Application submissions, including the Partnering PI Option: The anticipated combined direct costs budgeted for the entire period of performance for the Initiating and Partnering PIs' applications will not exceed **$1.5M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. Collaborating organizations should budget associated indirect costs in accordance with each organization's negotiated rate. The combined budgeted direct costs approved by the Government will not exceed **$1.5M** or use an indirect cost rate exceeding each organization's negotiated rate.

A separate award will be made to each PI's organization.

The Initiating and the Partnering PIs are expected to be partners in the research, and direct cost funding should be divided accordingly, unless otherwise warranted and clearly justified. Each partner may request no more than 75% (or no less than 25%) of the proposed direct costs.

For this award mechanism, direct costs may be requested for (not all-inclusive):

- Salary
- Research supplies
- Clinical research costs (clinical trials are not allowed)
- Support for multidisciplinary collaborations, including travel
- Travel costs for the PIs to disseminate project results at one DoD-supported meeting to be specified by the program office during award negotiations (i.e., the Military Health System Research Symposium)
- Travel costs for one investigator to travel to one scientific/technical meeting per year to present project outcomes or disseminate project results

Awards made to extramural organizations will consist solely of assistance agreements (Cooperative Agreements and Grants). For extramural awards with an intragovernmental component, direct transfer of funds from an extramural award recipient to a DoD or other Federal agency is not allowed except under very limited circumstances. Funding to intramural DoD and other Federal agencies will be managed through a direct fund transfer. Intramural applicants are responsible for coordinating through their agency's procedures the use of contractual or assistance funding awards or other appropriate agreements to support extramural collaborators. Application packages from associated extramural partners will be funded through assistance agreements.

Refer to the General Application Instructions, Section III.A.4, for budget regulations and instructions for the Research & Related Budget. ***For Federal agencies or organizations collaborating with Federal agencies, budget restrictions apply as are noted in the General Application Instructions, Section III.A.4***.

The CDMRP expects to allot approximately $95M of the $330M FY18 appropriation to fund approximately 47 Investigator-Initiated Research Award applications, depending on the quality and number of applications received. Funding of applications received in response to this Program Announcement is contingent upon the availability of Federal funds for this program.

Funds to be obligated on any award resulting from this funding opportunity will be available for use for a limited time period based on the fiscal year of the funds. The time is considered when establishing the award's period of performance. It is anticipated that awards made from this funding opportunity will be funded with FY18 funds, which will expire for use on September 30, 2024.

II.D.6. Other Submission Requirements

Refer to the General Application Instructions, Appendix 4, for detailed formatting guidelines.

II.E. Application Review Information

II.E.1. Criteria

II.E.1.a. Peer Review

To determine technical merit, all applications will be evaluated according to the following scored criteria, which are listed in decreasing order of importance:

- **Research Strategy and Feasibility**
    - How well the scientific rationale supports the project and its feasibility, as demonstrated by a critical review and analysis of the literature, supporting data, and logical reasoning.
    - How well the hypothesis, specific aims, and objective(s) are developed.
    - How well the experimental design, methods, data collection procedures, and analyses are developed and support completion of the aims.
    - If applicable, to what degree the statistical plan and power analysis are appropriate for the proposed project.
    - If animal studies are included, how well they are designed to achieve reproducible and rigorous results, including the choice of model and the endpoints/outcomes to be measured.
    - If applicable, whether data will be appropriately reported and documented to support a regulatory filing with the FDA.
    - If applicable, how well the application provides evidence of availability of and access to the necessary study populations and/or resources.
    - How well potential problems are identified and alternative approaches are addressed.
    - Whether the research can be completed within the proposed period of performance.
- **Impact**
    - To what extent the project impacts a central critical problem or question in at least one FY18 PRMRP Topic Area.
    - If applicable, how well the proposed research project addresses one or more FY18 PRMRP Areas of Encouragement.

- How the proposed research project, if successful, will make important scientific advances in the relevant field of research.

- To what degree the proposed project could, if successful, make a significant impact on the lives of relevant patient populations in the short term and/or long term.

- **Personnel**

  - How the background and expertise of the PIs and other key personnel demonstrate their ability to perform the proposed work.

  - How the levels of effort by the PIs and other key personnel are appropriate to ensure the successful conduct of the project.

  - How each PI's record(s) of accomplishment demonstrates their ability to accomplish the proposed work.

For applications submitted under the Partnering PI Option:

- **Partnership**

  - How well the research project is supported by the nature of the collaboration.

  - To what extent the proposed partnership will advance research beyond what would be possible through individual efforts.

  - How well the skills and perspectives of the Initiating and Partnering PIs complement each other.

  - How well the application reflects the requirement that the partners have equal intellectual input into the design of the project.

In addition, the following unscored criteria will also contribute to the overall evaluation of the application:

- **Environment**

  - How the scientific environment is appropriate for the proposed research.

  - How the research requirements are supported by the availability of and accessibility to facilities and resources (including collaborative arrangements).

  - How the quality and extent of organizational support are appropriate for the proposed research.

  - If applicable, to what degree the intellectual and material property plan is appropriate.

- **Budget**
    - Whether the budget is appropriate for the proposed research and within the limitations of this Funding Opportunity.
- **Application Presentation**
    - To what extent the writing, clarity, and presentation of the application components influence the review.

II.E.1.b. Programmatic Review

To make funding recommendations and select the application(s) that, individually or collectively, will best achieve the program objectives, the following criteria are used by programmatic reviewers:

- Ratings and evaluations of the peer reviewers
- Relevance to the mission of the DHP and FY18 PRMRP, as evidenced by the following:
    - Adherence to the intent of the award mechanism
    - Program portfolio composition
    - Military relevance
    - Relative impact

II.E.2. Application Review and Selection Process

All applications are evaluated by scientists, clinicians, and consumers in a two-tier review process. The first tier is peer review of applications against established criteria for determining technical merit. Each application is evaluated for its own merit, independent of other applications. The second tier is a programmatic review that makes recommendations for funding to the Commanding General, USAMRMC, on behalf of the DHA and the OASD(HA), based on technical merit, the relevance to the mission of the DHP and PRMRP, the specific intent of the award mechanism, and to other specified evaluation criteria in the Program Announcement. Programmatic review is a comparison-based process in which applications with scientific and technical merit compete in a common pool. ***The highest-scoring applications from the first tier of review are not automatically recommended for funding. Funding recommendations depend on various factors as described in Section II.E.1.b, Programmatic Review.*** Additional information about the two-tier process used by the CDMRP can be found at http://cdmrp.army.mil/about/fundingprocess.

All CDMRP review processes are conducted confidentially to maintain the integrity of the merit-based selection process. Panel members sign a statement that application and evaluation information will not be disclosed outside the panel. Violations of confidentiality can result in the dissolving of a panel(s) and other corrective actions. In addition, personnel at the applicant or

collaborating organizations are prohibited from contacting persons involved in the review and approval process to gain protected evaluation information or to influence the evaluation process. Violations of these prohibitions will result in the administrative withdrawal of the organization's application. Violations by panel members or applicants that compromise the confidentiality of the review and approval process may also result in suspension or debarment from Federal awards. Furthermore, the unauthorized disclosure of confidential information of one party to another third party is a crime in accordance with 18 USC 1905.

II.E.3. Integrity and Performance Information

Prior to making an assistance agreement award where the Federal share is expected to exceed the simplified acquisition threshold (currently $150,000) over the period of performance, the Federal awarding agency is required to review and consider any information about the applicant that is available in the Federal Awardee Performance and Integrity Information System (FAPIIS).

An applicant organization may review FAPIIS, accessible through SAM, and submit comments to FAPIIS on any information about the organization that a Federal awarding agency previously entered and is currently available in FAPIIS.

The Federal awarding agency will consider any comments by the applicant, in addition to other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics, and record of performance under Federal awards when determining a recipient's qualification prior to award, according to the qualification standards of the Department of Defense Grant and Agreement Regulations (DoDGAR), Section 22.415.

II.E.4. Anticipated Announcement and Federal Award Dates

All application review dates and times are indicated in Section I, Overview of the Funding Opportunity.

Each PI and organization will receive email notification of posting of the funding recommendation in eBRAP. Each PI will receive a peer review summary statement on the strengths and weaknesses of the application.

II.F. Federal Award Administration Information

II.F.1. Federal Award Notices

Awards will be made no later than September 30, 2019. Refer to the General Application Instructions, Appendix 2, for additional award administration information.

After email notification of application review results through eBRAP, and if selected for funding, a representative from the USAMRAA will contact the business official authorized to negotiate on behalf of the PI's organization.

Only an appointed USAMRAA Grants Officer may obligate the Government to the expenditure of funds. No commitment on the part of the Government should be inferred from discussions

with any other individual. The award document signed by the Grants Officer is the official authorizing document.

Federal Organizations: Awards to Federal Government organizations (to include intramural DoD organizations) will be executed through the Military Interdepartmental Purchase Request (MIPR) or Funding Authorization Document (FAD) process. Transfer of funds is contingent upon appropriate safety and administrative approvals. Intramural applicants and collaborators are reminded to coordinate receipt and commitment of funds through their respective Resource Manager/Task Area Manager/Comptroller or equivalent Business Official.

After email notification of application review results through eBRAP, and if selected for funding, a representative from the CDMRP will contact the business official authorized to negotiate on behalf of the PI's organization.

II.F.1.a. PI Changes and Award Transfers

Changes in PI and an organizational transfer of an award supporting the Initiating or Partnering PI are discouraged and will be evaluated on a case-by-case basis and only allowed at the discretion of the Grants Officer. An organizational transfer of an award will not be allowed in the last year of the (original) period of performance or any extension thereof.

Refer to the General Application Instructions, Appendix 2, Section B, for general information on organization or PI changes.

II.F.2. Administrative and National Policy Requirements

Applicable requirements in the DoDGAR found in 32 CFR, Chapter 1, Subchapter C, and 2 CFR, Chapter XI, apply to grants and cooperative agreements resulting from this Program Announcement.

Refer to the General Application Instructions, Appendix 2, for general information regarding administrative requirements.

Refer to the General Application Instructions, Appendix 5, for general information regarding national policy requirements.

Refer to full text of the USAMRAA General Research Terms and Conditions with Institutions of Higher Education, Hospitals, and Non-Profit Organizations: Addendum to the DoD R&D Terms and Conditions and the USAMRAA General Research Terms and Conditions with For-Profit Organizations for further information.

II.F.3. Reporting

Refer to the General Application Instructions, Appendix 2, Section A, for general information on reporting requirements. ***If there are technical reporting requirement delinquencies for any existing USAMRAA-sponsored awards at the applicant organization, no new awards will be issued to the applicant organization until all delinquent reports have been submitted.***

Annual progress reports as well as a final progress report will be required.

Quarterly technical progress reports may be required.

Award Chart: Complete the Award Chart template, a one-page PowerPoint file that must be downloaded from the CDMRP eBRAP System at https://ebrap.org/eBRAP/public/Program.htm, and submit to eBRAP at the time of award.

Award Expiration Transition Plan: An Award Expiration Transition Plan must be submitted with the final progress report. Use the one-page template titled, "Award Expiration Transition Plan," available on the on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) under the "Progress Report Formats" section.

Awards resulting from this Program Announcement will incorporate additional reporting requirements related to recipient integrity and performance matters. Recipient organizations that have Federal contract, grant, and cooperative agreement awards with a cumulative total value greater than $10,000,000 are required to provide information to FAPIIS about certain civil, criminal, and administrative proceedings that reached final disposition within the most recent 5-year period and that were connected with performance of a Federal award. Recipients are required to disclose semiannually information about criminal, civil, and administrative proceedings as specified in the applicable Terms and Conditions (see General Application Instructions, Section III.A.4).

II.G. Federal Awarding Agency Contacts

II.G.1. CDMRP Help Desk

Questions related to Program Announcement content or submission requirements as well as questions related to the pre-application or intramural application submission through eBRAP should be directed to the CDMRP Help Desk, which is available Monday through Friday from 8:00 a.m. to 5:00 p.m. ET. Response times may vary depending upon the volume of inquiries.

Phone: 301-682-5507

Email: help@eBRAP.org

II.G.2. Grants.gov Contact Center

Questions related to extramural application submission through Grants.gov portal should be directed to the Grants.gov Contact Center, which is available 24 hours a day, 7 days a week (closed on U.S. Federal holidays). Note that the CDMRP Help Desk is unable to provide technical assistance with Grants.gov submission.

Phone: 800-518-4726; International 1-606-545-5035

Email: support@grants.gov

Sign up on Grants.gov for "send me change notification emails" by following the link on the "Synopsis" page for the Program Announcement or by responding to the prompt provided by Grants.gov when first downloading the Grants.gov application package. If the Grants.gov application package is updated or changed, the original version of the application package may not be accepted by Grants.gov.

II.H. Other Information

II.H.1. Program Announcement and General Application Instructions Versions

Questions related to this Program Announcement should refer to the Program name, the Program Announcement name, and the Program Announcement version code 20180329c. The Program Announcement numeric version code will match the General Applications Instructions version code 20180329.

II.H.2. Administrative Actions

After receipt of pre-applications or applications, the following administrative actions may occur:

II.H.2.a. Rejection

The following will result in administrative rejection of the pre-application:

- Preproposal Narrative is missing.

The following will result in administrative rejection of the application:

- Submission of an application for which a letter of invitation was not received.
- Project Narrative exceeds page limit.
- Project Narrative is missing.
- Budget is missing.
- Submission of the same research project to different Funding Opportunities within the same program and fiscal year. Refer to Section II.D, Application and Submission Information, for exceptions.
- **Partnering PI Option:** Failure to submit both associated (Initiating and Partnering PI) applications by the deadline.

II.H.2.b. Modification

- Pages exceeding the specific limits will be removed prior to review for all documents other than the Project Narrative.
- Documents not requested will be removed.

II.H.2.c. Withdrawal

The following may result in administrative withdrawal of the pre-application or application:

- An FY18 PRMRP Programmatic Panel member is named as being involved in the research proposed or is found to have assisted in the pre-application or application processes including, but not limited to, concept design, application development, budget preparation, and the development of any supporting documentation. ***A list of the FY18 PRMRP Programmatic Panel members can be found at http://cdmrp.army.mil/prmrp/panels/panels18***.

- The application fails to conform to this Program Announcement description to the extent that appropriate review cannot be conducted.

- Inclusion of URLs, with the exception of links in References Cited and Publication and/or Patent Abstract sections.

- Page size is larger than 8.5 inches x 11.0 inches (approximately 21.59 cm x 27.94 cm).

- To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in the preparation, research or other duties for submitted applications. For FY18, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (http://cdmrp.army.mil/about/2tierRevProcess). Applications that include names of personnel from either of these companies will be administratively withdrawn unless plans to manage COIs are provided and deemed appropriate by the Grants Officer. Refer to the General Application Instructions, Appendix 3, for detailed information.

- Personnel from applicant or collaborating organizations are found to have contacted persons involved in the review or approval process to gain protected evaluation information or to influence the evaluation process.

- Applications from extramural organizations, including non-DoD Federal agencies, received through eBRAP may be withdrawn.

- Applications submitted by an intramural DoD organization may be withdrawn if the intramural organization cannot coordinate the use of contractual, assistance, or other appropriate agreements to provide funds to extramural collaborators.

- The proposed research project does not address at least one of the Congressionally directed FY18 PRMRP Topic Areas.

- If a clinical trial is proposed, the application will be withdrawn.

- An application submitted by a PI who does not meet the eligibility criteria will be withdrawn.

II.H.2.d. Withhold

Applications that appear to involve research misconduct will be administratively withheld from further consideration pending organizational investigation. The organization will be required to provide the findings of the investigation to the USAMRAA Grants Officer for a determination of the final disposition of the application.

II.H.3. Application Submission Checklist

Application Components	Action	Initiating PI Completed	Partnering PI Completed
SF424 (R&R) Application for Federal Assistance **(Extramural submissions only)**	Complete form as instructed.		
Summary (Tab 1) and Application Contacts (Tab 2) **(Intramural submissions only)**	Complete these tabs as instructed.		
Attachments	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf."		
	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf."		
	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf."		
	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf."		
	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf."		
	Impact Statement: Upload as Attachment 6 with file name "Impact.pdf."		
	Military Relevance Statement: Upload as Attachment 7 with file name "MilRel.pdf."		
	Partnership Statement: Upload as Attachment 8 with file name "Partnership.pdf," if applicable.		
	Representations (Extramural submissions only): Upload as Attachment 9 with file name "MandatoryReps.pdf," if applicable.		
	DoD Military Budget Form(s): Upload as Attachment 10 with file name "MFBudget.pdf," if applicable.		
Research & Related Personal Data	Complete form as instructed.		

Application Components	Action	Initiating PI Completed	Partnering PI Completed
Research & Related Senior/Key Person Profile (Expanded)	Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field.		
	Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field.		
	Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field.		
	Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field.		
Research & Related Budget **(Extramural submissions only)**	Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field.		
Budget **(Intramural submissions only)**	Complete the DoD Military Budget Form and Justification.		
Project/Performance Site Location(s) Form	Complete form as instructed.		
R&R Subaward Budget Attachment(s) Form	Complete form as instructed.		

APPENDIX 1: ACRONYM LIST

ACOS/R&D	Associate Chief of Staff for Research and Development
ACURO	Animal Care and Use Review Office
CDMRP	Congressionally Directed Medical Research Programs
CFR	Code of Federal Regulations
COI	Conflict of Interest
DHA	Defense Health Agency
DHP	Defense Health Program
DoD	Department of Defense
DoDGAR	Department of Defense Grant and Agreement Regulations
DUNS	Data Universal Numbering System
eBRAP	Electronic Biomedical Research Application Portal
EC	Ethics Committee
ET	Eastern Time
FAD	Funding Authorization Document
FAPIIS	Federal Awardee Performance and Integrity Information System
FDA	Food and Drug Administration
FY	Fiscal Year
HRPO	Human Research Protection Office
IACUC	Institutional Animal Care and Use Committee
IDE	Investigational Device Exemption
IND	Investigational New Drug
IRB	Institutional Review Board
M	Million
MIPR	Military Interdepartmental Purchase Request
OASD(HA)	Office of the Assistant Secretary of Defense for Health Affairs
OMB	Office of Management and Budget
ORCID	Open Researcher and Contributor ID, Inc.
ORP	Office of Research Protections
PI	Principal Investigator
PRMRP	Peer Reviewed Medical Research Program
RDT&E	Research, Development, Test, and Evaluation
SAM	System for Award Management
SOW	Statement of Work
USAMRAA	U.S. Army Medical Research Acquisition Activity
USAMRMC	U.S. Army Medical Research and Materiel Command
USC	United States Code
VA	Department of Veterans Affairs

APPENDIX 2: AREAS OF ENCOURAGEMENT

Applications addressing any of the FY18 PRMRP Topic Areas are of interest to the program. ***Any aspect of research relevant to one or more of the FY18 PRMRP Topic Areas may be considered for funding.*** Areas of Encouragement related to the FY18 PRMRP Topic Areas have been identified by the DoD, VA, and other relevant stakeholders. Applicants are urged to read and consider these Areas of Encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an Area of Encouragement in this list.***

Acute Lung Injury

- Research on the etiology and prevention of acute lung injury (ALI)/acute respiratory distress syndrome (ARDS) caused by the host's (e.g., immune system's) responses to trauma, transfusion, burns, infection, hemorrhagic shock, inhalation, and/or oxygen exposure.
- Novel and/or innovative detection technologies or therapeutics to reduce the incidence and/or severity of ALI/ARDS and/or other lung injury secondary to trauma, transfusion, infection, burns, hemorrhagic shock, inhalation, and/or oxygen exposure.
- Strategies to stabilize and support the safe transport of patients with ALI/ARDS in order to optimize therapeutic interventions, particularly in operational scenarios requiring prolonged field care and/or longer transport times.
- Development of metrics to associate the long-term health outcomes of ALI/ARDS with physiological and physical performance.

Antimicrobial Resistance

- Development of novel and/or innovative interventions, diagnostics, and treatment for multidrug-resistant pathogens, especially those that can be used in austere settings.
- Development of novel and/or innovative therapies that prevent and/or interrupt biofilm production in wound infections and infected hardware models.
- Development and testing of treatment protocols and/or diagnostic tests to limit prescribing antibiotics for conditions that are commonly viral in nature or conditions that would resolve themselves without antibiotic treatment (e.g., sinusitis, bronchitis, viral upper respiratory infections, and acute gastroenteritis).
- Development and evaluation of therapies to treat travelers' diarrhea to improve the time to clinical cure and minimize resistance acquisition.
- Development of gene editing tools (e.g., designer nucleases) that optimize treatment and raise the threshold for resistance of anti-infective agents.

Arthritis (other than Rheumatoid Arthritis or Post-Traumatic Osteoarthritis)

- Research toward the development of clinical practice guidelines to prevent, identify, and treat arthritis.

- Research quantifying the impacts of obesity, weight loss, physical fitness (all components including cardiovascular, strength, flexibility, balance), and dietary factors on the development of or prevention/risk reduction of arthritis.
- Studies to examine using regenerative medicine techniques and therapies (including cell-based therapies) to prevent or treat osteoarthritis, including dose response information and the frequency and timing of application.
- Basic and translational research to identify treatments to mitigate and/or reverse osteoarthritis, particularly in the knee, hip, ankle, and shoulder.
- Identification and/or validation of biomarkers for early psoriatic arthritis.
- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.

Burn Pit Exposure

- Research on the etiology and treatment of adverse health events related to military deployment to Iraq and Afghanistan that are associated with exposure to airborne hazards and open pit burning of solid waste and other materials.
- Toxicological studies to characterize emissions from open air burns, burn boxes, and incinerators and ascertain the toxicity and mechanisms of action for injury from such chemicals and airborne environmental dust and mixtures, as well as interactions among pollutants and particulate materials.
- Identification and validation of biomarkers of both exposure to and health effects of burn pit combustion products, burning biomass and refuse, and geogenic dusts.
- Development and validation of instruments for assessing (including in real time) levels of exposure to airborne hazards for use in research and for occupational and environmental exposures monitoring.

Cardiomyopathy

- Improve understanding of the pathophysiology of cardiomyopathies.
- Strategies to identify risk factors associated with the development of cardiomyopathy (i.e., genetic, lifestyle, exposure) in the civilian and/or military populations.
- Improve diagnosis and treatment of primary and secondary cardiomyopathies.
- Assess the multiple etiologies of cardiomyopathy (e.g., hypertension, ischemia, hemochromatosis, sleep apnea, radiation therapy, medications, smallpox vaccine, infections) in military Service members.

Cerebellar Ataxia

- Research to improve understanding of all causes of cerebellar ataxia.
- Research to improve understanding of the association between nutrition and cerebellar ataxia.
- Research to better understand the role of physical rehabilitation/exercise in affecting postural disorders, balance, and coordination in cerebellar ataxia patients.

- Research to identify therapeutic targets and novel therapeutic modalities, including gene silencing/gene editing.

Chronic Migraine and Post-Traumatic Headache

- Precision medicine research to investigate, develop, and validate biomarkers that are not only useful in diagnosing and monitoring traumatic brain injury patients with chronic migraine or post-traumatic headache, but can also identify individual responses to treatment.
- Epidemiological/natural history studies to characterize specific types of post-traumatic headache, the pathobiology of these headaches (such as the role of acute cortical spreading depression after injury as a risk factor for chronic headaches of a migrainous type), and the risk factors that might predispose people to certain types of post-traumatic headache.
- Research on the optimal approaches to effective management of acute and chronic pain management, and co-occurring psychological health disorders, for chronic migraine and post-traumatic headache, with a focus on assessing and eliminating adverse outcomes and decreasing polypharmacy.
- Evaluation of the use of mechanical stimulation and/or other non-pharmaceutical treatments to reduce acute and chronic migraines and headaches.
- Evaluation of the differences in etiology, diagnosis, treatment, and prevention of migraine headaches between men and women.

Chronic Pain Management

- Develop and validate a user-friendly, objective pain measurement tool (e.g., instrument, questionnaire, scale) to assess the severity of pain and to inform pain management clinical decisions.
- Development of tools to objectively assess and/or prevent pain chronification.
- Research to advance understanding of the impact of psychosocial factors and comorbidities on pain chronification.
- Research on non-addictive and/or alternative methods to treat and manage chronic pain, particularly in complex patients (i.e., chronic, high-utilization, polypharmacy patients).
- Research to understand the mechanisms that sustain or resolve chronic pain.

Congenital Heart Disease

- Development of approaches, including tissue engineering, that provide structural support, restore native activity, allow for tissue growth, and prevent the need for reoperation.
- Research to improve understanding of the causes of congenital heart defects, including genomic, proteomic, and metabolomic profiling.
- Research to design and implement disease-in-a-dish and/or microfluidic models with an established phenotype to increase the efficacy of finding novel and/or innovative drug targets, screen exiting drugs, perform cardiotoxicity testing, and/or uncover pathogenesis.
- Research both on the risk of neurologic injury and on enhanced neuroprotection before, during, and after surgery for congenital heart disease.

- Population-based and outcomes-based research to assess the health outcomes of individuals with congenital heart disease across their life spans.

Constrictive Bronchiolitis

- Research to understand the role of occupational and environmental exposures, including military relevant volatile compounds, mineral and soil dusts, and other airborne particulates, in the etiology of constrictive bronchiolitis.
- Clinical assessments to determine the prevalence and severity of constrictive bronchiolitis and related respiratory diseases in previously deployed military Service members and/or Veterans.
- Development and testing of minimally invasive and non-invasive approaches for diagnosing constrictive bronchiolitis.
- Research to develop novel and/or innovative therapeutics to slow or reverse the progression of constrictive bronchiolitis.
- Development and/or validation of animal models for understanding mechanisms and etiology of constrictive bronchiolitis.

Diabetes

- Research to better understand the heterogeneity of diabetes, including the identification of novel biomarkers.
- Identification and/or evaluation of interventions to reduce the development of diabetes among individuals meeting the clinical criteria for prediabetes.
- Research on interventions to prevent or treat diabetes complications, including diabetic retinopathy, nephropathy, neuropathy, and impaired wound healing.
- Research on the transplantation of allogenic or autologous pancreatic islet cells for long-term natural insulin production, including current good laboratory/clinical/manufacturing practices (as needed) for cell line development.
- Research to design and implement disease-in-a-dish and/or microfluidic models to model pancreatic islets to uncover pathogenesis and improve the efficiency of drug discovery.

Dystonia

- Research to improve identification of delayed onset dystonia following traumatic brain injury.
- Research on the risk, incidence, and etiology of generalized dystonia, focal dystonia, multifocal dystonia, segmental dystonia, and/or hemidystonia.
- Research on interventions to prevent, slow the progression of, or treat dystonia.

Eating Disorders

- Investigations into the prevalence, diagnosis, and treatment patterns of eating disorders in Service members and their families, including potential relationships with military-unique behaviors or conditions.

- Assessment of patterns of comorbidity between eating disorders and other mental health conditions, including an examination of whether eating disorders are more likely to precede or follow the development of other mental health conditions.
- Studies to identify the most effective treatments (and order of treatment) for patients with an eating disorder and a comorbid disorder.
- Research to advance the understanding of the biological, genetic, and environmental factors that influence eating disorders.
- Studies to elucidate and/or mitigate risk factors for the onset or recurrence of eating disorders, including the influence of social media.

Emerging Infectious Diseases

- Development of biomarker-guided clinical management strategies for severe infectious diseases in austere settings.
- Development of rapid, specific, sensitive, and broadly applicable diagnostic methods for emerging pathogens including SARS, H1N1, Ebola, Zika, malaria, dengue, chikungunya, and others.
- Development of risk assessment for vector-borne diseases and novel strategies for vector control, including, but not limited to, novel insecticides, larvicide applications, and barrier methods. Target vectors include major disease dipteran (including but not limited to vectors such as mosquitoes and sand flies) and non-dipteran (including but not limited to reduviids and fleas) and other arthropods of military medical importance (e.g., ticks).
- Surveillance and modeling of epidemics and development of strategies to counter risks in emerging infectious diseases.
- Development of broad-acting detection systems to identify emerging members of a known viral family (e.g., a broad coronavirus panel that can detect Middle Eastern Respiratory Syndrome).

Endometriosis

- Discovery and identification of new and/or validation of existing endometriosis-associated biomarkers for accurate, minimally invasive diagnosis.
- Research to elucidate the pathogenesis, evolution, pathophysiology, infertility, and pelvic pain associated with endometriosis.
- Development of novel treatments, including non-opioid pain therapies, or alternative therapies to alleviate symptoms and reduce secondary effects of endometriosis.
- Studies assessing the environmental etiology of endometriosis.

Epidermolysis Bullosa

- Research to provide further insight into those cellular pathways that promote the development of squamous cell carcinomas in recessive dystrophic and junctional epidermolysis bullosa.

- Research, including clinical trials, focused on therapeutics (topical or systemic) or dressings that enhance wound healing in inherited epidermolysis bullosa.
- Research, including clinical trials, focused on systemic drugs that prevent, delay the onset, or modify the aggressiveness of squamous cell carcinoma in patients with recessive and junctional epidermolysis bullosa.
- Development of novel therapeutics to cure epidermolysis bullosa, reduce epidermolysis bullosa symptoms, or improve quality of life.

Focal Segmental Glomerulosclerosis

- Research to improve understanding of the causes of primary and/or secondary focal segmental glomerulosclerosis, especially genetic mutations.
- Development of non-invasive methods to diagnose focal segmental glomerulosclerosis and its variants.
- Development of a curative therapy or treatments to delay or halt the progression of focal segmental glomerulosclerosis and/or prevent post-transplantation recurrence.
- Research to determine the efficacy of medications used off-label (i.e., outside the FDA-approved indication) to treat focal segmental glomerulosclerosis.

Fragile X

- Development and evaluation of gene modification (e.g., gene editing or gene reactivation) therapeutics for the treatment of fragile X syndrome [including fragile X-associated tremor/ataxia syndrome (FXTAS) and fragile X-associated primary ovarian insufficiency (FXPOI)].
- Identification and validation of functional measures of the manifestations of fragile X syndrome (including FXTAS and FXPOI) across the life span.
- Research to advance the understanding of the pathophysiology/natural history or life course of fragile X syndrome (including FXTAS and FXPOI).
- Identification of novel targets and/or testing novel or existing therapeutics (e.g., repurposing drugs) for fragile X syndrome (including FXTAS and FXPOI).
- Research to establish the benefits of early diagnosis/early treatment of fragile X syndrome in patients and progeny.
- Development of a preclinical model that is representative of human fragile X syndrome.

Frontotemporal Degeneration

- Basic research to establish in vivo and in vitro models for disease pathology, behavioral/ cognitive symptoms, and motor dysfunction.
- Research to understand the neurological basis of deficits in social cognition and emotional regulation.
- Research to identify biomarkers and/or improve diagnostics for frontotemporal degeneration.

- Research to identify risk factors (e.g., gene networks, environmental factors).
- Development of evidence-based non-pharmacological and/or pharmacological treatments for behavioral, cognitive, speech, and/or motor dysfunctions of frontotemporal degeneration.

Guillain-Barré Syndrome

- Research on the immune system cell types and molecular mechanisms responsible for the pathology of Guillain-Barré syndrome.
- Research to elucidate the characteristics of various exposures (e.g., viruses, bacteria, vaccinations, surgery, trauma) associated with Guillain-Barré syndrome and their effects on the immune system.
- Research to prevent or reduce the effects of residual weakness, relapse of muscle weakness, and other neurological and psychological symptoms of Guillain-Barré syndrome to improve patients' quality of life and increase their independence.
- Development of new treatments and refinement of existing treatments for Guillain-Barré syndrome.

Hepatitis B and C

- Development of a vaccine against hepatitis C.
- Identification and reduction of hepatitis in blood products for transfusion.
- Research on strategies to reduce vertical (mother-to-child) transmission of hepatitis B virus and hepatitis C virus.
- Development of strategies for reliable, non-invasive, early detection of hepatitis-related liver disease and hepatocellular carcinoma.
- Research on strategies to promote reversal of liver fibrosis and/or assess the associated clinical and pathological outcomes.
- Clinical studies to evaluate combination or curative therapies for treatment of hepatitis B infection.

Hereditary Angioedema

- Research toward the development of a cure for hereditary angioedema.
- Development and/or validation of novel and/or innovative therapeutic strategies for the treatment and/or prevention of hereditary angioedema attacks.
- Research to improve early diagnosis of hereditary angioedema.
- Evaluation of existing or novel and/or innovative therapeutics in pediatric hereditary angioedema patients.

Hydrocephalus

- Research on the etiology, prevention, diagnosis, and treatment of post-traumatic hydrocephalus.

- Discovery or validation of novel and/or innovative therapies and therapeutic targets for the treatment of hydrocephalus and its sequelae, including therapies directed at myelin regeneration and repair.
- Development or validation of biomarkers and imaging techniques, particularly multimodal approaches, to aid in diagnosis, prognosis, and monitoring of therapeutic efficacy.
- Research on the prevention of shunt failure.
- Development or validation of improved hydrocephalus model systems.

Immunomonitoring of Intestinal Transplants

- Studies to elucidate the role of the mucosal immune system, humoral, innate, and adaptive cellular immunity, other host-derived factors, or gut microbiota-derived factors in maintaining intestinal transplant viability and improving outcomes.
- Development and evaluation of evidence-based intestinal transplant strategies that focus on dampening the regional immune response against intestinal transplants or circumvent the induction of immunity against the transplant.
- Development and evaluation of implant-associated materials (e.g., scaffolds) with anti-inflammatory properties that protect the intestinal transplant from immune attack.
- Development and evaluation of strategies for inducing and maintaining populations of anti-inflammatory regulatory immune cell populations at the transplant site.
- Studies to improve immunomonitoring of recipient immune responses after intestinal transplantation, with a focus on prospective leukocyte profiling, to aid in diagnosis and treatment of immunological and immunosuppression-related complications.
- Development and/or validation of precise, real-time implanted monitoring devices to improve individualized patient outcomes after intestinal transplantation.

Inflammatory Bowel Diseases

- Studies directed toward understanding how acute enteric infections may trigger chronic bowel diseases with acute and sub-acute inflammatory bowel disease, including genomic, microbiomic, immune mechanisms, and systems biology approaches.
- Studies to understand the interaction between acute/chronic stress and infection and the development of inflammatory bowel disease.
- Research to better characterize the association between the use of drugs, such as isotretinoin and long-term doxycycline, and the development of inflammatory bowel disease.
- Research on the role of diet in the development and progression of inflammatory bowel disease.
- Research on the influence of the microbiome on inflammatory bowel disease.
- Research on treatment strategies for patients with inflammatory bowel disease, including those who are refractory to standard care.

Interstitial Cystitis

- Studies that define the risk, prevalence, and operational impact of interstitial cystitis among active duty personnel.
- Identification of biological markers for making a definitive diagnosis of interstitial cystitis.
- Evaluation and assessment of novel and/or innovative treatment options for interstitial cystitis patients, including intravesical therapy.
- Research on the etiology of interstitial cystitis to inform targeted therapy development.

Lung Injury

- Studies to identify the prevalence and associated morbidity and mortality of blast overpressure lung injury.
- Development of improved methods for assessing lung injury due to chemical or physical (e.g., radiation) hazards and materials in occupational, operational, and training environments to improve surveillance, diagnosis, and prognosis.
- Development of improved methods for monitoring pulmonary exposure to chemical or physical agents that might cause lung injury.
- Identification of factors that predispose an individual's susceptibility to lung injury resulting from environmental exposures (i.e., genetic predisposition).
- Development of preventive techniques, novel and/or innovative detection technologies, and therapeutics to reduce the incidence and/or severity of lung injury.

Malaria

- Investigation of mechanisms of drug resistance in malaria, to include host, pathogen, and region-specific resistance against drugs used for treatment and prophylaxis.
- Development of passive immunization approaches for the management of malaria.
- Development of malaria prophylactic regimens that encourage higher compliance and methods to monitor compliance in deployed Service members.
- Identification of novel and/or innovative malaria drug targets for blood and liver stage malaria parasites.
- Development of a vaccine that induces high levels of long-lived, broadly protective immunity against *Plasmodium falciparum* and/or *Plasmodium vivax*.

Metals Toxicology

- Identification and validation of biomarkers to evaluate military Service members' acute exposure to toxic metals in an operational environment and predict potential consequent health risks and associated health outcomes.
- Retrospective studies to evaluate risks and exposure to military-relevant toxic metals among workers at industrial facilities.
- Research on the toxicity of metal combinations and the interaction between different metal components.

- Research on the toxicity of metal-based engineered nanomaterials, including those used in military applications.

Mitochondrial Disease

- Identification and testing of non-invasive techniques and biomarkers to monitor mitochondrial function, aid in clinical diagnosis, and/or evaluate therapeutic efficacy.
- Development of improved tools and animal models to study primary mitochondrial diseases and evaluate therapeutics.
- Research to better understand the pathology of primary mitochondrial diseases.
- Development of tools and methodologies to assess mitochondrial heteroplasmy at the cellular, tissue, and organ levels.
- Research on novel and/or innovative treatments to alleviate symptoms or slow down the progression of mitochondrial diseases.

Musculoskeletal Disorders

- Research to increase understanding and improve diagnosis, prevention, and/or treatments of chronic overuse musculoskeletal disorders.
- Research on measures (e.g., clinical biomarkers, novel/innovative interventions) to diagnose, predict, reduce the incidence of, or optimize health or return-to-duty outcomes in military training- and Service-related musculoskeletal disorders.
- Research on the validation and/or optimization of rehabilitation strategies for musculoskeletal disorders.
- Research to prevent, control, and/or optimize musculoskeletal health outcomes for work-related musculoskeletal disorders.
- Research on back pain treatment and/or management strategies to prevent surgery and recurrence of symptoms, identify factors that predict optimal treatment response for different patients, and encourage self-management.

Myotonic Dystrophy

- Research on the role of epigenetic factors in the onset, progression, and/or severity of myotonic dystrophy in relevant animal models or patients.
- Research into the mechanisms of expanded CTG or CCTG repeat instability in somatic or germline cells in myotonic dystrophy.
- Identification of biomarkers that can be detected through minimally invasive means to signal early changes in the progression of myotonic dystrophy.
- Development and/or testing of novel and/or innovative treatments, including those utilizing gene editing or silencing.
- Clinical research into the natural history of myotonic dystrophy, to understand disease progression and develop/validate clinical trial endpoint measures across the multiple organ systems involved in the disease.

Non-Opioid Pain Management

- Development of non-opioid pain management therapies, including complementary and alternative medicine approaches.
- Research to increase understanding and prevention of the progression from acute pain to chronic pain.
- Research to identify and address biopsychosocial aspects of pain to reduce or eliminate the use of opioid pain medication(s).
- Research on pain management strategies for patients with limited access to skilled providers and resources, including battlefield, prolonged field, transport, and other resource-limited environments.
- Development of non-opioid pain medicine that can be given via inhalation or intramuscularly, submucosally, or intravenously on the battlefield to provide adequate relief from pain without affecting the cardiorespiratory system.

Nutrition Optimization

- Development and/or validation of nutrition-based strategies that mitigate the consequences of operational stressors on Service member health, readiness, and performance.
- Research on the impact of dietary supplements (e.g., vitamin supplements, probiotics, protein powders) on the physical and/or cognitive performance, including the readiness of military Service members.
- Development and/or validation of improved nutrition strategies for physical and/or cognitive performance enhancement and sustainment in the operational environment.
- Development of tools or devices to monitor nutritional intake at an individual level to promote a culture of wellness.
- Strategies to apply metabolomics to optimize nutrition, including improving Warfighter performance in training and operational environments.
- Research to optimize nutrition in resource-limited settings.

Pancreatitis

- Development and testing of novel and/or innovative therapeutics for acute and/or chronic pancreatitis.
- Research on the basic biology and physiology of the pancreas to better understand the etiology and pathology of pancreatitis.
- Research to improve understanding and management of complications of pancreatitis.
- Retrospective studies to determine the risk and incidence of pancreatitis among former and current active duty personnel.

Pathogen-Inactivated Blood Products

- Research on lyophilization of pathogen reduced/inactivated blood products and derivatives (platelets, plasma, red cells, cryoprecipitate, coagulation factors, etc.).

- Development and advancement of technology to improve the safety of blood products to include pathogen reduction/inactivation in whole blood for military/civilian blood donor centers and blood banks that meets the requirements for FDA licensure in support of domestic and global contingency/combat operations.
- Expansion and validation of the library of blood-borne pathogens that are reduced/inactivated to include emerging pathogens, genetically modified pathogens, and pathogens designed for biological warfare.
- Advancement in pathogen reduction technology to further improve the log-killed reduction for blood-borne pathogen of common interest (e.g., hepatitis B, Korean hemorrhagic fever virus, Bunyavirus, human immunodeficiency virus [HIV], Rift Valley fever, malaria, Babesia, Ebola, West Nile virus, dengue, chikungunya, Zika virus).
- Research studies, including clinical trials, to further characterize the effects of pathogen reduction technology in blood products (e.g., whole blood, platelets, plasma, cryoprecipitate).
- Development and validation of next generation technology and/or devices to reduce the production time for pathogen reduction/inactivation in whole blood.

Post-Traumatic Osteoarthritis

- Research into cell-based approaches for treatment or prevention of post-traumatic osteoarthritis.
- Development or validation of novel and/or innovative approaches to restoring joint stability after injury.
- Studies to evaluate and develop best practices for multidisciplinary team approaches and treatment algorithms for post-traumatic osteoarthritis.
- Sustained release, intra-articular injectable steroidal, non-steroidal, or disease-modifying therapies that offer two or more months of symptomatic relief of pain and/or inflammation in a single injection.
- Research on therapies that target multiple phases of the cellular response pathways that are implicated in the development of post-traumatic osteoarthritis, including cell death, inflammation, matrix changes, and changes in catabolic and anabolic responses.

Pressure Ulcers

- Novel strategies for the treatment (including mitigation of the advancement of stages) of pressure ulcers.
- Novel strategies for the prevention or early detection of pressure ulcers.
- Strategies to prevent or reduce the formation of pressure ulcers during long-range transport/aeromedical evacuation.
- Research on novel techniques for synthetic production, delivery, and adhesion methodologies leading to permanent closing of pressure ulcers. This might encompass synthetic fibers, novel tissue culture methodologies, growth factors, dermal printing, artificial skin, skin graft substitutes, regenerative medicine, etc.

Pulmonary Fibrosis

- Identification of biomarkers of pulmonary injury or early predictors of interstitial lung disease.
- Development and/or validation of improved tools and animal models (excluding mice) to study pulmonary fibrosis and evaluate therapeutics.
- Research into the pathobiology and molecular mechanisms underlying the development and progression of pulmonary fibrosis.
- Retrospective studies to determine the risk and incidence of pulmonary fibrosis among military Service members and Veterans.
- Development and/or testing of novel and/or innovative treatments, to include precision medicine approaches, to delay or modify the progression of pulmonary fibrosis.

Respiratory Health (excluding lung cancer and mesothelioma)

- Research on the causes, treatment, and prevention of chronic obstructive pulmonary disease (COPD), including identification and validation of biomarkers and disease phenotypes, as well as employing personalized medicine approaches in clinical research and disease management.
- Research on the cause, treatment, and prevention of respiratory symptoms and ailments possibly associated with deployment and redeployment military personnel.
- Research to evaluate the impact of military service, primarily deployment, on the prevalence and severity of respiratory disease.
- Identification and/or validation of biochemical, physiological, or combined biomarkers for evaluating risk or extent of injury from either acute or long-term toxic occupational or environmental exposures.
- Research investigating exposure rates, detection, and treatment of diseases related to inhalation of mold and fungi, such as coccidioidomycosis, from both indoor and outdoor sources.

Rett Syndrome

- Identification and/or validation of novel and/or innovative biological targets for the treatment of Rett syndrome.
- Development and testing of interventions to improve the neurological symptoms of Rett syndrome.
- Research to understand the relationship between genetic mutations, physical traits, and symptoms in individuals with Rett syndrome.
- Research to understand Rett syndrome's commonalities with, and differences from, classic autism and regressive autism.
- Research on the pathobiology of MeCP2 and associated genes and proteins.

Rheumatoid Arthritis

- Research to better understand the relationship between genetic risk and environmental triggers, such as infection or smoking, in developing rheumatoid arthritis.
- Studies that identify or validate biomarkers or personalized medicine strategies that allow for individualized medication choice based on the patient's underlying biology or disease state.
- Research on the long-term use of immunosuppressive and other therapies in patients with rheumatoid arthritis.
- Research to better characterize and understand the preclinical disease stage of rheumatoid arthritis for early diagnosis and treatment.
- Research on management of comorbidities, including biopsychosocial outcomes, for patients with rheumatoid arthritis.
- Research to establish activity recommendations following joint replacement for maximal joint life.

Scleroderma

- Research on the molecular mechanisms and pathogenesis of scleroderma, including the identification of novel and/or innovative therapeutic targets.
- Development and/or validation of novel and/or innovative therapies for scleroderma.
- Identification and/or validation of biomarkers and other approaches for early diagnosis, monitoring disease progression, and/or assessment of treatment response.
- Epidemiologic studies investigating the impact of localized scleroderma (morphea) on duty performance, use of personal protective equipment, and deployability of military personnel.

Sleep Disorders

- Research on how the disruption of normal sleep and circadian rhythms adversely affects the physical and psychological health, safety, performance, and productivity of military personnel and civilian populations, including sex and gender differences.
- Identification and/or validation of non-Continuous Positive Airway Pressure (CPAP)-based treatment regimens that enhance compliance in military personnel and civilian populations.
- Research on the prevention and/or mitigation of sleep disorders that are associated with long aeromedical evacuation flights for both clinical team members and patients.
- Development and/or testing of non-pharmacological treatments for sleep disorders associated with long-term exposure to enclosed environments (e.g., aircraft, submarines, tanks).

Spinal Muscular Atrophy

- Research to conduct molecular and proteomic phenotyping of spinal muscular atrophy disease states.
- Research to determine mitochondrial involvement and astrocytic and other non-neuronal contributions to motor neuron vulnerability.

- Exploration of the form and function of SMN-depleted neuromuscular junctions at ultrastructural (e.g., dysregulation of endocytosis), transcriptomic, and proteomic levels, particularly the mildest SMN reduction that leads to consistent quantifiable motor neuron loss.
- Research to find non-SMN-altering spinal muscular atrophy modifying genes that may lead to identification of novel and/or innovative therapeutic targets or treatments.
- Research to further understand SMN gene regulation and post-transcriptional mechanisms leading to synergistic SMN-repleting approaches, as well as to determine whether boosting SMN induction maximizes efficacy.

Sustained-Release Drug Delivery

- Development of technology that can provide long-term (for up to one week or more) sustained-release delivery of oral drugs. Potential applications of this technology could include long-term delivery of agents for post-traumatic stress disorder, opiate dependence, low-dose pain control, allergies, attention deficit/hyperactivity disorder, chemoprophylaxis, and other conditions.
- Development of a delivery system (including novel GMP-grade biomaterials) that could accurately deliver prescription and non-prescription medications.
- Development of novel and/or innovative approaches for bioavailable and sustained-release oral formulations of existing broad-spectrum fungicidal, antimicrobial, antiparasitic, and antiviral medications.
- Development of a sustained release formulation of anti-tuberculosis drugs that would facilitate long-term treatment and reduce the emergence of resistance due to poor compliance.
- Research into techniques to provide sustained release of drugs in tissue repair applications, such as bone or nerve regeneration or vision restoration.

Tinnitus

- Development and validation of objective tools/methods to diagnose and characterize tinnitus (e.g., imaging techniques to identify functional and structural changes in the brain, biomarkers of resiliency, and susceptibility to tinnitus).
- Research to understand the mechanisms of acute tinnitus, its relationship to noise-induced hearing loss, and progression to chronic tinnitus, with the focus on developing interventions.
- Research to understand and mitigate the negative impact of tinnitus on operational readiness of the military.
- Identification of novel and/or innovative therapies and/or devices for interventions to prevent, manage, and treat tinnitus, including behavioral approaches, new uses for existing drugs, nutritional and pharmaceutical strategies, and acoustic, electrical, and other stimulation technologies.

Tissue Regeneration

- Development of novel therapies to repair neurosensory damage, maintain the distal end organ interface, or regenerate the neuromuscular junction for reinnervation of end organs during peripheral nerve regeneration.
- Development of novel therapies for regeneration of tendons and musculotendinous junctions.
- Development of novel therapies for regeneration of functional skeletal muscle, particularly stem cell-based approaches and treatments for volumetric muscle loss.
- Development and improvement of extended-time tissue preservation therapies and technologies for ischemia-reperfusion injury prevention and treatment.
- Research on novel approaches and therapies to understand mechanisms of immune rejection and obviate the need for chronic toxic immunosuppression in reconstructive transplantation and vascularized composite allotransplantation.
- Research into innovative methods for developing biocompatible scaffolds and stem cell therapies for manufacturing and production of tissues.

Tuberculosis

- Development of a diagnostic assay that can be used at the point of care to rapidly and accurately diagnose tuberculosis to include multidrug-resistant tuberculosis or extensively drug-resistant tuberculosis.
- Development of novel and/or innovative tuberculosis vaccines or optimization of current tuberculosis vaccines.
- Research to understand, diagnose, or treat multidrug-resistant tuberculosis or extensively drug-resistant tuberculosis.

Vaccine Development for Infectious Diseases

- Development of a therapeutic vaccine and/or other strategies for infectious diseases.
- Identification of correlate(s) of immunity against dengue, malaria, and other infectious agents and development of a surrogate test of protection.
- Development and fielding of vaccines to prevent Service members from becoming ill from endemic disease exposure during operational deployments. This includes, but is not limited to, Zika, dengue, chikungunya, hantavirus hemorrhagic fever with renal/pulmonary syndrome, rickettsioses, trypanosomiasis, leptospirosis, HIV, norovirus, Middle East Respiratory Syndrome, coronavirus, schistosomiasis, leishmaniasis, nipah, Lassa fever, and West Nile fever.
- Development of flexible vaccine technologies that can be used to rapidly respond to emerging and re-emerging infectious diseases threats.
- Evaluation of passive immunization strategies to use in conjunction with emerging infectious disease vaccinations.

Vascular Malformations

- Studies into the natural history, genetics, and pathogenesis of vascular malformations.

- Research to improve methods to diagnose and manage vascular malformations.
- Research to discover or develop novel and/or innovative therapeutic targets and treatments to regress or prevent vascular malformations.
- Development of non-invasive or minimally invasive technologies or approaches for the control of internal bleeding, including cerebral arteriovenous malformations, associated with vascular malformations.
- Development of in vivo or in vitro models of vascular malformations for the purpose of identifying novel and/or innovative drug targets, screening existing drugs, and/or elucidating the pathogenesis of the disease.

Women's Heart Disease

- Identification of gender-specific approaches to either develop novel diagnostics and treatments or increase the effectiveness of current practice to improve clinical care of women.
- Research on factors to predict and prevent the long-term impacts of gestational diabetes, gestational hypertension, and preeclampsia on the cardiovascular health of women.
- Research on trauma-induced cardiac arrest secondary to hemorrhage and polytrauma in the female population.
- Research focused on elucidating the potential relationship between post-traumatic stress disorder and women's heart disease.
- Studies to determine the risk and incidence of heart disease among current and/or former female Service members.

APPENDIX 3: DOD AND VA WEBSITES

PIs are encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. Below is a list of websites that may be useful in identifying additional information about DoD and VA areas of research interest, ongoing research or potential opportunities for collaboration within the FY18 PRMRP Topic Areas.

Fort Belvoir, VA 22060-6201

Funding Opportunity Title: Fundamental Research to Counter Weapons of Mass Destruction (FRCWMD) Broad Agency Announcement (BAA)

Announcement Type: This is an amended announcement of this funding opportunity. This BAA is in effect from March 2015 through September 2024. It is anticipated that a majority of the actions funded from this announcement will be in the form of grants; however, other instruments such as contracts, cooperative agreements (CAs) or other transactions agreements (OTAs) may also be awarded from this announcement. Submissions for this BAA may occur in two ways: 1) in response to the published topics detailed in Attachment 1 or 2) to a general thrust area as described in Section 1.5.

In general, all topic-specific and general thrust area submissions require pre-coordination in accordance with the guidelines in Section 1.5 and Section 4.2.1. DTRA reserves the right to waive the pre-coordination requirement for topics on a case-by-case basis; and will state the waiver applies within the individual topic description. If a pre-application white paper is received without prior coordination, DTRA may not review it. From the date of the disposition email the applicant has 63 days to submit the pre-application white paper. If the submission is not feasible within this 63-day window, the abstract must be coordinated again to ensure the interest in the white paper remains.

The evaluation of all submissions will be conducted in two phases. Phase I is for receipt and evaluation of pre-application white papers in direct response to a published topic or by invitation based on the assessment of the idea by the Technical POC. Phase II is for receipt and evaluation of invited proposal applications. Invitation to the Phase II, invited proposal submission, will be based on the evaluation results of the Phase I pre-application white paper.

Funding Opportunity Number: HDTRA1-14-24-FRCWMD-BAA

Catalog of Federal Domestic Assistance (CFDA) Number: 12.351

Dates: This BAA is open continuously from March 2015 through September 2024. Published topics will include instructions on any topic-specific opening and closing dates as well as any topic-specific limitations on award types, dollar values, and eligibility. Submissions to a general thrust area may occur at any time this BAA is in effect. Applicants should take care to note requirements for pre-coordination of an abstract.

ADDITIONAL OVERVIEW CONTENT

Research, educational program, or other effort proposals are sought from accredited degree-granting colleges and universities. Research, educational program, or other effort proposals are also sought from industrial, commercial (including small businesses), and not-for-profit research entities. DTRA strongly encourages and may give preference to pre-application white papers and proposals that demonstrate a significant contribution (significant is defined as a minimum of

30% of total value) by one (1) or more universities.

All submissions (pre-application white papers and invited proposals) must be made in accordance with the submission instructions in this BAA through www.grants.gov using the application packages linked with this BAA (under the "Package" tab) on www.grants.gov. Applicants are responsible for ensuring compliant and final submission of their pre-application white papers and proposal applications. Any submission that does not conform to the requirements outlined in the BAA and in the invitation for proposal may not be reviewed or considered further at the discretion of DTRA.

Pre-application white papers may be evaluated any time after receipt. Invitations for full proposal submission may occur any time after the pre-application white paper evaluation and will be limited to available program funds.

Efforts may be proposed for up to five (5) years. Awards may be for a base period of one (1) year with four (4) additional years as possible options, a base period of two (2) years with three (3) additional years as possible options, or a base period of three (3) years with two (2) additional years as possible options. Applicants should take care to propose the most logical mix of base and option years for the scope of work. Further, the base period should yield a logical completion point for the work. In cases where option years are proposed, decisions regarding exercising those options will be based on the evaluation of the work accomplished in the base period. Pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable; however, the Government reserves the right to invite option years for awards that originally only included a base period.

Grants may range from small dollar value (e.g., $25K) up to $1M annually (total, including both direct and indirect costs) depending on the nature and the scope of work. Payments on grants will be made in advance, subject to the conditions described in 2 CFR 200.305. Funding amounts for contracts, CAs, and other procurement instruments will be considered on a case-by-case basis. Thirty (30)-60 individual awards are anticipated each year.

Any assistance instrument awarded under this announcement will be governed by the award terms and conditions, which conform to DoD's implementation of OMB circulars applicable to financial assistance. This includes DoD implementation of OMB guidance in 2 CFR part 200, "Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards."

1. FUNDING OPPORTUNITY DESCRIPTION

1.1. DTRA safeguards America and its allies from weapons of mass destruction (WMD) and provides capabilities to reduce, eliminate, and counter the threat and effects from chemical, biological, radiological, nuclear, and high yield explosives. DTRA seeks to identify, adopt, and adapt emerging, existing and revolutionary sciences that may demonstrate high payoff potential to Counter-WMD (C-WMD) threats, including improvised threats. This BAA is an extramural endeavor that combines the fundamental research, educational program, or other effort needs appropriate for basic or applied research funding of DTRA and other DoD interests.

This announcement solicits ideas and topic-based pre-application white papers for long-term challenges that offer a significant contribution: to the current body of knowledge, to the understanding of phenomena and observable facts, to significantly advance revolutionary technology, to new concepts for technology application, or that may have impact on future C-WMD threat reduction, expertise, or capabilities.

A portion of this effort is expected to be devoted to awards for science, technology, engineering and mathematics education programs with a C-WMD focus; such as, but not limited to postdoctoral fellowships, stipends, degrees, visiting scientist programs, student exchange programs, and development of accredited C-WMD curricula.

1.2. Fundamental research means basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

Contracted Fundamental Research includes research performed under grants, contracts (awards), or OTAs that are (a) funded by budget Category 6.1 (Basic Research), whether performed by universities or industry or (b) funded by budget Category 6.2 (Applied Research) performed on-campus at a university. Fundamental research provides for science and technology (S&T) research and early applied development. It seeks to lower performance risk to a manageable level and facilitate transition and funding to capability end-state programs.

1.3. Technology Readiness Levels (TRLs) provide a systematic metric/measurement system that supports assessments of the maturity of a particular technology and the consistent comparison of maturity between different types of technology. Fundamental research may be defined within the first four (4) TRLs.

1.4. This BAA seeks optimum approaches to meet DTRA fundamental research objectives. The Government encourages pre-application white papers and proposals that span a wide spectrum of research to expand fundamental scientific knowledge in response to specific topics and to the more general thrust areas. The Government reserves the right to award any combination of approaches which offer the best overall value to the Government and to oversee any and all processes and approaches once ongoing.

1.5. Thrust Areas 1-7 are described below. When a specific set of topics has been identified, these detailed needs will be described in Attachment 1 along with any topic-specific submission instructions, deadlines, anticipated award structure, and funding requirements. Otherwise, pre-application white papers and proposals may be written against one of the general thrust area descriptions.

DTRA may not review any pre-application white papers without prior coordination of the idea with the appropriate thrust area- e-mail address (Section 7). Applicants should note that there is extremely limited funding available for many of the thrust areas. Pre-application white papers will only be accepted from the coordinated abstracts under limited circumstances.

1.5.1. **Thrust Area 1—*Science of WMD Sensing and Recognition:*** The science of WMD sensing and recognition investigates the fundamental understanding of materials that demonstrate measurable changes when stimulated by radiation or particles from WMD in the environment. This involves the exploration and exploitation of interactions between materials and various electromagnetic phenomena, molecules, nuclear radiation, and particles. Furthermore, these interactions and the specific form of recognition they offer are used for the subsequent generation of information, providing knowledge of the presence, identity, and quantity of material or energy in the environment that may be significant. The goal of this thrust area's portfolio is to advance the following capabilities: location, identification and characterization of radiological-nuclear (RN) materials; detection of RN materials at significant stand-off distances; and the reduction of the technical nuclear forensics timeline. Thrust Area 1 is currently not interested in research focusing on the sensing of explosives or the detection of Improvised Explosive Devices (IEDs).

1.5.2. **Thrust Area 2—*Network Sciences:*** The fundamental science of network sciences includes advancing knowledge of complex disparate but interdependent networks critical to military operations where WMD-related robustness, resiliency, recovery of, and informational and operational utility is required. It includes response, resilience, and recovery of interdependent, multi-layered physical networks after exposure from electromagnetic pulse and other nuclear weapons effects, rapid discovery and analyzing low-observable WMD-related information from large, disparate WMD-related data sets from multiple types of networks, and to develop theories and representations for low observable WMD-related radical ideation from social networks.

1.5.3. **Thrust Area 3—*Science for Protection:*** Fundamental science for protection involves advancing knowledge in physical, biological, and engineering sciences to protect personnel, sensitive electronic systems, and structural infrastructure from the effects of weapons of mass destruction. Protection includes both passive and active defense against threats. Approaches include advanced highly-ordered materials and nanomaterials to hardening infrastructure and facilities against blast, nuclear events, or other CBRNE effects; exploring new methods to experimentally and computationally simulate the effects of a nuclear event; investigations of the interaction of radiation with sensitive electronics and systems as well as development of novel materials and methods that are robust against radiation effects; novel methods to protect personnel from the physical, radiological, and nuclear effects of WMDs; and the study of biological systems, including intact structures, metabolic products, or discrete components and pathways, as applied to protection of U.S. Forces during operations in areas actually or potentially contaminated by radiation. For protection of personnel the areas of interest include development of radiation countermeasures to prevent biological damage associated with exposure to ionizing radiation and development of novel biologically-based or -produced detection systems for wide area surveillance to determine the nature, extent, and distribution of contamination.

1.5.4. **Thrust Area 4—*Science to Defeat WMD:*** Fundamental science for significantly improving energetic materials for use against WMD facilities and systems with minimal

collateral effects from post-blast WMD release, for deeper penetration to deny the adversary sanctuary of WMD, and for predictable modeling of counter-WMD munitions and simulation of in-theater scenarios with accurate lethality calculations.

1.5.5. **Thrust Area 5—*Science to Secure WMDs:*** Fundamental science to support securing WMD includes: revolutionary means to safely handle, transport, control access, or eliminate WMD components and weapons; new physical or other methods to monitor compliance to support future agreements or treaties; and, exploring phenomena and means that facilitate reduction of nuclear or non-nuclear WMD proliferation pathways. This includes focus on: science principles to assist tagging, tracking, location to secure WMD; novel means to mark and read objects in order to secure inventories; remote or unattended monitoring to understand the nature of objects (e.g., is it nuclear, biological, chemical or conventional?); monitoring to detect intrusion, diversion or substitution, tampering, and other adverse activity; and, understanding of both physical and life science environmental signatures as witnesses of WMD-related activity. The ability to secure WMD may impact either verification of treaties, or control of WMD outside treaty regimes.

1.5.6. **Thrust Area 6—*Cooperative Counter WMD Research with Global Partners:*** Cooperative fundamental research to reduce the global threat of WMD in collaboration with a broad range of global research partners. This thrust area involves exploratory basic and applied research that will address opportunities to reduce, eliminate, and counter WMD across the Chemical, Biological, Radiological, Nuclear, and High Explosive (CBRNE) spectrum. Efforts in this area will develop strong international relationships which will foster a smooth transition of program ownership to the partnering country. The goal is to improve international collaboration to detect, characterize, and report WMD, and to advance partner nation sustainment through a culture of long-term cooperation and scientific responsibility for such programs. Multi-disciplinary, multinational research in science, technology, engineering, and mathematics development will be conducted to promote transparency through quality research publications and continual dialogue between scientists/engineers and young researchers.

The Cooperative Biological Engagement Program (CBEP), a component of the DoD Cooperative Threat Reduction (CTR) Program, recognizes the danger to U.S. and global health security posed by the risk of outbreaks of dangerous infectious diseases, whether natural or manmade. Consistent with the national and departmental strategies, CBEP strives to address this risk by promoting best practices in biological safety and security, improving partner country capability to safely and rapidly detect and report dangerous diseases, and establish and enhance international research partnerships that focus on informing the disease surveillance network. The desired end state for CBEP engagements is the development of sustainable partner country capabilities to:

- Employ responsible bio-risk management best practices and principles,
- Conduct a modern and effective disease surveillance mission,
- Independently sustain engagement with, and effectively compete for funding within, the international scientific community,
- Comply with World Health Organization (WHO) International Health Regulations (IHR) and World Organization for Animal Health (OIE)/U.N. Food and Agriculture Organization (FAO) reporting guidelines, and

- Promote the One Health Concept.

The goals and objectives of CBEP international research partnerships are to:

- Goal 1: Support Biosurveillance, Biosafety and Biosecurity (BS&S) Capability Building Efforts
    - Objective 1: Inform and enhance operational biosurveillance strategies and implementation through improved understanding of endemic disease burden and pathogen biology.
    - Objective 2: Institutionalize responsible biorisk management best practices with partner country scientists.
- Goal 2: Engage Partner Country Scientists in Hypothesis-Driven Research
    - Objective 1: Support local, national, and regional priorities for understanding and mitigating human and animal disease risk (e.g., small, focused projects within individual countries linked by broad, integrating projects that include regional partners).
    - Objective 2: Improve international collaborations to survey, detect, characterize, and report disease.
- Goal 3: Promote One Health Initiative
    - Objective 1: Emphasize the nexus of human health, animal health, and the environment, and seek to further understand the mechanisms and factors involved in disease transmission.
    - Objective 2: Advance partner country sustainment of global health security initiatives.
- Goal 4: Foster an International Culture of Responsible and Ethical Conduct in Biological Research
    - Objective 1: Transition to a culture of responsibility and ethical conduct in biological research through thoughtful experimental design and good laboratory practices that result in high-quality data, and active participation in professional societies and the peer-review process.
    - Objective 2: Train partner country researchers to think critically in the pursuit of ethical research and to be competitive in soliciting funding from the international scientific community.

Ultimately, the techniques, procedures, and approaches must be sustainable for the partner country and linked with appropriate training in order to promote global health security, reinforce norms of safe and responsible conduct, obtain timely and accurate insight on current and emerging infectious disease risks, and transform the international dialogue on biological threats.

CBEP research projects are not determined by or limited to specific biological agents, but must be plausibly linked to pathogens of security concern and aimed at measurably supporting threat reduction objectives that:

- Enhance partner country's/region's capability to identify, consolidate, and secure collections of pathogens and diseases of security concern in order to prevent the sale, theft, diversion, or accidental release of such pathogens and diseases.

- Enhance partner country's/region's capability to rapidly and accurately survey, detect, diagnose, and report biological terrorism and outbreaks of pathogens and diseases of security concern in accordance with international reporting requirements.

Region-specific areas of interest are described in CBEP Regional Science Plans. Examples of general CBEP research areas of interest include: Epidemiology (e.g. studies measuring disease prevalence and incidence), Pathogen Biology, Pathogen Characterization, Assay Adaptation and Optimization, Microbial Ecology within a Public Health Context, and Preventative Strategies and Countermeasures. For clarification, medical countermeasure development (i.e., development of diagnostic tools, vaccines, therapeutics) is supported by many other U.S. Government or international agencies and is generally not supported by CBEP; however, research projects may inform medical countermeasure development and support validation and verification testing (e.g., as part of proficiency testing, pilot studies/testing, or exercises, etc.). Additionally, CBEP does ***not*** generally support research with common disease agents such as HIV/AIDS, malaria, and tuberculosis where other U.S. agencies have dedicated missions to do so; however, the program may choose to capitalize on opportunities to leverage research on these diseases to further CBEP goals, for example by testing samples collected under the auspices of other programs. CBEP also **will not** support research which poses risks to the overall threat reduction mission of CBEP, Dual-Use Research of Concern, or related activities (i.e., *in vivo* pathogenicity studies, virulence studies, animal passaging, etc.).

CBEP is interested in collaborative research engagements with foreign partners in any one of the following regions: Countries of the Former Soviet Union (FSU) (specifically, Armenia, Azerbaijan, Georgia, Kazakhstan, and Ukraine), Africa (including, but not limited to, Kenya, Tanzania Uganda, South Africa), Southeast Asia (including, but not limited to, Cambodia, Indonesia, Laos, Malaysia, Philippines, Thailand), and Middle Eastern /South Asian countries (including, but not limited to, Afghanistan, Iraq, India and Pakistan). CBEP encourages proposers to develop projects in conjunction with foreign institutions in CBEP-engaged countries.

1.5.7. Thrust Area 7—*Fundamental Science for Chemical and Biological Defense:*

Fundamental science for chemical and biological (CB) defense includes science and technology research that advances knowledge in physical and life sciences to defend and counter chemical and biological WMD that could be used against our Nation's warfighters. Fundamental research efforts enable capabilities such as development of improved detection devices for traditional and nontraditional chemical agents; development of diagnostics for existing and emerging infectious disease threats; increasing knowledge and improved capabilities for development of new or improved medical and material countermeasures to CB threats for both pre- and post-exposure scenarios; enhanced personal protection against, modeling of, prevention of, or decontamination of CB threats; and providing effective elimination strategies via non-kinetic approaches for threat agent destruction, neutralization and/or sequestration.

1.6. This BAA, in addition to any amendments issued in conjunction with this BAA, will be posted to the Grant Opportunities Website (www.grants.gov), the Federal Business Opportunities Website (www.fbo.gov), and the DTRA website (www.dtra.mil). The DTRA website is not the official sites; applicants are responsible for monitoring both www.fbo.gov and www.grants.gov. Posted amendments supersede all previous versions of the BAA. Note that topics will be listed in Attachment 1 and will be added/closed with Amendments to this BAA.

1.7. All administrative coordination and communication between applicants and the Government will be conducted using the e-mail address associated with this BAA, specified in Section 7. DTRA will not release employee personal contact information.

---

2. AWARD INFORMATION

2.1. Award Types. The full range of flexible procurement instruments available to DTRA are possible results from this announcement, including but not limited to contracts, grants, CAs, and OTAs; however, grants will likely be the predominant procurement instrument. Each of the applicable procurement instruments offer different advantages, liabilities and responsibilities for applicants and the Government.

Applicants must specify in their submittal their recommended approach (e.g. contract, grant, CA, or OTA); however, the Government reserves the right to negotiate and award the types of procurement instruments determined most appropriate under the circumstances. If warranted, portions of resulting awards may be segregated into pre-priced options.

Except for OTAs, the Government actions under this BAA shall adhere to the requirements of the Federal Acquisition Regulation (FAR), Defense Federal Acquisition Regulation Supplement (DFARS) and/or DoD Grant and Agreement Regulations (DoDGARS), as appropriate for the type of instrument. DoDGARs can be accessed online at http://www.ecfr.gov/cgi-bin/text-idx?SID=e5d686f6760f3274b3368f36723fbb7e&mc=true&tpl=/ecfrbrowse/Title32/32CIsubchapC.tpl . See also 32 Code of Federal Regulations (CFR) 22, which can be accessed online at http://www.ecfr.gov/cgi-bin/text-idx?rgn=div5;node=32%3A1.1.1.3.16 . Any assistance instrument awarded under this announcement will be governed by the award terms and conditions, which conform to DoD's implementation of OMB circulars applicable to financial assistance. The current version of the Terms and Conditions for grant awards may be found online in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal).

On average, DTRA expects to award 30-60 individual awards each year. The predominance of awards will be grants. Payments on grants will be made in advance, subject to the conditions described in 2 CFR 200.305.

2.2. Scope of Awards. Awards may range from focused, exploratory projects with a high risk approach in innovative research in subjects with potential for high impact to C-WMD science to comprehensive programs of innovative research in an interdisciplinary area with potential for high impact.

Awards may have multiple Co-Principal Investigators (Co-PIs) and subawards. Authors of pre-application white papers and proposals should detail the contribution of all Co-PIs and any subawards to the C-WMD scientific impact.

Preference will be given to projects where undergraduate and/or graduate students, and/or postgraduate students are supported by the awards. Details regarding the participation of the students and the value of the research to the students as part of the pre-application white paper and full proposal are expected. Additional guidance regarding student and/or postgraduate student participation may be provided in the published topics or in communications with the applicant to include the coordination of the abstract or in the debrief summary of the pre-

application white paper. Any specific guidance provided in a topic or to an applicant supersedes the information provided herein.

2.3. Subawards. Subawards (subgrants and/or subcontracts) are permitted. Subawards may be used to carry out a portion of the research or efforts. Awards may have multiple subawards. Awards will be made by a single award, e.g., grant or contract, to the lead organization. All subawards are the responsibility of the award recipient; exceptions will not be made.

For submissions made to Thrust Area 6 and associated topics, there is no limitation on subawards. DTRA will review and consider the proposed subawards for all pre-application white papers and proposals on a case-by-case basis. The prime awardee will be responsible for transferring funds to the subawardee. Applicants are reminded that priority is given to projects with the main locus of activity in the region-of-interest, so budgets should be allocated accordingly. Preference will be given to proposals where the subaward component to the region-of-interest partner(s) represents more than half of the award value (as measured in U.S. dollars).

2.4. Award Values. Grants resulting from submissions to Thrust Areas 1-7, including topics associated with these thrust areas, may range from small dollar value (e.g., $25K) up to $1M annually (total, including both direct and indirect costs) depending on the nature and the scope of work. Contracts, CAs, and OTAs will be considered on a case-by-case basis. All awards are subject to the availability of funds. Additional guidance regarding award values may be provided in the published topics or in communications with the applicant to include the coordination of the abstract or in the debrief summary of the pre-application white paper. Any specific guidance provided in a topic or to an applicant supersedes the information provided herein. Funding for participation in this program is highly competitive and the cost of proposed research should strictly be maintained as detailed herein or as indicated in the invitation instructions.

2.5. Period of Performance and Award Structure. Efforts for Thrust Areas 1-7, including topics associated with these thrust areas, may be proposed for up to five (5) years. Awards may be for a base period of one (1) year with four (4) additional years as possible options, a base period of two (2) years with three (3) additional years as possible options, or a base period of three (3) years with two (2) additional years as possible options. Additional guidance regarding award structure may be provided in the published topics or in communications with the applicant to include the coordination of the abstract or in the debrief summary of the pre-application white paper. Any specific guidance provided in a topic or to an applicant supersedes the information provided herein.

Applicants should take care to propose the most logical mix of base and option years for the scope of work. Further, the base period should yield a logical completion point for the work. In cases where option years are proposed, decisions regarding exercising those options will be based on the evaluation of the work accomplished in the base period.

DTRA is flexible on the award structure unless otherwise specified in the published topics or in communications with the applicant to include the coordination of the abstract or in the debrief summary of the pre-application white paper. Applicants should take care to clearly label the tasks and anticipated outcomes for the base and option years in the pre-application white papers and the proposals. Pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable; however, the Government reserves the right to invite option years for awards that were originally awarded with only a base

period.

2.6. The Government Accountability Office, in its report GAO-16-14, WOMEN IN STEM RESEARCH: Better Data and Information Sharing Could Improve Oversight of Federal Grant-making and Title IX Compliance, December 3, 2015, recommended that the DoD collect certain demographic and career information to be able to assess the success rates of women who are proposed for key roles in applications in science, technology, engineering, or mathematics disciplines. To enable this assessment, DTRA will include with each Phase II application package the Research and Related Senior/Key Person Profile (Expanded) form and the Research and Related Personal Data form.

2.7. The Government does not anticipate the need to provide any hardware or software to execute the proposed research. However, DTRA will review and consider any hardware/software requests for all pre-application white papers and proposals on a case-by-case basis.

2.8. The Government reserves the right to fund all, some, or none of the proposals submitted; may elect to fund only part of any or all proposals; and may incrementally fund any or all awards under this BAA. The Government also reserves the right to request applicants make any changes necessary to submitted full proposals to increase the feasibility of making the proposal fundable. Applicants may decline to participate in any revisions to application packages requested by DTRA.

2.9. The Government may offer funding for any full proposals or portions of proposals at any time during the lifetime of this BAA.

---

3. ELIGIBILITY INFORMATION

3.1. Pre-application white papers and proposals submitted for this BAA will be considered from the following U.S. and Foreign Institutions as follows:

- Accredited degree-granting colleges, universities, and academic institutions.
- Industrial and commercial entities, including small businesses.
- Not-for-profit entities with a portfolio predominantly in research and foreign government laboratories. Proof of 501(c)(3) status from the Internal Revenue Service may be required. For foreign-based establishments entirely based outside the U.S. and/or its territories, proof of not-for-profit status may be required. Foreign based government laboratory equivalents include those residing in the Ministry of Defense, Ministry of Health, Ministry of Agriculture, Ministry of Education and Science and Food Safety Agencies.

DTRA strongly encourages and may give preference to pre-application white papers and proposals that demonstrate a significant contribution (significant is defined as a minimum of 30% of total value) by one (1) or more universities. Applicants should note that university participation may be mandatory for some published topics. Additional guidance regarding university participation may be provided in the published topics or in communications with the applicant to include the coordination of the abstract or in the debrief summary of the pre-application white paper. Any specific guidance provided in a topic or to an applicant supersedes the information provided herein.

The following entities may not participate as prime awardees nor furnish Principal Investigators (PIs) in awards made under this BAA but may act as collaborators, including as Co-PIs, and/or subawardees:

- Federal Academic organizations (e.g., Naval Postgraduate School).
- Federal laboratories (including DoD and Department of Energy (DOE)).
- U.S. Government agencies.
- DoD-sponsored Federally Funded Research and Development Centers (FFRDCs) specified in the Defense Federal Acquisition Regulation Supplement (DFARS) 235.017-1 (http://farsite.hill.af.mil/VFDFARA.HTM) and click on 'DFARS Part 35'.
- DOE-sponsored FFRDCs.

Note: Federal laboratories (including DoD and DOE) and FFRDCs are eligible to submit abstracts (when required), pre-application white papers, and proposals in response to the Government Call issued by the DTRA Chief Scientist and Innovations Department. However, a FFRDC (other than the DoD FFRDCs specified in DFARS 235.017-1) must have authorization from its sponsoring agency in accordance with FAR 35.017-1. Eligibility requirements under the Call are subject to change. See http://www.dtrasubmission.net and after logging in, follow the link to the 'FY12-17 Fundamental Research to Counter Weapons of Mass Destruction (C-WMD) Government Call'.

3.2. Cost Sharing or Matching. In general, cost sharing or matching is not required for applications to this announcement. However, DTRA reserves the right to require cost sharing or matching on a case-by-case basis. Such instances will be specifically detailed in the published topics or in communications with the applicant to include the coordination of the abstract or in the debrief summary of the pre-application white paper.

3.3. Other. DTRA uses the System for Award Management (SAM) to exclude recipients ineligible to receive Federal awards. SAM can be accessed online at http://sam.gov (Reference 2 CFR 1125).

---

4. APPLICATION AND SUBMISSION INFORMATION

4.1. Address to Request Application Package. This announcement contains all information required to submit a pre-application white paper and invited proposal. For convenience, Microsoft (MS) Word and MS PowerPoint templates for Phase II proposal submissions are provided in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal) for applicant use. Applicants are encouraged to use the templates for preparing submissions; however, use of the templates is not required. Note: there is not a template available for the pre-application white paper.

4.1.1. The required application packages for the pre-application white papers and for the invited proposals are posted with this announcement. Note that each thrust area (as outlined in Section 1.6) and each topic (as outlined in Attachment 1) has a unique application package posted with this BAA. The application package corresponding to both: a.) the thrust area or topic of interest and b.) the phase, should be used for submission of pre-application white papers and invited full

proposals.

4.1.2. The application packages posted to www.grants.gov consist of the forms as detailed in Table 2.

Form Name	Phase I Pre-Application White Paper	Phase II Invited Proposal
SF-424 (R&R) Application for Federal Assistance Form	Required	Required
RR Budget Form	N/A	Required
R&R Subaward Budget Attachment(s) Form(s)	N/A	If Applicable
Research & Related Senior/Key Person Profile Form	N/A	Required
RR Personal Data	N/A	Required
Research & Related Other Project Information	N/A	Required
Disclosure of Lobbying Activities (SF-LLL)	N/A	If Applicable
Attachments Form	N/A	Required

Table 2: Forms. The instructions for completing each of these forms may be found online at the following web link: http://www.grants.gov/web/grants/form-instructions.html.

4.2. Content and Form of Application Submission. Submissions for this BAA will be conducted in two phases. Phase I is for receipt of pre-application white papers. Phase II is for receipt of invited proposal applications. Invitation to the Phase II proposal submission will be based on the evaluation results of the Phase I pre-application white paper.

4.2.1. The predominance of efforts, including all submissions to the thrust areas and most submissions to topics posted in Attachment 1, **must be** coordinated with the relevant technical point of contact (POC) for the appropriate thrust area prior to submission of a pre-application white paper; an e-mail for the DTRA technical POCs for Thrust Areas 1-7 are provided in Section 7. Coordination of research ideas and efforts must be accomplished via these email addresses, except in cases where a topic specifically states that pre-coordination is not required, and includes submission of an abstract (recommend less than 250 words) of the proposed project/effort or a paragraph description of the proposed project/effort to the email address in Section 7 and a reply email from the relevant email address in Section 7 with the disposition to the applicant. Pre-coordination may not be accomplished with email addresses other than those listed in Section 7. DTRA may not review white papers without prior coordination. Please note that attachments to e-mails may not be reviewed.

Applicants should note that there is extremely limited funding available for the general thrust areas. Pre-application white papers will only be accepted from the coordinated abstracts under very limited circumstances.

Topics may be posted in Attachment 1 of this announcement that may not require pre-coordination of an abstract. Please review the topics carefully.

4.2.2. Pre-application white papers and invited proposals **must be** submitted electronically using www.grants.gov and the corresponding application packages linked with this BAA on www.grants.gov (under the "Packages" tab). All applications, including all supporting documents, must be submitted in the English language.

Applicants are responsible for ensuring compliant and final submission of their Phase I pre-application white paper and Phase II invited proposal application. Note that this also applies to applicants using third party systems to submit application packages and attachments. Any submission that does not conform to the requirements outlined in the BAA and in the invitation for proposal may not be reviewed or considered further at the discretion of DTRA.

4.2.3. DTRA will not review any of the following:

- Pre-application white papers that are not pre-coordinated as required
- Pre-application white papers and proposals that are not submitted in the English language.
- Pre-application white papers that are submitted to topics that have been previously closed via an amendment to the BAA.
- Application packages and proposals for Phase II submissions that were not invited.

Exceptions WILL NOT be made under any circumstances.

4.2.4. Phase I Pre-Application White Paper Submission and Content.

Each pre-application white paper must address only one thrust area or topic. Each pre-application white paper must use the corresponding thrust area or topic application package.

Each Phase I application package contains the following forms:

Form	Attachment	Action
SF-424 (R&R) Application for Federal Assistance Form	Up to four (4) page white paper	Enter the appropriate information in data fields

Table 3: Phase I Pre-Application White Paper Package Chart.

Each Phase I application package contains the SF 424 (R&R) Application for Federal Assistance. To be considered a complete package, an up to four (4) page white paper is required to be uploaded as an attachment to the SF 424 (R&R).

DTRA-specific instructions for completing the SF 424 (R&R) Application for Federal Assistance are below, general application instructions can be found on www.grants.gov:

- Block 1 – Type of Submission. Applicants should indicate the Phase I submission is a "Pre-Application."
- Block 2.1 – Applicant Identifier. Not applicable.
- Block 3 – Date Received by State. Not applicable.
- Block 3.1 – State Application Identifier. Not applicable.
- Block 5 – Applicant Information. You must provide a Business Office Point of Contact (BPOC) with an e-mail address.
- Block 19 – Authorized Representative. The "signature of AOR" is not an actual signature

and is automatically completed upon submission of the electronic application package. Hard copies or email attachments of applications will not be accepted.

- Block 20 – Pre-application. Must be used to attach an up to four (4) page white paper. The white paper itself should provide sufficient information on the research being proposed (e.g., the hypothesis, theories, concepts, approaches, data measurements and analysis, etc.) to allow for an assessment by a technical expert.

Any pages submitted for the white paper that exceed the limit of four pages will not be read or evaluated. A page is defined as 8 ½ x 11 inches, single-spaced, with one-inch margins in type not smaller than 12 point Times New Roman font. The white paper must be provided in portrait layout.

At minimum, the white paper should address the following:

- A project abstract, which should be concise (less than 250 words), provide a summary of the proposed work, and demonstrate relevance to the topic being addressed. The abstract should not contain any proprietary data or markings.
- Potential scientific impact to provide greater knowledge or understanding of the fundamental aspects of phenomena and of observable facts, including how the research contributes to the C-WMD science needs outlined in the thrust area or topic.
- The impact of the research on C-WMD science must be clearly delineated.
- Cost estimate by year and total dollars required to accomplish the research as presented in the white paper (no details or breakout of costs is required).
- Potential team and management plan, including details on student involvement.
- Multidisciplinary white papers should carefully detail each of the institutions/departments involved and the contribution that will be made by each of the investigators.
- Do NOT include corporate or personnel qualifications, past experience, or any supplemental information with the white paper. References may be included within the 4-page limit at the discretion of the applicant; however, extensive references are not required.
- Thrust Area 6 pre-application white papers must also include a description of the extent and duration of the relationship/collaboration between the universities/institutes/entities and/or scientists.
- The thrust area or the topic should be included as a header on the white paper attachment and referenced in the text of the white paper.

4.2.5. Phase I Pre-Application White Paper Re-Submission and Content.

On a limited basis a second pre-application white paper may be submitted without pre-coordination of an abstract. These re-submissions will be based on the review of the original pre-application white paper and will be allowed when changes to the project scope, technical approach, and/or cost are envisioned for any potential full proposals. Revised pre-application white papers must conform to the standards for the pre-application white papers detailed in Section 4.2.4.

All submissions should be made with the appropriate Phase I application package which contains

the following form:

Form	Attachment	Action
SF-424 (R&R) Application for Federal Assistance Form	Up to four (4) page white paper	Enter the appropriate information in data fields

Table 4: Phase I Pre-Application White Paper Package Chart.

Each Phase I application package contains the SF 424 (R&R) Application for Federal Assistance. To be considered a complete package, an up to four (4) page white paper is required to be uploaded as an attachment to the SF 424 (R&R).

The DTRA-specific instructions for completing the SF 424 (R&R) Application for Federal Assistance are the same as for the original pre-application white paper submission except for the following:

- Block 1 – Type of Submission. Applicants should indicate the Phase I re-submission is a "Changed/Corrected Application."
- Block 4c – Previous Grants.gov Tracking ID. Enter the Phase I Grant ID for the original submission.

At minimum, the revised white paper should address the issues and questions detailed in the debrief summary.

4.2.6. Phase II - Invited Proposal Submission and Content.

Each proposal must address only the thrust area or topic for which it was invited. The application package corresponding to the thrust area or topic of interest should be used for submission of invited full proposals.

Each Phase II application package contains the following forms and attachments:

Form	Attachment	Action
SF-424 (R&R) Application for Federal Assistance Form	*N/A*	Enter the appropriate information in data fields
RR Budget Form	Budget Justification for entire performance period	Attach to Section K in budget period one
RR Subaward Budget Attachment(s) Form (*if applicable*)	Individual subaward budgets	Attach a separate budget with justification for each subaward
Research & Related Senior/Key Person Profile Form	PI Biographical Sketch	Attach to Biographical Sketch field
	PI Current/Pending Support	Attach to Current & Pending Support field
	Key Personnel Biographical Sketches	Attach to Biographical Sketch field for each senior/key person
	Key Personnel Current/Pending Support	Attach to Current & Pending Support field for each senior/key person
RR Personal Data Form	*N/A*	Enter the appropriate information in data fields
Research & Related Other Project Information Form	Publically Releasable Proposal Summary/ Abstract	Attach to Block 7 Project Summary/ Abstract
	Project Narrative/Technical Proposal	Attach to Block 8 Project Narrative
Disclosure of Lobbying Activities (SF-LLL) *(if applicable)*	*N/A*	Enter the appropriate information
Attachments Form	Attachment 1 – SOW	Upload as Attachment 1
	Attachment 2 – Quad Chart	Upload as Attachment 2
	Attachment 3 – Supporting Documentation (Thrust Area 6 submissions only)	Upload as Attachment 3

Table 5: Phase II Proposal Package Forms and Attachments.

DTRA reserves the right to consider incomplete application packages and required attachments and to request any missing information via email. Should the applicant fail to provide all the requested information either as part of the www.grants.gov submission or in response to email requests from DTRA, at their discretion, DTRA may not consider the proposal further.

SF 424 (R&R) Application for Federal Assistance: DTRA-specific instructions for completing the SF 424 (R&R) are below. General application instructions can be found on www.grants.gov:

Block 1 – Type of Submission. Applicants should indicate the Phase II submission is an "Application."

Block 2.1 – Applicant Identifier. Not applicable.

Block 3 – Date Received by State. Not applicable.

Block 3.1 – State Application Identifier. Not applicable.

Block 4b – Agency Routing Identifier. Enter the corresponding Phase I Grant ID. If

resubmissions were involved, enter the Grant ID for the last submission.

Block 5 – Applicant Information. You must provide a Business Office Point of Contact (BPOC) with an e-mail address.

Block 19 – Authorized Representative. The "signature of AOR" is not an actual signature and is automatically completed upon submission of the electronic application package.

RR Budget Form: The Research and Related Budget Form provided as part of the application package for the Phase II submission should be filled out in its entirety for each project year proposed. Applicants are responsible for ensuring appropriate, approved rates are used in their budget forms. When notified of selection applicants will be requested to provide their current rate agreement and the rate agreement of their subcontractor(s), if applicable. Applicants should note that in accordance with 32 CFR 22.205(b), grants shall not provide for the payment of fee or profit to the recipient.

Applicants should plan and budget for travel to accommodate the two meetings outlined below:

- National Conferences/Workshops/Symposia: Applicants are strongly encouraged to attend a nationally recognized conference, workshop, or symposium in the field of research each calendar year (1 at minimum). Research should be presented as soon as adequate data are available to support posters and presentations. Conferences/workshops/symposia should be attended by the PI and students supporting the research, as appropriate.
- Annual Technical Review: Applicants should plan to attend an annual technical program review meeting. For planning purposes the review will be for five days and will be held in Northern Virginia.

Budget Justification: Applicants are required to submit a budget justification. The budget justification should be prepared as outlined in the instructions for the Research and Related Budget and uploaded as an attachment to Section K "Budget Justification" of the Research and Related Budget Form. The budget justification does not have a page limit, but should include sufficiently detailed information for meaningful evaluation. In addition, the budget justification must specifically address subaward costs and type to include the portion of work to be subawarded with a supporting rationale. The budget justification should include a discussion of how the subawardee(s) cost was determined to be fair and reasonable.

RR Subaward Budget Attachment(s) Form (if applicable): Detailed cost estimates are required for each proposed subaward. The cost estimate for the subawards should include sufficiently detailed information for meaningful evaluation, including labor rates and indirect cost rates.

Research and Related Senior/Key Person Profile Form: The Research and Related Senior/Key Person Profile Form should be completed in its entirety for each of the PIs and Co-PIs on the project. The inclusion of additional personnel is at the discretion of the PI. The Degree Type and Degree Year fields will be used by DoD as the source for career information to assess the success rates of women. In addition to the required fields on the form, applicants should complete these two fields for all individuals that are identified as senior or key persons. For Thrust Area 6 submissions, the PI (and Co-PIs) in the region-of-interest should be included as key personnel.

A biographical sketch is required for each PI and Co-PI on the project. DTRA does not have a preference for the format of the biographical sketch; however, it should be limited to 1 page per

person. The biographical sketch should be uploaded as an attachment to the corresponding field on the Research and Related Senior/Key Person Profile Form.

Additionally, a statement of current and pending support must be provided for each PI and Co-PI on the project. This statement should include a summary of the current and pending support of related work and requires disclosure of all grants and contracts through which each PI and Co-PI is currently receiving or may potentially receive financial support.

RR Personal Data Form: This form will be used by DoD as the source of demographic information, such as gender, race, ethnicity, and disability information for the PI and Co-PI(s). Each application must include this form with the name fields of the PI and any Co-PI(s) completed; however, provision of the demographic information in the form is voluntary. The demographic information, if provided, will be used for statistical purposes only and will not be made available to merit reviewers. Applicants who do not wish to provide some or all of the information should check or select the "Do not wish to provide" option.

Research and Related Other Project Information Form:

Block 7 – Project Summary/Abstract. To fulfill the requirements of Section 8123 of the Defense Appropriations Act, which states: "The Secretary of Defense shall post grant awards on a public Web site in a searchable format," DTRA will collect and post via the Defense Technical Information Center (DTIC) basic information about all awards made under this BAA. The information posted will include the abstract submitted to Block 7 of this form.

