, an updated Grants.gov application package must be submitted via Grants.gov as a "Changed/Corrected Application" with the previous Grants.gov Tracking ID prior to the application submission deadline.	**Submit package components to eBRAP (https://ebrap.org).** **Tab 5 – Submit/Request Approval Full Application:** After all components are uploaded and prior to the full application submission deadline, enter your password in the space provided "Enter Your Password Here" and press the "Submit Full Application" button. eBRAP will notify your Resource Manager/Comptroller or

Extramural Submissions	Intramural DoD Submissions
	equivalent Business Official by email to log into eBRAP to review and to approve prior to the application submission deadline.
Application Verification Period	
The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.	After eBRAP has processed the full application, the organizational Resource Manager/ Comptroller or equivalent Business Official and PI(s) will receive an email notification of this status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.
Further Information	
Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.	Refer to the General Application Instructions, Section IV, for further information regarding eBRAP requirements.

The organization's Business Official or Authorized Organization Representative (or Resource Manager/Comptroller) should approve/verify the full application submission prior to the application verification deadline.

Application viewing, modification, and verification in eBRAP are strongly recommended, but not required. ***The Project Narrative and Budget cannot be changed after the application submission deadline.*** Prior to the full application deadline, a corrected or modified full application package may be submitted. Other application components may be changed until the end of the application verification period. After the end of the application verifi cation period, the full application cannot be modified.

Material submitted after the end of the application verification period, unless specifically requested by the Government, will not be forwarded for processing.

Partnering PI Option: The CDMRP requires separate full application package submissions for the Initiating PI and Partnering PI, even if the PIs are located within the same organization. Initiating and Partnering PIs will each be assigned a unique eBRAP log number. Each full application package must be submitted using the unique eBRAP log number. ***Note: All associated applications (Initiating and Partnering PIs') must be submitted by the full application submission deadline.***

Application Components for the PI (for single PI applicants) or the Initiating PI (if applying under the Partnering PI Option)

The full application package must be submitted using the unique eBRAP log number to avoid delays in application processing.

II.D.2.b.ii. Full Application Submission Components:

- **Extramural Applications Only –**

  SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.

- **Extramural and Intramural Applications –**

  Attachments:

  Each attachment to the full application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Application Instructions, Appendix 4.

  For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or incorrect file names that contain characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some circumstances. Individual attachments may not exceed 20 MB and the file size for the entire full application package may not exceed 200 MB.

  - **Attachment 1: Project Narrative (15-page limit):** Upload as "ProjectNarrative.pdf." The page limit of the Project Narrative applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Project Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the application.

    Describe the proposed project in detail using the outline below.

    - **Background:** Describe how the proposed research project addresses one or more of the FY17 PRMRP Topic Areas. Present the ideas and reasoning behind the proposed work. Cite relevant literature. Describe previous experience most pertinent to the project. Include relevant preliminary data; these data may be unpublished or from the published literature.

    - **Hypothesis:** State the hypothesis to be tested.

    - **Specific Aims:** Concisely explain the project's specific aims and the objective(s) to be reached. These aims should agree with the primary aims and associated tasks

described in the Statement of Work. If the proposed work is part of a larger study, present only aims that this DoD award would fund.

- **Research Strategy:** Describe the experimental design, methods, and analyses, including appropriate controls, in sufficient detail for analysis. Address potential problem areas and present alternative methods and approaches. Clearly describe the statistical plan and the rationale for the statistical methodology as well as an appropriate power analysis, if applicable. If animal studies are proposed, describe how they will be conducted in accordance with the ARRIVE guidelines (http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf).

- If human subjects or human biological samples will be used, describe the study population and include a detailed plan for the recruitment of human subjects or the acquisition of samples. Describe the availability of the proposed study population and past successes in recruiting similar populations. If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe the feasibility of accessing the population(s)/dataset(s). ***Clinical trials are not allowed under the Investigator-Initiated Research Award.***

- If applicable, describe how data will be reported and how it will be assured that the documentation will support a regulatory filing with the U.S. Food and Drug Administration (FDA).

- **Attachment 2: Supporting Documentation:** Combine and upload as a single file named "Support.pdf." Start each document on a new page. If documents are scanned to PDF, the lowest resolution (100 to 150 dpi) should be used. The Supporting Documentation attachment should not include additional information such as figures, tables, graphs, photographs, diagrams, chemical structures, or drawings. These items should be included in the Project Narrative. Any additional material viewed as an extension of the Project Narrative will be removed or may result in administrative withdrawal of the application.

  There are no page limits for any of these components unless otherwise noted. Include only those components described below; inclusion of items not requested will result in the removal of those items or may result in administrative withdrawal of the application.

  - References Cited: List the references cited (including URLs, if available) in the Project Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, title of reference, source of reference, volume, chapter, page numbers, and publisher, as appropriate).

  - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

  - Facilities, Existing Equipment, and Other Resources: Describe the facilities and equipment available for performance of the proposed project and any additional facilities or equipment proposed for acquisition at no cost to the award. Indicate

whether or not Government-furnished facilities or equipment are proposed for use. If so, reference should be made to the original or present Government award under which the facilities or equipment items are now accountable. There is no form for this information.

- Publications and/or Patents: Include a list of relevant publication URLs and/or patents. If publications are not publicly available, then copies of up to five published manuscripts may be included in Attachment 2. Extra items will not be reviewed.

- Letters of Organizational Support: Provide a letter (or letters, if applicable), signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. Letters of support not requested in the Program Announcement, such as those from members of Congress, do not impact application review or funding decisions.

- Letters of Collaboration: Provide a signed letter from each collaborating individual or organization that will demonstrate that the PI has the support or resources necessary for the proposed work.

- Letters Confirming Access to Military or VA Patient Populations or Resources (if applicable): If the proposed research plan involves access to active duty military and/or VA patient populations or resources, include a letter of support, signed by the lowest ranking person with approval authority, confirming such access. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resources.

- Intellectual Property: Information can be found in Code of Federal Regulations, Title 2, Part 200.315 (2 CFR 200.315), "Intangible Property."

  - Intellectual and Material Property Plan (if applicable): Provide a plan for resolving intellectual and material property issues among participating organizations.

  - Commercialization Strategy (if applicable): Describe the commercialization plan. The plan should include intellectual property, market size, financial analysis, strengths and weaknesses, barriers to the market, competitors, and management team. Discuss the significance of this development effort, when it can be anticipated, and the potential commercial use for the technology being developed.

- Data and Research Resources Sharing Plan: Describe how data and resources generated during the performance of the project will be shared with the research community. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- **Attachment 3: Technical Abstract (one-page limit):** Upload as "TechAbs.pdf." The technical abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  - The technical abstract is used by all reviewers. Of particular importance, programmatic reviewers typically do not have access to the full application and therefore rely on the technical abstract for appropriate description of the project's key aspects. Therefore, clarity and completeness within the space limits of the technical abstract are highly important.

  - Describe the proposed research project including the following elements: background, rationale, hypothesis, specific aims and objectives, study design, long-term and short-term impact to the relevant research field and patient population(s), and the relevance of the project to at least one FY17 PRMRP Topic Area.

- **Attachment 4: Lay Abstract (one-page limit):** Upload as "LayAbs.pdf." The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***. Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  - Describe how the proposed research project addresses one or more of the FY17 PRMRP Topic Areas. Include a comprehensive overview of the proposed research project that will be ***readily understood by readers without a background in science or medicine.*** Clearly describe the central critical problem or question to be addressed and the ultimate applicability and impact of the research. ***Do not duplicate the technical abstract.***

- **Attachment 5: Statement of Work (SOW) (three-page limit):** Upload as "SOW.pdf." The suggested SOW format and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm). For the Investigator-Initiated Research Award mechanism, use the SOW format example titled "SOW (Statement of Work) Generic Format." The SOW must be in PDF format prior to attaching.

  The SOW should include a list of major tasks that support the proposed specific aims, followed by a series of subtasks outlined related to the major tasks and milestones within the period of performance. The SOW should describe only the work for which funding is being requested by this application and, as applicable, should also:

  Include the name(s) of the key personnel and contact information for each study site/ subaward site.

  Indicate the number (and type, if applicable) of research subjects (animal or human) and/or human anatomical samples projected or required for each task and at each site.

Refer to the General Application Instructions, Appendix 1, for additional information regarding regulatory requirements.

Briefly state the methods to be used.

For studies with prospective accrual of human subjects, indicate quarterly enrollment targets.

Identify cell line(s) and commercial or organizational source(s) to be used. If human anatomical substances (including cell lines) will be used, specify whether or not identifiable information is accessible to the research team by any means.

If applicable, indicate timelines required for regulatory approvals relevant to human subjects research (e.g., Investigational New Drug and Investigational Device Exemption applications) by the FDA or other Government agency.

Partnering PI Option: The Initiating and partnering PIs must submit an identical copy of a jointly created SOW. The contributions of the Initiating PI and Partnering PI should be noted for each task.

- **Attachment 6: Impact Statement (one-page limit): Upload as "Impact.pdf."**

  Explain why the proposed research project is important and relevant to understanding the cause or progression of the disease or condition, or to developing improvements in prevention, detection, diagnosis, treatment, patient care, or quality of life in the FY17 PRMRP Topic Area(s) addressed. Describe how the study will address a central critical problem or question in the relevant Topic Area(s). If applicable, describe how the project addresses an FY17 PRMRP Area of Encouragement (Appendix 2).

  - ***Describe the short-term impact:*** Detail the anticipated outcome(s)/product(s) (knowledge and/or material) that will be directly attributed to the results of the proposed research.

  - ***Describe the long-term impact:*** Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable. Explain the long-range vision for how the research will impact the field of study and/or clinical care.

- **Attachment 7: Military Relevance Statement (one-page limit): Upload as "MilRel.pdf."**

  Describe how the proposed study is responsive to the healthcare needs of military Service members, Veterans, and/or beneficiaries. Provide information about the incidence and/or prevalence of the disease or condition in the general population as well as in military Service members, Veterans, and/or beneficiaries.

  If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe the population(s)/dataset(s) and the

appropriateness of the population(s)/dataset(s) for the proposed study. If a non-military population will be used for the proposed research project, explain how the population simulates the targeted population (i.e., military Service members, Veterans, and/or beneficiaries).

If applicable, show how the proposed research project aligns with DoD and/or VA areas of research interest. Provide a description of how the knowledge, information, products, or technologies gained from the research could be implemented in a dual-use capacity to benefit the civilian population and address a military need, as appropriate.

- **Attachment 8: Partnership Statement (one-page limit): Upload as "Partnership.pdf."** ***This attachment is only required for applications submitted under the Partnering PI Option.***

  Describe the expertise of the Initiating and Partnering PIs and how each will bring different strengths to the proposed project. Describe how the combined effort will be synergistic and produce an outcome greater than any that could be achieved by independent efforts. Outline the contribution and time commitment of each partner and how each will have equal intellectual input on the design, conduct, and analysis of the project. Describe how the PIs will manage the collaboration and workflow to optimize research efforts.

- **Attachment 9: DoD Military Budget Form(s), if applicable: Upload as "MFBudget.pdf."** If a military facility (military health system facility, research laboratory, treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center) will be a collaborator in performance of the project, complete the DoD Military Budget Form, available for download on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm), including a budget justification, for each military facility as instructed. The costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

- **Extramural and Intramural Applications –**

  Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

  - PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf." The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The National Institutes of Health Biographical Sketch may also be used. All biographical sketches should be submitted in the portable document format (PDF) that is not editable.

  - PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

- Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."

  - If applying under the Partnering PI Option, include biographical sketches for the Partnering PI.

- Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

  - If applying under the Partnering PI Option, include previous/current/pending support for the Partnering PI.

Research & Related Budget: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.4, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.3, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf." The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

Partnering PI Option: ***Initiating and Partnering PIs must each submit a budget and justification specific to their own portion of the efforts as part of their separate application packages. The Initiating PI should not include budget information for the Partnering PI, even if they are located within the same organization. The anticipated combined direct costs budgeted for the entire period of performance for the Initiating and Partnering PIs' applications will not exceed $1.5M. Collaborating organizations should budget associated indirect costs in accordance with each organization's negotiated rate. The combined budgeted direct costs approved by the Government will not exceed $1.5M or use an indirect rate exceeding each organization's negotiated rate. Refer to Section II.D.5, Funding Restrictions, for detailed information.***

Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.4, for detailed information.

- **Extramural Applications Only –**

  R&R Subaward Budget Attachment(s) Form (if applicable): Refer to the General Application Instructions, Section III.A.6, for detailed information.

  - **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.6, for detailed information.)

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov as Attachment 9. (Refer to the General Application Instructions,

Section III.A.7, for detailed information.) Intramural DoD Collaborator(s) costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs. **DoD Military Budget Form:** A military facility collaborating in the performance of the project (but not participating as a Partnering PI) should be treated as a subaward for budget purposes. However, do not complete the Grants.Gov R&R Subaward Budget Attachment Form; instead, complete the DoD Military Budget Form (Attachment 9) to show all direct and indirect costs. The costs per year should be included on the Grants.gov Research & Related Budget Form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

Application Components for the Partnering PI, if applying under the Partnering PI Option

The Partnering PI MUST follow the link in the email from eBRAP and, if not registered in eBRAP, complete the registration process prior to the application submission deadline in order to associate his/her full application package with that of the Initiating PI.

For the Partnering PI, the Initiating PI must identify if the Partnering PI will be submitting an extramural or intramural application (in accordance with the guidelines in Section II.C.1.a, Organization) and the appropriate mode of submission (Grants.gov for extramural and eBRAP for intramural). The Partnering PI must verify his/her contact information and mode of submission within eBRAP to ensure proper submission of his/her application.

The application submission process for the Partnering PI uses an abbreviated full application package that includes:

- **Extramural and Intramural Applications –**

  Attachments:

  - **Attachment 5: Statement of Work (SOW) (three-page limit): Upload as "SOW.pdf."** Refer to the General Application Instructions, Section III.A.2, for detailed information on completing the SOW. The Initiating PI and Partnering PI must submit an identical copy of a jointly created SOW. The contributions of the Initiating PI and Partnering PI should be noted for each task.

  - **Attachment 9: DoD Military Budget Form (if applicable): Upload as "MilBudget.pdf."** Refer to the General Application Instructions, Section III.A.7, for detailed information. The costs per year should be included on the Grants.Gov Research and Related Budget form under subaward costs.

  Research & Related Budget: For extramural submissions, refer to the General Application Instructions, Section III.A.4, and for intramural submissions refer to the General Application Instructions, Section IV.A.3, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf."

Initiating and Partnering PIs must each submit a budget and justification specific to their own portion of the efforts as part of their separate Grants.gov application packages. The Research & Related Budget for the Partnering PI should not include budget information for the Initiating PI, even if they are located within the same organization.

Project/Performance Site Location(s) Form. For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to General Application Instructions, Section IV.A.4, for detailed information.

- **Extramural Applications Only –**

  R&R Subaward Budget Attachment(s) Form:

  - **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.6, for detailed information.)

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov as Attachment 9. (Refer to the General Application Instructions, Section IV.A.3, for detailed information.)

II.D.3. Dun and Bradstreet Universal Numbering System (DUNS) Number and System for Award Management (SAM)

Applicant organizations and all subrecipient organizations must have a DUNS number to submit applications to Grants.gov. The applicant organization must also be registered in the Entity Management functional area of the SAM with an "Active" status to submit applications through the Grants.gov portal. Verify the status of the applicant's organization's Entity registration in SAM well in advance of the application submission deadline. Allow 3 to 4 weeks to complete the entire SAM registration process. If an applicant has not fully complied with the requirements by the time the Federal awarding agency is ready to make a Federal award, the Federal awarding agency may determine that the applicant is not qualified to receive a Federal award and use that determination as a basis for making a Federal award to another applicant. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.

II.D.4. Submission Dates and Times

All submission dates and times are indicated in Section I, Overview of the Funding Opportunity. Pre-application and application submissions are required. The pre-application and application submission process should be started early to avoid missing deadlines. There are no grace periods. Failure to meet either of these deadlines will result in submission rejection.

Applicant Verification of Full Application Submission in eBRAP

Prior to the end of the application verification period, PIs and organizational representatives can review and modify in eBRAP certain components of a submitted application. Following retrieval and processing of the full application, eBRAP will notify the organizational representatives and PI by email to log into eBRAP to review, modify, and verify the full application submission. eBRAP will validate retrieved files against the specific Program Announcement requirements and discrepancies will be noted in both the email and in the Full Application Files tab in eBRAP. eBRAP does not confirm the accuracy of file content. It is the applicant's responsibility to review all application components and ensure proper ordering as specified in the Program Announcement. ***If either the Project Narrative or the budget fails eBRAP validation or needs to be modified, an updated full application package must be submitted prior to the application submission deadline.*** The Project Narrative and Budget Form cannot be changed after the application submission deadline.

II.D.5. Funding Restrictions

The maximum period of performance is **3** years.

Application submissions with a single PI:

The anticipated direct costs budgeted for the entire period of performance will not exceed **$1.2 million (M)**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. No budget will be approved by the Government exceeding **$1.2M** direct costs or using an indirect cost rate exceeding the organization's negotiated rate.

All direct and indirect costs of any subaward or contract must be included in the total direct costs of the primary award.

The applicant may request the entire maximum funding amount for a project that may have a period of performance less than the maximum **3** years.

Application submissions including the Partnering PI Option: The combined direct costs budgeted for the entire period of performance for the Initiating and Partnering PIs' applications will not exceed **$1.5M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. Collaborating organizations should budget associated indirect costs in accordance with each organization's negotiated rate. The combined budgeted direct costs approved by the Government will not exceed **$1.5M** or use an indirect cost rate exceeding each organization's negotiated rate.

A separate award will be made to each PI's organization.

The Initiating PI and the Partnering PI are expected to be equal partners in the research, and direct cost funding should be divided accordingly, unless otherwise warranted and clearly justified. Each partner may request no more than 75% (or no less than 25%) of the proposed direct costs.

For this award mechanism, direct costs may be requested for (not all-inclusive):

- Salary
- Research supplies
- Clinical research costs *(clinical trials are not allowed)*
- Support for multidisciplinary collaborations, including travel
- Travel costs for the PI(s) to disseminate project results at one DoD-sponsored meeting to be specified by the program office during award negotiations
- Travel costs for one investigator to travel to one scientific/technical meeting per year in addition to the DoD-sponsored meeting described above.

Extramural (non-Federal) awards will consist solely of assistance agreements (Cooperative Agreements and Grants). For extramural awards with an intragovernmental component, direct transfer of funds from an extramural award recipient to a DoD or other Federal agency is not allowed except under very limited circumstances. Funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intragovernmental only funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intramural applicants are responsible for coordinating through their agency's procedures the use of contractual or assistance funding awards or other appropriate agreements to support extramural collaborators. Application packages from associated extramural partners will be funded through assistance agreements.

Refer to the General Application Instructions, Section III.A.4, for budget regulations and instructions for the Research & Related Budget. ***For Federal agencies or organizations collaborating with Federal agencies, budget restrictions apply as are noted in the General Application Instructions, Section III.A.4***.

The CDMRP expects to allot approximately $90M of the $300M FY17 appropriation to fund approximately 47 Investigator-Initiated Research Award applications, depending on the quality and number of applications received. Funding of applications received in response to this Program Announcement is contingent upon the availability of Federal funds for this program.

II.D.6. Other Submission Requirements

Refer to the General Application Instructions, Appendix 4, for detailed formatting guidelines.

II.E. Application Review Information

II.E.1. Criteria

II.E.1.a. Peer Review

To determine technical merit, all applications will be evaluated according to the following scored criteria, which are listed in decreasing order of importance:

- **Research Strategy and Feasibility**
    - How well the scientific rationale supports the project and its feasibility, as demonstrated by a critical review and analysis of the literature, supporting data, and logical reasoning.
    - How well the hypothesis, specific aims, and objective(s) are developed.
    - How well the experimental design, methods, data collection procedures, and analyses are developed and support completion of the aims.
    - If applicable, to what degree the statistical plan and power analysis are appropriate for the proposed project.
    - If animal studies are included, how well they are designed to achieve reproducible and rigorous results, including the choice of model and the endpoints/outcomes to be measured.
    - If applicable, whether data will be appropriately reported and documented to support a regulatory filing with the FDA.
    - If applicable, how well the application provides evidence of availability of and access to the necessary study populations and/or resources.
    - How well potential problems are identified and alternative approaches are addressed.
    - Whether the research can be completed within the proposed period of performance.
- **Impact**
    - To what extent the project impacts a central critical problem or question in at least one FY17 PRMRP Topic Area.
    - If applicable, how well the proposed research project addresses one or more FY17 PRMRP Areas of Encouragement.
    - How the proposed research project, if successful, will make important scientific advances in the relevant field of research.
    - To what degree the proposed project could, if successful, make a significant impact on the lives of relevant patient populations in the short term and/or long term.

- **Personnel**
    - How the background and expertise of the PI(s) and other key personnel demonstrate their ability to perform the proposed work.
    - How the levels of effort by the PI(s) and other key personnel are appropriate to ensure the successful conduct of the project.
    - How each PI's record(s) of accomplishment demonstrates his/her ability to accomplish the proposed work.

For applications submitted under the Partnering PI Option:

- **Partnership**
    - How well the research project is supported by the nature of the collaboration.
    - To what extent the proposed partnership will advance research beyond what would be possible through individual efforts.
    - How well the skills and perspectives of the Initiating and Partnering PIs complement each other.
    - How well the application reflects the requirement that the partners have equal intellectual input into the design of the project.

In addition, the following unscored criteria will also contribute to the overall evaluation of the application:

- **Environment**
    - How the scientific environment is appropriate for the proposed research.
    - How the research requirements are supported by the availability of and accessibility to facilities and resources (including collaborative arrangements).
    - How the quality and extent of organizational support are appropriate for the proposed research.
    - If applicable, to what degree the intellectual and material property plan is appropriate.
- **Budget**
    - Whether the budget is appropriate for the proposed research and within the limitations of this Program Announcement.

- **Application Presentation**
    - To what extent the writing, clarity, and presentation of the application components influence the review.

II.E.1.b. Programmatic Review

To make funding recommendations and select the application(s) that, individually or collectively, will best achieve the program objectives, the following criteria are used by programmatic reviewers:

- Ratings and evaluations of the peer reviewers
- Relevance to the mission of the DHP and FY17 PRMRP, as evidenced by the following:
    - Adherence to the intent of the award mechanism
    - Program portfolio composition
    - Military relevance
    - Relative impact

II.E.2. Application Review and Selection Process

All applications are evaluated by scientists, clinicians, and consumers in a two-tier review process. The first tier is peer review of applications against established criteria for determining technical merit. Each application is evaluated for its own merit, independent of other applications. The second tier is a programmatic review that makes recommendations for funding to the Commanding General, USAMRMC, on behalf of the DHA and the OASD(HA), based on technical merit, the relevance to the mission of the DHP and PRMRP, the specific intent of the award mechanism, and to other specified evaluation criteria in the Program Announcement. Programmatic review is a comparison-based process in which applications with scientific and technical merit compete in a common pool. ***The highest-scoring applications from the first tier of review are not automatically recommended for funding. Funding recommendations depend on various factors as described in Section II.E.1.b, Programmatic Review.*** Additional information about the two-tier process used by the CDMRP can be found at http://cdmrp.army.mil/about/fundingprocess.

All CDMRP review processes are conducted confidentially to maintain the integrity of the merit-based selection process. Panel members sign a statement that application and evaluation information will not be disclosed outside the panel. Violations of confidentiality can result in the dissolving of a panel(s) and other corrective actions. In addition, personnel at the applicant or collaborating organizations are prohibited from contacting persons involved in the review process to gain protected evaluation information or to influence the evaluation process. Violations of these prohibitions will result in the administrative withdrawal of the organization's application. Violations by panel members or applicants that compromise the confidentiality of the review process may also result in suspension or debarment from Federal awards.

Furthermore, the unauthorized disclosure of confidential information of one party to another third party is a crime in accordance with 18 USC 1905.

II.E.3. Integrity and Performance Information

Prior to making an assistance agreement award where the Federal share is expected to exceed the simplified acquisition threshold (currently $150,000) over the period of performance, the Federal awarding agency is required to review and consider any information about the applicant that is available in the Federal Awardee Performance and Integrity Information System (FAPIIS).

An applicant, at its option, may review FAPIIS, accessible through SAM, and submit comments to FAPIIS on any information about itself that a Federal awarding agency previously entered and is currently available in FAPIIS.

The Federal awarding agency will consider any comments by the applicant, in addition to other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics and record of performance under Federal awards when determining a recipient's qualification prior to award, according to the qualification standards of the Department of Defense Grant and Agreement Regulations (DoDGAR), Section 22.415.

II.E.4. Anticipated Announcement and Federal Award Dates

All application review dates and times are indicated in Section I, Overview of the Funding Opportunity.

Each PI and organization will receive email notification of posting of the funding recommendation in eBRAP. Each PI will receive a peer review summary statement on the strengths and weaknesses of the application.

II.F. Federal Award Administration Information

II.F.1. Federal Award Notices

Awards will be made no later than September 30, 2018. Refer to the General Application Instructions, Appendix 2, for additional award administration information.

Awards are made to organizations, not to individual PIs. The types of awards made under the Program Announcement will be assistance agreements (grants or cooperative agreements). The level of involvement on the part of DoD during project performance is the key factor in determining whether to award a grant or cooperative agreement.

Extramural Organizations: An assistance agreement (grant or cooperative agreement) is appropriate when the Federal Government transfers a "thing of value," to a "state, local government," or "other recipient," to carry out a public purpose of support or stimulation authorized by a law of the United States, instead of acquiring property or service for the direct benefit and use of the U.S. Government. An assistance agreement can take the form of a grant or cooperative agreement. If "no substantial involvement" on the part of the funding agency is

anticipated, a grant award will be made (31 USC 6304). Conversely, if substantial involvement on the part of the funding agency is anticipated, a cooperative agreement will be made (31 USC 6305). Substantial involvement may include collaboration, participation, or intervention in the research to be performed under the award. The award type, along with the start date, will be determined during the negotiation process.

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the USAMRAA will contact the business official authorized to negotiate on behalf of the PI's organization.

Only an appointed USAMRAA Grants Officer may obligate the Government to the expenditure of funds. No commitment on the part of the Government should be inferred from discussions with any other individual. The award document signed by the Grants Officer is the official authorizing documents.

Intramural Organizations: Awards to Federal Government organizations (to include intramural DoD organizations) will be executed through the Military Interdepartmental Purchase Request (MIPR) or Funding Authorization Document (FAD) process. Transfer of funds is contingent upon appropriate safety and administrative approvals. Intramural applicants and collaborators are reminded to coordinate receipt and commitment of funds through their respective resource managers (RM).

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the CDMRP will contact the business official authorized to negotiate on behalf of the PI's organization.

II.F.1.a. Award Transfers

Changes in PI and an organizational transfer of an award supporting the Initiating or Partnering PI are discouraged and will be evaluated on a case-by-case basis and only allowed at the discretion of the Grants Officer. An organizational transfer of an award will not be allowed in the last year of the (original) period of performance or any extension thereof.

Refer to the General Application Instructions, Appendix 2, Section B, for general information on organization or PI changes.

II.F.2. Administrative and National Policy Requirements

Applicable requirements in the DoDGAR found in 32 CFR, Chapter 1, Subchapter C, and 2 CFR, Chapter XI, apply to grants and cooperative agreements resulting from this Program Announcement.

Refer to the General Application Instructions, Appendix 2, for general information regarding administrative requirements.

Refer to the General Application Instructions, Appendix 5, for general information regarding national policy requirements.

Refer to full text of the USAMRAA General Research Terms and Conditions for Institutions of Higher Education, Hospitals, and Non-Profit Organizations and the USAMRAA General Research Terms and Conditions with For-Profit Organizations for further information.

II.F.3. Reporting

Refer to the General Application Instructions, Appendix 2, Section A, for general information on reporting requirements. Annual progress reports as well as a final progress report will be required.

Quarterly technical progress reports may be required.

Award Chart: Complete the Award Chart template, a one-page PowerPoint file that must be downloaded from the CDMRP eBRAP System at https://ebrap.org/eBRAP/public/Program.htm, and submit to eBRAP at the time of award.

Award Expiration Transition Plan: Complete the Transition Plan template, a one-page Word document that must be submitted with the Final Progress Report. The Transition Plan must outline if and how the research supported by this award will progress, and include source(s) of funding, either known or pending.

Awards resulting from this Program Announcement will incorporate additional reporting requirements related to recipient integrity and performance matters. Recipient organizations that have Federal contract, grant, and cooperative agreement awards with a cumulative total value greater than $10,000,000 are required to provide information to FAPIIS about certain civil, criminal, and administrative proceedings that reached final disposition within the most recent 5-year period and that were connected with performance of a Federal award. Recipients are required to disclose semiannually information about criminal, civil, and administrative proceedings as specified in the applicable Terms and Conditions. The applicable Terms and Conditions for institutions of higher education, hospitals, and nonprofit organizations are available in OAR Article I, Section B, in the July 2016 R&D General Terms and Conditions. The applicable Terms and Conditions for for-profit organizations are available in Section 34 of the February 2017 USAMRAA General Research Terms and Conditions with For-Profit Organizations.

II.G. Federal Awarding Agency Contacts

II.G.1. CDMRP Help Desk

Questions related to Program Announcement content or submission requirements as well as questions related to the pre-application or intramural application submission through eBRAP should be directed to the CDMRP Help Desk, which is available Monday through Friday from 8:00 a.m. to 5:00 p.m. ET. Response times may vary depending upon the volume of inquiries.

Phone: 301-682-5507

Email: help@eBRAP.org

II.G.2. Grants.gov Contact Center

Questions related to extramural application submission through Grants.gov portal should be directed to the Grants.gov Contact Center, which is available 24 hours a day, 7 days a week (closed on U.S. Federal holidays). Note that the CDMRP Help Desk is unable to provide technical assistance with Grants.gov submission.

Phone: 800-518-4726; International 1-606-545-5035

Email: support@grants.gov

Sign up on Grants.gov for "send me change notification emails" by following the link on the Synopsis page for the Program Announcement or by responding to the prompt provided by Grants.gov when first downloading the Grants.gov application package. If the Grants.gov application package is updated or changed, the original version of the application package may not be accepted by Grants.gov.

II.H. Other Information

II.H.1. Program Announcement and General Application Instructions Versions

Questions related to this Program Announcement should refer to the Program name, the Program Announcement name, and the Program Announcement version code 20170516b. The Program Announcement numeric version code will match the General Applications Instructions version code 20170516.

II.H.2. Administrative Actions

After receipt of pre-applications or applications, the following administrative actions may occur:

II.H.2.a. Rejection

The following will result in administrative rejection of the pre-application:

- Preproposal Narrative is missing.

The following will result in administrative rejection of the application:

- Submission of an application for which a letter of invitation was not received.
- Project Narrative exceeds page limit.
- Project Narrative is missing.
- Budget is missing.

- Submission of the same research project to different Funding Opportunities within the same program and fiscal year. Refer to Section II.D., Application and Submission Information, for exceptions.

- **Partnering PI Option:** Both associated (Initiating and Partnering PI) applications are not submitted by the deadline.

II.H.2.b. Modification

- Pages exceeding the specific limits will be removed prior to review for all documents other than the Project Narrative.

- Documents not requested will be removed.

II.H.2.c. Withdrawal

The following may result in administrative withdrawal of the pre-application or application:

- An FY17 PRMRP Programmatic Panel member is named as being involved in the research proposed or is found to have assisted in the pre-application or application processes including, but not limited to, concept design, application development, budget preparation, and the development of any supporting documentation. ***A list of the FY17 PRMRP Programmatic Panel members can be found at http://cdmrp.army.mil/prmrp/panels/panels17***.

- The application fails to conform to this Program Announcement description to the extent that appropriate review cannot be conducted.

- Inclusion of URLs, with the exception of links in References Cited and Publication and/or Patent Abstract sections.

- Page size is larger than 8.5 inches x 11.0 inches (approximately 21.59 cm x 27.94 cm).

- To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in the preparation, research or other duties for submitted applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- Personnel from applicant or collaborating organizations are found to have contacted persons involved in the review process to gain protected evaluation information or to influence the evaluation process.

- Applications from extramural organizations, including non-DoD Federal agencies, received through eBRAP may be withdrawn.

- Applications submitted by an intramural DoD organization may be withdrawn if the intramural organization cannot coordinate the use of contractual, assistance, or other appropriate agreements to provide funds to extramural collaborators.

- The proposed research project does not address at least one of the Congressionally directed FY17 PRMRP Topic Areas.

- If a clinical trial is proposed, the application will be withdrawn.

- An application submitted by a PI who does not meet the eligibility criteria will be withdrawn.

II.H.2.d. Withhold

Applications that appear to involve research misconduct will be administratively withheld from further consideration pending organizational investigation. The organization will be required to provide the findings of the investigation to the USAMRAA Grants Officer for a determination of the final disposition of the application.

II.H.3. Application Submission Checklist

Application Components	Action	Initiating PI Completed	Partnering PI Completed
SF424 (R&R) Application for Federal Assistance **(Extramural submissions only)**	Complete form as instructed.		
Summary (Tab 1) and Application Contacts (Tab 2) **(Intramural submissions only)**	Complete these tabs as instructed.		
Attachments	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf."		
	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf."		
	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf."		
	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf."		
	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf."		
	Impact Statement: Upload as Attachment 6 with file name "Impact.pdf."		
	Military Relevance Statement: Upload as Attachment 7 with file name "MilRel.pdf."		
	Partnership Statement: Upload as Attachment 8 with file name "Partnership.pdf," if applicable.		
	DoD Military Budget Form(s): Upload as Attachment 9 with file name "MFBudget.pdf," if applicable.		
Research & Related Senior/Key Person Profile (Expanded)	Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field.		
	Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field.		
	Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field.		
	Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field.		

Application Components	Action	Initiating PI Completed	Partnering PI Completed
Research & Related Budget **(Extramural submissions only)**	Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field.		
Budget **(Intramural submissions only)**	Complete the DoD Military Budget Form and Justification.		
Project/Performance Site Location(s) Form	Complete form as instructed.		
R&R Subaward Budget Attachment(s) Form	Complete form as instructed.		

APPENDIX 1
ACRONYM LIST

ACURO	Animal Care and Use Review Office
CDMRP	Congressionally Directed Medical Research Programs
CFR	Code of Federal Regulations
DHA	Defense Health Agency
DHP	Defense Health Program
DoD	Department of Defense
DoDGAR	Department of Defense Grant and Agreement Regulations
DUNS	Data Universal Numbering System
eBRAP	Electronic Biomedical Research Application Portal
EC	Ethics Committee
ET	Eastern Time
FAPIIS	Federal Awardee Performance and Integrity Information System
FDA	U.S. Food and Drug Administration
FY	Fiscal Year
HRPO	Human Research Protection Office
IACUC	Institutional Animal Care and Use Committee
IRB	Institutional Review Board
M	Million
OASD(HA)	Office of the Assistant Secretary of Defense for Health Affairs
OMB	Office of Management and Budget
ORP	Office of Research Protections
PI	Principal Investigator
PRMRP	Peer Reviewed Medical Research Program
RDT&E	Research, Development, Test, and Evaluation
RM	Resource Manager
SAM	System for Award Management
SOW	Statement of Work
USAMRAA	U.S. Army Medical Research Acquisition Activity
USAMRMC	U.S. Army Medical Research and Materiel Command

VA	Department of Veterans Affairs

APPENDIX 2
AREAS OF ENCOURAGEMENT

Applications addressing any of the FY17 PRMRP Topic Areas are of interest to the program. ***Any aspect of research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding.*** Areas of encouragement related to the FY17 PRMRP Topic Areas have been identified by the DoD, VA, and other relevant stakeholders. Applicants are urged to read and consider these areas of encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an area of encouragement in this list.***

Acute Lung Injury

- Research on the etiology and prevention of acute respiratory distress syndrome caused by the host's or immune system's responses to infectious disease or septic shock.
- Preventive techniques, novel and/or innovative detection technologies, and therapeutics to reduce the incidence and/or severity of acute respiratory distress syndrome and/or other lung injury secondary to trauma, transfusion, burns, hemorrhagic shock, inhalation, and/or oxygen exposure.
- Development of a clinical laboratory-based device for manufacturing/amplification of stem cells to treat acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Clinical studies to test cellular therapies in the treatment of acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Metrics to associate the health outcomes of acute lung injury with physiological and physical performance, as well as the psychological health of military Service members.
- Strategies to stabilize and support the safe transport of patients with lung injury in order to optimize therapeutic interventions.
- Studies to identify the prevalence and associated morbidity and mortality of blast overpressure lung injury in forward operating environments.

Antimicrobial Resistance

- Identification and evaluation of novel and/or innovative antifungals against resistant fungal infections, particularly for use as topical therapies for wounds and for surgical and post-surgical therapies.
- Identification of novel and/or innovative targets for multi-drug resistant pathogens.
- Development of novel and/or innovative interventions, diagnostics, and treatment for multi-drug-resistant pathogens.
- Development of novel and/or innovative therapies that interrupt biofilm production in wound infections and infected hardware models.
- Development and testing of treatment protocols and/or diagnostic tests to limit prescribing antibiotics for conditions that are commonly viral in nature or conditions that would resolve themselves without antibiotic treatment (e.g., sinusitis, bronchitis, viral upper respiratory infections, and acute gastroenteritis).

- Development of rapid, rugged, sensitive, and specific diagnostics for antimicrobial resistance in remote environments.
- Research to improve understanding of the impact of travelers' diarrhea, as well as antibiotic treatment for the colonization of multi-drug-resistant organisms.

Arthritis

- Studies that define the risk of contracting septic arthritis; reactive arthritis; arthritis caused by a gastrointestinal, genitourinary, or viral infection (e.g., Lyme disease, Campylobacter, chikungunya); and other arthritis types in active duty military personnel.
- Research toward the development of clinical practice guidelines to prevent, identify, and treat arthritis, particularly that resulting from traumatic injury, surgery, and/or infectious diseases.
- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Strategies for repairing focal cartilage defects using cell-based therapies.
- Research quantifying the impacts of obesity, weight loss, physical fitness (all components—cardiovascular, strength, flexibility, balance), and dietary factors on the development of or prevention/risk reduction of arthritis.
- Identification and/or validation of biomarkers for early psoriatic arthritis.
- Basic and translational research to identify treatments to mitigate and/or reverse osteoarthritis, particularly in the knee, hip, ankle, and shoulder.
- Studies to examine using existing regenerative medicine techniques and therapies to treat osteoarthritis, including dose response information and the frequency and timing of application.
- Development of novel and/or innovative treatments or combination therapies for psoriatic arthritis.

Burn Pit Exposure

- Research on the etiology and treatment of adverse health events related to military deployment to Iraq and Afghanistan that are associated with exposure to airborne hazards and open pit burning of solid waste and other materials.
- Toxicological studies to ascertain the toxicity of natural dust, burn pit combustion products and interactions between pollutants, as well as their mechanisms of action.
- Characterization of emissions from open air burns, burn boxes, and incinerators.
- Development and validation of instruments for assessing levels of exposure to airborne hazards for use in research and for occupational and environmental exposure monitoring.

Chronic Migraine and Post-Traumatic Headache

- Research to investigate, develop, and validate biomarkers that are useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache.
- Epidemiological/natural history studies to characterize specific types of post-traumatic headache, the pathobiology of these headaches (such as the role of cortical spreading

depression acutely after injury as a risk factor for chronic headaches of a migrainous type), and the risk factors that might predispose people to certain types of post-traumatic headache.

- Double-blind, placebo-controlled trials in the post-traumatic headache population in order to determine whether similar phenotypes in primary headache disorders and post-traumatic headache will respond similarly to treatment.
- Research on the optimal approaches to effective management of co-occurring psychological health disorders and acute and chronic pain management for chronic migraine and post-traumatic headache, with a focus on assessing and eliminating adverse outcomes and decreasing polypharmacy.
- Research on the utility of the Patient-Centered Medical Home model of care for patients with chronic migraine or post-traumatic headache.
- Research on the treatment and prevention of acute flares of chronic migraine and post-traumatic headaches with an emphasis on non-opioid medications.
- Evaluation of the use of mechanical stimulation and/or other non-pharmaceutical treatments to reduce acute and chronic migraines and headaches.
- Precision medicine research to investigate, develop, and validate biomarkers that are not only useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache, but can also identify individual responses to treatment.
- Evaluation of the differences in etiology, diagnosis, treatment plan, and prevention of migraine headaches between men and women.

Congenital Heart Disease

- Population-based and outcomes-based research projects to assess the health outcomes of individuals with congenital heart disease across their life spans.
- Research on tissue engineering approaches to patches, grafts, and transplantation that provide structural support, restore native activity, allow for tissue growth, and prevent the need for reoperation.
- Research to improve understanding of the causes of congenital heart defects, including genomic, proteomic, and metabolomic profiling.
- Research on transition of the care of congenital heart disease patients from pediatric to adult providers.
- Research both on the risk of neurologic injury and on enhanced neuroprotection before, during, and after surgery for congenital heart disease.
- Research to design and implement disease-in-a-dish and/or microfluidic models with an established phenotype to increase the efficacy of finding novel and/or innovative drug targets, screen existing drugs, perform cardiotoxicity testing, and/or uncover pathogenesis.

Constrictive Bronchiolitis

- Clinical assessments to determine the prevalence and severity of constrictive bronchiolitis and related respiratory diseases in previously deployed military Service members and/or Veterans.

- Development and testing of less invasive and non-invasive approaches for diagnosing constrictive bronchiolitis.
- Research to develop novel and/or innovative therapeutics to slow or reverse the progression of constrictive bronchiolitis.
- Development and/or validation of animal models for constrictive bronchiolitis.
- Research to understand the role of environmental exposures, including mineralized dust and other particulates, in the etiology of constrictive bronchiolitis.

Diabetes

- Development of biomarkers to identify and monitor at-risk individuals and assess treatment response.
- Research on interventions to prevent diabetes complications, including diabetic retinopathy and diabetic neuropathy.
- Research to better understand the heterogeneity of diabetes.
- Research on the transplantation of allogenic or autologous pancreatic islet cells for long-term natural insulin production, including current good manufacturing practices for cell line development.
- Identification and/or evaluation of interventions to reduce the development of diabetes among individuals meeting the clinical criteria for pre-diabetes.
- Development and evaluation of an inpatient glycemic management program with strategies to improve in-hospital dysglycemia, improve short-term and long-term morbidity/mortality, reduce the cost of health care, and promote a seamless transition of care between inpatient and outpatient arenas.
- Research to design and implement disease-in-a-dish and/or microfluidic models to model pancreatic islets to uncover pathogenesis and improve the efficiency of drug discovery.

Diarrheal Diseases

- Development and testing of vaccines, including multi-pathogen combination approaches, against the most common causes of bacterial and viral travelers' diarrhea, including *Campylobacter jejuni, Shigella,* and Enterotoxigenic *E. coli*.
- Development and evaluation of antibiotic and non-antibiotic therapies to treat all-cause travelers' diarrhea to improve the time to clinical cure, minimize resistance acquisition, and mitigate the chronic health consequences of these infections.
- Research to improve understanding of host responses and develop therapies to treat acute bacterial and viral infections that are associated with travel and may lead to chronic functional bowel and rheumatologic disorders.
- Development of evidence necessary to demonstrate the need, impact, and potential market value of a therapeutic for post-infectious functional bowel disorders to include preventive, treatment, or vaccine technology strategies.
- Development and evaluation of point-of-care diagnostics for acute diarrheal illness that distinguishes between bacterial, viral, protozoal, and toxin-mediated etiologies and leads to actionable public health or individual management interventions.

- Investigations into the relationship between existing gastrointestinal flora (microbiome) and the susceptibility, duration, and severity of diarrheal disease, as well as the impacts of dietary modification and/or probiotic use.
- Research to identify, reduce, or eliminate sources of infection causing diarrheal diseases.

Dystonia

- Research on the risk, incidence, and etiology of generalized dystonia, focal dystonia, multifocal dystonia, segmental dystonia, and/or hemidystonia.
- Research on interventions to prevent, slow the progression of, or treat dystonia.
- Research to improve identification of delayed onset dystonia following traumatic brain injury.

Early Trauma Thermal Regulation

- Research into regional cooling for different environments, including prolonged care, as a therapeutic for secondary ischemic injury (e.g., head with traumatic brain injury, limb with tourniquet).
- Development of a tunable support mechanism for thermal homeostasis for use in prolonged field care, extended evacuation, or unmanned evacuation.
- Development and evaluation of a novel and/or innovative technology and techniques to reduce the impact of hypothermia.
- Research to determine the benefits of invasive warming/cooling during patient movement.
- Research to validate the attenuating effects of (early) external head cooling on concussive brain injuries.
- Research into therapeutic cooling or targeted temperature management as a neuroprotective treatment for traumatic brain injury.

Eating Disorders

- Investigations into the prevalence, diagnosis, and treatment patterns of eating disorders in Service members and their families, including potential relationships with military-unique behaviors or conditions.
- Assessment of patterns of comorbidity between eating disorders and other mental health conditions, including an examination of whether eating disorders are more likely to precede or follow the development of other mental health conditions.
- Studies to identify the most effective treatments (and order of treatment) for patients with an eating disorder and a comorbid disorder.
- Research to advance the understanding of the biological, genetic, and environmental factors that influence eating disorders.
- Studies to elucidate risk factors for the onset or recurrence of eating disorders.
- Research to develop screening tools and valid biomarkers that accurately identify individuals with binge eating disorder versus healthy controls in order to monitor at-risk populations and tailor treatments for disordered eating.

- Research to better understand subclinical disordered eating and other specified feeding and eating disorders and the potential for these to develop into full-blown eating disorders.

Emerging Infectious Diseases

- Methods to minimize risk from arboviruses among military Service members and their families deployed to/living in high-risk areas, including personal protective equipment and environmental controls.
- Investigation of revaccination strategies and identification of correlates of protection for currently available vaccines (especially mumps).
- Targeted vector management of *Aedes aegypti, Anopheline sp.* and related mosquito species, including focus areas on novel and/or innovative adult surveillance devices, pathogen identification, spatial repellents, and barrier treatments.
- Research toward understanding the potential influence of dietary intake as a potential repellent to mosquito vectors and vector behavior.
- Evaluation of non-vaccine prophylactics or therapeutics to prevent/treat dengue or Zika virus disease.
- Characterization of health emergency relevant infectious disease threats in West Africa.
- Development of biomarker-guided clinical management strategies for severe infectious disease in the austere African setting.
- Validation of airborne and droplet precaution recommendations in the medical transport environment.
- Development of new testing methods for emerging pathogens and pathogen reduction technologies for blood-borne pathogens, including Zika, malaria, dengue, and others, in blood products.
- Modeling of epidemics and development of strategies to counter risks in emerging infectious diseases.
- Rapid, rugged, sensitive, and specific screening and diagnostics, including biomarkers for infectious threats such as Zika and other clinically relevant bacterial, viral, or protozoal pathogens in clinical samples or blood products that can be transmitted sexually or by blood transmission.
- Development of broad-acting detection systems to identify emerging members of a known viral family (for example, a broad Coronavirus panel that can detect Middle Eastern Respiratory Syndrome).
- Determination of the human health effects, host preference, vector competence, and co-infection status of the dengue, chikungunya, Zika, and Mayaro viruses in *Aedes aegypti* and related mosquito species.

Epidermolysis Bullosa

- Research to provide further insight into those cellular pathways that might be corrected or bypassed that otherwise promote the development of squamous cell carcinomas in recessive dystrophic and junctional epidermolysis bullosa.

- Research, including randomized controlled clinical trials, focused on systemic drugs that prevent, delay the onset, or modify the aggressiveness of squamous cell carcinoma in patients with recessive and junctional epidermolysis bullosa.
- Research, including clinical trials, focused on medications (topical or systemic) or dressings that might enhance wound healing in inherited epidermolysis bullosa.

Focal Segmental Glomerulosclerosis

- Development of a curative therapy or treatments to delay or halt the progression of focal segmental glomerulosclerosis and/or prevent post-transplantation recurrence.
- Research to determine the efficacy of medications used off-label (outside the FDA-approved indication) to treat focal segmental glomerulosclerosis.
- Research to improve understanding of the causes of primary and secondary focal segmental glomerulosclerosis, especially genetic mutations.
- Development of non-invasive methods to diagnose focal segmental glomerulosclerosis and its variants.
- Research on the impact of dietary modifications on the progression of renal disease.

Fragile X

- Research to advance the understanding of the pathophysiology of fragile X syndrome.
- Identification and validation of functional measures of the manifestations of fragile X syndrome across the life span.
- Identification and testing of novel and/or innovative targets for fragile X syndrome therapeutics.
- Development and evaluation of novel, innovative, or existing therapeutics for the treatment of fragile X syndrome.

Guillain-Barré Syndrome

- Research to elucidate the characteristics of various exposures (e.g., viruses, bacteria, vaccinations, surgery) associated with Guillain-Barré syndrome and their effects on the immune system.
- Research on the immune system cell types and molecular mechanisms responsible for the disease pathology of Guillain-Barré syndrome.
- Research to prevent or reduce the effects of residual weakness, relapse of muscle weakness, and other neurological symptoms of Guillain-Barré syndrome to improve patients' quality of life and increase their independence.
- Development of new treatments and refinement of existing treatments for Guillain-Barré syndrome.

Hepatitis B and C

- Research on vaccination options for those persons unable to mount immunity to the hepatitis B virus.

- Development of strategies for reliable, non-invasive, early detection of hepatitis-related liver disease and hepatocellular carcinoma.
- Research on strategies to promote reversal of liver fibrosis and/or assess the associated clinical and pathological outcomes.
- Natural history or other studies to establish risk indicators of progression from asymptomatic or inactive chronic hepatitis infection to symptomatic disease and parameters for the initiation and duration of disease treatment.
- Clinical studies to evaluate combination or curative therapies for treatment of hepatitis infection.
- Identification and reduction of hepatitis in blood products for transfusion.
- Research on strategies to reduce vertical (mother-to-child) transmission of hepatitis B virus and hepatitis C virus.
- Development of a vaccine against hepatitis C.
- Development of treatment protocols for patients with hepatitis B and C co-infections.

Hereditary Angioedema

- Research to improve early diagnosis of hereditary angioedema.
- Evaluation of existing, innovative, or novel therapeutics in pediatric hereditary angioedema patients.
- Research toward development of a cure for hereditary angioedema.
- Development and/or validation of novel and/or innovative therapeutic strategies for the treatment and/or prevention of hereditary angioedema attacks.

Hydrocephalus

- Research on the etiology, prevention, diagnosis, and treatment of post-traumatic hydrocephalus.
- Discovery or validation of novel and/or innovative therapies and therapeutic targets for the treatment of hydrocephalus and its sequelae, including therapies directed at myelin regeneration and repair.
- Research on approaches to lessening the impact of brain damage caused by hydrocephalus.
- Development or validation of biomarkers and imaging techniques, particularly multimodal approaches, to aid in diagnosis, prognosis, and monitoring of therapeutic efficacy.
- Research on the prevention of shunt failure.
- Studies to better understand the causes and/or pathogenesis of hydrocephalus.
- Development or validation of improved hydrocephalus model systems.

Immunomonitoring of Intestinal Transplants

- Studies to elucidate the role of the mucosal immune system, other host-derived factors, or gut microbiota-derived factors in maintaining intestinal transplant viability.

- Development and evaluation of intestinal implant strategies that circumvent the induction of immunity against the transplant through the use of autologous stem cells or organoids derived from intestinal stem cells.
- Development and evaluation of evidence-based approaches that focus on dampening the regional immune response against intestinal transplants without inducing global immune suppression.
- Development and evaluation of implant-associated materials (e.g., scaffolds) with anti-inflammatory properties that protect the intestinal transplant from immune attack.
- Development and evaluation of strategies for inducing and maintaining populations of anti-inflammatory regulatory immune cell populations at the transplant site.
- Studies to improve immunomonitoring of recipient immune responses after intestinal transplantation, with a focus on prospective leukocyte profiling, to aid in diagnosis and treatment of immunological and immunosuppression-related complications.
- Development and/or validation of precise, real-time implanted monitoring devices to improve individualized patient outcomes after intestinal transplantation.

Inflammatory Bowel Diseases

- Clinical studies in human subjects directed toward understanding how acute enteric infections may trigger chronic bowel diseases with acute and sub-acute inflammatory bowel disease, including systems biology approaches.
- Mechanistic studies in animal models designed to understand how enteric infection may trigger inflammatory bowel disease, including genomic, microbiomic, and immune mechanisms.
- Epidemiological studies of post-infectious acute and sub-acute inflammatory bowel diseases that define risk and provide estimates of illness-associated disability, health care costs, and symptom duration from a military health system and societal perspective.
- Studies to understand the interaction between acute/chronic stress and infection and the development of inflammatory bowel disease.
- Research to explore whether the travel patterns of active duty personnel increase the risk of developing inflammatory bowel disease by means of exposure to changes in intestinal microflora.
- Research to better characterize the association between the use of drugs, such as isotretinoin and long-term doxycycline, and the development of inflammatory bowel disease.
- Research on the role of diet in the development and progression of inflammatory bowel disease.
- Research on the influence of the microbiome on inflammatory bowel disease.
- Research on hyperbaric oxygen treatment of inflammatory bowel disease.
- Research on treatment strategies for patients whose inflammatory bowel disease is refractory to standard care medications or who positively respond to standard care medications, but become nonresponsive over time.

Influenza

- Development of a diagnostic test for influenza drug resistance.
- Development and testing of a universal influenza vaccine.
- Development and evaluation of novel, innovative, and/or combination influenza therapies.
- Research to improve the understanding of host responses to influenza infection and the mechanisms of drug resistance.
- Research on the factors that contribute to and/or reduce the risk of the emergence of zoonotic and pandemic influenza viruses.

Integrative Medicine

- Research on the use of integrative medicine strategies, such as meditation, tai chi, acupuncture, and/or herbal medicine/nutritional supplementation, to improve the psychological health and quality of life in cancer patients and survivors.
- Research on the use of integrative medicine in treatment and management of chronic pain disorders, including comparative efficacy studies relative to standard of care.
- Rigorous longitudinal studies of integrative medicine approaches for enhancing resilience and treating psychological health issues and co-occurring disorders.
- Precision medicine research to investigate, develop, and validate biomarkers that can help determine an individual's response to integrative medicine treatments for pain.
- Development of outcomes tools and measures to evaluate the effectiveness of integrative medicine pain management approaches.
- Definitive studies to determine the effectiveness of self-care, meditation-based treatments, courses, and training programs in improving resiliency to stress in a military environment; in austere operational platforms such as submarines and small-deck ships; or in combat-fatigued military health care providers.

Interstitial Cystitis

- Studies that define the risk, prevalence, and operational impact of interstitial cystitis among active duty personnel.
- Identification of biological markers for making a definitive diagnosis of interstitial cystitis.
- Evaluation and assessment of novel and/or innovative treatment options for interstitial cystitis patients, including intravesical therapy.
- Research on the etiology of interstitial cystitis to inform targeted therapy development.

Malaria

- Investigation of mechanisms of drug resistance in malaria, to include host and pathogen, against drugs used for treatment and prophylaxis.
- Development of a vaccine that induces high levels of long-lived, broadly protective immunity against *Plasmodium falciparum* and/or *P. vivax*.
- Operational research to optimize application of existing malaria drugs to reduce impact of artemisinin resistant *P. falciparum* in military forces.

- Operational research to optimize deployment of pharmacovigilance systems to ensure capture of adverse events related to malaria chemoprophylaxis and treatment.
- Operational research to assess efficacy and spread of artemisinin combination therapies across the Greater Mekong Subregion's military forces.
- Development of malaria prophylactic regimens that encourage higher compliance and methods to monitor compliance in deployed Service members.
- Identification of novel and/or innovative malaria drug targets for blood and liver stage malaria parasites.
- Development of new, or improvement of existing, strategies for culturing relapsing malaria parasites, with emphasis on *Plasmodium vivax, P. ovale,* and *P. cynomolgi* in vitro.
- Development, testing, and evaluation of spatial repellents to provide protection against Anopheline vectors.
- Identification of a correlate of immunity against malaria and development of a surrogate test of protection.
- Structurally optimize validated malaria antigens by engineering protective epitopes to elicit specific and enhanced immune responses.

Metals Toxicology

- Identification and validation of biomarkers to evaluate military Service members' acute exposure to toxic metals in an operational environment and predict potential consequent health risks and associated health outcomes.
- Retrospective studies to evaluate risk and exposure among workers at industrial facilities.
- Research on the toxicity of metal combinations and the interaction between different metal components.
- Research on the additive effects of multiple exposures to metal(s).
- Research on underlying diet quality and micronutrient sufficiency and the risk for metals toxicity.
- Research on the toxicity of metal-based engineered nanomaterials.

Mitochondrial Disease

- Research on the basic biology and physiology of mitochondria to better understand the pathology of primary mitochondrial diseases.
- Development of improved tools and animal models to study primary mitochondrial disease and evaluate therapeutics.
- Identification and testing of non-invasive techniques and biomarkers to monitor mitochondrial function, aid in diagnosis, and/or evaluate therapeutic efficacy.
- Research on novel and/or innovative treatments to alleviate symptoms or slow down the progression of mitochondrial diseases.

Musculoskeletal Disorders

- Research to increase understanding, diagnosis, prevention, and/or treatments of chronic overuse musculoskeletal disorders.
- Research on measures (e.g., clinical biomarkers, novel/innovative interventions, therapeutics) to diagnose, predict, reduce the incidence of, or optimize health outcomes in military training- and Service-related musculoskeletal disorders.
- Research on the validation and/or optimization of rehabilitation strategies for Service-related musculoskeletal disorders.
- Research to prevent, control, and/or optimize musculoskeletal health outcomes for work-related musculoskeletal disorders.
- Research on lower back pain strategies to prevent surgery and recurrence of symptoms, identify factors that predict optimal treatment response for different patients, and encourage self-management as a treatment.
- Research to determine whether tailored psychosocial education interventions are effective in improving psychological resilience to musculoskeletal pain.
- Research on standardized approaches for early identification and prevention of chronic musculoskeletal pain.

Nanomaterials for Bone Regeneration

- Research on nanomaterials-based methods to facilitate recruitment of endogenous cell populations for enhanced bone regeneration and osseointegration.
- Technologies addressing segmental/large bone defects in craniomaxillofacial and/or load-bearing regions.
- Development of controlled release/extended release of growth factors for bone regeneration.
- Development of technologies that repair the soft tissue envelope to enhance bone regeneration.

Non-Opioid Pain Management

- Research on pain management strategies for patients with limited access to skilled providers and resources, including battlefield, prolonged field, transport, and other resource-limited environments.
- Development of population-based outcomes, tools, and measures to evaluate the effectiveness of pain management approaches across time and environments.
- Research on treatments for chronic pain management, particularly in complex patients (i.e., chronic, high-utilization, polypharmacy patients).
- Research to increase understanding of and preventative treatments for conversion of acute to chronic pain.
- Research that provides evidence of which pain management strategies work for whom and under what conditions.
- Research to identify and address biopsychosocial aspects of pain to reduce or eliminate the use of opioid pain medication(s).

- Comparative studies evaluating the efficacy of different pain management strategies, including complementary and alternative medicine approaches.
- Identification and development of non-opioid pain management techniques that promote positive psychological health-related outcomes.
- Development of non-opioid pain medicine that can be given via inhalation or intramuscularly, submucosally, or intravenously on the battlefield to provide adequate relief of pain without affecting the cardiorespiratory systems.
- Research on case management strategies designed to optimize the effectiveness of pain clinics, support use of non-opioid pain therapies, and reduce dependence on opioid therapies.
- Research that will directly obtain an FDA analgesic indication for oral transmucosal or intramuscular ketamine.

Pancreatitis

- Retrospective studies to determine the risk and incidence of pancreatitis among former and current active duty personnel.
- Development and testing of novel and/or innovative therapeutics for acute and/or chronic pancreatitis.
- Research on the basic biology and physiology of the pancreas to better understand the etiology and pathology of pancreatitis.

Pathogen-Inactivated Dried Cryoprecipitate

- Development or validation of technology to produce pathogen-reduced dried cryoprecipitate in military or civilian donor centers that is acceptable for FDA licensure in support of combat or contingency operations.

Polycystic Kidney Disease

- Development of improved treatment strategies for polycystic kidney disease, including approaches to identify and monitor patients at higher risk for progressing to end-stage renal disease.
- Research on the underlying pathobiology and molecular mechanisms of polycystic kidney disease, including studies of genetic factors, cyst formation and growth, the role of cilia, and factors that modify disease progression and/or severity.
- Research on the lifestyle factors that may modify the progression of polycystic kidney disease.

Post-Traumatic Osteoarthritis

- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Research into cell-based approaches for treatment or prevention of post-traumatic osteoarthritis.
- Studies to evaluate and develop best practices for multidisciplinary team approaches and treatment algorithms for post-traumatic osteoarthritis.

- Development or validation of novel and/or innovative approaches to restoring joint stability after injury.
- Sustained release, intra-articular injectable steroidal, non-steroidal, or disease-modifying therapies that offer two or more months of symptomatic relief of pain and/or inflammation in a single injection.
- Research on therapies that target multiple phases of the cellular response pathways that are implicated in the development of post-traumatic osteoarthritis, including cell death, inflammation, matrix changes, and changes in catabolic and anabolic responses.
- Development and/or validation of predictive models for early onset post-traumatic osteoarthritis in extremity-injured patients for the purpose of tailoring rehabilitation programs toward prevention, delay, or mitigation of onset.

Pulmonary Fibrosis

- Retrospective studies to determine the risk and incidence of pulmonary fibrosis among military Service members, including Veterans.
- Identification of biomarkers of pulmonary injury or early predictors of interstitial lung disease.
- Research into the pathobiology and molecular mechanisms underlying the development of pulmonary fibrosis.
- Development and/or testing of novel and/or innovative treatments to delay or modify the progression of pulmonary fibrosis.
- Development and/or validation of improved tools and animal models to study pulmonary fibrosis and evaluate therapeutics.

Respiratory Health (excludes lung cancer and mesothelioma)

- Research on the causes, treatment, and prevention of chronic obstructive pulmonary disease (COPD), including identification and validation of biomarkers and disease phenotypes, as well as employing personalized medicine in clinical research and disease management.
- Research investigating the treatment of patients with chronic mild hypoxia.
- Research on the cause, treatment, and prevention of respiratory symptoms and ailments possibly associated with deployed and redeployed military personnel, including acute eosinophilic pneumonia, asthma, allergies, and other chronic lung diseases and breathing problems.
- Research to evaluate the impact of deployment on the prevalence and severity of respiratory disease in military Service members and Veterans.
- Development and/or validation of methods to detect volatile organic hydrocarbons from the breath of individuals exposed to toxic chemicals or other agents that can cause lung injury, which can be utilized for diagnosis and prognosis of lung injury or disease.
- Identification of biochemical, physiological, or combined biomarkers for evaluating risk or extent of injury from either acute or long-term toxic occupational or environmental exposures.

- Research investigating exposure rates, detection, and treatment of diseases related to inhalation of mold and fungi, such as coccidioidomycosis.

Rett Syndrome

- Identification and/or validation of novel and/or innovative biological targets for the treatment of Rett syndrome.
- Development and testing of interventions to improve the neurological symptoms of Rett syndrome.
- Research to understand the relationship between genetic mutations, physical traits, and symptoms in individuals with Rett syndrome.
- Research on the pathobiology of the MeCP2 gene and protein.
- Research to understand Rett syndrome's commonalities with and differences from classic autism and regressive autism.

Rheumatoid Arthritis

- Research to better understand the relationship between genetic risk and environmental triggers, such as infection or smoking, in developing rheumatoid arthritis.
- Studies that identify or validate biomarkers or personalized medicine strategies that allow for individualized medication choice based on the patient's underlying biology or disease state.
- Research on the long-term use of immunosuppressants in patients with rheumatoid arthritis and the likelihood of developing infections.
- Research to establish activity recommendations following joint replacement for maximal joint life.

Scleroderma

- Research on the molecular mechanisms and pathogenesis of scleroderma.
- Development and/or testing of novel and/or innovative therapies and identification of novel and/or innovative therapeutic targets in scleroderma.
- Research on biomarkers and other approaches to diagnose scleroderma, monitor disease progression, and/or assess response to treatment.
- Epidemiologic studies investigating the impact of localized scleroderma (morphea) on duty performance, use of personal protective equipment, and deployability.
- Research on the efficacy of newer immunosuppressive agents, including biologics and small molecule inhibitors, in the treatment of morphea and scleroderma (systemic sclerosis).
- Research on the efficacy of UVA1 for topical treatment in localized scleroderma and systemic sclerosis.

Sleep Disorders

- Research on how the disruption of normal sleep and circadian biological rhythms adversely affects the physical and psychological health, safety, performance, and productivity of military and civilian populations.
- Studies to assess sleep disturbance and clinical sleep disorders in female military personnel.

- Research on the association between sleep disorders and post-traumatic stress disorder, traumatic brain injury, depression, and/or anxiety and suicidal behaviors.
- Research to assess clinical algorithms that improve adherence to continuous positive airway pressure (CPAP).
- Investigations into non-CPAP-based treatment regimens that enhance readiness and deployability in active duty military personnel.
- Research focused on investigating how psychiatric disorders (post-traumatic stress disorder in particular), combined with the disruption/degradation of sleep quality, impact long-term physical health through changes in hormonal physiology.
- Development and/or testing of non-pharmacological treatments for sleep disorders.
- Research on the impact of sleep deprivation on the efficacy of psychological treatments for post-traumatic stress disorder, depression, and other mood disorders.
- Research on the prevention and/or mitigation of sleep disorders that are associated with long aeromedical evacuation flights for both clinical team members and patients.
- Development of tools and technologies that allow rapid and objective measurement of Service member performance in the face of fragmented sleep and/or sleep maintenance difficulty.
- Research examining the broader effects of Warfighters' sleep disorders on the sleep, behavioral health, and productivity of their family members, as well as the readiness of their military unit.

Spinal Muscular Atrophy

- Research into phenotyping the spinal muscular atrophy disease state.
- Research into which molecular deficiency imposed by a deficiency of SMN, a motor neuron protein, causes motor neuron deficits.
- Exploration of the form and function of SMN-depleted neuromuscular junctions at ultrastructural (e.g., dysregulation of endocytosis), transcriptomic, and proteomic levels, particularly the mildest SMN reduction that leads to consistent quantifiable motor neuron loss.
- Research to find non-SMN-altering spinal muscular atrophy modifying genes in cellular, small animal, and human models that may lead to identification of novel and/or innovative therapeutic targets.
- Research to further understand SMN gene regulation and post-transcriptional mechanisms leading to synergistic SMN-repleting approaches, as well as to determine whether boosting SMN induction maximizes efficacy.
- Research to determine whether SMN can be repleted to physiologic levels in all cells in the spinal muscular atrophy model immediately post-natally and whether there is a limit to the therapeutic response.
- Clinical research to determine what clinical findings persist even with treatment; whether these findings are related to drug timing, dosage, biodistribution, or a combination of factors; and whether these factors are modifiable.

- Research involving dietary/nutritional studies in spinal muscular atrophy to identify the optimal anabolic diet.
- Research to determine mitochondrial involvement and astrocytic and other non-neuronal contributions to motor neuron vulnerability.

Sustained-Release Drug Delivery

- Development of technology that can provide a sustained-release delivery of drugs for a minimum of 1 week or more. Potential applications of this technology could include long-acting therapies for post-traumatic stress, opiate dependence, low-dose pain control, allergies, attention deficit/hyperactivity disorder, chemoprophylaxis, and other conditions.
- Research into the use of printable, sustained-release scaffolds for predictable delivery of prescription and non-prescription medications.
- Research into novel and/or innovative approaches to developing bioavailable and sustained-release oral formulations of intravenous broad-spectrum fungicidal and anti-microbial medications.

Tinnitus

- Research to understand the mechanisms of tinnitus, its relationship to noise-induced hearing loss, and progression to chronic tinnitus, with the focus on developing interventions for tinnitus.
- Research to increase knowledge of the prevalence, incidence, natural history, and occupational and sex-related differences of tinnitus and its possible relation to individual blast/noise exposures.
- Research to understand the operational readiness impacts of tinnitus on the military.
- Development and validation of objective tools/methods to diagnose and characterize tinnitus (e.g., imaging techniques to identify functional and structural changes in the brain, biomarkers of resiliency, and susceptibility to tinnitus).
- Identification of novel and/or innovative therapies for interventions to prevent, manage, and treat tinnitus, including behavioral approaches, new uses for existing drugs, nutritional and pharmaceutical strategies, and acoustic, electrical, and other stimulation technologies.

Tuberculosis

- Development of a diagnostic assay that can be used at the point of care to rapidly and accurately diagnose tuberculosis.
- Development of novel and/or innovative tuberculosis vaccines or optimization of current tuberculosis vaccines.
- Identification and/or validation of biomarkers that can be used to assess vaccine efficacy and protection against tuberculosis disease.
- Research to understand, diagnose, or treat multi-drug-resistant tuberculosis or extensively drug-resistant tuberculosis.
- Research to determine the appropriate precautions to use for transport of active tuberculosis patients.

- A sustained release formulation of anti-tuberculosis drugs that would facilitate long-term treatment and reduce the emergence of resistance due to poor compliance.

Vaccine Development for Infectious Disease

- Development of a therapeutic vaccine and/or other strategies to achieve HIV remission.
- Evaluation of passive immunization strategies to use in conjunction with dengue and Zika vaccinations.
- Research leading to a better understanding of the immune mechanisms involved in clearance of the dengue and Zika viruses and the mechanisms of immune enhancement that lead to more severe clinical disease.
- Development of flexible vaccine technologies that can be used to rapidly respond to emerging and re-emerging infectious diseases threats.
- Evaluation of humoral and cellular immune responses after vaccination compared to natural infection.
- Development of a safe, effective dengue human challenge model for clinical trials.
- Development of a non-human primate model to study Zika virus-induced microcephaly/fetal neuropathology as a tool to measure the safety and efficacy of vaccines and antivirals.
- Development and fielding of vaccines to prevent U.S. Service members from becoming ill from endemic disease exposure during operational deployments. This includes, but is not limited to, arthropod-borne diseases (Zika virus, dengue, chikungunya, hantavirus hemorrhagic fever with renal/pulmonary syndrome, rickettsioses, and trypanosomiasis), leptospirosis, HIV, norovirus, Middle East Respiratory Syndrome coronavirus, schistosomiasis, leishmaniasis, Nipah virus, Lassa fever, and West Nile fever.

Vascular Malformations

- Studies into the natural history, genetics, and pathogenesis of vascular malformations.
- Research to discover or develop novel and/or innovative therapeutic targets and treatments to regress or prevent vascular malformations.
- Research to improve methods to diagnose and manage vascular malformations.
- Development of non-invasive or minimally invasive technologies or approaches for the control of internal bleeding associated with vascular malformations.
- Studies to identify risk and/or establish standard practices for the treatment of hemorrhage from brain arteriovenous malformations.
- Research on the prevention or treatment of complications associated with vascular malformations such as pain, infection, seizures, tissue breakdown, tissue overgrowth, or airway obstruction.
- Studies to elucidate the progression of vascular malformations in disease-in-a-dish/microfluidic models for the purpose of identifying novel and/or innovative drug targets, screening existing drugs, and/or elucidating the pathogenesis of the disease.

Women's Heart Disease

- Retrospective studies to determine the risk and incidence of heart disease among former and current female active duty personnel, including Reservists and National Guard members.
- Research focused on elucidating the potential relationship between post-traumatic stress disorder and women's heart disease.
- Identification of sex-specific approaches to increase the effectiveness of diagnosis, treatment, and/or cardiac rehabilitation programs.
- Research on factors to predict and prevent the long-term impacts of gestational diabetes, gestational hypertension, and preeclampsia on the cardiovascular health of women.
- Research on trauma-induced cardiac arrest secondary to hemorrhage and polytrauma in the female population.

INFECTIOUS DISEASE

Zika virus activates de novo and cross-reactive memory B cell responses in dengue-experienced donors

Zika virus (ZIKV) shares a high degree of homology with dengue virus (DENV), suggesting that preexisting immunity to DENV could affect immune responses to ZIKV. We have tracked the evolution of ZIKV-induced B cell responses in three DENV-experienced donors. The acute antibody (plasmablast) responses were characterized by relatively high somatic hypermutation and a bias toward DENV binding and neutralization, implying the early activation of DENV clones. A DENV-naïve donor in contrast showed a classical primary plasmablast response. Five months after infection, the DENV-experienced donors developed potent type-specific ZIKV neutralizing antibody responses in addition to DENV cross-reactive responses. Because cross-reactive responses were poorly neutralizing and associated with enhanced ZIKV infection in vitro, preexisting DENV immunity could negatively affect protective antibody responses to ZIKV. The observed effects are epitope-dependent, suggesting that a ZIKV vaccine should be carefully designed for DENV-seropositive populations.

INTRODUCTION

Zika virus (ZIKV) is a mosquito-borne flavivirus that has been linked to microcephaly and severe neurological complications, such as Guillain-Barré syndrome (*1*, *2*). The virus is closely related to the four serotypes of dengue virus (DENV) (DENV1, 2, 3, and 4), as well as other circulating flaviviruses including West Nile virus (WNV), resulting in substantial immunological cross-reactivity (*3*–*7*). Although neutralizing antibodies (nAbs) play an important role in protection against flavivirus infection, they can also contribute to severe disease through a phenomenon termed antibody-dependent enhancement (ADE) (*8*–*10*). In the case of DENV, subneutralizing concentrations of preexisting heterotypic nAbs have been implicated in promoting viral replication by facilitating the interaction of the virus with Fc receptor–bearing target cells (*8*). Enhancement of ZIKV infection by cross-reactive DENV-specific antibodies and vice versa has been demonstrated in vitro, and ADE of ZIKV pathogenesis by preexisting anti-flavivirus immunity has been observed in mouse models (*5*–*7*, *11*–*14*). Because ZIKV is currently circulating in regions that are highly endemic for DENV, an understanding of how previous DENV exposure affects the B cell response to ZIKV will be critical for the design of vaccines and therapies intended for DENV-immune populations.

Previous studies have shown that nonstructural protein 1 (NS1), envelope (E), and precursor membrane (prM) proteins are dominant targets for the human B cell response to flaviviruses. NS1 is secreted by infected cells and functions in pathogenesis and immune evasion (*15*), the surface E protein mediates viral entry and is the primary target for nAbs (*7*, *16*, *17*), and prM is a 166–amino acid protein that is associated with E on immature and partially mature virions (*18*). The E protein consists of three domains: domain I (DI), which participates in conformational changes required for viral entry; domain II (DII), which contains the conserved fusion loop (FL); and domain III (DIII), which is the putative receptor binding domain (*19*). Previous studies have established that monoclonal antibodies (mAbs)-targeting epitopes within DIII are typically type-specific and potently neutralizing, whereas mAbs targeting the conserved FL are cross-reactive and poorly neutralizing (*7*, *16*, *17*, *20*).