The uploaded project abstract should be less than one page and provide a summary of the proposed work and demonstrate relevance to the topic being addressed. Most importantly, the abstract **must be** written such that the general public may easily understand the potential scientific contribution and the impact of the research. The header of this uploaded document must contain the following statement:

> *"This publically releasable abstract is provided to DTRA for use in fulfillment of Section 8123 of the Defense Appropriations Act and future versions of the same."*

The abstract absolutely must not contain any proprietary data or markings.

Block 8 – Project Narrative (Technical Proposal). The uploaded technical proposal must not exceed 20 pages (including references). If the proposal exceeds 20 pages, only the first 20 pages will be reviewed. A page is defined as 8 ½ x 11 inches, single-spaced, with one-inch margins in type not smaller than 12 point Times New Roman font. The technical proposal must be provided in portrait layout. A template for the technical proposal format may be found online in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal) (MS Word format).

The project narrative (technical proposal) must include the following components:

- ***Abstract.*** Should be a technical project abstract that is distinct from the Project Summary/Abstract that is attached to Block 7.
- ***Scope.***
- ***Objective.*** A clear and concise objective of the proposed project.
- ***Background.*** Provide the necessary technical and scientific background to support the scientific and/or technical merit of the proposed project.

- ***Programmatics.*** Describe your organization's management plan for the proposed project; list supporting and collaborating centers, and the roles/responsibilities of each identified academic and/or industrial subcontractor supporting the project. Authors of multidisciplinary proposals must take great care to clearly outline the impact to C-WMD science that is to be gained from the investment and justify the scientific contribution from each investigator.

  Thrust Area 6 narratives must also describe of the extent and duration of the relationship/collaboration between the universities/institutes/entities and/or scientists. Teams with pre-existing collaborative research relationships and those which propose to establish new collaborations will be considered, provided teams can supply documentation to demonstrate that an operational framework exists to support the proposed work. Please see Attachment 3 below for information on the submission of this documentation.

- ***Relevance.*** Describe the relevance of the proposed project in terms of advancing the state of the science and the anticipated scientific impact on capabilities to potentially reduce, eliminate, counter, provide greater knowledge or understanding of the threat, and mitigate the effects of WMD fundamental aspects of phenomena and of observable facts.

- ***Credentials.*** Describe the PI's qualifications and the organization's qualifications to perform the proposed work. Summarize the credentials of the primary performing center, and supporting academic and industrial partners to perform the work. Describe specific examples of equipment and/or facilities available to perform the proposed work. Focus on information directly relevant to the proposed work.

- ***Work to be Performed.*** Provide details of the work to be performed by task and subtask. Tasks must be grouped by project year; base and option years should be clearly labeled. Additional details that are required include the following:

  - ***Sample Repository.*** Thrust Area 6 narratives must also clearly identify how the applicant plans to maintain samples collected during the proposed research effort, along with relevant metadata, for at least 12 months after the project end date. Note that annual sample repository information must be submitted using a DTRA-specified format that is available in the Document and Template Library online at the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal)).

  - ***Protection of Human Subjects.*** For full discussion, see Section 6.2.2. If the proposed research does involve human subjects or materials, applicants are asked to: a) justify the use of human subjects, b) outline the human use, and c) include the source of the human subjects or materials involved in the research. Applicants shall submit written evidence, to include a provisional protocol number and Institutional Review Board (IRB) point of contact information, that a human use protocol has been submitted to, and is pending approval by, a qualified IRB. Further information may be required if the proposal is successful.

  - ***Animal Use.*** For full discussion, see Section 6.2.3. If the proposed research involves animal use, applicants are asked to justify the use of animals. Any proposals involving animal studies or animal work must include detailed information on the animal protocols to be used and verify the location where the studies will be conducted. Animal studies are subject to review and approval for safety and adherence to regulations. Applicants shall submit with the full proposal package written evidence, to include a provisional

protocol number and Institutional Animal Care and Use Committee (IACUC) point of contact information, that a vertebrate animal use protocol has been submitted to, and is pending approval by, a qualified IACUC. Further information may be required if the proposal is successful.

- ***Performance Schedule.*** Provide a table of tasks and sub-tasks and the duration of performance of each in a Gantt or other suitably formatted chart.
- ***References.*** List any relevant documents referenced.

Disclosure of Lobbying Activities (SF-LLL) Form: The Disclosure of Lobbying Activities Standard Form-LLL, if applicable, should be completed.

Attachments Form: The attachments form should be used to include the following three items with the application:

Attachment 1 – SOW. The SOW does not have a page limit, but should be approximately 3-5 pages in length for incorporation into an award document. The SOW should not contain any proprietary data or markings. Pages should be numbered and the initial page should have a date (document date) shown under the title (the title of the SOW should match that of the proposal). The SOW must be provided in portrait layout. A template for the SOW format may be found online in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal) (MS Word format).

The proposed SOW must accurately describe the research to be performed. The proposed SOW must also contain a summary description of the technical methodology as well as the task description, but not in so much detail as to make the SOW inflexible. The SOW format/guidance is as follows:

- ***Objective:*** Brief overview of the specialty area. Describe why the research is being pursued and what knowledge is being sought.
- ***Scope:*** Include a statement of what the SOW covers including the research area to be investigated, objectives/goals, and major milestones and schedule for the effort.
- ***Background:*** The applicant must identify appropriate documents, including publications that are applicable to the research to be performed. This section includes any information, explanations, or constraints that are necessary in order to understand the hypothesis and scientific impact on capabilities needed to reduce, eliminate, and counter the threat, and also mitigate the effects of WMD. It may also include previously performed relevant research and preliminary data.
- ***Tasks/Scientific Goals:*** This section contains the detailed description of tasks which represent the research to be performed that are contractually binding. Thus, this portion of the SOW should be developed in an orderly progression and presented in sufficient detail to establish the methodology and feasibility of accomplishing the overall program goals. The work effort should be segregated by performance period for all tasks to be performed and anticipated milestones realized in that year (e.g., Year 1, Year 2, etc., should be detailed separately). Identify the major tasks in separately numbered sub-paragraphs. Each major task should delineate, by subtask, the research to be performed by year and number each task using the decimal system (e.g., 4.1, 4.1.1, 4.1.1.1, 4.2, etc.). The sequence of performance of tasks and achievement of milestones must be presented by project year and task in the same

sequence as in the Project Narrative/Technical Proposal. The SOW must contain every task to be accomplished to include a detailed schedule.

- The tasks must be definite, realistic, and clearly stated. Use "the awardee shall" whenever the work statement expresses a provision that is binding. Use "should" or "may" whenever it is necessary to express a declaration of purpose. Use active voice in describing work to be performed. Do not use acronyms or abbreviations without spelling out acronyms and abbreviations at the first use; place the abbreviation in parenthesis immediately following a spelled-out phrase. If presentations/meetings are identified in your schedule, include the following statement in your SOW: "Conduct presentations/meetings at times and places specified in the grant schedule."
- ***Deliverables:*** Thrust Area 6 **requires** several additional items be included in the SOW. These items are as follows:
    - Submission of annual sample repository information using a DTRA-specified format (for the template, please see the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal)).
    - Access to all samples collected and data generated during the course of the project, up to and including at least 12 months after the project end date.

Attachment 2 – Quad Chart. The quad chart must be presented on one (1) page. The quad chart must not contain any proprietary data or markings. The quad chart must be provided in landscape layout. A template for the quad chart format may be found online in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal) (MS PowerPoint format). The inclusion of the DTRA logo is not required. The quad chart should be uploaded as "Attachment 2" of the Attachments Form.

Attachment 3 – Supporting Documentation. For Thrust Area 6 proposals ONLY. Thrust Area 6 narratives must also describe an operational framework to support the proposed work. This includes, but is not limited to the following: the extent and duration of the relationship/collaboration between the universities/institutes/entities and/or scientists. Teams with pre-existing collaborative research relationships and those which propose to establish new collaborations will be considered, provided teams can supply documentation to demonstrate that an operational framework exists to support the proposed work. Each of the following should be concatenated into a single document, in the order specified:

- Specific identification of foreign Principal Investigators (PIs) and number of/job title for other members of the foreign research team.
- Detailed description of the relationship between the proposed research project and current research efforts at the foreign institution.
- Description of facilities and any other evidence of suitability of foreign collaborators and sites. In the event that the foreign research component will involve human or other vertebrate animal use, appropriate facilities compliance and certifications documents must be provided. Refer to Section 6.2.2 and Section 6.2.3 for specific information on required approvals and documentation.
- Foreign PI letter of collaboration describing, at minimum, the suitability of the proposed work with respect to ongoing research efforts at the foreign institution, merit of the proposed

collaboration, and the expected mutual benefits.

Protocol Risk Assessment Tool (PRAT). For Thrust Area 6 proposals ONLY. Applicants **must** download the PRAT from the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal) and complete it in its entirety for **each** foreign institution participating in the project. Additional instructions for completing the PRAT may be found within the file. The completed PRAT file(s) should be emailed as a Portable Document File (PDF) format to HDTRA1-FRCWMD-A@mail.mil within two (2) weeks of the full proposal submission. **DO NOT** attempt to attach the PRAT(s) to the www.grants.gov submission.

4.2.7. Phase II - Additional Information Requests by DTRA. A revised proposal may be requested based on the review of the original proposal. Revised proposals will be requested when changes to the project scope, technical approach, and/or cost are required before the proposal could be further considered for an award. Applicants whose proposals are of interest to DTRA may be contacted to provide additional information or to make requested revisions prior to the final decision on funding. This request for further information may include revised budgets or budget explanations, revised SOWs, and other information, as applicable, to the proposed award. Applicants who are not responsive to Government requests for information in a timely manner, defined as meeting Government deadlines established and communicated with the request and not making satisfactory updates as requested, may be removed from award consideration. Applicants may also be removed from award consideration if the applicant and the Government fail to negotiate mutually agreeable terms within a reasonable period of time.

Re-submissions should be made with the appropriate Phase II application package for the thrust area or topic of interest and should be completed in accordance with the instructions provided in the notification email.

The DTRA-specific instructions for completing a proposal re-submission are the same as for the original submission, except the SF 424 (R&R) Application for Federal Assistance should be marked as follows:

- Block 1 – Type of Submission. Applicants should indicate the Phase II submission is a "Changed/Corrected Application."
- Block 4b – Agency Routing Identifier. Enter the corresponding Phase I Grant ID.
- Block 4c – Previous Grants.gov Tracking ID. Enter the Phase II Grant ID for the original Phase II submission.

4.2.8. File Format.

Documents should be uploaded as a Portable Document File (PDF) format. Perform a virus check before uploading any files to www.grants.gov as part of your application package. If a virus is detected, it may cause rejection of the file.

Do not lock or encrypt any files you upload to www.grants.gov as part of your application package. Movie and sound file attachments will not be accepted.

4.2.9. All submissions must be completely UNRESTRICTED and UNCLASSIFIED; submissions must not contain For Official Use Only (FOUO) or Official Use Only (OUO) information or be marked as such.

4.2.10. Confirmed Proposal Expiration Date. Applicants requesting contracts must provide written confirmation that holds the proposal, to include proposed costs, firm for 180 days after the submission due date, as included in the invitation to submit a full proposal. This information must be included in the text of the technical proposal.

4.2.11. Withdrawal of Proposals. Proposals may be withdrawn by written notice received at any time before award. Withdrawals are effective upon receipt of notice by the Grants/Contracting Officer via the administrative e-mail address listed in Section 7.

4.3. Submission Dates and Times.

Coordination of abstracts may be accomplished at any time that this BAA is in effect, unless otherwise stated as part of a specific topic. Once an applicant has been notified that a pre-application white paper is welcomed, the white paper should be submitted within 60 days. If the white paper is not submitted within 60 days, DTRA reserves the right to require the applicant to re-initiate the process with another abstract coordination.

Pre-application white papers may be submitted anytime that this BAA is in effect (as long as it occurs within the 60 day window following pre-coordination of the abstract), unless otherwise stated as part of a specific topic. Pre-application white papers may be evaluated at any time after submission and invitations for full proposal submission may occur any time after pre-application white paper evaluation. Note that proposal invitations may be limited to available program funds.

The due date for the Phase II invited proposal submissions will be provided in the letter of invitation. The applicant will not be allowed less than 45 days to prepare a full proposal submission; there is no penalty for early submissions. An extension for submission of the Phase II proposal submission may be requested by emailing the administrative email address in Section 7 prior to the deadline for the proposal submission. Full proposals may be evaluated at any time after submission.

Applicants are responsible for submitting all materials to www.grants.gov. When sending electronic files, the applicant should allow for potential delays in file transfer from the originator's computer server to the www.grants.gov website/computer server, as well as the delay associated with the www.grants.gov validation of applications, which may be up to 48 hours. Applicants are encouraged to submit their proposals early to avoid issues with file transfers, rejection of applications by www.grants.gov, and delays due to high website demand.

Acceptable evidence to establish the time of receipt at the Government office includes documentary and electronic evidence of receipt maintained by DTRA. Applicants should also print, and maintain for their records, the electronic receipt following submission of a proposal to www.grants.gov.

Applicants should note that DTRA uses a system that pulls applications from www.grants.gov en masse, but this system does not mark applications as "retrieved" on www.grants.gov. As a result, when applicants check the status on www.grants.gov the applications will always look like they have not been retrieved by DTRA. Should you require confirmation of receipt by the Agency, you may request such via the administrative email address provided in Section 7. Note that such requests will generally be treated with low priority by the Agency.

Please note 15 U.S.C. 260a establishes daylight saving time as the standard time during the daylight saving period.

If the application package and required attachments are submitted to www.grants.gov after the exact time and date specified in this announcement or in any written communications provided by DTRA, the application may be considered "late" and may not be reviewed.

If an emergency or unanticipated event interrupts normal Government processes so that proposals cannot be submitted to www.grants.gov by the exact time specified by DTRA correspondence, the time specified for receipt of applications will be deemed to be extended to the same time of day specified in the BAA or in the letter of invitation on the first work day on which normal Government processes resume.

4.4. Intergovernmental Review. Not Applicable.

4.5. Other Submission Requirements.

4.5.1. Registration with www.grants.gov. Applicants should note that each organization must complete a one-time registration in order to submit its pre-application white paper(s) and full proposal(s) through www.grants.gov. Please see the following web link on information about registering with www.grants.gov: http://www07.grants.gov/applicants/applicants.jsp. If your organization is already registered in www.grants.gov, no further action should be required.

The registration process may take up to **four (4) weeks** to complete depending on your organization and requires multiple steps, some of which are detailed below.

- Identifying the Data Universal Number Systems (DUNS) number or registering for one with Dun & Bradstreet at http://fedgov.dnb.com/webform/displayHomePage.do if your organization does not have a DUNS number.
- Registering with the System for Award Management (SAM) by calling the SAM Assistance Center at 1-866-606-8220, or you may register online at www.sam.gov. You will NOT be able to complete your SAM registration until SAM has confirmed your Employer Identification Number (EIN) or Taxpayer Identification Number (TIN) with the Internal Revenue Service (IRS).

4.5.2. Compliance with Appendix A to 32 CFR 28. All awards require certifications of compliance with Appendix A to 32 CFR 28 regarding lobbying. The full text of this certification is available in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal). Proposers are certifying compliance with this regulation by submitting the invited proposal. It is not necessary to include the certification text with your invited proposal. If applicable, proposers should submit the Disclosure of Lobbying Activities (SF-LLL) Form in accordance with Section 4.2.6.

4.5.3. Marking Guidance for Pre-Application White Paper and Invited Proposal and Disclosure of Proprietary Information other than to the Government. The pre-application white papers and invited proposals submitted in response to this BAA may contain technical and other data that the applicant does not want disclosed to the public or used by the Government for any purpose other than application evaluation. Public release of information in any pre-application white paper and invited proposal submitted will be subject to existing statutory and regulatory requirements.

If proprietary information which constitutes a trade secret, proprietary commercial or financial information, confidential personal information, or data affecting national security, is provided by an applicant in a pre-application white paper and/or invited proposal, it will be treated in

confidence, to the extent permitted by law, provided that the following legend is included on the front page of the pre-application white paper and/or invited proposal:

"For any purpose other than to evaluate the pre-application white paper and/or proposal, this data shall not be disclosed outside the Government and shall not be duplicated, used, or disclosed in whole or in part, provided that if an award is made to the applicant as a result of or in connection with the submission of this data, the Government shall have the right to duplicate, use or disclose the data to the extent provided in the agreement. This restriction does not limit the right of the Government to use information contained in the data if it is obtained from another source without restriction. The data subject to this restriction is contained in page(s) _____ of this pre-application white paper and/or proposal."

Any other legend may be unacceptable to the Government and may constitute grounds for removing the pre-application white paper and/or invited proposal from further consideration without assuming any liability for inadvertent disclosure.

The Government will limit dissemination of properly marked information to within official channels. In addition, the pages indicated as restricted must be marked with the following legend:

> *"Use or disclosure of the pre-application white paper and/or proposal data on lines specifically identified by asterisk (*) are subject to the restriction on the front page of this pre-application white paper and/or proposal."*

The Government assumes no liability for disclosure or use of unmarked data and may use or disclose such data for any purpose.

In the event that properly marked data contained in a pre-application white paper and/or invited proposal submitted in response to this BAA is requested pursuant to the Freedom of Information Act (FOIA), 5 U.S.C. § 552, the applicant will be advised of such request and prior to such release of information, will be requested to expeditiously submit to DTRA a detailed listing of all information in the pre-application white paper and/or invited proposal which the applicant believes to be exempt from disclosure under the Act. Such action and cooperation on the part of the applicant will ensure that any information released by DTRA pursuant to the Act is properly identified.

By submission of a pre-application white paper and/or invited proposal, the applicant understands that proprietary information may be disclosed outside the Government for the sole purpose of technical evaluation. DTRA will obtain a non-disclosure agreement from the evaluator that proprietary information in the pre-application white paper and/or invited proposal will only be used for evaluation purposes and will not be further disclosed or utilized.

4.6. Applicants that Propose Use of Contracts or OTAs.

4.6.1. Recommended Procurement Instrument and Pricing Arrangement. Applicants that propose use of contracts or OTAs must provide a summary of their recommended procurement instrument and pricing arrangement as part of the Phase II proposal. However, the Government reserves the right to negotiate and award the types of instruments determined most appropriate under the circumstances. It is anticipated that most instruments will be grants.

4.6.2. Representations and Certifications. Representations and Certifications must be completed at the time of Phase II submission. The applicant must complete the annual

representations and certifications electronically via the System for Award Management (SAM) website at https://www.sam.gov/portal/SAM/#1#1. After reviewing their information, the applicant verifies by submission of the application that the representations and certifications currently posted electronically have been entered or updated within the last 12 months.

4.6.3. Organization Conflict of Interest Advisory. Certain post-employment restrictions on former federal officers and employees may exist, including special Government employees (including but not limited to 18 U.S.C § 207, the Procurement Integrity Act, 41 U.S.C. § 2101 *et.seq*). If a prospective applicant believes that a conflict of interest exists, the situation should be raised to the DTRA Contract/Grant Officer before time and effort are expended in preparing a proposal. All applicants and proposed sub-contractors must therefore affirmatively state whether they are providing scientific, engineering and technical assistance (SETA), advisory and assistance services (A&AS) or similar support, through an active contract or subcontract, to any DoD technical office to include, but not limited to, the Joint Program Executive Office (JPEO), the Office of the Assistant Secretary of Defense for Nuclear, Chemical, and Biological Defense Programs (ASD-NCB), or the Office of the Special Assistant for Chemical and Biological Defense and Chemical Demilitarization Programs (OSA (CBD&CDP)). This information must be included in Technical Proposal of the Phase II full submission. All affirmations must state which office(s) the applicant(s) supports, and identify the prime contract number. Affirmations must be furnished at the time of Phase II full proposal submission. All facts relevant to the existence or potential existence of organizational conflicts of interest, including but not limited to those arising out of activities with the above-referenced organizations, must be disclosed. The disclosure must include a description of the action the applicant has taken or proposes to take to avoid, neutralize, or mitigate such conflict.

4.6.4. Contracts with Subcontracts. Any applicant, other than small businesses, submitting a proposal that exceeds $650,000.00 must submit a subcontracting plan in accordance with FAR 19.704(a) (1) and (2). This information must be included in Technical Proposal of the Phase II full submission. The plan format is outlined in FAR 19.704. Pursuant to Section 8(d) of the Small Business Act (15 U.S.C. § 637(d)), it is the policy of the Government to enable small business and small disadvantaged business concerns to be considered fairly as subcontractors to contractors performing work or rendering services as prime contractors or subcontractors under Government contracts, and to assure that prime contractors and subcontractors carry out this policy.

4.6.5. Limitations on OTAs. Applicants are advised that an Other Transaction for Research Agreement (10 U.S. Code § 2371) or an Other Transaction for Prototype Agreement (10 U.S. Code § 2371b) will only be awarded if the use of a standard contract or CA is not feasible or appropriate. Applicants are advised that an OTA may only be awarded if there is:

a. At least one nontraditional defense contractor participating to a significant extent in the prototype project, or

b. All significant participants in the transaction other than the Federal Government are small businesses or nontraditional defense contractors; or

c. At least one-third of the total cost of the prototype project is to be paid out of funds provided by the parties to the transaction other than the Federal Government. The cost share should generally consist of labor, materials, equipment, and facilities costs (including allocable indirect costs).

d. Exceptional circumstances justify the use of a transaction that provides for innovative business arrangements or structures that would not be feasible or appropriate under a procurement contract.

e. Although use of one of these options is required to use an Other Transaction for Prototype agreement as the procurement vehicle, no single option is encouraged or desired over the others.

NOTE: For purposes of determining whether or not a participant may be classified as a nontraditional defense contractor or a small business and whether or not such participation is determined to be participating to a significant extent in the prototype project, the following definitions are applicable:

a. "Nontraditional defense contractor" means an entity that is not currently performing or has not performed, for at least the one-year period preceding this solicitation, any of the following for the Department of Defense: any contract or subcontract that is subject to full coverage under the cost accounting standards prescribed pursuant to section 26 of the Office of Federal Procurement Policy Act (41 USCS §§ 1501 et seq.) and the regulations implementing such section; or any other contract in excess of $500,000 under which the contractor is required to submit certified cost or pricing data under section 2306a of this title (10 USCS § 2306a).b. "Small business" means a small business concern as defined under Section 3 of the Small Business Act (15 U.S.C. § 632).

"Participating to a significant extent in the prototype project" means that the nontraditional defense contractor or small business is supplying a new key technology or product, is accomplishing a significant amount of the effort wherein the role played is more than a nominal or token role in the research effort, or in some other way plays a significant part in causing a material reduction in the cost or schedule of the effort or an increase in performance of the prototype in question. NOTE: Applicants are cautioned that if they are classified as a traditional defense contractor, and propose the use of an Other Transaction for Prototype Agreement, the Government will require submittal of both a cost proposal under the guidelines of the FAR/DFARS, and a cost proposal under the proposed Other Transaction for Prototype Agreement, so that an evaluation may be made with respect to the cost tradeoffs applicable under both situations. The Government reserves the right to negotiate either a FAR based procurement contract, or Other Transaction for Prototype Agreement as it deems is warranted under the circumstances.

---

5. APPLICATION REVIEW INFORMATION

5.1. Evaluation Criteria. The four evaluation criteria to be used for responses received to this BAA are as follows:

1. Scientific and Technical Merit. The objective of this criterion is to assess the extent to which the applicant presents ideas that are innovative and/or unique with the potential for high payoff in the science area and details a comprehensive technical approach based on sound scientific principles. Innovation will be judged contextually against the white

paper's/proposal's scope, goals, and setting. To the extent possible, the technical risks, including those of biosafety and security, to accomplish the research or project should be identified with appropriate mitigation/management details.

For Thrust Area 6 white papers/proposals, innovation will also be considered with respect to partner country capabilities.

2. Value to Mission Goals. The objective of this criterion is to assess the extent to which the applicant demonstrates an understanding of the C-WMD research or mission challenges and the contribution to the C-WMD research or mission needs of that thrust area/topic. White papers/proposals must detail research or a project that is responsive to the thrust area/topic as presented in this solicitation. This criterion also addresses the benefit of the proposed effort on enabling knowledge, technology, or capabilities over current methods and/or practices and on the transition potential that is appropriate to the proposed effort. Applicants must also demonstrate an impact of the proposed effort on the institution's ability to perform research relevant to reducing the global WMD threat; and/or to train, through the proposed effort, students and/or partner scientists in science, technology, engineering and/or mathematics.

   Thrust Area 6 white papers/proposals must demonstrate an understanding of the CBEP priorities and mission. As such, the degree to which the proposed collaborations may lead to long-term partner country self-sufficiency and sustainment of the jointly developed capabilities will be considered.

3. Capability of the Personnel and Facilities to Perform the Proposed Effort. The objective of this criterion is to assess the extent to which the applicant's team has the requisite expertise, skills and resources necessary to perform the proposed program. This includes an assessment of the team's management construct, key personnel, facilities and past technical experience in conducting similar efforts of the proposed scope. Applicants must demonstrate that their team has the necessary background and experience to perform this project. Facilities should be detailed with discussion of any unique capabilities pertinent to the research. Subcontractors may include Government facilities or Agencies; however the unique expertise or specialized facilities provided through their inclusion must be clearly presented and the validity of the proposer-Governmental relationship must be clearly documented.

4. Cost Realism Evaluation. The objective of this criterion is to establish that the proposed costs are reasonable, realistic, and justified for the technical approach offered and to assess the applicant's practical understanding of the scope of the proposed effort.

5.2. Review and Selection Process.

The pre-application white paper and proposal selection process will be conducted based upon a technical review as described in the DoDGARs (32 CFR 22.315(c)) and includes the use of non-Government peer-reviewers.

Each pre-application white paper and invited proposal submitted to a general TA will be reviewed on a rolling basis; topic-based submissions will be reviewed as a batch following receipt deadlines. All applications will be reviewed based on the merit and relevance of the specific pre-application white paper/proposal as it relates to the DTRA program, rather than against other pre-application white papers/proposals for research in the same general area.

Pre-application white paper (Phase I) evaluation will be based on the two (2) equally weighted criteria of (1) Technical/Scientific Merit and (2) Value to Mission Goals. The criteria will be

scored as Outstanding (O), Good (G), Acceptable (A), Marginal (M) or Unacceptable (U). Any criterion scored as "Unacceptable (U)" will render the pre-application white paper "Not Selectable," and the pre-application white paper will not be considered further.

The full proposal evaluation will be based on the four criteria listed above. Of these, the first two (2) criteria of (1) Technical/Scientific Merit and (2) Value to Mission Goals are equally weighted and more important than the third criterion of (3) Capability of the Personnel and Facilities to Perform the Proposed Effort. These first three criteria will be scored Outstanding (O), Good (G), Acceptable (A), Marginal (M) or Unacceptable (U). The fourth criterion of Cost Realism will be scored as either Acceptable (A) or Unacceptable (U). Any criterion scored as "Unacceptable (U)" will render the proposal "Not Selectable," and the proposal will not be considered further.

Other factors that may be considered are duplication with other research, program balance, past performance and budget limitations. Prior to award, the Government reserves the right to perform a review of past performance. Sources that may be used for past performance review may include the Past Performance Information Retrieval System (PPIRS) and the Federal Awardee Performance and Integrity Information System (FAPIIS). The Government will also evaluate the impact of any proposed limitations to the use of intellectual property (e.g. asserted technical data/computer software restrictions or patents) during the selection and/or negotiation process, and may request additional information from the applicant, as may be necessary, to evaluate the applicant's assertions. Accordingly, proposals may be selected for funding which are not reviewed as highly as others, which are of higher risk and/or which may be of a higher cost.

The Government reserves the right to select all, some, or none of the proposals, or any part of any proposal received in response to this BAA and to make awards without discussions with applicants; however, the Government reserves the right to conduct discussions if determined necessary.

5.3. DTRA anticipates that the total Federal share of awards made under this announcement will be greater than the simplified acquisition threshold over the period of performance (see §200.88 Simplified Acquisition Threshold). Therefore, in accordance with Appendix I to 2 CFR Part 200, Section E.3, this section serves to inform applicant:

i. That DTRA, prior to making a Federal award with a total amount of Federal share greater than the simplified acquisition threshold, is required to review and consider any information about the applicant that is in the designated integrity and performance system accessible through SAM (currently Federal Awardee Performance and Integrity Information System (FAPIIS)) (see 41 U.S.C. 2313);

ii. That an applicant, at its option, may review information in the designated integrity and performance systems accessible through SAM and comment on any information about itself that a Federal awarding agency previously entered and is currently in the designated integrity and performance system accessible through SAM;

iii. That DTRA will consider any comments by the applicant, in addition to the other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics, and record of performance under Federal awards when completing the review of risk posed by applicants as described in §200.205

Federal awarding agency review of risk posed by applicants.

iv. For awards that exceed $500,000 over the period of performance, DTRA will employ the additional post-award reporting requirements reflected in Appendix XII—Award Term and Condition for Recipient Integrity and Performance Matters of 2 CFR 200.

5.4. Technical and Administrative Support by Non-Government Personnel.

It is the intent of DTRA to use both Government and non-Government personnel to assist with the review and administration of submittals for this BAA. All pre-application white papers and invited proposals may be reviewed by subject matter experts, including, but not limited to, peer reviewers from across the academic and industrial community, as applicable to the research proposed.

Further, participation in this BAA requires DTRA support contractors to have access to pre-application white paper and invited proposal information including information that may be considered proprietary or otherwise marked with restrictive legends. Existing DTRA contractors include but may not be limited to the following: Engility Corporation (Advisory & Assistance Services) and their subcontractors, Infinity Technology LLC, Quanterion Solutions Inc., Kforce Government Solutions Inc., KCK Inc., CACI,, , SBG Technology Solutions and their subcontractors, and Terremark Worldwide Inc. Each contract contains organizational conflict of interest provisions and/or includes contractual requirements for non-disclosure of proprietary contractor information or data/software marked with restrictive legends. The Offeror, by submitting a white paper or proposal, is deemed to have consented to the disclosure of its information to the aforementioned contractors under the conditions and limitations described herein.

All individuals—including subject matter experts and support contractors—having access to any proprietary data must certify that they will not disclose any information pertaining to this BAA including any submittal, the identity of any submitters, or any other information relevant to this BAA. All applicants to this BAA consent to the disclosure of their information under these conditions.

---

6. AWARD ADMINISTRATION INFORMATION

6.1. Award Notices. Applicants will be notified regarding the status of their applications (invitation/non-invitation for full proposals, re-submission of white papers, selection/non-selection for award, etc.) via e-mail to the BPOC listed in Block 5 of the SF-424 and the PI listed in Block 14 of the SF-424 provided at the time of submission. A debrief summary will be provided as part of all notification e-mails.

A notice of selection should not be construed as an obligation on the part of the Government; only duly authorized procurement personnel may commit resources, this will be done by issuing a grant or contract document to the selected applicant. Also, this notification must not be used as a basis for accruing costs to the Government prior to award. Selected applicants are not authorized to begin work, as any award is subject to successful negotiations (if determined necessary by DTRA) between the DTRA contracting division and the selected organization, and to the availability of funds.

All notifications will be made from notification@dtrasubmission.net. **E-mails to this e-mail**

address will not be answered or forwarded.

Applicants must be aware that it is their responsibility to ensure: (1) correct e-mail addresses are provided at the time of submission, (2) this e-mail notification reaches the intended recipient(s), and (3) the e-mail is not blocked by the use of 'spam blocker' software or other means that the recipient's Internet Service Provider may have implemented as a means to block the receipt of certain e-mail messages.

If for any reason there is a delivery failure of these e-mail notices, DTRA will not further attempt to contact the applicants.

6.2. Administrative and National Policy Requirements. The DTRA Grant Terms and Conditions may be found online in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal). There are different versions for different recipients. As the Terms and Conditions are updated, they will be posted in the Document & Template Library of the DTRA Basic and Fundamental Research Community Portal (www.dtrasubmission.net/portal). All awards require certifications of compliance with national policy requirements. Statutes and Government-wide regulations require some certifications to be submitted at the time of proposal submission. See Section 4.5.2 and Section 4.6.2 for the certification(s) required at the time of submission.

This BAA focuses on fundamental research in a DoD contractual context, which was defined in Section 1.2 of this BAA. Per DoD policy[1], "…products of fundamental research are to remain unrestricted to the maximum extent possible." Furthermore, "The DoD will place no other restrictions on the conduct or reporting of unclassified fundamental research, except as otherwise required by statue [sic], regulation, or Executive Order." As such, fundamental research is normally exempt from controls under the International Traffic in Arms Regulation (ITAR) (22 CFR Parts 120-130) and/or the Department of Commerce regarding the Export Administration Regulations (15 CFR Parts 730-774), but the DoD rule recognizes that there are "rare" situations where export-controlled information or technology may be used in fundamental research that may require a license(s) or restrictions on products.

6.2.1. Export Control Notification. Applicants are responsible for ensuring compliance with any export control laws and regulations that may be applicable to the export of and foreign access to their proposed research. Applicants may consult with the Department of State with any questions regarding the International Traffic in Arms Regulation (ITAR) (22 CFR Parts 120-130) and/or the Department of Commerce regarding the Export Administration Regulations (15 CFR Parts 730-774). Please note that the prime awardee is responsible for monitoring ITAR compliance of all subawardees.

6.2.2. Protection of Human Subjects. If the proposed research involves human subjects or materials, applicants are asked to: a) justify the use of human subjects, b) outline the human use, and c) include the source of the human subjects or materials involved in the research. As a condition precedent to receipt of DTRA funding, applicants must ensure that the basic rights and welfare of human subjects are protected. Applicants shall submit with the full proposal package written evidence, to include a provisional protocol number and Institutional Review Board (IRB)

[1] Under Secretary of Defense for Acquisition, Technology and Logistics Memorandum, SUBJECT: Contracted Fundamental Research, dated 26 Jun 2008

point of contact information, that a human use protocol has been submitted to, and is pending approval by, a qualified IRB. Further information may be required if the proposal is successful.

All research under any award made under this BAA involving human subjects must be conducted in accordance with 32 CFR 219, 10 U.S.C. § 980, and DoD Instruction 3216.02, and, as applicable, 21 CFR parts 11, 50, 56, Good Clinical Practice, the ICH, as well as other applicable federal and state regulations. Awardees must be cognizant of and abide by the additional restrictions and limitations imposed on the DoD regarding research involving human subjects, specifically as regards vulnerable populations (32 CFR 219 modifications to subparts B-D of 45 CFR 46), recruitment of military research subjects (32 CFR 219), and surrogate consent (10 U.S.C. § 980).

DTRA Directive 3216.01 of June 9, 2010, modified March 18, 2015, established the DTRA Human Subjects Protection Program, set forth the policies, defined the applicable terms, and delineated the procedures necessary to ensure DTRA compliance with federal and DoD regulations and legislation governing human subject research. The regulations mandate that all DoD activities, components, and agencies protect the rights and welfare of human subjects of study in DoD supported research, development, test and evaluation, and related activities hereafter referred to as "research." The requirement to comply with the regulations applies to new starts and to continuing research.

The DTRA Directive requires that research using human subjects may not begin or continue until the DTRA Research Oversight Board (ROB) has reviewed and approved the proposed protocol. Contractors and subcontractors are required to submit a valid federal assurance for their organization (institution, laboratory, facility) that has been issued by either DoD or the Department of Health and Human Services, and documentation of review of proposed protocols by the local IRB to include consent forms for any planned research using human subjects to the DTRA ROB for its review through the contracting officer's representative (if assigned) or the contracting officer. The ROB review is separate from, and in addition to, local IRB review.

A study is considered to involve human research subjects if: 1) there is interaction with the subject (even simply talking to the subject qualifies; no needles are required); and 2) if the study involves collection and/or analysis of personal/private information about an individual, or if material used in the study contains links to such information.

Written approval to begin research or to subcontract for the use of human subjects under the proposed protocol will be provided in writing from the DTRA ROB, through the contracting officer. Both the contractor and the Government must maintain a copy of this approval. Any proposed modifications or amendments to the approved protocol or consent forms must be submitted to the local IRB and the DTRA ROB for review and approval. Examples of modifications/amendments to the protocol include, but are not limited to:

- a change of the Principal Investigator;
- changes in duration or intensity of exposure to some stimulus or agent;
- changes in the information requested of volunteers, or changes to the use of specimens or data collected; or
- changes in perceived or measured risks or benefits to volunteers that require changes to the study.

Research pursuant to such modifications or amendments must not be initiated without IRB and ROB approval except when necessary to eliminate apparent and immediate hazards to the subject(s).

Research projects lasting more than one year require IRB review at least annually, or more frequently as required by the responsible IRB. The contractor or subcontractor must provide documentation of continued IRB review of protocols for ROB review and approval in accordance with the Contract Data Requirements List. Research changes must be reviewed by the IRB and ROB in advance unless necessary to eliminate apparent and immediate hazards to the subject(s).

A clause regarding human subjects research will be included in all contracts involving human subjects research. Non-compliance with any provision of this clause may result in withholding of payments under the contract pursuant to the contract's payments clause(s) and/or contract termination pursuant to the contract's termination clause(s). The Government shall not be responsible for any costs incurred for research involving human subjects prior to protocol approval by the ROB.

6.2.3. Animal Use. If the proposed research involves the use of live nonhuman vertebrate animals, applicants are required to justify the use of animals by providing detailed information on the proposed animal use, to include the proposed species and number of animals planned, along with the location(s) where the animal study(ies) is planned. Additional information will be required if the proposal is selected for award subject to successful negotiations. The Animal Care and Use Review Office (ACURO), a component of the USAMRMC Office of Research Protections (ORP), must review and approve all animal use prior to the start of working with animals. Therefore, Principle Investigators will be required to complete and submit the animal use appendix titled "Research Involving Animals", after award of the procurement instrument, which is available on the ACURO website (http://mrmc.amedd.army.mil/index.cfm?pageid=research_protections.acuro). Allow 2 to 4 months for regulatory review and approval processes for animal studies. Applicants are to build this review time into their project schedules.

DoD Instruction 3216.01, dated September 13, 2010, provides policy and requirements for the use of animals in DoD-funded research based on Army Regulation (AR) 40-33. The DoD definition of animal is any live nonhuman vertebrate. All proposals that involve the use of animals must be in compliance with DoD Instruction 3216.01 and AR 40-33. DTRA requires that research using animals not begin or continue until the ACURO has reviewed and approved the proposed animal use. For animals, the provisions include rules on animal acquisition, transport, care, handling, and use in: (i) 9 CFR parts 1-4, Department of Agriculture rules that implement the Laboratory Animal Welfare Action of 1966 (U.S.C. 2131-2156); and (ii) the "Guide for the Care and Use of Laboratory Animals," National Institutes of Health Publication No. 86-23.

6.2.4. Biological Defense Research Program (BDRP) Requirements: BioSurety and Select Agent Use.

Proposals must specify what Select Agent work will be conducted at the applicant's facility and what Select Agent work will be performed in other facilities. Proposals also must provide the source of the Select Agent(s), any appropriate registration information for the facilities, and specify the Laboratory Bio-safety Level. All Select Agent work is subject to verification of

information and certifications. Further information may be required if the proposal is successful.

For those institutions in which PI's are conducting research with Bio-safety Levels 3 and 4 material, a Facility Safety Plan must be prepared and made available during the project award phase in accordance with 32 CFR 626.18. For grants awarded to foreign institutions, you must follow either local or U.S. laws (as stated above) depending on which laws provide stronger protection. (DTRA requires that research using Select Agents not begin or continue until DTRA has reviewed and approved the proposed agent use. See URL: https://www.gpo.gov/fdsys/pkg/CFR-2002-title32-vol3/pdf/CFR-2002-title32-vol3-sec626-18.pdf for a copy of 32 CFR 626.18, Biological Defense Safety Program.)

For projects that will employ the use of chemical agents, either neat agent or dilute agent, the offeror must provide approved Facility Standard Operating Procedures that conform to Federal, State and local regulations and address the storage, use and disposition of these chemical materials.

6.2.5. Dual-Use Potential. In accordance with National Science Advisory Board for Biosecurity (NSABB) recommendations, DTRA will not support research that, based on current understanding, can reasonably be anticipated to provide knowledge, information, products, or technologies that could be directly misapplied to pose a significant threat with broad potential consequences to public health and safety, agricultural crops and other plants, animals, the environment, materiel, or national security. Research involving select agents and toxins is within scope of the DTRA mission; however, the use of select agents and toxins in certain experimental categories is considered "dual-use research of concern" (DURC) according to U.S. policy. (http://www.phe.gov/s3/dualuse/Documents/us-policy-durc-032812.pdf) Proposals that contain DURC will not be funded. Dual-use potential will be assessed based on application of the following criteria:

- Use of select agents or toxins. This factor evaluates whether the proposed research involves use of one or more select agents or toxins [as identified by the Select Agent Program under Federal Law (7 C.F.R. part 331, 9 C.F.R. part 121, and 42 C.F.R. part 73)] which pose significant risk of deliberate misuse with potential for mass casualties or devastating effects to the economy, critical infrastructure, or public confidence.
- Scope of proposed experiments. This factor evaluates whether the proposed research involves experiments that will produce, aim to produce, or is reasonably anticipated to produce: (a) Enhanced harmful consequences of the agent or toxin; (b) Disruption of immunity or effectiveness of an immunization against the agent or toxin without clinical or agricultural justification; (c) Conferred resistance by the agent or toxin to clinically or agriculturally useful prophylactic or therapeutic interventions against the agent or toxin, or facilitated ability to evade detection methodologies; (d) Increased stability, transmissibility, or dissemination ability of the agent or toxin; (e) Altered host range or tropism of the agent or toxin; (f) Enhanced susceptibility of a host population to the agent or toxin; or (g) Eradicated or extinct select agents or toxins.

6.2.6. Military Recruiting. This is to notify potential applicants that each award under this announcement to an institution of higher education, with exception of any grants awarded to institutions of higher education entirely located outside the United States and/or its territories, must include the following term and condition: "As a condition for receipt of funds available to DoD under this award, the recipient agrees that it is not an institution of higher education (as

defined in 32 CFR 216) that has a policy of denying, and that it is not an institution of higher education that effectively prevents, the Secretary of Defense from obtaining the following for military recruiting purposes: (A) entry to campuses or access to students on campuses; or (B) access to directory information pertaining to students. If the recipient is determined, using procedures in 32 CFR 216 to be such an institution of higher education during the period of performance of this agreement, and therefore to be in breach of this clause, the Government will cease all payments of DoD funds under this agreement and all other DoD grants and CAs, and it may suspend or terminate such grants and agreements unilaterally for material failure to comply with the terms and conditions of award." 32 CFR 216 may be accessed electronically at http://www.ecfr.gov/cgi-bin/text-idx?SID=ee45add5e352854b7089ce420c7fd0a6&mc=true&tpl=/ecfrbrowse/Title32/32cfr216_main_02.tpl . If your institution has been identified under the procedures established by the Secretary of Defense to implement Section 558 of Public Law 103-337, then: (1) no funds available to DoD may be provided to your institution through any grant, including any existing grant; and (2) your institution is not eligible to receive a grant in response to this BAA. This is to notify potential applicants that each award under this announcement to an institution of higher education, with exception of any grants awarded to institutions of higher education entirely located outside the United States and/or its territories, must include the following clause: 32 CFR 22.520 (DoDGARS 22.520), Military Recruiting and Reserve Officer Training Corps Program Access to Institutions of Higher Education.

6.2.7. Combating Trafficking in Persons. The recipient agrees to comply with the trafficking in persons requirement in Section 106(g) of the Trafficking Victims Protection Act of 2000 (TVPA), as amended (22 U.S.C. 7104(g)).

6.2.8. Reporting Subawards and Executive Compensation. The recipient agrees to ensure they have the necessary processes and systems in place to comply with the reporting requirements of the Transparency Act, as defined at 2 CFR 170.320, unless they meet the exception under 2 CFR 170.110(b).

6.2.9. Representation Regarding the Prohibition on Using Funds under Grants and Cooperative Agreements with Entities that Require Certain Internal Confidentiality Agreements. By submission of its proposal or application, the applicant represents that it does not require any of its employees, contractors, or subrecipients seeking to report fraud, waste, or abuse to sign or comply with internal confidentiality agreements or statements prohibiting or otherwise restricting those employees, contractors, or subrecipients from lawfully reporting that waste, fraud, or abuse to a designated investigative or law enforcement representative of a Federal department or agency authorized to receive such information. Note that: (1) the basis for this representation is a prohibition in section 743 of the Financial Services and General Government Appropriations Act, 2015 (Division E of the Consolidated and Further Continuing Appropriations Act, 2015, Pub. L. 113-235) and any successor provision of law on making funds available through grants and cooperative agreements to entities with certain internal confidentiality agreements or statements; and (2) section 743 states that it does not contravene requirements applicable to Standard Form 312, Form 4414, or any other form issued by a Federal department or agency governing the nondisclosure of classified information.

6.3. Reporting. General requirements are provided below; however, each awardee should check the award agreement and its contract data requirements list (CDRLs) and/or terms and conditions to determine the requirements for that specific award.

6.3.1. Annual Reports. Annual Reports will be due no later than 1 July of each year. Awards effective after 31 January will not require an Annual Report until 1 July of the following year. The Annual Report is *not* a cumulative report.

6.3.2. Final Technical Reports. A comprehensive final technical report is required prior to the end of an effort, due on the date specified in CDRLs and/or the terms and conditions of the award document. The purpose of the Final Report is to document the results of the effort. The Final Report *is* a cumulative report.

The final report will always be sent to the Defense Technical Information Center (DTIC) and reports may be available to the public through the National Technical Information Service (NTIS).

6.3.3. Financial Reports. Federal Financial Reports (SF-425) are due no later than 1 July of each year. Grants effective after 31 January will not require a Federal Financial Report until 1 July of the following year.

6.3.4. Foreign Travel Reports. Within thirty (30) days after returning to the United States from foreign travel, the PI may be required to submit an acceptable trip report summarizing the highlights of the trip. For grants, contracts, or OTAs awarded to institutions entirely located outside the United States and/or its territories, this is not required.

6.4. After-the-Award Requirements for *Grants*. Closeout, subsequent adjustments, continuing responsibilities, and collection of amounts due are subject to requirements found in 32 CFR 32.71 – 73 (Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations) and 32 CFR 34.61 – 63 (For-Profit Organizations).

---

7. AGENCY CONTACTS

Administrative Correspondence and Questions	HDTRA1-FRCWMD-A@mail.mil
Thrust Area 1: *Science of WMD Sensing and Recognition*	HDTRA1-FRCWMD-TA1@mail.mil
Thrust Area 2: *Network Sciences*	HDTRA1-FRCWMD-TA2@mail.mil
Thrust Area 3: *Science for Protection*	HDTRA1-FRCWMD-TA3@mail.mil
Thrust Area 4: *Science to Defeat WMD*	HDTRA1-FRCWMD-TA4@mail.mil
Thrust Area 5: *Science to Secure WMD*	HDTRA1-FRCWMD-TA5@mail.mil
Thrust Area 6: *Cooperative Counter WMD Research with Global Partners*	HDTRA1-FRCWMD-TA6@mail.mil
Thrust Area 7: *Fundamental Science for Chemical and Biological Defense*	HDTRA1-FRCWMD-TA7@mail.mil

Table 6: Agency Contacts.

7.1. Questions regarding administrative content of this BAA must be addressed to the administrative e-mail address listed above.

7.2. Questions regarding technical content of this BAA must be referred to the technical staff responsible for the relevant thrust areas.

DTRA will not release employee personal contact information.

---

8. OTHER INFORMATION

Topics from previous periods may or may not be repeated. DTRA will not provide additional information regarding the posting of future topics, including dates for posting, the potential for a topic to be repeated in out years, the potential for similar topics to be posted, and/or topic details in advance of issuance of an amended BAA.

ATTACHMENT 1: SPECIFIC TOPICS

Thrust Areas 1, 2, 3, 4, 5, and 6 have no specific topics at this time.

Thrust Area 7 has nine (9) topics —Topics I1-I9—detailed below. Submissions to the general thrust area descriptions for this thrust area in accordance with the requirements detailed in this BAA are also welcome.

Great care must be taken to use the appropriate application package on www.grants.gov, as the package selection dictates how each submission will be reviewed:

- If NOT submitting to one of the specific topic numbers detailed below, use one of the **Thrust Area N NO TOPIC** application packages
- If you ARE submitting to one of the specific topic numbers detailed below, use the applicable **Basic Research-Thrust Area 7-Topic I1 to I9** application package

*****BASIC RESEARCH TOPICS I1-I9*****

In accordance with Section 4.2.1, the requirement for abstract pre-coordination is waived for Topics I1-I9; this topic does NOT require pre-coordination of an abstract prior to the submission of pre-application white papers. All other pre-coordination requirements remain in effect.

The pre-application white paper deadline for Topics I1-I9 is 4 March 2019. **PRE-APPLICATION WHITE PAPERS FOR THESE TOPICS MUST BE SUBMITTED BY 11:59 PM (MIDNIGHT) EST ON 4 March 2019.** White papers submitted to Topics I1-I9 may not be considered if they are received after this deadline.

Responses to Topics I1-I9 must address ONLY basic research (Budget Category 6.1). Basic research is the systematic study directed toward greater knowledge or understanding of the fundamental aspects of phenomena and of observable facts without specific applications toward processes or products in mind. It includes all scientific study and experimentation directed toward increasing fundamental knowledge and understanding in those fields of the physical, engineering, environmental, and life sciences related to long-term national security needs. It is farsighted, high payoff research that provides the basis for technological programs.[2]

Topics I1-I9 are interested in research projects that span from those that focus on exploratory aspects of a unique problem or a high-risk approach to those that involve a comprehensive program with interdisciplinary areas. Consistent across all proposals should be the focus on innovative research with the potential for high impact to C-WMD science.

DTRA anticipates that the predominance of awards made under Topics I1-I9 will be grants. Pre-application white papers and proposals submitted to Topics I1-I9 must have a single lead organization and single submission for the pre-application white paper and the invited proposal. Awards will be made by a single award to the lead institution. Subawards, including all grants and/or contracts, are the responsibility of the award recipient; exceptions will not be made.

Thrust Area 7, Topic I1: In Search of the "lnc": Long Non-Coding Ribonucleic Acids (lncRNA) Role in Pathogenesis

Award Amounts for this topic are anticipated to be between $350,000 and $500,000 for year 1

and up to $1,000,000 per subsequent year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort.

The preferred award structure for this topic is a base period of two (2) years with one (1) additional year as possible option. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of three (3) years will not be considered.

Background: Infections caused by viral or bacterial pathogens are known to significantly up/down regulate various genes which can play a significant role in disease progression. Most of the transcriptomic studies currently sponsored by DTRA have focused on mRNA and their role in disease. Unfortunately, mRNAs represent a very small portion of the transcriptome since over 98% is represented by non-coding RNAs (ncRNAs). LncRNAs represent a class of ncRNAs that are longer than 200 nucleotides and are not well studied nor understood in relation to infectious diseases. LncRNAs are typically expressed at lower levels, but often are implicated to have greater tissue specificity related to biogenesis and epigenetic regulatory factors. LncRNAs are also known to interact with other molecules such as proteins, peptides, DNA, RNA, and even metal ions to form secondary and tertiary structures. By understanding the various lncRNAs interactions this knowledge can potentially be leveraged to understand their role in pathogenesis and to best design and develop novel diagnostic assays.

Impact: Studying lncRNAs potentially offer the ability to elucidate novel biothreat-relevant signatures for diagnosis and potential therapeutic application. It is believed that there is a great potential to best understand the role that lncRNAs play in infection from relevant pathogens to the Chemical and Biological Defense Program (CBDP) with current technologies, capabilities, and methods currently available. Learning the role that non-coding elements potentially play can greatly enhance the overall knowledge of pathogenesis and virulence that typically lead to adverse clinical symptoms and can impact the Warfighter's combat effectiveness and the greater mission.

Objective: The aim of this topic is to develop proof of concept to determine whether novel diagnostic markers can be discovered from lncRNA research. Specifically, the goal is to understand if lncRNAs play a significant role in pathogenesis and determine the appropriate mechanisms of action. For this basic research topic, the ideal focus is on lncRNAs, which are defined to be greater than 200 nucleotides in length, however, this topic is willing to entertain ncRNAs smaller than 200 nucleotides if their role, function, and mechanism of action can be accurately described. The primary goals and objectives of this basic research effort for the potential 2 year effort will be to:

a) Leverage the appropriate technologies to rapidly discover and identify lncRNAs
b) Determine lncRNA's role in infection and pathogenesis for relevant animal models and/or human infectious disease studies

Please note that only infectious disease studies that are directly relevant to the CBDP will be thoroughly evaluated and considered. These pathogen threats are typically considered to be high-containment microorganisms that are associated with extremely high rates of morbidity and

mortality as well as the high risk of transmissibility. Solicitations will be reviewed for experimental design and the necessary studies to elucidate and, if successful, conduct initial verification to showcase the role of lncRNAs in pathogenesis and disease progression.

Thrust Area 7, Topic I2: Algorithm Development for Optimization of Biologic Medical Countermeasures

Award Amounts for this topic are anticipated to be up to $400,000 per year through the base period phase to establish proof of concept and, if successful, up to $800,000 per year thereafter (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of one (1) year with up to four (4) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Note: For this topic, awardees will be required to grant the US Government a licensing agreement to all software and or hardware in perpetuity for all Chemical and Biological Defense Program (CBDP) uses.

Background: Machine learning and artificial intelligence (AI) has advanced greatly in the past decade. Coupled with cheaper computer power, the technology is rapidly moving into diverse areas from natural language processing to autonomous vehicles. The basic underpinnings of the technology is in the ability to "train" the software to recognize, generate, and analyze patterns from vast amounts of heterogeneous data that may not be readily obvious to the human mind. For example, AI has been successfully used in the field of clinical oncology medicine to accurately read mammograms.[1] The next step is leveraging the potential of AI to drive the next generation of rational drug discovery.[2]

Relevance: The DoD has a unique set of challenges within the CBDP for which AI may be ideally suited to help close gaps in our basic understanding. It is envisioned that a DoD-specific AI drug discovery platform will support the CBDP Agile Medical Platform. Specifically, a DoD-specific AI platform could ultimately be developed that is focused on generating and analyzing biological data specific to monoclonal antibody based therapies, to aid in identifying optimal candidates for advanced development of biological medical countermeasures (MCM) to protect the Warfighter and Nation against biological threat agents. Methods developed that can optimize the antibody for any number or numbers of traits that would accelerate MCM development, by reducing the time and cost, while maximizing efficiency and effectiveness for the DoD are especially of interest. To this end, this topic seeks to solicit groups working in the field of machine learning and algorithm design to help determine if AI/machine learning

technology is advanced enough to help define materiel monoclonal antibody based medical countermeasure solutions to the DoD.

Impact: If successful, the work will support the CBDP through improved pathways for moving product through the regulatory process to provide MCMs for the warfighter. It would also support in laying the groundwork for the potential to develop a more encompassing AI drug discovery platform that could be applied across the spectrum of DoD medical areas within the CBDP.

Objective: As a proof of concept, the initial work will be directed towards the optimization of monoclonal antibody biologics. While discovery of antibodies with strong binding is fairly routine, the ability to develop those into feasible drug candidates remains a challenge. Basic understanding of which amino acids can be changed to optimize an antibody to maximize its protection against a biological threat agent of interest to DoD is still a relatively novel research area.

This topic aims to answer fundamental research questions related to addressing whether AI can be utilized to provide information to aid optimizations in rational antibody based drug design, and whether AI can help address issues relevant to the development of antibody based MCMs for biological agents of relevance to DoD:

- Plasma stability / half-life – can we routinely achieve 6 months or greater duration of protection?
- Route of administration – can we optimize for intramuscular injection?
- Shelf-life – can we routinely lyophilize and reconstitute?
- Greater avidity – can we develop countermeasures with increased binding and clearance?
- Aggregation—can we minimize the aggregation potential of monoclonal antibodies?

Other directed applications that optimize manufacturability will also be considered.

The DoD has made significant investments in the development of antibody-based MCMs, and as such, has access to a potential "learning set" of proteins that could aid in the development of a useful algorithm. While not required, there may be some benefits to partnering with groups that have been involved in the design of antibodies against pathogens of interest to the DoD. Further guidance on potential partnerships/collaborations may be provided with each full proposal invitation.

The end state for this work will be a validated algorithm capable of optimizing an existing antibody for specific biological properties and the accompanying laboratory data to prove its predictability.

Proposals for small molecules will not be considered.

Thrust Area 7, Topic I3: Identification of Common Molecular Pathways Associated Chemical Warfare Agent (CWA)-Induced Inflammation

Award Amounts for this topic are anticipated to be between $250,000 and $500,000 per year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of two (2) years with up to three (3) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Background: Chemical warfare agents (CWAs) are amongst the most brutal weapons of mass destruction (WMD) created by mankind. CWAs are extremely toxic synthetic chemicals that can be dispersed as a gas, liquid or aerosol or as agents adsorbed to particles to become a powder. These CWAs have either lethal or incapacitating effects on humans. Thousands of toxic substances are known, but only some of them are considered as CWAs based on their characteristics, high toxicity, imperceptibility to senses and rapidity of action after dissemination and persistency, and are listed as scheduled chemicals in the Chemical Weapons Convention. The CWAs possess different characteristics and belong to various classes of compounds with pronounced physicochemical, physiological and chemical properties. While CWAs are known to cause a multitude of physiological insults, a common feature among many CWAs is the ability to provoke inflammation. The goal of this topic is to discover common molecular pathways

and/or mechanisms of action for inflammation that results from exposure to a broad range of chemicals – including nerve agents, pulmonary agents, blister agents, and other CBDP-relevant compounds.

Impact: Improved understanding of CWA-induced inflammation may point to novel therapeutic targets for intervention. Furthermore, identification of common molecular pathways and /or mechanisms of action for inflammation may enable the design or repurposing of potential therapeutics with broad spectrum action across a range of CWAs. Identification of novel therapeutic targets and or interventions are critical activities for advancing treatments associated with CWA exposure.

Objective: The objective of this topic is to solicit proposals that aim to both:

a) Characterize molecular pathways and/or mechanisms of action for CWA-induced inflammation. Competitive proposals will focus on inflammation from a broad range of CWA, including; nerve agents, pulmonary agents, blister agents, and other CBDP-relevant compounds. Additionally, proposals are expected to consider inflammation across a variety of tissues (e.g. nervous, epithelial, etc.). Activities may also rely upon both established and novel techniques (e.g. in-silico, in-vitro, ex-vivo, and in-vitro).

b) Identify common molecular pathways and/or mechanisms of action for CWA-induced inflammation that may be suggestive of novel targets for therapeutic intervention. An expected emphasis is in the identification of common inflammation-specific molecular elements that span CWAs and tissue type.

Thrust Area 7, Topic I-4: Identification of Novel Methods for Improving the Pharmacokinetic Properties of Proteins

Award Amounts for this topic are anticipated to be between $280,000 and $450,000 per year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of two (2) years with up to three (3) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Background: Prophylactic and therapeutic medical countermeasures (MCMs) for chemical and biological agents currently in development have limited circulatory stability and may elicit an immune response during repeat dosing. Therefore, the goal of this topic is the identification of novel methods for improving the Absorption Distribution Metabolism Excretion (ADME) properties specific to Excretion. This approach can incorporate either humanizing non-human proteins to decrease immunogenicity as well as identifying novel methods for increasing the half-life of biologic based MCMs. The first interest is the stabilization and decreased immunogenicity of antibodies derived from non-human sources (e.g. – murine model). The

second area of interest is identification of novel mechanisms to decrease methods of clearance and elimination to improve half-life of biologic MCMs (e.g. – increasing affinity of Fc to FcRN). Prolonged stability of therapeutic antibodies directed against chemical warfare agents (CWAs) or biological warfare agents (BWAs) has the potential to advance both novel and previously developed MCMs.

Impact: This research would be to be able to provide the Warfighter with an improved prophylactic and therapeutic MCMs against CWAs and BWAs. Discovery of novel technologies to improve the ADME properties of biologic MCMs such as antibodies would greatly increase the Warfighters' capability to operate during a biological or chemical attack.

Objective: The objective of this topic is to solicit proposals that aim to both:

a) Identify novel methods for humanizing non-human proteins to decrease immunogenicity and increase stability.

b) Provide solutions to extend the half-life of prophylactic or therapeutic MCMs.

Thrust Area 7, Topic I5: Receptor Mapping Across Humans and Animal Models

Award Amounts for this topic are anticipated to be between $250,000 and $500,000 per year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of two (2) years with up to three (3) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Background: A proper understanding of how receptors and enzymes map across humans and laboratory animal models is critical for providing relevant, translatable data necessary to develop safe and efficacious medical countermeasures for the warfighter. Little data exists that comprehensively compares the distribution (blood, brain, lung, heart, liver and kidney, etc.), type, and function of receptors that interact with the various chemical or biological warfare agents (CWAs and BWAs) in humans to those in the various laboratory animal models (mice, rates, guinea pigs, rabbits, ferrets, swine, and non-human primates). Such data would help determine which animal models are suited for studying the various CWAs and BWAs for their signs, symptoms and medical countermeasures. Receptors should include standard chemical weapon target receptors (AChE, GABA, opioid, and other CBDP-relevant chemical classes), as well as off-target receptors that have relatively high interactions with the chemicals of interest. Therefore, the goal of this topic is to utilize receptor mapping to aid in identifying the appropriate choice of animal models for medical countermeasures development studies as well as reveal potential areas for novel prophylactic and/or therapeutic intervention.

Impact: Understanding how receptors targeted by CWAs map and function across humans and laboratory animal models will allow for more relevant animal model selection in medical

countermeasure development.

Objective: The objective of this topic is to solicit proposals that aim to:

a) Define the type and distribution of receptors across humans and laboratory animal models for mice, rats, guinea pigs, rabbits, ferrets, swine, and non-human primates (NHP) to allow for more relevant animal model selection in medical countermeasure development. Targeted tissues in each animal model should include blood, brain, lung, heart, liver and kidney, etc. Receptors should include AChE, GABA, and opioid receptors, as well as off-target receptors that have relatively high interactions with CBDP relevant chemical classes.

b) Characterize the structural and physiological homologies of receptors and enzymes across humans and laboratory animal models for mice, rats, guinea pigs, rabbits, ferrets, swine, and NHP to allow for more relevant animal model selection in medical countermeasure development. Targeted tissues in each animal model should include blood, brain, lung, heart, liver and kidney, etc. Receptor and enzyme families should include AChE, GABA, opioid receptors, as well as off-target receptors that have relatively high interactions with the chemicals or biologics interest.

c) Amongst receptors and enzymes that differ significantly in their homology relative to human (characterized in Objective b, above), describe their relative affinities for (or inhibition by) chemicals of interest to include cholinesterase inhibitors, GABA inhibitors, opioids, biological toxins and other CBDP relevant chemical agents.

Thrust Area 7, Topic I6: Molecular Cascades for Signaling of Chemical and Biological Warfare Agents

Award Amounts for this topic are anticipated to be between $350,000 and $500,000 per year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of three (3) years with up to two (2) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Background: DTRA seeks to understand the design, synthesis, and characterization of a signal cascade or amplification scheme that may be incorporated into a stimuli responsive system which reacts and responds to chemical and biological warfare agents (CWAs and BWAs). In recent years, it has been shown that materials can selectively bind to CWAs and BWAs or stimulate a response. For example, aptamers and single domain antibodies have been explored for various assay applications for the detection of BWAs [Turner 2017; U.S. Patent US9310357B2]. Polymers can be synthesized to change shape or depolymerize when exposed to chemical warfare simulants [Sha, 2017; Phillips, 2014], or enzyme systems can be manipulated to elicit a pH or colorimetric change when exposed to CWAs [FLIR, 2017]. In addition,

responsive materials have been engineered for detection applications, as in the case of *"molecular beacons" for fluorescent detection of bacterial cells or spores*, or fluorophores released from shape responsive small molecules in the presence of cyanide [Jo, 2013]. However, in all cases, the response generated from the binding event is typically stoichiometric, not amplified sufficiently for live observation, and not amenable for non-assay based applications. A reaction scheme involving materials that bind CWA and BWA and elicit a cascade reaction leading to an amplified response for real-time observation is highly desired.

Impact: Successful novel materials that can be designed and scaled to react to CWA and BWAs can greatly enhance the capabilities of current contamination mapping efforts by enhancing protection and guiding decontamination.

Objective: This research topic seeks to develop a cascade reaction scheme involving a rationally-designed material that can bind to CWA and BWAs, resulting in an amplified response. The research should propose to: 1) Identify chemical and biological stimuli (i.e., signatures) that are unique to specific CWA and BWAs; 2) Iteratively design and synthesize materials that can bind to CWAs and BWAs, resulting in a cascade reaction scheme that leads to a rapid amplified response; and 3) Characterize amplified responses that support the iterative process of design and synthesis to achieve a sensitive response to one unit of CWAs and BWAs. A material or a reaction scheme that produces a change in infra-red or an anti-stokes shift is of particular interest to the agency; however, other acceptable responses include, but are not limited to, colorimetric, fluorescence, and phosphorescence. The amplified signal, or the cascade scheme should be robust and not easily interfered with from environmental factors: temperature, presence or absence of water/humidity, and pH. For example, BWA-responsive materials should be able to bind to specific signatures of the endospore and the vegetative bacteria and agnostic to delivery media (aqueous, solvent, or combination thereof). Ideal BWA-responsive materials would respond to a single colony or plaque forming unit of the BWA, with abilities to differentiate BWA strains through the amplified response or binding event.

Research areas may include, but are not limited to:

a) Studies involving multiplexed approaches for developing stimuli-responsive materials or classes of materials that respond to two or more CWAs or BWAs in the same sample, with the potential to identify CWAs or BWAs by the type of response;

b) Molecular-level interrogation of the interactions between a stimuli-responsive material and specific CWAs and BWAs (to include environmental requirements, specificity, sensitivity, and interference potential);

c) Approaches involving oligonucleotide aptamers or single domain antibodies or derivatives thereof.

A single model CWA or BWA can be used to demonstrate the technique or technology developed under this program; however, it is desired for the technology to be amenable to bind and react with a wide variety of agents. Due to the large body of literature and existing projects supporting responsive materials for CWAs, proposals wishing to study CWA responsive materials must address gaps in existing technologies supporting CWA contamination mapping. Proposals or teams looking to build sensors or devices will not be selected. Strategies and

partnerships for live agent testing of designed system is highly encouraged.

Thrust Area 7, Topic I7: An Every-Atom-Counts Approach to Designing Small Cluster Catalysts

Award Amounts for this topic are anticipated to be between $350,000 and $500,000 per year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of three (3) years with up to two (2) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Background: DTRA has invested considerable resources over the past two decades in the design and development of active materials for the capture and decomposition of chemical agents.

Relevance of Metal Oxide Research. In the 1990s and early 2000s much work was done in understanding properties of bulk metal oxides in supported/unsupported form to bind and decompose chemical agents at ambient and elevated temperatures. This period of work established an important benchmark as a historical departure from many decades of research on activated carbon chemistry. Insight into the role of the active nature of mixed metal oxides on porous activated carbons provided the motivation to explore these bulk oxides in a more rigorous manner. The results of this research showed important properties and limitations of certain metal systems to bind and decompose chemical agents. Many forms of the bulk oxides were shown to be limited in porosity which reduced accessibility of chemical adsorbates to a high number of

active centers. Bulk oxides demonstrated good hydrolytic chemistry at ambient temperatures due to the active nature of the proton on the metal-oxygen center (H-O-M) as well as binding with the Lewis acid metal. At high temperatures (350-900 ºC) these oxides showed increased activity for oxidation of chemical agents. The outcome of this body of work suggested that metal oxide systems of high porosity and accessibility to active centers (M-O-M) was critical to achieving high chemical adsorption and decomposition of chemical agents.

The emergence of reticulated metal organic frameworks in the middle of the last decade (~2005) provided new motivation to address the technical challenges as learned with bulk metal oxide systems. This era of periodic structures as presented by Metal Oxide Frameworks (MOF) and other related forms was driven by the rapidly emerging science of nanostructured materials in general, such as small metal cluster s (<10 nm) of Au, Ag and Pt in unsupported and supported form. For the past decade DTRA has invested heavily in understanding the structure and activity relationships of MOF. By design (in pristine form), MOFs are highly coordinated structures with high porosity making them attractive candidates for strong binding and active site utilization of adsorbed chemical agents. The chemistry of the MOF, like bulk metal oxides, demonstrate moderate to high hydrolytic chemistry for decomposition of chemical agents. Recently questions emerged regarding the role of defects in MOF structures and have provided additional motivation for understanding design rules regarding adsorption, diffusion and chemical decomposition. An important observation from all of the MOF work regarding chemical activity suggests that they are important platforms for inclusion of guest atoms and clusters that can be designed to enhance binding and decomposition beyond hydrolysis of chemical agents (such as oxidation and dealkylation).

Metal Atoms and Clusters. The next generation of active oxides centers on utilization of highly energetic forms of single atom and small clusters to promote stronger binding and molecular dissociation without the dependency on external energy sources (i.e., thermal, light). The ultimate small-size limit for metal particles is the single-atom catalyst (SAC), which contains isolated metal atoms singly dispersed on supports. SACs maximize the efficiency of metal atom use, which is particularly important for supported noble metal catalysts. Moreover, with well-defined and uniform single-atom dispersion, SACs offer great potential for achieving high activity and selectivity. Heterogeneous catalysis usually occurs at the surface of a solid catalyst, which ideally has a high surface area to volume ratio. For example, smaller metal particles have a higher fraction of surface atoms than do larger metal particles. This fraction not only has an impact on the fraction of metal atoms that are catalytically active (hereafter referred to as metal atom utilization), but also has a substantial effect on selectivity. The metal atom utilization in homogeneous molecular catalysts can reach 100% — a figure that may be orders of magnitude higher than that of heterogeneous catalysts. Heterogeneous catalysts might feature non-uniform aggregates of hundreds and/or thousands of metal atoms, only a small fraction of which are exposed to reactants. For example, the reactive, coordinately unsaturated metal atoms at apices, edges, steps and corners usually represent less than 20% of the total metal atoms. However, the surface free energy of metals increases significantly with decreasing particle size, promoting aggregation of small clusters. Using an appropriate support material that strongly interacts with the metal species prevents this aggregation, creating stable, finely dispersed metal clusters with a high catalytic activity, an approach industry has used for a long time.

Objective: To advance understanding on how to design new forms of highly active materials that exhibit new chemistries to bind, decompose and detoxify chemical agents of interest to

DTRA. This topic focuses on advancing the current knowledge in the design of active materials to provide tunable binding properties in order to promote highly efficient molecular dissociation (bond breaking) and detoxification of chemical agents. Specifically the work will concentrate on the design of very small metal oxide clusters (<2 nm) that possess a high surface concentration of undercoordinated metal centers to promote molecular dissociation through oxidation and dealkylation.

Research areas may include, but are not limited to:

a) Design of sub-nanometer clusters of metal atoms and molecules with strong size-dependent properties to promote active centers for binding and decomposition of chemical agents.

b) Employing theory and surface sensitive techniques to systematically investigate size-dependent properties of metal centers on binding and molecular dissociation of relevant systems (live agent/simulant).

c) Understanding the interactions of ambient chemicals on structure-activity of promising metal systems relevant to binding and dissociation of chemical adsorbates.

d) Investigating the dynamics of metal center aggregation and stabilization under ambient conditions, to include stabilizing substrates and environments to preserve activity of small metal clusters.

Thrust Area 7, Topic I8: Design Rules for a Biomimetic Membrane with Selective Water Permeability

Award Amounts for this topic are anticipated to be between $350,000 and $500,000 per year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of three (3) years with up to two (2) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable.

Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Background: DTRA seeks to understand the design and synthesis of biomimetic membranes that are selectively water permeable for use as protective barriers to CWAs. Current CWA protective barrier membranes like coated PTFE and butyl rubber offer high protection against CWA, but have low to no moisture vapor transport rates (MVTR). By contrast, in nature biological cells have highly selective membrane channels (e.g., aquaporins, AQP), that can selectively transport water molecules across membranes at a rate of 3×10^9 s^{-1} per channel [Groot, 2001], and have been impregnated in membranes for filtration applications [McCutcheon, 2017]. There is also a large body of literature describing synthetic water channels that transport water at equal or greater rates than biological channels, but with a significant loss of selectivity [Song, 2018]. For example, researchers have demonstrated synthetic membranes derived from self-assembled block copolymers with high selectivity and high tenability [Mulveena, 2014; Qu, 2015]. Ideally, biomimetic membrane channels might be leveraged to maximize selectivity and MVTR across the membrane while maintaining protection from CWAs. However, a number of knowledge gaps in critical areas must be addressed prior to achieving this, including: 1) Modeling at all length scales to develop a coherent molecular understanding of synthetic channel and membrane properties, provide insight for future materials design, and predict selectivity for water transport (and not CWA); 2) Basic understanding of compatibility of water transport channels in CWA protective polymer and tolerance to various processing conditions; 3) Fundamental understanding of biomimetic channel and membrane structure optimization to control transport properties; 4) Laboratory evaluation of membranes is often conducted with highly idealized mixtures, so separation performance in real applications with complex mixtures needs to be demonstrated; and 5) Lack of systematic understanding of methodologies to incorporate channels and scale promising membranes from the few square centimeters needed for laboratory characterization to the thousands of square meters needed for large applications impedes membrane deployment. Nevertheless, opportunities for biomimetic water-permeable channels and membranes in both existing and emerging technologies, together with an expanding set of membrane materials, hold great promise for the technology to effectively address CWA protection needs.

Impact: Successful design and synthesis of biomimetic, selective, water-permeable channels and their incorporation into substrate membranes could potentially be transformative in bringing new barrier technologies that are breathable, stretchable, and protective against CWA.

Objective: This research topic seeks to develop rational design approaches for robust, predictable and cost effective construction of synthetic membranes containing biomimetic water channels (natural, synthetic, or combination thereof) that can perform selective/facilitated transport of water molecules and air, and ability to block chemical warfare agent. The research should propose an iterative (spiral) approach to understand the opportunities for advancing biomimetic, water-selective, CWA impermeable membranes, to include: 1) novel discoveries in chemistries that lend themselves to scaling in a stimuli responsive system; 2) higher permeability and selectivity of water in membrane applications, without sacrificing CWA protection; and 3) membrane systems that lend itself to scaling. The biomimetic water channels can be derived from ruggedizing existing natural AQP channels or producing *de novo* [Lu, 2018] water selective

transmembrane proteins or synthetic channels that can tolerate chemical processing techniques. The biomimetic water channels can also be from completely synthetic materials embedded in a membrane. However, all membranes must be protective against CWA, and therefore strategies and partnerships for simulant (DMMP, 2-CEES) liquid and vapor permeation testing are highly encouraged.

Proposals offering only theoretical approaches (e.g., modeling) will not be entertained.

Research areas may include, but are not limited to:

a) Ruggedizing natural AQP through de novo design for incorporating on protective substrates;

b) Artificial water channels in self-assembled membrane substrates and testing against CWA

c) Other biomimetic mechanisms that could increase MVTR and selectivity without sacrificing protection

Thrust Area 7, Topic I9: Design of Repellant Permanent Thin Films for Chemical and Biological Agent Resistance

Award Amounts for this topic are anticipated to be between $500,000 and $1,000,000 per year (total dollar value = direct and indirect costs). In all cases, the proposed award value should be clearly substantiated by the scope of the effort. Further guidance on scope and cost may be provided in each full proposal invitation.

The preferred award structure for this topic is a base period of two (2) years with up to three (3) additional years as possible options. However, pre-application white papers and proposals that outline scope and effort for only the base period and do not propose options are also acceptable. Pre-application white papers and proposals that outline scope and effort for different base period and option combinations may also be considered; however, note that pre-application white papers and proposals that outline scope and effort that exceed a total of five (5) years will not be considered.

Background: Current chemical and biological agent resistant coatings fail to provide desired levels of contamination prevention. This means warfighters are required to expend significant effort during field decontamination of equipment. Attempts to control penetration of liquids into surfaces often harness the lotus leaf effect. This involves the use of a textured surface providing air-liquid and air-solid interfaces. For these surfaces, increases in pressure, for example applied weight or pressure washing, can lead to liquid intrusion into the textured surface resulting in a defeat of the repellent characteristic. The surface features that produce this effect also tend to be fragile. Alternatives to the lotus leaf effect have been described, including slippery liquid-infused porous surfaces (SLIPS) and slippery omniphobic covalently attached liquids (SOCAL). The liquid-liquid interaction interfaces of these materials address some shortfalls in the lotus effect, but current technologies tend to be temporary, or to weather poorly.

Improved coatings and thin films for agent resistance would decrease the logistical burden associated with decontamination of equipment by warfighters. In order to develop these materials, a fundamental understanding of the surfaces and the physical and chemical properties that assist with resisting contamination is needed. Ideally the thin film would allow for decreased sliding and shedding angles for agents and other contaminants as well as simplified decontamination approaches.

Impact: The research explored in this topic seeks to develop a fundamental understanding of a permanent technology for repelling chemical agents and decreasing the logistics of decontamination. Ideally, chemical and biological warfare agents and other contamination would be shed from coated surfaces, minimizing the need for additional decontamination strategies.

Objective: Proposals are sought for work which seeks to understand the fundamental aspects of coating technologies (or thin films) and how those aspects control penetration and repellency of chemical and biological warfare agents. The technologies should be permanent with a minimum persistence of 18-24 months and be transparent or offer pathways to achieving transparency. The work will include synthesis of the technology and evaluation of wetting by, and retention of, simulants for chemical warfare agents.

Research areas may include, but are not limited to:

a) Determination (theoretical or experimental) of composition impact on chemical agent resistance
    a. Experimental synthesis and characterization of the technologies and measurements at the laboratory scale with chemical warfare agent simulants
    b. Technologies must adhere to a polyurethane base coating
    c. CB warfare agent resistance with no more than 0.4% agent (or simulant) retention by the technology
    d. Technology must be compatible with military decontamination procedures or, ideally, with a water rinse
    e. Must be amenable to use under varying environmental conditions low/high temperatures, low/high humidity, continuous UV exposure, water/mud, and mechanical and thermal stresses etc.

f. Determination of chemical agent resistance over time (degradation of the thin film) physical, chemical mechanical and environmental
    i. Material should perform at initial metrics for a minimum of 18-24 months aging
    ii. Similar repellant performance in low/high temperatures, low/high humidity, mechanical stress, thermal stress, UV exposure after 18-24 months

b) Evaluation of chemical warfare agent simulant retention and repellency
    a. Technologies must be amenable to varying environmental conditions and provide a minimum resistance to chemical agents
    b. Applied technology layers must be thin while providing desired performance
    c. Thin films must be durable to mechanical and thermal stresses
    d. Determination of agent (simulant) retention/penetration after rinsing with water

The focus of proposals should be on development of thin film or coating technology and its characterization. Proposals should show preliminary simulant retention or wetting data, or evidence that the technology is capable of providing repellency. Finally, simplicity in the synthetic approach and in coating application is paramount for potential follow-on manufacturing and scaling; successful technologies could be candidates for transition to a product. The potential for development of a one-step spray coating is highly desirable.

ATTACHMENT 2: INTELLECTUAL PROPERTY

(Applies to FAR Contracts & OTAs)

Applicants must describe any limitations on the use of any intellectual property (patents, inventions, trade secrets, copyrights, trademarks, technical data or computer software) that will impact the offeror's performance of the contract or impact the Government's subsequent use of any deliverable under the contract. In particular, the applicant must describe the intellectual property in sufficient detail and describe the limitations on its use (potential patent licenses required by the Government, data assertions of the offeror or any subcontractor, etc.) and describe how the Government can accomplish the stated objectives of this BAA with the limitations described or proposed by the offeror.

Patents. Applicants must list any known patents, patent applications, or inventions which the offeror may be required to license in order to perform the work described in the Applicant's proposal, or which the Government may be required to license to make or use the deliverables of the contract should the Applicant's proposal be selected for award. For any patent, patent application or invention listed, the Offeror must provide the invention title, a summary of the invention, patent number, patent application publication number, or provisional patent application number, and indicate whether the offeror is the patent or invention owner. If a patent or invention is in-licensed by the offeror, identify the licensor.

If any listed patent, patent application or invention is owned or licensed by the applicant, the applicant must provide a statement, in writing, confirming that it either owns or possesses the appropriate licensing rights to patent, patent application or invention to perform the work described in the proposal and/or to grant the Government a license to make or use the deliverables for this program. If any listed patent, patent application or invention is not owned or licensed by the applicant, then the applicant must explain how it will obtain a license, how the Government may obtain a license and/or whether the offeror plans to obtain these rights on behalf of the Government.

Be advised that no patent, patent application, or invention disclosure will be accepted if identified in the Data Rights Assertion list. **The list of patents, patent applications, and inventions of this section must be a separate list from the Data Rights Assertion list.**

Government rights in any technology that might be invented or reduced to practice under the contract are addressed in the patent rights clause to be included in the contract.

Data Rights. Applications submitted in response to this BAA shall identify, to the extent known at the time an offer is submitted to the Government, the technical , the technical data, or computer software that the Offeror, its subcontractors or suppliers, or potential subcontractors or suppliers assert should be furnished to the Government with restrictions on use, release, or disclosure, in accordance with DFARS 252.227-7017, Identification and Assertion of Use, Release or Disclosure Restrictions, and DFARS 252.227-7028, Technical Data or Computer Software Previously Delivered to the Government. The applicant's assertions, including the assertions of its subcontractors or suppliers, or potential subcontractors or suppliers, shall be submitted in the following format, dated and signed by an official authorized to contractually obligate the applicant. If the applicant will deliver all technical data and computer software to the Government without restrictions, enter "NONE" in this table under the heading "Technical Data or Computer Software to be Furnished with Restrictions."

Identification and Assertion of Restrictions on the Government's Use, Release, or Disclosure of Technical Data or Computer Software.

The applicant asserts for itself, or the persons identified below, that the Government's rights to use, release, or disclose the following technical data or computer software should be restricted:

Technical Data or Computer Software to be Furnished with Restrictions*	Basis for Assertion**	Asserted Rights Category***	Name of Person Asserting Restrictions****
(LIST)*****	(LIST)	(LIST)	(LIST)

*For technical data (other than computer software documentation) pertaining to items, components, or processes developed at private expense, identify both the deliverable technical data and each such item, component, or process. For computer software or computer software documentation identify the software or documentation.

**Generally, development at private expense, either exclusively or partially, is the only basis for asserting restrictions. For technical data, other than computer software documentation, development refers to development of the item, component, or process to which the data pertain. The Government's rights in computer software documentation generally may not be restricted. For computer software, development refers to the software. Indicate whether development was accomplished exclusively or partially at private expense. If development was not accomplished at private expense, or for computer software documentation, enter the specific basis for asserting restrictions.

***Enter asserted rights category (e.g., government purpose license rights from a prior contract, rights in SBIR data generated under another contract, limited, restricted, or government purpose rights under this or a prior contract, or specially negotiated licenses).

****Corporation, individual, or other person, as appropriate.

*****Enter “none” when all data or software will be submitted without restrictions.

Date _____
Printed Name _____
Printed Title _____
Signature _____

Applicants responding to this BAA requesting an Other Transaction or Other Transaction for Prototype shall specifically identify any asserted restrictions on the Government’s use of intellectual property contemplated under those award instruments. For this purpose, offerors must propose specific Intellectual Property terms and conditions and a data deliverable list. Further, the offerors must explain why an Other Transaction is necessary and, in particular, how the intellectual property terms and conditions proposed will meet the objectives of this BAA.

I. OVERVIEW OF THE FUNDING OPPORTUNITY

Program Announcement for the Department of Defense

Defense Health Program

Congressionally Directed Medical Research Programs

Peer Reviewed Medical Research Program

Investigator-Initiated Research Award

Announcement Type: Initial

Funding Opportunity Number: W81XWH-19-PRMRP-IIRA

Catalog of Federal Domestic Assistance Number: 12.420 Military Medical Research and Development

SUBMISSION AND REVIEW DATES AND TIMES

- **Pre-Application Submission Deadline:** 5:00 p.m. Eastern time (ET), March 14, 2019
- **Invitation to Submit an Application:** May 2019
- **Application Submission Deadline:** 11:59 p.m. ET, July 11, 2019
- **End of Application Verification Period:** 5:00 p.m. ET, July 16, 2019
- **Peer Review:** August 2019
- **Programmatic Review:** October/November 2019

This Program Announcement must be read in conjunction with the General Application Instructions, version 20181120. The General Applications Instructions document is available for downloading from the Grants.gov funding opportunity announcement by selecting the "Package" tab, clicking "Preview," and then selecting "Download Instructions."

II. DETAILED INFORMATION ABOUT THE FUNDING OPPORTUNITY

II.A. Program Description

Applications to the Fiscal Year 2019 (FY19) Peer Reviewed Medical Research Program (PRMRP) are being solicited for the Defense Health Agency (DHA) J9, Research and Development Directorate, by the U.S. Army Medical Research Acquisition Activity (USAMRAA) using delegated authority provided by United States Code, Title 10, Section 2358 (10 USC 2358). As directed by the Office of the Assistant Secretary of Defense for Health Affairs (OASD[HA]), the DHA manages the Defense Health Program (DHP) Research, Development, Test, and Evaluation (RDT&E) appropriation. The execution management agent for this Program Announcement is the Congressionally Directed Medical Research Programs (CDMRP). The PRMRP was initiated in 1999 to provide support for military health-related research of exceptional scientific merit. Appropriations for the PRMRP from FY99 through FY18 totaled $2.0 billion (B). The FY19 appropriation is $350 million (M).

The vision of the FY19 PRMRP is to improve the health, care, and well-being of all military Service members, Veterans, and beneficiaries. The PRMRP challenges the scientific and clinical communities to address at least one of the FY19 PRMRP Topic Areas with original ideas that foster new directions along the entire spectrum of research and clinical care. The program seeks applications in laboratory, clinical, behavioral, epidemiologic, and other areas of research to advance knowledge in disease etiology, improve prevention, detection, diagnosis, treatment, and quality of life for those affected by a relevant disease or condition, and to develop and validate clinical care or public health guidelines.

II.A.1. FY19 PRMRP Topic Areas

All applications for PRMRP funding must specifically address at least one of the Topic Areas as directed by Congress and must be of clear scientific merit and direct relevance to military health. If the proposed research does not specifically address at least one of the FY19 PRMRP Topic Areas, the Government will administratively withdraw the application. The Government reserves the right to reassign the application's Topic Area if submitted under an inappropriate Topic Area. The FY19 PRMRP Topic Areas are listed below.

- Acute Lung Injury
- Antimicrobial Resistance
- Arthritis
- Burn Pit Exposure
- Cardiomyopathy
- Cerebellar Ataxia
- Chronic Migraine and Post-Traumatic Headache
- Congenital Heart Disease
- Constrictive Bronchiolitis
- Diabetes
- Dystonia
- Eating Disorders

- Emerging Infectious Diseases
- Epidermolysis Bullosa
- Focal Segmental Glomerulosclerosis
- Frontotemporal Degeneration
- Guillain-Barré Syndrome
- Hemorrhage Control
- Hepatitis B
- Hereditary Angioedema
- Hydrocephalus
- Immunomonitoring of Intestinal Transplants
- Inflammatory Bowel Diseases
- Interstitial Cystitis
- Lung Injury
- Metals Toxicology
- Mitochondrial Disease
- Musculoskeletal Disorders
- Myotonic Dystrophy
- Nanomaterials for Bone Regeneration
- Nutrition Optimization
- Pancreatitis
- Pathogen-Inactivated Blood Products
- Polycystic Kidney Disease
- Post-Traumatic Osteoarthritis
- Pressure Ulcers
- Pulmonary Fibrosis
- Resilience Training
- Respiratory Health
- Rett Syndrome
- Rheumatoid Arthritis
- Scleroderma
- Sleep Disorders
- Spinal Muscular Atrophy
- Tinnitus
- Tissue Regeneration
- Tuberculosis
- Vascular Malformations
- Women's Heart Disease

Applicants should select the FY19 Program Announcement most appropriate to the stage of the proposed research. Areas of Encouragement related to the FY19 PRMRP Topic Areas have been identified by the Department of Defense (DoD), the Department of Veterans Affairs (VA), and other relevant stakeholders (Appendix 2). Applicants are urged to read and consider these Areas of Encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an Area of Encouragement on this list.***

II.B. Award Information

The PRMRP Investigator-Initiated Research Award (IIRA) is intended to support studies that will make an important contribution toward research and/or patient care for a disease or condition related to at least one of the FY19 PRMRP Topic Areas.

The rationale for a research idea may be derived from a laboratory discovery, population-based studies, a clinician's first-hand knowledge of patients, or anecdotal data. Applications must include relevant data that support the rationale for the proposed study. These data may be unpublished or from the published literature.

Impact: The Investigator-Initiated Research Award is designed to support research with the potential to yield highly impactful data that could lead to critical discoveries or major advancements. The application must clearly demonstrate the project's potential immediate and long-range outcome(s)/product(s) (knowledge and/or materiel) and how they will impact a central critical problem or question in the field of research and/or patient care in the FY19 PRMRP Topic Area(s) addressed.

Research projects may focus on any phase of research from basic laboratory research through translational research, including preclinical studies in animal models and human subjects, as well as correlative studies associated with an existing clinical trial. Research involving human subjects and human anatomical substances is permitted; ***however, this award may not be used to conduct clinical trials.*** A clinical trial is defined as a prospective accrual of patients (human subjects) in whom an intervention (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the subject of that intervention or interaction. For more information on how to distinguish clinical research from clinical trials, see the Human Subject Resource Document at https://ebrap.org/eBRAP/public/Program.htm. Principal Investigators (PIs) seeking funding for a clinical trial should apply to the FY19 PRMRP Clinical Trial Award mechanism (Funding Opportunity Number: W81XWH-19-PRMRP-CTA).

The anticipated direct costs budgeted for the entire period of performance for a single PI FY19 PRMRP IIRA award will not exceed **$1.2M**. The anticipated direct costs budgeted for the entire period of performance for an FY19 PRMRP IIRA award with the Partnering PI Option will not exceed **$1.5M**. Refer to Section II.D.5, Funding Restrictions, for detailed funding information.

The CDMRP expects to allot approximately $79.6M to fund approximately 42 Investigator-Initiated Research Award applications. Funding of applications received is contingent upon the availability of Federal funds for this program as well as the number of applications received, the quality and merit of the applications as evaluated by scientific and programmatic review, and the requirements of the Government. Funds to be obligated on any award resulting from this funding opportunity will be available for use for a limited time period based on the fiscal year of the funds. It is anticipated that awards made from this FY19 funding opportunity will be funded with FY19 funds, which will expire for use on September 30, 2025.

Awards will be made no later than September 30, 2020. For additional information, refer to Section II.F.1, Federal Award Notices.

The types of awards made under the Program Announcement will be assistance agreements (grants or cooperative agreements). The level of involvement on the part of the DoD during project performance is the key factor in determining whether to award a grant or cooperative agreement.

An assistance agreement (grant or cooperative agreement) is appropriate when the Federal Government transfers a "thing of value" to a "state, local government," or "other recipient" to carry out a public purpose of support or stimulation authorized by a law of the United States, instead of acquiring property or service for the direct benefit and use of the U.S. Government. An assistance agreement can take the form of a grant or cooperative agreement. If "no substantial involvement" on the part of the funding agency is anticipated, a grant award will be made (31 USC 6304). Conversely, if substantial involvement on the part of the funding agency is anticipated, a cooperative agreement will be made (31 USC 6305) and the award will identify the specific substantial involvement. Substantial involvement may include collaboration, participation, or intervention in the research to be performed under the award. The award type, along with the start date, will be determined during the negotiation process.

Partnering PI Option: As a method to bring new perspectives in addressing the critical problem or question and facilitate progress in the field through collaborative efforts, the FY19 PRMRP is offering a Partnering PI Option for this award mechanism. The results of this partnering project should significantly advance the research beyond what would be possible through individual efforts. The Partnering PI Option is structured so that two investigators, each of whom will be designated as a PI, work synergistically on a single project. Each PI should bring complementary skills and perspectives to the research project. Developing the research plan should involve a reciprocal flow of ideas and information between the partners. The application should clearly demonstrate that both PIs have equal intellectual input into the design of the project and will devote equivalent levels of effort to the conduct of the project. Each PI must demonstrate that they possess the research experience and resources to function as a PI and must also exhibit an appropriate level of authority and responsibility to direct the project supported by the awards. ***New and multi-institutional collaborative efforts are strongly encouraged.*** PIs should include plans for communication between investigators at different organizations, if applicable. Additionally, participating organizations must be willing to resolve potential intellectual and material property issues and to remove any barriers that might interfere with achieving high levels of cooperation to ensure successful completion of the proposed research project.

For the application process, one PI will be identified as the Initiating PI and will be responsible for the majority of the administrative tasks associated with application submission. The other PI will be identified as the Partnering PI. Initiating and Partnering PIs each have different submission requirements, as described in Section II.D.2, Content and Form of the Application Submission; however, both PIs should contribute significantly to the development of the proposed research project, including the Project Narrative, Statement of Work, and other required components. If recommended for funding, each PI will receive their own award. ***A separate application submission is required for each partner, even if both PIs are at the same***

organization. Additional collaborators may be included in the application without being designated as PIs.

Applications submitted under the Partnering PI Option are allowed to request a higher direct cost budget than applications submitted with a single PI (see Section II.D.5, Funding Restrictions, for details). Costs should be divided as evenly as possible between both partners unless appropriately justified, but no more than 75% (or no less than 25%) of the proposed direct costs may be requested by a single partner. Submission of a Partnership Statement, Attachment 8, is required for applications submitted under the Partnering PI Option.

Relevance to Military Health: Relevance to the healthcare needs of military Service members, Veterans, military beneficiaries, and/or the American public is a key feature of this award. Investigators are encouraged to consider the following characteristics as examples of how a project may demonstrate relevance to military health:

- Explanation of how the project addresses an aspect of the target disease/condition/technology that has direct relevance or is unique to the health of military Service members, Veterans, or beneficiaries

- Explanation of how the project addresses an aspect of the target disease/condition/technology that has relevance or is unique to the military or family readiness of Service members

- Description of how the knowledge, information, products, or technologies gained from the proposed research could be implemented in a dual-use capacity to benefit the civilian population and also address a military need

- Use of military or Veteran populations or datasets, if appropriate to the proposed research

PIs are encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. A list of websites that may be useful in identifying additional information about ongoing DoD and VA areas of research interest or potential opportunities for collaboration within the FY19 PRMRP Topic Areas can be found in Appendix 2.

Use of DoD or VA Resources: If the proposed research involves access to active duty military patient populations and/or DoD resources or databases, the application must describe the access at the time of submission and include a plan for maintaining access as needed throughout the proposed research. Access to target active duty military patient population(s) and/or DoD resource(s) or database(s) should be confirmed by including a letter of support, signed by the lowest-ranking person with approval authority.

If the proposed research involves access to VA patient populations, VA study resources and databases, and/or VA research space and equipment, VA PIs/Co-PIs must have a plan for obtaining and maintaining access throughout the proposed research. Access to VA patients, resources, and/or VA research space should be confirmed by including a letter of support from the VA Facility Director(s) or individual designated by the VA Facility Director(s), such as the Associate Chief of Staff for Research and Development (ACOS/R&D) or Clinical Service Chief. If appropriate, the application should identify the VA-affiliated non-profit corporation (NPC) as

the applicant institution for VA PIs. If the VA NPC is not identified as the applicant institution for administering the funds, the application should include a letter from the VA ACOS/R&D confirming this arrangement and identifying the institution that will administer the funds associated with the proposed research.

Access to certain DoD or VA patient populations, resources, or databases may only be obtained by collaboration with a DoD or VA investigator who has a substantial role in the research and may not be available to a non-DoD or non-VA investigator if the resource is restricted to DoD or VA personnel. Investigators should be aware of which resources are available to them if the proposed research involves a non-DoD or non-VA investigator collaborating with the DoD and/or VA. If access cannot be confirmed at the time of application submission, the Government reserves the right to withdraw or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resource(s). Refer to Section II.D.2.b.ii, Full Application Submission Components, for detailed information.

Research Involving Human Anatomical Substances, Human Subjects, or Human Cadavers: All DoD-funded research involving new and ongoing research with human anatomical substances, human subjects, or human cadavers must be reviewed and approved by the U.S. Army Medical Research and Materiel Command (USAMRMC) Office of Research Protections (ORP), Human Research Protection Office (HRPO), prior to research implementation. This administrative review requirement is in addition to the local Institutional Review Board (IRB) or Ethics Committee (EC) review. Local IRB/EC approval at the time of submission is ***not*** required. The HRPO is mandated to comply with specific laws and requirements governing all research involving human anatomical substances, human subjects, or human cadavers that is supported by the DoD. These laws and requirements will necessitate information in addition to that supplied to the IRB/EC. ***Allow a minimum of 2 to 3 months for HRPO regulatory review and approval processes***. Additional time for regulatory reviews may be needed for clinical studies taking place in international settings. When possible, protocols should be written for research with human subjects and/or human anatomical substances that are specific to the DoD-supported effort outlined in the submitted application as a stand-alone study. Submission to HRPO of protocols involving more than the scope of work in the DoD-funded award will require HRPO review of the entire protocol (DoD and non-DoD funded). DoD human subjects protection requirements may be applied to non-DoD funded work and necessitate extensive revisions to the protocol. Applications that involve recruitment of human subjects must indicate the quarterly enrollment targets across all sites in Attachment 5: Statement of Work (SOW). Successful applicants will work with USAMRAA to establish milestones for human subjects recruitment. Continued support for the project will be based upon satisfactory progress in meeting the established milestones. Refer to the General Application Instructions, Appendix 1, and the Human Subject Resource Document available on the electronic Biomedical Research Application Portal (eBRAP) "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) for additional information.

Research Involving Animals: All projects should adhere to a core set of standards for rigorous study design and reporting to maximize the reproducibility and translational potential of preclinical research. The standards are described in Landis, S.C., et al. A call for transparent reporting to optimize the predictive value of preclinical research, *Nature* 2012, 490:187-191 (www.nature.com/nature/journal/v490/n7419/full/nature11556.html). While these standards are

written for preclinical studies, the basic principles of randomization, blinding, sample-size estimation, and data handling derive from well-established best practices in clinical studies. Applicants should consult the ARRIVE (Animal Research: Reporting *In Vivo* Experiments) guidelines to ensure relevant aspects of rigorous animal research are adequately planned for and, ultimately, reported. The ARRIVE guidelines can be found at http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf.

All DoD-funded research involving new and ongoing research with animals must be reviewed and approved by the USAMRMC ORP Animal Care and Use Review Office (ACURO), in addition to the local Institutional Animal Care and Use Committee (IACUC) of record. IACUC approval at the time of submission is ***not*** required. Specific documents relating to the use of animals in the proposed research will be requested **if the application is selected for funding**. The ACURO must review and approve all animal use prior to the start of working with animals, including amendments to ongoing projects. PIs must submit the institutional animal use protocol, IACUC approval of that protocol, and a version of the animal use appendix titled, "Research Involving Animals." ***Allow at least 2 to 3 months for ACURO regulatory review and approval processes for animal studies.*** Refer to the General Application Instructions, Appendix 1, for additional information.

The CDMRP intends that information, data, and research resources generated under awards funded by this Program Announcement be made available to the research community (which includes both scientific and consumer advocacy communities) and to the public at large. For additional guidance, refer to the General Application Instructions, Appendix 2, Section K.

II.C. Eligibility Information

II.C.1. Eligible Applicants

II.C.1.a. Organization: All organizations, including international organizations, are eligible to apply.

Government Agencies Within the United States: Local, state, and Federal Government agencies are eligible to the extent that applications do not overlap with their fully funded internal programs. Such agencies are required to explain how their applications do not overlap with their internal programs.

As applications for this Program Announcement may be submitted by extramural and intramural organizations, these terms are defined below.

Extramural Organization: An eligible non-DoD organization. Examples of extramural organizations include academic institutions, biotechnology companies, foundations, other Federal Government organization other than the DoD, and research institutes.

Intramural DoD Organization: A DoD laboratory, DoD military treatment facility, and/or DoD activity embedded within a civilian medical center.

Note: Applications from an intramural DoD organization or from an extramural Federal Government organization may be submitted to Grants.gov through a research foundation.

The USAMRAA makes awards to eligible organizations, not to individuals.

II.C.1.b. Principal Investigator

- Investigators at or above the level of Assistant Professor (or equivalent) may be named by the organization as the PI on the application.
    - **Partnering PI Option:** Investigators at or above the level of Assistant Professor (or equivalent) that bring complementary skills and perspectives to the research project.

An eligible PI, regardless of ethnicity, nationality, or citizenship status, must be employed by, or affiliated with, an eligible organization.

The CDMRP encourages all PIs to participate in a digital identifier initiative through Open Researcher and Contributor ID, Inc. (ORCID). Registration for a unique ORCID identifier can be done online at https://orcid.org/.

II.C.2. Cost Sharing

Cost sharing/matching is not an eligibility requirement.

II.C.3. Other

Organizations must be able to access **.gov** and **.mil** websites in order to fulfill the financial and technical deliverable requirements of the award and submit invoices for payment.

There are no limitations on the number of applications for which an investigator may be named as a PI or Partnering PI.

For general information on required qualifications for award recipients, refer to the General Application Instructions, Appendix 3.

Refer to Section II.H.2, Administrative Actions, for a list of administrative actions that may be taken if a pre-application or application does not meet the administrative, eligibility, or ethical requirements defined in this Program Announcement.

II.D. Application and Submission Information

Submission of applications that are essentially identical or propose essentially the same research project to different funding opportunities within the FY19 PRMRP is prohibited and will result in administrative withdrawal of the duplicative application(s). As an exception, applicants may submit the research project described in their Investigator-Initiated Research Award application as part of an application to the FY19 PRMRP Focused Program Award (Funding Opportunity Number: W81XWH-19-PRMRP-FPA); however, accepting multiple awards to support the same project will not be allowed.

Extramural Submission: An application submitted by an organization to Grants.gov.

Intramural DoD Submission: An application submitted by a DoD organization to eBRAP.

II.D.1. Address to Request Application Package

eBRAP is a multifunctional web-based system that allows PIs to submit their pre-applications electronically through a secure connection, to view and edit the content of their pre-applications and full applications, to receive communications from the CDMRP, and to submit documentation during award negotiations and period of performance.

Extramural Submissions:

- Pre-application content and forms must be accessed and submitted at eBRAP.org.
- Full application packages must be accessed and submitted at Grants.gov.

Intramural DoD Submissions:

- Pre-application content and forms must be accessed and submitted at eBRAP.org.
- Full application packages must be accessed and submitted at eBRAP.org.

Contact information for the CDMRP Help Desk and the Grants.gov Contact Center can be found in Section II.G, Federal Awarding Agency Contacts.

II.D.2. Content and Form of the Application Submission

Submission is a two-step process requiring both ***pre-application*** and ***full application*** as indicated below. The submission process should be started early to avoid missing deadlines. There are no grace periods.

Pre-Application Submission: All pre-applications for both extramural and intramural organizations must be submitted through eBRAP (https://eBRAP.org/).

Full Application Submission: Full applications must be submitted through the online portals as described below.

Extramural Organization Submissions: Full applications from extramural organizations must be submitted through Grants.gov Workspace. Applications submitted by extramural organizations (e.g., research foundations) on behalf of intramural DoD or other Federal organizations or investigators will be considered extramural submissions. Applications from extramural organizations, including non-DoD Federal organizations, received through eBRAP will be withdrawn. See definitions in Section II.C.1, Eligible Applicants.

Intramural DoD Organization Submissions: Intramural DoD organizations may submit full applications to either eBRAP or Grants.gov. Intramural DoD organizations that are unable to submit to Grants.gov should submit through eBRAP. Intramural DoD organizations with the

capability to submit through Grants.gov may submit following the instructions for extramural submissions through Grants.gov or may submit to eBRAP.

For Both Extramural and Intramural Applicants: eBRAP allows an organization's representatives and PIs to view and modify the full application submissions associated with them. eBRAP will validate full application files against the specific Program Announcement requirements, and discrepancies will be noted in an email to the PI and in the "Full Application Files" tab in eBRAP. It is the applicant's responsibility to review all application components for accuracy as well as ensure proper ordering as specified in this Program Announcement.

The application title, eBRAP log number, and all information for the PI, Business Official(s), performing organization, and contracting organization must be consistent throughout the entire pre-application and full application submission process. Inconsistencies may delay application processing and limit or negate the ability to view, modify, and verify the application in eBRAP. If any changes need to be made, the applicant should contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 prior to the application submission deadline.

The Investigator-Initiated Research Award mechanism is structured to accommodate two PIs under the Partnering PI Option. One PI will be identified as the Initiating PI and will be responsible for the majority of the administrative tasks associated with application submission. The other PI will be identified as the Partnering PI. Initiating and Partnering PIs each have different submission requirements; however, both PIs should contribute significantly to the development of the proposed research project, including the Project Narrative, Statement of Work, and other required components.

The Initiating PI must complete the pre-application submission process and submit the contact information for the Partnering PI. The Partnering PI will then be notified of the pre-application submission separately by email. ***The Partnering PI must follow the link in the notification email in order to associate his/her full application package with that of the Initiating PI. After following the link, the Partnering PI must verify his/her contact information, organization, and designation as an extramural or intramural submission within eBRAP.*** If not previously registered, the Partnering PI must register in eBRAP. A new pre-application based on this research project should not be initiated by the Partnering PI. Do not delay completing these steps. If they are not completed, the Partnering PI will not be able to view and modify his/her application during the verification period in eBRAP. If these steps are not completed, an intramural partner will not be able to submit the Partnering PI required full application package components to eBRAP.

II.D.2.a. Step 1: Pre-Application Submission Content

During the pre-application process, eBRAP assigns each submission a unique log number. This unique eBRAP log number is required during the full application submission process.

To begin the pre-application process, first select whether the submitting organization is extramural or intramural, then confirm your selection or cancel. **Incorrect selection of extramural or intramural submission type will delay processing.**

If an error has been made in the selection of extramural versus intramural and the pre-application submission deadline has passed, the PI or Business Official must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 to request a change in designation.

All pre-application components must be submitted by the PI (for single PI applicants) or Initiating PI (for applicants submitting under the Partnering PI Option) through eBRAP (https://eBRAP.org/). Because the invitation to submit an application is based on the contents of the pre-application, investigators should not change the title or research objectives after the pre-application is submitted.

The applicant organization and associated PIs identified in the pre-application should be the same as those intended for the subsequent application submission. If any changes are necessary after submission of the pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

PIs with an ORCID identifier should enter that information in the appropriate field in the "My Profile" tab in the "Account Information" section of eBRAP.

The pre-application consists of the following components, which are organized in eBRAP by separate tabs (refer to the General Application Instructions, Section II.B, for additional information on pre-application submission):

- **Tab 1 – Application Information**

  Submission of application information includes assignment of primary and secondary research classification codes, which may be found at https://ebrap.org/eBRAP/public/Program.htm. Note that the codes have recently been revised. Applicants are strongly encouraged to review and confirm the codes prior to making their selection.

  Select the FY19 PRMRP Topic Area addressed by the proposed research. If the proposed research project is aligned with more than one FY19 PRMRP Topic Area, select the Topic Area of highest relevance as the required first choice.

- **Tab 2 – Application Contacts**

  Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration (the "person to be contacted on matters involving this application" in Block 5 of the Grants.gov SF424 Research & Related Form). The Business Official must be either selected from the eBRAP list or invited in order for the pre-application to be submitted.

  Select the performing organization (site at which the PI will perform the proposed work) and the contracting organization (organization submitting on behalf of the PI, which corresponds to Block 5 on the Grants.gov SF424 Research & Related Form), and click on "Add Organizations to this Pre-application." The organization(s) must be either selected from the eBRAP drop-down list or invited in order for the pre-application to be submitted.

It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-application submission is needed.

- **Tab 3 – Collaborators and Key Personnel**

  Enter the name, organization, and role of all collaborators and key personnel associated with the application. The Initiating PI must enter the contact information for the Partnering PI in the Partnering PI section.

  FY19 PRMRP Programmatic Panel members should not be involved in any pre-application or application. For questions related to panel members and pre-applications or applications, refer to Section II.H.2.c, Withdrawal, or contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

- **Tab 4 – Conflicts of Interest**

  List all individuals other than collaborators and key personnel who may have a COI in the review of the application (including those with whom the PI has a personal or professional relationship).

- **Tab 5 – Pre-Application Files**

  Note: Upload documents as individual PDF files unless otherwise noted. eBRAP will not allow a file to be uploaded if the number of pages exceeds the limit specified below.

  - **Preproposal Narrative (four-page limit):** The Preproposal Narrative page limit applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Preproposal Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the pre-application.

    The Preproposal Narrative should include the following:

    - **Topic Area:** Describe how the proposed project relates to at least one of the FY19 PRMRP Topic Areas. If applicable, describe how the proposed research project addresses an FY19 PRMRP Area of Encouragement (Appendix 2).

    - **Research Idea:** Clearly articulate the rationale for the project by presenting the ideas and reasoning behind the proposed research; include relevant literature citations.

    - **Research Strategy:** State the hypothesis to be tested and the objective(s) to be reached. State the project's specific aims and briefly describe the experimental approach. If applying under the Partnering PI Option, describe how the collaborative effort will provide synergy and enhance the research.

- **Impact:** Describe the potential short-term and long-term impact of the results of the proposed study on at least one of the FY19 PRMRP Topic Areas, and its related research field(s) and/or patient population(s).

- **Relevance to Military Health:** Explain how the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

  - **Pre-Application Supporting Documentation:** The items to be included as supporting documentation for the pre-application ***must be uploaded as individual files*** and are limited to the following:

    - References Cited (one-page limit): List the references cited (including URLs if available) in the Preproposal Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, reference title, and reference source, including volume, chapter, page numbers, and publisher, as appropriate).

    - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols used in the Preproposal Narrative.

    - Key Personnel Biographical Sketches (five-page limit per individual): ***All biographical sketches should be uploaded as a single combined file.*** Biographical sketches should be used to demonstrate background and expertise through education, positions, publications, and previous work accomplished.

- **Tab 6 – Submit Pre-Application**

  This tab must be completed for the pre-application to be accepted and processed.

Pre-Application Screening

- **Pre-Application Screening Criteria**

  To determine the technical merits of the pre-application and the relevance to the mission of the DHP and the PRMRP, pre-applications will be screened based on the following criteria:

  - **Research Idea:** How well the rationale for the research idea is supported by presented background information.

  - **Research Strategy:** How well the specific aims and proposed methodology support the research idea and objectives. If applying under the Partnering PI Option, how the partnership will advance the research beyond what would be possible through individual efforts.

  - **Impact:** Whether the potential immediate and long-range outcome(s)/product(s) (knowledge and/or materiel) of the proposed research, if successful, will impact a central critical problem or question in the field of research and/or patient care in the FY19 PRMRP Topic Area(s) addressed.

- **Programmatic Relevance:** Whether the proposed research idea supports the objectives of the PRMRP. To what degree the project is relevant to the healthcare needs of military Service members, Veterans, and/or beneficiaries.

- **Notification of Pre-Application Screening Results**

  Following the pre-application screening, PIs (or Initiating PIs, if applying under the Partnering PI Option) will be notified as to whether or not they are invited to submit applications; however, they will not receive feedback (e.g., a critique of strengths and weaknesses) on their pre-application. The estimated timeframe for notification of invitation to submit an application is indicated in Section I, Overview of the Funding Opportunity. Invitations to submit a full application are based on the Pre-Application Screening Criteria listed above.

II.D.2.b. Step 2: Full Application Submission Content

Applications will not be accepted unless notification of invitation has been received by the PI or Initiating PI.

The CDMRP cannot make allowances/exceptions to its policies for submission problems encountered by the applicant organization using system-to-system interfaces with Grants.gov.

Each application submission must include the completed full application package for this Program Announcement. The full application package is submitted by the Authorized Organizational Representative through Grants.gov (https://www.grants.gov/) for extramural organizations or through eBRAP (https://ebrap.org/) for intramural organizations. See Table 1 below for more specific guidelines.

II.D.2.b.i. Full Application Guidelines

Extramural organizations must submit full applications through Grants.gov. Applicants must create a Grants.gov Workspace for submission, which allows the application components to be completed online and routed through the applicant organization for review prior to submission. Applicants may choose to download and save individual PDF forms rather than filling out webforms in Workspace. A compatible version of Adobe Reader **must** be used to view, complete, and submit an application package consisting of PDF forms. If more than one person is entering text into an application package, the ***same version*** of Adobe Reader software should be used by each person. Check the version number of the Adobe software on each user's computer to make sure the versions match. Using different versions of Adobe Reader may cause submission and/or save errors – even if each version is individually compatible with Grants.gov. Refer to the General Application Instructions, Section III, and the "Apply For Grants" page of Grants.gov (https://www.grants.gov/web/grants/applicants/apply-for-grants.html) for further information about the Grants.gov Workspace submission process. Submissions of extramural applications through eBRAP may be withdrawn.

Table 1. Full Application Submission Guidelines

Extramural Submissions	Intramural DoD Submissions
Application Package Location	
Download application package components for W81XWH-19-PRMRP-IIRA from Grants.gov (https://www.grants.gov) and create a Grants.gov Workspace. Workspace allows online completion of the application components and routing of the application package through the applicant organization for review prior to submission.	Download application package components for W81XWH-19-PRMRP-IIRA from eBRAP (https://ebrap.org).
Full Application Package Components	
SF424 Research & Related Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.	**Tab 1 – Summary:** Provide a summary of the application information. **Tab 2 – Application Contacts:** This tab will be pre-populated by eBRAP; add Authorized Organizational Representative.
Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Research & Related Personal Data • Research & Related Senior/Key Person Profile (Expanded) • Research & Related Budget • Project/Performance Site Location(s) Form • Research & Related Subaward Budget Attachment(s) Form (if applicable)	**Tab 3 – Full Application Files:** Upload files under each Application Component in eBRAP. Descriptions of each required file can be found under Full Application Submission Components: • Attachments • Key Personnel • Budget • Performance Sites **Tab 4 – Application and Budget Data:** Review and edit proposed project start date, proposed end date, and budget data pre-populated from the Budget Form.
Application Package Submission	
Create a Grants.gov Workspace. Add participants (investigators and Business Officials) to Workspace, complete all required forms, and check for errors before submission. **Submit a Grants.gov Workspace Package.** An application may be submitted through Workspace by clicking the "Sign and Submit" button on the "Manage Workspace" page, under the "Forms" tab. Grants.gov recommends	**Submit package components to eBRAP (https://ebrap.org).** **Tab 5 – Submit/Request Approval Full Application:** After all components are uploaded and prior to the full application submission deadline, enter your password in the space provided next to "Enter Your Password Here" and press the "Submit Full Application" button. eBRAP will notify your

Extramural Submissions	Intramural DoD Submissions
submission of the application package **at least 24-48 hours prior to the close date** to allow time to correct any potential technical issues that may disrupt the application submission. **Note:** If either the Project Narrative or the budget fails eBRAP validation or if the Project Narrative or the budget needs to be modified, an updated Grants.gov application package must be submitted via Grants.gov as a "Changed/Corrected Application" with the previous Grants.gov Tracking ID ***prior to*** the application submission deadline.	Resource Manager/Comptroller/Task Area Manager or equivalent Business Official by email.
Application Verification Period	
The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package may be modified ***with the exception of the Project Narrative and Research & Related Budget Form***.	After eBRAP has processed the full application, the organizational Resource Manager/Comptroller/Task Area Manager or equivalent Business Official and PI will receive email notification of this status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package may be modified ***with the exception of the Project Narrative and Research & Related Budget Form***. Your Resource Manager/Comptroller/Task Area Manager or equivalent Business Official should log into eBRAP to review and to approve prior to the application verification deadline.
Further Information	
Tracking a Grants.gov Workspace Package. After successfully submitting a Workspace package, a Grants.gov Tracking Number is automatically assigned to the package. The number will be listed on the "Confirmation" page that is generated after submission. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.	Refer to the General Application Instructions, Section IV, for further information regarding eBRAP requirements.

Both Extramural and Intramural Organizations: Application viewing, modification, and verification in eBRAP are strongly recommended, but not required. ***The Project Narrative and***

Research & Related Budget form cannot be changed after the application submission deadline. Prior to the full application deadline, a corrected or modified full application package may be submitted. Other application components may be changed until the end of the application verification period. Verify that subaward budget(s) and budget justification forms are present in eBRAP during the application verification period. If these components are missing, upload them to eBRAP before the end of the application verification period. After the end of the application verification period, the full application cannot be modified.

Partnering PI Option: The CDMRP requires separate full application package submissions for the Initiating PI and the Partnering PI, even if the PIs are located within the same organization. Initiating and Partnering PIs will each be assigned a unique eBRAP log number. Each full application package must be submitted using the unique eBRAP log number. ***Note: All associated applications (Initiating PI's and the Partnering PI's) must be submitted by the full application submission deadline.***

The full application package must be submitted using the unique eBRAP log number to avoid delays in application processing.

II.D.2.b.ii. Full Application Submission Components

- **Extramural Applications Only**

  SF424 Research & Related Application for Federal Assistance Form: Refer to the General Application Instructions, Section III.A.1, for detailed information.

- **Extramural and Intramural Applications**

  Attachments:

  Each attachment to the full application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Application Instructions, Appendix 4.

  For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or have incorrect file names that contain characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some circumstances. Individual attachments may not exceed 20 MB, and the file size for the entire full application package may not exceed 200 MB.

  - **Attachment 1: Project Narrative (15-page limit): Upload as "ProjectNarrative.pdf".** The page limit of the Project Narrative applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Project Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the application.

Describe the proposed project in detail using the outline below.

- **Background:** Describe how the proposed research project addresses one or more of the FY19 PRMRP Topic Areas. Present the ideas and reasoning behind the proposed work. Cite relevant literature. Describe previous experience most pertinent to the project. Include relevant preliminary data; these data may be unpublished or from the published literature.

- **Hypothesis:** State the hypothesis to be tested.

- **Specific Aims:** Concisely explain the project's specific aims and the objective(s) to be reached. These aims should agree with the primary aims and associated tasks described in the Statement of Work. If the proposed work is part of a larger study, present only aims that this DoD award would fund.

- **Research Strategy:** Describe the experimental design, methods, and analyses, including appropriate controls, in sufficient detail for analysis. Address potential problem areas and present alternative methods and approaches. Clearly describe the statistical plan and the rationale for the statistical methodology as well as an appropriate power analysis, if applicable. If animal studies are proposed, describe how they will be conducted in accordance with the ARRIVE guidelines (http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf).

- If human subjects or human biological samples will be used, describe the study population and include a detailed plan for the recruitment of human subjects or the acquisition of samples. Describe the availability of the proposed study population and past successes in recruiting similar populations. If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe the feasibility of accessing the population(s)/dataset(s). ***Clinical trials are not allowed under the Investigator-Initiated Research Award.***

- If applicable, describe how data will be reported and how it will be assured that the documentation will support a regulatory filing with the U.S. Food and Drug Administration (FDA).

- **Attachment 2: Supporting Documentation: Combine and upload as a single file named "Support.pdf".** Start each document on a new page. If documents are scanned to PDF, the lowest resolution (100 to 150 dpi) should be used. The Supporting Documentation attachment should not include additional information such as figures, tables, graphs, photographs, diagrams, chemical structures, or drawings. These items should be included in the Project Narrative.

  There are no page limits for any of these components unless otherwise noted. Include only those components described below; inclusion of items not requested or viewed as an extension of the Project Narrative will result in the removal of those items or may result in administrative withdrawal of the application.

- References Cited: List the references cited (including URLs, if available) in the Project Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, title of reference, source of reference, volume, chapter, page numbers, and publisher, as appropriate).

- List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

- Facilities, Existing Equipment, and Other Resources: Describe the facilities and equipment available for performance of the proposed project and any additional facilities or equipment proposed for acquisition at no cost to the award. Indicate whether or not Government-furnished facilities or equipment are proposed for use. If so, reference should be made to the original or present Government award under which the facilities or equipment items are now accountable. There is no form for this information.

- Publications and/or Patents: Include a list of relevant publication URLs and/or patent abstracts. If articles are not publicly available, then copies of up to five published manuscripts may be included in Attachment 2. Extra items will not be reviewed.

- Letters of Organizational Support: Provide a letter (or letters, if applicable), signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. Letters of support not requested in the Program Announcement, such as those from members of Congress, do not impact application review or funding decisions.

- Letters of Collaboration: Provide a signed letter from each collaborating individual or organization that will demonstrate that the PI has the support or resources necessary for the proposed work. If an investigator at an intramural organization is named as a collaborator on an application submitted through an extramural organization, the application must include a letter from the collaborator's Commander or Commanding Officer at the intramural organization that authorizes the collaborator's involvement.

- Intellectual Property: Information can be found in Code of Federal Regulations, Title 2, Part 200.315 (2 CFR 200.315), "Intangible Property."

    - Intellectual and Material Property Plan (if applicable): Provide a plan for resolving intellectual and material property issues among participating organizations.

- Data and Research Resources Sharing Plan: Describe how data and resources generated during the performance of the project will be shared with the research community. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- Use of DoD Resources (if applicable): If the proposed research plan involves access to active duty military patient populations or resources, the PI is responsible for demonstrating such access. Provide a letter of support signed by the lowest-ranking person with approval authority confirming access to active duty military populations and/or DoD resources or databases.

- Use of VA Resources (if applicable): Provide a letter of support from the VA Facility Director(s) or individual designated by the VA Facility Director(s), such as the ACOS/R&D or Clinical Service Chief confirming access to VA patients, resources, and/or VA research space. For VA PIs, if the VA NPC is not identified as the applicant institution for administering the funds, include a letter from the VA ACOS/R&D confirming this arrangement and identifying the institution that will administer the funds associated with the proposed research.

- **Attachment 3: Technical Abstract (one-page limit): Upload as "TechAbs.pdf".** The technical abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Programmatic reviewers typically do not have access to the full application and therefore rely on the technical abstract for appropriate description of the project's key aspects. Therefore, clarity and completeness within the space limits of the technical abstract are highly important.

  Describe the proposed research project, including the following elements: background, rationale, hypothesis, specific aims and objectives, study design, long-term and short-term impact to the relevant research field and patient population(s), and the relevance of the project to at least one FY19 PRMRP Topic Area.

- **Attachment 4: Lay Abstract (one-page limit): Upload as "LayAbs.pdf".** The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***. Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Describe how the proposed research project addresses one or more of the FY19 PRMRP Topic Areas. Include a comprehensive overview of the proposed research project that can be ***readily understood by readers without a background in science or medicine.*** Clearly describe the central critical problem or question to be addressed and the ultimate applicability and impact of the research. ***Do not duplicate the technical abstract***.

- **Attachment 5: Statement of Work (three-page limit): Upload as "SOW.pdf".** The suggested SOW format and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm). For the Investigator-Initiated Research

Award mechanism, use the SOW format example titled "SOW (Statement of Work) Generic Format." The SOW must be in PDF format prior to attaching.

The SOW should include a list of major tasks that support the proposed specific aims, followed by a series of subtasks outlined related to the major tasks and milestones within the period of performance. The SOW should describe only the work for which funding is being requested by this application and, as applicable, should also:

- Include the name(s) of the key personnel and contact information for each study site/ subaward site.

- Indicate the number (and type, if applicable) of research subjects (animal or human) and/or human anatomical samples projected or required for each task and at each site. Refer to the General Application Instructions, Appendix 1, for additional information regarding regulatory requirements.

- If applicable, indicate timelines required for regulatory approvals relevant to human or animal subjects research (e.g., IRB, IACUC, ORP, Investigational New Drug and Investigational Device Exemption applications) by the FDA or other Government agency.

Partnering PI Option: The Initiating and Partnering PIs must each submit an identical copy of a jointly created SOW. The contributions of the Initiating PI and the Partnering PI should be noted for each task.

- **Attachment 6: Impact Statement (one-page limit): Upload as "Impact.pdf".**

  Explain why the proposed research project is important and relevant to understanding the cause or progression of the disease or condition, or to developing improvements in prevention, detection, diagnosis, treatment, patient care, or quality of life in the FY19 PRMRP Topic Area(s) addressed. Describe how the study will address a central critical problem or question in the relevant Topic Area(s). If applicable, describe how the project addresses an FY19 PRMRP Area of Encouragement (Appendix 2).

  - ***Describe the short-term impact:*** Detail the anticipated outcome(s)/product(s) (knowledge and/or materiel) that will be directly attributed to the results of the proposed research.

  - ***Describe the long-term impact:*** Explain the anticipated long-term gains from this research. Compare to the information known/products currently available, if applicable. Explain the long-range vision for how the research will impact the field of study and/or clinical care.

- **Attachment 7: Relevance to Military Health Statement (one-page limit): Upload as "MilRel.pdf".**

  Describe how the proposed study is responsive to the healthcare needs of military Service members, Veterans, and/or beneficiaries. Provide information about the incidence and/or

prevalence of the disease or condition in the general population as well as in military Service members, Veterans, and/or beneficiaries.

If active duty military, military families, and/or Veteran population(s) or datasets will be used in the proposed research project, describe the population(s)/dataset(s) and the appropriateness of the population(s)/dataset(s) for the proposed study. If a non-military population will be used for the proposed research project, explain how the population simulates the targeted population (i.e., military Service members, Veterans, and/or beneficiaries).

If applicable, show how the proposed research project aligns with DoD and/or VA areas of research interest. Provide a description of how the knowledge, information, products, or technologies gained from the research could be implemented in a dual-use capacity to benefit the civilian population and address a military need, as appropriate

- **Attachment 8: Partnership Statement (one-page limit): Upload as "Partnership.pdf".** ***This attachment is only required for applications submitted under the Partnering PI Option.***

  Describe the expertise of the Initiating and Partnering PIs and how each will bring different strengths to the proposed project. Describe how the combined effort will be synergistic and produce an outcome greater than what could be achieved by independent efforts. Outline the contribution and time commitment of each partner and how each will have equal intellectual input on the design, conduct, and analysis of the project. Describe how the PIs will manage the collaboration and workflow to optimize research efforts.

- **Attachment 9: Representations, if applicable (extramural submissions only): Upload as "RequiredReps.pdf".** All extramural applicants must complete and submit the Required Representations template available on eBRAP (https://ebrap.org/eBRAP/public/Program.htm). For more information, see the General Application Instructions, Appendix 5, Section B, Representations.

- **Attachment 10: DoD Military Budget Form(s), if applicable: Upload as "MFBudget.pdf".** If a military facility (Military Health System facility, research laboratory, medical treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center) will be a collaborator in performance of the project, complete the DoD Military Budget Form, available for download on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm), including a budget justification, for each military facility as instructed. The costs per year should be included on the Grants.gov Research & Related Budget form under subaward costs. Refer to the General Application Instructions, Section III.A.8, for detailed information.

- **Extramural and Intramural Applications**

  To evaluate compliance with Title IX of the Education Amendments of 1972 (20 USC A§1681 et seq.), the DoD is collecting certain demographic and career information to be able to assess the success rates of women who are proposed for key roles in applications in

science, technology, engineering, and/or mathematics (STEM) disciplines. To enable this assessment, each application must include the following forms completed as indicated.

Research & Related Personal Data: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.4, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.3, for detailed information.

- PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf". The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The National Institutes of Health (NIH) Biographical Sketch may also be used. All biographical sketches should be submitted in uneditable PDF format.

- PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf".

- Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf".

- Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf".

Research & Related Budget: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.5, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.4, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf". The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

Partnering PI Option: ***Initiating and Partnering PIs must have a separate budget and justification specific to their distinct portions of the effort that the applicant organization will submit as separate Grants.gov or eBRAP application packages. The Initiating PI should not include budget information for the Partnering PI even if they are located within the same organization. The anticipated combined direct costs budgeted for the entire period of performance for the Initiating and Partnering PIs' applications will not exceed $1.5M. Refer to Section II.D.5, Funding Restrictions, for detailed information.***

Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.6, and for intramural

submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.5, for detailed information.

- **Extramural Applications Only**

  Research & Related Subaward Budget Attachment(s) Form (if applicable): Refer to the General Application Instructions, Section III.A.7, for detailed information.

  - **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.7, for detailed information.) Verify subaward budget(s) and budget justification forms are present in eBRAP during the application verification period. If these components are missing, upload them to eBRAP before the end of the application verification period.

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov attachment form as Attachment 10. (Refer to the General Application Instructions, Section IV.A.4, for detailed information.) Each Intramural DoD Collaborator should include costs per year on the Grants.gov Research & Related Budget form under subaward costs.

  DoD Military Budget Form: A military facility collaborating in the performance of the project (but not participating as a Partnering PI) should be treated as a subaward for budget purposes. **Note:** Applicants should complete the **DoD Military Budget Form (Attachment 10)** to show all direct and indirect costs. The costs per year should be included on the Grants.gov Research & Related Budget Form under subaward costs. Refer to the General Application Instructions, Section III.A.8, for detailed information.

Application Components for the Partnering PI, if applying under the Partnering PI Option

The Partnering PI must follow the link in the email from eBRAP and, if not registered in eBRAP, complete the registration process prior to the application submission deadline in order to associate his/her full application package with that of the Initiating PI.

For the Partnering PI, the Initiating PI must identify if the Partnering PI will be named on an extramural or intramural application (in accordance with the guidelines in Section II.C.1.a, Organization) and the appropriate mode of submission (Grants.gov for extramural and eBRAP for intramural). The Partnering PI must verify his/her contact information and mode of submission within eBRAP to ensure proper submission of his/her application.

The application submission process for the Partnering PI uses an abbreviated full application package that includes:

- **Extramural and Intramural Applications**

  Attachments:

  - **Attachment 5: Statement of Work (three-page limit): Upload as "SOW.pdf".** Refer to the General Application Instructions, Section III.A.2, for detailed information on

completing the SOW. Each PI must submit an identical copy of a jointly created SOW. The contributions of the Initiating PI and the Partnering PI should be noted for each task.

- **Attachment 9: Representations (Extramural Submissions only): Upload as "RequiredReps.pdf".** All extramural applicants must complete and submit the Required Representations template available on eBRAP (https://ebrap.org/eBRAP/public/Program.htm). For more information, see the General Application Instructions, Appendix 5, Section B, Representations.

- **Attachment 10: DoD Military Budget Form: Upload as "MFBudget.pdf".** Refer to the General Application Instructions, Section IV.A.4, for detailed information. The costs per year should be included on the Grants.gov Research & Related Budget form under subaward costs.

Research & Related Personal Data: For extramural submissions (via Grants.gov) refer to the General Application Instructions, Section III.A.3, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.2, for detailed information.

Research & Related Senior/Key Person Profile (Expanded): For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.4, and for intramural submissions (via eBRAP), refer to the General Application Instructions, Section IV.A.3, for detailed information.

- PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf". The suggested biographical sketch format is available on the "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) in eBRAP. The NIH Biographical Sketch may also be used. All biographical sketches should be submitted in the PDF format that is not editable.

- PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf".

- Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf".

- Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf".

Research & Related Budget: For extramural submissions, refer to the General Application Instructions, Section III.A.5, and for intramural submissions, refer to the General Application Instructions, Section IV.A.4, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf".

Initiating and Partnering PIs must each submit a budget and justification specific to his/her own portion of the efforts as part of his/her separate Grants.gov application packages. The Research & Related Budget for the Partnering PI should not include

budget information for the Initiating PI, even if they are located within the same organization. Refer to Section II.D.5, Funding Restrictions, for detailed information.

Project/Performance Site Location(s) Form: For extramural submissions (via Grants.gov), refer to the General Application Instructions, Section III.A.6, and for intramural submissions (via eBRAP), refer to General Application Instructions, Section IV.A.5, for detailed information.

- **Extramural Applications Only**

  Research & Related Subaward Budget Attachment(s) Form:

  - **Extramural Subaward:** Complete the Research & Related Subaward Budget Form through Grants.gov. (Refer to the General Application Instructions, Section III.A.7, for detailed information.)

  - **Intramural DoD Collaborator(s):** Complete the DoD Military Budget Form and upload to Grants.gov attachment form as Attachment 10. (Refer to the General Application Instructions, Section III.A.8, for detailed information.)

II.D.3. Dun and Bradstreet Data Universal Numbering System (DUNS) Number and System for Award Management (SAM)

Applicant organizations and all sub-recipient organizations must have a DUNS number to submit applications to Grants.gov. The applicant organization must also be registered in the Entity Management functional area of the SAM with an "Active" status to submit applications through the Grants.gov portal. Verify the status of the applicant organization's Entity registration in SAM well in advance of the application submission deadline. Allow several weeks to complete the entire SAM registration process. If an applicant has not fully complied with the requirements at the time the Federal awarding agency is ready to make a Federal award, the Federal awarding agency may determine that the applicant is not qualified to receive a Federal award and use that determination as a basis for making a Federal award to another applicant. Refer to the General Application Instructions, Section III, for further information regarding Grants.gov requirements.

II.D.4. Submission Dates and Times

All submission dates and times are indicated in Section I, Overview of the Funding Opportunity. Pre-application and application submissions are required. The pre-application and application submission process should be started early to avoid missing deadlines. There are no grace periods. Failure to meet either of these deadlines will result in submission rejection.

Applicant Verification of Full Application Submission in eBRAP

Following retrieval and processing of the full application, eBRAP will notify the organizational representatives and PI by email to log into eBRAP to review, modify, and verify the full application submission. eBRAP will validate retrieved files against the specific Program Announcement requirements, and discrepancies will be noted in both the email and in the "Full Application Files" tab in eBRAP. eBRAP does not confirm the accuracy of file content. It is the

applicant's responsibility to review all application components and ensure proper ordering as specified in the Program Announcement. ***If either the Project Narrative or the budget fails eBRAP validation or needs to be modified, an updated full application package must be submitted prior to the application submission deadline.*** The Project Narrative and Budget Form cannot be changed after the application submission deadline.

Extramural Submission: The full application package submitted to Grants.gov may be viewed and modified in eBRAP until the end of the application verification period. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form,*** may be modified.

Intramural DoD Submission: After eBRAP has processed the full application, the organizational Resource Manager/Comptroller/Task Area Manager or equivalent Business Official and PI will receive email notification of the status and will be able to view and modify application components in eBRAP. During the application verification period, the full application package, ***with the exception of the Project Narrative and Budget Form***, may be modified. The Resource Manager/Comptroller/Task Area Manager or equivalent Business Official should log into eBRAP to review and to approve the application package prior to the application verification deadline.

For All Submissions: Verify that subaward budget(s) with budget justification are present in eBRAP during the application verification period. If these components are missing, upload them to eBRAP before the end of the application verification period.

II.D.5. Funding Restrictions

The maximum period of performance is **3** years.

Application submissions with a single PI:

The anticipated direct costs budgeted for the entire period of performance will not exceed **$1.2M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. No budget will be approved by the Government exceeding **$1.2M** direct costs or using an indirect cost rate exceeding the organization's negotiated rate.

All direct and indirect costs of any subaward or contract must be included in the total direct costs of the primary award.

The applicant may request the entire maximum funding amount for a project that may have a period of performance less than the maximum **3** years.

Application submissions including the Partnering PI Option: The anticipated combined direct costs budgeted for the entire period of performance for the Initiating and Partnering PIs' applications will not exceed **$1.5M**. If indirect cost rates have been negotiated, indirect costs are to be budgeted in accordance with the organization's negotiated rate. Collaborating organizations should budget associated indirect costs in accordance with each organization's

negotiated rate. The combined budgeted direct costs approved by the Government will not exceed **$1.5M** or use an indirect cost rate exceeding each organization's negotiated rate.

A separate award will be made to each PI's organization.

The Initiating and Partnering PIs are expected to be partners in the research, and direct cost funding should be divided accordingly, unless otherwise warranted and clearly justified. Each partner may request no more than 75% (or no less than 25%) of the proposed direct costs.

For this award mechanism, direct costs may be requested for (not all-inclusive):

- Salary
- Research supplies
- Clinical research costs (clinical trials are not allowed)
- Support for multidisciplinary collaborations, including travel
- Travel costs for the PI(s) to disseminate project results at one DoD-supported meeting to be specified by the program office during award negotiations (e.g., the Military Health System Research Symposium)
- Travel costs for one investigator to travel to one scientific/technical meeting per year in addition to the required meeting described above. The intent of travel costs to scientific/technical meeting(s) is to present project information or disseminate project results.

Awards made to extramural organizations will consist solely of assistance agreements (grants and/or cooperative agreements). For extramural awards with an intragovernmental component, direct transfer of funds from an extramural award recipient to a DoD or other Federal agency is not allowed except under very limited circumstances. Funding to intramural DoD and other Federal agencies will be managed through a direct funds transfer. Intramural applicants are responsible for coordinating through their agency's procedures the use of contractual or assistance funding awards or other appropriate agreements to support extramural collaborators. Application packages from associated extramural partners will be funded through assistance agreements.

Refer to the General Application Instructions, Section III.A.5, for budget regulations and instructions for the Research & Related Budget. ***For Federal agencies or organizations collaborating with Federal agencies, budget restrictions apply as are noted in the General Application Instructions, Section III.A.5.***

Funds to be obligated on any award resulting from this funding opportunity will be available for use for a limited time period based on the fiscal year of the funds. The time is considered when establishing the award's period of performance. It is anticipated that awards made from this FY19 funding opportunity will be funded with FY19, which will expire for use on September 30, 2025.

II.D.6. Other Submission Requirements

Refer to the General Application Instructions, Appendix 4, for detailed formatting guidelines.

II.E. Application Review Information

II.E.1. Criteria

II.E.1.a. Peer Review

To determine technical merit, all applications will be evaluated according to the following **scored criteria**, which are listed in decreasing order of importance:

- **Research Strategy and Feasibility**
    - How well the scientific rationale supports the project and its feasibility, as demonstrated by a critical review and analysis of the literature, supporting data, and logical reasoning.
    - How well the hypothesis, specific aims, and objective(s) are developed.
    - How well the experimental design, methods, data collection procedures, and analyses are developed and support completion of the aims.
    - To what degree the statistical plan and power analysis are appropriate for the proposed project.
    - If animal studies are included, how well they are designed to achieve reproducible and rigorous results, including the choice of model and the endpoints/outcomes to be measured.
    - If applicable, whether data will be appropriately reported and documented to support a regulatory filing with the FDA.
    - If applicable, how well the application provides evidence of availability of and access to the necessary study populations and/or resources.
    - How well potential problems are identified and alternative approaches are addressed.
    - Whether the research can be completed within the proposed period of performance.
- **Impact**
    - To what extent the project impacts a central critical problem or question in at least one FY19 PRMRP Topic Area.
    - If applicable, how well the proposed research project addresses one or more of the FY19 PRMRP Areas of Encouragement.

- How the proposed research project, if successful, will make important scientific advances in the relevant field of research.
- To what degree the proposed project could, if successful, make a significant impact on the lives of the relevant patient population(s) in the short term and/or long term.

- **Personnel**
  - How the background and expertise of the PIs and other key personnel demonstrate their ability to perform the proposed work.
  - How the levels of effort by the PIs and other key personnel are appropriate to ensure the successful conduct of the project.
  - How each PI's record(s) of accomplishment demonstrates their ability to accomplish the proposed work.

For applications submitted under the Partnering PI Option:

- **Partnership**
  - How well the research project is supported by the nature of the collaboration.
  - To what extent the proposed partnership will advance research beyond what would be possible through individual efforts.
  - How well the skills and perspectives of the Initiating and Partnering PIs complement each other.
  - How well the application reflects the requirement that the partners have equal intellectual input into the design of the project.

In addition, the following **unscored** criteria will also contribute to the overall evaluation of all IIRA applications:

- **Environment**
  - How the scientific environment is appropriate for the proposed research.
  - How the research requirements are supported by the availability of and accessibility to facilities and resources (including collaborative arrangements).
  - How the quality and extent of organizational support are appropriate for the proposed research.
  - If applicable, to what degree the intellectual and material property plan is appropriate.

- **Budget**
    - Whether the direct maximum costs are equal to or less than the allowable direct maximum costs as published in the Program Announcement.
- **Application Presentation**
    - To what extent the writing, clarity, and presentation of the application components influence the review.

II.E.1.b. Programmatic Review

To make funding recommendations and select the application(s) that, individually or collectively, will best achieve the program objectives, the following criteria are used by programmatic reviewers:

- Ratings and evaluations of the peer reviewers
- Relevance to the mission of the DHP and FY19 PRMRP, as evidenced by the following:
    - Adherence to the intent of the award mechanism
    - Program portfolio composition
    - Relevance to military health
    - Relative impact

II.E.2. Application Review and Selection Process

All applications are evaluated by scientists, clinicians, and consumers in a two-tier review process. The first tier is **peer review**, the evaluation of applications against established criteria to determine technical merit, where each application is assessed for its own merit, independent of other applications. The second tier is **programmatic review**, a comparison-based process in which applications with high scientific and technical merit are further evaluated for programmatic relevance. Final recommendations for funding are made to the Commanding General, USAMRMC, on behalf of the DHA and the OASD(HA). ***The highest-scoring applications from the first tier of review are not automatically recommended for funding. Funding recommendations depend on various factors as described in Section II.E.1.b, Programmatic Review.*** Additional information about the two-tier process used by the CDMRP can be found at https://cdmrp.army.mil/about/2tierRevProcess. A PI Information Paper describing the funding recommendations and review process for the award mechanisms for the PRMRP will be provided to the PI and posted on the CDMRP website.

All CDMRP review processes are conducted confidentially to maintain the integrity of the merit-based selection process. Panel members sign a statement declaring that application and evaluation information will not be disclosed outside the panel. Violations of confidentiality can result in the dissolving of a panel(s) and other corrective actions. In addition, personnel at the

applicant or collaborating organizations are prohibited from contacting persons involved in the review and approval process to gain protected evaluation information or to influence the evaluation process. Violations of these prohibitions will result in the administrative withdrawal of the organization's application. Violations by panel members or applicants that compromise the confidentiality of the review and approval process may also result in suspension or debarment from Federal awards. Furthermore, the unauthorized disclosure of confidential information of one party to another third party is a crime in accordance with 18 USC 1905.

II.E.3. Integrity and Performance Information

Prior to making an assistance agreement award where the Federal share is expected to exceed the simplified acquisition threshold, as defined in 2 CFR 200.88, over the period of performance, the Federal awarding agency is required to review and consider any information about the applicant that is available in the Federal Awardee Performance and Integrity Information System (FAPIIS).

An applicant organization may review FAPIIS, accessible through SAM, and submit comments to FAPIIS on any information about the organization that a Federal awarding agency previously entered and is currently available in FAPIIS.

The Federal awarding agency will consider any comments by the applicant, in addition to other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics, and record of performance under Federal awards when determining a recipient's qualification prior to award, according to the qualification standards of the Department of Defense Grant and Agreement Regulations (DoDGARs), Section 22.415.

II.E.4. Anticipated Announcement and Federal Award Dates

All application review dates and times are indicated in Section I, Overview of the Funding Opportunity.

Each PI and organization will receive email notification of posting of the funding recommendation in eBRAP. Each PI will receive a peer review summary statement on the strengths and weaknesses of the application.

II.F. Federal Award Administration Information

II.F.1. Federal Award Notices

Awards supported with FY19 funds are anticipated to be made no later than September 30, 2020. Refer to the General Application Instructions, Appendix 2, for additional award administration information.

After email notification of application review results through eBRAP, and if selected for funding, a representative from USAMRAA will contact the Business Official authorized to negotiate on behalf of the PI's organization.

Only an appointed USAMRAA Grants Officer may obligate the Government to the expenditure of funds. No commitment on the part of the Government should be inferred from discussions with any other individual. **The award document signed by the Grants Officer is the official authorizing document.**

Federal Government Organizations: Funding made to Federal Government organizations (to include intramural DoD organizations) will be executed through the Military Interdepartmental Purchase Request (MIPR) or Funding Authorization Document (FAD) process. Transfer of funds is contingent upon appropriate safety and administrative approvals. Intramural applicants and collaborators are reminded to coordinate receipt and commitment of funds through their respective Resource Manager/Task Area Manager/Comptroller or equivalent Business Official.

After email notification of application review results through eBRAP, and if selected for funding, a representative from the CDMRP will contact the Business Official authorized to negotiate on behalf of the PI's organization.

II.F.1.a. PI Changes and Award Transfers

Changes in PI and an organizational transfer of an award supporting the Initiating PI or Partnering PI is discouraged and will be evaluated on a case-by-case basis and only allowed at the discretion of the USAMRAA Grants Officer. An organizational transfer of an award will not be allowed in the last year of the (original) period of performance or any extension thereof.

Refer to the General Application Instructions, Appendix 2, Section B, for general information on organization or PI changes.

II.F.2. Administrative and National Policy Requirements

Applicable requirements in the DoDGARs found in 32 CFR, Chapter I, Subchapter C, and 2 CFR, Chapter XI, apply to grants and cooperative agreements resulting from this Program Announcement.

Refer to the General Application Instructions, Appendix 2, for general information regarding administrative requirements.

Refer to the General Application Instructions, Appendix 5, for general information regarding national policy requirements.

Refer to full text of the latest DoD R&D General Terms and Conditions, the USAMRAA General Research Terms and Conditions with Institutions of Higher Education, Hospitals, and Non-Profit Organizations: Addendum to the DoD R&D General Terms and Conditions and the USAMRAA General Research Terms and Conditions with For-Profit Organizations for further information.

II.F.3. Reporting

Refer to the General Application Instructions, Appendix 2, Section A, for general information on reporting requirements. ***If there are technical reporting requirement delinquencies for any***

existing USAMRAA-sponsored awards at the applicant organization, no new awards will be issued to the applicant organization until all delinquent reports have been submitted.

Annual progress reports as well as a final progress report will be required.

Quarterly technical progress reports may be required.

In addition to written progress reports, annual Award Charts will be required. For the Investigator-Initiated Research Award mechanism, use the format example "Award Chart" available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm).

Award Expiration Transition Plan: An Award Expiration Transition Plan must be submitted with the final progress report. Use the one-page template "Award Expiration Transition Plan" available on the on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm) under the "Progress Report Formats" section. The Award Expiration Transition Plan must outline if and how the research supported by this award will progress and must include source(s) of funding, either known or pending.

Awards resulting from this Program Announcement will incorporate additional reporting requirements related to recipient integrity and performance matters. Recipient organizations that have Federal contract, grant, and cooperative agreement awards with a cumulative total value greater than $10,000,000 are required to provide information to FAPIIS about certain civil, criminal, and administrative proceedings that reached final disposition within the most recent 5-year period and that were connected with performance of a Federal award. Recipients are required to disclose, semiannually, information about criminal, civil, and administrative proceedings as specified in the applicable Representations (see General Application Instructions, Appendix 5, Section B).

II.G. Federal Awarding Agency Contacts

II.G.1. CDMRP Help Desk

Questions related to Program Announcement content or submission requirements as well as questions related to the pre-application or intramural application submission through eBRAP should be directed to the CDMRP Help Desk, which is available Monday through Friday from 8:00 a.m. to 5:00 p.m. ET. Response times may vary depending upon the volume of inquiries.

Phone: 301-682-5507

Email: help@eBRAP.org

II.G.2. Grants.gov Contact Center

Questions related to extramural application submission through Grants.gov portal should be directed to the Grants.gov Contact Center, which is available 24 hours a day, 7 days a week

(closed on U.S. Federal holidays). Note that the CDMRP Help Desk is unable to provide technical assistance with Grants.gov submission.

Phone: 800-518-4726; International 1-606-545-5035

Email: support@grants.gov

Sign up on Grants.gov for "send me change notification emails" by following the link on the "Synopsis" page for the Program Announcement or by responding to the prompt provided by Grants.gov when first downloading the Grants.gov application package. If the Grants.gov application package is updated or changed, the original version of the application package may not be accepted by Grants.gov.

II.H. Other Information

II.H.1. Program Announcement and General Application Instructions Versions

Questions related to this Program Announcement should refer to the Program name, the Program Announcement name, and the Program Announcement version code 20181120a. The Program Announcement numeric version code will match the General Applications Instructions version code 20181120.

II.H.2. Administrative Actions

After receipt of pre-applications or applications, the following administrative actions may occur:

II.H.2.a. Rejection

The following will result in administrative rejection of the pre-application:

- Preproposal Narrative is missing.

The following will result in administrative rejection of the application:

- Submission of an application for which a letter of invitation was not received.
- Project Narrative exceeds page limit.
- Project Narrative is missing.
- Budget is missing.

II.H.2.b. Modification

- Pages exceeding the specific limits will be removed prior to review for all documents other than the Project Narrative.
- Documents not requested will be removed.

II.H.2.c. Withdrawal

The following may result in administrative withdrawal of the pre-application or application:

- An FY19 PRMRP Programmatic Panel member is named as being involved in the research proposed or is found to have assisted in the pre-application or application processes including, but not limited to, concept design, application development, budget preparation, and the development of any supporting documentation. ***A list of the FY19 PRMRP Programmatic Panel members can be found at https://cdmrp.army.mil/prmrp/panels/panels19***.
- The application fails to conform to this Program Announcement description.
- Inclusion of URLs, with the exception of links in References Cited and Publication and/or Patent Abstract sections.
- Page size is larger than 8.5 inches x 11.0 inches (approximately 21.59 cm x 27.94 cm).
- To preserve the integrity of its peer and programmatic review processes, the CDMRP discourages inclusion of any employee of its review contractors having any role in the preparation, research or other duties for submitted applications. For FY19, the identities of the peer review contractor and the programmatic review contractor may be found at the CDMRP website (https://cdmrp.army.mil/about/2tierRevProcess). Applications that include names of personnel from either of these companies may be administratively withdrawn.
- Personnel from applicant or collaborating organizations are found to have contacted persons involved in the review or approval process to gain protected evaluation information or to influence the evaluation process.
- Applications from extramural organizations, including non-DoD Federal agencies, received through eBRAP may be withdrawn.
- Applications submitted by an intramural DoD organization may be withdrawn if the intramural organization cannot coordinate the use of contractual, assistance, or other appropriate agreements to provide funds to extramural collaborators.
- The proposed research project does not address at least one of the Congressionally directed FY19 PRMRP Topic Areas.
- A clinical trial is proposed.
- The PI does not meet the eligibility criteria.
- Submission of the same research project to different Funding Opportunities within the FY19 PRMRP. Refer to Section II.D, Application and Submission Information, for exceptions.
- **Partnering PI Option:** All associated (Initiating and Partnering PI) applications are not submitted by the deadline.

II.H.2.d. Withhold

Applications that appear to involve research misconduct will be administratively withheld from further consideration pending organizational investigation. The organization will be required to provide the findings of the investigation to the USAMRAA Grants Officer for a determination of the final disposition of the application.

II.H.3. Application Submission Checklist

Application Components	Action	Initiating PI Completed	Partnering PI Completed
SF424 Research & Related Application for Federal Assistance **(Extramural submissions only)**	Complete form as instructed		
Summary (Tab 1) and Application Contacts (Tab 2) **(Intramural submissions only)**	Complete tabs as instructed		
Attachments	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf"		
	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf"		
	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf"		
	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf"		
	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf"		
	Impact Statement: Upload as Attachment 6 with file name "Impact.pdf"		
	Relevance to Military Health Statement: Upload as Attachment 7 with file name "MilRel.pdf"		
	Partnership Statement: Upload as Attachment 8 with file name "Partnership.pdf" if applicable		
	Representations (extramural submissions only): Upload as Attachment 9 with file name "RequiredReps.pdf" if applicable		
	DoD Military Budget Form(s): Upload as Attachment 10 with file name "MFBudget.pdf" if applicable		
Research & Related Personal Data	Complete form as instructed		

Application Components	Action	Initiating PI Completed	Partnering PI Completed
Research & Related Senior/Key Person Profile (Expanded)	Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field		
	Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field		
	Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field		
	Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field		
Research & Related Budget **(Extramural submissions only)**	Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field		
Budget **(Intramural submissions only)**	Complete the DoD Military Budget Form and Justification		
Project/Performance Site Location(s) Form	Complete form as instructed		
Research & Related Subaward Budget Attachment(s) Form	Complete form as instructed		

APPENDIX 1: ACRONYM LIST

ACOS/R&D	Associate Chief of Staff for Research and Development
ACURO	Animal Care and Use Review Office
B	Billion
CDMRP	Congressionally Directed Medical Research Programs
CFR	Code of Federal Regulations
COI	Conflict of Interest
DHA	Defense Health Agency
DHP	Defense Health Program
DoD	Department of Defense
DoDGARs	Department of Defense Grant and Agreement Regulations
DUNS	Data Universal Numbering System
eBRAP	Electronic Biomedical Research Application Portal
EC	Ethics Committee
ET	Eastern Time
FAD	Funding Authorization Document
FAPIIS	Federal Awardee Performance and Integrity Information System
FDA	Food and Drug Administration
FY	Fiscal Year
HRPO	Human Research Protection Office
IACUC	Institutional Animal Care and Use Committee
IDE	Investigational Device Exemption
IND	Investigational New Drug
IRB	Institutional Review Board
M	Million
MIPR	Military Interdepartmental Purchase Request
NPC	Non-Profit Corporation
OASD(HA)	Office of the Assistant Secretary of Defense for Health Affairs
ORCID	Open Researcher and Contributor ID, Inc.
ORP	Office of Research Protections
PI	Principal Investigator
PRMRP	Peer Review Medical Research Program
RDT&E	Research, Development, Test, and Evaluation
SAM	System for Award Management
SOW	Statement of Work
STEM	Science, Technology, Engineering, and/or Mathematics
USAMRAA	U.S. Army Medical Research Acquisition Activity
USAMRMC	U.S. Army Medical Research and Materiel Command
USC	United States Code
VA	Department of Veterans

APPENDIX 2: AREAS OF ENCOURAGEMENT

Applications addressing any of the FY19 PRMRP Topic Areas are of interest to the program. ***Any aspect of research relevant to one or more FY19 PRMRP Topic Areas may be considered for funding.*** Areas of encouragement related to each FY19 PRMRP Topic Area have been identified by the DoD, VA, and other relevant stakeholders and are listed below under each Topic Area. Applicants are urged to read and consider these areas of encouragement before preparing their applications. ***The information provided is not exhaustive, and applicants are not restricted to submitting applications that address an area of encouragement in this list.***

Acute Lung Injury

- Research on the etiology and prevention of acute lung injury (ALI)/acute respiratory distress syndrome (ARDS) caused by host responses to trauma, transfusion, burns, infection, hemorrhagic shock, inhalation, and/or oxygen exposure.

- Novel and/or innovative detection technologies or therapeutics to reduce the incidence and/or severity of ALI/ARDS and/or other lung injury secondary to trauma, transfusion, infection, burns, hemorrhagic shock, inhalation, and/or oxygen exposure.

- Strategies to stabilize and support the safe transport of patients with ALI/ARDS in order to optimize therapeutic interventions, particularly in operational scenarios requiring prolonged field care and/or longer transport times.

- Development of metrics to associate the long-term health outcomes of ALI/ARDS with physiological and physical performance.

Antimicrobial Resistance

- Development of novel and/or innovative interventions to prevent the spread of or treat infections from multi-drug-resistant organisms, focused on hardware-associated infections and biofilms.

- Development and/or testing of new diagnostics to distinguish between viral and bacterial infectious diseases that will inform treatment and limit the spread of antibiotic resistance.

- Development and evaluation of strategies to support healthy gut microbiome (such as prebiotics, probiotics, colostrum, vaccines, and small molecules) to slow emergence of antibiotic-resistant organisms that cause infectious diarrhea in training or deployment settings.

- Development of rapid diagnostics platforms to identify and characterize new pathogen-specific, drug resistance markers that can be used in austere settings and during prolonged field care (e.g., “omic” and systems biology approaches).

- Development of gene-editing tools (e.g., designer nucleases) that optimize treatment and raise the threshold for resistance to anti-infective agents.

Arthritis (other than Rheumatoid Arthritis or Post-Traumatic Osteoarthritis)

- Research quantifying the impacts of obesity, weight loss, physical fitness (all components, e.g., cardiovascular, strength, flexibility, balance), and dietary factors on the development of or prevention/risk reduction of arthritis.
- Studies to examine the use of regenerative medicine techniques and therapies (including cell-based therapies) to prevent or treat osteoarthritis, including dose-response information and the frequency and timing of application.
- Basic and translational research to identify treatments to mitigate and/or reverse osteoarthritis, particularly in the knee, hip, ankle, and shoulder.
- Identification and/or validation of biomarkers for early psoriatic arthritis.
- Research to establish activity recommendations for maximal joint life following joint repair, particularly in young patient populations.

Burn Pit Exposure

- Research on the etiology and treatment of adverse health events related to military deployment to Iraq and Afghanistan that are associated with exposure to airborne hazards and open pit burning of solid waste and other materials.
- Toxicological studies to characterize emissions from open air burns, burn boxes, and incinerators, and to ascertain the toxicity and mechanisms of action of such chemicals and airborne environmental dust and mixtures, as well as interactions among pollutants and particulate materials.
- Identification and validation of biomarkers of both exposure to and health effects of burn pit combustion products, burning biomass and refuse, and geogenic dusts.
- Development and validation of instruments for assessing (including in real time) levels of exposure to airborne hazards for use in research and for occupational and environmental exposure monitoring.

Cardiomyopathy

- Development of novel therapeutic approaches for primary and secondary cardiomyopathies.
- Strategies to identify risk factors associated with the development of cardiomyopathy (i.e., genetic, lifestyle, exposure) in the civilian and/or military populations.
- Research to improve the understanding of the pathophysiology of cardiomyopathies.
- Improvement of noninvasive diagnostic techniques for primary and secondary cardiomyopathies.

- Research on the multiple etiologies of cardiomyopathy (e.g., hypertension, ischemia, hemochromatosis, sleep apnea, radiation therapy, medications, smallpox vaccine, infections).

Cerebellar Ataxia

- Research to identify therapeutic targets and novel therapeutic modalities including gene silencing/gene editing.
- Research to improve the understanding of the causes of cerebellar ataxia.
- Research to improve the understanding of the association between lifestyle, environment, nutrition, and cerebellar ataxia.
- Research to better understand the role of physical rehabilitation/exercise in affecting postural disorders, balance, and coordination in cerebellar ataxia patients.

Chronic Migraine and Post-Traumatic Headache

- Precision medicine research to investigate, develop, and validate biomarkers to diagnose and monitor traumatic brain injury patients with chronic migraine or post-traumatic headache and to characterize individual responses to treatment.
- Epidemiological/natural history studies to characterize specific types of post-traumatic headache and chronic migraine, the pathobiology of these headaches (such as the role of acute cortical spreading depression after injury as a risk factor for chronic headaches of a migrainous type), and the risk factors that might predispose people to certain types of post-traumatic headache and chronic migraine.
- Research on the optimal approaches to effective management of acute and chronic pain and co-occurring psychological health disorders for chronic migraine and post-traumatic headache with a focus on assessing and eliminating adverse outcomes and decreasing polypharmacy.
- Evaluation of the efficacy of existing or emerging pharmaceutical interventions (non-opioid), as well as evaluation of mechanical stimulation and/or other non-pharmaceutical interventions, for the treatment of chronic migraine and post-traumatic headache.
- Evaluation of the differences in etiology, diagnosis, treatment plan, and prevention of migraine headaches between men and women.

Congenital Heart Disease

- Development of approaches, including regenerative medicine, that provide structural support, restore native activity, allow for tissue growth, and prevent the need for reoperation.
- Research to improve understanding of the causes of congenital heart defects, including genomic, proteomic, and metabolomic profiling.

- Research to design and implement disease-in-a-dish and/or microfluidic models with an established phenotype to increase the efficacy of finding novel and/or innovative drug targets, screen existing drugs, perform cardiotoxicity testing, and/or uncover pathogenesis.

- Research both on the risk of neurologic injury and on enhanced neuroprotection before, during, and after surgery for congenital heart disease.

- Population-based and outcomes-based research to assess the health outcomes of individuals with congenital heart disease across their life spans.

Constrictive Bronchiolitis

- Research to understand the role of occupational and environmental exposures, including military relevant volatile compounds, toxic industrial chemicals/materials in dense urban environments, and airborne particulates, such as mineral and soil dusts, in the etiology of constrictive bronchiolitis.

- Research to determine the prevalence and severity of constrictive bronchiolitis and related respiratory diseases in previously deployed military Service members and/or Veterans.

- Development and testing of minimally invasive or non-invasive approaches for diagnosing constrictive bronchiolitis.

- Research to develop novel and/or innovative therapeutics to modify the progression of constrictive bronchiolitis.

- Development and/or validation of animal models for understanding mechanisms and etiology of constrictive bronchiolitis.

Diabetes

- Research to better understand the heterogeneity of diabetes including the identification of novel biomarkers.

- Identification and/or evaluation of interventions to reduce the development of diabetes among individuals meeting the clinical criteria for pre-diabetes.

- Research on interventions to prevent or treat diabetes complications, including diabetic retinopathy, nephropathy, neuropathy, cardiomyopathy, and impaired wound healing.

- Research on the transplantation of allogenic or autologous pancreatic islet cells for long-term natural insulin production, including current good laboratory/clinical/manufacturing practices (as needed) for cell line development.

- Research to design and implement disease-in-a-dish and/or microfluidic models to model pancreatic islets to uncover pathogenesis and improve the efficiency of drug discovery.

Dystonia

- Research to improve identification of delayed onset dystonia following traumatic brain injury.
- Research on interventions to prevent, slow the progression of, or treat dystonia.
- Studies into the natural history, genetics, and/or neurobiology of dystonia.
- Research to identify the relationship between specific molecular/genetic changes and circuitry/network alterations in dystonia.
- Identification and development of novel research tools (such as cellular models, phenotypic models, etc.) to aid dystonia research.

Eating Disorders

- Investigations into the prevalence, diagnosis, and treatment patterns of eating disorders in Service members and their families, including potential relationships with military-unique behaviors or conditions.
- Assessment of patterns of comorbidity between eating disorders and other mental health conditions, including an examination of whether eating disorders are more likely to precede or follow the development of other mental health conditions.
- Studies to identify the most effective treatments (and order of treatment) for patients with an eating disorder and a comorbid disorder.
- Research to advance the understanding of the biological, genetic, lifestyle, and environmental factors that influence eating disorders.
- Studies to elucidate and/or mitigate risk factors for the onset or recurrence of eating disorders, including social influences.

Emerging Infectious Diseases

- Surveillance and predictive modeling tools that leverage artificial intelligence approaches to predict outbreaks and epidemics and support strategies for mitigating the threat of emerging infectious diseases (e.g., dengue, malaria, Hanta).
- Research and development of in silico and/or in vitro tools to assess product manufacturability/developability, efficacy, and toxicity, such as cells-on-a-chip and 3D tissue modeling, to support development of medical countermeasures.
- Development of a wearable sensor that provides real-time diagnostics of naturally occurring infectious diseases to predict illness before onset of symptoms.
- Rapid prediction of protective antigens/epitopes and testable correlates of protection on emerging or novel pathogens.

- Development of highly sensitive diagnostic system for use at the point of need that provides early diagnosis of infection prior to the onset of classical symptoms.

- Research, development, and validation of animal models for the study of infectious diseases that clearly show the pathophysiological mechanism of the disease and provide translational data to advance drug products to human clinical trial.

- Development of risk assessment strategies for vector-borne diseases and novel interventions for vector control, including but not limited to novel insecticides, larvicide applications, and barrier methods.

Epidermolysis Bullosa

- Research, including clinical trials, focused on therapeutics (topical or systemic) or dressings that enhance wound healing in inherited epidermolysis bullosa.

- Development of novel therapeutics to reduce epidermolysis bullosa symptoms, improve quality of life, or lead to a cure.

- Research to provide further insight into those cellular pathways that promote the development of squamous cell carcinomas in recessive dystrophic and junctional epidermolysis bullosa.

- Research, including randomized controlled clinical trials, focused on systemic drugs that prevent, delay the onset, or modify the aggressiveness of squamous cell carcinoma in patients with recessive dystrophic and junctional epidermolysis bullosa.

Focal Segmental Glomerulosclerosis

- Research to improve understanding of the causes of primary and/or secondary focal segmental glomerulosclerosis (especially genetic mutations).

- Development of non-invasive methods to diagnose focal segmental glomerulosclerosis and its variants.

- Development of a curative therapy or treatments to delay or halt the progression of focal segmental glomerulosclerosis and/or prevent post-transplantation recurrence.

- Research to determine the efficacy of medications used off-label (outside the FDA-approved indication) to treat focal segmental glomerulosclerosis.

Frontotemporal Degeneration

- Basic research to establish in vivo and in vitro models for disease pathology, behavioral/cognitive symptoms, and motor dysfunction.

- Research to understand the neurological basis of deficits in social cognition and emotional regulation.

- Research to improve diagnostics of and/or prognostics for frontotemporal degeneration.
- Research to identify risk factors (e.g., gene networks, environmental factors, and family history of dementia).
- Development of evidence-based non-pharmacological and/or pharmacological treatments for frontotemporal degeneration and associated symptoms.

Guillain-Barré Syndrome

- Development of a rapid diagnostic test for Guillain-Barré syndrome.
- Research on the immune system cell types and molecular mechanisms responsible for the pathology of Guillain-Barré syndrome.
- Research to elucidate the characteristics of various exposures (e.g., viruses, bacteria, vaccinations, surgery, trauma) associated with Guillain-Barré syndrome and their effects on the immune system.
- Research to prevent or reduce the effects of residual weakness, relapse of muscle weakness, and other neurological and psychological symptoms of Guillain-Barré syndrome to improve patients' quality of life and increase their independence.
- Development of new treatments and refinement of existing treatments for Guillain-Barré syndrome.

Hemorrhage Control

- Development of new and innovative capabilities to stop non-compressible intracavitary hemorrhage and improved technologies to stop junctional and pelvic bleeding in pre-hospital environments.
- Development of innovative damage control resuscitation and damage control surgical capabilities.
- Research on strategies for early (e.g., pre-hospital) detection (especially internal bleeding) and treatment for hemorrhage, coagulopathy of trauma, and hemodynamic decompensation/ hypovolemic shock.
- Research on novel or engineered blood products that offer physiological, logistical, or cost advantages over current products. Proposals for HBOCs should address nitric oxide scavenging.
- Research on adjunctive pharmacological solutions for hemorrhage, shock, coagulopathy, transfusion, and/or the stabilization of polytrauma, with attention to contraindications and/or impact on TBI.

- Research to evaluate the effects of current combat blood product transfusion guidelines on immunological status and clinical outcomes.

Hepatitis B

- Identification and reduction of hepatitis B in blood products for transfusion.
- Research on strategies to reduce vertical (mother-to-child) transmission of hepatitis B.
- Development of strategies for reliable, non-invasive, early detection of hepatitis-related liver disease and hepatocellular carcinoma.
- Research on strategies to promote reversal of liver fibrosis and/or assess the associated clinical and pathological outcomes.
- Clinical studies to evaluate combination or curative therapies for treatment of hepatitis B infection.

Hereditary Angioedema

- Research toward the development of a cure for hereditary angioedema.
- Development and/or validation of novel and/or innovative therapeutic strategies for the treatment and/or prevention of hereditary angioedema attacks.
- Research to improve early diagnosis of hereditary angioedema.
- Evaluation of existing, innovative, or novel therapeutics in pediatric hereditary angioedema patients.

Hydrocephalus

- Research on the etiology, prevention, diagnosis, and treatment of post-traumatic hydrocephalus.
- Discovery or validation of novel and/or innovative therapies and therapeutic targets for the treatment of hydrocephalus and its sequelae, including therapies directed at myelin regeneration and repair.
- Development or validation of biomarkers and imaging techniques, particularly multimodal approaches, to aid in diagnosis, prognosis, and monitoring of therapeutic efficacy.
- Research on the prevention of shunt failure or the development of novel shunt technologies.
- Development or validation of improved hydrocephalus model systems.

Immunomonitoring of Intestinal Transplants

- Studies to elucidate the role of the mucosal immune system, humoral, innate, and adaptive cellular immunity, other host-derived factors, or gut microbiota-derived factors in maintaining intestinal transplant viability and improving outcomes.
- Development and evaluation of evidence-based intestinal transplant strategies that focus on dampening the immune response against intestinal transplants or circumvent the induction of immunity against the transplant.
- Development and evaluation of implant-associated materials (e.g., scaffolds) with anti-inflammatory properties that protect the intestinal transplant from immune attack.
- Development and evaluation of strategies for inducing and maintaining populations of anti-inflammatory regulatory immune cell populations at the transplant site.
- Studies to improve immunomonitoring of recipient immune responses after intestinal transplantation, with a focus on prospective leukocyte profiling, to aid in diagnosis and treatment of immunological and immunosuppression-related complications.
- Development and/or validation of precise, real-time implanted monitoring devices to improve individualized patient outcomes after intestinal transplantation.

Inflammatory Bowel Diseases

- Studies directed toward understanding how acute enteric infections may trigger chronic inflammatory bowel diseases.
- Studies that leverage genomic, microbiomic, immunological, and systems biology approaches to prevent inflammatory bowel disease (especially inflammatory bowel diseases associated with acute enteric infection).
- Studies to understand the interaction between acute/chronic stress and infection and their influence on inflammatory bowel diseases.
- Research to better characterize the association between the use of drugs, such as isotretinoin and long-term doxycycline, and the development of inflammatory bowel diseases.
- Research on the role of diet in the development and progression of inflammatory bowel diseases.
- Research on treatment strategies for patients with inflammatory bowel diseases to include, but not limited to, rebalancing the microbiome, pre- and probiotics use or colostrum products, including those who are refractory to standard care.

Interstitial Cystitis

- Studies that define the risk, prevalence, and operational impact of interstitial cystitis among active duty personnel.
- Identification and validation of biomarkers for making a definitive diagnosis of interstitial cystitis.
- Evaluation and assessment of novel and/or innovative treatment options for interstitial cystitis patients, including intravesical therapy.
- Research on the etiology and pathogenesis of interstitial cystitis to inform targeted therapy development.

Lung Injury

- Studies to identify the prevalence and associated morbidity and mortality of blast overpressure lung injury.
- Development of improved methods for assessing lung injury due to exposure to chemical or physical (e.g., radiation) hazards and materials in occupational, operational, and training environments to improve surveillance, diagnosis, and prognosis.
- Development of improved methods for monitoring pulmonary exposure to chemical or physical agents that might cause lung injury.
- Identification of pre-existing conditions that predispose an individual's susceptibility to lung injury resulting from environmental exposures (i.e., genetic predisposition).
- Development of novel preventive techniques, detection technologies, and therapeutics to reduce the incidence and/or severity of lung injury.

Metals Toxicology

- Identification and validation of biomarkers to evaluate military Service members' acute exposure to toxic metals in an operational environment and predict potential consequent health risks and associated health outcomes.
- Retrospective studies to evaluate risks and exposure to military-relevant toxic metals among workers at industrial facilities.
- Research on the toxicity of metal combinations and the interaction between different metal components.
- Research on the toxicity of metal-based engineered nanomaterials, including those used in military applications.
- Development of microsurgical techniques to remove embedded toxic metals.

Mitochondrial Disease

- Identification and testing of non-invasive techniques and biomarkers to monitor mitochondrial function, aid in clinical diagnosis, and/or evaluate therapeutic efficacy.
- Development of improved tools and animal models to study primary mitochondrial diseases and evaluate therapeutics.
- Research to better understand the pathology of primary mitochondrial diseases.
- Development of tools and methodologies to assess mitochondrial heteroplasmy on a cellular, tissue, and organ level.
- Research on novel and/or innovative treatments to alleviate symptoms or slow down the progression of mitochondrial diseases.

Musculoskeletal Disorders

- Research on computational models that provide personalized, actionable information regarding the physical resilience of the musculoskeletal system for the prevention and treatment of musculoskeletal disorders such as load carriage capability, effectiveness of physical training and treatments, and effective use of exoskeleton technology.
- Development and/or validation of metrics (clinical-based measures/tools and field-based measures/tools) to inform readiness and/or return-to-duty/work decision making following the management, treatment, and rehabilitation of musculoskeletal disorders.
- Research to increase understanding and to improve diagnosis, prevention, and/or treatment of chronic overuse musculoskeletal disorders.
- Research on back pain treatment and/or management strategies to prevent surgery and recurrence of symptoms, identify factors that predict optimal treatment response for different patients, and encourage self-management.

Myotonic Dystrophy

- Research on the role of epigenetic factors in the onset, progression, and/or severity of myotonic dystrophy in relevant animal models or patients.
- Research into the mechanisms of expanded CTG or CCTG repeat instability in somatic or germ line cells in myotonic dystrophy.
- Identification of biomarkers that can be detected through minimally invasive means to signal early changes in the progression of myotonic dystrophy.
- Development and/or testing of novel and/or innovative treatments, including those utilizing gene editing or silencing.

- Clinical research into the natural history of myotonic dystrophy, to understand disease progression and develop/validate clinical trial endpoint measures across the multiple organ systems involved in the disease.

Nanomaterials for Bone Regeneration

- Research on nanomaterials that stimulate vascularization and new bone growth.
- Research on nanomaterials-based methods to facilitate recruitment of endogenous cell populations for enhanced bone regeneration and osseointegration.
- Development of nanomaterial-based technologies addressing segmental/large bone defects in craniomaxillofacial and/or load-bearing regions.
- Development of nanomaterials for controlled release/extended release of growth factors for bone regeneration.
- Development of nanomaterial-based technologies that repair the soft tissue envelope to enhance bone regeneration.

Nutrition Optimization

- Development and/or validation of nutrition-based strategies that mitigate the consequences of stressors, especially on Service member health, readiness, and performance.
- Development of prolonged nutrition care using oral and/or intravenous approaches including precision nutrition care following injury or illness.
- Research on the impact of the use of dietary supplements (e.g., vitamins, probiotics, protein powders) on the physical and/or cognitive performance, including the readiness of military Service members.
- Development and/or validation of improved nutrition strategies for physical and/or cognitive performance enhancement and sustainment in operational environments and efforts to optimize nutrition in resource-limited settings.
- Research to develop strategies to apply metabolomics to optimize individual nutrition and the development of tools or devices to monitor nutritional intake at an individual level.

Pancreatitis

- Development and testing of novel and/or innovative therapeutics for acute and/or chronic pancreatitis.
- Research on the basic biology and physiology of the pancreas to better understand the etiology and pathology of pancreatitis.
- Research to improve understanding and management of complications of pancreatitis.

Pathogen-Inactivated Blood Products

- Research on lyophilization of pathogen-reduced/-inactivated blood products and derivatives (platelets, plasma, red cells, cryoprecipitate, coagulation factors, etc.).

- Development and advancement of technologies to improve the safety of blood products to include pathogen reduction/inactivation in whole blood for military/civilian blood donor centers and blood banks that meet the requirements for FDA licensure in support of domestic and global contingency/combat operations.

- Expansion and validation of the library of blood-borne pathogens that are reduced/inactivated to include emerging pathogens, genetically modified pathogens, and pathogens designed for biological warfare.

- Advancement in pathogen reduction technology to further improve the log-kill reduction for blood-borne pathogens (e.g., Hepatitis B, Korean Hemorrhagic Fever virus, Bunyan virus, HIV, Rift Valley Fever, Malaria, Babesia, Ebola, West Nile virus, Dengue, Chikungunya, Zika virus).

- Research studies, including clinical trials, to further characterize the effects of pathogen reduction technologies in blood products (e.g., whole blood, platelets, plasma, cryoprecipitate).

- Development and validation of next-generation technologies and/or devices to reduce the production time for pathogen reduction/inactivation in whole blood.

Polycystic Kidney Disease

- Development of improved treatment strategies for polycystic kidney disease, including approaches to identify and monitor patients at higher risk for progressing to end-stage renal disease.

- Research on the underlying pathobiology and molecular mechanisms of polycystic kidney disease, including studies of genetic factors, cyst formation and growth, the role of cilia, and factors that modify disease progression and/or severity.

- Research on the lifestyle factors or comorbidities that may modify the progression of polycystic kidney disease.

Post-Traumatic Osteoarthritis

- Development or validation of innovative regenerative rehabilitation approaches for preventing or mitigating post-traumatic osteoarthritis.

- Studies to evaluate and develop best practices for multidisciplinary team approaches and treatment algorithms for post-traumatic osteoarthritis.

- Intra-articular treatments that offer sustained (two or more months) relief of symptoms and/or disease-modifying effects.

- Research on therapies that target multiple phases of the cellular response pathways that are implicated in the development of post-traumatic osteoarthritis, including cell death, inflammation, matrix changes, and changes in catabolic and anabolic responses.

- Research on biomarkers that can serve as surrogate endpoints for post-traumatic osteoarthritis diagnosis and/or can optimize subject selection in clinical trials.

Pressure Ulcers

- Novel strategies for the treatment of pressure ulcers including mitigation of progression to advanced stages.

- Strategies to prevent or reduce the formation of pressure ulcers during prolonged immobilization of casualties in a pre-hospital environment (e.g., spinal cord injuries) or long-range transport/aeromedical evacuation.

- Research on novel techniques for synthetic production, delivery, and adhesion methodologies leading to permanent closing of pressure ulcers. This might encompass synthetic fibers, novel tissue culture methodologies, growth factors, dermal printing, artificial skin, skin graft substitutes, regenerative medicine, etc.

- Novel strategies for the prevention or early detection of pressure ulcers.

Pulmonary Fibrosis

- Identification of biomarkers of pulmonary injury or early predictors of interstitial lung disease.

- Development and/or validation of improved tools and animal models (excluding mice) to study pulmonary fibrosis and evaluate therapeutics.

- Research into the pathobiology and molecular mechanisms underlying the development and progression of pulmonary fibrosis.

- Retrospective studies to determine the risk and incidence of pulmonary fibrosis among military Service members and/or Veterans.

- Development and/or testing of novel and/or innovative treatments, to include precision medicine approaches, to delay or modify the progression of pulmonary fibrosis.

Resilience Training

- Research to deliver evidence-based interventions and improved comprehensive strategies for building individual, family, and community resilience to physical, psychological, environmental, and social stressors over the military life cycle, including transitions.

- Research that measures the effects of resilience training approaches on a broad array of outcomes and constructs of interest (physical health, performance, well-being, mental health, relationships, etc.) by evaluating the efficacy of resilience training and/or leadership approaches in response to stressors and challenges.

- Development and validation of physical or psychological measures of individual variation and response to stressors and meaningful resilience measures, including non-self-report objective measures.

- Research aimed at understanding the relationship between Service member resilience and successful/unsuccessful recovery from injury.

- Research in psychometric training or pharmacological treatment(s) to manage stress within individuals.

Respiratory Health (excludes lung cancer and mesothelioma)

- Research on the causes, treatment, and prevention of obstructive pulmonary diseases (e.g., chronic obstructive pulmonary disease and bronchiectasis), including identification and validation of biomarkers and disease phenotypes, as well as employing personalized medicine in clinical research and disease management.

- Research on the cause, treatment, and prevention of respiratory symptoms and ailments possibly associated with deployed and redeployed military personnel.

- Research to evaluate the impact of military service, primarily deployment, on the prevalence and severity of respiratory disease.

- Identification and/or validation of biochemical, physiological, or combined biomarkers for evaluating risk or extent of pulmonary injury from either acute or long-term toxic occupational or environmental exposures.

- Research investigating exposure rates, detection, and treatment of diseases related to inhalation of mold and fungi, such as coccidioidomycosis from both indoor and outdoor sources.

Rett Syndrome

- Identification and/or validation of novel and/or innovative biological targets for the treatment of Rett syndrome.

- Development and testing of interventions to improve the neurological symptoms of Rett syndrome.

- Research to understand the relationship between genetic mutations, physical traits, and symptoms in individuals with Rett syndrome.

- Research to understand Rett syndrome's commonalities with, and differences from, other autism spectrum disorders.

- Research on the pathobiology of MeCP2 and associated genes and proteins.

Rheumatoid Arthritis

- Research to better understand the relationship between genetic risk, environmental exposures, and predicted triggers, such as infection or smoking, in developing rheumatoid arthritis.

- Studies that identify or validate biomarkers or personalized medicine strategies that allow for individualized medication choice based on the patient's underlying biology or disease state.

- Research on the long-term use of immunosuppressive and other therapies in patients with rheumatoid arthritis.

- Research to better characterize and understand the preclinical disease stage of rheumatoid arthritis for early diagnosis and treatment.

- Research on management of comorbidities, including biopsychosocial outcomes, for patients with rheumatoid arthritis.

- Research to establish activity recommendations following joint replacement for maximal joint life.

Scleroderma

- Research on the molecular mechanisms and pathogenesis of scleroderma, including the identification of novel and/or innovative therapeutic targets.

- Development and/or validation of novel and/or innovative therapies for scleroderma.

- Identification and/or validation of biomarkers and other approaches for early diagnoses, monitoring disease progression, and/or assessment of treatment response.

- Epidemiologic studies investigating the impact of localized scleroderma (morphea) on duty performance, use of personal protective equipment, and deployability.

- Research on early identification and prevention of scleroderma-associated complications, such as lung, liver, or kidney disease.

Sleep Disorders

- Research on how the disruption of normal sleep and circadian rhythms adversely affects the physical and psychological health, safety, performance, and productivity of military personnel and civilian populations, including sex and gender differences.

- Identification and/or validation of non-Continuous Positive Air Pressure (CPAP)-based treatment regimens that enhance compliance in military personnel and civilian populations.

- Research on the prevention and/or mitigation of sleep disorders that are associated with long aeromedical evacuation flights for both clinical team members and patients.

- Development and/or testing of non-pharmacological treatments for sleep disorders associated with long-term exposure to enclosed environments (e.g., aircraft, submarines, tanks).

- Research on the precision diagnosis and/or treatment of sleep disorders, especially following traumatic brain injury or related to post-traumatic stress disorder.

Spinal Muscular Atrophy

- Research into molecular and proteomic phenotyping the spinal muscular atrophy disease state.

- Research to determine mitochondrial involvement and astrocytic and other non-neuronal contributions to motor neuron vulnerability.

- Exploration of the form and function of SMN-depleted neuromuscular junctions at ultrastructural (e.g., dysregulation of endocytosis), transcriptomic, and proteomic levels, particularly the mildest SMN reduction that leads to consistent quantifiable motor neuron loss.

- Research to find non-SMN-altering spinal muscular atrophy modifying genes that may lead to identification of novel and/or innovative therapeutic targets or treatments.

- Research to further understand SMN gene regulation and post-transcriptional mechanisms leading to synergistic SMN-repleting approaches, as well as to determine whether boosting SMN induction maximizes efficacy.

Tinnitus

- Development and validation of objective tools/methods to diagnose and characterize tinnitus (e.g., imaging techniques to identify functional and structural changes in the brain, biomarkers of resiliency, and susceptibility to tinnitus).

- Research to understand the mechanisms of tinnitus, its relationship to noise-induced hearing loss, and progression to chronic tinnitus, with the focus on developing interventions.

- Research to understand and mitigate the negative impact of tinnitus on operational readiness of the military.