In this study, we have longitudinally tracked the ZIKV-specific B cell response in three DENV-experienced donors using single B cell cloning and large-scale antibody isolation. The acute-phase (plasmablast) response was dominated by somatically mutated clones that showed preferential binding and neutralization of DENV, providing evidence for original antigenic sin (OAS) during the early B cell response to ZIKV in DENV-experienced donors. However, by 5 months after infection, the memory B cell responses were composed of both OAS-phenotype antibodies that were broadly cross-reactive and poorly neutralizing and de novo generated antibodies that were ZIKV-specific and potently neutralizing. Collectively, the results have implications for the development of ZIKV vaccines intended for DENV-immune populations and provide insight into the role that preexisting B cell memory plays in modulating the antibody specificities induced by antigenically variable viruses.

RESULTS

Potent plasmablast induction in ZIKV-infected, DENV-experienced donors

To study the early ZIKV-induced B cell response in DENV-experienced individuals, three ZIKV-infected donors (donors 2, 3, and 4) living in a highly DENV endemic region of Colombia were sampled during acute infection (within 8 days after symptom onset) (table S1). A single donor (donor 1) from the United States who was infected with ZIKV while overseas was also sampled for comparison (table S1). As expected, the acute sera from donors 2, 3, and 4 showed strong immunoglobulin G (IgG) binding reactivity to whole DENV1–4 particles and recombinant DENV NS1 proteins (fig. S1). In contrast, the acute serum from donor 1 showed little to no such binding (fig. S1). Although the acute serum reactivity to DENV particles and NS1 proteins could, in principle, be due to cross-reactive ZIKV-induced antibodies, previous studies have shown that NS1-specific IgG antibodies are not present in the serum during the first week

after the onset of symptoms of ZIKV infection (22, 23), implying that the acute serum reactivity to DENV NS1 observed for donors 2, 3, and 4 is largely mediated by preexisting antibodies that were induced by previous DENV exposure. Furthermore, the acute serum from these three donors showed similar or more potent neutralizing activity against DENV compared with ZIKV, whereas the acute serum from donor 1 showed little to no neutralizing activity against DENV1–4 and relatively weak neutralization of ZIKV. These serological and epidemiological data provide convincing evidence that donors 2, 3, and 4 were previously exposed to DENV, whereas donor 1 was DENV-naïve at the time of infection.

The appearance of antigen-specific plasmablasts in peripheral blood during acute viral infection is typically the first indication of a B cell response (24–26). Therefore, we first measured the plasmablast frequency in peripheral blood about 1 week after symptom onset (table S1). In all three DENV-experienced donors, a massive plasmablast population ($CD3^-CD20^{-/lo}CD19^+CD27^{hi}CD38^{hi}$) that accounted for 39 to 63% of peripheral B cells was observed (Fig. 1A and fig. S2). In contrast, the plasmablast population in the ZIKV-infected, DENV-naïve donor was relatively small, accounting for only 2.5% of peripheral B cells (Fig. 1A). To deconstruct the acute ZIKV-induced B cell response, we single cell–sorted between 100 and 300 plasmablasts from each donor sample and rescued the antibody variable heavy (V_H) and variable light (V_L) chain sequences by single-cell polymerase chain reaction (PCR). Between 42 and 119 cognate V_H and V_L pairs from each donor were cloned and expressed as full-length IgGs. Sequence analysis revealed that the plasmablasts sorted from the three DENV-experienced donors were somatically mutated—with per-donor averages ranging between 15 and 20 nucleotide substitutions in V_H—and clonally expanded (Fig. 1, B and C). This level of somatic hypermutation (SHM) is comparable with that observed in typical IgG memory B cells as well as in plasmablasts induced by influenza vaccination (25), supporting a memory B cell origin for these acutely induced cells. In contrast, most of the plasmablasts isolated from the DENV-naïve donor sample showed little to no SHM and somewhat more limited clonal expansion (Fig. 1, B and C), supporting their emergence via activation of naïve B cells. We conclude that ZIKV infection induces a rapid and robust plasmablast response in DENV-experienced donors and that the large majority of these acutely induced cells appear to originate from the memory B cell compartment.

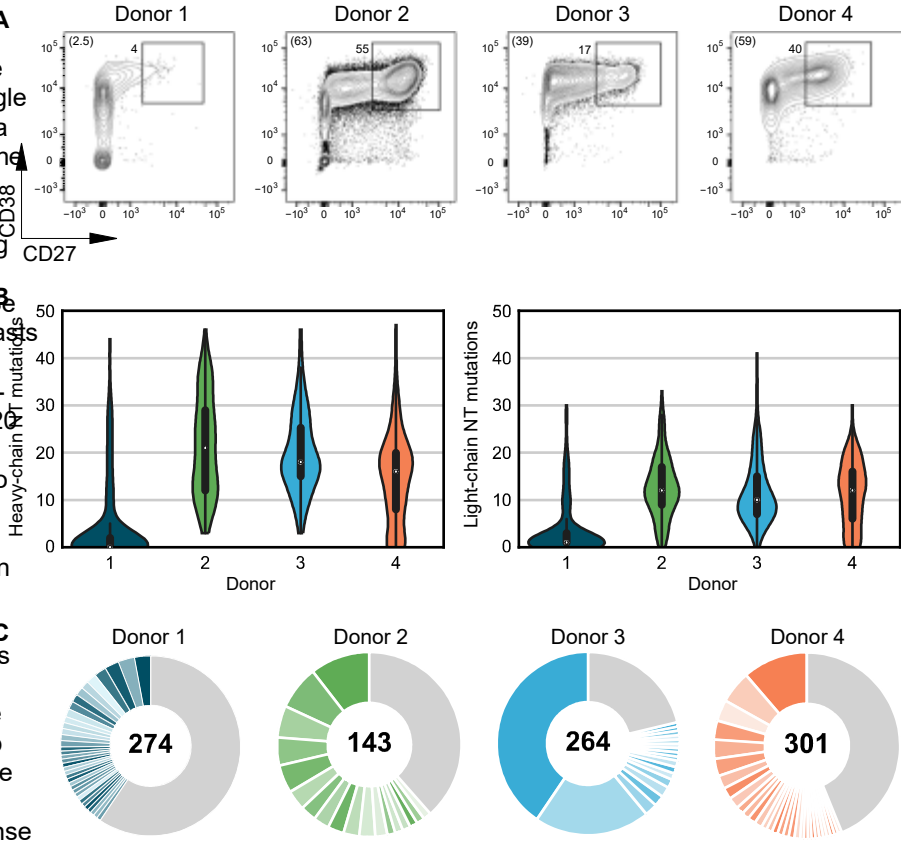

Fig. 1. Analysis of plasmablast responses in one naïve and three DENV-experienced donors. (**A**) Flow cytometric analysis of plasmablast responses in one naïve and three DENV-experienced donors during ongoing ZIKV infection. Plasmablasts are defined herein as $CD3^-CD20^{-/lo}CD38^{hi}CD27^{hi}$ cells. Plots shown are gated for $CD3^-CD20^{-/lo}$ cells, with the $CD27^{hi}CD38^{hi}$ plasmablasts marked by a box. The frequency of plasmablasts within the $CD3^-CD20^{-/lo}$ population is shown next to the gate. The numbers in parentheses show the percentage of peripheral B cells that are plasmablasts. Flow cytometry data were analyzed using FlowJo software (version 10.0.8). (**B**) Load of somatic mutations [expressed as the number of nucleotide (NT) substitutions] in V_H and V_L in plasmablast-derived mAbs isolated from a DENV-naïve (donor 1) and three DENV-experienced donors (donors 2 to 4). All V_H and V_L chains are shown, regardless of whether the paired antibody chain was recovered. (**C**) Clonal lineage analysis. Heavy-chain sequences were assigned to lineages using CHAIN (52). Each lineage is represented as a segment proportional to the lineage size. The total number of recovered heavy chains is shown in the center of each pie. All lineages that contain only a single sequence are combined and shown as a single gray segment.

A large proportion of plasmablast-derived mAbs isolated from ZIKV-infected, DENV-experienced donors bind the ZIKV E protein

Enzyme-linked immunosorbent assay (ELISA) binding studies showed that between 50 and 75% of the mAbs isolated from the DENV-experienced donors bound to whole ZIKV (fig. S3), which is similar to the percentage of antigen-specific mAbs recovered from plasmablasts induced by influenza vaccination and DENV infection (25, 27). In contrast, only 13% of the plasmablast-derived mAbs isolated from the DENV-naïve donor bound with detectable affinity to whole ZIKV particles. To further map the antigenic specificities of the 303 plasmablast-derived mAbs, we performed biolayer interferometry (BLI) binding experiments with recombinant ZIKV NS1 and E proteins. The percentage of mAbs isolated from the three DENV-experienced donors that showed reactivity with ZIKV NS1 was low at 8 to 12% and higher for recombinant E at 15 to 30% (Fig. 2A and table S2). In contrast, 17% of the mAbs isolated from the DENV-naïve donor bound to recombinant NS1, whereas only a single mAb bound with detectable affinity to recombinant E (Fig. 2A and table S2). The remaining ZIKV-specific mAbs, which accounted for 18 to 32% of the corresponding donor responses, bound to epitopes expressed on whole virus but not on recombinant E. Seventy percent of the plasmablast mAbs isolated from donor 1 and about 20 to 50% of the

Downloaded from http://immunology.sciencemag.org/ by guest on August 24, 2017

plasmablast mAbs isolated from donors 2, 3, and 4 could not be assigned to ZIKV in this assay (fig. S4). Hence, most of these mAbs likely bind to E-specific epitopes expressed only on intact virions. Similar ated with any ZIKV reactivity (Fig. 2A). Because anti-prM antibodies have been shown to dominate the antibody response during secondary specificities have been previously described for both DENV and ZIKV DENV infection (*28*), we next investigated the specificities of the whole (*4*, *7*, *27*, *29*).

virus–specific mAbs isolated from the DENV-experienced donors by To further define the epitopes targeted by the recombinant E– Western blot. None of the mAbs recognized prM, 30% showed reactive reactive mAbs isolated from the DENV-experienced donors, we (i) ity with E protein from viral lysates, and the remaining mAbs failed to compared the apparent binding affinities of the mAbs for recombin

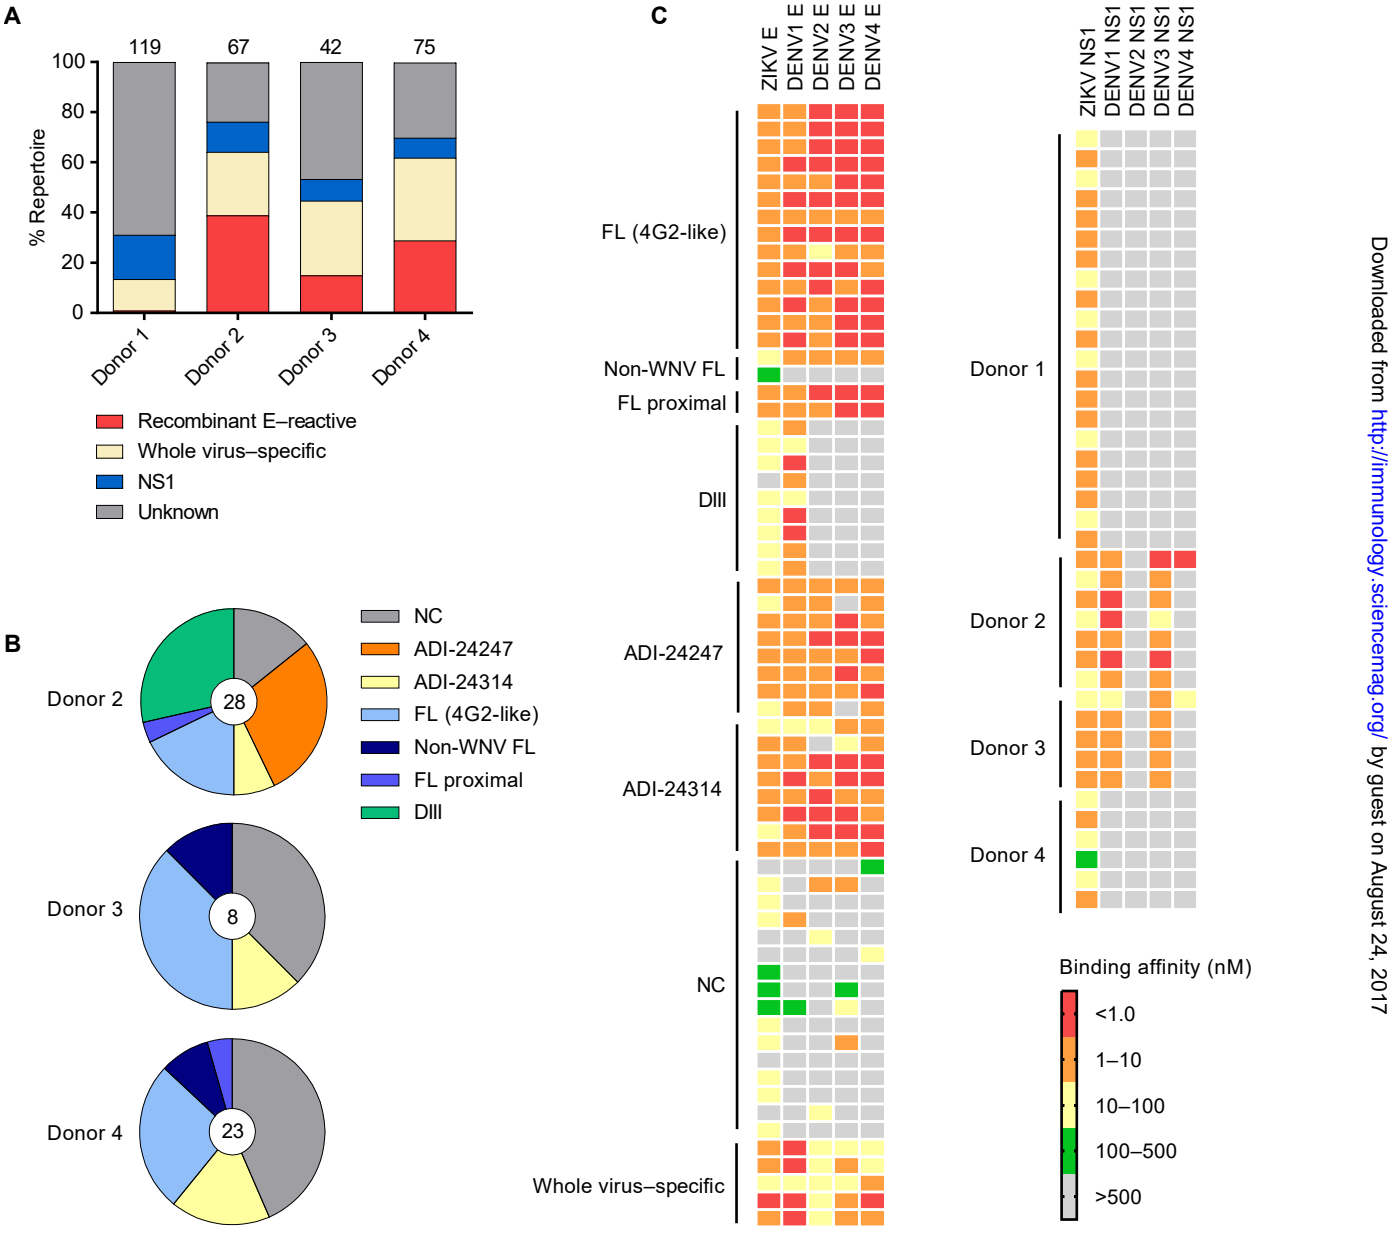

Fig. 2. Binding characteristics of mAbs isolated from plasmablasts during acute ZIKV infection. (**A**) Specificities of the mAbs isolated from one DENV naïve donor and three DENV-experienced donors. Distribution of mAbs that bind to NS1, recombinant E, epitopes expressed only on whole ZIKV, and those for which no specificity could be assigned are shown. The number at the top of each bar represents the total number of mAbs cloned from each donor. (**B**) Epitope mapping of recombinant E–specific antibodies isolated from three DENV-experienced donors. Pie charts show the distribution of antibodies that bind to epitopes within DIII, within or proximal to the FL on DII, and defined by mAbs ADI-24314 and ADI-24247. 4G2-like FL: Competition with 4G2, WNV E–reactive, and E-FL–sensitive; non-WNV FL: 4G2-compet E-FL–sensitive, and WNV E–nonreactive; FL proximal: 4G2 competitive, E-FL–reactive, and WNV E–nonreactive; DIII: Recombinant DIII binding; ADI-24314 competitor: 4G2-noncompetitive, ADI-24314–competitive, and E-FL–reactive; ADI-24247 competitor: 4G2-noncompetitive, ADI-24247–competitive, and E-FL–reactive. NC, not cha acterized because of low binding affinity. (**C**) Heat map of mAb binding reactivity to ZIKV and DENV1–4 E proteins or whole viral particles (left) and ZIKV and DENV1–4 NS1 proteins (right). The E-specific mAbs shown were isolated from DENV-experienced donors. Apparent binding affinities for recombinant E and NS1 proteins were de-termined by BLI measurements, and apparent binding affinities for whole virus were determined by ELISA.

Downloaded from http://immunology.sciencemag.org/ by guest on August 24, 2017

DIII, WNV E, and a previously described ZIKV E protein (E-FL) that contains substitutions within and proximal to the FL that abolish binding by most FL-specific antibodies (*30*) (fig. S5) and (ii) performed competitive binding experiments using two previously characterized mAbs, 4G2 and ZV-67, that bind to the FL on DII and the lateral ridge on DIII, respectively (table S2) (*31*, *32*). Because the FL-specific mAb 4G2 reacts with WNV E and fails to react with E-FL (table S3), we classified mAbs that competed with 4G2, bound to WNV E, and failed to bind to E-FL as "4G2-like FL binders." 4G2 competitor mAbs that failed to bind to E-FL but did not cross-react with WNV E were classified as "non-WNV FL binders," and 4G2 competitor mAbs that did not cross-react with WNV E but did bind to E-FL were classified as "FL proximal binders." Together, mAbs that bound within or proximal to the FL comprised up to 50% of the recombinant E–reactive responses (Fig. 2B and table S2). DIII-specific mAbs were absent from the donor 3 and donor 4 responses but comprised about 30% of the donor 2 response (Fig. 2B and table S2). Six of eight DIII-reactive mAbs competed with ZV-67, suggesting that they likely recognize epitopes within or proximal to the lateral ridge on DIII (table S2). This class of antibodies showed preferential VH3 germline gene usage and contained convergent sequence signatures in both CDRH3 and CDRL3 (table S4), suggesting that these mAbs may share a common mode of antigen recognition. To estimate the number of different antigenic sites recognized by the remaining E-specific mAbs, we performed competitive binding experiments with two broadly cross-reactive mAbs from the panel (ADI-24247 and ADI-24314) that did not compete with 4G2, ZV-67, or each other (tables S2 and S5). Between 12 and 35% of the E-specific donor responses bound to epitopes overlapping that of ADI-24247 or ADI-24314 (Fig. 2B). Overall, we conclude that substantial fractions of the acute ZIKV-induced B cell response in DENV-experienced donors are directed against quaternary epitopes expressed only on whole virus, and those that are reactive with recombinant E are largely directed to the FL and other highly conserved epitopes.

The ZIKV-induced plasmablast response in DENV-experienced donors is dominated by DENV cross-reactive clones

The E proteins of ZIKV and DENV share more than 50% sequence identity, resulting in substantial immunological cross-reactivity (*3*, *6*, *7*). To determine the degree to which mAbs generated from plasmablasts during acute ZIKV infection cross-reacted with DENV, we measured the apparent binding affinities of the mAbs for recombinant DENV1–4 E and NS1 proteins. Most of the E-specific mAbs from the three DENV-experienced donors bound with higher affinity to at least one of the four DENV E proteins than to ZIKV E, consistent with a recall response dominated by reactivated DENV-induced memory B cells (Fig. 2C, table S2, and fig. S6). Selected mAbs isolated from donors 2, 3, and 4 that targeted epitopes expressed only on whole ZIKV showed similar DENV-biased binding profiles (fig. S7). In contrast, the whole virus–specific mAbs isolated from donor 4 bound exclusively to ZIKV (fig. S7).

About 50% of the ZIKV E–reactive mAbs isolated from the DENV-experienced donors cross-reacted with all four DENV serotypes (Fig. 2C and table S2). Most of these broadly cross-reactive mAbs targeted epitopes within or proximal to the FL or unknown epitopes defined by ADI-24247 and ADI-24314 (Fig. 2C and table S2). In contrast, the DIII-specific mAbs only showed cross-reactivity with DENV1 E (Fig. 2C and table S2). One hundred percent of the NS1-specific mAbs isolated from donors 2 and 3 showed cross-reactivity with DENV1 and DENV3 NS1, whereas the NS1-specific mAbs from donor 4 were exclusively ZIKV-specific (Fig. 2C and table S6). Sequence analysis revealed that the ZIKV NS1-specific mAbs from donor 4 lacked SHM, supporting a naïve B cell origin (fig. S8). The reasons for this are unclear but may be due to the lack of preexisting cross-reactive NS1-specific memory B cells in this donor. As expected, all of the NS1-specific mAbs isolated from donor 1 were ZIKV-specific and lacked SHM (Fig. 2C). The affinities of these mAbs were comparable with the affinities of the NS1-specific mAbs isolated from the DENV-experienced donors (Fig. 2C and table S6), which is perhaps because the plasmablast-derived antibodies from the DENV-experienced donors had not undergone affinity maturation toward ZIKV. Together, the sequencing and binding results provide evidence for OAS during the acute-phase B cell response to ZIKV in DENV-experienced donors.

Most of the plasmablast-derived mAbs isolated from DENV-experienced donors are poorly neutralizing and potently enhancing

To assess the functional properties of the plasmablast-derived mAbs isolated from the DENV-experienced donors, we next performed neutralization and ADE assays. Because of the large number of mAbs, initial neutralization screening was performed using a single concentration of purified IgG. At a concentration of 1 mg/ml, about 20% of mAbs from each donor reduced ZIKV-Paraiba (Para) infectivity by ≥50%, and all of these nAbs cross-neutralized at least one of the four DENV serotypes (Fig. 3A). Additionally, the majority of mAbs (53 of 63 or 84%) showed more potent neutralizing activity against one of the four DENV serotypes than ZIKV-Para (Fig. 3A). We next performed neutralization titration experiments on a subset of mAbs to evaluate neutralization potency. Consistent with the binding and single-point neutralization results, a large proportion of mAbs showed preferential neutralization of DENV, further supporting a DENV-induced memory B cell origin for these recently activated cells (Fig. 3B, table S7, and fig. S9). Of significance, most of the plasmablast-derived mAbs showed poorly neutralizing activity against ZIKV-Para (Fig. 3, B and C). The notable exceptions were the four DIII-specific mAbs, which showed highly potent neutralizing activity against both ZIKV-Para and DENV1 (Fig. 3, B and C, and table S7). These nAbs displayed IC_{50} (half-maximal inhibitory concentrations) between 0.9 and 2.7 ng/ml against ZIKV-Para and between 0.2 and 27 ng/ml against DENV1 (Fig. 3, B and C, and table S7). Most of the mAbs that bound to quaternary epitopes on the E protein showed little to no neutralizing activity against ZIKV. Previous studies have described two classes of quaternary mAbs (EDE1 and EDE2), which are defined on the basis of differing sensitivity to removal of the N-glycan at Asp 153 (*4*). Given that mAbs directed against EDE2 have been shown to be substantially less potent against ZIKV than mAbs targeting EDE1, it is likely that the quaternary mAbs described here recognize the EDE2 epitope.

We next tested the abilities of selected mAbs to enhance ZIKV infection using nonpermissive K562 cells. Consistent with previous studies, all of the mAbs enhanced ZIKV infection, but peak enhancement was observed at lower concentrations for the potently neutralizing DIII-specific mAbs compared with the poorly neutralizing cross-reactive mAbs (fig. S10) (*16*, *32*). Additionally, there was a linear correlation between neutralization potency and the sum of the enhancement activity over the range of mAb concentrations tested,

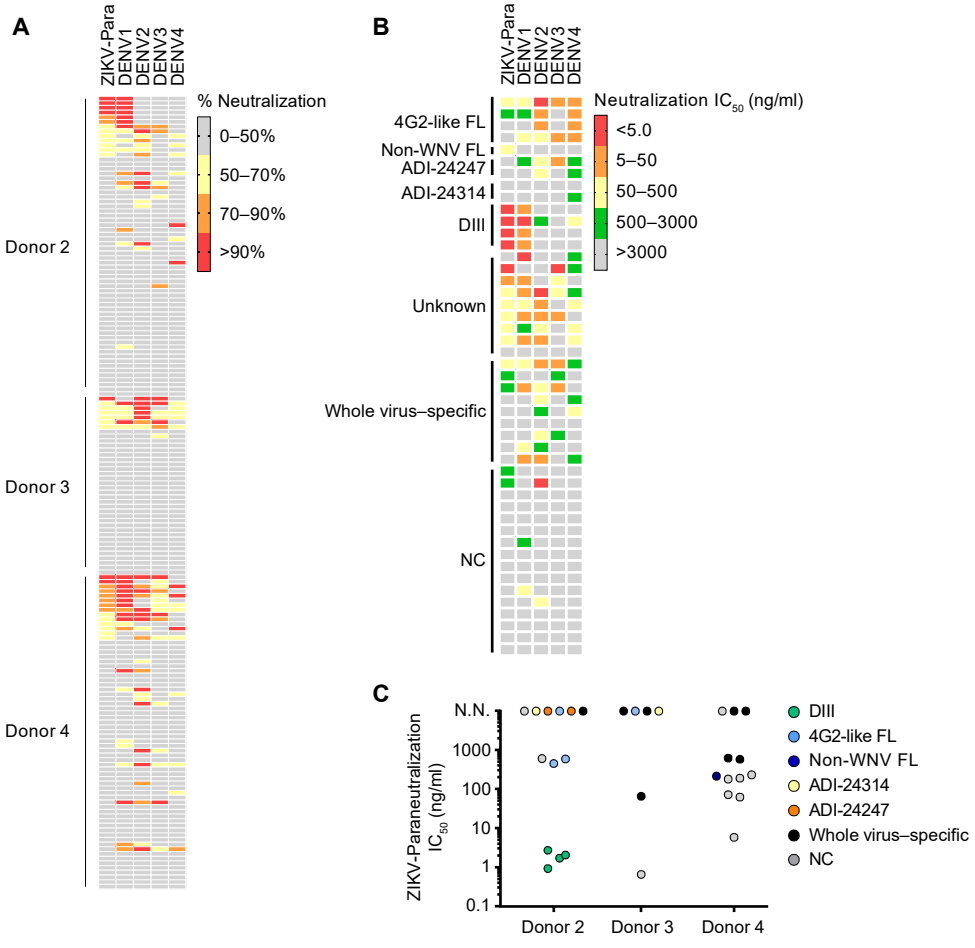

Fig. 3. Neutralizing activity of mAbs isolated from plasmablasts during acute ZIKV infection in DENV-experienced donors. (**A**) Heat map showing mAb neutralization of ZIKV-Para, DENV1, DENV2, DENV3, and DENV4 at a concentration of 1.0 mg/ml. (**B**) Heat map showing neutralization IC_{50} for selected mAbs against ZIKV-Para, DENV1, DENV2, DENV3, and DENV4. Epitope assignments are indicated on the right. (**C**) Neutralization IC_{50}s for selected mAbs against ZIKV-Para. IC_{50} values represent the concentration of IgG required to reduce viral infectivity by 50%. Neutralization assays were performed using a live virus plaque reduction assay. N.N., non-neutralizing.

as defined by the area under the curve (fig. S10). Together, these results show that the acute B cell response to ZIKV in DENV-immune donors is dominated by cross-reactive antibodies that show poor to no neutralizing activity and a propensity to enhance ZIKV infection in vitro.

Isolation of E-specific mAbs from longitudinal samples obtained from the DENV-experienced donors

To track the evolution of the B cell response to ZIKV in DENV-experienced donors, we collected blood samples from donors 2, 3, and 4 about 5 months after infection (table S1). To assess the magnitude of the E-specific memory B cell response at this time point, we stained peripheral B cells with a fluorescently labeled ZIKV-E protein and analyzed them by flow cytometry (Fig. 4A and fig. S11). Robust E-specific memory B cell responses were observed in donors 3 and 4, whereas E-specific memory B cells were undetectable in donor 2 (Fig. 4A). The reasons for this are unclear, but given that donor 2 showed the highest frequency of plasmablasts during acute infection, one explanation is that the virus was rapidly cleared by the immune system, thereby limiting the duration of plasmablast-derived antibodies, which prevented the formation of a germinal center (GC) response. Four hundred ZIKV E–specific memory B cells were single cell–sorted from donors 3 and 4, and about 200 V_H and V_L pairs were cloned and expressed as full-length IgGs for further characterization. To assess the extent of affinity maturation that occurred over this time period, the apparent binding affinities of the E-specific memory B cell–derived mAbs were measured and compared with the affinities of the E-specific plasmablast-derived mAbs. As expected, the average apparent affinity for ZIKV E was significantly higher in the memory B cell subset, suggesting that the ZIKV-induced B cells underwent affinity maturation over time (Fig. 4B). Clonal expansions were observed in both donor response repertoires (Fig. 4C), but there were few to no clonal lineages shared between the plasmablast and memory B cell–derived subsets (table S9 and fig. S12). Although the sampling size is too small to determine the degree of overlap between the two B cell populations, these results suggest that the most dominant clonal lineages likely differ between the two compartments.

ZIKV infection induces de novo and cross-reactive memory B cell responses in DENV-experienced donors

We next assessed the degree of cross-reactivity with the E proteins from DENV1–4. Unexpectedly, 60 and 30% of memory B cell–derived mAbs from donors 3 and 4, respectively, bound exclusively to ZIKV E, suggesting that these antibodies either arose from preexisting memory B cells that uniformly lost DENV reactivity during the process of affinity maturation or originated from activated naïve B cells that had entered GCs and undergone affinity maturation (Fig. 4D and table S8). In support of the latter hypothesis, sequence analysis revealed no overall increase in SHM in the ZIKV-specific memory B cell–derived mAbs compared with the plasmablast-derived mAbs (Fig. 4E). Epitope mapping experiments showed that about 10 to 20% of the ZIKV-specific memory B cell–derived Abs bound to epitopes within DIII, 0 to 15% bound to epitopes within or proximal to the FL, and 0 to 2% bound to epitopes overlapping that of ADI-24314 (fig. S13 and table S8). To estimate the number of different antigenic sites recognized by the remaining ZIKV-specific mAbs, we performed competitive binding assays with two mAbs from the panel (ADI-30056 and ADI-30023) that did not compete with ZV-67, 4G2, ADI-24314, ADI-24247, or each other (table S8). On the basis of these results, we found that 50 to 60% of the ZIKV-specific mAbs targeted unknown sites defined by ADI-30056 or ADI-30023 and 10 to

Downloaded from http://immunology.sciencemag.org/ by guest on August 24, 2017

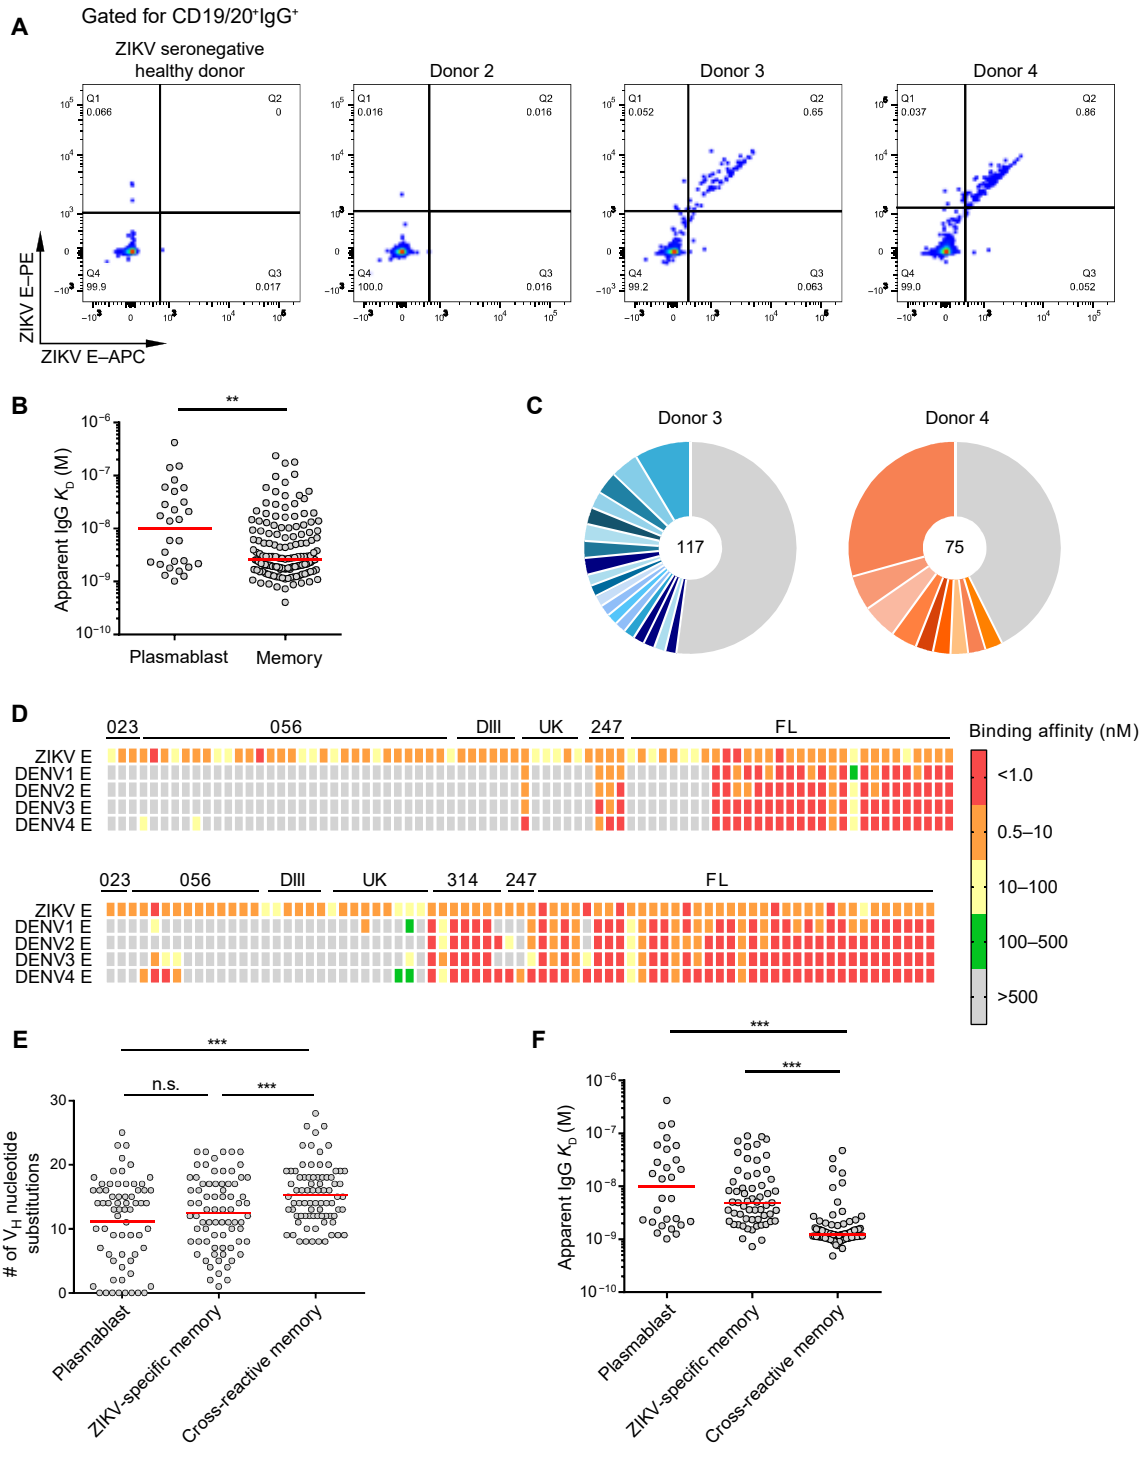

Fig. 4. Longitudinal analysis of ZIKV E–specific memory B cell responses in the DENV-experienced donors. (**A**) ZIKV E–specific memory B cell sorting. Fluorescence-activated cell sorting (FACS) plots show ZIKV E reactivity of IgG$^+$ B cells from the three convalescent DENV-experienced donors and a ZIKV seronegative healthy donor control. B cells in quadrant 2 (Q2) were single cell–sorted for mAb cloning. ZIKV E was labeled with two different colors to reduce background binding. (**B**) Apparent binding affinities of plasmablast and memory B cell–derived mAbs to recombinant ZIKV E. Red bars indicate the median IC_{50}s. (**C**) Clonal lineage analysis of memory B cell–derived mAbs. Heavy-chain sequences were assigned to lineages using Clonify (*52*). Each lineage is represented as a segment proportional to the lineage size. The total number of recovered heavy chains is shown in the center of each pie. All lineages that contain only a single sequence are combined and shown as a single gray segment. (**D**) Heat map showing apparent binding affinities of the memory B cell–derived mAbs to recombinant ZIKV E and DENV1–4 E proteins. Top: mAbs cloned from donor 3. Bottom: mAbs cloned from donor 4. 023, ADI-30023 competitor; 056, ADI-30056 competitor; 314, ADI-24314 competitor; 247, ADI-24247 competitor; FL, 4G2 competitor; DIII, recombinant DIII binder; UK, unknown. (**E**) Load of somatic mutations (expressed as the number of nucleotide substitutions in the V_H) in mAbs isolated from plasmablasts and memory B cells in DENV-experienced donors. Each point represents an individual mAb. Red bars indicate the median number of nucleotide substitutions. (**F**) Binding affinities of plasmablast and memory B cell–derived mAbs to recombinant ZIKV E. Apparent binding affinities are shown in the plot. Red bars indicate the apparent IC_{50}s. Statistical comparisons were made using Mann-Whitney test (***$P < 0.001$, **$P < 0.01$; n.s., not significant).

30% of mAbs did not compete with any of the control mAbs (fig. S13 and table S8).

The majority (84%) of DENV cross-reactive mAbs showed reactivity with all four DENV serotypes (Fig. 4D and table S8). Most of these broadly cross-reactive mAbs showed DENV-biased binding profiles and overall higher levels of SHM compared with the ZIKV-specific mAbs, suggesting that they likely arose from preexisting DENV-induced memory B cells that formed secondary GCs (Fig.

Downloaded from http://immunology.sciencemag.org/ by guest on August 24, 2017

D and E, and table S8). The latter result also provides additional evidence that the ZIKV-specific mAbs originated from naïve B cells that underwent affinity maturation rather than from preexisting memory B cells that lost DENV cross-reactivity. In addition, the average apparent affinity of the cross-reactive mAbs was significantly higher than those of the plasmablast-derived mAbs and the ZIKV-specific memory B cell–derived mAbs, providing further evidence for GC reentry by memory B cells (Fig. 4F). This result is consistent with recent studies in mice demonstrating that memory B cells can rediversify their B cell receptors within secondary GCs (*33*–*35*). As anticipated based on their broad cross-reactivity, most of these mAbs targeted epitopes within or proximal to the FL on DII (Fig. 4D and table S8).

We next tested the memory B cell–derived mAbs for neutralizing activity. Only a small minority of the cross-reactive mAbs (4 of 80 or 5%) showed neutralizing activity against ZIKV-Para at a concentration of 1 μg/ml, whereas the overwhelming majority (52 of 73 or 71%) of the ZIKV-specific mAbs showed such neutralizing activity (Fig. 5A and table S8). Neutralization titration experiments revealed that most potent ZIKV-specific mAbs displayed IC_{50} between 1.0 and 10 ng/ml and targeted epitopes overlapping that of ADI-30056 (Fig. 5B and table S10). About 90% of the cross-reactive mAbs tested showed weak potent neutralizing activity against at least one of the four DENV serotypes than ZIKV-Para, further suggesting that these mAbs originated from preexisting memory B cells that reentered GCs (Fig. 5B and table S10). We conclude that the ZIKV-induced memory B cell response is composed of both OAS-phenotype antibodies that display broad cross-reactivity and poorly neutralizing activity, and de novo generated ZIKV-specific antibodies that show potent but type-specific neutralizing activity.

DISCUSSION

Here, we have used single B cell cloning and large-scale antibody characterization to track the evolution of ZIKV-induced B cell responses in three DENV-experienced donors. In all three donors, massive plasmablast populations were observed during acute ZIKV infection, which were similar in magnitude to the plasmablast responses previously observed in individuals experiencing secondary DENV infection (*24*). The plasmablast population in a ZIKV-infected, DENV-naïve donor was relatively small, which could be due to multiple factors, such as differences in age, viral load, or immune history. However, the immune history explanation is consistent with previous studies that have shown that peripheral blood plasmablast responses during primary infection are delayed and substantially lower in magnitude than during secondary infection (*36*, *37*). The plasmablast responses in the three DENV-experienced donors were clonally expanded and showed relatively high levels of SHM—consistent with a recall response dominated by reactivated memory B cells—whereas the plasmablasts from the ZIKV-infected, DENV-naïve donor showed substantially lower levels of SHM and somewhat more limited clonal expansion, suggesting emergence via activation of naïve B cells. Over half of the plasmablast-derived mAbs isolated from the DENV-experienced donors showed reactivity with whole ZIKV particles or recombinant ZIKV NS1, whereas a substantially smaller fraction of the plasmablast-derived mAbs from the DENV-naïve donor showed such binding. This result could be either due to the low binding affinity of mAbs isolated from activated naïve B cells or that the plasmablast response in this donor was largely directed against viral antigens that were not tested in this study.

Binding and functional characterization of the plasmablast-derived mAbs from donors 2, 3, and 4 revealed that the acute B cell response to ZIKV is dominated by reactivated DENV clones, thus providing evidence of OAS during the acute-phase B cell response to ZIKV in DENV-experienced donors. Most of these antibodies, although broadly cross-reactive, displayed poorly neutralizing activity and enhanced ZIKV infection in vitro, suggesting that preexisting immunity to DENV virus may negatively affect early protective B cell responses to ZIKV. None of the mAbs isolated from the ZIKV-infected DENV-naïve donor showed cross-reactivity with any of the four serotypes of DENV, suggesting that highly conserved epitopes are not immunodominant in the context of primary ZIKV infection. Although ADE has been proposed to be primarily driven by

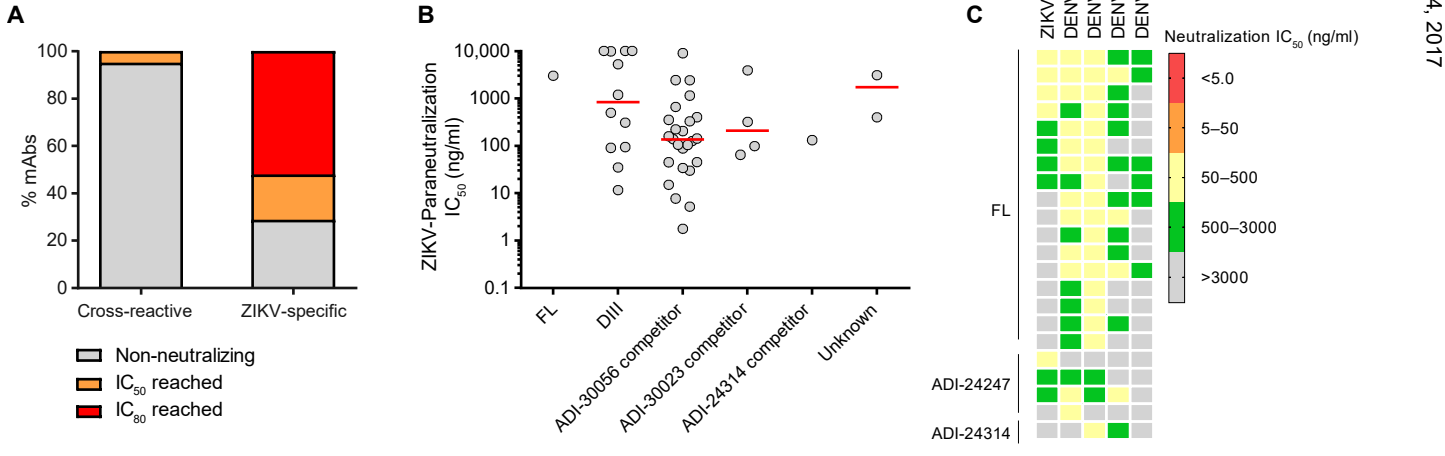

Fig. 5. Neutralizing activity of memory B cell–derived mAbs. (**A**) Percentage of cross-reactive and ZIKV-specific mAbs that reached neutralization IC_{50} or IC_{80} at a concentration of 1.0 μg/ml. (**B**) Neutralization IC_{50} values of selected mAbs from each competition group. IC_{50} values represent the concentration of IgG required to reduce viral infectivity by 50%. preexisting serum antibody, plasmablasts secrete substantial amounts of antibody during acute infection. It is therefore possible that boosting of poorly neutralizing responses during the early stages of infection could contribute to ADE. However, it is important to emphasize that although animal studies have suggested a role for ADE in vivo (*14*), the relevance of ADE in determining the severity and/or higher risk for ZIKV infection remains yet to be elucidated in humans.

Although most of the plasmablast-derived mAbs isolated from the three DENV-experienced donors were poorly neutralizing, a subset of mAbs from donor 2 showed highly potent neutralizing activity against both ZIKV and DENV1. These mAbs bound to epitopes within the lateral ridge of DIII and showed convergent sequence signatures in both the heavy and light chains. Similar antibodies were recently isolated from several DENV-immune donors that were selected on the basis of high ZIKV neutralizing titers (*38*). The identification of recurrent potent nAbs in multiple different donors suggests that this antigenic region may be a particularly attractive target for vaccines intended for DENV-immune populations. Despite the identification of potent nAbs from the donor 2 plasmablast population, the acute serum from this donor showed weaker neutralizing activity than the acute sera from donors 3 and 4. One possible explanation for this result is that the donor 3 and 4 sera contain overall higher titers of anti-ZIKV antibodies compared with the donor 2 serum. In support of this hypothesis, the donor 2 acute serum showed substantially weaker binding to whole DENV and ZIKV particles compared with the acute serum from donors 3 and 4.

The phenomenon of OAS has been documented in the context of repeated influenza virus exposure as well as during secondary DENV infections (*17*, *39*–*43*), and these studies have suggested that memory responses to the primary infecting strain may prevent the induction of effective de novo responses. Our results show that the ZIKV-induced memory B cell response in DENV-experienced donors is composed of both poorly neutralizing OAS-phenotype antibodies—which appear to have originated from preexisting DENV-induced memory B cells that reentered GCs—and potently neutralizing ZIKV-specific antibodies that likely originated from naïve B cells that entered primary GCs. Hence, our results suggest that effective de novo memory B cell responses to ZIKV can be induced in the presence of preexisting cross-reactive DENV clones. However, only about 50% of the mAbs isolated from E-specific memory B cells were ZIKV-specific, the remaining mAbs were broadly cross-reactive, poorly neutralizing, and potently enhancing. The relative contribution of these two different classes of antibodies to protection, virulence, and immunopathology of ZIKV infection remains to be elucidated.

One limitation of our study is the small number of donors studied. As a result, intradonor comparisons can be made with high certainty, but interdonor comparisons are less robust. However, we found evidence of OAS in all three DENV-experienced donors, suggesting that this phenomenon likely occurs in most ZIKV-infected donors that have been previously exposed to DENV. Another limitation of our study was the use of recombinant ZIKV E for memory B cell sorting, which prevented the isolation of memory B cell–derived mAbs that recognize quaternary epitopes. Last, because we were not able to obtain detailed medical histories for these donors, it was not possible to determine the number and frequency of previous DENV infections and the number of DENV serotypes to which they had been exposed. However, the serological data strongly suggest that donors 2, 3, and 4 had experienced at least one DENV infection before ZIKV infection, which we believe is sufficient for the interpretation of the results of this study.

Although our study was performed using naturally infected donors, vaccines expressing full-length ZIKV E—which include multiple recently described plasmid DNA, purified inactivated, protein subunit, adenovirus vector, and mRNA vaccines (*44*–*49*)—would be expected to induce similar responses in DENV-experienced individuals. Such vaccines, which will need to be deployed in areas that are highly endemic for DENV, will likely induce a substantial OAS response in these individuals. Given this possibility, the clinical development of ZIKV vaccines should also consider the recruitment and immunization of DENV-immune donors. Ongoing phase 1 studies on ZIKV vaccine candidates are currently being performed in individuals living in areas that are not endemic for DENV, and therefore, most of these individuals are likely DENV-naïve. Together, the results of this study provide rationale for the design of vaccines specifically focused on the DIII lateral ridge or other ZIKV-specific neutralizing epitopes for use in DENV-immune populations.

MATERIALS AND METHODS

Study design

We initiated this study to gain an in-depth understanding of the antibody response to ZIKV in DENV-experienced donors. To study these responses, we obtained peripheral blood mononuclear cells (PBMCs) from three ZIKV-infected donors that had serological evidence or previous DENV exposure and one ZIKV-infected naïve donor for comparison. Four donors were included in this study because this was the largest number of donors for which large numbers of antibodies could be practically cloned and characterized. At least two independent experiments were performed for affinity measurements, neutralization assays, enhancement assays, and antibody competition assays, and the results shown are derived from single representative experiments. All samples for this study were collected with informed consent of volunteers. This study was unblinded and not randomized.

PBMC and plasma isolation

Blood and serum samples were obtained through Antibody Systems Inc. under the Scripps Research Institute IRB-15-6683. PBMCs were isolated as previously described (*50*). Briefly, whole blood was diluted 1:2 with phosphate-buffered saline (PBS) and underwent ultracentrifugation over layered Lymphoprep (STEMCELL Technologies). The PBMC monolayer was collected, resuspended, and stored in liquid nitrogen.

Generation of ZIKV and DENV viruses

Vero cells were cultured in minimal essential medium (MEM) (Corning Cellgro) containing 5% heat-inactivated fetal bovine serum (Gibco-Invitrogen). Viruses were supplied by D. Watkins and included Zika-Paraiba 2015, DENV1 Western Pacific U88535.1, DENV2 NGC AF038403.1, DENV3 Selman/78 AY648961, and DENV4 AF326825.1. Vero cells were infected with each virus and maintained until 50% cytopathic reduction in viability was observed, after which supernatant was collected, filtered, and stored at −80°C.

Antibody sequencing

Reverse transcription and subsequent PCR amplification of IgV$_H$ and IgV$_L$ genes were performed using SuperScript III (Life Technologies) according to published protocols (*51*). All PCRs were performed in

Downloaded from http://immunology.sciencemag.org/ by guest on August 24, 2017

25-ml volume with 2.5 ml of complementary DNA (cDNA) transcript using HotStarTaq DNA polymerase master mix (Qiagen) and mixtures of previously described primers (*51*). Second-round nested PCRs were performed using Phusion proofreading polymerase (New England Biolabs). Two additional rounds of PCR were performed using primers with bar codes specific to the plate number and well location as well as adapters appropriate for sequencing on an Illumina MiSeq. This reaction was performed in a 25-ml volume with HotStarTaq DNA polymerase master mix (Qiagen). Amplified IgG V_H and V_L genes were sequenced on an Illumina MiSeq (600-base v3 reagent kit; Illumina), and reads corresponding to the same plate per well location were combined into consensus sequences. Germline assignment was performed with AbStar (https://github.com/briney/abstar), and clonal lineages were assigned with Clonify (*52*).

Western blots

Whole-virus ZIKV lysate, whole-virus DENV lysate, and recombinant E protein (catalog no. R01635, Meridian Life Science) were separated by SDS–polyacrylamide gel electrophoresis under reducing conditions in 4 to 20% gels (Bio-Rad) to polyvinylidene difluoride membranes (Thermo Fisher Scientific). Membranes were blocked overnight at 4°C in 5% nonfat dry milk in tris-buffered saline (TBS) containing 0.05% Tween 20 (TBS-T). Subsequently, membranes were incubated with 1:2000 dilution of mAb in 10 ml of TBS-T containing 5% milk for 1 hour and washed three times with TBS-T. The secondary antibody used to detect 4G2 was a horseradish peroxidase (HRP)–conjugated goat polyclonal secondary antibody to mouse IgG (Abcam), and the secondary antibody used to detect human mAbs was an HRP-conjugated goat polyclonal secondary antibody to human IgG (Abcam). Secondary antibodies were diluted 1:2000 in 10 ml of TBS-T with 5% milk and applied to the membrane for 1 hour, and then the membrane was washed three times with TBS-T and developed with HRP development solution (Bio-Rad).

Focus reduction neutralization test

Virus-specific nAb responses were titrated essentially as previously described (*53*). Briefly, antibody was diluted serially in MEM (Corning Cellgro) containing 5% heat-inactivated fetal bovine serum (Gibco-Invitrogen) and incubated for 1 hour at 37°C with virus. The initial dilution tested for all mAbs was 10 mg/ml, and threefold dilutions were performed. After incubation, the antibody-virus mixture was added in triplicate to 96-well plates containing 80% confluent monolayers of Vero E6 cells. Plates were incubated for 1.5 hours at 37°C. After the incubation, wells were overlaid with 1% methylcellulose in supplemented MEM with 2% heat-inactivated fetal bovine serum (Gibco-Invitrogen) and 1:100 Hepes. Plates were incubated at 37°C and 5% CO_2 for 40 hours, after which cells were fixed and permeabilized with Perm/Wash buffer (BD Biosciences) for 5 min. After permeabilization, cells were incubated with 1:2000 dilution of anti-flavivirus antibody (MAB10216) for 2 hours and then washed with PBS (EMD Millipore). After washing, the cells were incubated with anti-mouse HRP-conjugated secondary antibody (Sigma) in Perm/Wash buffer for 2 hours. After washing of cells with PBS, plates were developed with peroxidase substrate (KPL). All viruses were titered to yield 100 plaques per well in the absence of neutralization and fixed at 40 hours to prevent plaque spread or overlap. Experiments were performed in triplicate. Neutralization IC_{50}s were determined using GraphPad Prism software. One site - Fit IC_{50} was used with the following model: $Y = \text{Bottom} + (\text{Top} - \text{Bottom})/(1 + 10^{X(-\text{Log}IC_{50})})$. The top and bottom of the curves were constrained to values of 100 and 0. The IC_{50} was then defined from the best-fit curve for each antibody as defined by the concentration that resulted in 50% reduction in foci number.

Serum ELISAs

For NS1 ELISAs, plates were coated with NS1 protein (5 mg/ml) diluted in PBS and incubated overnight at 4°C. Wells were washed and then blocked with 3% bovine serum albumin (BSA) in PBS for 1 hour at 37°C. Wells were washed, and serial dilutions of human plasma diluted in 1% BSA and 0.05% Tween 20 were added and incubated for 1 hour at 37°C. Wells were washed, and alkaline phosphatase (AP)–conjugated goat anti-human IgG (Jackson ImmunoResearch) secondary antibody was added and incubated for 1 hour at 37°C. Wells were washed twice and developed with *para*-nitrophenylphosphate in 1× diethanolamine. Plates were read on a SpectraMax microplate reader (Molecular Devices) at 405-nm wavelength. For virus binding, ELISA plates were coated with 4G2 (2 mg/ml) (Millipore, MAB10216) diluted in PBS and incubated overnight at 4°C. After washing, wells were blocked with 3% BSA in PBS for 1 hour at 37°C. After removal of the blocking solution, whole ZIKV or DENV particles diluted in 1% BSA and 0.05% Tween 20 were applied to the plates and incubated at 37°C for 1 hour. After washing, serum was titrated and incubated at 37°C for 1 hour. The wells were washed, and AP-conjugated goat anti-human IgG (Jackson ImmunoResearch) secondary antibody was added and incubated for 1 hour at 37°C. Wells were washed twice and developed with *para*-nitrophenylphosphate in 1× diethanolamine. Plates were read on a SpectraMax microplate reader (Molecular Devices) at 405-nm wavelength.

mAb binding ELISAs

ELISA plates were coated with 4G2 (2 mg/ml) (Millipore MAB10216) diluted in PBS and incubated overnight at 4°C. After washing, wells were blocked with 3% BSA in PBS for 1 hour at 37°C. After removal of the blocking solution, 10^4 plaque-forming units of unpurified ZIKV or DENV particles diluted in 1% BSA and 0.05% Tween 20 was added to each well of the ELISA plate and incubated at 37°C for 1 hour. After washing, mAbs were either titrated or added at a concentration of 10 mg/ml and incubated at 37°C for 1 hour. Wells were washed, and AP-conjugated goat anti-human IgG (Jackson ImmunoResearch) secondary antibody was added and incubated for 1 hour at 37°C. Wells were washed twice and developed with *para*-nitrophenylphosphate in 1× diethanolamine. Plates were read on a SpectraMax microplate reader (Molecular Devices) at 405-nm wavelength.

Single B cell sorting

For plasmablast sorting, PBMCs were stained using anti-human CD38 (fluorescein isothiocyanate), CD27 [phycoerythrin (PE)–Cy7], CD20 (BUV737), CD3 [allophycocyanin (APC)–Cy7], CD8 (APC-Cy7), and CD14 (APC-Cy7). Plasmablasts were defined as $CD3^-CD8^-CD20^{-/lo}CD27^{+}CD38^{hi}$. For memory B cell sorting, purified B cells were stained using anti-human IgG [Brilliant Violet (BV) 605], CD27 (BV421), CD8 [peridinin chlorophyll protein (PerCP)–Cy5.5], CD14 (PerCP-Cy5.5), CD19 (PE-Cy7), CD20 (PE-Cy7), and a mixture of dual-labeled ZIKV E tetramers (50 nM each). Single cells were sorted on a BD FACSAria II into 96-well PCR plates (Bio-Rad) containing 20 ml of lysis buffer per well [5 ml of 5× first-strand cDNA buffer (Invitrogen), 0.25 ml of RNaseOUT (Invitrogen), 1.25 ml of dithiothreitol (Invitrogen), 0.625 ml of NP-40 (New England Biolabs), and 12.5 ml of deionized H_2O].

Downloaded from http://immunology.sciencemag.org/ by guest on August 24, 2017

Plates were immediately frozen on dry ice before storage at −80°C. Flow cytometry data were analyzed using FlowJo software.

Amplification and cloning of antibody variable genes

Single B cell PCR was performed essentially as previously described (*51*). Briefly, IgH, Igλ, and Igκ variable gene transcripts were amplified by reverse transcription PCR and nested PCRs using cocktails of primers specific for IgG (*51*). The primers used in the second round PCR contained 40 base pairs' and 5′ homology to the cut expression vectors to allow for cloning by homologous recombination into *Saccharomyces cerevisiae* (*54*). PCR products were cloned into *S. cerevisiae* using the lithium acetate method for chemical transformation (*55*). Each transformation reaction contained 20 μl of unpurified heavy-chain and light-chain PCR product and 200 ng of cut heavy-chain and light-chain plasmids. Individual yeast colonies were picked for sequencing and downstream characterization.

Expression and purification of antibodies

Antibodies used for binding experiments, competition assays, neutralization assays, and structural studies were expressed in *S. cerevisiae* cultures grown in 24-well plates (*54*). After 6 days of growth, the yeast cell culture supernatant was harvested by centrifugation and subject to purification. Cell supernatants were purified by passing over Protein A agarose (MabSelect SuRe from GE Healthcare Life Sciences). The bound antibodies were washed with PBS, eluted with 200 mM acetic acid/50 mM NaCl (pH 3.5) into one-eighth volume of 2 M Hepes (pH 8.0), and buffer-exchanged into PBS (pH 7.0). Fab fragments were generated by digesting the IgGs with papain for 2 hours at 30°C. The digestion was terminated by the addition of iodoacetamide, and the Fab and Fc mixtures were passed over Protein A agarose to remove Fc fragments and undigested IgG. The flowthrough of the Protein A resin was then passed over CaptureSelect IgG-CH1 affinity resin (ThermoFisher Scientific) and eluted with 200 mM acetic acid/50 mM NaCl (pH 3.5) into one-eighth volume of 2 M Hepes (pH 8.0). Fab fragments then were buffer-exchanged into PBS (pH 7.0).

BLI binding analysis

IgG binding affinities were determined by BLI measurements using a FortéBio Octet HTX instrument (Pall Life Sciences). For high-throughput binding affinity screening, IgGs were immobilized on AHQ sensors (Pall Life Sciences) and exposed to 100 nM ZIKV E (Meridian Life Science Inc.), DENV1–4 E (Native Antigen Company), or NS1 proteins (Native Antigen Company) in PBS containing 0.1% BSA (PBSF) for an association step, followed by a dissociation step in PBSF buffer. Data were analyzed using the FortéBio Data Analysis Software 7. The data were fit to a 1:1 binding model to calculate an association and dissociation rate, and binding K_Ds (equilibrium dissociation constant) were calculated using the ratio k_d (dissociation constant)/k_a (association constant).

Antibody competition assays

Antibody competition assays were performed as previously described (*54*). Antibody competition was measured by the ability of a control anti-ZIKV E Fab to inhibit binding of yeast surface–expressed anti-ZIKV E IgGs to ZIKV E (Meridian Life Science Inc.). Biotinylated ZIKV E (50 nM) was preincubated with 1 μM competitor Fab for 30 min at room temperature and then added to a suspension of yeast-expressed anti-ZIKV E IgG. After 5-min incubation, unbound antigen was removed by washing with PBSF. After washing, bound antigen was detected using streptavidin–Alexa Fluor 633 (Life Technologies) at a 1:500 dilution and analyzed by flow cytometry using a BD-FACS Canto II. Results are expressed as the fold reduction in antigen binding in the presence of competitor Fab relative to an antigen-only control.

Statistical analyses

All statistical analyses were performed using GraphPad Prism. Statistical significance was determined using an unpaired nonparametric Mann-Whitney test or Kruskal-Wallis test. *P* values less than 0.05 were considered significant.

Science Immunology

Zika virus activates de novo and cross-reactive memory B cell responses in dengue-experienced donors

Thomas F. Rogers, Eileen C. Goodwin, Bryan Briney, Devin Sok, Nathan Beutler, Alexander Strubel, Rebecca Nedellec, Khoa Le, Michael E. Brown, Dennis R. Burton and Laura M. Walker

Sci. Immunol. **2**, eaan6809.
DOI: 10.1126/sciimmunol.aan6809

For zika virus, experience counts

For the immune system, practice makes perfect. Previous exposure to an infection elicits a stronger, faster memory response. But how does the immune system respond to a similar but not identical infection? Rogers *et al*. tracked the neutralizing antibody response to zika virus infection in individuals with and without previous exposure to the closely related dengue viruses. They found that zika virus infection primed the preexisting dengue virus response, but that this cross-reactive response was poorly neutralizing. In contrast, de novo zika virus responses were potently neutralizing. These data suggest that zika virus vaccines should target epitopes not present in dengue virus subtypes.

I. OVERVIEW OF THE FUNDING OPPORTUNITY

Program Announcement for the Department of Defense

Defense Health Program

Congressionally Directed Medical Research Programs

Peer Reviewed Medical Research Program

Focused Program Award

Announcement Type: Initial

Funding Opportunity Number: W81XWH-17-PRMRP-FPA

Catalog of Federal Domestic Assistance Number: 12.420 Military Medical Research and Development

SUBMISSION AND REVIEW DATES AND TIMES

- **Pre-Application Submission Deadline:** 5:00 p.m. Eastern time (ET), July 20, 2017
- **Invitation to Submit an Application:** August 2017
- **Application Submission Deadline:** 11:59 p.m. ET, October 26, 2017
- **End of Application Verification Period:** 5:00 p.m. ET, October 31, 2017
- **Peer Review:** December 2017
- **Programmatic Review:** February 2018

This Program Announcement must be read in conjunction with the General Application Instructions, version 20170516. The General Applications Instructions document is available for downloading from the Grants.gov funding opportunity announcement by selecting the "Package" tab, clicking "Preview," and then selecting "Download Instructions."

II. DETAILED INFORMATION ABOUT THE FUNDING OPPORTUNITY

II.A. Program Description

Applications to the Fiscal Year 2017 (FY17) Peer Reviewed Medical Research Program (PRMRP) are being solicited for the Defense Health Agency (DHA) J9, Research and Development Directorate, by the U.S. Army Medical Research Acquisition Activity (USAMRAA) using delegated authority provided by United States Code, Title 10, Section 2358 (10 USC 2358). As directed by the Office of the Assistant Secretary of Defense for Health Affairs (OASD[HA]), the DHA manages the Defense Health Program (DHP) Research, Development, Test, and Evaluation (RDT&E) appropriation. The execution management agent for this Program Announcement is the Congressionally Directed Medical Research Programs (CDMRP). The PRMRP was initiated in 1999 to provide support for military health-related research of exceptional scientific merit. Appropriations for the PRMRP from FY99 through FY16 totaled $1.371 billion. The FY17 appropriation is $300 million (M).

The vision of the FY17 PRMRP is to improve the health and well-being of all military Service members, Veterans, and beneficiaries. The PRMRP challenges the scientific and clinical communities to address at least one of the FY17 Topic Areas with original ideas that foster new directions along the entire spectrum of research and clinical care. The program seeks applications in laboratory, clinical, behavioral, epidemiologic, and other areas of research to advance knowledge in disease etiology, improve prevention, detection, diagnosis, treatment, and quality of life for those affected by a relevant disease or condition, and to develop and validate clinical care or public health guidelines.

II.A.1. FY17 PRMRP Topic Areas

All applications for PRMRP funding must specifically address at least one of the Topic Areas as directed by Congress and must be directly relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries. If the proposed research does not specifically address at least one of the FY17 PRMRP Topic Areas, the Government will administratively withdraw the application. The Government reserves the right to reassign the application's Topic Area if submitted under an inappropriate Topic Area. The FY17 PRMRP Topic Areas are listed below.

- Acute Lung Injury
- Antimicrobial Resistance
- Arthritis
- Burn Pit Exposure
- Chronic Migraine and Post-Traumatic Headache
- Congenital Heart Disease
- Constrictive Bronchiolitis
- Diabetes
- Diarrheal Diseases
- Dystonia
- Early Trauma Thermal Regulation
- Eating Disorders

- Emerging Infectious Diseases
- Epidermolysis Bullosa
- Focal Segmental Glomerulosclerosis
- Fragile X
- Guillain-Barré Syndrome
- Hepatitis B and C
- Hereditary Angioedema
- Hydrocephalus
- Immunomonitoring of Intestinal Transplants
- Inflammatory Bowel Diseases
- Influenza
- Integrative Medicine
- Interstitial Cystitis
- Malaria
- Metals Toxicology
- Mitochondrial Disease
- Musculoskeletal Disorders
- Nanomaterials for Bone Regeneration
- Non-Opioid Pain Management
- Pancreatitis
- Pathogen-Inactivated Dried Cryoprecipitate
- Polycystic Kidney Disease
- Post-Traumatic Osteoarthritis
- Pulmonary Fibrosis
- Respiratory Health
- Rett Syndrome
- Rheumatoid Arthritis
- Scleroderma
- Sleep Disorders
- Spinal Muscular Atrophy
- Sustained-Release Drug Delivery
- Tinnitus
- Tuberculosis
- Vaccine Development for Infectious Disease
- Vascular Malformations
- Women's Heart Disease

Research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding. ***Applicants should select the FY17 PRMRP Program Announcement most appropriate to the stage of the proposed research.*** Areas of Encouragement related to the FY17 PRMRP Topic Areas have been identified by the Department of Defense (DoD), the Department of Veterans Affairs (VA), and other relevant stakeholders (Appendix 2). Applicants are urged to read and consider these Areas of Encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an Area of Encouragement on this list.***

II.B. Award Information

The PRMRP Focused Program Award mechanism is intended to optimize research and accelerate the solution for a critical question related to at least one of the Congressionally directed FY17 PRMRP Topic Areas through a synergistic, multidisciplinary research program. The anticipated total costs budgeted for the entire period of performance for an FY17 PRMRP Focused Program Award will not exceed **$10M**. Refer to Section II.D.5, Funding Restrictions, for detailed funding information.

Key aspects of this award include:

Overarching Challenge: Focused Program Award applications must describe a unifying, overarching challenge that will be addressed by a set of research projects. The overarching challenge must be relevant to a critical problem or question in the field of research and/or patient care in at least one of the FY17 PRMRP Topic Areas.

Research Projects: Applications shall include multiple, distinct research projects led by individual project leaders that address complementary aspects of the overarching challenge. Applicants are strongly encouraged to submit a minimum of four research projects; additional studies are allowed. While individual projects must be capable of standing on their own high scientific merits, they must also be interrelated and synergistic with the other proposed projects and advance a solution beyond what would be possible through individual efforts. The exploration of multiple hypotheses or viewpoints of the same line of questioning is encouraged. This award mechanism is not intended to support a series of research projects that are dependent on the success of any other project. Each project should propose a unique approach to addressing the overarching challenge and be capable of producing research findings with potential to impact the field and/or patient care. Individual research projects may range from exploratory, hypothesis-developing studies through small-scale clinical trials (i.e., up to and including Phase II or equivalent). There should be a clear intent to progress toward translational/ clinical work over the course of the effort.

Implementation: The research strategy to address the overarching challenge must be supported by a detailed plan that identifies critical milestones; outlines the knowledge, resources, and technical innovations that will be utilized to achieve the milestones; and explains how the outcomes will be translated to patients. A robust statistical plan and statistical expertise should be included where applicable. A plan for assessing individual project performance and progress toward addressing the overarching challenge must be included in the implementation plan. Plans to include an External Advisory Board are encouraged; however, applicants must be careful to avoid potential conflicts of interest (COIs) during review of the application by ensuring no contact with, recruiting of, or naming of specific members in the application. For multi-institutional collaborations, plans for communication and data transfer among the collaborating institutions, as well as how data, specimens, and/or imaging products obtained during the study will be handled, must be included. An intellectual and material property plan agreed to by participating organizations is required in the application's supporting documentation.

Research Team: The overall effort will be led by a Principal Investigator (PI) with demonstrated success in leading large, focused projects. The PI is required to devote a minimum

of 20% effort to this award. The PI should create an environment that fosters and supports collaboration and innovation in a way that engages all members of the team in all aspects of the research plan. The research team assembled by the PI should be highly qualified and multidisciplinary, with identified project leaders for each of the complementary and synergistic research projects. The resources and expertise brought to the team by each project leader should combine to create a robust, synergistic collaboration. The PRMRP Science Officer assigned to a resulting award must be invited to participate in periodic research team meetings. The plan for such meetings should be noted in the application.

Milestone Meeting: The PI will be required to present an update on progress toward accomplishing the goals of the award at a Milestone Meeting to be held in the National Capital Region after the conclusion of Year 2 of the period of performance. The PI may bring up to three additional members of the research team to the meeting. The Milestone Meeting will be attended by members of the PRMRP Programmatic Panel, CDMRP staff, and the USAMRAA Grants Officer.

Military Relevance: Relevance to the healthcare needs of military Service members, Veterans, and beneficiaries is a key feature of this award. Investigators are encouraged to consider the following characteristics as examples of how a project may demonstrate military relevance:

- Explanation of how the project addresses an aspect of the target disease/condition that has direct relevance to military Service members, Veterans, or other military health system beneficiaries

- Description of how the knowledge, information, products, or technologies gained from the proposed research could be implemented in a dual-use capacity to benefit the civilian population and also address a military need

- Use of military or Veteran populations or datasets in the proposed research, if appropriate to the proposed research project

- Involvement of military consultants (Army, Air Force) or specialty leaders (Navy, Marine Corps) to the Surgeons General in a relevant specialty area

PIs are strongly encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with the DoD or VA is also encouraged. A list of websites that may be useful in identifying additional information about ongoing DoD and VA areas of research interest or potential opportunities for collaboration within the FY17 PRMRP Topic Areas can be found in Appendix 3.

Use of Active Duty Military and VA Populations: If the proposed research plan involves access to active duty military and/or VA patient populations or resources, the PI is responsible for establishing such access. If possible, access to target active duty military and/or VA patient populations/resources should be confirmed at the time of application submission by inclusion of a letter of support, signed by the lowest ranking person with approval authority, for studies involving active duty military Service members, Veterans, military- and/or VA-controlled study materials, and military and/or VA databases. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until

the PI has demonstrated support for and access to the relevant population(s) and/or resources. Note that access to a Veteran population for clinical studies may only be obtained by either collaboration with a VA investigator where the VA investigator has a substantial role in the research or by advertising to the general public.

Research Involving Human Anatomical Substances, Human Subjects, or Human Cadavers: All DoD-funded research involving new and ongoing research with human anatomical substances, human subjects, or human cadavers must be reviewed and approved by the U.S. Army Medical Research and Materiel Command (USAMRMC) Office of Research Protections (ORP), Human Research Protection Office (HRPO) prior to research implementation. This administrative review requirement is in addition to the local Institutional Review Board (IRB) or Ethics Committee (EC) review. Local IRB/EC approval at the time of submission is ***not*** required. The HRPO is mandated to comply with specific laws and requirements governing all research involving human anatomical substances, human subjects, or human cadavers that is supported by the DoD. These laws and requirements will necessitate information in addition to that supplied to the IRB/EC. ***Allow a minimum of 2 to 3 months for HRPO regulatory review and approval processes***. When possible, protocols should be written for research with human subjects and/or human anatomical substances that are specific to the DoD-supported effort outlined in the submitted application. Submission to HRPO of protocols covering more than the scope of work in the DoD-funded award will require HRPO review of the entire protocol as DoD-supported research and may include extensive modifications to meet DoD human subjects protection requirements. Refer to the General Application Instructions, Appendix 1, and the Human Subject Resource Document available on the electronic Biomedical Research Application Portal (eBRAP) "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) for additional information.

A clinical trial is defined as a prospective accrual of patients (human subjects) in whom an intervention (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the subject of that intervention or interaction.

Research Involving Animals: All projects should adhere to a core set of standards for rigorous study design and reporting to maximize the reproducibility and translational potential of preclinical research. The standards are described in Landis, S.C., et al. A call for transparent reporting to optimize the predictive value of preclinical research. *Nature* 2012, 490:187-191 (www.nature.com/nature/journal/v490/n7419/full/nature11556.html). While these standards are written for preclinical studies, the basic principles of randomization, blinding, sample-size estimation, and data handling derive from well-established best practices in clinical studies. Applicants should consult the ARRIVE (Animal Research: Reporting *In Vivo* Experiments) guidelines to ensure relevant aspects of rigorous animal research are adequately planned for and, ultimately, reported. The ARRIVE guidelines can be found at http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf

All DoD-funded research involving new and ongoing research with animals must be reviewed and approved by the USAMRMC ORP Animal Care and Use Review Office (ACURO), in addition to the local Institutional Animal Care and Use Committee (IACUC) of record. IACUC

approval at the time of submission is ***not*** required. Specific documents relating to the use of animals in the proposed research will be requested **if the application is selected for funding**. The ACURO must review and approve all animal use prior to the start of working with animals, including amendments to ongoing projects. PIs must submit the institutional animal use protocol, IACUC approval of that protocol, and a version of the animal use appendix titled "Research Involving Animals." ***Allow at least 2 to 3 months for ACURO regulatory review and approval processes for animal studies.*** Refer to the General Application Instructions, Appendix 1, for additional information.