- Identification of novel and/or innovative therapies and/or devices for interventions to prevent, manage, and treat tinnitus, including behavioral approaches, new uses for existing drugs, nutritional and pharmaceutical strategies, and acoustic, electrical, and other stimulation technologies.

Tissue Regeneration

- Development of novel therapies to repair neurosensory damage, maintain the distal end organ interface, or regenerate the neuromuscular junction for reinnervation of end organs during peripheral nerve regeneration.
- Development of novel therapies for regeneration of tendons and musculotendinous junctions.
- Development of novel therapies for regeneration of functional skeletal muscle, particularly (1) stem cell-based approaches and (2) treatments for volumetric muscle loss.
- Research on novel approaches and therapies to understand mechanisms of immune rejection and obviate the need for chronic toxic immunosuppression in reconstructive transplantation and vascularized composite allotransplantation.
- Research into innovative methods for developing biocompatible scaffolds and stem cell therapies for manufacturing and production of tissues.
- Research on novel interventions to regenerate brain tissue and recover neurological function, especially following traumatic brain injury.

Tuberculosis

- Research to understand, diagnose, or treat multi-drug-resistant tuberculosis or extensively drug-resistant tuberculosis.
- Development of novel strategies or therapeutics to treat tuberculosis.
- Development of a diagnostic assay that can be used at the point of care to rapidly and accurately diagnose tuberculosis to include multi-drug-resistant tuberculosis or extensively drug-resistant tuberculosis.
- Development of novel and/or innovative tuberculosis vaccines or optimization of current tuberculosis vaccines.

Vascular Malformations

- Studies into the natural history, genetics, and pathogenesis of vascular malformations.
- Research to develop or improve methods to diagnose and manage vascular malformations.
- Research to discover or develop novel and/or innovative therapeutic targets and treatments to regress or prevent vascular malformations.
- Development of non-invasive or minimally invasive technologies or approaches for the control of internal bleeding, including cerebral arteriovenous malformations, associated with vascular malformations.

- Development of in vivo or in vitro models of vascular malformations for the purpose of identifying novel and/or innovative drug targets, screening existing drugs, and/or elucidating the pathogenesis of the disease.

Women's Heart Disease

- Identification of sex-specific approaches to either develop novel diagnostics and treatments or increase the effectiveness of current practice to improve clinical care of women.

- Research on factors to predict and prevent the long-term impacts of the endocrine system, gestational diabetes, gestational hypertension, menopause, or preeclampsia on the cardiovascular health of women.

- Research on trauma-induced cardiac arrest secondary to hemorrhage and polytrauma in the female population.

- Research focused on elucidating the potential relationship between post-traumatic stress disorder and women's heart disease.

- Studies to determine the risk and incidence of heart disease among current and/or former female Service members.

APPENDIX 3: DOD AND VA WEBSITES

PIs are encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. Below is a list of websites that may be useful in identifying additional information about DoD and VA areas of research interest, ongoing research or potential opportunities for collaboration within the FY19 PRMRP Topic Areas.

Copied from https://research.unc.edu/creativity-hubs/rfp/

Stage 2: Full proposals due April 12, 2019

Please use 1-inch margins and use a font size no smaller than 11pt. to ensure readability.

Proposals should be submitted as one document in PDF format to creativityhubs@unc.edu by 5:00 pm of April 12, 2019.

Full proposals will consist of the following:

Proposal Cover Page

Please use the provided template:

- Include the title of the project;
- A list of 5 key words;
- Principal investigator contact information;
- List of other key personnel and their college/school and/or Center/Institute affiliation, and proposed project effort (both paid and cost-shared);
- Total amount of funding requested;
- Answers to compliance questions; and
- A 200-word (maximum) summary of the proposed research program that is appropriate for a broad faculty readership.

Project description (6 pages):

The project description should include sufficient detail such that reviewers can evaluate the appropriateness and feasibility of the proposed plans. The project description must articulate a clear set of goals that are aspirational yet attainable. Preliminary data are not required but teams must demonstrate that they can successfully advance the project.

The project description should include the following sections:

- Research plan: This section should address how the proposed research program is consistent with the Key Review Criteria. It should include a discussion of the major challenges in the field, a description of innovativeness of the proposed research, how it would solve these challenges, and the impact it would have on the challenge, as well as its benefits to society, culture, community, the environment or the economy. This section should also include a description of convergence: how the project takes advantage of expertise from multiple and diverse disciplines, how the different parts would form a greater whole and contribute to the project's success.
- Sustainability Plan: Detailed plan for sustainability of the proposed research program via the attraction of extramural support. Description of specific sources of extramural funding that will be targeted for future proposals. Plans for extramural funding should be as specific as possible, including name of the private or public sponsor, agency or source names, agency programs that would be the source of funding, timelines for proposal submissions and potential amounts of funding.
- Work and Management Plan: Description of the leadership experience of the PI, how each participating key personnel contributes to the team, how the inter-disciplinary team will function

as a unit and form a greater whole that promote new ways of thinking to push disciplinary boundaries. This section should also include an outline of the plan of work, with milestones to be achieved in the first year of funding, and metrics to gauge success throughout the course of the two years of funding.

Budget

Please use the provided budget template form. A single two-year budget with justification. Funds may be used for any legitimate research-related expense, and may include minimal faculty effort. Funds cannot be used for administrative support, support of workshops/symposia, or F&A costs. Additionally, funds should not be used to develop small grants program. Use of funds for equipment purchase is discouraged, but if new equipment is required to meet the goals and milestones of the project, a detailed justification will need to be included. Since the goal of this program is to grow UNC's research enterprise, if funds are to be requested for subawards, they should be kept at a minimum and clearly justified. Please note that the requested funds for Year 1 should specifically address how the milestones outlined in the Research Plan for Year 1 will be achieved.

Please provide a Budget Justification limited to no more than 2 pages.

Biosketches

Biosketches of the PI(s) and all key personnel that include relevant publications and research funding to date. Please use one of the following formats:

- NIH Biosketch
- NSF Biosketch and a list of currently funded projects from your latest NSF Current and Pending Support document

Additionally, biosketches should provide a statement that describes how the included faculty's contribution and expertise are both required and sufficient to accomplish the proposal's stated goals.

Letters of Support

Applications including any cost-share/match should include a letter of support from the entity providing these funds. Additionally, letters of support from non-funded collaborators may be included.

Review

Full proposals will be reviewed and ranked by a panel that includes university research associate/vice deans, center/institute directors, and faculty with relevant expertise. The Associate Vice Chancellor for Research/Office of Research Development will provide guidance and oversight of the review process.

Rankings for full proposals will be based on the following criteria:

- Innovation and originality of the proposed research program as a solution to the stated challenge in the field.
- Clear articulation of the importance of the challenge and the impact that the ideas for the solution can provide to benefit society, culture, community, the environment or the economy, including the State of North Carolina.
- Impact of the proposed research program on the advancement of interdisciplinary research.

- Qualifications and track record of the PI and project faculty, synergy among team members' expertise to enable research and promote new ways of thinking that push disciplinary boundaries, and how the team will work as a unit.
- Likelihood that the proposed research program will lead to large-scale funding support by government agencies, corporations, private foundations, and/or venture capital and likelihood for long-term sustainability of the research program via extramural funding.
- Likelihood that the proposed research program will be successful.
- How well the proposed research program advances UNC's preeminence in the OVCR's strategic research areas, if relevant.
- Clear description and feasibility of the milestones and metrics.
- A coherent management and work plan that clearly describes feasibility of the milestones and metrics.
- Reasonableness of the budget.

Prior to the finalization of rankings, the proposal teams will be required to make an oral presentation to the review panel and to guest reviewers who are experts in the field. Ranked proposals will be considered by the Vice Chancellor for Research and other UNC Executive Officers, and final selection will be made. PIs of the proposal selected for funding will be notified by the end of June, and funds will be made available July 1, 2019.

Decision Regarding Second Year of Funding

An advisory committee consisting of the representatives from the Office of the Vice Chancellor for Research, the Office or Research Development, Office of Technology Commercialization, and faculty with relevant expertise for each Creativity Hub will advise/track progress against proposed metrics. The Office of Research Development will schedule meetings every 3 months to assess progress, ensure funds are being spent as planned, and help the team overcome any roadblocks that may have arisen. Eleven months after funds are made available, a two-page report describing accomplishments to date, as well as a complete financial accounting of fund expenditures, will be due to the Office of Research Development. Decision regarding the release of funds for the second year of funding will be made by the Vice Chancellor for Research within two weeks. Criteria to be employed to review accomplishments to date and assess research program progress include:

- Are the accomplishments to date consistent with the timeline and metrics presented in the full proposal? If not, do reasonable extenuating circumstances explain lack of progress?
- Are project expenditures to date consistent with progress of the research program and the budget accompanying the full proposal?
- Have there been any changes to the timeline for research or plans for the solicitation of extramural funding?

Assistance from the Office of Research Development for Creativity Hub-Assisted Large-Scale Proposals

Creativity Hubs awardees are guaranteed proposal development assistance from the Office for any large-scale follow-on funding opportunities that spring from Creativity Hub funding. Please contact the Office of Research Development well in advance of the due date for any follow-on funding proposals to ensure that your proposal can be prioritized.

Presentations to Campus and Lay Audiences

Awardees should expect to be called upon to develop and deliver a presentation on their projects suitable for campus leadership or lay audiences.

Final Report

On or before two months after the end of the final year of Creativity Hub funding, a two-page final report will be due to the Office of Research Development that details accomplishments to date. This report should describe research accomplishments as well as tangible results, such as publications, presentations at symposia, patents, and grant submissions/awards that were produced/obtained as a consequence of funding provided by the Creativity Hubs program. Plans for the submission of proposals for extramural funding should be included, and the Office of Research Development should be notified of all subsequent awards.

Questions

For all questions related to this program, please write to creativityhubs@unc.edu. Please also see our FAQ website.

I. OVERVIEW OF THE FUNDING OPPORTUNITY

United States Army Medical Research and Materiel Command

DEPARTMENT OF DEFENSE

BROAD AGENCY ANNOUNCEMENT
for Extramural Medical Research

Funding Opportunity Number: W81XWH18SBAA1

Announcement Type: Initial

Catalog of Federal Domestic Assistance Number: 12.420
Military Medical Research and Development

KEY DATES

Release/Posted Date: October 1, 2017

Closing Date: September 30, 2022, 11:59 p.m. Eastern Time

This Funding Opportunity Announcement is a Broad Agency Announcement (BAA). It is continuously open for a 5-year period, from October 1, 2017 through September 30, 2022, 11:59 p.m. Eastern Time.

This Broad Agency Announcement must be read in conjunction with the General Submission Instructions, which are available for downloading from Grants.gov. The General Submission Instructions are located under the "package tab" and can be downloaded by selecting the "Download Instructions" icon when previewing the submission package.

I.A. New for Fiscal Year 2018

The Fiscal Year 2018 – Fiscal Year 2022 (FY18-FY22) U.S. Army Medical Research and Materiel Command's (USAMRMC) Broad Agency Announcement (BAA) for Extramural Medical Research contains several changes from previous USAMRMC BAAs. Read each section carefully. Note the following:

- The open period of the BAA has been extended to 5 years and will be amended annually with any updates.
- The format of the BAA has been revised to conform to Chapter II of Title 2, Code of Federal Regulations (CFR), Section 200.203 "Notices of funding opportunities."
- The "Research Areas of Interest" can be found in Appendix I.
- For assistance agreements:
    - The total period of performance may be proposed for up to 4 years in length; additional periods may be considered.
    - Any assistance agreement (grant or cooperative agreement) awarded under this BAA will be governed by the award terms and conditions that conform to the Department of Defense's (DoD) implementation of Office of Management and Budget (OMB) guidance in 2 CFR part 200, "Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards." DoD implementation is located in Chapter XI of Title 2, CFR.
- For contract awards:
    - The total period of performance may be proposed for up to 5 years in length.
    - The total period of performance for conference or symposium support contracts may be proposed for up to 2 years in length.

II. DETAILED INFORMATION ABOUT THE FUNDING OPPORTUNITY

The USAMRMC mission is to provide solutions to medical problems of importance to the American Service member at home and abroad, as well as to the general public at large. The scope of this effort and the priorities attached to specific projects are influenced by changes in military and civilian medical science and technology, operational requirements, military threat assessments, and national defense strategies. Extramural research and development programs play a vital role in the fulfillment of the objectives established by the USAMRMC. General information on USAMRMC can be obtained at http://mrmc.amedd.army.mil/index.cfm.

This BAA is intended to solicit extramural research and development ideas using the authority provided by United States Code, Title 10, Section 2358. The BAA is issued under the provisions of the Competition in Contracting Act (CICA) of 1984 (Public Law 98-369), as implemented in Federal Acquisition Regulation (FAR) 6.102(d)(2) and 35.016 and in DoD Grant and Agreement Regulations (DoDGAR) 22.315. In accordance with FAR 35.016, projects funded under this BAA must be for basic and applied research to support scientific study and experimentation directed toward advancing the state of the art or increasing knowledge or understanding rather than focusing on development of a specific system or hardware solution. Research and development funded through this BAA are intended and expected to benefit and inform both military and civilian medical practice and knowledge.

The selection process is highly competitive, and the quantity of meaningful submissions (both pre-proposals/pre-applications and full proposals/applications) received typically exceeds the number of awards that available funding can support.

This BAA provides a general description of USAMRMC's research and development programs, including Research Areas of Interest, evaluation and selection criteria, pre-proposal/ pre-application and full proposal/application preparation instructions, and general administrative information. Specific submission information and additional administrative requirements can be found in the document titled "General Submission Instructions" available in Grants.gov along with this BAA.

The execution management agent for this BAA will be the Congressionally Directed Medical Research Programs (CDMRP). The CDMRP manages the electronic Biomedical Research Application Portal (eBRAP) system and retrieval and processing of full proposal/application submissions from Grants.gov. Refer to Section II.G, Agency Contacts, for additional information.

The USAMRMC's supporting acquisition office, the U.S. Army Medical Research Acquisition Activity (USAMRAA), will be the awarding and administering office for proposals/applications selected for funding, unless approval is obtained from the USAMRAA Principal Assistant Responsible for Contracting to allow another Federal acquisition office to execute and administer an award.

II.A. Program Descriptions

II.A.1. Military Infectious Diseases Research Program

The Military Infectious Diseases Research Program (MIDRP) focuses on vaccines, drugs, vector detection assays, and novel therapeutics to treat multidrug-resistant organisms in combat wound infections, as well as vector control measures for insect vectors that transmit naturally occurring endemic diseases with demonstrated or potential capability to decrease military operational effectiveness. Malaria, dengue, and bacterial diarrhea are the main areas of interest for the MIDRP. The MIDRP also has programs in multidrug-resistant bacteria and fungi, Rickettsial diseases, emerging infectious diseases (e.g., chikungunya virus, Zika virus) not found on the Defense Threat Reduction Agency (DTRA) biothreat list. The MIDRP does not support proposals/applications for funding research on any biological or chemical warfare threats or cancer.

Research efforts that focus on novel technologies and/or Investigational New Drug (IND)-enabling preclinical and clinical studies to facilitate the development of preventive and treatment therapies for the above-mentioned research areas are of interest to the MIDRP.

The MIDRP is also interested in proposals/applications incorporating a systems biology approach. Systems biology is the study of systems of biological components, which may be molecules, cells, organisms, or entire species. For more information, refer to Section II.D.2.b.i, Attachment 7, Data- and Research Resource-Sharing Plan.

Research Areas of Interest to the MIDRP are found in Appendix I.I. Applicants are urged to read and consider these before preparing their proposals/applications.

II.A.2. Combat Casualty Care Research Program

The Combat Casualty Care Research Program (CCCRP) provides integrated capabilities for current and future operations to reduce the mortality and morbidity associated with major combat-related trauma across the spectrum of combat casualty care including point of injury and pre- or out-of-hospital care, the spectrum of en-route care, and facilities-based treatment. A primary emphasis of the CCCRP is to identify and develop medical techniques, knowledge products, and materiel[1] (medical devices, drugs, and biologics) for early intervention in life-threatening battle injuries and prolonged field care[2] (PFC). Because battlefield conditions impose severe constraints on available manpower, equipment, and medical supplies available for casualty care, the CCCRP places a premium on medical interventions that can be used within the battle area or as close to it as possible, before or during medical evacuation. Preferred medical techniques and materiel that can be used by combat medics must be easily transportable (i.e.,

[1] Materiel is defined as equipment and supplies of a military force.

[2] Prolonged field care is defined as field medical care, applied beyond "doctrinal planning timelines" by a North Atlantic Treaty Organization (NATO) Special Operations Combat Medic (NSOCM) or higher, in order to decrease patient mortality and morbidity. PFC utilizes limited resources and is sustained until the patient arrives at an appropriate level of care. Rasmussen TE, Baer DG, Cap AP, et al. 2015. Ahead of the Curve. *J Trauma Acute Care Surg* 79: S61-64.

small, lightweight, and durable in extreme environments and handling); devices must be easy to use and require low maintenance, with self-contained power sources as necessary. The CCCRP is interested in existing materiel for which concept and/or patient care efficacy have already been demonstrated, but that require improvement to meet military requirements. The CCCRP is also interested in proposals/applications incorporating a systems biology approach. For more information, refer to Section II.D.2.b.i, Attachment 7, Data- and Research Resource-Sharing Plan.

Research efforts are needed in principles and technologies to enhance self- and buddy-aid, also referred to as tactical care; techniques, methods, or materiel to improve basic and advanced life support for all injured persons; monitoring, sustainment, and management of all injured casualties during episodes of delayed care or PFC; and enhanced capability for triage of large numbers of casualties and staged treatment in the field. The principal causes of death among Service members who die within the first hour of wounding are hemorrhage and traumatic brain injury (TBI).

The CCCRP supports additional aspects of casualty care. These include drugs, devices, and/or novel surgical techniques to decontaminate, debride, protect, monitor, repair, and/or stabilize hard and soft tissue wounds to mitigate secondary tissue damage; orthopaedic and maxillofacial trauma repair strategies; and the prevention and/or mitigation of wound infection and disease in austere environments. The CCCRP is also interested in the development of sensors; diagnostic and prognostic algorithms; data gathering or capture modalities; processors to improve our capability for remote triage, monitoring, and management of casualties; and products to maintain casualties during prolonged evacuation.

The CCCRP also supports the conduct of military-relevant clinical research aimed at translating knowledge or materiel from basic and preclinical trauma research into clinical practice. This includes, but is not limited to, single- and multi-center clinical trials performed in the civilian setting to clarify the safety, efficacy, and optimal use of products stemming from the previously mentioned research areas.

The CCCRP supports the conduct of military-relevant, large data research projects including the use of large databases of common elements from trauma research projects (preclinical, translational, and clinical). Such studies should directly contribute to or effectively enable the data-driven conduct of combat casualty care. Examples include, but are not limited to, post-hoc analysis of data from completed trauma research projects, meta-analyses of a number of otherwise separate but completed studies, and the ability to harmonize data from planned or ongoing but otherwise separate research studies.

The Research Areas of Interest to the CCCRP are found in Appendix I.II. Applicants are urged to read and consider these before preparing their proposals/applications.

II.A.3. Military Operational Medicine Research Program

The mission of the Military Operational Medicine Research Program (MOMRP) is to develop effective countermeasures against military-relevant stressors and to prevent physical and psychological injuries during training and operations in order to maximize the health, readiness,

and performance of Service members and their families, in support of the Army Human Performance Optimization and Enhancement, Human Dimension, Multi-Domain Battle, and the DoD Total Force Fitness concepts.

The MOMRP provides the planning, programming and budgeting of biomedical research to deliver products and solutions to Service members and their families that address readiness, health, and performance throughout the deployment cycle and Service member lifecycle. The MOMRP is centered on cutting-edge scientific research and bringing "Science to the Service member" on the battlefield and at home in a relevant, timely manner.

The MOMRP supports research focused on solving critical problems facing the military today and in the future. Service- and platform-specific issues are addressed through close coordination with all Services to prevent unnecessary duplication of effort.

The MOMRP is divided into four Research Areas of Interest (with examples of types of research efforts shown in parentheses): (1) *Environmental Health and Protection* (performance optimization and biomarker validation during heat/cold/altitude exposures); (2) *Injury Prevention and Reduction* (countermeasures against aviation stressors; blast, blunt trauma, and accelerative injury prevention strategies; neurosensory injury protection; injury return-to-duty standards and strategies; and physiological mechanisms of musculoskeletal injury); (3) *Physiological Health and Performance* (performance and recovery nutrition, weight balance optimization, cognitive health and performance sustainment in the face of operational challenges, restorative sleep, and establishment of a physiological basis for resilience to operational and environmental stressors); and (4) *Psychological Health and Resilience* (post-traumatic stress disorder [PTSD], suicide prevention, resilience [including military families], substance abuse prevention, and violence prevention within the military).

More information on these Research Areas of Interest can be found in Appendix I.III.
Applicants are urged to read and consider these before preparing their proposals/applications.

The MOMRP is particularly interested in proposals/applications and products that incorporate integrated biomedical approaches (e.g., systems biology). Proposals/Applications are encouraged to leverage existing resources and infrastructure to support lifecycle logistics and sustainability. For more information, refer to Section II.D.2.b.i, Attachment 7, Data- and Research Resource-Sharing Plan.

II.A.4. Clinical and Rehabilitative Medicine Research Program

The Clinical and Rehabilitative Medicine Research Program (CRMRP) focuses on the innovations required to reset our wounded Service members, both in terms of duty performance and quality of life. Innovations developed from CRMRP-supported research efforts are expected to improve restorative treatments and rehabilitative care to maximize function for return to duty (RTD) or civilian life. Medical technologies (drugs, biologics, and devices) and treatment/rehabilitation strategies (methods, guidelines, standards, and information) that will significantly improve the medical care our wounded Service members receive within the DoD healthcare system are of particular interest. Implementation of these technologies and strategies should improve the rate of RTD of Service members, the time to RTD, clinical outcome

measures, and quality of life, as well as reduce the hospital stay lengths, clinical workload (patient encounters, treatments, etc.), and initial and long-term costs associated with restorative and rehabilitative or acute care.

Development and validation of in-vitro and in-vivo assessment models that represent military-relevant conditions in wounded Service members, as well as those that incorporate a systems biology approach, are of interest to the CRMRP when they can be used to identify and describe, in a predictable manner, the safety and efficacy of novel technologies in patients. For more information, refer to Section II.D.2.b.i, Attachment 7, Data- and Research Resource-Sharing Plan.

The CRMRP focuses its efforts on the following research areas: neuromusculoskeletal injury (including limb trauma and amputation), sensory systems impairment (including hearing, balance, tinnitus, and vision), acute and chronic pain, and regenerative medicine. While research topics of highest priority and interest are listed in Appendix I.IV for each of these areas, proposals/applications for topics that align within an overall research area will also be considered, except as specifically noted. TBI research proposals/applications will only be considered if the focus is related to one or more of the following: hearing, balance, tinnitus, vision, or pain related to TBI. Novel manufacturing technologies necessary to translate innovative therapies or devices into clinical development are a focus.

All projects should adhere to a core set of reporting standards for rigorous study design. The CRMRP strongly encourages award recipients to follow the Animal Research: Reporting *In Vivo* Experiments (ARRIVE) guidelines (http://www.elsevier.com/__data/promis_misc/622936arrive_guidelines.pdf). While these standards are written for animal studies, the basic principles of randomization, blinding, sample size estimation, and data handling derive from well-established best practices in clinical studies and should be applied to those projects as well.

The Research Areas of Interest to the CRMRP are found in Appendix I.IV. Applicants are urged to read and consider these before preparing their proposals/applications.

II.A.5. Medical Biological Defense Research Program

The DTRA Joint Science and Technology Office for Chemical and Biological Defense (JSTO-CBD) manages research directed toward medical biological defense. The DTRA JSTO-CBD has limited funding for proposals/applications submitted through the USAMRMC BAA. DTRA also seeks proposals/applications for its requirements through the Federal Business Opportunities (FedBizOpps) and the DoD Small Business Innovation Research (SBIR) Program solicitations. For information regarding DTRA business opportunities, visit the website at http://www.dtra.mil/Contracts/BusinessOpportunities.aspx.

The Medical Biological Defense Research Program (MBDRP) provides medical countermeasures for biological warfare agents. These countermeasures include specialized medical materiel or procedures designed to enhance protection. The priorities of the program are (a) prophylaxis or pretreatment to prevent any casualty; (b) identification and diagnosis of biological agents; and (c) treatment or supportive care regimens. The MBDRP is interested in

applications and products incorporating a systems biology approach. For more information, refer to Section II.D.2.b.i, Attachment 7, Data- and Research Resource-Sharing Plan.

Examples of some of the infectious agents of interest are those causing anthrax, plague, and glanders; the Ebola, Marburg, Venezuelan, Western and Eastern equine encephalitis viruses; and poxvirus models of variola virus. Examples of toxins of interest include those from plants (Ricin) and bacteria (Staphylococcal enterotoxins, botulinum).

The Research Areas of Interest to the MBDRP are found in Appendix I.V. Applicants are urged to read and consider these before preparing their proposals/applications.

II.A.6. Medical Chemical Defense Research Program

The DTRA JSTO-CBD manages research directed toward medical chemical defense; the program has limited funding for proposals/applications submitted through the USAMRMC BAA. DTRA also seeks proposals/applications for its requirements through FedBizOpps and DoD SBIR program solicitations. For information on DTRA business opportunities, visit its website at http://www.dtra.mil/Contracts/BusinessOpportunities.aspx.

The Medical Chemical Defense Research Program (MCDRP) seeks to preserve combat effectiveness through timely provision of medical countermeasures in response to Joint Service Chemical Warfare Defense Requirements. The fundamental orientation of the program is to protect U.S. Forces from the effects of chemical warfare agents by developing protective, pretreatment, and prophylactic products, providing products usable by the individual Service member for immediate treatment of chemical warfare agent exposures, developing antidotes/therapeutics to chemical warfare agents, defining care procedures for chemical warfare agent casualties, and advancing management of these casualties. The medical countermeasures are intended to preserve and sustain the Service members' combat effectiveness in the face of combined threats from chemical and conventional munitions on the integrated battlefield. The MCDRP is interested in applications and products incorporating a systems biology approach. For more information, refer to Section II.D.2.b.i, Attachment 7, Data- and Research Resource-Sharing Plan.

The broad goals of this program are described below:

a. Maintain the technological capability to meet present requirements and counter future chemical warfare agent threats: The program will maintain the scientific base and technological capability to develop timely medical countermeasures for both current and future chemical warfare agent threats. Research funded by this program will be used to identify concepts and candidate medical countermeasures for use by the individual Service member or by medical personnel. Basic and applied research are both supported and may address topics as diverse as determining sites/mechanisms of action and effects of exposure to chemical warfare agents with emphasis on exploitation of neuroscience technology and respiratory, ocular, and dermal pathophysiology; identifying sites and biochemical mechanisms of action of medical countermeasures; exploiting molecular biological and biotechnological approaches for development of new approaches for medical countermeasures to chemical warfare agents; and

exploiting molecular modeling and quantitative structure-activity relationships in support of drug discovery and design.

b. Provide medical countermeasures for the individual Service member to maintain combat effectiveness and prevent or reduce injury from chemical warfare agents: This goal encompasses research supporting development of new concepts for prophylaxes, pretreatments, antidotes, and therapeutic countermeasures; development of skin protectants and decontaminants; identification of factors that influence safety and efficacy of candidate medical countermeasures; and development and maintenance of preformulation, formulation, and radiolabeling capabilities.

c. Provide medical management of chemical casualties to enhance survival and expedite the RTD of chemical warfare agent casualties through definitive therapies and life support technologies: This goal includes developing concepts and therapeutic regimens and procedures for the management of chemical warfare agent casualties; developing diagnostic and prognostic indicators for chemical warfare agent casualties; and developing life-support equipment for definitive care of chemical warfare agent casualties.

Recent changes in the security situation facing the U.S. have not materially reduced the threat that chemical weapons present to American Forces in the field. Many countries and terrorist groups have the capability of producing and delivering chemical warfare agents, thus posing a substantial and serious threat to the Armed Forces of the U.S.

Classical chemical agent threat categories include vesicant or blister agents (e.g., sulfur mustard), blood agents (e.g., cyanide), respiratory agents (e.g., phosgene), and nerve agents (e.g., GA or Tabun, GB or Sarin, GD or Soman, and VX).

The Research Areas of Interest to the MCDRP are found in Appendix I.VI. Applicants are urged to read and consider these before preparing their proposals/applications.

II.A.7. Medical Simulation and Information Sciences Research Program

The mission of the Medical Simulation and Information Sciences Research Program (MSISRP) is to explore the implications of models and technology for medical education and for the provision, management, and support of health services in the military. The MSISRP plans, coordinates, and oversees a responsive world-class, tri-Service science and technology program focused on three areas of research. The first area is focused on improving military medical training through medical modeling, simulation, educational gaming, assessment systems, interoperable training platforms, and objective training metrics. The second area is focused on developing, researching, and/or improving technologies and informatics that support Theater and Operational Medicine, such as the capture, movement, storage, usability, use, and sharing of health-related data for better clinical care, strategic planning, process development, and software applications. The third area is focused on the Multi-Domain Battle, an operational environment involving greater dispersion and near isolation over great distances, which is likely to cause severe restrictions on mobility for medical missions and shortfalls in both human and materiel human resources due to area denial challenges. Combat units will need to be more self-sufficient and less dependent on logistical support. Combatant commanders with increased sick or

wounded Soldiers will face degradation of medical resources and encumbered combat effectiveness without new combat casualty management and Force multiplication strategies.

MSISRP is organized into three portfolios, one for each of the three focus areas.

The sub-focus areas and Research Areas of Interest to the MSISRP are found in Appendix I.VII. Applicants are urged to read and consider these before preparing their proposals/applications.

II.A.8. Radiation Health Effects Research Program

The Radiation Health Effects Research Program (RHERP) focuses on developing medical countermeasures for acute ionizing radiation injury. The program has interest in the following research focus areas: post-exposure mitigation of radiation injury; protection and prevention of injury from ionizing radiation exposure (prophylaxis); mechanism of radiation injury; and development of novel biodosimetry tools. Research Areas of Interest to the RHERP are found in Appendix I.VIII. The RHERP is interested in applications and products incorporating a systems biology approach. For more information, refer to Section II.D.2.b.i, Attachment 7, Data- and Research Resource-Sharing Plan.

II.A.9. Other Information

II.A.9.i. Clinical Trial Support

Investigator(s) proposing a clinical trial should refer to Appendix II for a detailed description of the requirements for such an application. The pre-application/pre-proposal submission process should be performed as described in Section II.D.2.a.i. Full applications submission is described in Appendix II.B. Refer to the Clinical Trial Submission Checklist in preparing the full application/proposal.

A clinical trial is defined as a prospective accrual of human subjects where one or more intervention(s) (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested on a human subject for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the human subject of that intervention or interaction. The term "human subjects" is used in this BAA to refer to individuals who will be recruited for or who will participate in the proposed clinical trial. For more information, a Human Subject Resource Document is provided at https://ebrap.org/eBRAP/public/Program.htm.

If the proposed clinical trial involves the use of a drug that has not been approved by the U.S. Food and Drug Administration (FDA) for the proposed investigational use, then an IND application to the FDA that meets all requirements under the Code of Federal Regulations, Title 21, Part 312 (21 CFR 312) may be required. *If invited to submit a full application, the investigator(s) must submit an IND application to the FDA on or before the date of application submission. If the investigational product is a device, evidence that an Investigational Device Exemption (IDE) application that meets all requirements under 21 CFR 812 has been submitted to the FDA by the application submission deadline, or that the device is exempt or qualifies for an abbreviated IDE, is required.* The Government reserves the right to withdraw funding if an IND or IDE is necessary but has not been submitted to the FDA prior to the grant submission

deadline, or if documented status of the IND or IDE has not been obtained within 6 months of the award date.

II.A.9.ii. Conference or Symposium Support

The USAMRMC may, on a very limited basis, provide financial support for the management and execution of conferences or symposia that are critical to USAMRMC's mission. Funding for conference or symposium support may require approval outside of USAMRMC and will only be considered if the event significantly furthers the mission of the DoD and has a quantifiable benefit or return on investment. If a conference or symposium proposal is selected for funding, the award will be issued as a contract.

II.A.9.iii. Use of Military and Department of Veterans Affairs (VA) Populations or Resources

PIs are encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with the DoD or VA is also encouraged. A list of websites that may be useful in identifying additional information about ongoing DoD and VA areas of research interest or potential opportunities for collaboration can be found in Appendix III.

If the proposed research involves access to active duty military and/or VA population(s) and/or resource(s), the PI is responsible for establishing access. If possible, access to target active duty military and/or VA patient population(s) should be confirmed at the time of proposal/application submission. A letter of support, signed by the lowest ranking person with approval authority, should be included for studies involving Service members, Veterans, military and/or VA-controlled study materials, and military and/or VA databases. Use Attachment 2, Supporting Documentation, to provide this documentation.

II.a.9.iv. Data Sharing

The USAMRMC intends that information, data, and research resources generated under awards funded by this BAA be made available to the research community and to the public at large. The Government reserves the right to identify repositories for submission of data for archive. For additional guidance, refer to the General Submission Instructions, Appendix 2, Section K.

A number of research areas utilize Common Data Elements (CDEs) to facilitate the sharing of data to promote collaboration, accelerate research, and advance knowledge in specific topic areas. In accordance with the White House Office of Science and Technology Policy memorandum "Increasing Access to the Results of Federally Funded Research" and Executive Order (EO) 13625 and the National Research Action Plan (NRAP) responding to the EO "Improving Access to Mental Health Services for Veterans, Service Members, and Families (August 31, 2012)," federally funded research is required to be conducted in a manner that promotes public access to scientific data. In cases of psychological health and traumatic brain injury, use of CDEs is required under the NRAP. The USAMRMC strongly encourages applicants to incorporate CDE measures appropriate to each field of study, such as:

- PhenX Core and Specialty collections, which are available in the Mental Health Research, Substance Abuse and Addiction, and Research Domains Collections of the PhenX Toolkit, https://www.phenxtoolkit.org/index.php, in all studies involving human subjects, as applicable.

- TBI CDEs related to Federal Interagency Traumatic Brain Injury Research (FITBIR) informatics system data sharing requirements, which can be found at http://fitbir.nih.gov.

- Spinal cord injury research CDEs developed through the collaboration of the International Spinal Cord Society, the American Spinal Injury Association, and the National Institute of Neurological Disorders and Stroke CDE team, as referenced at http://www.commondataelements.ninds.nih.gov/SCI.aspx.

  If the project includes the collection of bio-fluids, such as blood, saliva, urine, etc., the PI may be required to include a set of collection variables and patient phenotypic data in order to standardize the quality of bio-fluid studies. The suggested procedures for acquisition, processing, storage, and shipment of bio-fluids can be found in Appendix IV.

II.B. Award Information

II.B.1. Funds Available and Anticipated Number of Awards

The funding amount for this BAA is unspecified, and the number of awards is indeterminate and contingent upon funding availability. Selection of research projects is a highly competitive process and is based on the evaluation of the proposal/application's technical merit, programmatic considerations, and the availability of funds. The quantity of meaningful submissions received normally exceeds the number of awards that the available funding can support. Any funding that is received by the USAMRMC and is appropriate for a research area described within this BAA may be utilized to fund proposals/applications.

II.B.2. Award Amounts and Periods of Performance

There are no specified funding limitations identified for a proposal/application submitted under this BAA. A budget should be commensurate with the nature and complexity of the proposed research. Researchers should submit budgets that include the entire period of performance of the research project. Budgets should include all direct and indirect costs, based on supportable, verifiable estimates. The budget for the full proposal/application should not differ significantly from the Pre-Application Budget Summary Form provided in the pre-proposal/pre-application submission.

Period of performance may differ depending upon the type of funding mechanism awarded under this BAA. For an assistance agreement, the total period of performance may be proposed for up to 4 years in length; additional periods may be considered. For research support contract awards, the total period of performance may be proposed for up to 5 years in length. For conference or symposium support contract awards, the total period of performance may be proposed for up to 2 years in length. Because the nature and scope of each proposed research project will vary, it is anticipated that the size and duration of each award will vary. Start dates will vary, depending

on when proposals/applications were submitted and reviewed and the negotiation process. However, no proposal/application submitted under this BAA will be considered for funding after 24 months from the date of submission.

Principal Investigators (PIs) seeking additional or continuation funding must submit new pre-proposals/pre-applications and be invited to submit full proposals/applications.

Refer to the General Submission Instructions, Section III.A.4, for additional information regarding the research and related budget.

II.B.3. Mechanisms of Support

The USAMRMC executes its extramural research program primarily through the awarding of contracts and assistance agreements (grants and cooperative agreements). The type of instrument used to reflect the business relationship between the organization and the Government is at the discretion of the Government, in accordance with the Federal Grant and Cooperative Agreement Act of 1977, as amended, 31 USC[3] 6301-6308, which provides the legal criteria to select a procurement contract or an assistance agreement. Refer to the General Submission Instructions, Appendix 2, for additional information.

II.C. Eligibility Information

II.C.1. Eligible Applicants

II.C.1.a. Organizations

Awards are made to organizations only. Organizations eligible to apply include national, international, for-profit, non-profit, public, and private organizations. Refer to the General Submission Instructions, Appendix 3, for general eligibility information.

NOTE: In accordance with FAR 35.017, Federally Funded Research and Development Centers (FFRDCs) are not eligible to directly receive awards under this BAA. However, teaming arrangements between FFRDCs and eligible organizations are allowed so long as they are permitted under the sponsoring agreement between the Federal Government and the specific FFRDC.

The USAMRMC is committed to supporting small businesses. Small business, Veteran-owned small business, Service-disabled Veteran-owned small business, HUBZone small business, small disadvantaged business, and woman-owned small business concerns must be given the maximum practical opportunity to participate through subawards on research proposals/ applications submitted through the BAA.

Government Agencies Within the United States: Local, state, and Federal Government agencies are eligible to the extent that proposals/applications do not overlap with their fully

[3] United States Code

funded internal programs. Such agencies are required to explain how their proposals/ applications do not overlap with their internal programs.

II.C.1.b. Investigator(s)

Eligible investigators include all individuals, regardless of ethnicity, nationality, or citizenship status, who are employed by, or affiliated with, an eligible organization.

Investigators are cautioned that awards are made to organizations only, not individuals.

II.C.2. Cost Sharing

Cost sharing or matching is not required under this BAA.

II.C.3. Other

Organizations must be able to access .gov and .mil websites in order to fulfill the financial and technical deliverable requirements of the award and submit invoices for payment.

Use of the System for Award Management (SAM) and the Federal Awardee Performance and Integrity Information System (FAPIIS): To protect the public interest, the Federal Government ensures the integrity of Federal programs by striving to conduct business only with responsible organizations. The USAMRMC uses the "Exclusions" within the Performance Information functional area of the SAM and data from FAPIIS, a component within SAM, to verify that an organization is eligible to receive Federal awards. More information about SAM and FAPIIS is available at https://www.sam.gov/. Refer to the General Submission Instructions, Appendix 3, for additional information.

Conflicts of Interest: All awards must be free of conflicts of interest (COIs) that could bias the research results. Prior to award of an assistance agreement or contract, applicants will be required to disclose all potential or actual COIs along with a plan to manage them. An award may not be made if it is determined by the Grants Officer or Contracting Officer that COIs cannot be adequately managed. Refer to the General Submission Instructions, Appendix 1, for additional information.

Review of Risk: The following areas may be reviewed in evaluating the risk posed by an applicant: Financial stability; quality of management systems and operational controls; history of performance; reports and findings from audits; ability to effectively implement statutory, regulatory, or other requirements imposed on non-Federal entities; degree of institutional support; integrity; adequacy of facilities; and conformance with safety and environmental statutes and regulations.

Subcontracting Plan: If the resultant award is a contract that exceeds $700,000 and the offeror is other than a small business, the contractor will be required to submit a subcontracting plan for small business and small disadvantaged business concerns, in accordance with FAR 19.704 and DFARS 219.704. A mutually agreeable plan will be incorporated as part of the resultant contract.

II.D. Proposal/Application Submission Information

II.D.1. Where to Obtain the Proposal/Application Submission Package

To obtain the complete Grants.gov proposal/application package (hereinafter, submission package), including all required forms, perform a Grants.gov (http://www.grants.gov/) basic search using the Funding Opportunity Number **W81XWH18SBAA1**.

Submission is a two-step process requiring both (1) pre-proposal/pre-application submission through eBRAP (https://eBRAP.org/) and (2) full proposal/application submission through Grants.gov or eBRAP, depending on the type of application being submitted.

II.D.2. Content and Form of the Proposal/Application Submission for Research Awards Not Including a Clinical Trial

Investigator(s) proposing a clinical trial should refer to Appendix II for a detailed description of the requirements for such an application.

Submission of a pre-proposal/pre-application is required and must be submitted through eBRAP (https://eBRAP.org/). If the USAMRMC is interested in receiving a full proposal/application, the PI will be sent an invitation via eBRAP to submit. Investigator(s) proposing a clinical trial should refer to Appendix II for a detailed description of the requirements for such an application. eBRAP is a multifunctional web-based system that allows PIs to submit their pre-proposals/ pre-applications electronically through a secure connection, to view and edit the content of their pre-proposals/pre-applications and full proposals/applications, to receive communications from the CDMRP, and to submit documentation during award negotiations and period of performance.

A key feature of eBRAP is the ability of an organization's representatives and PIs to view and modify the full proposal/application submissions associated with them. eBRAP will validate full proposal/application files against the BAA requirements and discrepancies will be noted in an email to the PI and in the Full Application Files tab in eBRAP. It is the applicant's responsibility to review all proposal/application components for accuracy as well as ensure proper sequence as specified in this BAA.

The proposal/application title, eBRAP log number, and all information for the PI, Business Official(s), performing organization, and contracting organization must be consistent throughout the entire pre-proposal/pre-application and proposal/application submission process. Inconsistencies may delay proposal/application processing and limit or negate the ability to view, modify, and verify the proposal/application in eBRAP. If any changes need to be made, the applicant should contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507 prior to the proposal/application deadline.

Because the invitation to submit a proposal/application is based on the contents of the pre-proposal/pre-application, a PI should not change the title or research objectives after the pre-proposal/pre-application is submitted. A PI and organization identified in the pre-proposal/pre-application should be the same as those intended for the full proposal/ application submission. If any changes are necessary after submission of the pre-proposal/

pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507. A change in PI or organization after submission of the pre-proposal/pre-application will be allowed only at the discretion of the USAMRAA Contracting or Grants Officer.

The organization, Business Official, and PI must register in eBRAP before submitting a pre-proposal/pre-application. Upon completion of an organization's registration in eBRAP and approval by the CDMRP Help Desk, the organization name will be displayed in eBRAP to assist the organization's Business Officials and PIs as they register. The organization, Business Officials, and PIs must all be registered and affiliated in eBRAP. (See *eBRAP User Guide* at https://ebrap.org/eBRAP/public/UserGuide.pdf.)

Pre-proposals/Pre-applications may be submitted at any time prior to the BAA closing date. Pre-proposals/Pre-applications should describe specific ideas or projects that pertain to any of the areas described under "Program Description" in this BAA. A pre-proposal/pre-application must include a brief description of the scientific methods and design to address the problem as described below. Brochures or other descriptions of general organizational or individual capabilities will not be accepted as a pre-proposal/pre-application. ***DO NOT include any proprietary information in the pre-proposal/pre-application.***

II.D.2.a.i. Step 1: Pre-Proposal/Pre-Application Submission Content

During the pre-proposal/pre-application process, each submission is assigned a unique log number by eBRAP. This unique eBRAP log number will be needed during the full proposal/application submission process.

All pre-proposal/pre-application components must be submitted through eBRAP (https://eBRAP.org/). Because the invitation to submit a proposal/application is based on the contents of the pre-proposal/pre-application, investigators should not change the title or research objectives after the pre-proposal/pre-application is submitted.

PIs and organizations identified in the pre-proposal/pre-application should be the same as those intended for the subsequent proposal/application submission. If any changes are necessary after submission of the pre-proposal/pre-application, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

The pre-proposal/pre-application consists of the following components, which are organized in eBRAP by separate tabs for each proposal/application type. Select "Research," "Research Including Clinical Trial," or "Conference/Symposium" when initiating the application. Refer to the General Submission Instructions, Section II, for additional information on pre-proposal/ pre-application submission.

- **Tab 1 – Application Information**

  Enter the information as described in eBRAP before continuing the pre-proposal/ pre-application.

- **Tab 2 – Application Contact**

  Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration (the "person to be contacted on matters involving this application" in Block 5 of the Grants.gov SF424 Form). The Business Official must either be selected from the eBRAP list or invited for the pre-proposal/pre-application to be submitted.

  Select the performing organization (site at which the PI will perform the proposed work) and the contracting organization (organization submitting on behalf of the PI, which corresponds to Block 5 on the Grants.gov SF424 (R&R) Form), and click on "*Add Organizations to this Pre-application.*" The organization(s) must be either selected from the eBRAP drop-down list or invited in order for the pre-proposal/pre-application to be submitted.

  It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-proposal/pre-application submission is needed.

- **Tab 3 – Collaborators and Key Personnel**

  Enter the name, organization, and role of all collaborators and key personnel associated with the pre-proposal/pre-application.

- **Tab 4 – Conflicts of Interest**

  List all individuals other than collaborators and key personnel who may have a conflict of interest (COI) in the review of the pre-proposal/pre-application (including those with whom the PI has a personal or professional relationship).

  Federal agency personnel involved in the review process and/or with making funding recommendations are prohibited from being involved in the research proposed or assisting in any pre-proposal/pre-application, including, but not limited to, concept design, proposal/ application development, budget preparation, and the development of any supporting documentation. ***If formal collaboration with Military Facility personnel is planned (i.e., included in the proposal/application in performance of the research), this prohibition is not applicable. Military Facility is defined as Military Health System (MHS) facility, research laboratory, medical treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center. However, these Military Facility personnel cannot be involved in the review process and/or with making funding recommendations.***

  Refer to the General Submission Instructions, Appendix 3, for additional information. For questions related to COI, contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

- **Tab 5 – Required Files**

  NOTE: No figures, charts, graphs, or other additional material will be accepted during the pre-proposal/pre-application process.

Provide responses in the appropriate data fields for the following in eBRAP. **EVERY DATA FIELD MUST CONTAIN COMPLETE INFORMATION.** eBRAP will truncate characters exceeding the limit specified for each data field. Enter "none" if there is no information to be included.

- Problem To Be Studied (4,000 character limit, including spaces).
- Theoretical Rationale, Scientific Methods, and Design (4,000 character limit, including spaces).
- Significance and/or Uniqueness of the Proposed Effort (4,000 character limit, including spaces).
- Military Relevance and Impact (4,000 character limit, including spaces).
- Brief Description of Research Involving Animals, Human Anatomical Substances and/or Human Subjects (4,000 character limit, including spaces).
- Plans and Strategy for Translation, Implementation, and/or Commercialization (4,000 character limit, including spaces).

Upload document(s) as individual PDF file(s). eBRAP will not allow a document to be uploaded in the Required Files tab if the number of pages exceeds the limits specified below.

- Budget Summary: Upload as "BudgetSummary.pdf." Complete the two-page Budget Summary Form (available for download in eBRAP) as instructed.
- PI and Key Personnel Biographical Sketches (five-page limit per individual): Use boldfaced type or highlight titles of publications relevant to the proposed project. All biographical sketches should be uploaded as a single combined file.

Refer to the General Submission Instructions, Section II.C, for detailed information.

- **Tab 6 – Submit Pre-Application**

  This tab must be completed for the pre-proposal/pre-application to be accepted and processed.

Pre-Proposal/Pre-Application Screening

USAMRMC scientists or outside experts will screen pre-proposals/pre-applications for technical merit and programmatic considerations. Based on the screening of the pre-proposal/ pre-application, a PI may be invited to submit a full proposal/application.

Notification of Pre-Proposal/Pre-Application Screening Results

Following the pre-proposal/pre-application screening, PIs will be notified as to whether or not they are invited to submit full proposals/applications; however, they will not receive feedback

(e.g., a critique of strengths and weaknesses) on their pre-proposals/pre-applications. Within 120 days of submission, PIs should receive email notification via eBRAP regarding disposition of their pre-proposals/pre-applications.

II.D.2.a.ii. Step 2: Full Proposal/Application Submission Content

Proposals/Applications will not be accepted unless the PI has received notification of invitation.

All contributors and administrators to the proposal/application must use matching compatible versions of Adobe software when editing and preparing proposal/application components. The use of different software versions will result in corruption of the submitted file. Refer to the General Submission Instructions, Section III, for details on compatible Adobe software.

The CDMRP cannot make allowances/exceptions to its policies for submission problems encountered by the applicant organization using system-to-system interfaces with Grants.gov.

Each proposal/application submission must include the completed full submission package for this BAA. The full submission package is submitted by the Authorized Organizational Representative through Grants.gov (***http://www.grants.gov/***)

Proprietary information should only be included if necessary for evaluation of the proposal/ application. Conspicuously and legibly mark any proprietary information that is included in the proposal/application.

The organization's Business Official or Authorized Organizational Representative (or Resource Manager/Comptroller) should approve/verify the full proposal/application submission prior to the proposal/application verification deadline.

II.D.2.a.iii. Full Proposal/Application Submission Components

The Grants.gov submission package includes the following components (refer to the General Submission Instructions, Section III, for additional information on proposal/application submission). Note that components for a proposal/application including a clinical trial are provided in Appendix II.

- **SF424 (R&R) Application for Federal Assistance Form:** Refer to the General Submission Instructions, Section III.A.1, for detailed information.

  Attachments

  Each attachment to the full proposal/application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Submission Instructions, Appendix 4.

  For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or if they have incorrect file names, i.e., containing characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some

circumstances. Individual attachments may not exceed 20 MB and the file size for the entire full submission package may not exceed 200 MB.

- **Attachment 1: Project Narrative (20-page limit):** Upload as "ProjectNarrative.pdf." There is no form for this information. The attachments must be PDF files in accordance with the formatting guidelines specified for full proposal/application preparation.

  A detailed description of the research to be undertaken should be submitted. This should include the areas provided below and address their relationship to the state of knowledge in the field and to comparable work in progress elsewhere. Evaluation of the proposed research will be influenced by the adequacy of this information.

  Literature references and curriculum vitae will be shown in separate addenda entries. The following general outline should be followed:

  - Background: Provide a brief statement of ideas and theoretical reasoning behind the proposed study. Describe previous experience most pertinent to this proposal/ application. Cite relevant literature references. Include discussion of any findings (if available) from relevant pilot or preliminary work or any related work underway. For development of devices and technologies, provide an intellectual property plan as part of the supporting documentation.

  - Hypothesis: State the hypothesis to be tested and the expected results. For development of devices and technologies, discuss the technical feasibility of the proposed project including background of the problem, previous and current solutions, similar projects previously undertaken, and related development activities.

  - Technical Objectives: State concisely the question to be answered by each research objective.

  - Project Milestones: Identify timelines for critical events that must be accomplished in order for the project to be successful in terms of cost, schedule, and performance. For development of devices and technologies, discuss the timelines and provide a commercialization strategy/plan for the technology being developed.

  - Military Significance: State precisely the estimates as to the immediate and/or long-range usefulness of this study to the Armed Forces, as distinguished from general advancement of knowledge in medicine.

  - Public Purpose: If appropriate, provide a concise, detailed description of how this research project will benefit the general public.

  - Methods: Give details about the experimental design and methodology. If the methodology is new or unusual, describe it in sufficient detail for evaluation. For synthetic chemistry applications, include a clear statement of the rationale for the proposed syntheses. Outline and document the routes to the syntheses. For development of devices and technologies, discuss the engineering/technical design to achieve the project goals demonstrating the feasibility of the proposed product

development. Discuss the perceived engineering/design strengths and flaws and recommendations for overcoming/preventing them. For studies involving human subjects, describe the recruitment plan and access to populations. The proposal/ application should describe a plan for data access and sharing. (Access to subjects and data is the sole responsibility of the investigator.) As relevant, describe plans for addressing issues unique to working with military populations. For studies involving human and animal research, provide a statistical and data analysis plan. Describe the statistical model and data analysis plan with respect to the study objectives as appropriate to the type of study. For clinical studies and applied research involving human subjects, specify the approximate number of human subjects that will be enrolled. If multiple study sites are involved, state the approximate number to be enrolled at each site. Include a complete power analysis to demonstrate that the sample size is appropriate to meet the objectives of the study. When possible, investigators should write protocols for research with human subjects and/or human anatomical substances that are specific to the DoD-supported effort outlined in the submitted application. Submission to HRPO of protocols covering more than the scope of work in the DoD-funded proposal will require HRPO review of the entire protocol as DoD-supported research and may include extensive modifications to meet DoD human subjects protection requirements.

- Additional Information: If human subjects, animals, or cadavers are involved in the research, proposals/applications may be submitted prior to obtaining human, animal, or cadaver protocol institutional approvals. However, protocols with required institutional approvals must be submitted no later than 60 days after award to demonstrate continued progress and ensure continuation of payment. The Contracting or Grants Officer may make exceptions in situations where human and/or animal use is not expected to begin until after the first year of the research project. In such cases, a timeframe for submission of the appropriate protocols and institutional approvals will be established prior to award.

PIs and collaborating organizations may not use, employ, or subcontract for the use of any human participants, including the use of human anatomical substances, human data, and/or human cadavers, or laboratory animals until applicable regulatory documents are reviewed and approved by the USAMRMC Office of Research Protections (ORP) to ensure that DoD regulations have been met.

- For studies with prospective accrual of human subjects, indicate quarterly enrollment targets.

- For use of human anatomical substances, identify the commercial or organizational source(s) of the material. For cell lines, identify cell line(s) to be used. If human anatomical substances (including cell lines) will be used, specify whether or not identifiable information is accessible to the research team by any means.

- If applicable, indicate time required for submission and/or approval of documents (e.g., IND and IDE) to the FDA or appropriate Government regulatory agency.

- For studies involving human subjects, allow at least 2 to 3 months for regulatory review and approval by the USAMRMC Human Research Protection Office (HRPO); this does not include the additional time required for local Institutional Review Board (IRB) review and approval, as stated above.

- For animal studies, allow at least 2 to 3 months for regulatory review and approval by the USAMRMC Animal Care and Use Review Office; this does not include the additional time required for local Institutional Animal Care and Use Committee review and approval, as stated above.

- Refer to the General Submission Instructions, Appendix 1, for additional regulatory information.

- **Attachment 2: Supporting Documentation:** The attachment should be in PDF in accordance with the formatting guidelines specified for full proposal/application preparation. Start each document on a new page. Combine and upload as a single file named "Support.pdf." If documents are scanned to pdf, the lowest resolution (100 to 150 dpi) should be used. ***There are no page limits for any of these components unless otherwise noted.***

  - Bibliography and References Cited: List the references in the order they appear in the proposal/application narrative. Use a reference format that gives the title of the citation. Do not send or attach copies of articles in print. There is no form for this information.

  - List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

  - Facilities and Other Resources: Describe the facilities available for performance of the proposed research project and any additional resources proposed for acquisition at no cost to the award. Indicate if a Government-owned facility is proposed for use. Reference should be made to the original or present award under which the facilities or resources are now accountable. There is no form for this information.

  - Equipment: Include a description of existing equipment to be used for the proposed research project.

  - Publications and/or Patent Abstracts (five-document limit): Include relevant publication URLs and/or patent abstracts. If publications are not publicly available, then a copy/copies of the published manuscript(s) must be attached.

  - Letters of Organizational Support: Provide a letter (or letters, if applicable), signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. A letter from each organization involved in the project should be provided.

  - Collaboration: Provide letter(s) supporting stated collaborative efforts necessary for the project's success, even if the collaboration is offered at no cost.

- Letter of Support for Use of Military and VA Populations or Resources (if applicable; one-page limit per letter is recommended): If the proposed research plan involves access to active duty military and/or VA patient populations or resources, include a letter(s) of support, signed by the lowest-ranking person with approval authority, confirming such access. If access cannot be confirmed at the time of proposal/ application submission, the Government reserves the right to withhold or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resources.

- *If the project involves collaboration with a Military Facility, special requirements apply.* A DoD researcher, to include collaborating DoD PIs, must obtain a letter from his/her commanding officer or Military Facility director authorizing his/her participation in the research project. This letter must be included with the proposal/application.

- Joint Sponsorship: Describe present or prospective joint sponsorship of any portion of the program outlined in the proposal/application. In the absence of agreements among sponsors for joint support, the proposal/application should be structured so that the research can be carried out without the resources of any other sponsor. If, however, it is desirable to request partial support from another agency, the proposed plan should be stated and the reasons documented. If the plan cannot be formulated at the time the proposal/application is submitted, information should be sent later as an addendum to the proposal/application. Prior approval from both agencies must be secured for research to be undertaken under joint sponsorship. Provide letters of support related to recruitment, subject access, and data access plans.

- Intellectual Property (if applicable):

  - Background and Proprietary Information: All software and data first produced under the award are subject to a Federal purpose license. A term of the award requires the recipient to grant the Government all necessary and appropriate licenses, which could include licenses to background and proprietary information that have been developed at private expense.

    Therefore, it is important to disclose/list any intellectual property (software, data, patents, etc.) that will be used in performance of the project or provide a statement that none will be used. If applicable, all proprietary information to be provided to the Government should be stated and identified; the applicant should indicate whether a waiver of the Federal purpose license will be required.

  - Intellectual and Material Property Plan: Provide a plan for resolving intellectual and material property issues among participating organizations.

- **Attachment 3: Technical Abstract (one-page limit):** Upload as "TechAbs.pdf." The abstract is vitally important to both the scientific peer and programmatic review processes. In accordance with Section 8123 of the Consolidated and Further Continuing Appropriations Act, 2015 (Public Law 113-235), the PI is required to submit a technical

abstract that fully describes the proposed work. The abstract must contain the title of the project and the name of the PI. Do not include figures or tables in the abstract. Use only characters available on a standard QWERTY keyboard. Spell out all Greek or other non-English letters. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** .

The structured technical abstract should be clear and concise and, at a minimum, provide the following information:

- Background: Provide a brief statement of the ideas and theoretical reasoning behind the proposed work.
- Objective/Hypothesis: State the objective/hypothesis to be tested. Provide evidence or rationale that supports the objective/hypothesis.
- Specific Aims: State concisely the specific aims of the study.
- Study Design: Briefly describe the study design.
- Relevance: Provide a brief statement explaining the potential relevance of the proposed work to the specific topic area being addressed and its impact on health outcomes.

- **Attachment 4: Lay Abstract (one-page limit):** Upload as "LayAbs.pdf." The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information.*** Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Lay abstracts should be written using the outline below. Do not duplicate the technical abstract.

  - Clearly describe the objectives and theoretical reasoning behind the proposed work in a manner readily understood by readers without a background in science or medicine.
  - Clearly describe the problem or question to be addressed and the ultimate applicability and impact of the research.
    - What types of patients will it help, and how will it help them? Include the current available statistics to the related injury/condition.
    - What are the potential clinical applications, benefits, and risks?
    - What is the projected timeline it may take to achieve the expected patient-related outcome?
    - Describe how the proposed project will benefit Service members, Veterans, and/or their family members.

- **Attachment 5: Statement of Work (SOW) (two-page limit):** Upload as "SOW.pdf." The SOW outlines and establishes the performance expectations and milestones for which the USAMRMC may provide funding. The SOW will be incorporated into the award document and, as such, is subject to release under the Freedom of Information Act. The SOW should identify all collaborating research sites involved in the performance of the research. Suggested SOW formats and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm).

  A series of relatively short statements should be included that comprise the approach to each of the major goals or objectives of the proposed research. The statements should outline the specific tasks, systems, key assessments/techniques, and materials that are reasonable estimates for testing the proposed hypotheses of the study. A timeline should be included that shows the work statements to be accomplished in each year of the award. Any animal use and/or human subjects recruitment should be included. Allow at least 2 to 3 months for the USAMRMC ORP regulatory review and approval processes for studies involving human subjects and 2 to 3 months for studies involving animal subjects.

- **Attachment 6: Impact/Outcomes Statement (one-page limit):** Upload as "Impact.pdf." Explain the potential impact of the research in the field, the significance of this impact, and when it can be anticipated. Explain how the results of this research are expected to impact the intended beneficiaries. Expand upon the dual (military and public) purpose for the research, as appropriate.

- **Attachment 7: Data- and Research Resource-Sharing Plan (one-page limit):** ***All data must be shared while ensuring appropriate protection of information.*** Upload as "Sharing.pdf." Describe how unique and/or final research data will be shared with the research community, along with any resulting research resources. This includes cases where pre-existing data or research resources will be utilized and/or modified during the course of the proposed project. If there are limitations associated with a pre-existing agreement for the original data or research resources that preclude subsequent sharing, the applicant should explain this in the data- and/or research resource-sharing plan. For projects involving clinical trials, PIs may be required to register their clinical trials on Clinicaltrials.gov (https://clinicaltrials.gov/). For projects involving TBI, PIs may be required to report data to the FITBIR informatics system (http://fitbir.nih.gov/). If the project includes systems biology-related research, the PI may be required to make the systems biology data, generated via an award, available to the research community by depositing research data into the SysBioCube system (https://sysbiocube-abcc.ncifcrf.gov). For studies that will enroll subjects with psychological health disorders, awardees may be requested to submit data to the National Institute of Mental Health Data Archive (NDA) https://data-archive.nimh.nih.gov. The NDA is a data repository run by the National Institute of Mental Health (NIMH) that allows researchers studying mental illness to collect and share de-identified information with each other. Such studies may require the inclusion of specific language in the informed consent form which references the NDA (see Appendix V).

  Refer to the General Submission Instructions, Appendix 2.K, for additional information.

- **Attachment 8: Transition Plan and Regulatory Strategy:** Upload as "Transition.pdf." Provide information on the methods and strategies proposed to move the anticipated research outcomes (e.g., knowledge, models, devices, technologies, interventions) from this project to the next level (e.g., additional research, clinical trials, delivery to the military or civilian market, incorporation into clinical practice) after successful completion of the award. Applicants are encouraged to work with their organization's Technology Transfer Office to develop the transition plan. The transition plan should include the components listed below, as applicable.

  - Details of the funding strategy that will be used to bring the outcomes to the next level (e.g., specific potential industry partners, specific funding opportunities to be pursued).

  - Description of collaborations and other resources that will be used to provide continuity of development.

  - Brief schedule/timeline and milestones for bringing the outcome(s) to the next level.

  - For knowledge outcomes, a description of what will be further developed and how it will be disseminated, and incorporated into clinical care.

  - Identification of the anticipated regulatory strategy (e.g., additional non-clinical or clinical studies anticipated/required, FDA or regulatory authority meetings desired, industry partnerships) for movement of the research into later phases of development and to support a potential marketing application (e.g., New Drug Application, Biologics License Application).

  - Outline of ownership rights and/or access to the intellectual property necessary for the development and/or commercialization of products or technologies supported with this award and the Government's ability to access such products or technologies in the future.

  - Evidence for involvement of appropriate intellectual property, licensing, and/or business professionals.

  - A risk analysis for cost, schedule, manufacturability, and sustainability.

  - A commercialization strategy including intellectual property, market size, financial analysis, strengths and weaknesses, barriers to market, competitors, and management team. Discuss the significance of this development effort, when it can be anticipated, and the potential commercial use for the technology being developed.

- **Attachment 9: Collaborating DoD Military Facility Budget Form(s), *if applicable*:** Upload as "MFBudget.pdf." If a Military Facility will be a collaborator in performance of the project, complete the Collaborating DoD Military Facility Budget Form (available for download on eBRAP "Funding Opportunities and Forms" web page), including a budget justification for each year. If more than one Military Facility is proposed, submit

a separate budget form for each site. Refer to the General Submission Instructions, Section II.A.4, for detailed information.

Research & Related Senior/Key Person Profile (Expanded): Refer to the General Submission Instructions, Section III.A.3, for detailed information.

- PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf."
- PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."
- Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."
- Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

Research & Related Budget: Refer to the General Submission Instructions, Section III.A.4, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf." The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

Project/Performance Site Location(s) Form: Refer to the General Submission Instructions, Section III.A.5, for detailed information.

R & R Subaward Budget Attachment(s) Form (if applicable): Refer to the General Submission Instructions, Section III.A.6, for detailed information.

NOTE: Proposals/Applications from **Federal agencies** must include in their budget justifications a **Federal Financial Plan**. Proposals/Applications from organizations that include **collaborations with DoD Military Facilities** must comply with special requirements. Refer to the General Submission Instructions, Section III.A.4, Research & Related Budget, for detailed information.

II.D.2.b. Content and Form of the Proposal/Submission Information for Conference or Symposium Support

II.D.2.b.i. Where to Obtain the Proposal/Application Submission Package

To obtain the complete Grants.gov proposal package (hereinafter, submission package), including all required forms, perform a Grants.gov (http://www.grants.gov/) basic search using the Funding Opportunity Number **W81XWH18SBAA1**.

Submission is a two-step process requiring both pre-proposal submission and full proposal submission through eBRAP (https://eBRAP.org/).

II.D.2.b.ii. Content and Form of the Proposal Submission

Refer to instructions for research proposal submission for details on the use of eBRAP.

II.D.2.b.iii. Step 1: Pre-Proposal Submission Content

During the pre-proposal process, each submission is assigned a unique log number by eBRAP. This unique eBRAP log number will be needed during the full proposal submission process.

All pre-proposal components must be submitted through eBRAP (https://eBRAP.org/). Because the invitation to submit a proposal is based on the contents of the pre-proposal, investigators should not change the title or research objectives after the pre-proposal is submitted.

PIs and organizations identified in the pre-proposal should be the same as those intended for the subsequent proposal submission. If any changes are necessary after submission of the pre-proposal, the PI must contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

The pre-proposal consists of the following components, which are organized in eBRAP by separate tabs. Refer to the General Submission Instructions, Section II, for additional information on pre-proposal submission.

- **Tab 1 – Application Information**
    - Enter the information as described in eBRAP before continuing the pre-proposal.
- **Tab 2 – Application Contact**
    - Enter contact information for the PI. Enter the organization's Business Official responsible for sponsored program administration. The Business Official must either be selected from the eBRAP list or invited for the pre-proposal to be submitted.
    - Select the performing organization (site at which the PI will perform the proposed work) and contracting organization (organization submitting on behalf of the PI), and click on "Add Organizations to this Pre-application." The organization(s) must either be selected from the eBRAP drop-down list or invited for the pre-proposal to be submitted.
    - It is recommended that PIs identify an Alternate Submitter in the event that assistance with pre-proposal submission is needed.

NOTE: The eBRAP system does not require approval of the pre-proposal by the PI's organization.

- **Tab 3 – Collaborators and Key Personnel**
    - To enable the USAMRMC to avoid COI during the screening and review processes, list the name, organization, and role of all participants in the proposed conference or symposium support, including collaborators, consultants, and subrecipients/subawardees.

- **Tab 4 – Conflicts of Interest**

    - List all individuals other than collaborators and key personnel who may have a COI in the review of the pre-proposal (including those with whom the PI has a personal or professional relationship).

Federal agency personnel involved in the review process and/or with making funding recommendations are prohibited from being involved in the conference or symposium support proposed or assisting in any pre-proposal, including, but not limited to, proposal development, budget preparation, and the development of any supporting documentation. ***If formal collaboration with Military Facility personnel is planned (i.e., included in the proposal), this prohibition is not applicable. However, these Military Facility personnel cannot be involved in the review process and/or with making funding recommendations.***

Refer to the General Submission Instructions, Appendix 3, for additional information. For questions related to COI, contact the CDMRP Help Desk at help@eBRAP.org or 301-682-5507.

- **Tab 5 – Required Files**

    NOTE: Figures, charts, graphs, or other additional material will not be accepted during the pre-proposal process.

    Provide responses in the appropriate data fields for the following in eBRAP. DO NOT LEAVE ANY FIELDS BLANK. eBRAP will truncate characters exceeding the limit specified for each data field. Enter "none" if there is no information to be included.

    - Conference or Symposium Objectives: (4,000 character limit, including spaces).

    - Impact and Outcomes of the Proposed Conference or Symposium: (2,000 character limit, including spaces).

    - Proposed Budget to Include Direct and Indirect Costs: (1,000 character limit, including spaces).

    - PI and Key Personnel Biographical Sketches (five-page limit per individual): Use boldfaced type or highlight titles of publications or specific expertise relevant to the proposed conference or symposium support. All biographical sketches should be uploaded in a single combined file.

    - Refer to the General Submission Instructions, Section II, for detailed information.

- **Tab 6 – Submit Pre-Application:** This tab must be completed for the pre-proposal to be accepted and processed.

Pre-Proposal Screening

USAMRMC scientists or outside experts will screen pre-proposals for technical merit and programmatic considerations. Based on the screening of the pre-proposal, a PI may be invited to submit a full proposal.

Notification of Pre-Proposal Screening Results

Following the pre-proposal screening, PIs will be notified as to whether or not they are invited to submit full proposals; however, they will not receive feedback (e.g., a critique of strengths and weaknesses) on their pre-proposals. Within 120 days of submission, PIs should receive email notification via eBRAP regarding disposition of their pre-proposals.

II.D.2.b.iv. Step 2: Full Proposal Submission Components for Conference or Symposium Support

eBRAP submission package components: For the FY18-FY22 BAA Conference or Symposium Support contract award, the eBRAP submission package includes the following components, which are organized in eBRAP by separate tabs. To access these tabs, go to "My Applications" and click on "Start Full Application" for the log number under which the pre-proposal was submitted.

- **Tab 1 – Summary:** Provides a summary of the proposal information.
- **Tab 2 – Application Contacts:** This tab will be populated by eBRAP. Add Authorized Organizational Representative.
- **Tab 3 – Full Application Files:** Under each Application Component in eBRAP, upload each as an individual PDF file. Refer to the General Submission Instructions, Appendix 4, for detailed formatting guidelines.

  Proposal Component: Attachments: Each attachment must be uploaded as an individual PDF file unless otherwise stated.

  - **Attachment 1: Conference or Symposium Objectives: (five-page limit):** Upload as "Objectives.pdf." The page limit applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings, etc.) used to describe the conference or symposium. Inclusion of URLs that provide additional information to expand the Conference or Symposium Objectives and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the proposal.

    A detailed description of the conference or symposium to be undertaken should be submitted. This should include the areas listed below and address the relevance to the USAMRMC mission. Evaluation of the proposed conference or symposium will be influenced by the adequacy of this information.

- Literature-relevant publications and curriculum vitae will be shown in separate addenda entries. The following general outline should be followed:

  - Background: Provide a brief statement of ideas and theoretical reasoning behind the proposed conference or symposium. Describe previous experience most pertinent to this proposal such as participation in professional societies and attendance at other relevant meetings. Cite relevant literature references.

  - Technical Objectives: State concisely the question(s) to be answered during the conference or symposium, and how the outcomes of the conference or symposium will benefit the USAMRMC mission.

  - Project Milestones: Identify timelines for critical events that must be accomplished in order for the conference or symposium to be successful in terms of cost, schedule, performance, and outcomes.

- **Attachment 2: Agenda (two-page limit):** Upload as "Agenda.pdf." The proposed agenda should include potential topics and speakers and a schedule format that will meet the conference or symposium objectives.

- **Attachment 3: List of Relevant Publications (two-page limit):** Upload as "References.pdf." Relevant publications should provide evidence for why the conference or symposium, with the proposed agenda and speakers, should be supported.

- **Attachment 4: Statement of Work (two-page limit):** Upload as "SOW.pdf." The SOW outlines and establishes the performance expectations and milestones for which the USAMRMC may provide funding. The SOW will be incorporated into the award document and, as such, is subject to release under the Freedom of Information Act. A series of relatively short statements should be included that comprise the approach to each of the major goals or objectives of the proposed effort. The statements should outline the specific tasks, including but not limited to: planning committee meeting dates, speaker selection, meeting publication plan, invitation and Save-the-Date release dates, compilation of abstract submission guidelines, etc.

- **Attachment 5: Impact/Outcomes Statement (two-page limit):** Upload as "Impact/Outcomes.pdf." Describe the potential impact of the conference or symposium content in the field and the significance of this impact. Describe the potential impact of the conference or symposium for individual attendees at various levels. Provide the milestones and methods for publication and/or peer review of the conference or symposium results and recommendations.

- **Attachment 6: Key Personnel Qualifications (two-page limit):** Upload as "Personnel.pdf." Describe the qualifications, capabilities, and experience of the proposed key personnel to demonstrate that they will be able to achieve the proposed objectives.

- **Attachment 7: Key Personnel Biographical Sketches (five-page limit per biographical sketch):** Upload all biographical sketches as a single document as "Biosketch.pdf."

- **Attachment 8: Budget (no page limit):** Upload as "Budget.pdf." Prepare the budget using the Conference/Symposium Budget form and include a detailed budget justification.

- **Tab 4 – Application and Budget Data:** Review and edit Proposed Project Start Date, Proposed End Date, and Budget Data pre-populated from the Conference/Symposium Budget form.

- **Tab 5 – Submit/Request Approval Full Proposal**: Once all components have been uploaded and prior to the full proposal submission deadline, enter your password in the space provided next to "Enter Your Password Here" and press the "Submit Full Application" button. eBRAP will validate files against the BAA requirements and discrepancies will be noted. If no discrepancies are noted, press the "Confirm Submission" button to complete the proposal submission. eBRAP will notify your Business Official by email to log into eBRAP to review and to approve the proposal prior to the Approval deadline.

  The PI should receive disposition regarding the proposal via an email from eBRAP within 180 days of submission.

II.D.3. Dun and Bradstreet Data Universal Numbering System (DUNS) Number and System for Award Management (SAM)

Applicant organizations and all subrecipient organizations must have a DUNS number to submit proposals/applications to Grants.gov. The applicant organization must also be registered in the Entity Management functional area of the SAM with an "Active" status to submit proposals / applications through the Grants.gov portal. Verify the status of the applicant organization's Entity registration in SAM well in advance of the proposal/applications submission deadline. Allow 3 to 4 weeks to complete the entire SAM registration process.

Applicants must maintain an "Active" SAM status to be qualified to receive federal awards. If an applicant is not fully compliant with the requirements at the time the Federal awarding agency is ready to make a Federal award, the Federal awarding agency may determine that the applicant is not qualified to receive a Federal award and use that determination as a basis for making a Federal award to another applicant.

Refer to the General Submission Instructions, Section III, for further information regarding Grants.gov requirements.

II.D.4. Submission Dates and Times

This is a continuously open announcement through September 30, 2022; therefore, reviews occur throughout the year. Pre-proposals/Pre-applications may be submitted at any time throughout the 5-year period noted above. An invited full proposal/application should be submitted within 90 days of the PI's receipt of an invitation to submit. No pre-proposal/pre-application or full proposal/application may be submitted under this BAA after September 30, 2022, 11:59 p.m. Eastern Time. If an invited proposal/application is not submitted by September 30, 2022, 11:59 p.m. Eastern Time, the applicant must wait for the next available opportunity for submission, i.e., the release of the FY23 BAA (to be posted to Grants.gov October 1, 2022). No

proposal/application received under this BAA will be considered for funding after 24 months from the date of submission.

II.D.5. Intergovernmental Review

This BAA is not subject to EO 12372, "Intergovernmental Review of Federal Programs." The EO provides for state and local government coordination and review of proposed Federal financial assistance and direct Federal development. The EO allows each state to designate an entity to perform this function. This coordination and review is not required under this BAA.

II.D.6. Funding Restrictions

There are no specified funding limitations identified for a proposal/application submitted under this BAA. Refer to the General Submission Instructions, Section III.A.4, "Research & Related Budget," for discussion of allowable costs, including pre-award costs and collaborations with Military Facilities.

II.D.7. Other Submission Requirements

Refer to the General Submission Instructions, Appendix 4, for detailed formatting guidelines.

II.E. Proposal/Application Review and Selection Information

II.E.1. Criteria for Research Proposals/Applications Not Including a Clinical Trial

II.E.1.a. Peer and Programmatic Review

1. **Peer Review:** To determine technical merit, all proposals/applications will be evaluated according to the following scored criteria, which are listed in descending order of importance:

    - **Research Objectives:** The degree to which the stated objectives are clear, valid, and logical. For development of devices and technologies, the degree to which the performance objectives are plausible; the proposed effort demonstrates familiarity with the historical background of the problem and previous/current solutions; and the awareness of similar projects previously undertaken and related activities. The extent to which the proposed research project demonstrates an innovative approach and relates to the Research Areas of Interest identified in Section II.A and Appendix I.

    - **Scientific Design Excellence:** The degree to which proposed plans, methods, techniques, and procedures are feasible, clear, valid, adequately referenced, and state-of-the-art; the merit of the statistical features of the study; the extent to which literature searches were used to document the strengths of the proposed project. For development of devices and technologies, the feasibility of the proposed product/technology development plan; how well the engineering/technical design is likely to achieve the goals indicated; adequacy of the engineering/design solutions; and how well the perceived engineering/design strengths and flaws are addressed. To what degree the

intellectual and material property plan is appropriate, and demonstrates cooperating institutions' willingness and ability to resolve intellectual and material property issues.

- **Impact/Outcomes:** The potential impact of the research in the field, the significance of this impact, and when it can be anticipated. For development of devices and technologies, the potential translation, implementation, and/or commercial use for the product/technology being developed, including whether the funding strategy described to bring the product(s) to the next level of development (e.g., clinical trial, transition to industry, delivery to the market, progression toward incorporation into standard practice) is appropriate and proposed milestones are appropriate and feasible.

- **PI and Key Personnel Qualifications:** The qualifications, capabilities, and experience of the proposed PI and other key personnel to demonstrate that the proposed staff has the knowledge, technical expertise, and management skills to achieve the proposed objectives as well as the time available for the percentage of efforts indicated for the project.

- **Facilities and Resources:** The proposed facilities and equipment, population resources, or unique combinations of these, to demonstrate that the organization has the necessary facilities and resources required for accomplishing the proposed objectives.

- **Budget:** The degree to which the budget reflects the actual needs of the proposed work and is thoroughly detailed and fully justified so that the Government can evaluate and determine the costs to be allocable, allowable and reasonable, and commensurate with the complexity and nature of the research proposed.

2. **Programmatic Review:** To make funding recommendations, the following criteria will be used by programmatic reviewers:

   - Scientific peer review results

   - Adherence to the intent of the award mechanism

   - Program portfolio balance and priorities

   - Relative military benefit

   - Relative innovation, impact, and translatability

   NOTE: Military-relevant research must be responsive to the healthcare needs of the Armed Forces, family members of the Armed Forces, and the U.S. Veteran population. Proposals/ Applications must address a military-relevant health problem responsive to one of the Research Areas of Interest identified in Section II.A and Appendix I.

II.E.2. Criteria for Research Proposals/Applications Including a Clinical Trial

II.E.2.a. Peer and Programmatic Review

1. **Peer Review:** To determine technical merit, all proposals/ applications will be evaluated according to the following scored criteria, which are listed in descending order of importance:

   - **Clinical Impact**
     - How relevant the anticipated outcomes of the proposed clinical trial are to the targeted population.
     - How well the sample population represents the targeted patient population that might benefit from the proposed intervention.
     - How the potential outcomes of the proposed clinical trial will provide/improve short-term benefits for individuals.
     - How significantly the long-term benefits for implementation of the intervention may impact patient care and/or quality of life.
   - **Research Strategy**
     - How well the scientific rationale for testing the intervention is supported by the preliminary data, critical review and analysis of the literature, and/or laboratory/ preclinical evidence.
     - How well the study aims, hypotheses or objectives, experimental design, methods, data collection procedures, and analyses are designed to answer clearly the clinical objective.
     - How well the inclusion and randomization criteria meet the needs of the proposed clinical trial.
     - How well the exclusion criteria are justified.
     - How well plans to collect specimens and conduct laboratory evaluations are addressed, if applicable.
     - To what degree the data collection instruments (e.g., surveys, questionnaires), if applicable, are appropriate to the proposed study.
   - **Statistical Plan**
     - To what degree the statistical model and data analysis plan are suitable for the planned study.

- How the statistical plan, including sample size projections and power analysis, is adequate for the study and all proposed correlative studies.

- Whether the statistical plan compensates for the use of a subpopulation of a recruited sample population to ensure appropriate power can be achieved within the subpopulation study.

- **Intervention**

  - Whether there is evidence of support, indicating availability of the intervention from its source, for the duration of the proposed clinical trial (if applicable).

  - To what degree the intervention addresses the clinical need(s) described.

  - How the intervention compares with currently available interventions and/or standards of care.

  - To what degree t preclinical and/or clinical evidence to support the safety of the intervention is provided.

  - Whether a member of the study team holds the IND/IDE for the indication proposed or whether the timeline proposed for obtaining the IND/IDE is appropriate (if applicable).

  - For investigator-sponsored INDs, whether there is evidence of appropriate institutional support, including capabilities to ensure monitoring as required by the FDA.

  - Whether plans to comply with Good Manufacturing Practices (GMP), Good Laboratory Practices (GLP), and Good Clinical Practices (GCP) guidelines are appropriate.

  - Whether measures are described to ensure the consistency of dosing of active ingredients for nutritional supplements (if applicable).

- **Recruitment, Accrual, and Feasibility**

  - How well the availability of human subjects for the clinical trial and the prospect of their participation is addressed.

  - Whether access to the proposed human subjects population is demonstrated.

  - The degree to which the recruitment, informed consent, screening, and retention processes for human subjects will meet the needs of the proposed clinical trial.

  - How well the application identifies possible delays (e.g., slow accrual, attrition) and presents adequate contingency plans to resolve them.

- To what extent the proposed clinical trial might affect the daily lives of the individual human subjects participating in the study (e.g., Will human subjects still be able to take their regular medications while participating in the clinical trial? Are human subjects required to stay overnight in a hospital?).

- **Ethical Considerations**

  - How the level of risk to human subjects is minimized and how the safety monitoring and reporting plan is appropriate for the level of risk.

  - Whether a research monitor with expertise consistent with the nature of the potential risk(s) is identified, if applicable.

  - How well the evidence shows that the procedures are consistent with sound research design and, when appropriate, that these procedures are already in use for diagnostic or treatment purposes.

  - To what degree privacy issues are appropriately considered.

  - To what degree the process for seeking informed consent is appropriate and whether safeguards are in place for vulnerable populations.

- **Personnel and Communication**

  - Whether the composition of the study team (e.g., study coordinator, statistician) is appropriate.

  - To what degree the study team's background and expertise are appropriate to accomplish the proposed work (e.g., statistical expertise, expertise in the disease, and clinical studies).

  - How the levels of effort of the study team members are appropriate for successful conduct of the proposed trial.

  - How well the logistical aspects of the proposed clinical trial (e.g., communication plan, data transfer and management, standardization of procedures) meet the needs of the proposed clinical trial.

- **Transition Plan and Regulatory Strategy**

  - Whether the identified next level of development and/or commercialization is realistic.

  - Whether the funding strategy described to bring the intervention to the next level of development (e.g., specific industry partners, specific funding opportunities to be applied for) is reasonable and realistic.

- How the regulatory strategy and development plan to support a product label change, if applicable, is appropriate and well described.

- Whether the proposed collaborations and other resources for providing continuity of development, including proposed development or modification of clinical practice guidelines (CPG) and recommendations, provider training materials, patient brochures, and other clinical support tools, scientific journal publications, models, simulations, and applications are established and/or achievable.

- Whether the schedule and milestones for bringing the intervention to the next level of development (next-phase clinical trials, transition to industry, delivery to the market, incorporation into standard practice, and/or approval by the FDA) are achievable.

- Whether the potential risk analysis for cost, schedule, manufacturability, and sustainability is realistic and reasonable.

- How well the application identifies intellectual property ownership, describes any appropriate intellectual and material property plan among participating organizations (if applicable), and addresses any impact of intellectual property issues on product development and subsequent Government access to products supported by this Program Announcement/Funding Opportunity.

- Whether the applicant has demonstrated that they have access to all intellectual property rights necessary for development and commercialization and evidence that the Government has the ability to access such products or technologies.

- **Budget**

  - Whether the budget is appropriate for the proposed research.

- **Environment**

  - To what degree the scientific environment, clinical setting, and accessibility of institutional resources support the clinical trial at each participating center or institution (including collaborative arrangements).

  - Whether there is evidence for appropriate institutional commitment from each participating institution.

  - If applicable, to what degree the intellectual and material property plan is appropriate.

2. **Programmatic Review:** To make funding recommendations, the following criteria will be used by programmatic reviewers:

   - Scientific peer review results

   - Adherence to the intent of the award mechanism

- Program portfolio balance and priorities
- Relative military benefit
- Relative innovation, impact, and translatability

NOTE: Military-relevant research must be responsive to the healthcare needs of the Armed Forces, family members of the Armed Forces, and the U.S. Veteran population. Proposals/ Applications must address a military-relevant health problem responsive to one of the Research Areas of Interest identified in Section II.A and Appendix I.

II.E.3. Criteria for Conference or Symposium Support Proposals

II.E.3.a. Peer and Programmatic Review

1. **Peer Review:** To determine technical merit, proposals will be evaluated according to the following scored criteria, which are listed in descending order of importance:

   - **Conference or Symposium Objectives and Plan:** The degree to which the stated objectives are clear, valid, and logical. The degree to which the performance objectives are plausible; the proposed effort demonstrates familiarity with the historical background of the problem and previous/current solutions (such as professional society meetings). The degree of quality and completeness of the overall management and execution plan. The extent to which the conference or symposium relates to the Research Areas of Interest identified in Section II.A and Appendix I. The extent to which the conference or symposium circumstances do not create the appearance of Government impropriety.

   - **Scientific Excellence:** The degree to which proposed conference or symposium procedures are state-of-the-art; the degree to which the conference or symposium includes expert peer review in rating and selection of presentation through methods such as abstract submission and established processes for invitation of appropriate participants.

   - **Impact/Outcomes:** The potential impact of the conference or symposium content in the field and for individual attendees, the significance of this impact, and when it can be anticipated, as well as methods for publication and peer review of conference or symposium results and recommendations.

   - **Key Personnel Qualifications:** The qualifications, capabilities, and experience of the proposed key personnel to demonstrate that the proposed staff has the knowledge, technical expertise, and management skills to achieve the proposed objectives.

   - **Budget:** The degree to which the budget reflects the actual needs of the proposed work and is thoroughly detailed and fully justified so that the Government can evaluate and determine the costs to be allocable, allowable and reasonable, and commensurate with the complexity and nature of the meeting proposed. The extent to which the costs reflect common sense and good judgment as to appropriate and necessary conference or symposium expenses and do not include expenses that are prohibited (including, but not limited to, entertainment-related expenses including hiring musicians or other

entertainers, procurement of extraneous promotional items, decorations or other goods and services for participants that are unrelated to the purpose of the conference or symposium, procuring tickets to recreational activities outside of the conference setting, or using DoD funds to produce non-substantive audio/visual materials).

2. **Programmatic Review:** The following criteria will be used by programmatic reviewers:

- Programmatic relevance
- Scientific merit and relative impact
- Relevance to the DoD mission

II.E.4. Proposal/Application Selection Process

All invited proposals/applications are evaluated by USAMRMC scientists, other Federal agency representatives, outside scientists with diverse expertise, clinicians, consumers, or combinations thereof, using a two-tier review process. The first tier is peer review of proposals/applications against established criteria for determining technical merit. The second tier is programmatic review based on established criteria for determining relevance to the mission of the USAMRMC and its programs.

All USAMRMC review processes are conducted confidentially to maintain the integrity of the merit-based selection process. Panel members sign agreements to (1) protect the confidentiality of the information in the proposal/application and (2) not disclose evaluation information outside the panel. Violations of confidentiality can result in the dissolving of a panel(s) and other corrective actions. In addition, personnel at the applicant or collaborating organizations are prohibited from contacting persons involved in the review process to gain protected evaluation information or to influence the evaluation process. Violations of these prohibitions will result in the administrative withdrawal of the organization's proposal/application. Violations by panel members or applicants that compromise the confidentiality of the review process may also result in suspension or debarment from Federal awards. Furthermore, the unauthorized disclosure of confidential information of one party to another third party by military personnel or employee of the Federal Government is a crime in accordance with 18 USC 1905.

After the two-tier evaluation, proposals/applications recommended for funding may be prioritized. A prioritized listing of alternates (deferred decisions) may also be prepared, when warranted. Subsequent awards depend upon the availability of funds and fulfillment of requirements and priorities determined to exist at the time of award. In some cases, funding priorities may change as certain scientific tasks are addressed and new mission assignments arise.

If selected for funding, the award may also be dependent on the organization providing adequate additional regulatory documentation, such as human subjects/anatomical substances/use of cadavers protocols and approvals, animal subjects protocols and approvals, and environmental information. The award may also be dependent on additional supporting administrative and budgetary information.

II.E.5. Integrity and Performance Information

Prior to making an award where the Federal share is expected to exceed the simplified acquisition threshold (currently $150,000) over the period of performance, the Federal awarding agency is required to review and consider any information about the applicant that is available in the Federal Awardee Performance and Integrity Information System (FAPIIS).

An applicant, at its option, may review FAPIIS, accessible through SAM, and submit comments to FAPIIS on any information about itself that a Federal awarding agency previously entered and is currently available in FAPIIS.

The Federal awarding agency will consider any comments by the applicant, in addition to other information in the designated integrity and performance system, in making a judgment about the applicant's integrity, business ethics, and record of performance under Federal awards when determining an organization's qualification prior to award, according to the qualification standards of the DoDGAR or the FAR.

II.E.6. Notification of Proposal/Application Review Results

Each PI and organization will receive email notification via eBRAP of the proposal/application status. Notifications should be sent within 180 days of submission. Each PI will receive a peer review summary statement on the strengths and weaknesses of the proposal/application.

A recommended for funding notification is NOT an authorization to begin performance or a guarantee of an award. Awards are contingent upon availability of funding, adequacy of supporting documentation submitted, fulfillment of all requirements, and upon completion of successful negotiations. Authorization to begin performance will be received via an award document (contract, grant, or cooperative agreement, as applicable) signed by the USAMRAA Contracting or Grants Officer. Awards may be issued at any time throughout the year.

II.F. Award Administration Information

II.F.1. Award Notices

The PI should receive disposition regarding the full proposal/application via an email from eBRAP within 180 days of submission. **A recommended for funding notification is NOT an authorization to begin performance nor a guarantee of an award.**

The awarding agency will be the USAMRAA. The USAMRAA Contracting and Grants Officers are the only individuals authorized to obligate funds and bind the Federal Government.

Authorization to begin performance will be received via an award document (contract, grant, or cooperative agreement, as applicable) signed by the USAMRAA Contracting or Grants Officer. No commitment on the part of the Government should be inferred from discussions with any other individual.

Awards will be made at any time throughout the year and are contingent upon availability of funding, adequacy of supporting documentation submitted, fulfillment of requirements, and

completion of successful negotiations. No proposal/application submitted under this BAA will be considered for funding after 24 months from the date of submission to Grants.gov.

Refer to the General Submission Instructions, Appendix 2, Section D, Award Notices, for additional information. Applicable requirements in the DoDGAR are found in 32 CFR, Chapter I, subchapter C, and 2 CFR, Chapter XI, apply to grants and cooperative agreements resulting from this BAA. Refer to the full text of the USAMRAA General Research Terms and Conditions for Institutions of Higher Education, Hospitals, and Non-Profit Organizations and the USAMRAA General Research Terms and Conditions for For-Profit Organizations available at http://www.usamraa.army.mil/Pages/Resources.aspx for further information.

II.F.1.a. PI Changes and Award Transfers

Refer to the General Submission Instructions, Appendix 4, Sections L and M, for general information on changes to PIs and organizational transfers.

II.F.2. Administrative and National Policy Requirements

Applicable requirements in the DoDGAR apply to grants and cooperative agreements resulting from this BAA. See 2 CFR, Chapter XI, and 32 CFR, Chapter I.

Refer to the General Submission Instructions, Appendix 2, for general information regarding administrative requirements.

Refer to the General Submission Instructions, Appendix 5, for general information regarding national policy requirements.

II.F.3. Reporting Requirements

Refer to the General Submission Instructions, Appendix 2, Section A, for general information on reporting requirements.

II.G. Agency Contacts

II.G.1. CDMRP Help Desk

Questions related to BAA content or submission requirements as well as questions related to the submission of the pre-proposal/pre-application through eBRAP should be directed to the CDMRP Help Desk, which is available Monday through Friday from 8:00 a.m. to 5:00 p.m. Eastern Time. Response times may vary depending upon the volume of inquiries.

Phone: 301-682-5507

Email: help@eBRAP.org

II.G.2. Grants.gov Contact Center

Questions related to full proposal/application submission through the Grants.gov portal should be directed to the Grants.gov Contact Center, which is available 24 hours a day, 7 days a week (closed on U.S. Federal holidays). Note that the CDMRP Help Desk is unable to provide technical assistance with Grants.gov submission.

Phone: 800-518-4726 (International: 1-606-545-5035)

Email: support@grants.gov

Sign up on Grants.gov for "send me change notification emails" by following the link on the Synopsis page for the BAA or by responding to the prompt provided by Grants.gov when first downloading the submission package. If the submission package is updated or changed, the original version of the submission package may not be accepted by Grants.gov.

II.H. Other Information

II.H.1. Contractor/Recipient Qualification

Refer to the General Submission Instructions, Appendix 3, for general information on required qualifications.

In addition to other information provided herein, by submitting a proposal/application and accepting an award, the organization is: (1) certifying that the investigators' credentials have been examined; (2) verifying that the investigators are qualified to conduct the proposed study and to use humans or animals as research subjects, if proposed. Investigators include all individuals, regardless of ethnicity, nationality, or citizenship status, who are employed by, or affiliated with, an eligible organization.

Investigators are cautioned that awards are made to organizations, not individuals. A PI must submit a proposal/application through an organization in order to receive support.

Should the PI of a funded project leave the award organization, both the PI and organization must contact the USAMRAA as soon as possible to discuss options for continued support of the research project. Every effort should be made to notify the USAMRAA prior to the PI leaving the organization.

II.H.2. Proprietary Information

Do not include any proprietary information in the pre-proposal/pre-application. Proprietary information should ***only be included*** in the full proposal/application ***if necessary for evaluation purposes.*** Abstracts of all funded proposals/applications will be posted publicly. ***Therefore, do not include proprietary information in the abstract.***

Conspicuously and legibly, mark any proprietary information that is included in the full proposal/application. Identify any proprietary information to be provided to the Government and indicate whether the applicant will request a waiver of Government purpose rights.

II.H.3. Administrative Actions

After agency receipt of proposals/applications from Grants.gov, the following administrative actions may occur:

II.H.3.a. Rejection

The following will result in administrative rejection of the proposal/application:

- Project Narrative exceeds the page limit.
- Project Narrative is missing.
- Budget form contains only zeros.
- Full proposal/application submission in the absence of an invitation.
- For proposals/applications including a clinical trial, the following may result in administrative rejection:
  - Human Subject Recruitment and Safety Procedures (Attachment 6) is missing.
  - Intervention (Attachment 7) is missing.
  - Data Management (Attachment 8) is missing

II.H.3.b. Modification

- Pages exceeding the specific limits may be removed prior to review for all documents other than the Project Narrative.
- Documents not requested may be removed.
- Following proposal/application submission to Grants.gov, the PI will receive an email request from eBRAP to review, modify, and verify the proposal/application submitted to Grants.gov. During this verification period, the PI may upload missing documents (excluding those listed above, Section II.H.3.a, Rejection), replace files, and re-categorize files. These modifications must be completed by the end of the proposal/application verification period; otherwise, the proposal/application will be reviewed as submitted. If either the Project Narrative exceeds the page limit or the Budget form contains only zeros, an updated Grants.gov submission package must be submitted via Grants.gov as a "Changed/Corrected Application" with the previous Grants.gov Tracking ID.

II.H.3.c. Withdrawal

The following may result in administrative withdrawal of the pre-proposal/pre-application or proposal/application:

- Federal agency personnel involved in the review process and/or with making funding recommendations are named as being involved in the research proposed or found to have assisted in the pre-proposal/pre-application or proposal/application processes, including, but not limited to, concept design, proposal/application development, budget preparation, and the development of any supporting documentation. ***If formal collaboration with Military Facility personnel is planned (i.e., included in the proposal/application in performance of the research), this prohibition is not applicable. However, these Military Facility personnel are prohibited from being involved in the review process and/or with making funding recommendations.***

- Inclusion of any employee of USAMRMC review contractors in pre-proposal/ pre-applications or full proposals/applications for funding without adequate plans to manage COIs. Refer to General Submission Instructions, Appendix 3.D, for detailed information.

- Personnel from applicant or collaborating organizations are found to have contacted persons involved in the review process to gain protected evaluation information or to influence the evaluation process.

- The full proposal/application does not propose the same research project as described in the pre-proposal/pre-application.

- The full proposal/application budget differs significantly from the budget included in the pre-proposal/pre-application.

- Proposed research of work that was or is currently funded may result in withdrawal.

- For studies requiring an IND or IDE, documentation of IND/IDE submission and/or approval is not provided

- Applications may be administratively withdrawn from further consideration if the applicant cannot demonstrate access to the relevant study population and resources.

II.H.3.d. Withhold

Proposals/Applications that appear to involve research misconduct will be administratively withheld from further consideration pending organizational investigation. The organization will be required to provide the findings of the investigation to the USAMRAA Contracting or Grants Officer for a determination of the final disposition of the proposal/application.

II.H.4. Common Submission Problems

- Failure to enter an email address for change notifications under the BAA in Grants.gov for notifications on any modification made to the initial posting.

- Attachments are uploaded into the incorrect form on Grants.gov forms. (See the appropriate Proposal/Application Submission Checklist below.)

- Failure to contact the Grants.gov Help Desk when needed.

- Failure to send attachments.
- Inability to locate attachment forms. (Select "Search Grants" at http://www.grants.gov and enter W81XWH18SBAA1 in the "Opportunity Number" block; or in the "CFDA" block, enter 12.420, and perform a "Search." Under the "Opportunity Number" column, look for number W81XWH18SBAA1 in the list.)
- Use of "illegal" characters in attachment titles.
- Attachments exceed size limits.
- Upload attempts of unacceptable attachments: bitmap, TIFF, etc.
- Duplicate upload of documents.

II.I. Research Proposal/Application Not Including a Clinical Trial Submission Checklist

Grants.gov Application Components	Upload Order	Action	Completed
SF424 (R&R) Application for Federal Assistance		Complete form as instructed.	
Attachments Form	1	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf."	
	2	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf."	
	3	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf."	
	4	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf."	
	5	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf."	
	6	Impact/Outcomes Statement: Upload as Attachment 6 with file name "Impact.pdf."	
	7	Data- and Research Resource-Sharing Plan: Upload as Attachment 7 with file name "Sharing.pdf."	
	8	Transition Plan: Upload as Attachment 8 with file name "Transition.pdf."	
	9	Collaborating DoD Military Facility Budget Form(s): Upload as Attachment 9 with file name "MFBudget.pdf," if applicable.	
Research & Related Senior/Key Person Profile (Expanded)		Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field.	
		Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field.	
		Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field.	
		Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field.	
Research & Related Budget		Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field.	
Project/Performance Site Location(s) Form		Complete form as instructed.	
R & R Subaward Budget Attachment(s) Form		Complete form as instructed.	

II.J. Research Proposal/Application Including a Clinical Trial Submission Checklist

Application Components	Action	Completed
SF424 (R&R) Application for Federal Assistance	Complete form as instructed.	
Attachments	Project Narrative: Upload as Attachment 1 with file name "ProjectNarrative.pdf."	
	Supporting Documentation: Upload as Attachment 2 with file name "Support.pdf."	
	Technical Abstract: Upload as Attachment 3 with file name "TechAbs.pdf."	
	Lay Abstract: Upload as Attachment 4 with file name "LayAbs.pdf."	
	Statement of Work: Upload as Attachment 5 with file name "SOW.pdf."	
	Human Subject Recruitment and Safety Procedures: Upload as Attachment 6 with file name "HumSubProc.pdf."	
	Intervention: Upload as Attachment 7 with file name "Intervention.pdf."	
	Data Management: Upload as Attachment 8 with file name "Data_Manage.pdf."	
	Study Personnel and Organization: Upload as Attachment 9 with file name "Personnel.pdf."	
	Surveys, Questionnaires, and Other Data Collection Instruments: Upload as Attachment 10 with file name "Surveys.pdf."	
	Impact Statement: Upload as Attachment 11 with file name "Impact.pdf."	
	Transition Plan and Regulatory Strategy: Upload as Attachment 12 with file name "Transition.pdf."	
	IND/IDE Documentation: Upload as Attachment 13 with file name "IND-IDE.pdf."	
	Military Relevance Statement: Upload as Attachment 14 with file name "MilRel.pdf."	
	DoD Military Budget Form(s): Upload as Attachment 15 with file name "MFBudget.pdf," as applicable.	

Application Components	Action	Completed
Research & Related Senior/Key Person Profile (Expanded)	Attach PI Biographical Sketch (Biosketch_LastName.pdf) to the appropriate field.	
	Attach PI Previous/Current/Pending Support (Support_LastName.pdf) to the appropriate field.	
	Attach Biographical Sketch (Biosketch_LastName.pdf) for each senior/key person to the appropriate field.	
	Attach Previous/Current/Pending (Support_LastName.pdf) for each senior/key person to the appropriate field.	
Research & Related Budget	Complete as instructed. Attach Budget Justification (BudgetJustification.pdf) to the appropriate field.	
Project/Performance Site Location(s) Form	Complete form as instructed.	
R&R Subaward Budget Attachment(s) Form, if applicable	Complete form as instructed.	

II.K. Conference and Symposium Support Proposal Checklist

eBRAP Application Components	Upload Order	Action	Completed
Attachments Form	1	Conference or Symposium Objectives: Upload as Attachment 1 with file name "Objectives.pdf."	
	2	Agenda: Upload as Attachment 2 with file name "Agenda.pdf."	
	3	List of Relevant Publications: Upload as Attachment 3 with file name "References.pdf."	
	4	Statement of Work: Upload as Attachment 4 with file name "SOW.pdf."	
	5	Impact/Outcomes Statement: Upload as Attachment 5 with file name "Impact/Outcomes.pdf."	
	6	Key Personnel Qualifications: Upload as Attachment 6 with file name "Personnel.pdf."	
	7	Key Personnel Biographical Sketches: Upload as Attachment 7 with file name "Biosketch.pdf."	
	8	Budget: Upload as Attachment 8 with file name "Budget.pdf."	

APPENDIX I: RESEARCH AREAS OF INTEREST

I. Military Infectious Diseases Research Program

A. Research and Development Toward Preventive Measures for Infectious Diseases

- **Vaccines:** The development of vaccines to protect the Warfighter is a priority for the MIDRP. Vaccines can be administered prior to deployment, thereby protecting the Warfighter by preventing disease, obviating the need for prophylactic medication, and reducing the medical logistic burden. The MIDRP supports studies to characterize infectious disease agents and their mechanisms of pathogenesis, utilizing various approaches to identify and evaluate vaccine candidates in animal models and humans, as well as studies of protective immune responses to these agents.

- **Anti-Parasitic Drugs:** The MIDRP supports research efforts for discovery, design, and development of drugs to prevent malarial infections. This includes drug synthesis, characterization of modes of action, screening for antimalarial activity, in vitro and in vivo research using animal models, and drug resistance mechanisms. Investigations into parasite metabolism, structural biology, genomics, proteomics, and metabolomics focused on identification of potential novel targets for drug intervention are also relevant to the MIDRP.

- **Vector Control Products:** The MIDRP supports investigations focusing on arthropod vectors and arthropod vector-borne diseases (primary malaria, dengue, and scrub typhus). Current studies target vector-pathogen-human interactions, vector control measures (including personal protective equipment), and risk assessment (including identification and classification of vectors, improved surveillance techniques, and field-deployable assays for detecting pathogens in their vectors).

- **Combat Wound Infections:** The MIDRP supports research to inform and/or facilitate product development to detect, prevent, treat, and manage combat wound infections. Investigations in this area include characterization of the mechanisms of biofilm formation in wounds, the mitigation of biofilm formation in wounds, novel therapies for wound infection treatment, and methods to understand the dynamics of microbial communities in infected and healing wounds. In addition, novel chemical classes and/or biologics to prevent or treat combat wound infection and/or biofilm formation are of interest.

B. Research and Development of Therapeutic Measures for Infectious Diseases

Therapeutic drug development (including studies to screen, synthesize, and develop therapeutic drugs for malaria and other military-relevant infectious agents) is secondary to prophylactic drug development within the MIDRP (see above). However, efforts to advance novel drug delivery systems (i.e., sustained-release reduce toxicity or targeted drug delivery) would be considered. In addition, MIDRP supports investigations into the development of novel medical countermeasures and innovative treatment approaches (e.g., chelators, phage, antimicrobial peptides, quorum-sensing inhibitors, and host immune augmentation) against multidrug-resistant organisms in combat wound infections and pathogenic biofilm formation. Given modest pharmaceutical industry interest in developing and marketing vaccines for orphan diseases, the

MIDRP is also interested in applications for the development of products leading to FDA-licensed treatment options and broadly active therapeutics against multiple endemic disease threats.

II. Combat Casualty Care Research Program

A. Research and development of technologies to stop blood loss, resuscitate the casualty, and limit the immediate, short-, and long-term deleterious consequences of severe hemorrhage: Research focused on the pre-hospital setting including point of injury, the initial "Golden Hour" after injury, and scenarios in which a casualty cannot be transported through traditional levels of care (i.e., prolonged field care [PFC]) are of high interest. Included in this area of interest are diagnostics and therapeutics to predict, diagnose, prevent, and treat coagulopathy of trauma and non-invasive or minimally invasive sensors to detect and warn of impending vascular collapse and/or significant tissue damage due to perfusion deficits. Examples of specific products include local and systemic hemostatic agents or devices (exovascular or endovascular) for control of vascular disruption and subsequent compressible and non-compressible hemorrhage, treatments to sustain or enhance oxygen delivery and perfusion of vital tissues and organs, and equipment and procedures for effective fluid resuscitation and enhanced resuscitation fluids. Also of interest are the improved preservation, storage, transportability, and processing of red blood cells, platelets and plasma, and other blood or blood-like substitutes.

B. Research and development of technologies to diagnose and to limit the immediate, short-, and long-term impairments that follow TBI and spinal cord injury: Research specializing in "polytrauma" accounting for the impact of hemorrhagic shock and failure to oxygenate and/or ventilate as brain injury progresses is of interest to provide insight leading to improvements in clinical practice guidelines. Included in this area of interest are non-invasive or minimally invasive sensors or assays to rapidly diagnose the severity of brain and neurological injury within the battle area (or as close to it as possible) and drugs, biologics, or other agents to mitigate the progression of neurotrauma/secondary brain injury such as post-injury neural and immune cell overstimulation, inflammation, cell loss, and/or neurologic dysfunction.

C. Research and development of technologies to diagnose and reduce acute secondary organ damage: Secondary damage to organs frequently occurs after severe trauma and resuscitation. The CCCRP is interested in materiel and/or devices that can reduce acute secondary organ damage such as ischemia/reperfusion injury, cell death, general organ failure, and secondary brain/spinal cord damage. Technologies to sustain or support single- and multiple-organ injury and failure are also of interest to the CCCRP. These objectives include methods to reduce cellular demand for oxygen and metabolic substrates and therapeutics to modulate the immune response to traumatic injury as well as single- and multiple-organ support or replacement technologies (extracorporeal). In addition, the utilities of these modalities during (and the effects of longer distance) en-route care on the critically injured casualty are also of interest.

D. Research and development into the impacts of transport: An important element of combat casualty care is the transport of patients from the initial point of injury and

throughout the continuum of care. Accordingly, the CCCRP is interested in improving and maintaining optimal clinical outcomes for en-route care including PFC. Identifying feasible ways to mitigate the stresses of flight and/or transport (such as hypobaria, hypoxia, vibration, and g-forces) in an austere/constrained environment and the impact on clinical outcomes (such as healing rates, pain, infection rates, etc.) are particularly important. Additionally, establishing either timeframes or ways to measure the appropriate time to transport patients with critical injuries (including neurotrauma, burns, lung injuries, and musculoskeletal injuries) are a critical element to improving outcomes.

III. Military Operational Medicine Research Program

A. Injury Prevention and Reduction: This area of research addresses the requirement to provide the biomedical basis for countermeasures that prevent and mitigate Service member injuries and performance decrements occurring in training and operational environments, decrease attrition and medical cost, minimize personal impact to the Service member, and promote readiness. The primary need of the Injury Prevention and Reduction portfolio is the development of validated injury criteria utilizing animal models and postmortem human subjects against blunt and ballistic threats that will inform the development of helmets and body armor. Coordination with DoD labs such as the U.S. Army Aeromedical Research Laboratory, U.S. Army Research Laboratory (ARL) Survivability, Lethality, and Analysis Directorate and/or ARL Weapons and Materials Research Directorate is encouraged. Other research areas of interest include: developing and validating return-to-duty (RTD) clinical assessments and physical performance standards following neurosensory and musculoskeletal injury; understanding the physiological impact of exposure to repetitive low-level blast in order to validate military safety standards and health hazard assessment prediction tools to prevent brain, sensory, and lung injury; understanding the bioeffects from exposure to, and developing injury thresholds against, directed energy threats (e.g., laser, microwave, and radiofrequency waves); and developing interventions to mitigate neurosensory and musculoskeletal injury risk and optimize performance in complex military systems, and develop and validate assessment tools and strategies to promote Service member physical performance optimization (individual and group). In addition, this research includes the development of policy, training, planning/management tools, knowledge and materiel solutions, status monitoring systems, interventions, and reset solutions to sustain Service member health and operational effectiveness.

B. Psychological Health and Resilience: The Psychological Health and Resilience research program area is interested in research aimed at maximizing resilience and psychological health and decreasing PTSD, depression and anxiety disorders, suicide, and risk behaviors (e.g., substance abuse, anger/aggression, sexual harassment and assault, and interpersonal violence within the military). Additional psychological health areas of interest include military-related grief, guilt, or loss issues; moral injury; interdisciplinary and comprehensive prevention and life-skills training strategies to reduce negative psychological health trajectories; and reduction of stigma and other barriers to psychological healthcare-seeking. MOMRP has interest in understanding and addressing psychosocial/psychological health challenges unique to military families, women Service members, Reserve and Guard, and lesbian, gay, bisexual, and transgender Service members. This research area focuses on the development and validation of effective training and prevention interventions, screening and

assessment strategies, and treatment and rehabilitation interventions that address the psychological health topic areas. In addition, this research area focus may include development and validation of effective evidence-based training and prevention interventions for concussion/mild TBI. Research areas of particular interest include foundational studies to generate and validate theories and elucidate underlying mechanisms of psychological disorders and treatment response; studies addressing comorbidities (including, but not limited to, PTSD, concussion, alcohol and other drug abuse, sleep disturbance, mood disorders, suicidality, and psychosocial factors); studies focused on enhancing translation, implementation, and uptake of evidence-based strategies and treatments; research focused on establishing validated objective RTD standards following psychological injury; and research focused on systems approaches to psychological health. Proposals/Applications are encouraged that incorporate and evaluate leveraging of technology (e.g., telemedicine, remote monitoring, biosensors, advance immunologic testing, and health information technologies), and leverage existing resources and infrastructure to support lifecycle logistics and sustainability. Also of interest are rigorous studies on integrative medicine and complementary and alternative medicine (CAM) approaches spanning mind/body, movement, natural products, non-Western medicine approaches and spiritual practices, along with validation studies of CAM therapies. Research topics of particular interest include those directed at evaluating efficacy of cognitive training approaches to promote resilience and prevent/mitigate acute negative responses to psychological trauma and promote readiness; and the development of a systematically applied set of therapeutic services designed to reduce cognitive dysfunction and restore functions that can be restored and/or improve quality of life.

C. **Physiological Health and Performance:** This area of research develops biomedical countermeasures to sustain Service member health and operational effectiveness. It informs military policy, training, clinical practice guidelines, and the development of materiel solutions to establish, sustain, optimize, and monitor Service member health, physiological factors of resilience, and cognitive and physical performance throughout the military lifecycle, including training, deployment, reset, and injury recovery cycles. This research area aims to prevent or mitigate the negative effects of operational and training stressors on the readiness, performance, and fitness of Service members, as well as safely enhance performance with evidence-based pharmacological and non-pharmacological personalized strategies based on a systems medicine approach. Studies may include, but are not limited to, those that investigate the use of dietary supplements and nutritional and behavioral interventions to mitigate threats to readiness, operational health, and performance. Research also aims to develop healthy sleep and fatigue management strategies, strategies that exploit individual differences in sleep loss resilience, and strategies that promote individualized resilience to various operational stressors and injuries. Physiological health and performance research also encompasses work focusing on overall brain and cognitive fitness. Basic, applied, and advanced research studies utilizing technologies and strategies to monitor and promote Service member and family readiness and health to support the Army Surgeon General's Performance Triad and U.S. Army Training and Doctrine Command Human Dimension Initiative are of interest.

D. **Environmental Health and Protection:** This area of research includes assessment and sustainment of health, Force readiness, and the operational effectiveness of Service members

exposed to harsh operational environments including altitude, cold, heat, undersea, and exposure to environmental toxicant health hazards or combination of environmental stressors. Studies may include, but are not limited to, methods for effective monitoring of environmental exposures in individuals and populations and assessment of health risks following exposures to environmental stressors. In addition, this research includes development of policy, training, planning/management tools, decision aids, knowledge and materiel solutions, physiological status monitoring systems, interventions, and reset solutions to sustain Service member readiness, and health and operational effectiveness to environmental stressors encountered during training or operations. Additional research identifies biomarkers of exposure, dosimetry, and risk management to environmental toxicant health hazards, neurological and physical assessment tools for optimizing performance of the Service member exposed to environmental toxicant hazards, and development of portable devices for rapid identification of biomarkers of complex exposures and health effects in support of military operational requirements. Additional research focuses on developing wearable solutions that are small size, low weight, cube, and have minimal power requirements for real-time physiological status monitoring in harsh operational environments.

IV. Clinical and Rehabilitative Medicine Research Program

A. Neuromusculoskeletal (NMS) Injury Rehabilitation: The NMS Injury Rehabilitation program area seeks research efforts directed toward optimal treatment, rehabilitation, and reintegration following Service-related NMS injury including: Service-related acute and repetitive overuse injury management, limb loss rehabilitation and prosthetic management, and limb trauma rehabilitation and orthotic management. Areas of encouragement include: validation of therapeutic exercise dosage (frequency, intensity, timing, and/or type) and rehabilitation strategies to improve Warfighter function, performance, and quality of life; understanding confounders of optimal rehabilitation; research to develop and validate standardized metrics of function, performance, and quality of life across and beyond the continuum of rehabilitative care; validation of existing short- and long-term reintegration strategies; research to predict and mitigate secondary health deficits following NMS injury; and efforts to develop and validate rehabilitation technologies (e.g., rehabilitation tools, interoperability of devices, prosthetic sockets, orthotic devices, advanced prosthetic control, sensory/proprioception, etc.) for Warfighters with NMS injuries to restore function and quality of life.

B. Vision Restoration and Rehabilitation: The Sensory Systems program area is seeking research efforts aimed at understanding and treating traumatic and Service-related injuries (e.g., blast, burn, penetrating, chemical, etc.) to ocular structures and the visual system (e.g., optic neuropathy, corneal scarring, retinal injury, lids and adnexal injuries, and ocular polytrauma, etc.). Additional areas of interest include studies to improve or advance visual system diagnostic/assessment capabilities, and restoration/rehabilitation strategies (including, but not limited to, rehabilitation for multisensory dysfunctions, low vision and blindness, and oculomotor vision disorders) following traumatic injury.

C. Hearing Loss/Dysfunction, Balance Disorders, and Tinnitus: The Sensory Systems program area is seeking research efforts to support the development of strategies and technologies (including, but not limited to, medical devices, pharmaceuticals, rehabilitation

strategies, and regenerative medicine-based approaches) to restore and/or rehabilitate patients with hearing loss/dysfunction, balance disorders, and/or tinnitus due to trauma (including TBI). This includes research focused on the etiology of injury including studies to support an understanding of the molecular, cellular, and physiological mechanisms underlying hearing loss/dysfunction, balance disorders, and tinnitus. Additional areas of interest include research supporting the development, advancement, and/or validation of objective diagnostics, and treatment/rehabilitative strategies for hearing loss/dysfunction, balance disorders, multisensory dysfunction, and tinnitus after traumatic or Service-related injuries.

D. Pain Management: The primary interest of the Pain Management program area is management of acute and chronic pain associated with traumatic or combat-related injuries. The CRMRP's specific needs include development of alternative interventions to current opioid analgesics for pain management by the medic/corpsman on the battlefield/remote locations; development of intervention strategies for acute pain management in deployed locations, including battlefield and resource-limited environments; development of strategies for management of acute pain under the care of a clinician in non-deployed settings; development of intervention strategies for chronic pain management in deployed locations, including battlefield and resource-limited environments; development of intervention strategies for management of chronic pain under the care of a clinician in non-deployed settings; identification of pain generators and etiology of pain; development of strategies for identifying and addressing biopsychosocial aspects of pain; and development of substance misuse and abuse assessments and treatments in pain management.

E. Regenerative Medicine and Composite Tissue Engineering: Regenerative medicine involves the use of innovative technologies such as scaffolds and tissue engineering, growth factors, and cell-based treatments to restore Service members who have suffered combat-related injuries. Research topics of particular interest include those directed toward the use of regenerative medicine-based technologies to repair functional neural deficits (to include all peripheral nerves, visual system, and auditory system but excluding other deficits associated with central nervous system or spinal cord), repair/replace neuromuscular tissue units of the extremities or face including composite facial features (eyelids, lips, and nares), regenerate bone defects (weight-bearing and alveolar), regenerate skin, address vascular repair/revascularization, regenerate cartilage/musculoskeletal connective tissues for the prevention of post-traumatic arthritis, muscle protection/regeneration, vascularized tissue allotransplantation, immunomodulation, and tolerization related to vascularized tissue allotransplantation and wound management and tissue preservation such as promotion of scarless wound healing (not to include infection control).

F. TBI Rehabilitation: The sensorimotor clinical rehabilitation line of effort within the TBI program seeks to develop, evaluate, and/or validate rehabilitation intervention strategies (e.g., multitask/dual-task) to address TBI-related sequelae. Interventions should remediate TBI-related deficits including, but not limited to, dizziness, cognitive dysfunction (e.g., attention, memory, or impaired executive function), or sensorimotor deficits (e.g., gaze or gait instability). Intervention strategies should aim to increase patient tolerance for rehabilitation and result in clinically meaningful and measurable improvement in targeted impairments, functional deficits, and barriers to participation. Competitive proposals/applications will address theorized physiologic mechanisms underlying treatment

strategy. Clinical research is needed to investigate the optimal delivery of rehabilitation interventions and prescription (i.e., frequency, intensity, timing, and type) and to investigate comparative effectiveness of standard of care and novel intervention strategies. Studies that characterize or investigate proposed neural mechanisms of recovery with rehabilitation will be favorably considered. Cognitive rehabilitation studies that utilize a practice-based evidence design to identify clinical best practices and optimal outcomes among active duty Service members and like-aged Veterans with persistent post-traumatic cognitive sequelae are encouraged.

G. Ecological Assessment: The Ecological Assessment line of effort within the TBI program aims to develop, evaluate, and/or validate RTD outcome measures following rehabilitation in patients with mild TBI. Outcome measures may integrate novel or commercially available assessment technologies to enhance sensitivity and/or specificity. Outcome measures should be both ecologically valid (i.e., focused on military-specific tasks) and clinically feasible, with an aim to inform RTD/participation decisions in either an operational or garrison-based environment. Outcome measures should quantify and characterize patient impairments, functional limitations, and barriers to participation and have a strong plan for validation in the Warfighter population.

V. Medical Biological Defense Research Program

A. Viral, Toxin, and Bacterial Studies

- Identification and characterization of organisms and toxins. Molecular antigenic analysis; development of diagnostic assays; studies on structure and function that are related to mechanisms of action, binding, internalization, and interaction with the immune system and neutralizing antibodies; investigation of pathogenesis and immunology that will inform and enable decisions regarding the optimal approach to disease prevention and control. Specific long-term goals include development of physiological support methodologies, diagnostic tests, rational prevention and control strategies, and improvement of existing products.

- Vaccine development, with emphasis on protection from aerosolized agents, molecular approaches for development of vaccines, measurement of relevant cellular and humoral protective immune responses, and expression or production of protective antigens using recombinant technology. Development of vaccines for specific toxins and disease agents involving the generation, selection, and characterization of attenuated strains or inactivated purified antigen preparations, to include polyvalent vaccines that are more broadly effective. Safer means of passive immunization such as production of human monoclonal or modified antibodies that are de-speciated are also of interest. Identification of surrogate markers of protection for the agents identified above and development of assays to assess such protection are needed.

- Development of improved methods for delivery of vaccines, including adjuvants, nucleic acid vaccines, methods for oral or nasal immunization with inactivated, live, and subunit antigens; sustained release formulations; and development of methods for delivery of antigens for specific induction of mucosal immunity and development of methods to enhance appropriate immune responses to include co-delivery of cytokines.

- Preparation of research quantities of highly purified and characterized toxins as well as studies on basic chemistry, mechanisms of action, metabolism, and excretion.

B. Drug Development: Development, synthesis, and testing of compounds that possess antiviral, antibacterial, immunomodulatory, or antitoxin activities, with emphasis on compounds that provide broad, non-specific protection against viruses, bacteria, and toxins as described above. Studies of their pharmacokinetics and other measurements relevant to more effective drug use are also of interest, as is the development of lead compound(s) that are potent, active-site inhibitors that may include combinatorial-derived organic molecules and/or rationally designed transition-state substrate analogs. Testing for potency is required. Approaches that will be considered include, but are not limited to, computational chemistry, combinatorial organic synthesis, high-throughput in vitro screening, and x-ray analysis of ligand-toxin co-crystals.

Research areas of interest include:

- Discovery of novel or unique biochemical elements or compounds with antiviral, antibacterial, or antitoxin activity against biological organisms.

- Development of testing models for evaluation of compounds effective against toxins of several classes, including pre- and post-synaptic toxins, membrane-damaging toxins, and toxins that inhibit protein synthesis and others.

- Mechanism of action studies of immunomodulators, including characterization of effector cells (lymphocytes, macrophages), effector mechanisms, ancillary effects on other cells of the immune system, and production and characterization of cytokines released as a consequence of immunomodulation.

- Development of novel treatments to reverse paralysis in nerve terminals exposed to botulinum neurotoxin (BoNT) serotypes A, B, E, or F, with emphasis on the following objectives: (a) development of clinically feasible treatments to block the catalytic activity of the BoNT light chain; (b) treatments to accelerate recovery from paralysis-induced atrophy by targeting skeletal muscle regenerative pathways; and (c) identification and development of novel chemical scaffolds for small molecule inhibitors of the catalytic activity of the light chain of BoNT serotype A. While there may be limited funds available for development of promising approaches, this effort is predominantly focused on the accelerated development of clinically viable treatments with existing efficacy data.

C. Identification and Diagnosis: The investigation and evaluation of sensitive and specific methods of identifying and diagnosing both antigens and antibodies of viruses, bacteria, and rickettsia in biological materials. Development of sensitive and specific immunologic, chemical, or biological assays for the rapid (within minutes) and reliable (1) diagnoses of acute diseases due to agents of potential biological threat and (2) identification of toxins or their metabolites in biological samples. Assay may include antigen, antibody, or metabolite detection or the use of nucleic acid probes or synthetic antigens. In addition, there is interest in the development of rapid identification and diagnostic methods for the assay of toxins, metabolites, and analogs in clinical specimens.

D. Biosurveillance (BSV): The process of gathering, integrating, analyzing, and communicating a range of information that relates to health threats for people, animals, and plants to help inform decisions and provide for increased global health security. The Joint Biosurveillance Common Framework (JBCF) will be the first materiel solution and provides a single enterprise environment that supports collaboration, data sharing, and coordination between multiple BSV stakeholders. The JBCF and future BSV applications, tools, and devices will provide a conduit between the medical, physical, and operational communities. This topic includes:

- Algorithms for rapid identification of baseline deviation; novel/unknown pathogens, naturally occurring versus intentional release.
- Models to predict the likelihood of an outbreak, forecast the associated epidemic curves and impacts of interventions, and update forecast based on field (and simulated) data.
- Applications to engage citizens via social media, crowd sourcing, gaming, etc.

In addition, two specific topics currently of interest are:

- Next-generation analytic capabilities for BSV: The objective is to develop next-generation methodologies to enhance analytic capabilities in the detect-identify-respond timeline for a bioevent. Research should be exploratory, with a low-technology readiness level, and should address long-term challenges in threat surveillance. Efforts should significantly contribute to the current body of knowledge and lead to new concepts for technology application that may have impact on future BSV analytic capabilities.
- Biosurveillance Ecosystem (BSVE) Analytics 2.0: The objective is to ensure state-of-the-art technologies are made rapidly accessible through the BSVE. This topic seeks to develop analytic applications to synthesize and interrogate multiple sources of data to provide high confidence in the prediction, early warning, and forecasting (inclusive of mitigation strategies) of disease events. Metrics shall be devised such that successful utilization of these analytic tools will result in a measurable impact on the bioevent timeline. Efforts in this area should result in flexible, extensible, and sustainable analytics and models that are designed to plug into the BSVE as a-la-carte services rather than as standalone capabilities.

VI. Medical Chemical Defense Research Program

- Characterizing the mechanisms of vesicant agent pathophysiology to identify medical countermeasures against vesicant agents.
- Developing innovative models of the pathophysiology of vesicant agent injury.
- Identifying and/or evaluating innovative candidate medical countermeasures against vesicant agents.
- Identifying, exploring, and developing innovative clinical diagnostic, prognostic, and management approaches to vesicant agent casualties.

- Characterizing the ocular lesions associated with vesicant agent exposures; developing treatments to ameliorate these injuries.
- Characterizing the mechanisms of nerve agent-induced seizures and resulting pathophysiology to identify medical countermeasures against nerve agent-induced seizures.
- Identifying, synthesizing, and/or evaluating innovative candidate medical countermeasures against nerve agent-induced seizures.
- Developing innovative models of the pathophysiology of nerve agent-induced seizures.
- Developing catalytic and/or stoichiometric chemical warfare agent scavengers from biological molecules (e.g., antibodies and enzymes) that provide protection against nerve agent incapacitation and lethality for extended periods following their administration.
- Developing innovative models for evaluation of chemical warfare agent scavengers.
- Identifying, expressing, synthesizing, and/or evaluating biotechnologically derived or pharmaceutically based scavengers as candidate medical countermeasures against chemical warfare agents.
- Developing and evaluating custom-synthesized pharmaceuticals based on a detailed understanding of the pathophysiology and mechanisms of action of the chemical warfare agent structure and the function of the intended target molecule.
- Developing catalytic and/or stoichiometric additives for use in skin protectants, or decontaminants, to protect against chemical warfare agents, especially vesicant and nerve agents.
- Developing innovative models for evaluation of catalytic and/or stoichiometric additives in skin protectants or decontaminants.
- Developing candidate formulations for skin protectants or decontaminants containing catalytic and/or stoichiometric additives and evaluating these formulations against chemical warfare agents.
- Characterizing the pathophysiology and natural progression of chemical warfare agent-induced damage to human tissues.
- Developing and validating innovative techniques for rapid and accurate analysis of human tissues and body fluids for detection of chemical warfare agent exposures.
- Characterizing the effects of long-term or chronic exposures to chemical warfare agents and/or medical countermeasures to these agents.
- Identifying, exploring, and developing innovative clinical diagnostic, prognostic, and management approaches to nerve agent casualties.

- Developing and validating field-usable procedures for diagnosis, prognosis, and treatment of chemical warfare agent casualties under both field and laboratory conditions.

VII. Medical Simulation and Information Sciences Research Program

A. The Medical Simulation (MedSim) Portfolio

The Medical Simulation (MedSim) Portfolio is focused on three overarching initiatives: Combat Casualty Simulation Initiative, Medical Readiness Initiative, and Tools for Medical Education. These three science and technology initiatives feed into broader Defense Health Agency programs with programmatic goals in Joint Evacuation and Transport Simulation (JETS) and Point of Injury Training Simulation (POINTS). The JETS program seeks to standardize patient movement training within the Military Health System (MHS) continuum of care while sustaining clinical standards of patient management. The POINTS program seeks to enable Point of Demand, mass-customizable training.

- **Combat Casualty Simulation Initiative (CCSI):** This initiative focuses on simulations that advance combat casualty care. Research in this area will examine the efficacy of modern simulation system technology versus current training models with emphasis on multi-trauma and mass casualty scenarios. The CCSI supports research to inform simulation development and acquisition in ways to develop appropriate fidelity material properties and characteristics that best mimic tissue and respond appropriately to users' actions; develop training assets for high state of combat medical readiness; provide resiliency training prior to deployment to better elicit higher performance under pressure; and to create and evaluate efficient and effective ways to deliver team (collective) training. Goals include:

    - Optimizing critical lifesaving skills and procedures through training and educational simulation systems

    - Developing adaptable, flexible, and interoperable training assets to reflect the continuous changes and modifications in combat-related injuries for high state of combat casualty medical readiness

    - Increasing psychological resilience into pre-deployment training and increasing emphasis on mastery of skills and procedures through simulation system training tools

    - Creating and integrating more physiologically based algorithms and models into simulation systems (mannequins and/or virtual/augmented/immersive reality) to appropriately and accurately represent tissue behaviors and characteristics

    - Increasing emphasis on PFC training and researching and integrating simulation systems to substantially improve communicating and connecting with each other to transfer and accept information/data from one system to another to support a system of system training and education interactive environment

    - Developing system of systems interoperable architecture to allow all Services at all roles within the continuum of care to train collectively, either with a modular training system

or a collection of training systems to better understand clinical outcomes from a holistic patient perspective instead of as individual skills or procedures

- **Medical Readiness Initiative:** This initiative focuses on medical provider training systems and assessment of competence for sustained military and public medical readiness. Research efforts are aligned with maximizing healthcare professionals' training and investigating how existing medical cognitive and psychomotor skills might degrade. The initiative seeks to research improved intelligent automated assessment systems that will assist in directing and catering the type of training courses an individual needs as well as systems that connect medical training to real-world patient outcomes. This initiative invites research and development toward near-time, pre-intervention rehearsal. Goals include:

    - Identifying, researching, and developing predictive models that may accelerate cognitive, psychomotor, and healthcare behavioral skills (tasks) to a level of proficiency and develop reliable and predictable tools to accelerate development of clinical skills or to minimize skill decay (or degradation)

    - Identifying, researching, and developing simulation system tools that will improve (or allow) ethical, patient-focused, and more predictable pre-surgical/intervention models and pre-surgical/intervention training systems to optimize clinical outcomes

    - Identifying and researching potential predictors (data, markers, classifiers, etc.) for how training or use of any type of simulation system transitions to the real-world and patient outcomes

    - Improving assessment systems of users' cognition, psychomotor skills, and affective behavior before, during, and after (retention) training

    - Leading the effort to develop a sustainable medical education lifecycle

- **Tools for Medical Education:** Research and develop next-generation inter-professional, open-source platforms, toolkits, and models to deliver future training systems in combat casualty care and medical readiness to improve the overall health of the Force. Focus is on promoting deliberate practice, enhancing mastery learning, enabling instructors, and preventing skill decay. Outcomes will result in resource sharing, collaborative research, and wide dissemination of knowledge and products to the medical modeling, simulation, training, and education community at large. Goals include:

    - Ensuring that advanced medical simulation tools and system capabilities are ubiquitous and support a diverse set of skills as well as allowing an individual or team to learn more advanced skills on a single device

    - Creating medical models and repositories that can be openly shared for medical simulation system developers and for the medical simulation community at large

    - Researching effective, efficient, elegant, accurate, appropriate, and robust medical models (anatomical, physiological, and/or behavioral) for developing next-generation mannequin prototypes and virtual/augmented/immersive reality simulation systems

- Democratizing of knowledge and products through training platforms and tools that deliver healthcare content and advocate open-source/open-architectures to allow limited resources to be shared

B. The Health Information Technology and Informatics (HITI) Portfolio

- **Theater/Operational Medicine:** This is the main priority research domain for technologies and data management that improve and document clinical care and support services to the Armed Forces combat and deployment Warfighters. Focusing on providing high-quality healthcare services by improving information accessibility, data management, data movement, remote healthcare delivery, and decision support for Joint Casualty Management, Joint Patient Movement, Joint Performance Enhancement, Joint Medical Logistics and Infrastructure Support, and Joint Theater Medical Command and Control and research for the Armed Forces to promote, improve, conserve, or restore the mental or physical well-being of personnel.

  The HITI Theater/Operational Medicine focus area provides technology solutions, software, decision support tools, algorithms, data management, knowledge, and HITI services to enhance the efficiency of healthcare operations in combat and operational environments. The objective of HITI Theater/Operational Medicine research is to ensure delivery of high-quality healthcare services through technologies for improved information accessibility and information management and use of emerging/advanced technologies by clinicians caring for injured Service members. The Government plans to use research outcomes to assess critical technology elements and technology maturity, system integration risk, future use feasibility, and, where necessary, technology maturation and demonstration to fulfill critical capability gaps in theater/operational medicine healthcare delivery and support. Particular focus is placed on advanced information management and use of emerging and next generation technologies. The goal is to research technology and data tools/strategies to support Theater/Operation Medicine within the following categories:

  - **Joint Casualty Management (JCM)** directly supports medical care in theater/operational environments and sustains a healthy and fit Force. JCM delivers five of the seven Joint Health Services Support capabilities outlined in the new Taxonomy Continuum of Health Care Capabilities developed in Joint Publication 4-02, Health Service Support. The capabilities delivered are expected to be technology and informatics solutions for first responders, forward resuscitative care, theater hospitalization, definitive care, and en route care.

  - **Joint Medical Logistics Infrastructure Support (JMLIS**) must establish the principles and practices that will move medical logistics into focused logistics. To integrate into the focused logistics system and to provide the highest quality of care, the medical logistics system must be able to accomplish two primary tasks. The first, accomplished in conjunction with Service Force management and Force design organizations, is to ensure that the medical supplies, materiel, and equipment with which U.S. medical forces deploy include the latest technologies and advances in the medical field. The second task is to ensure that medical supplies, materiel, and equipment are delivered to the right person, at the right place, and at the right time. JMLIS must incorporate new technologies and

informatics solutions to provide real-time medical and operational capability and situational awareness of medical logistics operations within the joint area of operations. JMLIS technology and informatics will rapidly integrate advances in research, technology, and doctrine from science, medicine, engineering, information technology, and other areas into fielded capabilities.

- **Joint Patient Movement** supplies and develops solutions for interoperable device data to improve ground and air evacuation capabilities, standardization for device data to improve ability to evacuate the casualty to a treatment site and autonomous device interoperability to support reception/staging en route care operations, and prolonged care in place.

- **Joint Performance Enhancement** supplies and develops innovative data capture, storage, analytics, management, and movement solutions for real-time, non-invasive monitoring of vigilance, subject performance, and enhancement of cognitive abilities for optimal decision making in Warfighter readiness.

- **Joint Theater Medical Command and Control** will research and validate a Joint Medical Command and Control solution that will synchronize and integrate health and medical force-related information from disparate databases and systems into one efficient, effective command and control capability. The resulting medical decision-based application will utilize intelligence, algorithms, decision support, or other novel approaches to organize and synthesize planning information queried from existing databases. It is anticipated that the data will eventually be migrated to a cloud solution to enable real-time response to anticipated, emerging, or contingency (crisis) situations. The research will enable direction, management, and/or coordination of assigned medical forces, assets, and resources in the accomplishment of assigned missions.

- **Military Healthcare Services:** Research into how healthcare providers and patients can better use health services and population health-related data, information, and technologies to improve health. Efforts to directly impact the way healthcare is provided to the patient, improve medical providers' ability to treat patients, promote health through readiness-centric patient engagement, patient safety-driven medical device information, interoperability, and connected healthcare services. Focus areas are as follows:

  - **Readiness-Centric Patient Engagement Applied Solutions:** Improve readiness through patient-initiated healthcare activities. Provide a user view of information that is comprehensive of healthcare and patient-generated data that can apply analytic and trending algorithms to help providers and patients make better decisions. Provide large volumes of data from agnostic input and devices, from any environment, in real time, to enable usable, actionable information. Develop and apply methods for analysis, interpretation, prediction, and modeling of health system and patient-generated data. The objective is to use mathematical and/or intelligent learning/machine learning tools to extract practical information, usable/actionable clinical knowledge, and/or predict disease or adverse events from health system and patient-generated data.

- **Patient Safety-Driven Medical Device Information and Interoperability:** Improve systems or applications that will enable medical devices to interact with each other for the purpose of improving patient care, and to integrate health system or patient-generated medical device information seamlessly with an Electronic Health Record system for the purpose of providing effective clinical decision support to assist healthcare professionals and patients in making better clinical and/or lifestyle decisions.

- **Connected Healthcare Services:** Promote "Healthcare Anywhere" through mobile and telehealth solutions that are usable, and facilitate point-of-injury care and documentation of care in theater/operational medicine environments for Roles 1, 2, and 3.

  – Role 1

    This includes the provision of primary care, emergency treatment (resuscitation and stabilization), and preparation for transfer, usually under the guidance of a medical officer. This capability is normally integral to a major land-based unit and also reflects the provision of medical support inherent to an afloat platform.

  – Role 2

    This includes the reception and sorting of patients as well as the ability to provide elements of damage control resuscitation and the treatment of casualties. This is bolstered by a wider range of medical and nursing interventions and enhanced laboratory and imaging facilities. In addition, this level of care will prepare patients for further transfer with a limited holding capacity to prepare casualties for onward evacuation or for RTD.

  – Role 3

    This incorporates reception from Role 2 Military Treatment Facilities as well as direct receipt from local incidents. Major specialist facilities are available at this level of care with intensive care, holding, and nursing capabilities. Final sorting of casualties for transfer to Role 4 or RTD will occur here.

- **Health Information Technology Infrastructure and Data Management:** Research to enhance health enterprise infrastructure by implementing superior information technology and communications infrastructure.

  - **Health Data Management:** Improvements to data availability, management, storage, and operational use of Enterprise Health Data. Proposed objectives will ensure the unique identification of each patient, as well as aggregated data strategies for population health and big data.

  - **Health Informatics or Information Technology (HIT) Infrastructure:** Research into system interfaces that will ensure that products or systems work efficiently with other products or systems, present or future, without any unintended restrictions. Improve the ability of medical devices to securely and reliably exchange health system or patient-generated data/information with other devices and with medical documentation and

management systems. Research to examine technology integration and clinical/business process integration to reduce implementation barriers with regard to remote health monitoring.

- **Medical Resourcing:** Research to improve financial and personnel management for better delivery of healthcare services. Distribution of healthcare resources around the globe through solutions for personnel management and personnel support functions, or interoperable Joint Force research outcomes with concentration on:

    - **Medical Personnel Resource Planning and Allocation:** Deliver technologies and solutions for personnel management functions. Research to harness potential novel HITI approaches to efficiently and effectively match incoming patients with a provider and efficiencies gained through HITI mobile technologies for budgetary planning and execution.

    - **Education and Training:** Explore technologies to streamline the access to, and management of, educational systems across the MHS. Conduct research to explore the use of HIT in the provision of training. Develop best approaches to leveraging HIT and discovering efficient training delivery across the enterprise. Research to harness potential efficiencies gained through e-textbook interoperability.

    - **Financial Planning and Budget Execution:** Research on efficiencies gained through HITI technologies and data management for budgetary planning and execution.

C. Medical Capabilities to Support Dispersed Operations Portfolio

The Multi-Domain Battle, an operational environment involving greater dispersion and near-isolation over great distances, is likely to cause severe restrictions on mobility for medical missions and shortfalls in both human and materiel human resources due to area denial challenges. Combat units will need to be more self-sufficient and less dependent on logistical support. Combatant commanders with an increased number of sick or wounded Soldiers will face degradation of medical resources and encumbered combat effectiveness without new combat casualty management and Force multiplication strategies.

- **Medical Robotics Research** focuses on man-machine teaming in the delivery of medical care and patient handling to include automated patient monitoring and assessment functions for patient hold capabilities, aid in patient extraction from contested areas, and autonomous closed-loop interventions. As robotic capabilities continue to evolve, autonomous and tele-operated semi-autonomous robotic patient support systems could serve as Force multipliers for medical operations for closed-loop patient monitoring and triage as for robotics intervention. In addition to what may be considered contemporary robotics, i.e., an integration of knowledge-based software with electrical and mechanical engineering technologies, or so-called "hard robotics," one approach to employing robotics for medical applications is the emerging field of so-called "soft robotics." Soft robotics involves the use of soft and deformable structures in the robotics systems that deal with uncertain and dynamic task environments, e.g., grasping and manipulation of unknown objects, locomotion in rough terrains, and physical contacts with living cells and human bodies. Soft robotics

faces a number of fundamental scientific challenges: the studies of unconventional materials are still in their exploration phase; it has not been fully clarified what materials are available and useful for robotics applications; tools and methods for fabrication and assembly are not established; the Government does not have broadly agreed upon methods of modeling and simulation of soft continuum bodies; it is not fully understood how to achieve sensing, actuation and control in soft bodied robots; and the Government is still exploring ways to test, evaluate, and communicate the soft robotics technologies.

- **Medical Autonomous and Unmanned Systems** focuses on delivering enhanced autonomous and unmanned medical capabilities such as the delivery of forward resuscitation treatment and emergency resupply of Class VIII products like whole blood as well as closed-loop en route care modules that could enable general purpose unmanned vehicles to perform casualty evacuation (CASEVAC) missions with some level of on-board medical capability and bi-directional interface with remote medical personnel. Focus areas include automating critical care procedures such as physical (pressure-controlled, palpable, tactile) diagnostics and automated therapeutics in the field and to integrate those capabilities into ground and air unmanned systems platforms to enable unmanned CASEVAC missions. Areas of basic research include:

    - Intelligent agent approaches to integration of intelligent algorithms from multiple critical care systems during PFC or extended evacuation. This effort focuses on new approaches for autonomous clustering of individual closed-loop medical systems and intelligent agent algorithms that interact with each other to enable future development of systems that provide care for multiple injuries (polytrauma) while maximizing patient outcomes through physiologic optimization and deconflicting multiple medical procedures.

    - Strategies for interfacing medical intelligent systems, closed-loop diagnostic, and critical care systems into autonomous unmanned ground and air platforms that allow for unmanned and expedited care of combat casualties and extended evacuations in the dispersed field environment.

    - Research in the area of artificial intelligence and perception systems for accurate detection, monitoring, and modeling of human physiology to enable future applied research in autonomous casualty extraction and en route care systems. Autonomous systems for these applications require high-fidelity mapping and identification of the human body, organs, and structures in near real-time for safe physical contact with casualties and interaction with Soldiers.

- **Virtual Health/Telehealth and Decision Support Tools for the Combat Medic** focuses on enabling greater field medical capabilities for the combat medic in the far-forward future battlefield in PFC and austere environments. The task is to research, design, and develop advanced telehealth capabilities and tools as well as automated decision support systems that operate in a pre-hospital context capable of providing greater support for the combat medic in the diagnosis, triage, and treatment stages, as well as reachback, if available, either synchronously (real time) or asynchronously (store/forward) to specialty care providers and other expert medical consultants from remote locations (both in-garrison and in-theater).

VIII. Radiation Health Effects Research Program

A. Medical Countermeasures (MCMs) for Acute Radiation Exposure: Radiation MCMs include radioprotectants (pre-exposure) and mitigators and therapeutics (post-exposure). Both categories of MCMs are focused on preventing or treating the effects of acute radiation exposure, including the resultant development of acute radiation syndrome (ARS). The focus area examines ARS resulting from exposure to ionizing radiation from radioactive sources or a nuclear detonation, including low linear energy transfer (LET) sources (gamma and x-rays) and high LET sources (neutrons). Research objectives include, but are not limited to, identifying mechanisms of action, obtaining efficacy and safety data in animal models for MCMs for ARS, and demonstrating improved survivability following high doses of radiation with treatment either before exposure or within 24 hours after exposure. Research in biodosimetry in support of MCM development may also be considered.

APPENDIX II: CLINICAL TRIALS

A. Important Aspects of Clinical Trials

A clinical trial is defined as a prospective accrual of human subjects in which one or more intervention(s) (e.g., device, drug, biologic, surgical procedure, rehabilitative modality, behavioral intervention, or other) is tested on a human subject for a measurable outcome with respect to safety, effectiveness, and/or efficacy. This outcome represents a direct effect on the human subject of that intervention or interaction. The term "human subjects" is used in this Broad Agency Announcement to refer to individuals who will be recruited for or who will participate in the proposed clinical trial. For more information, a Human Subject Resource Document is provided at https://ebrap.org/eBRAP/public/Program.htm.

The following are important aspects of submission for the Clinical Trial Award:

- The proposed clinical trial is expected to begin no later than 12 months after the award date.
- The proposed intervention to be tested should offer significant potential impact for the targeted population.
- Inclusion of preliminary data relevant to the proposed clinical trial is required.
- The proposed clinical trial must be based on sound scientific rationale that is established through logical reasoning and critical review and analysis of the literature.
- The application should describe the planned indication for the product label, if appropriate, and include an outline of the development plan required to support that indication.
- The application should demonstrate availability of, and access to, a suitable patient population that will support a meaningful outcome for the study. The PI should discuss how accrual goals will be achieved and how standards of care may impact the study population.
- The application should demonstrate documented availability of and access to the drug/ compound, device, and/or other materials needed, as appropriate. The quality of the product should be commensurate with U.S. Food and Drug Administration (FDA) manufacturing standards applicable to the type and phase of product being developed (i.e., Quality System Regulation, Good Manufacturing Practices).
- The proposed clinical trial design should include clearly defined and appropriate endpoints, and follow Good Clinical Practice (GCP) guidelines.
- The application should include a clearly articulated statistical analysis plan, appropriate statistical expertise on the research team, and a power analysis reflecting sample size projections that will clearly answer the objectives of the study.
- The application should include a clearly articulated data management plan and use of an appropriate database to safeguard and maintain the integrity of the data.

- The application should include a clearly articulated safety management plan outlining how safety pharmacovigilance will be conducted, as applicable.

- The application should include a clearly articulated clinical monitoring plan outlining how the study will be monitored for GCP compliance.

- The application should include a study coordinator(s), who will guide the clinical protocol through the local IRB of record and other Federal agency regulatory approval processes, coordinate activities from all sites participating in the trial, and coordinate participant accrual.

- The application should include a Transition Plan (including potential funding and resources) showing how the product will progress to the next clinical trial phase and/or delivery to the market after the successful completion of the award.

- The application should clearly demonstrate strong institutional support.

Funded studies are required to file the study in the National Institutes of Health (NIH) clinical trials registry, www.clinicaltrials.gov. Refer to the General Application Instructions, Appendix 6, Section C, for further details.

Multi-Institutional Clinical Trials: If the proposed clinical trial is multi-institutional, plans for the multi-institutional structure governing the research protocol(s) should be outlined in the Attachment 9: Study Personnel and Organization. The lead organization responsible for developing the master protocol and master consent form should be identified and should be the single point of contact for regulatory submissions and requirements. A single Institutional Review Board (IRB) or Ethics Committee (EC) pathway is strongly recommended whenever possible. The master protocol and consent form must be reviewed by the Human Research Protection Office prior to distribution to the additional sites for IRB/EC review. Communication and data transfer among the collaborating institutions, as well as how specimens and/or imaging products obtained during the study will be handled, should be included in the appropriate sections of the application. A separate intellectual and material property plan agreed upon by all participating institutions is also required for multi-institutional clinical trials.

If the IRB determines that a trial presents greater than minimal risk to human subjects, the DoD requires an independent research monitor with expertise consistent with the nature of risk(s) identified within the research protocol.

B. Full Proposal/Application Submission Components

The Grants.gov submission package includes the following components (refer to the General Submission Instructions, Section III, for additional information on proposal/application submission):

SF424 (R&R) Application for Federal Assistance Form: Refer to the General Submission Instructions, Section III.A.1, for detailed information.

Attachments:

Each attachment to the full proposal/application components must be uploaded as an individual file in the format specified and in accordance with the formatting guidelines listed in the General Submission Instructions, Appendix 4.

For all attachments, ensure that the file names are consistent with the guidance. Attachments will be rejected if the file names are longer than 50 characters or incorrect file names that contain characters other than the following: A-Z, a-z, 0-9, underscore, hyphen, space, and period. In addition, there are file size limits that may apply in some circumstances. Individual attachments may not exceed 20 MB and the file size for the entire full submission package may not exceed 200 MB.

The Project Narrative is NOT the formal clinical trial protocol. Instead, all essential elements of the proposed clinical trial necessary for scientific review must be included as directed in Attachment 1 (the Project Narrative) and Attachments 6-8 described below. Failure to submit these attachments as part of the application package will result in rejection of the entire application.

- **Attachment 1: Project Narrative (20-page limit):** Upload as "ProjectNarrative.pdf." The page limit of the Project Narrative applies to text and non-text elements (e.g., figures, tables, graphs, photographs, diagrams, chemical structures, drawings) used to describe the project. Inclusion of URLs that provide additional information to expand the Project Narrative and could confer an unfair competitive advantage is prohibited and may result in administrative withdrawal of the application.

  Describe the proposed project in detail using the outline below.

  - **Background:** Describe in detail the rationale for the study. Provide a literature review and describe the preliminary studies and/or preclinical data that led to the development of the proposed clinical trial. Provide a summary of other relevant ongoing, planned, or completed clinical trials and describe how the proposed study differs. Include a discussion of any current clinical use of the intervention under investigation and/or details of its study in clinical trials for other indications (as applicable). The Background section should clearly support the choice of study variables and should explain the basis for the study questions and/or study hypotheses. This section should establish the relevance of the study and explain the applicability of the proposed findings.

    If the proposed clinical trial was initiated using other funding prior to this application, explain the history and background of the clinical trial and declare the source of prior funding. Specifically, identify the portions of the study that will be supported with funds from this award.

  - **Objectives/Specific Aims/Hypotheses:** Provide a description of the purpose and objectives of the study with detailed specific aims and/or study questions/hypotheses. The aims should agree with the primary aims and associated tasks described in the Statement of Work.

- **Study Design:** Describe the type of study to be performed (e.g., prospective, randomized, controlled) and outline the proposed methodology in sufficient detail to show a clear course of action. Describe potential challenges and alternative strategies where appropriate.

    - Identify the intervention to be tested and describe the projected outcomes.

    - Define the study variables, outline why they were chosen, and describe how they will be measured. Include a description of appropriate controls and the endpoints to be tested.

    - Describe the study population and inclusion and exclusion criteria that will be used.

    - Describe the methods that will be used to recruit a sample of human subjects from the accessible population (e.g., convenience, simple random, stratified random).

    - Describe the human subject-to-group assignment process (e.g., randomization, block randomization, stratified randomization, age-matched controls, alternating group, or other procedures), if applicable. Explain the specific actions to accomplish the group assignment (e.g., computer assignment, use of table of random numbers).

    - If using psychometric measures, describe their reliability and validity.

- **Statistical Plan and Data Analysis:** Describe the statistical model and data analysis plan with respect to the study objectives. Specify the approximate number of human subjects to be enrolled. If multiple study sites are involved, state the approximate number to be enrolled at each site. Include a complete power analysis to demonstrate that the sample size is appropriate to meet the objectives of the study. If a subpopulation of a recruited sample population will be used for analysis, complete a statistical analysis to ensure appropriate power can be achieved within the subpopulation study.

- **Attachment 2: Supporting Documentation:** Combine and upload as a single file named "Support.pdf." Start each document on a new page. If documents are scanned to pdf, the lowest resolution (100 to 150 dpi) should be used. The Supporting Documentation attachment should not include additional information such as figures, tables, graphs, photographs, diagrams, chemical structures, or drawings. These items should be included in the Project Narrative. Any additional material viewed as an extension of the Project Narrative will be removed or may result in administrative withdrawal of the application. ***There are no page limits for any of these components unless otherwise noted.***

    - References Cited: List the references cited (including URLs, if available) in the Project Narrative using a standard reference format that includes the full citation (i.e., author[s], year published, title of reference, source of reference, volume, chapter, page numbers, and publisher, as appropriate).

- List of Abbreviations, Acronyms, and Symbols: Provide a list of abbreviations, acronyms, and symbols.

- Facilities, Existing Equipment, and Other Resources: Describe the facilities and equipment available for performance of the proposed project and any additional facilities or equipment proposed for acquisition at no cost to the award. Indicate whether or not Government-furnished facilities or equipment are proposed for use. If so, reference should be made to the original or present Government award under which the facilities or equipment items are now accountable. There is no form for this information.

- Publications and/or Patents: Include a list of relevant publication URLs and/or patent abstracts. If publications are not publicly available, then copies of up to five published manuscripts may be included in Attachment 2. Extra items will not be reviewed.

- Letters of Organizational Support: Provide a letter (or letters, if applicable), signed by the Department Chair or appropriate organization official, confirming the laboratory space, equipment, and other resources available for the project. Letters of support not requested in the Program Announcement, such as those from members of Congress, do not impact application review or funding decisions.

- Letters of Collaboration (if applicable): Provide a signed letter from each collaborating individual or organization that will demonstrate that the PI has the support or resources necessary for the proposed work. If an investigator at a Military Facility is named as a collaborator on a proposal/application, the proposal/application must include a letter from the collaborator's Commander or Commanding Officer at the intramural organization that authorizes the collaborator's involvement.

- Letters of Commitment (if applicable): If the proposed study involves use of a commercially produced investigational drug, device, or biologic, provide a letter of commitment from the commercial entity indicating availability of the product for the duration of the study, support for the proposed phase of research, and support for the indication to be tested.

- Letter of Support for Use of Military and VA Populations or Resources (if applicable; one-page limit per letter is recommended): If the proposed research plan involves access to active duty military and/or VA patient populations or resources, include a letter(s) of support, signed by the lowest-ranking person with approval authority, confirming such access. If access cannot be confirmed at the time of proposal/ application submission, the Government reserves the right to withhold or revoke funding until the PI has demonstrated support for and access to the relevant population(s) and/or resources.

- *If the project involves collaboration with a Military Facility, special requirements apply.* A DoD researcher, to include collaborating DoD PIs, must obtain a letter from his/her commanding officer or Military Facility director authorizing his/her

participation in the research project. This letter must be included with the proposal/application.

- Joint Sponsorship: Describe present or prospective joint sponsorship of any portion of the program outlined in the proposal/application. In the absence of agreements among sponsors for joint support, the proposal/application should be structured so that the research can be carried out without the resources of any other sponsor. If, however, it is desirable to request partial support from another agency, the proposed plan should be stated and the reasons documented. If the plan cannot be formulated at the time the proposal/application is submitted, information should be sent later as an addendum to the proposal/application. Prior approval from both agencies must be secured for research to be undertaken under joint sponsorship. Provide letters of support related to recruitment, subject access, and data access plans

- Intellectual Property: Information can be found in Code of Federal Regulations, Title 2, Part 200.315 (2 CFR 200.315), "Intangible Property."

    - Intellectual and Material Property Plan (if applicable): Provide a plan for resolving intellectual and material property issues among participating organizations.

- Data and Research Resources Sharing Plan: Describe how data and resources generated during the performance of the project will be shared with the research community. Refer to the General Application Instructions, Appendix 2, Section K, for more information about the CDMRP expectations for making data and research resources publicly available.

- **Attachment 3: Technical Abstract (one-page limit):** Upload as "TechAbs.pdf." The abstract is vitally important to both the scientific peer and programmatic review processes. In accordance with Section 8123 of the Consolidated and Further Continuing Appropriations Act, 2015 (Public Law 113-235), the PI is required to submit a technical abstract that fully describes the proposed work. The abstract must contain the title of the project and the name of the PI. Do not include figures or tables in the abstract. Use only characters available on a standard QWERTY keyboard. Spell out all Greek or other non-English letters. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***.

  The structured technical abstract should be clear and concise and, at a minimum, provide the following information:

  - Background: Provide a brief statement of the ideas and theoretical reasoning behind the proposed work.

  - Objective/Hypothesis: State the objective/hypothesis to be tested. Provide evidence or rationale that supports the objective/hypothesis.

  - Specific Aims: State concisely the specific aims of the study.

- Study Design: Briefly describe the study design.

- Relevance: Provide a brief statement explaining the potential relevance of the proposed work to the specific topic area being addressed and its impact on health outcomes.

- Clinical Impact: Briefly describe how the proposed project will have an impact on research and patient care.

- **Attachment 4: Lay Abstract (one-page limit):** Upload as "LayAbs.pdf." The lay abstract is used by all reviewers. Abstracts of all funded research projects will be posted publicly. ***Do not include proprietary or confidential information***. Use only characters available on a standard QWERTY keyboard. Spell out all Greek letters, other non-English letters, and symbols. Graphics are not allowed.

  Lay abstracts should be written using the outline below. Do not duplicate the technical abstract.

  - Clearly describe the objectives and rationale for the proposed study in a manner readily understood by readers without a background in science or medicine.

  - Describe the ultimate applicability and impact of the research.

    - What types of patients will it help, and how will it help them? Include the current available statistics to the related injury/condition.

    - What are the potential clinical applications, benefits, and risks?

    - What is the projected timeline it may take to achieve the expected patient-related outcome?

    - Describe how the proposed project will benefit Service members, Veterans, and/or their family members.

- **Attachment 5: Statement of Work (SOW) (three-page limit):** Upload as "SOW.pdf." The SOW outlines and establishes the performance expectations and milestones for which the USAMRMC may provide funding. The SOW will be incorporated into the award document and, as such, is subject to release under the Freedom of Information Act. The SOW should identify all collaborating research sites involved in the performance of the research. Suggested SOW formats and examples specific to different types of research projects are available on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm).

  A series of relatively short statements should be included that comprise the approach to each of the major goals or objectives of the proposed research. The statements should outline the specific tasks, systems, key assessments/techniques, and materials that are reasonable estimates for testing the proposed hypotheses of the study. A timeline should be included that shows the work statements to be accomplished in each year of the award.

Any animal use and/or human subjects recruitment should be included. Allow at least 2 to 3 months for the USAMRMC ORP regulatory review and approval processes for studies involving human subjects and 2 to 3 months for studies involving animal subjects.

If applicable, indicate timelines required for regulatory approvals relevant to human subjects research (e.g., Investigational New Drug [IND] and Investigational Device Exemption [IDE] applications) by the FDA or other Government agency.

- **Attachment 6: Human Subject Recruitment and Safety Procedures (no page limit): Upload as "HumSubProc.pdf."** The Human Subject Recruitment and Safety Procedures attachment should include the components listed below.

  - **Study Population:** Describe the target population (to whom the study findings will be generalized) and the nature, approximate number, and pertinent demographic characteristics of the accessible population at the study site(s) (population from whom the sample will be recruited/drawn). Demonstrate that the research team has access to the proposed study population. Furthermore, discuss past efforts in recruiting human subjects from the target population for previous clinical trials (if applicable). Address any potential barriers to accrual and plans for addressing unanticipated delays. Include justification of any age, race, ethnicity, or sex limitations provided.

  - **Inclusion/Exclusion Criteria:** List the inclusion and exclusion criteria for the proposed clinical trial. Inclusion/exclusion criteria should take into consideration the specific risk profile of the studies to be conducted and the standard of care for that patient population. Provide detailed justification for exclusions.

    Inclusion of Women and Minorities in Study: Consistent with the Belmont Report, "Ethical Principles and Guidelines for the Protection of Human Subjects," and Congressional legislation, special attention is given to inclusion of women and/or minorities in studies funded or supported by the USAMRMC. This policy is intended to promote equity both in assuming the burdens and in receiving the benefits of human subjects research. Include an appropriate justification if women and/or minorities will be excluded from the clinical trial.

  - **Description of the Recruitment Process:** Explain methods for identification of potential human subjects (e.g., medical record review, obtaining sampling lists, healthcare provider identification).

    - Describe the recruitment process in detail. Address who will identify potential human subjects, who will recruit them, and what methods will be used to recruit them.

    - If human subjects will be compensated for participation in the study, include a detailed description of and justification for the compensation plan.

    - Describe the recruitment and advertisement materials. The recruitment materials should not be coercive or offer undue inducements and should accurately reflect the study.

- **Description of the Informed Consent Process:** Specifically describe the plan for obtaining informed consent from human subjects.

  - ***For the proposed clinical trial, provide a draft, in English, of the Informed Consent Form.***

  - Identify who is responsible for explaining the study, answering questions, and obtaining informed consent. Include a plan for ensuring that human subjects' questions will be addressed during the consent process and throughout the trial.

  - Include information regarding the timing and location of the consent process.

  - Address issues relevant to the mental capacity of the potential human subject (e.g., altered capacity due to administration of any mind-altering substances such as tranquilizers, conscious sedation or anesthesia, brain injury, stress/life situations, or human subject age), if applicable.

  - Address how privacy and time for decision making will be provided and whether or not the potential human subject will be allowed to discuss the study with anyone before making a decision.

  - Consider the need for obtaining ongoing consent or for re-assessing capacity over the course of a long-term study and describe any relevant procedures to assure continued consent.

  - Describe the plan for the consent of the individual's Legally Authorized Representative (LAR) to be obtained prior to the human subject's participation in the study. State law defines who may act as the LAR. The local IRB of record should be consulted for guidance regarding who can serve as LAR for research at the study site. Note: The PI must describe a clear intent to benefit for human subjects who cannot give their own consent to participate in the proposed clinical trial to be in compliance with Title 10 United States Code Section 980 (10 USC 980) (http://www.gpo.gov/fdsys/pkg/USCODE-2011-title10/pdf/USCODE-2011-title10-subtitleA-partII-chap49-sec980.pdf). If applicable, please refer to the General Application Instructions, Appendix 6, for more information.

  - ***Assent:*** If minors or other populations that cannot provide informed consent are included in the proposed clinical trial, a plan to obtain assent (agreement) from those with capacity to provide it, or a justification for a waiver of assent, should be provided. PIs should consult with their local IRB to identify the conditions necessary for obtaining assent.

- **Screening Procedures:** List and describe any evaluations (e.g., laboratory procedures, history, or physical examination) that are required to determine eligibility/suitability for study participation and the diagnostic criteria for entry. Please note that some screening procedures may require a separate consent or a two-stage consent process. Informed consent must be obtained prior to initiation of any procedures for the purpose of determining eligibility.

- **Risks/Benefits Assessment:**

  - **Foreseeable risks:** Clearly identify all study risks, including potential safety concerns and adverse events. Study risks include any risks that the human subject is subjected to as a result of participation in the clinical trial. Consider psychological, legal, social, and economic risks as well as physical risks. If the risks are unknown, this should be stated. If applicable, any potential risk to the study personnel should be identified.

  - **Risk management and emergency response:**

    - Describe how safety surveillance and reporting to the IRB and FDA (if applicable) will be managed and conducted.

    - Describe all safety measures to minimize and/or eliminate risks to human subjects and study personnel or to manage unpreventable risks. Include safeguards and planned responses such as dose reduction or stopping criteria based on toxicity grading scales or other predetermined alert values.

    - Discuss the overall plan for provision of emergency care or treatment for an adverse event for study-related injuries, to include who will be responsible for the cost of such care.

    - Address any special precautions to be taken by the human subjects before, during, and after the study (e.g., medication washout periods, dietary restrictions, hydration, fasting, pregnancy prevention).

    - Describe any special care (e.g., wound dressing assistance, transportation due to side effects of study intervention impairing ability to drive) or equipment (e.g., thermometers, telemedicine equipment) needed for human subjects enrolled in the study.

    - If the IRB determines that a trial presents greater than minimal risk to human subjects, the DoD requires an independent research monitor with expertise consistent with the nature of risk(s) identified within the research protocol. If applicable, please refer to the General Application Instructions, Appendix 6, for more information on study reporting authorities and responsibilities of the research monitor.

  - **Potential benefits:** Describe known and potential benefits of the study to the human subject, a specific community, or society.

- **Attachment 7: Intervention (no page limit): Upload as "Intervention.pdf."** The Intervention attachment should include the components listed below.

  - **Description of the Intervention:** Identify the intervention to be tested and describe the particular outcomes. As applicable, the description of the intervention should include the following components: complete name and composition, storage and

handling information, source, dose, schedule, administration route, washout period, duration of the intervention, and concomitant medications allowed. Description of devices should include general concept of design, detailed operational instructions, any potential risks to users, and intended benefits. Other types of interventions should be fully described. Indicate who holds the intellectual property rights to the intervention, if applicable, and how the PI has obtained access to those rights for the conduct of the clinical trial.

Summarize key preclinical pharmacological findings, dosage studies, and other clinical studies (if applicable) that examine the safety of the intervention.

- **Study Procedures:** Describe the interaction with the human subject to include the study intervention that he/she will experience. Provide sufficient detail in chronological order for a person uninvolved in the study to understand what the human subject will experience. Provide a schedule (e.g., flowchart or diagram) of study evaluations and follow-up procedures. Discuss how compliance with Good Laboratory Practices (GLP), Good Manufacturing Practices (GMP), and other regulatory considerations will be established, monitored, and maintained, as applicable.

- **Clinical Monitoring Plan:** Describe how the study will be conducted by and monitored for ICH E6 (International Conference on Harmonisation of Technical Requirements for Registration of Pharmaceuticals for Human Use) GCP compliance, by an independent clinical trial monitor (or clinical research associate). The monitoring plan should describe the types of monitoring visits to be conducted, the intervals (based on level of risk), how corrective actions will be reported to the Sponsor and PI, and how they will be corrected and prevented by the clinical trial site/PI.

- **Attachment 8: Data Management (no page limit): Upload as "Data_Manage.pdf."** The Data Management attachment should include the components listed below.

  - **Data Management:** Describe all methods used for data collection to include the following:

    - **Identifiers:** Describe the unique identifiers or specific code system to be used to identify human subjects, if applicable.

    - **Confidentiality:**

      - Explain measures taken to protect the privacy of human subjects and maintain confidentiality of study data. Strategies to protect the privacy and confidentiality of study records, particularly those containing identifying information, should be addressed.

      - Address who will have access to study records, data, and specimens, including an acknowledgment that representatives of the DoD are eligible to review study records.

- ❖ Address requirements for reporting sensitive information to state or local authorities.

- **Data capture, verification, and disposition:** Describe how data will be captured and verified. Describe where data (both electronic and hard copy) will be stored, who will keep the data, how the data will be stored, the process for locking the database at study completion, and the length of time data will be stored. Describe the proposed database, how it will be developed and validated, and its capability to safeguard and maintain the integrity of the data. For FDA-regulated studies, compliance with 21 CFR 11 is required.

- **Sharing study results:** In cases where the human subject could possibly benefit medically or otherwise from the information, explain whether or not the results of screening and/or study participation will be shared with human subjects or their primary care provider, to include results from any screening or diagnostic tests performed as part of the study.

– **Laboratory Evaluations:**

- **Specimens to be collected, schedule, and amount:** All specimens that will be collected for study purposes must be clearly stated. The collection schedule and amount of material collected must also be clearly described.

- **Evaluations to be made:** Describe all evaluations that will be made for study purposes. Explain how the results of laboratory evaluations will be used to meet the objectives of the study (or to monitor safety of human subjects).

- **Storage:** Describe specimen storage, to include location of storage, how long specimens will be stored, any special conditions required, labeling, and specimen disposition. Outline the plan to store specimens for future use to include considerations for informed consent and providing human subjects with an opportunity to decline participation in the study.

- **Labs performing evaluations and special precautions:** Identify the laboratory performing each evaluation, as well as any special precautions that should be taken in handling the samples. Special precautions that should be taken by the human subject before, during, or after the laboratory procedure should be clearly defined. If transport of samples is required, describe provisions for ensuring proper storage during transport.

○ **Attachment 9: Study Personnel and Organization (no page limit): Start each document on a new page. Combine into one document and upload as "Personnel.pdf."** The Study Personnel and Organization attachment should include the components listed below.

– **Organizational Chart:** Provide an organizational chart that identifies key members of the study team and provides an outline of the governing structure for multi-institutional studies. Identify collaborating organizations, centers, and/or departments

and name each person's position on the project. Identify the data and clinical coordinating center(s) and note any involvement from Contract Research Organizations, as appropriate. If applicable, identify the FDA regulatory sponsor and any external consultants or other experts who will assist with FDA applications. While there is no specified format for this information, a table(s) or diagram is recommended.

- **Study Personnel Description:** Briefly describe the roles of the individuals listed in the organizational chart on the project. Describe relevant experience and qualifications that demonstrate appropriate expertise for the given role. An external research monitor (if applicable) and study coordinator(s) should be included.

- **Study Management Plan:** Provide a plan for ensuring the standardization of procedures among staff and across sites (if applicable). If the proposed clinical trial is multi-institutional, clearly describe the multi-institutional structure governing the research protocol(s) across all participating institutions. Provide a regulatory submission plan for the master protocol and master consent form by the lead organization; include a single IRB/EC pathway whenever possible. If applicable, describe how communication and data transfer between the collaborating institutions will occur, as well as how data, specimens, and/or imaging products obtained during the study will be handled and shared.

- **Attachment 10: Surveys, Questionnaires, and Other Data Collection Instruments, if applicable (no page limit): Upload as "Surveys.pdf."** The Surveys, Questionnaires, and Other Data Collection Instruments attachment should include a copy of the most recent version of surveys, questionnaires, data collection forms, rating scales, interview guides, or other instruments. For each instrument, describe how the information collected is related to the objectives of the study. Describe how and when the instrument(s) will be administered. Describe how the instrument(s) will be adapted to the subject population, if applicable.

- **Attachment 11: Impact Statement (two-page limit): Upload as "Impact.pdf."**

  - Identify the volunteer population(s) that will participate in the proposed intervention, describe how they represent the target population that would benefit from the intervention, and describe the potential impact of the proposed clinical trial on the outcomes of individuals with the targeted disease or condition.

  - Describe the short-term impact: Detail the anticipated outcomes that will be directly attributed to the results of the proposed clinical trial.

  - Describe the long-term impact: Explain the long-range vision for implementation of the intervention in the clinic or field, and describe the anticipated long-term benefits for the targeted population.

  - Describe any relevant controversies or treatment issues that will be addressed by the proposed clinical trial.

- Describe any potential issues that might limit the impact of the proposed clinical trial.

- Describe how the intervention represents an improvement over currently available interventions and/or standards of care.

- **Attachment 12: Transition Plan and Regulatory Strategy (three-page limit): Upload as "Transition.pdf."** Describe/discuss the methods and strategies proposed to move the intervention to the next phase of development (clinical trials, commercialization, and/or delivery to the civilian or military market) after successful completion of the award. Applicants are encouraged to work with their organization's Technology Transfer Office (or equivalent) to develop the transition plan. PIs are encouraged to explore developing relationships with industry and/or other funding agencies to facilitate moving the product into the next phase of development. The post-award transition plan should include the components listed below.

  - The planned indication for the product label, if appropriate, and an outline of the development plan required to support that indication. Describe in detail the FDA regulatory strategy, to include considerations for compliance with GMP, GLP, and GCP (if appropriate).

  - Details of the funding strategy to transition to the next level of development and/or commercialization (e.g., partners, internal/external funding opportunities to be applied for). Include a description of collaborations and other resources that will be used to provide continuity of development.

  - For Knowledge Products, a description of collaborations and other resources that will be used to provide continuity of development including proposed development or modification of clinical practice guidelines (CPGs) and recommendations, provider training materials, patient brochures, and other clinical support tools, scientific journal publications, models, simulations, and applications. A "Knowledge Product" is a non-materiel product that addresses an identified need, topic area, or capability gap, is based on current evidence and research, aims to transition into medical practice, training, tools, or to support materiel solutions (systems to develop, acquire, provide, and sustain medical solutions and capabilities), and educates or impacts behavior throughout the continuum of care, including primary prevention of negative outcomes.

  - A brief schedule and milestones for transitioning the intervention to the next phase of development (next-phase clinical trials, commercialization, delivery to the military or civilian market, incorporation into clinical practice, and/or approval by the FDA).

  - Ownership rights/access to the intellectual property necessary for the development and/or commercialization of products or technologies supported with this award and the Government's ability to access such products or technologies in the future.

  - A risk analysis for cost, schedule, manufacturability, and sustainability.

- **Attachment 13: IND/IDE Documentation:** If submitting multiple documents, start each document on a new page. **Combine and upload as a single file named "IND-IDE.pdf."**

  - Complete the IND/IDE Documentation Form, which is available for download on the Full Announcement page for the Broad Agency Announcement on Grants.gov.

  - State whether the trial requires regulation by the FDA. If FDA regulation is required, describe the planned indication for the proposed product and whether an IND/IDE is necessary. Identify the IND/IDE sponsor. If an IND or IDE is required, it must be submitted to the FDA ***prior to submission of the full proposal/application.***

  - If an IND or IDE has already been obtained for the investigational drug or device pertaining to the indication to be studied, provide evidence in the form of formal communication (e.g., letterhead correspondence) from the FDA.

  - If an IND or IDE application has been submitted, provide an explanation of the status of the IND or IDE application (e.g., past the critical 30-day period, pending response to questions raised by the Agency, on clinical hold). Provide a summary of previous meetings with the FDA on development of this product, if appropriate. A copy of the Agency meeting minutes should be included if available. Provide copies of communications from the FDA relevant to the most recent status of the IND or IDE application.

  - If an IND or IDE is not required for the proposed study, or if it qualifies for an abbreviated IDE, provide evidence in the form of formal communication (e.g., letterhead correspondence) from the FDA or the IRB of record to that effect. Devices qualifying for an abbreviated IDE must comply with the abbreviated IDE requirements but do not require the submission of an IDE application to the FDA.

- **Attachment 14: Military Relevance Statement (one-page limit): Upload as "MilRel.pdf."**

  - Describe how the proposed study is responsive to the healthcare needs of military – Service members, Veterans, and/or beneficiaries. Provide information about the incidence and/or prevalence of the disease or condition in the general population as well as in military Service members, Veterans, and/or beneficiaries.

  - If active duty military, military families, and/or Veteran population(s) will be used in –the proposed research project, describe the population(s) and the appropriateness of the population(s) for the proposed study. If a non-military population will be used for the proposed research project, explain how the population simulates the targeted population (i.e., military Service members, Veterans, and/or beneficiaries).

  - If applicable, show how the proposed research project aligns with DoD and/or VA – areas of research interests. Provide a description of how the knowledge or technology gained from the research could be implemented in a dual-use capacity to benefit the civilian population and address a military need, as appropriate.

- **Attachment 15: DoD Military Budget Form(s), if applicable: Upload as "MFBudget.pdf."** If a military facility (military health system facility, research laboratory, treatment facility, dental treatment facility, or a DoD activity embedded with a civilian medical center) will be a collaborator in performance of the project, complete the DoD Military Budget Form, available for download on the eBRAP "Funding Opportunities & Forms" web page (https://ebrap.org/eBRAP/public/Program.htm), including a budget justification, for each military facility as instructed. The costs per year should be included on the Grants.gov Research and Related Budget form under subaward costs. Refer to the General Application Instructions, Section III.A.7., for detailed information.

Research & Related Senior/Key Person Profile (Expanded): Refer to the General Submission Instructions, Section III.A.3, for detailed information.

- PI Biographical Sketch (five-page limit): Upload as "Biosketch_LastName.pdf."
- PI Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."
- Key Personnel Biographical Sketches (five-page limit each): Upload as "Biosketch_LastName.pdf."
- Key Personnel Previous/Current/Pending Support (no page limit): Upload as "Support_LastName.pdf."

Research & Related Budget: Refer to the General Submission Instructions, Section III.A.4, for detailed information.

Budget Justification (no page limit): Upload as "BudgetJustification.pdf." The budget justification for the entire period of performance must be uploaded to the Research & Related Budget after completion of the budget for Period 1.

Project/Performance Site Location(s) Form: Refer to the General Submission Instructions, Section III.A.5, for detailed information.

R & R Subaward Budget Attachment(s) Form (if applicable): Refer to the General Submission Instructions, Section III.A.6, for detailed information.

NOTE: Proposals/Applications from **Federal agencies** must include in their budget justifications a **Federal Financial Plan**. Proposals/Applications from organizations that include **collaborations with DoD Military Facilities** must comply with special requirements. Refer to the General Submission Instructions, Section III.A.4, Research & Related Budget, for detailed information.

APPENDIX III: DOD AND VA WEBSITES

PIs are encouraged to integrate and/or align their research projects with DoD and/or VA research laboratories and programs. Collaboration with DoD or VA investigators is also encouraged. APPENDIX IV: PROCEDURES FOR ACQUISITION, PROCESSING, STORAGE, AND SHIPMENT OF BIO-FLUIDS

The following pre-analytical variables should be recorded when collecting bio-fluids:

- Time of sample collection
- Time of sample freezing and the interval between collection and freezing
- Temperature of freeze
- Needle size and type (21 G preferred)
- Tube collection order
- Tube labels
- Centrifugation parameters
- Handling, shipping, and storage temperature
- Tube handling
- Small aliquot size
- Sample storage quality control

The following subject characteristics should be recorded when collecting bio-fluids:

- Fasting and diet
- Therapy
- Time of day
- Physical activity
- Acute state (rested?)
- Body position

APPENDIX V: NATIONAL INSTITUTE OF MENTAL HEALTH DATA ARCHIVE — INFORMED CONSENT

Psychological Health, Human Subjects Studies
Informed Consent and Data Repository

Data from this study may be submitted to the National Institute of Mental Health Data Archive (NDA). NDA is a data repository run by the National Institute of Mental Health (NIMH) that allows researchers studying mental illness to collect and share deidentified information with each other. A data repository is a large database where information from many studies is stored and managed. Deidentified information means that all personal information about research participants such as name, address, and phone number is removed and replaced with a code number. With an easier way to share, researchers hope to learn new and important things about mental illnesses more quickly than before.

During and after the study, the researchers will send deidentified information about your health and behavior and in some cases, your genetic information, to NDA. Other researchers nationwide can then file an application with the NIMH to obtain access to your deidentified study data for research purposes. Experts at the NIMH who know how to protect health and science information will look at every request carefully to minimize risks to your privacy.

You may not benefit directly from allowing your information to be shared with NDA. The information provided to NDA may help researchers around the world treat future children and adults with mental illnesses so that they have better outcomes. NIMH will also report to Congress and on its web site about the different studies that researchers are conducting using NDA data. However, you will not be contacted directly about the data you contributed to NDA.

You may decide now or later that you do not want to share your information using NDA. If so, contact the researchers who conducted this study, and they will tell NDA, which can stop sharing the research information. However, NDA cannot take back information that was shared before you changed your mind. If you would like more information about NDA, this is available on-line at https://data-archive.nimh.nih.gov.

Experimental Usutu virus infection of suckling mice causes neuronal and glial cell apoptosis and demyelination

Received: 13 May 2004 / Revised: 22 July 2004 / Accepted: 26 July 2004 / Published online: 14 September 2004
Springer-Verlag 2004

Abstract Usutu virus (USUV), a mosquito-borne flavivirus of the Japanese encephalitis virus group has been responsible for avian mortality in Austria since 2001. In the present study, the neuropathogenicity and neuroinvasiveness of USUV for 1-week-old suckling mice was investigated. After intraperitoneal inoculation, clinical signs like depression, disorientation, paraplegia, paralysis and coma were observed between 6 and 11 days post infection. Histologically, there was widespread neuronal apoptosis especially in the brain stem. Inflammatory infiltrates were scarce. Apoptosis was also present in white matter of cerebellum, medulla and spinal cord, and was frequently accompanied by primary demyelination. While apoptosis of neurons was clearly associated with presence of viral signals, the cause of apoptosis of white matter cells was more ambiguous. However, focal immunostaining was found in the white matter, especially in the spinal cord. As with all flaviviruses, USUV proved to be neuropathogenic for mice. In contrast to other flaviviruses, neuroinvasion occurred only in animals that were not older than 1 week at the time of inoculation. While neuronal apoptosis is a general aspect of flavivirus pathogenicity, demyelination seems to be a unique feature of USUV infection.

Introduction

Usutu virus (USUV), a mosquito-borne flavivirus of the Japanese encephalitis virus group, has been responsible for avian mortality in Austria since 2001 [28]. The virus is highly pathogenic for Eurasian blackbirds (Turdus merula), which succumbed in high numbers, but also affects other bird species [29]. Most members of this virus group are pathogenic for human beings, inducing febrile illnesses, meningitis or encephalitis. The pathogenicity of USUV for humans seems to be low with so far only one published case of fever and rash in Central Africa [1]. Except for birds in Austria, clinical disease due to USUV infection has not been reported from any animal species and any other country. Practically all members of the Flavivirus and Alphavirus genera are neuropathogenic for mice, and experimental infections with some of these viruses serve as models for the study of apoptosis, inflammation or demyelination induced by neuronotropic viruses [4, 9, 14, 18, 27]. The neuropathogenicity of USUV for mice has never been demonstrated. In this report we describe the effects of peripheral infection with USUV in suckling mice, and show that neuronal apoptosis and multifocal demyelination are key features in this experimental disease.

Materials and methods

Experimental animals

For all experiments 1-week-old specified pathogen-free (SPF) NMRI mice were used. The animals were

purchased from Charles River Hungary Ltd. (Budapest) and were kept in the experimental animal house of the Department of Microbiology, Faculty of Veterinary Science, Budapest. The principles of laboratory animal care (NIH publication No. 86–23, revised 1985) were followed and the animals were kept and handled according to the standard requirements and regulations of the Experimental Animal Welfare Codex of the Faculty of Veterinary Science, Budapest (project permit number: 70/2003).

Virus

USUV strain 939/01, designated Vienna 2001-blackbird, was isolated in Vero cell culture, which had been inoculated with a brain homogenate of a blackbird. This blackbird was found dead in Perchtoldsdorf near Vienna on September 4, 2001, and USUV-specific nucleic acid and antigen had been identified in several organs of the bird by reverse transcription (RT)-PCR, sequencing, in situ hybridization (ISH) and immunohistochemistry (IHC). The virus isolate was passaged twice in Vero cells and then stored frozen at ff 80 C.

Experimental schedule, euthanasia, necropsy, histology

Forty-two (experiment 1) and 10 (experiment 2) mice were infected intraperitoneally (i.p.) into the abdominal cavity with 1,000 tissue culture infectious doses 50% ($TCID_{50}$) of virus in 100 l l minimal essential medium (MEM). The amount of virus was checked by back-titration of the working dilution on Vero cell cultures. Control animals were inoculated i.p. with 100 l l MEM without virus. Preliminary experiments (not shown) had revealed that this inoculation procedure resulted in reliable induction of encephalitis in 1-week-old animals, but not in animals aged 2 weeks and more. Additional pilot studies (not shown) demonstrated that intracerebral (i.c.) inoculation of adult and suckling mice resulted in mortality and widespread neuronal death, which was accompanied by non-suppurative encephalitis in adult animals. To study both neuroinvasion and neurovirulence of USUV, we decided to use the i.p. route for the main experiments.