The CDMRP intends that information, data, and research resources generated under awards funded by this Program Announcement be made available to the research community (which includes both scientific and consumer advocacy communities) and to the public at large. For additional guidance, refer to the General Application Instructions, Appendix 2, Section K.

Awards will be made no later than September 30, 2018. For additional information refer to Section II.F.1, Federal Award Notices.

II.C. Eligibility Information

II.C.1. Eligible Applicants

II.C.1.a. Organization: All organizations, including international organizations, are eligible to apply.

Government Agencies within the United States: Local, state, and Federal Government agencies are eligible to the extent that applications do not overlap with their fully funded internal programs. Such agencies are required to explain how their applications do not overlap with their internal programs.

As applications for this Program Announcement may be submitted by extramural and intramural organizations, these terms are defined below.

Extramural Organization: An eligible non-DoD organization. Examples of extramural organizations include academia, biotechnology companies, foundations, Government, and research institutes. *Extramural Submission: Application submitted by a non-DoD organization to Grants.gov.*

Intramural DoD Organization: A DoD laboratory, DoD military treatment facility, and/or DoD activity embedded within a civilian medical center. *Intramural Submission: Application submitted by a DoD organization for an intramural investigator who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility or in a DoD activity embedded within a civilian medical center.*

Note: Applications from an intramural organization or from an extramural non-DoD Federal organization may be submitted through a research foundation.

The USAMRAA makes awards to eligible organizations, not to individuals.

II.C.1.b. Principal Investigator:

- The PI must be an independent investigator at or above the level of Full Professor (or equivalent).
    - Project leaders for each of the complementary and synergistic research projects must be at or above the level of Assistant Professor (or equivalent).

An eligible PI, regardless of ethnicity, nationality, or citizenship status, must be employed by, or affiliated with, an eligible organization.

The CDMRP encourages all PIs to participate in a digital identifier initiative through Open Researcher and Contributor ID, Inc. (ORCID). Registration for a unique ORCID identifier can be done online at http://orcid.org/.

II.C.2. Cost Sharing

Cost sharing/matching is not an eligibility requirement.

II.C.3. Other

Extramural organizations must be able to access **.gov** and **.mil** websites in order to fulfill the financial and technical deliverable requirements of the award and submit invoices for payment.

There are no limitations on the number of applications for which an investigator may be named as a PI.

For general information on required qualifications for award recipients, refer to the General Application Instructions, Appendix 3.

Refer to Section II.H.2, Administrative Actions, for a list of administrative actions that may be taken if a pre-application or application does not meet the administrative, eligibility, or ethical requirements defined in this Program Announcement.

II.D. Application and Submission Information

Submission of applications that are essentially identical or propose essentially the same research project to different funding opportunities within the same program and fiscal year is prohibited and will result in administrative withdrawal of the duplicative application(s). ***As an exception, applicants may submit a research project described in their FY17 PRMRP Focused Program Award to the Discovery Award (Funding Opportunity Number: W81XWH-17-PRMRP-DA), Investigator-Initiated Research Award (Funding Opportunity Number: W81XWH-17-PRMRP-IIRA), and/or Clinical Trial Award (Funding Opportunity Number: W81XWH-17-PRMRP-CTA); however, accepting multiple awards to support the same project will not be allowed.***

Extramural Submission is defined as an application submitted by a non-DoD organization to Grants.gov.

Intramural Submission is defined as an application submission by a DoD organization for an intramural investigator, who is a DoD military or civilian employee working within a DoD laboratory or military treatment facility, or working in a DoD activity embedded within a civilian medical center.

II.D.1. Address to Request Application Package

Submitting Extramural and Intramural Organizations: Pre-application content and forms can be accessed at eBRAP (https://eBRAP.org).

Submitting Extramural Organizations: Full application packages can be accessed at Grants.gov.

Submitting Intramural DoD Organizations: Full application packages can be accessed at eBRAP.org.

Contact information for the CDMRP Help Desk and the Grants.gov Contact Center can be found in Section II.G, Federal Awarding Agency Contacts.

II.D.2. Content and Form of the Application Submission

Submission is a two-step process requiring both ***pre-application*** and ***full application*** as indicated below. The submission process should be started early to avoid missing deadlines. There are no grace periods.

Pre-application Submission: All pre-applications for both extramural and intramural organizations must be submitted through eBRAP (https://eBRAP.org/).

eBRAP is a multifunctional web-based system that allows PIs to submit their pre-applications electronically through a secure connection, to view and edit the content of their pre-applications and full applications, to receive communications from the CDMRP, and to submit documentation during award negotiations and period of performance.

Full Application Submission: Full applications must be submitted through the online portals as described below.

***Submitting Extramural Organizations*:** Full applications from extramural organizations must be submitted through Grants.gov. Applications submitted by extramural organizations (e.g., research foundations) on behalf of intramural DoD or other Federal organizations or investigators will be considered extramural submissions.

Submitting Intramural DoD Organizations: Intramural DoD organizations may submit full applications to either eBRAP or Grants.gov. Intramural DoD organizations that are unable to submit to Grants.gov should submit through eBRAP. Intramural DoD organizations with the capability to submit through Grants.gov may submit following the instructions for extramural submissions through Grants.Gov or may submit to eBRAP. Applications from extramural organizations, including non-DoD Federal organizations, received through eBRAP will be withdrawn. See definitions in Section II.C.1, Eligible Applicants.

For both Extramural and Intramural applicants: A key feature of eBRAP is the ability of an organization's representatives and PIs to view and modify the full application submissions associated with them. eBRAP will validate full application files against the specific Program Announcement requirements and discrepancies will be noted in an email to the PI and in the Full Application Files tab in eBRAP. It is the applicant's responsibility to review all application components for accuracy as well as ensure proper ordering as specified in this Program Announcement.

The application title, eBRAP log number, and all information for the PI, Business Official(s), performing organization, and contracting organization must be consistent throughout the entire pre-application and application submission process. Inconsistencies may delay application processing and limit or negate the ability to view, modify, and verify the application in eBRAP. If any changes need to be made, the applicant should contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 prior to the application deadline.

II.D.2.a. Step 1: Pre-Application Submission Content

During the pre-application process, each submission is assigned a unique log number by eBRAP. This unique eBRAP log number will be needed during the full application submission process.

To begin the pre-application process, first select whether the submitting organization is extramural or intramural, then confirm your selection or cancel. **Incorrect selection of extramural or intramural submission type may result in delays in processing.**

If an error has been made in the selection of extramural versus intramural and the pre-application submission deadline has passed, the PI or Business Official must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

All pre-application components must be submitted by the PI through eBRAP (https://eBRAP.org/). Because the invitation to submit an application is based on the contents of the pre-application, investigators should not change the title or research objectives after the pre-application is submitted.

PIs and organizations identified in the pre-application should be the same as those intended for the subsequent application submission. If any changes are necessary after submission of the pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

The pre-application consists of the following components, which are organized in eBRAP by separate tabs (refer to the General Application Instructions, Section II.B, for additional information on pre-application submission):

- **Tab 1 – Application Information**

  Select the FY17 PRMRP Topic Area addressed by the proposed research. If the proposed research project is aligned with more than one FY17 PRMRP Topic Area, select the Topic Area of highest relevance as the required first choice.

- **Tab 2 – Application Contacts**

  Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration (the "person to be contacted on matters involving this application" in Block 5 of the Grants.gov SF424 (R&R) Form for extramural submissions). The Business Official must be either selected from the eBRAP list or invited in order for the pre-application to be submitted.

  Select the performing organization (site at which the PI will perform the proposed work) and the contracting organization (organization submitting on behalf of the PI, which corresponds to Block 5 on the Grants.gov SF424 (R&R) Form for extramural submissions), and click on "*Add Organizations to this Pre-application.*" The organizations must be either selected from the eBRAP drop-down list or invited in order for the pre-application to be submitted.

  It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-application submission is needed.

- **Tab 3 – Collaborators and Key Personnel**

  Enter the name, organization, and role of all collaborators and key personnel associated with the application.

  FY17 PRMRP Programmatic Panel members should not be involved in any pre-application or application. For questions related to Panel members and pre-applications or applications, refer to Section II.H.2.c, Withdrawal, or contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

  To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in pre-application or application preparation, research, or other duties for submitted pre-applications or applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Pre-applications or applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- **Tab 4 – Conflicts of Interest**

  List all individuals other than collaborators and key personnel who may have a COI in the review of the application (including those with whom the PI has a personal or professional relationship). Refer to the General Application Instructions, Appendix 3, Section C, for further information regarding COIs.

- **Tab 5 – Pre-Application Files**

  Note: Upload documents as individual PDF files unless otherwise noted. eBRAP will not allow a file to be uploaded if the number of pages exceeds the limit specified below.

- **Preproposal Narrative (five-page limit):** The Preproposal Narrative page limit applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Preproposal Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the pre-application.

  The Preproposal Narrative should include the following:

  - **Topic Area:** Describe how the proposed program relates to at least one of the FY17 PRMRP Topic Areas. If applicable, describe how the proposed research program addresses an FY17 PRMRP Area of Encouragement (Appendix 2).

  - **Overarching Challenge:** Describe the unifying challenge or question to be addressed and how it is relevant to a critical problem or question in the field of research and/or patient care in at least one of the FY17 PRMRP Topic Area(s). Clearly articulate the rationale for the overarching challenge; include relevant preliminary data and literature citations.

  - **Research Strategy:** The FY17 PRMRP Focused Program Award strongly encourages a minimum of four individual but complementary research projects addressing the overarching challenge. For each proposed project, state the hypothesis to be tested, the specific aims, and the objectives to be reached. Briefly describe the experimental approach. Describe how the projects are interrelated to and synergistic with each other and align with the overarching challenge.

  - **Impact:** Describe the potential short-term and long-term impact of the proposed research on at least one of the FY17 PRMRP Topic Areas and its related research field(s), and patient population(s). Explain how the effort is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

  - **Research Team:** Briefly describe the composition, expertise, and organization of the research team. Identify the project leaders and describe each team member's role in the projects, with additional emphasis on the leadership role of the PI. Briefly describe how these features will facilitate the success of the key aspects of the projects.

  - **Clinical Trial (if applicable):** If the proposed research includes a clinical trial(s), briefly state the clinical intervention(s), subject population(s), and the type and phase of the clinical trial(s). Describe the objectives of the clinical trial(s), how it addresses the overarching challenge, and how it complements the other proposed projects. ***Only small-scale (i.e., up to and including Phase II or equivalent) clinical trials are allowed.***

- **Pre-Application Supporting Documentation:** The items to be included as supporting documentation for the pre-application ***must be uploaded as individual files*** and are limited to the following:

- References Cited (one-page limit): List the references cited (including URLs if available) in the Preproposal Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, reference title, and reference source, including volume, chapter, page numbers, and publisher, as appropriate).

- List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols used in the Preproposal Narrative.

- Key Personnel Biographical Sketches (five-page limit per individual). ***All biographical sketches should be uploaded as a single combined file.*** Biographical sketches should be used to demonstrate background and expertise through education, positions, publications, and previous work accomplished.

- **Tab 6 – Submit Pre-Application**

  This tab must be completed for the pre-application to be accepted and processed.

Pre-Application Screening

Pre-Application Screening Criteria

To determine the technical merits of the pre-application and the relevance to the mission of the DHP and the PRMRP, pre-applications will be screened based on the following criteria:

- **Overarching Challenge:** How well the unifying challenge or question addresses a critical problem or question in the field of research and/or patient care of one or more FY17 PRMRP Topic Area(s). How well the rationale supports the overarching challenge.

- **Research Strategy:** How well a hypothesis and specific aims are defined for each proposed project and to what extent each project's approach will address them. How well the proposed projects complement each other and synergistically address the overarching challenge to advance a solution beyond what would be possible through individual efforts.

- **Impact:** Whether the potential immediate and long-range outcome(s)/product(s) (intellectual and/or material) of the proposed research, if successful, will impact a central critical problem or question in the field of research and/or patient care in the FY17 PRMRP Topic Area(s) addressed. To what degree the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Research Team:** To what degree the background and expertise of the PI, project leaders, and key personnel are appropriate with respect to their abilities to successfully complete the projects and the extent to which the PI is well prepared and committed to lead the research team and proposed projects.

Notification of Pre-Application Screening Results

Following the pre-application screening, PIs will be notified as to whether or not they are invited to submit applications; however, they will not receive feedback (e.g., a critique of strengths and

weaknesses) on their pre-application. The estimated time frame for notification of invitation to submit an application is indicated in Section I, Overview of the Funding Opportunity. Invitations to submit a full application are based on the Pre-Application Screening Criteria listed above.

II.D.2.b. Step 2: Full Application Submission Content

Applications will not be accepted unless the PI has received notification of invitation.

All contributors and administrators to the application must use matching compatible versions of Adobe software when editing and preparing application components. The use of different software versions will result in corruption of the submitted file. Refer to the General Application Instructions, Section III, for details on compatible Adobe software.

The CDMRP cannot make allowances/exceptions to its policies for submission problems encountered by the applicant organization using system-to-system interfaces with Grants.gov.

Each application submission must include the completed full application package for this Program Announcement. The full application package is submitted by the Authorized Organizational Representative through Grants.gov (http://www.grants.gov/) for extramural organizations or through eBRAP (https://ebrap.org/) for intramural organizations. See Table 1 below for more specific guidelines.

II.D.2.b.i. Full Application Guidelines

Extramural organizations, including non-DoD Federal agencies, must submit full applications through Grants.gov. Submissions of extramural applications through eBRAP may be withdrawn.

Table 1. Full Application Submission Guidelines

Extramural Submissions	Intramural DoD Submissions
Application Package Location	
Download application package components for W81XWH-17-PRMRP-FPA from Grants.gov (http://www.grants.gov).	Download application package components for W81XWH-17-PRMRP-FPA from eBRAP (https://ebrap.org).
Full Application Package Components	
SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.	**Tab 1 – Summary:** Provide a summary of the application information. **Tab 2 – Application Contacts:** This tab will be pre-populated by eBRAP; add Authorized Organizational Representative.

Extramural Submissions	Intramural DoD Submissions
Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Research & Related Senior/Key Person Profile (Expanded) • Research & Related Budget • Project/Performance Site Location(s) Form • R&R Subaward Budget Attachment(s) Form (if applicable)	**Tab 3 – Full Application Files:** Upload files under each Application Component in eBRAP. Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Key Personnel • Budget • Performance Sites **Tab 4 – Application and Budget Data:** Review and edit proposed project start date, proposed end date, and budget data pre-populated from the Budget Form.
Application Package Submission	
Submit package components to Grants.gov (https://www.grants.gov/). If either the Project Narrative or the budget fails eBRAP validation or if the Project Narrative or the budget need to be modified, an updated Grants.gov application package must be submitted via Grants.gov as a "Changed/Corrected Application" with the previous Grants.gov Tracking ID prior to the application submission deadline.	**Submit package components to eBRAP (https://ebrap.org).** **Tab 5 – Submit/Request Approval Full Application:** After all components are uploaded and prior to the full application submission deadline, enter your password in the space provided "Enter Your Password Here" and press the "Submit Full Application" button. eBRAP will notify your Resource Manager/Comptroller or equivalent Business Official by email to log into eBRAP to review and to approve prior to the application submission deadline.
Application Verification Period	
The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.	After eBRAP has processed the full application, the organizational Resource Manager/ Comptroller or equivalent Business Official and PI(s) will receive an email notification of this status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.
Further Information	
Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.	Refer to the General Application Instructions, Section IV, for further information regarding eBRAP requirements.

The organization's Business Official or Authorized Organization Representative (or Resource Manager/Comptroller) should approve/verify the full application submission prior to the application verification deadline.

Application viewing, modification, and verification in eBRAP are strongly recommended, but not required. ***The Project Narrative and Budget cannot be changed after the application submission deadline.*** Prior to the full application deadline, a corrected or modified full application package may be submitted. Other application components may be changed until the end of the application verification period. After the end of the application verification period, the full application cannot be modified.

Material submitted after the end of the application verification period, unless specifically requested by the Government, will not be forwarded for processing.

The full application package must be submitted using the unique eBRAP log number to avoid delays in application processing.

II.D.2.b.ii. Full Application Submission Components:

- **Extramural Applications Only –**

  SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.

- **Extramural and Intramural Applications –**

  Attachments:

  Each attachment to the full application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Application Instructions, Appendix 4.

  For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or incorrect file names that contain characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some circumstances. Individual attachments may not exceed 20 MB and the file size for the entire full application package may not exceed 200 MB.

  - **Attachment 1: Project Narrative (40-page limit):** Upload as "ProjectNarrative.pdf." The page limit of the Project Narrative applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Project Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the application.

    Describe the proposed project in detail using the outline below.

Overall Program: Provide a description of the comprehensive effort using the following outline. Applicants are strongly encouraged to submit a minimum of four research projects; additional studies are allowed. Emphasize areas of synergy throughout the narrative.

- **Overarching Challenge:** Describe the unifying, overarching challenge or question to be addressed and how it is relevant to a critical problem or question in the field of research and/or patient care in one or more FY17 PRMRP Topic Areas. Clearly articulate the rationale for the overarching challenge; include relevant literature citations. Clearly describe how the proposed research projects are interrelated and synergistic and will advance toward a solution through a multidisciplinary research program. Describe how each project will address the overarching challenge in a unique but complementary way and how the combined efforts of the projects will address the overarching challenge more effectively than if the projects were conducted independently.

- **Leadership:** Describe how the PI's research experience, leadership skills, and commitment to making an impact in his/her field of research and/or patient care demonstrate substantial qualifications to coordinate this collaborative effort. Describe the PI's demonstrated success in leading large, focused projects and outline the PI's responsibilities during the conduct of the award. Discuss the qualifications of the research team being brought together by the PI and how the assembled expertise will create a robust, synergistic collaboration necessary to address the overarching challenge and enable the success of the proposed research.

- **Implementation Plan and Environment:** Provide an overall strategic plan for completing the proposed projects that identifies critical milestones. Outline the knowledge, expertise, and technical innovations that the investigative team will utilize to make decisions, allocate resources, and accomplish the milestones. Describe and/or provide evidence that the research can be initiated without delay once the award is made. Present an overall management plan to facilitate consistent and intensive interactions by all team members, including aspects such as adherence to regulatory requirements, administrative support, and oversight to accelerate translation of the projects' outcomes to patients and/or for clinical use. Describe the research environment(s) and how the facilities and resources will support the research requirements and the collaboration. Outline shared resources and/or cores that will be created and/or leveraged through the award. Describe plans for communication, data transfer among the collaborating institutions, and how data, specimens, and/or imaging products obtained during the study will be handled. If applicable, describe how Standard Operating Procedures will be created, reviewed, implemented, and modified during the course of the award. Describe how individual project performance will be assessed during the course of the award, including progression toward defined milestones, realization of study objectives, and addressing the overarching challenge. If an External Advisory Board (EAB) is to be utilized, describe the role of the board and the expertise to be sought in its members. To avoid potential COIs in the review of the application, potential candidates for an EAB should not be contacted, recruited, or named during the application process.

Research Plan: Provide the following details for each proposed research project, organizing each project clearly and separately. Start each project on a separate page:

- **Title:** Provide a title for each project.

- **Project Leader:** Identify the project leader and any key personnel, as appropriate, describing each person's qualifications and specific contributions to the project.

- **Background:** Briefly describe the ideas and reasoning on which the proposed work is based. Provide sufficient preliminary data to support the feasibility of work proposed. If the project is exploratory/hypothesis-developing, preliminary data are not required. For each project, the leader must demonstrate logical reasoning and provide a sound scientific rationale for the proposed project as established through a critical review and analysis of published literature. If proposing translational or clinical research, it is important to describe the project showing proof of concept and, if applicable, efficacy in an in-vivo system(s) to support the translational feasibility and promise of the approach.

- **Hypothesis/Objective:** State the hypothesis to be tested and/or the objective(s) to be reached.

- **Specific Aims:** Concisely explain each project's specific aims. The specific aims should align with the overall goal of the program and associated tasks described in the Statement of Work.

- **Research Strategy:** Describe the experimental design, methods, and analyses, in sufficient detail for analysis. Provide a description of how the study will be controlled and how the study variables will be measured. If the project is a clinical trial, define the primary and secondary endpoints and how they will be assessed. Explain how the research strategy will address the overarching challenge and meet appropriate milestones. Address potential problem areas and present alternative methods and approaches. Clearly describe the statistical plan and the rationale for the statistical methodology as well as an appropriate power analysis, if applicable. If animal studies are proposed, describe how they will be conducted in accordance with the ARRIVE guidelines (http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf). Justify how the model system or human subjects/samples are appropriate to the proposed research project. If human subjects or human biological samples will be used, describe the study population and include a detailed plan for the recruitment of human subjects or the acquisition of samples. Describe the availability of the proposed study population and past successes in recruiting similar populations. If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe how access to the population(s)/dataset(s) will be obtained. If applicable, describe how data will be reported and how it will be assured that the documentation will support a regulatory filing with the U.S. Food and Drug Administration (FDA).

- **Statistical Plan:** Clearly describe a statistical plan appropriate to the type of study; provide the rationale for the statistical methodology. Define the number of samples and/or subjects (animal and/or human) to be used, and include a power analysis to demonstrate that the sample size is appropriate to meet the objectives of the study.

- **Impact:** Describe the anticipated outcome(s)/product(s) (intellectual and/or material) that will be directly attributed to the results of the proposed research. Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable.

- **Clinical Trial (if applicable):** ***Only small-scale (e.g., up to and including Phase II or equivalent) clinical trials are allowed.*** Provide detailed plans for initiating and conducting the clinical trial during the course of this award. As appropriate, outline a plan for applying for and obtaining Investigational New Drug/Investigational Device Exemption (IND/IDE) status (or other FDA approvals). Describe the type of clinical trial to be performed (e.g., prospective, randomized, controlled) and indicate the phase of trial and/or class of device, as appropriate. Outline the regulatory strategy. Provide preclinical and/or clinical evidence to support the safety of the intervention.

    - Identify the intervention to be tested and describe the projected outcomes. Describe how the proposed intervention compares with currently available interventions and/or standards of care. Include a discussion of any current clinical use of the intervention under investigation, and/or details of its study in clinical trials for other indications (as appropriate).

    - Describe the methods that will be used to recruit a sample of human subjects from the accessible population (e.g., convenience, simple random, stratified random). Provide information on and justification for the inclusion and exclusion criteria.

    - Describe the process for obtaining informed consent and any screening procedures required to determine eligibility for study participation.

    - Describe the human subject-to-group assignment process (e.g., randomization, block randomization, stratified randomization, age-matched controls, alternating group, or other procedures), if applicable. Explain the specific actions to accomplish the group assignment (e.g., computer assignment, use of table of random numbers). If multiple site studies are involved, state the approximate number of subjects to be enrolled at each site.

    - Provide evidence to document the availability of and access to all critical reagents, including the intervention itself, if applicable, for the duration of the proposed trial.

    - Describe how quality control will be addressed. Describe how compliance with Good Laboratory Practices (GLP), Good Manufacturing Practices (GMP), and Good Clinical Practices (GCP) guidelines will be established, monitored, and maintained, as applicable.

- Describe the composition of the clinical trial team. Provide details on how the team (including investigator(s), study coordinator, and statistician) possesses the appropriate expertise in conducting clinical trials.

- **Attachment 2: Supporting Documentation:** Combine and upload as a single file named "Support.pdf." Start each document on a new page. If documents are scanned to PDF, the lowest resolution (100 to 150 dpi) should be used. The Supporting Documentation attachment should not include additional information such as figures, tables, graphs, photographs, diagrams, chemical structures, or drawings. These items should be included in the Project Narrative. Any additional material viewed as an extension of the Project Narrative will be removed or may result in administrative withdrawal of the application.

  There are no page limits for any of these components unless otherwise noted. Include only those components described below; inclusion of items not requested will result in the removal of those items or may result in administrative withdrawal of the application.

  - References Cited: List the references cited (including URLs, if available) in the Project Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, title of reference, source of reference, volume, chapter, page numbers, and publisher, as appropriate).

  - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

  - Facilities, Existing Equipment, and Other Resources: Describe the facilities and equipment available for performance of the proposed project and any additional facilities or equipment proposed for acquisition at no cost to the award. Indicate whether or not Government-furnished facilities or equipment are proposed for use. If so, reference should be made to the original or present Government award under which the facilities or equipment items are now accountable. There is no form for this information.

  - Publications and/or Patents: Include a list of relevant publication URLs and/or patent abstracts. If publications are not publicly available, then copies of up to eight published manuscripts may be included in Attachment 2. Extra items will not be reviewed.

  - Letters of Organizational Support: Provide a letter (or letters, if applicable), signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. Letters of support not requested in the Program Announcement, such as those from members of Congress, do not impact application review or funding decisions.

  - Letters of Collaboration: Provide a signed letter from each collaborating individual or organization that will demonstrate that the PI has the support or resources necessary for the proposed work. If an investigator at an intramural organization is

named as a collaborator on an application submitted through an extramural organization, the application must include a letter from the collaborator's Commander or Commanding Officer at the intramural organization that authorizes the collaborator's involvement.

- Letters of Commitment (if applicable): If the proposed study involves use of a commercially produced investigational drug, device, or biologic, provide a letter of commitment from the commercial entity indicating availability of the product for the duration of the study, support for the proposed phase of research, and support for the indication to be tested.

- Letters Confirming Access to Military or VA Patient Populations or Resources (if applicable): If the proposed research plan involves access to active duty military and/or VA patient populations or resources, include a letter of support, signed by the lowest ranking person with approval authority, confirming such access. If access cannot be confirmed at the time of application submission, the Government reserves the right to withhold or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resources.

- Intellectual Property: Information can be found in Code of Federal Regulations, Title 2, Part 200.315 (2 CFR 200.315), "Intangible Property."

  - Intellectual and Material Property Plan (if applicable): Provide a plan for resolving intellectual and material property issues among participating organizations.

- Data and Research Resources Sharing Plan: Describe how data and resources generated during the performance of the project will be shared with the research community. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- **Attachment 3: Technical Abstract (one-page limit):** Upload as "TechAbs.pdf." The technical abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Clarity and completeness within the space limits of the technical abstract are highly important. Describe the proposed research effort including the following elements:

  - **Overarching Challenge:** Identify the unifying, overarching challenge or question that will be addressed by the research plan and describe how it relates to a critical problem or question in one or more of the FY17 PRMRP Topic Areas.

  - **Background:** Briefly articulate the rationale for the overarching challenge and the proposed research.

- **Research Plan:** Provide a brief description of the studies proposed, including hypotheses, objectives, and scientific approach.

- **Impact:** Briefly describe the potential short-term and long-term impact of the results of the proposed research on at least one of the FY17 PRMRP Topic Areas and its related research field(s) and patient population(s).

- **Military Relevance:** Explain how the effort is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Attachment 4: Lay Abstract (one-page limit):** Upload as "LayAbs.pdf." The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***. Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  State the FY17 PRMRP Topic Area(s) addressed by the proposed research program. Include a comprehensive overview of the effort that can be ***readily understood by readers without a background in science or medicine.*** Clearly describe the central critical problem or question to be addressed and the ultimate applicability and impact of the research. Do not duplicate the technical abstract.

- **Attachment 5: Statement of Work (SOW) (eight-page limit):** Upload as "SOW.pdf." The suggested SOW format and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm). For the Focused Program Award mechanism, use the SOW format example titled "SOW for Collaborative Projects ." The SOW must be in PDF format prior to attaching.

  The SOW should include a list of major tasks that support the proposed specific aims, followed by a series of subtasks outlined related to the major tasks and milestones within the period of performance. The SOW should describe only the work for which funding is being requested by this application and, as applicable, should also:

  Include the name(s) of the key personnel and contact information for each study site/ subaward site.

  Indicate the number (and type, if applicable) of research subjects (animal or human) and/or human anatomical samples projected or required for each task and at each site. Refer to the General Application Instructions, Appendix 1, for additional information regarding regulatory requirements.

  Briefly state the methods to be used.

  For studies with prospective accrual of human subjects, indicate quarterly enrollment targets.

Identify cell line(s) and commercial or organizational source(s) to be used. If human anatomical substances (including cell lines) will be used, specify whether or not identifiable information is accessible to the research team by any means.

If applicable, indicate timelines required for regulatory approvals relevant to human subjects research (e.g., IND/IDE applications) by the FDA or other Government agency.

- **Attachment 6: Impact Statement (two-page limit): Upload as "Impact.pdf."**

  - Explain why the proposed program is important and relevant to understanding the cause or progression of the disease or condition, and/or to developing improvements in prevention, detection, diagnosis, treatment, or quality of life in the FY17 PRMRP Topic Area(s) addressed. Describe how the overarching challenge addresses a central critical problem or question in the relevant Topic Area(s). If applicable, describe how the project addresses an FY17 PRMRP Area of Encouragement (Appendix 2). In addition to articulating the potential impact of the overall program, address the potential impact of each individual project. Explain how the various projects' outcomes will ultimately be translated to patients.

  - ***Describe the short-term impact:*** Detail the anticipated outcome(s)/product(s) (intellectual and/or material) that will be directly attributed to the results of the proposed research.

  - ***Describe the long-term impact:*** Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable. Explain the long-range vision for how the research will impact the field of study and/or patient care.

- **Attachment 7: Military Relevance Statement (one-page limit): Upload as "MilRel.pdf."**

  - Describe how the proposed effort is responsive to the healthcare needs of military Service members, Veterans, and/or beneficiaries. Provide information about the incidence and/or prevalence of the disease or condition to be studied in the general population as well as in military Service members, Veterans, and/or beneficiaries.

  - If active duty military, military families, and/or Veteran population(s) or dataset(s) will be used in the proposed research project, describe the population(s)/dataset(s) and the appropriateness of the population(s)/dataset(s) for the proposed study. If a non-military population will be used for the proposed research project, explain how the population simulates the targeted population (i.e., military Service members, Veterans, and/or beneficiaries).

  - If applicable, show how the proposed research project aligns with DoD and/or VA areas of research interest and/or patient care. Provide a description of how the knowledge, information, products, or technologies gained from the research could be implemented in a dual-use capacity to benefit the civilian population and address a military need, as appropriate.

- **Attachment 8: Transition Plan and Regulatory Strategy (three-page limit): Upload as "Transition.pdf."**

  - Provide information on the methods and strategies proposed to move the product or knowledge outcomes of the program to the next phases of development and to eventual clinical use. Articulate this information for the overall effort as well as the individual projects. Applicants are encouraged to work with their organization's Technology Transfer Office (or equivalent) to develop the transition plan. The transition plan should include the components listed below, as appropriate:

  - A description of the outcomes expected upon completion of the proposed research efforts. Outcomes should be specific, measurable, and should include the intended end user.

  - Details of the funding strategy that will be used to bring the outcomes to the next phase of development and/or delivery to market or incorporation into patient care (e.g., specific potential industry partners, specific funding opportunities to be applied for).

  - Details of the development plan and FDA regulatory strategy, to include considerations for compliance with GMP, GLP, and GCP guidelines (if appropriate).

  - For knowledge outcomes, a description of how the knowledge will be further developed, disseminated, and incorporated into clinical/patient care.

  - A description of collaborations and other resources that will be used to provide continuity of development.

  - A brief schedule and milestones for bringing the outcomes to the next phase of development (e.g., further research, clinical trials, transition to industry, delivery to the market, incorporation into clinical practice, approval by the FDA).

  - If applicable, ownership rights and/or access to the intellectual property necessary for the development and/or commercialization of products or technologies supported with this award and the Government's ability to access such products or technologies in the future.

- **Attachment 9: Data and Research Resource Sharing Plan (one-page limit): Upload as "Sharing.pdf."**

  - Describe how data and resources generated during the performance of the proposed research projects will be shared with the research community. This includes cases where pre-existing data or research resources will be utilized and/or modified during the course of the proposed projects. Specifically describe a plan to make animal models, tissue samples, and other resources developed as part of the proposed research projects available to the scientific community. If there are limitations associated with a pre-existing agreement for the original data or research resources that preclude subsequent sharing, the applicant should explain this in the data- and/or

research resource-sharing plan. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- In preparing requested budgets, applicants may include anticipated costs associated with data- and research resource-sharing (i.e., making a large dataset available to the public or developing an important resource for the scientific community).

- **Attachment 10: IND/IDE Documentation:** ***Only applicable for applications that include a clinical trial(s).*** If submitting multiple documents, start each document on a new page. **Combine and upload as a single file named "IND-IDE.pdf."** The IND/IDE Documentation Form located on the eBRAP website may ***not*** be used in place of this information:

  - State whether the trial(s) requires regulation by the FDA. If FDA regulation is required, describe the planned indication for the proposed product and whether an IND/IDE is necessary.

  - If an IND or IDE application is required, indicate when it was submitted to the FDA and provide an explanation of the status of the IND or IDE application (e.g., past the critical 30-day period, pending response to questions raised by the Agency, on clinical hold). If the IND or IDE application has not been submitted to the FDA yet, provide a detailed timeline with appropriate milestones for application preparation and submission. Identify any consultants or experts who will assist in the regulatory application, if applicable, and include a copy of any curricula vitae or biographical sketches in the Key Personnel Biographical Sketches section of the application. Provide a summary of previous meetings with the FDA on development of this product, if appropriate. A copy of the Agency meeting minutes should be included if available. Provide copies of communications from the FDA relevant to the most recent status of the IND or IDE application.

  - If an IND or IDE is not required for the proposed trial(s), or if it qualifies for an abbreviated IDE, provide evidence in the form of communication from the FDA or the IRB of record to that effect. Devices qualifying for an abbreviated IDE must comply with the abbreviated IDE requirements but do not require the submission of an IDE application to the FDA.

- **Attachment 11: DoD Military Budget Form(s), if applicable: Upload as "MFBudget.pdf."** If a military facility (military health system facility, research laboratory, treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center) will be a collaborator in performance of the project, complete the DoD Military Budget Form, available for download on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm), including a budget justification, for each military facility as instructed. The costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

- **Extramural and Intramural Applications –**

  Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

  - PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf." The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The National Institutes of Health Biographical Sketch may also be used. All biographical sketches should be submitted in the portable document format (PDF) that is not editable.

  - PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

  - Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."

  - Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

  Research & Related Budget: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.4, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.3, for detailed information.

  Budget Justification (no page limit): Upload as "BudgetJustification.pdf." The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

  Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.4, for detailed information.

- **Extramural Applications Only –**

  R&R Subaward Budget Attachment(s) Form (if applicable): Refer to the General Application Instructions, Section III.A.6, for detailed information.

  - **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.6, for detailed information.)

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov as Attachment 11. (Refer to the General Application Instructions, Section III.A.7, for detailed information.) Intramural DoD Collaborator(s) costs per year

should be included on the Grants.gov Research and Related Budget form under subaward costs. **DoD Military Budget Form:** A military facility collaborating in the performance of the project should be treated as a subaward for budget purposes. However, do not complete the Grants.Gov R&R Subaward Budget Attachment Form; instead, complete the DoD Military Budget Form (Attachment 11) to show all direct and indirect costs. The costs per year should be included on the Grants.gov Research & Related Budget Form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

II.D.3. Dun and Bradstreet Universal Numbering System (DUNS) Number and System for Award Management (SAM)

Applicant organizations and all subrecipient organizations must have a DUNS number to submit applications to Grants.gov. The applicant organization must also be registered in the Entity Management functional area of the SAM with an "Active" status to submit applications through the Grants.gov portal. Verify the status of the applicant's organization's Entity registration in SAM well in advance of the application submission deadline. Allow 3 to 4 weeks to complete the entire SAM registration process. If an applicant has not fully complied with the requirements by the time the Federal awarding agency is ready to make a Federal award, the Federal awarding agency may determine that the applicant is not qualified to receive a Federal award and use that determination as a basis for making a Federal award to another applicant. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.

II.D.4. Submission Dates and Times

All submission dates and times are indicated in Section I, Overview of the Funding Opportunity. Pre-application and application submissions are required. The pre-application and application submission process should be started early to avoid missing deadlines. There are no grace periods. Failure to meet either of these deadlines will result in submission rejection.

Applicant Verification of Full Application Submission in eBRAP

Prior to the end of the application verification period, PIs and organizational representatives can review and modify in eBRAP certain components of a submitted application. Following retrieval and processing of the full application, eBRAP will notify the organizational representatives and PI by email to log into eBRAP to review, modify, and verify the full application submission. eBRAP will validate retrieved files against the specific Program Announcement requirements and discrepancies will be noted in both the email and in the Full Application Files tab in eBRAP. eBRAP does not confirm the accuracy of file content. It is the applicant's responsibility to review all application components and ensure proper ordering as specified in the Program Announcement. ***If either the Project Narrative or the budget fails eBRAP validation or needs to be modified, an updated full application package must be submitted prior to the application submission deadline.*** The Project Narrative and Budget Form cannot be changed after the application submission deadline.

II.D.5. Funding Restrictions

The maximum period of performance is **4** years.

The anticipated total costs budgeted for the entire period of performance will not exceed **$10M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. No budget will be approved by the Government exceeding **$10M** total costs or using an indirect cost rate exceeding the organization's negotiated rate.

All direct and indirect costs of any subaward or contract must be included in the total direct costs of the primary award.

The applicant may request the entire maximum funding amount for a project that may have a period of performance less than the maximum **4** years.

For this award mechanism, direct costs must be requested for:

Travel costs for the PI and up to three additional members of the research team to attend a 1-day Milestone Meeting to be held in the National Capital Area during the award period of performance. This meeting will be held to provide a presentation on progress. Costs associated with travel to this meeting should be included in Year 3 of the budget. These travel costs are in addition to those allowed for annual scientific/technical meetings.

May be requested for (not all-inclusive):

- Salary
- Research supplies
- Equipment
- Research-related subject costs
- Clinical research costs
- Support for multidisciplinary collaborations, including travel
- Travel costs for up to four investigators to travel to one scientific/technical meeting per year in addition to the required meeting described above

Extramural (non-Federal) awards will consist solely of assistance agreements (Cooperative Agreements and Grants). For extramural awards with an intragovernmental component, direct transfer of funds from an extramural award recipient to a DoD or other Federal agency is not allowed except under very limited circumstances. Funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intragovernmental only funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intramural applicants are responsible for coordinating through their agency's procedures the use

of contractual or assistance funding awards or other appropriate agreements to support extramural collaborators.

Refer to the General Application Instructions, Section III.A.4, for budget regulations and instructions for the Research & Related Budget. ***For Federal agencies or organizations collaborating with Federal agencies, budget restrictions apply as are noted in the General Application Instructions, Section III.A.4***.

The CDMRP expects to allot approximately $60M of the $300M FY17 appropriation to fund approximately six Focused Program Award applications, depending on the quality and number of applications received. Funding of applications received in response to this Program Announcement is contingent upon the availability of Federal funds for this program.

II.D.6. Other Submission Requirements

Refer to the General Application Instructions, Appendix 4, for detailed formatting guidelines.

II.E. Application Review Information

II.E.1. Criteria

II.E.1.a. Peer Review

To determine technical merit, all applications will be evaluated according to the following scored criteria, which are of equal importance:

Scored Review Criteria for the Overall Program:

- **Overall Impact**
    - To what extent the overarching challenge impacts a critical problem or question in the designated FY17 PRMRP Topic Area(s).
    - To what degree the proposed program could, if successful, make a significant impact on the lives of relevant patient populations in the short term or long term.
    - How well the research projects are integrated, complement each other, and provide a synergistic, multidisciplinary approach to solving a critical problem.
    - How well the research program will, if successful:
        - Make important scientific advances in the relevant field of research
        - Promote greater understanding of the causes and progression of the relevant disease(s)/condition(s), or
        - Promote the development of improvements in prevention, detection, diagnosis, treatment, or quality of life

- **Implementation Plan**
    - How the proposed projects are supported by a detailed plan that identifies critical milestones and explains how these milestones will be achieved.
    - How well resources and/or cores that will be created or leveraged will be utilized and shared.
    - To what extent the plans to assess individual project performance during the course of the award are appropriate.
    - How well the overall management plan will facilitate consistent and intensive interactions by all team members in the projects.
    - How the proposed plans for communication, data and specimen collection, data transfer, and periodic meetings are appropriate and robust.
    - To what extent the plans for creating, reviewing, implementing, and modifying Standard Operating Procedures are appropriate, if applicable.
- **Leadership and Environment**
    - To what degree the PI is experienced in successfully leading large, focused projects and is therefore well-positioned to lead the research team in achieving the overarching goal of the proposed effort.
    - How well the PI demonstrates experience, leadership skills, and commitment to making an impact in the relevant field of research and/or patient care.
    - Whether the PI will devote a minimum of 20% effort to this award.
    - To what degree the scientific environment(s) is appropriate for the proposed research.
    - How well the research requirements are supported by the availability of and accessibility to facilities and resources (including patient populations, samples, and collaborative arrangements).
    - To what degree the quality and extent of organizational support are appropriate for the proposed research.
- **Transition Plan and Regulatory Strategy**
    - The degree to which the strategy proposed to bring the outcomes to the next level of development, including funding, milestones, and schedule, is realistic.
    - Whether appropriate collaborations and other resources for providing continuity of development are established and/or well described.
    - How the regulatory strategy and development plan are appropriate and well described.

- How well the application identifies intellectual property ownership, and whether there is sufficient evidence of a plan to resolve intellectual and material property issues, if applicable.

- Whether the applicant has demonstrated that they have access to all intellectual property rights necessary for development and commercialization and evidence that the Government has the ability to access such products or technologies, if applicable.

- If applicable, whether data will be appropriately reported and documented to support a regulatory filing with the FDA.

Scored Review Criteria for Individual Research Projects <u>without</u> a clinical trial:

- **Impact**

  - To what extent the individual project impacts the overarching challenge.

  - To what degree the individual project could, if successful, make a significant impact on the lives of relevant patient populations in the short term or long term.

  - How well the individual project will, if successful, make important scientific advances in the relevant field of research.

- **Research Strategy and Feasibility**

  - How well the scientific rationale supports the research and its feasibility, as demonstrated by a critical review and analysis of the literature, the presentation of preliminary data (where applicable), and logical reasoning.

  - How well the hypothesis, objectives, and aims are developed.

  - To what degree the experimental approach, methods, endpoints, and analyses support completion of the aims and are designed to achieve rigorous and reproducible results.

  - How well the choice of model (animal, cell line, or other) is justified and whether it is appropriate.

  - If applicable, to what degree the statistical plan and power analysis, including sample size projections, are appropriate for the proposed project.

  - Whether there is sufficient evidence to support availability and accessibility of the populations, samples, or other resources required for the study, if applicable.

  - How well potential problems are acknowledged and alternative approaches are addressed.

- **Personnel**

  - To what degree the project team's background and expertise are appropriate with respect to its ability to perform the proposed work, including whether there is evidence of

sufficient expertise for all aspects of the work and whether there is evidence of strong commitment to the projects.

- To what degree the levels of effort are appropriate for successful conduct of the proposed work.

Scored Review Criteria for Individual Research Projects <u>with</u> clinical trials:

- **Impact**
  - To what extent the individual project impacts the overarching challenge.
  - How well the individual project will, if successful, make important scientific advances in the relevant field of research.
  - How well the sample population represents the targeted patient population that might benefit from the proposed intervention.
  - How the potential outcomes of the proposed clinical trial will provide/improve short-term benefits for individuals.
  - How significantly the long-term benefits for implementation of the intervention may impact patient care and/or quality of life.
- **Research Strategy and Feasibility**
  - How well the scientific rationale supports the research and its feasibility, as demonstrated by a critical review and analysis of the literature, the presentation of preliminary data, and logical reasoning.
  - How well the hypothesis and/or objectives and specific aims are developed.
  - To what degree the experimental approach, methods, endpoints, and analyses support completion of the aims and are designed to achieve rigorous and reproducible results.
  - To what degree the statistical plan and power analysis, including sample size projections, are appropriate for the proposed trial and any proposed correlative studies.
  - How well the application demonstrates the availability of and access to the appropriate patient population(s), as well as the ability to accrue a sufficient number of subjects.
  - How well potential problems and delays (e.g., slow accrual, attrition) are acknowledged and alternative approaches are addressed.
- **Clinical Strategy**
  - How the intervention compares with currently available interventions and/or standards of care.

- Whether there is evidence of support, indicating availability of the intervention from its source, for the duration of the proposed clinical trial (if applicable).
- To what degree the PI has provided preclinical and/or clinical evidence to support the safety of the intervention.
- How well the inclusion and exclusion criteria meet the needs of the proposed clinical trial.
- The degree to which the informed consent, screening, and retention processes for human subjects will meet the needs of the proposed clinical trial.
- Whether a member of the study team holds the IND/IDE for the indication proposed or whether the timeline proposed for obtaining the IND/IDE is appropriate (if applicable).
- For investigator-sponsored INDs, whether there is evidence of appropriate institutional support, including capabilities to ensure monitoring as required by the FDA.
- Whether plans to comply with GMP, GLP, and GCP guidelines are appropriate.
- Whether measures are described to ensure the consistency of dosing of active ingredients for nutritional supplements (if applicable).

- **Personnel**
  - To what degree the project team's background and expertise are appropriate with respect to its ability to perform the proposed work, including whether there is evidence of sufficient expertise for all aspects of the work and whether there is evidence of strong commitment to the projects.
  - How well the project leader has assembled an appropriate and robust clinical team with the combined backgrounds and expertise needed to enable successful conduct of the clinical trial.
  - To what degree the levels of effort are appropriate for successful conduct of the proposed work.

In addition, the following unscored criteria will also contribute to the overall evaluation of the application:

- **Data and Resource Sharing**
  - To what degree the plan for sharing of project data and research resources is appropriate and reasonable to facilitate use by the wider research community.
- **Budget**
  - Whether the budget is appropriate for the proposed research and within the limitations of this Program Announcement.

- **Environment**
    - If applicable, to what degree the intellectual and material property plan is appropriate.
- **Application Presentation**
    - To what extent the writing, clarity, and presentation of the application components influence the review.

II.E.1.b. Programmatic Review

To make funding recommendations and select the application(s) that, individually or collectively, will best achieve the program objectives, the following criteria are used by programmatic reviewers:

- Ratings and evaluations of the peer reviewers
- Relevance to the mission of the DHP and FY17 PRMRP, as evidenced by the following:
    - Adherence to the intent of the award mechanism
    - Military relevance
    - Program portfolio composition
    - Relative impact

II.E.2. Application Review and Selection Process

All applications are evaluated by scientists, clinicians, and consumers in a two-tier review process. The first tier is peer review of applications against established criteria for determining technical merit. Each application is evaluated for its own merit, independent of other applications. The second tier is a programmatic review that makes recommendations for funding to the Commanding General, USAMRMC, on behalf of the DHA and the OASD(HA), based on technical merit, the relevance to the mission of the DHP and PRMRP, the specific intent of the award mechanism, and to other specified evaluation criteria in the Program Announcement. Programmatic review is a comparison-based process in which applications with scientific and technical merit compete in a common pool. ***The highest-scoring applications from the first tier of review are not automatically recommended for funding. Funding recommendations depend on various factors as described in Section II.E.1.b, Programmatic Review.*** Additional information about the two-tier process used by the CDMRP can be found at http://cdmrp.army.mil/about/fundingprocess.

All CDMRP review processes are conducted confidentially to maintain the integrity of the merit-based selection process. Panel members sign a statement that application and evaluation information will not be disclosed outside the panel. Violations of confidentiality can result in the dissolving of a panel(s) and other corrective actions. In addition, personnel at the applicant or collaborating organizations are prohibited from contacting persons involved in the review

process to gain protected evaluation information or to influence the evaluation process. Violations of these prohibitions will result in the administrative withdrawal of the organization's application. Violations by panel members or applicants that compromise the confidentiality of the review process may also result in suspension or debarment from Federal awards. Furthermore, the unauthorized disclosure of confidential information of one party to another third party is a crime in accordance with 18 USC 1905.

II.E.3. Integrity and Performance Information

Prior to making an assistance agreement award where the Federal share is expected to exceed the simplified acquisition threshold (currently $150,000) over the period of performance, the Federal awarding agency is required to review and consider any information about the applicant that is available in the Federal Awardee Performance and Integrity Information System (FAPIIS).

An applicant, at its option, may review FAPIIS, accessible through SAM, and submit comments to FAPIIS on any information about itself that a Federal awarding agency previously entered and is currently available in FAPIIS.

The Federal awarding agency will consider any comments by the applicant, in addition to other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics and record of performance under Federal awards when determining a recipient's qualification prior to award, according to the qualification standards of the Department of Defense Grant and Agreement Regulations (DoDGAR), Section 22.415.

II.E.4. Anticipated Announcement and Federal Award Dates

All application review dates and times are indicated in Section I, Overview of the Funding Opportunity.

Each PI and organization will receive email notification of posting of the funding recommendation in eBRAP. Each PI will receive a peer review summary statement on the strengths and weaknesses of the application.

II.F. Federal Award Administration Information

II.F.1. Federal Award Notices

Awards will be made no later than September 30, 2018. Refer to the General Application Instructions, Appendix 2, for additional award administration information.

Awards are made to organizations, not to individual PIs. The types of awards made under the Program Announcement will be assistance agreements (grants or cooperative agreements). The level of involvement on the part of DoD during project performance is the key factor in determining whether to award a grant or cooperative agreement.

Extramural Organizations: An assistance agreement (grant or cooperative agreement) is appropriate when the Federal Government transfers a "thing of value," to a "state, local

government," or "other recipient," to carry out a public purpose of support or stimulation authorized by a law of the United States, instead of acquiring property or service for the direct benefit and use of the U.S. Government. An assistance agreement can take the form of a grant or cooperative agreement. If "no substantial involvement" on the part of the funding agency is anticipated, a grant award will be made (31 USC 6304). Conversely, if substantial involvement on the part of the funding agency is anticipated, a cooperative agreement will be made (31 USC 6305). Substantial involvement may include collaboration, participation, or intervention in the research to be performed under the award. The award type, along with the start date, will be determined during the negotiation process.

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the USAMRAA will contact the business official authorized to negotiate on behalf of the PI's organization.

Only an appointed USAMRAA Grants Officer may obligate the Government to the expenditure of funds. No commitment on the part of the Government should be inferred from discussions with any other individual. The award document signed by the Grants Officer is the official authorizing documents.

Intramural Organizations: Awards to Federal Government organizations (to include intramural DoD organizations) will be executed through the Military Interdepartmental Purchase Request (MIPR) or Funding Authorization Document (FAD) process. Transfer of funds is contingent upon appropriate safety and administrative approvals. Intramural applicants and collaborators are reminded to coordinate receipt and commitment of funds through their respective resource managers (RM).

After email notification of application review results through the eBRAP, and if selected for funding, a representative from the CDMRP will contact the business official authorized to negotiate on behalf of the PI's organization.

II.F.1.a. Award Transfers

Changes in PI are not allowed, except under extenuating circumstances that will be evaluated on a case-by-case basis and at the discretion of the Grants Officer. An organizational transfer of an award will not be allowed in the last year of the (original) period of performance or any extension thereof.

The organizational transfer of an award supporting a clinical trial is strongly discouraged and in most cases will not be allowed. Approval of a transfer request will be on a case-by-case basis at the discretion of the Grants Officer.

Refer to the General Application Instructions, Appendix 2, Section B, for general information on organization or PI changes.

II.F.2. Administrative and National Policy Requirements

Applicable requirements in the DoDGAR found in 32 CFR, Chapter 1, Subchapter C, and 2 CFR, Chapter XI, apply to grants and cooperative agreements resulting from this Program Announcement.

Refer to the General Application Instructions, Appendix 2, for general information regarding administrative requirements.

Refer to the General Application Instructions, Appendix 5, for general information regarding national policy requirements.

Refer to full text of the USAMRAA General Research Terms and Conditions for Institutions of Higher Education, Hospitals, and Non-Profit Organizations and the USAMRAA General Research Terms and Conditions with For-Profit Organizations for further information.

II.F.3. Reporting

Refer to the General Application Instructions, Appendix 2, Section A, for general information on reporting requirements. Annual progress reports as well as a final progress report will be required.

Quarterly technical progress reports will be required. In addition to written progress reports, in-person presentations may be requested.

Award Chart: Complete the Award Chart template, a one-page PowerPoint file that must be downloaded from the CDMRP eBRAP System at https://ebrap.org/eBRAP/public/Program.htm, and submit to eBRAP at the time of award.

Award Expiration Transition Plan: Complete the Transition Plan template, a one-page Word document that must be submitted with the Final Progress Report. The Transition Plan must outline if and how the research supported by this award will progress, and include source(s) of funding, either known or pending.

Awards resulting from this Program Announcement will incorporate additional reporting requirements related to recipient integrity and performance matters. Recipient organizations that have Federal contract, grant, and cooperative agreement awards with a cumulative total value greater than $10,000,000 are required to provide information to FAPIIS about certain civil, criminal, and administrative proceedings that reached final disposition within the most recent 5-year period and that were connected with performance of a Federal award. Recipients are required to disclose semiannually information about criminal, civil, and administrative proceedings as specified in the applicable Terms and Conditions. The applicable Terms and Conditions for institutions of higher education, hospitals, and nonprofit organizations are available in OAR Article I, Section B, in July 2016 R&D General Terms and Conditions. The applicable Terms and Conditions for for-profit organizations are available in Section 34 of the February 2017 USAMRAA General Research Terms and Conditions with For-Profit Organizations.

II.G. Federal Awarding Agency Contacts

II.G.1. CDMRP Help Desk

Questions related to Program Announcement content or submission requirements as well as questions related to the pre-application or intramural application submission through eBRAP should be directed to the CDMRP Help Desk, which is available Monday through Friday from 8:00 a.m. to 5:00 p.m. ET. Response times may vary depending upon the volume of inquiries.

Phone: 301-682-5507

Email: help@eBRAP.org

II.G.2. Grants.gov Contact Center

Questions related to extramural application submission through Grants.gov portal should be directed to the Grants.gov Contact Center, which is available 24 hours a day, 7 days a week (closed on U.S. Federal holidays). Note that the CDMRP Help Desk is unable to provide technical assistance with Grants.gov submission.

Phone: 800-518-4726; International 1-606-545-5035

Email: support@grants.gov

Sign up on Grants.gov for "send me change notification emails" by following the link on the Synopsis page for the Program Announcement or by responding to the prompt provided by Grants.gov when first downloading the Grants.gov application package. If the Grants.gov application package is updated or changed, the original version of the application package may not be accepted by Grants.gov.

II.H. Other Information

II.H.1. Program Announcement and General Application Instructions Versions

Questions related to this Program Announcement should refer to the Program name, the Program Announcement name, and the Program Announcement version code 20170516b. The Program Announcement numeric version code will match the General Applications Instructions version code 20170516.

II.H.2. Administrative Actions

After receipt of pre-applications or applications, the following administrative actions may occur:

II.H.2.a. Rejection

The following will result in administrative rejection of the pre-application:

- Preproposal Narrative is missing.

The following will result in administrative rejection of the application:

- Submission of an application for which a letter of invitation was not received.
- Project Narrative exceeds page limit.
- Project Narrative is missing.
- Budget is missing.
- Submission of the same research project to different Funding Opportunities within the same program and fiscal year. Refer to Section II.D, Application and Submission Information, for exceptions.

II.H.2.b. Modification

- Pages exceeding the specific limits will be removed prior to review for all documents other than the Project Narrative.
- Documents not requested will be removed.

II.H.2.c. Withdrawal

The following may result in administrative withdrawal of the pre-application or application:

- An FY17 PRMRP Programmatic Panel member is named as being involved in the research proposed or is found to have assisted in the pre-application or application processes including, but not limited to, concept design, application development, budget preparation, and the development of any supporting documentation. ***A list of the FY17 PRMRP Programmatic Panel members can be found at http://cdmrp.army.mil/prmrp/panels/panels17.shtml***.
- The application fails to conform to this Program Announcement description to the extent that appropriate review cannot be conducted.
- Inclusion of URLs, with the exception of links in References Cited and Publication and/or Patent Abstract sections.
- Page size is larger than 8.5 inches x 11.0 inches (approximately 21.59 cm x 27.94 cm).
- To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in the preparation, research or other duties for submitted applications. For FY17, the identities of the peer review contractor and the programmatic review contractor may be found at the

CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- Personnel from applicant or collaborating organizations are found to have contacted persons involved in the review process to gain protected evaluation information or to influence the evaluation process.
- Applications from extramural organizations, including non-DoD Federal agencies, received through eBRAP may be withdrawn.
- Applications submitted by an intramural DoD organization may be withdrawn if the intramural organization cannot coordinate the use of contractual, assistance, or other appropriate agreements to provide funds to extramural collaborators.
- The proposed research project does not address at least one of the Congressionally directed FY17 PRMRP Topic Areas.
- An application for which the PI does not meet the eligibility criteria will be withdrawn.

II.H.2.d. Withhold

Applications that appear to involve research misconduct will be administratively withheld from further consideration pending organizational investigation. The organization will be required to provide the findings of the investigation to the USAMRAA Grants Officer for a determination of the final disposition of the application.

II.H.3. Application Submission Checklist

Application Components	Action	Completed
SF424 (R&R) Application for Federal Assistance **(Extramural submissions only)**	Complete form as instructed.	
Summary (Tab 1) and Application Contacts (Tab 2) **(Intramural submissions only)**	Complete these tabs as instructed.	
Attachments	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf."	
	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf."	
	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf."	
	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf."	
	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf."	
	Impact Statement: Upload as Attachment 6 with file name "Impact.pdf."	
	Military Relevance: Upload as Attachment 7 with file name "MilRel.pdf."	
	Transition Plan and Regulatory Strategy: Upload as Attachment 8 with file name "Transition.pdf."	
	Data and Research Resources Sharing Plan: Upload as Attachment 9 with file name "Sharing.pdf."	
	IND/IDE Documentation: Upload as Attachment 10 with file name "IND-IDE.pdf," if applicable.	
	DoD Military Budget Form(s): Upload as Attachment 11 with file name "MFBudget.pdf," if applicable.	
Research & Related Senior/Key Person Profile (Expanded)	Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field.	
	Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field.	
	Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field.	
	Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field.	

Application Components	Action	Completed
Research & Related Budget **(Extramural submissions only)**	Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field.	
Budget **(Intramural submissions only)**	Complete the DoD Military Budget Form and justification.	
Project/Performance Site Location(s) Form	Complete form as instructed.	
R&R Subaward Budget Attachment(s) Form, if applicable	Complete form as instructed.	
Additional Application Components	**Action**	**Completed**
Confidential Letters of Recommendation	Confirm upload to eBRAP.	

APPENDIX 1
ACRONYM LIST

ACURO	Animal Care and Use Review Office
CDMRP	Congressionally Directed Medical Research Programs
CFR	Code of Federal Regulations
DHA	Defense Health Agency
DHP	Defense Health Program
DoD	Department of Defense
DoDGAR	Department of Defense Grant and Agreement Regulations
DUNS	Data Universal Numbering System
eBRAP	Electronic Biomedical Research Application Portal
EC	Ethics Committee
ET	Eastern Time
FAPIIS	Federal Awardee Performance and Integrity Information System
FY	Fiscal Year
GCP	Good Clinical Practices
GLP	Good Laboratory Practices
GMP	Good Manufacturing Practices
HRPO	Human Research Protection Office
IACUC	Institutional Animal Care and Use Committee
IRB	Institutional Review Board
M	Million
OASD(HA)	Office of the Assistant Secretary of Defense for Health Affairs
OMB	Office of Management and Budget
ORP	Office of Research Protections
PI	Principal Investigator
PRMRP	Peer Reviewed Medical Research Program
RDT&E	Research, Development, Test, and Evaluation
RM	Resource Manager
SAM	System for Award Management
SOW	Statement of Work
USAMRAA	U.S. Army Medical Research Acquisition Activity
USAMRMC	U.S. Army Medical Research and Materiel Command
USC	United States Code
VA	Department of Veterans Affairs

APPENDIX 2
AREAS OF ENCOURAGEMENT

Applications addressing any of the FY17 PRMRP Topic Areas are of interest to the program. ***Any aspect of research relevant to one or more FY17 PRMRP Topic Areas may be considered for funding.*** Areas of encouragement related to the FY17 PRMRP Topic Areas have been identified by the Department of Defense, Department of Veterans Affairs, and other relevant stakeholders. Applicants are urged to read and consider these areas of encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an area of encouragement in this list.***

Acute Lung Injury

- Research on the etiology and prevention of acute respiratory distress syndrome caused by the host's or immune system's responses to infectious disease or septic shock.
- Preventive techniques, novel and/or innovative detection technologies, and therapeutics to reduce the incidence and/or severity of acute respiratory distress syndrome and/or other lung injury secondary to trauma, transfusion, burns, hemorrhagic shock, inhalation, and/or oxygen exposure.
- Development of a clinical laboratory-based device for manufacturing/amplification of stem cells to treat acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Clinical studies to test cellular therapies in the treatment of acute lung injury/acute respiratory distress syndrome due to inhalation injury, trauma, or other causes.
- Metrics to associate the health outcomes of acute lung injury with physiological and physical performance, as well as the psychological health of military Service members.
- Strategies to stabilize and support the safe transport of patients with lung injury in order to optimize therapeutic interventions.
- Studies to identify the prevalence and associated morbidity and mortality of blast overpressure lung injury in forward operating environments.

Antimicrobial Resistance

- Identification and evaluation of novel and/or innovative antifungals against resistant fungal infections, particularly for use as topical therapies for wounds and for surgical and post-surgical therapies.
- Identification of novel and/or innovative targets for multi-drug resistant pathogens.
- Development of novel and/or innovative interventions, diagnostics, and treatment for multi-drug-resistant pathogens.
- Development of novel and/or innovative therapies that interrupt biofilm production in wound infections and infected hardware models.
- Development and testing of treatment protocols and/or diagnostic tests to limit prescribing antibiotics for conditions that are commonly viral in nature or conditions that would resolve themselves without antibiotic treatment (e.g., sinusitis, bronchitis, viral upper respiratory infections, and acute gastroenteritis).

- Development of rapid, rugged, sensitive, and specific diagnostics for antimicrobial resistance in remote environments.
- Research to improve understanding of the impact of travelers' diarrhea, as well as antibiotic treatment for the colonization of multi-drug-resistant organisms.

Arthritis

- Studies that define the risk of contracting septic arthritis; reactive arthritis; arthritis caused by a gastrointestinal, genitourinary, or viral infection (e.g., Lyme disease, Campylobacter, chikungunya); and other arthritis types in active duty military personnel.
- Research toward the development of clinical practice guidelines to prevent, identify, and treat arthritis, particularly that resulting from traumatic injury, surgery, and/or infectious diseases.
- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Strategies for repairing focal cartilage defects using cell-based therapies.
- Research quantifying the impacts of obesity, weight loss, physical fitness (all components—cardiovascular, strength, flexibility, balance), and dietary factors on the development of or prevention/risk reduction of arthritis.
- Identification and/or validation of biomarkers for early psoriatic arthritis.
- Basic and translational research to identify treatments to mitigate and/or reverse osteoarthritis, particularly in the knee, hip, ankle, and shoulder.
- Studies to examine using existing regenerative medicine techniques and therapies to treat osteoarthritis, including dose response information and the frequency and timing of application.
- Development of novel and/or innovative treatments or combination therapies for psoriatic arthritis.

Burn Pit Exposure

- Research on the etiology and treatment of adverse health events related to military deployment to Iraq and Afghanistan that are associated with exposure to airborne hazards and open pit burning of solid waste and other materials.
- Toxicological studies to ascertain the toxicity of natural dust, burn pit combustion products and interactions between pollutants, as well as their mechanisms of action.
- Characterization of emissions from open air burns, burn boxes, and incinerators.
- Development and validation of instruments for assessing levels of exposure to airborne hazards for use in research and for occupational and environmental exposure monitoring.

Chronic Migraine and Post-Traumatic Headache

- Research to investigate, develop, and validate biomarkers that are useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache.
- Epidemiological/natural history studies to characterize specific types of post-traumatic headache, the pathobiology of these headaches (such as the role of cortical spreading

depression acutely after injury as a risk factor for chronic headaches of a migrainous type), and the risk factors that might predispose people to certain types of post-traumatic headache.

- Double-blind, placebo-controlled trials in the post-traumatic headache population in order to determine whether similar phenotypes in primary headache disorders and post-traumatic headache will respond similarly to treatment.
- Research on the optimal approaches to effective management of co-occurring psychological health disorders and acute and chronic pain management for chronic migraine and post-traumatic headache, with a focus on assessing and eliminating adverse outcomes and decreasing polypharmacy.
- Research on the utility of the Patient-Centered Medical Home model of care for patients with chronic migraine or post-traumatic headache.
- Research on the treatment and prevention of acute flares of chronic migraine and post-traumatic headaches with an emphasis on non-opioid medications.
- Evaluation of the use of mechanical stimulation and/or other non-pharmaceutical treatments to reduce acute and chronic migraines and headaches.
- Precision medicine research to investigate, develop, and validate biomarkers that are not only useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache, but can also identify individual responses to treatment.
- Evaluation of the differences in etiology, diagnosis, treatment plan, and prevention of migraine headaches between men and women.

Congenital Heart Disease

- Population-based and outcomes-based research projects to assess the health outcomes of individuals with congenital heart disease across their life spans.
- Research on tissue engineering approaches to patches, grafts, and transplantation that provide structural support, restore native activity, allow for tissue growth, and prevent the need for reoperation.
- Research to improve understanding of the causes of congenital heart defects, including genomic, proteomic, and metabolomic profiling.
- Research on transition of the care of congenital heart disease patients from pediatric to adult providers.
- Research both on the risk of neurologic injury and on enhanced neuroprotection before, during, and after surgery for congenital heart disease.
- Research to design and implement disease-in-a-dish and/or microfluidic models with an established phenotype to increase the efficacy of finding novel and/or innovative drug targets, screen existing drugs, perform cardiotoxicity testing, and/or uncover pathogenesis.

Constrictive Bronchiolitis

- Clinical assessments to determine the prevalence and severity of constrictive bronchiolitis and related respiratory diseases in previously deployed military Service members and/or Veterans.

- Development and testing of less invasive and non-invasive approaches for diagnosing constrictive bronchiolitis.
- Research to develop novel and/or innovative therapeutics to slow or reverse the progression of constrictive bronchiolitis.
- Development and/or validation of animal models for constrictive bronchiolitis.
- Research to understand the role of environmental exposures, including mineralized dust and other particulates, in the etiology of constrictive bronchiolitis.

Diabetes

- Development of biomarkers to identify and monitor at-risk individuals and assess treatment response.
- Research on interventions to prevent diabetes complications, including diabetic retinopathy and diabetic neuropathy.
- Research to better understand the heterogeneity of diabetes.
- Research on the transplantation of allogenic or autologous pancreatic islet cells for long-term natural insulin production, including current good manufacturing practices for cell line development.
- Identification and/or evaluation of interventions to reduce the development of diabetes among individuals meeting the clinical criteria for pre-diabetes.
- Development and evaluation of an inpatient glycemic management program with strategies to improve in-hospital dysglycemia, improve short-term and long-term morbidity/mortality, reduce the cost of health care, and promote a seamless transition of care between inpatient and outpatient arenas.
- Research to design and implement disease-in-a-dish and/or microfluidic models to model pancreatic islets to uncover pathogenesis and improve the efficiency of drug discovery.

Diarrheal Diseases

- Development and testing of vaccines, including multi-pathogen combination approaches, against the most common causes of bacterial and viral travelers' diarrhea, including *Campylobacter jejuni, Shigella,* and Enterotoxigenic *E. coli*.
- Development and evaluation of antibiotic and non-antibiotic therapies to treat all-cause travelers' diarrhea to improve the time to clinical cure, minimize resistance acquisition, and mitigate the chronic health consequences of these infections.
- Research to improve understanding of host responses and develop therapies to treat acute bacterial and viral infections that are associated with travel and may lead to chronic functional bowel and rheumatologic disorders.
- Development of evidence necessary to demonstrate the need, impact, and potential market value of a therapeutic for post-infectious functional bowel disorders to include preventive, treatment, or vaccine technology strategies.
- Development and evaluation of point-of-care diagnostics for acute diarrheal illness that distinguishes between bacterial, viral, protozoal, and toxin-mediated etiologies and leads to actionable public health or individual management interventions.

- Investigations into the relationship between existing gastrointestinal flora (microbiome) and the susceptibility, duration, and severity of diarrheal disease, as well as the impacts of dietary modification and/or probiotic use.
- Research to identify, reduce, or eliminate sources of infection causing diarrheal diseases.

Dystonia

- Research on the risk, incidence, and etiology of generalized dystonia, focal dystonia, multifocal dystonia, segmental dystonia, and/or hemidystonia.
- Research on interventions to prevent, slow the progression of, or treat dystonia.
- Research to improve identification of delayed onset dystonia following traumatic brain injury.

Early Trauma Thermal Regulation

- Research into regional cooling for different environments, including prolonged care, as a therapeutic for secondary ischemic injury (e.g., head with traumatic brain injury, limb with tourniquet).
- Development of a tunable support mechanism for thermal homeostasis for use in prolonged field care, extended evacuation, or unmanned evacuation.
- Development and evaluation of a novel and/or innovative technology and techniques to reduce the impact of hypothermia.
- Research to determine the benefits of invasive warming/cooling during patient movement.
- Research to validate the attenuating effects of (early) external head cooling on concussive brain injuries.
- Research into therapeutic cooling or targeted temperature management as a neuroprotective treatment for traumatic brain injury.

Eating Disorders

- Investigations into the prevalence, diagnosis, and treatment patterns of eating disorders in Service members and their families, including potential relationships with military-unique behaviors or conditions.
- Assessment of patterns of comorbidity between eating disorders and other mental health conditions, including an examination of whether eating disorders are more likely to precede or follow the development of other mental health conditions.
- Studies to identify the most effective treatments (and order of treatment) for patients with an eating disorder and a comorbid disorder.
- Research to advance the understanding of the biological, genetic, and environmental factors that influence eating disorders.
- Studies to elucidate risk factors for the onset or recurrence of eating disorders.
- Research to develop screening tools and valid biomarkers that accurately identify individuals with binge eating disorder versus healthy controls in order to monitor at-risk populations and tailor treatments for disordered eating.

- Research to better understand subclinical disordered eating and other specified feeding and eating disorders and the potential for these to develop into full-blown eating disorders.

Emerging Infectious Diseases

- Methods to minimize risk from arboviruses among military Service members and their families deployed to/living in high-risk areas, including personal protective equipment and environmental controls.
- Investigation of revaccination strategies and identification of correlates of protection for currently available vaccines (especially mumps).
- Targeted vector management of *Aedes aegypti, Anopheline sp.* and related mosquito species, including focus areas on novel and/or innovative adult surveillance devices, pathogen identification, spatial repellents, and barrier treatments.
- Research toward understanding the potential influence of dietary intake as a potential repellent to mosquito vectors and vector behavior.
- Evaluation of non-vaccine prophylactics or therapeutics to prevent/treat dengue or Zika virus disease.
- Characterization of health emergency relevant infectious disease threats in West Africa.
- Development of biomarker-guided clinical management strategies for severe infectious disease in the austere African setting.
- Validation of airborne and droplet precaution recommendations in the medical transport environment.
- Development of new testing methods for emerging pathogens and pathogen reduction technologies for blood-borne pathogens, including Zika, malaria, dengue, and others, in blood products.
- Modeling of epidemics and development of strategies to counter risks in emerging infectious diseases.
- Rapid, rugged, sensitive, and specific screening and diagnostics, including biomarkers for infectious threats such as Zika and other clinically relevant bacterial, viral, or protozoal pathogens in clinical samples or blood products that can be transmitted sexually or by blood transmission.
- Development of broad-acting detection systems to identify emerging members of a known viral family (for example, a broad Coronavirus panel that can detect Middle Eastern Respiratory Syndrome).
- Determination of the human health effects, host preference, vector competence, and co-infection status of the dengue, chikungunya, Zika, and Mayaro viruses in *Aedes aegypti* and related mosquito species.

Epidermolysis Bullosa

- Research to provide further insight into those cellular pathways that might be corrected or bypassed that otherwise promote the development of squamous cell carcinomas in recessive dystrophic and junctional epidermolysis bullosa.

- Research, including randomized controlled clinical trials, focused on systemic drugs that prevent, delay the onset, or modify the aggressiveness of squamous cell carcinoma in patients with recessive and junctional epidermolysis bullosa.
- Research, including clinical trials, focused on medications (topical or systemic) or dressings that might enhance wound healing in inherited epidermolysis bullosa.

Focal Segmental Glomerulosclerosis

- Development of a curative therapy or treatments to delay or halt the progression of focal segmental glomerulosclerosis and/or prevent post-transplantation recurrence.
- Research to determine the efficacy of medications used off-label (outside the FDA-approved indication) to treat focal segmental glomerulosclerosis.
- Research to improve understanding of the causes of primary and secondary focal segmental glomerulosclerosis, especially genetic mutations.
- Development of non-invasive methods to diagnose focal segmental glomerulosclerosis and its variants.
- Research on the impact of dietary modifications on the progression of renal disease.

Fragile X

- Research to advance the understanding of the pathophysiology of fragile X syndrome.
- Identification and validation of functional measures of the manifestations of fragile X syndrome across the life span.
- Identification and testing of novel and/or innovative targets for fragile X syndrome therapeutics.
- Development and evaluation of novel, innovative, or existing therapeutics for the treatment of fragile X syndrome.

Guillain-Barré Syndrome

- Research to elucidate the characteristics of various exposures (e.g., viruses, bacteria, vaccinations, surgery) associated with Guillain-Barré syndrome and their effects on the immune system.
- Research on the immune system cell types and molecular mechanisms responsible for the disease pathology of Guillain-Barré syndrome.
- Research to prevent or reduce the effects of residual weakness, relapse of muscle weakness, and other neurological symptoms of Guillain-Barré syndrome to improve patients' quality of life and increase their independence.
- Development of new treatments and refinement of existing treatments for Guillain-Barré syndrome.

Hepatitis B and C

- Research on vaccination options for those persons unable to mount immunity to the hepatitis B virus.

- Development of strategies for reliable, non-invasive, early detection of hepatitis-related liver disease and hepatocellular carcinoma.
- Research on strategies to promote reversal of liver fibrosis and/or assess the associated clinical and pathological outcomes.
- Natural history or other studies to establish risk indicators of progression from asymptomatic or inactive chronic hepatitis infection to symptomatic disease and parameters for the initiation and duration of disease treatment.
- Clinical studies to evaluate combination or curative therapies for treatment of hepatitis infection.
- Identification and reduction of hepatitis in blood products for transfusion.
- Research on strategies to reduce vertical (mother-to-child) transmission of hepatitis B virus and hepatitis C virus.
- Development of a vaccine against hepatitis C.
- Development of treatment protocols for patients with hepatitis B and C co-infections.

Hereditary Angioedema

- Research to improve early diagnosis of hereditary angioedema.
- Evaluation of existing, innovative, or novel therapeutics in pediatric hereditary angioedema patients.
- Research toward development of a cure for hereditary angioedema.
- Development and/or validation of novel and/or innovative therapeutic strategies for the treatment and/or prevention of hereditary angioedema attacks.