For the study of sequential development of lesions and viral distribution, 42 mice were used. It was planned to process 2 infected animals and one control animal daily, starting at day 1 p.i. until the planned end of the experiment at day 14 (experiment 1).

An additional experiment (experiment 2) with 10 animals treated as above was performed to study spinal cord changes with the plan to euthanize the animals after development of clinical symptoms. In both experiments the mice were checked twice daily for clinical signs.

According to the experimental schedule, the mice were killed by overdosing of CO_2. Animals showing severe clinical signs were also killed, regardless of the schedule. The mice from experiment 1 were necropsied, and brain, lung, heart, liver, spleen, kidneys and small intestine were collected; some tissues were fixed in 4% buffered formaldehyde and others—for virological examinations—frozen at ff 80 C. From the mice of experiment 2 only brain and spinal cord were fixed. The fixed organs were embedded in paraffin wax and a series of 4-l m sections were cut. The brains of experiment 1 animals were cut into paramedian sagittal sections. The brains of experiment 2 animals were cut into transversal sections at three levels and the entire vertebral column was cut at four transversal levels corresponding to C3, C5, L1 and L3 segments. The sections were stained with hematoxylin and eosin for general histomorphology, cresyl echt violet for neuronal morphology, and Luxol-fast blue (Klu¨ver-Barrera) for myelin. In addition, they were subjected to IHC, ISH and terminal deoxynucleotidyl transferase-mediated dUTP-biotin nick end labeling (TUNEL) as described below.

Immunohistochemistry

The avidin biotin complex (ABC) technique and a rabbit USUV antiserum (produced at the Department of Microbiology, Faculty of Veterinary Science, Budapest) were used to localize USUV antigen in tissue samples. Additional primary antibodies for detection of T cells (anti-CD3; Dako, Glostrup, Denmark), macrophages (anti-lysozyme; Dako), astrocytes (anti-glial fibrillary acidic protein, GFAP; Dako) and neurofilament (anti-neurofilament 200; Sigma, St. Louis, MO) were applied. Paraffin wax sections (4 l m) were mounted on positively charged glass slides (Superfrost plus; Menzel-Gläser, Braunschweig, Germany). After dewaxing and rehydration, antigen retrieval was performed by protease digestion (protease type XIV, Sigma; lysozyme, GFAP, neurofilament) or heating the slides in citrate buffer (pH 6.0) in a microwave oven (USUV, CD3). Endogenous peroxidase activity was blocked with 0.3% H_2O_2 in methanol for 30 min. The sections were then incubated with a 1:10 dilution of normal goat serum (Vector Laboratories, Burlingame, CA) for 60 min, followed by an overnight incubation with the primary antibodies at 4 C in the following dilutions: anti-USUV 1:2,500; anti-GFAP 1:1,000; and anti-CD3, anti-lysozyme, and anti-neurofilament all at 1:200. After washing in phosphate-buffered saline (PBS), the tissues were incubated with a 1:400 dilution of biotinylated anti-rabbit IgG (Vector Laboratories) for 30 min, followed by the Vectastain Elite ABC Kit (Vector Laboratories) for 60 min. The reaction was visualized with a DAB Substrate Kit for peroxidase (Vector Laboratories). After counterstaining with hemalum and dehydrating, the slides were mounted under coverslips with Neomount (VWR, Vienna, Austria).

In situ hybridization

ISH was used to show the distribution of USUV-specific nucleotide sequences After dewaxing and rehydration,

the tissueswere incubated in TRIS-buffered saline with 2.5 l g/ml proteinase K (Roche, Basel, Switzerland) at 37 C for 30 min. After rinsing, the slides were covered with hybridization mixture, 100 l l of which contained 50 l l formamide, 20 l l 20· standard saline citrate buffer (SSC), 2 l l Denhardt's, 10 l l dextran sulfate, 5 l l boiled herring sperm DNA, 11.5 l l distilled water and 1.5 l l USUV-specific digoxigenin-labeled oligonucleotide probe (MWG Biotech, Ebersberg, Germany) with a final concentration of approximately 0.35 ng/l l. The probe sequence was: 5'-TCGCATAACTTTCACCACCTT-GTGTTTGTAGGTCAGCTC-3'. The slides were hybridized for 16 h in a humid chamber at 40 C. After hybridization, the slideswere washedin 2· SSC, 1· SSC and 0.1· SSC (10 min each) at room temperature. For detection of digoxigenin-labeled hybrids, the slides were incubated for 60 min with anti-digoxigenin-AP Fab fragments (dilution 1:100; Roche). The slides were rinsed twice and the signal was visualized using BCIP (5-bromo-4-chloro-3-indolyl phosphate) and NBT (4-nitro blue tetrazolium chloride) (both Roche). After 4 h, the color development was stopped with TE buffer (pH 8.0); the slides were counterstained with hemalum, dehydrated, and mounted under coverslipswith Aquatex (VWR).

TUNEL

Detection of nuclear DNA fragmentation indicative of apoptosis was achieved using DeadEnd Colorimetric TUNEL System (Promega, Madison, WI). The assay was performed according to the manufacturer's instructions.

RT-PCR

Those samples, which were negative by histology, IHC and ISH (infected mice from days 1 to 4 and controls) as well as selectedIHC- and ISH-positive sampleswere investigated by RT-PCR to detect USUV-specific nucleic acid. The organs of the animals were homogenized in ceramic mortars using sterile sand, and the homogenates were suspended in 1,500 l l diethyl pyrocarbonate (DEPC)-treated distilled water. The suspension was centrifuged at 8,000 g for 10 min and RNA was isolated from 140 l l of the supernatant using QiaAmp Viral RNA Mini Kit (Qiagen, Hilden, Germany) according to the manufacturer's instructions. RT and amplification were performed with a continuous RT-PCR method using the Qiagen One-Step RT-PCR Kit (Qiagen). Each 25-l l reaction mixture contained 5 l l of 5· buffer (final $MgCl_2$ concentration 2.5 mM), 0.4 mM of each deoxynucleoside triphosphate (dNTP), 10 U RNasin RNase inhibitor (Promega), 20 pmol of the USUV-specific forward (5'-AGGACCATTGGTTAGGAAGA-3') and reverse (5'-GGCTTGACAACACAATCATC-3') primers, 1 l l of enzyme mix (containing Omniscript and Sensiscript Reverse Transcriptases and HotStarTaq DNA polymerase) and 2.5 l l of template RNA. RT was carried out at 50 C for 30 min, followed by a denaturation step at 95 C for 15 min. Thereafter the cDNA was amplified in 40 cycles (heat denaturation at 94 C for 40 s, primer annealing at 57 C for 50 s, and DNA extension at 72 C for 1 min), and the reaction was completed by a final extension for 7 min at 72 C. The sampleswere kept at 4 C until electrophoresiswas carried out. The reactions were performed in a Perkin Elmer GeneAmp PCR System 2400 thermocycler. Following RT-PCR, 10 l l of the amplicons were electrophoresed in a 1.2% TRIS acetate-EDTA-agarose gel at 5 V/cm for 80 min. The gel was stained with ethidium bromide; bands were visualized by UV transillumination at 312 nm using a TFX 35 M UV transilluminator (Life Technologies, Paisley, UK) and photographed with a Kodak DS Electrophoresis Documentation and Analysis System using the Kodak Digital Science 1D software program. Product sizes were determined with reference to a 100-bp DNA ladder (Promega).

Results

Clinical signs

Experiment 1

The animals investigated from days 1 to 5 of the experiment had no clinical signs. At day 6, seven mice showed depression or disorientation. In three mice identical clinical signs started at day 7, in one at day 8, in three at day 9 and in two eachat days 10 and 11. The signs were progressiveand led to paraplegia, paralysis, and coma. Death occurred within at least 2 days after onset, if the animal had not beenkilled before. All mice that were still in the experiment after day 5 developed clinical disease. Diseased animals did not gain weight and by the end of the experimenthad only about half the weight of controls.

The experiment could not be performed as initially designed, becausebetween days 7 and 8 of the experiment eight animals died. There were two more spontaneousdeathsat days 9 and 11. Thus, there wereno more infected animals left after day 11.

There were no clinical signs in control animals.

Experiment 2

Clinical signs were noticed between days 6 and 9 p.i. They were identical to the signs described above. After the development of clinical signs, four animals were killed on day 7 p.i. and three animals eachon days 8 and 9 p.i.

Neuropathology and TUNEL assay

Experiment 1

All control animals and the infected animals killed between days 1 and 4 p.i. showed no pathological lesions, not more than five TUNEL-positive cells per · 100 field, and no viral signals by IHC and ISH.

Infected animals which were killed or died from day 5 p.i. onwards showed multifocal or diffuse neuronal death widely distributed in the brain. Neuronal death was identified as nuclear shrinkage and condensation, frequently followed by breaking into chromatin fragments (Fig. 1A). In larger neurons the cytoplasm was frequently distinctly hypereosinophilic, suggesting lytic necrosis (Fig. 2). Using TUNEL, however, in areas with neuronal death, the majority of neurons had positive signals und TUNEL staining showed a clear correlation to morphological changes. The fragmented DNA was usually confined to the nuclei; sometimes, however, diffuse, brownish-staining patterns of the cytoplasm were also observed, suggesting leakage of DNA fragments into the cytoplasm or extracellular space (Fig. 3). From days 5 to 6 p.i., lesions and TUNEL signals were mild to moderate and multifocal. They were predominantly found in nuclei of the medulla oblongata (such as the medial parabrachial nucleus, spinal trigeminal nucleus, rostral periolivary region, spinal vestibular nucleus, lateral vestibular nucleus), in the cerebellum, affecting Purkinje cells, cells of the internal granule layer and white matter cells, in the mesencephalon, especially in external cortex of the inferior colliculus, deep mesencephalic nucleus, and deep gray layer of the superior colliculus, in thalamic nuclei, and, to a limited extent, in the CA3 region of the hippocampus. From days 7 to 9 p.i., the lesions were generally severe and more widespread but had still a multifocal distribution pattern. In addition to the regions already mentioned, they were also present in the dentate gyrus and the CA1 and CA2 region of the hippocampus. In the medulla, the lesions were more widespread, including also the motor trigeminal nucleus, the parvicellular reticular nucleus, the nucleus of the solitary tract, and the spinal trigeminal nucleus. In other brain regions the pararubral nucleus of the mesenceph-

alon, the nucleus of the horizontal limb of the diagonal band, the caudate putamen, the claustrum, the accumbens nucleus, the anterior olfactory nucleus, and foci in the motor, sensory and visual cortex were affected. At days 10 and 11 p.i., lesions and TUNEL signals were significantly reduced and only focally found in the cerebellum, thalamus, motor cortex, dentate gyrus, caudate putamen and medulla. The distribution of neuronal damage was not uniform in all animals investigated per time point. The regions mentioned above and shown in Fig. 4 represent a compilation of the affected areas of all animals available per time point.

Subtle and inconsistent demyelinating lesions were observed by day 7 p.i. By day 8 p.i., the demyelination was robust and consistently found through the last time points examined. The demyelination was present in the cerebellar white matter (Fig. 5), where it was predominantly multifocal, and in some white matter tracts of the medulla oblongata. Immunostaining for neurofilament in demyelinated areas revealed no significant axonal damage or axonal loss. This finding is indicative of primary demyelination. Numerous TUNEL-positive cells were frequently found in demyelinated areas (Fig. 6).

There were only minor inflammatory changes at all time points examined, as evidenced by immunostaining for T cells and macrophages; these changes consisted of infrequent and mild perivascular infiltrates of mononuclear cells. There was no obvious glial response.

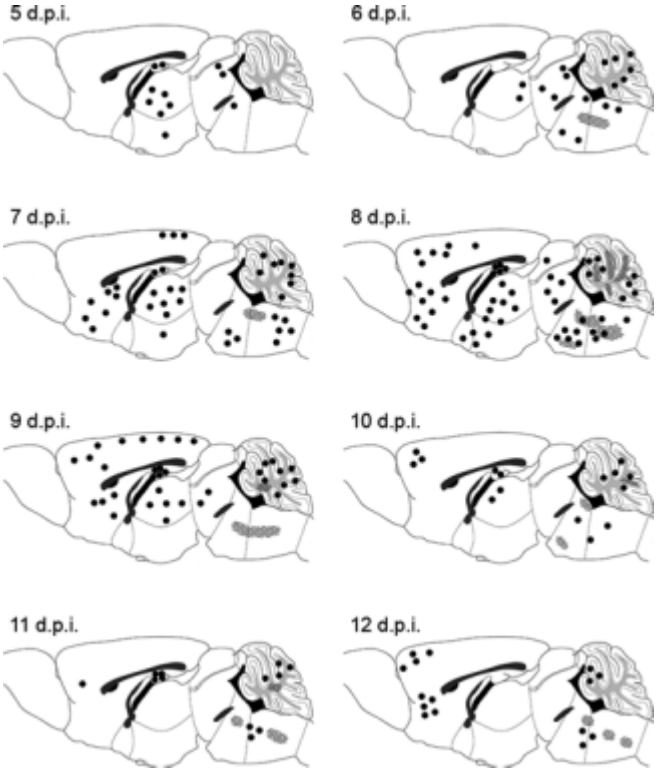

Fig. 4 Distribution of cerebral lesions during the time course of the experiment from days 5 to 12 p.i.: number and location of dots represent intensity of neuronal apoptosis and associated viral signals and their distribution; hatched areas represent locations of demyelination

Experiment 2

The brain lesions closely matched the changes of experiment 1. The spinal cords showed moderate neuronal death, especially in the ventral horns, and considerable demyelination especially of the dorsal (Fig. 7) and dorsolateral funiculi. Nuclear fragmentation characteristic of apoptosis (Fig. 8A–C) was present in gray matter. GFAP immunostaining showed that fragmented nuclei were not attributable to astrocytes (Fig. 9). Moderate numbers of TUNEL-positive nuclei were present in demyelinated white matter (Fig. 10). In demyelinated areas, axons were preserved (Fig. 11). Immunostaining did not reveal significant numbers of T cells or macrophages.

Distribution of viral signals

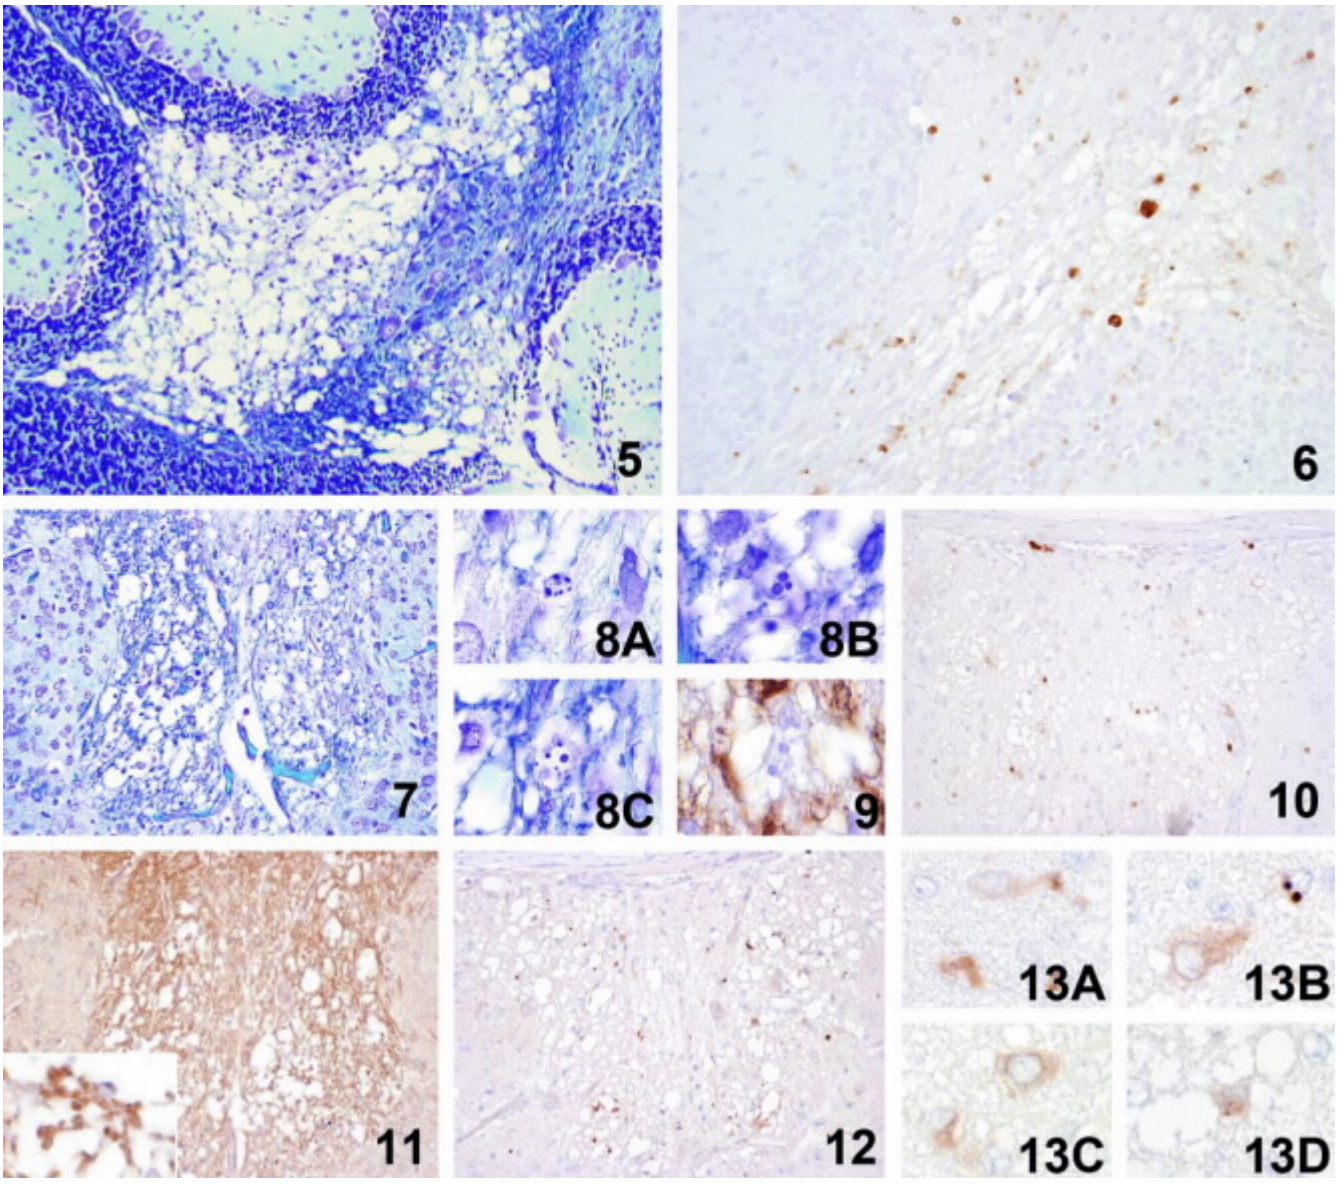
Experiment 1

IHC and ISH did not detect viral replication in brain neurons before day 5 p.i. From this time point until the end of the experiment viral signals were present in the perikarya of neurons, occasionally extending into neuronal processes, of many brain regions (Fig. 1B, C). The positive cells were usually arranged in clusters, occasionally they were found singly. The locations of infected neurons generally correlated well with areas of neuronal apoptosis. However, the number of cells with viral signals was by far exceeded by the number of apoptotic nuclei in the respective regions. Exceptions were the Purkinje cells, which frequently showed viral infection, but never displayed TUNEL signals. The white matter, in unchanged as well as demyelinated regions, showed inconsistent and generally weak viral signals. They were generally present as diffuse or granular deposits close to nuclei of white matter cells.

By RT-PCR, USUV-specific nucleic acid was detected in the organ homogenates of the infected mice of all time points examined, even in those processed from days 1 to 4 p.i. The control animals were all negative by RT-PCR until the end of the experiment.

Experiment 2

In the spinal cord, signals were found in the cytoplasm of gray matter neurons and their processes, especially of the ventral horn. In addition, there was multifocal weak to moderate staining in the white matter, both of demyelinated (Figs. 12, 13D) and unchanged areas (Fig. 13A–C). The signal was predominantly dotted or granular and not easily attributable to cells; sometimes, the staining was clearly intracellular with spared nuclei within white matter cells, probably oligodendrocytes (Fig. 13A–D).



Discussion

In suckling mice, USUV led to central nervous system (CNS) infection after peripheral inoculation; in this model the virus proved neuroinvasive and neurovirulent. Viral replication and associated cell damage was obvious in neurons. Whether other gray matter cells are affected remains to be shown. Damage to white matter cells, presumably oligodendrocytes, was also present, although viral signals were generally scarce. Mice of 2 weeks of age were resistant to peripheral USUV infection: neither peripheral viral replication nor neuroinvasion were observed. The age dependence of neuroinvasiveness is well known from numerous experiments with other flavi- and alphaviruses. While peripheral infection of suckling mice is generally lethal, older animals are frequently resistant to neuroinvasion. The age until which neuroinvasion by peripheral inoculations can be achieved ranges from 12 days (Semliki forest virus, SFV) [7], over 6 weeks (West Nile virus) [6], and 4 months (Saint Louis encephalitis virus) [2, 23] to even adult age (Banzi virus) [3, 16]. However, different strains of the same virus can exhibit dramatic differences in neuroinvasiveness. Highly invasive strains of SFV kill mice of all ages after i.p. infection, while strains of low neuroinvasiveness kill only mice aged 12 days and younger [7].

In the present USUV model, apoptosis (as evidenced by the TUNEL method) seems to be the major mode of neuronal death. This clearly correlates with other flavivirus and alphavirus infections, where neuronal apoptosis plays a pivotal role in pathogenesis [12, 15, 21, 30]. The TUNEL method has been claimed to be superior to other in situ labeling techniques for the detection of

DNA fragmentation specific for apoptosis [10, 24]. However, TUNEL staining may also occur in very late stages of necrosis, although at reduced intensity [10, 24]. Thus, it appears possible that some cells displaying morphological features of lytic necroses may also have been stained by TUNEL. Purkinje cells, however, although frequently positive for viral signals, were never labeled by TUNEL. This phenomenon was also observed by Jackson and Rossiter [15] in experimental Venezuelan equine encephalitis and was explained by specific anti-apoptotic mechanisms in place in these particular neurons.

Peripheral USUV infection of mice older than 1 week did not result in neuroinvasion, whereas younger mice developed widespread neuronal death and succumbed to infection. The higher susceptibility to virus-induced neuronal apoptosis in very young animals has also been observed with other arboviruses, e.g., Sindbis virus and SFV [7, 13]. The neurons of newborn mice may simply be more prone to activation of an apoptotic cascade as a general response to stress, because programmed cell death is a crucial part of normal nervous system development, and thus the intracellular machinery is already in place. Neurons of more mature mice have down-regulated these cell death pathways [17].

On the other hand, the age of mice also affected neuroinvasion; due to the not fully developed blood brain barrier (BBB), neuroinvasion may take place more frequently in newborn or suckling mice [5, 20, 22]. The neuroinvasiveness of USUV tested here seems to be low compared to other viruses, as it does not cross the BBB when inoculated i.p. at the age of 2 weeks.

The occurrence of neuronal apoptosis in a flavivirus model of suckling mice is not surprising; however, infection of white matter cells with resulting apoptosis and demyelination is intriguing. So far, no flavivirus model has been reported in which demyelination has been described. The authors of the MODV hamster model do not describe demyelination, although in figures showing spinal cord of animals with acute disease, lesions suggestive of demyelination are present [19]. The only well-characterized arboviral model of demyelination is the murine SFV model [7, 8, 9]. Here demyelination became apparent at 14 days p.i. and seemed to be an immune-mediated event as a result of $CD8^+$ T cell-mediated destruction of virus-infected oligodendrocytes.

In USUV-infected mice, however, demyelination occurred comparatively early, was not associated with considerable inflammatory infiltrates, and was preceded by viral infection and apoptosis of adjacent cells. Phenotyping of these cells has yet to be done, but they did not display cell markers of astrocytes, macrophages or T cells, which most likely identified them as oligodendroglial cells. However, viral products were very scarce in white matter compared to the focal abundance of TUNEL-positive nuclei. Hence, we conclude that viral replication may only trigger myelin breakdown, which is finally maintained by other, as yet unidentified, factors. Thus also an indirect, but not primarily immunopathological mechanism of oligodendrocyte damage, as shown in other models, e.g., morbillivirus, may be occur [11, 31]. This particular aspect of the USUV mouse model deserves to be studied in more detail to gain more insight into the mechanism by which demyelination occurs during acute flaviviral encephalomyelitis.

There has been considerable debate concerning the route of entry into the CNS of neurovirulent flavi- and alphaviruses. While St. Louis encephalitis virus in animals infected i.p. has been shown to enter the brain via the olfactory neuroepithelium with the early viral replication taking place in the rostral brain regions [23], SFV seems to enter the brain across cerebral endothelial cells, leading to initial perivascular foci of infection. In USUV-infected mice, the disseminated distribution of early lesions in thalamic, midbrain, and hindbrain areas does not favor the olfactory entry route; hematogenous spread is more likely.

Animals from the later time points of the experiment had limited viral load. It is not entirely clear whether this reflects attempts at viral clearance or whether the animals survived longer because viral replication and resulting lesions occurred at a lower rate in these individuals.

Skeletal muscle has been identified as the only site of peripheral viral replication, a site where also SFV multiplies [7]. Interestingly, all investigated internal organs remained negative, although some replication at these sites has been found in this type of models [7, 25, 26]. However, virus titrations demonstrated that peripheral replication was less efficient and was probably not found because it was below the sensitivity level of the assays used.

ABSTRACT

Usutu virus (USUV) is an emerging flavivirus that causes Usutu disease mainly in birds, but infection of mammals such as rodents, bats and horses has also been demonstrated. In addition, human cases (both in immunocompromised and -competent individuals) were also reported. Large outbreaks with other flaviviruses, such as West Nile virus and Zika virus, indicate that one should be vigilant for yet other outbreaks. To allow the identification of inhibitors of USUV replication, we established in vitro antiviral assays, which were validated using a small selection of known flavivirus inhibitors, including the broad-spectrum viral RNA polymerase inhibitor favipiravir (T-705). Next, an USUV infection model in AG129 (IFN-α/β and IFN-γ receptor knockout) mice was established. AG129 mice proved highly susceptible to USUV; an inoculum as low as 10^2 PFU (1.3×10^5 $TCID_{50}$) resulted in the development of symptoms as early as 3 days post infection with viral RNA being detectable in various tissues. Treatment of mice with favipiravir (150 mg/kg/dose, BID, oral gavage) significantly reduced viral load in blood and tissues and significantly delayed virus-induced disease. This USUV mouse model is thus amenable for assessing the potential in vivo efficacy of (novel) USUV/flavivirus inhibitors.

1. Main text

Usutu virus (USUV) is a mosquito-borne flavivirus originating from Africa, where it was first detected in the late 1950's. This virus is a relatively unknown member of the Japanese encephalitis serocomplex and is thus closely related to human pathogens such as Japanese encephalitis virus (JEV), yellow fever virus (YFV), Saint Louis encephalitis virus (SLEV), West Nile virus (WNV) and Murray Valley encephalitis virus (MVEV) (Moureau et al., 2015). The Culex mosquitoes are the primary vectors although other mosquito species such as Aedes albopictus have also been proposed as potential vectors (Eiden et al., 2018; Calzolari et al., 2010; Vázquez et al., 2011). USUV most likely emerged for the first time in Europe in 1996 causing massive deaths among blackbirds (Turdus merula) (Weissenböck et al., 2013). Currently, the virus is ubiquitous in Europe as its presence has been demonstrated in various animal species (e.g. birds, rodents, bats and horses) in more than ten European countries (Becker et al., 2012; Busquets et al., 2008; Cadar et al., 2014; Calzolari et al., 2012; Chvala et al., 2007; Garigliany et al., 2017; Hubálek et al., 2008; Lecollinet et al., 2016; Rijks et al., 2016; Steinmetz et al., 2011). Potentially even more concerning is the presence of USUV in humans. Seroprevalence studies showed that antibodies against USUV could be detected in the blood of 0.02% and 0.23%–1.1% of otherwise healthy blood donors in respectively Germany and Italy (Allering et al., 2012; Gaibani et al., 2012; Pierro et al., 2013). However, a higher seroprevalence was detected in serum samples from both healthy and sick individuals in Italy (6.6% seroprevalence) and healthy individuals in Serbia (7.5% seroprevalence), respectively (Cvjetković et al., 2016; Gaibani and Rossini, 2017; Grottola et al., 2017). USUV infections in humans remain largely asymptomatic. However, as of 2009, the number of USUV infections that are associated with disease, ranging from mild (rash, fever, headache) to severe disease (encephalitis, meningoencephalitis, meningitis), is slowly increasing in Europe. Although the first cases were reported on the African continent, more recent cases have been reported in Italy, Croatia, Germany, and France (Allering et al., 2012; Cavrini et al., 2009, 2011; Grottola et al., 2017; Nikolay et al., 2011; Pecorari et al., 2009; Simonin et al., 2018; Vilibic-Cavlek et al., 2014). The widespread distribution in different hosts in Europe provides evidence that the virus can jump between species and adapt to a new host. Hence, USUV should be considered a potential health concern. Given the recent -and

mostly unexpected-outbreaks of related flaviviruses such as WNV, YFV, dengue virus and Zika virus (Musso et al., 2018; Weaver, 2018), it will thus be important to have broad-spectrum antivirals at hand that are also active against USUV.

To allow the identification of molecules that can inhibit in vitro USUV replication, antiviral assays were established. First, various cell types were tested for their permissiveness to USUV replication: Vero E6 (African Green monkey kidney) cells, BHK (baby hamster kidney) cells and C6/36 mosquito (from Ae. albopictus larvae) cells. Vero cells were highly permissive to USUV (strain V18; kindly provided by Dr. Stephan Günther, Bernhard Nocht Institute for Tropical Medicine, Hamburg, Germany; Becker et al., 2012), resulting in a full cytopathic effect (CPE) at day 7 post infection (pi) (data not shown). Hence, prior to performing subsequent experiments, USUV was propagated to a maximum of two passages in Vero E6 cells after which infectious titers were determined by performing plaque assays on BHK cells, essentially as described previously (Zmurko et al., 2016). The in vitro kinetics of USUV replication is comparable with that of other flaviviruses (Mastrangelo et al., 2012; Zmurko et al., 2016), with USUV RNA becoming first detectable by RT-qPCR at 6–8 h pi (Supplemental Fig. 1, grey bars). Next, a CPE-based assay followed by colorimetric read out (i.e. MTS/PMS; Promega) as well as a virus yield reduction assay followed by RT-qPCR was established using Vero E6 cells. Both assays were then validated using a selection of molecules with known antiviral activity against other flaviviruses (reviewed in Boldescu et al., 2017). All compounds were able to inhibit CPE formation as well as USUV RNA replication, with favipiravir as well as the 2′-C-methyl nucleoside analogs 2′-C-methyladenosine (2′CMA) and 7-deaza-2-C-methyladenosine (7DMA) being the best, albeit not very potent, inhibitors, as based on the selectivity index (i.e. ratio CC_{50}/EC_{50}) (Table 1). More in detail, favipiravir was most effective in inhibiting USUV replication when added to the infected cells during the first 6 h after infection (Supplemental Fig. 1, black bars). The antiviral activity was lost when the compound was added after the onset of viral RNA synthesis, which corroborates with its proposed mechanism of action against other RNA viruses, i.e. acting as a mimetic nucleobase by interfering with the viral RNA synthesis (Delang et al., 2014; Furuta et al., 2005). The in vitro assays that were established are thus capable of identifying inhibitors of USUV replication.

To evaluate the in vivo efficacy of molecules against USUV, we aimed to establish a small animal model. Since USUV is an avian (flavi-) virus, we anticipated that the virus would replicate well in embryonated chicken eggs. USUV (10^4, 10^5 or 10^6 PFU) was injected in the allantoic cavity of chicken eggs ten days after fertilization, after which the allantoic fluid was harvested at various days (d2, d4 and d6) pi to determine infectious virus content. Surprisingly, only low USUV titers (i.e. 10^3 PFU/ml) were detected in only 14% of the chicken eggs, which may represent remnants of the input virus. In addition, all embryonated chicks developed normally (data not shown). Embryonated chicken eggs are thus not suitable to serve as a replication model for USUV.

Table 1
Antiviral activity of a selection of compounds against USUV and their anti-metabolic effect.

Compound	EC_{50} (μM)		CC_{50} (μM)
	CPE	RT-qPCR	
2′CMA	7.2 ± 0.1	12 ± 7.7	69 ± 1.3
2′CMC	13 ± 1.0	24 ± 9.1	71 ± 14
2′CMG	26 ± 0.8	43 ± 7.5	> 168
7DMA	45 ± 7.1	130 ± 2.1	> 357
Favipiravir	90 ± 26	151 ± 28	> 637
Ribavirin	139 ± 30	ND	> 410

Antiviral activities were determined in CPE reduction assays (CPE) followed by MTS/PMS read out or in virus yield reduction assay followed by real time quantitative PCR (RT-qPCR). Anti-metabolic activities were determined in toxicity assays followed by MTS read out. Data represent mean values ± standard deviations from at least three independent experiments with three replicates for each experiment (n = 9). 2′-C-methyladenosine, 2′CMA; 2′-C-methylcytidine, 2′CMC; 2′-C-methylguanosine, 2′CMG; 7-deaza-2-C-methyladenosine, 7DMA. ND, not determined.

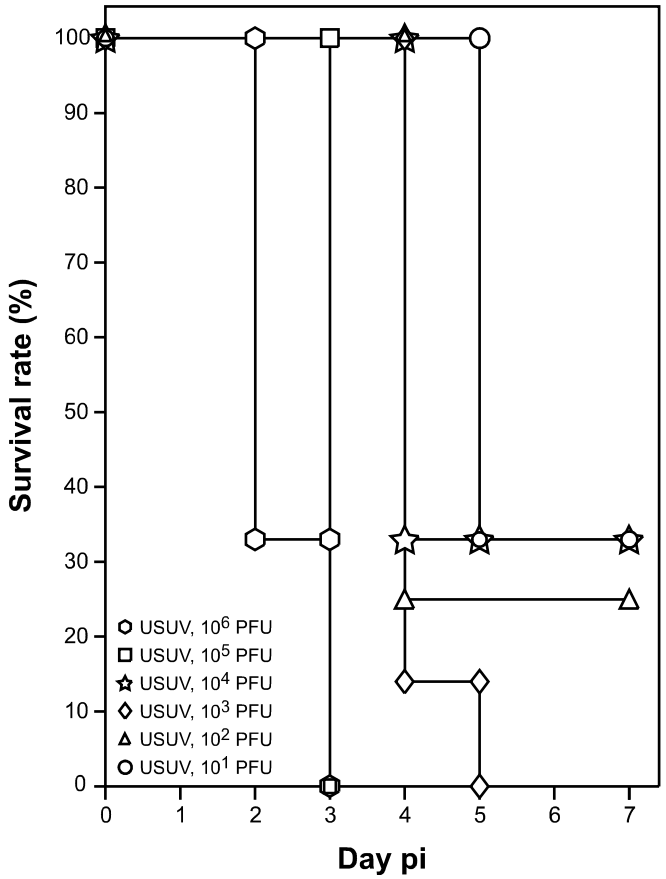

Fig. 1. Kaplan-Meier survival curve for mice infected with different inoculums of USUV. Male (8–14 weeks of age) 129/Sv mice deficient in both IFN-alpha/beta (IFN-α/β) and IFN-gamma (IFN-γ) receptors (AG129) were inoculated intraperitoneally (ip) with USUV V18 using different inoculums (ranging from 10^1 PFU - 10^6 PFU, corresponding to 1.3×10^4 $TCID_{50}$ - 1.3×10^9 $TCID_{50}$). Mice were observed daily for body weight loss and the development of virus-induced disease and were euthanized when reaching humane endpoints. In case of a body weight loss of ≥ 20% and/or severe illness (neurotropic symptoms such as movement impairment, lower limb paralysis), mice were euthanized with pentobarbital (Dolethal). All animal experiments were performed with approval of and under the guidelines of the Ethical Committee of KU Leuven [P099-2013].

We next studied whether AG129 mice can be infected with USUV. AG129 mice are deficient in IFN-α/β and IFN-γ receptors, which makes them highly susceptible to other (flavi-)viruses (Couderc et al., 2008; Rocha-Pereira et al., 2013; Schul et al., 2007; Zmurko et al., 2016), Moreover, it was previously reported that an USUV infection is partly regulated by the interferon response (Blázquez et al., 2015; Cacciotti et al., 2015; Martín-Acebes et al., 2016; Scagnolari et al., 2013), which is impaired in AG129 mice. Indeed, intraperitoneal (ip) infection of AG129 mice (8–14 weeks old) with USUV resulted in a rapid development of disease requiring euthanasia in the majority of the mice within a few days after infection (Fig. 1). When inoculated with 10^6 PFU (corresponding to 1.3×10^9 $TCID_{50}$), mice developed the first signs of disease 2 days pi and all mice had to be euthanized by day 3 pi. At the lowest inoculum used (10^1 PFU/1.3×10^4 $TCID_{50}$), first signs of disease appeared a few days later (day 4 pi) and most of the mice had to be euthanized by day 7 pi (33% survival). Disease signs include general

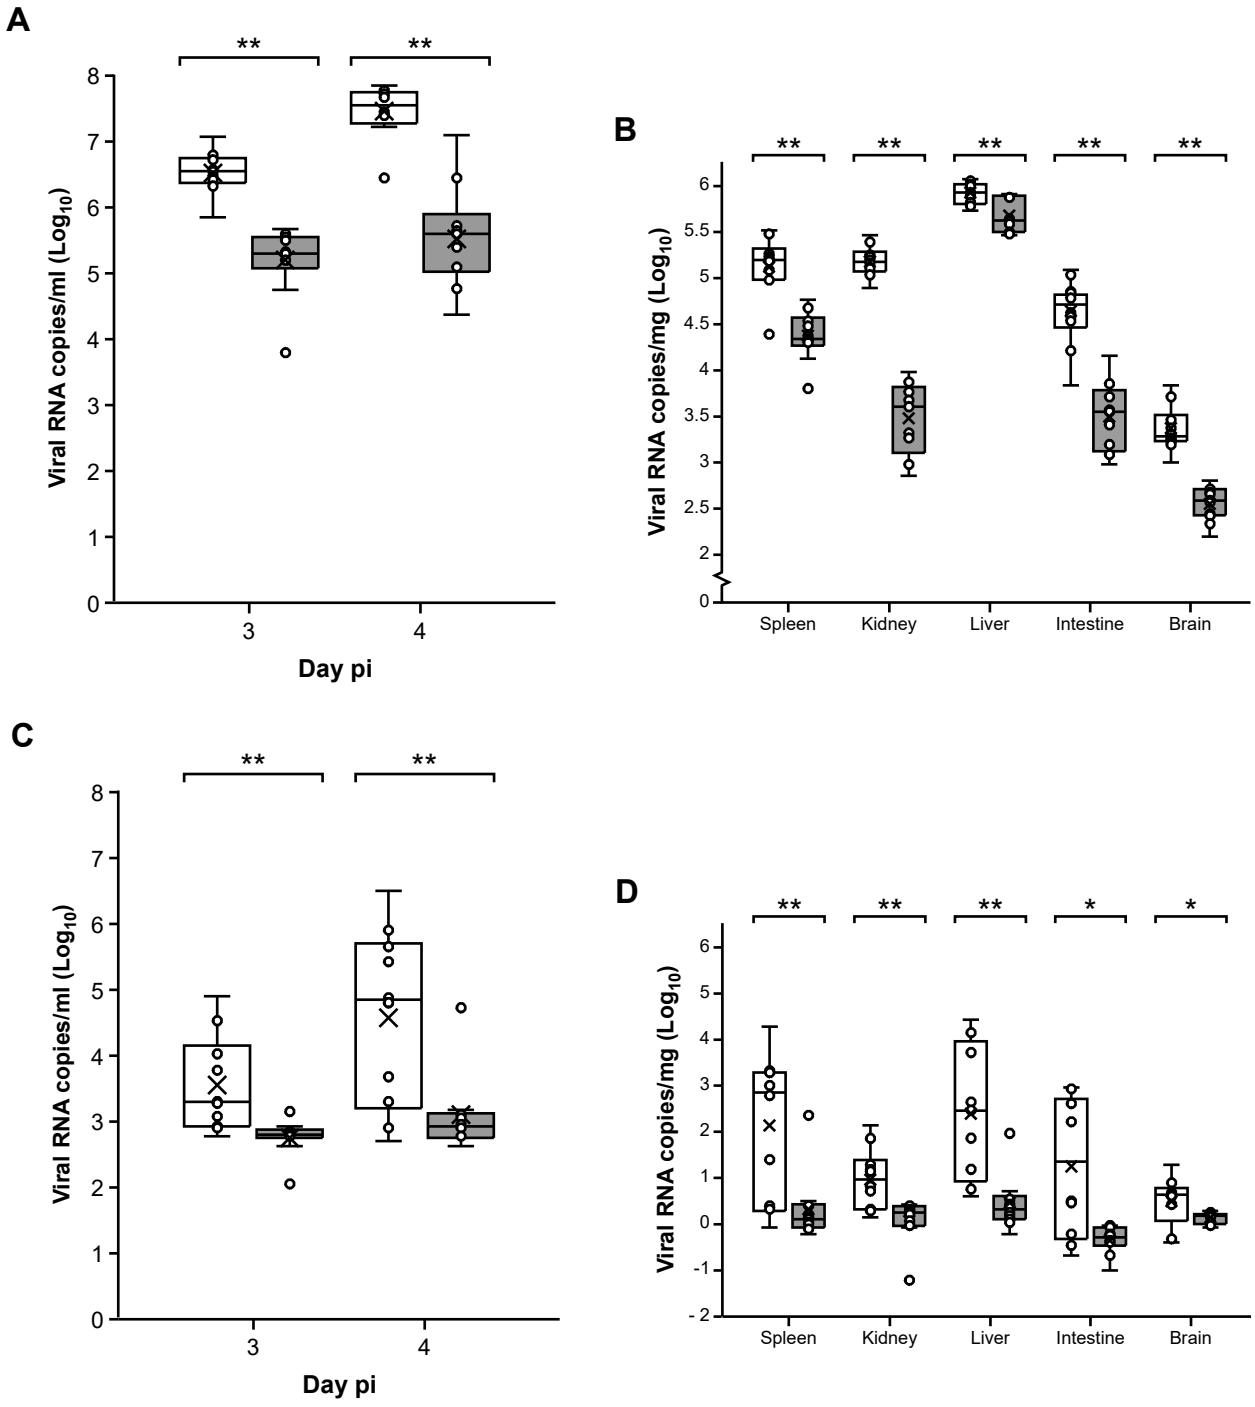

Fig. 2. Significant reduction in viral RNA load in serum and tissues of USUV-infected mice treated with favipiravir compared to those treated with vehicle. Male (8–14 weeks old) AG129 mice (n = 10/group) were inoculated ip with either 10^2 PFU/1.3 × 10^5 $TCID_{50}$ (A and B) or 10^0 PFU/1.3 × 10^3 $TCID_{50}$ (C and D) of USUV V18. Mice were treated twice-daily by oral gavage with favipiravir (T-705, 150 mg/kg/dose; grey bars) or vehicle (0.4% sodium carboxymethylcellulose, CMC-Na; white bars) for 5 consecutive days, starting one day prior to infection. Viral RNA load in serum (A and C) was determined on d3 and d4 pi, whereas viral RNA load in tissues (B and D) was determined at d4 pi, a time point at which all mice were sacrificed. Viral RNA was extracted from tissues using the RNeasyMini Kit (Qiagen, The Netherlands) followed by viral RNA quantification by means of RT-qPCR.Statistical analysis was performed using the Shapiro–Wilk test for normality followed by the one-tailed Mann-Whitney U test. **, $p < 0.01$; *, $p < 0.05$ (Statistical tools, available from http://sdittami.altervista.org/shapirotest/ShapiroTest.html and http://in-silico.online , accessed May 2018).

symptoms (such as rapid body weight loss, hunched posture, and lethargy), conjunctivitis as well as neurotropic symptoms (such as movement impairment, lower limb paralysis). Next, viral RNA levels were monitored in the blood at d3-d5 pi to determine the day of peak viremia. In mice infected with either 10^2 PFU (1.3 × 10^5 $TCID_{50}$) or 10^3 PFU (1.3 × 10^6 $TCID_{50}$), comparable high levels of viral RNA were detected in the blood of infected mice at day 3 pi: 6.6 log_{10} and 6.5 log_{10}, respectively (Supplemental Fig. 2). Viral RNA levels increased further in the following days, reaching a peak level of 8.3log_{10} at d4 pi and 8.8log_{10} at d5 pi for mice infected with 10^2 PFU (1.3 × 10^5 $TCID_{50}$) and 10^3 PFU (1.3 × 10^6 $TCID_{50}$), respectively. At d5, pi the majority of the mice infected with the higher inoculum were euthanized, whereas

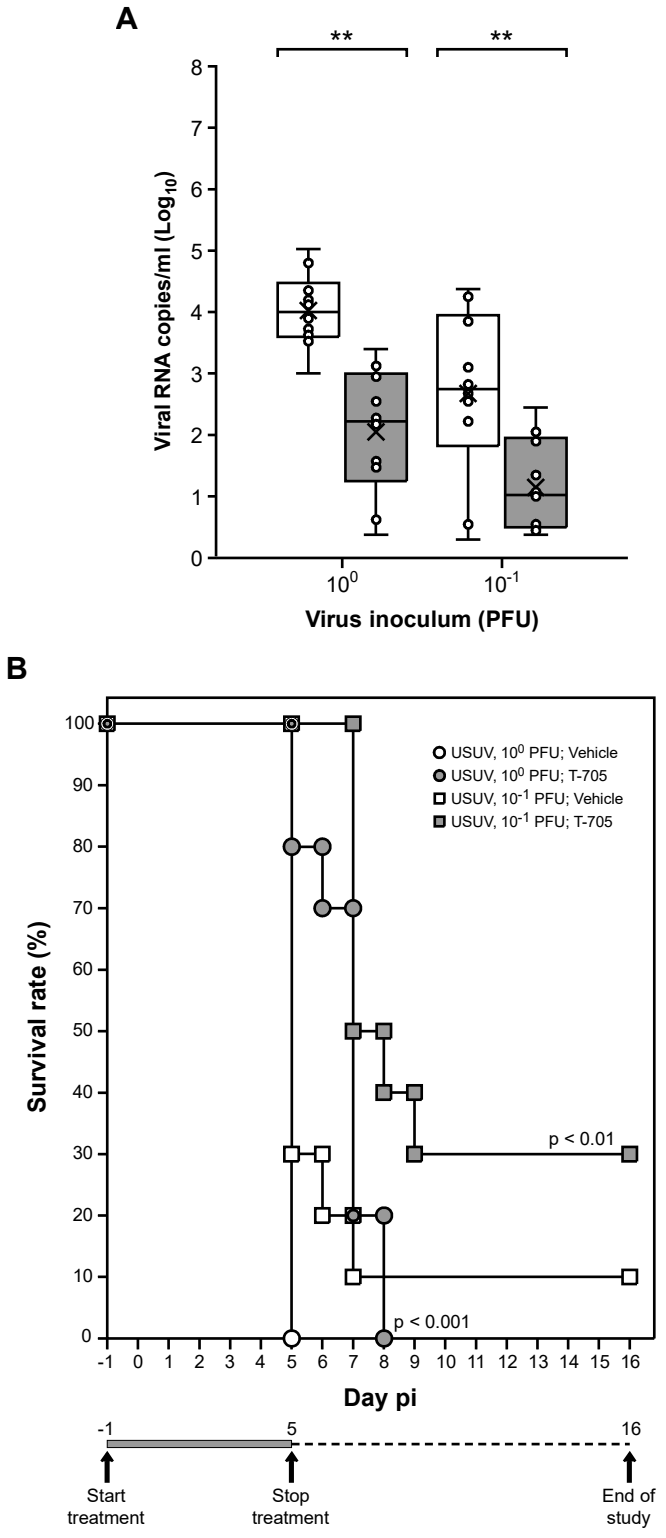

Fig. 3. Significant reduction in viremia (A) translates in significant delay in USUV-induced disease(B) in mice treated with favipiravir. Male (8–14 weeks old) AG129 mice (n = 10/group) were inoculated ip with either 10^0 PFU/ 1.3×10^3 $TCID_{50}$ (depicted by circles in B) or 10^{-1} PFU/1.3×10^2 $TCID_{50}$ (depicted by squaresin B) of USUV V18. Mice were treated twice-daily by oral gavage with favipiravir (T-705, 150 mg/kg/dose; grey bars, squaresor circles) or vehicle (0.4% CMC-Na;white bars, squaresor circles) for 6 consecutive days, starting one day prior to infection. Mice were observed daily for body weight loss and the development of virus-induced disease.In caseof a body weight loss of ≥ 20% and/or severe illness, mice were euthanized with pentobarbital (Dolethal). Viral RNA load in serum was determined at the day of peak viremia (d4 pi) by RT-qPCR.Statistical analysis was performed using the Shapiro–Wilk test for normality followed by the one-tailed Mann-Whitney U test (viremia) or the Log rank test (survival). **, $p < 0.01$ (Statistical tools, available from http://sdittami.altervista.org/shapirotest/ShapiroTest.html and http://in-silico.online , accessedMay 2018).

this was the case for only one mouse in the lower inoculum group. Based on these findings, it was decided to quantify viremia in blood at d3 and d4 pi and in tissues at d4 pi in all further experiments using an inoculum of 10^2 PFU (1.3×10^5 $TCID_{50}$) or lower.

The USUV mouse model was then validated for suitability in antiviral studies. To this end, favipiravir was used, which was earlier shown to be active in mouse infection models with other (related) viruses (Delang et al., 2014; Furuta et al., 2002; Gowen et al., 2007; Julander et al., 2009; Morrey et al., 2008; Rocha-Pereiraet al., 2012). Treatment of mice infected with 10^2 PFU (1.3×10^5 $TCID_{50}$) USUV for 5 consecutive days with favipiravir (150 mg/kg/dose, BID, oral gavage) resulted in a statistically significant reduction of viral RNA levels in the blood as compared to vehicle-treated mice at both d3 and d4 pi: $1.3\log_{10}$ and 1.9 $\log_{10}$, respectively (Fig. 2A). In addition, viral RNA levels were also statistically significantly reduced in tissues (spleen, kidney, liver, intestine and brain) as compared to vehicle-treated mice (Fig. 2B). The reduction in viremia appeared to be independent on the inoculum used, as significant reductions in viral RNA load were also observed in favipiravir-treated mice infected with a 100 fold lower virus inoculum (i.e. 10^0 PFU/1.3×10^3 $TCID_{50}$) (Fig. 2C and D).

Finally, it was assessedwhether the reduction in viremia that is brought about by favipiravir translates into a significant delay of virus-induced disease progression. Mice were infected with 10^0 PFU (1.3×10^3 $TCID_{50}$; as in Fig. 2C and D) or a lower inoculum (i.e., 10^{-1} PFU/1.3×10^2 $TCID_{50}$). Treatment with favipiravir significantly reduced viremia by $1.8\log_{10}$ and 1.7 $\log_{10}$ in mice infected with 10^0 PFU respectively 10^{-1} PFU (Fig. 3A), as was shown before. In addition, treatment with the compound significantly delayed virus-induced diseasein both groups (Fig. 3B). In mice infected with 10^0 PFU, the mean day of euthanasia (MDE) was 5.0 and 6.7 for mice treated with vehicle or favipiravir, respectively, whereas the MDE was 6.4 (vehicle) and 10 (favipiravir) in mice infected with a 10-fold lower inoculum. Favipiravir could not halt the progression of the diseaseand ultimately all 10 mice (inoculated with 10^0 PFU/1.3×10^3 $TCID_{50}$), respectively 7 out 10 mice (inoculated with 10^{-1} PFU/1.3×10^2 $TCID_{50}$), had to be euthanized.

In conclusion, the USUV infection model in AG129 mice represents a suitable model for use in antiviral studies. USUV causesa particularly fulminant infection in AG129 mice, which may also explain the rather modest protection that is achieved by the reference compound favipiravir.

Abstract: The Usutu virus (USUV) is a flavivirus that is drawing increasing attention because of its potential for emergence. First isolated in Africa, it was introduced into Europe where it caused significant outbreaks in birds, such as in Austria in 2001. Since then, its geographical distribution has rapidly expanded, with increased circulation, especially in the last few years. Similar to West Nile virus (WNV), the USUV enzootic transmission cycle involves Culex mosquitoes as vectors, and birds as amplifying reservoir hosts, with humans and other mammals likely being dead-end hosts. A similarity in the ecology of these two viruses, which co-circulate in several European countries, highlights USUV's potential to become an important human pathogen. While USUV has had a severe impact on the blackbird population, the number of human cases remains low, with most infections being asymptomatic. However, some rare cases of neurological disease have been described, both in healthy and immuno-compromised patients. Here, we will discuss the transmission dynamics and the current state of USUV circulation in Europe.

Keywords: USUV; Usutu; WNV; flavivirus; emergence

1. Introduction

The dramatic outbreaks and global spread of the chikungunya virus (CHIKV) and the Zika virus (ZIKV) illustrate the danger that emerging arboviruses represent. Given the plethora of mosquito-transmitted viruses, which have been identified to date, and the known ability of RNA viruses to mutate rapidly to adapt to new environments, it is likely that other arboviruses will emerge in the next decades. The Usutu virus (USUV), an arbovirus from the Flaviviridae family, genus Flavivirus, has recently garnered a great deal of attention from the scientific community, particularly since its emergence in Europe. Similar to other flaviviruses, its (+)-strand RNA genome of 11,064 nucleotides encodes a single polyprotein of 3,434 amino acids that is subsequently cleaved into structural (C, prM and E) and non-structural (NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5) proteins. The natural life cycle of USUV involves Culex mosquitoes as its main vector, and multiple bird species as a natural viral reservoir. To date, USUV has been mostly associated with disease in birds, with spectacular episodes of mass mortality occurring in Central Europe; but it can also infect humans, and in some rare cases, it can be associated with neurological complications.

In this review, we will summarize the current knowledge on USUV, with particular emphasis on the increased circulation in Europe in recent years, the dynamics of transmission, and the human clinical cases described to date.

2. Introduction of USUV in Europe and Genetic Diversity

USUV belongs to the Japanese encephalitis virus (JEV) antigenic complex, together with West Nile virus (WNV) and Murray Valley encephalitis virus (MVEV). It was isolated for the first time in

1959 from a Culex neavei mosquito caught near the Usutu river in Swaziland [1]. Since then, the virus has continuously circulated within Africa, having been detected in Senegal, Uganda, Central African Republic, Nigeria, Burkina Faso, and Côte d'Ivoire (reviewed in [2]). USUV was observed in Europe for the first time in Vienna in 2001 [3], where it was responsible for massive outbreaks in blackbirds (Turdus merula) and gray owls (Strix nebulosa). A retrospective study analyzing dead birds conducted in the Tuscany region of Italy showed that USUV has been circulating in Europe since 1996 [4].

The genetic variability of USUV has been explored through phylogenetic studies performed over full-length sequences, as well as the envelope and NS5 genes [5–9]. These analyses cluster USUV sequences into distinct lineages which are designated on the basis of their geographic origin of isolation: Africa 1, 2 and 3 and Europe 1, 2, 3 and 4 (Figure 1). A recent phylogenetic study focused on partial NS5 gene sequences (265 bp) revealed a novel lineage (Europe 5) composed of strains isolated from birds in Germany in 2016 [8]. The prototype African strain SAAR-1776 (represented with a star in Figure 1) is distantly related to the European lineages. In addition to these genetic differences, SAAR-1776 differs from other USUV strains in that it was generated by intracerebral inoculation of newborn mice [1].

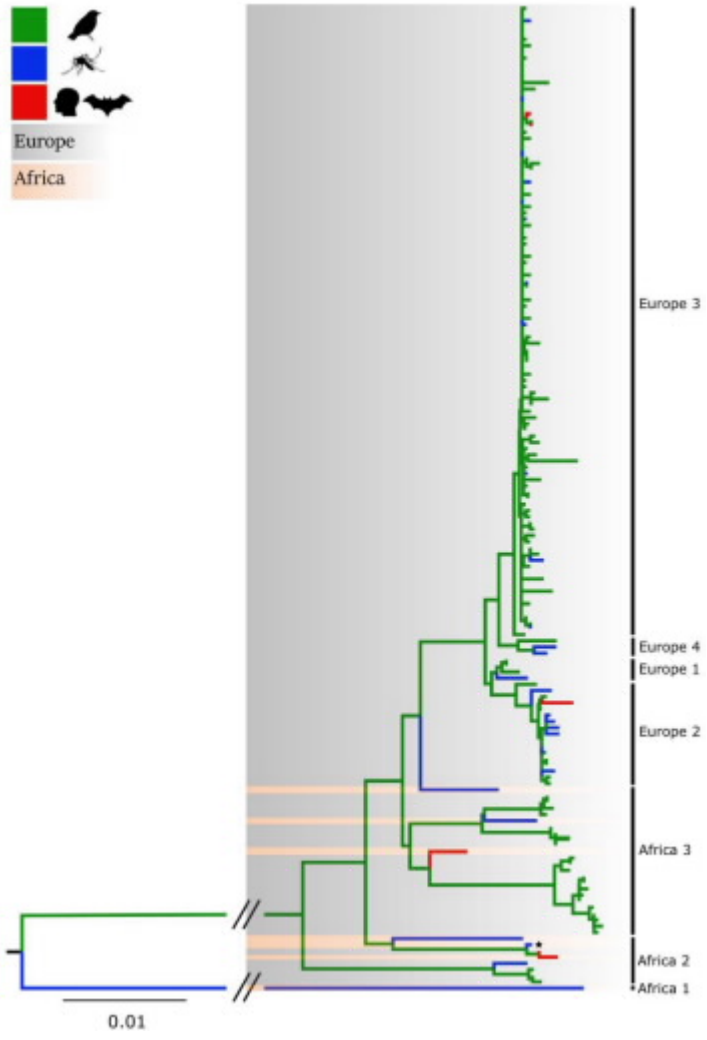

Figure 1. Maximum-likelihood phylogenetic tree analysis of the NS5 gene of USUV strains (n_1 = 158) circulating worldwide. Strains isolated from birds, mosquitoes and mammals are indicated in green, blue and red, respectively. African and European variants are shaded in pink and gray, respectively. The prototype SAAR-1776 strain is indicated by a star. The bar at the bottom of the tree denotes evolutionary distance, as number of base substitutions per site. The interrupted branches (indicated by oblique lines) were shortened by 50% for better graphic representation. The list of USUV strains used to generate the tree are provided in Supplemental Materials: Table S1.

3. Transmission Dynamics

3.1. WNV and USUV Co-Circulation and Co-Infection Dynamics

The transmission dynamics of arboviruses are generally influenced by biological and environmental factors, such as the identity and population density of vector and reservoir species,

USUV is thought to have been introduced in Europe multiple times through bird migration, starting in the 1950s [7]. The Europe 1 lineage is thought to derive from a virus in Senegal that reached Spain, and is likely the origin of the first epizoosis in Central Europe. According to the same study, the Europe 2 and 3 lineages probably originated in Austria in 1993, and in Italy in 2007, respectively (Figure 2). Since these introductions, the virus has spread rapidly around the Mediterranean basin and Central Europe, reaching Tunisia [10], Morocco [11], Israel [12], Greece [13], France [14], Spain [15], Poland [16], Hungary [17], Czech Republic [18], Serbia [5], the United Kingdom [19], Croatia [20], the Netherlands [21], Switzerland [22], Italy [23], where it gave rise to the Europe 4 lineage, and Germany [24], where 3 different lineages have been recently shown to co-circulate [25]. Recent evidence suggests that introduction events into Europe from Africa are still happening. Indeed, viruses from African lineages were recently detected in Germany [26] and in the Camargue area of France [14].

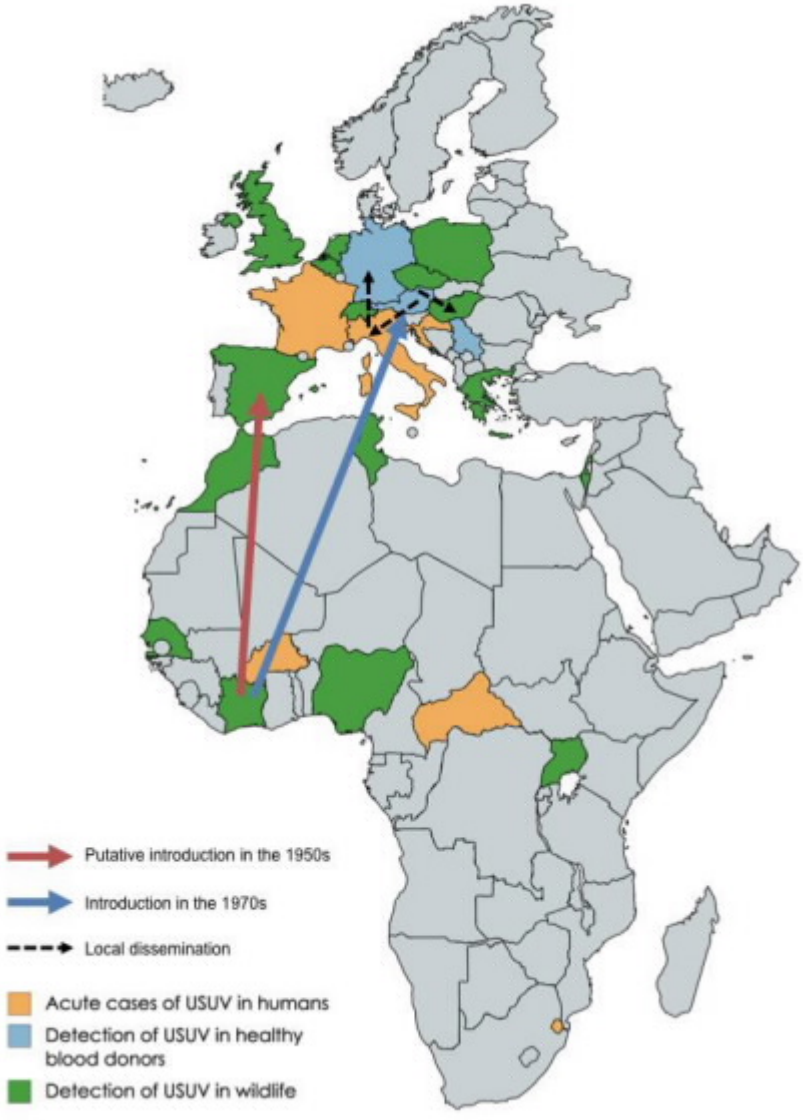

Figure 2. Geographical distribution of USUV. Countries where USUV was detected in wildlife (birds, mosquitoes, horses, etc.) are indicated in green; countries where USUV was detected in healthy blood donors are represented in blue; and countries where USUV caused symptomatic, acute infections are shown in orange. The arrows represent the presumed bird migration event that led to introduction of USUV in Europe, according to Engel et al. [7].

In one human case, viral RNA was detected simultaneously for both viruses [31,32], confirming that co-infection does occur. How significant USUV and WNV co-circulation and co-infections are at

The viral or immunological determinants responsible for USUV adaptation to birds and humans remain unclear. Similar to other arboviruses alternating between the insect vector and mammalian host species, evidence of strong purifying selection was detected across the entire viral genome [7]. In the case of USUV, European lineages seem to be subjected to a stronger negative selection than African lineages [7]. Nevertheless, one position in the viral polymerase gene NS5 (amino acid 898) evolved under significant positive selection, possibly reflecting an ongoing host/pathogen evolutionary conflict. Interestingly, another substitution in the NS5 gene has been observed in the Bologna/09 viral strain [27] derived from an USUV-positive patient recovering from orthotropic liver transplant [28]. As more viral sequences are made available, the viral determinants influencing USUV pathogenesis may be identified, as well as whether or not other factors such as evasion from the IFN response participate in this process.

3. Transmission Dynamics

3.1. WNV and USUV Co-Circulation and Co-Infection Dynamics

The transmission dynamics of arboviruses are generally influenced by biological and environmental factors, such as the identity and population density of vector and reservoir species, the extrinsic incubation period, humidity, temperature, host immunity, etc. In this regard, USUV shares a few common features with WNV: both viruses are mainly transmitted by Culex mosquitoes, with migratory birds acting as the major amplifying host (Table 1). Therefore, it is not surprising that in Europe, where WNV has also recently re-emerged, the two viruses co-circulate in 10 European countries and in 34 species of birds [29], as well as in horses [10]. Furthermore, 9 cases of birds [19,30] and 3 cases of humans [31,32] with positive serology for both viruses have been reported to date. This may be the result of local co-circulation of WNV and USUV, although cross-reactivity of antibodies complicates interpretation of results. Indeed, the envelope protein of USUV shares some structural features with the WNV envelope [33,34], and antibody cross-reactivity has been observed [35]. Thus, serological tests, such as ELISAs, cannot always distinguish USUV from WNV, which has led to the hypothesis that USUV circulation may be underestimated [36]. Other assays, such as protein microarray based on NS1 [37] or quantitative multiplex real-time RT-PCR [38], have been developed in recent years.

In one human case, viral RNA was detected simultaneously for both viruses [31,32], confirming that co-infection does occur. How significant USUV and WNV co-circulation and co-infections are at the population level, and whether a previous flavivirus infection influences subsequent WNV or USUV infections, remain to be determined. An in vivo study suggested that the immunization of mice with recombinant WNV particles induced low levels of antibodies cross-reacting with USUV [39]. Similarly, a previous infection with USUV was shown to reduce the susceptibility of adult mice to WNV [40]. Future work should determine whether such processes of cross-protection, or in the opposite sense, whether antibody enhancement of infection, may occur and be relevant for USUV transmission in birds and humans.

3.2. Vector Species for USUV

While USUV has been detected in a wide range of mosquitoes, it seems to be most frequently associated with *Culex pipiens* [41,42], which is thought to be the main vector for USUV in Europe. Indeed, competence studies have shown that *Culex pipiens* supports high levels of USUV infection [43–46]. Notably, competence of *Culex pipiens* for USUV and WNV is comparable at 18 $^{+}$C and 23 $^{+}$C, but not at 28 $^{+}$C, where mosquitoes had higher susceptibility for USUV [43]. This may indicate some interesting temperature-related di (erences in the ability of the two viruses to overcome anatomical barriers and bottlenecks. As noted for other arboviruses, there may be some variation in the ability of USUV to infect di (erent *Culex pipiens* populations. Indeed, the prototype strain SAAR-1776 could only infect one of the two *Culex pipiens* colonies from the United Kingdom [44], suggesting that host factors or

genetics may restrict infection in these mosquitoes. Whether this is specific to the SAAR-1776 strain, or whether this happens with European USUV strains, remains to be established.

Other species of Culex have been described to be competent for USUV: for instance, both Culex neavei and Culex quinquefasciatus show high infection and dissemination rates [45,47]. USUV has been detected in pools of Aedes albopictus [41,48,49], an invasive mosquito species involved as an alternative vector for the transmission of many arboviruses, such as CHIKV. This prompted further investigation into Aedes albopictus competence for USUV. The results indicated that Aedes albopictus exhibits a lower competence for USUV [45], although the virus can replicate in the body and escape the midgut barrier [50]. In more rare cases, USUV was also detected in other mosquito species such as Aedes japonicus, Aedes vexans, Anopheles maculipennis, Anopheles plumbeus, Coquillettidia richiardii, Culiseta annulata, and some Ochlerotatus species [41,42,46]. USUV has never been detected in ticks, even in areas such as Italy where USUV circulation is known to be significant [51,52]. Since a single mutation was required for CHIKV adaptation to Aedes albopictus [53], sustained surveillance efforts may be required to rapidly detect potential adaptation of USUV to new vector species, which may allow viral dissemination into new geographic regions.

3.3. Reservoir of USUV

The main USUV natural hosts are birds, with infection being reported to date in 93 different species belonging to 35 families [54]. USUV is particularly pathogenic in a few species such as blackbirds (Turdus merula), gray owls (Strix nebulosa), and house sparrows (Passer domesticus) [17,55]. In these birds, systemic USUV replication is likely the cause of the severe pathogenesis, as the virus was detected in many organs such as the liver, heart, brain, and spleen [56]. Necrotic lesions were noted in these organs [57]. It is currently not known whether USUV can infect American robins (Turdus migratorius), a bird species that was critical for WNV dissemination across the US [58]. However, USUV potently infects its European counterpart Turdus merula, and many other Passeriformes birds known to be susceptible to WNV, such as the common starling (Sturnus vulgaris) or the house sparrow [29].

USUV induced mass mortality in blackbirds and grey owls in Austria [57], Germany [56], France [59], and the Netherlands [21], with dramatic consequences on bird populations. For instance, in Germany, the blackbird population declined by 15% within 5 years of USUV's arrival [8]. In Austria, however, bird mortality sharply dropped after 2004, while the number of infected birds with low viral titers increased [17]. This may have resulted from the acquisition of herd immunity: in owls and birds of prey, the proportion of seropositive birds reached levels above 50% [60]. Interestingly, only a relatively low number of bird species have been subjected to large die-off episodes, and in some avian species such as chickens or geese, experimental inoculation of USUV only caused mild pathogenicity [61,62]. The basis for these species-specific differences in pathogenicity is currently unknown. The co-infection of birds with USUV and other pathogens may increase disease severity: for instance, co-infection of birds with USUV and Plasmodium spp. can lead to a more severe outcome than when they carry only one of these pathogens [21,63]. Future investigation will help determine which virological and immunological factors influence USUV pathogenesis and co-morbidities.

3.4. Other Dead-End Hosts

Beyond infection of birds and humans, USUV has been detected in many mammalian species considered to be dead-end hosts. As is the case with WNV, horses are considered to be a sensitive host for USUV: viral circulation has been detected in Tunisia [10], Spain [64], Serbia [65], Poland [16] and Croatia [20]. USUV can also infect dogs [66,67], dear [68] and wild boars [69]. USUV was also detected in bats [70], squirrels [71] and rodents [72], in which the virus did not seem to cause the same severe pathogenicity as it does in birds, raising concerns that these species could act as secondary reservoirs. Whether USUV can reach a viremia in these animals to sustain a new mosquito infection cycle is unclear. The expanding range of wild animals susceptible to USUV highlights its potential as an important emerging pathogen.

4. Human Clinical Cases and Disease

The first human cases of USUV infection were described in Central African Republic and Burkina Faso in the 1980s and in 2004, respectively, with mild symptoms such as fever and rash [2]. To date, a total of 28 acute USUV infections have been reported in humans [73], including some serious complications such as meningoencephalitis [28,74] and facial paralysis [75]. Seroprevalence studies suggested that USUV infections in humans may have been largely underestimated, and many of them may be asymptomatic. Indeed, antibodies against USUV were detected in the blood of 0.01% to 1% of healthy blood donors in Germany and Italy, respectively [49,76,77]. Higher seroprevalence was detected in serum samples collected from healthy individuals in Serbia (7.5%) [78] and from forestry workers in Italy (18%) [79]. A large retrospective study, conducted on over 900 patients, of which about a third were suspected for encephalitis or meningoencephalitis, found a prevalence of 6.5% [80]. In contrast, two studies failed to detect USUV in the cerebrospinal fluid of patients with encephalitis in Italy and Switzerland [81,82]. These studies indicate that USUV already circulates to significant levels in human populations, although it is rarely associated with neurological complications.

While most USUV infections are mild or asymptomatic, neurotropism represents a growing concern for human health, especially since two immuno-compromised patients tested positive for USUV. One of them was recovering from a liver transplant [28], and the other was diagnosed with a B cell lymphoma [74]: both showed signs of neuropathogenesis that were thought to be caused by USUV. Both survived the infection. USUV RNA was also detected by RT-PCR in cerebrospinal fluid of patients su(ering from meningoencephalitis, suggesting that the virus may establish an infection in the brain [83]. Several other lines of evidence suggest that USUV can be neurotropic. First, this virus was detected in the brains of dead bats and birds in the wild [57,70]. Furthermore, experimental infection of 1-week-old suckling mice leads to paraplegia and paralysis, and is associated with apoptosis and demyelination of neuronal and glial cells [84]. Moreover, the USUV virus isolated from a patient diagnosed with facial paralysis could infect primary astrocytes [75]. An in vitro study confirmed these findings and demonstrated that USUV can establish productive infection and induce apoptosis in a wide range of neural cells such as neurons, astrocytes, microglial cells and neuronal stem cells [85]. USUV was even shown to be associated with levels of infection and apoptosis in neuronal cells that were higher than ZIKV, suggesting that USUV may potentially cause significant neurological defects [85].

5. Cellular Responses to USUV Infection

USUV infection triggers the induction of pro-inflammatory and antiviral responses, including cytokine secretion. In primary human nasal epithelial cells, USUV induces a modest expression of IL6, IL8 and IP10, albeit to lower levels than JEV [86]. In dendritic cells (DCs), USUV induces high levels of TNF-([87], and of both IFN-(and IFN-) [87,88], leading to the expression of Interferon Stimulated Genes (ISGs). Interestingly, cells infected by USUV induce IFN to higher levels than cells infected by WNV (10- to 100-fold, depending on the multiplicity of infection and time point considered) [88]. USUV is also very sensitive to the antiviral e(ect of IFN: in A549 cells, USUV replication is restricted 10 times more potently than WNV by a wide variety of IFN-I and IFN-III subtypes [88]. Consistent with these findings, while adult Swiss mice are highly susceptible to WNV infection, they are not to USUV [40]. In contrast, USUV infection induced high mortality rates in suckling mice, which have not yet developed a functional IFN response [40,84], or in AG129 mice, knocked-out for the IFN-(and IFN- pathways [89]. Taken together, these results suggest that USUV is potently controlled by the IFN response, which may account (at least in part) for its low viral pathogenicity in humans.

Conversely, USUV may also hijack cellular responses to its advantage: for instance, it triggers the autophagy pathway in infected cells, stimulating viral replication [90]. The interplay between autophagy and flaviviruses, which has been described before [91], could be particularly interesting, since it may provide cellular drug targets. Indeed, the autophagy inhibitors 3-methyladenine and wortmanin significantly reduced USUV replication in Vero cells (from 3-fold to 5-fold) [90]. Host lipid

biosynthesis pathways are also required for the production of infectious viral particles: inhibition of the acetyl-CoA carboxylase (ACC) enzyme by two different drugs very potently (up to 3 logs) inhibited WNV and USUV [92]. Finally, favipiravir, a broad-spectrum viral RNA polymerase inhibitor, has shown some efficacy in restricting USUV replication in the AG129 model [89].

6. USUV Circulation in the Future: Surveillance and Mathematical Modeling

The circulation of USUV in bird and human populations is already solidly established in Europe, as evidenced by the massive decline in blackbird populations [8] and the significant levels of seroconversion in human blood donors [76–80]. However, the extent of USUV circulation in 2018 is unprecedented [93]. In France, USUV was detected from dead birds in 46 administrative districts, versus only 4 in 2017 (Cécile Beck, personal communication). In Austria, 18 blood donors (16 of them asymptomatic) tested positive for USUV, while only 6 did in 2017 [32]. According to the European Centre for Disease Prevention and Control (EDCC), WNV circulation also reached historically high levels in Europe in 2018, with 2083 human cases, representing a 7-fold increase compared to 2017. Some countries, such as Bulgaria (15-fold increase), France (13.5-fold increase) and Italy (11-fold increase) were particularly impacted by the uptick in WNV circulation. A likely hypothesis for this is that some environmental and ecological factors influencing both USUV and WNV account for the exceptional levels of viral circulation in 2018. However, the possibility that viral adaptation may have contributed to this increased circulation of USUV cannot be ruled out. Therefore, surveillance of USUV circulation, as well as monitoring USUV evolution, will be crucial to try to prevent future outbreaks. This goal remains difficult to achieve, notably because of the lack of large-scale cohort studies and the absence of commercially available diagnostic reagents for USUV. In this context, mathematical modeling can help estimate the potential levels of USUV circulation. Habitat models have recently been used to predict the number of USUV cases in under-sampled areas [94]. Two models have been developed to study USUV transmission dynamics: a mechanistic epidemiological model, aimed at estimating USUV transmission in Austria [95,96]; and a correlation-based environmental model, based on data collected in Germany [8]. Both models were used in a recent study to generate risk maps for USUV [97]. Large areas of Central and Western Europe including northern Italy, Austria, southern France, and a large area spanning the North East of France, Belgium, and the North West of Germany, were predicted as suitable for USUV replication. As temperatures are likely to increase in Europe because of the effects of climate change, these risk maps are even likely underestimating future USUV transmission rates.

Given the similarities in the ecology of WNV and USUV (Table 1), and the relatively recent emergence of USUV in Europe, it is possible that USUV has the potential to reach levels of viral circulation similar to those of WNV. For now, USUV has seemingly not reached the United States, but a study established that North American colonies of Culex pipiens and Culex quinquefasciatus are competent vectors for USUV [45]. As stated earlier, USUV also infects multiple bird species very closely related to the ones that were involved in dissemination of WNV in the United States. Therefore, USUV emergence outside of Europe should be considered a real possibility, prompting research and surveillance efforts.

On the other hand, it is possible that WNV and USUV are competing with each other, and that the co-existence of both viruses at high levels in the same geographical areas and ecological niches is impossible. Such competition between two related flaviviruses has been observed before, for instance in the case of WNV and Saint Louis encephalitis virus (SLEV). Indeed, prior to WNV emergence in the US, SLEV was endemic in southern California, but circulation drastically dropped after WNV invasion in 2003 [104]. This led to the hypothesis that SLEV, while still capable of sporadically re-emerging [105], has been outcompeted by WNV, which infects similar bird and vector species with greater success.

Table 1. Comparison of WNV and USUV main characteristics. Some important features of West Nile Virus (WNV) and Usutu Virus (USUV) are listed here, with the corresponding bibliographical references.

	WNV	USUV
Geographical Distribution	Africa, Europe, Middle East, North America and West Asia	Africa, Europe
Main Vector	Culex spp.	Culex spp.
Putative Secondary Vector	A. vexans [98], A. japonicus [99], A. albopictus [100]	A. albopictus [45,50]
Amplifying Host	Migratory birds	Migratory birds
Main Route of Transmission	Mosquito bite	Mosquito bite
Alternate Route of Transmission	Rare cases of contamination through organ transplant and transfusion [101] and of mother-to-child transmission [102]	Not described
Sensitivity to IFN	Strong [88]	Very strong [88]
Antagonism of IFN Response	Through NS4B [103]	Not described

7. Concluding Remarks

While USUV has caused significant outbreaks in birds since 2001, its limited circulation and overall low pathogenicity in humans explain why researchers and public health authorities are not yet too concerned about this pathogen. In the context of unprecedented viral circulation in 2018, and since USUV has now clearly been shown to be associated with neurological disorders, increased surveillance and research efforts are in order. In particular, larger cohort studies of populations of interest, such as wildlife workers and patients suffering from encephalitis, will help more accurately estimate USUV prevalence. Identifying molecular determinants associated with virulence, host tropism, and adaptation to new vectors may help anticipate key events leading to the possible emergence of USUV. Finally, developing antiviral approaches, or other preemptive or control measures in humans or at the reservoir-vector interface, will help control USUV circulation and reduce the economic and sanitary burden it may pose in the future.

ABSTRACT Venezuelan equine encephalitis virus (VEEV) is a representative member of the New World alphaviruses. It is transmitted by mosquito vectors and causes highly debilitating disease in humans, equids, and other vertebrate hosts. Despite a continuous public health threat, very few compounds with anti-VEEV activity in cell culture and in mouse models have been identified to date, and rapid development of virus resistance to some of them has been recorded. In this study, we investigated the possibility of using a modified nucleoside analog, β-D-N⁴-hydroxycytidine (NHC), as an anti-VEEV agent and defined the mechanism of its anti-VEEV activity. The results demonstrate that NHC is a very potent antiviral agent. It affects both the release of genome RNA-containing VEE virions and their infectivity. Both of these antiviral activities are determined by the NHC-induced accumulation of mutations in virus-specific RNAs. The antiviral effect is most prominent when NHC is applied early in the infectious process, during the amplification of negative- and positive-strand RNAs in infected cells. Most importantly, only a low-level resistance of VEEV to NHC can be developed, and it requires acquisition and cooperative function of more than one mutation in nsP4. These adaptive mutations are closely located in the same segment of nsP4. Our data suggest that NHC is more potent than ribavirin as an anti-VEEV agent and likely can be used to treat other alphavirus infections.

IMPORTANCE Venezuelan equine encephalitis virus (VEEV) can cause widespread epidemics among humans and domestic animals. VEEV infections result in severe meningoencephalitis and long-term sequelae. No approved therapeutics exist for treatment of VEEV infections. Our study demonstrates that β-D-N⁴-hydroxycytidine (NHC) is a very potent anti-VEEV compound, with the 50% effective concentration being below 1 μM. The mechanism of NHC antiviral activity is based on induction of high mutation rates in the viral genome. Accordingly, NHC treatment affects both the rates of particle release and the particle infectivity. Most importantly, in contrast to most of the anti-alphavirus drugs that are under development, resistance of VEEV to NHC develops very inefficiently. Even low levels of resistance require acquisition of multiple mutations in the gene of the VEEV-specific RNA-dependent RNA polymerase nsP4.

KEYWORDS alphaviruses, antivirals, N-hydroxycytidine, RNA-dependent RNA polymerase, Venezuelan equine encephalitis virus, drug-resistant mutant, lethal mutagenesis

Alphaviruses represent a group of mosquito-borne viruses that are widely distributed on all continents. Most of them are maintained in nature by continuous transmission between mosquito vectors and vertebrates that serve as amplifying hosts.

Based on their geographical distribution, the currently known members of the Alphavirus genus are divided into the New World (NW) and the Old World (OW) alphaviruses (1). Although the OW alphaviruses cause less severe diseases characterized by rash, fever, and arthritis, most of the NW alphaviruses exhibit an encephalitogenic phenotype (1). The NW representative members include Venezuelan (VEEV), eastern (EEEV), and western (WEEV) equine encephalitis viruses (2–6). In humans, these viruses cause debilitating diseases, and the overall mortality rates are ! 1% (7), 30 to 80% (8), and 1 to 5% (9) for VEEV, EEEV and WEEV, respectively.

Alphaviruses replicate to very high titers in many commonly used cell lines of vertebrate and mosquito origins. They can be produced on a large scale, stored in lyophilized form for a long period of time, and efficiently distributed by aerosol. Moreover, mortality rates are amplified with aerosol infection (10). Therefore, EEEV and some VEEV strains can potentially be used by bioterrorists, and thus they are on the U.S. Select Agents and Toxins list. Nevertheless, despite continuous circulation in Central, South, and North America and the public health threat, no safe and efficient vaccines or therapeutics exist against VEEV or other NW alphavirus infections.

VEEV is a relatively small enveloped virus. Its genome consists of a single-stranded RNA (G RNA) of positive polarity. Upon release into the cytoplasm from the nucleocapsids, G RNA serves directly as a template for the translation of nonstructural proteins that mediate replication of viral G RNA and transcription of the subgenomic RNA (SG RNA). The latter RNA is translated into viral structural proteins that ultimately form infectious, G RNA-containing virions. The nonstructural proteins are initially synthesized as precursor polyproteins P123 and P1234 and are later processed by nsP2-associated protease activity into individual nsP1, nsP2, nsP3, and nsP4. This stepwise processing of the polyproteins regulates synthesis of the negative-strand RNA genome intermediates, G RNAs and SG RNAs (11–13).

To date, many functions of individual nsPs in RNA and virus replication have been identified. nsP2, which exhibits protease and helicase activities, and nsP4, which contains the predicted RNA-dependent RNA polymerase (RdRp) domain (1), attracted most of the attention as possible targets for the development of antiviral drugs. However, few screens have yielded positive results thus far. In one study, the identified CID15997213 compound demonstrated a strong inhibitory effect on VEEV replication in vitro and in a small animal model via its targeting of the nsP2 protein and ultimately viral RNA replication (14). Some other quinazolinone-derived molecules also exhibited antiviral activity against VEEV (15, 16). For example, compound ML336 inhibited several VEEV strains in the nanomolar range in vitro and also protected mice from a lethal VEEV infection. Although the exact mechanism of action for this compound has not been fully elucidated, the mutations that determined drug-resistant phenotypes of VEEV occurred in nsP2 and nsP4 proteins (15).

Compounds that indirectly interfere with VEEV replication by modifying intracellular processes in the host were also investigated as potential therapeutic options to modulate the course of alphavirus infections (17–20). These included (i) an inhibitor of glycogen synthase kinase-3! (GSK-3!) that governs proinflammatory responses in the host cell (17); (ii) acriflavine, an inhibitor of Ago2 (18); (iii) D-(") enantiomer of carbodine, which inhibited cellular CTP synthetase and was capable of decreasing the levels of intracellular CTP (19); (iv) VX-497, a reversible uncompetitive inhibitor of inosine-5=monophosphate dehydrogenase, that demonstrated a moderately negative effect on VEEV replication in vitro (20); and (v) selective inhibitors of nuclear export, which enhanced accumulation of the capsid protein in cell nuclei and thus decreased the titers of released VEEV (21). Ribavirin, a broad-spectrum antiviral drug, exhibited a very limited effect against VEEV even if applied at concentrations higher than 500 " M (20).

Although several compounds show anti-VEEV activity in cell culture and in mouse models, it is unlikely that a single drug can be sufficiently potent and/or applied without rapid selection of resistant mutants. Therefore, in this study, we investigated the possibility of using a modified nucleoside analog, ! -D-N^4-hydroxycytidine (NHC) as

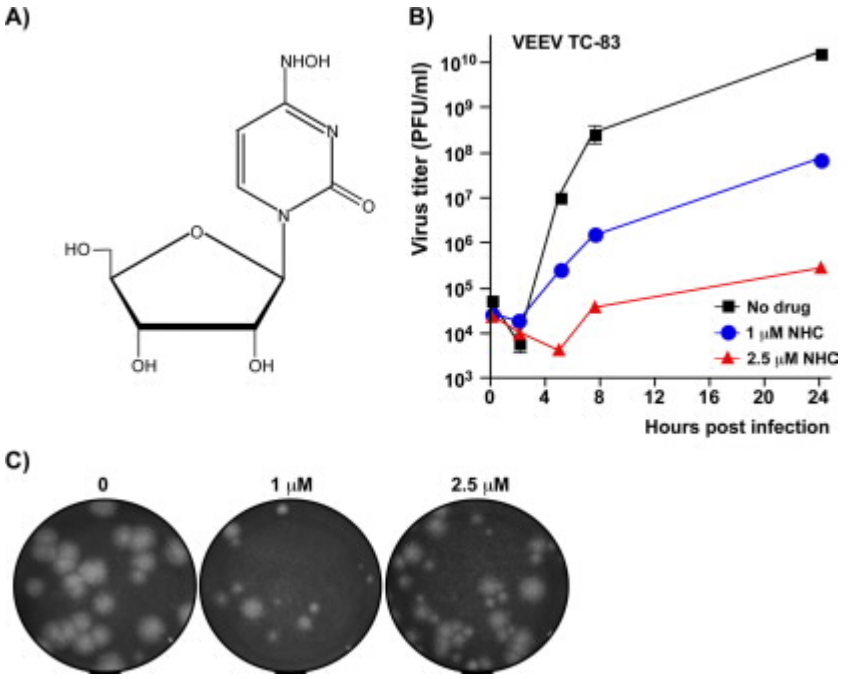

FIG 1 NHC has a strong negative effect on VEEV TC-83 replication. (A) Chemical structure of NHC. (B) Vero cells were infected with VEEV TC-83 at an MOI of 0.5 PFU/cell and were either treated with NHC at the indicated concentrations starting from 0 h postinfection (p.i.) throughout the 24 h of incubation period or they remained mock treated. At the indicated times p.i., media were harvested, and viral titers were determined by a plaque assay on Vero cells. Starting from 5 h p.i., virus titers in the samples harvested from the drug-treated cells were significantly different from those collected from the mock-treated cells (P # 0.0001). (C) Morphology of the plaques formed on Vero cells by VEEV TC-83 variants from the samples harvested at 24 h p.i. from mock- and NHC-treated cells. Due to profound differences in infectious titers, different dilutions are presented.

an anti-VEEV agent. Previous studies demonstrated that NHC significantly inhibits replication of hepatitis C virus (HCV) replicon and bovine viral diarrhea virus in Huh7 and MDBK cells, respectively (22). NHC was also capable of inhibiting human norovirus replicon in HG23 cells (23), human coronavirus (24), and chikungunya virus (25). It was reasonable to expect that the antiviral effect of this nucleoside analog is not limited to these few viruses, and might also be effective against other viral species with RNA genomes, such as VEEV. We tested the effect of NHC on VEEV replication, defined optimal in vitro conditions for its application, and the mechanism of its antiviral activity. Our data demonstrate several important features of NHC. (i) NHC is a very potent anti-VEEV agent, with an EC_{50} below 1 " M. (ii) Most VEE virions released from the NHC-treated cells contain mutated viral genomes, which are incapable of replication. (iii) The antiviral effect of NHC is more prominent if it is applied during the first 4 h postinfection, when amplification of negative-strand RNA intermediates and G RNA takes place. (iv) The resistance to NHC develops very inefficiently and is determined by a cooperative function of multiple mutations in nsP4. Even after 20 passages of VEEV under increasing concentrations of NHC, the pool of VEEV mutants remained highly sensitive to NHC treatment.