Hydrocephalus

- Research on the etiology, prevention, diagnosis, and treatment of post-traumatic hydrocephalus.
- Discovery or validation of novel and/or innovative therapies and therapeutic targets for the treatment of hydrocephalus and its sequelae, including therapies directed at myelin regeneration and repair.
- Research on approaches to lessening the impact of brain damage caused by hydrocephalus.
- Development or validation of biomarkers and imaging techniques, particularly multimodal approaches, to aid in diagnosis, prognosis, and monitoring of therapeutic efficacy.
- Research on the prevention of shunt failure.
- Studies to better understand the causes and/or pathogenesis of hydrocephalus.
- Development or validation of improved hydrocephalus model systems.

Immunomonitoring of Intestinal Transplants

- Studies to elucidate the role of the mucosal immune system, other host-derived factors, or gut microbiota-derived factors in maintaining intestinal transplant viability.

- Development and evaluation of intestinal implant strategies that circumvent the induction of immunity against the transplant through the use of autologous stem cells or organoids derived from intestinal stem cells.
- Development and evaluation of evidence-based approaches that focus on dampening the regional immune response against intestinal transplants without inducing global immune suppression.
- Development and evaluation of implant-associated materials (e.g., scaffolds) with anti-inflammatory properties that protect the intestinal transplant from immune attack.
- Development and evaluation of strategies for inducing and maintaining populations of anti-inflammatory regulatory immune cell populations at the transplant site.
- Studies to improve immunomonitoring of recipient immune responses after intestinal transplantation, with a focus on prospective leukocyte profiling, to aid in diagnosis and treatment of immunological and immunosuppression-related complications.
- Development and/or validation of precise, real-time implanted monitoring devices to improve individualized patient outcomes after intestinal transplantation.

Inflammatory Bowel Diseases

- Clinical studies in human subjects directed toward understanding how acute enteric infections may trigger chronic bowel diseases with acute and sub-acute inflammatory bowel disease, including systems biology approaches.
- Mechanistic studies in animal models designed to understand how enteric infection may trigger inflammatory bowel disease, including genomic, microbiomic, and immune mechanisms.
- Epidemiological studies of post-infectious acute and sub-acute inflammatory bowel diseases that define risk and provide estimates of illness-associated disability, health care costs, and symptom duration from a military health system and societal perspective.
- Studies to understand the interaction between acute/chronic stress and infection and the development of inflammatory bowel disease.
- Research to explore whether the travel patterns of active duty personnel increase the risk of developing inflammatory bowel disease by means of exposure to changes in intestinal microflora.
- Research to better characterize the association between the use of drugs, such as isotretinoin and long-term doxycycline, and the development of inflammatory bowel disease.
- Research on the role of diet in the development and progression of inflammatory bowel disease.
- Research on the influence of the microbiome on inflammatory bowel disease.
- Research on hyperbaric oxygen treatment of inflammatory bowel disease.
- Research on treatment strategies for patients whose inflammatory bowel disease is refractory to standard care medications or who positively respond to standard care medications, but become nonresponsive over time.

Influenza

- Development of a diagnostic test for influenza drug resistance.
- Development and testing of a universal influenza vaccine.
- Development and evaluation of novel, innovative, and/or combination influenza therapies.
- Research to improve the understanding of host responses to influenza infection and the mechanisms of drug resistance.
- Research on the factors that contribute to and/or reduce the risk of the emergence of zoonotic and pandemic influenza viruses.

Integrative Medicine

- Research on the use of integrative medicine strategies, such as meditation, tai chi, acupuncture, and/or herbal medicine/nutritional supplementation, to improve the psychological health and quality of life in cancer patients and survivors.
- Research on the use of integrative medicine in treatment and management of chronic pain disorders, including comparative efficacy studies relative to standard of care.
- Rigorous longitudinal studies of integrative medicine approaches for enhancing resilience and treating psychological health issues and co-occurring disorders.
- Precision medicine research to investigate, develop, and validate biomarkers that can help determine an individual's response to integrative medicine treatments for pain.
- Development of outcomes tools and measures to evaluate the effectiveness of integrative medicine pain management approaches.
- Definitive studies to determine the effectiveness of self-care, meditation-based treatments, courses, and training programs in improving resiliency to stress in a military environment; in austere operational platforms such as submarines and small-deck ships; or in combat-fatigued military health care providers.

Interstitial Cystitis

- Studies that define the risk, prevalence, and operational impact of interstitial cystitis among active duty personnel.
- Identification of biological markers for making a definitive diagnosis of interstitial cystitis.
- Evaluation and assessment of novel and/or innovative treatment options for interstitial cystitis patients, including intravesical therapy.
- Research on the etiology of interstitial cystitis to inform targeted therapy development.

Malaria

- Investigation of mechanisms of drug resistance in malaria, to include host and pathogen, against drugs used for treatment and prophylaxis.
- Development of a vaccine that induces high levels of long-lived, broadly protective immunity against *Plasmodium falciparum* and/or *P. vivax*.
- Operational research to optimize application of existing malaria drugs to reduce impact of artemisinin resistant *P. falciparum* in military forces.

- Operational research to optimize deployment of pharmacovigilance systems to ensure capture of adverse events related to malaria chemoprophylaxis and treatment.
- Operational research to assess efficacy and spread of artemisinin combination therapies across the Greater Mekong Subregion's military forces.
- Development of malaria prophylactic regimens that encourage higher compliance and methods to monitor compliance in deployed Service members.
- Identification of novel and/or innovative malaria drug targets for blood and liver stage malaria parasites.
- Development of new, or improvement of existing, strategies for culturing relapsing malaria parasites, with emphasis on *Plasmodium vivax, P. ovale,* and *P. cynomolgi* in vitro.
- Development, testing, and evaluation of spatial repellents to provide protection against Anopheline vectors.
- Identification of a correlate of immunity against malaria and development of a surrogate test of protection.
- Structurally optimize validated malaria antigens by engineering protective epitopes to elicit specific and enhanced immune responses.

Metals Toxicology

- Identification and validation of biomarkers to evaluate military Service members' acute exposure to toxic metals in an operational environment and predict potential consequent health risks and associated health outcomes.
- Retrospective studies to evaluate risk and exposure among workers at industrial facilities.
- Research on the toxicity of metal combinations and the interaction between different metal components.
- Research on the additive effects of multiple exposures to metal(s).
- Research on underlying diet quality and micronutrient sufficiency and the risk for metals toxicity.
- Research on the toxicity of metal-based engineered nanomaterials.

Mitochondrial Disease

- Research on the basic biology and physiology of mitochondria to better understand the pathology of primary mitochondrial diseases.
- Development of improved tools and animal models to study primary mitochondrial disease and evaluate therapeutics.
- Identification and testing of non-invasive techniques and biomarkers to monitor mitochondrial function, aid in diagnosis, and/or evaluate therapeutic efficacy.
- Research on novel and/or innovative treatments to alleviate symptoms or slow down the progression of mitochondrial diseases.

Musculoskeletal Disorders

- Research to increase understanding, diagnosis, prevention, and/or treatments of chronic overuse musculoskeletal disorders.
- Research on measures (e.g., clinical biomarkers, novel/innovative interventions, therapeutics) to diagnose, predict, reduce the incidence of, or optimize health outcomes in military training- and Service-related musculoskeletal disorders.
- Research on the validation and/or optimization of rehabilitation strategies for Service-related musculoskeletal disorders.
- Research to prevent, control, and/or optimize musculoskeletal health outcomes for work-related musculoskeletal disorders.
- Research on lower back pain strategies to prevent surgery and recurrence of symptoms, identify factors that predict optimal treatment response for different patients, and encourage self-management as a treatment.
- Research to determine whether tailored psychosocial education interventions are effective in improving psychological resilience to musculoskeletal pain.
- Research on standardized approaches for early identification and prevention of chronic musculoskeletal pain.

Nanomaterials for Bone Regeneration

- Research on nanomaterials-based methods to facilitate recruitment of endogenous cell populations for enhanced bone regeneration and osseointegration.
- Technologies addressing segmental/large bone defects in craniomaxillofacial and/or load-bearing regions.
- Development of controlled release/extended release of growth factors for bone regeneration.
- Development of technologies that repair the soft tissue envelope to enhance bone regeneration.

Non-Opioid Pain Management

- Research on pain management strategies for patients with limited access to skilled providers and resources, including battlefield, prolonged field, transport, and other resource-limited environments.
- Development of population-based outcomes, tools, and measures to evaluate the effectiveness of pain management approaches across time and environments.
- Research on treatments for chronic pain management, particularly in complex patients (i.e., chronic, high-utilization, polypharmacy patients).
- Research to increase understanding of and preventative treatments for conversion of acute to chronic pain.
- Research that provides evidence of which pain management strategies work for whom and under what conditions.
- Research to identify and address biopsychosocial aspects of pain to reduce or eliminate the use of opioid pain medication(s).

- Comparative studies evaluating the efficacy of different pain management strategies, including complementary and alternative medicine approaches.
- Identification and development of non-opioid pain management techniques that promote positive psychological health-related outcomes.
- Development of non-opioid pain medicine that can be given via inhalation or intramuscularly, submucosally, or intravenously on the battlefield to provide adequate relief of pain without affecting the cardiorespiratory systems.
- Research on case management strategies designed to optimize the effectiveness of pain clinics, support use of non-opioid pain therapies, and reduce dependence on opioid therapies.
- Research that will directly obtain an FDA analgesic indication for oral transmucosal or intramuscular ketamine.

Pancreatitis

- Retrospective studies to determine the risk and incidence of pancreatitis among former and current active duty personnel.
- Development and testing of novel and/or innovative therapeutics for acute and/or chronic pancreatitis.
- Research on the basic biology and physiology of the pancreas to better understand the etiology and pathology of pancreatitis.

Pathogen-Inactivated Dried Cryoprecipitate

- Development or validation of technology to produce pathogen-reduced dried cryoprecipitate in military or civilian donor centers that is acceptable for FDA licensure in support of combat or contingency operations.

Polycystic Kidney Disease

- Development of improved treatment strategies for polycystic kidney disease, including approaches to identify and monitor patients at higher risk for progressing to end-stage renal disease.
- Research on the underlying pathobiology and molecular mechanisms of polycystic kidney disease, including studies of genetic factors, cyst formation and growth, the role of cilia, and factors that modify disease progression and/or severity.
- Research on the lifestyle factors that may modify the progression of polycystic kidney disease.

Post-Traumatic Osteoarthritis

- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.
- Research into cell-based approaches for treatment or prevention of post-traumatic osteoarthritis.
- Studies to evaluate and develop best practices for multidisciplinary team approaches and treatment algorithms for post-traumatic osteoarthritis.

- Development or validation of novel and/or innovative approaches to restoring joint stability after injury.
- Sustained release, intra-articular injectable steroidal, non-steroidal, or disease-modifying therapies that offer two or more months of symptomatic relief of pain and/or inflammation in a single injection.
- Research on therapies that target multiple phases of the cellular response pathways that are implicated in the development of post-traumatic osteoarthritis, including cell death, inflammation, matrix changes, and changes in catabolic and anabolic responses.
- Development and/or validation of predictive models for early onset post-traumatic osteoarthritis in extremity-injured patients for the purpose of tailoring rehabilitation programs toward prevention, delay, or mitigation of onset.

Pulmonary Fibrosis

- Retrospective studies to determine the risk and incidence of pulmonary fibrosis among military Service members, including Veterans.
- Identification of biomarkers of pulmonary injury or early predictors of interstitial lung disease.
- Research into the pathobiology and molecular mechanisms underlying the development of pulmonary fibrosis.
- Development and/or testing of novel and/or innovative treatments to delay or modify the progression of pulmonary fibrosis.
- Development and/or validation of improved tools and animal models to study pulmonary fibrosis and evaluate therapeutics.

Respiratory Health (excludes lung cancer and mesothelioma)

- Research on the causes, treatment, and prevention of chronic obstructive pulmonary disease (COPD), including identification and validation of biomarkers and disease phenotypes, as well as employing personalized medicine in clinical research and disease management.
- Research investigating the treatment of patients with chronic mild hypoxia.
- Research on the cause, treatment, and prevention of respiratory symptoms and ailments possibly associated with deployed and redeployed military personnel, including acute eosinophilic pneumonia, asthma, allergies, and other chronic lung diseases and breathing problems.
- Research to evaluate the impact of deployment on the prevalence and severity of respiratory disease in military Service members and Veterans.
- Development and/or validation of methods to detect volatile organic hydrocarbons from the breath of individuals exposed to toxic chemicals or other agents that can cause lung injury, which can be utilized for diagnosis and prognosis of lung injury or disease.
- Identification of biochemical, physiological, or combined biomarkers for evaluating risk or extent of injury from either acute or long-term toxic occupational or environmental exposures.

- Research investigating exposure rates, detection, and treatment of diseases related to inhalation of mold and fungi, such as coccidioidomycosis.

Rett Syndrome

- Identification and/or validation of novel and/or innovative biological targets for the treatment of Rett syndrome.
- Development and testing of interventions to improve the neurological symptoms of Rett syndrome.
- Research to understand the relationship between genetic mutations, physical traits, and symptoms in individuals with Rett syndrome.
- Research on the pathobiology of the MeCP2 gene and protein.
- Research to understand Rett syndrome's commonalities with and differences from classic autism and regressive autism.

Rheumatoid Arthritis

- Research to better understand the relationship between genetic risk and environmental triggers, such as infection or smoking, in developing rheumatoid arthritis.
- Studies that identify or validate biomarkers or personalized medicine strategies that allow for individualized medication choice based on the patient's underlying biology or disease state.
- Research on the long-term use of immunosuppressants in patients with rheumatoid arthritis and the likelihood of developing infections.
- Research to establish activity recommendations following joint replacement for maximal joint life.

Scleroderma

- Research on the molecular mechanisms and pathogenesis of scleroderma.
- Development and/or testing of novel and/or innovative therapies and identification of novel and/or innoavtive therapeutic targets in scleroderma.
- Research on biomarkers and other approaches to diagnose scleroderma, monitor disease progression, and/or assess response to treatment.
- Epidemiologic studies investigating the impact of localized scleroderma (morphea) on duty performance, use of personal protective equipment, and deployability.
- Research on the efficacy of newer immunosuppressive agents, including biologics and small molecule inhibitors, in the treatment of morphea and scleroderma (systemic sclerosis).
- Research on the efficacy of UVA1 for topical treatment in localized scleroderma and systemic sclerosis.

Sleep Disorders

- Research on how the disruption of normal sleep and circadian biological rhythms adversely affects the physical and psychological health, safety, performance, and productivity of military and civilian populations.
- Studies to assess sleep disturbance and clinical sleep disorders in female military personnel.

- Research on the association between sleep disorders and post-traumatic stress disorder, traumatic brain injury, depression, and/or anxiety and suicidal behaviors.
- Research to assess clinical algorithms that improve adherence to continuous positive airway pressure (CPAP).
- Investigations into non-CPAP-based treatment regimens that enhance readiness and deployability in active duty military personnel.
- Research focused on investigating how psychiatric disorders (post-traumatic stress disorder in particular), combined with the disruption/degradation of sleep quality, impact long-term physical health through changes in hormonal physiology.
- Development and/or testing of non-pharmacological treatments for sleep disorders.
- Research on the impact of sleep deprivation on the efficacy of psychological treatments for post-traumatic stress disorder, depression, and other mood disorders.
- Research on the prevention and/or mitigation of sleep disorders that are associated with long aeromedical evacuation flights for both clinical team members and patients.
- Development of tools and technologies that allow rapid and objective measurement of Service member performance in the face of fragmented sleep and/or sleep maintenance difficulty.
- Research examining the broader effects of Warfighters' sleep disorders on the sleep, behavioral health, and productivity of their family members, as well as the readiness of their military unit.

Spinal Muscular Atrophy

- Research into phenotyping the spinal muscular atrophy disease state.
- Research into which molecular deficiency imposed by a deficiency of SMN, a motor neuron protein, causes motor neuron deficits.
- Exploration of the form and function of SMN-depleted neuromuscular junctions at ultrastructural (e.g., dysregulation of endocytosis), transcriptomic, and proteomic levels, particularly the mildest SMN reduction that leads to consistent quantifiable motor neuron loss.
- Research to find non-SMN-altering spinal muscular atrophy modifying genes in cellular, small animal, and human models that may lead to identification of novel and/or innovative therapeutic targets.
- Research to further understand SMN gene regulation and post-transcriptional mechanisms leading to synergistic SMN-repleting approaches, as well as to determine whether boosting SMN induction maximizes efficacy.
- Research to determine whether SMN can be repleted to physiologic levels in all cells in the spinal muscular atrophy model immediately post-natally and whether there is a limit to the therapeutic response.
- Clinical research to determine what clinical findings persist even with treatment; whether these findings are related to drug timing, dosage, biodistribution, or a combination of factors; and whether these factors are modifiable.

- Research involving dietary/nutritional studies in spinal muscular atrophy to identify the optimal anabolic diet.
- Research to determine mitochondrial involvement and astrocytic and other non-neuronal contributions to motor neuron vulnerability.

Sustained-Release Drug Delivery

- Development of technology that can provide a sustained-release delivery of drugs for a minimum of 1 week or more. Potential applications of this technology could include long-acting therapies for post-traumatic stress, opiate dependence, low-dose pain control, allergies, attention deficit/hyperactivity disorder, chemoprophylaxis, and other conditions.
- Research into the use of printable, sustained-release scaffolds for predictable delivery of prescription and non-prescription medications.
- Research into novel and/or innovative approaches to developing bioavailable and sustained-release oral formulations of intravenous broad-spectrum fungicidal and anti-microbial medications.

Tinnitus

- Research to understand the mechanisms of tinnitus, its relationship to noise-induced hearing loss, and progression to chronic tinnitus, with the focus on developing interventions for tinnitus.
- Research to increase knowledge of the prevalence, incidence, natural history, and occupational and sex-related differences of tinnitus and its possible relation to individual blast/noise exposures.
- Research to understand the operational readiness impacts of tinnitus on the military.
- Development and validation of objective tools/methods to diagnose and characterize tinnitus (e.g., imaging techniques to identify functional and structural changes in the brain, biomarkers of resiliency, and susceptibility to tinnitus).
- Identification of novel and/or innovative therapies for interventions to prevent, manage, and treat tinnitus, including behavioral approaches, new uses for existing drugs, nutritional and pharmaceutical strategies, and acoustic, electrical, and other stimulation technologies.

Tuberculosis

- Development of a diagnostic assay that can be used at the point of care to rapidly and accurately diagnose tuberculosis.
- Development of novel and/or innovative tuberculosis vaccines or optimization of current tuberculosis vaccines.
- Identification and/or validation of biomarkers that can be used to assess vaccine efficacy and protection against tuberculosis disease.
- Research to understand, diagnose, or treat multi-drug-resistant tuberculosis or extensively drug-resistant tuberculosis.
- Research to determine the appropriate precautions to use for transport of active tuberculosis patients.

- A sustained release formulation of anti-tuberculosis drugs that would facilitate long-term treatment and reduce the emergence of resistance due to poor compliance.

Vaccine Development for Infectious Disease

- Development of a therapeutic vaccine and/or other strategies to achieve HIV remission.
- Evaluation of passive immunization strategies to use in conjunction with dengue and Zika vaccinations.
- Research leading to a better understanding of the immune mechanisms involved in clearance of the dengue and Zika viruses and the mechanisms of immune enhancement that lead to more severe clinical disease.
- Development of flexible vaccine technologies that can be used to rapidly respond to emerging and re-emerging infectious diseases threats.
- Evaluation of humoral and cellular immune responses after vaccination compared to natural infection.
- Development of a safe, effective dengue human challenge model for clinical trials.
- Development of a non-human primate model to study Zika virus-induced microcephaly/fetal neuropathology as a tool to measure the safety and efficacy of vaccines and antivirals.
- Development and fielding of vaccines to prevent U.S. Service members from becoming ill from endemic disease exposure during operational deployments. This includes, but is not limited to, arthropod-borne diseases (Zika virus, dengue, chikungunya, hantavirus hemorrhagic fever with renal/pulmonary syndrome, rickettsioses, and trypanosomiasis), leptospirosis, HIV, norovirus, Middle East Respiratory Syndrome coronavirus, schistosomiasis, leishmaniasis, Nipah virus, Lassa fever, and West Nile fever.

Vascular Malformations

- Studies into the natural history, genetics, and pathogenesis of vascular malformations.
- Research to discover or develop novel and/or innovative therapeutic targets and treatments to regress or prevent vascular malformations.
- Research to improve methods to diagnose and manage vascular malformations.
- Development of non-invasive or minimally invasive technologies or approaches for the control of internal bleeding associated with vascular malformations.
- Studies to identify risk and/or establish standard practices for the treatment of hemorrhage from brain arteriovenous malformations.
- Research on the prevention or treatment of complications associated with vascular malformations such as pain, infection, seizures, tissue breakdown, tissue overgrowth, or airway obstruction.
- Studies to elucidate the progression of vascular malformations in disease-in-a-dish/microfluidic models for the purpose of identifying novel and/or innovative drug targets, screening existing drugs, and/or elucidating the pathogenesis of the disease.

Women's Heart Disease

- Retrospective studies to determine the risk and incidence of heart disease among former and current female active duty personnel, including Reservists and National Guard members.
- Research focused on elucidating the potential relationship between post-traumatic stress disorder and women's heart disease.
- Identification of sex-specific approaches to increase the effectiveness of diagnosis, treatment, and/or cardiac rehabilitation programs.
- Research on factors to predict and prevent the long-term impacts of gestational diabetes, gestational hypertension, and preeclampsia on the cardiovascular health of women.
- Research on trauma-induced cardiac arrest secondary to hemorrhage and polytrauma in the female population.

APPENDIX 3
DOD AND VA WEBSITES

PIs are encouraged to integrate and/or align their research projects with Department of Defense (DoD) and/or Department of Veterans Affairs (VA) research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. Below is a list of websites that may be useful in identifying additional information about DoD and VA areas of research interest, ongoing research or potential opportunities for collaboration within the FY17 PRMRP Topic Areas.

Sample Incoming UNC-CH Subcontract Commitment Letter

Instructions: Please use this letter as a template/guideline when UNC-CH is committing to a subcontract under another institution's prime award. Fill in the blank areas and those areas marked in ***BOLD ITALICS***.

UNC-CH Letterhead
UNC-CH Department/Center Name
UNC-CH Address

Date

Prime Awardee Name and Address

Reference: ***Response to solicitation/RFP/RFA number _____, entitled _____, dated _____***

Dear **_____,**

This letter confirms that the appropriate program and administrative personnel at The University of North Carolina at Chapel Hill (UNC-CH) have reviewed the above referenced Solicitation/RFP/RFA and are committed to enter into a subcontract with the ***Prime Awardee*** for the performance period of ____ to ____. The work to be performed by UNC-CH ___ does ___ does not include ___ animal and/or ____ human research subjects. UNC-CH maintains an active and enforced conflict of interest policy meeting the requirements of 42 CFR Part 50, Subpart F and 45CFR Part 94.

The ***Prime Awardee's*** Principal Investigator on this proposal is _____. The UNC-CH budget, budget justification and scope of work are provided as separate enclosures to this letter. The estimated cost of the proposed subcontract will not exceed $_____ and includes appropriate direct and indirect costs.

Furthermore, by submission of this commitment letter UNC-CH and its Principal Investigator (PI) certify (1) that the information submitted within the application is true, complete and accurate to the best of the UNC-CH's and PI's knowledge; (2) that any false, fictitious, or fraudulent statements or claims may subject the UNC-CH and PI to criminal, civil, or administrative penalties; and (3) that the PI agrees to accept responsibility for the scientific conduct of the project and to provide the required progress reports if an award is made as a result of UNC-CH's application.

If you have any questions, please contact the undersigned at **_____.**

Sincerely,

Signature of Authorized UNC-CH Official

Signature of UNC-CH Principal Investigator

Analysis of a recombinant dengue-2 virus–dengue-3 virus hybrid envelope protein expressed in a secretory baculovirus system

Helle Bielefeldt-Ohmann[1], David W. C. Beasley[1], David R. Fitzpatrick[2] and John G. Aaskov[1]

[1] Centre for Molecular Biotechnology, School of Life Science, Queensland University of Technology, GPO Box 2434, Brisbane, Australia
[2] Leukocyte Biology Unit, Queensland Institute of Medical Research, Herston, Queensland, Australia

In a step towards a tetravalent dengue virus subunit vaccine which is economical to produce, highly immunogenic and stable, a hybrid dengue virus envelope (E) protein molecule has been constructed. It consists of 36 amino acids from the membrane protein, the N-terminal 288 amino acids of the dengue-2 virus E protein plus amino acids 289–424 of the dengue-3 virus E protein. It has been engineered for secretory expression by fusion to a mellitin secretory signal sequence and truncation of the hydrophobic transmembrane segment. Using the baculovirus expression system and serum-free conditions, more than 95% of recombinant dengue-2 virus–dengue-3 virus hybrid E protein (rD2D3E) was secreted into the cell culture supernatant in a stable form with multiple features indicative of preserved conformation. The hybrid molecule reacted with a panel of dengue virus- and flavivirus-specific MAbs which recognize linear or conformational epitopes on dengue virions. Human dengue virus-specific antisera also reacted with the protein. The hybrid rD2D3E protein was able to inhibit the *in vitro* binding of dengue-2 and dengue-3 viruses to human myelomonocytic cells, suggesting that the receptor-binding epitope(s) was preserved. Adjuvant-free immunization with the hybrid protein induced an antibody response to both dengue-2 and dengue-3 virus in outbred mice, comparable in strength to that of individual rD2E and rD3E proteins. Notably, these antibody responses were primarily of the IgG2a and IgG2b isotype. A strong dengue virus cross-reactive T cell response was also induced in the mice, suggesting that dengue virus hybrid E proteins could form the basis of an efficacious multivalent dengue virus vaccine.

Introduction

Dengue viruses (serotypes 1–4) are now endemic in most tropical countries, and are a major cause of paediatric morbidity and mortality (Monath, 1994). Severe disease occurs most commonly, but not exclusively, following reinfection with virus serotypes not previously encountered (Morens, 1994). Epidemiological and laboratory data suggest that sub-neutralizing levels of antibody may enhance infection of Fc receptor-bearing cells, resulting in more severe disease (Morens, 1994). Other, not mutually exclusive, hypotheses suggest that it is particular combinations of antibody-independent host factors and virus pathogenic characteristics (strain characteristics) which result in a more severe inflammatory response, haemorrhagic manifestations and shock (Monath, 1994).

Author for correspondence: Helle Bielefeldt-Ohmann. Fax› 61 7 3864 1534. e-mail helle! biosci.uq.edu.au

The envelope (E) protein of dengue virus contains the majority of the determinants involved in attachment to, and penetration of, host cells as well as epitopes involved in neutralization (Rey *et al.*, 1995). Because of the similarity between the amino acid sequence (Chu, 1989; Deubel *et al.*, 1993) and predicted structure of the E protein of flaviviruses (Rey *et al.*, 1995), the possibility of preparing hybrid E proteins containing antigenic determinants from two or more dengue virus serotypes was considered. Epidemiological data suggest that clinical infections in humans are rare following exposure to a third or fourth dengue virus serotype (Morens, 1994; Monath, 1994), and Rhesus monkeys infected sequentially with three dengue virus serotypes did not develop a viraemia following quaternary challenge with any of the four dengue virus serotypes (Halstead *et al.*, 1973). Thus, broad-spectrum immunity would appear to be a desired and achievable goal for any dengue virus vaccine programme.

Intertypic chimaeric dengue viruses have been constructed in which all of the structural protein genes of dengue-4 virus

were replaced with those of dengue-1, dengue-2 or dengue-3 viruses, whilst the non-structural dengue-4 virus proteins were retained (Bray & Lai, 1991; Calain *et al.*, 1995). In the case of the dengue-2 virus–dengue-4 virus chimaera, retardation of virus replication relative to either parent virus type was observed, and it was speculated that this type of virus might be more amenable to attenuation (Bray & Lai, 1991). However, further attenuation and the safety of these hybrid viruses has not yet been reported.

Megret *et al.* (1992), employing recombinant fusion proteins, demonstrated that the maintenance of a topographical arrangement of discontinuous antigenic domains in the flavivirus E protein may be important for induction of neutralizing and protective antibodies. This interpretation was corroborated by the finding that most of the antigenic epitopes of the flavivirus E protein are located on ridges on the external surfaces of the molecule (Rey *et al.*, 1995). MAb neutralization escape mutants of flaviviruses have been used to delineate epitopes which might be involved in binding to and fusion of these viruses with host cell membranes. In the flaviviruses studied, regions surrounding amino acids 71–72, 128, 224–227, 270, 303–311, 333 and 402–403 appear to be important, directly or indirectly, for the binding and fusion of the virus to host cell membranes (Lobigs, 1987; Cecilia & Gould, 1991; Jiang *et al.*, 1993; Lin *et al.*, 1994). Our own studies suggest that some of these regions (adjacent to amino acids 128, 224–227 and 333) also contain epitopes commonly recognized by antibodies from human dengue patients (Aaskov *et al.*, 1989). The majority of these site(s) regions appear to localize in domains II and III of the crystallographic model of the flavivirus E protein (Rey *et al.*, 1995). It would therefore appear to be essential to ensure integrity of most or all of these regions in the design of any subunit vaccine.

The baculovirus expression system that utilizes *Autographa californica* nuclear polyhedrosis virus (AcNPV) has been used to obtain high-level expression of many foreign genes, including those that require proteolytic processing, glycosylation or secretion (Richardson, 1995). The system has also been employed to produce recombinant dengue virus E protein and NS-1, which, to varying degrees, induced protective immune responses in mice (Putnak *et al.*, 1991; Deubel *et al.*, 1991; Delenda *et al.*, 1994; Smucny *et al.*, 1995). Of these, only Delenda *et al.* (1994) described elicitation of dengue virus serotype cross-reactive antibody responses. Although an attenuated multivalent dengue virus vaccine is currently under evaluation (Bhamarapravati & Yoksan, 1989), a similar approach using multivalent recombinant E proteins has not been reported. This is perhaps not surprising considering the level of quality control required for a four-component vaccine. In this report, we describe the generation of a recombinant dengue-2 virus–dengue-3 virus hybrid E protein (rD2D3E), expressed in a secretory baculovirus expression system, which induced strong dengue virus serotype-specific antibody responses and dengue virus cross-reactive T cell responses in outbred mice.

Methods

Cells and viruses. C6.36 *Aedes albopictus* mosquito cells, used for growth of dengue virus stocks, were maintained in RPMI 1640 (Gibco) supplemented with 2–5 % heat-inactivated foetal bovine serum (FBS) at 30 °C. BHK cells were used for virus neutralization assays and grown in RPMI containing 5 % FBS at 37 °C. The human myelomonocytic cell line HL60 (Harris & Ralph, 1985) and the human non-Epstein–Barr virus-transformed B cell leukaemia cell line BM13674 (Baxter & Lavin, 1992) were maintained in RPMI containing 10 % FBS supplemented with 25 mM glutamine. *Spodoptera frugiperda* clone 21 (Sf21) cells were employed for growth of baculoviruses as described in detail below. The baculovirus (AcNPV) used throughout was strain AcBac6. Dengue-2 virus [prototype strain New Guinea C (NGC); GenBank accession no. D00346], dengue-1 virus (prototype Hawaii) and dengue-4 virus (prototype H241) were originally obtained from Yale Arbovirus Reference Center, and had been passaged in both sucking mice by intracerebral inoculation and in tissue culture in C6.36 cells. Dengue-3 virus (strain 1327, Tahiti-65; GenBank accession no. L11439) was generously provided by the Center for Disease Control, Atlanta, GA, USA, and upon receipt was passaged twice in C6.36 cells before use for RNA isolation (see below). For production of semi-purified dengue virus preparations, virus was grown in C6.36 cells under serum-free conditions. Following clarification of the culture supernatants (*g* 4300, 15 min), the virus was pelleted by centrifugation at 15 000 *g* for 16–18 h at 4 °C. The virus was resuspended in either TNE buffer (10 mM Tris–HCl pH 7·5; 100 mM NaCl; 1 mM EDTA) or RPMI and stored in 1 ml aliquots at −70 °C. Since dengue-3 virus strain 1327 is non-cytopathic, all viruses were quantified by haemagglutination assay, where the number of virus particles equals the number of red blood cells in the reaction mixture (Schlesinger, 1977).

Cloning of the hybrid rD2D3E protein and truncated rD2E and rD3E protein genes. Virus RNA was isolated from the supernatants of C6.36 cultures infected with dengue-2 virus and dengue-3 virus by the guanidinium isothiocyanate method, and reverse transcribed to cDNA using random hexamer primers and avian myeloblastosis virus reverse transcriptase (Amersham) (Bielefeldt-Ohmann *et al.*, 1994). The cDNA was amplified by PCR using primers which included unique endonuclease restriction sites for both the joining site of the two E protein genes (*Eco*RI) and for cloning into the baculovirus transfer vectors (*Xma*I at the 5′ end of the dengue-2 virus cDNA and a *Bgl*II site at the 3′ end of the dengue-3 virus cDNA, respectively), as well as a stop codon at the end of the dengue-3 virus gene (D2 sense, 5′ *ATCCCGGGC*CAGGCTTTACCATAATG 3′; D2 antisense, 5′ *GGAATTC*CATCCTCAGCCTGCAG 3′; D3 sense, 5′ *GGAATTC*CTGGAACTCAAGGGGATG 3′; D3 antisense, 5′ *GTAGATCT*CAACCCACTGACCCAAAG 3′). The *Eco*RI site was chosen to minimize alterations to the predicted secondary structure and hydrophilicity of the E protein in the joining region. The two PCR products were cloned individually into pGem-5Zf(+) shuttle T-vectors (Promega) and subsequently joined at the *Eco*RI site and subcloned into the baculovirus transfer vectors pMbac and pPbac (Stratagene), containing the mellitin and the human placental alkaline phosphatase secretory signals, respectively (Mroczkowski *et al.*, 1994). Truncated rD2E and rD3E protein genes, encompassing nucleotides 733–2074 and 672–2115, respectively, were cloned in a similar manner into pMbac, following initial cloning into the shuttle vector pGem by TA cloning of PCR products generated as above using the following primers: D2 sense, as above; D2 antisense, 5′ *GGAATTC*ACAGGACATCTCAAGTGC 3′; D3 sense, 5′ *ATCCCGGGT*GGATGTCGGCTGAAGGA 3′; D3 antisense, as above. The further truncation of the rD2E protein gene as

well as the inclusion of additional prM sequence in the rD3E construct were dictated by the constraints on PCR primer design using the OLIGO program. Construction integrity was verified by DNA sequencing using dye terminators, cycle sequencing reactions and automated sequence analysis (ABI Systems).

+ **Transfection and selection of recombinant viruses.** Using the pMbac-D2D3E, pBac-D2D3E, pMbac-D2E and pMbac-D3E plasmids, Sf21 cells were co-transfected with linearized AcPak6 DNA (ClonTech) using 25 ng baculovirus DNA and approximately 500 ng plasmid DNA per transfection. The DNAs were mixed with liposomes (ClonTech) and after a 15 min incubation were added to serum-free confluent monolayers of Sf21 cells in 10 cm# tissue culture plates. Following an overnight incubation in serum-free TC100 medium (Gibco), the cultures were supplemented with TC100 medium containing 5 % FBS and incubated for a further 48 h. The medium was then collected and replaced with fresh medium. The cultures were incubated for a further 24 h, after which the medium was collected and the cells fixed with X-Gal (0·3 %, v/v) to assess the level of recombinant virus replication. The two batches of culture media collected were employed separately for plaque purification of recombinant virus, which was performed according to published protocols (O'Reilly *et al.*, 1994) except that incubations were for 4–5 days. At this stage, X-Gal was applied to the cultures, and after a further overnight incubation, blue plaques were picked and resuspended in 500 µl TC100 medium containing 10 % serum. One hundred µl of this sample was adsorbed to 10^6 Sf21 cells in 5 cm# tissue culture wells, and the cell cultures were incubated for 4 days. The culture supernatant was then collected and subjected to a second round of plaque purification. Following each round of clone expansion, 80 µl of clarified culture medium was blotted onto nitrocellulose and the dot blots were immunolabelled with a flavivirus E protein-specific, conformation-dependent MAb, 4G2 (Gentry *et al.*, 1982), as described below, to confirm the presence of immunoreactive dengue virus E protein.

+ **Preparative production of recombinant proteins.** Confluent monolayers of Sf21 cells in 150# tissue culture flasks were inoculated with the recombinant or wild-type baculoviruses at an m.o.i. of 5 in less than 5 ml medium. Adsorption was allowed to proceed for 2 h, and was followed by addition of 40–50 ml serum-free medium [either ExCell 400 (JRH Biosciences) or Protein-Free Medium (Pharmingen)]. The conditioned medium was collected after 48 h (see Results) and the proteins were precipitated with a final concentration of 9 % sterile polyethylene glycol 6000 (PEG; BDH) by overnight incubation with stirring at 4 °C. The precipitates were pelleted by centrifugation (6 h at 14 300 *g*) and resuspended in sterile TNE buffer. The proteins were stored at −20 °C, without addition of proteinase inhibitors, until use.

+ **SDS–PAGE, electroblotting and immunodetection by enhanced chemiluminescence (ECL).** The recombinant dengue virus proteins and proteins from virions were separated on non-reducing 10 or 15 % SDS–PAGE gels (with 5 % stacking gels) and transferred to nitrocellulose membranes by electroblotting in methanol–Tris–glycine buffer, followed by blocking for 48 h with ECL blocking buffer (Staton *et al.*, 1995). The membranes were incubated with primary antibodies [either dengue virus-specific MAbs (see Table 1) or human or murine sera], diluted in Tris-buffered saline (TBS) (pH 7·4) containing 0·1 % Tween 20, 1 mg/ml BSA, 1 mg/ml non-fat skimmilk powder and 1 % FBS, for 2 h at room temperature, followed by 4×3 min washes in TBS containing 0·1 % Tween 20. This was followed by a 1 h incubation with horseradish peroxidase-conjugated rabbit anti-mouse or anti-human immunoglobulin antibody (Dakopatts), or in the case of isotyping studies, with isotype-specific goat anti-mouse IgM, IgG1, IgG2a, IgG2b or IgG3 (The Binding Site). Bound antibody was visualized by ECL (reagents and films from Amersham) as described by Staton *et al.* (1995). Unless otherwise indicated, the results shown are from the first 50–60 s exposure.

+ **Analysis of glycosylation of recombinant dengue virus E proteins.** The effect of endoglycosidase F and H (both from Boehringer Mannheim) on the recombinant E proteins was assessed as described by O'Reilly *et al.* (1994). Briefly, PEG-precipitated rD2D3E, rD2E or rD3E or the corresponding cell lysates were incubated with either endoglycosidase F in 20 mM sodium phosphate (pH 7) containing 2 % (v/v) NP40 and 10 mM EDTA, or endoglycosidase H in 100 mM sodium acetate (pH 5) (all final concentrations). Enzymes were omitted from the control samples. Following incubation at 37 °C for 20–24 h, the proteins were separated on 8, 10 or 15 % polyacrylamide gels, electroblotted, and immunolabelled with MAb 4G2 and visualized as described above. Alternatively, the lectin-binding properties of the recombinant E proteins, with or without prior endoglycosidase treatment, were examined by a protocol modified from Seto *et al.* (1995). Proteins transferred onto nitrocellulose membranes by electroblotting were reacted with different dilutions of biotinylated lectins (*Daturastramonium*, *Galanthus nivalis*, *Maackia amurensis* and concanavalin A; all from Vector Laboratories), followed by incubation with horseradish peroxidase-conjugated streptavidin (Boehringer Mannheim) and visualization of binding by ECL.

+ **ELISA.** Flexible PVP 96-well ELISA plates (Dynatech) were coated overnight at 4 °C with rD2D3E protein or dengue virus diluted in borate–saline buffer (pH 9·0). Following blocking for 60 min at 23 °C with 5 % KPL milk diluent (Kirkegaard & Perry Laboratories) and two washes in PBS containing 0·05 % Tween 20 (PBST), primary antibodies (MAbs or polyclonal sera) at appropriate dilutions in PBST containing 5 % KPL milk diluent were applied and incubation was continued for 45 min at 23 °C. After four washes in PBST, horseradish peroxidase-conjugated anti-mouse immunoglobulin (Dakopatts) diluted in PBST containing 5 % KPL milk diluent was added to the wells. Following incubation for 45 min at 23 °C, the plates were washed four times with PBST and four times in PBS, followed by application of *o*-phenylenediamine substrate (Sigma). After addition of 3 M H2SO4, the plates was read on a Dynatech MR5000 plate reader.

+ **Virus-binding blocking.** To demonstrate blocking of dengue virus binding to HL60 and BM cells by rD2D3E, washed and pre-cooled (4 °C) cells were pre-incubated for 2 h with either media control or PEG-precipitated proteins from wild-type baculovirus-infected cultures supernatant or the rD2D3E protein (10 µg per 10^6 cells). This was followed by incubation of the cells with semi-purified dengue-2 or dengue-3 virus, at a cell to particle ratio of 1 : 5×10^3 to 1 : 1×10^4, for 90 min. All incubations were at 4 °C. Following extensive washing of the cells, total RNA was extracted as described above, and the relative levels of virus binding were assessed by RT–PCR using primers for either the prM protein gene (D2 sense, 5′ ATGGCGTTCCATTTAACCACACGTA 3′; D2 antisense, 5′ CATTGAAGGAGCGACAGC 3′; D3 sense, 5′ ACTTGACTTCACGAGATGGAGA 3′; D3 antisense, 5′ CCACTCCCACGCATCTCATTGT 3′) or the transmembrane part (D2 sense, 5′ TAGAAGCAGAACCTCCAT 3′; D2 antisense, 5′ GAGCACCATAACTCCCAAAT 3′; D3 sense, 5′ TTGTGATTGGAACTGGAG 3′; D3 antisense, 5′ CACCACAGCTCCTAGAT 3′) of the dengue-2 and dengue-3 virus E protein genes, respectively. Using 28 cycles of amplification, approximately 5–8×10^3 virus particles in a reaction with 10^6 cells could be detected. Primers for human β-actin were included in the PCR reaction for sample equalization (Bielefeldt-Ohmann, 1994). This allowed semi-quantitative comparison of virus binding to target cells with or without pre-incubation with rD2D3E protein or controls following densitometric analysis using an ImageQuant densitometer and

‹‹ Human post-primary dengue virus infection sera, collected in Queensland.

nd, Not done.

software (Molecular Dynamics) as described previously (Bielefeldt-Ohmann *et al.*, 1994).

+ **Immunization of mice.** Groups of four mice (female outbred Quackenbush Animal Resources Centre, Murdoch, Western Australia) were immunized by the intraperitoneal (i.p.) or intramuscular (i.m.) route with approximately 10 | g PEG-precipitated rD2D3E, rD2E or rD3E in TNE (the concentration was determined by comparison to purified histidine-tagged rD2E in a dot-blot titration; not shown), or one of the four dengue viruses (live in serum-free RPMI) in amounts equalized with respect to the E protein, as determined by 4G2 reactivity in a dot-blot titration and corresponding to approximately 4‹ 10& virus particles (infectious, non-infectious and incomplete; Setterquist, 1977). The mice received three injections, at days 0, 14 and 42, and were bled on days 28, 56 and 72 or 90. The sera recovered were subsequently tested by Western blotting and neutralization assays. All animal experiments were conducted with institutional ethics approval in accordance with the National Health and Medical Research Council Guidelines for Experiments in Animals.

+ **Virus neutralization assay.** Sera collected from immunized mice were assayed by a plaque reduction neutralization test (Aaskov *et al.*,

Downloaded from www.microbiologyresearch.org by
IP: 203.126.233.162
On: Tue, 05 Sep 2017 06:39:54

1988). Briefly, 1 : 20 dilutions of pools of heat-inactivated serum from groups of mice immunized in the same manner were mixed with 10-fold dilutions of dengue-2 virus (NGC) or dengue-3 virus (strain PRS225489) prior to addition of BHK cells. After 7 days incubation, the cells were stained with 0·5 % crystal violet and plaques were counted. Antibody titre was expressed as a neutralization index : $\log_{10}$ (p.f.u. virus alone) − (p.f.u. virus + antibody).

+ ***In vitro* lymphocyte stimulation and IL-3 assay.** Animals were terminated 4–8 days after the third vaccination and spleen cells were isolated as described by Bielefeldt-Ohmann *et al.* (1994). Triplicate cultures of 1×10^6 cells in RPMI containing 5 % FBS, in round-bottomed microculture wells (Nunc), were incubated with or without a dose range (approximately $0{\cdot}3–2{\cdot}3 \times 10^7$ virus particles per cell) of semi-pure dengue-2, dengue-3 or dengue-4 virus for 5 days at 37 °C in 7·5 % CO_2 in air. The culture supernatants were then collected and tested for IL-3 bioactivity using the FDC-P1 reporter cell line, as described by Fitzpatrick & Kelso (1995).

Results

Construction of a hybrid rD2D3E protein gene, expression in the baculovirus expression system, and biochemical features

Using the cloning strategy described in Methods and illustrated in Fig. 1, a hybrid molecule encoded by nucleotides 733–1709 from the dengue-2 virus genome and nucleotides 1710–2115 from the dengue-3 virus genome was generated. This approach introduced two amino acid changes at the joining site : from DK in both of the native dengue-2 virus and dengue-3 virus E proteins to EF in the hybrid protein (Fig. 1). This change did not alter the predicted secondary structure and hydrophilicity of the protein, as assessed by six algorithms using the GCG program suite (University of Wisconsin), and is within the range of inter- and intratypic amino acid variations seen in this region of the protein (Lanciotti *et al.*, 1994). Furthermore, a search of both GenBank and the SWISS-PROT databases failed to demonstrate homology of the newly created sequence with any known human protein sequences. The integrity of the hybrid gene was affirmed by DNA sequencing.

Spodoptera cells infected with recombinant baculovirus containing the mellitin secretory signal produced and secreted more recombinant protein more quickly than recombinant virus containing the alkaline phosphatase secretory signal. However, in both cases, maximum secretion, in excess of 250 µg recombinant protein per 10^7 cells, was obtained 48–72 h post-infection, with ≥ 95 % of the protein secreted during the first 48–56 h. After that time, increasing cell death correlated with intracellular retention of recombinant protein. The hybrid protein mainly occurred as monomers with an apparent molecular mass of 48–49 kDa on non-reducing gels. Low levels of rD2D3E dimerization could be detected by immunoblotting using MAb 4G2 following protein separation under the same gel conditions. Endoglycosidase F treatment of rD2D3E slightly increased the mobility of the protein compared to the undigested control, indicating glycosylation

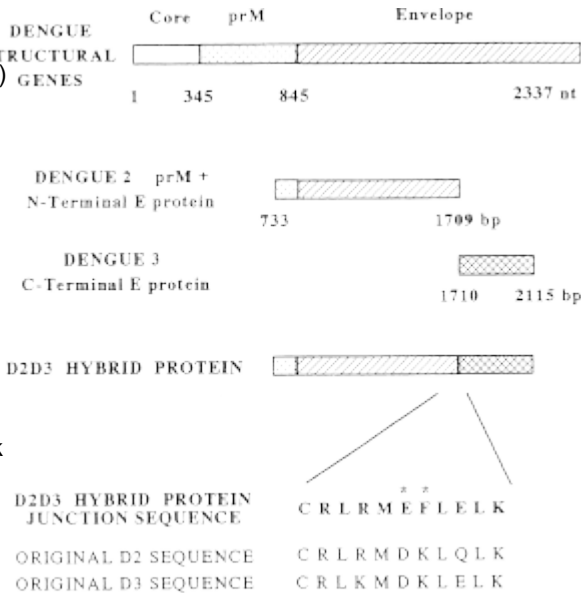

Fig. 1. Schematic depiction of the gene segments constituting the hybrid rD2D3E protein gene, and indication of the amino acid changes resulting from introduction of an *Eco*RI site in the hybrid gene.

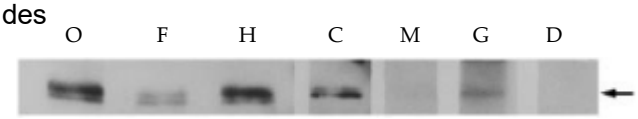

Fig. 2. Effect of endoglycosidases F and H on the mobility of rD2D3E in SDS–PAGE and lectin binding to the hybrid protein. Lanes : O, unmodified rD2D3E ; F, rD2D3E digested with endoglycosidase F ; H, rD2D3E digested with endoglycosidase H ; C, rD2D3E reacted with concanavalin A ; M, rD2D3E reacted with *Maackia amurensis* I (a very weak reaction discernable on the original blot) ; G, rD2D3E reacted with *Galanthus nivalis* ; D, rD2D3E reacted with *Datura stramonium*. Undigested and digested proteins were separated by SDS–PAGE (7·5 %) and electroblotted to nitrocellulose. Detection of protein in lanes O, F and H was performed using MAb 4G2. Visualization of antibody and lectin binding was by ECL. The arrowhead indicates a molecular mass of 48·3 kDa.

(Fig. 2). The molecular mass of the digested protein was approximately 47–48 kDa. These changes are comparable to those found for dengue-2 virus grown in insect cells (Johnson *et al.*, 1994) and for recombinant dengue virus proteins (Deubel *et al.*, 1991). Endoglycosidase H had no detectable effect on the mobility of either intracellular or secreted protein (Fig. 2 and data not shown). Concanavalin A, *Galanthus nivalis* and *Maackia amurensis* I, but not *Datura stramonium*, bound to the rD2D3E protein, suggesting the presence of mannose residues in high-mannose and / or hybrid oligosaccharide chains and sialic acid residues, but no complex or hybrid *N*-glycan structures (Fig. 2 and data not shown).

Antigenicity and functional activity of the hybrid rD2D3E protein

The antigenic properties of the hybrid rD2D3E proteins were analysed using MAbs raised against dengue virus

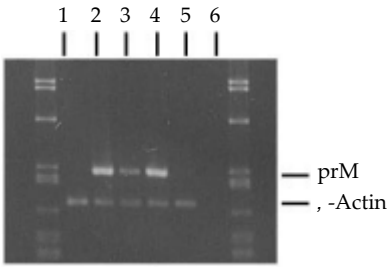

Fig. 3. Inhibition of binding of dengue-2 virus to HL60 cells by pre-incubation with the hybrid rD2D3E protein, assessed by semi-quantitative RT–PCR using the b-actin signal as reference. Lanes: 1, cells without virus or rD2D3E; 2, cells incubated with virus only; 3, cells pre-incubated with rD2D3E followed by virus binding; 4, cells incubated with a control protein preparation from wild-type baculovirus-infected cells followed by virus binding; 5, cells incubated with a control protein preparation from wild-type baculovirus-infected cells only; 6, PCR contamination control.

serotypes 1–4 and against other flaviviruses, and assessed by Western blotting and solid-phase ELISA. An abridged summary of the results is given in Table 1; the preservation of both conformation-dependent and cross-reactive determinants on the hybrid E protein is demonstrated. The lack of reactivity with MAb 3H5 is consistent with its specificity for an epitope in domain III of dengue-2 virus (Trirawatanapong *et al.*, 1992). This domain in the hybrid is derived from dengue-3 virus. In contrast, the interesting reactivity of MAbs 128 and 234, reportedly specific for dengue-2 virus, may be due to hitherto unknown cross-reactivities with the dengue-3 virus strain used here. Sera obtained from human dengue fever patients (primary infections) also reacted with the recombinant hybrid protein in Western blot experiments (Table 1).

Pre-incubation of the human myelomonocytic cell line HL60 or the human B cell line BM13674 with rD2D3E protein inhibited, in a specific manner, subsequent binding of both dengue-2 and dengue-3 viruses. Densitometric assessment, using equalization with respect to the b-actin signal, demonstrated a reduction of & 38 % of dengue-2 or dengue-3 virus binding following pre-incubation of the cells with rD2D3E (Fig. 3 and data not shown). This is a notable level of inhibition considering the primarily monomeric nature of the recombinant E protein and the highly multimeric occurrence of the E protein on virions (Rey *et al.*, 1995).

Immunogenicity of the rD2D3E protein

Groups of four outbred mice were immunized three times, by the i.p. or i.m. route, with approximately 10 l g adjuvant-free rD2D3E, rD2E or rD3E in TNE. The animals were bled 2 weeks after the second and third vaccinations, as well as at the termination of the experiment (day 90), and the sera were pooled and tested for reactivity with all four dengue virus serotypes in Western blot experiments (at final dilutions of 1:75), as well as for dengue-2 and dengue-3 virus neutralizing activity. A strong antibody response against both dengue-2 and dengue-3 virus E proteins was detected 2 weeks following the third vaccination, but no or only minimal cross-reactivity with dengue-1 and dengue-4 virus was detected (Fig. 4 and data not shown). Significant levels of antibody specific for dengue-3 virus were present after the second vaccination, with a further increase after the third vaccination, whereas notable levels of dengue-2 virus-specific antibodies were seen only after the third vaccination, and then only in the group receiving rD2D3E i.p. (Fig. 4 and data not shown). Significantly, however, the virus-specific antibodies were primarily of the IgG2a and IgG2b isotypes, with some additional anti-dengue-3 virus-specific activity of the IgM and IgG1 isotypes (Fig. 4).

In order to compare the immune response to the hybrid rD2D3E protein with that induced by live virus, groups of four Quackenbush mice were vaccinated with one of the three recombinant proteins (in the same amounts as in the previous experiment) or with semi-pure dengue-1, dengue-2, dengue-3

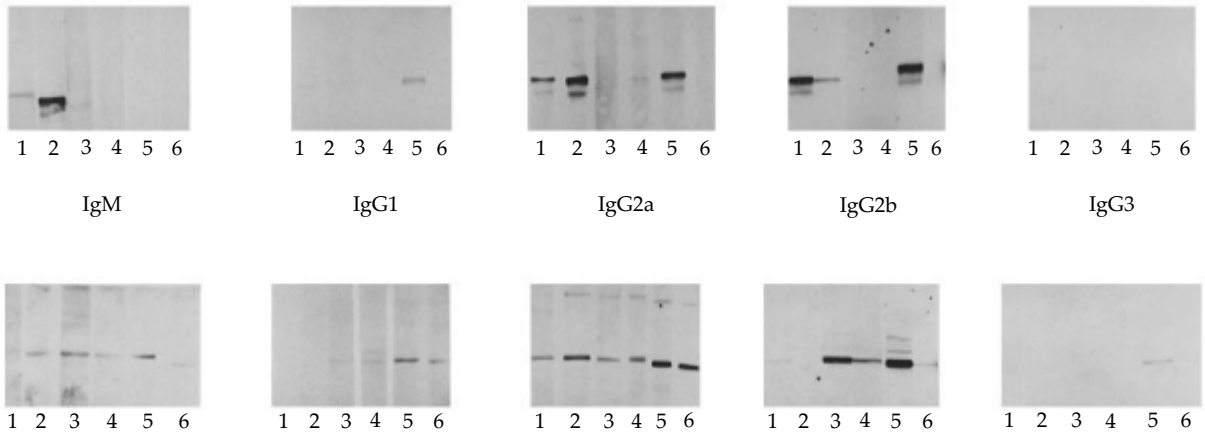

Fig. 4. Antibody class-and subclass-specific responses by mice to immunization with rD2E, rD3E or rD2D3E proteins, assessed on Western blots of dengue-2 virus (top panel) and dengue-3 virus (bottom panel) 2 weeks after the third vaccination. Lanes: 1, rD2E i.p.; 2, rD2E i.m.; 3, rD3E i.p.; 4, rD3E i.m.; 5, rD2D3E i.p.; 6, rD2D3E i.m.

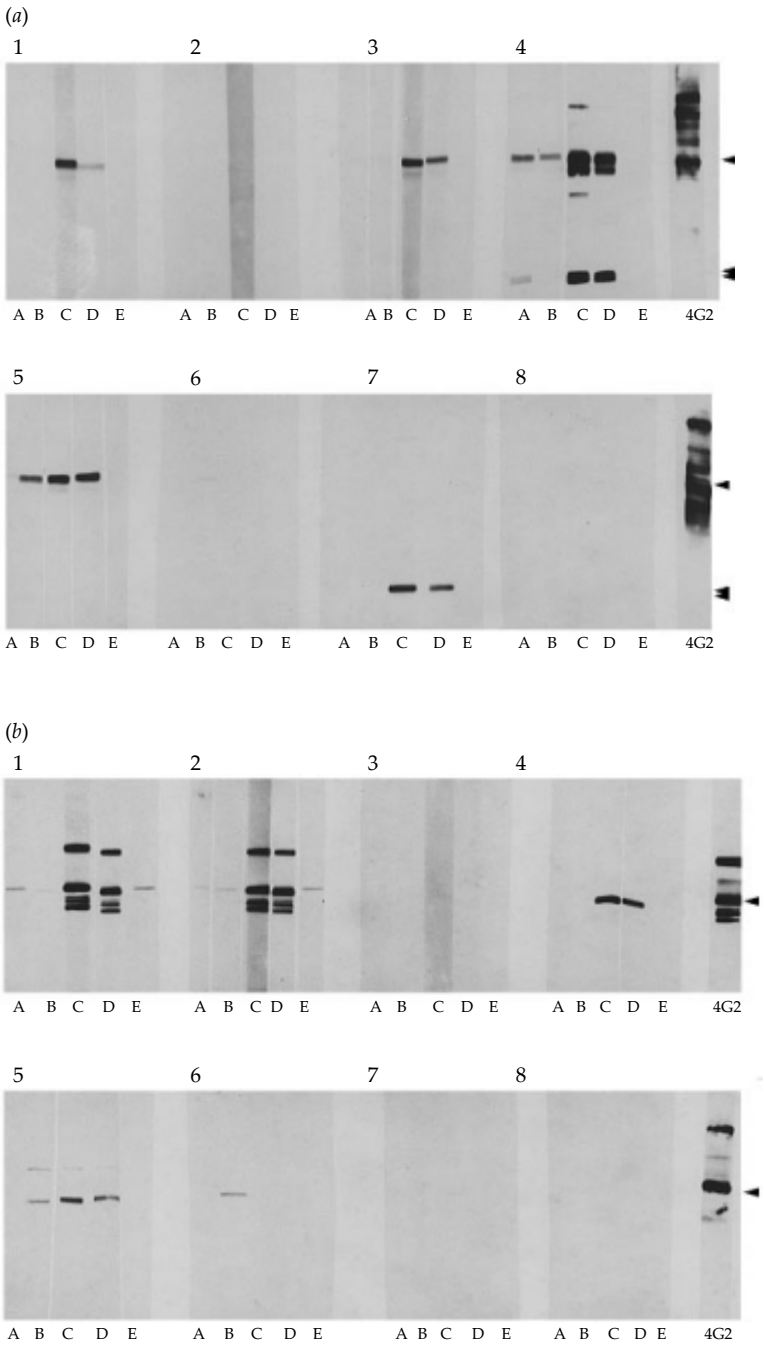

Fig. 5. Murine immunoglobulin subclass responses specific for (*a*) dengue-2 and (*b*) dengue-3 virus following adjuvant-free immunization with hybrid rD2D3E protein, rD2E protein or rD3E protein, or dengue-1, dengue-2, dengue-3 or dengue-4 virus. Pooled sera from each group bled 2 weeks after the third vaccination were tested at a final dilution of 1 : 75, and ECL films were exposed for 50–60 s. Groups : 1, rD2D3E ; 2, rD3E ; 3, rD2E ; 4, dengue-2 virus ; 5, dengue-3 virus ; 6, dengue-4 virus ; 7, dengue-1 virus ; 8, TNE buffer control. Lanes : A, IgM ; B, IgG1 ; C, IgG2a ; D, IgG2b ; E, IgG3. A weak IgG3 response could be detected in groups 1–5 upon longer exposure of the ECL films. Single arrowhead, virion E protein ; double arrowhead, virion M protein

or dengue-4 virus (the latter in amounts equalized to the recombinant proteins with respect to levels of native E protein). Vaccination was by the i.p. route, using the same vaccination schedule, and again no adjuvant was used. The results confirmed those of the previous experiment, i.e. strong antibody responses to dengue-2 and dengue-3 viruses, mainly of the IgG2a and IgG2b isotypes, were obtained with the hybrid rD2D3E protein, as well as with the rD2E and rD3E proteins, respectively (Fig. 5). Furthermore, the hybrid protein appeared to induce a response comparable to that of live dengue-2 and dengue-3 viruses, with low but detectable cross-reactivity to dengue-1 and dengue-4 viruses (data not shown).

A dose titration experiment in which groups of four mice received three i.p. adjuvant-free vaccinations with 10, 100 or 50 µg rD2D3E or TNE demonstrated that the antibody response reached a plateau at 10 µg per animal per dose.

In both the former experiments, 1 log or more of neutralizing activity was detected against dengue-2 but not dengue-3 virus in animals immunized with the hybrid protein by the i.p. route, as well as in animals immunized with rD2E

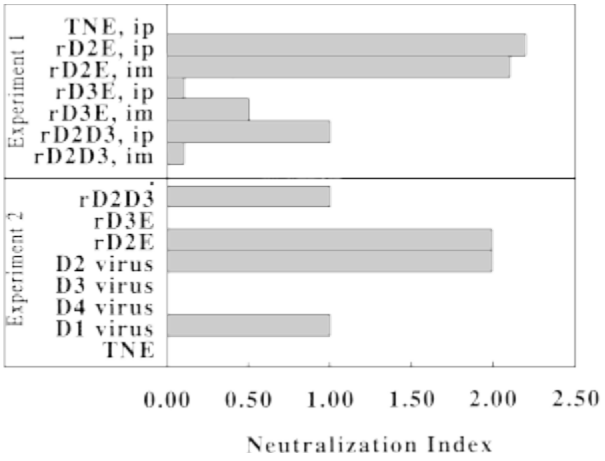

Fig. 6. Dengue-2 virus neutralizing antibody activity induced by adjuvant-free vaccination with hybrid rD2D3E protein, truncated rD2E protein or rD3E protein or with live dengue viruses. Pooled sera (four animals per group), obtained 2 weeks after the third vaccination, were tested at a final concentration of 1 : 20 in a plaque reduction assay (see Methods). Data are presented as neutralization indices, with & 1 significant. In experiment 2, all vaccinations were by the i.p. route.

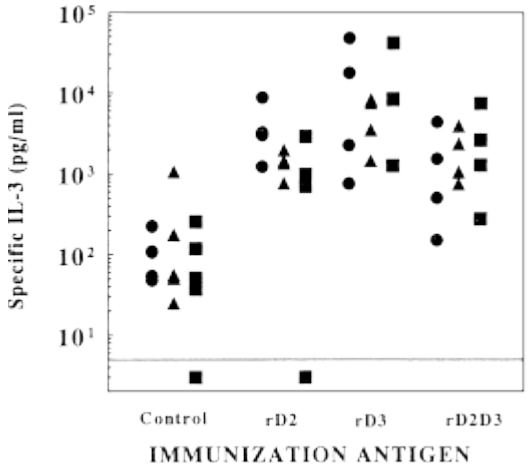

Fig. 7. Cross-reactive *in vitro* T lymphocyte responses (IL-3 production) induced by adjuvant-free immunization of mice with hybrid rD2D3E protein, rD2E protein or rD3E protein. Mice were terminated 6 weeks following the third i.p. vaccination (groups 1, 3 and 5 in Fig. 6, as well as the TNE buffer control group) and purified spleen cells were stimulated *in vitro* for 5 days with a dose range of semi-pure dengue-2 (E), dengue-3 (_) or dengue-4 (+) virus, followed by bioassay for IL-3 activity. Each data-point represents values obtained for individual mice with the optimal virus concentration (in this experiment approx. 10 haemagglutination units per 10^5 cells at the start of culture).

protein or dengue-2 virus (Fig. 6), whereas neither the hybrid molecule, rD3E nor dengue-3 virus induced antibodies with detectable neutralizing activity under the test conditions employed here (data not shown). Furthermore, the hybrid rD2D3E protein induced a strong dengue virus cross-reactive T cell response as evidenced by IL-3 production in response to *in vitro* dengue virus stimulation, with levels in immunized mice ranging from 10- to 1000-fold those seen in control mice (Fig. 7).

Discussion

This study demonstrates that a hybrid molecule consisting of the N-terminal two-thirds of the dengue-2 virus E protein and a truncated C-terminal one-third of dengue-3 virus, corresponding to domain I–II and domain III, respectively, of the tick-borne encephalitis virus E protein model (Rey *et al.*, 1995), can be secreted from baculovirus-infected insect cells in an antigenic form with high conformational integrity. The site of the junction between the dengue-2 virus and the dengue-3 virus portions of this E protein was chosen so as not to disrupt disulfide bridges (Lin *et al.*, 1994) or change the predicted hydrophilic characteristics of the native proteins. Both dengue-2 and dengue-3 virus-specific epitopes as well as dengue virus and flavivirus cross-reactive epitopes were preserved on the hybrid molecule (Table 1). Although the majority of the hybrid molecules occurred as monomers, the rD2D3E protein could still interfere with the binding to (Fig. 3), and subsequent infection of (unpublished data), several cell types by dengue-2 and dengue-3 viruses, suggesting that functional epitopes are preserved.

The hybrid protein induced a strong antibody response in outbred mice, with the majority of the anti-dengue-2 and anti-dengue-3 virus-specific antibodies being of the IgG2a and IgG2b isotype. This latter finding is significant in light of a recent report by Smucny *et al.* (1995) that recombinant baculovirus-derived dengue-2 virus E protein preferentially induced an IgG1 response in contrast to the dengue-2 virus, which preferentially induced IgG2a. The reason for the discrepancy between the results of Smucny *et al.* (1995) and those of the present study is not entirely clear, but three possibilities could be considered. Firstly, the strain of mice used and secondly the age of the animals are both factors known to influence the murine antibody response due to biased T helper cell stimulation (Barrios *et al.*, 1996; Hocart *et al.*, 1989). Thirdly, there is increasing evidence to suggest that the dose of antigen, perhaps more than any other single factor, influences the cytokine profile of both naive (primary response) and differentiated (secondary response) T cells (Bretscher 1992; Constant *et al.*, 1995; Hosken *et al.*, 1995), and thus, through cognate B cell–T cell interactions, the regulation of immunoglobulin isotype synthesis, including levels and specificities (Coffman *et al.*, 1993). Since most currently available reports on recombinant dengue virus E protein vaccines lack exact data on doses used, this aspect will have to await more definite comparisons. In our preliminary assessments of the T lymphocyte response in animals vaccinated with the rD2D3E protein, a strong dengue virus cross-reactive secondary *in vitro* IL-3 response was induced, suggesting preservation of T cell epitopes on the rD2D3E protein (Roehrig *et al.*, 1994; Kulkarni *et al.*, 1992). It is notable that IL-3 production is closely correlated with IFN-γ production (Maraskovsky *et al.*, 1992), a finding corroborated by testing a selected set of samples for IFN-γ from the experiment reported

here (H. Bielefeldt-Ohmann, unpublished data). IFN-γ is considered to be the main factor regulating the isotype switch from IgM to IgG2a production in mice (Coffman *et al.*, 1993).

The present results suggest that induction of IgG2a production is in itself not necessarily commensurate with virus neutralization, but the lack of *in vitro* neutralizing antibody activity does not preclude *in vivo* protection against virus challenge (Levine *et al.*, 1991). Unfortunately, the current murine model used for dengue virus protection studies, i.e. challenge of very young mice by the intracerebral route, may be inappropriate for revealing the true potential of this and previously described subunit dengue virus vaccines (Aaskov *et al.*, 1988; Delenda *et al.*, 1994). Susceptibility of mice to intracerebral dengue virus challenge is age-dependent, and immunization must therefore be initiated at a time when the immune system is still immature (Sarzotti *et al.*, 1996; Barrios *et al.*, 1996). Furthermore, the effector mechanisms required for protection of brain tissue may have little relevance to the effector mechanisms required for protection of humans against a mosquito-borne infection. Finally, challenge studies following immunization with the candidate rD2D3E protein vaccine have not been conducted due to the ethical problems associated with the intracerebral challenge model.

Although not yet studied in detail, the results depicted in Table 1 and Figs 4 and 5 suggest that the anti-dengue-2 and anti-dengue-3 virus antibody responses may be directed against different epitopes on the E protein, and also that neither part of the hybrid molecule significantly interferes with the response to the other part. These may thus constitute important factors in the overall safety of a human vaccine based on hybrid E proteins, in light of (i) the limited antibody cross-reactivity to dengue-1 and dengue-4 viruses induced by rD2D3E, (ii) the fact that the human antibody response to dengue viruses is directed towards multiple disparate epitopes on the E protein (Aaskov *et al.*, 1989; Innis *et al.*, 1989) and (iii) antibody-mediated infection enhancement of Fc receptor-bearing cells is mainly or solely due to flavivirus cross-reactive determinants (Brandt *et al.*, 1982; Morens, 1994).

The approach taken in this study offers several advantages over most systems so far reported for baculovirus-produced dengue virus E proteins: (i) greater stability of the secreted protein compared to protein accumulating intracellularly (unpublished data), (ii) easier purification, and thus (iii) relatively higher yields (amounts exceeding 250 μg per 10^9 cells) (Staropoli *et al.*, 1996; Delenda *et al.*, 1994; Richardson, 1995). In contrast to the original report on the baculovirus transfer vectors used in this study (Mroczkowski, 1994), higher yields of recombinant protein were consistently obtained with the mellitin construct than with the alkaline phosphatase construct. The present study has demonstrated that it is possible to construct a hybrid E protein which not only retains native tertiary structure and functional qualities in the form of putative receptor binding, but is also a strong immunogen, inducing B cell and T cell responses to the two dengue viruses constituting the hybrid and, at the T helper cell level, to the dengue virus serotypes not included in the construct. This suggests that a tetravalent dengue virus vaccine could be based on two components, a rD2D3E and a rD1D4E protein, thereby reducing the amount of safety and quality control, as well as preliminary assessment required, compared to a vaccine constituting four individually produced molecules.

Thanks are due to Dr T. Maguire (New Zealand) for making dengue virus-specific MAbs and pre-publication results available, to Professor A. Boyd (QIMR, Brisbane) for providing the HL60 cells, to Mr T. Forster (QUT) for providing the BM13674 cells, and to Miss Ina Serafin for performing neutralization assays. The animal attendants at QUT Animal Holding Facility are thanked for their caring for the experimental animals. A preliminary report of this work was presented at the Xth International Congress of Virology, Jerusalem, Israel, August 11–16, 1996. This work was supported by grants from the National Health and Medical Research Council (NHMRC) of Australia (grants nos 941446 and 961080).

Abstract

DNA shuffling and screening technologies were used to produce chimeric DNA constructs expressing antigens that shared epitopes from all four dengue serotypes. Three shuffled constructs (sA, sB and sC) were evaluated in the rhesus macaque model. Constructs sA and sC expressed pre-membrane and envelope genes, whereas construct sB expressed only the ectodomain of envelope protein. Five of six, and four of six animals vaccinated with sA and sC, respectively, developed antibodies that neutralized all 4 dengue serotypes in vitro. Four of six animals vaccinated with construct sB developed neutralizing antibodies against 3 serotypes (den-1, -2 and -3). When challenged with live dengue-1 or dengue-2 virus, partial protection against dengue-1 was observed. These results demonstrate the utility of DNA shuffling as an attractive tool to create tetravalent chimeric dengue DNA vaccine constructs, as well as a need to find ways to improve the immune responses elicited by DNA vaccines in general.

Introduction

Dengue is one of the most important arboviral diseases of humans. An estimated 100 million dengue infections are caused each year by four antigenically distinct serotypes of dengue viruses (dengue-1 to dengue-4), resulting in widespread dengue fever (DF) and at least 250,000 cases of dengue hemorrhagic fever/dengue shock syndrome (DHF/DSS) (Halstead, 1988). These viruses are transmitted primarily by the mosquito Aedes aegypti and are endemic throughout the tropical and subtropical regions of the world. A major expansion of dengue transmission has occurred throughout the tropical Americas accompanied by a large increase in the number of DHF cases. Despite the public health importance of DF and DHF, vector control, which has proven difficult and costly to sustain over time, is the only available control measure (Gubler, 1994). Vaccines are available for two related flaviviruses, yellow fever (YF) virus and Japanese encephalitis (JE) virus (Barrett, 1997a, 1997b). However, decades of effort have not produced a successful dengue virus vaccine. A major obstacle to dengue vaccine development is the epidemiologic abbservation that a dengue virus infection only produces protective immunity against the infecting serotype, and that a secondary infection by a heterologous serotype increases the risk for DHF/DSS. It is postulated that this increased risk for severe dengue disease during secondary infections is due to antibody mediated enhancement (ADE) of infection (Halstead and O'Rourke, 1977), in which virus–antibody complex formed due to pre-existing antibodies from the primary infection gain greater access to target cells via the Fc-receptors. It is therefore imperative that a dengue vaccine produces robust protective immune responses to all 4 dengue serotypes. Conventional methodologies such as live attenuated virus vaccines (Edelman et al., 1994), inactivated dengue viruses (Schlesinger, 1977) and subunit vaccines (Deubel et al., 1988; Eckels et al., 1994) have not yet produced a vaccine. More recently, considerable advances have been made using dengue-yellow fever virus chimeras as vaccine candidates (Guirakhoo et al., 2001, 2002, 2004). However, these methodologies have relied on developing 4

individual vaccines, one for each serotype, and mixing them to produce the final tetravalent formulation. This approach presents challenges related to commercial scale manufacture and formulation of a human dengue vaccine.

DNA vaccines offer an alternative strategy for developing effective dengue virus vaccines. This approach, in which plasmid DNA expressing an antigen of interest is used as a vaccine, has been shown to induce immune responses in animal models against a number of different viruses, including several flaviviruses (Colombage et al., 1998; Konishi et al., 1998; Phillpotts et al., 1996; Schmaljohn et al., 1997). A West Nile virus (also a flavivirus) DNA vaccine has recently been approved for use in horses (http://www.aphis.usda.gov/lpa/issues/issues_archive/wnv/wnv_vaccine.html), making it the first DNA vaccine to be commercially marketed. We have previously demonstrated the feasibility of DNA vaccines for dengue viruses in a number of studies (Kochel et al., 1997, 2000; Porter et al., 1998; Raviprakash et al., 1995, 2000a, 2000b, 2001, 2003).

In an effort to produce a single DNA vaccine capable of eliciting immune responses to all 4 serotypes, we employed directed molecular evolution by DNA shuffling and screening to generate chimeric vaccine constructs encoding antigens comprising epitopes from all four dengue serotypes. DNA shuffling and screening technologies have previously been used in evolving interferon α, IL-12, co-stimulatory molecules and viruses (Chang et al., 1999; Lazetic et al., 2002; Leong et al., 2003; Patten et al., 1997; Soong et al., 2000). Using this approach, we generated a number of chimeric DNA vaccines that were shown to contain sequences representative of all 4 dengue serotypes. A number of these chimeric DNA vaccines also produced multivalent neutralizing antibodies in mice and provided protection against intracerebral challenge by dengue-2 virus (Apt et al., 2005). In the present study, we show that 3 selected chimeric DNA vaccines produced by DNA shuffling and screening elicited multivalent dengue virus neutralizing antibodies in vaccinated rhesus macaques. When vaccinated animals were challenged with live virus, partial protection was observed.