RESULTS

NHC has a strong negative effect on infectious titers of the released VEEV TC-83. In initial experiments, we assessed the antiviral potential of NHC (Fig. 1A) by testing whether it was capable of inhibiting VEEV replication. Indeed, NHC demonstrated a strong negative effect on the replication of VEEV TC-83 in Vero cells. In the applied experimental conditions (see the legend to Fig. 1B), NHC at 1 and 2.5 " M concentrations reduced titers of released virus progeny by 2 and 4 orders of magnitude, respectively. Moreover, in the plaque assay, samples harvested from NHC-treated cells,

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

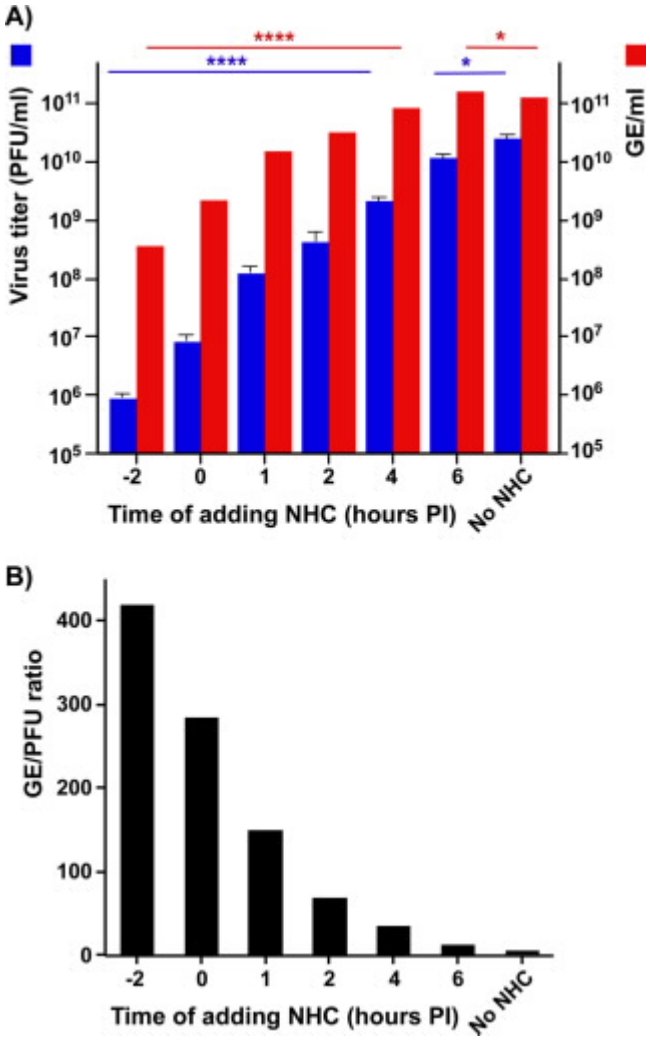

FIG 2 The antiviral effect of NHC depends on its application time. (A) Vero cells were infected with VEEV TC-83 at an MOI of 0.5 PFU/cell. At the time points indicated, cells were treated with 2 " M NHC and then harvested at 24 h p.i. Viral titers were determined using a plaque assay on Vero cells. The data are presented as mean values and standard deviations. In the same samples, the number of genome copies of VEEV TC-83 (GE/ml) was measured by qPCR. (B) GE/PFU ratio in the samples presented in panel A. This experiment was repeated twice with consistent results.

but not from the mock-treated cells, contained a large fraction of small-plaque-forming VEEV variants (Fig. 1C). The heterogeneity of plaques suggested that the antiviral effect of NHC is likely, at least partially, determined by its RNA-mutagenic activity.

Antiviral effect of NHC depends on the timing of its application. In subsequent experiments, Vero cells were infected with VEEV at a multiplicity of infection (MOI) of 0.5 PFU/cell. NHC was added to cells at 2 " M either 2 h prior to VEEV infection, at the moment of infection, or at different times postinfection (p.i.). Infectious titers of the released virus were determined at 24 h p.i. using a plaque assay (PFU/ml), and the concentrations of genome-containing viral particles in the same samples were assessed by reverse transcription-quantitative PCR (RT-qPCR) as genome equivalents (GE) per ml.

NHC was most potent when applied 2 h before infection, causing a reduction in infectious virus titers of more than 4 orders of magnitude. If it was added at later times p.i., the negative effect on released viral progeny titers gradually decreased (Fig. 2A). Addition of the compound at 6 h p.i. had a very small, # 5-fold, negative effect on final infectious titers. NHC treatment prior to infection or at early times p.i. also had a negative effect on the release of genome-containing viral particles. However, the

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

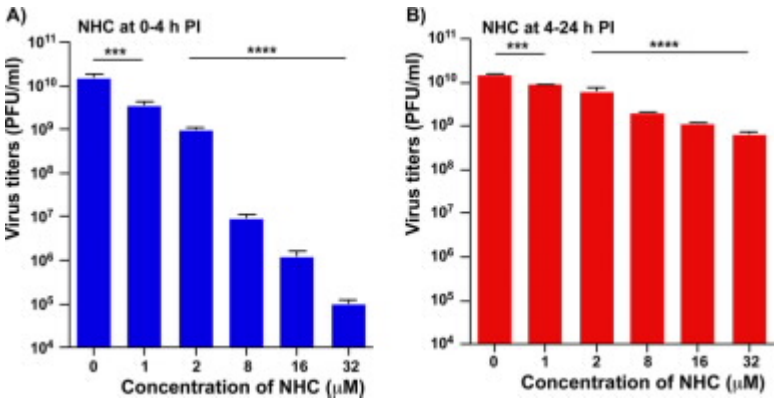

FIG 3 The first 4 h p.i. are a critical time for the antiviral effect of NHC. Vero cells in six-well Costar plates were infected at room temperature with VEEV TC-83 at an MOI of 20 PFU/cell. (A) Cells were incubated with NHC at the concentrations indicated from 0 to 4 h p.i. At 4 h p.i., the cells were washed, and media were replaced with NHC-free medium. (B) Infected cells were incubated in NHC-free medium until 4 h p.i., and then media were replaced by those supplemented with NHC at indicated concentrations. All of the samples indicated in panels A and B were harvested at 24 h p.i., and viral titers were determined by a plaque assay on Vero cells. The experiments were performed in triplicates. The reductions in viral titers in all NHC treated samples were statistically significant, as assessed by the one-way ANOVA.

measured changes in concentrations of GE in the same samples were less prominent than the decreases in the infectious titers (Fig. 2A). Accordingly, samples from the cells treated with NHC starting from 2 h prior to infection, 0 h p.i., 1 h p.i., and 2 h p.i. exhibited higher GE/PFU ratios than those obtained for mock-treated cells or in samples harvested from cells treated with NHC from 6 h p.i. (Fig. 2B). In the media from cells incubated with the compound starting from 2 h prior to infection, the GE/PFU ratio was $ 100-fold higher than in media harvested from mock-treated cells. This was an indication that early treatment led to release of mostly noninfectious virions. Thus, these experiments demonstrated that NHC treatment has strong negative effects on both the efficiency of genome-containing virion release and their infectivity. However, the antiviral effect of NHC is strongly dependent on the timing of its application in relation to viral infection.

To further evaluate the time-dependent effect of NHC treatment, the compound was added at different concentrations (1 to 32 " M) to the media either (i) for the first 4 h p.i. only, followed by incubation in drug-free media (Fig. 3A), or (ii) incubation in the presence of NHC started at 4 h p.i. (Fig. 3B) and continued until 24 h p.i.. All of the samples were harvested at 24 h p.i. to assess infectious titers. NHC treatment within the first 4 h caused profound reduction in infectious titers at 24 h p.i., and there was a strong dose dependence. In contrast, treatment started after 4 h p.i. caused a relatively small negative effect on the infectious titers, irrespective of NHC concentration and despite its presence in the media for a longer period of time (20 h) compared to the samples incubated with this compound for only the first 4 h p.i.

Taken together, these data strongly suggested that NHC is most effective against VEEV in vitro when applied early in the viral replication cycle. As a result, measuring the 50% effective concentration (EC_{50}) and other antiviral characteristics of NHC is very dependent on the time of its application and the MOI used. Therefore, for detailed evaluation of the antiviral effect of NHC on its concentration, subconfluent Vero cells were synchronously infected at an MOI of 20 PFU/cell, and drug was applied at different concentrations at 0 h p.i. The media were harvested at 24 h p.i., and the virus titers were determined by plaque assay on Vero cells. The results are presented in Fig. 4A. Based on these data, the EC_{50}, EC_{90}, and EC_{99} were 0.426, 1.036, and 2.5 " M, respectively.

In parallel experiments, we also assessed the cytotoxicity of NHC (Fig. 4B). Vero cells were incubated in the media supplemented with NHC at 0 to 200 " M for 24 h. Cell viability was assessed using Cell Titer-GLO 2.0 assay. In this range of concentrations,

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

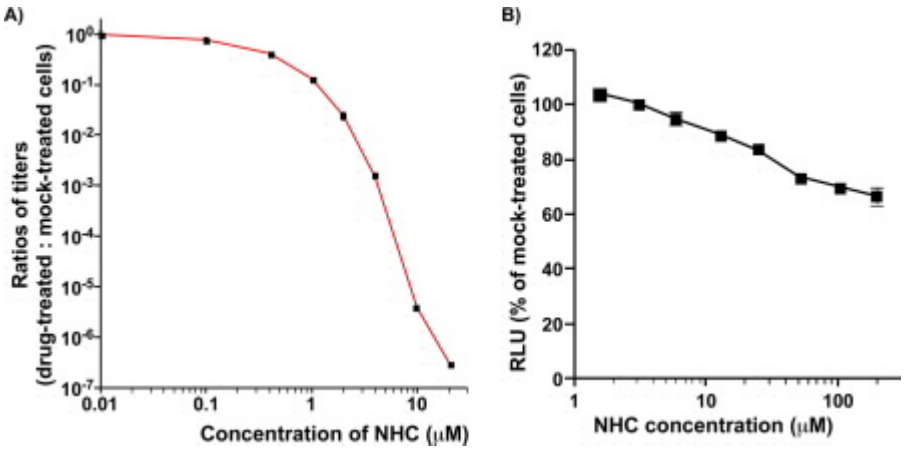

FIG 4 NHC is a potent anti-VEEV compound with low cytotoxicity. (A) Vero cells were infected with VEEV TC-83 at an MOI of 20 PFU/cell. The indicated concentrations of NHC were applied at 0 h p.i., and media were harvested at 24 h p.i. Infectious titers were determined by a plaque assay on Vero cells and normalized to those in the mock-treated samples. The experiment was performed three times. The standard deviation are too low to be visible on the plot. (B) Vero cells were incubated for 24 h with indicated concentrations of NHC in the media. Cell viability was assessed using the Cell Titer-GLO 2.0 assay. Data were normalized to those generated on the mock-treated cells. RLU, relative light units.

NHC demonstrated a cytotoxicity that was too low to determine a 50% cytotoxic concentration (CC_{50} $ 200 " M).

NHC induces high mutation rates in VEEV G RNA. Next, we tested whether the presence of NHC increases the mutation rates of viral G RNA. Vero cells were infected with VEEV TC-83 at an MOI of 2 PFU/cell and incubated for 24 h either in NHC-free media or in media supplemented with 2 " M NHC at the time of infection. G RNAs were purified from harvested stocks, and a 941-nucleotide (nt) fragment of viral genome in both samples was amplified by RT-PCR. The PCR products were cloned into a plasmid, and for each sample, the plasmid insertions of 50 randomly selected clones were sequenced. We identified 42 mutations (8.9 mutations per 10,000 nt) in sequences derived from the virus population generated on NHC-treated cells, and only 4 mutations were detected in the sequences generated from virus harvested on mock-treated cells (0.85 mutations per 10,000 nt). Thus, within a single passage, NHC treatment at 2 " M concentration led to at least a 10-fold increase in accumulation of mutations. However, this ratio is probably even higher, since both pools likely contained equal numbers of mutations introduced by RT and PCRs. The majority of mutations acquired in the presence of NHC were transition mutations. U-to-C or C-to-U transitions were the most prevalent and were likely generated during positive-strand RNA synthesis. The number of A-to-G and G-to-A transitions was ! 4-fold lower, and these likely resulted from NHC incorporation into the negative-strand RNA.

VEEV resistance to NHC develops very inefficiently. Characterization of the drug's antiviral effects requires assessing the possibility for development of resistant viral mutants. Moreover, identification of the adaptive mutations provides critical information about the mechanism of antiviral function. In this study, we passaged the cDNA-derived VEEV TC-83 20 times in the presence of incrementally increasing concentrations of NHC (see Materials and Methods for details). Drug resistance developed very inefficiently and became clearly detectable only after 15 passages, as evidenced by more efficient cytopathic effect (CPE) development in the presence of NHC. This was suggestive that the drug-resistant phenotype likely required multiple adaptive mutations, and a high resistance is probably impossible to generate. After 20 passages, we selected a viral population, which was capable of replication and CPE production in the presence of 3.2 " M NHC. Starting from passage 1, harvested virus stocks produced heterogeneous plaques, and no homogeneous viral population was found at any passage, including passage 20. This was indicative of continuous viral evolution, even after acquiring partial resistance to NHC.

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

After passage 20, two plaques were randomly selected from the agarose overlay supplemented with 2 " M NHC. After extraction from the agarose, plaque-purified viruses were amplified once in the presence of 1 " M NHC to avoid appearance of true or second-site revertants with an NHC-sensitive phenotype. Total RNA was isolated from Vero cells, which were used for this virus amplification. These cell-derived RNAs were used to sequence the genome fragment encoding nsP1-, nsP2-, nsP3-, and nsP4-coding genes (nt 540 to 7700 of viral G RNA). This genome fragment encodes all viral nonstructural proteins, which form a replication complex and thus are directly involved in RNA synthesis. Mutations in these genes could directly determine viral resistance to NHC.

Both plaque isolates contained large numbers of mutations. The nsP-coding sequence of plaque isolate 1 (PP1) contained 34 synonymous and nonsynonymous mutations (47.5 mutations per 10,000 nt), and the plaque isolate 2 (PP2), which was used in the following experiments, had 41 mutations in the same fragment (57.3 mutations per 10,000 nt). The mutations resulting in amino acid substitutions in the nsPs are presented in Fig. 5A. Similarly, in the PP2 genome, the RNA sequence encoding viral structural proteins contained 21 mutations (55 mutations per 10,000 nt) with 4 of them causing amino acid changes (H96R and F389L in E2; P8S and V388M in E1). These mutations in structural genes had no effect on virus infectivity, and the PP2 isolate demonstrated the same GE/PFU ratio as did the original VEEV TC-83 (see Fig. 7B). Therefore, these mutations were not further investigated. In agreement with the results described above, obtained after treating the infected cells with NHC for 24 h, all but one mutations found in viruses passaged 20 times in the presence of NHC were transition mutations, with prevalent U-to-C or C-to-U transitions (Fig. 5B). Importantly, a large number of synonymous and nonsynonymous mutations in the nsP-coding sequence were the same in both randomly selected plaque isolates. This was a strong indication that development of any resistance to NHC is likely to be a rare event and requires a cooperative/synergistic effect of more than one adaptive mutation. Such a mutant likely appeared in one of the intermediate, earlier passages; however, it continued to accumulate other mutations, which distinguished nucleotide sequences of plaque isolates selected after final passage 20.

As a control, VEEV TC-83 was passaged in parallel 20 times in the absence of NHC. After this serial passage, neither changes in the plaque sizes nor changes in virus titers were detected (data not shown). Sequencing of the nsP-coding fragment of a plaque purified after passage 20 virus identified only two mutations (2.8 mutations per 10,000 nt). Both mutations found in the virus passaged without drug were transversions. Thus, the passaging in the presence of NHC resulted in accumulation ! 20-fold more mutations than in the absence of the compound. These results correlate well with the above data, showing a strong difference in the mutation rates during a single passage of VEEV TC-83 in the presence or absence of NHC.

To complete evaluation of the drug resistance development process, we tested the efficiency of reverting of the NHC-resistant isolate back to an NHC-sensitive phenotype. The PP2 isolate was passaged 20 times in Vero cells in NHC-free media. After the last passage, the resulting virus population was homogeneous in terms of plaque size, and these plaques were indistinguishable from those formed by VEEV TC-83 (see Fig. 6C). A plaque-purified variant (PREV1) from this population was used to sequence the nsP-coding genes. Surprisingly, it retained all of the PP2-specific mutations in nonstructural genes, but accumulated 12 additional mutations, from which 6 were nonsynonymous (Fig. 5A).

In the absence of NHC, PREV1 growth rates were very similar to those of the original VEEV TC-83 (Fig. 6A) and were strongly affected by the presence of NHC in the media (Fig. 6B). In side-by-side experiments, without NHC, the PP2 mutant exhibited delayed replication and achieved lower titers (Fig. 6A) compared to both wild-type (wt) VEEV and PREV1 but reproducibly yielded higher titers in NHC-containing media (Fig. 6B). Similarly, in a plaque assay when NHC was present in the agarose overlay, the PP2 mutant was capable of forming plaques in the presence of NHC at 1.2 and 2.5 " M

FIG 5 VEEV TC-83 accumulates a large number of mutations when exposed to NHC. (A) VEEV TC-83 was serially passaged in the presence of NHC (see Materials and Methods for details), and the nsP-coding fragments in the genomes of two randomly selected plaque isolates (PP1 and PP2) were sequenced. PP2 isolate was then passaged 20 times in NHC-free media, and the same nsP-coding fragment in the genome of plaque-purified variant PREV1 was sequenced. Only the nonsynonymous mutations are presented. The mutations identified in both PP1 and PP2 are highlighted in gray. Additional mutations identified in PREV1 are highlighted in red. (B) Matrixes of nucleotide substitutions identified in plaque purified variants PP1, PP2, PREV1, and plaque-purified VEEV TC-83 after 20 passages in the absence of NHC.

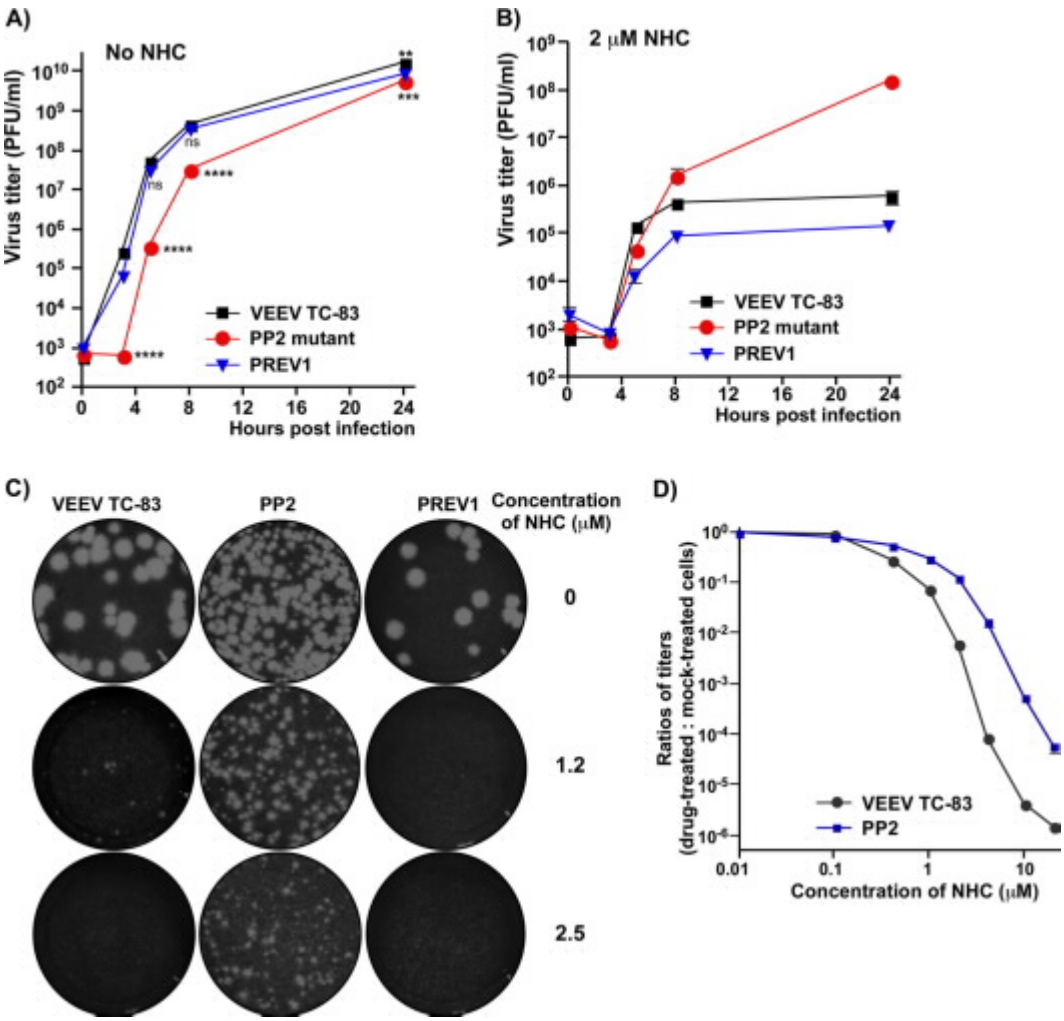

FIG 6 Drug-resistant VEEV isolate PP2 replicates more efficiently than parental VEEV TC-83 and pseudorevertant PREV1 in the presence, but not in the absence of NHC. Subconfluent Vero cells were infected with parental VEEV TC-83, selected PP2 mutant or PREV1 viruses at an MOI of 1 PFU/cell. Starting from 0 h p.i., cells were incubated either in the absence (A) or in the presence (B) of 2 " M NHC. At the indicated time points, media were harvested, and viral titers were determined using a plaque assay on Vero cells. The experiment was repeated three times. Most of the standard deviations are too small to be visible on the plots. On panel B, starting from 5 h p.i., titers of PP2 and PREV1 are significantly different from those of VEEV TC-83 and from each other (P # 0.0001). (C) In a standard plaque assay, cell monolayers infected with the same dilution samples were overlaid with 0.5% agarose-containing media (see Materials and Methods for details) without or with the indicated concentrations of NHC. Plaques were visualized by crystal violet staining at 2 days p.i. (D) Vero cells were infected with VEEV TC-83 and PP2 mutant at an MOI of 20 PFU/cell. The indicated concentrations of NHC were applied at 0 h p.i., and media were harvested at 24 h p.i. Infectious titers were determined by a plaque assay on Vero cells and normalized to those in the mock-treated samples. The standard deviations are too low to be visible on the plot.

concentrations. In contrast, wt VEEV TC-83 could not develop plaques in the presence of 2.5 " M NHC, and PREV1 did not produce plaques under the drug at both concentrations (Fig. 6C).

Taken together, our results demonstrated that (i) in the presence of NHC, the selected PP2 mutant replicated more efficiently than parental VEEV TC-83 and PREV1; (ii) the PP2 drug resistance was unstable and in the absence of NHC, this mutant reverted to an NHC-sensitive phenotype; (iii) the evolution to higher replication rates of the pseudorevertant PREV1 and its sensitivity to drug were the results of accumulation of additional mutations in the PP2 genome, but not the reversal of those developed under the prior NHC treatment.

NHC inhibits VEEV replication via a dual mechanism. To further evaluate the mechanism of NHC-specific inhibition of VEEV replication, we performed a detailed

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

comparative analysis of VEEV TC-83, the PP2 mutant, and the PREV1 pseudorevertant for their ability to produce both infectious virus and G RNA-containing viral particles. Vero cells were infected with these viruses at the same MOI and incubated either with or without 2 " M NHC added at the time of infection. At the indicated time points, media were harvested and used for assessment of both infectious titers (PFU/ml) and concentrations of released viral particles (GE/ml). The results of these experiments (Fig. 7A) demonstrate that the presence of NHC in the media caused a dramatic ($ 1,000-fold) decrease of VEEV TC-83 and PREV1 infectious titers. However, depending on the time p.i., we detected only a 5- to 50-fold decrease in PP2 infectious titers in media harvested from the drug-treated cells compared to mock-treated cells. (ii) In agreement with the results presented in Fig. 2, NHC at 2 " M had a relatively small, but readily detectable negative effect on the release of genome-containing viral particles (GE/ml) of both the original VEEV TC-83 and PREV1. For both viruses, at any time p.i., the G RNA concentrations (GE/ml) in the media of drug-treated cells were 10- to 20-fold lower than in the mock-treated controls. In contrast, the NHC-resistant PP2 mutant produced essentially the same level of particles (GE) in the presence or absence of NHC (Fig. 7A).

Thus, NHC treatment had a dual effect on parental VEEV TC-83 and PREV1 replication. This compound caused a modest decrease in virion release and a strong decrease in virion infectivity. The latter effect likely resulted from the introduction of lethal mutations into G RNA. On the other hand, in the presence of 2 " M NHC, PP2 mutant was able to release viral particles to higher infectious titers compared to VEEV TC-83 and PREV1. However, the negative effect of the compound on infectious titers of PP2, but not on particle release, was also detectable. This resulted in an increase in the PP2 GE/PFU ratio (Fig. 7B) but not to the levels detected in VEEV TC-83 and PREV1 samples. Thus, a large fraction of released PP2 virions also contained noninfectious G RNA, and this was an additional indication that the resistance of PP2 to NHC was only partial.

NHC induces rapid evolution of the VEEV population. Sequencing the plaque-purified variants provided important information about virus evolution under NHC pressure. To complement these data, we applied next-generation sequencing (NGS) to additionally characterize the effect of NHC treatment and/or virus passaging on accumulation of mutations in VEEV TC-83 pools. We sequenced genomes in virus samples harvested at passages 5, 10, 15, and 20, performed either in the absence or presence of NHC. The read sequences were aligned against the VEEV TC-83 genome and analyzed as described in Materials and Methods. The results presented in Fig. 8A, were in agreement with sequencing of the plaque-purified variants. Even after 20 passages in the absence of drug, the VEEV TC-83 population demonstrated relatively low diversity. Only 7 mutations with frequency above 5% were found after 20 passages. None of the mutations became prevalent (with frequencies above 50%). In contrast, passaging VEEV TC-83 in the presence of NHC induced high levels of mutations and led to high heterogeneity of the viral population. After passage 5, four mutations with frequencies above 5% were already present. After passage 20, more than 200 mutations with frequencies above 5% were detected in the virus pool, and 30 of them became prevalent ($ 50%). These data correlated with finding of one synonymous or nonsynonymous mutation per every 150 to 200 nt in the genomes of plaque-purified variants (Fig. 5A), which were isolated from the same passage 20 viral pool.

Using NGS, we detected the accumulation of mutations in essentially all viral genome sequences. However, it was reasonable to expect the mutations responsible for resistance to NHC to be localized in nsP4 and to become dominant by passage 20. In the NHC passage 20 stock, NGS detected four nonsynonymous nsP4-specific mutations, which were present in the viral pool with frequencies higher than 50%. Most importantly, the same mutations were identified in the plaque-purified variants, PP1 and PP2 (Fig. 5A). This was an additional indication that they may be responsible for development of resistance to NHC. Three out of four mutations, namely, P187S, A189V, and I190T, were closely located on the index finger in a three-dimensional (3D) structural model of nsP4 (see Fig. 10).

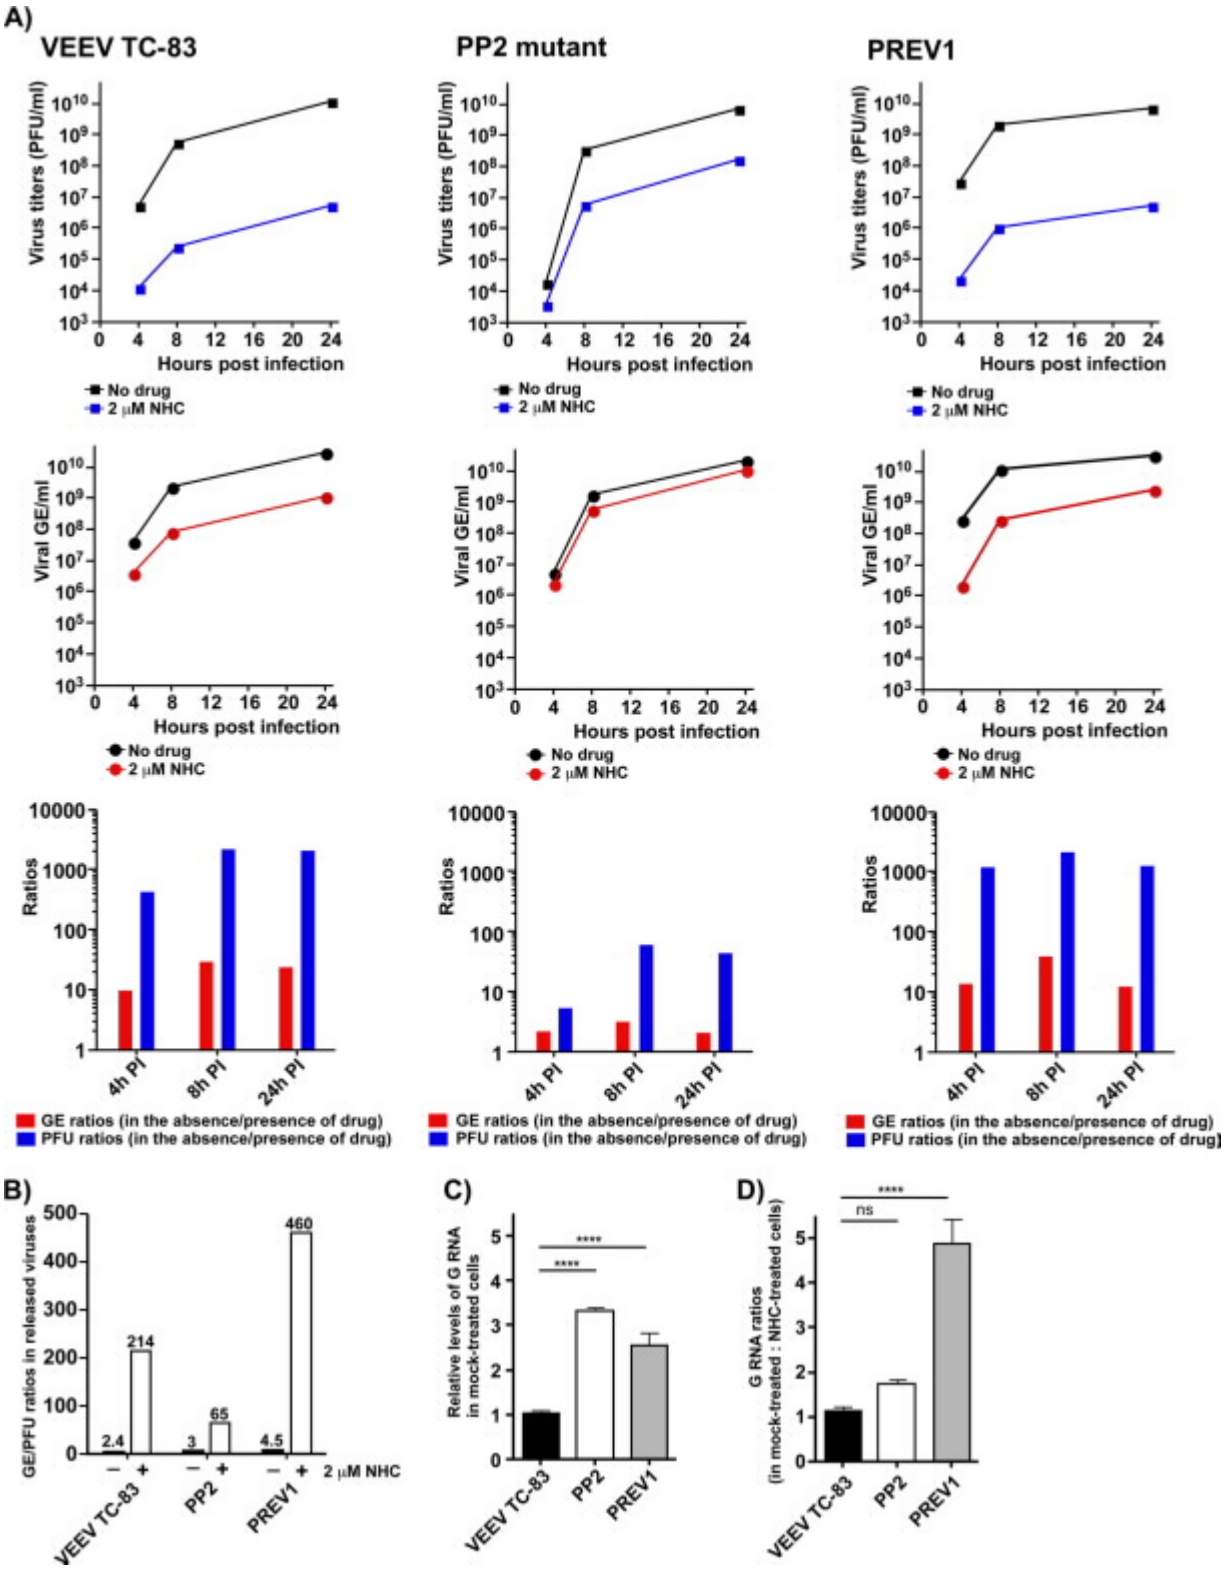

FIG 7 NHC has stronger negative effects on the release and infectivity of VEEV TC-83 and PREV1 particles than those of the PP2 mutant. A total of 5 % 10^5 Vero cells in six-well plates were infected with VEEV TC-83, PP2, or PREV1 at an MOI of 1 PFU/cell and were incubated with or without 2 " M NHC. At the indicated time points, media were collected, and the infectious titers (PFU/ml) and concentrations of genome-containing viral particles (GE/ml) were determined by a plaque assay on Vero cells and RT-qPCR, respectively. Experiments were performed in triplicates. The standard deviations are too small to be visible on the plots. (B) GE/PFU ratios in virus samples harvested at 24 h p.i. of mock-treated and NHC-treated cells in the experiment presented in panel A. (C) Levels of viral G RNAs in the mock-treated cells at 24 h p.i. The cells were harvested after collecting the medium samples described in panel A at 24 h p.i. Data were normalized to the G RNA levels in VEEV TC-83-infected cells. (D) Ratio of G RNAs in mock-treated versus NHC-treated cells at 24 p.i. with the indicated viruses. Cells were collected in the experiment presented in panel A.

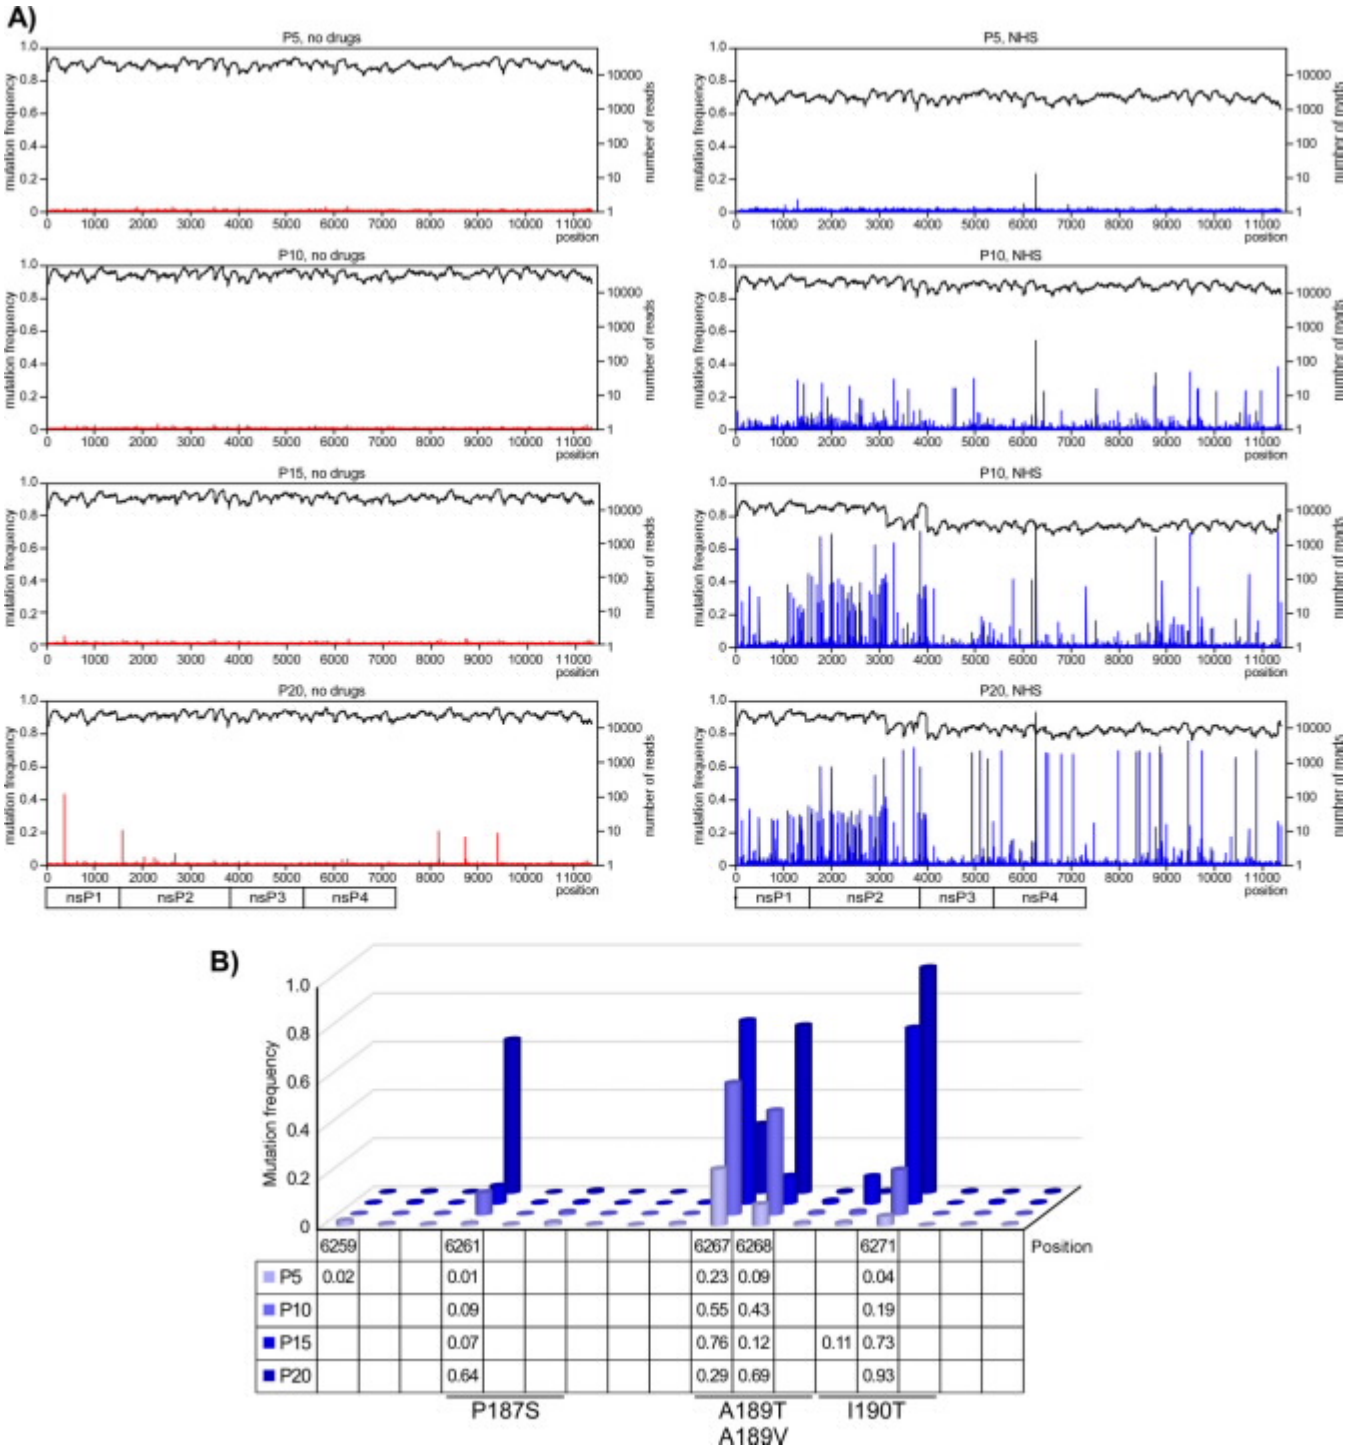

FIG 8 VEEV TC-83 passaging in the presence of increasing concentrations of NHC leads to rapid accumulation of mutations in viral pool. (A) Frequencies of mutations in viral pools at passage 5, 10, 15, and 20 in the absence or presence of NHC, determined by NGS (see Materials and Methods for details). (B) Dynamics of the increase in the frequencies of mutations at the indicated positions of VEEV nsP4.

Further analysis of the NGS data revealed an interesting dynamic in nsP4 evolution (Fig. 8B). The presence of VEEV genomes encoding a nonconservative amino acid substitution I190T steadily increased with virus passaging. After passage 20, the mutation was present in more than 90% of G RNAs. The prevalence of variants with another substitution (A189T) was 23% at passage 5 and steadily increased to 76% by passage 15. However, by passage 20, the A189T mutation was no longer prevalent and

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

was replaced in the virus pool by a combination of two other amino acid substitutions, P187S and A189V. The dynamics of mutation accumulation in the index finger suggested the possibility of its function in regulating nucleotide incorporation by VEEV nsP4.

NHC-resistant VEEV variant continued to rapidly evolve in the absence of NHC. NGS was also applied for analysis of mutation accumulation in the NHC-resistant PP2 plaque isolate during its serial passage in NHC-free media. As in the above-described experiments, we sequenced population of G RNAs isolated from samples of PP2-originated viruses after passages 5, 10, 1, and 20 in drug-free media. Interestingly, in the absence of NHC, the replication complex of PP2 continued to introduce additional mutations, which were equally distributed throughout the viral genome (Fig. 9A). After passage 5, the frequencies of the detected mutations were already higher than those in similarly passaged VEEV TC-83 (Fig. 8A, left panel). Mutations continued to accumulate during the following passages, whereas the viral pools retained all of the PP2-specific mutations. These data correlated with the findings of numerous new mutations in the plaque-purified PREV1 isolate from the passage 20 stock (Fig. 5A).

At passage 20 in drug-free media, only two new prevalent mutations that led to amino acid substitutions in nsP4 (A201V and V308I) were identified (Fig. 9B). Interestingly, in the predicted 3D structure of VEEV nsP4, they were located very close to each other (Fig. 10) and to the mutations found in the NHC-resistant virus population and in the plaque isolates PP1 and PP2. Based on the frequencies of A201V and V308I mutations in the passage 20 viral pool and on the different dynamics of their appearance (Fig. 9B), it is reasonable to expect that they function independently and are present in different viral genomes. Moreover, substitution A201V, but not V308I, was identified in the PREV1 variant (Fig. 5A), which had reverted to an NHC-sensitive phenotype. Therefore, the effects of A201V on loss of resistance to NHC were analyzed further.

The identified nsP4-specific mutations are the determinants of resistance and sensitivity of selected VEEV variants to NHC. To design VEEV variants with mutated nsP4, we used the following information. The I190T mutation in VEEV nsP4 was the most prevalent in the virus pool after 20 passages in the presence of NHC (Fig. 8B). Based on the predicted 3D structure of VEEV nsP4, the second identified mutation, P187S, changed the same amino acid as that previously implicated in ribavirin resistance development by foot-and-mouth disease virus (26). Combination of I190T, P187S, and A189V mutations was identified in both the pool of NHC-resistant mutants (Fig. 8B) and the genomes of plaque-purified variants (Fig. 5). Thus, based on these data, we designed single (VEEV/P187S and VEEV/I190T) and triple (VEEV/3x) mutants (Fig. 11A) and evaluated the effects of the introduced mutations on the ability of VEEV TC-83 to replicate in the presence of NHC.

In the absence of drug, all of the reengineered mutants were viable, replicated at essentially the same rates as VEEV TC-83 (Fig. 11C), and formed large plaques in Vero cells (Fig. 11B). However, in the presence of 1.5 " M NHC in the agarose overlay (Fig. 11B), (i) the parental VEEV TC-83 formed almost undetectable, pinpoint plaques; (ii) the VEEV/P187S mutant, surprisingly, was found to be more sensitive to compound than parental VEEV TC-83 and did not form plaques at all; (iii) the VEEV/I190T mutant produced readily detectable plaques, which remained relatively small; (iv) the combination of all three mutations in nsP4 made the VEEV/3x variant capable of forming midsize plaques in the presence of NHC, which was suggestive of its higher resistance to the drug. To confirm this result, Vero cells were infected with the indicated mutants at an MOI of 2 PFU/cell, and NHC at the indicated concentrations was added to the media at the time of infection. Figure 11D presents the ratios of infectious viral titers produced in the presence or absence of NHC at 8 h p.i. As in the above-described experiments, the VEEV/I190T mutant was more resistant to NHC than the parental VEEV, VEEV/P187S was more sensitive to this compound, and the VEEV/3x mutant was the most resistant to the NHC treatment. The NGS data also suggested that during passaging in the presence of NHC (Fig. 8B), the virus population became

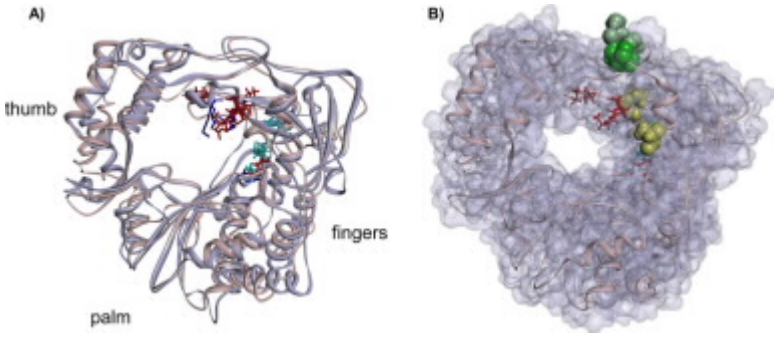

FIG 10 The mutations that lead to NHC-resistant and NHC-sensitive phenotypes of VEEV TC-83 are closely located in the 3D structure of the catalytic domain of VEEV nsP4. (A) Structural alignment of the predicted 3D structure of VEEV nsP4 RdRp domain with FMDV 3D polymerase (2E9T). The VEEV RdRp structure is presented as a solid, light red ribbon. The structure of FMDV 3D protein is presented as a solid, light blue ribbon. The amino acids involved in coordination of NTP phosphates are presented as red sticks (VEEV) or blue sticks (FMDV). The amino acids that bind RNA template are presented as turquoise sticks for both polymerases. (B) Positions of mutations identified in nsP4 of NHC-resistant and NHC-sensitive mutants of VEEV TC-83 on the predicted structure of the catalytic domain. The amino acids that were substituted in the NHC-resistant viruses are shown in medium green (I190) and light green (A189 and P187). The amino acids that were substituted in the pool of PP2 virus passaged 20 times in NHC-free media (A201V and V308I, see Fig. 9 for details) are shown in yellow.

initially enriched with the variants containing A189T mutation in nsP4. During further passaging, the latter mutation was mostly replaced in virus pool by A189V. Therefore, in additional experiments, we compared the effects of both mutations on development of virus resistance to drug. As expected, the ultimate A189V mutation induced significantly higher resistance to NHC than the early A189T mutation in nsP4 (Fig. 11E).

Analysis of the NGS data and sequencing of the PREV1 isolate suggested the possibility that the A201V mutation in nsP4 plays a critical role in reversion of PP2 to an NHC-sensitive phenotype. Indeed, cloning of A201V into the genome of the VEEV/3x mutant (Fig. 12A) had a profound negative effect on viral resistance to NHC. The VEEV/3x/A201V variant replicated in Vero cells to the same titers and at the same rates as the parental VEEV TC-83 and VEEV/3x mutant but was reproducibly less resistant to NHC than both of these viruses (Fig. 12B and C). Thus, the identified A201V mutation in nsP4 was sufficient for reverting the drug-resistant phenotype of VEEV/3x to NHC sensitive.

DISCUSSION

Currently, the most widely used nucleoside analog with the antiviral activity is ribavirin (27, 28). It demonstrates a broad-spectrum inhibitory effect against a number of RNA viruses and low cytotoxicity and functions as an RNA mutagen, since it is incorporated into virus-specific RNAs by viral RdRp (22, 28). This leads to the accumulation of random mutations in viral genomes, which either affect virus replication rates at the next round of infection or make them nonviable (29–31). One of the potential concerns about application of ribavirin is that its antiviral activity only becomes evident when this drug is applied at relatively high concentrations of 100 to 1,000 " M (32) and when it is applied hours before the beginning of infection (33). To detectably inhibit CHIKV replication in vitro, this drug was used at 100 " M (34) and, thus far, no antiviral effect of ribavirin has been unambiguously demonstrated for VEEV (20). Another complication of using ribavirin is that at least some viruses develop drug-resistant mutants (35). This resistance is most often determined by single point mutations in RdRp-coding sequences, and they were intensely investigated in several positive-strand RNA viruses (34, 36).

In the present study, we characterized the antiviral activity of another nucleoside analog, NHC (Fig. 1A). This compound exhibited a very strong inhibitory effect on VEEV infection in cell culture. The antiviral function was readily detectable when NHC was

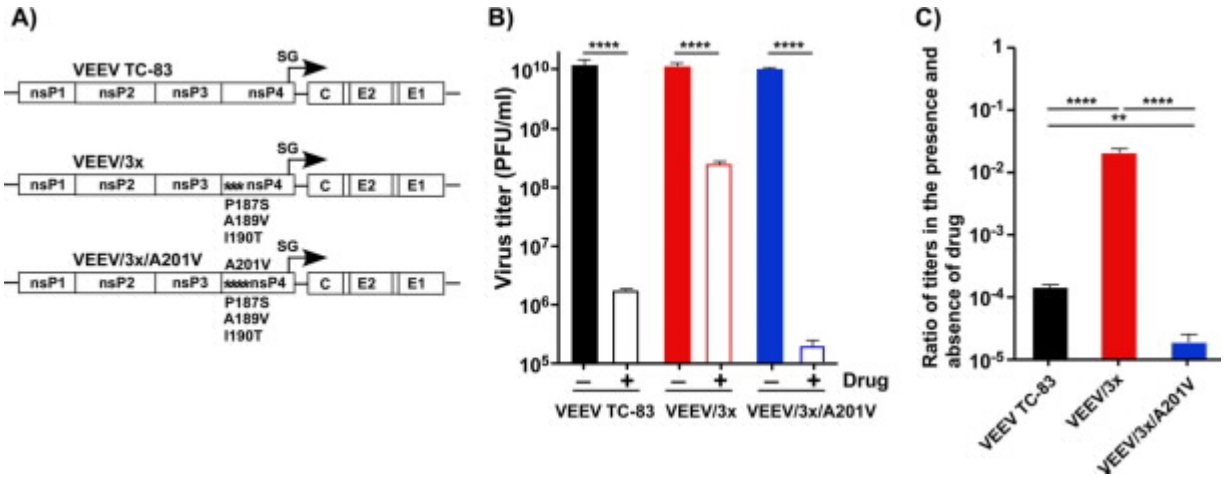

FIG 12 A201V mutation in VEEV nsP4 reverts the NHC-resistant phenotype of the VEEV/3x mutant to drug sensitive. (A) Schematic presentation of VEEV genomes containing the indicated nsP4 mutations. (B) Vero cells were infected with indicated mutant viruses at an MOI of 1 PFU/cell. Cells were incubated in the presence of 2 " M NHC starting from 0 h p.i. At 8 h p.i., media were harvested, and viral titers were determined by a plaque assay on Vero cells. (C) Titers in samples from NHC-treated cells were normalized to those in samples from mock-treated cells. This experiment was repeated three times using different concentrations of drug with consistent results. The data from one of the representative experiments are presented in this figure.

applied at 1 to 2 " M prior to, at the time of, or within 4 h after VEEV infection (Fig. 2). Previous studies showed that in cultured cells, NHC is rapidly converted into mono-, di-, and triphosphate forms, along with other metabolites, such as CTP and UTP (22, 25, 37). Because the levels of the NHC-triphosphate form (NHC-TP) were highest among the intracellular metabolites, it was proposed as the metabolite primarily responsible for the antiviral effect of NHC (22). In vitro experiments using purified HCV NS5B polymerase demonstrated that NHC-TP can serve as a substrate with a low efficiency of incorporation (22). Because NHC-TP can be incorporated into RNA to replace either CTP or UTP (38), one would expect the appearance of C-to-U and U-to-C transition mutations in synthesized viral G RNAs if NHC-TP is introduced into G RNA during positive-strand synthesis and A-to-G and G-to-A mutations if NHC-MP is incorporated during synthesis of the negative strand of the viral genome.

Our data support a notion that the primary antiviral effect of NHC is based on its potent RNA-mutagenic activity, which can force VEEV replication into an “error catastrophe” or “lethal defection” (39). Accordingly, viral pools released from Vero cells treated with NHC starting at early times p.i. demonstrated GE/PFU ratios that were almost 2 orders of magnitude higher than those from mock-treated cells. This was an indication that most of the released virions contained noninfectious viral genomes that were incapable of producing a spreading infection. The released viral pools also produced heterogeneous plaques, with a high proportion of these plaques being small and pinpoint in size. A $ 10-fold increase in the VEEV genome mutation rate was detected in the presence of 2 " M NHC compared to drug-free media. In agreement with these data, both NGS of viral pools and Sanger sequencing of the genomes in randomly selected plaque-purified variants also demonstrated that NHC treatment during VEEV replication resulted in the generation of large numbers of synonymous and nonsynonymous mutations in all of the nonstructural and structural viral genes.

On the other hand, in the presence of NHC, infected cells produced 10- to 20-fold

FIG 11 Legend (Continued)
concentrations of drug with consistent results. The data from one of the representative experiments are presented in this figure. (E) A total of 5 % 10^5 Vero cells were infected with the indicated viruses at an MOI of 2 PFU/cell. Cells were incubated with NHC starting from 0 h p.i. At 20 h p.i., media were harvested, and viral titers were determined by a plaque assay on Vero cells. Titers were normalized to those in the samples harvested from mock-treated cells.

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

fewer G RNA-containing viral particles (GE). We detected only a small decrease in G RNA accumulation in the cells treated with NHC compared to the mock-treated cells (Fig. 7D). Therefore, there is some possibility that similar to favipiravir (40), NHC can function as a direct, weak inhibitor of RdRp. However, another, more plausible explanation for less efficient release of G RNA-containing virions is that during intracellular viral replication, NHC-TP is responsible for accumulation of mutations in nonstructural and structural proteins rather than for direct inhibition of RNA synthesis. Similarly, prior in vitro studies using HCV RdRp did not find evidence that the presence of NHC could lead to direct inhibition of the polymerization reaction. It has also been proposed that the incorporation of NHC-TP may change the thermodynamics of RNA secondary structures and thereby affect the initiation of replication and/or protein translation (22). Although this is a considerable possibility for VEEV RdRp, such an assumption needs experimental support.

The anti-VEEV effect of NHC is dramatically more prominent when it is applied a few hours before or within the first 4 h p.i. There are two possible explanations for such temporal dependence of the inhibitory effect. First, the immature replication complex, which is composed of P123 and nsP4, is only present within the first 4 h p.i., at the amplification stage of viral RNA. In this complex, RdRp might utilize NHC-TP more efficiently than in a mature RC that contains completely processed, individual nsPs. The second and more likely possibility is that during the early stage of replication, when G RNA undergoes multiple rounds of amplification, incorporation of NHC-MP into both positive- or negative-strand RNAs generates large numbers of mutations in the viral progeny. Moreover, early in the infection, the synthesized mutated G RNAs are also translated into defective nsPs, and this in turn affects VEEV replication rates and the efficiency of particle release.

Another major characteristic of NHC is that the development of resistance to this compound by VEEV is a highly inefficient process. The difficulty in selection and the poor resistance of selected mutants suggested that (i) the acquisition of a single mutation in nsP4 has a relatively small positive effect on virus resistance to NHC and (ii) the accumulation of a few mutations appears to be required for advanced resistance to the drug. In two independent selections, one of which is presented in this study, the low-level resistance to NHC only became evident after 15 passages.

Further experiments clearly demonstrated that this low-level resistance is determined by a combination of nsP4-specific mutations. The NGS of G RNAs in viral pools at different passages, sequencing of the genomes of plaque-purified viruses and subsequent reverse genetics experiments demonstrated that resistance to NHC resulted from sequential selection of several mutations in VEEV nsP4. Acquisition of I190T substitution was likely the most critical step. It was detected as early as passage 5 (4% frequency) and became present in almost 100% of the viral genomes by passage 20 (in the presence of NHC). Moreover, the same mutation was prevalent in viral genomes after the second independent selection of NHC-resistant variants (data not shown). Although I190T substitution alone caused detectable resistance of VEEV to NHC (Fig. 11), the ultimately developed triple mutant contained a combination of P187S, A189V, and I190T substitutions in nsP4. Their presence made virus replication clearly more resistant to the drug (Fig. 11). Based on a predicted structural model of VEEV nsP4 RdRp (Fig. 10), all three mutated amino acids were located in the RdRp index finger domain near the template entrance channel. Other research teams, using a variety of picornaviruses, have previously identified several RdRp-specific mutations that generate resistance to different nucleoside analogs (32, 40–42). However, only the P44S substitution in the RdRp of foot-and-mouth disease virus (FMDV) appeared in the same position as P187S in the structural model of VEEV-specific RdRp (26). The indicated FMDV-specific mutation has been proposed to amplify the resistance of this virus to ribavirin. The authors of that study suggested that the substitution of P44S increased the frequency of ribavirin incorporation instead of guanosine by affecting the shape of the template channel and the template transition rates through the active site. This in turn resulted in a

Downloaded from http://jvi.asm.org/ on March 25, 2019 by guest

detectable reduction of the FMDV mutant replication rates. The NHC-resistant PP2 variant selected in our study also demonstrated lower replication rates than both the original VEEV TC-83 and the drug-sensitive pseudorevertant PREV1. This suggests that less efficient RNA replication may be an important contributor to VEEV resistance to the compound. This assumption needs more detailed investigation because, in the case of PP2, the lower rate of viral replication was likely determined by a synergistic effect of numerous mutations accumulated in viral nsPs. Importantly, upon the withdrawal of NHC, the selected PP2 mutant further evolved to a more efficiently replicating phenotype. It was also acquiring mutations dramatically more efficiently than the original VEEV TC-83 in the absence of drug. At this stage, we cannot definitively distinguish whether the higher evolution rates of PP2 in the absence of NHC were the direct result of accumulation of previous mutations in nsP4 or its higher replication rates. However, the more efficiently replicating phenotype of PREV1 correlated with a complete loss of NHC resistance, and it became even more sensitive to this compound than the original VEEV TC-83.

Based on the results of NGS, after 20 passages of the NHC-resistant PP2 isolate in NHC-free media, the resulting viral pool retained all of the original PP2-specific mutations and also acquired A201V and V308I substitutions in nsP4. Based on their frequencies and the presence of only the A201V substitution in PREV1-specific nsP4, we hypothesized that A201V and V308I substitutions were likely encoded by different genomes rather than present together. Spatially, they are located close to each other and to the mutations leading to NHC resistance (Fig. 10), suggesting their possible function in both increasing the viral replication rates and lowering the resistance levels to the drug. Indeed, the addition of a single A201V-encoding mutation into the genome of NHC-resistant triple mutant (VEEV/3x) resulted in reversion to a drug-sensitive phenotype. Interestingly, in a predicted model of the nsP4 RdRp, A201 in the F motif is located next to K200, which, based on a structural alignment with FMDV 3D polymerase, may interact with the RNA template (43). Therefore, this mutation may compensate for the defect caused by a triple substitution in the index finger domain. Thus, the amino acid substitutions that lead to NHC resistance and its reversion possibly affect the interaction of template RNA with VEEV-specific RdRp.

In summary, this study demonstrated several key features of NHC. (i) NHC is a very potent anti-VEEV compound. (ii) NHC induces high mutation rates in the genome of replicating VEEV. (iii) NHC application has negative effects on both the release of viral particles and their infectivity. (iv) The antiviral effect of NHC is most prominent when it is applied at early times postinfection, during the rapid amplification of negative and positive-strand RNAs and assembly of replication complexes. (v) VEEV resistance to NHC develops very inefficiently. Even a low-level resistance requires acquisition of more than one mutation in VEEV nsP4. (vi) The development of such mutations correlates with lower replication rates of the virus. (vii) In the absence of NHC, the resistant mutants of VEEV revert to an NHC-sensitive phenotype and higher replication rates by acquiring additional mutations in nsP4. Taken together, our data suggest that NHC is a very promising and potent anti-VEEV agent that can likely also be used against other alphavirus infections.

MATERIALS AND METHODS

NHC was synthesized at Emory Institute for Drug Development. Its synthesis and additional characterization will be presented elsewhere.

Cell cultures. Vero cells were obtained from the American Type Culture Collection (Manassas, VA). BHK-21 cells were kindly provided by Paul Olivo (Washington University, St. Louis, MO). These cell lines were maintained at 37°C in alpha minimum essential medium supplemented with 10% fetal bovine serum and vitamins.

Plasmid constructs. The original plasmids containing the infectious cDNAs of VEEV TC-83 were described elsewhere (44). Mutations were introduced into nsP4 using standard PCR-based techniques. Schematic representations of all of the modified genomes are presented in the corresponding figures. The sequences of the plasmids and details regarding the cloning procedures can be provided upon request.

In vitro RNA transcription and transfection. Plasmids with the VEEV TC-83 genome and its derivatives were purified by ultracentrifugation in CsCl gradients. They were then linearized using a MluI restriction site located downstream of the poly(A) sequence. RNAs were synthesized by SP6 RNA polymerase in the presence of a cap analog, as described elsewhere (45). Electroporation of BHK-21 cells by in vitro-synthesized RNA was performed under previously described conditions (45, 46). In all of the experiments, viral titers were determined by a plaque assay on Vero cells as described elsewhere (47).

Selection of VEEV TC-83 mutants. A total of 2.5 % 10^6 Vero cells in 100-mm dishes were infected at an MOI of 1 PFU/cell with either original, electroporation-derived VEEV TC-83 or stocks harvested at the prior passage. The starting concentration of NHC was 1 " M, and it was gradually increased by passage 20 to 3.2 " M. Viral stocks were harvested at each passage after developing signs of a CPE, either at 24 or 48 h p.i. After the final passage, the plaques were randomly selected from the agarose cover, supplemented with 2 " M NHC. Viruses from two agarose plugs (PP1 and PP2) were extracted and used to infect Vero cells in the presence of 1 " M NHC to avoid the possible selection of true and pseudorevertants. At 24 h p.i., cells were harvested for RNA isolation and sequencing of viral genomes, and media were used as stocks for further analysis of viral isolates. One of the plaque-purified variants, PP2, was additionally passaged 20 times in Vero cells in the absence of NHC. During this serial passage, the volume of inoculum harvested from the previous passage was being gradually decreased from 100 to 0.01 " l. After the last passage, the viral population was homogeneous in terms of plaque size. One of the plaques (PREV1) was selected, and the extracted virus was used to infect Vero cells. Harvested medium was used for further experiments, and RNA from the infected cells was used for sequencing of viral nsP genes. Passaging of the original VEEV TC-83 in the absence of NHC was performed in parallel under the same conditions. After passage 20, one of plaques was also isolated, and the nsP-coding sequence was sequenced. For all isolates, DNA fragments were synthesized using RT-PCR and sequenced in the UAB Heflin Center Genomics Core Facility.

RT-qPCR. The viral RNA was isolated using ZR viral RNA kit (Zymo Research) from 100-" l portions of medium samples harvested at different time points p.i. with the indicated viruses grown in the absence or presence of NHC. As an internal control for normalization of the data, 10 " l of media containing the same amount of Sindbis virus (SINV) was added to each sample before RNA purification. VEEV- and SINV-specific cDNAs were synthesized using a QuantiTect reverse transcription kit (Qiagen) and further used for quantitative PCR (qPCR) analysis using VEEV and SINV nsP2-specific primers. The qPCRs were performed in triplicates using SsoFast EvaGreen Supermix (Bio-Rad) and a CFX96 real-time PCR detection system (Bio-Rad). The specificities of the products were tested by measuring their melting temperatures, and the data were normalized to the mean threshold cycle of the SINV control in each sample. Averages from three reactions and standard deviations were calculated and plotted on the graphs. Total cellular RNAs were isolated from infected Vero cells using a ZR viral RNA kit. cDNAs synthesis and qPCR analyses were performed using the above-described protocols, and the data were normalized to the concentrations of 18S rRNA present in the same samples.

NGS. Viral G RNAs were isolated from 0.6-ml portions of viral stocks indicated in the corresponding figures using ZR viral RNA or Direct-Zol RNA Mini Prep kits (Zymo Research). Purified viral RNAs were used to prepare NGS libraries using an Agilent SureSelect strand-specific mRNA library kit according to the manufacturer's instructions (Agilent, Santa Clara, CA), except that poly(A) selection was omitted. Briefly, 40-ng portions of viral RNAs were randomly fragmented with cations and heat, followed by the first-strand cDNA synthesis using random primers with the inclusion of actinomycin D (2.4 ng/" l final concentration). Second-strand cDNA was synthesized using standard techniques for stranded libraries. Adaptors were ligated for indexing to allow for multiplexing during sequencing. The size selection and purification of the libraries was performed using the Agilent 2100 bioanalyzer. The average amplicon length was 400 bp. Prior to cluster generation, the cDNA libraries were quantitated using qPCR in a Roche LightCycler 480 with a Kapa Biosystems kit for Illumina library quantitation (Kapa Biosystems, Woburn, MA). The 300-bp paired-end sequencing was performed on a MiSeq Illumina machine in the UAB Heflin Center Genomics Core Facility.

Illumina BaseSpace was used for base-calling and read demultiplexing. Trim Galore (v0.4.1) was used to remove adaptor contaminants and reads shorter than 15 bp and to trim low-quality bases (Q-score # 30). The high-quality, trimmed, paired-end fastq reads were them merged into one single-end read fastq file. The single-end trimmed fastq reads were then aligned using BWA-MEM (v0.7.15-r1140) to the VEEV reference genome in order to create the aligned SAM file. Naive Variant Caller (Galaxy, v0.0.2) was used to generate a variant file from the sorted BAM file on all positions of the VEEV genome. To create the count lists containing the number of bases seen at each position, Variant Annotator (Galaxy, v1.2) was used on the Naive Variant Caller's vcf file. The list was further processed in Excel to account for all possible mutations at each position and to generate figures. Table 1 presents the total and aligned read numbers.

Analysis of viral replication. A total of 5 % 10^5 Vero cells were seeded into six-well Costar plates and infected at MOIs indicated in the figure legends. NHC was added to the cells at the indicated times, media were harvested, and viral titers in the samples were determined by a plaque assay on Vero cells as described elsewhere (47).

Statistical analysis. Statistical analysis was performed using GraphPad Prism 7 software. The two-way analysis of variance (ANOVA) with the Tukey correction was used for statistical analysis of virus replication rates. The one-way ANOVA with the Dunnett's correction was used for statistical analysis of infectious virus titers and concentrations of GE. The data are presented as means & the standard

Application #:

Principal Investigator(s):

OVERALL IMPACT

Reviewers will provide an overall impact score to reflect their assessment of the likelihood for the project to exert a sustained, powerful influence on the research field(s) involved, in consideration of the following five scored review criteria, and additional review criteria. An application does not need to be strong in all categories to be judged likely to have major scientific impact.

Overall Impact *Write a paragraph summarizing the factors that informed your Overall Impact score.*

SCORED REVIEW CRITERIA

Reviewers will consider each of the five review criteria below in the determination of scientific and technical merit, and give a separate score for each.

1. Significance
Strengths • **Weaknesses** •

2. Investigator(s)
Strengths • **Weaknesses** •

3. Innovation
Strengths • **Weaknesses** •

4. Approach
Strengths • **Weaknesses** •

5. Potential for Fit/Collaboration with SIG-U19 Program

Acetalated Dextran: A Tunable and Acid-Labile Biopolymer with Facile Synthesis and a Range of Applications

Eric M. Bachelder*, Erica N. Pino, and Kristy M. Ainslie

Division of Pharmacoengineering and Molecular Pharmaceutics, Eshelman School of Pharmacy, University of North Carolina, Chapel Hill, North Carolina 27599, United States

* Supporting Information

Acetalated dextran (Ac-DEX) is a tunable acid-labile biopolymer with facile synthesis, aptly designed for the formulation of microparticles for vaccines and immunemodulation. Tunability of degradation is achieved based on the kinetics of reaction and the molecular weight of the parent dextran polymer. This tunability translated to differential rates of activation of CD8+ T cells in an in vitro ovalbumin model and illustrated that acid-labile polymer can activate CD8+ T cells at an increased rate compared to acid-insensitive polymers. In addition, Ac-DEX has been used to encapsulate small molecules, deliver nucleotides, transport inorganic molecules, formulate immune modulating therapies and vaccines, and trigger pH responsive constructs for therapy. Here we highlight the properties and results of Ac-DEX nano-/microparticles as well as the use of the polymer in other constructs and chemistries.

1. INTRODUCTION

Dextran is an FDA approved polysaccharide that has been used for decades as a plasma expander. The acetalation of dextran was first reported by Bachelder et al. wherein 2-methoxypropene was used to modify dextran, resulting in a biopolymer with dextran, methanol, and acetone as degradation products (Figure 1).[1] The acetalation of the dextran pendant hydroxyl group results in the polymer being hydrophobic, which allows the encapsulation of drugs through emulsion chemistry, similar to what is done with polyester polymers. This acetalized polymer (Ac-DEX) facilitated the encapsulation of hydrophobic and other drugs that would typically be difficult to deliver. Additionally, acetalated dextran (Ac-DEX) is an acid-sensitive polymer that degrades more rapidly at lower pH, such as in the endosome of phagocytic cells, tumors, or areas of inflammation, allowing for site-specific degradation of the polymer and subsequent release of the encapsulated therapeutic.

In the reaction of dextran with 2-methoxypropene, the kinetically favored acyclic acetals will initially form, followed by the thermodynamically stable cyclic acetals. Acyclic acetals degrade rapidly during hydrolysis and result in the generation of methanol and acetone. In contrast, cyclic acetals degrade more slowly through hydrolysis and result in the generation of acetone only. This differential acetal formation was shown to be dependent on the reaction time of the polymer and to result in varying degradation rates based on the ratio of cyclic to acyclic acetals. With the differential tunability of Ac-DEX came a marked difference in T cell activation using β-galactosidase reporter cells and the model antigen protein ovalbumin. Most notably, faster degrading materials at lower pHs resulted in the most significant major histocompatibility complex class I (MHC I) and MHC II presentation. When comparing fast and slow degrading Ac-DEX to other acid-sensitive (polyacrylamide), degradable (poly(lactic-*co*-glycolic acid) (PLGA)), and nondegradable (iron oxide) carriers,[2] fast degrading Ac-DEX displayed enhanced MHC I presentation and the best MHC II presentation over other carriers. CD8+ T cells are cytotoxic T cells that can kill infected cells indirectly by inducing apoptosis in the target cell, or can kill cells directly through the secretion of perforin. Therefore, CD8+ T cell

activation, via MHC I, is desirable to generate protective vaccine mediated immune responses against intracellular pathogens such as viruses, as well as some bacteria, parasites, and fungi. Moreover, MHC I presentation is required for the development of a therapeutic cancer vaccine. This tunability and enhanced MHC I class presentation illustrates Ac-DEX is a well-designed polymer for vaccine applications (Figure 2). Moreover, Ac-DEX particles displayed significantly greater CD4+ (MHC II) presentation in comparison to other biomaterials, exhibiting that Ac-DEX particles cross-presented to both CD4+ and CD8+ T cells, arming both the cellular and humoral responses that would be needed for many vaccines.[2]

Apart from enhanced activation of cellular immune responses, Ac-DEX has several other benefits when compared to other commonly used biopolymers. A primary benefit is its facile synthesis. Ac-DEX synthesis is a single vessel reaction with subsequent purification through precipitation.[3] Moreover, the degradation products of Ac-DEX are pH-neutral, unlike commonly used polyesters (e.g., poly beta amino esters (PBAEs), poly(lactic-co-glycolic) acid (PLGA), polycaprolactone (PCL)) and several polyanhydrides. This allows for minimal degradation of the payload due to low pH, without the addition of excipients.[4−6]

Other acid-sensitive polymers have been developed for drug delivery applications, including PBAEs, poly(ortho esters) (POEs), and polyketals. PBAEs, while associated with increased cellular internalization and transfection efficiencies over PLGA particles, have illustrated increased cytotoxicity, likely due to their highly positive zeta potentials from their cationic amines in the backbone.[7] In contrast to PBAEs, POEs are very biocompatible but have relatively slow degradation at pH 5.[8] Polyketals, another acid-sensitive polymer class, offer great polymer degradation control, but their difficult synthesis is less appealing than that of Ac-DEX.[9] In comparison to these polymers, Ac-DEX's inherent acid-sensitivity allows for tunable degradation profiles based on reaction time, thus allowing precise control over payload release. Since both sustained and burst release can be selectively achieved, Ac-DEX is an ideal carrier for a wide range of therapeutics. Ac-DEX is a unique biopolymer in that where other commonly used polymers degrade into acidic byproducts, all byproducts of Ac-DEX degradation are pH-neutral. This property gives Ac-DEX the following two advantages: first, a neutral pH should not adversely affect the encapsulated payloads; second, the environment surrounding Ac-DEX should not be harmed upon degradation as it could by the degradation of polymers with acidic byproducts, such as PLGA.

Ac-DEX stands alone as an easily made, tunable, and acid-sensitive polymer, which makes it understandable why it has been used in over 30 publications since 2008 and has been mentioned in five reviews.[10−14] Here we report its application to deliver a variety of compounds, including small molecules, proteins, peptides, nucleotides, and inorganic molecules. Moreover, the most common formulation of Ac-DEX, nano-/

microparticles, has been studied extensively in vitro and in vivo and has been delivered through parenteral and needle-free routes. In addition to the particulate constructs, Ac-DEX has been incorporated into a variety of copolymers and advanced designed delivery devices which rely on the polymer's acid sensitivity and tunable degradation rates (Supporting Information Table 1). The many publications that use Ac-DEX, as well as its broad range of applications, make it an emerging biomaterial for drug delivery.

2. ADJUVANT AND VACCINE DELIVERY

The original proposed application of Ac-DEX was the formation of nano-/microparticles as a subunit vaccine. Since subunit vaccines often rely on adjuvant activity for innate immune activation,[15] it goes hand-in-hand that adjuvant encapsulation in Ac-DEX would also be studied. If Ac-DEX microparticles (MPs) are of a certain size, they can passively target antigen presenting cells (APCs). Unlike most cell types in vivo, phagocytes (e.g., dendritic cells (DCs), macrophages) can internalize particles larger than 100 nm, thereby allowing uptake only by phagocytic cells if particles are greater than 100 nm.[16,17] Furthermore, passive targeting of professional APCs (DCs) is possible with further sizing. Studies have shown that MPs in the range of 1−2 μm are four times more likely to be phagocytosed by CD11c+/CD11b+ cells (DCs, professional APCs) than CD11c-/CD11b+ cells (e.g., macrophages). Also, in this same size range, when observing cells extracted from the local draining lymph nodes, approximately 50 times more CD11c+CD11b+ or CD11c+CD11b+ cells (DCs) phagocytosed the MPs, compared to CD11c-CD11b+ cells (macrophages). These results indicate that large particles (1−2 μm) are predominately transported by DCs from the injection site to the lymph nodes, whereas smaller particles are cleared by resident macrophages.[18] Moreover, once the MPs are taken up, the acid-sensitivity of particles leads to an enhanced release of cargo through more rapid degradation of the polymer, compared to degradation at neutral pH. This combination of acid-sensitivity and passive targeting makes Ac-DEX MPs apt carriers for adjuvants and vaccines.

2.1. Adjuvant Encapsulation

Primarily, toll-like receptor (TLR) agonists are the type of adjuvants that have been reported to be encapsulated in Ac-DEX particles. Of the TLRs studied, TLR 3 and TLR 7/8 are the most common, since these are intracellular Pathogen-Associated Molecular Patterns (PAMPs) found within the cell's phagolysosome, which is where Ac-DEX particles would reside after phagocytosis. Imiquimod, the active ingredient in Aldera cream and a TLR 7/8 agonist was first encapsulated into Ac-DEX particles by Bachelder et al.[19] A dose sparing of the hydrophobic adjuvant was observed in vitro in both macrophages and bone-marrow derived dendritic cells (BMDCs). A statistically significant difference in both mRNA and soluble cytokine responses was observed when BMDCs and macrophages were cultured with Ac-DEX MPs encapsulating imiquimod in comparison to empty Ac-DEX MPs and soluble imiquimod, at the same concentrations (Figure 3).[19] Resiquimod, a more hydrophilic imiquimod derivative, was later encapsulated into Ac-DEX MPs, and also displayed a dose sparing response in cytokine production in macrophages.[20] Moreover, by creating a library of polymers with unique cyclic acetal coverage and molecular weight, it has been illustrated that the loading of resiquimod as well as its release and bioactivity in macrophages can be controlled and illustrate dose sparing.[21]

In addition to the encapsulation of small molecule adjuvants, nucleotide adjuvants have been formulated into Ac-DEX MPs. Two adjuvant-based nucleotides, in particular, have been used: Poly I:C, which is an agonist for TLR 3, and CpG, which activates TLR 9. In contrast to TLR 8 expression, which is uniform across species, TLR 9 activity differs between mice and humans, where in it is significantly reduced in humans because it is limited to only plasmacytoid DCs and B cells.[22] Despite this, CpG is heavily studied and therefore a practical adjuvant for vaccine formulation. In the comparison of poly I:C encapsulation with Ac-DEX versus PLGA, there was a significant increase in adjuvant encapsulation efficacy (EE) at intermediate (71K) dextran molecular weights. Also, the more quickly degrading poly I:C loaded Ac-DEX MPs resulted in increased cellular activation compared to more slowly degrading Ac-DEX and PLGA. One or both degradation rates of Ac-DEX resulted in a dose sparing compared to soluble drug.[23] Increased EE in comparison to PLGA and dose sparing compared to soluble drug was also observed with the encapsulation of CpG in Ac-DEX MPs. Moreover, the viability of Ac-DEX MPs was shown to be comparable to that of PLGA MPs, indicating that increased cytotoxicity is not the cause of the increased adjuvant activity observed with Ac-DEX MPs. The encapsulation of adjuvant in Ac-DEX particles paves the way for formulation of subunit vaccines using the biopolymer.

2.2. Vaccine Formulations

The model antigen ovalbumin (OVA) was encapsulated into Ac-DEX to evaluate the effect of Ac-DEX encapsulation[1] and tunability[2] on MHC I and MHC II presentation using model cell lines (B3Z for MHC I presentation and KZO for MHC II presentation). Both cell lines will express β-galactosidase downstream of CD3 signaling when the immunodominant peptide of OVA is presented on APCs. The enhanced MHC I presentation (indicator of cellular activity) observed by

Bachelder et al. in the initial reporting of Ac-DEX is due in part because particle cross-presentation of protein antigen has resulted in both MHC II and MHC I expression of antigen.[24] Broaders et al. then illustrated that the acid-sensitivity of Ac-DEX generates a greater cellular response at more rapid degradation rates and in comparison to non-acid-sensitive formulations. It is this foundation in enhanced cellular responses compared to free protein as well as other biomaterials that leads to the formation of vaccines with Ac-DEX MPs.[2]

Using separate particles, a complete subunit vaccine comprised of Ac-DEX was formulated for protection against anthrax. Separate emulsion based particles were used for adjuvant and antigen because the adjuvant had poor EE using homogenization compared to sonication, but homogenization was less damaging to the protein antigen. For the study, ~400 nm homogenized particles encapsulated recombinant protective antigen (rPA) and ~200 nm sonicated particles loaded with resiquimod were used. Ac-DEX MPs were shown to be an efficacious vaccine carrier for both antigen and adjuvant over unencapsulated delivery. The study also indicated that high levels of total IgG antibody, significantly greater than Alum and rPA, were generated in the particle vaccine group; however, these antibodies were non-neutralizing, likely due to the denaturation of the protein during the emulsion fabrication process. Despite the poor neutralizing response, a Type 1 helper T-cell (Th1) response was observed in both the antigen recall study as well as by the generation of IgG2 antibodies (Figure 4). This illustrated that the protection observed with the lethal challenge could be the result of a cellular immunity,[25] which corresponds with the results of both Bachelder et al.[1] and Broaders et al.[2]

The work with the anthrax vaccine paved the way for the evaluation of a Burkholderia pseudomallei vaccine for the prevention of melioidosis. Using cell lysate as a crude antigen and resiquimod, again in separate particles, vaccination with Ac-DEX particles was shown to significantly delay time to death, after lethal challenge, in both a rapid and more traditional vaccine schedule. The particle formulation generated humoral and cellular immune responses greater than those of alum and lysate. Additionally, approximately 10% of mice were sterile (blood, liver, spleen) after challenge when treated with encapsulated resiquimod Ac-DEX particles, with and without antigen. This indicates a potential post exposure treatment for this bioterrorism agent.[26]

With the use of emulsion for both the anthrax and B. pseudomallei vaccine work, there were several inherent manufacturing limitations that needed to be addressed prior to additional development of the Ac-DEX vaccine platform. These limitations included: (1) batch processing, (2) high energy methods (e.g., sonication, homogenization) which could denature the protein antigen, (3) extended solvent and protein antigen contact times during the solvent evaporation process which can also cause denaturation of the protein; (4) limited control over the amount of drug and efficacy at which it is encapsulated, and (5) broad polydispersity of particles. The effects of protein denaturation can result in poor B cell activation, which was illustrated by the lack of neutralizing antibodies observed with the emulsion anthrax work.[25] To address these limitations, an Ac-DEX MP anthrax vaccine was formulated using scalable electrospray.[27] In contrast to emulsion, electrospray can be scaled by multiplexing the electrospray heads. Electrospray can have limited interaction with solvents, offers a broader range of control of EE of the payload, produces fairly monodisperse MPs, and uses slow flow rates, which translates to reduced shear stress (Figure 5). When electrospray was used to encapsulate PA, decreased protein denaturation was observed compared to emulsion, which resulted in increased toxin neutralization of generated antibodies (Figure 5). Also due to the flexibility of particle fabrication via electrospray, we were able to encapsulate both protein and adjuvant into a single MP. In comparison to separately encapsulated adjuvant and antigen, the coencapsulated group provided decreased survival in response to a lethal challenge (Figure 5), although both groups outperformed the FDA approved anthrax vaccine formulation, BioThrax. This work illustrates the feasibility of manufacturing an Ac-DEX MP

vaccine platform, and the platform's ability to protect better than the current standard vaccine.

Ac-DEX particles have not only been used to stimulate an effector immune response, but they have also been used to attenuate immune responses in an antigen-specific manner. By using a tolerizing agent (e.g., dexamethasone) with an antigen (Myelin Oligodendrocyte Glycoprotein (MOG)), the costimulatory signals required for generation of an effector response are absent in the education of the T cell by the DC. This can result in antigen-specific attenuation of the immune response via mechanisms such as the formation of T-regulatory cells, anergy, or T cell deletion. Using Ac-DEX particles to encapsulate MOG and dexamethasone into one particle, via emulsion, it was shown using a Multiple Sclerosis (MS) model (experimental autoimmune encephalomyelitis (EAE)) that mice could be taken, on average, from full hind and partial front paralysis to only exhibiting a limp tail. The application of Ac-DEX for these autoimmune therapies is reviewed by Chen et al.[10] and, later, by Northrup et al.[14] The application of Ac-DEX particles has gone beyond the model antigen to illustrate protective responses in

disease models, further illustrating the strong application of this biopolymer in a vaccine formulation.

3. DELIVERY TO MACROPHAGES

Like DCs, macrophages can be targeted by particles that are too large to be taken up by nonphagocytic cells. Moreover, since smaller particles are taken up and cleared by macrophages, one can also have a concentrated uptake in macrophages by sizing the particles between 100 nm and 1,000 nm.[18] Since macrophages serve as host cells to a variety of pathogens, including viral, bacterial, parasitic, and fungal, they can act as interdiction points for therapy. By disrupting the mechanisms the pathogen usurps to reside intracellularly, pathogen growth and survival can be decreased. These host-directed therapies (HDT) are thought to mitigate the emergence of drug resistance, since they are not targeting the pathogen directly. Ac-DEX has been used to formulate one HDT, AR-12 (also known as OSU-03012). AR-12 has illustrated broad spectrum activity against multiple bacteria, viruses, and the parasite Leishmania donovani,[12,28−33] and its activity has been reviewed by Collier et al.[31] Compared to unencapsulated drug, AR-12 in Ac-DEX particles had significantly reduced cytotoxicity and higher intracellular drug loading. Additionally, the particles were taken up freely by human monocyte derived macrophages (Figure 6).[33] In vivo, AR-12 in Ac-DEX particles displayed enhanced clearance of Francisella tularensis infection compared to the unencapsulated compound. When AR-12 in Ac-DEX particles were co-delivered with a suboptimum dose of antibiotic intranasally, there was a significant increase in mouse survival compared to free drug and free suboptimum antibiotic. In the host-directed treatment of intracellular parasite, L. donovani used intravenously delivered AR-12 in Ac-DEX particles and displayed a significant reduction in parasite burden over free AR-12, both alone and when co-delivered with amphotericin B. Overall, this work displays that Ac-DEX particles can more aptly deliver HDTs that target macrophages to reduce drug toxicity and increase drug efficacy.

4. CONTROLLED RELEASE

Probably the broadest application of Ac-DEX is its use as a controlled release drug delivery vehicle. Similar to the payloads seen with vaccine formulations, small molecules, proteins, peptides, and nucleotides have all been encapsulated or adsorbed to Ac-DEX to achieve a desired effect. In addition, inorganic based silver carbine has been encapsulated into Ac-DEX to serve as an antibacterial agent.[24] Many of these formulations are the traditional emulsion based nano-/microparticles that are used for both vaccine and macrophage targeting applications. By varying emulsion parameters with Ac-DEX, it has been shown that the encapsulation of rapamycin is dependent on the molecular weight of the base dextran,[35] which corresponds to what was observed with the encapsulation of poly I:C.[23] Also using traditional emulsion chemistry, it was shown that a model protein enzyme (horseradish peroxidase), encapsulated in Ac-DEX particles, had enhanced stability compared to unencapsulated protein. Moreover, Ac-DEX protected the enzyme and its activity from −20 to 45 °C, while PLGA melted at these higher temperatures. As expected, homogenized particles maintained better activity of the enzyme over sonicated particles (Figure 7).[36]

Using Ac-DEX to encapsulate proteins has advantages over polyesters and polyanhydrides because the degradation products are pH-neutral and can therefore be less damaging to the encapsulated protein. In contrast to Ac-DEX, when PLGA degrades, the core of the PLGA particle becomes extremely acidic.[4] It is then not surprising that Ac-DEX has been used to deliver proteins and peptides for therapeutic treatment. Henniget al. compared the EE of a peptide in Ac-DEX particles versus PLGA. They observed a decreased EE with Ac-DEX over PLGA for positively charged peptides for PLGA terminated with a carboxylic acid. The higher

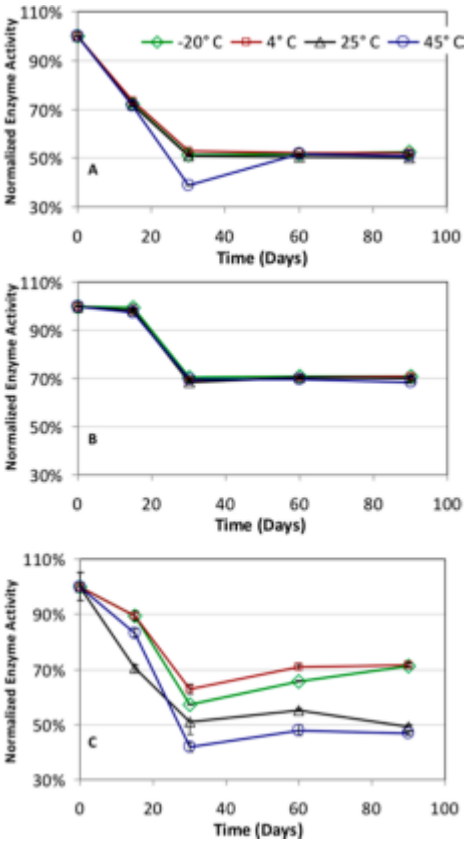

Figure 7. Activity of horseradish peroxidase when (A) encapsulated in sonicated Ac-DEX particles, (B) encapsulated in homogenized Ac-DEX particles, or (C) unencapsulated and stored at different temperatures as a dry powder. Reprinted with permission from ref 36. Copyright 2012 Elsevier.

encapsulation for PLGA is probably due to the interaction between the positive charge of the peptide and the negative charge of the carboxylic acid.[37] For neutral charged peptides and small molecules, Ac-DEX had higher EE. Other studies have encapsulated peptide into Ac-DEX particles[38] but have not compared their encapsulation to PLGA. Despite differences in EE, another advantage of Ac-DEX over polyesters is the tunable delivery. Suarez et al. illustrate this as an advantage in the delivery of basic fibroblast growth factor (bFGF) and myoglobin for treatment after myocardial infarction (MI). The tunability of release of these proteins afforded optimization of the release rates for the best therapeutic effect.[39] The temporal control of Ac-DEX was also illustrated to deliver a hepatocyte growth factor fragment for cardioprotective therapy.[40] As with the MI treatment, an optimum therapeutic effect was determined by varying the degradation rate of the polymer, underlining the importance of this Ac-DEX property.

For the delivery of nucleotides, polycations have been covalently attached to Ac-DEX to facilitate ionic absorption of siRNA,[41] resulting in increased knock-down compared to the free siRNA control. The increased intracellular trafficking over soluble siRNA of the Ac-DEX particles likely contributed to the increased siRNA efficacy.[41] Similarly, poly beta amino esters (PBAEs) were blended with Ac-DEX to deliver plasmid. Plasmid transfection in both HeLa and RAW macrophages was found to be dependent on the weight fraction of PBAE to Ac-DEX.[42]

Other constructs of Ac-DEX have been generated to offer controlled release, including porous microparticles, composite spray dried particles, electrosprayed microparticles, electrospun mats, and electrospun mat fragments called microconfetti (Figure 8). To mimic the large porous PLGA microparticles originally developed by Edwards et al.[43] Ac-DEX was made into porous microparticles, which display a significantly reduced density to volume ratio, compared to traditional emulsion particles. When modeled in a cascade impactor, the porous Ac-DEX particles had aerosol properties for deep lung penetration. The porous particles displayed a controlled release of the chemotherapeutic camptothecin as well as degradation-dependent release.[44] To advance lung delivery using Ac-DEX, nanoparticles made of the biopolymer were loaded with either tobramycin or paclitaxel[45,46] and then spray dried in a secondary matrix to form composite microparticles. Ac-DEX adjuvant microparticles, albeit not composite, have also been made through electrospray. Compared to emulsion, electrospray

affords a more scalable method that uses air as a continuous phase, in place of an aqueous or organic solution, resulting in increased EEs of compounds. The EE of resiquimod was increased almost 10-fold over emulsion with electrospray to form microparticles that could be delivered intravenously to treat L. donovani infection.[47] A method similar to electrospray, electrospinning, has also been used to generate controlled release nanofibrous scaffolds for Ac-DEX. By electrospinning Ac-DEX with different degradation rates, controlled release of resiquimod was observed, as well as a differential effect of resiquimod on macrophages.[47] The differential effect of Ac-DEX degradation rates aligns with the cardioprotective effects with the MI treatment with bFGF and myoglobin and also the release of saquinavir from electrospun fibers ground into injectable fragments called microconfetti.[48] Collier et al. illustrated that fragments of nanofibrous Ac-DEX scaffolds that are milled can afford nearly week-long release of the protease inhibitor saquinavir when injected subcutaneously. Microconfetti could not be fabricated from PLGA or PCL, even when milled under liquid nitrogen. The high glass transition temperature of Ac-DEX (~160−190 °C)[36] allowed electrospun nanofibrous scaffolds, loaded up to 50 w/w % with saquinavir, to be milled into small injectable pieces.[48]

Ac-DEX has also been used in the formation of Janus particles with PLGA.[49] By using electrohydrodynamic (EHD; electrospray) cojetting, Rahman et al. formed microparticles where one-half of the particle consists of PLGA, and the other half consists of a PLGA/Ac-DEX blend. They loaded the chemotherapeutic irinotecan into the part of the particle that consisted of Ac-DEX, and they were capable of releasing in a pH-sensitive manner.[50] Expanding on their previous work, Ross et al. then proceeded to use their Janus particles for the delivery of drugs to the cochlea in an animal model of cochlear implants. By using piribedil loaded microparticles, they were able to show extended release in vivo.[51] These controlled release studies illustrate that the range of degradation and processability afforded with Ac-DEX is much greater than that which is observed with PLGA, leading to better controlled release systems, as included in reviews by Miladi et al.[13] and Chifiriuc et al.[11]

5. DEVICES

The acid-sensitive acceleration in degradation as well as Ac-DEX's broadly tunable degradation make it an appealing candidate for incorporation into highly engineered devices. Ac-DEX has been used to more rapidly release insulin in response to changes in glucose,[52] as valves in mesoporous silicon,[53,54] and as vehicles to trap water for laser-assisted release of payload.[55] Gu et al. coated Ac-DEX microparticles with chitosan or alginate to give alternating charges. By creating a low acid environment with gluconic acid, one product of glucose and glucose oxidase, insulin encapsulated in the Ac-DEX particles is released at an accelerated rate in the presence of glucose. This device was shown to attenuate blood sugar in diabetic mice.[52] This is similar to the work that was done in the 1990s using poly ortho-esters as the pH-sensitive material.[8] Additionally, Wang et al. has incorporated anti-PD1 antibodies into Ac-DEX for microneedle applications.[56] By incorporating anti-PD1 into a polymeric microneedle, they show enhanced antibody efficacy. Also taking advantage of Ac-DEX's acid-sensitivity, two laboratories have reported the incorporation of the biopolymer into mesoporous silicon to work as valves to control the release of drug that has been absorbed into the inorganic material. Either by using different degradation rates of polymer or by exposing the composite particles to an acid-environment, drug can be released in a more controlled manner, compared to drug absorbed on mesoporous silicon alone.[53] Furthermore, Ac-DEX was used to functionalize the silicon, by attaching cell penetrating peptide to the biopolymer incorporated in the mesoporous silicon.[54] Beyond mesoporous silicon, Viger et al. trapped water in Ac-DEX microparticles fabricated via electrospray. They then heated the water into vapor using a near-IR laser, which results in destabilization of the Ac-DEX matrix and more triggered drug release.[55] These devices display the broad applicability of Ac-DEX.