Results

Shuffled vaccine candidates

The DNA shuffling and screening methods used to generate and select vaccine candidates that expressed antigens with combined attributes of all four dengue serotypes were recently described (Apt et al., 2005). Based on murine immunogenicity studies (Apt et al., 2005), 3 shuffled clones were selected for evaluation in a nonhuman primate model. The 3 shuffled clones, 6E12-D4, 18H6 and 2G11-D4 (referred to in this study as sA, sB and sC, respectively), all expressed antigens that reacted with all 4 dengue-specific antibodies and elicited antibodies in vaccinated mice that neutralized all 4 dengue serotypes in vitro (Apt et al., 2005). The distribution of amino acid sequences from all 4 dengue serotypes on the hydrophilic surface of each of the 3 shuffled E (envelope) antigens (sA, sB and sC) in a modeled dimer formation (Modis et al., 2003) is shown in Fig. 1.

Immunogenicity in rhesus macaques

Animals were vaccinated by intramuscular injection of 5 mg empty vector DNA , shuffled DNA vaccines sA, sB or sC, a mixture of 1.25 mg each of the 4 wild-type parental DNA (wt-mix) or a mixture of 1.65 mg each of sA, sB and sC DNA (sABC) on days 0, 28 (week 4) and 84 (week 12). Treatment groups and the immunization regimen are shown in Fig. 2. Sera obtained 4 weeks after the first vaccination were diluted 100-fold and dengue-specific IgG antibody was measured by ELISA. All animals (6/6) vaccinated with the wild-type vaccine mixture (wt-mix) had seroconverted after the first dose and elicited antibodies that reacted with all 4 dengue antigens (Fig. 3A). Similarly, a majority of animals vaccinated with sA (4/6), sC (3/6) or sABC (4/6) had seroconverted after first dose producing antibodies reacting to all 4 dengue antigens; remaining animals produced antibodies that reacted with 2 or 3 dengue antigens. Vaccines sB produced the lowest antibody levels after the initial dose, and the antibodies reacted primarily

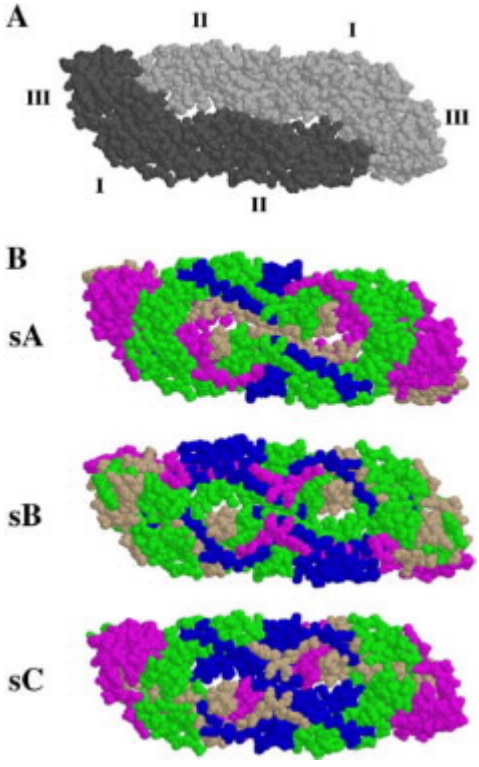

Fig. 1. Space-filling models depicting the chimeric nature of the deduced amino acid sequence expressed from shuffled DNA vaccines sA, sB and sC. (A) The hydrophilic face of the soluble dimeric ectodomain from dengue type 2 is shown. The dimer is formed by two anti-parallel E monomers, shown in light gray and dark gray. The 3 domains (I, II and III) of the ectoprotein are outlined. (B) The hydrophilic face of the shuffled E antigens, where amino acid residues from dengue-1, dengue-2, dengue-3 and dengue-4 are shown in magenta, tan, green and blue, respectively. This figure was created with protein explorer (Martz, 2002) using the atomic coordinates 1OAN (Modis et al., 2003) from the protein data bank.

with dengue-1 and dengue-3 antigens. However, after 3 vaccinations, all animals except for the control group produced antibodies reacting with all 4 dengue antigens. Fig. 3B shows mean ELISA optical densities for each group for each dengue antigen, 4 weeks after the last immunization (week 16), measured at 1:1000 serum dilution.

The ability of these antibodies to neutralize virus in vitro was measured by plaque reduction neutralization test (PRNT). All vaccines, except sB, elicited antibodies in a subset of animals (4/6, 5/6, 4/6, 6/6 for wt-mix, sA, sC and sABC, respectively) that neutralized all 4 dengue serotypes in vitro. The geometric mean titers (GMT) for 50% neutralization ($PRNT_{50}$) for all vaccines (day 112 sera) against all 4 dengue serotypes were significantly higher compared to those for the vector control group ($P < 0.05$), with the exception of vaccine sB which elicited antibodies that only neutralized dengue-1, -2 and -3 (Fig. 4). An examination of the neutralization titers also revealed that among the 3 individual shuffled vaccines, vaccine sA performed the best, eliciting mean titers of 27, 23, 58 and 30 against dengue-1, -2, -3 and -4, respectively. However, by day 224 (day of virus challenge), the GMTs for all groups against all dengue serotypes had declined by 50% or more (Fig. 4).

Live virus challenge

Three animals from each group were challenged with live virus by subcutaneous inoculation of 10^5 plaque forming units (PFU) of dengue-1 (strain western pacific 74) or dengue-2 (strain OBS-8041) virus. The vector control group for dengue-1 challenge had 2 animals (1 animal died before the beginning of the protocol due to study unrelated cause). Viremia was assessed by detection of virus in the serum samples of daily bleeds following virus challenge. Table 1 shows a summary of viremia data, as well as neutralizing antibody titers at the time of challenge. Results suggest a partial protection against dengue-1 viremia in vaccinated groups compared to the control group. The mean days of viremia were reduced from 4 (control group) to 1.3, 2.3, 1.3, 2.3 and 0.6 for wt-mix, sA, sB, sC and sABC vaccinated groups, respectively. The reduction in the days of viremia for the sABC group was statistically significant ($P < 0.05$). However, none of the vaccinated groups showed any reduction in dengue-2 viremia. The neutralizing antibody levels at the time of challenge had declined from their observed peak levels at day 112 (Table 1 and Fig. 4), and a clear correlation between neutralizing antibody titers and protection from viremia could not be established.

To determine if the vaccination had primed the animals sufficiently to mount a secondary antibody response to virus challenge, IgM and IgG antibodies were measured by ELISA during the challenge phase (Fig. 5). For dengue-1, the vector control group exhibited a typical primary antibody response in which there was an initial IgM response by day 6 followed by an increasing IgG response by day 10 after challenge. The wt-mix, sB and sC vaccinated animals also showed an IgM response, although their IgGs were boosted at the same time. sA and

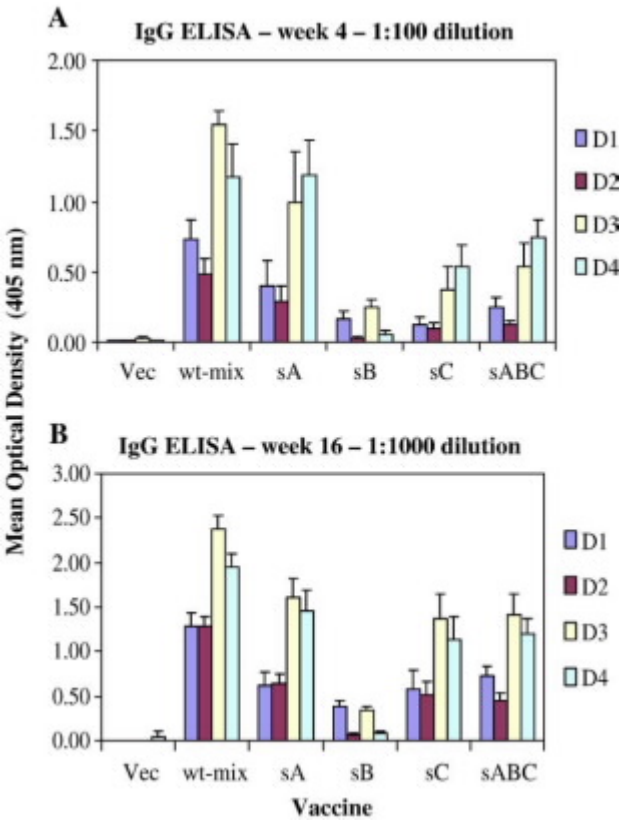

Fig. 3. ELISA reactive antibodies after 1st and 3rd dose of vaccine. Sera were diluted 1:100 (A) or 1:1000 (B) and dengue-specific IgG reacting with each serotype antigen was measured by ELISA (week 4 sera were barely positive at 1:1000 dilution). Mean optical density (405 nm) and standard error for each group against each antigen is shown. All animals were included in the analysis.

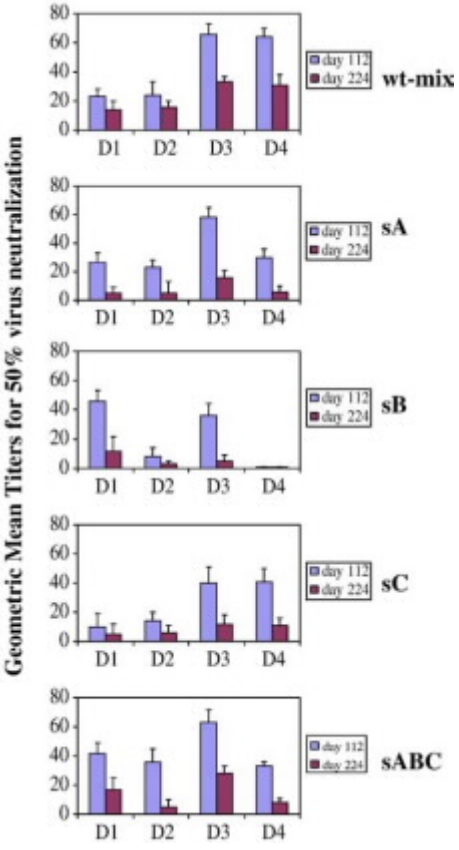

Fig. 4. Virus neutralizing antibodies. Sera from each animal obtained on day 112 (4 weeks after 3rd dose) and on day 224 (day of virus challenge) were used to measure neutralization of dengue-1, -2, -3 and -4 virus by PRNT. A pre-immune serum pool of all the animals was used as the baseline. GMT of ($PRNT_{50}$) for each vaccine group for each dengue serotype is shown.

sABC vaccinated animals demonstrated a typical secondary antibody response in which their IgG antibodies increased soon after challenge without significant accumulation of IgM antibodies. Response to dengue-2 challenge was slower; by day 10, IgM antibody was still increasing with little accumulation of IgG antibody in the vector control group. Anti-dengue2 IgM antibody was still rising on day 10 for sB vaccinated animals as well, but unlike vector control group, dengue2-IgG increased simultaneously. Although dengue2-IgG levels at the time of challenge were substantially lower compared to dengue-1 IgG, there was a rapid increase in IgG levels by day 6 without IgM accumulation in wt-mix, sA, sC and sABC vaccinated animals. Measurement of neutralizing antibodies on day 10 after challenge clearly showed a slow primary response for both dengue-1 and dengue-2 challenge in control animals whereas all vaccinated animals exhibited significantly high titers indicating an anamnestic antibody response (Table 2).

Discussion

Development of a dengue vaccine has been complicated by the need to raise protective immune responses against all 4 dengue serotypes. Traditional approaches that depend on using 4 individual dengue virus vaccines mixed to produce a final vaccine have been plagued by constraints of commercial scale manufacture and formulation. In this study, we have taken advantage of the DNA shuffling and screening technology to produce single DNA vaccine candidates that express antigens containing immunogenic epitopes from all 4 dengue serotypes. DNA shuffling and screening is a powerful technology that allows for the selection of clones based on functional attributes in the absence of precise information on the location or structure of the key epitopes. Three shuffled vaccine constructs were chosen for this study based on previous in vitro characterization and in vivo data in a murine model (Apt et al., 2005). All 3 chimeras elicited antibodies in mice that neutralized all 4 dengue serotypes in vitro.

This study demonstrated that single shuffled DNA vaccines sA and sC are capable of producing multiple serotype reactive antibodies in rhesus macaques. The mixture of 4 parental monovalent vaccine constructs and the mixture of the shuffled chimeras also produced antibodies for all serotypes. A tendency for higher antibody response for dengue-3 and dengue-4 compared to dengue-1 and dengue-2 in all vaccinated groups including the wt-mix (Figs. 3 and 4) may indicate inherent differences in the immunogenicity of these E proteins. Shuffled vaccines sA and sC induced neutralizing antibody titers that were comparable to those induced by the vaccine mixtures and caused a reduction in dengue-1 viremia indicating the feasibility of generating multivalent immune responses by single chimeric antigens in macaques. However, the best protection against dengue-1 viremia was demonstrated by the mixture of shuffled vaccines (sABC) and the mixture of parental DNA vaccines (wt-mix). No reduction in viremia was observed in vaccinated animals challenged with dengue-2 virus. It should be noted that the dengue-1 and dengue-2 sequences used for shuffling were derived from published envelope protein sequences of strains AHF 82-80 and D2-04, respectively (Apt et al., 2005). A comparison of E protein sequences of AHF 82-80 and Western Pacific 74 (dengue-1 challenge strain) revealed 7 amino acid substitutions of which 4 were conservative changes. Similarly, 10 amino acid substitutions, of which 4 were conservative changes, were found between D2-04 and OBS-8041 (dengue-2 challenge strain). It is not clear if these substitutions affected the level of protection. It is also possible that shuffling altered the folding of the chimeric envelope proteins.

Virus neutralizing antibodies are of paramount importance in protection against dengue virus (Kliks et al., 1988) and epidemiological data suggest that neutralizing antibodies are sufficient to provide protection against dengue infection. Our measurement of virus neutralizing antibodies showed that shuffled vaccines sA and sC produced virus neutralizing antibodies in macaques to all 4 dengue serotypes, just like the mixture of 4 parental vaccines did. The antibody titers were comparable to those reported for a single dose of recombinant tetravalent live attenuated virus vaccine formulation ($PRNT_{50}$ of 54, 16, 18 and 126 for dengue-1 to dengue-4, respectively) in rhesus macaques (Blaney et al., 2005). These animals were protected against dengue-1, -3 and -4 challenge but not dengue-2. In the study reported

Presence of virus in the serum of virus challenged animals was determined for 8 days after challenge as described under Materials and methods. Dengue-1 and dengue-2 viremia were determined by infection of vero and C6/36 cells, respectively. Dengue-1 and dengue-2 challenge virus stocks were produced by propagation in vero and C6/36 cells, respectively, and using these cells for viremia determination increased assay sensitivity (unpublished). '+' and '- ' indicate the presence or absence of virus in the serum of each animal for each of the days post-challenge. Also shown for reference are the dengue-1 and dengue-2 virus neutralization titers at the time of challenge (day 0).

here, we have demonstrated a reduction in viremia for dengue-1 but not dengue-2 in animals immunized with shuffled vaccine constructs. The same authors (Blaney et al., 2005) also reported that when dengue-2 neutralizing antibody titer was raised ($PRNT_{50}$ = 174) after a second dose of vaccine, animals were protected from dengue-2 challenge. In another study using recombinant MVA (modified vaccinia, Ankara) expressing dengue-2 truncated E (monovalent vaccine) protein, Men et al. (2000) have reported $PRNT_{50}$ titers of 70 and higher as being protective. Bray et al. (1996) have shown that rhesus monkeys vaccinated with a dengue-2/dengue-4 chimera vaccine (dengue-2 structural genes in an attenuated dengue-4 background) produced dengue-2 virus neutralizing antibody titers of about 640 and were protected from a dengue-2 challenge. Data presented here are consistent with these studies indicating higher neutralizing antibody titers are necessary for protection against dengue-2 challenge. However, in a tetravalent dengue vaccine study using yellow fever virus-dengue chimeras, low antibody titers of 20–80 were also found protective against dengue-2 challenge (Guirakhoo et al., 2004). It is possible that immune responses other than antibody response may be contributing to protection in this case.

It is clear from our study that the animals immunized with DNA vaccines encoding single chimeric dengue antigens provided efficient priming against multiple dengue serotypes. Accumulation of IgM antibody following challenge in some vaccinated animals may be due to presentation of some epitopes by the virus not presented by the chimeric antigen. The chimeric vaccines also provided partial protection against dengue-1

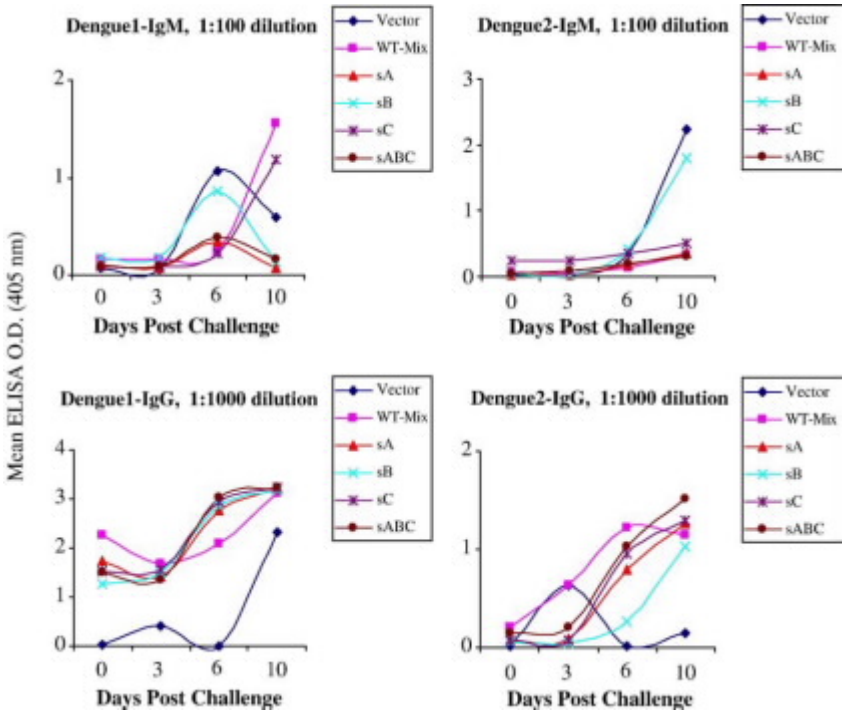

Fig. 5. IgM and IgG antibody responses following virus challenge. Sera obtained on days 0, 3, 6 and 10 (post-challenge) were diluted 1:100 (IgM) or 1:1000 (IgG) and dengue-1 or dengue-2-specific IgM and IgG were measured by ELISA as described in Materials and methods.

virus challenge. This is the first demonstration that the use of DNA shuffling technology can produce vaccine candidates that elicit immune responses against related multiple antigenic proteins in non-human primates. This is important especially to dengue vaccinology where epidemiological data mandate that a vaccine produces protective immune responses to all 4 dengue serotypes. We believe that further investigation to enhance immune responses to these and other shuffled vaccine candidates is warranted.

Table 2
Anamnestic neutralizing antibody response

Geometric mean of $PRNT_{50}$ titers are shown for each group at the time of challenge as well as 10 days post-challenge. Undetectable titers (<10) were assigned a value of 1 for purposes of GMT calculation. SE = standard error.

Materials and methods

Animals

Rhesus monkeys (Macaca mulatta), of either sex, age 3–8 years, weighing between 2 and 5 kg, were housed at the Naval Medical Research Center/Walter Reed Army Institute of Research animal facility in Silver Spring, MD. The monkeys were prescreened for the presence of dengue-specific antibody by enzyme linked immunosorbant assay (ELISA) and the plaque reduction neutralization test (PRNT). Only those animals that did not show evidence of previous dengue exposure were included in the study. Animals were excluded if the ELISA O.D. exceeded two or more standard deviations at a 1:100 dilution of their sera when tested against a cocktail of dengue antigens (PEG precipitated dengue-1, -2, -3 and -4 virions) compared to the O.D. obtained with a negative control antigen or if the sera (1:10 dilution) exhibited greater than 30% neutralization of input dengue virus (serotypes 1-4) in a standard PRNT.

Vaccines

Construction of the parent and shuffled DNA vaccines has been previously described (Apt et al., 2005). Four parental DNA constructs (D1, D2, D3 and D4) each expressed prM and E genes of dengue-1, -2, -3 and -4, respectively. Two shuffled DNA constructs, sA and sC (clones 6E12-d4 and 2G11-d4, respectively; Apt et al., 2005), expressed prM and E genes in which the N-terminal 90% of E gene was shuffled (contained

portions of sequence representing each of the 4 serotypes). A third shuffled DNA construct sB (clone 18H6; Apt et al., 2005) expressed a shuffled truncated E protein. The DNAs were produced free of endotoxin by Althea Corp., CA.

Immunizations

Groups of 6 animals were immunized by intramuscular injection of 5 mg empty vector DNA, shuffled vaccine A, B or C DNA (sA, sB or sC), a mixture of 1.25 mg each of the 4 wild-type parental DNA (wt-mix) or a mixture of 1.65 mg each of sA, sB and sC DNA (sABC). Immunizations were repeated at weeks 4 and 12. Three milliliters of DNA in PBS was administered at 4 sites (0.65 ml each), one in each of the deltoids and anterior tibialis muscles. Fig. 2 shows the study design indicating different vaccinations and challenges.

Antibody analyses

The monkeys were bled at 4-week intervals, and their sera were tested for dengue serotype-specific antibody by ELISA and/or PRNT. IgG antibody was detected by ELISA as previously described (Ansari et al., 1993) except that polyethylene glycol (PEG) precipitated dengue-1, -2, -3 or -4 virions were used as the antigen, and a peroxidase-labeled anti-human IgG was used as the conjugate. A similar procedure with peroxidase-labeled anti-human IgM was used for IgM determinations. PRNT was performed with vero cells as described (Russell et al., 1967), using two-fold serial dilutions of serum samples. A pool of the pre-immune sera of all the animals was used as the negative control for PRNT. Fifty percent PRNT titers ($PRNT_{50}$) were determined by probit analysis using Minitab software (Minitab Inc, State College, PA).

Virus challenge and viremia

At week 32 (20 weeks after the final dose of vaccine), 3 animals from each vaccine group were challenged with live dengue-1 or dengue-2 virus. Each monkey was bled prior to challenge, then inoculated subcutaneously in the upper left arm with 0.5 ml DMEM containing 10^5 plaque forming units (PFU) of dengue-1 (strain Western Pacific 74) or dengue-2 (strain OBS-8041) virus. The dengue-1 and dengue-2 challenge virus stocks were produced by propagation in vero or C6/36 cells, respectively. These virus doses had earlier been determined to produce uniform viremia of 3–5 days (unpublished). Monkeys were bled daily for 10 days and again on days 21 and 28 after challenge. Sera were used to measure viremia and antibody responses. Viremia was measured by inoculating 25 cm^2 flasks of confluent vero or C6/36 cells in duplicate with 0.2 ml of a 1:10 diluted serum sample. The inoculated cells were incubated for 10 days at 37 °C in a CO_2 incubator. The cells were then scraped off the flasks, washed with PBS and spotted in duplicate onto immunofluorescence slides. Dengue-specific antigen was detected by indirect immunofluorescence using mouse monoclonal antibody 7E11 and FITC-conjugated anti-mouse immunoglobulin. Monoclonal antibody 7E11 is specific to dengue NS-1 protein and is known to bind NS-1 protein of all 4 dengue serotypes (unpublished). Slides were examined under a fluorescent microscope with appropriate positive and negative controls.

Statistical analyses

Log transformed PRNT-50 titers for each of the 4 dengue serotypes were analyzed by one-way ANOVA for equality among different vaccine treatments. Animals that had titers of zero were assigned a value of 1 for log transformation purpose. Following one-way ANOVA, comparison of multiple means was performed using Fisher's LSD test. Because all the animals in the vector control group had titers of zero indicating no variability, thus nullifying the assumption of equal variances among groups, Fisher's LSD test was repeated excluding the vector control group from analysis. However, both analyses (with and without control group) produced identical results. Similarly, for virus challenge data, mean days of viremia for dengue-1 and dengue-2 were analyzed separately by one-way ANOVA and Fisher's LSD test.

Acknowledgments

We are grateful to Dr. Peter O'Hanley for his support and expert advice. This work was funded by a cooperative research and development agreement between the Naval Medical Research Center and Maxygen Inc., and by the Bill and Melinda Gates Foundation. The initial work to generate shuffled dengue antigens was supported by a grant from the Defense Advanced Research Projects Agency (DARPA). The experiments reported herein were conducted according to the principles set forth in the "Guide for the Care and Use of Laboratory Animals", Institute of Laboratory Animals Resources, National Research Council, DHHS Publication No. (NIH) 86-23 (1985). Edited by Alan Fersht

The Flavivirus genus includes widespread and severe human pathogens like the four serotypes of dengue virus (DENV1 to DENV4), yellow fever virus, Japanese encephalitis virus and West Nile virus. Domain III (ED3) of the viral envelope protein interacts with cell receptors and contains epitopes recognized by virus neutralizing antibodies. Its structural, antigenic and immunogenic properties have been thoroughly studied contrary to its physicochemical properties. Here, the ED3 domains of the above pathogenic flaviviruses were produced in the periplasm of Escherichia coli. Their thermodynamic stabilities were measured and compared in experiments of unfolding equilibriums, induced with chemicals or heat and monitored through protein fluorescence. A designed ED3 domain, with the consensus sequence of DENV strains from all serotypes, was highly stable. The low stability of the ED3 domain from DENV3 was increased by three changes of residues in the protein core without affecting its reactivity towards DENV-infected human serums. Additional changes showed that the stability of ED3 varied with the DENV3 genotype. The T_m of ED3 was higher than 69°C for all the tested viruses and reached 86°C for the consensus ED3. The latter, deprived of its disulfide bond by mutations, was predominantly unfolded at 20°C. These results will help better understand and design the properties of ED3 for its use as diagnostic, vaccine or therapeutic tools.

Keywords antigenicity/consensus sequence/envelope protein/flavivirus/protein stability

Introduction

The Flavivirus genus includes several human pathogens such as the yellow fever virus (YFV), Japanese encephalitis virus (JEV), West Nile virus (WNV) and the four serotypes of dengue virus (DENV1 to DENV4). These viruses are widely distributed in the world, result in millions of human infections annually, and can cause deadly encephalitis and haemorrhagic fever. Here, we focus on these mosquito-borne flaviviruses but important studies have also been performed on tick-borne flaviviruses (Weaver and Reisen, 2010).

The flaviviruses are enveloped RNA viruses. The structures of the whole virus and of its envelope (E) protein have been solved by electron cryo-microscopy and X-ray crystallography for a number of them (Kuhn et al., 2002; Modis et al., 2003; 2005; Mukhopadhyay et al., 2003; Kanai et al., 2006; Nybakken et al., 2006; Luca et al., 2012). Ninety dimers of the E protein cover the surface of the virus. Each E protein monomer comprises three ectodomains, ED1–ED3, and a transmembrane segment. ED2 includes the dimerization interface, glycosylation sites and the peptide of fusion with the cellular membrane. ED3 is continuous and comprises residues 296–400 of the E protein (DENV1 numbering). Its fold is compact, immunoglobulin-like and stabilized by a disulfide bond between residues Cys302 and Cys333. The solution structures of recombinant ED3 domains have been solved by NMR methods for YFV, JEV, WNV, DENV2 and DENV4 (Wu et al., 2003a; Volk et al., 2004; Volk et al., 2007; Huang et al., 2008; Volk et al., 2009). The structure of the isolated ED3 domain is close to its structure in the crystals of the E protein.

The ED3 domain participates in the interaction between the virus and primary or secondary cell receptors, including heparan sulfates and ribosomal protein SA (Chen et al., 1996; Thullier et al., 2001; Hung et al., 2004; Lee et al., 2006; Pattnaik et al., 2007; Huerta et al., 2008; Hershkovitz et al., 2009; Kaufmann and Rossmann, 2011; Watterson et al., 2012; Zidane et al., 2013). Consistently, recombinant ED3 domains inhibit infectivity of the cognate virus for DENV1, DENV2, WNV and JEV and some authors have proposed to use ED3 as a basis for therapeutic molecules (Hung et al., 2004; Jaiswal et al., 2004; Chu et al., 2005; Chin et al., 2007; Chavez et al., 2010; Li et al., 2012). Mutations in the ED3 domains of YFV and DENV2 affect their cell tropism and virulence (Hahn et al., 1987; Jennings et al., 1994; Pryor et al., 2001).

In mice, the ED3 domain is highly antigenic and recognized by monoclonal antibodies (mAbs) that neutralize the virus, strongly block its adsorption to cells and protect against viral infection (Crill and Roehrig, 2001; Brien et al., 2010). ED3 contains type-, subcomplex- and complex-specific epitopes (Roehrig, 2003; Diamond et al., 2008; Chavez et al., 2010; Guzman et al., 2010). The crystal structures of several complexes between the ED3 domain and either the Fab or Fv fragment of neutralizing monoclonal antibodies have been solved to high resolution (Nybakken et al., 2005; Lok et al., 2008; Austin et al., 2012; Cockburn et al., 2012; Midgley et al., 2012).

In humans, only a small proportion of the IgG population in DENV2-, DENV3- or WNV-infected serums targets ED3,

it appears to play a minor role in the immune response to the infection, and it does not correlate with its clinical outcome (Oliphant et al., 2007; Crill et al., 2009; Wahala et al., 2009). However, one group has shown that the titer in IgG to ED3 in DENV2 infected serums correlates with the neutralization of DENV2 (Crill et al., 2009). Moreover, human mAbs (hmAb) to the ED3 of DENV potently neutralize DENV infection (Beltramello et al., 2010).

Several studies have shown that the ED3 domain is a useful antigen for flavivirus serologic diagnosis since antibodies to ED3 are less cross-reactive than those against ED1 or ED2 (Chavez et al., 2010). ED3 domains have been used as antigen in indirect IgM or IgG enzyme-linked immunosorbent assay (ELISA) to detect infection by DENV, WNV, JEV and several tick-borne flaviviruses (Simmons et al., 1998b; Beasley et al., 2004; Holbrook et al., 2004; Shukla et al., 2009; Batra et al., 2011). A single polypeptide that includes the ED3 domains of the four DENV serotypes has been used as an antigen for detecting infection by any of the four DENV serotypes (Batra et al., 2010b, 2011). An ED3 domain (ED3.DENVc) with the consensus sequence of ED3 domains from viral strains of the four DENV serotypes is recognized by immune ascitic fluids from mice infected by DENV1, DENV2 or DENV3 but not DENV4 (Danecek et al., 2010; Bowen et al., 2012).

ED3 has been considered as a potential immunogen for subunit vaccines against flaviviruses (Chavez et al., 2010; Guzman et al., 2010). Many studies have shown that the isolated ED3 domain is immunogenic in mice and elicits neutralizing and often protective antibodies, e.g. to JEV, WNV and the four DENV serotypes (Simmons et al., 1998a; Wu et al., 2003b; Alka et al., 2007; Chu et al., 2007; Zhang et al., 2007; Babu et al., 2008; Verma et al., 2009; Batra et al., 2010a; Guzman et al., 2010). The ED3 domain from DENV2 (ED3.DENV2) elicits neutralizing antibodies and partial protection in monkey against the cognate virus (Guzman et al., 2010). Multivalent ED3 domains, i.e. single polypeptides including the ED3 domains from several serotypes of DENV, elicit neutralizing and protective antibodies in mice, e.g. simultaneously to DENV2 and DENV4 or to the four DENV serotypes (Khanam et al., 2006; Chen et al., 2007; Etemad et al., 2008). A consensus ED3.DENV domain elicits protective antibodies to all four DENV serotypes (Leng et al., 2009; Chiang et al., 2011). Recombinant or synthetic genes coding for a single ED3 domain or several ED3.DENV domains in tandem have been inserted in the genome of infective non-pathogenic viruses and shown to elicit neutralizing antibodies in mice, e.g. using adenovirus or measle vaccine virus as vectors (Brandler et al., 2007, 2010; Khanam et al., 2009).

Thus, the ED3 domains have been thoroughly studied from the viewpoints of structure, function, antigenicity and immunogenicity. However, very few studies of their physicochemical properties have been reported (Yu et al., 2004). Here, we report the production of the isolated ED3 domains from several pathogenic flaviviruses in Escherichia coli. We measured and compared their thermodynamic stabilities in experiments of unfolding equilibriums, induced with chemical denaturants or heat, and monitored through the protein intrinsic fluorescence. In particular, we measured the stability of the ED3.DENVc domain that derived from the four serotypes of DENV by consensus (Danecek et al., 2010). We increased the stability of the least stable ED3 domain, ED3.DENV3, by molecular design without modifying its antigenicity and analyzed whether this stability varied with the genotype within the serotype. Finally, we abolished the disulfide bond of an ED3 domain by mutation and determined its folding state at 208C. We discuss our results in relation with the biology of the flaviviruses and the potential applications of the ED3 domains.

Materials and methods

Media, reagents and buffers

The culture medium 2-YT, NuPAGE Novex Bis-Tris 4–12% gradient gels, MES-SDS Running Buffer, sample buffer and See Blue Plus 2 Prestained Standards were purchased from Invitrogen; IPTG from Euromedex; phosphate-buffered saline (PBS), MES hydrate, Tween 20, 4-nitrophenyl phosphate (pNPP), polymyxin B sulfate, hen egg-white lysozyme and goat antibodies to human IgMs from Sigma-Aldrich; bovine serum albumin from Roche; low-fat milk powder from Regilait; Maxisorp ELISA plates from NUNC; the fast-flow Ni-NTA resin from Qiagen; the Quick change II site-directed mutagenesis kit from Agilent Technologies; and ultrapure urea and Guanidine-HCl (GuHCl) from MP Biochemicals. Ampicillin was used at 200 mg ml^{-1} and chloramphenicol at 34 mg ml^{-1}. The solutions of 10 M urea and 8 M GuHCl were prepared daily and their pH was adjusted as described (Pace, 1986). The concentrations of denaturant, urea or GuHCl, were measured with a refractometer and a precision of 0.01 M.

Buffer A contained 20 mM Tris-HCl, 500 mM NaCl; buffer B: 8 M urea, 100 mM NaH_2PO_4, 10 mM Tris-HCl, pH 8.0; buffer C: 20 mM Tris-HCl, 100 mM NaCl; buffer D: 50 mM Tris-HCl, 150 mM NaCl, pH 7.9; buffer E: 30 mM MES, 150 mM NaCl, pH 5.5; buffer F: 0.1% Tween 20 in PBS; buffer G: 5% (w/v) low-fat milk powder in buffer F; buffer H: 1% (w/v) low-fat milk powder in buffer F; and buffer J: 10% diethanolamine, pH 9.8, 10 mM $MgSO_4$, 20 mM $ZnCl_2$. The pH of buffers A and C was distant by 1 unit from the protein pI.

Bacterial, plasmid and viral strains

The E.coli strain BL21(DE3, pLysS), plasmid pET20b+ (Novagen) and the plasmids encoding the ED3-H6 and H6-ED3-PhoA hybrids (Brandler et al., 2007; Lisova et al., 2007; Zidane et al., 2013) have been described. The origin of the viral ED3 domains and the corresponding segments of the envelope protein are indicated in Table I.

Clinical samples

A first set of human serums (Group 1) was collected within the normal activity of the National Reference Center (NRC) for Arboviruses, Institut Pasteur de la Guyane, French Guiana. These serums were collected from patients who displayed clinical symptoms of dengue and whose infection by DENV was confirmed by laboratory methods. A second set of human serums (Group 2) was collected in the context of a clinical study (DENFRAME project) that was performed in French Guiana (Dussart et al., 2012). These serums were collected from patients who displayed clinical symptoms of dengue but were diagnosed as negative for DENV infection.

In the following, we designate these serums as DENV-uninfected serums. Both Group 1 and Group 2 serums consisted of paired blood samples collected during the acute and convalescent phases of infection. The samples were characterized by standard diagnostic methods, as described in details elsewhere, in particular, the DENV serotype that was responsible for the disease was identified by reverse transcriptase polymerase chain reaction (RT-PCR) (Dussartet al., 2012). All the serums of group 1 were positive for the presence of anti-DENV IgM in an IgM antibody capture ELISA (MAC-ELISA) that used mouse brain extracts as antigens. The constitution of the above human serum collections and their use for the present study were approved by the Institutional Review Board of Institut Pasteur and a regional ethical committee (Comité de Protection des Personnes, Ile-de-France 1).

Genetic constructions

The genes coding for the ED3.YFV(Asibi), ED3.DENVc and ED3.DENV3(st) domains were chemically synthesized by GenScript (USA) after optimization of the codon usage for E.coli. They were inserted between the NcoI and XhoI of plasmid pET20b+, under control of the pelB signal sequence as previously described (Lisova et al., 2007). Mutations were introduced by site-directed mutagenesis with synthetic oligonucleotides and the Quick change II kit. The changes of nucleotides that resulted in the change C302V of amino acid residue in ED3.DENVc, introduced a second NcoI site at codons 300–302, 5′ACC-ATG-GTT3′. The pelB signal sequence of the double mutant ED3.DENVc(C302V,C333A) was precisely deleted by inserting a synthetic double-stranded DNA cassette between the NdeI site, coding for the initiator Met, and the NcoI sites at codons 300–302. This cassette was formed by annealing two synthetic oligonucleotides: 5′TATGGGCATGAGCTATAC3′ and 5′CATGGTATA GCTCATGCCCA′. All the genetic constructions were verified by DNA sequencing.

Production and purification of the hybrids

The productions of the ED3-H6 and H6-ED3-PhoA hybrids in the periplasmic space of E.coli and their purification from periplasmic extracts through their His-tag were performed essentially as described (Brandler et al., 2007; Lisova et al., 2007; Zidane et al., 2013). The cysteine-less domain ED3.DENVc(C302V,C333A)-H6 was produced in the cytoplasm of strain BL21(DE3, pLysS). The producing bacteria were grown at 24–28°C in 2-YT broth, supplemented with ampicillin and chloramphenicol during a preculture and with ampicillin alone during the main culture. The expression of the Cys-less ED3-H6 domain was induced during the exponential phase of growth by the addition of 1.0 mM IPTG and the bacteria further grown overnight in the same conditions. The subsequent steps were performed at 4–8°C. One volume of culture was cooled on ice and then centrifuged to pellet the bacteria. The bacterial pellet was resuspended in 1/20th volume of 1 mg ml^{-1} lysozyme, 5 mM imidazole in buffer A and the cells were disrupted by sonication. The insoluble materials were pelleted by centrifugation, washed with 1/20th volume of 5 mM imidazole in buffer A and pelleted again. The subsequent steps were performed at room temperature to avoid crystallization of urea. The insolubles were resuspended in 1/20th volume of buffer B. The suspension was mildly agitated until it became translucent, and then centrifuged 20 min at 15000*g* to remove the cell debris. The supernatant contained the solubilized proteins.

The Cys-less ED3-H6 domain was then separated from the other proteins by affinity chromatography on a column of NiNTA resin (0.5 ml l^{-1} of culture), and refolded within the column before elution. The column was equilibrated with 6 volumes of buffer B, loaded with the preparation of solubilized proteins and then washed with 20 volumes of buffer C to remove urea and the unbound proteins. The subsequent steps were performed at 4–8°C. The outlet of the column was capped, one volume of buffer C was added and the reaction of refolding was left to run for several hours. The column was washed with 10 volumes of 5 mM imidazole in buffer A to remove the weakly bound proteins. The Cys-less ED3-H6 domain was then eluted by a step gradient of imidazole in buffer A. The fractions of purification were analyzed by sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) in reducing conditions. The purest fractions were pooled, snap-frozen and kept at −20–80°C. They were homogeneous at ~98%. The yield of purified ED3.DENVc(C302V,C333A) domain was about 3 mg l^{-1} of bacterial culture.

Fluorescence measurements

The fluorescence spectra were recorded with a FP-6300 spectrofluorometer (Jasco) in a quartz cuvette of 10 × 2 mm^2 path lengths, between 310 and 370 nm with excitation at 278 nm in buffer D. The slit width was equal to 2.5 nm for the excitation light and 5 nm for the emission. The increment of wavelength was equal to 0.5 nm. The fluorescence signal for the protein was obtained by subtraction of the signal for the solvent alone.

Unfolding with urea or GuHCl

Unfolding with urea or GuHCl was performed as described (Pace, 1986). Each reaction mixture (1 ml) contained purified protein (10 mg ml^{-1}) and varying concentrations of urea (0–8 M) or GuHCl (0–6 M) in buffer D. Control reactions were prepared by replacing the protein with buffer. The mixtures were incubated for ~14 h at 20–28°C to enable the reaction of unfolding to reach equilibrium. To test the reversibility of the unfolding reaction, a protein sample was denatured in 8 M urea or 6 M GuHCl and buffer D for 4 h. The denatured protein was diluted with buffer D to reach varying concentrations of denaturant. The diluted mixtures were then incubated

Downloaded from https://academic.oup.com/peds/article-abstract/26/6/389/1541185/Thermodynamic-stability-of-domain-III-from-the
by White and Case LLP user
on 05 September 2017

for 14 h at 208C as above. The concentration of denaturant was measured in each reaction mixture after completion of the experiments. The equilibriums of unfolding were monitored with the intrinsic fluorescence of proteins as described in the previous paragraph.

Thermal unfolding

Unfolding with heat was performed with a Quantamaster spectrofluorometer (Photon Technology International), equipped with a computer-operated thermoelectric cuvette holder. The signal for the protein was obtained by subtraction of the signal for the solvent alone, recorded in a separate experiment. The purified protein (80 mg ml^{-1}) in buffer D or E was melted in a quartz cuvette of 10 10 mm^2 path-length with a constant heating rate of 0.258C min^{-1} between 45 and 908C. The intrinsic fluorescence was excited at 278 nm and the emission was recorded at 330 and 350 nm. The excitation and emission slit widths were equal to 1 and 10 nm, respectively.

Thermal precipitation

The periplasmic extracts were divided into identical portions, which were simultaneously incubated at 48C, 598C and 698C for 30 min. The samples were cooled for ten minutes on ice, the protein precipitates were eliminated by centrifugation and the supernatants were analyzed by SDS-PAGE in reducing conditions.

MAC-ELISA

The capture ELISAs were performed in 96-well flat-bottom microtiter plates with a volume of 100 ml/well. The plates were sensitized with antibodies to human IgMs as follows. A goat antibody to human IgMs (1.0 mg ml^{-1} in PBS) was loaded in wells of the plate. The plate was incubated overnight at 48C for the reaction of adsorption. The wells were washed with buffer F (three times), blocked with buffer G for 1 h at 378C and then washed as above. The serums and recombinant antigens were diluted in buffer H. The serums were diluted 100-fold. Wells were loaded with the diluted serums or with buffer H as a blank sample, and the plate was incubated for 1 h at 378C for the reaction of antibody capture. The wells were washed as above and then loaded with the solution of recombinant antigen. The plate was incubated for 1 h at 378C for the binding reaction. The wells were washed as above and the bound antigen, (ED3-PhoA)$_2$, was detected by addition of 5 mM pNPP in buffer J and measurement of A_{405nm} after 3 h at 258C.

Analysis of the sequences, structures and experimental data

The values of the theoretical molecular mass (MM_{th}) and extinction coefficient e_{280nm} of the proteins were computed from the amino acid sequences with the sub-program PepStat of the EMBOSS software suite (Rice et al., 2000). The atomic coordinates of the proteins were retrieved from the RCSB protein data bank (www.rcsb.org). The solvent accessible surface areas (ASA) were computed with the access routine of the What If software package and a probe radius of 1.4 Å (Vriend, 1990). The structures were drawn with RasMol version 2.7.3 (www.rasmol.org).

The equilibriums of unfolding were analyzed with a two-state system, exactly as described (Ould-Abeih et al., 2012). The curve fits were performed with Kaleidagraph (Synergy Software), which gives Pearson's coefficient of correlation, R_P. Semi-parametric receiver operating characteristics (ROC) curves were computed with the LABROC4 program (Metz et al., 1998) as implemented in the Web based calculator JLABROC4 by J. Eng (http://www.jrocfit.org). These curves plot the true positive fraction of samples as a function of their false-positive fraction when the value of the threshold varies. The area under the curve (AUC) is an unbiased measure of the assay accuracy. The standard error SE on a sum of two terms A and B was calculated from the equation of error propagation: $SE(A + B)^2 = SE(A)^2 + SE(B)^2$.

Results

Fluorescence properties of recombinant ED3 domains

The isolated ED3 domains from several pathogenic flaviviruses were produced in the periplasmic space of E. coli where the formation of their disulfide bond is enzymically catalyzed, and purified through their hexahistidine tag. Each ED3 domain includes a tryptophan residue, which is conserved in all flaviviruses, unique in the mosquito-borne flaviviruses (position 391 in the E protein of DENV1) and partially buried in the available crystal structures (see Introduction). The intrinsic fluorescence of the ED3 domains was excited at the wavelength of 278 nm. For all the ED3 domains that we studied here, the value of the fluorescence intensity F decreased and the wavelength l_{max} of its maximum increased when going from the native state (N) to the unfolded state (U) in 8 M urea or 6 M guanidinium-HCl (GuHCl) as previously reported for the ED3 domain from DENV1 (ED3.DENV1) (Monsellier and Bedouelle, 2005). More precisely, we found 340 nm, l_{max}, 343.3 nm for the N state and 347 nm, l_{max}, 350.5 nm for the U state at pH 7.9, 208C.

Stability of ED3 domains as measured with chemical denaturants

We measured the thermodynamic stability of ED3 domains by analyzing their unfolding equilibriums, induced with urea and monitored through their fluorescence intensity F. The signal was measured at the emission wavelength for which the difference between the F values for states N and U was maximal. The profiles of unfolding showed a single cooperative transition when the concentration of denaturant x varied (Fig. 1). We, therefore, modeled them by a two-state system, N and U. The fitting of this model to the experimental data allowed us to determine three characteristic parameters (only two of which are independent) the difference in free energy $DG(H_2O)$ between states N and U in the absence of denaturant, which is the protein stability; its coefficient of dependence m towards the concentration of denaturant, which measures the cooperativity of unfolding; and the concentration $x_{1/2}$ of denaturant for half-unfolding, which measures the protein resistance to unfolding (Table II).

The unfolding profile of ED3.DENV2, induced with urea, was incomplete because the cooperative transition happened at too high a value of x. We, therefore, induced its unfolding with GuHCl, a stronger denaturant. We performed both types of experiments, with urea and GuHCl, for ED3.DENV1 because we wanted to rank the stabilities of the different ED3 domains (Table II) and the $DG(H_2O)$ values are not

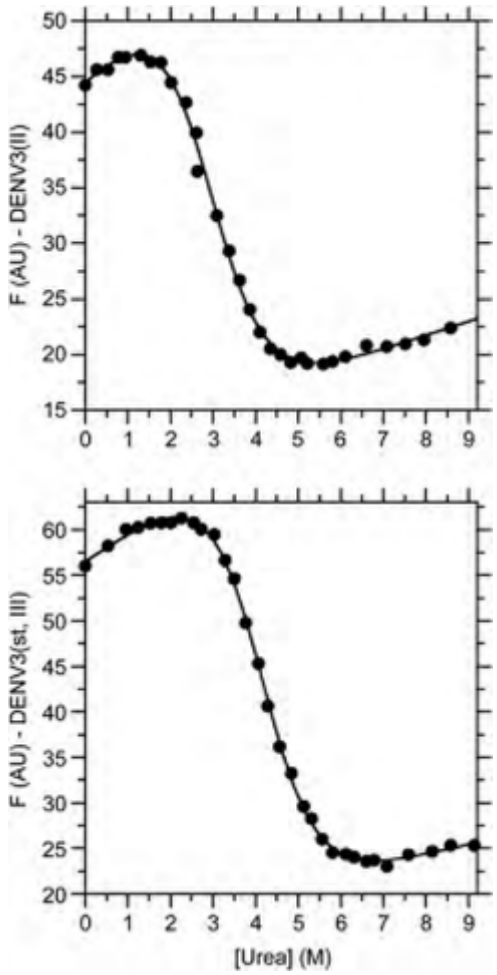

Fig. 1. Unfolding equilibria of ED3.DENV3 derivatives, induced with urea at 20°C in buffer D and monitored through their intrinsic fluorescence. The proteins were excited at 278 nm and their fluorescence intensity F recorded at 332.5 nm for ED3.DENV3(II) (top part) and 337 nm for ED3.DENV3(st, III) (bottom part), in arbitrary units (AU). The solid lines correspond to the fitting of a two-state model to the experimental data points (R_P = 0.99879 and 0.99967, respectively).

necessarily identical when obtained with urea or GuHCl (Monera et al., 1994). We checked that its unfolding equilibriums were reversible when induced with GuHCl, as they were with urea (Monsellier and Bedouelle, 2005).

We found the following decreasing order for the stabilities $\Delta G(H_2O)$ of the ED3 domains: WNV = DENV2 > DENV4 > DENV1 > JEV > YFV(17D) > YFV(Asibi) > DENV3. The values of $x_{1/2}$ gave a slightly different order because of the slight variations in the values of m and the relation $\Delta G(H_2O) = m x_{1/2}$. For proteins of identical lengths and close structures, the variations of m are usually due to differences in the residual interactions that exist in the unfolded state and are favored by the existence of a disulfide bond (Monsellier and Bedouelle, 2006).

Stability of ED3.DENV1 at pH 5.5

The envelope protein of flaviviruses undergoes a transition from a dimeric to a trimeric quaternary structure when it goes from a neutral to a low pH, as in the endosomes, and fuses with the cell membrane. The structure of the ED3 domain is maintained during this transition but its position relative to ED1 and ED2 is modified (Modis et al., 2004; Nayak et al., 2009). We compared the stabilities of the ED3.DENV1 domain at pH 7.9 and 5.5 to reveal a potential change in the endosomes. We found a significant difference in stability between the two pHs, $\Delta\Delta G(H_2O)$ = 0.9+ 0.2 kcal mol^{-1}, due to a smaller cooperativity of unfolding at pH 5.5, Δm = 0.19+ 0.03 kcal mol^{-1} M^{-1} (Table II).

Table II. Thermodynamic parameters for the unfolding equilibriums of ED3 domains, induced with chemical denaturants at 20°C and monitored through the intrinsic fluorescence intensity of the protein. The fluorescence was excited at 278 nm. Mean and SE value in at least three independent experiments.

Denat, nature of the denaturant.

Stability of a consensus ED3 domain

We designed, optimized for E.coli, and chemically synthetized a recombinant gene that encoded the consensus sequence for the ED3 domains from viral strains of the four DENV serotypes (Daneceket al., 2010). We produced and purified this consensus domain, which we named ED3.DENVc, as described for the parental ED3 domains and measured its stability by monitoring its unfolding equilibriums induced with GuHCl. Its yield of production and purification was equal to 7 mg l^{-1} of culture in flask. Its stability was identical to that of ED3.DENV2, i.e. greater or equal to the stabilities of the individual ED3.DENV domains from the four serotypes. The resistance $x_{1/2}$ to denaturation of ED3.DENVc was significatively greater than those of ED3.DENV1 and ED3.DENV2, but its cooperativity m of unfolding was slightly lower (Table II).

Design of a stabilized ED3.DENV3 domain

The ED3.DENV3 domain was the least stable of all the flaviviral ED3 domains tested. This poor stability could be a disadvantage for its uses. We, therefore, sought to increase its stability without compromising its antigenicity. Our design consisted in changing buried residues of ED3.DENV3 into those of ED3.DENVc, while keeping unchanged its solvent exposed residues. Therefore, we considered only those residues of ED3.DENV3 whose side chains had solvent ASA lower than 10 Å^2 and which were different in ED3.DENVc. This search restricted the changes to three positions, 320,

by White and Case LLP user
on 05 September 2017

322 and 339 (with the DENV1 numbering; Fig. 2). We, therefore, introduced three changes I320V, I322V and T339I in ED3.DENV3 at the genetic level. The resultant derivative, which we named ED3.DENV3(st), was more stable than the parental ED3.DENV3, with $\Delta\Delta G(H_2O) = 0.95 \pm 0.18$ kcal mol^{-1}. This stabilization was due to a greater resistance to denaturation, with $\Delta x_{1/2} = 0.84$ M urea, without any change in the cooperativity m of unfolding.

Variation of stability between genotypes within a DENV serotype

The sequence of our parental ED3.DENV3 domain was identical to that of the ED3 domain from the prototypic strain Philippines/H87/1956, which belongs to the Asian genotype II of DENV3. Therefore, we renamed ED3.DENV3(II) and ED3.DENV3(st, II) our parental ED3.DENV3 domain and its stabilized derivative to indicate their genotype. The ED3 domain from strain H87 is not recognized by human serums that were infected and sampled during the Havana (Cuba) epidemics of 2001–02 (Zulueta et al., 2006). We observed that the sequence of the ED3.DEN3 domains from strains of the Asian genotype II and from strains of the Latin-American genotype III differ only by two changes, L303T and K385N (DENV1 numbering), of residues whose side chains are exposed to the solvent and, for some of them, by an additional change, A331V (Fig. 2) (Modis et al., 2005; Wahala et al., 2010). These residues are, respectively, Thr303, Ala331 and Ser385 in ED3.DENVc. On the basis of the above, we constructed an additional derivative of ED3.DENV3(II) that derived from ED3.DENV3(st, II) by the two changes of residues L303T and K385N and that we named ED3.DENV3(st, III). We also constructed two intermediate domains that carried the single changes L303T or K385N and that we named ED3.DENV3(st,II, L303T) and ED3.DENV3(st,II, K385N).

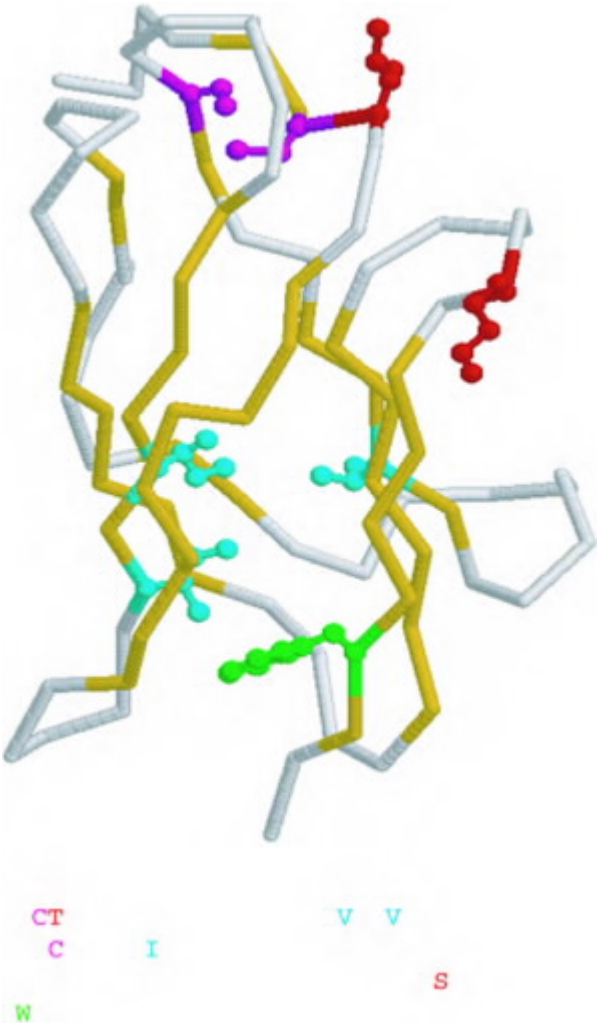

Fig. 2. Comparison between the structure of ED3.DENV3(II) and the sequence of ED3.DENVc. The structure of ED3.DENV3(II) is represented by the chain of its C_a atoms. The b-sheets are colored in yellow. Relevant amino acid side chains are in ball-and-stick representation. The residues are numbered according to the E protein of DENV3, as in the PDB file 1UZG. Add two to obtain the DENV1 numbering. The sequence of ED3.DENVc is numbered according to the E protein of DENV1. The color codes of the residues are identical in the structure and sequence.

The ED3.DENV3(st, III) domain was stabler than ED3.DENV3(st, II), with $\Delta\Delta G(H_2O) = 0.64 \pm 0.25$ kcal mol^{-1}. The main contribution to the difference in stability came again from the resistance to denaturation, with $\Delta x_{1/2} = 0.42 \pm 0.05$ M urea. Overall, ED3.DENV3(st, III) was 1.59 ± 0.26 kcal mol^{-1} more stable than ED3.DENV3(II) (Table II). ED3.DENV3(st, II, L303T) was 2.50 ± 0.49 kcal mol^{-1} more stable than ED3.DENV3(II) with $\Delta x_{1/2} = 1.37 \pm 0.11$ M urea. Interestingly, mutation K385N was neutral in the structural context of ED3.DENV3(st, II) and destabilizing in the context of ED3.DENV3(st, II, L303T). The effect of mutation K385N therefore depended on the side chain in position 303. Such a context effect is quite common (Monsellier and Bedouelle, 2006).

Unfolding with heat

The experiments of chemical unfolding, induced with urea or GuHCl, allowed us to determine and compare the stabilities of ED3 domains from various flaviviruses. However, heat rather than chemical unfolding is important for applications. Therefore, we analyzed the unfolding equilibriums of several ED3 domains, induced with heat and monitored through their fluorescence intensity.

The profiles of heat-induced unfolding showed a single cooperative transition for all the analyzed ED3 domains (Fig. 3). We checked that these equilibriums were reversible (not shown) and modeled them again with a two-state system, N and U. The model depended on three parameters: the temperature T_m at which the variation of free energy $\Delta G(T)$ between states N and U was nil; the variation of enthalpy ΔH_m between states N and U at temperature T_m, and the variation of caloric capacity ΔC_p between states N and U. We reduced this number to two characteristic parameters by empirically predicting $\Delta C_p = 1.678$ kcal mol^{-1} K^{-1} as described (Myers et al., 1995).

The results (Table III) showed that the ED3.DENV1 and ED3.DENVc domains had close values of ΔH_m, 113.33 and 118.49 kcal mol^{-1}, respectively, and therefore close cooperativities of unfolding. In contrast, T_m was greater by 7.8 ± 0.2°C for ED3.DENVc than for ED3.DENV1. The T_m value was remarkably high for these two proteins, 86.17°C for ED3.DENVc and 78.37°C for ED3.DENV1. The ED3.DENV3(II) domain had both T_m and ΔH_m values lower than those of ED3.DENV1, resulting in a lower stability. The T_m value of ED3.DENV3(II) was nevertheless quite high, 70.39°C. ED3.DENV3(II) and ED3.DENV3(st,III) had close

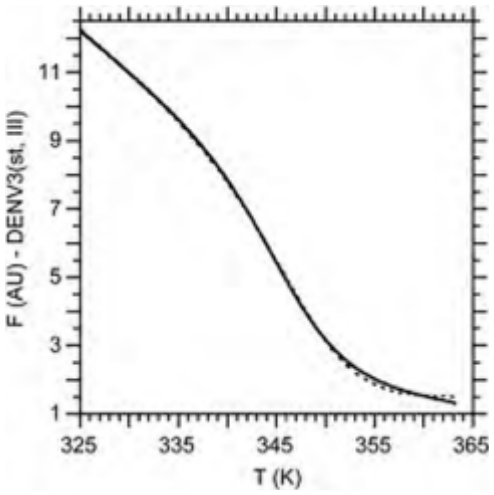

Fig. 3. Unfolding equilibria of the ED3.DENV3(st, III) domain, induced with heat in buffer D and monitored through its intrinsic fluorescence. The protein was excited at 278 nm and its fluorescence intensity F recorded at 330 nm in arbitrary units (AU). The solid line corresponds to the 3172 experimental data points and the dashed line to the fitting of a two-state model with DC_p ¼ 1.678 kcal mol^{-1} K^{-1} (R_P ¼ 0.99993).

Table III. Thermodynamic parameters for the unfolding equilibriums of ED3 domains, induced with heat and monitored through the intrinsic fluorescence intensity of the protein. The fluorescence was excited at 278 nm and its intensity recorded at 330 nm. SE in the curve fit.

ED3 origin	T_m (K)	DH_m (kcal mol^{-1})	R_P
DENV1	351.52 ± 0.17	113.3 ± 4.9	0.99966
DENV1 (pH5.5)	350.32 ± 0.04	74.1 ± 0.6	0.99996
DENV3(II)	343.54 ± 0.21	67.7 ± 1.6	0.99980
DENV3(st, III)	347.28 ± 0.03	61.0 ± 0.1	0.99993
DENVc	359.32 ± 0.18	118.5 ± 1.8	0.99985

values of DH_m, 67.7 and 61.0 kcal mol^{-1}, respectively. In contrast, T_m was greater by 3.7 °C for ED3.DENV3(st, III) than for ED3.DENV3(II). Finally, we found a slight destabilization of ED3.DENV1 at pH 5.5 relative to pH 7.9, mainly due to a lower cooperativity of unfolding, with heat as with urea (see above). It was not possible to calculate the values of $DG(H_2O)$ at 20 °C from the values of T_m and DH_m and to compare them with those obtained by unfolding with urea or GuHCl because of a too long extrapolation.

A consensus ED3 domain without disulfide-bond

We tested whether the ED3.DENVc domain, which had one of the highest thermodynamic stability ($DG(H_2O)$ ¼ 5.2 kcal mol^{-1} at 20 °C), could fold in a stable state in the absence of its disulfide bond. We constructed three double mutants of ED3.DENVc, carrying the couples of changes (C302A, C333V), (C302V, C333A) and (C302A, C333A), on the basis of published studies on immunoglobulin variable fragments (Proba et al., 1998). The three double mutants were produced in very small quantities in the periplasm of E.coli, in comparison with the parental ED3.DENVc domain. We further studied the double mutant ED3.DENVc(C302A, C333V), which was produced slightly better than the other two mutants. We constructed, at the genetic level, a derivative of ED3.DENVc(C302A, C333V) that was devoid of signal peptide for a cytoplasmic expression. An analysis of cellular extracts by SDS-PAGE showed that the double mutant was produced predominantly in the insoluble fraction and in very low quantities in the soluble fraction (not shown). The insoluble fraction was solubilized with 8 M urea and loaded on a nickel ion column. The ED3 domain was refolded within the column by washing out the urea, and then eluted with imidazole. The purified protein was highly homogeneous and its yield equal to several milligrams of protein per liter of culture in flask. An analysis of the unfolding equilibriums of the purified refolded ED3.DENVc(C302A, C333V) mutant, induced with urea at 20 °C and monitored through the ratio F_{330}/F_{350} of the intrinsic fluorescence intensities at 330 and 350 nm, showed a profile that could be approached by an exponential decay function, with a decay constant of 1.56 M^{-1}, and therefore a half-decay at 0.44 M urea (Fig. 4). These results showed that the ED3.DENVc(C302A, C333V) mutant, devoid of disulfide bond, was in equilibrium between a predominant fraction of unfolded state and a minority fraction of folded state even in the absence of urea. They were consistent with the presence of this domain as inclusion bodies in the cytoplasm and our observation that it slowly precipitated at 4 °C.

Thermoprecipitation of periplasmic extracts

The unfolding equilibriums, induced with heat, showed that the values of T_m were high for some ED3 domains. We tested whether it would be possible to obtain partially purified preparations of the ED3 domains by a differential heat-induced precipitation of the bulk of proteins in the periplasmic extracts. Identical aliquots of such extracts were treated at 48 °C, 59 °C and 69 °C for 30 min and cooled on ice. The protein precipitate was removed by centrifugation and the content of the supernatant analyzed by SDS-PAGE (not shown). We observed that the tested ED3 domains, from DENV1, DENVc and DENV3(st, III), resisted to the treatment at 69 °C and that the heat-treated periplasmic extracts were highly enriched in recombinant ED3 domain. The

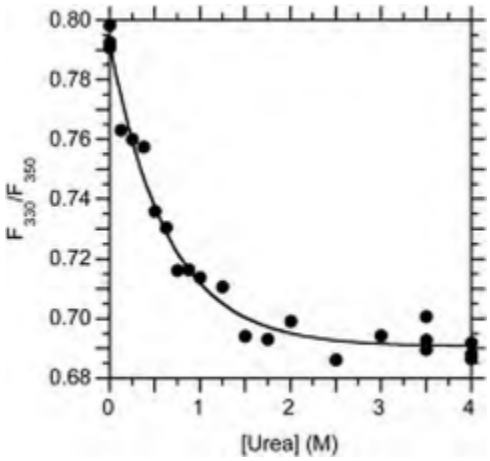

Fig. 4. Unfolding equilibria of the ED3.DENVc(C302V, C333A) domain, induced with urea at 20 °C in buffer D and monitored through its intrinsic fluorescence. The protein was excited at 278 nm and its fluorescence intensities F_{330} and F_{350} recorded at 330 and 350 nm. The urea concentration is given along the x axis and the ratio F_{330}/F_{350} along the y axis. The solid line corresponds to the fitting of an exponential decay function to the experimental data points (R_P ¼ 0.990).

results of these thermoprecipitation experiments confirmed the high resistance to heat of these three ED3 domains and could lead to simple methods of partial purification.

Antigenicity of the ED3.DENV3 derivatives

Since the engineering of the ED3.DENV3 domain aimed at increasing its stability without modifying its antigenicity, it was important to test this assumption. We constructed three dimeric hybrids ($H6\text{-}ED3\text{-}PhoA_2$) between ED3 and E.coli alkaline phosphatase to assay and compare the recognitions of the engineered ED3 domains by anti-DENV IgM in human serums. We assayed 6 serums of patients infected with DENV1, 5 with DENV2, 21 with DENV3, 5 with DENV4 and 6 non-infected serums by an IgM antibody capture ELISA (MAC-ELISA), using the dimeric hybrids as antigens. We focused our analysis on the IgMs because they are the first antibodies to appear after a flaviviral infection. The distribution of the MAC-ELISA signals were very similar for the antigens derived from DENV3(II), DENV3(st, II) and DENV3(st, III) (Fig. 5). We quantified the capacity of the three dimeric hybrids to distinguish either between DENV3-infected serums and non-infected serums or between DENV3-infected serums and the pool of serums that were non-infected or infected by DENV1, DENV2 or DENV4, by using ROC curves. AUC is a measure of the precision of the test. There were not significant differences between the precisions of the test when it was performed with any of the three dimeric hybrids, given the errors on the AUC values. Nevertheless, we observed that the signal was higher on average when the antigen was one of the stabilized ED3.DENV3 domains. In conclusion, we increased the stability of the ED3.DENV3 domain without modifying its antigenicity in a MAC-ELISA.

Discussion

A better knowledge of the biophysical properties of the ED3 domains is needed to clarify their role in antigenicity, immunogenicity and function, and to improve their applications. In particular, more data are needed on the relations between folding and either antigenicity or immunogenicity.

Periplasmic expression and folding state

Recombinant ED3 domains are generally produced in the cytoplasm of E.coli in the form of either insoluble aggregates or soluble fusion proteins, e.g. between ED3 and the maltose-binding protein. However, the disulfide bonds do not form in the reducing medium of the cytoplasm and therefore must be established in vitro. Here, we exported the isolated ED3 domains in the periplasmic space of E.coli where the formation of disulfide bonds is efficiently catalyzed in vivo by the Dsb system (Kadokura et al., 2003). In these conditions, we have previously shown that the experimental mass of the ED3.DENV1 domain is equal to the theoretical mass of a domain whose disulfide bond is correctly formed and whose N-terminal residue, resulting from the cleavage of the signal peptide, is Gly296 or Met-Gly296. An Ellman's test has shown that . 94% of the molecules of the ED3 domain have a disulfide bond, for DENV1, WNV, JEV and YFV(17D) (Lisova et al., 2007). The ED3.DENV1, ED3.DENV2 and ED3.DENV4 thus produced were crystallized in complex with the mouse neutralizing mAb 4E11, whose

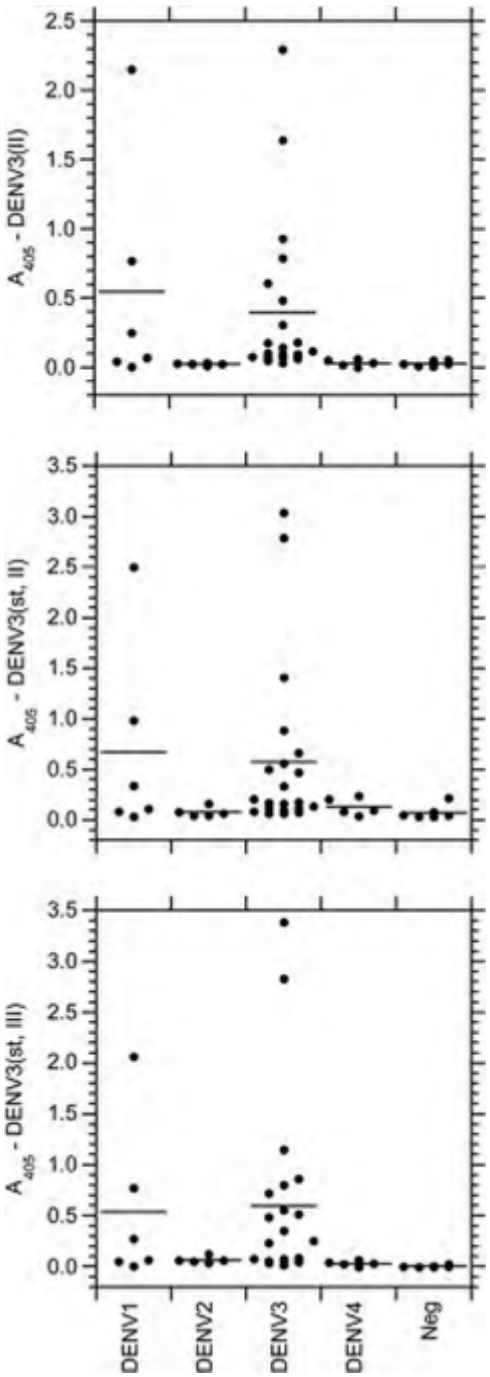

Fig. 5. MAC-ELISA performed with ($H6\text{-}ED3\text{-}PhoA_2$) dimers on five categories of human serums. The graphs give the distribution of the serum-specific signals along the y axis for each category of serum. The horizontal lines correspond to the mean value of the serum-specific signals for each category of serums. DENV1 to DENV4, human serums infected by the corresponding virus; Neg, DENV-uninfected serums. Top, middle and bottom parts, MAC-ELISA performed with ($H6\text{-}ED3\text{-}PhoA_2$) dimers from ED3.DENV3(II), ED3.DENV3(st,II) and ED3.DENV3(st,III), respectively.

epitope depends on the correct folding of the ED3 domain. The structures of the complexes at a resolution of 2 Å showed the presence of a disulfide bond and correct folding of the ED3 domain (Cockburn et al., 2012). All the ED3 domains that we studied here, except one, showed a cooperative transition of unfolding by denaturants, with a shift of their I_{max} of fluorescence emission from , 343.3nm to

Downloaded from https://academic.oup.com/peds/article-abstract/26/6/389/1541185/Thermodynamic-stability-of-domain-III-from-the
by White and Case LLP user
on 05 September 2017

. 347 nm, corresponding to an increased exposure of their unique Trp residue to solvent. The exception, ED3.DENVc (C302V, C333A), was devoid of disulfide bond, did not show any cooperative transition and was already more than half-unfolded in 0 M urea.

We tested the antigenicity of ED3.DENV3 and its various derivatives in the form of dimeric hybrids (ED3-PhoA)$_2$. The ED3 domain has one disulfide bond, the PhoA monomer has two disulfide bonds and PhoA is enzymically active only as a dimer. We have previously shown that the (ED3-PhoA)$_2$ dimers have both their ED3 and PhoA portions correctly folded and active when they are produced in the E.coli periplasm (Bedouelle et al., 2008). These dimeric hybrids have been used to probe the interaction between ED3 domains and cell receptors by using the reinforced interaction due to an avidity effect, e.g. with the NKp44 receptor of natural killer cells or the ribosomal protein SA, which is also known as the high-affinity laminin receptor 1 (Hershkovitz et al., 2009; Zidane et al., 2013). In conclusion, producing the ED3 domains, either isolated or in fusion with PhoA, in the periplasm ensures their proper folding, the formation of the disulfide bonds and thus the reproducibility of the biophysical and functional results.

Validity of a two-state model of unfolding

The recombinant ED3 domains are in a monomeric state at high concentration, as shown by structural methods (see Introduction). They can be refolded in vitro from a fully denatured state to their native state (Nybakken et al., 2005; Lok et al., 2008; Austin et al., 2012; Midgley et al., 2012). Previous studies have shown that the profiles of unfolding for the ED3 domains from several flaviviruses, monitored through circular dichroism, fluorescence or gel filtration, present a single transition in every case (Yu et al., 2004; Monsellier and Bedouelle, 2005). Here, we observed that the profiles of unfolding were cooperative, showed only one visible transition and were reversible. These profiles were approximated satisfactorily by functions that were derived from a two-state system of unfolding (Tables II and III). With regard to the experiments with chemical denaturants, the values of the cooperativity coefficient, m, were close to the values that could be predicted from their number of residues and disulfide bond, i.e. 1.218, m, 1.270 and 2.493, m, 2.593 for urea and GuHCl-induced unfolding, respectively (Myers et al., 1995). The $DG(H_2O)$ values were consistent with those reported for monomeric proteins having a similar molecular mass, and unfolding according to a two-state model (Kumar et al., 2006). With regard to the experiments with heat, the values of T_m and DH_m were consistent with those reported for similar proteins, although those for DENVc were among the highest reported for proteins from mesophilic organisms (Kumar et al., 2006). We concluded that our analysis of the unfolding profiles with a two-state model was pertinent.

Stability, structure and in vivo functions

The stability, disulfide bond and correct folding of the ED3 domain are important for its functions. For example, the epitopes of three neutralizing mouse mAbs in the E protein of DENV2 are inactivated by changing residue Cys333 into Ala at the genetic level and thus eliminating the disulfide bond between residues Cys302 and Cys333 (Roehrig et al., 2004). The epitope of another neutralizing mAb in a recombinant ED3.DENV2 domain is inactivated by the reduction and carbamidomethylation of the domain Cys residues. However, the binding of this ED3.DENV2 domain to its receptors in a cell microsomal fraction is unaffected by the chemical treatment (Huerta et al., 2008). Moreover, preparations of ED3 domains whose folding state is ill defined, can nevertheless detect antibodies to flaviviruses in infected human serums and elicit neutralizing antibodies in mice and monkeys (Simmons et al., 1998b; Beasley et al., 2004; Alka et al., 2007; Shukla et al., 2009; Wahala et al., 2009). Thus, the folding of the ED3 domain seems important only for some of its functions.

The folding of most mosquito-borne flaviviruses depends on the side chain of Tyr326, which belongs to a loop between two b-strands, is buried in the ED3 structure and forms hydrogen bonds with the main chain nitrogen atoms of residues 303 and 304 (DENV1 numbering). This structure, named 'tyrosine corner', does not exist in the viruses of the YFV group where Tyr326 is replaced by Val326 (Zhang et al., 2010). This structural difference could explain the lower stability of the ED3.YFV domains relative to those from other flaviviruses.

ED3.DENV3 was the least stable and least resistant to denaturation among the studied ED3 domains. This weak stability could explain the difficulties that we had to produce and crystallize this domain in complex with a monoclonal antibody (Cockburn et al., 2012). It could be related to the higher dynamics of this domain. Indeed, we observed that more residues are missing in the crystal structure of the isolated ED3 domain for DENV3 than for DENV1, DENV2, DENV4 or WNV (Nybakken et al., 2005; Lok et al., 2008; Austin et al., 2012; Cockburn et al., 2012; Midgley et al., 2012). This higher dynamics could be important for the interaction between the ED3 domain and cellular receptors.

Previously, differences in biophysical properties between various ED3 domains have been proposed to correlate with the higher tolerance of tick-borne flaviviruses to environmental conditions compared with mosquito-borne flaviviruses (Yu et al., 2004). Among the small sample of mosquito-borne flaviviruses that we analyzed here, a high virulence of the parental virus in primary infections was associated with a low stability of the ED3 domain, e.g. the wild-type strain YFV(Asibi) versus the vaccine strain YFV(17D); or DENV1 and DENV3 versus DENV2 and DENV4. Indeed, DENV1 and DENV3 are more pathogenic than DENV2 and DENV4 for patients who had had not an immune priming from other serotypes (Fried et al., 2010). Consistent with a proposed relation between lower stability and higher virulence, the interaction between ED3 and its cell receptors is strengthened at endosomal pH (Huerta et al., 2008) and we found that ED3.DENV1 was less stable in buffer E (pH 5.5) than buffer D (pH 7.9) (Tables II and III).

Applications

We found that some ED3 domains had strong resistances to chemical denaturant- and heat-induced unfolding. These properties are important for potential applications, e.g. use in diagnostic assays, vaccines or therapy. ED3.DENV3 was the least stable and least resistant to denaturation among the studied ED3 domains. This weak stability could bias the experimental data on antigenicity and immunogenicity obtained

by White and Case LLP user
on 05 September 2017

with this domain. It could also be an impediment or a disadvantage for its applications. Here, we improved its stability without compromising its antigenicity. These results have potential applications for the diagnostic assays and recombinant vaccines that use ED3.DENV3 either alone or in fusion with the ED3 domains from other serotypes. It could be extended to protein domains from other pathogens. Previously, it has been reported that the binding and neutralization capacity of mouse mAbs to ED3.DENV3 are strongly influenced by naturally occuring mutations in DENV3 (Brien et al., 2010; Wahala et al., 2010). Here, the comparison between ED3.DENV3(st, II) and ED3.DENV3(st,III) showed that solvent-exposed residues could influence stability and that different genotypic strains of the same viral serotype may have different biophysical properties. These variabilities complicate the design of efficient diagnostic assays and vaccines against DENV.

As mentioned above, the ED3 domains of the four DENV serotypes are used both in diagnostic assays and vaccines. There is a clear interest in a unique antigen or immunogen that could detect an infection by any one of the four DENVs or vaccinate against all of them. Two types of solutions have been proposed to this problem. Some authors have created recombinant molecules that link the ED3 domains of the four serotypes in a single chimeric polypeptide (see Introduction). Others have created a unique ED3 domain that has the consensus sequence of the four serotypes. They have reported that such a consensus domain indeed raises protective antibodies against the four DENV serotypes and is recognized by murine antibodies to at least three of the serotypes (Leng et al., 2009; Danecek et al., 2010; Chiang et al., 2011; Bowen et al., 2012). The consensus ED3.DENVc domain has the advantage of being highly stable and having a defined fold relative to the four ED3.DENV domain linked in a single recombinant polypeptide. The greater stability of a consensus protein relative to the individual proteins of organisms that live in the same physiological conditions has been reported previously and form the basis of a general method for increasing the stability of proteins (Steipe et al., 1994; Steipe, 2004; Monsellier and Bedouelle, 2006). The present study shows that such an approach can be used to increase the stability not only of antibodies or enzymes, as previously reported, but also of antigens and immunogens provided that the solvent-accessible residues are kept unchanged.

In conclusion, our results could contribute to a better understanding of the flavivirus biology and immunology and should be useful for the potential applications of the ED3 domains in the fields of diagnostics, vaccines and therapeutic molecules against this important class of viral pathogens.

Special Notice (SN) DARPA-SN-18-18: PREventing EMerging Pathogenic Threats (PREEMPT) Proposers Day

DATE: January 30, 2018
LOCATION: Arlington, VA
REGISTRATION DEADLINE: January 23, 2018 or when capacity is reached, whichever comes first. We will continue to accept webinar only registrations through January 26, 2018 or until webinar capacity is reached, whichever comes first.
REGISTRATION WEBSITE: https://events.sa-meetings.com/PREEMPTProposersDay
TECHNICAL POC: Dr. Jim Gimlett, DARPA/BTO
Email: DARPA-SN-18-18@darpa.mil

The Biological Technologies Office (BTO) of the Defense Advanced Research Projects Agency (DARPA) is hosting a Proposers Day for the potential proposer community in support of a planned Broad Agency Announcement (BAA) for the PREventing EMerging Pathogenic Threats (PREEMPT) program. The Proposers Day will be held on January 30, 2018 at the Executive Conference Center (ECC) in Arlington, VA. The event will be webcast for those who would like to participate remotely. Advance registration is required for both the physical meeting and the webcast. Note, all times listed in this announcement and on the registration website are Eastern Time.

The Proposers Day objectives are:

- To introduce the science and technology community (industry, academia, and government) to the PREventing EMerging Pathogenic Threats program vision and goals;
- To explain the general mechanics of a DARPA program and the specific objectives and milestones of this program; and
- To encourage and promote teaming arrangements among organizations with the expertise, research facilities, and capabilities needed to execute research and development responsive to PREEMPT program goals.

The Proposers Day will include overview presentations by government personnel, an information session to respond to questions from participants, and "lightning" talks (three minutes, one PowerPoint slide) for potential proposers to highlight technical capability or interest to promote teaming. Lightning talks must be scheduled via the registration website.

Attendance at this event is not a requirement for submission of a proposal or selection for funding. Information relayed during the Proposers Day will be made available on the BTO section of the DARPA Opportunities page: http://www.darpa.mil/work-with-us/opportunities.

PREEMPT Program Overview:

During US international operations, military forces are deployed to remote locations around the globe, often in areas where endemic and emerging diseases are prevalent. Most of these emerging and re-emerging diseases originate in animal reservoirs and then jump into humans. Despite biosurveillance efforts around the globe, viral outbreaks continue to outpace preparedness with new viral infectious diseases arising every year. Current approaches to biosurveillance focus on detection of known pathogens in human populations, human-to-human transmission, and modeling the trajectory of the epidemic following an outbreak event. Animal pathogens that have the potential to infect humans, but have not yet spilled over, are rarely considered. As a result, infectious agents are detected only after an outbreak, health responses are largely reactive, and often arrive late. The PREEMPT program represents a radical departure from current practice, aiming to target viral biothreats within animal reservoir to preempt their entry into human populations before an outbreak occurs.

To combat viruses that may emerge or re-emerge from animal populations or are transmitted by insect vectors, the PREEMPT program aims to produce and validate integrated multiscale models and experimental testbeds that quantify the probability a human virus pathogen will emerge from an animal reservoir and develop scalable approaches to suppress and prevent species jump from wild or domestic reservoirs and/or to impede insect-mediated viral transmission. Successful teams will address and integrate these program components to demonstrate proof-of-principle of a block-before-jump preemptive capability.

Attendee Presentations

Interested attendees are invited to present a brief **one-slide** PowerPoint summary of their interests and capabilities (**see Attachment 1**). These will be presented during 3-minute "lightning" presentations at Proposers Day. Presentations consisting of multiple slides will not be granted a time slot. Lightning talks will be accepted on a first-come, first-served basis until time constraints are reached. Lightning talk submissions are restricted to those attending the physical meeting. All presentations must be emailed to DARPA-SN-18-18@darpa.mil no later than 12:00 PM EDT on **January 23, 2018**.

Teaming

DARPA highly encourages teaming before proposal submission and, as such, will facilitate the formation of teams with the necessary expertise. Potential proposers may choose to be included on the (optional) Proposer Profile List by submitting a one-page profile consisting of their contact information (name, organization, email, telephone number, mailing address and, if applicable, organization website); a brief description of their technical competencies; and, if applicable, their desired expertise from other teams/organizations (**Attachment 2**).

All profiles must be emailed to DARPA-SN-18-18@darpa.mil no later than 4:00 PM ET on **January 23, 2018**. Following the deadline, the consolidated teaming profiles will be sent via

email to the interested parties who submitted a **valid profile (following the format provided and not exceeding the single page limit)**. Specific content, communications, networking, and team formation are the sole responsibility of the participants. Neither DARPA nor the DoD endorses the information and organizations contained in the consolidated teaming profile document, nor does DARPA or the DoD exercise any responsibility for improper dissemination of the teaming profiles.

Registration Information:

PLEASE NOTE: Registration for physical participation will close on January 23, 2018 at 12:00 PM EST or when capacity is reached and registration for webinar participation will close on January 26, 2018 at 12:00 PM EST or when webinar capacity is reached.

Registration is limited by the venue capacity, and early registration is strongly recommended. **There will be no on-site registration.**

Participants must register in advance through the registration website. There will an optional **$15** meal fee for the Proposers Day. Early registration is strongly recommended. Due to space limitations, attendance for the Proposers Day will be limited to the first **140** registrants. Remote participation via webcast is limited to **500** participants. Interested parties are encouraged to coordinate attendance internally within their organizations prior to registration. Physical attendance is limited to no more than two representatives per division/department. Individuals who are unable to register because the deadline has occurred or capacity has been reached, will be added to a waitlist. If slots remain open after registration closes or become available due to cancellations, the slots will be filled on a first-come, first-served basis from the waitlist.

An online registration form and various other meeting details can be found at the registration website, https://events.sa-meetings.com/PREEMPTProposersDay.

All attendees are required to present government-issued photo identification upon entry to the event.

Further administrative questions should be addressed to DARPA-SN-18-18@darpa.mil. Please refer to the PREventing EMerging Pathogenic Threats Proposers Day (DARPA-SN-18-18) in all correspondence. This announcement is not a request for proposals; any sent will be disregarded.

This SN is issued solely for information and potential new program planning purposes; the SN does not constitute a formal solicitation for proposals or proposal abstracts. In accordance with FAR 15.201(e), responses to this notice are not offers and cannot be accepted by the Government to form a binding contract. Submission is voluntary and is not required to propose to subsequent Broad Agency Announcements (if any) or research solicitations (if any) on this topic. DARPA will not provide reimbursement for costs incurred in responding to this SN. Respondents are advised that DARPA is under no obligation to acknowledge receipt of the information received,

or provide feedback to respondents with respect to any information submitted under this SN. NO CLASSIFIED INFORMATION SHOULD BE INCLUDED IN THE SN RESPONSE.

PART II: FULL TEXT OF ANNOUNCEMENT

1. Funding Opportunity Description

This publication constitutes a Broad Agency Announcement (BAA) as contemplated in Federal Acquisition Regulation (FAR) 6.102(d)(2) and 35.016 and 2 CFR § 200.203. Any resultant award negotiations will follow all pertinent law and regulation, and any negotiations and/or awards for procurement contracts will use procedures under FAR 15.4, Contract Pricing, as specified in the BAA.

DARPA is soliciting innovative proposals for research to develop new tools and models to quantify the likelihood of a virus to jump from an animal host into humans, and to develop and validate new scalable technologies to target potential human-capable viral pathogens in wild reservoirs and/or mosquito vectors to prevent transmission to humans.

1.1. PROGRAM OVERVIEW

Introduction

During U.S. international operations, military forces are deployed to remote locations around the globe, often in areas where endemic and emerging diseases are prevalent[1]. Most of these emerging and re-emerging diseases originate in animal reservoirs and then jump into humans. Numerous trends, including the increased interactions between human, animal and insect populations due to increased population densities, globalization, densification of livestock production, and rising human encroachment into animal habitats, have increased the risks of new viral outbreaks in those regions where Department of Defense (DoD) personnel are typically deployed. Often, DoD personnel are among the first responders in outbreak situations. Emerging infectious diseases, for which few medical countermeasures are available, represent a major threat to the warfighter and national security and could have devastating impacts on U.S. public health.

Despite biosurveillance efforts around the globe, new viral outbreaks continue to outpace preparedness efforts and show no signs of abating. During the first three quarters of 2017 outbreaks of avian influenza A (H7N9), Chikungunya, MERS coronavirus, Ebola, Seoul virus, Hepatitis E, Hepatitis A, Yellow Fever, Lassa, and Zika viruses were recorded[2]. While current biosurveillance strategies focus on detection of known pathogens within the human population following an infectious outbreak event, there is a dearth of research and surveillance on sentinel or reservoir animals[3]. Animal-specific viruses that have the potential to infect humans (*namely "*human-capable" pathogens), but have not yet spilled over into human populations, are rarely considered. As a result, infectious agents are detected only *after* an outbreak—that is, after an animal pathogen has adapted to become capable of infecting humans. Consequently, the outbreak response is largely reactive and not initiated until after an epidemic has already begun. The PREEMPT program represents a radical departure from current practice, aiming to target viral

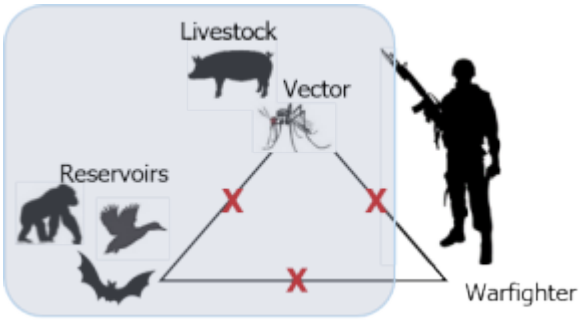
[3] Metcalf, J.E. and Lessler, J. (2017). Opportunities and challenges in modeling emerging infectious diseases. Science.

biothreats within the animal reservoirs where they originate and preempt their entry into human populations *before* an outbreak occurs.

Recently, the scientific community has advanced its understanding of host-pathogen genetics and mechanisms of adaptation across hosts[4,5], developed analytic tools to predict animal hosts of new and potential human-transmissible viruses, and learned how to identify "hot spot" geographic regions where an animal-to-human virus jump is imminent[6,7]. This understanding is empowered by new high-throughput data generation capabilities and sophisticated analytic and computational tools. Together, this new understanding and capability hold great promise for the development of advanced integrated models that can assess and likely provide guidance for action that prevents human virus emergence before the virus gains entry to the human population. The PREEMPT program aims to develop new tools and models to quantify the likelihood of a virus quasispecies (QS) to jump from an animal host into humans. In parallel, PREEMPT seeks to develop and validate new scalable technologies that prevent transmission of viral pathogens in wild reservoirs and/or mosquito vectors to humans or to bridge animals that serve as intermediary hosts prior to virus jump into humans.



Research Objectives

PREEMPT research objectives are structured along two Technical Areas (TAs). Both Technical Areas must be performed in parallel by vertically integrated, interdisciplinary teams. Proposers must present a plan to address both Technical Areas and meet key milestone decision points that occur at the end of year 2.

1) TA1: Develop and validate integrated, multiscale models that quantify the likelihood a human-capable virus will emerge from an animal reservoir residing in a "hot spot" geographic region.

2) TA2: Develop scalable approaches that target and suppress the animal virus in its reservoir(s) and/or vector(s), to reduce the likelihood of virus transmission into humans.

Technical Area 1 (TA1)

[4] Lloyd-Smith, J.O. (2010). Identifying genetic markers of adaptation for surveillance of viral host jumps. Nature Reviews Microbiology.
[5] Plowright, R.K. et al. (2017). Pathways to zoonotic spillover. Nature Reviews Microbiology.
[6] Olival, K.J. et al. (2017). Host and viral traits predict zoonotic spillover from mammals. Nature.
[7] Han, B.A. et al. (2016). Undiscovered Bat Hosts of Filoviruses. PLoS Negl Trop Dis.

Studies within TA1 must produce and validate models that: (a) quantify the likelihood of a virus to jump into a new animal species and/or humans, (b) identify opportunities for proactive intervention, and (c) determine likely efficacy, scalability, and sustainability of prevention strategies.

Proposers are expected to leverage high-throughput virus screening methods, metagenomics, ecological surveillance, and advanced modeling tools to generate risk models for species jump that will enable near real-time data analysis and identification of potential risks and risk factors. This far-forward biosurveillance system should also identify opportunities for preemptive intervention, assessing likely efficacy, scalability, safety, and sustainability of preemptive strategies to target viral threats in animal reservoirs and/or vectors before they enter the human population.

TA1 Components
Proposers should address, at minimum, the following aspects:

1) Selection of zoonotic or vector-borne viral pathogen(s) (multiple viruses within the same family may be addressed if they share a common animal reservoir and/or vector)
2) Field data collection
3) Multi-species field samples studied in a controlled laboratory setting
4) Data analysis, integration, and model development
5) Real-time data sharing and analysis
6) Model outputs
7) Experimental validation of model predictions in a controlled, environment-simulated laboratory setting

1. Selection of zoonotic or vector-borne viral pathogen

This BAA only will consider proposals focused on zoonotic and/or vector-borne viruses. Microorganisms other than viruses are not responsive to this announcement. A rationale for the viruses selected is required. Virus selection may be based on, but is not limited to, the following factors: high frequency of re-emergence (*e.g.* avian influenza virus), patterns of virus host range or host breadth (predicted zoonotic potential), potential for rapid spread due to vector-mediated transmissibility, severity of disease pathology, and likelihood of pandemic threat.

2. Field data collection

Proposers must identify and justify suitable geographic "hotspots" within which they will collect field data. Proposers must consider <u>all</u> of the following criteria when selecting geographic hot spots for field data collection:

1) Previous evidence of geographic distribution of zoonotic reservoirs and/or vectors for known or unknown human viruses; these maps may be based on epidemiological, phylogenetic, ecological, biogeographic, socio-economic data, or other;
2) Evidence of past species jump events in or near the selected geographic location;

3) Demonstrated capabilities and infrastructure to perform research in the selected geographic region and/or collaboration with an established DoD or Department of Health and Human Services (DHHS) partner (*e.g.*, a Naval Medical Research Unit site, Armed Forces Research Institute of Medical Sciences, or Centers for Disease Control), such that the performer can coordinate far-forward surveillance activities and access local lab and analytics capabilities;
4) Appropriate levels of in-country government approval, cooperation, infrastructure and logistical support where samples will be collected and analyzed; and
5) Rationale for reservoirs/species to be sampled.

Where applicable, proposers must consider seasonal distribution (*e.g.,* wet-dry seasons for mosquito), temporal ecological factors (*e.g.,* time of fruiting for fruit bats), and temporal behavioral traits (*e.g.,* sexual maturation) of zoonotic species for field sampling. Potential geographic areas may include, but are not limited to, endemic regions; those undergoing ecological shifts (thus increasing risk for spillover due to changes in animal-human interactions); those harboring host species with high zoonotic potential that are in proximity to human populations and "bridge" animal hosts (*e.g.,* human-bat-swine ecosystems); and prior sites of spillover events or outbreaks. The selection of geographic areas of common military deployment that also meet the above criteria is strongly encouraged. Proposers should describe feasible approaches to increase the probability of detecting viruses within animal reservoirs and/or vectors—residing in selected geographic areas—that have the potential to become human-capable. Proposers should describe sample collection methods in detail, being sure to include longitudinal sampling frequency. Development of novel and rapid sampling approaches for the real-time continuous screening of emerging or re-emerging pathogens at the human-animal interface is encouraged. Proposers are encouraged to identify field samples that were collected during past outbreak events, or field data already generated, that could be accessed for retrospective analyses. In such cases, proposers should describe how and where the data were collected, and establish quality control methods for data evaluation and use. Although human use research will not be funded by PREEMPT, the use of human samples or data from prior outbreaks obtained through other programs may be included in the research plan as long as samples are appropriately de-identified (see, for example, https://humansubjects.nih.gov/human-specimens-cell-lines-data).

3. Multi-species laboratory testing of field samples

Proposers should discuss protocols to determine and quantify the virus population QS diversity from the vector or reservoir at the time of sample collection (t=0) in a manner that minimizes QS alterations, which commonly result from cell line passaging. Proposers should assess the need for longitudinal collection of samples to understand viral QS temporal dynamics (temporal changes in sequence and fitness landscapes) in field virus populations. The initial viral QS isolated from a field sample (t=0) will be hereon annotated as "QS_0". Proposers must describe *in vitro* and/or *in vivo* experiments to assess jump potential of the QS_0 population to a relevant new host. Experimental approaches to monitor viral species jump may include, but are not limited to: changes in viral population QS during cell line passaging between relevant species; infection of appropriate animal models; infection of natural animal hosts; and controlled, multi-species laboratory ecosystems.

Lab testing should determine the key parameters influencing the probability of a viral QS_0 to jump and adapt to a new host species. Potential parameters across different host animals or vectors may include, but are not limited to:

1) QS diversity profiles
2) Rates of virus infection and amplification
3) Virus incubation period
4) Viremia and viral shedding
5) Transmission bottlenecks
6) Animal host evolutionary and immune pressures

The data generated should enable the development of genotype-to-phenotype maps and the determination of mutation(s) associated with virus jump to a new host.

4. Data analysis, integration, and model development

Proposers should identify the relevant data needed for developing integrated models of risk assessment. Proposers should discuss the development of probabilistic models of virus jump using advanced computational methods and tools, including both model-driven and data-driven approaches. Models should integrate multi-scale and cross-host species data, including but not limited to, field and experimental data (*e.g.,* QS dynamics), ecological data (*e.g.,* demographic, socio-economic, epidemiological, biogeographical, and other metadata), and other relevant data available, especially that generated from past spillover events. Models should consider all factors associated with pathogen emergence and transmission, particularly multi-host immunological landscapes. Models should also capture viral evolutionary trajectories, fitness landscapes in zoonotic and/or vector species, and quantify the transmission dynamics underlying species jump.

5. Real-time data sharing and analysis

The PREEMPT program is expected to generate significant amounts of data, primarily from next generation sequencing (NGS) of viral populations and analysis of host molecular signatures. Proposers should identify methods for near-real-time data sharing and analysis.

6. Model outputs

Proposers should explain how they will develop probabilistic models and machine learning techniques that integrate multi-scale and cross-species data (*e.g.,* molecular signatures, demographic, ecological, socio-economic, epidemiological, weather, climate, and other metadata) to quantify a pathogen's likelihood to cross species barriers and infect humans. Models should capture viral evolutionary trajectories and mutations that govern species jump. Models should quantify transmission dynamics, accounting for the diversity of viral QS. Models should identify key parameters of the pathogen, host species, vector dynamics, and ecological interactions contributing to species jump, and should inform a preemption strategy by identifying optimal pressure points (*e.g.,* jump-enabling mutations, stochastic transmission bottlenecks, and viral amplification requirements) that can be targeted to reduce the likelihood of species jump. For proposals addressing vector-borne viruses, proposers should describe methods to quantify

the likelihood of virus adaptation to a new vector and propose experimental methods to validate these predictions. Proposers should discuss metrics for grading model accuracy, sensitivity, and specificity. Models should be able to receive dynamic biosurveillance inputs and accommodate virus QS changes.

7. Experimental validation of model predictions

Proposers must describe in detail a plan to establish relevant *in vivo*, multi-species experimental approaches to validate model outputs. Experimental testing may closely resemble or recapitulate real-life settings (*e.g.,* climate, phylogenetically adjacent host species, and vector "biting" patterns) to enable the quantification of the probability of spillover and/or transmission events in a controlled manner. Approaches that closely recapitulate real-life ecosystems and natural hosts are strongly encouraged. To improve model accuracy, sensitivity, and specificity, performers must iterate both theoretical and empirical experiments.

TA1 Key Outputs
The key outputs for TA1 must include the following:

1) Integrated models that quantify likelihood of virus jump and can be easily adapted to receive dynamic surveillance and virus data input.
2) Stochastic models quantifying bottlenecks (e.g., transmission, cell entry, and infection rates) and mutational fitness maps (e.g., enabler mutations and their frequency).
3) Identification and assessment of potential preemptive intervention targets to preempt virus jump from the reservoir and/or vector.

Technical Area 2 (TA2)
Studies within this technical area aim to develop deployable and scalable methods to preempt viral jump across species.

TA2 Components
Technical Area 2 aims to develop deployable and scalable methods to preempt viral jump to other species. Proposers must address, at minimum, all of the following aspects:

1) Proof-of-concept preemption approaches;
2) Scalable delivery methods;
3) Analysis of long-term sustainability; and
4) Experimental validation.

1. Proof-of-concept preemption approaches

Proposers should describe how the output of TA1 *in silico* models will guide preventive method design, and how quantitative information of virus-host species barriers and transmission bottlenecks will be used to develop strategies to preempt emergence of human-capable viruses. Models should guide the selection of: host species to be treated (*e.g.*, wild animals, "bridge"

animals, vectors, and livestock); potential molecular targets (*e.g.,* key mutation(s) enabling receptor binding in a new host); targets associated with transmission cycle dynamics (*e.g.,* reduction of viral load within the reservoir and/or vector that would preclude transmission); and other relevant factors identified by the models. Proposers should describe the preemptive methods that address different model outputs. Examples of preemptive approaches include but are not limited to:

1) Specific disruption of jump-capable genes from virus QS in reservoirs and/or vectors using small interfering RNAs or CRISPR/Cas-based targeted deletions.
2) Suppression of virus jump to a new host through antibody-mediated virus neutralization.
3) Suppressed reservoir and/or vector viremia using virus defective interfering particles (DIPs) to outcompete virus replication.
4) Suppressed transmission among animal reservoirs through induced immunity (*e.g.,* vaccinate the animal).
5) Alternative methods informed by experimental and theoretical models. The development of novel preemptive approaches are strongly encouraged.

2. Scalable delivery methods

Proposers must describe scalable approaches to deliver the preemptive therapeutic to achieve animal and/or vector population-level control of the targeted virus, including strategies for reaching less accessible animal reservoirs (*e.g.,* rodents or non-human primates). Approaches that enable host-to-host therapeutic distribution (*i.e.,* do not require individual treatment) that are self-limiting, only activate when the viral pathogen target is present, and/or have a controllable "on/off-switch" are encouraged. Potential scalable methods of inoculation may include, but are not limited to:

1) Self-disseminating treatments or preventives (*e.g.,* transmissible recombinant vaccines, therapeutic interfering particles, or self-spreading antiviral therapies).
2) Bait vaccination or treatment of wild or domestic animals.
3) Spray-based methods.

Approaches that utilize genetic modifications of vectors (*e.g.,* engineered mitochondrial DNA) are acceptable. The proposed method of inoculation must be justified. The proposer must describe strategies for closely controlling preemptive delivery and spread.

3. Analysis of long-term safety and efficacy

Proposers must establish initial methods to assess the long-term safety and efficacy of preemptive approaches (*e.g*., determine the mechanism by which species specificity of a vaccine is maintained, and assess evolutionary stability and ecological safety).

4. Experimental validation

Proposers must describe approaches to validate preemptive methods of choice in controlled experimental models. Multi-species experimental platforms that closely recapitulate real-life ecosystems and use natural hosts are strongly encouraged.

TA2 Key Outputs
The key outputs of TA2 must include the validation of new "block-before-jump" preemption technologies for one of the following:

1) Validate suppression of virus jump from wild animal reservoir to humans and/or an intermediate animal carrier (*e.g.,* domestic livestock).
2) Validate suppression of virus jump or transmission from wild reservoir to vector, vector to a different vector species, and/or from vector to human.

Period of Performance
DARPA anticipates that the PREEMPT program will provide up to three and a half years of funding for research and development to be performed over Phase I (base) and II (option) periods of 24 and 18 months, respectively.

Timeline
PREEMPT spans a 42-month effort with a 24-month Phase I (base) and an 18-month Phase II (option). In general, Phase I should provide early validation of zoonosis risk models, and Phase II should establish efficacy and scalability of zoonosis prevention approaches.

Phase I (Base period)
Phase I efforts aim to develop experimental and mathematical models to quantify the likelihood a virus will jump from one host species to another, identify potential targets for spillover preemption, and develop scalable methods of preemption. During Phase I, performer teams will:

1) Identify the genetic adaptations that enable species jump.
2) Develop mathematical models to quantify the likelihood of species jump based on:
    a. Molecular data (*e.g.,* viral QS data from deep sequencing*)* and
    b. Ecological data *(e.g.,* immune state of the host population before pathogen emergence, species relatedness, etc.).
3) Identify bottlenecks for intervention (*e.g.. transmission, cell entry, viral amplification, infection rate, and other mechanisms associated with viral cross-species compatibility)*.
4) Develop initial scalable platforms that target viruses in reservoirs and/or vectors to prevent viral jump into other animals or humans.

By the end of year 1 (Phase I) performers will be expected to have:
1) Identified signatures of fitness and spillover potential of a pathogen between two species.
2) Quantified the genetic and transmission factors requirements of viral QS to jump to a new host (*e.g.,* develop genotype-to-phenotype maps, identify specific mutations, etc.) using far-forward biosurveillance data from selected high-risk regions.

By the end of year 2 (Phase I) performers will be expected to have:

1) Initially demonstrated that models can quantify the probability of human-capable virus pathogens to jump from one species to another species.
2) Demonstrated proof of concept methods for targeting human-capable virus pathogens in the reservoirs and/or vectors to reduce the probability of virus jump.
3) Provided initial strategies to scale up preemption methods.

Phase II (Option period)
Phase II efforts aim to develop probabilistic models for intra- and inter-species viral amplification and transmission dynamics, integrated models for risk assessment, and experimental validation of new approaches to preempt species jump. During Phase II, performer teams will extend Phase I modeling efforts to:

1) Quantify intra- and inter-species viral amplification dynamics and transmission.
2) Develop integrated models that quantify the probability of a virus QS to jump to bridge animal species or to humans.
3) Experimentally validate scalable methods for their ability to preempt zoonotic spillover.

By the end of year 3.5 (Phase II) performers will be expected to:

1) Demonstrate accuracy of risk assessment and preemption models in a relevant multi-species experimental setting.
2) Demonstrate the ability to suppress viral jump to a new species in controlled experimental settings.

It is recognized that appropriate milestones and metrics may depend upon the type of virus, the reservoir, the mechanisms of species jump, and the proposed preemption methods. Proposers must offer quantitative milestones and metrics (see Tables 1 and 2 below for notional metrics) for their proposed proof-of-principle use case. Proposers must demonstrate relevant research experience in the required technical areas. Proposals involving multiple teams and/or experimental approaches should be structured as unified efforts that address the program Technical Areas in parallel, in an integrated manner.

1.2. PROGRAM METRICS

In order for the Government to evaluate the effectiveness of a proposed solution in achieving the stated program objectives, proposers should note that the Government hereby promulgates the following program metrics that may serve as a guideline for assessing program progress, risk and impact. Although the following program metrics are provided, proposers should note that the Government has identified these goals with the intention of bounding the scope of effort while affording the maximum flexibility, creativity, and innovation in proposing solutions to the stated problem. Proposers should offer more appropriate and specific metrics for their particular use case and technical approach, including intermediate metrics (i.e. every 6 months, or sooner) to help further evaluate progress. Final metrics are to be negotiated at the time of contracting.

Table 1: Notional Milestones, Deliverables, and Program Metrics for TA1

Phase	Milestones and Deliverables	Program Metric
I	Collected field surveillance data: • Virus QS molecular data (*e.g.* from deep sequencing) and metadata from longitudinal samples (*e.g.* obtained from selected high-risk areas (*e.g.* bat cave) and/or from prior outbreak event • Host species immune molecular data	Quantitative measures of: • Longitudinal viral population QS ($QS_{t=0}$, $QS_{t=6\ months}$, $QS_{t=12\ months}$,..) diversity in selected high-risk areas (*e.g.* frequency of mutations, evolutionary trajectories) (**6 months**) • Viral QS diversity in samples obtained from animal, vector, and/or human from prior outbreak event (*e.g.* frequency of species-specific mutations) (**9 months**) • Immune molecular signatures from host reservoir or intermediate reservoir species (**12 months**)
	Multi-species lab test data: • Virus QS genotype-phenotype maps for at least 2 relevant host species	Quantitative measures of: • Cell entry and adaptation across species *in vitro* and/or *in vivo* (*e.g.* QS diversity during passage across species) (**18 months**)
	Initial mathematical models that assess risk of virus jump	Model capability to describe/predict: • Virus QS evolutionary trajectories between 2 relevant species (**9 months**) • Key molecular factors that could be targeted to prevent virus jump *in vitro* and/or *in vivo* (*e.g.* signatures of fitness of a pathogen between two relevant host species) (**18 months**) • Molecular targets for preemption (**24 months**)
	Established testbeds for validation of model predictions	Testbeds mimic natural environment as quantified by performer-defined parameters (**24 months**)
II	Multi-species lab test data • Quantify virus QS transmission factors between two species *in vivo*	Quantitative measures of: • Virus amplification and transmission dynamics (*e.g.* rate of infection vs. viremia, amplification rates, and incubation time) (**30 months**)
	Advanced mathematical models that assess risk of virus jump • Integration of molecular data and virus amplification/transmission dynamics • Integration of host immune evolutionary pressures and virus QS dynamics	Models predict: • Intra- and inter-species transmission dynamics (**36 months**) • Probability of spillover (risk assessment) (**42 months**) • Top 2 targets to reduce probability of transmission between two species to

Phase	Milestones and Deliverables	Program Metric
		inform TA2 (**42 months**)
	Further validation of model prediction in established testbeds	Validated model prediction accuracy in multispecies environment (**42 months**)

Table 2: Notional Milestones, Deliverables, and Program Metrics for TA2

Phase	Milestones and Deliverables	Program Metric
I	Proof-of-concept demonstration of preemptive approach that reduces either the probability of virus jump or the frequency of virus QS variants at high risk for species jump	Quantitative validation of preemptive approach as established by performer (**24 months**) Examples: • Frequency of high-risk mutation within virus QS in reservoir reduced >3X • Virus incubation period in vector extended >3X • Virus amplification rate in reservoir or vector reduced >3X • Viremia in host or vector reduced >5X
II	Demonstrated efficacy of preemption method	Reduced probability of transmission between two species by >5X *in vivo* for top 2 targets (**36 months**)
	Demonstrated scalability of preemption method	Quantitative scalability as established by performer (**42 months**)

Data Sharing

Proposers must ensure all technical data items (including experimental findings, processed data, methods of processing, research reports, and publications) and software (source code and executables) generated from PREEMPT program funding are made available to DARPA. Regularly submitted reports (*e.g.*, monthly or quarterly) should contain all relevant project data, including (but not limited to) raw and analyzed data and any necessary annotations and interpretation. Data and/or samples collected from de-identified human volunteers/patients from previous outbreak events must include associated anonymized metadata (*e.g.,* signs/symptoms, diagnostic test results, interventions, clinical observations, and outcomes). All raw data and metadata should be recorded according to approved experimental standards.

To gain enhanced scientific value from open collaboration in fundamental research, DARPA may seek permission to share some or all program-generated data with the broader research community as open data (including the possibility of accessing, reusing, and redistributing under appropriate licensing terms) to the extent permitted by applicable laws and regulations (*e.g.*, privacy, security, and export control).

DARPA anticipates that a large amount of data will be generated under this program by each performer and that the analyses and validation will be strengthened by compiling and integrating

information across all performers. Performers are strongly encouraged to establish the appropriate agreements to enable collaboration and data sharing. DARPA encourages sharing of pre-existing data, including those generated through funding by other sources, although this is not a requirement of the program.

As feasible, DARPA intends to share data within the PREEMPT performer community to promote program goals. To facilitate sharing and exchange of data items, performers will be required to enter an Associate Contractor Agreement (ACA); an ACA clause will be included in the contract or agreement awarded.

PREEMPT Transition Plan
Proposers must include a PREEMPT Technology Transition Plan. Proposers must indicate the types of partners (*e.g.*, government, private industry, non-profit) they plan to pursue and submit a timeline with incremental milestones toward successful engagement. Proposers should begin transition activities during the early stages of the program (Phase I). Awardees must include DARPA in the development of transition relationships. If the transition plan includes a start-up company, a business development strategy must be included as well. The extent by which the proposed intellectual property (IP) rights will impede the Government's ability to transition the technology will be considered in the proposal evaluation.

1.3. ETHICAL, LEGAL, AND SOCIETAL IMPLICATIONS (ELSI)

DARPA is committed to ensuring that efforts funded under this BAA adhere to ethical and legal regulations currently in place for federally and DoD-funded research. Program developments will be discussed with a panel of expert external advisors with expertise in bioethical and biosafety issues that may emerge as a consequence of advances in biomedical science and technology. Proposers to this BAA should address potential ethical, legal, and societal implications of the proposed technology.

1.4. PROTECTION OF SENSITIVE INFORMATION

PREEMPT is a 6.1 fundamental research program aimed at enhanced biosurveillance and novel approaches to preempt viral pathogens in animal reservoirs from jumping into human populations. DARPA follows current DoD policy for contracted fundamental research. DARPA recognizes, however, that PREEMPT program components aimed at understanding and quantifying mechanisms for viral zoonotic spillover could potentially generate sensitive information that could be misused. Since this is a fundamental research program, the risk of misuse currently cannot be reasonably evaluated. However, proposers are notified that during proposal evaluation and/or program performance, when such a risk reasonably can be evaluated, DARPA may determine that risk of misuse creates exceptional circumstances, compelling reasons, and/or national security reasons under current DoD policy for contracted fundamental research. DARPA therefore expects that proposers to this program understand and will comply with various government guidance regarding potential gain-of-function research of concern (GOFROC)[8] and dual use research of concern (DURC)[9,10,11,12,13]. See https://www.phe.gov/s3/dualuse/Pages/default.aspx for further information.

[8] Gain-of-Function Research (GOFROC) refers to studies with the potential to generate pathogens with pandemic potential exhibiting high transmissibility and high virulence.

DARPA requires that proposals include a Risk Mitigation Plan that will be incorporated into any resulting agreements or contracts and includes the following information:

1) An assessment of potential risks to public health, agriculture, plants, animals, the environment, and national security.
2) Proposed guidelines that the proposer will follow to ensure maximal biosafety and biosecurity during the course of the research.
3) A communication plan that addresses content, timing, and the extent of distribution of potentially sensitive dual-use information. The plan must also address how input from DARPA, other government, and community stakeholders will be taken into account in decisions regarding communication and publication of potentially sensitive dual-use information.

2. Award Information

2.1. GENERAL AWARD INFORMATION

Multiple awards are possible. The amount of resources made available under this BAA will depend on the quality of the proposals received and the availability of funds.

The Government reserves the right to select for negotiation all, some, one, or none of the proposals received in response to this solicitation and to make awards without discussions with proposers. The Government also reserves the right to conduct discussions if it is later determined to be necessary. If warranted, portions of resulting awards may be segregated into pre-priced options. Additionally, DARPA reserves the right to accept proposals in their entirety or to select only portions of proposals for award. In the event that DARPA desires to award only portions of a proposal, negotiations may be opened with that proposer. The Government reserves the right to fund proposals in phases with options for continued work, as applicable. The Government reserves the right to fund a Phase II option based on funding availability, an

---

[9] Dual Use Research of Concern (DURC) refers to life sciences research that can be reasonably anticipated to provide knowledge, information, products or technology that could be directly misapplied to pose a significant threat with broad potential consequences to public health and safety, agricultural crops and other plants, animals, the environment, materiel, or national security.
[10] Proposed framework for the oversight of dual use life sciences research: strategies for minimizing the potential misuse of research information, National Science Advisory Board for Biosecurity (NSABB). June 2007.
[11] Recommendations for the evaluation and oversight of proposed gain-of-function research by the National Science Advisory Board for Biosecurity (NSABB). May 2016.
[12] Tools for the Identification, Assessment, Management, and Responsible Communication of Dual Use Research of Concern: A Companion Guide to the United States Government Polices for Oversight of Life Sciences Dual Use Research of Concern. NIH. September 2014.
[13] United States Government Policy for Oversight of Life Sciences Dual Use Research of Concern. DURC Policy. March 2012.

assessment of Phase I research results, and a determination that awarding the option is in the best interests of the Government. The Government reserves the right to request any additional, necessary documentation once it makes the award instrument determination. Such additional information may include but is not limited to Representations and Certifications (see Section VI.B.2., "Representations and Certifications"). The Government reserves the right to remove proposers from award consideration should the parties fail to reach agreement on award terms, conditions, and/or cost/price within a reasonable time, and the proposer fails to timely provide requested additional information. Proposals identified for negotiation may result in a procurement contract, grant, cooperative agreement, or other transaction, depending upon the nature of the work proposed, the required degree of interaction between parties, whether or not the research is classified as Fundamental Research, and other factors.

Proposers looking for innovative, commercial-like contractual arrangements are encouraged to consider requesting Other Transactions. To understand the flexibility and options associated with Other Transactions, consult http://www.darpa.mil/work-with-us/contract-management#OtherTransactions.

In all cases, the Government contracting officer shall have sole discretion to select award instrument type, regardless of instrument type proposed, and to negotiate all instrument terms and conditions with selectees. DARPA will apply publication or other restrictions, as necessary, if it determines that the research resulting from the proposed effort will present a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense. Any award resulting from such a determination will include a requirement for DARPA permission before publishing any information or results on the program. For more information on publication restrictions, see the section below on Fundamental Research.

2.2. FUNDAMENTAL RESEARCH

It is DoD policy that the publication of products of fundamental research will remain unrestricted to the maximum extent possible. National Security Decision Directive (NSDD) 189 defines fundamental research as follows:

> 'Fundamental research' means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

As of the date of publication of this BAA, the Government expects that program goals as described herein may be met by proposers intending to perform fundamental research and proposers not intending to perform fundamental research or the proposed research may present a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense. Based on the nature of the performer and the nature of the work, the Government anticipates that some awards will include restrictions on the resultant research that will require the awardee to seek DARPA permission before publishing any information or results relative to the program.

Proposers should indicate in their proposal whether they believe the scope of the research included in their proposal is fundamental or not. While proposers should clearly explain the intended results of their research, the Government shall have sole discretion to select award instrument type and to negotiate all instrument terms and conditions with selectees. Appropriate clauses will be included in resultant awards for non-fundamental research to prescribe publication requirements and other restrictions, as appropriate. This clause can be found at http://www.darpa.mil/work-with-us/additional-baa.

For certain research projects, it may be possible that although the research being performed by the awardee is restricted research, a subawardee may be conducting fundamental research. In those cases, it is the awardee's responsibility to explain in their proposal why its subawardee's effort is fundamental research

3. Eligibility Information

3.1. ELIGIBLE APPLICANTS

All responsible sources capable of satisfying the Government's needs may submit a proposal that shall be considered by DARPA.

3.1.1. Federally Funded Research and Development Centers (FFRDCs) and Government Entities

FFRDCs

FFRDCs are subject to applicable direct competition limitations and cannot propose to this BAA in any capacity unless they meet the following conditions: (1) FFRDCs must clearly demonstrate that the proposed work is not otherwise available from the private sector. (2) FFRDCs must provide a letter on official letterhead from their sponsoring organization citing the specific authority establishing their eligibility to propose to Government solicitations and compete with industry, and their compliance with the associated FFRDC sponsor agreement's terms and conditions. This information is required for FFRDCs proposing to be awardees or subawardees.

Government Entities

Government Entities (e.g., Government/National laboratories, military educational institutions, etc.) are subject to applicable direct competition limitations. Government entities must clearly demonstrate that the work is not otherwise available from the private sector and provide written documentation citing the specific statutory authority and contractual authority, if relevant, establishing their ability to propose to Government solicitations.

Authority and Eligibility

At the present time, DARPA does not consider 15 U.S.C. § 3710a to be sufficient legal authority to show eligibility. While 10 U.S.C.§ 2539b may be the appropriate statutory starting point for some entities, specific supporting regulatory guidance, together with evidence of agency approval, will still be required to fully establish eligibility. DARPA will consider FFRDC and

Government entity eligibility submissions on a case-by-case basis; however, the burden to prove eligibility for all team members rests solely with the proposer.

3.1.2. Non-U.S. Organizations

Non-U.S. organizations and/or individuals may participate to the extent that such participants comply with any necessary nondisclosure agreements, security regulations, export control laws, and other governing statutes applicable under the circumstances.

3.2. ORGANIZATIONAL CONFLICTS OF INTEREST

FAR 9.5 Requirements

In accordance with FAR 9.5, proposers are required to identify and disclose all facts relevant to potential OCIs involving the proposer's organization and *any* proposed team member (subawardee, consultant). Under this Section, the proposer is responsible for providing this disclosure with each proposal submitted to the BAA. The disclosure must include the proposer's, and as applicable, proposed team member's OCI mitigation plan. The OCI mitigation plan must include a description of the actions the proposer has taken, or intends to take, to prevent the existence of conflicting roles that might bias the proposer's judgment and to prevent the proposer from having unfair competitive advantage. The OCI mitigation plan will specifically discuss the disclosed OCI in the context of each of the OCI limitations outlined in FAR 9.505-1 through FAR 9.505-4.

Agency Supplemental OCI Policy

In addition, DARPA has a supplemental OCI policy that prohibits contractors/performers from concurrently providing Scientific Engineering Technical Assistance (SETA), Advisory and Assistance Services (A&AS) or similar support services and being a technical performer. Therefore, as part of the FAR 9.5 disclosure requirement above, a proposer must affirm whether the proposer or *any* proposed team member (subawardee, consultant) is providing SETA, A&AS, or similar support to any DARPA office(s) under: (a) a current award or subaward; or (b) a past award or subaward that ended within one calendar year prior to the proposal's submission date.

If SETA, A&AS, or similar support is being or was provided to any DARPA office(s), the proposal must include:

- The name of the DARPA office receiving the support;
- The prime contract number;
- Identification of proposed team member (subawardee, consultant) providing the support; and
- An OCI mitigation plan in accordance with FAR 9.5.

Government Procedures

In accordance with FAR 9.503, 9.504 and 9.506, the Government will evaluate OCI mitigation plans to avoid, neutralize or mitigate potential OCI issues before award and to determine whether it is in the Government's interest to grant a waiver. The Government will only evaluate OCI mitigation plans for proposals that are determined selectable under the BAA evaluation criteria and funding availability.

The Government may require proposers to provide additional information to assist the Government in evaluating the proposer's OCI mitigation plan.

If the Government determines that a proposer failed to fully disclose an OCI; or failed to provide the affirmation of DARPA support as described above; or failed to reasonably provide additional information requested by the Government to assist in evaluating the proposer's OCI mitigation plan, the Government may reject the proposal and withdraw it from consideration for award.

3.3. COST SHARING/MATCHING

Cost sharing is not required; however, it will be carefully considered where there is an applicable statutory condition relating to the selected funding instrument. Cost sharing is encouraged where there is a reasonable probability of a potential commercial application related to the proposed research and development effort.

For more information on potential cost sharing requirements for Other Transactions for Prototype, see http://www.darpa.mil/work-with-us/contract-management#OtherTransactions

4. Application and Submission Information

4.1. ADDRESS TO REQUEST APPLICATION PACKAGE

This announcement, any attachments, and any references to external websites herein constitute the total solicitation. If proposers cannot access the referenced material posted in the announcement found at http://www.darpa.mil, contact the administrative contact listed herein.

4.2. CONTENT AND FORM OF APPLICATION SUBMISSION

All submissions, including abstracts and proposals must be written in English with type not smaller than 12 point font. Smaller font may be used for figures, tables, and charts. Copies of all documents submitted must be clearly labeled with the DARPA BAA number, proposer organization, and proposal title/proposal short title.

4.2.1. Proposal Abstract Format

Proposers are strongly encouraged to submit an abstract in advance of a proposal to minimize effort and reduce the potential expense of preparing an out of scope proposal. The abstract is a concise version of the proposal comprising a **maximum of 8 pages** including all figures, tables, charts, and the Executive Summary slide. The (optional) submission letter is not included in the page count. All pages shall be formatted for printing on 8-1/2 by 11-inch paper with font size not smaller than 12 point. Smaller font sizes may be used for figures, tables, and charts.

Submissions must be written in English.

Abstracts must include the following components:

A. Cover Sheet (does not count towards page limit): Include the administrative and technical points of contact (name, address, phone, fax, email, lead organization). Also

include the BAA number, title of the proposed project, primary subcontractors, estimated cost, duration of the project, and the label "ABSTRACT."

B. Executive Summary Slide: Provide a one slide summary in PowerPoint that effectively and succinctly conveys the main objective, key innovations, expected impact, and other unique aspects of the proposed project. Proposers should use the slide template provided as Attachment 1 to the BAA posted at http://www.fbo.gov.

C. Goals and Impact: Clearly describe what is being proposed and what difference it will make (qualitatively and quantitatively), including brief answers to the following questions:

1. What is the proposed work attempting to accomplish or do?
2. How is it done today? And what are the limitations?
3. What is innovative in your approach and how does it compare to current practice and state-of-the-art (SOA)?
4. What are the key technical challenges in your approach and how do you plan to overcome these?
5. Who will care and what will the impact be if you are successful?
6. How much will it cost and how long will it take?

D. Technical Plan: Outline and address all technical challenges inherent in the approach and possible solutions for overcoming potential problems. This section should provide appropriate specific milestones (quantitative, if possible) at intermediate stages of the project to demonstrate progress and a brief plan for accomplishment of the milestones.

E. Capabilities: Provide a brief summary of expertise of the team, including subcontractors and key personnel. A principal investigator for the project must be identified, and a description of the team's organization. Include a description of the team's organization including roles and responsibilities. Describe the organizational experience in this area, existing intellectual property required to complete the project, and any specialized facilities to be used as part of the project. List Government-furnished materials or data assumed to be available. If desired, include a brief bibliography with links to relevant papers, reports, or resumes of key performers. Do not include more than two resumes as part of the abstract. Resumes count against the abstract page limit.

4.2.2. Proposal Format

All full proposals must be in the format given below. Proposals shall consist of two volumes: 1) **Volume I, Technical and Management Proposal**, and 2) **Volume II, Cost Proposal.** All pages shall be printed on 8-1/2 by 11-inch paper with type not smaller than 12 point. Smaller font may be used for figures, tables and charts. The page limitation for full proposals includes all figures, tables, and charts. Volume I, Technical and Management Proposal, may include an attached bibliography of relevant technical papers or research notes (published and unpublished) which document the technical ideas and approach upon which the proposal is based. Copies of not more than three (3) relevant papers may be included with the submission. The bibliography

and attached papers are not included in the page counts given below. The submission of other supporting materials along with the proposals is strongly discouraged and will not be considered for review. **The maximum page count for Volume 1 is 36 pages.** A submission letter is optional and is not included in the page count. Volume I should include the following components:

NOTE: Non-conforming submissions that do not follow the instructions herein may be rejected without further review.

a. Volume I, Technical and Management Proposal

Section I. Administrative

A. Cover Sheet (LABELED "PROPOSAL: VOLUME I"):

1. BAA number (HR001118S0017);
2. Lead organization submitting proposal (prime contractor);
3. Type of organization, selected from among the following categories: "LARGE BUSINESS," "SMALL DISADVANTAGED BUSINESS," "OTHER SMALL BUSINESS," "HBCU," "MI," "OTHER EDUCATIONAL," OR "OTHER NONPROFIT";
4. Proposer's reference number (if any);
5. Other team members (if applicable) and type of business for each;
6. Proposal title;
7. Technical point of contact (Program Manager or Principle Investigator) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax, e-mail;
8. Administrative point of contact (Contracting Officer or Grant Officer) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax, e-mail;
9. Award instrument requested: cost-plus-fixed-free (CPFF), cost-contract—no fee, firm-fixed-price, grant, cooperative agreement, other transaction, or other type (specify);
10. Place(s) and period(s) of performance ;
11. Proposal validity period;
12. Total funds requested from DARPA, and the amount of cost share (if any); AND
13. Date proposal was submitted.

Information on award instruments is available at http://www.darpa.mil/work-with-us/contract-management.

B. Official Transmittal Letter.

Section II. Detailed Proposal Information

A. Executive Summary: Provide a synopsis of the proposed project, including answers to the following questions:

- What is the proposed work attempting to accomplish or do?
- How is it done today, and what are the limitations?
- What is innovative in your approach?
- What are the key technical challenges in your approach and how do you plan to overcome these?
- Who or what will be affected and what will be the impact if the work is successful?
- How much will it cost, and how long will it take?

B. Executive Summary Slide: Provide a one slide summary in PowerPoint that effectively and succinctly conveys the main objective, key innovations, expected impact, and other unique aspects of the proposed project. Proposers should use the slide template provided as **Attachment 1** to the BAA posted at https://www.fbo.gov.

C. Goals and Impact: Clearly describe what the team is trying to achieve and the difference it will make (qualitatively and quantitatively) if successful. Describe the innovative aspects of the project in the context of existing capabilities and approaches, clearly delineating the uniqueness and benefits of this project in the context of the state of the art, alternative approaches, and other projects from the past and present. Describe how the proposed project is revolutionary and how it significantly rises above the current state of the art. Describe the deliverables associated with the proposed project and any plans to commercialize the technology, transition it to a customer, or further the work.

D. Technical Plan: Outline and address technical challenges inherent in the approach and possible solutions for overcoming potential problems. This section should provide appropriate measurable milestones (quantitative if possible) and program metrics (see Section 1.2) at intermediate stages of the program to demonstrate progress, and a plan for achieving the milestones. The technical plan should demonstrate a deep understanding of the technical challenges and present a credible (even if risky) plan to achieve the program goal. Discuss mitigation of technical risk. The technical plan should address the TA1 and TA2 proposal content requirements detailed in Section 1.1.

E. Management Plan: Provide a summary of expertise of the team, including any subcontractors, and key personnel who will be doing the work. Resumes count against the proposal page count. Identify a principal investigator for the project. Provide a clear description of the team's organization including an organization chart that includes, as applicable: the programmatic relationship of team members; the unique

capabilities of team members; the task responsibilities of team members, the teaming strategy among the team members; and key personnel with the amount of effort to be expended by each person during each year. Provide a detailed plan for coordination including explicit guidelines for interaction among collaborators/subcontractors of the proposed effort. Include risk management approaches. Describe any formal teaming agreements that are required to execute this program.

F. Capabilities: Describe organizational experience in relevant subject area(s), existing intellectual property, specialized facilities, and any Government-furnished materials or information. Discuss any work in closely related research areas and previous accomplishments.

G. Statement of Work (SOW): The SOW should provide a detailed task breakdown, citing specific tasks and their connection to the interim milestones and program metrics. Each phase of the program (Phase I base and Phase II option) should be separately defined in the SOW and each task should be identified by TA (1 or 2). The SOW must not include proprietary information.

For each task/subtask, provide:

- A detailed description of the approach to be taken to accomplish each defined task/subtask.
- Identification of the primary organization responsible for task execution (prime contractor, subcontractor(s), consultant(s), by name).
- A measurable milestone, i.e., a deliverable, demonstration, or other event/activity that marks task completion. Include quantitative metrics.
- A definition of all deliverables (e.g., data, reports, software) to be provided to the Government in support of the proposed tasks/subtasks.

H. Schedule and Milestones: Provide a detailed schedule showing tasks (task name, duration, work breakdown structure element as applicable, performing organization), milestones, and the interrelationships among tasks. The task structure must be consistent with that in the SOW. Measurable milestones should be clearly articulated and defined in time relative to the start of the project.

I. PREEMPT Transition Plan (see Section 1.2): Proposers must indicate the types of partners (e.g., government, private industry, non-profit) they plan to pursue and submit a timeline with incremental milestones toward successful engagement. Proposers should begin transition activities during the early stages of the program (Phase I). The plan should describe any potential DARPA roles. If the plan includes a start-up company, a business development strategy must be included as well.

J. PREEMPT Risk Mitigation Plan (see Section 1.4): Proposers must provide a risk mitigation plan that addresses the following:

- An assessment of potential risks to public health, agriculture, plants, animals, the environment, and national security.
- Proposed guidelines that the proposer will follow to ensure maximal biosafety and biosecurity during the course of the research.
- A communication plan that addresses content, timing, and the extent of distribution of potentially sensitive dual-use information. The plan must also address how input from DARPA, other government, and community stakeholders will be taken into account in decisions regarding communication and publication of potentially sensitive dual-use information.

K. Ethical, Legal, and Societal Implications (ELSI) (see Section 1.3): Proposers should address potential ethical, legal, and societal implications of the proposed technology.

Section III. Additional Information (Note: Does not count towards page limit)

A brief bibliography of relevant technical papers and research notes (published and unpublished) which document the technical ideas upon which the proposal is based. Copies of not more than three (3) relevant papers can be included in the submission.

a. Volume II, Cost Management Proposal

Cover Sheet (LABELED "PROPOSAL: VOLUME II"):

1. BAA number;
2. Lead Organization Submitting proposal;
3. Type of organization, selected among the following categories: "LARGE BUSINESS", "SMALL DISADVANTAGED BUSINESS", "OTHER SMALL BUSINESS", "HBCU", "MI", "OTHER EDUCATIONAL", OR "OTHER NONPROFIT";
4. Proposer's reference number (if any);
5. Other team members (if applicable), CAGE Code(s), and type of business for each;
6. Proposal title;
7. Technical point of contact (Program Manager or Principal Investigator) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax (if available), electronic mail (if available);
8. Administrative point of contact (Contracting Officer or Grant Officer) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax (if available), and electronic mail (if available);

9. Award instrument requested: cost-plus-fixed-free (CPFF), cost-contract—no fee, cost sharing contract – no fee, or other type of procurement contract (*specify*), grant, cooperative agreement, or other transaction;
10. Place(s) and period(s) of performance;
11. Total proposed cost separated by basic award and option(s) (if any);
12. Name, address, and telephone number of the proposer's cognizant Defense Contract Management Agency (DCMA) administration office (*if known)*;
13. Name, address, and telephone number of the proposer's cognizant Defense Contract Audit Agency (DCAA) audit office (*if known*);
14. Date proposal was prepared;
15. DUNS number (http://www.dnb.com/get-a-duns-number.html);
16. Taxpayer ID number (https://www.irs.gov/Individuals/International-Taxpayers/Taxpayer-Identification-Numbers-TIN);
17. CAGE code (https://www.dlis.dla.mil/bincs/FAQ.aspx);
18. Proposal validity period

Note that nonconforming proposals may be rejected without review.

Proposers that do not have a Cost Accounting Standards (CAS) complaint accounting system considered adequate for determining accurate costs that are negotiating a cost- type procurement contract must complete an SF 1408. For more information on CAS compliance, see http://www.dcaa.mil/cas.html. To facilitate this process, proposers should complete the SF 1408 found at http://www.gsa.gov/portal/forms/download/115778 and submit the completed form with the proposal. To complete the form, check the boxes on the second page, then provide a narrative explanation of your accounting system to supplement the checklist on page one. For more information, see (http://www.dcaa.mil/preaward_accounting_system_adequacy_checklist.html).

The Government strongly encourages that tables included in the cost proposal also be provided in an editable (e.g., MS Excel) format with calculation formulas intact to allow traceability of the cost proposal numbers across the prime and subcontractors.

The Government requires that the proposer provide a detailed cost breakdown to include:

(1) Total program cost broken down by Phase I (Base) and Phase II (Option) in Contractor Fiscal Year to include:
   i. Direct Labor – Including individual labor categories with associated labor hours and direct labor rates. If selected for award, be prepared to submit supporting documentation to justify labor rates. (i.e., screenshots of HR databases, comparison to NIH or other web-based salary database);
   ii. Consultants – If consultants are to be used, proposer must provide a copy of the consultant's proposed SOW as well as a signed consultant agreement or other document which verifies the proposed loaded daily / hourly rate, hours and any other proposed consultant costs (e.g., travel);

iii. Indirect Costs – Including Fringe Benefits, Overhead, General and Administrative Expense, Cost of Money, Fee, etc. (must show base amount and rate), if available, provide current Forward Pricing Rate Agreement or Forward Pricing Rate Proposal. If not available, provide 2 years historical data to include pool and expense costs used to generate the rates. For academia, provide DHHS or ONR negotiated rate package or, if calculated by other than a rate, provide University documentation identifying G&A and fringe costs by position;

iv. Travel – Provide the purpose of the trip, number of trips, number of days per trip, departure and arrival destinations, number of people, estimated rental car and airfare costs, and prevailing per diem rates as determined by gsa.gov, etc.; Quotes must be supported by screenshots from travel websites;

v. Other Direct Costs – Itemized with costs including tuition remission, animal per diem rates, health insurance/fee; back-up documentation is to be submitted to support proposed costs;

vi. Equipment Purchases – Itemization with individual and total costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase (NOTE: For equipment purchases, include a letter stating why the proposer cannot provide the requested resources from its own funding), and;

vii. Materials – Itemization with costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase.

(2) A summary of total program costs by major task;

(3) A summary of projected funding requirements by month;

(4) An itemization of any information technology (IT) purchase (including a letter stating why the proposer cannot provide the requested resources from its own funding), as defined in FAR Part 2.101;

(5) An itemization of Subcontracts. **All subcontractor cost proposal documentation must be prepared at the same level of detail as that required of the prime.** Subcontractor proposals should include Interdivisional Work Transfer Agreements (IWTA) or evidence of similar arrangements (an IWTA is an agreement between multiple divisions of the same organization);

(6) The source, nature, and amount of any industry cost-sharing. Where the effort consists of multiple portions which could reasonably be partitioned for purposes of funding, these should be identified as options with separate cost estimates for each;

(7) Identification of pricing assumptions of which may require incorporation into the resulting award instrument (e.g., use of Government Furnished Property/Facilities/Information, access to Government Subject Matter Expert/s, etc.);

(8) Any Forward Pricing Rate Agreement, DHHS rate agreement, other such approved rate information, or such documentation that may assist in expediting negotiations (if available); and

(9) Proposers with a Government acceptable accounting system who are proposing a cost-type contract must submit the DCAA document approving the cost accounting system.

4.2.3. Additional Proposal Information

Proprietary Markings

Proposers are responsible for clearly identifying proprietary information. Submissions containing proprietary information must have the cover page and each page containing such information clearly marked with a label such as "Proprietary" or "Company Proprietary." NOTE: "Confidential" is a classification marking used to control the dissemination of U.S. Government National Security Information as dictated in Executive Order 13526 and should not be used to identify proprietary business information.

Unclassified Submissions

DARPA anticipates that submissions received under this BAA will be unclassified. However, should a proposer wish to submit classified information, an *unclassified* email must be sent to the BAA mailbox requesting submission instructions from the Technical Office PSO. If a determination is made that the award instrument may result in access to classified information, a SCG and/or DD Form 254 will be issued by DARPA and attached as part of the award.

Human Research Subjects/Animal Use

Proposers that anticipate involving Human Research Subjects or Animal Use must comply with the approval procedures detailed at http://www.darpa.mil/work-with-us/additional-baa.

Small Business Subcontracting Plan

Pursuant to Section 8(d) of the Small Business Act (15 U.S.C. § 637(d)) and FAR 19.702(a)(1), each proposer who submits a contract proposal and includes subcontractors might be required to submit a subcontracting plan with their proposal. The plan format is outlined in FAR 19.704.

Section 508 of the Rehabilitation Act (29 U.S.C. § 749d)/FAR 39.2

All electronic and information technology acquired or created through this BAA must satisfy the accessibility requirements of Section 508 of the Rehabilitation Act (29 U.S.C. § 749d)/FAR 39.2.

Intellectual Property

All proposers must provide a good faith representation that the proposer either owns or possesses the appropriate licensing rights to all intellectual property that will be utilized under the proposed effort.

For Procurement Contracts

Proposers responding to this BAA requesting procurement contracts will need to complete the certifications at DFARS 252.227-7017. See http://www.darpa.mil/work-with-us/additional-baa for further information. If no restrictions are intended, the proposer should state "NONE."

The table below captures the requested information:

Technical Data	Summary of	Basis for	Asserted Rights	Name of Person

Computer Software To be Furnished With Restrictions	Intended Use in the Conduct of the Research	Assertion	Category	Asserting Restrictions
(LIST)	(NARRATIVE)	(LIST)	(LIST)	(LIST)

For All Non-Procurement Contracts

Proposers responding to this BAA requesting a Grant, Cooperative Agreement, Technology Investment Agreement, or Other Transaction for Prototypes shall follow the applicable rules and regulations governing these various award instruments, but, in all cases, should appropriately identify any potential restrictions on the Government's use of any Intellectual Property contemplated under the award instrument in question. This includes both Noncommercial Items and Commercial Items. Proposers are encouraged to use a format similar to that described in the section above. If no restrictions are intended, then the proposer should state "NONE."

System for Award Management (SAM) and Universal Identifier Requirements

All proposers must be registered in SAM unless exempt per FAR 4.1102. FAR 52.204-7, "System for Award Management" and FAR 52.204-13, "System for Award Management Maintenance" are incorporated into this BAA. See http://www.darpa.mil/work-with-us/additional-baa for further information.

4.2.4. Submission Information

DARPA will acknowledge receipt of all submissions and assign an identifying control number that should be used in all further correspondence regarding the submission. DARPA intends to use electronic mail correspondence regarding HR001118S0017. Submissions may not be submitted by fax or e-mail; any so sent will be disregarded.

Submissions will not be returned. An electronic copy of each submission received will be retained at DARPA and all other non-required copies destroyed. A certification of destruction may be requested, provided the formal request is received by DARPA within 5 days after notification that a proposal was not selected.

For (abstract and) proposal submission dates, see Part I., Overview Information. Submissions received after these dates and times may not be reviewed.

For Proposers Submitting Proposal Abstracts or Full Proposals as Hard Copies/On CD-ROM:

Proposers must submit an original hardcopy and one (1) electronic copy of the abstract or proposal in PDF (preferred) on a CD-ROM to the mailing address listed in Part I. Each copy must be clearly labeled with HR001118S0017, proposer organization, technical point of contact, and proposal title (short title recommended).

Please note that submitters via hardcopy/CD-ROM will still need to visit https://baa.darpa.mil to register their organization concurrently to ensure the BAA office can verify and finalize their submission.

For Proposers Submitting Proposal Abstracts or Full Proposals Requesting Procurement Contracts or OTs through DARPA's BAA Submission Portal:

Abstracts and Full Proposals sent in response to HR001118S0017 may be submitted via DARPA's BAA Website (https://baa.darpa.mil). Visit the website to complete the two-step registration process. Submitters will need to register for an Extranet account (via the form at the URL listed above) and wait for two separate e-mails containing a username and temporary password. After accessing the Extranet, submitters may then create an account for the DARPA BAA website (via the "Register your Organization" link along the left side of the homepage), view submission instructions, and upload/finalize the abstract. Proposers using the DARPA BAA Website may encounter heavy traffic on the submission deadline date; it is highly advised that submission process be started as early as possible.

All unclassified concepts submitted electronically through DARPA's BAA Website must be uploaded as zip files (.zip or .zipx extension). The final zip file should be no greater than 50 MB in size. Only one zip file will be accepted per submission. Classified submissions and proposals requesting assistance instruments (grants or cooperative agreements) should NOT be submitted through DARPA's BAA Website (https://baa.darpa.mil), though proposers will likely still need to visit https://baa.darpa.mil to register their organization (or verify an existing registration) to ensure the BAA office can verify and finalize their submission.

Technical support for BAA Website may be reached at BAAT_Support@darpa.mil, and is typically available during regular business hours, (9:00 AM- 5:00 PM EST Monday – Friday).

Proposers using the DARPA BAA Website may encounter heavy traffic on the submission deadline date; it is highly advised that submission process be started as early as possible.

For Full Proposals Requesting Cooperative Agreements:

Proposers requesting cooperative agreements may submit proposals through one of the following methods: (1) hard copy mailed directly to DARPA; or (2) electronic upload per the instructions at http://www.grants.gov/applicants/apply-for-grants.html. Cooperative agreement proposals may not be submitted through any other means. If proposers intend to use Grants.gov as their means of submission, then they must submit their entire proposal through Grants.gov; applications cannot be submitted in part to Grants.gov and in part as a hard-copy. Proposers using the Grants.gov do not submit paper proposals in addition to the Grants.gov electronic submission.

Grants.gov Submissions: Grants.gov requires proposers to complete a one-time registration process before a proposal can be electronically submitted. First time registration can take between three business days and four weeks. For more information about registering for Grants.gov, see http://www.darpa.mil/work-with-us/additional-baa.

Hard-copy Submissions: Proposers electing to submit grant or cooperative agreement proposals as hard copies must complete the SF 424 R&R form (Application for Federal Assistance,) available on the Grants.gov website http://aaply07.grants.gov/apply/forms/sample/RR_SF424_2_0-V2.0.pdf.

Failure to comply with the submission procedures may result in the submission not being evaluated. DARPA will acknowledge receipt of complete submissions via email and assign control numbers that should be used in all further correspondence regarding proposals.

4.2.5. Disclosure of Information and Compliance with Safeguarding Covered Defense Information Controls

The following provisions and clause apply to all solicitations and contracts; however, the definition of "controlled technical information" clearly exempts work considered fundamental research and therefore, even though included in the contract, will not apply if the work is fundamental research.

DFARS 252.204-7000, "Disclosure of Information"
DFARS 252.204-7008, "Compliance with Safeguarding Covered Defense Information Controls"
DFARS 252.204-7012, "Safeguarding Covered Defense Information and Cyber Incident Reporting"

The full text of the above solicitation provision and contract clauses can be found at http://www.darpa.mil/work-with-us/additional-baa#NPRPAC.

Compliance with the above requirements includes the mandate for proposers to implement the security requirements specified by National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171, "Protecting Controlled Unclassified Information in Nonfederal Information Systems and Organizations" (see https://doi.org/10.6028/NIST.SP.800-171r1) that are in effect at the time the BAA is issued, or as authorized by the Contracting Officer, not later than December 31, 2017.

For awards where the work is considered fundamental research, the contractor will not have to implement the aforementioned requirements and safeguards; however, should the nature of the work change during performance of the award, work not considered fundamental research will be subject to these requirements.

4.3. FUNDING RESTRICTIONS

Not Applicable.

4.4. OTHER SUBMISSION REQUIREMENTS

Not Applicable.

5. Application Review Information

5.1. EVALUATION CRITERIA

Proposals will be evaluated using the following criteria, listed in descending order of importance: 5.1.1 Overall Scientific and Technical Merit; 5.1.2 Potential Contribution and Relevance to the DARPA Mission; and 5.1.3 Cost Realism.

5.1.1. Overall Scientific and Technical Merit

The proposed technical approach is innovative, feasible, achievable, and complete.

Task descriptions and associated technical elements provided are complete and in a logical sequence with all proposed deliverables clearly defined such that a final outcome that achieves the goal can be expected as a result of award. The proposal identifies major technical risks and planned mitigation efforts are clearly defined and feasible. The proposed PREEMPT Risk Mitigation Plan effectively provides the following: an assessment of potential risks; proposed guidelines to ensure maximal biosafety and biosecurity; a risk management plan for responsible communications; and a plan to address how input from the Government and community stakeholders will be considered regarding communication and publication of potentially sensitive dual-use information.

5.1.2. Potential Contribution and Relevance to the DARPA Mission

The potential contributions of the proposed effort are relevant to the national technology base. Specifically, DARPA's mission is to make pivotal early technology investments that create or prevent strategic surprise for U.S. National Security.

The proposer clearly demonstrates its capability to transition the technology to the research, industrial, and/or operational military communities in such a way as to enhance U.S. defense. In addition, the evaluation will take into consideration the extent to which the proposed intellectual property (IP) rights will potentially impact the Government's ability to transition the technology.

5.1.3. Cost Realism

The proposed costs are realistic for the technical and management approach and accurately reflect the technical goals and objectives of the solicitation. The proposed costs are consistent with the proposer's Statement of Work and reflect a sufficient understanding of the costs and level of effort needed to successfully accomplish the proposed technical approach. The costs for the prime proposer and proposed subawardees are substantiated by the details provided in the proposal (e.g., the type and number of labor hours proposed per task, the types and quantities of materials, equipment and fabrication costs, travel and any other applicable costs and the basis for the estimates).

It is expected that the effort will leverage all available relevant prior research in order to obtain the maximum benefit from the available funding. For efforts with a likelihood of commercial application, appropriate direct cost sharing may be a positive factor in the evaluation. DARPA recognizes that undue emphasis on cost may motivate proposers to offer low-risk ideas with minimum uncertainty and to staff the effort with junior personnel in order to be in a more competitive posture. DARPA discourages such cost strategies.

5.2. REVIEW OF PROPOSALS

Review Process

It is the policy of DARPA to ensure impartial, equitable, comprehensive proposal evaluations based on the evaluation criteria listed in Section V.A. and to select the source (or sources) whose offer meets the Government's technical, policy, and programmatic goals.

DARPA will conduct a scientific/technical review of each conforming proposal. Conforming proposals comply with all requirements detailed in this BAA; proposals that fail to do so may be deemed non-conforming and may be removed from consideration. Proposals will not be evaluated against each other since they are not submitted in accordance with a common work statement. DARPA's intent is to review proposals as soon as possible after they arrive; however, proposals may be reviewed periodically for administrative reasons

Award(s) will be made to proposers whose proposals are determined to be the most advantageous to the Government, consistent with instructions and evaluation criteria specified in the BAA herein, and availability of funding.

Handling of Source Selection Information

DARPA policy is to treat all submissions as source selection information (see FAR 2.101 and 3.104), and to disclose their contents only for the purpose of evaluation. Restrictive notices notwithstanding, during the evaluation process, submissions may be handled by support contractors for administrative purposes and/or to assist with technical evaluation. All DARPA support contractors performing this role are expressly prohibited from performing DARPA-sponsored technical research and are bound by appropriate nondisclosure agreements. Subject to the restrictions set forth in FAR 37.203(d), input on technical aspects of the proposals may be solicited by DARPA from non-Government consultants/experts who are strictly bound by the appropriate non-disclosure requirements.

Federal Awardee Performance and Integrity Information (FAPIIS)

Per 41 U.S.C. 2313, as implemented by FAR 9.103 and 2 CFR § 200.205, prior to making an award above the simplified acquisition threshold, DARPA is required to review and consider any information available through the designated integrity and performance system (currently FAPIIS). Awardees have the opportunity to comment on any information about themselves entered in the database, and DARPA will consider any comments, along with other information in FAPIIS or other systems prior to making an award.

6. Award Administration Information

6.1. SELECTION NOTICES

As soon as the evaluation of a proposal is complete, the proposers will be notified that 1) the proposal has been selected for funding pending contract negotiations, or 2) the proposal has not been selected. These official notifications will be sent via email to the Technical POC identified on the proposal coversheet.

6.1.1. Proposal Abstracts

DARPA will respond to abstracts with a statement as to whether DARPA is interested in the idea. If DARPA does not recommend the proposer submit a full proposal, DARPA will provide feedback to the proposer regarding the rationale for this decision. Regardless of DARPA's response to an abstract, proposers may submit a full proposal. DARPA will review all full proposals submitted using the published evaluation criteria and without regard to any comments resulting from the review of an abstract.