6. COPOLYMER AND OTHER ACETALATED POLYMERS

To further enhance Ac-DEX, functional groups have been covalently attached to the polymer and copolymers have been formed to create new micelles and other drug delivery vehicles. Initially Ac-DEX was modified with oxime chemistry to covalently link cell penetrating peptide to the particle surface. This chemistry was used to attach the peptide with a fluorophore that then displayed strong covalent attachment to the peptide.[57] Also for enhanced targeting of Ac-DEX particles, mannose was ligated to the biopolymer to actively target the mannose receptor, which is highly expressed in immune cells. Mannose targeting resulted in increased MHC I presentation of OVA over conventional Ac-DEX particles.[58] To cationically charge the Ac-DEX particles, spermine[59] and diethylenetriamine (DET) grated poly(L-aspartic acid)[60] have been covalently bound to Ac-DEX. The spermine functionalized Ac-DEX resulted in better knock-down than sham siRNA, without a marked difference in cell viability.[59] For the DET grated poly(L-aspartic acid) functionalized to Ac-DEX particles,

both doxorubicin and plasmid were delivered to cancer cells with polymeric particles formed through emulsion and micelles. These carriers resulted in significant uptake of doxorubicin in cancer cells.[60] In addition to the peptide-DET-Ac-DEX micelles formed, poly(ethylene glycol) (PEG) has been covalently attached in two ways to Ac-DEX to form copolymer micelles with pH-sensitive triggers. With the addition of PEG to Ac-DEX with varying degradation rates, micelles were formed to deliver doxorubicin. The Ac-DEX-PEG micelles released drug in a pH-sensitive manner and illustrated increased cell death compared to PEG-b-polylactide (PLA) pH-insensitive micelles at some concentrations when cultured with HeLa cells.[61] PEG was also attached to Ac-DEX by adenine termination of the biopolymer and thymine termination of PEG to form a triblock polymer. Using Ac-DEX at different degradation rates resulted in differential pH-sensitive release of doxorubicin. All triblock micelles loaded with doxorubicin resulted in a significant decrease in cell viability when cultured with HeLa cells.[62] In each of these cases, the acid-sensitivity and/or degradation tunability of Ac-DEX was used to help facilitate better drug delivery.

In addition to copolymers, two acetalated polymers have been produced that display similar properties as the original Ac-DEX. Ace-DEX, which was used in several of the previously mentioned results,[21,31,33,52] is formed by the reaction of dextran and 2-ethoxypropene (leading to the use of the e in Ace over Ac), resulting in ethanol, in place of methanol, as a degradation product. Ace-DEX displays similar degradation tunability as Ac-DEX as well as similar cytocompatibility (Figure 9).[63] Using similar chemistry, Ace-Inulin was formed (Figure 10). Whereas dextran is immunologically inert, inulin has naturally occurring immune stimulating properties, allowing Ace-Inulin to serve as its own adjuvant in vaccine formulations. Blending Ace-Inulin with Ace-DEX results in better encapsulation of protein, but decreased immune stimulatory activity, as measured through tumor necrosis factor-alpha (TNF-α) production by RAW macrophages. Overall, an Ace-Inulin blended OVA vaccine did elicit strong total IgG antibodies on order with OVA and alum.[64] Similarly, silylated dextran and inulin have shown tunable properties and generation of IgG.[65] These second generation Ac-DEX polymers have the same beneficial properties of Ac-DEX with some added features, including more benign degradation products and immune stimulating capabilities.

7. CONCLUSION

In conclusion, we have reviewed the emerging biopolymer acetalated dextran (Ac-DEX). Ac-DEX has several features which make it a unique biodegradable polymer, including facile synthesis, acid-sensitivity, and tunable degradation rates. For these reasons it has emerged as a top candidate for applications in vaccines, targeted host-directed therapies to macrophages, controlled release of drug, chemotherapeutic delivery, engineered drug delivery devices, and as copolymers in drug and vaccine carriers. Ac-DEX has displayed delivery of small molecules, proteins, peptides, nucleotides, and inorganic compounds, illustrating the broad applicability of this material. Moreover, it has been used to modify inorganic mesoporous silicon, spun into nanofibrous mats, made into microconfetti, and covalently bound to other polymers to form micelles. Current uses of this biopolymer are merely the tip of the iceberg, the applications of Ac-DEX will certainly expand in the coming years.

Biographies

Eric M. Bachelder gained extensive immunological experience while completing his graduate studies in Dr. Polly Matzinger's lab at the National Institutes of Health (NIH), National Institute of Allergy and Infectious Diseases (NIAID). During his graduate studies, he studied

DOI: 10.1021/acs.chemrev.6b00532
Chem. Rev. 2017, 117, 1915−1926

the interaction of T-cells and dendritic cells. After completing his Ph.D. in Chemical Engineering, he joined Prof. Jean Fréchet's lab at the University of California, Berkeley's chemistry department for a postdoc. While there, Dr. Bachelder invented various biodegradable polymers for vaccine and drug delivery applications, including Acetalated Dextran (Ac-DEX). Dr. Bachelder continued his work on Ac-DEX as an Assistant Professor at the Ohio State University and currently at the University of North Carolina at Chapel Hill. The focus of Dr. Bachelder's research program is to develop novel drug delivery moieties for the formulation of vaccines, infectious disease treatments, and autoimmune therapies.

Erica N. Pino received her B.S. in Biology from the Massachusetts Institute of Technology in 2013. Her undergraduate thesis work in the laboratories of Dr. Robert Desimone and Dr. Edward Boyden centered on characterizing heat and light propagation through rodent cortex to establish safe guidelines for optogenetic studies in nonhuman primates. Following graduation, she continued research in the Desimone lab, focusing on optogenetic inactivation of frontal eye field neurons during memory-guided saccade tasks. She is now a graduate student in the Ainslie lab, working toward her Ph.D. in the Division of Pharmacoengineering and Molecular Pharmaceutics at the University of North Carolina at Chapel Hill.

Kristy M. Ainslie is an Associate Professor with appointments in the Division of Pharmacoengineering and Molecular Pharmaceutics, within the Eshelman School of Pharmacy, and the Department of Biomedical Engineering at the University of North Carolina at Chapel Hill. Her research focuses on the use of novel micro- and nanoscaled carriers for the modulation of immune responses to create vaccines for and therapies against infectious diseases. Previously, she was an Assistant Professor in the Division of Pharmaceutics and Pharmaceutical Chemistry at The Ohio State University. As a postdoctoral scholar at the University of California, San Francisco, she researched the microfabrication of oral drug delivery vehicles and the immune response of nanobiomaterials. Previously, she studied biosensors at the Naval Research Laboratory in Washington, DC, and completed a Ph.D. in Chemical Engineering at The Pennsylvania State University in the application of nanobiomaterials for antifouling implant surfaces.

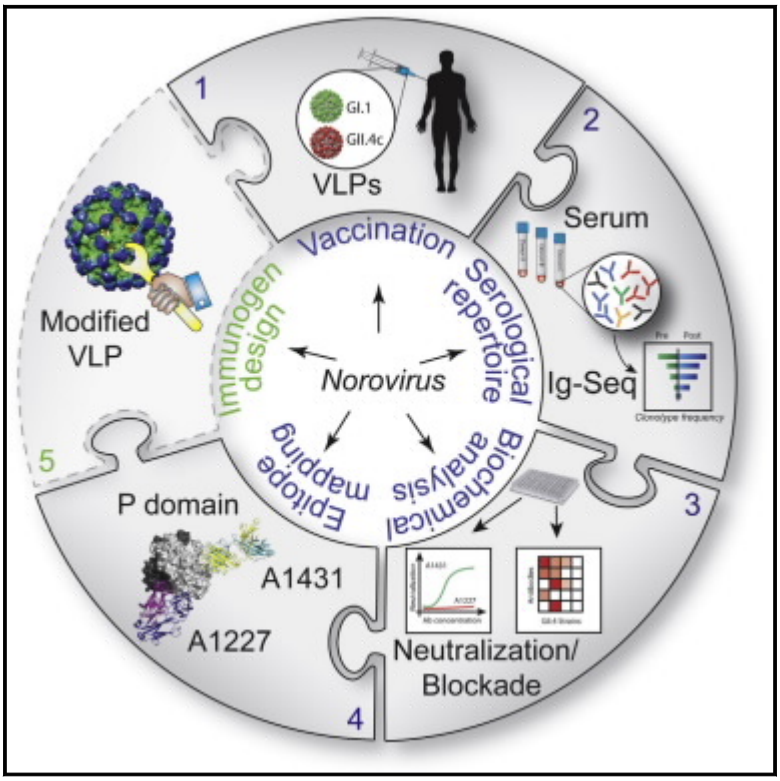
Immunity

Sera Antibody Repertoire Analyses Reveal Mechanisms of Broad and Pandemic Strain Neutralizing Responses after Human Norovirus Vaccination

Graphical Abstract



Highlights

- Serum vaccine response is dominated by a small number of abundant antibody clonotypes
- Vaccine-boosted antibodies predominantly target conserved norovirus epitopes
- Identified cross-genogroup and strain-specific epitopes
- Discovered a pandemic-genotype neutralizing antibody recognizing a conserved epitope

In Brief

Human norovirus (HuNoV) is a leading cause of gastroenteritis. Lindesmith et al. identify circulating serum antibodies following experimental HuNoV vaccination in humans and map them to viral epitopes. One antibody recognizes a neutralizing epitope conserved across three decades of pandemic strains and neutralizes virus in vitro, demonstrating that vaccination can elicit pandemic-strain neutralizing antibody responses in some individuals.

SUMMARY

Rapidly evolving RNA viruses, such as the GII.4 strain of human norovirus (HuNoV), and their vaccines elicit complex serological responses associated with previous exposure. Specific correlates of protection, moreover, remain poorly understood. Here, we report the GII.4-serological antibody repertoire—pre- and post-vaccination—and select several antibody clonotypes for epitope and structural analysis. The humoral response was dominated by GII.4-specific antibodies that blocked ancestral strains or by antibodies that bound to divergent genotypes and did not block viral-entry-ligand interactions. However, one antibody, A1431, showed broad blockade toward tested GII.4 strains and neutralized the pandemic GII.P16-GII.4 Sydney strain. Structural mapping revealed conserved epitopes, which were occluded on the virion or partially exposed, allowing for broad blockade with neutralizing activity. Overall, our results provide high-resolution molecular information on humoral immune responses after HuNoV vaccination and demonstrate that infection-derived and vaccine-elicited antibodies can exhibit broad blockade and neutralization against this prevalent human pathogen.

INTRODUCTION

Human norovirus (HuNoV) is the leading cause of acute gastroenteritis, a disease responsible for an estimated 200,000 deaths per year, mostly in children less than five years old and the elderly (Collaborators, 2017; Patel et al., 2008). The human norovirus genome is a single-stranded, plus-sensed RNA with 3 open reading frames (ORFs), including an ORF2 major capsid protein (viral protein 1, VP1) composed of shell and protruding (P) domains. Expression of VP1 in insect and mammalian systems leads to self-assembly of 90 VP1 dimers into icosahedral virus-like particles (VLPs)that are antigenically indistinguishable from virions (Baric et al., 2002; Green et al., 1993; Jiang et al., 1995; Prasad et al., 1999). Despite more than 30 known human norovirus genotypes, 60% of norovirus outbreaks are caused by GII.4 genotype strains (Burke et al., 2019; Cannon et al., 2017). Efforts to develop an effective vaccine against human norovirus are complicated by the large number of antigenically distinct genotypes and the rapid evolution of GII.4 viruses (Atmar et al., 2018; Bull et al., 2007; Debbink et al., 2014a; Kocher et al., 2018; Lindesmith et al., 2008). Increased understanding of which capsid epitopes should be targeted to protect against different genotypes and of the impact of pre-exposure history on the elicitation of protective immunity after vaccination are important considerations in vaccine design and efficacy (Havenar-Daughton et al., 2018; Lindesmith et al., 2015, 2017; Snijder et al., 2018).

Antigenic drift within GII.4 norovirus strains has prompted serial pandemic outbreaks in 1995, 2002, 2006, 2009, and 2012, each correlating with the emergence of new GII.4 antigenic variants that appeared to have escaped pre-existing immunity (Debbink et al., 2012b; Lindesmith et al., 2008; Siebenga et al., 2007). Human norovirus attaches to the cell surface via binding to histoblood group antigens (HBGAs; typically A, B, O, or Lewis antigens) on mucosal surfaces of the gut (Lindesmith et al., 2003; Tan and Jiang, 2011). Extensive studies have established that antibodies that block norovirus VLP binding to HBGAs strongly correlate with protective immunity in chimpanzees and humans (Atmar et al., 2011; Bok et al., 2011; Malm et al., 2014; Reeck et al., 2010). Immune escape frequently relies on mutations at key residues in the immunodominant A, D, and E epitopes targeted by blockade

antibodies, with blockade measured by a surrogate neutralization assay based on the antibody-dependent inhibition of VLP binding to HBGAs (Debbink et al., 2012a; Harrington et al., 2002; Lindesmith et al., 2012a, 2012b). Carbohydrate ligand blockade assays are the primary functional assay used to predict serological immunity and represent the clinical endpoint for evaluating norovirus infection and vaccination outcomes (Atmar et al., 2011; Lindesmith et al., 2015, 2017; Malm et al., 2014; Reeck et al., 2010). Recent development of human intestinal enteroids (HIEs) as an *in vitro* system that successfully supports the replication of HuNoV also allows for direct evaluation of neutralization (Costantini et al., 2018; Ettayebi et al., 2016).

Multivalent VLP immunization broadens the breadth of blockade antibodies produced after immunization of mice (Debbink et al., 2014b; LoBue et al., 2006) and humans (Lindesmith et al., 2015). Currently, the leading human norovirus vaccine candidate is in phase IIb clinical trials (Bernstein et al., 2015; Leroux-Roels et al., 2018). This vaccine comprises a mixture of two VLPs: GI.1, the prototypical genogroup 1 strain, and GII.4c (GII.4 consensus), a VLP based on the consensus sequence of the GII.4 strains Houston (2002), Yerseke (2006a), and Den Haag (2006b) (Bernstein et al., 2015; Parra et al., 2012; Treanor et al., 2014). GII.4.2006a was used as the default sequence where all three of the strains diverged, most notably within the evolving immunodominant epitopes A, D, and E. The vaccine induces rapid (evident at day 7 post vaccination) antibody responses against both genogroup I and genogroup II VLPs (Lindesmith et al., 2015). The rapid blockade antibody response after vaccination suggests that the vaccine may activate a memory B cell or recall response in adults (Lindesmith et al., 2015), though the mechanisms governing this immune outcome have remained unknown.

Here, we report on the serological repertoire to the GII.4c VLP component of the bivalent human norovirus vaccine pre- and post-immunization. We determined the serological repertoire using immunoglobulin sequencing (Ig-Seq), a proteomics-based serum antibody repertoire analysis methodology (Georgiou et al., 2014; Lee et al., 2016; Williams et al., 2017). We focused on the GII.4c component of the vaccine because GII.4 strains have proven more clinically significant and display a higher rate of evolutionary drift, which potentially complicates the elicitation of protective immunity. Our results (1) provide clear evidence of the dominant effect of pre-existing immunity arising from earlier exposure on the humoral response to the vaccine; (2) define three classes of HuNoV circulating antibodies: one class comprising antibodies with very extensive binding breadth recognizing GI strains and GII strains but having no blockade activity, a second class that is specific to GII.4 and has blockade activity towards historical pandemic strains, and finally, a third class represented by one virus-neutralizing antibody with potent blockade activity towards historical GII.4 strains and contemporary strains that emerged well after the strains which were used to design the vaccine GII.4c VLP and human trials; (3) characterize in molecular detail VP1 epitopes that are targeted to enable broad binding or broad blockade with neutralizing activity, and (4) highlight the impact of pre-existing serological repertoire breadth and titers on the response to the vaccine.

RESULTS

The GII.4 HuNoV Serological Repertoire after HuNoV Bivalent Vaccination Is Highly Polarized and Shaped by Previous GII.4 Infection

We analyzed three donors that experienced a significant increase in GII.4 titer after immunization with the bivalent GII.4c + GI.1 VLP vaccine (Figure 1A; Table S1). The serological repertoire was delineated using Ig-Seq, a proteomic methodology in which serum antibodies are purified by affinity chromatography against an immobilized antigen—in this case, immobilized GII.4c VLP—then proteolytically digested into peptides and analyzed by liquid chromatography-tandem mass spectrometry (LC-MS/MS). Peptide spectral matches were obtained using a custom database of heavy-chain-variable (VH) genes encoded by peripheral B cells from the respective donor. To construct the VH database, peripheral blood mononuclear cells (PBMCs) collected at each time point were split into two aliquots: one aliquot was sequenced using high-throughput single-cell flow-focusing technology (DeKosky et al., 2015; McDaniel et al., 2016) to determine the native VH/VL (heavy-chain-variable/light-chain-variable) paired repertoire, and the second aliquot was processed to determine the VH repertoire. Relative quantitation of serum anti-GII.4c antibodies was determined from the LC peak intensity of high-confidence peptide-spectrum matches (PSMs) derived from peptides of the third complementarity determining region of the heavy chain (CDR-H3). Antibodies belonging to a CDR-H3 clonotype likely recognize the same epitope, given the dominant role of CDR-H3 in antigen recognition. As we established earlier, the Ig-Seq workflow identifies the majority (>70%) of the most abundant antigen-specific antibodies in the serum, and quantitation calibrations using isobaric peptide spike-ins show that peak intensities correlate well with absolute peptide concentrations (Lavinder et al., 2014). The antibody repertoire composition and relative quantities at the clonotypic level are plotted as a histogram with each bar representing an individual clonotype and the horizontal axis showing its relative abundance (Figure 1B). All three donors had a titer to GII.4c at day 0, presumably a consequence of prior exposure to GII.4 infection and consistent with earlier data indicating that the vast majority of asymptomatic adults have antibodies to HuNoV (Carmona-Vicente et al., 2015; Nurminen et al., 2011). As has been the case with the serological repertoire to other antigens reported so far (e.g., influenza hemagglutinin [Lee et al., 2016], tetanus toxoid [Lavinder et al., 2014], or desmoglin in pemphigus patients [Chen et al., 2017]), the repertoire to GII.4c was found to be oligoclonal and highly polarized, in that <3 antibodies dominated the response, contributing more than 50% of the antigen-specific titer (Figure 1B). In particular, at day 0, the dominant CDR-H3 clonotype in each repertoire accounted for between 58% and 86% of the total CDR-H3 peptide intensity, suggesting that the long-term serological memory to GII.4 is dominated by a single antibody. Other examples of highly skewed serological repertoire polarization with one clonotype accounting for >60% of the response have been reported previously (Lee et al., 2016).

Antibody clonotypes present in both the pre-vaccination repertoire (day 0) and the post-vaccination repertoire were defined as "pre-existing," whereas clonotypes observed exclusively in the post-vaccination repertoire were defined as "emergent." The term "emergent antibodies" refers only to the

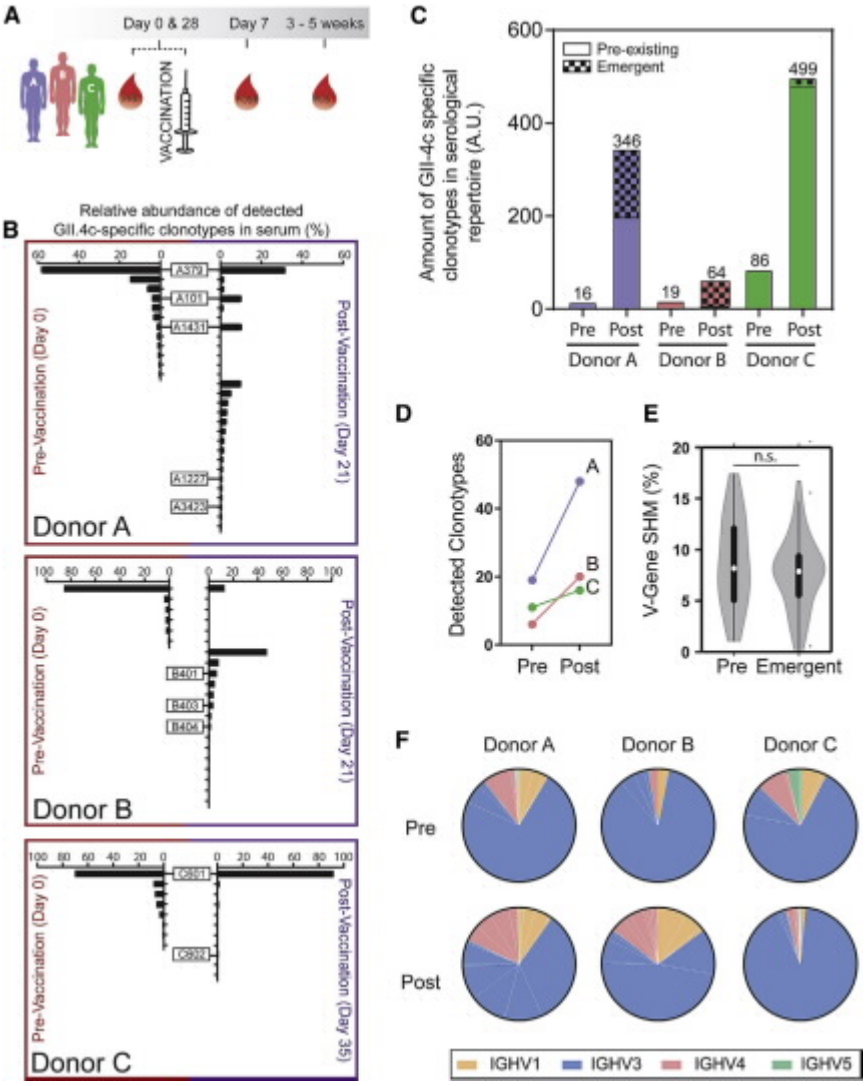

Figure 1. The Anti-NoV GII.4c IgG Serum Antibody Repertoire following Vaccination Is Polarized and Shaped by Previous HuNoV Infection

(A) Donors (n = 3) were immunized with experimental HuNoV vaccine and serum and PBMCs were collected at the times indicated.

(B) Relative abundance of GII.4c-specific IgG clonotypes pre- and post-vaccination. Each bar represents a CDR-H3 antibody clonotype observed at a 0.5% of the GII.4c antigen-specific antibody repertoire.

(C) Amount of anti-GII.4c serum antibodies (i.e., the product of anti-GII.4c IgG ELISA titer 3 relative antibody abundance as determined by LS-MS/MS; see STAR Methods) pre- and post-vaccination; ELISA titer shown over each bar.

(D) Number of detected antibody clonotypes before and after vaccination.

(E) Anti-GII.4c antibody V-gene somatic hypermutation rates for pre-existing and emergent antibodies; n.s. represents not statistically significant (two-tailed t test; $p > 0.3$).

(F) V-gene family usage in the serological repertoire. Related to Table S1.

fact that they become detectable in the serum post vaccination and should not be interpreted in terms of B cell ontogeny (i.e., whether they arise from stimulated naive cells or memory B cells). Although vaccination increased the diversity of the serological repertoire in all donors, both the number and abundance of vaccine-elicited clonotypes were substantially lower in donor C, who had a 4- to 5-fold higher titer to GII.4c before vaccination (day 0) compared to the other two donors (Figures 1B–1D). In this donor, the increase in the GII.4c titer 4 weeks post vaccination was overwhelmingly due to the boosting of the dominant antibody clonotype C601, which accounted for >90% of the serum response and increased in absolute abundance by more than 7-fold relative to the level observed at day 0. The low level of emergent antibodies in donor C, who had the highest pre-vaccination titer, is consistent with the strong inverse correlation between day 0 serum titer and the number of emergent antibody clonotypes in the serological memory after immunization with the seasonal influenza vaccine (Lee et al., 2016).

Pre-existing and emergent antibodies displayed similar somatic hypermutation profiles (Figure 1E). Although emergent antibodies (7.1 ± 0.5% mean rate of somatic hypermutation) were slightly less mutated than the pre-existing antibodies (8.2 ± 1.1%), this difference did not reach statistical significance. The anti-GII.4c serological repertoire was predominantly comprised of antibodies using the immunoglobulin heavy variable 3 (IGHV3)family (80%; Figure 1F) compared to 30% in naive or mature B cells (DeKosky et al., 2016; Mroczek et al., 2014). These findings suggest that the serological IgG response to human norovirus vaccination is largely dominated by the boosting of a limited number of pre-existing antibody clonotypes.

Recombinant HuNoV Serum Antibodies Demonstrate Neutralization against GII.4 and Breadth of Binding across Strains

We expressed and characterized a set of 10 representative serum antibodies for which both VH and VL sequences were detected by paired VH/VL sequencing. These included the top most abundant clonotypes in donors A and C (A379 and C601), two strongly boosted pre-existing clones (A101 and A1431, boosted by 123 and 1263 , respectively, in terms of abundance in the post-vaccination serum relative to day 0), and six emergent antibodies (Figure 1B). Binding and blockade activity were tested using an antigenically diverse panel of norovirus genogroup I and genogroup II VLPs, including a time-ordered panel of pandemic GII.4 VLPs representing historical variant strains, including US95_96 (GII.4 1997), Farmington Hills (GII.4 2002), and Den Haag (GII.4 2006b), as well as prospective strains that emerged following vaccine design (2006) and the

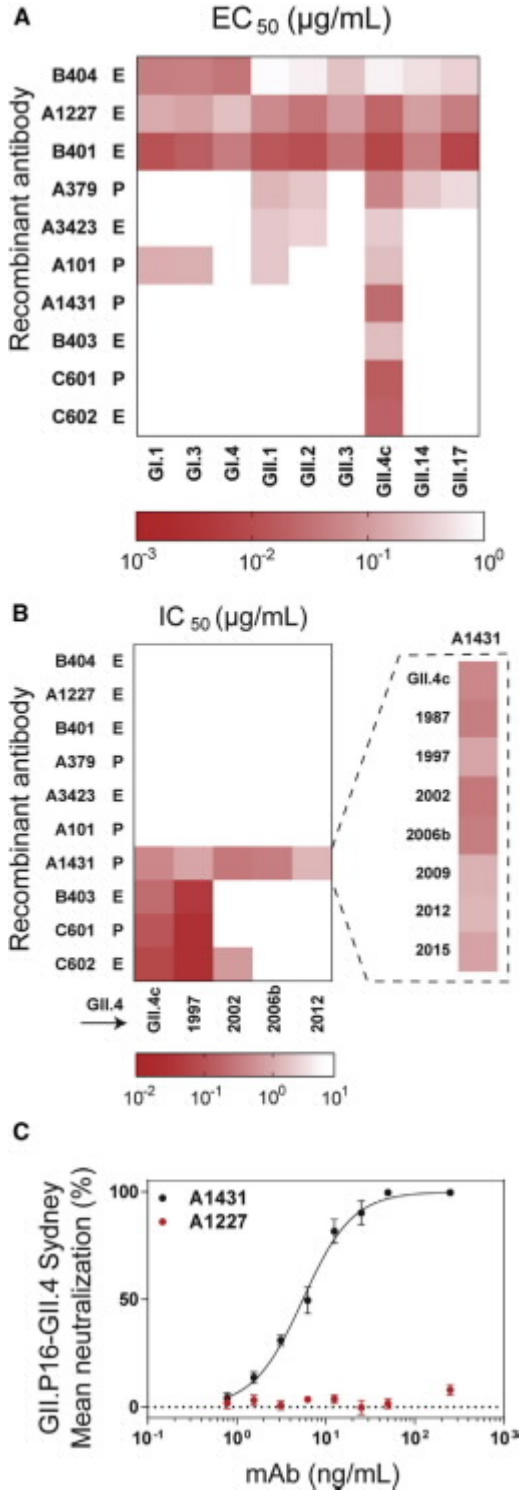

Figure 2. HuNoV Recombinant Serum Antibodies Recognize Conserved Binding, Ligand-Blocking, and GII.4 Neutralizing Epitopes

Sigmoidal dose response curves were fit to the mean percent control binding for determination of (A) half-maximum binding (EC_{50}) or (B) half-maximum blocking of HBGA binding (half-maximum inhibitory concentration, IC_{50}) of pre-existing (P) and emergent (E) antibodies. Titers >2 mg/mL were scored as negative (white box). The HBGA blocking assay was used to characterize A1431 against a panel of pandemic norovirus GII.4 strains. Antibodies were tested in duplicate in a minimum of two independent experiments. (C) Sigmoidal dose response curves were fit to the mean percent viral genomic copies control for determination of IC_{50} in a neutralization assay. The neutralization assay was used to characterize A1431 and A1227 against the GII.P16-GII 4 Sydney strain. Error bars represent mean ± SEM from four independent experiments with 2 technical replicates for each dilution. Related to Figure S1.

clinical trial (2010), such as GII.Pe-GII.4 Sydney (GII.4 2012) and GII.P16-GII.4 Sydney (GII.4 2015) (Lindesmith et al., 2018a). As expected, all antibodies bound to the vaccine strain VLP (Figure 2A), with half-maximal effective concentration (EC_{50}) values between 8 and 717 ng/mL. The potential for neutralization by inhibition of cellular ligand binding was evaluated by determining blockade of VLP-ligand binding (blockade assay) (Figure 2B). The 10 serum antibodies could be categorized into three classes. The first class consisted of 6 antibodies that displayed broad binding but no blocking activity toward multiple GI and GII strains; three of these, namely A1227, B401, and B404, showed binding to all strains tested, including a variety of GI and GII genotypes such as GI.I, GII.2, and GII.17. The VP1 protein among these strains shows only 50% amino acid identity (Zheng et al., 2006). The second class consisted of antibodies B403, C601, and C602, which had strong blockade activity towards the vaccine strain and the earlier pandemic GII.4 1997 strain but not to GII.4 strains that emerged post vaccination. Finally, the third class of serum antibodies had a single member, A1431, which had strong blockade activity to all known historical GII.4 strains from 1987 onwards. A1431 had very extensive breadth and potency not only towards all historical strains available but also towards prospective GII.4 strains that appeared after the vaccine trial, including GII.4 2012 and 2015, neither of which had circulated in the general population at the time of sample collection (Figure 2B). Furthermore, A1431 potently neutralized GII.P16-GII.4 Sydney virus, a GII.4 strain that emerged 5 years post sample collection, in a human intestinal enteroid culture system (Costantini et al., 2018; Ettayebi et al., 2016) (IC_{50} 5.5 ng/mL), supporting the correlation between blockade of ligand-binding potency and antibody-mediated neutralization (Figures 2C and S1) (Alvarado et al., 2018; Ettayebi et al., 2016).

We sought to define biochemically the epitopes recognized by the antibodies with blockade activity to historical strains, namely B403, C601, and C602; as discussed below, the epitope of A1431 that has broad blockade breadth was determined by crystallography. We first evaluated antibody mediated blockade against a panel of VLPs with epitopes A, D, and E exchanged from GII.4 2012 (non-binding VLP) into GII.4 1987 (binding VLP). Exchange of epitope A residues ablated blockade potency of B403 and diminished potency of C601 by 13.5-fold but had little effect on C602 blockade (1.8-fold decrease). Exchange of epitope D or E residues had little impact on blockade of any of the three antibodies, suggesting that the major binding determinants for B403 and C601 likely reside within epitope A (Figures 3A–3C). VLPs displaying an acidic residue at 298, Val at position 356, and His at 357 had lower EC_{50} titers than VLPs without these residues for all three antibodies (Figures 3B and 3C). Exchange of V298E/A356V/E357H into the null backbone VLP 581 (Lindesmith et al., 2018b) (VLP 581.A4A) gained binding of B403 and C601 and improved binding of C602 by 11.6-fold compared to

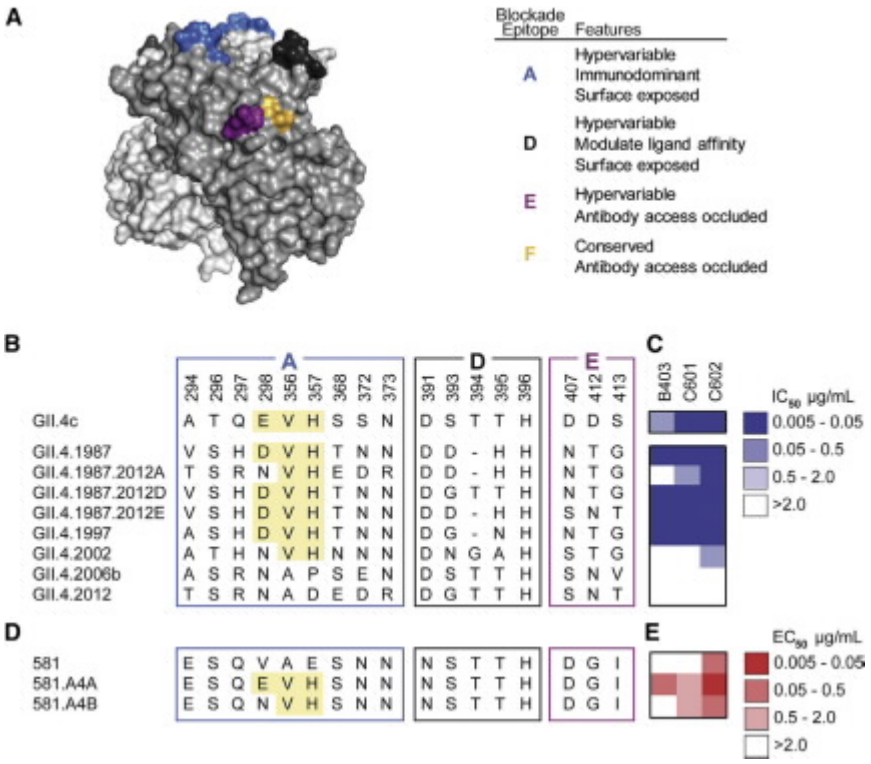

Figure 3. Serum Antibodies that Block Historical GII.4 Strains Recognize Overlapping Epitopes within Epitope A

the 581 VLP (Figures 3D and 3E). Substitution of V298N/A356V/E357H (VLP 581.A4B) did not gain binding for B403, yielded similar binding to that to 581.A4A for C601, and decreased C602 binding by 7.6-fold compared to 591.A4A. These data confirm E or D at position 298 as an anchor residue for B403. For antibody C601, binding was heavily influenced by V356/H357, residues that are predicted to contribute to epitope A but have not been previously verified. Further, our analysis also revealed that C602 recognizes a previously undefined blockade epitope. Together, these data categorize antibodies boosted by HuNoV VLP vaccination into three classes: (1) genogroup I and genogroup II broadly binding, non-neutralizing antibodies; (2) ancestral GII.4 binding and ligand-blocking antibodies; and (3) GII.4 broadly binding and neutralizing antibodies. Genetic mapping indicated that antibodies displaying a limited breadth of GII.4 ligand-blockade potency (class 2 above) recognized the immunodominant epitope A antigenic site (Mallory et al., 2019) and accounted for previously observed back-boost antibody responses in HuNoV vaccinated donors (Lindesmith et al., 2015). These data demonstrate that HuNoV vaccination can elicit serum antibodies capable of neutralizing GII.4 pandemic strains.

Structural Studies Define a Highly Conserved Non-Blocking Epitope and a Conserved GII.4 Neutralizing Epitope within the Capsid P Domain

To gain insight into the molecular mechanisms underlying cross-reactive, non-blockade activity, we selected the pan-reactive antibody A1227 for crystallographic analysis. We purified the antigen-binding fragment (Fab) of A1227 in complex with soluble GII.4 P domains from 2002, 2006, 2009, or 2012 pandemic strains and screened for crystallization. Complexes with the GII.4.2002 P domain (P2002) yielded diffracting crystals suitable for structural analysis.

Single crystals of the complex between A1227 and P2002 diffracted to 2.6 Å, and the structure was solved by molecular replacement using the apo P2002 structure (PDB: 4OOV) (Singh et al., 2015) (Table S2). A1227 Fab bound to each of the conserved P1 subdomains of the P2002 dimer (Figure 4A). Each Fab bound at the interface between monomers in the P2002 dimer, with the heavy chain recognizing both protomers and the light chain recognizing only a single protomer (Figure 4B). A1227 recognized a region of P2002 which was mostly conserved across genogroups GI and GII (Figures 4C and S2), thus explaining the broad cross-reactivity of antibody A1227. Overall, each Fab buried 950 $Å^2$ by establishing polar contacts and favorable van der Waals interactions with P2002 (Figures 4D and S2). There were no substantial conformational changes upon A1227 binding to P2002, with a root-mean-square deviation (RMSD) of 0.6 Å between apo-P2002 and A1227-P2002 complex structures.

To map the A1227 epitope within the context of the VLP, the crystal structure of the A1227-P2002 complex was superimposed onto the GI.1 capsid structure (PDB: 1IHM) (Prasad et al., 1999). The GI.1 capsid structure was chosen as a template for modeling due to similarities between GI.1 and GII.4 capsid structures indicated by prior electron microscopy (EM) studies (Chen et al., 2004). Modeling revealed that the conserved region recognized by A1227 was located at an occluded site on the norovirus capsid, at the interface between the P domain and shell domain. Overlay of Fab A1227 onto the GI.1 capsid structure (Figures 4E and 4F) indicated that other P domains on the assembled norovirus capsid would clash with both heavy and light chains of the Fab, with only minor clashes with the shell domains (Figure 4G), suggesting that structural rearrangements of the P domain could either expose the A1227 binding site or allow binding at a neighboring P domain. Its lack of blockade or neutralizing activity likely results from antibody A1227 only recognizing defects or maturation intermediates (Pogan et al., 2018).

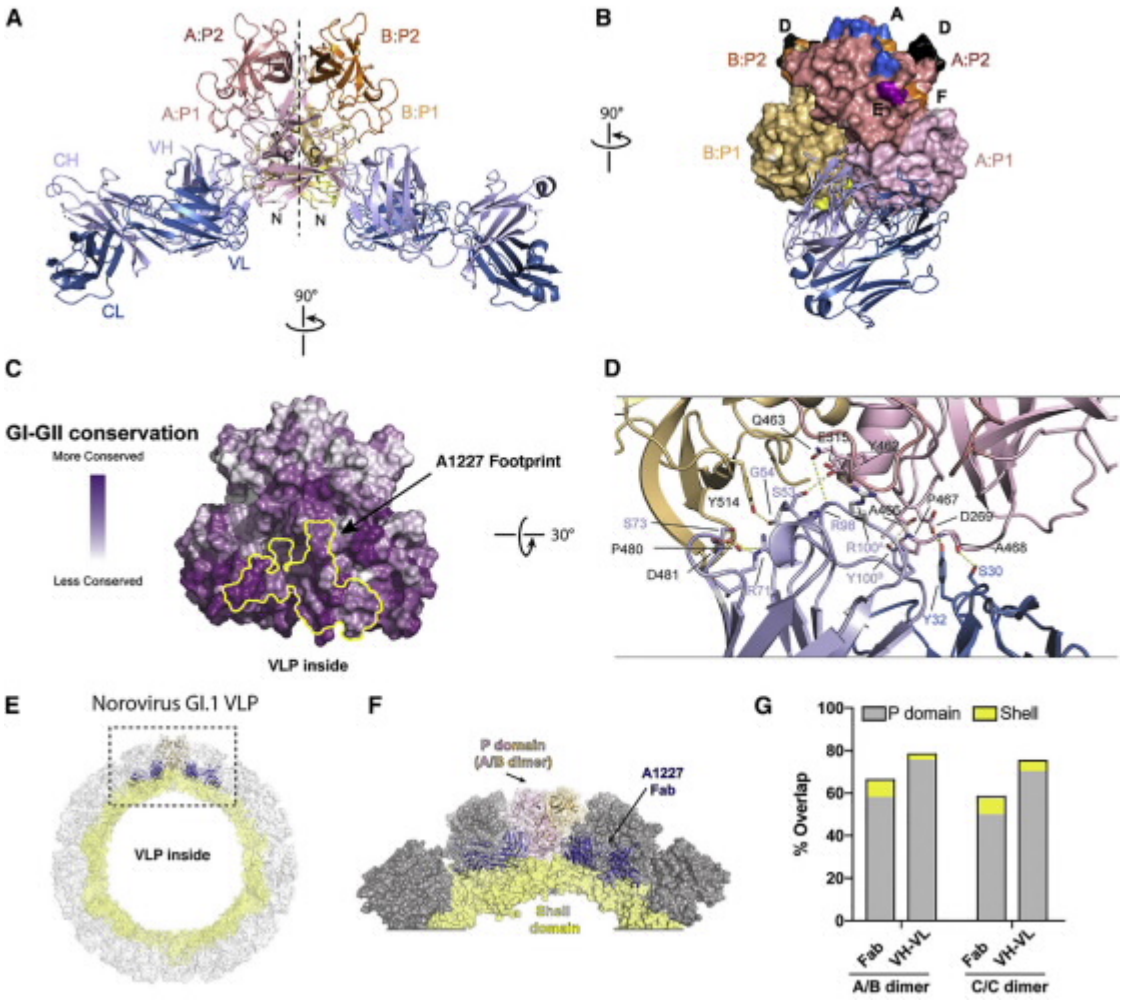

Figure 4. The Broadly Binding Non-Blockade Antibody A1227 Binds to a Highly Conserved Epitope within the P Domain

(B) The A1227 antibody binds near the P1 dimeric interface (P domain dimer in surface representation and A1227 Fab in cartoon).

(C) A1227 Fab footprint is outlined in yellow on the P domain surface, mapped by GI-GII sequence conservation, with degree of conservation colored from variable (white) to conserved (purple).

(D) Detailed view of A1227 Fab-P domain binding interface, with interacting residues depicted in stick and hydrogen bonds shown in yellow dotted lines.

(E) Modelling of the GII.4.2002 P domain-A1227 Fab crystal structure onto the GI.1 capsid structure (PDB: 1IHM) reveals an antibody binding site that is occluded on the assembled VLP.

(F) Close-up view from (E) showing the occlusion of A1227 Fab within the GI.1 capsid.

(G) Quantification of volume overlap between A1227 Fab (or VH/VL) and GI.1 capsid proteins. Over 60% of the volume of A1227 Fab overlaps with neighboring P domains when modelled onto either A/B or C/C dimers. Only small overlaps are due to clashing with shell domains. Overlaps from P domain and shell domain are colored in gray and yellow, respectively. Volumes were calculated using Voss-Void-Voxelator program (Voss and Gerstein, 2010).

Related to Table S2 and Figure S2.

To provide a structural basis for recognition by the GII.4 broad blockade antibody A1431, we solved the crystal structure of A1431 Fab in complex with the GII.4.2002 P domain at 3.1 Å resolution (Table S2). The asymmetric unit contained two P-domain-A1431 Fab complexes, with each dimer generated by crystallographic 2-fold symmetry. Both complexes were nearly identical, with an RMSD of 0.3 Å. Electron density for both P2002 and A1431 variable domains was well defined, although regions of A1431 constant domains were not well ordered.

Antibody A1431 bound each P domain monomer at a cleft between the P1 and P2 subdomains (Figure 5A). Similar to A1227, A1431 binding did not induce substantial conformational changes in the P domain, with an overall RMSD of 0.4 Å between the complex and apo (PDB: 4OOV) structures. Antibody A1431 recognized an epitope located near previously mapped blockade epitopes D and F and distinct from the site of HBGA binding (Figure 5B). Both A1431 heavy and light chains contributed to the binding interface with a total buried surface area of 985 $Å^2$ on the P domain. The CDR-H3 loop of A1431 was

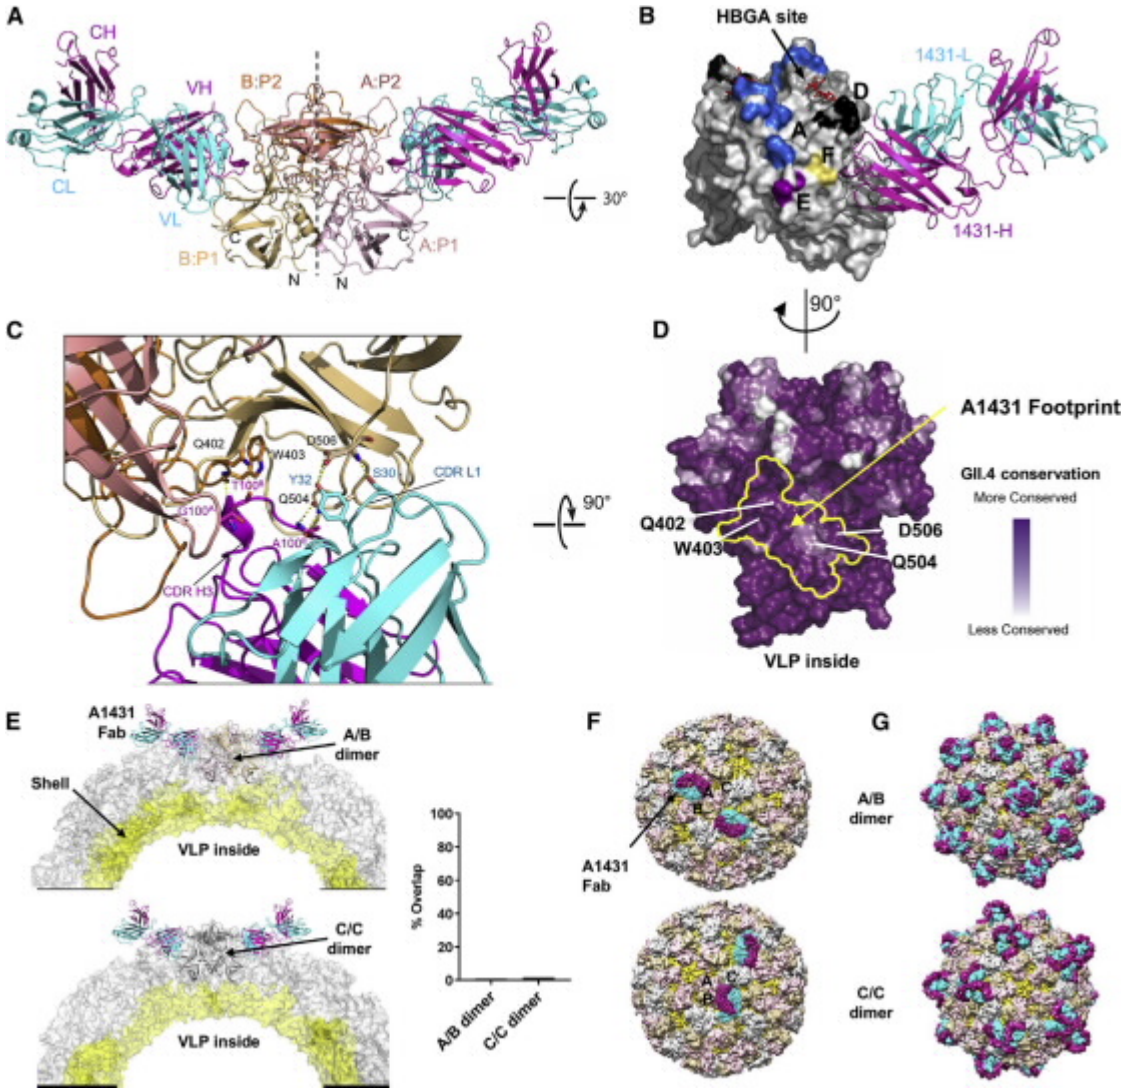

Figure 5. Broad GII.4-Blockade Antibody A1431 Recognizes an Accessible Semi-Conserved Site of Vulnerability

(A) Overall structure of A1431 Fab bound to GII.4.2002 P domain dimer is shown in ribbon representation, with P domain monomers in pink and orange and A1431 heavy and light chains in magenta and cyan, respectively.

(B) Mapped blockade epitopes are highlighted on a surface representation of GII.4.2002 P domain dimer (colored as in Figure 3A) with the A1431 Fab shown in cartoon. The crystal structure of GII.4 (Farmington Hills, 2004) P domain complexed to HBGA type B ligand (PDB: 4X05) was superimposed onto the GII.4.2002 P domain + A1431 complex to show location of HBGA binding site.

(C) Details of A1431 Fab interactions with P domain residues are highlighted with interacting residues depicted in stick and hydrogen bonds shown in yellow dotted lines.

(D) A1431 Fab footprint is outlined in yellow on the P domain dimer surface, mapped by GII.4 sequence conservation, with degree of conservation colored from variable (white) to conserved (purple).

(E) The GII.4.2002 P domain-A1431 Fab crystal structure is modeled onto the GI.1 capsid structure (1IHM; Prasad et al., 1999), with a cross-section showing the P domain fit onto the A/B dimer (top) or the C/C dimer (bottom). Overlap between A1431 Fab and P domain, as modeled onto either GI.1 capsid A/B or C/C dimers, is minimal and shown on right, as in Figure 4G.

(F) Modeling of A1431 Fab to the A/B dimer (top) or C/C dimer (bottom) on the GI.1 capsid structure, with A/B dimers colored pink and tan, C/C dimers colored in gray and shell domain shown in yellow.

(G) GI.1 capsid models, colored as in (F), showing occupancy of A1431 binding sites on all A/B dimers (top) or all C/C dimers (bottom).

Related to Table S2 and Figure S3.

inserted into a cleft between the P1:P2 subdomains and was held in place by hydrogen bonding between main-chain atoms of the CDR-H3 and P domain residues Gln402, Trp403, and Gln504 (Figure 5C). Ser30 and Tyr32 from the CDR-L1 loop provide additional stabilization via hydrogen bonds to Asp506 on the P1 subdomain. The recognized surface, including P domain residues Gln402, Trp403, Gln504, and Asp506, was nearly completely conserved in GII.4 (Figure 5D) but only semi-conserved between GI and GII genogroups, with Asp506 changed to Pro506 in most other GI and GII strains (Figure S3),

providing the structural basis for the broad recognition of A1431 of GII.4 viruses but not of other norovirus genotypes.

To gain insight into the molecular mechanism of blockade activity by antibody A1431, we superimposed the crystal structure of the P2002-A1431 Fab complex onto the GI.1 capsid structure (Figure 5E). On the assembled VLP, the P domain dimer exists in two distinct structural environments, defined by A/B and C/C dimers (Prasad et al., 1999). A1431 Fab binding to the A/B dimer showed no overlap between Fab and either P or S domains, whereas binding to the C/C dimer showed minor overlap (Figures 5E and 5F). Binding of the A1431 Fab to all equivalent sites on the VLP showed recognition at the A/B dimer to cover most of the VLP surface, whereas recognition of the C/C dimer left the 5-fold vertices potentially capable of attaching to HBGAs at the cell surface (Figure 5G). In both cases, binding at all sites would lead to substantial antibody-antibody overlap (Figures 5F and 5G), suggesting that A1431 exerts its blockade and neutralizing activity by binding to only a fraction of potential binding sites on the VLP. Overall, in contrast to the A1227 binding site, modeling suggested the A1431 blockade epitope to be mostly accessible on the capsid surface. Notably, the A1431 epitope did not overlap with identified sites of HBGA recognition, and therefore, the observed blockade functionality likely stems either from antibody A1431 sterically inhibiting the approach of the VLP to the >500 kDa multivalent HBGAs found on MUC2 in PGM and in human gastric and duodenal tissues (Park et al., 2015) or from subtle allosteric effects, as reported for another antibody that docks near to the 1431 binding site (Lindesmith et al., 2014, 2018b), as defined by epitope mapping. High-resolution structures of broadly reactive and/or neutralizing epitopes expand our understanding of the HuNoV antigenic landscape and narrow the search for optimal vaccine candidates. For instance, whereas antibodies targeting hypervariable P2 epitopes (i.e., epitope A) have limited cross-strain ligand-blocking potency and antibodies recognizing highly conserved epitopes near the P1-shell-domain interface are highly cross-reactive but have no blocking potency, the antibodies targeting genotype-conserved epitopes at the P1-P2 interface display broad ligand-binding blocking potency. It should be noted that each of these antibody classes may contribute to vaccine-induced protection, and further studies and *in vivo* models are required to fully understand the interplay between the antibody targets and the physiological response.

DISCUSSION

Vaccine-induced immunity relies on the development and maintenance of long-term protective antibody titers or serological memory. The best studied correlate for protective immunity after HuNoV infection is the development of robust blockade antibody responses (Lindesmith et al., 2015; Malm et al., 2014; Reeck et al., 2010). Immune responses to rapidly evolving viral infections are complex and heavily impacted by pre-exposure histories that shape the antibody response to newly evolved strains (Belongia et al., 2017; Gostic et al., 2016; Lessler et al., 2012; Lindesmith et al., 2017). These studies demonstrate that bivalent HuNoV vaccines can elicit GII.4 neutralizing antibody responses in humans, while also structurally defining the highly conserved GII.4 (1987–2015)epitope recognized by a neutralizing antibody.

Here, we demonstrate that the serological repertoire to HuNoV is oligoclonal and dominated by IGHV3 family antibodies in three pre-immune individuals who received the vaccine. A large fraction (6/10) of the serum antibodies that we biochemically characterized in detail displayed significant binding breadth, with 4/6 recognizing both GI and GII genotype VLPs. Although these high-binding-breadth antibodies did not have blockade activity, they may play a role in protection against HuNoV infection via Fc-mediated mechanisms. Non-neutralizing antibodies that protect against infection in animal models are observed at significant levels in circulation after influenza vaccination (Lee et al., 2016), and recent studies report the isolation of such antibodies for other viruses as well (Bootz et al., 2017; Henry Dunand et al., 2016). Current technologies do not allow direct evaluation of HuNoV Fc-mediated protection.

In donor A, we showed that the most dramatically back-boosted blockade antibody following vaccination is capable of blocking VLP-HBGA binding of all examined GII.4 strains circulating between 1987 and 2015 and is potently neutralizing in the human intestinal enteroid culture system. This antibody was present in appreciable amounts in the serum prior to vaccination, suggesting that it must have been elicited by an earlier HuNoV infection. Although lack of successful propagation of historic GII.4 strains limits our ability to test the breadth of GII.4 neutralization, all tested blockade monoclonal antibodies have also been neutralizing antibodies (Alvarado et al., 2018), indicating that A1431 is also likely cross-GII.4 neutralizing. These findings reveal that HuNoV infection can induce broad blockade and neutralizing antibodies and that these antibodies can be boosted by vaccination (Lindesmith et al., 2012a, 2015).

A1431 is a broad blockade neutralizing human antibody for which the binding site has now been structurally defined. The structures of antibodies A1431 and A1227 in complex with the P domain described here, as well as structures of the GI.1-specific, HBGA-blocking 5I2 IgA (Shanker et al., 2016) and of the broadly GII-reactive 5B18 IgG (Hansman et al., 2012) described previously, support multiple mechanisms of antibody-mediated recognition and potentially protection from norovirus infection (Koromyslova et al., 2018). The most abundant ligand-blocking antibodies recognize hypervariable surface-exposed epitopes that are frequently mutated as a result of antigenic drift (Debbink et al., 2012a; Lindesmith et al., 2013, 2015). Antibody binding of these epitopes blocks the HBGA binding pocket (Shanker et al., 2016). In contrast, A1431 recognizes conserved residues distal to the HBGA binding pocket but accessible on the assembled VLP. Blocking of ligand binding and neutralization likely results not from direct interference at the ligand-binding site but rather from either prevention of attachment to the ligand-displaying surface (i.e., steric effects) or modulation of capsid dynamics (Lindesmith et al., 2014, 2018b). We note that the unprecedented blockade breadth of A1431 may be useful for therapeutic purposes, as currently there are no treatment options for chronic infection or life-threatening HuNoV infection (Ahmed et al., 2012; Cardemil et al., 2017; Petrignani et al., 2018). The co-crystal structure of A1431 with the P domain potentially provides avenues by which this antibody may be further improved for breadth and potency (Diskin et al., 2011; Kwon et al., 2018). Antibodies like A1227 with broad cross-genogroup binding have not yet been shown to neutralize or block VLP binding to

HBGAs. These antibodies likely bind to occluded epitopes available for antibody access during phases of particle assembly and/or disassembly, intermediates, or rearrangements. Although mechanisms of protection driven by this class of antibodies are undefined, short-term boosting of cross-blockade antibodies after vaccination (Lindesmith et al., 2015) and mouse norovirus (MNV) monoclonal antibodies with cross-serotype neutralization (Kolawole et al., 2017) support the potential for HuNoV cross-genotype neutralization.

These data provide structural and mechanistic evidence supporting that the GII.4 component of the Takeda multivalent norovirus VLP vaccine recalls a memory antibody response that persists for at least six months, indicating that, similar to other rapidly evolving RNA viruses, early-life norovirus strain exposure shapes antibody responses to subsequent norovirus strains (Lindesmith et al., 2015, 2017). As with influenza, exposure history and genetic background are expected to impact outcomes differently by age groups, potentially impacting vaccine efficacy (Gostic et al., 2016; Lessler et al., 2012). Future studies are needed to determine additional mechanisms of the antibody boost to prospective GII.4 strains, as well as the antibody response in key vaccine target populations, including the aged, with a life-time of norovirus exposure but waning immune responsiveness, and the very young, with no pre-exposure history and possibly with maternal antibodies. These data are critical for understanding vaccine performance and population-based immunity against future pandemic isolates. Cross-blocking antibodies like A1431 provide one mechanism of breadth, and serological repertoire analyses offer robust strategies to dissect the molecular basis for this and other responses in human populations. Coupled with blockade, neutralization potency in the enteroid culture system (Costantini et al., 2018; Ettayebi et al., 2016), and structural determination of antibody binding sites, recombinant serum antibodies can provide invaluable information for immunogen design and vaccination strategies that phenocopy infection and provide broad, long-term protection to HuNoV pandemics.

STAR+ METHODS

Detailed methods are provided in the online version of this paper and include the following:

- KEY RESOURCESTABLE
- CONTACT FOR REAGENTAND RESOURCESHARING
- EXPERIMENTALMODEL AND SUBJECT DETAILS
  - Humans Subjects
  - Cell lines
  - Microbes
- METHOD DETAILS
  - Ten percent stool filtrate
  - Human intestinal enteroid culture (HIE)
  - High-throughput sequencing of BCR transcripts
  - VH Sequencing
  - VH/VL Sequencing
  - Isolation of HuNoV specific antibodies
  - Sample preparation and LC-MS/MS analysis
  - Antibody expression and purification
  - Production of Virus Like Particles
  - Antibody functional assays
  - P domain expression and purification
  - Crystallization of Fab complex with P2002
  - Structure determination and analysis
  - Neutralization Assay
- QUANTIFICATIONAND STATISTICALANALYSIS
- DATA AND SOFTWAREAVAILABILITY

SUPPLEMENTAL INFORMATION

CONTACT FOR REAGENT AND RESOURCE SHARING

Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Ralph Baric (rbaric@email.unc.edu). All human samples remain property of Takeda Vaccines.

EXPERIMENTAL MODEL AND SUBJECT DETAILS

Humans Subjects

Serum and PBMC samples

This study used de-identified human samples under University of North Carolina institutional review board exemption approval #11-0883. Serum and PBMC samples were collected from two female ages 25 and 46 and one male age 30 participants in a study conducted by Takeda Vaccines Inc. (Deerfield, IL) (Treanor et al., 2014). Participants in Group A1 received an intramuscular injection of 5 mg of both GI.1 and GII.4c VLP adjuvanted with 3-O-deacylated monophosphoryl lipid A (MPL, GlaxoSmithKline) and alhydrogel on day 0 (dose 1) followed by an identical booster vaccination on day 28 (dose 2). This study was done under IRB approval and subjects provided informed consent. The trial was registered at ClinicalTrials.gov (NCT01168401).

Cell lines

BHK -21 cells (ATCC CCL-10, derived from unsexed hamsters) were grown at 37! C in 5% CO_2 in Minimum Essential Medium with Earles salts and L-glutamine (Gibco) supplemented with 7% fetal Clone II (Hyclone), non-essential amino acids (Gibco), sodium pyruvate (Gibco) and Antibiotic-Antimycotic (Gibco).

Microbes

E coli Top 10 with pVR21 plasmid containing norovirus capsid genes were propagated at 30! C in the presence of 0.1mg/ml carbenicillin in Luria-Bertani broth. For full IgG expression and characterization, VH and VL plasmids were transfected into 30 mL cultures of Expi293F cells (Invitrogen) at a 1:2 ratio and incubated at 37! C and 8% CO_2 for 7 days.

For protein crystallization, P-domains were transfected into *E.coli* BL21 (DE3)(Agilent Technologies) and plated onto Luria-Bertani plates with 50mg/mL Ampicillin (LB-Amp). VH and VL chains were cotransfected into Expi293F cells (ThermoFisher)using a 3:1 ratio of Turbo293 transfection reagent (Speed Biosystem) to plasmid. Cells were incubated at 37! C, 5% CO_2, 130 rpm shaking, 70% humidity for 18 h and subsequently boosted with 80mL of AbBooster (Abi Scientific).

METHOD DETAILS

Ten percent stool filtrate

This investigation was determined by CDC to be public health non-research, and therefore was not subject to institutional review board review. Ten percent stool suspension was prepared by adding 0.5 g of GII.P16-GII.4 Sydney positive whole stool to 4.5 mL of PBS. The stool suspension was vortexed for 30 seconds, kept at room temperature for 5 min and vortexed again. Sample was sonicated and solids were removed by centrifugation for 10 min at 10,000 x g. The supernatant was serially filtered through 5 mm, 1 mm, 0.45 mm, and 0.22 mm filters. The resulting 10% stool filtrate was aliquoted and stored at 70! C.

Human intestinal enteroid culture (HIE)

HIE cells were kindly provided by Dr. Mary K. Estes, Baylor College of Medicine, Houston, Texas. Adult (female) secretor positive jejunal HIE cultures were grown as undifferentiated 3D cultures as described previously with minor modifications (Costantini et al., 2018; Ettayebi et al., 2016). Briefly, HIEs were recovered from liquid nitrogen (LN_2), suspended in 20 ml of Matrigel (Corning), plated in a single well of a 24 well plate, and grown as 3D cultures in 500 mL IntestiCult Organoid Growth Medium (Human) (STEMCELL Technologies) supplemented with 10 mM Y-27632 (Sigma-Aldrich). Media was refreshed every other day. Highly dense 3D cultures were passaged once per week. To passage, HIE were taken up in ice-cold complete medium without growth factors (CMGF-), broken up by repeating pipetting cycles, suspended in Matrigel (Corning), and plated in 24 well plates. CMGF- compromises Advanced Dulbecco Modified Eagle Medium (DMEM)/F12 supplemented with 1% GlutaMAX, 1% Penicillin/Streptomycin, 1% 1M HEPES. If single cell suspension was required, HIE were taken up in ice-cold 0.5mM EDTA and broken up by repeating pipetting cycles. After centrifugation (200 x g for 5 min at 4! C), single cell suspension was obtained upon treatment of the HIE with 0.05% Trypsin/0.5mM EDTA (Invitrogen) for 3–4 min at 37! C. Trypsin was then inactivated by adding CMGF- /10% FBS to the cell suspension. Cell suspensions were prepared by pipetting with a P1000 pipet and passing the cells through a 40 mm cell strainer. The cells were pelleted for 5 min at 400 x *g*, suspended in 100 ml of in IntestiCult Organoid Growth Medium (Human)(STEMCELL Technologies) supplemented with 10 mM Y-27632 (Sigma-Aldrich) and plated as undifferentiated monolayers in collagen IV (Sigma-Aldrich) pre-coated 96 well plates. After 24 h, culture medium was replaced with differentiation medium to induce cell differentiation. Differentiation media compromises CMGF- ,1:100 B27 supplement, 1:50 N2 supplement, 1:1000 mouse epidermal growth factor (all Invitrogen), 1 mM n-Acetyl-L-cysteine, 10 nM [Leu15]-Gastrin, 10 mM Y-27632 (all Sigma-Aldrich), Noggin 20%, (conditioned home-made medium), 500 nM A83-01 (Tocris). Cells were differentiated for 4 days. Media was refreshed every other day.

High-throughput sequencing of BCR transcripts

Frozen PBMCs were thawed at 37! C, resuspended in RPMI-1640 (Fisher) supplemented with 10% Fetal Bovine Serum (FBS) and 20 U/mL deoxyribonuclease I (Roche), concentrated by centrifugation (300 x g for 15 min at 20! C), and allowed to recover in 4 mL media at 37! C for 30 min. The cells were then split: half were dedicated to BCR heavy chain transcript sequencing, and half were used to identify the native VH/VL repertoire.

VH Sequencing

Cells were diluted with 10 mL of cold buffer (phosphate buffered saline supplemented with 0.5% BSA and 2 mM EDTA)and pelleted via centrifugation (300 x g for 15 min at 4! C). The supernatant was decanted, and the cells were resuspended in 1mL of TRIzol reagent (Thermo Fisher). RNA was extracted using RNeasy (Qiagen), and first strand cDNA was synthesized from 500 ng total RNA using SuperScript II (Invitrogen). IgM and IgG heavy chain repertoires were amplified using a multiplex primer set (Table S3) under the following conditions: 2 min at 94! C; 4 cycles of 94! C for 30 s, 50! C for 30 s, 72! C for 30 s; 4 cycles of 94! C for 30 s, 55! C for 30 s, 72! C for 30 s; 22 cycles of 94! C for 30 s, 63! C for 30 s, 72! C for 30 s; 72! C for 7 min; hold at 4! C (Ippolito et al., 2012) and sequenced by 2x300 paired-end Illumina MiSeq.

VH/VL Sequencing

Total B cells were isolated from PBMCs using the Human Memory B Cell Isolation Kit (Miltenyi Biotec) with an LD column according to the manufacturer's instructions. B cells were then coemulsified with oligo d(*T*)25 magnetic beads (New England Biolabs) and lysis buffer (100 mM Tris pH 7.5, 500 mM LiCl, 10 mM EDTA, 1% lithium dodecyl sulfate, and 5 mM dithiothreitol) using a custom-designed flow focusing device as described (McDaniel et al., 2016). The magnetic beads were washed, resuspended in One step fast qRT-PCR solution (VWR)supplemented with an overlap extension VH and VL primer set as described (McDaniel et al., 2016), emulsified, and subjected to overlap-extension RT-PCR under the following conditions: 30 min at 55 ! C followed by 2 min at 94 ! C; 4 cycles of 94 ! C for 30 s, 50 ! C for 30 s, 72 ! C for 2 min; 4 cycles of 94 ! C for 30 s, 55 ! C for 30 s, 72 ! C for 2 min; 32 cycles of 94 ! C for 30 s, 60 ! C for 30 s, 72 ! C for 2 min; 72 ! C for 7 min; hold at 4 ! C. VH/VL amplicons were then extracted from the emulsions, amplified using nested PCR, and sequenced by 2x300 Illumina MiSeq.

Isolation of HuNoV specific antibodies

HuNoV VLP (GII.4c, 1 mg) was immobilized on 250 mg N-hydroxysuccinimide (NHS)-agarose beads (Thermo Fisher) by overnight rotation at 4! C. The conjugated resin was washed with PBS, and unreacted NHS groups were blocked with 1M ethanolamine, pH 8.3, for 20 min at RT. The beads were washed with PBS, packed into a 5 mL column, washed with 10 column volumes (cv) of 4M urea in PBS, and finally washed with 20 cv PBS. Total IgG was isolated from each serum sample using melon gel purification (Thermo Fisher) according to the manufacturer's instructions. IgG was then passed over the affinity column in gravity flow mode to capture GII.4c VLP-specific antibodies. Flow through was collected and reapplied to the column five times. The column was washed with PBS with 2 cv followed by 1 cv of water before elution in 12-1 mL fractions of 5% formic acid. 10 mL of each elution fraction was neutralized with 100 ml of 25x PBS in 2% milk and analyzed via ELISA against GII.4c VLP (antibodies bound to immobilized GII.4c were detected using goat anti-human IgG Fc peroxidase antibody (Invitrogen)). Fractions containing antigen-specific antibodies were pooled, concentrated under vacuum, and resuspended into 50 mL of 100 mM Tris-pH 8.

Sample preparation and LC-MS/MS analysis

For each sample, the flow through and antigen enriched elution were denatured in 1:1 (v/v) trifluoroethanol, reduced with 5 mL tris(2-carboxyethyl)phosphine (TCEP,110 mM) in the dark at 55! C for 45 min, and alkylated with 32 mM iodoacetamide by incubating in the dark for 30 min. Samples were diluted 10x into 50 mM Tris (pH 8.0) and digested with trypsin (1:10 trypsin/protein) for 5 h at 37! C. Formic acid (0.1%) was used to quench the reaction. The solution was then concentrated, desalted using a C18 Hypersep SpinTip (Thermo) according to the manufacturer's instructions, and submitted for LC-MS/MS.

Peptides were separated by reversed-phase chromatography (Dionex UltiMate 3000 RSLCnano System with Dionex Acclaim PepMap RSLC C18 column, Thermo Scientific) and analyzed online by nano–electrospray ionization–MS/MS on Orbitrap Velos Pro (Thermo Scientific). MS1 scans were collected in the orbitrap at a resolution of 60,000 Å, and the ions with >+1 charge were fragmented by collision-induced dissociation with up to 20 MS2 spectra collected per MS1.

SEQUEST (Proteome Discoverer 1.4, Thermo Scientific) with previously described settings (Williams et al., 2017) was used to search the spectra against a patient-specific protein database constructed from the full-length VH and VL sequences, Ensembl human protein-coding sequences, and common contaminants (maxquant.org). PSMs were filtered with Percolator (Proteome Discoverer 1.4) at a false discovery rate of <1% and filtered for average mass deviations <1.5 parts per million. Peptides mapping to the CDR-H3 region of unique antibody lineages were grouped, and the relative abundances of the corresponding peptide matches were determined by the sum of the extracted ion chromatograms (XIC)of the respective precursor ions. Relative abundances were multiplied by the patient specific anti-GII.4c titer to calculate the amount of GII.4c specific clonotypes in serum.

Antibody expression and purification

Selected antibody sequences were purchased as gBlocks gene fragments (Integrated DNA Technologies) and cloned into a customized pcDNA3.4 vector (Invitrogen) containing human IgG1 Fc regions. VH and VL plasmids were transfected into 30 mL cultures of Expi293F cells (Invitrogen) at a 1:2 ratio and incubated at 37! C and 8% CO_2 for 7 days. The supernatant containing secreted antibodies was collected following centrifugation (1000 g for 10 min at 4! C), neutralized, and filtered. Antibodies were isolated using Protein G Plus agarose (Pierce Thermo Fisher Scientific) affinity chromatography, washed with 20 column volumes of PBS, eluted with 100 mM glycine-HCl pH 2.7, and neutralized with 1 M Tris-HCl pH 8.0. The antibodies were then concentrated and buffer exchanged into PBS using 10,000 MWCO Vivaspin centrifugal spin columns (Sartorius).

Production of Virus Like Particles

For production of the VLP for this study, HuNoV ORF2 genes were synthesized by Bio Basic Inc (Markham, ON) with ApaI and AcsI restriction sites for direct insertion into the VEE replicon vector pVR21. The sequence-verified pDNA was propagated in Ecoli Top 10 (Invitrogen). pDNA was purified with QIAprep Miniprep kit (Qiagen). Purified pDNA was linearized with NotI, agarose gel purified with QIAquick Gel Extraction kit (Qiagen) and mRNA generated using mMESSAGE mMachine T7 transcription kit (Invtirogen). Message RNA was electroplated into BHK cells (ATCC CCL-10) for production of VLP (Agnihothram et al., 2018; Debbink et al., 2013). After 27 h, cells were washed and lysed in 1% Triton X-100 in PBS plus cOmplete EDTA-free protease inhibitor cocktail (Roche) and cell lysates layered above a cushion of 40% sucrose in PBS. VLP were purified into the cushion by ultracentrifugation at 120,000 x g for 75 min and stored at -80! C in 40% sucrose/PBS. Protein concentration was determined by BCA assay (Pierce). VLPs were verified for particle integrity by ligand and antibody binding and visualization by electron microscopy of 40nm particles.

Antibody functional assays

EIA and blockade antibody assays were performed at described (Lindesmith et al., 2018a) at 0.25 mg/ml VLP. EIA plates were coated with VLP in PBS for 4 h and blocked over night at 4! C in 5% dry milk in PBS-0.05% Tween-20 before the addition of decreasing two-fold serial dilutions of mAb at 37! C. Bound mAb was detected by anti-human IgG-HRP (GE Healthcare) and color developed with 1-Step Ultra TMB ELISA HRP substrate solution (Thermo-Fisher). Similarly, VLPs were pretreated with decreasing concentrations of mAb for 1 h and added to pig gastric mucin type III (Sigma Aldrich, St. Louis, MO) coated plates for 1 h. Bound VLP was detected by anti-VLP rabbit hyperimmune sera followed by anti-rabbit IgG-HRP (GE Healthcare) and color developed as above. Percent control binding is defined as the binding in the presence of antibody pretreatment compared to the binding in the absence multiplied by 100.

P domain expression and purification

The gene for the P-domain of HuNoV GII.4.2002 (accession number: AFJ04708) corresponding to amino acids 225-530 was synthesized by GenScript and codon optimized for *E. coli* expression. The P-domain gene was cloned in pMal-C5X plasmid (NEB) with a HRV-3C cleavage site between the MBP-6xHis and the P-domain (Nucleotide sequence: CATCACCACCACCAT CACGGTTCTGGTCTGGAAGTTC-TGTTCCAGGGGCCCTCC).The plasmid was transformed into *E.coli* BL21 (DE3) (Agilent Technologies) and plated onto Luria-Bertani plates with 50mg/mL Ampicillin (LB-Amp). A single colony was used to inoculate 100mL of LB-Amp. After incubation for 18 h at 37! C and 210 rpm shaking, 10 mL of culture was used to inoculate 1L of LB-Amp at 37! C and 210 rpm shaking. When OD_{600} reached 0.7, flasks were cooled for 30 min in ice/water bath. Flasks were subsequently incubated at 18! C and 210 rpm shaking for 30 min before induction with 0.5mM IPTG (Isopropyl b-D-1-thiogalactopyranoside). After 18 h, cells were harvested by centrifugation at 10,000 x g for 20 min at 20! C. Pellets from 1L cell culture were resuspended in 40mL of PBS with addition of 150mM of NaCl and flash frozen in liquid nitrogen. Cell pellets were stored at -80! C until further use.

Pellets from 1L of cell culture were thawed on ice and supplemented with one tablet of protease inhibitors (Roche cOmplete EDTA-free cocktail) and 1mg/mL of Lysozyme (Sigma-Aldrich). Cell slurry was kept on ice and sonicated with a Branson Sonifier SFX150 equipped with micro-tip (5 seconds ON, 30 seconds OFF for a total process time of 2 min). Lysed cells were centrifuged at 38,000 x g for 45 min at 4! C. Clarified lysate was batch bound to 4mL of Ni-resin (Roche cOmplete His-Tag Purification Resin) for 1 h at 4! C with end-over-end rotation. Resin slurry was loaded on a plastic column and allowed to flow by gravity. Resin was sequentially washed with 40mL of PBS and 40mL of PBS with 20mM Imidazole (pH 8.0). Bound protein was eluted with PBS with 200mM Imidazole (pH 8.0) and elution collected in 5mL fractions. Protein concentration was determined by absorption at 280nm using a calculated extinction coefficient of 102010 M^{-1} cm^{-1}. Fractions with highest concentration were pooled and 20U of HRV-3C protease (Millipore-Sigma) were added. Cleavage reaction was subsequently dialyzed in 10 kDa MWCO cassette (Thermofisher Slide-A-Lyzer) overnight against 4L of buffer containing 25mM Tris-HCl (pH 7.5), 150mM NaCl and 5mM b-mercaptoethanol. Complete cleavage of MBP-6His from P-domain was confirmed by SDS-PAGE gel shift after Coomassie staining. Cleavage reaction was bound to 2mL of Ni-resin and incubated with end-over-end rotation for 1 h. Resin was loaded onto plastic column and flow-through containing cleaved P-domain was collected. Resin was washed with 5mL of dialysis buffer and both flow-throughs were pooled and concentrated to around 10mg/mL in 10kDa MWCO Amicon Ultra (Millipore-Sigma). Concentrated sample was loaded onto Superdex-200 Increase 10/300 GL (GE-healthcare) equilibrated with 25mM Tris-HCl (pH 7.5), 150mM NaCl and the peak corresponding to P-domain (elution volume 15.5mL) was collected. Purification was assessed by SDS-PAGE and purified P-domain was concentrated to 5mg/mL in 10kDa MWCO Amicon Ultra and stored at 4! C until further use.

Antibodies A1227 and A1431 were produced as previously described (McLellan et al., 2011). Briefly, heavy chain plasmids, containing the HRV3C cleavage site in the hinge region, and light chain plasmids were cotransfected in Expi293F cells (ThermoFisher) using a 3:1 ratio of Turbo293 transfection reagent (Speed Biosystem) to plasmid. Cells were incubated at 37! C, 5% CO_2, 130 rpm shaking, 70% humidity for 18 h and subsequently boosted with 80mL of AbBooster (Abi Scientific). Temperature was lowered to 33! C and expression was continued for additional 6 days. Cells were pelleted at 10000 x g, 20! C for 45 min and pellet discarded. Supernatant containing secreted antibody was supplemented with two tablets of protease inhibitors (Roche cOmplete EDTA-free). All subsequent steps were performed at 4! C. Cell supernantant was loaded by gravity onto 5ml of Protein A slurry (GE MabSelect) pre-equilibrated with PBS. Resin was washed with 50 mL of PBS and eluted in 1mL fractions with Pierce IgG Elution buffer. Elution was immediately neutralized with 1M Tris-Cl, pH 8.0 (final concentration 0.1M). Fractions with highest concentration (determined by A280 absorption) were pooled and 40U of HRV-3C protease (Millipore-Sigma) were added. Cleavage reaction was allowed to

proceed for 18 h at 4! C with end-over-end rotation. Cleavage reaction was assessed by SDS-PAGE before proceeding to next step. One mL of Ni-resin (Roche cOmplete His-Tag Purification Resin) loaded onto plastic column and overlaid with two mL of protein A resin. Ni-resin was used to capture His-tag, while protein A resin was used to capture free Fc. Both resins were equilibrated with PBS. Cleavage reaction was loaded by gravity onto resins and flow-through was collected. Resins were washed with 10mL of PBS and the second flow-through pooled with the first. Protein concentration was assessed by absorption at 280nm and removal of Fc and His-tag was verified after SDS-page and Coomassie staining. Purified Fab were concentrated to 10mg/mL in 10kDa MWCO Amicon Ultra (Millipore-Sigma) and purified on a Superdex-200 Increase 10/300 GL (GE-healthcare). Fractions containing pure Fab were pooled, concentrated to 10mg/mL in 10kDa MWCO Amicon Ultra (Millipore-Sigma) and stored at 4! C until further use.

Crystallization of Fab complex with P2002

Purified P2002 was mixed with 1.5-fold molar excess of purified Fab A1227 or Fab A1431 and incubated at 20! C for 1 h with end-over-end rotation. The mixture was injected onto Supredex 200 Increase 10/300 GL equilibrated with 25mM Tris pH 7.5, 150mM NaCl. Both complexes had a retention volume of around 12.3mL, consistent with two Fabs binding to one P-domain dimer. The fractions containing the complex were pooled and concentrated to 5mg/mL in MWCO 10kDa and immediately used for crystallization trials. The P2002-A1227 Fab complex was mixed with an equal volume of precipitant solution (10% polyethylene glycol 4000, 0.1M Tris pH 8.5, 50mM proline) and crystallized by sitting-drop vapor diffusion over the precipitant solution at 20! C. Rod-shaped crystals formed after 2 days. Crystals were harvested using Dual-Thickness MicroLoops (MiTeGen), cryoprotected using 30% ethylene glycol and immediately flash frozen in liquid nitrogen. The same procedure was used to crystallize the P2002-A1431 Fab complex, except the precipitant solution contained 10% polyethylene glycol 8000 and 0.1M CHES pH 9.5. Rod-shaped crystals formed after 2 days.

Structure determination and analysis

All diffraction data were collected at 100 K and 1.000 Å wavelength at the SER-CAT beamline ID-22 (Advanced Photon Source, Argonne National Laboratory) and processed with the HKL2000 suite (Otwinowski and Minor, 1997). A complete dataset was collected for the GII.4.2002 P domain-A1227 Fab complex to 2.6 Å using 0.25! oscillations and translating the crystal to different spots throughout data collection. A complete dataset was collected for the GII.4.2002 P domain-A1431 Fab complex to 3.1 Å from a single crystal using 0.5! oscillations. Each structure was solved by molecular replacement with the program PHASER (McCoy et al., 2007) using PDB ID 4OOV for the apo structure of GII.4.2002 P domain and PDB ID 3EYQ for the Fab as search models. Iterative cycles of model building and refinement were performed using COOT (Emsley and Cowtan, 2004) and PHENIX (Adams et al., 2004). Data collection and refinement statistics are shown in Table S2.

GI, GII and GII.4 sequence conservation scores were calculated using the AL2CO server (Pei and Grishin, 2001) and mapped onto the GII.4 P domain surface as described previously (Hansman et al., 2011). Buried surface area calculations and interface analyses were carried out with PISA (Krissinel and Henrick, 2007). Structure figures were prepared using the programs The PyMOL Molecular Graphics System, Version 2.0.5 Schrödinger, LLC and Chimera (Pettersen et al., 2004).

Neutralization Assay

Norovirus antibody neutralization

Serial dilutions of each mAb were prepared in complete medium without growth factors (CMGF) and pre-incubated with GII.P16-GII.4 Sydney stool filtrate (3.1 x 10^5 viral genomic copies). After 1 h incubation at 37! C and 5% CO_2, samples were diluted 1:2 in CMGF supplemented with 1000 mM sodium glycochenodeoxycholate (GCDCA; Sigma-Aldrich) plus 100 mM ceramide (Santa Cruz Biotechnology). Duplicated, 100% confluent 4-day old differentiated monolayers, were inoculated. After 1 h incubation at 37! C and 5% CO_2, monolayers were washed twice with CMGF and 100 ml of differentiation medium containing 500 mM GCDCA plus 50 mM ceramide was added to each well. For each set of infections, one plate was immediately frozen at -70! C and a duplicate plate was incubated at 37! C, 5% CO_2 for 24 h and frozen at -70! C.

For each monoclonal antibody, 4 independent experiments with 2 technical replicates for each mAb dilution on each experiment were performed. Neutralization was expressed as a measure of the reduction in viral genomic copies (as percentage) when compared to a control (no mAb) within each assay using real-time RT-qPCR.

Norovirus detection and quantification

Viral RNA was extracted from cultures (cells and media) at 1 h post-infection (hpi) and 24 hpi using the KingFisher instrument and MagMAX - 96 Viral RNA Isolation Kit (Applied Biosystems) according to the manufacturer's instructions. Norovirus RNA was detected by GI/GII TaqMan real-time RT-PCR (Cannon et al., 2017). Standard curves were generated using 10-fold serial dilutions of GII.4 Sydney RNA transcripts.

QUANTIFICATION AND STATISTICAL ANALYSIS

Antibody EC_{50} and IC_{50} were determined from log-transformed non-linear, dose-response sigmoidal curve fit data using GraphPad 7.02 (Lindesmith et al., 2015; Lindesmith et al., 2017). Antibody binding by EIA less than 0.2 OD at 2 mg/ml or blockade assays IC_{50} >2mg/ml was scored as negative for binding. Samples were tested in duplicate in a minimum of two independent experiments and the results reported in Figures 2 and 3.

DATA AND SOFTWARE AVAILABILITY

The datasets generated during the current study are available from the Lead Contact upon reasonable request. The accession numbers for the amino acids sequence of HuNoV strain capsids reported in this paper are GenBank: AAB50466.2 (GI.1), AFK75851.1 (GI.3), AFK75852.1 (GI.4), AFJ04707.1 (GII.4 1997), AFJ04708.1 (GII.4 2002), AFJ04709.1 (GII.4 2006b), AFV08795.1 (GII.4 2012), APA31970.1 (GII.4 2015), AFS33555.1 (GII.1), AAN08112.1 (GII.2), AFK75854.1 (GII.3), AAN05735.1 (GII.14), AKB94547.1 (GII.17), MK614455 (GII.4c), MK614084 (GII.4 2006a.581 virus-like particles), MK614085 (GII.4 2006a.581.A4A virus-like particles), MK614086 (GII.4 2006a.581.A4B virus-like particles), MK614081 (GII.4 1987. 2012A virus-like particles), MK614082 (GII.4 1987. 2012D virus-like particles), MK614083 (GII.4 1987. 2012E virus-like particles). The accession numbers for the atomic coordinates and structure factors for the reported crystal structures are Protein Data Bank (PDB): 6N81 and 6N8D.

The purpose of Modification 2 to HR001117S0019, the Pandemic Prevention Platform (P3) Broad Agency Announcement, is to change the requirement for the quantity of virus that must be grown as part of the effort. Specifically, the requirement to grow 10^{13} infectious viral units is no longer applicable. The new requirement states that performers must demonstrate the ability to grow pathogen quantities that are sufficient to complete medical countermeasure development, including "bait" for antibody or countermeasure discovery as well as *in vitro* and *in vivo* assays to determine countermeasure efficacy.

The corresponding changes can be found on pages 12 and 13 of the BAA and are bolded below:

Platform Integration and Testing

To ensure end-to-end functional platform integration, the performer will be required to transition the technological advances from the three TAs into capability demonstrations. A central component of this program will be the demonstration of an end-to-end platform functionality. The first capability demonstration will occur in month 12 of the program. Performer groups will be allotted 90 days to:

- **Grow pathogen quantities sufficient to complete medical countermeasure discovery, testing, and evaluation**
- Discover pathogen-specific antibodies
- Successfully transition both antibody/therapy and virus to the antibody evolution group
- Evolve antibody/therapy to 100-fold increased potency
- Deliver genetic sequence of highly potent antibody/therapy to the manufacturing group (data)
- Manufacture research grade material for animal studies
- Demonstrate both product delivery and protection from viral challenge in an animal model

At month 24, performers will conduct a capability demonstration with a pathogen of performer choice. At 36 months, performers will conduct a third 60-day capability demonstration with a DARPA selected pathogen. It is required that during one of the capability demonstrations, GMP manufacturing of clinical grade material will be completed for use in a human clinical trial. The proposal must include a discussion of the number of doses to be manufactured during the demonstration, and the time for manufacturing of these doses must fall within the 60-day timeline.

Using the lessons learned in the previous capability demonstrations, performers will conducted two final capability demonstrations with pathogens that are unidentified to the groups to simulate a "real–world" response to an unknown pathogen. The final deliverable will be the ability to produce at a minimum 1000 doses. The platform should be capable to scale-up manufacturing to 20,000 doses of gene-encoded antibody product for Phase I/II human clinical trials in <60 days, with a delivery platform able to achieve protective levels inside the body.

Finally, the proposal must include a discussion of where the capability platform will be located. It is anticipated that the platform will either be centrally located in one facility run by one of the performer teams, or that aspects of the platform will be physically located at different facilities which are integrated through a system of agreements allowing for the facile transfer of material between locations. In the latter case, the proposal must discuss the coordination and management of the decentralized platform.

Proposers must provide the following in the proposal:

- The proposed manufacturing plan, demonstrating the ability to GMP manufacture products in addition to being able to scale-up manufacturing and distribute 20,000 doses
- The proposed transition plan describing the product/data pipeline from receipt of pathogen and antibody input to final product
- The regulatory plan for phase I clinical safety trials

Table 1. Program metrics and milestones

Technical Metrics
TA 1: On-demand platform to grow virus **1. Grow pathogen quantities sufficient to complete medical countermeasure discovery, testing, and evaluation** 2. Pathogen genetic drift less than 0.1% after 5 successive culturing (growth) iterations (mutations per base pair per culturing cycle) 3. Progeny virus bio-identical to original isolate in lipid, protein, and carbohydrate content 4. Apply platform to five viruses representing at least one RNA virus, one DNA virus, and both (+)-sense and (-)-sense single stranded viral genomes
TA 2: System to evolve antibodies. 1. Ready for use in less than 72 hours 2. Demonstrate the ability to couple antibody discovery capability with the antibody evolution capability either through new discovery technologies or physical coupling with existing technologies 3. Support rapid potency maturation improving antibody/therapy greater than 100-fold in under 8 days 4. Apply technology to mature five different antibodies/therapies targeting at a minimum three (3) different pathogens representing at least one RNA virus, one DNA virus, and both (+)-sense and (-)-sense single stranded viral genomes *While it is assumed that the development of antibody therapies may be necessary to achieve a protective countermeasure in <60 days, all innovative approaches that meet the time and quality metrics stated above will be considered.

Technical Metrics
TA 3: Deliver medical countermeasure(s) 1. Achieve greater than 10 μg/mL serum concentration of target medical countermeasure with peak production in <3 days post-injection in large animals 2. Minimally or low-invasive simple delivery method given at 1 delivery site 3. Demonstrate reproducible production (less than 10% variance in serum concentration) in large animals 4. Demonstrate 100% protection against performer defined pathogen challenge in animal models by day 3 post countermeasure administration 5. Demonstrate longevity of protection lasts for greater than 30 days *While it is assumed that the development of antibody therapies may be necessary to achieve a protective countermeasure in <60 days, all innovative approaches that meet the time and quality metrics stated above will be considered.
Platform Integration: All of the following metrics must be achieved within 60 days and must include full integration with the metrics for TA1-3: 1. Demonstrate the ability to identify a pathogen specific antibody/therapy for rapid affinity maturation in TA2 within 14 days 2. Demonstrate the ability to manufacture research grade genetic constructs for use in animal studies 3. Demonstrate the ability to manufacture clinical grade GMP material for human safety trials – this metric must be met for only one of the phase II demonstrations. The ability to scale-up manufacturing and distribution to 20,000 doses must also be addressed as part of this metric 4. Demonstrate safety and efficacy in animal models and in human clinical trials