6.1.2. Full Proposals

As soon as the evaluation of a proposal is complete, the proposer will be notified that (1) the proposal has been selected for funding pending award negotiations, in whole or in part, or (2) the proposal has not been selected. These official notifications will be sent via e-mail to the Technical POC and/or Administrative POC identified on the proposal coversheet.

6.2. ADMINISTRATIVE AND POLICY REQUIREMENTS

6.2.1. Meeting and Travel Requirements

There will be a program kickoff meeting in the Arlington, VA vicinity and all key participants are required to attend. Performers should also anticipate regular program-wide PI meetings and periodic site visits at the Program Manager's discretion to the Arlington, VA vicinity. Proposers shall include within the content of their proposal details and costs of any travel or meetings they deem to be necessary throughout the course of the effort, to include periodic status reviews by the government.

6.2.1. FAR and DFARS Clauses

Solicitation clauses in the FAR and DFARS relevant to procurement contracts and FAR and DFARS clauses that may be included in any resultant procurement contracts are incorporated herein and can be found at http://www.darpa.mil/work-with-us/additional-baa.

6.2.2. Controlled Unclassified Information (CUI) on Non-DoD Information Systems

Further information on Controlled Unclassified Information on Non-DoD Information Systems is incorporated herein can be found at http://www.darpa.mil/work-with-us/additional-baa.

6.2.3. Representations and Certifications

If a procurement contract is contemplated, prospective awardees will need to be registered in the SAM database prior to award and complete electronic annual representations and certifications consistent with FAR guidance at 4.1102 and 4.1201; the representations and certifications can be found at www.sam.gov. Supplementary representations and certifications can be found at http://www.darpa.mil/work-with-us/additional-baa.

.

6.2.4. Terms and Conditions

A link to the DoD General Research Terms and Conditions for Grants and Cooperative Agreements and supplemental agency terms and conditions can be found at http://www.darpa.mil/work-with-us/contract-management#GrantsCooperativeAgreements.

6.3. REPORTING

The number and types of reports will be specified in the award document, but will include as a minimum monthly financial status reports and quarterly technical status reports. The reports shall be prepared and submitted in accordance with the procedures contained in the award document and mutually agreed on before award. Reports and briefing material will also be required as appropriate to document progress in accomplishing program metrics. A Final Report that summarizes the project and tasks will be required at the conclusion of the performance period for the award, notwithstanding the fact that the research may be continued under a follow-on vehicle.

6.4. ELECTRONIC SYSTEMS

6.4.1. Wide Area Work Flow (WAWF)

Performers will be required to submit invoices for payment directly to https://wawf.eb.mil, unless an exception applies. Performers must register in WAWF prior to any award under this BAA.

6.4.2. i-EDISON

The award document for each proposal selected for funding will contain a mandatory requirement for patent reports and notifications to be submitted electronically through i-Edison (http://public.era.nih.gov/iedison).

7. Agency Contacts

Communication via e-mail is preferred.

Points of Contact
The BAA Coordinator for this effort may be reached at:
PREEMPT@darpa.mil
DARPA/BTO
ATTN: HR001118S0017
675 North Randolph Street
Arlington, VA 22203-2114

For information concerning agency level protests see http://www.darpa.mil/work-with-us/additional-baa#NPRPAC.

8. Other Information

DARPA will host a Proposers Day in support of the PREEMPT program on **January 30, 2018**, at the Executive Conference Center in Arlington, VA. The purpose is to provide potential

proposers with information on the PREEMPT program, promote additional discussion on this topic, address questions, provide a forum to present their capabilities, and to encourage team formation.

Interested proposers are not required to attend to respond to the PREEMPT BAA, and relevant information and materials discussed at Proposers Day will be made available to all potential proposers in the form of a FAQ posted on the DARPA Opportunities Page. The event will be webcast for those who would like to participate remotely.

DARPA will not provide cost reimbursement for interested proposers in attendance.

An online registration form and various other meeting details can be found at the registration website, https://events.sa-meetings.com/PREEMPTProposersDay.

To encourage team formation, interested proposers are encouraged to submit information to be shared with all potential proposers through the Proposers Day website and the DARPA Opportunities Page. This information may include contact information, relevant publications, and a slide or poster to summarize the proposer's interests.

Participants are required to register no later than **January 23, 2018**, for physical attendance, and **January 26, 2018**, for the webcast. This event is not open to the Press. The Proposers Day will be open to members of the public who have registered in advance for the event; **there will be no onsite registration**.

All foreign nationals, including permanent residents, must complete and submit a DARPA Form 60 "Foreign National Visit Request," which will be provided in the registration confirmation email.

Proposers Day Point of Contact: DARPA-SN-18-18@darpa.mil.

9. Appendix 1 – Volume II checklist

Volume II, Cost Proposal
Checklist and Sample Templates

The following checklist and sample templates are provided to assist the proposer in developing a complete and responsive cost volume. Full instructions appear in Section 4.2.2 beginning on Page 25 of HR001118S0017. This worksheet must be included with the coversheet of the Cost Proposal.

1. Are all items from Section 4.2.2 (Volume II, Cost Proposal) of **HR001118S0017** included on your Cost Proposal cover sheet?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]
   If reply is "No", please explain:

2. Does your Cost Proposal include (1) a summary cost buildup by Phase, (2) a summary cost buildup by Year, and (3) a detailed cost buildup of for each Phase that breaks out each task and shows the cost per month?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

3. Does your cost proposal (detailed cost buildup #3 above in item 2) show a breakdown of the major cost items listed below:
   Direct Labor (Labor Categories, Hours, Rates)
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Indirect Costs/Rates (i.e., overhead charges, fringe benefits, G&A)
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Materials and/or Equipment
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Subcontracts/Consultants
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Other Direct Costs
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Travel
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

4. Have you provided documentation for proposed costs related to travel, to include purpose of trips, departure and arrival destinations and sample airfare?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

5. Does your cost proposal include a complete itemized list of all material and equipment items to be purchased (a priced bill-of-materials (BOM))?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

6. Does your cost proposal include vendor quotes or written engineering estimates (basis of estimate) for all material and equipment with a unit price exceeding $5000?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

7. Does your cost proposal include a clear justification for the cost of labor (written labor basis-of-estimate (BOE)) providing rationale for the labor categories and hours proposed for each task?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

8. Do you have subcontractors/consultants? If YES, continue to question 9. If NO, skip to question 13.
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

9. Does your cost proposal include copies of all subcontractor/consultant technical (to include Statement of Work) and cost proposals?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

10. Do all subcontract proposals include the required summary buildup, detailed cost buildup, and supporting documentation (SOW, Bill-of-Materials, Basis-of-Estimate, Vendor Quotes, etc.)?
    ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

    If reply is "No", please explain:

11. Does your cost proposal include copies of consultant agreements, if available?
    ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

    If reply is "No", please explain:

12. If requesting a FAR-based contract, does your cost proposal include a tech/cost analysis for all proposed subcontractors?
    ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

    If reply is "No", please explain:

13. Have all team members (prime and subcontractors) who are considered a Federally Funded Research & Development Center (FFRDC), included documentation that clearly demonstrates work is not otherwise available from the private sector AND provided a letter on letterhead from the sponsoring organization citing the specific authority establishing their eligibility to propose to government solicitations and compete with industry, and compliance with the associated FFRDC sponsor agreement and terms and conditions.

○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

14. Does your proposal include a response regarding Organizational Conflicts of Interest?

○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

15. Does your proposal include a completed Data Rights Assertions table/certification?

○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

Executive Summary: Proposal Title

Organization; PI Name

CONCEPT

Provide graphic.

APPROACH

Describe new ideas.

IMPACT

Describe need and problem being addressed.

Describe goal.

	Phase I	Phase II	Total
Proposed	$-	$-	$-

☐ Human Use/☐ Animal Use

CONTEXT

Describe existing approaches; compare to state of the art.

Slide 1 Notes

Goals and Impact

Clearly describe what is being proposed and what difference it will make (qualitatively and quantitatively), including brief answers to the following questions:

- What is the proposed work attempting to accomplish or do?
- How is it done today? And what are the limitations?
- What is innovative in your approach and how does it compare to current practice and state-of-the-art (SOA)?
- What are the key technical challenges in your approach and how do you plan to overcome these?
- Who will care and what will the impact be if you are successful?
- How much will it cost and how long will it take?

Technical Plan

Outline and address all technical challenges inherent in the approach and possible solutions for overcoming potential problems. This section should provide appropriate specific milestones (quantitative, if possible) at intermediate stages of the project to demonstrate progress and a brief plan for accomplishment of the milestones.

Capabilities

Provide a brief summary of expertise of the team, including subcontractors and key personnel. A principal investigator for the project must be identified. Include a description of the team's organization including roles and responsibilities. Describe the organizational experience in this area, existing intellectual property required to complete the project, and any specialized facilities to be used as part of the project. List Government-furnished materials or data assumed to be available. If desired, include a brief bibliography with links to relevant papers, reports, or resumes of key performers. Do not include more than two resumes as part of the abstract. Resumes count against the abstract page limit.

PART I: OVERVIEW INFORMATION

- **Federal Agency Name** – Defense Advanced Research Projects Agency (DARPA), Biological Technologies Office
- **Funding Opportunity Title –** Epigenetic CHaracterization and Observation
- **Announcement Type –** Initial Announcement
- **Funding Opportunity Number –** HR001118S0023
- **Catalog of Federal Domestic Assistance Numbers (CFDA) – 12.910 Research and Technology Development**
- **Dates**
  - Posting Date **– February 12, 2018**
  - Proposal Abstract Due Date and Time **– March 22, 2018, 4:00 PM ET**
  - Proposal Due Date and Time **– May 3, 2018, 4:00 PM ET**
  - BAA Closing Date **– May 3, 2018, 4:00 PM ET**
  - Proposers Day **– February 23rd, 2018**

https://www.fbo.gov/spg/ODA/DARPA/CMO/DARPA-SN-18-23/listing.html

- **Concise description of the funding opportunity:** The Epigenetic CHaracterization and Observation (ECHO) program will utilize an individual's epigenome to reveal their history of exposure to weapons of mass destruction (WMD) and WMD precursors. The program will build a field-deployable platform capable of using the epigenome to diagnose biothreat exposures and infections and support military forensics operations to counter-WMD proliferation.
- **Anticipated individual awards** - Multiple awards are anticipated.
- **Types of instruments that may be awarded** - Procurement contract, cooperative agreement or other transaction.
- **Agency contact**
  - Points of Contact
    The BAA Coordinator for this effort may be reached at:

    Arlington, VA 22203-2114

PART II: FULL TEXT OF ANNOUNCEMENT

1. Funding Opportunity Description

This publication constitutes a Broad Agency Announcement (BAA) as contemplated in Federal Acquisition Regulation (FAR) 6.102(d)(2) and 35.016 and 2 CFR § 200.203. Any resultant award negotiations will follow all pertinent law and regulation, and any negotiations and/or awards for procurement contracts will use procedures under FAR 15.4, Contract Pricing, as specified in the BAA.

The Defense Advanced Research Projects Agency (DARPA) is soliciting innovative proposals to provide a field-forward system that evaluates an individual's epigenome, revealing their history of exposure to threats, including weapons of mass destruction (WMD) and their molecular precursors. Success in this program will require groundbreaking approaches to characterize epigenetic signatures from militarily relevant exposure events, and new bioinformatics tools to perform forensic analysis and disease diagnostics with high sensitivity, specificity and temporal resolution. These novel signatures and associated analytics will integrate into a single, man-portable device that operates in an austere setting with an untrained user. Proposing teams should be multidisciplinary with expertise in WMD threat agents, chromatin biology, epigenetics, gene expression, bioinformatics, microfluidics, next-generation sequencing, forensics, circulating biomarker discovery, point-of-care diagnostic device development, and computational modeling. Proposals describing incremental research and device development will be excluded.

1.1. PROGRAM OVERVIEW

WMD production is dramatically proliferating among terror groups and non-state actors, severely impacting foreign policy and national security. To disrupt this growing threat, our military must identify and stop WMD development while also mitigating the increased risk of exposure to DoD personnel while deployed. Current practice uses residues associated with weapons manufacture or exposure which are often transient and in such low concentrations that samples are not available to collect. Even when remaining traces are collected, detection requires controlled laboratory environments that are not available in austere settings. Addressing the emerging WMD threat requires a capability that can move beyond the state of the art to forensically link an individual to WMD manufacture and diagnose WMD exposure, with high specificity and temporal resolution.

The Epigenetic CHaracterization and Observation (ECHO) program aims to reveal an individual's exposure history, recorded in their own epigenome after exposure events, with a focus on WMD and molecular precursors. ECHO will build a new forensic and diagnostic modality that provides an advantage over current tools, as the epigenome is persistent and detectable even when physical evidence has been erased. For this BAA, the epigenome is considered the combination of all genomic modifications that do not alter the DNA sequence but change gene activity. Exposure to environmental factors change these epigenetic features. Depending upon the exposure type, the epigenetic features can change within minutes, while also leaving a lasting 'mark' on the epigenome for decades. ECHO will build signatures that incorporate the pattern of unique epigenetic changes associated with a specific exposure to a single compound or agent (hereafter referred to as "*exposure-specific*"). The exposure-specific

signatures will contain information that denotes the specific exposure and time since exposure. The final epigenetic signature panel (ECHO Signature Panel - *ESP*) will consist of all identified exposure-specific signatures within the program, and integrate these into a point-of-need forensic and diagnostic system.

1.2. TECHNICAL APPROACH

The ECHO program will consist of two Technical Areas (TAs) with a total period of performance of 48 months. TA1 will focus on epigenetic signature identification, and TA2 will focus on the integrated device. ***Proposing teams will be required to address both TAs***, and thus will need multidisciplinary backgrounds. Teams are strongly encouraged to propose with industry partners that can develop commercial applications based on work performed in the ECHO program. The breadth and depth of a proposing technical team's capabilities and related experience will be considereded as part of the evaluation of proposals. The comprehensive team must accomplish the following goals for each technical area:

TA1 will sequentially:

1) Generate molecular epigenetic datasets associated with relevant WMD and/or precursor exposure
2) Characterize and define exposure-specific epigenetic signatures
3) Identify unknown exposures using the ESP

TA2 will build an integrated device to achieve:

1) Epigenetic molecular analysis integration
2) Onboard computational and bio-analytical capability

Teams will be required to produce epigenetic signatures from a ***minimum of 21*** total exposure-specific agents or compounds. ECHO teams must develop an exposure-specific signature for each of the ***4 required biological agents*** listed in Table 1. These required exposure-specific signatures will be created from Government-provided, de-identified human samples comprised of blood, nasal and buccal swabs, and sputum from infectious disease surveillance sites. Teams must source human samples to develop an ***additional 17*** exposure-specific signatures spanning across the 10 sub-categories listed in Table 1. Proposers are strongly encouraged to address militarily-relevant compounds or agents. As ECHO aims to maximize the forensic and diagnostic capability of the ESP on the final device, proposals will be evaluated on the diversity of the additional 17 compound or agents selected. Proposals will be evaluated on applicable team experience in the proposed exposure category. Teams may also propose animal models and human organ chip approaches to supplement the human samples for better time-resolution, dosing control, and creation of exposure scenarios involving highly dangerous pathogens and compounds.

Table 1. Classification of Exposures

Exposure Category	Exposure Sub-category	Minimum Required List of Exposure-Specific Agents/Compounds
Biological	1. Bacterial agents*	*Staphylococcus aureus* (MRSA) *Burkholderia pseudomallei* **(2 total)**
	2. Viral agents*:	Human immunodeficiency virus (HIV) Lassa fever virus **(2 total)**
	3. Other emerging infectious diseases	Proposers may select exposure-specific samples from any of the additional exposure categories. Teams are strongly encouraged to address militarily relevant compounds, precursors•, or agents from each of the 10 sub-categories **(17 total)**
Chemical	4. Chemical agent precursors‡	
	5. Conventional agents†	
	6. Toxic industrial compounds	
Radiological	7. Medical isotopes	
	8. Isotopes associated with weapons production	
Explosives	9. Explosives precursors	
	10. Explosives compounds#	

*https://www.selectagents.gov/selectagentsandtoxinslist.html
‡Precursors in schedules 1, 2, 3 of the OPCW CWC list: https://www.opcw.org/chemical-weapons-convention/annexes/annex-on-chemicals/schedule-1/
†Agents listed in schedules 1,2,3, of the OPCW CWC list: https://www.opcw.org/chemical-weapons-convention/annexes/annex-on-chemicals/schedule-1/
#https://www.atf.gov/file/97721/download
•Precursors should be selected based on their importance and uniqueness to a specific agent production process, while also considering the likelihood of acquiring human samples for a given precursor exposure.

Technical Area 1 (TA1):
The aim of TA1 is to build an ESP and associated bioinformatics algorithms to identify militarily relevant exposures. The signatures and algorithms will be iteratively refined throughout TA1 and transitioned to the device developed in TA2.

1) Generate molecular epigenetic datasets associated with relevant WMD and/or precursor exposure

To characterize the specific exposure event and time since exposure, teams will construct molecular epigenetic datasets from each of the 21 exposure-specific compounds/agents outlined above.
When building these datasets, teams must consider the following factors including, but not limited to:

- **Sample types** such as buccal, nasal, sputum or blood
- **Cell types** including, but not limited to T-cells, B-cells, and keratinocytes

- **The combination of molecular methods** used to reveal epigenetic marks. Epigenetic marks to consider include, but are not limited to, gene expression profiles, chromatin access/state, histone modifications, regulatory marks on cellular or cell-free DNA (cfDNA), circulating non-coding RNA, and cellular or circulating mitochondrial DNA (mtDNA).

Teams will generate the molecular epigenetic datasets by achieving a balance of the factors above, with the metric of maximizing the uniqueness of the epigenetic signature associated with a specific exposure. Of the factors above, proposers should aim to identify approaches that combine the minimum set of molecular methods that fully captures epigenetic events that correlate to a given exposure. Proposals should include a specific plan to develop molecular methods to maximize the uniqueness of the exposure-specific epigenetic signature. Table 2 describes an example set of epigenetic events and molecular methods that may be employed for generating molecular epigenetic datasets.

Table 2. Exemplar epigenetic events and molecular methods

Example Epigenetic Target	Example Epigenetic Event(s)	Example Method(s)
mRNA	Up or down regulation	RNA-SEQ
Chromatin State	Open, condensed	SONO-SEQ, ATAC-SEQ, DNase-SEQ, FAIRE-SEQ, MNase-SEQ
Histone Modifications	Activating, poised for activation, or repressing: For example, H3K4me2/3, H3K27me3	ChIP-SEQ, MINT-ChIP
Cellular or Circulating DNA (cfDNA) Modifications	Methylation, hydroxylation, or alkyklation: 5-mC, 5-hMC, 5-fC, 5-caC, and 3-mC	Meth-SEQ, WGBS, TAB-SEQ,
Cellular or Circulating Mitochondrial DNA (mtDNA)	Methylation	Meth-SEQ
Circulating Non-coding RNA	MicroRNA (miRNA), long non-coding RNAs (lncRNAs), and piwiRNAs (piRNA)	RNA-SEQ, ChIRP-SEQ
Chromosomal Interactions	Interaction of Genomic Loci	Hi-C, 3C, 4C, 5C, ChIA-PET

Teams will be required to share all molecular epigenetic datasets on a DARPA-specified database. This will provide other teams the opportunity to build exposure-specific signatures from samples to which they do not have access, increase the power of the bioinformatics analysis algorithms, as well as provide a means for verification and validation.

2) Characterize and define exposure-specific epigenetic signatures

The molecular epigenetic datasets discussed above will serve as the foundation to develop exposure-specific signatures. Teams must use quantitative approaches to justify which cell type(s), epigenetic changes, or combination of changes maximize specificity and temporal resolution of exposure-specific signatures.

Teams should additionally consider variability across individuals and other factors that can adversely affect signal-to-noise ratio. Algorithms should refine signature signal to noise ratio by segregating epigenetic components that are dynamic and static. These signatures will then populate the ESP.

3) Identify unknown exposures using the ESP

The developed algorithms will need to compare an unknown exposure against the ESP to identify the specific exposure, and when the individual was exposed. Therefore, algorithm developers will leverage a wide range of analytical approaches, which may include multifactorial, topographical, principal component, and other dimensional reduction methods.

Figure 1 summarizes a potential technical approach and factors to consider when building a signature and associated algorithms to identify unknown exposures against the ESP.

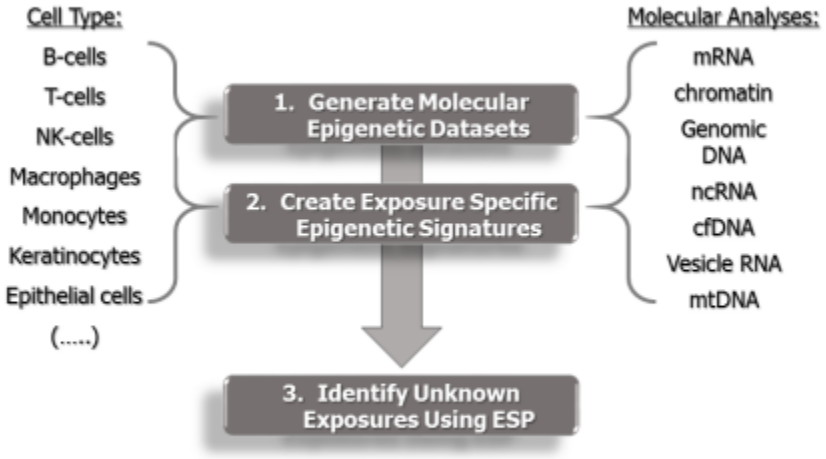

Figure 1. Possible pathway to generate signatures, include them in the ESP, and perform identification.

Technical Area 2 (TA2):

TA2 will require teams to integrate the down-selected molecular methods and bioinformatics tools necessary for exposure identification from TA1 into a single epigenetics analysis platform. The integrated platform should operate as man-portable device with a size, weight and power (SWaP) footprint equivalent to a point-of-care clinical diagnostic device, and should perform rapid analysis (< 30 minutes) in a field forward setting by minimally trained personnel.

1) Epigenetic molecular analysis integration

The TA2 system must ultimately produce an epigenetic profile from an unknown exposure for comparison to the ESP. The final epigenetic analysis system is expected to be an integrated sample-answer system capable of the following functions:

- Extract material for epigenetic analysis from blood, nasal and buccal swabs, and surface samples that may contain residual genetic material;
- Isolate nucleic acid and prepare it for epigenetic analysis; and
- Perform multiple epigenetic analyses via sequencing or other molecular analyses.

Fully automated execution of the above functions will require fluidics transfer, appropriately-timed activation of reaction and analysis modules, and data acquisition to occur through a built-in control system. Iterative progress towards a fully automated sample-to-answer device is expected. Teams may first demonstrate independent operation of subcomponents, with manual fluids transfer, before engineering the integration of all of the device components. Ultimately, by the end of the program, the system should operate with no human intervention between the time the sample is introduced and results pertinent to exposure and timing is provided.

2) Onboard computational and bio-analytical capability

Teams will translate the bioinformatics analysis capability from TA1 into purpose-built computing hardware, firmware, and software to support operations in a field-forward setting. Signature analyses must be performed onboard, rather than via cloud computing, to enable read assembly and identification in low Quality of Service (QoS) environments. This new informatics capability should rapidly identify an exposure type and time since exposure while being used by a minimally trained operator. This computational and analytical pipeline should operate seamlessly with the molecular analysis modules, on the same device.

1.3. PROGRAM METRICS AND SCHEDULE

Proposals should include a Gantt chart of the quantitative and qualitative milestones proposed to meet ECHO program metrics, listed by phase and technical area. Figure 2 lists the minimum DARPA-desired programmatic milestones and metrics. Although the following minimum milestones and metrics are specified, the Government identifies these to bound the effort while affording the maximum flexibility, creativity, and innovation in proposing solutions to the stated problems. Proposers are encouraged to add additional milestones or metrics based on the team's specific technical approach. Proposals must address all key milestones, technical metrics, and pressure tests described in this section. Proposers must clearly and uniquely itemize tasks needed to accomplish planned milestones, metrics and deliverables.

Phase I (Base) and Phase II (Option)

DARPA anticipates that the ECHO program will provide up to four years of funding for research and development to be performed over Phase I (base) and II (option). ECHO spans a 48-month effort with a 24-month Phase I base effort and 24-month Phase II option effort. In general, Phase I should provide seven exposure-specific signatures and functional small-scale epigenetic analysis modules, and, if awarded, Phase II should provide an additional 14 exposure-specific signatures and a final integrated man-portable epigenetic analysis device.

TA1 Phase I (Base)
Under TA1, teams will be required to generate two molecular epigenetic datasets (one virus and one bacteria) within six months of contract award. The samples for these datasets will be provided by the Government to support this early milestone, as indicated above. At 12 months after contract, teams will create exposure-specific signatures from the initial two biological epigenetic datasets. Also, at 12 months after contract award, teams will create five additional, non-biological exposure-specific signatures, over a range of compounds to include chemical, radiological, and explosive materials (per Table 1). At 18 months after contract, teams will be required to distinguish bacterial from viral signatures when presented with an unknown sample. By the end of Phase I, at 24 months after contract award, teams will have a multi-target test against an unknown sample to identify the specific exposure substance, organism, or biological agent, and when in time the exposure occurred (within +/- 1 year).

Teams are required to share the molecular epigenetic datasets with Independent Verification and Validation (IV&V) partners within 30 days of completing the molecular analyses for a specific exposure. IV&V partners will measure the quality of the datasets provided by each proposer team using method-specific parameters, such as read depth, error rates, and review of molecular analysis protocols. IV&V teams will identify discrepancies, which may lead to a request for teams to re-run analyses.

TA1 Phase II (Option)
By 36 months after contract award, teams will need to deliver seven additional exposure-specific signatures, with a demonstrated positive predictive value (PPV) of 65%. At 48 months after contract, teams must complete an additional seven finalized signatures with PPV increased to 85%. At program completion, 21 total exposure-specific signatures will be identified and incorporated onto the TA2 device by each team.

Table 3. ECHO Signature Development Timetable

Phase I (Base)	Phase II (Option)
TA1: Epigenetic Signature Identification	
6 mos. – Molecular epigenetic dataset creation from 1 virus and 1 bacterium.	36 mos. – 7 additional exposure-specific signatures per team.
12 mos. – Generation of 7 (1 virus, 1 bacterium, and 5 non-biological) exposure-specific signatures.	48 mos. – 7 additional exposure-specific signatures per team.
18 mos. – Determination of unknown sample. Distinguish between bacterial or viral.	
24 mos. – Multi-target test against an unknown sample. Identify the specific exposure substance, organism, or biological agent, and timing of exposure (within +/- 1 year).	

TA2 Phase I (Base)
In Phase I of TA2, the device will have to demonstrate capacity that will include human-in-the-loop fluid transfer, subsystem manual operation, and off-platform bioinformatics processing sample preparation, processing, and analysis components optimized independently. At 18

months after contract, a pressure test will evaluate the ability of the systems to operate as a complete unit for end-end epigenetic signature generation and analysis. This performance will be compared to traditional lab-based systems to ensure equivalent signature quality. QoS will initially be at 100% or the equivalent of 5 Mbps, but will be reduced to 85% by the end of Phase I to encourage a more local data analysis strategy (24 months after contract).

TA1 and TA2 Phase II (Option)

TA1 and TA2 will produce a fully integrated system with automatic fluid transfer, full subsystem automation, and onboard bioinformatics processing in Phase II. During Phase II, the QoS will continue to decrease gradually. At 30 months after contract, QoS will be 50% with intermittent coverage, and at 36 months after contract, QoS will be 25% with intermittent coverage. The final SWaP of the epigenetic deployable platform is expected to be equivalent to today's POC diagnostics systems: 1 ft^3, < 10 lbs., and < 20 W. The final system will have to pass a field forward system demonstration with military staff operating it, using < $5x10^4$ cells, with sample to answer under 30 min, 85% PPV, QoS 10% with intermittent coverage with minimally trained operators.

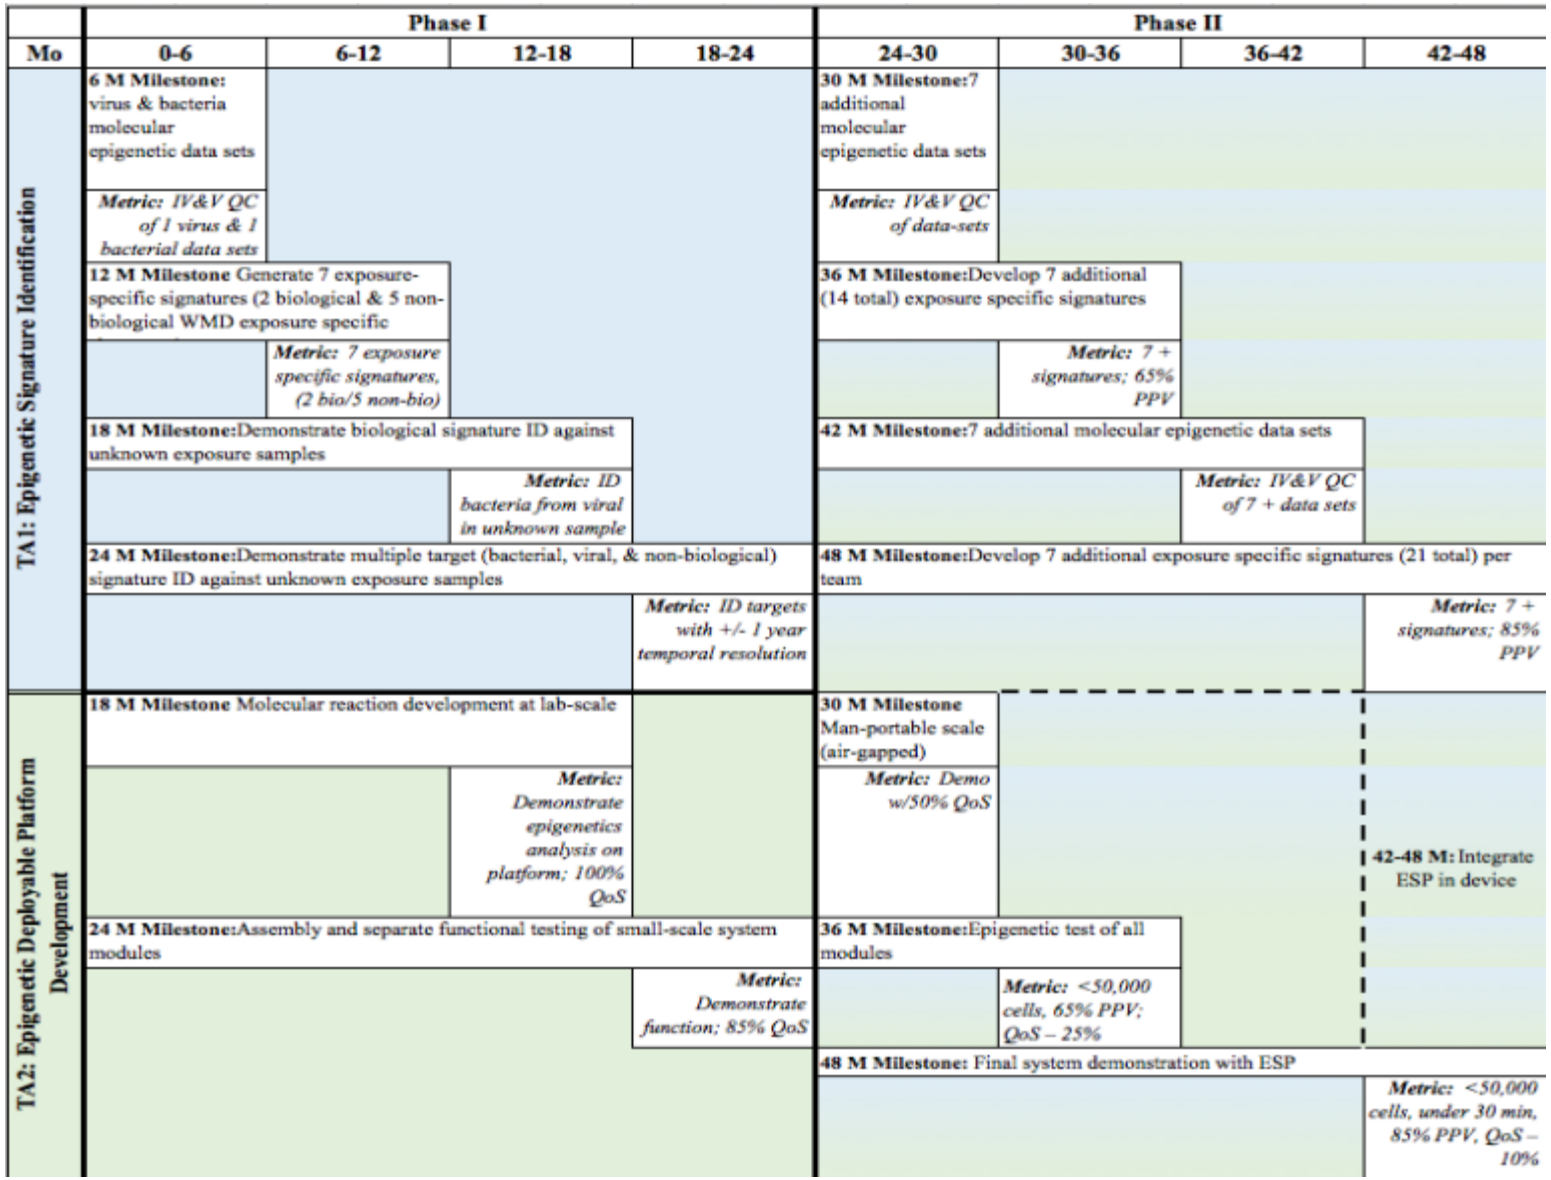

Figure 2. ECHO Milestones and Metrics

In addition to the pressure tests and system demonstration milestones, teams will be required to participate in program review meetings every six months. These meetings will include all ECHO team participants, allowing the researchers to present their latest results and update progress toward program goals. The meetings may include Government participation, program agents, defense laboratories, and the potential customers including IV&V partners. Government sidebars will be held to provide individual feedback to the performers and to ensure they are developing relevant technologies.

Deliverables
The following is the list of anticipated minimum deliverables for the Phase I base effort and Phase II option effort. Proposers may supplement this list with additional deliverables as appropriate.
Phase I Base:

- Monthly Technical/Financial Status Reports
- Epigenetic Datasets for seven compounds/agents (see table 1)
- Exposure-specific signatures for seven compounds/agents (see table 1)
- Demonstration (2) of signatures against unknown exposure samples at month 18 and 24
- Demonstration (2) of epigenetics analysis platform at month 18 and 24
- Final Report (if Phase II option is not awarded)

Phase II Option

- Monthly Technical/Financial Status Reports
- Epigenetic Datasets for an additional fourteen (see table 1)
- Exposure-specific signatures for additional fourteen (see table 1)
- Demonstration (3) of epigenetics analysis platform at months 30, 36, and 48
- ESP Prototype with operating instructions, collection cartridges, and software licenses (add description of all other items that may accompany delivery of the prototype)
- Final Report

Not all proposer teams selected for the Phase I base effort will be awarded the Phase II option effort. This decision will be based on funding availability and the performance against the metrics and milestones, and according to performance during the pressure tests described in this section.

1.4. CONTROLLED UNCLASSIFIED INFORMATION STATEMENT

To prevent the release of sensitive technical information, certain aspects of proposals may be considered Controlled Unclassified Information (CUI) and may require safeguarding or dissemination controls, pursuant to and consistent with applicable law, regulations, and Government-wide policies.

The following applied military technical information could be considered Controlled Technical Information (CTI) by DARPA:

- Potential procedure to evade ECHO Signature Panel identification: Any known techniques for rendering the exposure-specific signature undetectable.

- Epigenetic Signature Variances: Any known variances between populations that could lead to bias towards race, gender, geographic region, or inherited traits that cannot be controlled through careful clinical sampling design.

- DoD Collected Genetic or Epigenetic Data: Any genetic and epigenetic data collected from DoD efforts that has not been de-identified.

Proposals that produce any such information must deliver a detailed risk mitigation plan to DARPA (see 4.2.2. Proposal Format Section II: I). Proposers must partition potentially sensitive tasks from non-sensitive research efforts. All proposers (prime contractor and subcontractor) desiring public release of project information that may contain CTI, as defined above, must submit a request for public release to DARPA's Public Release Center (DARPA/PRC) in accordance with their contractual requirements.

2. Award Information

2.1. GENERAL AWARD INFORMATION

Multiple awards are possible. The amount of resources made available under this BAA will depend on the quality of the proposals received and the availability of funds.

The Government reserves the right to select for negotiation all, some, one, or none of the proposals received in response to this solicitation and to make awards without discussions with proposers. The Government also reserves the right to conduct discussions if it is later determined to be necessary. If warranted, portions of resulting awards may be segregated into pre-priced options. Additionally, DARPA reserves the right to accept proposals in their entirety or to select only portions of proposals for award. In the event that DARPA desires to award only portions of a proposal, negotiations may be opened with that proposer. The Government reserves the right to fund proposals in phases with options for continued work, as applicable. The Government reserves the right to fund a Phase II option based on funding availability, an assessment of Phase I research results, and a determination that awarding the option is in the best interest of the Government.

The Government reserves the right to request any additional, necessary documentation once it makes the award instrument determination. Such additional information may include but is not limited to Representations and Certifications (see Section VI.B.2., "Representations and Certifications"). The Government reserves the right to remove proposers from award consideration should the parties fail to reach agreement on award terms, conditions, and/or cost/price within a reasonable time, and the proposer fails to timely provide requested additional information. Proposals identified for negotiation may result in a procurement contract, grant, cooperative agreement, or other transaction, depending upon the nature of the work proposed, the

required degree of interaction between parties, whether or not the research is classified as Fundamental Research, and other factors.

Proposers looking for innovative, commercial-like contractual arrangements are encouraged to consider requesting Other Transactions. To understand the flexibility and options associated with Other Transactions, consult http://www.darpa.mil/work-with-us/contract-management#OtherTransactions.

In all cases, the Government contracting officer shall have sole discretion to select award instrument type, regardless of instrument type proposed, and to negotiate all instrument terms and conditions with selectees. DARPA will apply publication or other restrictions, as necessary, if it determines that the research resulting from the proposed effort will present a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense. Any award resulting from such a determination will include a requirement for DARPA permission before publishing any information or results on the program. For more information on publication restrictions, see the section below on Fundamental Research.

2.2. FUNDAMENTAL RESEARCH

It is DoD policy that the publication of products of fundamental research will remain unrestricted to the maximum extent possible. National Security Decision Directive (NSDD) 189 defines fundamental research as follows:

> 'Fundamental research' means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

As of the date of publication of this BAA, the Government expects that program goals as described herein may be met by proposers intending to perform fundamental research and proposers not intending to perform fundamental research or the proposed research may present a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense. Based on the nature of the performer and the nature of the work, the Government anticipates that some awards will include restrictions on the resultant research that will require the awardee to seek DARPA permission before publishing any information or results relative to the program.

Proposers should indicate in their proposal whether they believe the scope of the research included in their proposal is fundamental or not. While proposers should clearly explain the intended results of their research, the Government shall have sole discretion to select award instrument type and to negotiate all instrument terms and conditions with selectees. Appropriate clauses will be included in resultant awards for non-fundamental research to prescribe publication requirements and other restrictions, as appropriate. This clause can be found at http://www.darpa.mil/work-with-us/additional-baa.

For certain research projects, it may be possible that although the research being performed by the awardee is restricted research, a subawardee may be conducting fundamental research. In those cases, it is the awardee's responsibility to explain in their proposal why its subawardee's effort is fundamental research

3. Eligibility Information

3.1. ELIGIBLE APPLICANTS

All responsible sources capable of satisfying the Government's needs may submit a proposal that shall be considered by DARPA.

3.1.1. Federally Funded Research and Development Centers (FFRDCs) and Government Entities

FFRDCs

FFRDCs are subject to applicable direct competition limitations and cannot propose to this BAA in any capacity unless they meet the following conditions: (1) FFRDCs must clearly demonstrate that the proposed work is not otherwise available from the private sector. (2) FFRDCs must provide a letter on official letterhead from their sponsoring organization citing the specific authority establishing their eligibility to propose to Government solicitations and compete with industry, and their compliance with the associated FFRDC sponsor agreement's terms and conditions. This information is required for FFRDCs proposing to be awardees or subawardees.

Government Entities

Government Entities (e.g., Government/National laboratories, military educational institutions, etc.) are subject to applicable direct competition limitations. Government entities must clearly demonstrate that the work is not otherwise available from the private sector and provide written documentation citing the specific statutory authority and contractual authority, if relevant, establishing their ability to propose to Government solicitations.

Authority and Eligibility

At the present time, DARPA does not consider 15 U.S.C. § 3710a to be sufficient legal authority to show eligibility. While 10 U.S.C.§ 2539b may be the appropriate statutory starting point for some entities, specific supporting regulatory guidance, together with evidence of agency approval, will still be required to fully establish eligibility. DARPA will consider FFRDC and Government entity eligibility submissions on a case-by-case basis; however, the burden to prove eligibility for all team members rests solely with the proposer.

3.1.2. Non-U.S. Organizations

Non-U.S. organizations and/or individuals may participate to the extent that such participants comply with any necessary nondisclosure agreements, security regulations, export control laws, and other governing statutes applicable under the circumstances.

3.2. ORGANIZATIONAL CONFLICTS OF INTEREST

FAR 9.5 Requirements

In accordance with FAR 9.5, proposers are required to identify and disclose all facts relevant to potential OCIs involving the proposer's organization and *any* proposed team member (subawardee, consultant). Under this Section, the proposer is responsible for providing this disclosure with each proposal submitted to the BAA. The disclosure must include the proposer's, and as applicable, proposed team member's OCI mitigation plan. The OCI mitigation plan must include a description of the actions the proposer has taken, or intends to take, to prevent the existence of conflicting roles that might bias the proposer's judgment and to prevent the proposer from having unfair competitive advantage. The OCI mitigation plan will specifically discuss the disclosed OCI in the context of each of the OCI limitations outlined in FAR 9.505-1 through FAR 9.505-4.

Agency Supplemental OCI Policy

In addition, DARPA has a supplemental OCI policy that prohibits contractors/performers from concurrently providing Scientific Engineering Technical Assistance (SETA), Advisory and Assistance Services (A&AS) or similar support services and being a technical performer. Therefore, as part of the FAR 9.5 disclosure requirement above, a proposer must affirm whether the proposer or *any* proposed team member (subawardee, consultant) is providing SETA, A&AS, or similar support to any DARPA office(s) under: (a) a current award or subaward; or (b) a past award or subaward that ended within one calendar year prior to the proposal's submission date.

If SETA, A&AS, or similar support is being or was provided to any DARPA office(s), the proposal must include:

- The name of the DARPA office receiving the support;
- The prime contract number;
- Identification of proposed team member (subawardee, consultant) providing the support; and
- An OCI mitigation plan in accordance with FAR 9.5.

Government Procedures

In accordance with FAR 9.503, 9.504 and 9.506, the Government will evaluate OCI mitigation plans to avoid, neutralize or mitigate potential OCI issues before award and to determine whether it is in the Government's interest to grant a waiver. The Government will only evaluate OCI mitigation plans for proposals that are determined selectable under the BAA evaluation criteria and funding availability.

The Government may require proposers to provide additional information to assist the Government in evaluating the proposer's OCI mitigation plan.

If the Government determines that a proposer failed to fully disclose an OCI; or failed to provide the affirmation of DARPA support as described above; or failed to reasonably provide additional information requested by the Government to assist in evaluating the proposer's OCI mitigation plan, the Government may reject the proposal and withdraw it from consideration for award.

3.3. COST SHARING/MATCHING

Cost sharing is not required; however, it will be carefully considered where there is an applicable statutory condition relating to the selected funding instrument. Cost sharing is encouraged where there is a reasonable probability of a potential commercial application related to the proposed research and development effort.

For more information on potential cost sharing requirements for Other Transactions for Prototype, see http://www.darpa.mil/work-with-us/contract-management#OtherTransactions

4. Application and Submission Information

4.1. ADDRESS TO REQUEST APPLICATION PACKAGE

This announcement, any attachments, and any references to external websites herein constitute the total solicitation. If proposers cannot access the referenced material posted in the announcement found at http://www.darpa.mil, contact the administrative contact listed herein.

4.2. CONTENT AND FORM OF APPLICATION SUBMISSION

All submissions, including abstracts and proposals must be written in English with type not smaller than 12 point font. Smaller font may be used for figures, tables, and charts. Copies of all documents submitted must be clearly labeled with the DARPA BAA number, proposer organization, and proposal title/proposal short title.

4.2.1. Proposal Abstract Format

Proposers are strongly encouraged to submit an abstract in advance of a proposal to minimize effort and reduce the potential expense of preparing an out of scope proposal. The abstract is a concise version of the proposal comprising a maximum of **6** pages including all figures, tables, and charts. The (optional) submission letter is not included in the page count. All pages shall be formatted for printing on 8-1/2 by 11 inch paper with font size not smaller than 12 point. Smaller font sizes (not smaller than 9 point) may be used for figures, tables, and charts.

Submissions must be written in English.

Abstracts must include the following components:

> A. Cover Sheet (does not count towards page limit): Include the administrative and technical points of contact (name, address, phone, fax, email, lead organization). Also include the BAA number, title of the proposed project, primary subcontractors, estimated cost, duration of the project, and the label "ABSTRACT."
>
> B. Goals and Impact (1 page): Clearly describe what is being proposed and what difference it will make (qualitatively and quantitatively), including brief answers to the following questions:
>
> 1. What is the proposed work attempting to accomplish or do?
> 2. How is it done today? And what are the limitations?
> 3. What is innovative in your approach and how does it compare to SOA?

4. What are the key technical challenges in your approach and how do you plan to overcome these?
5. Who will care and what will the impact be if you are successful?
6. How much will it cost and how long will it take?

C. Technical Plan (3-4 pages): Outline and address all technical challenges inherent in the approach and possible solutions for overcoming potential problems. The technical plan should address both TA1 and TA2. For TA1, the abstract should include a description of the epigenetic analysis methods used to generate ESP, the proposed exposure targets (i.e. chemical agents, biological agents, radiological, nuclear, and explosives); the proposed human sample type (buccal, nasal, or blood); and the proposed cell types (e.g., T-cells, B-cells, keratinocytes, etc.) your team plans to use. Any novel techniques or approaches that are unique to your organization should be highlighted. For TA2, the abstract should include your level of access and plan for incorporating the molecular and epigenetic analysis technologies in Phase I and a brief description of the components your final system will house. Where possible, please provide data and examples to support your plan. This section should provide appropriate specific milestones (quantitative, if possible) at intermediate stages of the project to demonstrate progress, and a brief plan for accomplishment of the milestones.

D. Capabilities (.5- 1 page): Provide a brief summary of expertise of the team, including subcontractors and key personnel. A principal investigator for the project must be identified, and a description of the team's organization. Include a description of the team's organization including roles and responsibilities. Describe the organizational experience in this area, existing intellectual property required to complete the project, any specialized facilities, and access to epigenetics and molecular analysis technologies to be used as part of the project. List Government-furnished materials or data assumed to be available. If desired, include a brief bibliography with links to relevant papers, reports, or resumes of key performers. Do not include more than two resumes as part of the abstract. Resumes count against the abstract page limit.

E. Budget (.5 page): Please provide a rough order of magnitude of the costs of accomplishing the goals of the ECHO program. Costs should be broken out by technical area and phase. Any anticipated Government furnished equipment should be identified.

4.2.2. Proposal Format

All full proposals must be in the format given below. Proposals shall consist of two volumes: 1) **Volume I, Technical and Management Proposal**, and 2) **Volume II, Cost Proposal.** All pages shall be printed on 8-1/2 by 11 inch paper with type not smaller than 12 point. Smaller font (not smaller than 9 point) may be used for figures, tables and charts. The page limitation for full proposals includes all figures, tables, and charts. Volume I, Technical and Management Proposal, may include an attached bibliography of relevant technical papers or research notes (published and unpublished), which document the technical ideas and approach upon which the proposal is based. Copies of not more than three (3) relevant papers may be included with the

submission. The bibliography and attached papers are not included in the page counts given below. The submission of other supporting materials along with the proposals is strongly discouraged and will not be considered for review. **The maximum page count for Volume 1 is 25 pages.** A submission letter is optional and is not included in the page count. Volume I should include the following components:

NOTE: Non-conforming submissions that do not follow the instructions herein may be rejected without further review.

a. Volume I, Technical and Management Proposal

Section I. Administrative

A. Cover Sheet (LABELED "PROPOSAL: VOLUME I"):

1. BAA number (HR001118S0023);
2. Technical area;
3. Lead organization submitting proposal (prime contractor);
4. Type of organization, selected from among the following categories: "LARGE BUSINESS," "SMALL DISADVANTAGED BUSINESS," "OTHER SMALL BUSINESS," "HBCU," "MI," "OTHER EDUCATIONAL," OR "OTHER NONPROFIT";
5. Proposer's reference number (if any);
6. Other team members (if applicable) and type of business for each;
7. Proposal title;
8. Technical point of contact (Program Manager or Principle Investigator) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax, e-mail;
9. Administrative point of contact (Contracting Officer or Grant Officer) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax, e-mail;
10. Award instrument requested: cost-plus-fixed-free (CPFF), cost-contract—no fee, firm-fixed-price, grant, cooperative agreement, other transaction, or other type (specify);
11. Place(s) and period(s) of performance ;
12. Proposal validity period;
13. Total funds requested from DARPA, and the amount of cost share (if any); AND
14. Date proposal was submitted.

Information on award instruments is available at http://www.darpa.mil/work-with-us/contract-management.

B. Official Transmittal Letter.

Section II. Detailed Proposal Information

A. Executive Summary (1-2 pages): Provide a synopsis of the proposed project, including answers to the following questions:

- What is the proposed work attempting to accomplish or do?
- How is it done today, and what are the limitations?
- What is innovative in your approach?
- What are the key technical challenges in your approach and how do you plan to overcome these?
- Who or what will be affected and what will be the impact if the work is successful?
- How much will it cost, and how long will it take?

B. Goals and Impact (1-2 pages): Clearly describe what the team is trying to achieve and the difference it will make (qualitatively and quantitatively) if successful. Describe the innovative aspects of the project in the context of existing capabilities and approaches, clearly delineating the uniqueness and benefits of this project in the context of the state of the art, alternative approaches, and other projects from the past and present. Describe how the proposed project is revolutionary and how it significantly rises above the current state of the art. Describe the deliverables associated with the proposed project and any plans to commercialize the technology, transition it to a customer, or further the work.

C. Technical Plan (7-10 pages): Outline and address technical challenges inherent in the approach and possible solutions for overcoming potential problems. This section should provide appropriate measurable milestones (qualitative and quantitative) and program metrics (see Section 1.3) at intermediate stages of the program to demonstrate progress, and a plan for achieving the milestones. The technical plan should demonstrate a deep understanding of the technical challenges and present a credible (even if risky) plan to achieve the program goal. Discuss mitigation of technical risk. The technical plan should address the TA1 and TA2 proposal content requirements detailed in Sections 1.2 and 1.3.

A complete technical plan must address the following:

- Proposed (7) candidate signatures for Phase I and (14) candidate signatures for Phase II.

- Proposed human sample types (buccal, nasal, or blood); and the proposed cell types (e.g., T-cells, B-cells, keratinocytes, etc.) your team plans to use. Any animal models and tissue chip technologies that are to be supplemented should be identified as well as the cohort or vender providing the samples.
- All molecular epigenetic analysis methods to be utilized in both TA1 and TA2 must be identified.
- Anticipated components or modules in the platform system and any anticipated off-the-shelf technologies
- Any data from other funded or internal efforts that support your approach.
- Any examples of past experience demonstrating capability of developing platform technologies

D. Management Plan (1-2 pages): Provide a summary of expertise of the team, including any subcontractors, and key personnel who will be doing the work. Resumes count against the proposal page count. Identify a principal investigator for the project. Provide a clear description of the team's organization including an organization chart that includes, as applicable: the programmatic relationship of team members; the unique capabilities of team members; the task responsibilities of team members, the teaming strategy among the team members; and key personnel with the amount of effort to be expended by each person during each year. Provide a detailed plan for coordination including explicit guidelines for interaction among collaborators/subcontractors of the proposed effort. Include risk management approaches. Describe any formal teaming agreements that are required to execute this program.

E. Capabilities (2-3 pages): Describe organizational experience in relevant subject area(s), existing intellectual property, specialized facilities, and any Government-furnished materials or information. Discuss any work in closely related research areas and previous accomplishments. Describe experience with the proposed exposure-specific agents or compounds.

F. Statement of Work (SOW) (2-3 pages): The SOW should provide a detailed task breakdown, citing specific tasks and their connection to the interim milestones and program metrics. Each phase of the program (Phase I base and Phase II option) should be separately defined in the SOW and each task should be identified by TA (1 or 2). The SOW must not include proprietary information.

For each task/subtask, provide:

- A detailed description of the approach to be taken to accomplish each defined task/subtask.

- Identification of the primary organization responsible for task execution (prime contractor, subcontractor(s), consultant(s), by name).
- A measurable milestone, i.e., a deliverable, demonstration, or other event/activity that marks task completion. Include quantitative metrics.
- A definition of all deliverables (e.g., data, reports, software) to be provided to the Government in support of the proposed tasks/subtasks.

G. Schedule and Milestones (1-2 pages): Provide a detailed schedule showing tasks (task name, duration, work breakdown structure element as applicable, performing organization), milestones, and the interrelationships among tasks. The task structure must be consistent with that in the SOW. Measurable milestones should be clearly articulated and defined in time relative to the start of the project.

H. Transition Plan (.5-1- page): As this program is expecting a prototype system at the end of 48 months; proposals must address plan to complete, beta-test, and market the deployable platform to the military and commercial partners. Proposals should include a rough order of magnitude of the prototype system and disposables cost. If off-the-shelf technologies were proposed, proposals should address IP licensing and associated risks.

I. CUI Risk Mitigation Plan (.5 page) (Required for proposers who anticipate generating work that may be considered CUI in accordance with Section 1.4 "Controlled Unclassified Information"): Provide a detailed plan for how the organization and its subcontractors will meet CUI safeguarding requirements. The plan should provide a detailed strategy to protect CUI without unnecessarily compartmentalizing information flow within or among performer teams. This plan must describe safeguard procedures for generating any sensitive program deliverables.

Section III. Additional Information (Note: Does not count towards page limit)

A brief bibliography of relevant technical papers and research notes (published and unpublished) which document the technical ideas upon which the proposal is based. Copies of not more than three (3) relevant papers can be included in the submission.

a. Volume II, Cost Management Proposal

Cover Sheet (LABELED "PROPOSAL: VOLUME II"):

1. BAA number;
2. Technical area;
3. Lead Organization Submitting proposal;

4. Type of organization, selected among the following categories: “LARGE BUSINESS”, “SMALL DISADVANTAGED BUSINESS”, “OTHER SMALL BUSINESS”, “HBCU”, “MI”, “OTHER EDUCATIONAL”, OR “OTHER NONPROFIT”;
5. Proposer’s reference number (if any);
6. Other team members (if applicable), CAGE Code(s), and type of business for each;
7. Proposal title;
8. Technical point of contact (Program Manager or Principal Investigator) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax (if available), electronic mail (if available);
9. Administrative point of contact (Contracting Officer or Grant Officer) to include: salutation, last name, first name, street address, city, state, zip code, telephone, fax (if available), and electronic mail (if available);
10. Award instrument requested: cost-plus-fixed-free (CPFF), cost-contract—no fee, cost sharing contract – no fee, or other type of procurement contract (*specify*), cooperative agreement, or other transaction;
11. Place(s) and period(s) of performance;
12. Total proposed cost separated by basic award and option(s) (if any);
13. Name, address, and telephone number of the proposer’s cognizant Defense Contract Management Agency (DCMA) administration office (*if known)*;
14. Name, address, and telephone number of the proposer’s cognizant Defense Contract Audit Agency (DCAA) audit office (*if known*);
15. Date proposal was prepared;
16. DUNS number (http://www.dnb.com/get-a-duns-number.html);
17. Taxpayer ID number (https://www.irs.gov/Individuals/International-Taxpayers/Taxpayer-Identification-Numbers-TIN);
18. CAGE code (https://cage.dla.mil/Home/UsageAgree);
19. Proposal validity period

Note that nonconforming proposals may be rejected without review.

Proposers that do not have a Cost Accounting Standards (CAS) complaint accounting system considered adequate for determining accurate costs that are negotiating a cost- type procurement contract must complete an SF 1408. For more information on CAS compliance, see http://www.dcaa.mil/cas.html. To facilitate this process, proposers should complete the SF 1408 found at http://www.gsa.gov/portal/forms/download/115778 and submit the completed form with the proposal. To complete the form, check the boxes on the second page, then provide a narrative explanation of your accounting system to supplement the checklist on page one. For more information, see (http://www.dcaa.mil/Home/Preaward).

The Government strongly encourages that tables included in the cost proposal also be provided in an editable (e.g., MS Excel) format with calculation formulas intact to allow traceability of the cost proposal numbers across the prime and subcontractors.

The Government strongly encourages that the proposer provide a detailed cost breakdown to include:

(1) Total program costs broken down by Phase I (Base) and Phase II (Option) in Contractor Fiscal Year to include:

i. Direct Labor – Including individual labor categories with associated labor hours and direct labor rates. If selected for award, be prepared to submit supporting documentation to justify labor rates. (i.e., screenshots of HR databases, comparison to NIH or other web-based salary database);

ii. Consultants – If consultants are to be used, proposer must provide a copy of the consultant's proposed SOW as well as a signed consultant agreement or other document which verifies the proposed loaded daily / hourly rate, hours and any other proposed consultant costs (e.g., travel);

iii. Indirect Costs – Including Fringe Benefits, Overhead, General and Administrative Expense, Cost of Money, Fee, etc. (must show base amount and rate), if available, provide current Forward Pricing Rate Agreement or Forward Pricing Rate Proposal. If not available, provide 2 years historical data to include pool and expense costs used to generate the rates. For academia, provide DHHS or ONR negotiated rate package or, if calculated by other than a rate, provide University documentation identifying G&A and fringe costs by position;

iv. Travel – Provide the purpose of the trip, number of trips, number of days per trip, departure and arrival destinations, number of people, estimated rental car and airfare costs, and prevailing per diem rates as determined by gsa.gov, etc.; Quotes must be supported by screenshots from travel websites;

v. Other Direct Costs – Itemized with costs including tuition remission, animal per diem rates, health insurance/fee; back-up documentation is to be submitted to support proposed costs;

vi. Equipment Purchases – Itemization with individual and total costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase (NOTE: For equipment purchases, include a letter stating why the proposer cannot provide the requested resources from its own funding), and;

vii. Materials – Itemization with costs, including quantities, unit prices, proposed vendors (if known), and the basis of estimate (e.g., quotes, prior purchases, catalog price lists, etc.); any item that exceeds $5,000 must be supported with back-up documentation such as a copy of catalog price lists or quotes prior to purchase.

(2) A summary of total program costs by major TA1 and TA2 tasks;

(3) A summary of projected funding requirements by month;

(4) An itemization of any information technology (IT) purchase (including a letter stating why the proposer cannot provide the requested resources from its own funding), as defined in FAR Part 2.101;

(5) An itemization of Subcontracts. **All subcontractor cost proposal documentation must be prepared at the same level of detail as that required of the prime.** Subcontractor proposals should include Interdivisional Work Transfer Agreements (IWTA) or evidence

of similar arrangements (an IWTA is an agreement between multiple divisions of the same organization);
(6) The source, nature, and amount of any industry cost-sharing. Where the effort consists of multiple portions which could reasonably be partitioned for purposes of funding, these should be identified as options with separate cost estimates for each;
(7) Identification of pricing assumptions of which may require incorporation into the resulting award instrument (e.g., use of Government Furnished Property/Facilities/Information, access to Government Subject Matter Expert/s, etc.);
(8) Any Forward Pricing Rate Agreement, DHHS rate agreement, other such approved rate information, or such documentation that may assist in expediting negotiations (if available); and
(9) Proposers with a Government acceptable accounting system who are proposing a cost-type contract, must submit the DCAA document approving the cost accounting system.

4.2.3. Additional Proposal Information

Proprietary Markings

Proposers are responsible for clearly identifying proprietary information. Submissions containing proprietary information must have the cover page and each page containing such information clearly marked with a label such as "Proprietary" or "Company Proprietary." NOTE: "Confidential" is a classification marking used to control the dissemination of U.S. Government National Security Information as dictated in Executive Order 13526 and should not be used to identify proprietary business information.

Unclassified Submissions

DARPA anticipates that submissions received under this BAA will be unclassified. However, should a proposer wish to submit classified information, an *unclassified* email must be sent to the BAA mailbox requesting submission instructions from the Technical Office PSO. If a determination is made that the award instrument may result in access to classified information, a SCG and/or DD Form 254 will be issued by DARPA and attached as part of the award.

Human Research Subjects/Animal Use

Proposers that anticipate involving Human Research Subjects or Animal Use must comply with the approval procedures detailed at http://www.darpa.mil/work-with-us/additional-baa.

Approved Cost Accounting System Documentation

Proposers that do not have a Cost Accounting Standards (CAS) complaint accounting system considered adequate for determining accurate costs that are negotiating a cost- type procurement contract must complete an SF 1408. For more information on CAS compliance, see http://www.dcaa.mil/cas.html. To facilitate this process, proposers should complete the SF 1408 found at http://www.gsa.gov/portal/forms/download/115778 and submit the completed form with the proposal. To complete the form, check the boxes on the second page, then provide a narrative explanation of your accounting system to supplement the checklist on page one. For more information, see (http://www.dcaa.mil/preaward_accounting_system_adequacy_checklist.html).

Small Business Subcontracting Plan

Pursuant to Section 8(d) of the Small Business Act (15 U.S.C. § 637(d)) and FAR 19.702(a)(1), each proposer who submits a contract proposal and includes subcontractors might be required to submit a subcontracting plan with their proposal. The plan format is outlined in FAR 19.704.

Section 508 of the Rehabilitation Act (29 U.S.C. § 749d)/FAR 39.2

All electronic and information technology acquired or created through this BAA must satisfy the accessibility requirements of Section 508 of the Rehabilitation Act (29 U.S.C. § 749d)/FAR 39.2.

Intellectual Property

All proposers must provide a good faith representation that the proposer either owns or possesses the appropriate licensing rights to all intellectual property that will be utilized under the proposed effort.

For Procurement Contracts

Proposers responding to this BAA requesting procurement contracts will need to complete the certifications at DFARS 252.227-7017. See http://www.darpa.mil/work-with-us/additional-baa for further information. If no restrictions are intended, the proposer should state "none." The table below captures the requested information:

Technical Data Computer Software To be Furnished With Restrictions	Summary of Intended Use in the Conduct of the Research	Basis for Assertion	Asserted Rights Category	Name of Person Asserting Restrictions
(LIST)	(NARRATIVE)	(LIST)	(LIST)	(LIST)

For All Non-Procurement Contracts

Proposers responding to this BAA requesting a Grant, Cooperative Agreement, Technology Investment Agreement, or Other Transaction for Prototypes shall follow the applicable rules and regulations governing these various award instruments, but, in all cases, should appropriately identify any potential restrictions on the Government's use of any Intellectual Property contemplated under the award instrument in question. This includes both Noncommercial Items and Commercial Items. Proposers are encouraged to use a format similar to that described in the section above. If no restrictions are intended, then the proposer should state "NONE."

System for Award Management (SAM) and Universal Identifier Requirements

All proposers must be registered in SAM unless exempt per FAR 4.1102. FAR 52.204-7, "System for Award Management" and FAR 52.204-13, "System for Award Management Maintenance" are incorporated into this BAA. See http://www.darpa.mil/work-with-us/additional-baa for further information.

4.2.4. Submission Information

DARPA will acknowledge receipt of all submissions and assign an identifying control number that should be used in all further correspondence regarding the submission. DARPA intends to use electronic mail correspondence regarding HR001118S0023. Submissions may not be submitted by fax or e-mail; any so sent will be disregarded.

Submissions will not be returned. An electronic copy of each submission received will be retained at DARPA and all other non-required copies destroyed. A certification of destruction may be requested, provided the formal request is received by DARPA within 5 days after notification that a proposal was not selected.

For abstract and proposal submission dates, see Part I., Overview Information. Submissions received after these dates and times may not be reviewed.

For Proposers Submitting Proposal Abstracts or Full Proposals as Hard Copies/On CD-ROM:

Proposers must submit an original hardcopy and one (1) electronic copy of the abstract or proposal in PDF (preferred) on a CD-ROM to the mailing address listed in Part I. Each copy must be clearly labeled with HR001118S0023, proposer organization, technical point of contact, and proposal title (short title recommended).

Please note that submitters via hardcopy/CD-ROM will still need to visit https://baa.darpa.mil to register their organization concurrently to ensure the BAA office can verify and finalize their submission.

For Proposers Submitting Proposal Abstracts or Full Proposals Requesting Procurement Contracts or OTs through DARPA's BAA Submission Portal:

Abstracts and Full Proposals sent in response to HR001118S0023 may be submitted via DARPA's BAA Website (https://baa.darpa.mil). Visit the website to complete the two-step

registration process. Submitters will need to register for an Extranet account (via the form at the URL listed above) and wait for two separate e-mails containing a username and temporary password. After accessing the Extranet, submitters may then create an account for the DARPA BAA website (via the "Register your Organization" link along the left side of the homepage), view submission instructions, and upload/finalize the abstract. Proposers using the DARPA BAA Website may encounter heavy traffic on the submission deadline date; it is highly advised that submission process be started as early as possible.

All unclassified concepts submitted electronically through DARPA's BAA Website must be uploaded as zip files (.zip or .zipx extension). The final zip file should be no greater than 50 MB in size. Only one zip file will be accepted per submission. Classified submissions and proposals requesting assistance instruments (grants or cooperative agreements) should NOT be submitted through DARPA's BAA Website (https://baa.darpa.mil), though proposers will likely still need to visit https://baa.darpa.mil to register their organization (or verify an existing registration) to ensure the BAA office can verify and finalize their submission.

Technical support for BAA Website may be reached at BAAT_Support@darpa.mil, and is typically available during regular business hours, (9:00 AM- 5:00 PM EST Monday – Friday).

Proposers using the DARPA BAA Website may encounter heavy traffic on the submission deadline date; it is highly advised that submission process be started as early as possible.

For Full Proposals Requesting Cooperative Agreements:

Proposers requesting cooperative agreements may submit proposals through one of the following methods: (1) hard copy mailed directly to DARPA; or (2) electronic upload per the instructions at http://www.grants.gov/applicants/apply-for-grants.html. Cooperative agreement proposals may not be submitted through any other means. If proposers intend to use Grants.gov as their means of submission, then they must submit their entire proposal through Grants.gov; applications cannot be submitted in part to Grants.gov and in part as a hard-copy. Proposers using the Grants.gov do not submit paper proposals in addition to the Grants.gov electronic submission.

Grants.gov Submissions: Grants.gov requires proposers to complete a one-time registration process before a proposal can be electronically submitted. First time registration can take between three business days and four weeks. For more information about registering for Grants.gov, see http://www.darpa.mil/work-with-us/additional-baa.

Hard-copy Submissions: Proposers electing to submit grant or cooperative agreement proposals as hard copies must complete the SF 424 R&R form (Application for Federal Assistance,) available on the Grants.gov website
http://apply07.grants.gov/apply/forms/sample/RR_SF424_2_0-V2.0.pdf

Failure to comply with the submission procedures may result in the submission not being evaluated. DARPA will acknowledge receipt of complete submissions via email and assign control numbers that should be used in all further correspondence regarding proposals.

4.2.5. Disclosure of Information and Compliance with Safeguarding Covered Defense Information Controls

The following provisions and clause apply to all solicitations and contracts; however, the definition of "controlled technical information" clearly exempts work considered fundamental research and therefore, even though included in the contract, will not apply if the work is fundamental research.

DFARS 252.204-7000, "Disclosure of Information"
DFARS 252.204-7008, "Compliance with Safeguarding Covered Defense Information Controls"
DFARS 252.204-7012, "Safeguarding Covered Defense Information and Cyber Incident Reporting"

The full text of the above solicitation provision and contract clauses can be found at http://www.darpa.mil/work-with-us/additional-baa#NPRPAC.

Compliance with the above requirements includes the mandate for proposers to implement the security requirements specified by National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171, "Protecting Controlled Unclassified Information in Nonfederal Information Systems and Organizations" (see https://doi.org/10.6028/NIST.SP.800-171r1) that are in effect at the time the BAA is issued, or as authorized by the Contracting Officer, not later than December 31, 2017.

For awards where the work is considered fundamental research, the contractor will not have to implement the aforementioned requirements and safeguards; however, should the nature of the work change during performance of the award, work not considered fundamental research will be subject to these requirements.

4.3. FUNDING RESTRICTIONS

Individual piece of equipment greater than $100,000.00 DARPA. This restriction includes any item of equipment under the contract or subcontract, purchased for the program, irrespective of the dollar threshold of the item.

Proposers are encouraged to propose leasing or purchasing of equipment that is commercially available and have a proven track record with technologies specific to this solicitation. If equipment is limited due to high internal demand, leasing and external vendors are optional solutions.

4.4. OTHER SUBMISSION REQUIREMENTS

Not applicable.

5. Application Review Information

5.1. EVALUATION CRITERIA

Proposals will be evaluated using the following criteria, listed in descending order of importance:

5.1.1 Overall Scientific and Technical Merit; 5.1.2 Potential Contribution and Relevance to the DARPA Mission; 5.1.3 Cost Realism; 5.1.4 Realism of Proposed Schedule; 5.1.5 Proposer's Capabilities and/or Related Experience; and 5.1.6 Plans and Capabilities to Accomplish Technology Transition.

5.1.1. Overall Scientific and Technical Merit

The proposed technical approach is innovative, feasible, achievable, and complete. The proposed technical team has the expertise and experience to accomplish the proposed tasks. Task descriptions and associated technical elements provided are complete and in a logical sequence with all proposed deliverables clearly defined such that a final outcome that achieves the goal can be expected as a result of award. The proposal identifies major technical risks and planned mitigation efforts are clearly defined and feasible. The diversity of the proposed additional 17 exposure compounds and agents supports the program's goal to maximize the forensic and diagnostic capability of the ESP on the final device.

5.1.2. Potential Contribution and Relevance to the DARPA Mission

The potential contributions of the proposed effort are relevant to the national technology base. Specifically, DARPA's mission is to make pivotal early technology investments that create or prevent strategic surprise for U.S. National Security.

5.1.3. Cost Realism

The proposed costs are realistic for the technical and management approach and accurately reflect the technical goals and objectives of the solicitation. The proposed costs are consistent with the proposer's Statement of Work and reflect a sufficient understanding of the costs and level of effort needed to successfully accomplish the proposed technical approach. The costs for the prime proposer and proposed subawardees are substantiated by the details provided in the proposal (e.g., the type and number of labor hours proposed per task, the types and quantities of materials, equipment and fabrication costs, travel and any other applicable costs and the basis for the estimates).

It is expected that the effort will leverage all available relevant prior research in order to obtain the maximum benefit from the available funding. For efforts with a likelihood of commercial application, appropriate direct cost sharing may be a positive factor in the evaluation. DARPA recognizes that undue emphasis on cost may motivate proposers to offer low-risk ideas with minimum uncertainty and to staff the effort with junior personnel in order to be in a more competitive posture. DARPA discourages such cost strategies.

5.1.4. Realism of Proposed Schedule

The proposed schedule aggressively pursues performance metrics in the shortest timeframe and accurately accounts for that timeframe. The proposed schedule identifies and mitigates any potential schedule risk.

5.1.5. Proposer's Capabilities and/or Related Experience

The proposer's prior experience in similar efforts must clearly demonstrate an ability to deliver products that meet the proposed technical performance within the proposed budget and schedule. The proposed team has the expertise to manage the cost and schedule. Similar efforts

completed/ongoing by the proposer in this area are fully described including identification of other Government sponsors. The proposed team has experience with the proposed exposure categories.

5.1.6. Plans and Capability to Accomplish Technology Transition

The proposer clearly demonstrates its capability to transition the technology to the research, industrial, and/or operational military communities in such a way as to enhance U.S. defense. In addition, the evaluation will take into consideration the extent to which the proposed intellectual property (IP) rights will potentially impact the Government's ability to transition the technology.

5.2. REVIEW OF PROPOSALS

Review Process

It is the policy of DARPA to ensure impartial, equitable, comprehensive proposal evaluations based on the evaluation criteria listed in Section V.A. and to select the source (or sources) whose offer meets the Government's technical, policy, and programmatic goals.

DARPA will conduct a scientific/technical review of each conforming proposal. Conforming proposals comply with all requirements detailed in this BAA; proposals that fail to do so may be deemed non-conforming and may be removed from consideration. Proposals will not be evaluated against each other since they are not submitted in accordance with a common work statement. DARPA's intent is to review proposals as soon as possible after they arrive; however, proposals may be reviewed periodically for administrative reasons

Award(s) will be made to proposers whose proposals are determined to be the most advantageous to the Government, consistent with instructions and evaluation criteria specified in the BAA herein, and availability of funding.

Handling of Source Selection Information

DARPA policy is to treat all submissions as source selection information (see FAR 2.101 and 3.104), and to disclose their contents only for the purpose of evaluation. Restrictive notices notwithstanding, during the evaluation process, submissions may be handled by support contractors for administrative purposes and/or to assist with technical evaluation. All DARPA support contractors performing this role are expressly prohibited from performing DARPA-sponsored technical research and are bound by appropriate nondisclosure agreements. Subject to the restrictions set forth in FAR 37.203(d), input on technical aspects of the proposals may be solicited by DARPA from non-Government consultants/experts who are strictly bound by the appropriate non-disclosure requirements.

Federal Awardee Performance and Integrity Information (FAPIIS)

Per 41 U.S.C. 2313, as implemented by FAR 9.103 and 2 CFR § 200.205, prior to making an award above the simplified acquisition threshold, DARPA is required to review and consider any information available through the designated integrity and performance system (currently FAPIIS). Awardees have the opportunity to comment on any information about themselves

entered in the database, and DARPA will consider any comments, along with other information in FAPIIS or other systems prior to making an award.

6. Award Administration Information

6.1. SELECTION NOTICES

As soon as the evaluation of a proposal is complete, the proposers will be notified that 1) the proposal has been selected for funding pending contract negotiations, or 2) the proposal has not been selected. These official notifications will be sent via email to the Technical POC identified on the proposal coversheet.

6.1.1. Proposal Abstracts

DARPA will respond to abstracts with a statement as to whether DARPA is interested in the idea. If DARPA does not recommend the proposer submit a full proposal, DARPA will provide feedback to the proposer regarding the rationale for this decision. Regardless of DARPA's response to an abstract, proposers may submit a full proposal. DARPA will review all full proposals submitted using the published evaluation criteria and without regard to any comments resulting from the review of an abstract.

6.1.2. Full Proposals

As soon as the evaluation of a proposal is complete, the proposer will be notified that (1) the proposal has been selected for funding pending award negotiations, in whole or in part, or (2) the proposal has not been selected. These official notifications will be sent via e-mail to the Technical POC and/or Administrative POC identified on the proposal coversheet.

6.2. ADMINISTRATIVE AND NATIONAL POLICY REQUIREMENTS

6.2.1. Meeting and Travel Requirements

There will be a program kickoff meeting in the Arlington, VA vicinity and all key participants are required to attend. Performers should also anticipate 6 month program-wide PI meetings alternating between the East and West Coast, as well as periodic site visits at the Program Manager's discretion.

Proposers shall include within the content of their proposal details and costs of any travel or meetings they deem to be necessary throughout the course of the effort, to include periodic status reviews by the Government.

6.2.1. FAR and DFARS Clauses

(Full text or text selections from website may be used in addition to or in lieu of text below.) Solicitation clauses in the FAR and DFARS relevant to procurement contracts and FAR and DFARS clauses that may be included in any resultant procurement contracts are incorporated herein and can be found at http://www.darpa.mil/work-with-us/additional-baa.

6.2.2. Controlled Unclassified Information (CUI) on Non-DoD Information Systems

Further information on Controlled Unclassified Information on Non-DoD Information Systems is incorporated herein can be found at http://www.darpa.mil/work-with-us/additional-baa.

6.2.3. Representations and Certifications

If a procurement contract is contemplated, prospective awardees will need to be registered in the SAM database prior to award and complete electronic annual representations and certifications consistent with FAR guidance at 4.1102 and 4.1201; the representations and certifications can be found at www.sam.gov. Supplementary representations and certifications can be found at http://www.darpa.mil/work-with-us/additional-baa.

.

6.2.4. Terms and Conditions

A link to the DoD General Research Terms and Conditions for Grants and Cooperative Agreements and supplemental agency terms and conditions can be found at http://www.darpa.mil/work-with-us/contract-management#GrantsCooperativeAgreements.

6.3. REPORTING

The number and types of reports will be specified in the award document, but will include as a minimum monthly financial status reports and quarterly technical status reports. The reports shall be prepared and submitted in accordance with the procedures contained in the award document and mutually agreed on before award. Reports and briefing material will also be required as appropriate to document progress in accomplishing program metrics. A Final Report that summarizes the project and tasks will be required at the conclusion of the performance period for the award, notwithstanding the fact that the research may be continued under a follow-on vehicle.

6.4. ELECTRONIC SYSTEMS

6.4.1. Wide Area Work Flow (WAWF)

Performers will be required to submit invoices for payment directly to https://wawf.eb.mil, unless an exception applies. Performers must register in WAWF prior to any award under this BAA.

6.4.2. i-EDISON

The award document for each proposal selected for funding will contain a mandatory requirement for patent reports and notifications to be submitted electronically through i-Edison (http://public.era.nih.gov/iedison).

7. Agency Contacts

Administrative, technical or contractual questions should be sent via e-mail (preferred) to ECHO@darpa.mil.

Points of Contact
The BAA Coordinator for this effort may be reached at:
ECHO@darpa.mil
DARPA/BTO
ATTN: HR001118S0023
675 North Randolph Street

Arlington, VA 22203-2114

For information concerning agency level protests see http://www.darpa.mil/work-with-us/additional-baa#NPRPAC.

8. Other Information

DARPA will host a Proposers Day in support of the ECHO program on **February 23, 2018**, at the Executive Conference Center in Arlington, VA. The purpose is to provide potential proposers with information on the ECHO program, promote additional discussion on this topic, address questions, provide a forum to present their capabilities, and to encourage team formation.

Interested proposers are not required to attend to respond to the ECHO BAA, and relevant information and materials discussed at Proposers Day will be made available to all potential proposers in the form of a FAQ posted on the DARPA Opportunities Page.

DARPA will not provide cost reimbursement for interested proposers in attendance.

An online registration form and various other meeting details can be found at the registration website, https://events.sa-meetings.com/ECHOProposersDay.

To encourage team formation, interested proposers are encouraged to submit information to be shared with all potential proposers through the Proposers Day website and the DARPA Opportunities Page. This information may include contact information, a brief description of their technical capabilities, and the desired expertise from other teams, as applicable.

Participants are required to register no later than **February 16, 2018**, for the event. This event is not open to the Press. The Proposers Day will be open to members of the public who have registered in advance for the event; **there will be no onsite registration**.

All foreign nationals, including permanent residents, must complete and submit a DARPA Form 60 "Foreign National Visit Request," which will be provided in the registration confirmation email.

Proposers Day Point of Contact: DARPA-SN-18-23@darpa.mil.

9. APPENDIX 1 – Volume II checklist

Volume II, Cost Proposal
Checklist and Sample Templates

The following checklist and sample templates are provided to assist the proposer in developing a complete and responsive cost volume. Full instructions appear in Section 4.2.2 beginning on Page 23 of HR001118S0023. This worksheet must be included with the coversheet of the Cost Proposal.

1. Are all items from Section 4.2.2 (Volume II, Cost Proposal) of **HR001118S0023** included on your Cost Proposal cover sheet?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]
   If reply is "No", please explain:

2. Does your Cost Proposal include (1) a summary cost buildup by Phase, (2) a summary cost buildup by Year, and (3) a detailed cost buildup of for each Phase that breaks out each task and shows the cost per month?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

3. Does your cost proposal (detailed cost buildup #3 above in item 2) show a breakdown of the major cost items listed below:
   Direct Labor (Labor Categories, Hours, Rates)
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Indirect Costs/Rates (i.e., overhead charges, fringe benefits, G&A)
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Materials and/or Equipment
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Subcontracts/Consultants
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Other Direct Costs
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   Travel
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

4. Have you provided documentation for proposed costs related to travel, to include purpose of trips, departure and arrival destinations and sample airfare?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

5. Does your cost proposal include a complete itemized list of all material and equipment items to be purchased (a priced bill-of-materials (BOM))?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

6. Does your cost proposal include vendor quotes or written engineering estimates (basis of estimate) for all material and equipment with a unit price exceeding $5000?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

7. Does your cost proposal include a clear justification for the cost of labor (written labor basis-of-estimate (BOE)) providing rationale for the labor categories and hours proposed for each task?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

8. Do you have subcontractors/consultants? If YES, continue to question 9. If NO, skip to question 13.
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

9. Does your cost proposal include copies of all subcontractor/consultant technical (to include Statement of Work) and cost proposals?
   ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

   If reply is "No", please explain:

10. Do all subcontract proposals include the required summary buildup, detailed cost buildup, and supporting documentation (SOW, Bill-of-Materials, Basis-of-Estimate, Vendor Quotes, etc.)?
    ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

    If reply is "No", please explain:

11. Does your cost proposal include copies of consultant agreements, if available?
    ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

    If reply is "No", please explain:

12. If requesting a FAR-based contract, does your cost proposal include a tech/cost analysis for all proposed subcontractors?
    ○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

    If reply is "No", please explain:

13. Have all team members (prime and subcontractors) who are considered a Federally Funded Research & Development Center (FFRDC), included documentation that clearly demonstrates work is not otherwise available from the private sector AND provided a letter on letterhead from the sponsoring organization citing the specific authority establishing their eligibility to propose to government solicitations and compete with industry, and compliance with the associated FFRDC sponsor agreement and terms and conditions.

○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

14. Does your proposal include a response regarding Organizational Conflicts of Interest?

○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

15. Does your proposal include a completed Data Rights Assertions table/certification?

○ **YES** ○ **NO** **Appears on Page(s)** [Type text]

If reply is "No", please explain:

Risk Mitigation Plan- 'Gain of Function' Research

DARPA requires that proposals include a **Risk Mitigation Plan (Section J of the proposal)** that will be incorporated into any resulting agreements or contracts and includes the following information:

1) An assessment of potential risks to public health, agriculture, plants, animals, the environment, and national security.
2) Proposed guidelines that the proposer will follow to ensure maximal biosafety and biosecurity during the course of the research.
3) A communication plan that addresses content, timing, and the extent of distribution of potentially sensitive dual-use information. The plan must also address how input from DARPA, other government, and community stakeholders will be taken into account in decisions regarding communication and publication of potentially sensitive dual-use information.

1.4. PROTECTION OF SENSITIVE INFORMATION

PREEMPT is a 6.1 fundamental research program aimed at enhanced biosurveillance and novel approaches to preempt viral pathogens in animal reservoirs from jumping into human populations. DARPA follows current DoD policy for contracted fundamental research. DARPA recognizes, however, that PREEMPT program components aimed at understanding and quantifying mechanisms for viral zoonotic spillover could potentially generate sensitive information that could be misused. Since this is a fundamental research program, the risk of misuse currently cannot be reasonably evaluated. However, proposers are notified that during proposal evaluation and/or program performance, when such a risk reasonably can be evaluated, DARPA may determine that risk of misuse creates exceptional circumstances, compelling reasons, and/or national security reasons under current DoD policy for contracted fundamental research. DARPA therefore expects that proposers to this program understand and will comply with various government guidance regarding potential gain-of-function research of concern (GOFROC)[8] and dual use research of concern (DURC)[9,10,11,12,13].
See https://www.phe.gov/s3/dualuse/Pages/default.aspx for further information.

[8] Gain-of-Function Research (GOFROC) refers to studies with the potential to generate pathogens with pandemic potential exhibiting high transmissibility and high virulence.

2.2. FUNDAMENTAL RESEARCH

It is DoD policy that the publication of products of fundamental research will remain unrestricted to the maximum extent possible. National Security Decision Directive (NSDD) 189 defines fundamental research as follows:

> 'Fundamental research' means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

As of the date of publication of this BAA, the Government expects that program goals as described herein may be met by proposers intending to perform fundamental research and proposers not intending to perform fundamental research or the proposed research may present a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense. Based on the nature of the performer and the nature of the work, the Government anticipates that some awards will include restrictions on the resultant research that will require the awardee to seek DARPA permission before publishing any information or results relative to the program.

Proposers should indicate in their proposal whether they believe the scope of the research included in their proposal is fundamental or not. While proposers should clearly explain the intended results of their research, the Government shall have sole discretion to select award instrument type and to negotiate all instrument terms and conditions with selectees. Appropriate clauses will be included in resultant awards for non-fundamental research to prescribe publication requirements and other restrictions, as appropriate. This clause can be found at http://www.darpa.mil/work-with-us/additional-baa.

For certain research projects, it may be possible that although the research being performed by the awardee is restricted research, a subawardee may be conducting fundamental research. In those cases, it is the awardee's responsibility to explain in their proposal why its subawardee's effort is fundamental research

WORKSPACE FORM

1-800-518-4726
SUPPORT@GRANTS.GOV

This Workspace form is one of the forms you need to complete prior to submitting your Application Package. This form can be completed in its entirety offline using Adobe Reader. You can save your form by clicking the "Save" button and see any errors by clicking the “Check For Errors” button. In-progress and completed forms can be uploaded at any time to Grants.gov using the Workspace feature.

When you open a form, required fields are highlighted in yellow with a red border. Optional fields and completed fields are displayed in white. If you enter invalid or incomplete information in a field, you will receive an error message. Additional instructions and FAQs about the Application Package can be found in the Grants.gov Applicants tab.

Middle East Respiratory Syndrome Coronavirus in Bats, Saudi Arabia

Ziad A. Memish, Nischay Mishra, Kevin J. Olival, Shamsudeen F. Fagbo, Vishal Kapoor, Jonathan H. Epstein, Rafat AlHakeem, Mushabab Al Asmari, Ariful Islam, Amit Kapoor, Thomas Briese, Peter Daszak, Abdullah A. Al Rabeeah, and W. Ian Lipkin

The source of human infection with Middle East respiratory syndrome coronavirus remains unknown. Molecular investigation indicated that bats in Saudi Arabia are infected with several alphacoronaviruses and betacoronaviruses. Virus from 1 bat showed 100% nucleotide identity to virus from the human index case-patient. Bats might play a role in human infection.

Since Middle East respiratory syndrome (MERS) was described in September 2012, over 90 cases have been reported worldwide, 70 from Saudi Arabia. The incidence of infection with the causative agent, a betacoronavirus (MERS CoV) (*1*), has not been determined; however, the mortality rate among those who received clinical care is ≈65% (*2*). Although instances of human-to-human transmission have been documented between case-patients and others in close contact (including hospital patients sharing rooms, family members, and medical personnel), the sources of infection for most patients remain unknown. Because of sequence similarities between β-CoVs identified in bats and those of MERS CoV isolated from humans, a bat reservoir has been posited (*3–5*). Although neither detection of MERS CoV in bats nor contact of human MERS patients with bats have been reported, a role for bats in human infection cannot be excluded because contact can be indirect (mediated through another animal vector or fomites).

The Study

In October 2012 and April 2013, three agencies collected samples from bats in regions where MERS cases had been identified (Figure 1). The agencies are the Ministry of Health of Saudi Arabia, the Center for Infection and Immunity of Columbia University, and EcoHealth Alliance.

During the October investigation, the team interviewed the family of an index case-patient in Bisha and collected samples from bats <12 km from his home, in an abandoned date palm orchard, and <1 km from his place of employment, a hardware store that fronted a garden and date palm orchard. Although neither family members nor employees recalled seeing bats, the team observed roosting bats and guano in abandoned wells and ruins within 12 km of his home and insectivorous bats at dusk in the garden behind his store. Over 3 weeks, 96 bats representing 7 species (*Rhinopoma hardwickii*, *Rhinopoma microphyllum*, *Taphozous perforatus*, *Pipistrellus kuhlii*, *Eptesicus bottae*, *Eidolon helvum*, and *Rosettus aegyptiacus*) were captured in mist nets and harp traps, then released after visual speciation and collection of morphometric measurements; wing punch biopsy samples; blood; throat swab samples; and rectal swab samples or fecal pellets. Samples were collected into viral transport medium or lysis buffer.

During the 3-week April investigation, fecal samples were collected on tarps laid out at bat roosting sites in and around Bisha, Unaizah, and Riyadh. Representative animals at each roosting site were captured, identified morphologically, and released after wing punch biopsy samples were collected for speciation by DNA analysis. Samples were collected into cryovials.

*CoV, coronavirus; MERS, Middle East respiratory syndrome; RdRp, RNA-dependent RNA polymerase; NA, not applicable; ORF, open reading frame.
†Primer locations are based on human β-CoV 2c EMC/2012, complete genome (GenBank accession no. JX869059).

All samples were stored in liquid nitrogen and conveyed to Riyadh for storage at −80°C before being transported to Columbia University in New York in dry nitrogen. The October 2012 shipment was inadvertently opened at customs in the United States and sat at room temperature for 48 hours before transfer to Columbia University; at arrival, all samples had thawed. The April 2013 samples arrived intact.

Total nucleic acid was extracted from samples by using the NucliSENS easyMAG system (bioMérieux, Durham, NC, USA) and subjected to 8 PCRs with primers and protocols designed to amplify regions within the helicase, RNA-dependent RNA polymerase (RdRp), and nucleocapsid or envelope proteins of CoVs (*6*–*9*). Products were sequenced and analyzed for similarity to GenBank database entries by using the BLASTn and BLASTx programs (www.ncbi.nlm.nih.gov/blast/Blast.cgi). Primer sequences are shown in Table 1. The identity of bat species yielding specific viral products was determined by amplifying and sequencing a fragment of the cytochrome B gene (*10*). All visual classifications of species were confirmed except for that of *T. perforatus* bats. There is no reference sequence for *T. perforatus* bats in GenBank. However, because the closest reference sequence was from *T. nudiventris* bats, at 84% identity we presume that the product represents bona fide *T. perforatus* bat cytochrome B gene sequence. Representative cytochrome B sequences have been uploaded to GenBank (accession nos. KF498635–KF498641).

Table 1 indicates the CoV genera identified by using individual primer sets. As anticipated, pan-CoV assays detected α- and β-CoVs. One assay specific for MERS CoV (*9*) also detected α-CoVs. This finding reinforces the need for sequence confirmation of PCR products. Table 2 indicates the CoV species identified with respect to location, sample type, and bat species. CoV sequences were amplified from rectal swab samples or fecal pellets and from roost feces but not from serum, throat swab samples, or urine. α-CoV sequences were amplified more frequently than β-CoV sequences (223 vs. 4). Whereas α- and β-CoV sequences were amplified from CoVs from *T. perforatus*, *E. helvum,* and *R. hardwickii* bats, only alpha sequences were amplified from CoVs from *P. kuhlii* bat samples.

CoV sequences were amplified from 220 of 732 roost feces samples and 7 of 91 rectal swab samples or fecal pellets. A product obtained by PCR amplification of nucleic acid from a fecal pellet of a *T. perforatus* bat captured in October 2012 in Bisha showed 100% nt identity to the human β-CoV 2c EMC/2012 cloned from the index case-patient in Bisha. A phylogenetic analysis of CoVs obtained in this study is shown in Figure 2. CoV sequences have been uploaded in GenBank (accession nos. KF493884–KF493888).

Conclusions

A wide range of CoV species are circulating among bats in Saudi Arabia. Although the prevalence of CoVs was high (≈28% of fecal samples), MERS CoV was found in only 1 bat. A 3.5% MERS CoV infection rate (n = 29; 95% CI 0–20%) in *T. perforatus* bats is low compared with that for severe acute respiratory syndrome–like CoV in rhinolophid bats in China (10%–12.5%) but consistent with CoV prevalence among bats in Mexico (*4*). Furthermore, the sensitivity for viral nucleic acid detection in samples collected in October 2012 was probably reduced because of failure in cold chain transport. Whereas 219 (32%) of 675 of fecal pellets collected in April revealed a CoV sequence by PCR, only 8 (5%) of 148 of rectal swab samples or fecal pellets collected in October were positive by the same assays. We were unable to recover additional sequences beyond the 190-nt RdRp fragment represented in Figure 2 but are confident in the fidelity of the finding. First, although RdRp is a conserved portion of the CoV genome, there is no precedent for 100% identity of a bat sequence with a human MERS CoV sequence. Second, when this work began we did not have cultured MERS CoV, human MERS samples, or MERS CoV cDNA in the

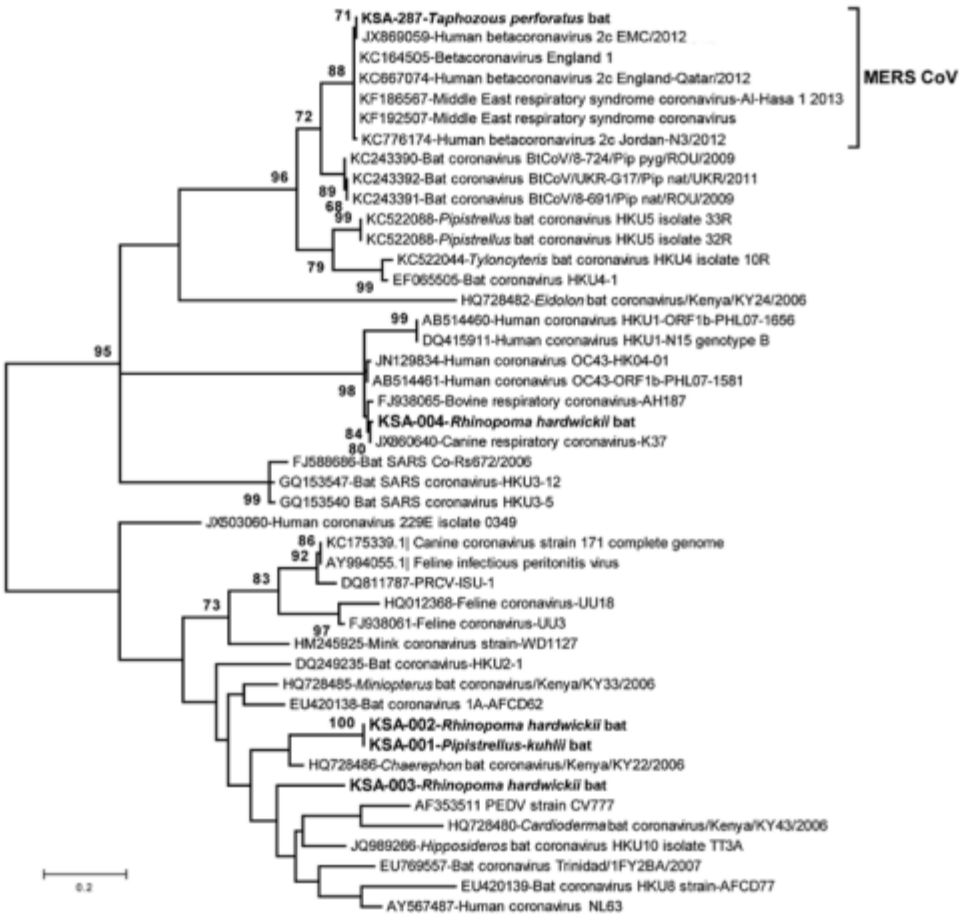

Figure 2. Phylogenetic tree showing genetic relatedness between coronaviruses identified in bat samples from Saudi Arabia (**boldface**), MERS coronaviruses, and other published coronavirus sequences available in GenBank. The maximum-likelihood tree of partial RNA-dependent RNA polymerase gene (nt position 15068–15249 of GenBank accession no. JX869059) was constructed by using the Tamura-Nei model with discrete gamma rate differences among sites as implemented in MEGA 5.2 (www.megasoftware.net). Each branch shows the GenBank accession number followed by a brief description of the sequence used. Scale bar indicates nucleotide substitutions per site. MERS, Middle East respiratory syndrome; CoV, coronavirus; SARS, severe acute respiratory syndrome; KSA, Kingdom of Saudi Arabia.

laboratory at Columbia University where samples were removed directly from the tubes in which they were collected in the field for nucleic acid extraction, PCR, and sequence analysis. Third, the only MERS-positive signal was obtained in PCR analysis of the *T. perforatus* bat captured in Bisha near the home and workplace of the MERS index case-patient used to generate the human β-CoV 2c EMC/2012 sequence.

Bats are reservoirs of several viruses that can cause human disease, including rabies, Hendra, Nipah, Marburg, severe acute respiratory syndrome CoV, and probably Ebola viruses (*11*–*14*). Cross-species transmission from bats to humans can be direct, through contact with infected bats or their excreta, or facilitated by intermediate hosts (*15*). Bat CoVs are typically host specific; however, MERS-related CoVs have reportedly been found in many bat families, including Vespertillionidae, Molosidae, Nyteridae, and now Emballonuridae (sheath-tailed bats) in Africa, the Americas, Asia, and Europe. We sampled only a small sample of bats in Saudi Arabia. Nonetheless, given the rarity of MERS CoV sequences detected by our survey and the broad distribution of MERS cases throughout the Middle East, we speculate that there are probably other hosts. Future work should investigate additional bat and other wildlife species and domestic animals for CoV infection and potential linkage to human disease.

Acknowledgments

We thank Rebecca Hersch and George Amato for cytochrome B gene sequencing, Lorenzo Uccellini and Steven Sameroff for assistance with nucleic acid extraction, Kawathar Muhammad for sample coordination, and Meera Bhat and Ellie Kahn for assistance with manuscript preparation.

Work in the Center for Infection and Immunity and EcoHealth Alliance was supported by the National Institute of Allergy and Infectious Diseases, the US Agency for International Development (PREDICT), and the Defense Threat Reduction Agency.

SUMMARY OF RELATED ACTIVITIES

The following specific information must be provided by the offeror pertaining to the Project Director, Principal Investigator, and each of any other proposed key professional individuals designated for performance under any resulting contract.

a. Identify the total amount of all presently active federal contracts/cooperative agreements/grants and commercial agreements citing the committed levels of effort for those projects for each of the key individuals* in this proposal.

Professional's Name and Title/Position:

Identifying Number	Agency	Total Effort Committed

*If an individual has no obligation(s), so state.

b. Provide the total number of outstanding proposals, exclusive of the instant proposal, having been submitted by your organization, not presently accepted but in an anticipatory stage, which will commit levels of effort by the proposed professional individuals*.

Professional's Name and Title/Position:

Identifying Number	Agency	Total Effort Committed

*If no commitment of effort is intended, so state.

c. Provide a statement of the level of effort to be dedicated to any resultant contract awarded to your organization for those individuals designated and cited in this proposal.

Name	Title/Position	Total Proposed Effort

Documentation of Relationship to Candidate
(Required for external letters of recommendation only)

Please complete this form & submit with your letter of recommendation.

Candidate's Name: _____

Reviewer's Name: _____

Reviewer's Rank/Title: _____

Length of time you have known the candidate: ____ years

Check all that apply in each category:

1. Your relationship to the candidate and his/her work:

☐ Collaborator (worked with or co-authored papers)
☐ Present or past colleague, mentor or mentee, at same academic institution or hospital as a student, post-doctoral fellow, resident or faculty member
☐ Present or past colleague in professional activities (study sections, advisory boards, professional society activities, etc)
☐ None of the above (please provide brief description of your relationship:

2. Your knowledge of the candidate's work is based on (mark all that apply):

☐ CV and personal statement
☐ Publications
☐ Presentations
☐ Personal knowledge and discussions of his/her work
☐ Participation with candidate in professional activities (study sections, advisory boards, professional society activities, etc…)

3. Comments *(optional)*:

I. OVERVIEW OF THE FUNDING OPPORTUNITY

Program Announcement for the Department of Defense

Defense Health Program

Congressionally Directed Medical Research Programs

Peer Reviewed Medical Research Program

Investigator-Initiated Research Award

Announcement Type: Initial

Funding Opportunity Number: W81XWH18PRMRPIIRA

Catalog of Federal Domestic Assistance Number: 12.420 Military Medical Research and Development

SUBMISSION AND REVIEW DATES AND TIMES

- **Pre-Application Submission Deadline:** 5:00 p.m. Eastern time (ET), June 12, 2018
- **Invitation to Submit an Application:** July 2018
- **Application Submission Deadline:** 11:59 p.m. ET, September 20, 2018
- **End of Application Verification Period:** 5:00 p.m. ET, September 24, 2018
- **Peer Review:** November 2018
- **Programmatic Review:** January 2019

This Program Announcement must be read in conjunction with the General Application Instructions, version 20180329. The General Applications Instructions document is available for downloading from the Grants.gov funding opportunity announcement by selecting the "Package" tab, clicking "Preview," and then selecting "Download Instructions."

II. DETAILED INFORMATION ABOUT THE FUNDING OPPORTUNITY

***New for 2018*: Application submission by extramural organizations through Grants.gov requires use of the Workspace interface, which separates the application package into individual forms. Applicants must create a Workspace in Grants.gov, complete the required forms, and submit their application Workspace package.**

II.A. Program Description

Applications to the Fiscal Year 2018 (FY18) Peer Reviewed Medical Research Program (PRMRP) are being solicited for the Defense Health Agency (DHA) J9, Research and Development Directorate, by the U.S. Army Medical Research Acquisition Activity (USAMRAA) using delegated authority provided by United States Code, Title 10, Section 2358 (10 USC 2358). As directed by the Office of the Assistant Secretary of Defense for Health Affairs (OASD[HA]), the DHA manages the Defense Health Program (DHP) Research, Development, Test, and Evaluation (RDT&E) appropriation. The execution management agent for this Program Announcement is the Congressionally Directed Medical Research Programs (CDMRP). The PRMRP was initiated in 1999 to provide support for military health-related research of exceptional scientific merit. Appropriations for the PRMRP from FY99 through FY17 totaled $1.7 billion. The FY18 appropriation is $330 million (M).

The vision of the FY18 PRMRP is to improve the health and well-being of all military Service members, Veterans, and beneficiaries. The PRMRP challenges the scientific and clinical communities to address at least one of the FY18 PRMRP Topic Areas with original ideas that foster new directions along the entire spectrum of research and clinical care. The program seeks applications in laboratory, clinical, behavioral, epidemiologic, and other areas of research to advance knowledge in disease etiology, improve prevention, detection, diagnosis, treatment, and quality of life for those affected by a relevant disease or condition, and to develop and validate clinical care or public health guidelines.

II.A.1. FY18 PRMRP Topic Areas

All applications for PRMRP funding must specifically address at least one of the Topic Areas as directed by Congress and must be directly relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries. If the proposed research does not specifically address at least one of the FY18 PRMRP Topic Areas, the Government will administratively withdraw the application. The Government reserves the right to reassign the application's Topic Area if submitted under an inappropriate Topic Area. The FY18 PRMRP Topic Areas are listed below.

- Acute Lung Injury
- Antimicrobial Resistance
- Arthritis
- Burn Pit Exposure
- Cardiomyopathy
- Cerebellar Ataxia

- Chronic Migraine and Post-Traumatic Headache
- Chronic Pain Management
- Congenital Heart Disease
- Constrictive Bronchiolitis
- Diabetes
- Dystonia
- Eating Disorders
- Emerging Infectious Diseases
- Endometriosis
- Epidermolysis Bullosa
- Focal Segmental Glomerulosclerosis
- Fragile X
- Frontotemporal Degeneration
- Guillain-Barré Syndrome
- Hepatitis B and C
- Hereditary Angioedema
- Hydrocephalus
- Immunomonitoring of Intestinal Transplants
- Inflammatory Bowel Diseases
- Interstitial Cystitis
- Lung Injury
- Malaria
- Metals Toxicology
- Mitochondrial Disease
- Musculoskeletal Disorders
- Myotonic Dystrophy
- Non-Opioid Pain Management
- Nutrition Optimization
- Pancreatitis
- Pathogen-Inactivated Blood Products
- Post-Traumatic Osteoarthritis
- Pressure Ulcers
- Pulmonary Fibrosis
- Respiratory Health
- Rett Syndrome
- Rheumatoid Arthritis
- Scleroderma
- Sleep Disorders
- Spinal Muscular Atrophy
- Sustained-Release Drug Delivery
- Tinnitus
- Tissue Regeneration
- Tuberculosis
- Vaccine Development for Infectious Diseases
- Vascular Malformations
- Women's Heart Disease

Research relevant to one or more of the FY18 PRMRP Topic Areas may be considered for funding. ***Applicants should select the FY18 Program Announcement most appropriate to the stage of the proposed research.*** Areas of Encouragement related to the FY18 PRMRP Topic Areas have been identified by the Department of Defense (DoD), the Department of Veterans Affairs (VA), and other relevant stakeholders (Appendix 2). Applicants are urged to read and consider these Areas of Encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an Area of Encouragement on this list.***

II.B. Award Information

The PRMRP Investigator-Initiated Research Award (IIRA) is intended to support studies that will make an important contribution toward research and/or patient care for a disease or condition related to at least one of the FY18 PRMRP Topic Areas.

The rationale for a research idea may be derived from a laboratory discovery, population-based studies, a clinician's first-hand knowledge of patients, or anecdotal data. Applications must include relevant data that support the rationale for the proposed study. These data may be unpublished or from the published literature.

Impact: The Investigator-Initiated Research Award is designed to support research with the potential to yield highly impactful data that could lead to critical discoveries or major advancements. It is the responsibility of the Principal Investigator (PI) to clearly articulate the project's potential immediate and long-range outcome(s)/product(s) (knowledge and/or materiel) and how they will impact a central critical problem or question in the field of research and/or patient care in the FY18 PRMRP Topic Area(s) addressed.

Research projects may focus on any phase of research from basic laboratory research through translational research, including preclinical studies in animal models and human subjects, as well as correlative studies associated with an existing clinical trial. Research involving human subjects and human anatomical substances is permitted; ***however, this award may not be used to conduct clinical trials.*** A clinical trial is defined as a prospective accrual of patients (human subjects) in whom an intervention (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the subject of that intervention or interaction. For more information on how to distinguish clinical research from clinical trials, see the Human Subject Resource Document at https://ebrap.org/eBRAP/public/Program.htm. PIs seeking funding for a clinical trial should apply to the FY18 PRMRP Clinical Trial Award mechanism (Funding Opportunity Number: W81XWH18PRMRPCTA).

The anticipated direct costs budgeted for the entire period of performance for a single PI FY18 PRMRP IIRA award will not exceed **$1.2M**. The anticipated direct costs budgeted for the entire period of performance for an FY18 PRMRP IIRA award with the Partnering PI Option will not exceed **$1.5M**. Refer to Section II.D.5, Funding Restrictions, for detailed funding information.

Partnering PI Option: As a method to bring new perspectives in addressing the critical problem or question and facilitate progress in the field through collaborative efforts, the FY18 PRMRP is offering a Partnering PI Option for this award mechanism. The results of this partnering project should significantly advance the research beyond what would be possible through individual efforts. The Partnering PI Option is structured so that two investigators, each of whom will be designated as a PI, work synergistically on a single project. Each PI should bring complementary skills and perspectives to the research project. Developing the research plan should involve a reciprocal flow of ideas and information between the partners. The application should clearly demonstrate that both PIs have equal intellectual input into the design of the project and will devote equivalent levels of effort to the conduct of the project. Each PI must demonstrate that they possess the research experience and resources to function as a PI and must also exhibit an appropriate level of authority and responsibility to direct the project supported by the awards. ***New and multi-institutional collaborative efforts are strongly encouraged.*** PIs should include plans for communication between investigators at different organizations, if applicable. Additionally, participating organizations must be willing to resolve potential intellectual and material property issues and to remove any barriers that might interfere with achieving high levels of cooperation to ensure successful completion of the proposed research project. As noted above, collaborations with DoD or VA researchers and clinicians are encouraged.

For the application process, one PI will be identified as the Initiating PI and will be responsible for the majority of the administrative tasks associated with application submission. The other PI will be identified as the Partnering PI. Initiating and Partnering PIs each have different submission requirements as described in Section II.D.2.b, Full Application Submission Content. If recommended for funding, each PI will receive their own award. ***A separate application submission is required for each partner, even if both PIs are at the same organization.*** Additional collaborators may be included in the application without being designated as PIs.

Applications submitted under the Partnering PI Option are allowed to request a higher direct cost budget than applications submitted with a single PI (see Section II.D.5, Funding Restrictions, for details). Costs should be divided as evenly as possible between both partners unless appropriately justified, but no more than 75% (or no less than 25%) of the proposed direct costs may be requested by a single partner. Submission of a Partnership Statement, Attachment 8, is required for applications submitted under the Partnering PI Option.

The proposed research must be relevant to active duty Service members, Veterans, military beneficiaries, and/or the American public.

Military Relevance: Relevance to the healthcare needs of military Service members, Veterans, and beneficiaries is a key feature of this award. Investigators are encouraged to consider the following characteristics as examples of how a project may demonstrate military relevance:

- Explanation of how the project addresses an aspect of the target disease/condition that has direct relevance to military Service members, Veterans, or other Military Health System beneficiaries

- Description of how the knowledge, information, products, or technologies gained from the proposed research could be implemented in a dual-use capacity to benefit the civilian population and also address a military need

- Use of military or Veteran populations or datasets in the proposed research, if appropriate to the proposed research project

- Involvement of military consultants (Army, Air Force) or specialty leaders (Navy, Marine Corps) to the Surgeons General in a relevant specialty area

PIs are encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. A list of websites that may be useful in identifying additional information about ongoing DoD and VA areas of research interest or potential opportunities for collaboration within the FY18 PRMRP Topic Areas can be found in Appendix 3.

Use of DoD or VA Resources: If the proposed research involves access to active duty military patient populations and/or DoD resources or databases, the PI is responsible for demonstrating such access at the time of application submission and should develop a plan for maintaining access as needed throughout the proposed research. Access to target active duty military patient population(s) and/or DoD resource(s) or database(s) should be confirmed by including a letter of support, signed by the lowest-ranking person with approval authority.

If the proposed research involves access to VA patient populations, VA study resources and databases, and/or VA research space and equipment, VA PIs must have a plan for obtaining and maintaining access throughout the proposed research. Access to VA patients, resources, and/or VA research space should be confirmed by including a letter of support from the VA Facility Director(s) or individual designated by the VA Facility Director(s), such as the Associate Chief of Staff for Research and Development (ACOS/R&D) or Clinical Service Chief. If appropriate, the application should identify the VA-affiliated non-profit corporation (NPC) as the applicant institution for VA PIs. If the VA NPC is not identified as the applicant institution for administering the funds, the application should include a letter from the VA ACOS/R&D confirming this arrangement and identifying the institution that will administer the funds associated with the proposed research.

Access to certain DoD or VA patient populations, resources, or databases may only be obtained by collaboration with a DoD or VA investigator who has a substantial role in the research and may not be available to a non-DoD or non-VA investigator if the resource is restricted to DoD or VA personnel. Investigators should be aware of which resources are available to them if the proposed research involves a non-DoD or non-VA investigator collaborating with the DoD and/or VA. If access cannot be confirmed at the time of application submission, the Government reserves the right to withdraw or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resource(s). Refer to Section II.D.2.b.ii, Full Application Submission Components, for detailed information.

Research Involving Human Anatomical Substances, Human Subjects, or Human Cadavers: All DoD-funded research involving new and ongoing research with human

anatomical substances, human subjects, or human cadavers must be reviewed and approved by the U.S. Army Medical Research and Materiel Command (USAMRMC) Office of Research Protections (ORP), Human Research Protection Office (HRPO), prior to research implementation. This administrative review requirement is in addition to the local Institutional Review Board (IRB) or Ethics Committee (EC) review. Local IRB/EC approval at the time of submission is ***not*** required. The HRPO is mandated to comply with specific laws and requirements governing all research involving human anatomical substances, human subjects, or human cadavers that is supported by the DoD. These laws and requirements will necessitate information in addition to that supplied to the IRB/EC. ***Allow a minimum of 2 to 3 months for HRPO regulatory review and approval processes***. When possible, protocols should be written for research with human subjects and/or human anatomical substances that are specific to the DoD-supported effort outlined in the submitted application. Submission to HRPO of protocols covering more than the scope of work in the DoD-funded award will require HRPO review of the entire protocol as DoD-supported research and may include extensive modifications to meet DoD human subjects protection requirements. Refer to the General Application Instructions, Appendix 1, and the Human Subject Resource Document available on the electronic Biomedical Research Application Portal (eBRAP) "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) for additional information.

A clinical trial is defined as a prospective accrual of patients (human subjects) in whom an intervention (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the subject of that intervention or interaction.

Research Involving Animals: All projects should adhere to a core set of standards for rigorous study design and reporting to maximize the reproducibility and translational potential of preclinical research. The standards are described in Landis, S.C., et al. A call for transparent reporting to optimize the predictive value of preclinical research. *Nature* 2012, 490:187-191 (www.nature.com/nature/journal/v490/n7419/full/nature11556.html). While these standards are written for preclinical studies, the basic principles of randomization, blinding, sample-size estimation, and data handling derive from well-established best practices in clinical studies. Applicants should consult the ARRIVE (Animal Research: Reporting *In Vivo* Experiments) guidelines to ensure relevant aspects of rigorous animal research are adequately planned for and, ultimately, reported. The ARRIVE guidelines can be found at http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf.

All DoD-funded research involving new and ongoing research with animals must be reviewed and approved by the USAMRMC ORP Animal Care and Use Review Office (ACURO), in addition to the local Institutional Animal Care and Use Committee (IACUC) of record. IACUC approval at the time of submission is ***not*** required. Specific documents relating to the use of animals in the proposed research will be requested **if the application is selected for funding**. The ACURO must review and approve all animal use prior to the start of working with animals, including amendments to ongoing projects. PIs must submit the institutional animal use protocol, IACUC approval of that protocol, and a version of the animal use appendix titled, "Research Involving Animals." ***Allow at least 2 to 3 months for ACURO regulatory review and***

approval processes for animal studies. Refer to the General Application Instructions, Appendix 1, for additional information.

The types of awards made under the Program Announcement will be assistance agreements (grants or cooperative agreements). The level of involvement on the part of the DoD during project performance is the key factor in determining whether to award a grant or cooperative agreement.

Extramural Organizations: An assistance agreement (grant or cooperative agreement) is appropriate when the Federal Government transfers a "thing of value" to a "state, local government," or "other recipient" to carry out a public purpose of support or stimulation authorized by a law of the United States, instead of acquiring property or service for the direct benefit and use of the U.S. Government. An assistance agreement can take the form of a grant or cooperative agreement. If "no substantial involvement" on the part of the funding agency is anticipated, a grant award will be made (31 USC 6304). Conversely, if substantial involvement on the part of the funding agency is anticipated, a cooperative agreement will be made (31 USC 6305) and the award will identify the specific substantial involvement. Substantial involvement may include collaboration, participation, or intervention in the research to be performed under the award. The award type, along with the start date, will be determined during the negotiation process.

The CDMRP intends that information, data, and research resources generated under awards funded by this Program Announcement be made available to the research community (which includes both scientific and consumer advocacy communities) and to the public at large. For additional guidance, refer to the General Application Instructions, Appendix 2, Section K.

Awards will be made no later than September 30, 2019. For additional information refer to Section II.F.1, Federal Award Notices.

II.C. Eligibility Information

II.C.1. Eligible Applicants

II.C.1.a. Organization: All organizations, including international organizations, are eligible to apply.

Government Agencies Within the United States: Local, state, and Federal Government agencies are eligible to the extent that applications do not overlap with their fully funded internal programs. Such agencies are required to explain how their applications do not overlap with their internal programs.

As applications for this Program Announcement may be submitted by extramural and intramural organizations, these terms are defined below.

Extramural Organization: An eligible non-DoD organization. Examples of extramural organizations include academic institutions, biotechnology companies, foundations, Government, and research institutes.

Intramural DoD Organization: A DoD laboratory, DoD military treatment facility, and/or DoD activity embedded within a civilian medical center.

Note: Applications from an intramural DoD organization or from an extramural Federal organization may be submitted through a research foundation.

The USAMRAA makes awards to eligible organizations, not to individuals.

II.C.1.b. Principal Investigator

- Investigators at or above the level of Assistant Professor (or equivalent) are eligible to submit applications.
    - **Partnering PI Option:** Investigators at or above the level of Assistant Professor (or equivalent) that bring complementary skills and perspectives to the research project.

An eligible PI, regardless of ethnicity, nationality, or citizenship status, must be employed by, or affiliated with, an eligible organization.

The CDMRP encourages all PIs to participate in a digital identifier initiative through Open Researcher and Contributor ID, Inc. (ORCID). Registration for a unique ORCID identifier can be done online at http://orcid.org/.

II.C.2. Cost Sharing

Cost sharing/matching is not an eligibility requirement.

II.C.3. Other

Organizations must be able to access **.gov** and **.mil** websites in order to fulfill the financial and technical deliverable requirements of the award and submit invoices for payment.

There are no limitations on the number of applications for which an investigator may be named as a PI or Partnering PI.

For general information on required qualifications for award recipients, refer to the General Application Instructions, Appendix 3.

Refer to Section II.H.2, Administrative Actions, for a list of administrative actions that may be taken if a pre-application or application does not meet the administrative, eligibility, or ethical requirements defined in this Program Announcement.

II.D. Application and Submission Information

Submission of applications that are essentially identical or propose essentially the same research project to different funding opportunities within the same program and fiscal year is prohibited and will result in administrative withdrawal of the duplicative application(s). As an exception, applicants may submit the research project described in their Investigator-Initiated

Research Award application as part of an application to the FY18 PRMRP Focused Program Award (Funding Opportunity Number: W81XWH18PRMRPFPA); however, accepting multiple awards to support the same project will not be allowed.

Extramural Submission is defined as an application submitted by an organization to Grants.gov.

Intramural DoD Submission is defined as an application submitted by a DoD organization to eBRAP.

II.D.1. Address to Request Application Package

eBRAP is a multifunctional web-based system that allows PIs to submit their pre-applications electronically through a secure connection, to view and edit the content of their pre-applications and full applications, to receive communications from the CDMRP, and to submit documentation during award negotiations and period of performance.

Extramural Submissions: Pre-application content and forms must be accessed and submitted at eBRAP.org. Full application packages must be accessed and submitted at Grants.gov.

Intramural DoD Submissions: Pre-application content and forms and full application packages must be accessed and submitted at eBRAP.org.

Contact information for the CDMRP Help Desk and the Grants.gov Contact Center can be found in Section II.G, Federal Awarding Agency Contacts.

II.D.2. Content and Form of the Application Submission

Submission is a two-step process requiring both ***pre-application*** and ***full application*** as indicated below. The submission process should be started early to avoid missing deadlines. There are no grace periods.

Pre-Application Submission: All pre-applications for both extramural and intramural organizations must be submitted through eBRAP (https://eBRAP.org/).

Full Application Submission: Full applications must be submitted through the online portals as described below.

Submitting Extramural Organizations: Full applications from extramural organizations must be submitted through a Grants.gov Workspace. Applications submitted by extramural organizations (e.g., research foundations) on behalf of intramural DoD or other Federal organizations or investigators will be considered extramural submissions. Applications from extramural organizations, including non-DoD Federal organizations, received through eBRAP will be withdrawn. See definitions in Section II.C.1, Eligible Applicants.

Submitting Intramural DoD Organizations: Intramural DoD organizations may submit full applications to either eBRAP or Grants.gov. Intramural DoD organizations that are unable to submit to Grants.gov should submit through eBRAP. Intramural DoD organizations with the

capability to submit through Grants.gov may submit following the instructions for extramural submissions through Grants.gov or may submit to eBRAP.

For Both Extramural and Intramural Applicants: A key feature of eBRAP is the ability of an organization's representatives and PIs to view and modify the full application submissions associated with them. eBRAP will validate full application files against the specific Program Announcement requirements, and discrepancies will be noted in an email to the PI and in the "Full Application Files" tab in eBRAP. It is the applicant's responsibility to review all application components for accuracy as well as ensure proper ordering as specified in this Program Announcement.

The application title, eBRAP log number, and all information for the PI, Business Official(s), performing organization, and contracting organization must be consistent throughout the entire pre-application and full application submission process. Inconsistencies may delay application processing and limit or negate the ability to view, modify, and verify the application in eBRAP. If any changes need to be made, the applicant should contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 prior to the application submission deadline.

The Investigator-Initiated Research Award mechanism is structured to accommodate two PIs under the Partnering PI Option. One PI will be identified as the Initiating PI and will be responsible for the majority of the administrative tasks associated with application submission. The other PI will be identified as the Partnering PI. Initiating and Partnering PIs each have different submission requirements; however, both PIs should contribute significantly to the development of the proposed research project, including the Project Narrative, Statement of Work, and other required components.

The Initiating PI must complete the pre-application submission process and submit the contact information for each Partnering PI. The Partnering PI will then be notified of the pre-application submission separately by email. ***The Partnering PI must follow the link in the notification email in order to associate his/her full application package with that of the Initiating PI. After following the link, the Partnering PI must verify his/her contact information, organization, and designation as an extramural or intramural submission within eBRAP.*** If not previously registered, the Partnering PI must register in eBRAP. A new pre-application based on this research project should not be initiated by the Partnering PI. Do not delay completing these steps. If they are not completed, the Partnering PI will not be able to view and modify his/her application during the verification period in eBRAP. If these steps are not completed, an intramural partner will not be able to submit the Partnering PI required full application package components to eBRAP.

II.D.2.a. Step 1: Pre-Application Submission Content

During the pre-application process, each submission is assigned a unique log number by eBRAP. This unique eBRAP log number is required during the full application submission process.

To begin the pre-application process, first select whether the submitting organization is extramural or intramural, then confirm your selection or cancel. **Incorrect selection of extramural or intramural submission type will delay processing.**

If an error has been made in the selection of extramural versus intramural and the pre-application submission deadline has passed, the PI or Business Official must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 to request a change in designation.

All pre-application components must be submitted by the PI (for single PI applicants) or Initiating PI (for applicants submitting under the Partnering PI Option) through eBRAP (https://eBRAP.org/). Because the invitation to submit an application is based on the contents of the pre-application, investigators should not change the title or research objectives after the pre-application is submitted.

PIs and organizations identified in the pre-application should be the same as those intended for the subsequent application submission. If any changes are necessary after submission of the pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

PIs with an ORCID identifier should enter that information in the appropriate field in the "My Profile" tab in the "Account Information" section of eBRAP.

The pre-application consists of the following components, which are organized in eBRAP by separate tabs (refer to the General Application Instructions, Section II.B, for additional information on pre-application submission):

- **Tab 1 – Application Information**

  Submission of application information includes assignment of primary and secondary research classification codes, which may be found at https://ebrap.org/eBRAP/public/Program.htm. Note that the codes have recently been revised. Applicants are strongly encouraged to review and confirm the codes prior to making their selection.

  Select the FY18 PRMRP Topic Area addressed by the proposed research. If the proposed research project is aligned with more than one FY18 PRMRP Topic Area, select the Topic Area of highest relevance as the required first choice.

- **Tab 2 – Application Contacts**

  Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration (the "person to be contacted on matters involving this application" in Block 5 of the Grants.gov SF424 (R&R) Form). The Business Official must

be either selected from the eBRAP list or invited in order for the pre-application to be submitted.

Select the performing organization (site at which the PI will perform the proposed work) and the contracting organization (organization submitting on behalf of the PI, which corresponds to Block 5 on the Grants.gov SF424 (R&R) Form), and click on "Add Organizations to this Pre-application." The organization(s) must be either selected from the eBRAP drop-down list or invited in order for the pre-application to be submitted.

It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-application submission is needed.

- **Tab 3 – Collaborators and Key Personnel**

  Enter the name, organization, and role of all collaborators and key personnel associated with the application. The Initiating PI must enter the contact information for the Partnering PI in the Partnering PI section.

  FY18 PRMRP Programmatic Panel members should not be involved in any pre-application or application. For questions related to panel members and pre-applications or applications, refer to Section II.H.2.c, Withdrawal, or contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

  To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in pre-application or application preparation, research, or other duties for submitted pre-applications or applications. For FY18, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Pre-applications or applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage conflicts of interest (COIs) are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- **Tab 4 – Conflicts of Interest**

  List all individuals other than collaborators and key personnel who may have a COI in the review of the application (including those with whom the PI has a personal or professional relationship). Refer to the General Application Instructions, Appendix 3, Section C, for further information regarding COIs.

- **Tab 5 – Pre-Application Files**

  Note: Upload documents as individual PDF files unless otherwise noted. eBRAP will not allow a file to be uploaded if the number of pages exceeds the limit specified below.

  - **Preproposal Narrative (four-page limit):** The Preproposal Narrative page limit applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that

provide additional information to expand the Preproposal Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the pre-application.

The Preproposal Narrative should include the following:

- **Topic Area:** Describe how the proposed project relates to at least one of the FY18 PRMRP Topic Areas. If applicable, describe how the proposed research project addresses an FY18 PRMRP Area of Encouragement (Appendix 2).
- **Research Idea:** Clearly articulate the rationale for the project by presenting the ideas and reasoning behind the proposed research; include relevant literature citations.
- **Research Strategy:** State the hypothesis to be tested and the objective(s) to be reached. State the project's specific aims and briefly describe the experimental approach. If applying under the Partnering PI Option, describe how the collaborative effort will provide synergy and enhance the research.
- **Impact:** Describe the potential short-term and long-term impact of the results of the proposed study on at least one of the FY18 PRMRP Topic Areas, and its related research field(s) and/or patient population(s).
- **Military Relevance:** Explain how the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Pre-Application Supporting Documentation:** The items to be included as supporting documentation for the pre-application ***must be uploaded as individual files*** and are limited to the following:
  - References Cited (one-page limit): List the references cited (including URLs if available) in the Preproposal Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, reference title, and reference source, including volume, chapter, page numbers, and publisher, as appropriate).
  - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols used in the Preproposal Narrative.
  - Key Personnel Biographical Sketches (five-page limit per individual): ***All biographical sketches should be uploaded as a single combined file.*** Biographical sketches should be used to demonstrate background and expertise through education, positions, publications, and previous work accomplished.

- **Tab 6 – Submit Pre-Application**

  This tab must be completed for the pre-application to be accepted and processed.

Pre-Application Screening

- **Pre-Application Screening Criteria**

  To determine the technical merits of the pre-application and the relevance to the mission of the DHP and the PRMRP, pre-applications will be screened based on the following criteria:

  - **Research Idea:** How well the rationale for the research idea is supported by presented background information.

  - **Research Strategy:** How well the specific aims and proposed methodology support the research idea and objectives. If applying under the Partnering PI Option, how the partnership will advance the research beyond what would be possible through individual efforts.

  - **Impact:** Whether the potential immediate and long-range outcome(s)/product(s) (knowledge and/or materiel) of the proposed research, if successful, will impact a central critical problem or question in the field of research and/or patient care in the FY18 PRMRP Topic Area(s) addressed.

  - **Programmatic Relevance:** Whether the proposed research idea supports the objectives of the PRMRP. To what degree the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Notification of Pre-Application Screening Results**

  Following the pre-application screening, PIs (or Initiating PIs, if applying under the Partnering PI Option) will be notified as to whether or not they are invited to submit applications; however, they will not receive feedback (e.g., a critique of strengths and weaknesses) on their pre-application. The estimated timeframe for notification of invitation to submit an application is indicated in Section I, Overview of the Funding Opportunity. Invitations to submit a full application are based on the Pre-Application Screening Criteria listed above.

II.D.2.b. Step 2: Full Application Submission Content

Applications will not be accepted unless the PI or Initiating PI has received notification of invitation.

The CDMRP cannot make allowances/exceptions to its policies for submission problems encountered by the applicant organization using system-to-system interfaces with Grants.gov.

Each application submission must include the completed full application package for this Program Announcement. The full application package is submitted by the Authorized Organizational Representative through Grants.gov (http://www.grants.gov/) for extramural organizations or through eBRAP (https://ebrap.org/) for intramural organizations. See Table 1 below for more specific guidelines.

II.D.2.b.i. Full Application Guidelines

Extramural organizations must submit full applications through Grants.gov. Applicants must create a Grants.gov Workspace for submission, which allows the application components to be completed online and routed through the applicant organization for review prior to submission. Applicants may choose to download and save individual PDF forms rather than filling out webforms in the Workspace. A compatible version of Adobe Reader **must** be used to view, complete, and submit an application package consisting of PDF forms. If more than one person is entering text into an application package, the ***same version*** of Adobe Reader software should be used by each person. Check the version number of the Adobe software on each user's computer to make sure the versions match. Using different versions of Adobe Reader may cause submission and/or save errors – even if each version is individually compatible with Grants.gov. Refer to the General Application Instructions, Section III, and the "Apply For Grants" page of Grants.gov (https://www.grants.gov/web/grants/applicants/apply-for-grants.html) for further information about the Grants.gov Workspace submission process. Submissions of extramural applications through eBRAP may be withdrawn.

Table 1. Full Application Submission Guidelines

Extramural Submissions	Intramural DoD Submissions
Application Package Location	
Download application package components for W81XWH18PRMRPIIRA from Grants.gov (http://www.grants.gov) and create a Grants.gov Workspace. The Workspace allows online completion of the application components and routing of the application package through the applicant organization for review prior to submission.	Download application package components for W81XWH18PRMRPIIRA from eBRAP (https://ebrap.org).
Full Application Package Components	
SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.	**Tab 1 – Summary:** Provide a summary of the application information. **Tab 2 – Application Contacts:** This tab will be pre-populated by eBRAP; add Authorized Organizational Representative.
Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Research & Related Personal Data • Research & Related Senior/Key Person Profile (Expanded) • Research & Related Budget • Project/Performance Site Location(s) Form	**Tab 3 – Full Application Files:** Upload files under each Application Component in eBRAP. Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Key Personnel • Budget • Performance Sites

Extramural Submissions	Intramural DoD Submissions
• R&R Subaward Budget Attachment(s) Form (if applicable)	**Tab 4 – Application and Budget Data:** Review and edit proposed project start date, proposed end date, and budget data pre-populated from the Budget Form.
Application Package Submission	
Create a Grants.gov Workspace. Add participants (investigators and Business Officials) to the Workspace, complete all required forms, and check for errors before submission. **Submit a Grants.gov Workspace Package.** An application may be submitted through Workspace by clicking the "Sign and Submit" button on the "Manage Workspace" page, under the "Forms" tab. Grants.gov recommends submission of the application package **at least 24-48 hours prior to the close date** to allow time to correct any potential technical issues that may disrupt the application submission. Note: If either the Project Narrative or the budget fails eBRAP validation or if the Project Narrative or the budget needs to be modified, an updated Grants.gov application package must be submitted via Grants.gov as a "Changed/Corrected Application" with the previous Grants.gov Tracking ID prior to the application submission deadline.	**Submit package components to eBRAP (https://ebrap.org).** **Tab 5 – Submit/Request Approval Full Application:** After all components are uploaded and prior to the full application submission deadline, enter your password in the space provided next to "Enter Your Password Here" and press the "Submit Full Application" button. eBRAP will notify your Resource Manager/Comptroller/Task Area Manager or equivalent Business Official by email.

Extramural Submissions	Intramural DoD Submissions
Application Verification Period	
The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.	After eBRAP has processed the full application, the organizational Resource Manager/Comptroller/Task Area Manager or equivalent Business Official and PI(s) will receive email notification of this status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified. Your Resource Manager/Comptroller/Task Area Manager or equivalent Business Official should log into eBRAP to review and to approve prior to the application verification deadline.
Further Information	
Tracking a Grants.gov Workspace Package. After successfully submitting a Workspace package, a Grants.gov Tracking Number is automatically assigned to the package. The number will be listed on the "Confirmation" page that is generated after submission. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.	Refer to the General Application Instructions, Section IV, for further information regarding eBRAP requirements.

Application viewing, modification, and verification in eBRAP are strongly recommended, but not required. ***The Project Narrative and Budget cannot be changed after the application submission deadline.*** Prior to the full application deadline, a corrected or modified full application package may be submitted. Other application components may be changed until the end of the application verification period. Verify that subaward budget(s) and budget justification forms are present in eBRAP during the application verification period. If these components are missing, upload them to eBRAP before the end of the application verification period. After the end of the application verification period, the full application cannot be modified.

Material submitted after the end of the application verification period, unless specifically requested by the Government, will not be forwarded for processing.

Partnering PI Option: The CDMRP requires separate full application package submissions for the Initiating PI and the Partnering PI, even if the PIs are located within the same organization. Initiating and Partnering PIs will each be assigned a unique eBRAP log number. Each full

application package must be submitted using the unique eBRAP log number. ***Note: All associated applications (Initiating and Partnering PIs') must be submitted by the full application submission deadline.***

The full application package must be submitted using the unique eBRAP log number to avoid delays in application processing.

II.D.2.b.ii. Full Application Submission Components

- **Extramural Applications Only**

  SF424 (R&R) Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.

- **Extramural and Intramural Applications**

  Attachments:

  Each attachment to the full application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Application Instructions, Appendix 4.

  For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or have incorrect file names that contain characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some circumstances. Individual attachments may not exceed 20 MB, and the file size for the entire full application package may not exceed 200 MB.

  - **Attachment 1: Project Narrative (15-page limit):** Upload as "ProjectNarrative.pdf." The page limit of the Project Narrative applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Project Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the application.

    Describe the proposed project in detail using the outline below.

    - **Background:** Describe how the proposed research project addresses one or more of the FY18 PRMRP Topic Areas. Present the ideas and reasoning behind the proposed work. Cite relevant literature. Describe previous experience most pertinent to the project. Include relevant preliminary data; these data may be unpublished or from the published literature.

    - **Hypothesis:** State the hypothesis to be tested.

    - **Specific Aims:** Concisely explain the project's specific aims and the objective(s) to be reached. These aims should agree with the primary aims and associated tasks

described in the Statement of Work. If the proposed work is part of a larger study, present only aims that this DoD award would fund.

- **Research Strategy:** Describe the experimental design, methods, and analyses, including appropriate controls, in sufficient detail for analysis. Address potential problem areas and present alternative methods and approaches. Clearly describe the statistical plan and the rationale for the statistical methodology as well as an appropriate power analysis, if applicable. If animal studies are proposed, describe how they will be conducted in accordance with the ARRIVE guidelines (http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf).

- If human subjects or human biological samples will be used, describe the study population and include a detailed plan for the recruitment of human subjects or the acquisition of samples. Describe the availability of the proposed study population and past successes in recruiting similar populations. If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe the feasibility of accessing the population(s)/dataset(s). ***Clinical trials are not allowed under the Investigator-Initiated Research Award.***

- If applicable, describe how data will be reported and how it will be assured that the documentation will support a regulatory filing with the U.S. Food and Drug Administration (FDA).

- **Attachment 2: Supporting Documentation:** Combine and upload as a single file named "Support.pdf." Start each document on a new page. If documents are scanned to PDF, the lowest resolution (100 to 150 dpi) should be used. The Supporting Documentation attachment should not include additional information such as figures, tables, graphs, photographs, diagrams, chemical structures, or drawings. These items should be included in the Project Narrative.

  There are no page limits for any of these components unless otherwise noted. Include only those components described below; inclusion of items not requested or viewed as an extension of the Project Narrative will result in the removal of those items or may result in administrative withdrawal of the application.

  References Cited: List the references cited (including URLs, if available) in the Project Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, title of reference, source of reference, volume, chapter, page numbers, and publisher, as appropriate).

  List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

  Facilities, Existing Equipment, and Other Resources: Describe the facilities and equipment available for performance of the proposed project and any additional facilities or equipment proposed for acquisition at no cost to the award. Indicate whether or not Government-furnished facilities or equipment are proposed for use. If so, reference should be made to the original or present Government award under

which the facilities or equipment items are now accountable. There is no form for this information.

Publications and/or Patents: Include a list of relevant publication URLs and/or patent abstracts. If publications are not publicly available, then copies of up to five published manuscripts may be included in Attachment 2. Extra items will not be reviewed.

Letters of Organizational Support: Provide a letter (or letters, if applicable) signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. Letters of support not requested in the Program Announcement, such as those from members of Congress, do not impact application review or funding decisions.

Letters of Collaboration: Provide a signed letter from each collaborating individual or organization that will demonstrate that the PI has the support or resources necessary for the proposed work. If an investigator at an intramural organization is named as a collaborator on an application submitted through an extramural organization, the application must include a letter from the collaborator's Commander or Commanding Officer at the intramural organization that authorizes the collaborator's involvement.

Use of Military Resources (if applicable): If the proposed research plan involves access to active duty military patient populations or resources, the PI is responsible for demonstrating such access. Provide a letter of support signed by the lowest-ranking person with approval authority confirming access to active duty military patient populations and/or DoD resources or databases.

Use of Veterans Affairs Resources (if applicable): Provide a letter of support from the VA Facility Director(s) or individual designated by the VA Facility Director(s), such as the ACOS/R&D or Clinical Service Chief confirming access to VA patients, resources, and/or VA research space. For VA PIs, if the VA NPC is not identified as the applicant institution for administering the funds, include a letter from the VA ACOS/R&D confirming this arrangement and identifying the institution that will administer the funds associated with the proposed research.

Intellectual Property: Information can be found in Code of Federal Regulations, Title 2, Part 200.315 (2 CFR 200.315), "Intangible Property."

- Intellectual and Material Property Plan (if applicable): Provide a plan for resolving intellectual and material property issues among participating organizations.

- Commercialization Strategy (if applicable): Describe the commercialization plan. The plan should include intellectual property, market size, financial analysis, strengths and weaknesses, barriers to the market, competitors, and management team. Discuss the significance of this development effort, when it can be anticipated, and the potential commercial use for the technology being developed.

Data and Research Resources Sharing Plan: Describe how data and resources generated during the performance of the project will be shared with the research community. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- **Attachment 3: Technical Abstract (one-page limit):** Upload as "TechAbs.pdf." The technical abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  The technical abstract is used by all reviewers. Of particular importance, programmatic reviewers typically do not have access to the full application and therefore rely on the technical abstract for appropriate description of the project's key aspects. Therefore, clarity and completeness within the space limits of the technical abstract are highly important.

  Describe the proposed research project, including the following elements: background, rationale, hypothesis, specific aims and objectives, study design, long-term and short-term impact to the relevant research field and patient population(s), and the relevance of the project to at least one FY18 PRMRP Topic Area.

- **Attachment 4: Lay Abstract (one-page limit):** Upload as "LayAbs.pdf." The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***. Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Describe how the proposed research project addresses one or more of the FY18 PRMRP Topic Areas. Include a comprehensive overview of the proposed research project that will be ***readily understood by readers without a background in science or medicine.*** Clearly describe the central critical problem or question to be addressed and the ultimate applicability and impact of the research. ***Do not duplicate the technical abstract***.

- **Attachment 5: Statement of Work (SOW) (three-page limit):** Upload as "SOW.pdf." The suggested SOW format and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm). For the Investigator-Initiated Research Award mechanism, use the SOW format example titled, "SOW (Statement of Work) Generic Format." The SOW must be in PDF format prior to attaching.

  The SOW should include a list of major tasks that support the proposed specific aims, followed by a series of subtasks outlined related to the major tasks and milestones within the period of performance. The SOW should describe only the work for which funding is being requested by this application and, as applicable, should also:

Include the name(s) of the key personnel and contact information for each study site/ subaward site.

Indicate the number (and type, if applicable) of research subjects (animal or human) and/or human anatomical samples projected or required for each task and at each site. Refer to the General Application Instructions, Appendix 1, for additional information regarding regulatory requirements.

For studies with prospective accrual of human subjects, indicate quarterly enrollment targets.

Identify cell line(s) and commercial or organizational source(s) to be used. If human anatomical substances (including cell lines) will be used, specify whether or not identifiable information is accessible to the research team by any means.

If applicable, indicate timelines required for regulatory approvals relevant to human subjects research (e.g., Investigational New Drug and Investigational Device Exemption applications) by the FDA or other Government agency.

Partnering PI Option: The Initiating and Partnering PIs must each submit an identical copy of a jointly created SOW. The contributions of the Initiating PI and the Partnering PI should be noted for each task.

- **Attachment 6: Impact Statement (one-page limit):** Upload as "Impact.pdf."

  Explain why the proposed research project is important and relevant to understanding the cause or progression of the disease or condition, or to developing improvements in prevention, detection, diagnosis, treatment, patient care, or quality of life in the FY18 PRMRP Topic Area(s) addressed. Describe how the study will address a central critical problem or question in the relevant Topic Area(s). If applicable, describe how the project addresses an FY18 PRMRP Area of Encouragement (Appendix 2).

  - ***Describe the short-term impact:*** Detail the anticipated outcome(s)/product(s) (knowledge and/or materiel) that will be directly attributed to the results of the proposed research.

  - ***Describe the long-term impact:*** Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable. Explain the long-range vision for how the research will impact the field of study and/or clinical care.

- **Attachment 7: Military Relevance Statement (one-page limit):** Upload as "MilRel.pdf."

  Describe how the proposed study is responsive to the healthcare needs of military Service members, Veterans, and/or beneficiaries. Provide information about the incidence and/or prevalence of the disease or condition in the general population as well as in military Service members, Veterans, and/or beneficiaries.

If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe the population(s)/dataset(s) and the appropriateness of the population(s)/dataset(s) for the proposed study. If a non-military population will be used for the proposed research project, explain how the population simulates the targeted population (i.e., military Service members, Veterans, and/or beneficiaries).

If applicable, show how the proposed research project aligns with DoD and/or VA areas of research interest. Provide a description of how the knowledge, information, products, or technologies gained from the research could be implemented in a dual-use capacity to benefit the civilian population and address a military need, as appropriate

- **Attachment 8: Partnership Statement (one-page limit):** Upload as "Partnership.pdf." ***This attachment is only required for applications submitted under the Partnering PI Option.***

  Describe the expertise of the Initiating and Partnering PIs and how each will bring different strengths to the proposed project. Describe how the combined effort will be synergistic and produce an outcome greater than what could be achieved by independent efforts. Outline the contribution and time commitment of each partner and how each will have equal intellectual input on the design, conduct, and analysis of the project. Describe how the PIs will manage the collaboration and workflow to optimize research efforts.

- **Attachment 9: Representations, if applicable (extramural submissions only):** Upload as "MandatoryReps.pdf." All extramural applicants must complete and submit the Required Representations template available on eBRAP (https://ebrap.org/eBRAP/public/Program.htm). For more information, see the General Application Instructions, Appendix 5, Section B, Representations.

- **Attachment 10: DoD Military Budget Form(s), if applicable:** Upload as "MFBudget.pdf." If a military facility (Military Health System facility, research laboratory, medical treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center) will be a collaborator in performance of the project, complete the DoD Military Budget Form, available for download on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm), including a budget justification, for each military facility as instructed. The costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

- **Extramural and Intramural Applications**

  To evaluate compliance with Title IX of the Education Amendments of 1972 (20 USC A§1681 et seq.), the DoD is collecting certain demographic and career information to be able to assess the success rates of women who are proposed for key roles in applications in science, technology, engineering, or mathematics disciplines. To enable this assessment, each application must include the following forms completed as indicated.

Research & Related Personal Data: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

- PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf." The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The National Institutes of Health Biographical Sketch may also be used. All biographical sketches should be submitted in the PDF format that is not editable.

- PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

- Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."

- Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

Research & Related Budget: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.4, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.3, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf." The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

Partnering PI Option: ***Initiating and Partnering PIs must each submit a budget and justification specific to their own portion of the effort as part of their separate Grants.gov or eBRAP application packages. The Initiating PI should not include budget information for the Partnering PI, even if they are located within the same organization. The anticipated combined direct costs budgeted for the entire period of performance for the Initiating and Partnering PIs' applications will not exceed $1.5M. Refer to Section II.D.5, Funding Restrictions, for detailed information.***

Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.4, for detailed information.

- **Extramural Applications Only**

R&R Subaward Budget Attachment(s) Form (if applicable): Refer to the General Application Instructions, Section III.A.6, for detailed information.

- **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.6, for detailed information.) Verify subaward budget(s) and budget justification forms are present in eBRAP during the application verification period. If these components are missing, upload them to eBRAP before the end of the application verification period.

Intramural DoD Collaborator(s): Complete the DoD Military Budget Form and upload to Grants.gov attachment form as Attachment 10. (Refer to the General Application Instructions, Section III.A.7, for detailed information.) Intramural DoD Collaborator(s) costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs.

DoD Military Budget Form: A military facility collaborating in the performance of the project (but not participating as a Partnering PI) should be treated as a subaward for budget purposes. However, do not complete the Grants.gov R&R Subaward Budget Attachment Form; instead, complete the DoD Military Budget Form (Attachment 10) to show all direct and indirect costs. The costs per year should be included on the Grants.gov Research & Related Budget Form under subaward costs. Refer to the General Application Instructions, Section III.A.7, for detailed information.

Application Components for the Partnering PI, if applying under the Partnering PI Option

The Partnering PI must follow the link in the email from eBRAP and, if not registered in eBRAP, complete the registration process prior to the application submission deadline in order to associate their full application package with that of the Initiating PI.

The Initiating PI must identify if that Partnering PI will be submitting an extramural or intramural application (in accordance with the guidelines in Section II.C.1.a, Organization) and the appropriate mode of submission (Grants.gov for extramural and eBRAP for intramural). The Partnering PI must verify his/her contact information and mode of submission within eBRAP to ensure proper submission of his/her application.

The application submission process for the Partnering PI uses an abbreviated full application package that includes:

- **Extramural and Intramural Applications**

  Attachments:

  - **Attachment 5: Statement of Work (three-page limit):** Upload as "SOW.pdf." Refer to the General Application Instructions, Section III.A.2, for detailed information on completing the SOW. Each PI must submit an identical copy of a jointly created SOW. The contributions of the Initiating PI and Partnering PI should be noted for each task.

- **Attachment 9: Representations, if applicable (extramural submissions only):** Upload as "MandatoryReps.pdf." All extramural applicants must complete and submit the Required Representations template available on eBRAP (https://ebrap.org/eBRAP/public/Program.htm). For more information, see the General Application Instructions, Appendix 5, Section B, Representations.

- **Attachment 10: DoD Military Budget Form:** Upload as "MFBudget.pdf." Refer to the General Application Instructions, Section III.A.7, for detailed information. The costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs.

Research & Related Personal Data: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

- PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf." The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The National Institutes of Health Biographical Sketch may also be used. All biographical sketches should be submitted in the PDF format that is not editable.

- PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

- Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."

- Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

Research & Related Budget: For extramural submissions, refer to the General Application Instructions, Section III.A.4, and for intramural submissions, refer to the General Application Instructions, Section IV.A.3, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf."

Initiating and Partnering PIs must each submit a budget and justification specific to their own portion of the efforts as part of their separate Grants.gov application packages. The Research & Related Budget for the Partnering PI should not include budget information for the Initiating PI, even if they are located within the same organization. Refer to Section II.D.5, Funding Restrictions, for detailed information.

Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to General Application Instructions, Section IV.A.4, for detailed information.

- **Extramural Applications Only**

  R&R Subaward Budget Attachment(s) Form:

  - **Extramural Subaward:** Complete the R&R Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.6, for detailed information.)

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov attachment form as Attachment 10. (Refer to the General Application Instructions, Section IV.A.3, for detailed information.)

II.D.3. Dun and Bradstreet Data Universal Numbering System (DUNS) Number and System for Award Management (SAM)

Applicant organizations and all subrecipient organizations must have a DUNS number to submit applications to Grants.gov. The applicant organization must also be registered in the Entity Management functional area of the SAM with an "Active" status to submit applications through the Grants.gov portal. Verify the status of the applicant's organization's Entity registration in SAM well in advance of the application submission deadline. Allow 3 to 4 weeks to complete the entire SAM registration process. If an applicant has not fully complied with the requirements at the time the Federal awarding agency is ready to make a Federal award, the Federal awarding agency may determine that the applicant is not qualified to receive a Federal award and use that determination as a basis for making a Federal award to another applicant. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.

II.D.4. Submission Dates and Times

All submission dates and times are indicated in Section I, Overview of the Funding Opportunity. Pre-application and application submissions are required. The pre-application and application submission process should be started early to avoid missing deadlines. There are no grace periods. Failure to meet either of these deadlines will result in submission rejection.

Applicant Verification of Full Application Submission in eBRAP

Following retrieval and processing of the full application, eBRAP will notify the organizational representatives and PI by email to log into eBRAP to review, modify, and verify the full application submission. eBRAP will validate retrieved files against the specific Program Announcement requirements and discrepancies will be noted in both the email and in the "Full Application Files" tab in eBRAP. eBRAP does not confirm the accuracy of file content. It is the applicant's responsibility to review all application components and ensure proper ordering as specified in the Program Announcement. ***If either the Project Narrative or the budget fails eBRAP validation or needs to be modified, an updated full application package must be***

submitted prior to the application submission deadline. The Project Narrative and Budget Form cannot be changed after the application submission deadline.

Extramural Submission: The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.

Intramural DoD Submission: After eBRAP has processed the full application, the organizational Resource Manager/Comptroller/Task Area Manager or equivalent Business Official and PIs will receive email notification of the status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form***, may be modified. The Resource Manager/Comptroller/Task Area Manager or equivalent Business Official should log into eBRAP to review and to approve prior to the application verification deadline.

For All Submissions: Verify that subaward budget(s) with budget justification are present in eBRAP during the application verification period. If these components are missing, upload them to eBRAP before the end of the application verification period.

II.D.5. Funding Restrictions

The maximum period of performance is **3** years.

Application submissions with a single PI:

The anticipated direct costs budgeted for the entire period of performance will not exceed **$1.2M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. No budget will be approved by the Government exceeding **$1.2M** direct costs or using an indirect cost rate exceeding the organization's negotiated rate.

All direct and indirect costs of any subaward or contract must be included in the total direct costs of the primary award.

The applicant may request the entire maximum funding amount for a project that may have a period of performance less than the maximum **3** years.
